O. Ba. OSWALD BARRON, F.S.A.
Editor of *The Ancestor*, 1902–1905. Hon. Genealogist to Standing Council of the Honourable Society of the Baronetage.
→ **Russell** (*Family*).

O. M.* OCTAVE MAUS, LL.D.
Advocate of the Court of Appeal at Brussels. Director of *L'Art Moderne* and of the *Libre Esthétique*. President of the Association of Belgian writers. Officer of the Legion of Honour. Author of *Le Théâtre de Bayreuth*; *Aux Ambassadeurs*; *Malta, Constantinople et la Crimée*; &c.
→ **Rops, Félicien.**

P. A. A. PHILIP A. ASHWORTH, M.A., DOC.JURIS.
New College, Oxford. Barrister-at-Law. Translator of H. R. von Gneist's *History of the English Constitution.*
→ **Rhine** (*in part*).

P. A. K. PRINCE PETER ALEXEIVITCH KROPOTKIN.
See the biographical article: KROPOTKIN, PRINCE P. A.
→ **Riga** (*in part*); **Russia:** *Geography and Statistics* (*in part*).

P. C. M. PETER CHALMERS MITCHELL, M.A., F.R.S., F.Z.S., D.Sc., LL.D.
Secretary of the Zoological Society of London. University Demonstrator in Comparative Anatomy and Assistant to Linacre Professor at Oxford, 1888–1891. Author of *Outlines of Biology*; &c.
→ **Regeneration of Lost Parts; Reproduction:** *of Animals.*

P. Gi. PETER GILES, M.A., LL.D., LITT.D.
Fellow and Classical Lecturer of Emmanuel College, Cambridge, and University Reader in Comparative Philology. Formerly Secretary of the Cambridge Philological Society.
→ **S.**

P. G. K. PAUL GEORGE KONODY.
Art Critic of the *Observer* and the *Daily Mail*. Formerly Editor of *The Artist*. Author of *The Art of Walter Crane*; *Velasquez: Life and Work*· &c.
→ **Rembrandt** (*in part*); **Rubens** (*in part*).

P. V. PASQUALE VILLARI.
See the biographical article: VILLARI, PASQUALE.
→ **Rimini; Rome:** *Roman Republic in the Middle Ages.*

R. A. N. REYNOLD ALLEYNE NICHOLSON, M.A., LITT.D.
Lecturer in Persian in the University of Cambridge. Sometime Fellow of Trinity College, Cambridge, and Professor of Persian at University College, London. Author of *Selected Poems from the Dîwâni Shamsi Tabriz*; *A Literary History of the Arabs*; &c.
→ **Sabians.**

R. C. J. SIR RICHARD CLAVERHOUSE JEBB, LL.D., D.C.L.
See the biographical article: JEBB, SIR RICHARD CLAVERHOUSE.
→ **Rhetoric.**

R. H. C. REV. ROBERT HENRY CHARLES, M.A., D.D., D.LITT.
Grinfield Lecturer, and Lecturer in Biblical Studies, Oxford. Fellow of Merton College. Fellow of the British Academy. Formerly Professor of Biblical Greek, Trinity College, Dublin. Author of *Critical History of the Doctrine of a Future Life*; *Book of Jubilees*; &c.
→ **Revelation, Book of.**

R. J. M — RONALD JOHN MCNEILL, M.A.
Christ Church, Oxford. Barrister-at-Law. Formerly Editor of the *St James's Gazette*, London.
→ **Richmond, Earls and Dukes of; Richmond and Lennox, Duchess of; Sacheverell, William.**

R. L.* — RICHARD LYDEKKER, F.R.S., F.Z.S., F.G.S.
Member of the Staff of the Geological Survey of India, 1874–1882. Author of *Catalogues of Fossil Mammals, Reptiles and Birds in the British Museum*; *The Deer of all Lands*; &c.
→ **Reindeer; Rhinoceros** (*in part*); **Rhytina; Rivers-hog; Rocky Mountain Goat; Rodentia; Roe-buck; Rorqual.**

R. N. B. — ROBERT NISBET BAIN (d. 1909).
Assistant Librarian, British Museum, 1883–1909. Author of *Scandinavia: the Political History of Denmark, Norway and Sweden, 1513–1900*; *The First Romanovs, 1613–1725*: *Slavonic Europe: the Political History of Poland and Russia from 1469 to 1796*; &c.
→ **Repnin; Reuterholm, Baron; Sadolin, Jörgen.**

R. R. M. — ROBERT RANULPH MARETT, M.A.
Reader in Social Anthropology, Oxford University, and Fellow and Tutor of Exeter College. Formerly Dean and Sub-Rector of Exeter College. Author of *The Threshold of Religion*.
→ **Religion:** *Primitive Religion*; **Ritual.**

R. S. C. — ROBERT SEYMOUR CONWAY, M.A., D.LITT.
Professor of Latin and Indo-European Philology in the University of Manchester. Formerly Professor of Latin in University College, Cardiff, and Fellow of Gonville and Caius College, Cambridge. Author of *The Italic Dialects*.
→ **Rome:** *Ancient History* (*in part*); **Rutuli; Sabellic; Sabini.**

R. W. F. H. — ROBERT WILLIAM FREDERICK HARRISON.
Barrister-at-Law, Inner Temple. Assistant Secretary of the Royal Society, London.
→ **Royal Society, The.**

S. A. C. — STANLEY ARTHUR COOK, M.A
Lecturer in Hebrew and Syriac, and formerly Fellow, Gonville and Caius College, Cambridge. Editor for the Palestine Exploration Fund. Author of *Glossary of Aramaic Inscriptions*; *The Law of Moses and the Code of Hammurabi*; *Critical Notes on Old Testament History*; *Religion of Ancient Palestine*; &c.
→ **Ruth, Book of** (*in part*); **Sabbath** (*in part*).

St C. — VISCOUNT ST CYRES.
See the biographical article: IDDESLEIGH, 1st EARL OF.
→ **Roman Catholic Church** (*in part*).

S. H. V.* — SYDNEY HOWARD VINES, M.A., D.Sc., F.R.S.
Sherardian Professor of Botany, Oxford University, and Fellow of Magdalen College. Fellow of the University of London. Hon. Fellow, formerly Fellow and Lecturer, of Christ's College, Cambridge. President of the Linnean Society, 1900–1904. Author of *A Student's Text-Book of Botany*; &c.
→ **Reproduction:** *of Plants*; **Sachs, Julius von.**

S. N. — SIMON NEWCOMB, D.Sc., L.L.D.
See the biographical article: NEWCOMB, SIMON.
→ **Refraction:** *Astronomical Refraction*.

T. As. — THOMAS ASHBY, M.A., D.LITT. (Oxon.).
Director of British School of Archaeology at Rome. Formerly Scholar of Christ Church, Oxford. Craven Fellow, 1897. Conington Prizeman, 1906. Member of the Imperial German Archaeological Institute. Author of *The Classical Topography of the Roman Campagna*
→ **Regillus; Regium; Rovigo; Ruscellae; Ruvo; St Bernard Passes** (*in part*).

T. A. I. — THOMAS ALLAN INGRAM, M.A., LL.D.
Trinity College, Dublin.
→ **Sacrilege:** *English Law*.

T. Ba. — SIR THOMAS BARCLAY.
Member of the Institute of International Law. Officer of the Legion of Honour. Author of *Problems of International Practice and Diplomacy*; &c. M.P. for Blackburn, 1910.
→ **Reprisals.**

T. B. L. — THOMAS BELL LIGHTFOOT, M.INST.C.E., M.INST.MECH.E.
Author of *Preservation of Foods by Cold*; &c.
→ **Refrigerating.**

T. H.* — THOMAS HARRIS, M.D., F.R.C.P.
Formerly Hon. Physician to Manchester Royal Infirmary, and Lecturer on Diseases of the Respiratory Organs at Owens College, Manchester. Author of numerous articles on diseases of the respiratory organs.
→ **Respiratory System:** *Pathology* (*in part*).

T. Wo. — THOMAS WOODHOUSE.
Head of the Weaving and Textile Designing Department, Technical College, Dundee.
→ **Rope and Rope-making; Sacking and Sack Manufacture; Sailcloth.**

T. W.-D. — WALTER THEODORE WATTS-DUNTON.
See the biographical article: WATTS-DUNTON, WALTER THEODORE.
→ **Rossetti, Dante Gabriel.**

W. A. B. C. — REV. WILLIAM AUGUSTUS BREVOORT COOLIDGE, M.A., F.R.G.S., PH.D.
Fellow of Magdalen College, Oxford. Professor of English History, St David's College, Lampeter, 1880–1881. Author of *Guide du Haut Dauphiné*; *The Range of the Tods*; *Guide to Grindelwald*; *Guide to Switzerland*; *The Alps in Nature and in History*; &c. Editor of the *Alpine Journal*, 1880–1881; &c.
→ **Referendum and Initiative; Reschen Scheideck; Rhine:** *Swiss Portion*; **Rhone; Rorschach; Rosa, Monte; Rovereto; St Bernard Passes** (*in part*).

W. A. P. — WALTER ALISON PHILLIPS, M.A.
Formerly Exhibitioner of Merton College and Senior Scholar of St John's College, Oxford. Author of *Modern Europe*; &c.
→ **Rochet:** *Church of England*; **Roman Catholic Church** (*in part*); **Russia:** *Government and Administration*.

W. E. A. A.	WILLIAM EDMUND ARMYTAGE AXON, LL.D. Formerly Deputy Chief Librarian of the Manchester Free Libraries. On Literary Staff of *Manchester Guardian*, 1874–1905. Member of the Gorsedd, with the bardic name of Manceinion. Author of *Annals of Manchester*; &c.	**Roscoe, William.**
W. H. F.	SIR WILLIAM H. FLOWER, F.R.S. See the biographical article: FLOWER, SIR W. H.	**Rhinoceros** (*in part*).

ENCYCLOPÆDIA BRITANNICA

ELEVENTH EDITION

VOLUME XXIII

REFECTORY (med. Lat. *refectorium*, from *reficere*, to refresh), the hall of a monastery, convent, &c., where the religious took their chief meals together. There frequently was a sort of ambo, approached by steps, from which to read the *legenda sanctorum*, &c., during meals. The refectory was generally situated by the side of the S. cloister, so as to be removed from the church but contiguous to the kitchen; sometimes it was divided down the centre into two aisles, as at Fountains Abbey in England, Mont St Michel in France and at Villiers in Belgium, and into three aisles as in St Mary's, York, and the Bernardines, Paris. The refectory of St Martin-des-Champs in Paris is in two aisles, and is now utilized as the library of the École des Arts et Métiers. Its wall pulpit, with an arcaded staircase in the thickness of the wall, is still in perfect preservation.

REFEREE, a person to whom anything is referred; an arbitrator. The court of referees in England was a court to which the House of Commons committed the decision of all questions as to the right of petitioners to be heard in opposition to private bills. As originally constituted the referees consisted of the chairman of ways and means, and other members, the Speaker's counsel and several official referees not members of the House of Commons. In 1903 the appointment of official referees was discontinued. The court now consists of the chairman of ways and means, the deputy chairman and not less than seven other members of the House appointed by the Speaker, and its duty, as defined by a standing order, is to decide upon all petitions against private bills, or against provisional orders or provisional certificates, as to the rights of the petitioners to be heard upon such petitions. In the high court of justice, under the Judicature Act 1873, cases may be submitted to three official referees, for trial, inquiry and report, or assessment of damages. Inquiry and report may be directed in any case, trial only by consent of the parties, or in any matter requiring any prolonged examination of documents or accounts, or any scientific or local investigation which cannot be tried in the ordinary way.

REFERENDUM and **INITIATIVE,** two methods by which the wishes of the general body of electors in a constitutional state may be expressed with regard to proposed legislation. They are developed to the highest extent in Switzerland, and are best exemplified in the Swiss federal and cantonal constitutions. By these two methods the sovereign people in Switzerland (whether in the confederation or in one of its cantons) approve or reject the bills and resolutions agreed upon by the legislative authority (Referendum), or compel that authority to introduce bills on certain specified subjects (Initiative)—in other words, exercise the rights of the people as regards their elected representatives at times other than general elections. The *Referendum* means "that which is referred" to the sovereign people, and prevailed (up to 1848) in the federal diet, the members of which were bound by instructions, all matters outside which being taken "ad referendum." A similar system obtained previously in the formerly independent confederations of the Grisons and of the Valais, in the former case not merely as between the Three Leagues, and even the bailiwicks of each within its respective league, but also (so far as regards the upper Engadine) the communes making up a bailiwick, though in the Valais the plan prevailed only as between the seven *Zehnten* or bailiwicks. The *Initiative*, on the other hand, is the means by which the sovereign people can compel its elected representatives to take into consideration either some specified object or a draft bill relating thereto, the final result of the deliberations of the legislature being subject by a referendum vote to the approval or rejection of the people. These two institutions therefore enable the sovereign people to control the decisions of the legislature, without having recourse to a dissolution, or waiting for the expiration of its natural term of office.

As might have been expected, both had been adopted by different cantons before they found their way into the federal constitution, which naturally has to take account of the sovereign rights of the cantons of which it is composed. Further, they (at any rate the referendum) were employed in the case of constitutional matters relating to cantonal constitutions before being applied to all or certain specified laws and resolutions. Finally, the action of both has been distinctly conservative in the case of the confederation, though to a less marked degree in the case of the cantons.

Two forms of the Referendum should be carefully distinguished: the *facultative* or optional (brought into play only on the demand of a fixed number of citizens), and the *obligatory* or compulsory (which obtains in all cases that lie within its sphere as defined in the constitution). The Initiative exists only in the facultative form, being exercised when a certain number of citizens demand it. Both came into common use during the Liberal reaction in Switzerland after the Paris revolution of July 1830. In 1831 St Gall first adopted the "facultative referendum" (then and for some time after called the "Veto"), and its example was followed by several cantons before 1848. The "obligatory referendum" appears first in 1852 and 1854 respectively in the Valais and the Grisons, when the older system was reformed, but in its modern form it was first adopted in 1863 by the canton of rural Basel. The Initiative was first adopted in 1845 by Vaud. Of course the cantons with *Landsgemeinden*, Uri, Unterwalden, Appenzell and Glarus (where the citizens appear in person) possessed both from time immemorial. Excluding these there were at the end of 1907 9½ cantons, which had the "obligatory referendum" (Aargau, rural Basel, Bern, the Grisons, Schaffhausen, Schwyz, Soleure, Thurgau, the Valais and Zürich), while 7½ cantons possess only the "facultative referendum" (Basel town, Geneva, Lucerne, Neuchâtel, St Gall, Ticino, Vaud and Zug). Fribourg alone had neither, save an obligatory referendum (like all the rest) as to the revision of the cantonal constitution. As regards the Initiative, all the cantons have it as to the revision of the cantonal constitution; while all but Fribourg have it also as to bills or legislative projects. In the case both of the facultative referendum and of the Initiative each canton fixes the number of citizens who have a right to exercise this power. The constitution of the Swiss confederation lags behind those of the cantons. It is true that both in 1848 (art. 113) and in 1874 (art. 120) it is provided that a vote on the question whether the constitution shall be revised must take place if either house of the federal legislature or 50,000 qualified voters demand it—of course a popular vote (obligatory referendum) must take place on the finally elaborated project of revision. But as regards bills the case is quite different. The "facultative referendum" was not introduced till 1874 (art. 89) and then only as regards all bills and resolutions of being of a pressing nature, 8 cantons or 30,000 qualified voters being entitled to ask for such a popular vote. But the Initiative did not appear in the federal constitution till it was inserted in 1891 (art. 121), and then merely in the case of a partial (not a total) revision of the constitution, if 50,000 qualified voters require it, whether as regards a subject in general or a draft bill,—of course the federal legislature had an Initiative in this matter in 1848 already. The results of the working of these two institutions in federal matters up to the end of 1908 are as follows. Excluding the votes by which the two federal constitutions of 1848 and 1874 were adopted, there have been 30 (10 of them between 1848 and 1874) votes (obligatory referendum) as to amendments of the federal constitution; in 15 cases only (of which only one was before 1874) did the people accept the amendment proposed. In the case of bills there have been 30 votes (very many bills have not been attacked at all), all of course since the facultative referendum was introduced in 1874; in 11 cases only have the people voted in the affirmative. Finally, with regard to the Initiative, there have been 7 votes, of which two only were in the affirmative. Thus, between 1874 and 1907, of 57 votes 27 only were in the affirmative, while if we include the 10 votes between 1848 and 1874 the figures are respectively 67 and 28, one only having been favourable during that period. The result is to show that the people, voting after mature reflection, are far less radically disposed than has sometimes been imagined.

The method of referendum by itself is also in use in some of the states of the American Union (see UNITED STATES) and in Australia, and under the name of *plébiscite* has been employed in France; but it is best studied in the Swiss constitution.

AUTHORITIES.—W. A. B. Coolidge, "The Early History of the Referendum" (article in the *English Historical Review* for October 1891); T. Curti, *Die schweizerischen Volksrechte, 1848 bis 1900* (Bern, 1900) (Fr. trans. by J. Ronjat with additions by the author, Paris, 1905)—Curti's earlier work, *Geschichte d. schweiz. Volksgesetzgebung* (Bern, 1882), is not entirely superseded by his later one; S. Deploige, *The Referendum in Switzerland*, Engl. trans. with additional notes (London, 1898); N. Droz, "The Referendum in Switzerland" (article in the *Contemporary Review*, March 1895); J. M. Vincent, *Government in Switzerland*, chaps. v. and xiv. (New York and London, 1900). REFLECTION OF LIGHT. When a ray of light in a homogeneous medium falls upon the bounding surface of another medium, part of it is usually turned back or reflected and part is scattered, the remainder traversing or being absorbed by the second medium. The scattered rays (also termed the irregularly or diffusely reflected rays) play an important part in rendering objects visible—in fact, without diffuse reflection non-luminous objects would be invisible; they are occasioned by irregularities in the surface, but are governed by the same law as holds for regular reflection. This law is: the incident and reflected rays make equal angles with the normal to the reflecting surface at the point of incidence, and are coplanar with the normal. This is equivalent to saying that the path of the ray is a minimum.[1] In fig. 1, MN represents the section of a plane mirror; OR is the incident ray, RP the reflected ray, and TR the normal at R. Then the law states that the angle of incidence ORT equals the angle of reflection PRT, and that OR, RT and RP are in the same plane.

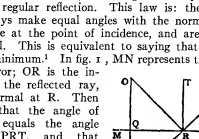

FIG. 1.

This natural law is capable of ready experimental proof (a simple one is to take the altitude of a star with a meridian circle, its depression in a horizontal reflecting surface of mercury and the direction of the nadir), and the most delicate instruments have failed to detect any divergence from it. Its explanation by the Newtonian corpuscular theory is very simple, for we have only to assume that at the point of impact the perpendicular velocity of a corpuscle is reversed, whilst the horizontal velocity is unchanged (the mirror being assumed horizontal). The wave-theory explanation is more complicated, and in the simple form given by Huygens incomplete. The theory as developed by Fresnel shows that regular reflection is due to a small zone in the neighbourhood of the point R (above), there being destructive interference at all other points on the mirror; this theory also accounts for the polarization of the reflected light when incident at a certain angle (see POLARIZATION OF LIGHT). The smoothness or polish of the surface largely controls the reflecting power, for, obviously, crests and furrows, if of sufficient magnitude, disturb the phase relations. The permissible deviation from smoothness depends on the wave-length of the light employed: it appears that surfaces smooth to within ⅛th of a wave-length reflect regularly; hence long waves may be regularly reflected by a surface which diffuses short waves. Also the obliquity of the incidence would diminish the effect of any irregularities; this is experimentally confirmed by observing the images produced by matt surfaces or by smoked glass at grazing incidence.

We now give some elementary constructions of reflected rays, or, what comes to the same thing, of images formed by mirrors.

1. If O be a luminous point and OR a ray incident at R on the plane mirror MN (fig. 1) to determine the reflected ray and the image of O. If RP be the reflected ray and RT perpendicular

[1] This principle of the minimum path, however, only holds for plane and convex surfaces; with concave surfaces it may be a maximum in certain cases.

to MN, then, by the law of reflection, angle ORT = TRP or ORM = PRN. Hence draw OQ perpendicular to MN, and produce it to S, making QS = OQ; join SR and produce to P. It is easily seen that PR and OR are equally inclined to RT (or MN). A point-eye at P would see a point object O at S, *i.e.* at a distance below the mirror equal to its height above. If the object be a solid, then the images of its corners are formed by taking points at the same distances below as the corners are above the mirror, and joining these points. The eye, however, sees the image perverted, *i.e.*, in the same relation as the left hand to the right. Fig. 2 shows how an extended object is viewed in a mirror by a natural eye.

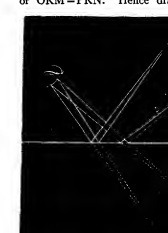

FIG. 2.

2. If A, B be two parallel plane mirrors and O a luminous point between them (fig. 3) to determine the images of O all the images must lie on the line (produced) PQ passing through O and perpendicular to the mirrors. Let $OP = p$, $OQ = q$. Then if O′ be the image of O in A, $OO' = 2p$; now O′ has an image O'' in B, such that $O'O'' = 2q + 2p = 2p + 2q$; similarly O″ has an image O‴ in A, such that $OO''' = 4p + 2q$. In the same way O forms an image O_1 in B such that $OO_1 = 2q$; O_1 has an image O_{11} in A, such that $OO_{11} = 2p + 2q$; O_{11} has an image O_{111} in B, such that $OO_{111} = 2p + 4q$, and so on. Hence there are an infinite number of images at definite distances from the mirrors. This explains the vistas as seen, for example, between two parallel mirrors at the ends of a room.

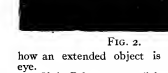

FIG. 3.

3. If A, B be two plane mirrors inclined at an angle θ, and intersecting at C, and O a luminous point between them, determine the position and number of images.

Call arc $OA = a$, $OB = \beta$. The image of O in A, *i.e.* a', is such that Oa' is perpendicular to CA, and $Oa' = 2a$. Also $Ca' = CO$; and it is easily seen that all the images lie on a circle of centre C and radius CO. The image a' forms an image a'' in B such that $Oa'' = OB + Ba'' = \beta + Ba' = \beta + OB + Oa' = 2\beta + 2a = 2\theta$. Also a'' forms an image a''' in A such that $Oa''' = OA + Aa'' = 2a + 2\theta$. Hence in both cases the number of images is the integer next greater than $(\pi - a)/\theta$. In the same way it can be shown that the number of images of the b series is the integer next greater than $(\pi - \beta)/\theta$. If a/θ be an integer, then the number of images of each series is π/θ, for a/θ and β/θ are proper fractions. But an image of each series coincides; for if $\pi/\theta = 2n$, we have $Oa^{2n} + Ob^{2n} = 2n\theta + 2n\theta = 2\pi$ *i.e.* a^{2n} and b^{2n} coincide; and if $\pi/\theta = 2n + 1$, we have $Oa^{2n+1} + Ob^{2n+1} = 4n\theta + 2(a + \beta) = (4n + 2)\theta = 2\pi$, *i.e.* a^{2n+1} and b^{2n+1} coincide. Hence the number of images, including the luminous point, is $2\pi/\theta$. This principle is utilized in the *kaleidoscope* (*q.v.*), which produces five images by means of its mirrors inclined at 60° (fig. 4). Fig. 5 shows the seven images formed by mirrors inclined at 45°.

4. To determine the reflection at a spherical surface. Let APB (fig. 6) be a section of a concave spherical mirror through its centre O and luminous point U. If a ray, say UP, meet the surface, it will be reflected along PV, which is coplanar with UP and the normal PO at P, and makes the angle VPO = UPO. Hence VO/VP = OU/UP. This expression may be simplified if we assume P to be very close to A, *i.e.* that the ray UP is very slightly inclined to the axis. Writing A for P, we have VO/AV = OU/AU; and calling $AU = u$, $AV = v$ and $AO = r$, this reduces to $u^{-1} + v^{-1} = 2r^{-1}$. This formula connects the distances of the object and image formed by a spherical concave mirror with the radius of the mirror. Points satisfying this relation are called "conjugate foci," for obviously they are reciprocal, *i.e.* u and v can be interchanged in the formula.

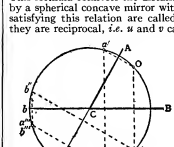

FIG. 4.

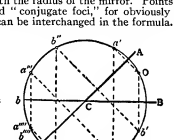

FIG. 5.

If u be infinite, as, for example, if the luminous source be a star, then $v^{-1} = 2r^{-1}$, *i.e.* $v = \frac{1}{2}r$. This value is called the focal length of

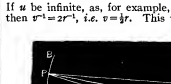

FIG. 6.

the mirror, and the corresponding point, usually denoted by F, is called the "principal focus." This formula requires modification for a convex mirror. If u be always considered as positive (v may be either positive or negative), r must be regarded as positive with concave mirrors and negative with convex. Similarly the focal length, having the same sign as r, has different signs in the two cases.

In this formula all distances are measured from the mirror; but it is sometimes more convenient to measure from the principal focus. If the distances of the object and image from the principal focus be x and y, then $u = x + f$ and $v = y + f$ (remembering that f is positive for concave and negative for convex mirrors). Substituting these values in $u^{-1} + v^{-1} = f^{-1}$ and reducing we obtain $xy = f^2$. Since f^2 is always positive, x and y must have the same sign, *i.e.* the object and image must lie on the same side of the principal focus.

We now consider the production of the image of a small object placed symmetrically and perpendicular to the axis of a concave (fig. 7) and a convex mirror (fig. 8). Let PQ be the object and A

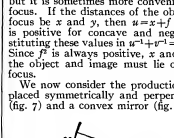

FIG. 7.

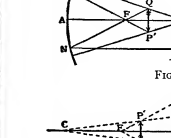

FIG. 8.

the vertex of the mirror. Consider the point P. Now a ray through P and parallel to the axis after meeting the mirror at M is reflected through the focus F. The line MF must therefore contain the image of P. Also a ray through P and also through the centre of curvature C of the mirror is reflected along the same path; this also contains the image of P. Hence the image is at P, the intersection of the lines MF and PC. Similarly the image of any other point can be found, and the final image deduced. We notice that in fig. 6 the image is inverted and real, and in fig. 7 erect and virtual. The "magnification" or ratio of the size of the image to the object can be deduced from the figures by elementary geometry; it equals the ratio of the distances of the image and object from the mirror or from the centre of curvature of the mirror.

The positions and characters of the images for objects at varying

distances are shown in the table (F is the principal focus and C the centre of curvature of the mirror MA).

CONCAVE MIRROR

Position of Object.	Position of Image.	Character of Image.
∞	F	Real.
Between ∞ and C	Between F and C	Real, inverted, diminished
C	C	" " same size
Between C and F	Between C and ∞	" " magnified
Between F and A	Between A and −∞	Virtual, erect, magnified
A	A	Erect, same size

CONVEX MIRROR

Position of Object.	Position of Image.	Character of Image.
∞	F	Virtual
Between ∞ and A	Between F and A	Virtual, erect, diminished
A	A	Erect, same size

The above discussion of spherical mirrors assumes that the mirror has such a small aperture that the reflected rays from any point unite in a point. This, however, no longer holds when the mirror has a wide aperture, and in general the reflected rays envelop a caustic (*q.v.*, see also ABERRATION). The only mirror which can sharply reproduce an object-point as an image-point has for its section an ellipse, which is so placed that the object and image are at its foci. This follows from a property of the curve, viz. the sum of the focal distances is constant, and that the focal vectores are equally inclined to the normal at the point. More important than the elliptical mirror, however, is the parabolic, which has the property of converting rays parallel to the axis into a pencil through its focus; or, inversely, rays from a source placed at the focus are converted into a parallel beam; hence the use of this mirror in searchlights and similar devices.

REFORMATION, THE. The Reformation, as commonly understood, means the religious and political revolution of the 16th century, of which the immediate result was the partial disruption of the Western Catholic Church and the establishment of various national and territorial churches. These agreed in repudiating certain of the doctrines, rites and practices of the medieval Church, especially the sacrifice of the Mass and the headship of the bishop of Rome, and, whatever their official designations, came generally to be known as "Protestant." In some cases they introduced new systems of ecclesiastical organization, and in all they sought to justify their innovations by an appeal from the Church tradition to the Scriptures. The conflicts between Catholics and Protestants speedily merged into the chronic political rivalries, domestic and foreign, which distracted the European states; and religious considerations played a very important part in diplomacy and war for at least a century and a half, from the diet of Augsburg in 1530 to the English revolution and the league of Augsburg, 1688–89. The terms "Reformation" and "Protestantism" are inherited by the modern historian; they are not of his devising, and come to him laden with reminiscences of all the exalted enthusiasms and bitter antipathies engendered by a period of fervid religious dissension. The unmeasured invective of Luther and Aleander has not ceased to re-echo, and the full issues are by no means tried.

The Reformation not exclusively a Religious Revolution.

The heat of controversy is, however, abating, and during the past thirty or forty years both Catholic and Protestant investigators have been vying with one another in adding to our knowledge and in rectifying old mistakes; while an ever-increasing number of writers pledged to neither party are aiding in developing an idea of the scope and nature of the Reformation which differs radically from the traditional one. We now appreciate too thoroughly the intricacy of the medieval Church; its vast range of activity, secular as well as religious; the inextricable interweaving of the civil and ecclesiastical governments; the slow and painful process of their divorce as the old ideas of the proper functions of the two institutions have changed in both Protestant and Catholic lands: we perceive all too clearly the limitations of the reformers, their distrust of reason and criticism—in short, we know too much about medieval institutions and the process of their disintegration longer to see in the Reformation an abrupt break in the general history of Europe. No one will, of course, question the importance of the schism which created the distinction between Protestants and Catholics, but it must always be remembered that the religious questions at issue comprised a relatively small part of the whole compass of human aspirations and conduct, even to those to whom religion was especially vital, while a large majority of the leaders in literature, art, science and public affairs went their way seemingly almost wholly unaffected by theological problems.

That the religious elements in the Reformation have been greatly overestimated from a modern point of view can hardly be questioned, and one of the most distinguished students of Church history has ventured the assertion that "The motives, both remote and proximate, which led to the Lutheran revolt were largely secular rather than spiritual." "We may," continues Mr H. C. Lea, "dismiss the religious changes incident to the Reformation with the remark that they were not the object sought, but the means for attaining the object. The existing ecclesiastical system was the practical evolution of dogma, and the overthrow of dogma was the only way to obtain permanent relief from the intolerable abuses of that system" (*Cambridge Modern History*, i. 653). It would perhaps be nearer the truth to say that the secular and spiritual interests intermingled and so permeated one another that it is almost impossible to distinguish them clearly even in thought, while in practice they were so bewilderingly confused that they were never separated, and were constantly mistaken for one another.

Resemblance of the medieval Church to the State.

The first step in clarifying the situation is to come to a full realization that the medieval Church was essentially an international *state*, and that the character of the Protestant secession from it was largely determined by this fact. As Maitland suggests: "We could frame no acceptable definition of a State which would not comprehend the Church. What has it not that a State should have? It has laws, law givers, law courts, lawyers. It uses physical force to compel men to obey the laws. It keeps prisons. In the 13th century, though with squeamish phrases, it pronounced sentence of death. It is no voluntary society; if people are not born into it they are baptized into it when they cannot help themselves. If they attempt to leave they are guilty of *crimen laesae majestatis*, and are likely to be burned. It is supported by involuntary contributions, by tithe and tax" (*Canon Law in the Church of England*, p. 100). The Church was not only organized like a modern bureaucracy, but performed many of the functions of a modern State. It dominated the intellectual and profoundly affected the social interests of western Europe. Its economic influence was multiform and incalculable, owing to its vast property, its system of taxation and its encouragement of monasticism. When Luther made his first great appeal to the German people in his *Address to the German Nobility*, he scarcely adverts to religious matters at all. He deals, on the contrary, almost exclusively with the social, financial, educational, industrial and general moral problems of the day. If Luther, above all others had the religious issue ever before him, attacks the Church as a source of worldly disorder, it is not surprising that his contemporary Ulrich von Hutten should take a purely secular view of the issues involved. Moreover, in the fascinating collection of popular satires and ephemeral pamphlets made by Schade, one is constantly impressed with the absence of religious fervour, and the highly secular nature of the matters discussed. The same may be said of the various *Gravamina*, or lists of grievances against the papacy drafted from time to time by German diets.

Historic continuity of the Reformation.

But not only is the character of the Reformation differently conceived from what it once was; our notions of the process of change are being greatly altered. Formerly, writers accounted for the Lutheran movement by so magnifying the horrors of the pre-existing regime that it appeared intolerable, and its abolition consequently inevitable. Protestant writers once contented themselves with a brief caricature of the Church,

a superficial account of the traffic in indulgences, and a rough and ready assumption, which even Köstlin makes, that the darkness was greatest just before the dawn. Unfortunately this crude solution of the problem proved too much; for conditions were no worse immediately before the revolt than they had been for centuries, and German complaints of papal tyranny go back to Hildegard of Bingen and Walther von der Vogelweide, who antedated Luther by more than three centuries. So a new theory is logically demanded to explain why these conditions, which were chronic, failed to produce a change long before it actually occurred. Singularly enough it is the modern Catholic scholars, Johannes Janssen above all, who, in their efforts further to discredit the Protestant revolt by rehabilitating the institutions which the reformers attacked, have done most to explain the success of the Reformation. A humble, patient Bohemian priest, Hasak, set to work toward half a century ago to bring together the devotional works published during the seventy years immediately succeeding the invention of printing. Every one knows that one at least of these older books, *The German Theology*, was a great favourite of Luther's; but there are many more in Hasak's collection which breathe the same spirit of piety and spiritual emulation. Building upon the foundations laid by Hasak and other Catholic writers who have been too much neglected by Protestant historians, Janssen produced a monumental work in defence of the German Church before Luther's defection. He exhibits the great achievements of the latter part of the 15th and the early portion of the 16th centuries; the art and literature, the material prosperity of the towns and the fostering of the spiritual life of the people. It may well be that his picture is too bright, and that in his obvious anxiety to prove the needlessness of an ecclesiastical revolution he has gone to the opposite extreme from the Protestants. Yet this rehabilitation of pre-Reformation Germany cannot but make a strong appeal to the unbiased historical student who looks to a conscientious study of the antecedents of the revolt as furnishing the true key to the movement.

Revolt of the various European governments from the papal monarchy.

Outwardly the Reformation would seem to have begun when, on the 10th of December 1520, a professor in the university of Wittenberg invited all the friends of evangelical truth among his students to assemble outside the wall at the ninth hour to witness a pious spectacle—the burning of the "godless book of the papal decrees." He committed to the flames the whole body of the canon law, together with an edict of the head of the Church which had recently been issued against his teachings. In this manner Martin Luther, with the hearty sympathy of a considerable number of his countrymen, publicly proclaimed and illustrated his repudiation of the papal government under which western Europe had lived for centuries. Within a generation after this event the states of north Germany and Scandinavia, England, Scotland, the Dutch Netherlands and portions of Switzerland, had each in its particular manner permanently seceded from the papal monarchy. France, after a long period of uncertainty and disorder, remained faithful to the bishop of Rome. Poland, after a defection of years, was ultimately recovered for the papacy by the zeal and devotion of the Jesuit missionaries. In the Habsburg hereditary dominions the traditional policy and Catholic fervour of the ruling house resulted, after a long struggle, in the restoration of the supremacy of Rome; while in Hungary the national spirit of independence kept Calvinism alive to divide the religious allegiance of the people. In Italy and Spain, on the other hand, the rulers, who continued loyal to the pope, found little difficulty in suppressing any tendencies of revolt on the part of the few converts to the new doctrines. Individuals, often large groups, and even whole districts, had indeed earlier rejected some portions of the Roman Catholic faith, or refused obedience to the ecclesiastical government; but previously to the burning of the canon law by Luther no prince had openly and permanently cast off his allegiance to the international ecclesiastical state of which the bishop of Rome was head. Now, a prince or legislative assembly that accepted the doctrine of Luther, that the temporal power had been "ordained by God for the chastisement of the wicked and the protection of the good" and must be permitted to exercise its functions "unhampered throughout the whole Christian body, without respect to persons, whether it strikes popes, bishops, priests, monks, nuns, or whoever else"—such a government could proceed to ratify such modifications of the Christian faith as appealed to it in a particular religious confession; it could order its subject to conform to the innovations, and could expel, persecute or tolerate dissenters, as seemed good to it. A "reformed" prince could seize the property of the monasteries, and appropriate such ecclesiastical foundations as he desired. He could make rules for the selection of the clergy, disregarding the ancient canons of the Church and the claims of the pope to the right of ratification. He could cut off entirely all forms of papal taxation and put an end to papal jurisdiction. The personnel, revenue, jurisdiction, ritual, even the faith of the Church, were in this way placed under the complete control of the territorial governments. This is the central and significant fact of the so-called Reformation. Wholly novel and distinctive it is not, for the rulers of Catholic countries, like Spain and France, and of England (before the publication of the Act of Supremacy) could and did limit the pope's claims to unlimited jurisdiction, patronage 'and taxation, and they introduced the *placet* forbidding the publication within their realms of papal edicts, decisions and orders, without the express sanction of the government—in short, in many ways tended to approach the conditions in Protestant lands. The Reformation was thus essentially a stage in the disengaging of the modern state from that medieval, international ecclesiastical state which had its beginning in the *ecclesia* of the Acts of the Apostles. An appreciation of the issues of the Reformation—or Protestant revolt, as it might be more exactly called—depends therefore upon an understanding of the development of the papal monarchy, the nature of its claims, the relations it established with the civil powers, the abuses which developed in it and the attempts to rectify them, the sources of friction between the Church and the government, and finally the process by which certain of the European states threw off their allegiance to the Christian commonwealth, of which they had so long formed a part.

Character of the papal monarchy and its claims.

It is surprising to observe how early the Christian Church assumed the form of a state, and how speedily upon entering into its momentous alliance with the Roman imperial government under Constantine it acquired the chief privileges and prerogatives it was so long to retain. In the twelfth book of the Theodosian Code we see the foundations of the medieval Church already laid; for it was the 4th, not the 13th century that established the principle that defection from the Church was a crime in the eyes of the State, and raised the clergy to a privileged class, exempted from the ordinary taxes, permitted under restrictions to try its own members and to administer the wealth which flowed in from the offerings of the faithful. The bishop of Rome, who had from the first probably enjoyed a leading position in the Church as "the successor of the two most glorious of the apostles," elaborated his claims to be the divinely appointed head of the ecclesiastical organization. Siricius (384–389), Leo the Great (440–461), and Gelasius I. (492–496) left little for their successors to add to the arguments in favour of the papal supremacy. In short, if we recall the characteristics of the Church in the West from the times of Constantine to those of Theodoric—its reliance upon the civil power for favours and protection, combined with its assumption of a natural superiority over the civil power and its innate tendency to monarchical unity—it becomes clear that Gregory VII. in his effort in the latter half of the 11th century to establish the papacy as the great central power of western Europe was in the main only reaffirming and developing old claims in a new world. His brief statement of the papal powers as he

conceived them is found in his *Dictatus*. The bishop of Rome, who enjoys a unique title, that of "pope," may annul the decrees of all other powers, since he judges all but is judged by none. He may depose emperors and absolve the subjects of the unjust from their allegiance. Gregory's position was almost inexpugnable at a time when it was conceded by practically all that spiritual concerns were incalculably more momentous than secular, that the Church was rightly one and indivisible, with one divinely revealed faith and a system of sacraments absolutely essential to salvation. No one called in question the claim of the clergy to control completely all "spiritual" matters. Moreover, the mightiest secular ruler was but a poor sinner dependent for his eternal welfare on the Church and its head, the pope, who in this way necessarily exercised an indirect control over the civil government, which even the emperor Henry IV. and William the Conqueror would not have been disposed to deny. They would also have conceded the pope the right to play the rôle of a secular ruler in his own lands, as did the German bishops, and to dispose of such fiefs as reverted to him. This class of prerogatives, as well as the right which the pope claimed to ratify the election of the emperor, need not detain us, although they doubtless served in the long run to weaken the papal power. But the pope laid claim to a direct power over the civil governments. Nicholas II. (1058–1061) declared that Jesus had conferred on Peter the control (*jura*) of an earthly as well as of a heavenly empire; and this phrase was embodied in the canon law. Innocent III., a century and a half later, taught that James the brother of the Lord and Peter not only the government of the whole Church, but that of the whole world (*totum seculum gubernandum*).[1] So the power of the pope no longer rested upon his headship of the Church or his authority as a secular prince, but on a far more comprehensive claim to universal dominion. There was no reason why the bishop of Rome should justify such acts as Innocent himself performed in deposing King John of England and later in annulling Magna Carta; or Gregory IV. when he struck out fourteen articles from the *Sachsenspiegel*; or Nicholas V. when he invested Portugal with the right to subjugate all peoples on the Atlantic coast; or Julius II. when he threatened to transfer the kingdom of France to England; or the conduct of those later pontiffs who condemned the treaties of Westphalia, the Austrian constitution of 1867 and the establishment of the kingdom of Italy. The theory and practice of papal absolutism was successfully promulgated by Gratian in his *Decretum*, completed at Bologna about 1142. This was supplemented by later collections composed mainly of papal decretals. (See CANON LAW and DECRETALS, FALSE.) As every fully equipped university had its faculty of canon law in which the *Corpus juris canonici* was studied, Rashdall is hardly guilty of exaggeration when he says: "By means of the happy thought of the Bolognese monk the popes were enabled to convert the new-born universities—the offspring of that intellectual new birth of Europe which might have been so formidable an enemy to the papal pretensions—into so many engines for the propagation of Ultramontane ideas." Thomas Aquinas was the first theologian to describe the Church as a divinely organized absolute monarchy, whose head concentrated in his person the entire authority of the Church, and was the source of all the ecclesiastical law (*conditor juris*), issuing the decrees of general councils in his own name, and claiming the right to revoke or modify the decrees of former councils—indeed, to make exceptions or to set aside altogether anything which did not rest upon the dictates of divine or natural law. In practice the whole of western Europe was subject to the jurisdiction of one tribunal of last resort, the Roman Curia. The pope claimed the right to tax church property throughout Christendom. He was able to exact an oath of fidelity from the archbishops, named many of the bishops, and asserted the right to transfer and dispose them. The organs of this vast monarchy were the papal Curia, which first appears distinctly in the 11th century (see CURIA ROMANA), and the legates, who visited the courts of Europe as haughty representatives of the central government of Christendom.

[1] See further, Innocent III.

It should always be remembered that the law of the Church was regarded by all lawyers in the later middle ages as the law common to all Europe (*jus commune*). The laws of the Carolingian empire provided that one excommunicated by the Church who did not make his peace within a year and a day should be outlawed, and this general principle was not lost sight of. It was a capital offence in the eyes of the State to disagree with the teachings of the Church, and these, it must be remembered, included a recognition of the papal supremacy. The civil authorities burnt an obstinate heretic, condemned by the Church, without a thought of a new trial. The emperor Frederick II.'s edicts and the so-called *établissements* of St Louis provide that the civil officers should search out suspected heretics and deliver them to the ecclesiastical judges. The civil government recognized monastic vows by regarding a professed monk as civilly dead and by pursuing him and returning him to his monastery if he violated his pledges of obedience and ran away. The State recognized the ecclesiastical tribunals and accorded them a wide jurisdiction that we should now deem essentially secular in its nature. The State also admitted that large classes of its citizens—the clergy, students, crusaders, widows and the miserable and helpless in general—were justiceable only by Church tribunals. By the middle of the 13th century many lawyers took the degree of doctor of both laws (J.U.D.), civil and canon, and practised both. As is well known, temporal rulers constantly selected clergymen as their most trusted advisers. The existence of this theocratic international state was of course conditioned by the weakness of the civil government. So long as feudal monarchy continued, the Church supplied to some extent the deficiencies of the turbulent and ignorant princes by endeavouring to maintain order, administer justice, protect the weak and encourage learning. So soon as the modern national state began to gain strength, the issue between secular rulers and the bishops of Rome took a new form. The clergy naturally stoutly defended the powers which they had long enjoyed and believed to be rightly theirs. On the other hand, the State, which could count upon the support of an ever-increasing number of prosperous and loyal subjects, sought to protect its own interests and showed itself less and less inclined to tolerate the extreme claims of the pope. Moreover, owing to the spread of education, the king was no longer obliged to rely mainly upon the assistance of the clergy in conducting his government.

Relations of the ecclesiastical and civil governments.

The chief sources of friction between Church and State were four in number. First, the growth of the practice of "reservation" and "provision," by which the popes assumed the right to appoint their own nominees to vacant sees and other benefices, in defiance of the claims of the crown, the chapters and private patrons. In the case of wealthy bishoprics or abbacies this involved a serious menace to the secular authority. Both pope and king were naturally anxious to place their own friends and supporters in these influential positions. The pope, moreover, had come to depend to a considerable extent for his revenue upon the payments made by his nominees, which represented a corresponding drain on the resources of the secular states. Secondly, there was the great question, how far the lands and other property of the clergy should be subject to taxation. Was this vast amount of property to increase indefinitely without contribution to the maintenance of the secular government? A decretal of Innocent III. permitted the clergy to make voluntary contributions to the king when there was urgent necessity, and the resources of the laity had proved inadequate. But the pope maintained that, except in the most critical cases, his consent must be obtained for such grants. Thirdly, there was the inevitable jealousy between the secular and ecclesiastical courts and the serious problem of the exact extent of the original and appellate jurisdiction of the Roman Curia. Fourthly, and lastly, there was the most fundamental difficulty of all, the extent to which the pope, as the universally acknowledged head

of the Church, was justified in interfering in the internal affairs of particular states. Unfortunately, most matters could be viewed from both a secular and religious standpoint; and even in purely secular affairs the claims of the pope to at least indirect control were practically unlimited. The specific nature of the abuses which flourished in the papal monarchy, the unsuccessful attempts to remedy them, and the measures taken by the chief European states to protect themselves will become apparent as we hastily review the principal events of the 14th and 15th centuries.

The papacy in the 14th century.

As one traces the vicissitudes of the papacy during the two centuries from Boniface VIII. to Leo X. one cannot fail to be impressed with the almost incredible strength of the ecclesiastical state which had been organized and fortified by Gregory VII., Alexander III., Innocent III. and Gregory IX. In spite of the perpetuation of all the old abuses and the continual appearance of new devices for increasing the papal revenue; in spite of the jealousy of kings and princes, the attacks of legists and the preaching of the heretics; in spite of seventy years of exile from the holy city, forty years of distracting schism and discord, and thirty years of conflict with stately œcumenical councils deliberating in the name of the Holy Spirit and intent upon permanently limiting the papal prerogatives; in spite of the unworthy conduct of some of those who ascended the papal throne, their flagrant political ambitions, and their greed; in spite of the spread of knowledge, old and new, the development of historical criticism, and philosophical speculation; in spite, in short, of every danger which could threaten the papal monarchy, it was still intact when Leo X. died in 1521. Nevertheless, permanent if partial dissolution was at hand, for no one of the perils which the popes had seemingly so successfully overcome had failed to weaken the constitution of their empire; and it is impossible to comprehend its comparatively sudden disintegration without reckoning with the varied hostile forces which were accumulating and combining strength during the 14th and 15th centuries. The first serious conflict that arose between the developing modern state and the papacy centred about the pope's claim that the property of the clergy was normally exempt from royal taxation. Boniface VIII. was forced to permit Edward I. and Philip the Fair to continue to demand and receive subsidies granted by the clergy of their realms. Shortly after the bitter humiliation of Boniface by the French government and his death in 1303, the bishop of Bordeaux was elected pope as Clement V. (1305). He preferred to remain in France, and as the Italian cardinals died they were replaced by Frenchmen. The papal court was presently established at Avignon, on the confines of France, where it remained until 1377. While the successors of Clement V. were not so completely under the control of the French kings as has often been alleged, the very proximity of the curia to France served inevitably to intensify national jealousies. The claims of John XXII. (1316–1334) to control the election of the emperor called forth the first fundamental and critical attack on the papal monarchy, by Marsiglio of Padua, who declared in his *Defensor pacis* (1324) that the assumed supremacy of the bishop of Rome was without basis, since it was very doubtful if Peter was ever in Rome, and in any case there was no evidence that he had transmitted any exceptional prerogatives to succeeding bishops. But Marsiglio's logical and elaborate justification for a revolt against the medieval Church produced no perceptible effects. The removal of the papal court from Rome to Avignon, however, not only reduced its prestige but increased the pope's chronic financial embarrassments, by cutting off the income from his own dominions, which he could no longer control, while the unsuccessful wars waged by John XXII., the palace building and the notorious luxury of some of his successors, served enormously to augment the expenses. Various devices were resorted to, old and new, to fill the treasury. The fees of the Curia were raised for the numberless favours, dispensations, absolutions, and exemptions of all kinds which were sought by clerics and laymen. The right claimed by the pope to fill benefices of all kinds was extended, and the amount contributed to the pope by his nominees amounted to from a third to a half of the first year's revenue (see ANNATES). Boniface VIII. had discovered a rich source of revenue in the jubilee, and in the jubilee indulgences extended to those who could not come to Rome. Clement VI. reduced the period between these lucrative occasions from one hundred to fifty years, and Urban VI. determined in 1389 that they should recur at least once in a generation (every thirty-three years). Church offices, high and low, were regarded as investments from which the pope had his commission.

England and the papacy in the 14th century.

England showed itself better able than other countries to defend itself against the papal control of church preferment. From 1343 onward, statutes were passed by parliament forbidding any one to accept a papal provision, and cutting off all appeals to the papal curia or ecclesiastical courts in cases involving benefices. Nevertheless, as a statute of 1379 complains, benefices continued to be given "to divers people of another language and of strange lands and nations, and sometimes to actual enemies of the king and of his realm, which never made residence in this same, nor cannot, may not, nor will not in any wise bear and perform the charges of the same benefice in hearing confessions, preaching or teaching the people." When, in 1365, Innocent VI. demanded that the arrears of the tribute promised by King John to the pope should be paid up, parliament abrogated the whole contract on the ground that John had no right to enter into it. A species of anticlerical movement, which found an unworthy leader in John of Gaunt, developed at this time. The Good Parliament of 1376 declared that, in spite of the laws restricting papal provisions, the popes at Avignon received five times as much revenue from England as the English kings themselves. Secularization was mentioned in parliament. Wycliffe began his public career in 1366 by proving that England was not bound to pay tribute to the pope. Twelve years later he was, like Marsiglio, attacking the very foundations of the papacy itself, as lacking all scriptural sanction. He denounced the papal government as utterly degraded, and urged that the vast property of the Church, which he held to be the chief cause of its degradation, should be secularized and that the clergy should consist of "poor priests," supported only by tithes and alms. They should preach the gospel and encourage the people to seek the truth in the Scriptures themselves, of which a translation into English was completed in 1382. During the later years of his life he attacked the doctrine of transubstantiation, and all the most popular institutions of the Church—indulgences, pilgrimages, invocation of the saints, relics, celibacy of the clergy, auricular confession, &c. His opinions were spread abroad by the hundreds of sermons and popular pamphlets written in English for the people (see WYCLIFFE). For some years after Wycliffe's death his followers, the Lollards, continued to carry on his work; but they roused the effective opposition of the conservative clergy, and were subjected to a persecution which put an end to their public agitation. They rapidly disappeared and, except in Bohemia, Wycliffe's teachings left no clearly traceable impressions. Yet the discussions he aroused, the attacks he made upon the institutions of the medieval Church, and especially the position he assigned to the Scriptures as the exclusive source of revealed truth, serve to make the development of Protestantism under Henry VIII. more explicable than it would otherwise be.

The Great Schism (1377–1417).

Wycliffe's later attacks upon the papacy had been given point by the return of the popes to Rome in 1377 and the opening of the Great Schism which was to endure for forty years. There had been many anti-popes in the past, but never before had there been such prolonged and genuine doubt as to which of two lines of popes was legitimate, since in this case each was supported by a college of cardinals, the one at Rome, the other at Avignon. Italy, except Naples, took the side of the Italian pope; France, of the Avignon pope; England, in its hostility to France,

sided with Urban VI. in Rome, Scotland with Clement VII., his rival; Flanders followed England; Urban secured Germany, Hungary and the northern kingdoms; while Spain, after remaining neutral for a time, went over to Clement. Western Christendom had now two papal courts to support. The schism extended down to the bishoprics, and even to the monasteries and parishes, where partisans of the rival popes struggled to obtain possession of sees and benefices. The urgent necessity for healing the schism, the difficulty of uniting the colleges of cardinals, and the prolonged and futile negotiations carried on between the rival popes inevitably raised the whole question of the papal supremacy, and led to the search for a still higher ecclesiastical authority, which, when the normal system of choosing the head of the Church broke down, might re-establish that ecclesiastical unity to which all Europe as yet clung. The idea of the supreme power on earth of a general council of Christendom, deliberating in the name of the Holy Spirit, convoked, if necessary, independently of the popes, was defended by many, and advocated by the university of Paris. The futile council of Pisa in 1409, however, only served to increase to three the number of rival representatives of God on earth. The considerable pamphlet literature of the time substantiates the conclusion of an eminent modern Catholic historian, Ludwig Pastor, who declares that the crisis through which the church passed in this terrible period of the schism was the most serious in all its history. It was at just this period, when the rival popes were engaged in a life-and-death struggle, that heretical movements appeared in England, France, Italy, Germany, and especially in Bohemia, which threatened the whole ecclesiastical order.

The councils of Constance and Basel.

The council of Constance assembled in 1414 under auspices hopeful not only for the extinction of the schism but for the general reform of the Church. Its members showed no patience with doctrinal innovations, even such moderate ones as John Huss represented. They turned him over to the secular arm for execution, although they did not thereby succeed in checking the growth of heresy in Bohemia (see Huss). The healing of the schism proved no very difficult matter; but the council hoped not only to restore unity and suppress heresy, but to re-establish general councils as a regular element in the legislation of the Church. The decree *Sacrosancta* (April 1415) proclaimed that a general council assembled in the Holy Spirit and representing the Catholic Church militant had its power immediately from Christ, and was supreme over every one in the Church, not excluding the pope, in all matters pertaining to the faith and reformation of the Church of God in head and members. The decree *Frequens* (October 1417) provided for the regular convocation of councils in the future. As to ecclesiastical abuses the council could do very little, and finally satisfied itself with making out a list of those which the new pope was required to remedy in co-operation with the deputies chosen by the council. The list serves as an excellent summary of the evils of the papal monarchy as recognized by the unimpeachably orthodox. It included: the number, character and nationality of the cardinals, the abuse of the "reservations" made by the apostolic see, the annates, the collation to benefices, expectative favours, cases to be brought before the papal Curia (including appeals), functions of the papal chancery and penitentiary, benefices *in commendam*, confirmation of elections, income during vacancies, indulgences, tenths, for what reasons and how is a pope to be corrected or deposed. The pope and the representatives of the council made no serious effort to remedy the abuses suggested under these several captions; but the idea of the superiority of a council over the pope, and the right of those who felt aggrieved by papal decisions to appeal to a future council, remained a serious menace to the theory of papal absolutism. The decree *Frequens* was not wholly neglected; though the next council, at Siena, came to naught, the council at Basel, whose chief business was to put an end to the terrible religious war that had been raging between the Bohemians and Germans, was destined to cause Eugenius IV. much anxiety. It reaffirmed the decree *Sacrosancta*, and refused to recognize the validity of a bull Eugenius issued in December 1431 dissolving it. Two years later political reverses forced the pope to sanction the existence of the council, which not only concluded a treaty with the Bohemian heretics but abolished the papal fees for appointments, confirmation and consecration—above all, the annates—and greatly reduced papal reservations; it issued indulgences, imposed tenths, and established rules for the government of the papal states. France, however, withdrew its support from the council, and in 1438, under purely national auspices, by the famous Pragmatic Sanction of Bourges, adjusted the relations of the Gallican Church to the papacy; and Eugenius soon found himself in a position to repudiate the council and summoned a new one to assemble in 1438 at Ferrara under his control to take up the important question of the pending union with the Greek Church. The higher clergy deserted the council of Basel, and left matters in the hands of the lower clergy, who chose an anti-pope; but the rump council gradually lost credit and its lingering members were finally dispersed. The various nations were left to make terms with a reviving papacy. England had already taken measures to check the papal claims. France in the Pragmatic Sanction reformulated the claim of the councils to be superior to the pope, as well as the decision of the council of Basel in regard to papal fees, annates and other dues, limitations on ecclesiastical jurisdiction, and appeals to the pope. While the canonical elections were re-established, the prerogatives of the crown were greatly increased, as in England. In short, the national ecclesiastical independence of the French Church was established. The German diet of Regensburg (1439) ratified in the main the decrees of the council of Basel, which clearly gratified the electors, princes and prelates; and Germany for the first time joined the ranks of the countries which subjected the decrees of the highest ecclesiastical instance to the *placet* or approval of the civil authorities. But there was no strong power, as in England and France, to attend to the execution of the provisions.

Germany and the papacy in the 15th century.

In 1448 Eugenius's successor, Nicholas V., concluded a concordat with the emperor Frederick III. as representative of the German nation. This confined itself to papal appointments and the annates. In practice it restored the former range of papal reservations, and extended the papal right of appointment to all benefices (except the higher offices in cathedrals and collegiate churches) which fell vacant during the odd months. It also accorded him the right to confirm all newly elected prelates and to receive the annates. Nothing was said in the concordat of a great part of the chief subjects of complaint. This gave the princes an excuse for the theory that the decrees of Constance and Basel were still in force, limiting the papal prerogatives in all respects not noticed in the concordat. It was Germany which gave the restored papacy the greatest amount of anxiety during the generation following the dissolution of the council of Basel. In the "recesses" or formal statements issued at the conclusion of the sessions of the diet one can follow the trend of opinion among the German princes, secular and ecclesiastical. The pope is constantly accused of violating the concordat, and constant demands are made for a general council, or at least a national one, which should undertake to remedy the abuses. The capture of Constantinople by the Turks afforded a new excuse for papal taxation. In 1453 a crusading bull was issued imposing a tenth on all benefices of the earth to equip an expedition against the infidel. The diet held at Frankfort in 1456 recalled the fact that the council of Constance had forbidden the pope to impose tenths without the consent of the clergy in the region affected, and that it was clear that he proposed to "pull the German sheep's fleece over its ears." A German correspondent of Aeneas Sylvius assures him in 1457 that "thousands of tricks are devised by the Roman see which enables it to extract the money from our pockets very

neatly, as if we were mere barbarians. Our nation, once so famous, is a slave now, who must pay tribute, and has lain in the dust these many years bemoaning her fate." Aeneas Sylvius issued, immediately after his accession to the papacy as Pius II. the bull *Execrabilis* forbidding all appeals to a future council. This seemed to Germany to cut off its last hope. It found a spokesman in the vigorous Gregory of Heimburg, who accused the pope of issuing the bull so that he and his cardinals might conveniently pillage Germany unhampered by the threat of a council. "By forbidding appeals to a council the pope treats us like slaves, and wishes to take for his own pleasures all that we and our ancestors have accumulated by honest labour. He calls me a chatterer, although he himself is more talkative than a magpie." Heimburg's denunciations of the pope were widely circulated, and in spite of the major excommunication he was taken into the service of the archbishop of Mainz and was his representative at the diet of Nuremberg in 1462. It is thus clear that motives which might ultimately lead to the withdrawal of a certain number of German princes from the papal ecclesiastical state were accumulating and intensifying during the latter half of the 15th century.

Conditions in Germany at the opening of the 16th century.

It is impossible to review here the complicated political history of the opening years of the 16th century. The names of Charles VIII. and Louis XII. of France, of Ferdinand and Isabella of Spain, of Henry VII. and Henry VIII. of England, of Maximilian the German king, of Popes Alexander VI., Julius II. and Leo X., stand for better organized civil governments, with growing powerful despotic heads; for a perfectly worldly papacy absorbed in the interests of an Italian principality, engaged in constant political negotiations with the European powers which are beginning to regard Italy as their chief field of rivalry, and are using its little states as convenient counters in their game of diplomacy and war. It was in Germany, however, seemingly the weakest and least aggressive of the European states, that the first permanent and successful revolts against the papal monarchy occurred. Nothing came of the lists of German *gravamina*, or of the demands for a council, so long as the incompetent Frederick III. continued to reign. His successor, Maximilian, who was elected emperor in 1493, was mainly preoccupied with his wars and attempts to reform the constitution of the empire; but the diet gave some attention to ecclesiastical reform. For instance, in 1501 it took measures to prevent money raised by the granting of a papal indulgence from leaving the country. After the disruption of the league of Cambray, Maximilian, like Louis XII., was thrown into a violent anti-curial reaction, and in 1510 he sent to the well-known humanist, Joseph Wimpheling, a copy of the French Pragmatic Sanction, asking his advice and stating that he had determined to free Germany from the yoke of the Curia and prevent the great sums of money from going to Rome. Wimpheling in his reply rehearsed the old grievances and complained that the contributions made to the pope by the archbishops on receiving the pallium was a great burden on the people. He stated that that of the archbishop of Mainz had been raised from ten to twenty-five thousand gulden, and that there had been seven vacancies within a generation, and consequently the subjects of the elector had been forced to pay that amount seven times. But Wimpheling had only some timid suggestions to make, and, since Maximilian was once more on happy terms with the pope, political considerations served to cool completely his momentary ardour for ecclesiastical reform. In 1514 the archbishopric of Mainz fell vacant again, and Albert of Brandenburg, already archbishop of Magdeburg and administrator of Halberstadt, longing to add it to his possessions, was elected. After some scandalous negotiations with Leo X. it was arranged that Albert should pay 14,000 ducats for the papal confirmation and 10,000 as a "composition" for permission to continue to hold, against the rules of the Church, his two former archbishoprics. Moreover, in order to permit him to pay the sums, he was to have half the proceeds in his provinces from an indulgence granted to forward the rebuilding of St Peter's. A Dominican monk, Johann Tetzel, was selected to proclaim the indulgence (together with certain supplementary graces) in the three provinces of the elector. This suggestion came from the curia, not the elector, whose representatives could not suppress the fear that the plan would arouse opposition and perhaps worse. Tetzel's preaching and the exaggerated claims that he was reported to be making for the indulgences attracted the attention of an Augustinian friar, Martin Luther, who had for some years been lecturing on theology at the university of Wittenberg. He found it impossible to reconcile Tetzel's views of indulgences with his own fundamental theory of salvation. He accordingly hastily drafted ninety-five propositions relating to indulgences, and posted an invitation to those who wished to attend a disputation in Wittenberg on the matter, under his presidency. He points out the equivocal character of the word *poenitentia*, which meant both "penance" and "penitence"; he declared that "true contrition seeks punishment, while the ampleness of pardons relaxes it and causes men to hate it." Christians ought to be taught that he who gives to a poor man or lends to the needy does better than if he bought pardons. He concludes with certain "keen questionings of the laity," as, Why does not the pope empty purgatory forthwith for charity's sake, instead of cautiously for money? Why does he not, since he is rich as Croesus, build St Peter's with his own money instead of taking that of poor believers? It was probably these closing reflections which led to the translation of the theses from Latin into German, and the surprising circulation that it must not be assumed that Luther's ninety-five theses produced any considerable direct results. They awakened the author himself to a consciousness that his doctrines were after all incompatible with some of the Church's teachings, and led him to consider the nature of the papal power which issued the indulgence. Two or three years elapsed before Luther began to be generally known and to exercise a perceptible influence upon affairs.

The diet of Augsburg of 1518.

In July 1518 a diet assembled in Augsburg to consider the new danger from the Turks, who were making rapid conquests under Sultan Selim I. The pope's representative, Cardinal Cajetan, made it clear that the only safety lay in the collection of a tenth from the clergy and a twentieth from laymen; but the diet appointed a committee to consider the matter and explain why they proposed to refuse the pope's demands. Protests urging the diet not to weaken came in from all sides. There was an especially bitter denunciation of the Curia by some unknown writer. He claims that "the pope bids his collectors go into the whole world, saying, 'He that believeth, and payeth the tenths, shall be saved.' But it is not necessary to stand in such fear of the thunder of Christ's vicar, but rather to fear Christ Himself, for it is the Florentine's business, not Christ's, that is at issue." The report of the committee of the diet was completed on the 27th of August 1518. It reviews all the abuses, declares that the German people are the victims of war, devastation and dearth, and that the common man is beginning to comment on the vast amount of wealth that is collected for expeditions against the Turk through indulgences or otherwise, and yet no expedition takes place. This is the first recognition in the official *gravamina* of the importance of the people. Shortly after the committee submitted its report the clergy of Liége presented a memorial which, as the ambassador from Frankfort observed, set forth in the best Latin all the various forms of rascality of which the *curtizanen* (i.e. *curiales*, officials of the curia) were guilty. From this time on three new streams begin to reinforce the rather feeble current of official efforts for reform. The common man, to whom the diet of Augsburg alludes, had long been raising his voice against the "parsons" (*Pfaffen*); the men of letters, Brand, Erasmus, Reuchlin, and above all Ulrich von Hutten, contributed, each in their way, to discredit the Roman Curia; and lastly, a new type of theology, represented chiefly by Martin Luther, threatened to sweep away the very foundations of the papal monarchy.

The growing discontent of the poor people, whether in country or town, is clearly traceable in Germany during the 15th century, and revolutionary agitation was chronic in southern Germany at least during the first two decades of the 16th. The clergy were satirized and denounced in popular pamphlets and songs. The tithe was an oppressive form of taxation, as were the various fees demanded for the performance of the sacraments. The so-called "Reformation of Sigismund," drawn up in 1438, had demanded that the celibacy of the clergy should be abandoned and their excessive wealth reduced. "It is a shame which cries to heaven, this oppression by tithes, dues, penalties, excommunication, and tolls of the peasant, on whose labour all men depend for their existence." In 1476 a poor young shepherd drew thousands to Nicklashausen to hear him denounce the emperor as a rascal and the pope as a worthless fellow, and urge the division of the Church's property among the members of the community. The "parsons" must be killed, and the lords reduced to earn their bread by daily labour. An apocalyptic pamphlet of 1508 shows on its cover the Church upside down, with the peasant performing the services, while the priest guides the plough outside and a monk drives the horses. Doubtless the free peasants of Switzerland contributed to stimulate disorder and discontent, especially in southern Germany. The conspiracies were repeatedly betrayed and the guilty parties terribly punished. That discovered in 1517 made a deep impression on the authorities by reason of its vast extent, and doubtless led the diet of Augsburg to allude to the danger which lay in the refusal of the common man to pay the ecclesiastical taxes. "It was into this mass of seething discontent that the spark of religious protest fell—the one thing needed to fire the train and kindle the social conflagration. This was the society to which Luther spoke, and its discontent was the sounding board which made his words reverberate."[1]

Hostility of the masses to the clergy in Germany.

On turning from the attitude of the peasants and poorer townspeople to that of the scholars, we find in their writings a good deal of harsh criticism of the scholastic theology, satirical allusions to the friars, and, in Germany, sharp denunciations of the practices of the Curia. But there are many reasons for believing that the older estimate of the influence of the so-called Renaissance, or "new learning," in promoting the Protestant revolt was an exaggerated one. The class of humanists which had grown up in Italy during the 15th century, and whose influence had been spreading into Germany, France and England during the generation immediately preceding the opening of the Protestant revolt, represented every phase of religious feeling from mystic piety to cynical indifference, but there were very few anti-clericals among them. The revival of Greek from the time of Chrysoloras onward, instead of begetting a Hellenistic spirit, transported the more serious-minded to the nebulous shores of Neo-Platonism, while the less devout became absorbed in scholarly or literary ambitions, translations, elegantly phrased letters, clever epigrams or indiscriminate invective. It is true that Lorenzo Valla (d. 1457) showed the Donation of Constantine to be a forgery, denied that Dionysius the Areopagite wrote the works ascribed to him, and refuted the commonly accepted notion that each of the apostles had contributed a sentence to the Apostles' Creed. But such attacks were rare and isolated and were not intended to effect a breach in the solid ramparts of the medieval Church, but rather to exhibit the ingenuity of the critic. In the libraries collected under humanistic influences the patristic writers, both Latin and Greek, and the scholastic doctors are conspicuous. Then most of the humanists were clerics, and in Italy they enjoyed the patronage of the popes. They not unnaturally showed a tolerant spirit on the whole toward existing institutions, including the ecclesiastical abuses, and, in general, cared little how long the vulgar herd was left in the superstitious darkness which befitted their estate, so long as the superior man was permitted to hold discreetly any views he pleased. Of this attitude Mutian (1471–1526), the German humanist who perhaps approached most nearly the Italian type, furnishes a good illustration. He believed that Christianity had existed from all eternity, and that the Greeks and Romans, sharing in God's truth, would share also in the celestial joys. Forms and ceremonies should only be judged as they promoted the great object of life, a clean heart and a right spirit, love to God and one's neighbour. He defined faith as commonly understood to mean "not the conformity of what we say with fact, but an opinion upon divine things founded upon credulity which seeks after profit." "With the cross," he declares, "we put our foes to flight, we extort money, we consecrate God, we shake hell, we work miracles."

Attitude of the humanists.

These reflections were, however, for his intimate friends, and like him, his much greater contemporary, Erasmus, abhorred anything suggesting open revolt or revolution. The extraordinary popularity of Erasmus is a sufficient indication that his attitude of mind was viewed with sympathy by the learned, whether in France, England, Germany, Spain or Italy. He was a firm believer in the efficacy of culture. He maintained that old prejudices would disappear with the progress of knowledge, and that superstition and mechanical devices of salvation would be insensibly abandoned. The laity should read their New Testament, and would in this way come to feel the true significance of Christ's life and teachings, which, rather than the Church, formed the centre of Erasmus's religion. The dissidence of dissent, however, filled him with uneasiness, and he abhorred Luther's denial of free will and his exaggerated notion of man's utter depravity; in short, he did nothing whatever to promote the Protestant revolt, except so far as his frank denunciation and his witty arraignment of clerical and monastic weaknesses and soulless ceremonial, especially in his *Praise of Folly* and *Colloquies*, contributed to bring the faults of the Church into strong relief, and in so far as his edition of the New Testament furnished a simple escape from innumerable theological complications.

Erasmus (1466–1536).

A peculiar literary feud in Germany served, about 1515, to throw into sharp contrast the humanistic party, which had been gradually developing during the previous fifty years, and the conservative, monkish, scholastic group, who found their leader among the Dominicans of the university of Cologne. Johann Reuchlin, a well-known scholar, who had been charged by the Dominicans with heresy, not only received the support of the newer type of scholars, who wrote him encouraging letters which he published under the title *Epistolae clarorum virorum*, but this collection suggested to Crotus Rubianus and Ulrich von Hutten one of the most successful satires of the ages, the *Epistolae obscurorum virorum*. As Creighton well said, the chief importance of the "Letters of Obscure Men" lay in its success in popularizing the conception of a stupid party which was opposed to the party of progress. At the same time that the Neo-Platonists, like Ficino and Pico de la Mirandola, and the pantheists, whose God was little more than a reverential conception of the universe at large, and the purely worldly humanists, like Celtes and Bebel, were widely diverging each by his own particular path from the ecclesiastical *Weltanschauung* of the middle ages, Ulrich von Hutten was busy attacking the Curia in his witty *Dialogues*, in the name of German patriotism. He, at least, among the well-known scholars eagerly espoused Luther's cause, as he understood it. A few of the humanists became Protestants—Melanchthon, Bucer, Oecolampadius and others—but the great majority of them, even if attracted for the moment by Luther's denunciation of scholasticism, speedily repudiated the movement. In Socinianism (see below) we have perhaps the only instance of humanistic antecedents leading to the formation of a religious sect.

A new type of theology made its appearance at the opening of the 16th century, in sharp contrast with the Aristotelian scholasticism of the Thomists and Scotists. This was due to the renewed enthusiasm for, and appreciation of, St Paul with which Erasmus sympathized, and which found an able exponent in England in John Colet and in France in Lefèvre of Étaples (Faber Stapulensis). Luther was reaching somewhat similar views at the same time,

The new theology and Martin Luther.

[1] Lindsay.

although in a strikingly different manner and with far more momentous results for the western world. Martin Luther was beyond doubt the most important single figure in the Protestant revolt. His influence was indeed by no means so decisive and so pervasive as has commonly been supposed, and his attacks on the evils in the Church were no bolder or more comprehensive than those of Marsiglio and Wycliffe, or of several among his contemporaries who owed nothing to his example. Had the German princes not found it to their interests to enforce his principles, he might never have been more than the leader of an obscure mystic sect. He was, moreover, no statesman. He was recklessly impetuous in his temperament, coarse and grossly superstitious according to modern standards. Yet in spite of all these allowances he remains one of the great heroes of all history. Few come in contact with his writings without feeling his deep spiritual nature and an absolute genuineness and marvellous individuality which seem never to sink into mere routine or affectation. In his more important works almost every sentence is alive with that autochthonic quality which makes it unmistakably his. His fundamental religious conception was his own hard-found answer to his own agonized question as to the nature and assurance of salvation. Even if others before him had reached the conviction that the Vulgate's word *justitia* in Romans i. 16–17 meant "righteousness" rather than "justice" in a juridical sense, Luther exhibited supreme religious genius in his interpretation of "God's righteousness" (*Gerechtigkeit*) as the over against the "good works" of man, and in the overwhelming importance he attached to the promise that the just shall live by faith. It was his anxiety to remove everything that obscured this central idea which led him to revolt against the ancient Church, and this conception of faith served, when he became leader of the German Protestants, as a touchstone to test the expediency of every innovation. But only gradually did he come to realize that his source of spiritual consolation might undermine altogether the artfully constructed fabric of the medieval Church. As late as 1516 he declared that the life of a monk was never a more enviable one than at that day. He had, however, already begun to look sourly upon Aristotle and the current scholastic theology, which he believed hid the simple truth of the gospel and the desperate state of mankind, who were taught a vain reliance upon outward works and ceremonies, when the only safety lay in throwing oneself on God's mercy. He was suddenly forced to take up the consideration of some of the most fundamental points in the orthodox theology by the appearance of Tetzel in 1517. In his hastily drafted Ninety-five Theses he sought to limit the potency of indulgences, and so indirectly raised the question as to the power of the pope. He was astonished to observe the wide circulation of the theses both in the Latin and German versions. They soon reached Rome, and a Dominican monk, Prierius, wrote a reply in defence of the papal power, in an insolent tone which first served to rouse Luther's suspicion of the theology of the papal Curia. He was summoned to Rome, but, out of consideration for his prince, the important elector of Saxony, he was permitted to appear before the papal legate during the diet of Augsburg in 1518. He boldly contradicted the legate's theological statements, refused to revoke anything and appealed to a future council. On returning to Wittenberg, he turned to the canon law, and was shocked to find it so completely at variance with his notions of Christianity. He reached the conclusion that the papacy was but four hundred years old. Yet, although of human origin, it was established by common consent and with God's sanction, so that no one might withdraw his obedience without offence.

It was not, however, until 1520 that Luther became in a sense the leader of the German people by issuing his three great pamphlets, all of which were published in German as well as in Latin—his *Address to the Christian Nobility of the German Nation*, his *Babylonish Captivity of the Church*, and his *Freedom of the Christian*. In the first he urged that, since the Church had failed to reform itself, the secular government should come to the rescue. "The Romanists have with great dexterity built themselves about with three walls, which have hitherto protected them against reform; and thereby is Christianity fearfully fallen. In the first place, when the temporal power has pressed them hard, they have affirmed and maintained that the temporal power has no jurisdiction over them—that, on the contrary, the spiritual is above the temporal. Secondly, when it was proposed to admonish them from the Holy Scriptures they said, 'It beseems no one but the pope to interpret the Scriptures,' and, thirdly, when they were threatened with a council, they invented the idea that no one but the pope can call a council. Thus they have secretly stolen our three rods that they may go unpunished, and have entrenched themselves safely behind these three walls in order to carry on all the rascality and wickedness that we now see."

He declares that the distinction between the "spiritual estate," composed of pope, bishops, priests and monks, as over against the "temporal estate" composed of princes, lords, artisans and peasants, is a very fine hypocritical invention of which no one should be afraid. "A cobbler, a smith, a peasant, every man has his own calling and duty, just like the consecrated priests and bishops, and every one in his calling or office must help and serve the rest, so that all may work together for the common good." After overthrowing the other two walls, Luther invites the attention of the German rulers to the old theme of the pomp of the pope and cardinals, for which the Germans must pay. "What the Romanists really mean to do, the wretched Germans are not to see until they have lost everything. . . . If we rightly hang thieves and behead robbers, why do we leave the greed of Rome unpunished? for Rome is the greatest thief and robber that has ever appeared on earth, or ever will; and all in the holy names of the Church and St Peter." After proving that the secular rulers were free and in duty bound to correct the evils of the Church, Luther sketches a plan for preventing money from going to Italy, for reducing the number of idle, begging monks, harmful pilgrimages and excessive holidays. Luxury and drinking were to be suppressed, the universities, especially the divinity schools, reorganized, &c.

Apart from fundamental rejection of the papal supremacy, there was little novel in Luther's appeal. It had all been said before in the various protests of which we have spoken, and very recently by Ulrich von Hutten in his *Dialogues*, but no one had put the case so strongly, or so clearly, before. In addressing the German nobility Luther had refrained from taking up theological or religious doctrines; but in September 1520 he attacked the whole sacramental system of the medieval Church in his *Babylonish Captivity of the Church*. Many reformers, like Glapion, the Franciscan confessor of Charles V., who had read the *Address* with equanimity if not approval, were shocked by Luther's audacity in rejecting the prevailing fundamental religious conceptions. Luther says: "I must begin by denying that there are seven sacraments, and must lay down for the time being that there are only three—baptism, penance and the bread, and that by the court of Rome all these have been brought into miserable bondage, and the Church despoiled of her liberty." It is, however, in the *Freedom of the Christian* that the essence of Luther's religion is to be found. Man cannot save himself, but *is* saved then and there so soon as he believes God's promises, and to doubt these is the supreme crime. So salvation was to him not a painful *progress* toward a goal to be reached by the sacraments and by right conduct, but a *state* in which man found himself so soon as he despaired absolutely of his own efforts, and threw himself on God's assurances. Man's utter incapacity to do anything to please God, and his utter personal dependence on God's grace seemed to render the whole system of the Church well-nigh gratuitous even if it were purged of all the "sophistry" which to Luther seemed to bury out of sight all that was essential in religion. Luther's gospel was one of love and confidence, not of fear and trembling, and came as an overwhelming revelation to those who understood and accepted it.

The old question of Church reform inevitably reappeared

when the young emperor Charles V. opened his first imperial diet at Worms early in 1521, and a committee of German princes drafted a list of *gravamina*, longer and bitterer than any preceding one. While the resolute papal nuncio Aleander was indefatigable in his efforts to induce the diet to condemn Luther's teachings, his curious and instructive despatches to the Roman Curia complain constantly of the ill-treatment and insults he encountered, of the readiness of the printers to issue innumerable copies of Luther's pamphlets and of their reluctance to print anything in the pope's favour. Charles apparently made up his mind immediately and once for all. He approved the *gravamina*, for he believed a thorough reform of the Church essential. This reform he thought should be carried out by a council, even against the pope's will; and he was destined to engage in many fruitless negotiations to this end before the council of Trent at last assembled a score of years later. But he had no patience with a single monk who, led astray by his private judgment, set himself against the faith held by all Christians for a thousand years. "What my forefathers established at the council of Constance and other councils it is my privilege to maintain," he exclaims. Although, to Aleander's chagrin, the emperor consented to summon Luther to Worms, where he received a species of ovation, Charles readily approved the edict drafted by the papal nuncio, in which Luther is accused of having "brought together all previous heresies in one stinking mass," rejecting all law, teaching a life which is brutish, and urging the lay people to bathe their hands in the blood of priests. He and his adherents were outlawed; no one was to print, sell or read any of his writings, "since they are foul, harmful, suspected, and come from a notorious and stiff-necked heretic." The edict of Worms was entirely in harmony with the laws of Western Christendom, and there were few among the governing classes in Germany at that time who really understood or approved Luther's fundamental ideas; nevertheless—if we except the elector of Brandenburg, George of Saxony, the dukes of Bavaria, and Charles V.'s brother Ferdinand—the princes, including the ecclesiastical rulers and the towns, commonly neglected to publish the edict, much less to enforce it. They were glad to leave Luther unmolested in order to spite the "Curtizanen," as the Lutherists of the papal Curia were called. The emperor was forced to leave Germany immediately after the diet had dissolved, and was prevented by a succession of wars from returning for nearly ten years. The governing council, which had been organized to represent him in Germany, fell rapidly into disrepute, and exercised no restraining influence on those princes who might desire to act on Luther's theory that the civil government was supreme in matters of Church reform.

The edict of Worms, 1521.

The records of printing indicate that religious, social and economic betterment was the subject of an ever-increasing number of pamphlets. The range of opinion was wide. Men like Thomas Murner, for instance, heartily denounced "the great Lutheran fool," but at the same time bitterly attacked monks and priests, and popularized the conception of the simple man with the hoe (Karsthans). Hans Sachs, on the other hand, sang the praises of the "Wittenberg Nightingale," and a considerable number of prominent men of letters accepted Luther as their guide—Zell and Bucer, in Strassburg, Eberlin in Ulm, Oecolampadius in Augsburg, Osiander and others in Nuremberg, Pellicanus in Nördlingen. Moreover, there gradually developed a group of radicals who were convinced that Luther had not the courage of his convictions. They proposed to abolish the "idolatry" of the Mass and all other outward signs of what they deemed the old superstitions. Luther's colleague at Wittenberg, Carlstadt (*q.v.*), began denouncing the monastic life, the celibacy of the clergy, the veneration of images; and before the end of 1521 we find the first characteristic outward symptoms of Protestantism. Luther had meanwhile been concealed by his friends in the Wartburg, near Eisenach, where he busied himself with a new German translation of the New Testament, to be followed in a few years by the Old Testament. The Bible had long been available in the language of the people, and there are indications that the numerous early editions of the Scriptures were widely read. Luther, however, possessed resources of style which served to render his version far superior to the older one, and to give it an important place in the development of German literature, as well as in the history of the Protestant churches. During his absence two priests from parishes near Wittenberg married; while several monks, throwing aside their cowls, left their cloisters. Melanchthon, who was for a moment carried away by the movement, partook, with several of his students, of the communion under both kinds, and on Christmas Eve a crowd invaded the church of All Saints, broke the lamps, threatened the priests and made a travesty of the venerable ritual. Next day, Carlstadt, who had laid aside his clerical robes, dispensed the Lord's Supper in the "evangelical fashion." At this time three prophets arrived from Zwickau, eager to hasten the movement of emancipation. They were weavers who had been associated with Thomas Münzer, and like him looked forward to a very radical reform of society. They rejected infant baptism, and were among the forerunners of the Anabaptists.

Wide divergence of opinion in Germany.

In January 1522, Carlstadt induced the authorities of Wittenberg to publish the first evangelical church ordinance. The revenues from ecclesiastical foundations, as well as those from the industrial gilds, were to be placed in a common chest, to be in charge of the townsmen and the magistrates. The priests were to receive fixed salaries; begging, even by monks and poor students, was prohibited; the poor, including the monks, were to be supported from the common chest. The service of the Mass was modified, and the laity were to receive the elements in both kinds. Reminders of the old religious usages were to be done away with, and fast days were to be no longer observed. These measures, and the excitement which followed the arrival of the radicals from Zwickau, led Luther to return to Wittenberg in March 1522, where he preached a series of sermons attacking the impatience of the radical party, and setting forth clearly his own views of what the progress of the Reformation should be. "The Word created heaven and earth and all things; the same Word will also create now, and not we poor sinners. The Word must be unconstrained and must be accepted without compulsion. To marry, to do away with images, to become monks and nuns, or for monks and nuns to leave their convent, to eat meat on Friday or not to eat it, and other like things—all these are open questions, and should not be forbidden by any man . . . . What we want is the heart, and to win that we must preach the gospel. Then the Word will drop into one heart to-day and to-morrow into another, and so will work that each will forsake the Mass." Luther succeeded in quieting the people both in Wittenberg and the neighbouring towns, and in preventing the excesses which had threatened to discredit the whole movement.

The Protestant Revolt begins in Saxony, 1522.

In January 1522, Leo X. had been succeeded by a new pope, Adrian VI., a devout Dominican theologian, bent on reforming the Church, in which, as he injudiciously confessed through his legate to the diet at Nuremberg, the Roman Curia had perhaps been the chief source of "that corruption which had spread from the head to the members." The Lutheran heresy he held to be God's terrible judgment on the sins of the clergy. The diet refused to accede to the pope's demand that the edict of Worms should be enforced, and recommended that a Christian council should be summoned in January, to include not only ecclesiastics but laymen, who should be permitted freely to express their opinions. While the diet approved the list of abuses drawn up at Worms, it ordered that Luther's books should no longer be published, and that Luther himself should hold his peace, while learned men were to admonish the erring preachers. The decisions of this diet are noteworthy, since they probably give a very fair idea of the prevailing opinion of the ruling classes in Germany. They refused to regard Luther as in any way their leader, or even to recognize him as a discreet

Adrian VI., 1522–1523.

person. On the other hand, they did not wish to take the risk of radical measures against the new doctrines, and were glad of an excuse for refusing the demands of the pope. Adrian soon died, worn out by his futile attempts to correct the abuses at home, and was followed by Clement VII., a Medici, less gifted but not less worldly in his instincts than Leo X.

Clement sent one of his ablest Italian diplomatists, Campeggio, to negotiate with the diet which met at Spires in 1524.

Beginning of the religious cleft between the German states of the north and south in 1524.

He induced the diet to promise to execute the edict of Worms as far as that should be possible; but it was generally understood that it was impossible. The diet renewed the demand for a general council to meet in a German town to settle the affairs of the Church in Germany, and even proposed the convocation of a national council at Spires in November, to effect a temporary adjustment. In this precarious situation Campeggio, realizing the hopelessness of his attempt to induce all the members of the diet to co-operate with him in re-establishing the pope's control, called together at Regensburg a certain number of rulers whom he believed to be rather more favourably disposed toward the pope than their fellows. These included Ferdinand, duke of Austria, the two dukes of Bavaria, the archbishops of Salzburg and Trent, the bishops of Bamberg, Spires, Strassburg and others. He induced these to unite in opposing the Lutheran heresy on condition that the pope would issue a decree providing for some of the most needed reforms. There was to be no more financial oppression on the part of the clergy, and no unseemly payments for performing the church services. Abuses arising from the granting of indulgences were to be remedied, and the excessive number of church holidays, which seriously interfered with the industrial welfare of Germany, was to be reduced. The states in the Catholic League were permitted to retain for their own uses about one-fifth of the ecclesiastical revenue; the clergy was to be subjected to careful discipline; and only authorized preachers were to be tolerated, who based their teachings on the works of the four Latin Church fathers. Thus the agreement of Regensburg is of great moment in the development of the Protestant revolt in Germany. For Austria, Bavaria and the great ecclesiastical states in the south definitely sided with the pope against Luther's heresies, and to this day they still remain Roman Catholic. In the north, on the other hand, it became more and more apparent that the princes were drifting away from the Roman Catholic Church. Moreover, it should be noted that Campeggio's diplomacy was really the beginning of an effective betterment of the old Church, such as had been discussed for two or three centuries. He met the long-standing and general demand for reform without a revolution in doctrines or institutions. A new edition of the German Bible was issued with the view of meeting the needs of Catholics, a new religious literature grew up designed to substantiate the beliefs sanctioned by the Roman Church and to carry out the movement begun long before toward spiritualizing its institutions and rites.

In 1525 the conservative party, which had from the first feared that Luther's teaching would result in sedition, received a new and terrible proof, as it seemed to them, of the noxious influence of the evangelical preachers. The peasant movements alluded to above, which had caused so much anxiety at the diet of Augsburg in 1518, culminated in the fearful Peasant Revolt in which the common man, both in country and town, rose in the name of "God's justice" to avenge long-standing wrongs and establish his rights. Luther was by no means directly responsible for the civil war which followed, but he had certainly contributed to stir up the ancient discontent. He had asserted that, owing to the habit of foreclosing small mortgages, "any one with a hundred gulden could gobble up a peasant a year." The German feudal lords he pronounced hangmen, who knew only how to swindle the poor man—"such fellows were formerly called scoundrels, but now we must call them 'Christians and revered princes.'" Yet in spite of this harsh talk about princes, Luther relied upon them to forward the reforms in which he was interested, and he justly claimed that he had greatly increased their powers by reducing the authority of the pope and subjecting the clergy in all things to the civil government.

The Peasant Revolt, 1525.

The best known statement of the peasants' grievances is to be found in the famous "Twelve Articles" drawn up in 1524. They certainly showed the unmistakable influence of the evangelical teaching. The peasants demanded that the gospel should be taught them as a guide in life, and that each community should be permitted to choose its pastor and depose him if he conducted himself improperly. "The pastor thus chosen should teach us the gospel pure and simple, without any addition, doctrine or ordinance of man." The old tithe on grain shall continue to be paid, since that is established by the Old Testament. It will serve to support the pastor, and what is left over shall be given to the poor. Serfdom is against God's word, "since Christ has delivered and redeemed us all without exception, by the shedding of his precious blood, the lowly as well as the great." Protests follow against hunting and fishing rights, restrictions on wood-cutting, and excessive demands made on peasants. "In the twelfth place," the declaration characteristically concluded, "it is our conclusion and final resolution that if one or more of the articles here set forth should not be in agreement with the word of God, as we think they are, such articles will we willingly retract if it be proved by a clear explanation of Scripture really to be against the word of God." More radical demands came from the working classes in the towns. The articles of Heilbronn demanded that the property of the Church should be confiscated and used for the community; clergy and nobility alike were to be deprived of all their privileges, so that they could no longer oppress the poor man. The more violent leaders, like Münzer, renewed the old cry that the parsons must be slain. Hundreds of castles and monasteries were destroyed by the frantic peasantry, and some of the nobles were murdered with shocking cruelty. Luther, who believed that the peasants were trying to cloak their dreadful sins with excuses from the gospel, exhorted the government to put down the insurrection. "Have no pity on the poor folk; stab, smite, throttle, who can!" To him the peasants' attempt to abolish serfdom was wholly unchristian, since it was a divinely sanctioned institution, and if they succeeded they would "make God a liar." The German rulers took Luther's advice with terrible literalness, and avenged themselves upon the peasants, whose lot was apparently worse afterwards than before.

Appearance of an evangelical party.

The terror inspired by the Peasant War led to a new alliance, the League of Dessau, formed by some of the leading rulers of central and northern Germany, to stamp out the "accursed Lutheran sect." This included Luther's old enemy, Duke George of Saxony, the electors of Brandenburg and Mainz, and two princes of Brunswick. Rumour that the emperor was planning to return to Germany in order to root out the growing heresy, led a few princes who had openly favoured Luther to unite also. Among these the chief were the new elector of Saxony, John (who, unlike his brother, Frederick the Wise, had openly espoused the new doctrines), and the energetic Philip, landgrave of Hesse. The emperor did not return, and since there was no one to settle the religious question in Germany, the diet of Spires (1526) determined that, pending the meeting of the proposed general council, each prince, and each knight and town owing immediate allegiance to the emperor, should decide individually what particular form of religion should prevail within the limits of their territories. Each prince was "so to live, reign and conduct himself as he would be willing to answer before God and His Imperial Majesty." While the evangelical party still hoped that some form of religion might be agreed upon which would prevent the disruption of the Church, the conservatives were confident that the heretics

would soon be suppressed, as they had so often been in the past. The situation tended to become more, rather than less, complicated, and there was every variety of reformer and every degree of conservatism, for there were no standards for those who had rejected the papal supremacy, and even those who continued to accept it differed widely. For example, George of Saxony viewed Aleander, the pope's nuncio, with almost as much suspicion as he did Luther himself.

The religious ideas in South Germany were affected by the development of a reform party in Switzerland, under the influence of Zwingli, who claimed that at Einsiedeln, near the lake of Zürich, he had begun to preach the gospel of Christ in the year 1516 " before any one in my locality had so much as heard the name of Luther." Three years later he became preacher in the cathedral of Zürich. Here he began to denounce the abuses in the Church, as well as the traffic in mercenaries which had so long been a blot upon his country's honour. From the first he combined religious and political reform. In 1523 he prepared a complete statement of his beliefs, in the form of sixty-seven theses. He maintained that Christ was the only high priest and that the gospel did not gain its sanction from the authority of the Church. He denied the existence of purgatory, and rejected those practices of the Church which Luther had already set aside. Since no one presented himself to refute him, the town council ratified his conclusions, so that the city of Zürich practically withdrew from the Roman Catholic Church. Next year the Mass, processions and the images of saints were abolished. The shrines were opened and the relics burned. Some other towns, including Bern, followed Zürich's example, but the Forest cantons refused to accept the innovations. In 1525 a religious and political league was arranged between Zürich and Constance, which in the following year was joined by St Gallen, Biel, Mühlhausen, Basel and Strassburg. Philip of Hesse was attracted by Zwingli's energy, and was eager that the northern reformers should be brought into closer relations with the south. But the league arranged by Zwingli was directed against the house of Habsburg, and Luther did not deem it right to oppose a prince by force of arms. Moreover, he did not believe that Zwingli, who conceived the church as merely symbolical in its character, " held the whole truth of God." Nevertheless, Philip of Hesse finally arranged a religious conference in the castle of Marburg (1529) where Zwingli and Luther met. They were able to agree on fourteen out of the fifteen " Marburg Articles," which stated the chief points in the Christian faith as they were accepted by both. A fundamental difference as to the doctrine of the eucharist, however, stood in the way of the real union.

Zwingli and the Reformation in Switzerland.

Zwingli and Luther. The Marburg Articles.

The diet of Spires (1529) had received a letter from the emperor directing it to look to the enforcement of the edict of Worms against the heretics. No one was to preach against the Mass, and no one was to be prevented from attending it freely. This meant that the evangelical princes would be forced to support the semi-Lutheristic Catholic rite. As they formed only a minority in the diet, they could only draw up a protest, which was signed by John Frederick of Saxony, Philip of Hesse, and fourteen of the three towns, including Strassburg, Nuremberg and Ulm. In this they claimed that the majority had no right to abrogate the stipulations of the former diet of Spires, which permitted each prince to determine religious matters provisionally for himself, for all had unanimously pledged themselves to observe that agreement. They therefore appealed to the emperor and to a future council against the tyranny of the majority. Those who signed this appeal were called *Protestants*, a name which came to be generally applied to those who rejected the supremacy of the pope, the Roman Catholic conceptions of the clergy and of the Mass, and discarded sundry practices of the older Church, without, however, repudiating the Catholic creeds.

The diet of Spires, 1529, and the "Protestants."

During the period which had elapsed since the diet of Worms, the emperor had resided in Spain, busy with a series of wars, waged mainly with the king of France.[1] In 1530 the emperor found himself in a position to visit Germany once more, and summoned the diet to meet at Augsburg, with the hope of settling the religious differences and bringing about harmonious action against the Turk. The Protestants were requested to submit a statement of their opinions, and on June 25th the " Augsburg Confession " was read to the diet. This was signed by the elector of Saxony and his son and successor, John Frederick, by George, margrave of Brandenburg, two dukes of Lüneburg, Philip of Hesse and Wolfgang of Anhalt, and by the representatives of Nuremberg and Reutlingen. The confession was drafted by Melanchthon, who sought consistently to minimize the breach which separated the Lutherans from the old Church. In the first part of the confession the Protestants seek to prove that there is nothing in their doctrines at variance with those of the universal Church " or even of the Roman Church so far as that appears in the writings of the Fathers." They made it clear that they still held a great part of the beliefs of the medieval Church, especially as represented in Augustine's writings, and repudiated the radical notions of the Anabaptists and of Zwingli. In the second part, those practices of the Church are enumerated which the evangelical party rejected; the celibacy of the clergy, the Mass, as previously understood, auricular confession, and monastic vows, the objections to which are stated with much vigour. Christian perfection is this: to fear God sincerely, to trust assuredly that we have, for Christ's sake, a gracious and merciful God; to ask and look with confidence for help from him in all our affairs, accordingly to our calling, and outwardly to do good works diligently, and to attend to our vocation. In these things doth true perfection and a true worship of God consist. It doth not consist in going about begging, or in wearing a black or a grey cowl." The Protestant princes declared that they had no intention of depriving the bishops of their jurisdiction, but this one thing only is requested of them, " that they would suffer the gospel to be purely taught, and would relax a few observances in which we cannot adhere without sin."

The diet and confession of Augsburg, 1530.

The confession was turned over to a committee of conservative theologians, including Eck, Faber and Cochlaeus. Their refutation of the Protestant positions seemed needlessly sharp to the emperor, and the drafts were made of it. Charles finally reluctantly accepted it, although he would gladly have had it milder, for it made reconciliation hopeless. The majority of the diet approved a recess, allowing the Protestants a brief period of immunity until the 15th of April 1531, after which they were to be put down by force. Meanwhile, they were to make no further innovations, they were not to molest the conservatives, and were to aid the emperor in suppressing the doctrines of Zwingli and of the Anabaptists. The Lutheran princes protested, together with fourteen cities, and left the diet. The diet thereupon decided that the edict of Worms should at last be enforced. All Church property was to be restored, and, perhaps most important of all, the jurisdiction of the Imperial court (*Reichskammergericht*), which was naturally Catholic in its sympathies, was extended to appeals involving the seizure of ecclesiastical benefices, contempt of episcopal decisions and other matters deeply affecting the Protestants. In November the Protestants formed the Schmalkaldic League, which, after the death of Zwingli, in 1531, was joined by a number of the South German towns. The period of immunity assigned to the Protestants passed by; but they were left unmolested, for the emperor was involved in many difficulties, and the Turks were threatening Vienna. Consequently, at the diet of Nuremberg (1532) a recess was drafted indefinitely extending the religious truce and quashing such cases in the *Reichskammergericht* as involved Protestant

Course of events in Germany, 1531–1540.

[1] In 1527 the pope's capital was sacked by Charles's army. This was, of course, but an incident in the purely political relations of the European powers with the pope, and really has no bearing upon the progress of the Protestant revolt.

innovations. The conservatives refused to ratify the recess, which was not published, but the Protestant states declared that they would accept the emperor's word of honour, and furnished him with troops for repelling the Mahommedans. The fact that the conservative princes, especially the dukes of Bavaria, were opposed to any strengthening of the emperor's power, and were in some cases hereditary enemies of the house of Habsburg, served to protect the Protestant princes. In 1534 the Schmalkaldic League succeeded in restoring the banished duke of Württemberg, who declared himself in favour of the Lutheran reformation, and thus added another to the list of German Protestant states. In 1539 George of Saxony died, and was succeeded by his brother Henry, who also accepted the new faith, and in the same year the new elector of Brandenburg became a Protestant. Indeed, there was reason to believe at this time that the archbishops of Mainz, Trier and Cologne, as well as some other bishops, were planning the secularization of their principalities.

To the north, Lutheran influence had spread into Denmark; Sweden and Norway were also brought within its sphere.

Denmark, Norway and Sweden become Protestant.

Christian II. of Denmark, a nephew of the elector of Saxony, came to the throne in 1513, bent on bringing Sweden and Norway, over which he nominally ruled in accordance with the terms of the Union of Kalmar (1397), completely under his control. In order to do this it was necessary to reduce the power of the nobility and clergy, privileged classes exempt from taxation and serfs of the royal power. Denmark had suffered from all the abuses of papal provisions, and the nuncio of Leo X. had been forced in 1518 to flee from the king's wrath. Christian II. set up a supreme court for ecclesiastical matters, and seemed about to adopt a policy similar to that later pursued by Henry VIII. of England, when his work was broken off by a revolt which compelled him to leave the country. Lutheranism continued to make rapid progress, and Christian's successor permitted the clergy to marry, appropriated the annates and protected the Lutherans. Finally Christian III., an ardent Lutheran, ascended the throne in 1536; with the sanction of the diet he severed, in 1537, all connexion with the pope, introducing the Lutheran system of Church government and accepting the Augsburg Confession.[1] Norway was included in the changes, but Sweden had won its independence of Denmark, under Gustavus Vasa, who, in 1523, was proclaimed king. He used the Lutheran theories as an excuse for overthrowing the ecclesiastical aristocracy, which had been insolently powerful in Sweden. In 1527, supported by the diet, he carried his measures for secularizing such portions of the Church property as he thought fit, and for subjecting the Church to the royal power (Ordinances of Vesterås); but many of the old religious ceremonies and practices were permitted to continue, and it was not until 1592 that Lutheranism was officially sanctioned by the Swedish synod.[2]

Charles V., finding that his efforts to check the spread of the religious schism were unsuccessful, resorted once more to conferences between Roman Catholic and Lutheran theologians, but it became apparent that no permanent compromise was possible. The emperor then succeeded in disrupting the Schmalkaldic League by winning over, on purely political grounds, Philip of Hesse and young Maurice of Saxony, whose father, Henry, had died after a very brief reign. Charles V. had always exhibited the greatest confidence in the proposed general council, the summoning of which had hitherto been frustrated by the popes, and at last, in 1545, the council was summoned to meet at Trent, which lay conveniently upon the confines of Italy and Germany (see TRENT, COUNCIL OF). The Dominicans and, later, members of the newly born Order of Jesus, were conspicuous, among the theological deputies, while the Protestants, though invited, refused to attend. It was clear from the first that the decisions of the council would be uncompromising in character, and that the Protestants would certainly refuse to be bound by its decrees. And so it fell out. The very first anathemas of the council were directed against those innovations which the Protestants had most at heart. The emperor had now tried threats, conferences and a general council, and all had failed to unify the Church.

The Council of Trent.

Maurice of Saxony, without surrendering his religious beliefs, had become the political friend of the emperor, who had promised him the neighbouring electorate of Saxony. John Frederick, the elector, was defeated at Mühlberg, April 1547, and taken prisoner. Philip of Hesse also surrendered, and Charles tried once more to establish a basis of agreement. Three theologians, including a conservative Lutheran, were chosen to draft the so-called "Augsburg Interim." This reaffirmed the seven sacraments, transubstantiation and the invocation of saints, and declared the pope head of the Church, but adopted Luther's doctrine of justification by faith in a conditional way, as well as the marriage of priests, and considerably modified the theory and practice of the Mass. For four years Charles, backed by the Spanish troops, made efforts to force the Protestant towns to observe the Interim, but with little success. He rapidly grew extremely unpopular, and in 1552 Maurice of Saxony turned upon him and attempted to capture him at Innsbruck. Charles escaped, but Maurice succeeded for the moment in leader of the German princes who gathered at Passau (August 1552) to discuss the situation. The settlement, however, was deferred for the meeting of the diet, which took place at Augsburg, 1555. There was a general anxiety to conclude a peace—"*beständiger, beharrlicher, unbedingter, für und für ewig währender.*" There was no other way but to legalize the new faith in Germany, but only those were to be tolerated who accepted the Augsburg Confession. This excluded, of course, not only the Zwinglians and Anabaptists, but the ever-increasing Calvinistic or "Reformed" Church. The principle *cujus regio ejus religio* was adopted, according to which each secular ruler might choose between the old faith and the Lutheran. His decision was to bind all his subjects, but a subject professing another religion from his prince was to be permitted to leave the country. The ecclesiastical rulers, however, were to lose their possessions if they abandoned the old faith.[3] Freedom of conscience was thus established for princes alone, and their power became supreme in religious as well as secular matters. The Church and the civil government had been closely associated with one another for centuries, and the old system was perpetuated in the Protestant states. Scarcely any one dreamed that individual subjects could safely be left to believe what they would, and permitted, so long as they did not violate the law of the land, freely to select and practise such religious rites as afforded them help and comfort.

Events culminating in the religious peace of Augsburg, 1555.

During the three or four years which followed the signing of the Augsburg Confession in 1530 and the formation of the Schmalkaldic League, England, which bitterly denouncing and burning Lutheran heretics in the name of the Holy Catholic Church, was herself engaged in severing the bonds which had for well-nigh a thousand years bound her to the Apostolic See. An independent national Church was formed in 1534, which continued, however, for a time to adhere to all the characteristic beliefs of the medieval Catholic Church, excepting alone the headship of the pope. The circumstances which led to the English schism are dealt with elsewhere (see ENGLAND, CHURCH OF), and need be reviewed here only in the briefest manner. There was some heresy in England during the opening decades of the 16th century, survivals of the Lollardy which now and then brought a victim to the stake. There was also the old discontent among the orthodox in regard to the Church's exactions, bad clerics and

Religious situation in England at the opening of the 16th century.

[1] The episcopal office was retained, but the "succession" broken, the new Lutheran bishops being consecrated by Buggenhagen, who was only in priest's orders.

[2] The episcopal system and succession were maintained, and the "Mass vestments" (*i.e.* alb and chasuble) remain in use to this day.

[3] This so-called "ecclesiastical reservation" was not included in the main peace.

dissolute and lazy monks. Scholars, like Colet, read the New Testament in Greek and lectured on justification by faith before they knew of Luther, and More included among the institutions of Utopia a rather more liberal and enlightened religion than that which he observed around him. Erasmus was read and approved, and his notion of reform by culture no doubt attracted many adherents among English scholars. Luther's works found their way into England, and were read and studied at both Oxford and Cambridge. In May 1521 Wolsey attended a pompous burning of Lutheran tracts in St Paul's churchyard, where Bishop Fisher preached ardently against the new German heresy. Henry VIII. himself stoutly maintained the headship of the pope, and, as is well known, after examining the arguments of Luther, published his *Defence of the Seven Sacraments* in 1521, which won for him from the pope the glorious title of "Defender of the Faith." The government and the leading men of letters and prelates appear therefore to have harboured no notions of revolt before the matter of the king's divorce became prominent in 1527.

Henry's elder brother Arthur, a notoriously sickly youth of scarce fifteen, had been married to Catherine, daughter of Ferdinand and Isabella, but had died less than five months after the marriage (April 1502), leaving doubts as to whether the union had ever been physically consummated. Political reasons dictated an alliance between the young widow and her brother-in-law Henry, prince of Wales, nearly five years her junior; Julius II. was induced reluctantly to grant the dispensation necessary on account of the relationship, which, according to the canon law and the current interpretation of Leviticus xviii. 16, stood in the way of the union. The wedding took place some years later (1509), and several children were born, none of whom survived except the princess Mary. By 1527 the king had become hopeless of having a male heir by Catherine. He was tired of her, and in love with the black-eyed Anne Boleyn, who refused to be his mistress. He alleged that he was beginning to have a horrible misgiving that his marriage with Catherine had been invalid, perhaps downright "incestuous." The negotiations with Clement VII. with the hope of obtaining a divorce from Catherine, the reluctance of the pope to impeach the dispensation of his predecessor Julius II., and at the same time to alienate the high-handed nephew Charles V., the futile policy of Wolsey and his final ruin in 1529 are described elsewhere (see ENGLISH HISTORY; HENRY VIII.; CATHERINE OF ARAGON). The king's agents secured the opinion of a number of prominent universities that his marriage was void, and an assembly of notables, which he summoned in June 1530, warned the pope of the dangers involved in leaving the royal succession in uncertainty, since the heir was not only a woman, but, as it seemed to many, of illegitimate birth.

Henry VIII. and the divorce case.

Henry's next move was to bring a monstrous charge against the clergy, accusing them of having violated the ancient laws of *praemunire* in submitting to the authority of papal legates (although he himself had ratified the appointment of Wolsey as legate *a latere*). The clergy of the province of Canterbury were fined £100,000 and compelled to declare the king "their singular protector and only supreme lord, and, as far as that is permitted by the law of Christ, the supreme head of the Church and of the clergy." This the king claimed, perhaps with truth, was only a clearer statement of the provisions of earlier English laws. The following year, 1532, parliament presented a petition to the king (which had been most carefully elaborated by the monarch's own advisers) containing twelve charges against the bishops, relating to their courts, fees, injudicious appointments and abusive treatment of heretics, which combined to cause an unprecedented and "marvellous disorder of the godly quiet, peace and tranquillity" of the realm. For the remedy of these abuses parliament turned to the king, "in whom and by whom the only and sole redress, reformation and remedy herein absolutely rests and remains." The ordinaries met these accusations with a lengthy and dignified answer; but this did not satisfy the king, and convocation was compelled on the 15th of May 1532, further to clarify the ancient laws of the land, as understood by the king, in the very brief, very humble and very pertinent document known as the "Submission of the Clergy." Herein the king's "most humble subjects daily orators, and bedesmen" of the clergy of England, in view of his goodness and fervent Christian zeal and his learning far exceeding that of all other kings that they have read of, agree never to assemble in convocation except at the king's summons, and to enact and promulgate no constitution or ordinances except they receive the royal assent and authority. Moreover, the existing canons are to be subjected to the examination of a commission appointed by the king, half its members from parliament, half from the clergy, to abrogate with the king's assent such provisions as the majority find do not stand with God's laws and the laws of the realm. This appeared to place the legislation of the clergy, whether old or new, entirely under the monarch's control. A few months later Thomas Cranmer, who had been one of those to discuss sympathetically Luther's works in the little circle at Cambridge, and who believed the royal supremacy would tend to the remedying of grave abuses and that the pope had acted *ultra vires* in issuing a dispensation for the king's marriage with Catherine, was induced by Henry to succeed Warham as archbishop of Canterbury. About the same time parliament passed an interesting and important statute, forbidding, unless the king should wish to suspend the operation of the law, the payment to the pope of the annates. This measure, which remained in force during the next few years, the parliament declared, "at the least to eight score thousand pounds, besides other great and intolerable sums which have yearly been conveyed to the said court of Rome by many other ways and means to the great impoverishment of this realm." The annates were thereafter to accrue to the king; and bishops and archbishops were thenceforth, in case the pope refused to confirm them,[1] to be consecrated and invested within the realm, "in like manner as divers other archbishops and bishops have been heretofore in ancient times by sundry the king's most noble progenitors." No censures, excommunications or interdicts with which the Holy Father might vex or grieve the sovereign lord or his subjects, should be published or in any way impede the due performance of the sacraments and other divine and divine offices. In February parliament discovered that "by divers sundry old authentic histories and chronicles" it was manifest that the realm of England was an empire governed by one supreme head, the king, to whom all sorts and degrees of people—both clergy and laity—ought to bear next to God a natural and humble obedience, and that to him God had given the authority finally to determine all causes and contentions in the realm, "without restraint, or provocation to any foreign princes or potentates of the world." The ancient statutes of the *praemunire* and provisors are recalled and the penalties attached to their violation re-enacted. All appeals were to be tried within the realm, and suits begun before an archbishop were to be determined by him without further appeal. Acting on this, Cranmer tried the divorce case before his court, which declared the marriage with Catherine void and that with Anne Boleyn, which had been solemnized privately in January, valid. The pope replied by ordering Henry under pain of excommunication to put away Anne and restore Catherine, his legal wife, within ten days. This sentence the emperor, all the Christian princes and the king's own subjects were summoned to carry out by force of arms if necessary.

Beginning of England's revolt against papacy.

As might have been anticipated, this caused no break in the policy of the English king and his parliament, and a series of famous acts passed in the year 1534 completed and confirmed the independence of the Church of England, which, except during five years under Queen Mary, was thereafter as completely severed from the papal monarchy as the electorate of Saxony or the duchy of Hesse. The payment of annates and of Peter's pence

Secession of England from the papal monarchy, 1534.

[1] Cranmer himself had taken the oath of canonical obedience to the Holy See and duly received the pallium.

was absolutely forbidden, as well as the application to the bishop of Rome for dispensations. The bishops were thereafter to be elected by the deans and chapters upon receiving the king's *congé d'eslire* (*q.v.*). The Act of Succession provided that, should the king have no sons, Elizabeth, Anne's daughter, should succeed to the crown. The brief Act of Supremacy confirmed the king's claim to be reputed the "only supreme head in earth of the Church of England"; he was to enjoy all the honours, dignities, jurisdictions and profits thereunto appertaining, and to have full power and authority to reform and amend all such errors, heresies and abuses, as by any manner of spiritual authority might lawfully be reformed, or amended, most to the pleasure of Almighty God, and the increase of virtue in Christ's religion, "foreign authority, prescription, or any other thing or things to the contrary hereof, notwithstanding." The Treasons Act, terrible in its operation, included among capital offences that of declaring in words or writing the king to be "a heretic, schismatic, tyrant, infidel or usurper." The convocations were required to abjure the papal supremacy by declaring "that the bishop of Rome has not in Scripture any greater jurisdiction in the kingdom of England than any other foreign bishop." The king had now clarified the ancient laws of the realm to his satisfaction, and could proceed to abolish superstitious rites, remedy abuses, and seize such portions of the Church's possessions, especially pious and monastic foundations, as he deemed superfluous for the maintenance of religion.

The reform of the English Church under Henry VIII.

In spite of the fact that the separation from Rome had been carried out during the sessions of a single parliament, and that there had been no opportunity for a general expression of opinion on the part of the nation, there is no reason to suppose that the majority of the people, thoughtful or thoughtless, were not ready to reconcile themselves to the abolition of the papal supremacy. It seems just as clear that there was no strong evangelical movement, and that Henry's pretty consistent adherence to the fundamental doctrines of the medieval Church was agreeable to the great mass of his subjects. The ten "Articles devised by the King's Highness Majestic to stablysh Christen quietness" (1536) together with the "Injunctions" of 1536 and 1538 are chiefly noteworthy for their affirmation of almost all the current doctrines of the Catholic Church, except those relating to the papal supremacy, purgatory, images, relics and pilgrimages, and the old rooted distrust of the Bible in the vernacular. The clergy were bidden to exhort their hearers to the "works of charity, mercy and faith, specially prescribed and commanded in Scripture, and not to repose their trust or affiance in any other works devised by men's phantasies beside Scripture; as in wandering to pilgrimages, offering of money, candles or tapers to images or relics, or kissing or licking the same, saying over a number of beads, not understood or minded on, or in such-like superstition." To this end a copy of the whole English Bible was to be set up in each parish church where the people could read it. During the same years the monasteries, lesser and greater, were dissolved, and the chief shrines were despoiled, notably that of St Thomas of Canterbury. Thus one of the most important of all medieval ecclesiastical institutions, monasticism, came to an end in England. Doubtless the king's sore financial needs had much to do with the dissolution of the abbeys and the plundering of the shrines, but there is no reason to suppose that he was not fully convinced that the monks had long outlived their usefulness and that the shrines were centres of abject superstition and ecclesiastical deceit. Henry, however, stoutly refused to go further in the direction of German Protestantism, even with the prospect of forwarding the proposed union between him and the princes of the Schmalkaldic League. An insurrection of the Yorkshire peasants, which is to be ascribed in part to the distress caused by the enclosure of the commons on which they had been wont to pasture their cattle, and in part to the destruction of popular shrines, may have caused the king to defend his orthodoxy by introducing into parliament in 1539 the six questions. These parliament enacted into the terrible statute of "The Six Articles," in which a felon's death was prescribed for those who obstinately denied transubstantiation, demanded the communion under both kinds, questioned the binding character of vows of chastity, or the lawfulness of private Masses or the expediency of auricular confession. On the 30th of July 1540 three Lutheran clergymen were burned and three Roman Catholics beheaded, the latter for denying the king's spiritual supremacy. The king's ardent desire that diversities of minds and opinions should be done away with and unity be "charitably established" was further promoted by publishing in 1543 *A Necessary Doctrine and Erudition for any Christian Man, set forth by the King's Majesty of England*, in which the tenets of medieval theology, except for denial of the supremacy of the bishop of Rome and the unmistakable assertion of the supremacy of the king, were once more restated.

Henry VIII. died in January 1547, having chosen a council of regency for his nine-year-old son Edward, the members of which were favourable to further religious innovations. Somerset, the new Protector, strove to govern on the basis of civil liberty and religious tolerance. The first parliament of the reign swept away almost all the species of treasons created during the previous two centuries, the heresy acts, including the Six Articles, all limitations on printing the Scriptures in English and reading and expounding the same—indeed "all and every act or acts of parliament concerning doctrine or matters of religion." These measures gave a great impetus to religious discussion and local innovations. Representatives of all the new creeds hastened from the Continent to England, where they hoped to find a safe and fertile field for the particular seed they had to plant. It is impossible exactly to estimate the influence which these teachers exerted on the general trend of religious opinion in England; in any case, however, it was not unimportant, and the Articles of Religion and official homilies of the Church of England show unmistakably the influence of Calvin's doctrine. They were, however, not a sudden breach with the traditions of the past as characterized the Reformation in some continental countries. Under Edward VI. the changes were continued on the lines laid down by Henry VIII. The old hierarchy continued, but service books in English were substituted for those in Latin, and preaching was encouraged. A royal visitation, beginning in 1547, discovered, however, such a degree of ignorance and illiteracy among the parish clergy that it became clear that preaching could only be gradually given its due place in the services of the Church. Communion under both kinds and the marriage of the clergy were sanctioned, thus gravely modifying two of the fundamental institutions of the medieval Church. A conservative *Book of Common Prayer and Administration of the Sacraments and other Rites and Ceremonies after the Use of the Church of England* —commonly called the First Prayer Book of Edward VI.— was issued in 1549. This was based upon ancient "uses," and represented no revolutionary change in the traditions of the "old religion." It was followed, however, in 1552 by the second Prayer Book, which was destined to be, with some modifications, the permanent basis of the English service. This made it clear that the communion was no longer to be regarded as a propitiatory sacrifice, the names "Holy Communion" and "Lord's Supper" being definitively substituted for "Mass" (*q.v.*), while the word "altar" was replaced by "table." In the Forty-two Articles we have the basis of Queen Elizabeth's Thirty-nine Articles. Thus during the reign of Edward we have not only the foundations of the Anglican Church laid, but there appears the beginning of those evangelical and puritanical sects which were to become the "dissenters" of the following centuries.

England becomes Protestant under Edward VI., 1547–1553.

With the death of Edward there came a period of reaction lasting for five years. Queen Mary, unshaken in her attachment to the ancient faith and the papal monarchy, was able with the sanction of a subservient parliament to turn back the wheels of ecclesiastical legislation, to restore the old religion, and to reunite the English Church with the papal monarchy; the pope's legate, Cardinal Pole, was primate of all England. Then, the ancient heresy laws having been revived, came the burnings of Rogers, Hooker, Latimer, Ridley, Cranmer and many a less noteworthy champion of the new religion. It would seem as if this sharp, uncompromising reaction was what was needed to produce a popular realization of the contrast between the *Ecclesia anglicana* of Henry VIII. and Edward VI., and the alternative of "perfect obedience to the See Apostolic."

Catholic reaction under Mary, 1553-1558.

Elizabeth, who succeeded her sister Mary in 1558, was suspected to be Protestant in her leanings, and her adviser, Cecil, had received his training as secretary of the Protector Somerset; but the general European situation as well as the young queen's own temperament precluded any abrupt or ostentatious change in religious matters. The new sovereign's first proclamation was directed against all such preaching as might lead to contention and the breaking of the common quiet. In 1559 ten of Henry VIII.'s acts were revived. On Easter Sunday the queen ventured to display her personal preference for the Protestant conception of the eucharist by forbidding the celebrant in her chapel to elevate the host. The royal supremacy was reasserted, the title being modified into "supreme governor"; and a new edition of Edward VI.'s second Prayer Book, with a few changes, was issued. The Marian bishops who refused to recognize these changes were deposed and imprisoned, but care was taken to preserve the "succession" by consecrating others in due form to take their places.[1] Four years later the Thirty-nine Articles imposed an official creed upon the English nation. This was Protestant in its general character: in its appeal to the Scriptures as the sole rule of faith (Art. VI.), its repudiation of the authority of Rome (Art. XXXVII.), its definition of the Church (Art. XIX.), its insistence on justification by faith only (Art. XI.) and repudiation of the sacrifice of the Mass (Arts. XXVIII. and XXXI.). As supreme governor of the Church of England the sovereign strictly controlled all ecclesiastical legislation and appointed royal delegates to hear appeals from the ecclesiastical courts, to be a "papist" or to "hear Mass" (which was construed as the same thing) was to risk incurring the terrible penalties of high treason. By the Act of Uniformity (1559) a uniform ritual, the Book of Common Prayer, was imposed upon clergy and laity alike, and no liberty of public worship was permitted. Every subject was bound under penalty of a fine to attend church on Sunday. While there was in a certain sense freedom of opinion, all printers had to seek a licence from the government for every manner of book or paper, and heresy was so closely affiliated with treason that the free expression of thought, whether reactionary or revolutionary, was beset with grave danger.

Settlement under Elizabeth.

Attempts to estimate the width of the gulf separating the Church of England in Elizabeth's time from the corresponding institution as it existed in the early years of her father's reign are likely to be gravely affected by personal bias. There is a theory that no sweeping revolution in dogma took place, but that only a few medieval beliefs were modified or rejected owing to the practical abuses to which they had given rise. To Professor A. F. Pollard, for example, "The Reformation in England was mainly a domestic affair, a national protest against national grievances rather than part of a cosmopolitan movement toward doctrinal change" (*Camb. Mod. Hist.* ii. 478–9). This estimate appeals to persons of widely different views and temperaments. It is as grateful to those who, like many "Anglo-Catholics," desire on religious grounds to establish the doctrinal continuity of the Anglican Church with that of the middle ages, as it is obvious to those who, like W. K. Clifford, perceive in the ecclesiastical organization and its influence nothing more than a perpetuation of demoralizing medieval superstition. The nonconformists have, moreover, never wearied of denouncing the "papistical" conservatism of the Anglican establishment. On the other hand, the impartial historical student cannot compare the Thirty-nine Articles with the contemporaneous canons and decrees of the council of Trent without being impressed by striking contrasts between the two sets of dogmas. Their spirit is very different. The unmistakable rejection on the part of the English Church of the conception of the eucharist as a sacrifice had alone many wide-reaching implications. Even although the episcopal organization was retained, the conception of "tradition," of the conciliar powers, of the "characters" of the priest, of the celibate life, of purgatory, of "good works," &c.—all these serve clearly to differentiate the teaching of the English Church before and after the Reformation. From this standpoint it is obviously unhistorical to deny that England had a very important part in the cosmopolitan movement toward doctrinal change.

The little backward kingdom of Scotland definitely accepted the new faith two years after Elizabeth's accession, and after having for centuries sided with France against England, she was inevitably forced by the Reformation into an alliance with her ancient enemy to the south when they both faced a confederation of Catholic powers. The first martyr of Luther's gospel had been Patrick Hamilton, who had suffered in 1528; but in spite of a number of executions the new ideas spread, even among the nobility. John Knox, who, after a chequered career, had come under the influence of Calvin at Geneva, returned to Scotland for a few months in 1555, and shortly after (1557) that part of the Scottish nobility which had been won over to the new faith formed their first "covenant" for mutual protection. These "Lords of the Congregation" were able to force some concessions from the queen regent. Knox appeared in Scotland again in 1559, and became a sort of second Calvin. He opened negotiations with Cecil, who induced the reluctant Elizabeth to form an alliance with the Lords of the Congregation, and the English sent a fleet to drive away the French, who were endeavouring to keep their hold on Scotland. In 1560 a confession of faith was prepared by John Knox and five companions. This was adopted by the Scottish parliament, with little opposition. The bishops of Rome have no jurisdiction nor authoritie in this Realme in tymes cuming." The alliance of England and the Scottish Protestants against the French, and the common secession from the papal monarchy, was in a sense the foundation and beginning of Great Britain. Scottish Calvinism was destined to exercise no little influence, not only on the history of England, but on the form that the Protestant faith was to take in lands beyond the seas, at the time scarcely known to the Europeans.

The Reformation in Scotland, 1560.

While France was deeply affected during the 16th century by the Protestant revolt, its government never undertook any thoroughgoing reform of the Church. During the latter part of the century its monarchs were engaged in a bloody struggle with a powerful religious political party, the Huguenots, who had won a toleration which they continued to enjoy until the revocation of the edict of Nantes in 1685. It was not until 1789 that the French Church of the middle ages lost its vast possessions and was subjected to a fundamental reconstruction by the Civil Constitution of the Clergy (1791).[2] Yet no summary of

Beginnings of the Protestant movement in France.

[1] Only one of the Marian bishops, Kitchin of Llandaff, was found willing to conform.

[2] In 1795 the National Convention gruffly declared that the Republic would no longer subsidize any form of worship or furnish buildings for religious services. "The law recognizes no minister of religion, and no one is to appear in public with costumes or ornaments used in religious ceremonies." Bonaparte, in the Concordat which he forced upon the pope in 1801, did not provide for the return of any of the lands of the Church which had been sold, but agreed that the government should pay the salaries of bishops and priests, whose appointment it controlled. While the Roman Catholic religion was declared to be that accepted by the majority of Frenchmen, the state subsidized the Reformed Church, those adhering to the Augsburg Confession and the Jewish community. Over a

the Protestant revolt would be complete without some allusion to the contrast between the course of affairs in France and in the neighbouring countries. The French monarchy, as we have seen, had usually succeeded in holding its own against the centralizing tendencies of the pope. By the Pragmatic Sanction of Bourges (1438) it had secured the advantages of the conciliar movement. In 1516, after Francis I. had won his victory at Marignano, Leo X. concluded a new concordat with France, in which, in view of the repudiation of the offensive Pragmatic Sanction, the patronage of the French Church was turned over, with scarce any restriction, to the French monarch, although in another agreement the annates were reserved to the pope. The encroachments—which had begun in the time of Philip the Fair—of the king's lawyers on the ancient ecclesiastical jurisdiction, had reached a point where there was little cause for jealousy on the part of the State. The *placet* had long prevailed, so that the king had few of the reasons, so important in Germany and England, for quarrelling with the existing system, unless it were on religious grounds. France had been conspicuous in the conciliar movement. It had also furnished its due quota of heretics, although no one so conspicuous as Wycliffe or Huss. Marsiglio of Padua had had Frenchmen among his sympathizers and helpers. The first prominent French scholar to "preach Christ from the sources" was Jacques Lefèbvre of Etaples, who in 1512 published a new Latin translation of the epistles of St Paul. Later he revised an existing French translation of both the New Testament (which appeared in 1523, almost contemporaneously with Luther's German version) and, two years later, the Old Testament. He agreed with Luther in rejecting transubstantiation, and in believing that works without the grace of God could not make for salvation. The centre of Lefèbvre's followers was Meaux, and they found an ardent adherent in Margaret of Angoulême, the king's sister, but had no energetic leader who was willing to face the danger of disturbances. Luther's works found a good many readers in France, but were condemned (1521) by both the Sorbonne and the parlement of Paris. The parlement appointed a commission to discover and punish heretics; the preachers of Meaux fled to Strassburg, and Lefèbvre's translation of the Bible was publicly burned. A council held at Sens, 1528–29, approved all those doctrines of the old Church which the Protestants were attacking, and satisfied itself with enumerating a list of necessary conservative reforms.

After a fierce attack on Protestants caused by the mutilation of a statue of the Virgin, in 1528, the king, anxious to conciliate both the German Protestants and anti-papal England, invited some of the reformers of Meaux to preach in the Louvre. An address written by a young man of twenty-four, Jean Cauvin (to become immortal under his Latin name of Calvinus) was read by the rector of the university. It was a defence of the new evangelical views, and so aroused the Sorbonne that Calvin was forced to flee from Paris. In October 1534, the posting of placards in Paris and other towns, containing brutal attacks on the Mass and denouncing the pope and the "vermin" of bishops, priests and monks as blasphemers and liars, produced an outburst of persecution, in which thirty-five Lutherans were burned, while many fled the country. The events called forth from Calvin, who was in Basel, the famous letter to Francis which forms the preface to his *Institutes of the Christian Religion*. In this address he sought to vindicate the high aims of the Protestants, and to put the king on his guard against those mad men who were disturbing his kingdom with their measures of persecution. The *Institutes*, the first great textbook of Protestant theology, was published in Latin in 1536, and soon (1541) in a French version. The original work is much shorter than in its later editions, for, as Calvin says, he wrote learning and learned century elapsed before the Concordat was abrogated by the Separation Law of 1905 which suppressed all government appropriations for religious purposes and vested the control of Church property in "associations for public worship" (*associations cultuelles*), to be composed of from seven to twenty-five members according to the size of the commune.

John Calvin and his "Institutes of the Christian Religion."

writing. His address had little effect on the king. The parlements issued a series of edicts against the heretics, culminating in the very harsh general edict of Fontainebleau, sanctioned by the parlement of Paris in 1543. The Sorbonne issued a concise series of twenty-five articles, refuting the *Institutes* of Calvin. This statement, when approved by the king and his council, was published throughout France, and formed a clear test of orthodoxy. The Sorbonne also drew up a list of prohibited books, including those of Calvin, Luther and Melanchthon; and the parlement issued a decree against all printing of Protestant literature. The later years of Francis's reign were noteworthy for the horrible massacre of the Waldenses and the martyrdom of fourteen from the group of Meaux, who were burnt alive in 1546. When Francis died little had been done, in spite of the government's cruelty, to check Protestantism, while a potent organ of evangelical propaganda had been developing just beyond the confines of France in the town of Geneva.

In its long struggle with its bishops and with the dukes of Savoy, Geneva had turned to her neighbours for aid, especially to Bern, with which an alliance was concluded in 1526. Two years later Bern formally sanctioned the innovations advocated by the Protestant preachers, and although predominantly German assumed the rôle of protector of the reform party in the Pays de Vaud and Geneva. William Farel, one of the group of Meaux, who had fled to Switzerland and had been active in the conversion of Bern, went to Geneva in 1531. With the protection afforded him and his companions by Bern, and the absence of well-organized opposition on the part of the Roman Catholics, the new doctrines rapidly spread, and by 1535 Farel was preaching in St Pierre itself. After a public disputation in which the Catholics were weakly represented, and a popular demonstration in favour of the new doctrines, the council of Geneva rather reluctantly sanctioned the abolition of the Mass. Meanwhile Bern had declared war on the duke of Savoy, and had not only conquered a great part of the Pays de Vaud, including the important town of Lausanne, but had enabled Geneva to win its complete independence. In the same year (September 1536), as Calvin was passing through the town on his way back to Strassburg from a short visit in Italy, he was seized by Farel and induced most reluctantly to remain and aid him in thoroughly carrying out the Reformation in a city in which the conservative sentiment was still very strong. As there proved to be a large number in the town councils who did not sympathize with the plans of organization recommended by Calvin and his colleagues, the town preachers were, after a year and a half of unsatisfactory labour, forced to leave Geneva. For three years Calvin sojourned in Germany; he signed the Augsburg Confession, gained the friendship of Melanchthon and other leading reformers, and took part in the religious conferences of the period. In 1541 he was induced with great difficulty to surrender once more his hopes of leading the quiet life of a scholar, and to return again to Geneva (September 1541), where he spent the remaining twenty-three years of his life. His ideal was to restore the conditions which he supposed prevailed during the first three centuries of the Church's existence; but the celebrated Ecclesiastical Ordinances adopted by the town in 1541 and revised in 1561 failed fully to realize his ideas, which find a more complete exemplification in the regulations governing the French Church later. He wished for the complete independence and self-government of the Church, with the right of excommunication to be used against the ungodly. The Genevan town councils were quite ready to re-enact all the old police regulations common in that age in regard to excessive display, dancing, obscene songs, &c. It was arranged too that town government should listen to the "Consistory," made up of the "Elders," but the Small Council was to choose the members of the Consistory, two of whom should belong to the Small Council, four to the Council of Sixty, and six to the Council of Two Hundred. One of the four town syndics was to preside over its sessions. The Consistory was thus a sort of committee of

Geneva becomes a centre of propaganda.

the councils, and it had no power to inflict civil punishment on offenders. Thus "we ought," as Lindsay says, "to see in the disciplinary powers and punishments of the Consistory of Geneva not an exhibition of the working of the Church organized on the principles of Calvin, but the ordinary procedure of the town council of a medieval city. Their petty punishments and their minute interferences with private life are only special instances of what was common to all municipal rule in the 16th century." This is true of the supreme crime of heresy, which in the notorious case of Servetus was only an expression of rules laid down over a thousand years earlier in the Theodosian Code. Geneva, however, with its most distinguished of Protestant theologians, became a school of Protestantism, which sent its trained men into the Netherlands, England and Scotland, and especially across the border into France. It served too as a place of refuge for thousands of the persecuted adherents of its beliefs. Calvin's book furnished the Protestants not only with a compact and admirably written handbook of theology, vigorous and clear, but with a system of Church government and a code of morals.

Origin of Huguenot party under Henry II.

After the death of Francis I., his successor, Henry II., set himself even more strenuously to extirpate heresy; a special branch of the parlement of Paris—the so-called *Chambre ardente* (*q.v.*)—for the trial of heresy cases was established, and the fierce edict of Chateaubriand (June 1551) explicitly adopted many of the expedients of the papal inquisition. While hundreds were imprisoned or burned, Protestants seemed daily to increase in numbers, and finally only the expostulations of the parlement of Paris prevented the king from introducing the Inquisition in France in accordance with the wishes of the pope and the cardinal of Lorraine. The civil tribunals, however, practically assumed the functions of regular inquisitorial courts, in spite of the objections urged by the ecclesiastical courts. Notwithstanding these measures for their extermination, the French Protestants were proceeding to organize a church in accordance with the conceptions of the early Christian communities as Calvin described them in his *Institutes*. Beginning with Paris, some fifteen communities with their consistories were established in French towns between 1555 and 1560. In spite of continued persecution a national synod was assembled in Paris in 1559, representing at least twelve Protestant churches in Normandy and central France, which drew up a confession of faith and a book of church discipline. It appears to have been from France rather than from Geneva that the Presbyterian churches of Holland, Scotland and the United States derived their form of government. A reaction against the extreme severity of the king's courts became apparent at this date. Du Bourg and others ventured warmly to defend the Protestants in the parlement of Paris in the very presence of the king and of the cardinal of Lorraine. The higher aristocracy began now to be attracted by the new doctrines, or at least repelled by the flagrant power enjoyed by the Guises during the brief reign of Francis II. (1559–1560). Protestantism was clearly becoming inextricably associated with politics of a very intricate sort. The leading members of the Bourbon branch of the royal family, and Gaspard de Coligny, admiral of France, were conspicuous among the converts to Calvinism. Persecution was revived by the Guises; Du Bourg, the brave defender of the Protestants, was burned as a heretic; yet Calvin could in the closing years of his life form a cheerful estimate that some three hundred thousand of his countrymen had been won over to his views. The death of Francis II. enabled Catherine de' Medici, the queen mother, to assert herself against the Guises, and become the regent of her ten-year-old son Charles IX. A meeting of the States General had already been summoned to consider the state of the realm. Michel de l'Hôpital, the chancellor, who opened the assembly, was an advocate of toleration; he deprecated the abusive use of the terms "Lutherans," "Papists" and "Huguenots," and advocated deferring all action until a council should have been called. The deputies of the clergy were naturally conservative, but advocated certain reforms, an abolition of the Concordat, and a re-establishment of the older Pragmatic Sanction. The noblesse were divided on the matter of toleration, but the *cahiers* (lists of grievances and suggestions for reform) submitted by the Third Estate demanded, besides regular meetings of the estates every five years, complete toleration and a reform of the Church. This grew a little later into the recommendation that the revenues and possessions of the French Church should be appropriated by the government, which, after properly subsidizing the clergy, might hope, it was estimated, that a surplus of twenty-two millions of livres would accrue to the State. Two hundred and thirty years later this plan was realized in the Civil Constitution of the Clergy. The deliberations of 1561 resulted in the various reforms, the suspension of persecution and the liberation of Huguenot prisoners. These were not accorded freedom of worship, but naturally took advantage of the situation to carry on their services more publicly than ever before. An unsuccessful effort was made at the conference of Poissy to bring the two religious parties together; Beza had an opportunity to defend the Calvinistic cause, and Lainez, the general of the Order of Jesus, that of the bishop of Rome. The government remained tolerant toward the movement, and in January 1562 the Huguenots were given permission to hold public services outside the walls of fortified towns and were not forbidden to meet in private houses within the walls. Catherine, who had promoted these measures, cared nothing for the Protestants, but desired the support of the Bourbon princes. The country was Catholic, and disturbances inevitably occurred, culminating in the attack of the duke of Guise and his troops on the Protestants at Vassy, less than two months after the issuing of the edict.

The French Wars of Religion and the edict of Nantes, 1562–1598.

It is impossible to review here the Wars of Religion which distracted France, from the "massacre of Vassy" to the publication of the edict of Nantes, thirty-six years later. Religious issues became more and more dominated by purely political and dynastic ambitions, and the whole situation was constantly affected by the policy of Philip II. and the struggle going on in the Netherlands. Henry IV. was admirably fitted to reunite France once more, and, after a superficial conversion to the Catholic faith, to meet the needs of his former co-religionists, the Huguenots. The edict of Nantes was capitulated and codified the provisions of a series of earlier edicts of toleration, which had come with each truce during the previous generation. Liberty of conscience in religious matters was secured and the right of private worship to those of the "so-called Reformed religion." Public worship was permitted everywhere where it had existed in 1596–1597, in two places within each *bailliage* and *sénéchaussée*, and in the châteaux of the Protestant nobility, with slight restrictions in the case of lower nobility. Protestants were placed upon a political equality and made eligible to all public offices. To ensure these rights, they were left in military control of two hundred towns, including La Rochelle, Montauban and Montpellier. Jealous of their "sharing the State with the king," Richelieu twenty-five years later reduced the exceptional privileges of the Huguenots, and with the advent of Louis XIV. they began to suffer renewed persecution, which the king at last flattered himself had so far reduced their number that in 1685 he revoked the edict of Nantes and reduced the Protestants to the status of outlaws. It was not until 1786 that they were restored to their civil rights, and by the Declaration of the Rights of Man, in 1789, to their religious freedom.

The United Netherlands and their importance in the history of toleration.

Contemporaneously with the Wars of Religion in France a long and terrible struggle between the king of Spain and his Dutch and Belgian provinces had resulted in the formation of a Protestant state—the United Netherlands, which was destined to play an important rôle in the history of the Reformed religion. Open both to German and French influences, the Netherlands had been the scene of the first executions of Lutherans; they had been a centre of Anabaptist agitation; but Calvinism finally triumphed in the Confession of Dordrecht, 1572, since Calvin's system of church government did not, like

Luther's, imply the sympathy of the civil authorities. Charles V. had valiantly opposed the development of heresy in the Netherlands, and nowhere else had there been such numbers of martyrs, for some thirty thousand are supposed to have been put to death during his reign. Under Philip II. it soon became almost impossible to distinguish clearly between the religious issues and the resistance to the manifold tyranny of Philip and his representatives. William of Orange, who had passed through several phases of religious conviction, stood first and foremost for toleration. Indeed, Holland became the home of modern religious liberty, the haven of innumerable free spirits, and the centre of activity of printers and publishers, who asked for no other *imprimatur* than the prospect of intelligent readers.

It is impossible to offer any exhaustive classification of those who, while they rejected the teachings of the old Church, refused at the same time to conform to the particular types of Protestantism which had found favour in the eyes of the princes and been imposed by them on their subjects. This large class of "dissenters" found themselves as little at home under a Protestant as under a Catholic regime, and have until recently been treated with scant sympathy by historians of the Church. Long before the Protestant revolt, simple, obscure people, under the influence of leaders whose names have been forgotten, lost confidence in the official clergy and their sacraments and formed secret organizations of which vague accounts are found in the reports of the 13th-century inquisitors, Rainerius Sacchoni, Bernard Gui, and the rest. Their anti-sacerdotalism appears to have been their chief offence, for the inquisitors admit that they were puritanically careful in word and conduct, and shunned all levity. Similar groups are mentioned in the town chronicles of the early 16th century, and there is reason to assume that informal evangelical movements were no new things when Luther first began to preach. His appeal to the Scriptures against the traditions of the Church encouraged a more active propaganda on the part of Balthasar Hubmaier, Carlstadt, Münzer, Johann Denk (d. 1527) and others, some of whom were well-trained scholars capable of maintaining with vigour and effect their ideas of an apostolic life as the high road to salvation. Münzer dreamed of an approaching millennium on earth to be heralded by violence and bloodshed, but Hubmaier and Denk were peaceful evangelists who believed that man's will was free and that each had within him an inner light which would, if he but followed it, guide him to God. To them persecution was an outrage upon Jesus's teachings. Luther and his sympathizers were blind to the reasonableness of the fundamental teachings of these "brethren." The idea of adult baptism, which had after 1525 become generally accepted among them, roused a bitterness which it is rather hard to understand nowadays. But it is easy to see that informal preaching to the people at large, especially after the Peasant Revolt, with which Münzer had been identified, should have led to a general condemnation, under the name "Anabaptist" or "Catabaptist," of the heterogeneous dissenters who agreed in rejecting the State religion and associated a condemnation of infant baptism with schemes for social betterment. The terrible events in Münster, which was controlled for a short time (1533–34) by a group of Anabaptists under the leadership of John of Leiden, the introduction of polygamy (which appears to have been a peculiar accident rather than a general principle), the speedy capture of the town by an alliance of Catholic and Protestant princes, and the ruthless retribution inflicted by the victors, have been cherished by ecclesiastical writers as a choice and convincing instance of the natural fruits of a rejection of infant baptism. Much truer than the common estimate of the character of the Anabaptists is that given in Sebastian Franck's Chronicle: "They taught nothing but love, faith and the crucifixion of the flesh, manifesting patience and humility under many sufferings, breaking bread with one another in sign of unity and love, helping one another with true helpfulness, lending, borrowing, giving, learning to have all things in common, calling each other 'brother.'" Menno Simons (b. *circ.* 1500) succeeded in bringing the scattered Anabaptist communities into a species of association; he discouraged the earlier apocalyptic hopes, inculcated non-resistance, denounced the evils of State control over religious matters, and emphasized personal conversion, and adult baptism as its appropriate seal. The English Independents and the modern Baptists, as well as the Mennonites, may be regarded as the historical continuation of lines of development going back to the Waldensians and the Bohemian Brethren, and passing down through the German, Dutch and Swiss Anabaptists.

The Anabaptists.

The modern scholar as he reviews the period of the Protestant Revolt looks naturally, but generally in vain, for those rationalistic tendencies which become so clear in the latter part of the 17th century. Luther found no intellectual difficulties in his acceptance and interpretation of the Scriptures as God's word, and in maintaining against the Anabaptists the legitimacy of every old custom that was not obviously contrary to the Scriptures. Indeed, he gloried in the inherent and divine unreasonableness of Christianity, and brutally denounced reason as a cunning fool, "a pretty harlot." The number of questions which Calvin failed to ask or eluded by absolutely irrational expedients frees him from any taint of modern rationalism. But in Servetus, whose execution he approved, we find an isolated, feeble revolt against assumptions which both Catholics and Protestants of all shades accepted without question. It is pretty clear that the common accounts of the Renaissance and of the revival of learning grossly exaggerate the influence of the writers of Greece and Rome, for they produced no obvious rationalistic movement, as would have been the case had Plato and Cicero, Lucretius and Lucian, been taken really seriously. Neo-Platonism, which is in some respects nearer the Christian patristic than the Hellenic spirit, was as far as the radical religious thinkers of the Italian Renaissance receded. The only religious movement that can be regarded as even rather vaguely the outcome of humanism is the Socinian. Faustus Sozzini, a native of Sienna (1539–1603), much influenced by his uncle Lelio Sozzini, after a wandering, questioning life, found his way to Poland, where he succeeded in uniting the various Anabaptist sects into a species of church, the doctrines of which are set forth in the Confession of Rakow (near Minsk), published in Polish in 1605 and speedily in German and Latin. The Latin edition declares that although this new statement of the elements of the Christian faith differs from the articles of other Christian creeds it is not to be mistaken for a challenge. It does not aim at binding the opinions of men or at condemning to the tortures of hell-fire those who refuse to accept it. *Absit a nobis ea mens, immo amentia.* "We have, it is true, ventured to prepare a catechism, but we force it on no one; we express our opinions, but we coerce no one. It is free to every one to form his own conclusions in religious matters; and so we do no more than set forth the meaning of divine things as they appear to our minds without, however, attacking or insulting those who differ from us. This is the golden freedom of preaching which the holy words of the New Testament so strictly enjoin upon us. . . . Who art thou, miserable man, who would smother and extinguish in others the fire of God's Spirit which it has pleased him to kindle in them?" The Socinian creed sprang from intellectual rather than religious motives. Sufficient reasons could be assigned for accepting the New Testament as God's word and Christ as the Christian's guide. He was not God, but a divine prophet born of a virgin and raised on the third day as the first-fruits of them that slept. From the standpoint of the history of enlightenment, as Harnack has observed, "Socinianism with its systematic criticism (tentative and imperfect as it may now seem) and its rejection of all the assumptions based upon mere ecclesiastical tradition, can scarcely be rated too highly. That modern Unitarianism is all to be traced back to Sozzini and the Rakow Confession need not be assumed. The anti-Trinitarian path was one which opened invitingly before a considerable class of critical minds, seeming as it did to lead out into

Socinians or Anti-Trinitarians.

a sunny open, remote from the unfathomable depths of mystery and clouds of religious emotion which beset the way of the sincere Catholic and Protestant alike.

The effects of the Protestant secession on the doctrines, organization and practices of the Roman Catholic Church are difficult to estimate, still more so to substantiate. It is clear that the doctrinal conclusions of the council of Trent were largely determined by the necessity of condemning Protestant tenets, and that the result of the council was to give the Roman Catholic faith a more precise form than it would otherwise have had. It is much less certain that the disciplinary reforms which the council, following the example of its predecessors, re-enacted, owed anything to Protestantism, unless indeed the council would have shown itself less intolerant in respect to such innovations as the use of the vernacular in the services had this not smacked of evangelicalism. In the matter of the pope's supremacy, the council followed the canon law and Thomas Aquinas, not the decrees of the council of Constance. It prepared the way for the dogmatic formulation of the plenitude of the papal power three centuries later by the council of the Vatican. The Protestants have sometimes taken credit to themselves for the indubitable reforms in the Roman Catholic Church, which by the end of the 16th century had done away with many of the crying abuses against which councils and diets had so long been protesting. But this conservative reformation had begun before Luther's preaching, and might conceivably have followed much the same course had his doctrine never found popular favour or been ratified by the princes.

The Catholic Reformation.

In conclusion, a word may be said of the place of the Reformation in the history of progress and enlightenment. A "philosopher," as Gibbon long ago pointed out, who asks from what articles of faith *above* and *against* reason the early Reformers enfranchised their followers will be surprised at their timidity rather than scandalized by their freedom. They remained severely orthodox in the doctrines of the Fathers—the Trinity, the Incarnation, the plenary inspiration of the Bible—and they condemned those who rejected their teachings to a hell whose fires they were not tempted to extenuate. Although they surrendered transubstantiation, the loss of one mystery was amply compensated by the stupendous doctrines of original sin, redemption, faith, grace and predestination upon which they founded their theory of salvation. They ceased to appeal to the Virgin and saints, and to venerate images and relics, procure indulgences and go on pilgrimages, they deprecated the monastic life, and no longer nourished faith by the daily repetition of miracles, but in the witch persecutions their demonology cost the lives of thousands of innocent women. They broke the chain of authority, without, however, recognizing the propriety of toleration. In any attempt to determine the relative importance of Protestant and Catholic countries in promoting modern progress it must not be forgotten that religion is naturally conservative, and that its avowed business has never been to forward scientific research or political reform. Luther and his contemporaries had not in any degree the modern idea of progress, which first becomes conspicuous with Bacon and Descartes, but believed, on the contrary, that the strangling of reason was the most precious of offerings to God. "Freethinker" and "rationalist" have been terms of opprobrium whether used by Protestants or Catholics. The pursuit of salvation does not dominate by any means the whole life and ambition of even ardent believers; statesmen, philosophers, men of letters, scientific investigators and inventors have commonly gone their way regardless of the particular form of Christianity which prevailed in the land in which they lived. The Reformation was, fundamentally, then, but one phase, if the most conspicuous, in the gradual decline of the majestic medieval ecclesiastical State, for this decline has gone on in France, Austria, Spain and Italy, countries in which the Protestant revolt against the ancient Church ended in failure.

The place of the Reformation in the history of progress.

BIBLIOGRAPHY.—Reference is made here mainly to works dealing with the Reformation as a whole. Only recent books are mentioned, since the older works have been largely superseded owing to modern critical investigations: Thomas M. Lindsay, *History of the Reformation*, 2 vols. (1906–7), the best general treatment; *The Cambridge Modern History*, vol. i. (1902), chaps. xviii. and xix., vol. ii. (1904), "The Reformation," and vol. iii. (1905), "The Wars of Religion," with very full bibliographies; Mandell Creighton, *History of the Papacy during the Reformation*, 6 vols. (new ed. 1899–1901). From a Catholic standpoint: L. Pastor, *Geschichte der Päpste seit dem Ausgang des Mittelalters* (1891 sqq., especially vol. iv. in two parts, 1906–7, and vol. v., 1909). This is the best work of publication and is being translated into English (8 vols. have appeared, 1891–1908, covering the period 1305–1521); J. Janssen, *History of the German People at the Close of the Middle Ages*, 12 vols., 1896–1909, corresponding to vols. i.–viii. of the German original, 16 vols., edited by Pastor, 1897–1904. This is the standard Catholic treatment of the Reformation, and is being supplemented by a series of monographs, *Ergänzungen zu Janssens Geschichte des deutschen Volkes*, which have been appearing since 1898 and correspond with the Protestant *Schriften des Vereins für Reformationsgeschichte* (1883 sqq.). F. von Bezold, *Geschichte der deutschen Reformation* (1890), an excellent illustrated account; E. Troeltsch, *Protestantisches Christentum und Kirche der Neuzeit*, in the series "Kultur der Gegenwart," Teil i. Abt. 4, i. Hälfte, 1905; Charles Beard, *The Reformation of the Sixteenth Century in its Relation to Modern Thought and Knowledge* (The Hibbert Lectures for 1883), and by the same, *Martin Luther*, vol. i. (no more published, 1889); A. Harnack, *History of Dogma* (trans. from the 3rd German edition, vol. vii., 1900); A. E. Berger, *Die Kulturaufgaben der Reformation* (2nd ed., 1908); Thudichum, *Papsttum und Reformation* (1903); "Janus," *The Pope and the Council* (1869). Among the many others, a suggestive if not wholly accurate sketch of the papal claims; W. Maurenbrecher, *Geschichte der Katholischen Reformation*, vol. i. (no more published) (1880); J. Haller, *Papsttum und Kirchenreform*, vol. i. (1903) relates to the 11th century; J. Köstlin, *Martin Luther, sein Leben und seine Schriften*, new edition by Kawerau, 2 vols., 1903, the most useful life of Luther; H. Denifle, *Luther und Lutherthum*, 2 vols. (1904–6), a bitter but learned arraignment of Luther by a distinguished Dominican scholar; H. Boehmer, *Luther im Lichte der neueren Forschungen* (1906), brief and suggestive. *First Principles of the Reformation, the Three Primary Works of Dr Martin Luther*, edited by Wace and Buchheim,—an English translation of the famous pamphlets of 1520. (J. H. R.*)

REFORMATORY SCHOOL, an institution for the industrial training of juvenile offenders, in which they are lodged, clothed and fed, as well as taught. They are to be distinguished from "industrial schools," which are institutions for potential and not actual delinquents. To reformatory schools in England are sent juveniles up to the age of sixteen who have been convicted of an offence punishable with penal servitude or imprisonment. The order is made by the court before which they are tried; the limit of detention is the age of nineteen. Reformatory schools are regulated by the Children Act 1908, which repealed the Reformatory Schools Act 1866, as amended by acts of 1872, 1874, 1891, 1893, 1899 and 1901. See further JUVENILE OFFENDERS.

REFORMED CHURCHES, the name assumed by those Protestant bodies who adopted the tenets of Zwingli (and later of Calvin), as distinguished from those of the Lutheran or Evangelical divines. They are accordingly often spoken of as the Calvinistic Churches, Protestant being sometimes used as a synonym for Lutheran. The great difference is in the attitude towards the Lord's Supper, the Reformed or Calvinistic Churches repudiating not only transubstantiation but also the Lutheran consubstantiation. They also reject the use of crucifixes and other symbols and ceremonies retained by the Lutherans.

Full details of these divergences are given in M. Schneckenburger, *Vergleichende Darstellung des lutherischen und reformierten Lehrbegriffs* (Stuttgart, 1855); G. B. Winer, *Comparative Darstellung* (Berlin, 1866; Eng. tr., Edinburgh, 1873). See also REFORMATION; PRESBYTERIANISM; CAMERONIANS.

REFORMED CHURCH IN AMERICA, until 1867 called officially "The Reformed Protestant Dutch Church in North America," and still popularly called the Dutch Reformed Church, an American Calvinist church, originating with the settlers from Holland in New York, New Jersey and Delaware, the first permanent settlers of the Reformed faith in the New World. Their settlements were at Manhattan, Wallabout and Fort Orange (now Albany), where the West India Company formally established the Reformed Church of Holland.

Their first minister was Jonas Michaelius, pastor in New Amsterdam of the "church in the fort" (now the Collegiate Church of New York City). The second *domine*, Everardus Bogardus (d. 1647), migrated to New York in 1633 with Governor Wouter van Twiller, with whom he quarrelled continually; in the same year a wooden church "in the fort" was built; and in 1642 it was succeeded by a stone building. A minister, John van Mekelenburg (Johannes Megapolensis) migrated to Rensselaerwyck manor in 1642, preached to the Indians—probably before any other Protestant minister—and after 1649 was settled in New Amsterdam. With the access of English and French settlers, Samuel Drisius, who preached in Dutch, German, English and French, was summoned, and he laboured in New Amsterdam and New York from 1652 to 1673. On Long Island John T. Polhemius preached at Flatbush in 1654–76. During Peter Stuyvesant's governorship there was little toleration of other denominations, but the West India Company reversed his intolerant proclamations against Lutherans and Quakers. About 1659 a French and Dutch church was organized in Harlem. The first church in New Jersey, at Bergen, in 1661, was quickly followed by others at Hackensack and Passaic. After English rule in 1664 displaced Dutch in New York, the relations of the Dutch churches there were much less close with the state Church of Holland; and in 1679 (on the request of the English governor of New York, to whom the people of New Castle appealed) a classis was constituted for the ordination of a pastor for the church in New Castle, Delaware. The Dutch strongly opposed the establishment of the Church of England and contributed largely toward the adoption (in October 1683) of the Charter of Liberties which confirmed in their privileges all churches then "in practice" in the city of New York and elsewhere in the province, but which was repealed by James II. in 1686, when he established the Church of England in New York but allowed religious liberty to the Dutch and others. The Dutch ministers stood by James's government during Leisler's rebellion. Under William III., Governors Sloughter and Fletcher worked for a law (passed in 1693 and approved in 1697) for the settling of a ministry in New York, Richmond, Westchester and Queen's counties; but the Assembly foiled Fletcher's purpose of establishing a Church of England clergy, although he attempted to construe the act as applying only to the English Church. In 1696 the first church charter in New York was granted to the Reformed Protestant Dutch Church (now the Collegiate Church) of New York City; at this time there were Dutch ministers at Albany and Kingston, on Long Island and in New Jersey; and for years the Dutch and English (Episcopalian) churches alone received charters in New York and New Jersey—the Dutch church being treated practically as an establishment—and the church of the fort and Trinity (Episcopalian; chartered 1697) were fraternally harmonious. In 1700 there were twenty-nine Reformed Dutch churches out of a total of fifty in New York. During the administration of Governor Edward Hyde, Lord Cornbury, many members joined the Episcopal Church and others removed to New Jersey. The Great Awakening crowned the efforts of Theodore J. Frelinghuysen, who had come over as a Dutch pastor in 1720 and had opposed formalism and preached a revival. The Church in America in 1738 asked the Classis of Amsterdam (to whose care it had been transferred from the West India Company) for the privilege of forming a Coetus or Association with power to ordain in America; the Classis, after trying to join the Dutch with the English Presbyterian churches, granted (1747) a Coetus first to the German and then to the Dutch churches, which therefore in September 1754 organized themselves into a classis. This action was opposed by the church of New York City, and partly through this difference and partly because of quarrels over the denominational control of King's College (now Columbia), five members of the Coetus seceded, and as the president of the Coetus was one of them they took the records with them; they were called the Conferentie; they organized independently in 1764 and carried on a bitter warfare with the Coetus (now more properly called the American Classis), which in 1766 (and again in 1770) obtained a charter for Queen's (now Rutgers) College at New Brunswick. But in 1771–72 through the efforts of John H. Livingston (1746–1825), who had become pastor of the New York City church in 1770, on the basis of a plan drafted by the Classis of Amsterdam Coetus and Conferentie were reunited with a substantial independence of Amsterdam, which was made complete in 1792 when the Synod (the nomenclature of synod and classis had been adopted upon the declaration of American Independence) adopted a translation of the eighty-four Articles of Dort on Church Order with seventy-three "explanatory articles."[1] In 1800 there were about forty ministers and one hundred churches. In 1819 the Church was incorporated as the Reformed Protestant Dutch Church; and in 1867 the name was changed to the Reformed Church in America. Preaching in Dutch had nearly ceased in 1820, but about 1846 a new Dutch immigration began, especially in Michigan, and fifty years later Dutch preaching was common in nearly one-third of the churches of the country, only to disappear almost entirely in the next decade. Union with other Reformed churches was planned in 1743, in 1784, in 1816–20, 1873–78 and 1886, but unsuccessfully; however, ministers go from one to another charge in the Dutch and German Reformed, Presbyterian, and to a less degree Congregational churches.

A conservative secession "on account of Hopkinsian errors" in 1822 of six ministers (five then under suspension) organized a General Synod and the classes of Hackensack and Union (central New York) in 1824; it united with the Christian Reformed Church, established by immigrants from Holland in 1835, to which there was added a fresh American secession in 1882 due to opposition (on the part of the seceders) to secret societies.

The organization of the Church is: a General Synod (1794); the (particular) synods of New York (1800), Albany (1800), Chicago (1856) and New Brunswick (1869); classes, corresponding to the presbyteries of other Calvinistic bodies; and the churches, numbering, in 1906, 659. The agencies of the Church are: the Board of Education, privately organized in 1828 and adopted by the General Synod in 1831; a Widows' Fund (1837) and a Disabled Ministers' Fund; a Board of Publication (1855); a Board of Domestic Missions (1831; reorganized 1849) with a Church Building Fund (1874); a Woman's Executive Committee; a Board of Foreign Missions (1832) succeeding the United Missionary Society (1816), which included Presbyterian, Dutch Reformed and Associate Reformed Churches, and which was merged (1826) in the American Board of Commissioners for Foreign Missions, from which the Dutch Church did not entirely separate itself until 1857; and a Woman's Board of Foreign Missions (1875). The principal missions are in India at Arcot (1854; transferred in 1902 to the Synod of S. India) and at Amoy in China (1842); and the work of the Dutch in Japan was very successful, especially under Guido Fridolin Verbeck[2] (1830–1898), and 1877 native churches built up by Presbyterians and Dutch Reformed missionaries were organized as the United Church of our Lord Jesus Christ in Japan. There is also an Arabian mission, begun privately in 1888 and transferred to the Board in 1894.

The colleges and institutions of learning connected with the Church are: Rutgers, already mentioned; Union College (1795), the outgrowth of Schenectady Academy, founded in 1785 by Dirck Romeyn, a Dutch minister; Hope College (1866; coeducational) at Holland, Michigan, originally a parochial school (1850) and then (1853) Holland Academy; the Theological Seminary at New Brunswick (*q.v.*); and the Western Theological Seminary (1869) at Holland, Michigan.

In 1906 (according to *Bulletin 103* (1909) of the Bureau of the U.S. Census) there were 659 organizations with 773 church edifices reported and the total membership was 124,938. More than one-half of this total membership (63,350) was in New York state, the principal home of the first great Dutch immigration; more than one-quarter (32,290) was in New Jersey; and the other states were: Michigan (11,260), Illinois (4962), Iowa (4835), Wisconsin (2312), and Pennsylvania (1979). The Church was also represented in Minnesota, S. Dakota, Oklahoma, Nebraska, Indiana, Ohio, Kansas, N. Dakota, S. Carolina, Washington and Maryland—the order being that of rank in number of communicants.

The Christian Reformed Church, an "old school" secession, had in 1906, 174 organizations, 181 churches and a membership of 26,669,

[1] In 1832 the articles of Church government were rearranged and in 1872–74 they were amended.

[2] See W. E. Griffis, *Verbeck of Japan* (New York, 1900)

of which more than one-half (14,779) was in Michigan, where many of the immigrants who came after 1835 belonged to the secession church in Holland. There were 2990 in Iowa, 2392 in New Jersey, 2332 in Illinois, and smaller numbers in Wisconsin, Indiana, Minnesota, S. Dakota, Ohio, New York, Washington, Kansas, Massachusetts, Montana, N. Dakota, New Mexico, Nebraska and Colorado.

See D. D. Demarest, *The Reformed Church in America* (New York, 1889); E. T. Corwin, *The Manual of the Reformed Church in America* (*ibid.*, 4th ed., 1902), his sketch of the history of the Church in vol. viii. (*ibid.*, 1895) of the American Church History Series, and his *Ecclesiastical Records of the State of New York* (Albany, 1901 seq.), published by the State of New York.

REFORMED CHURCH IN THE UNITED STATES. a German Calvinistic church in America, commonly called the German Reformed Church. It traces its origin to the great German immigration of the 17th century, especially to Pennsylvania, where, although the German Lutherans afterwards outnumbered them, the Reformed element was estimated in 1730 to be more than half the whole number of Germans in the colony. In 1709 more than 2000 Palatines emigrated to New York with their pastor, Johann Friedrich Hager (d. *c.* 1723), who laboured in the Mohawk Valley. A church in Germantown, Virginia, was founded about 1714. Johann Philip Boehm (d. 1749), a school teacher from Worms, although not ordained, preached after 1725 to congregations at Falckner's Swamp, Skippack, and White Marsh, Pennsylvania, and in 1729 he was ordained by Dutch Reformed ministers in New York. Georg Michael Weiss (*c.* 1700–*c.* 1762), a graduate of Heidelberg, ordained and sent to America by the Upper Consistory of the Palatinate in 1727, organized a church in Philadelphia; preached at Skippack; worked in Dutchess and Schoharie counties, New York, in 1731–46; and then returned to his old field in Pennsylvania. Johann Heinrich Goetschius was pastor (*c.* 1731–38) of ten churches in Pennsylvania, and was ordained by the Presbyterian Synod of Philadelphia in 1737. A part of his work was undertaken by Johann Conrad Wirtz, who was ordained by the New Brunswick (New Jersey) Presbytery in 1750, and in 1761–63 was pastor at York, Pennsylvania. A church was built in 1736 at Lancaster, Pennsylvania, where Johann Bartholomaeus Rieger (1707–1760), who came from Germany with Weiss on his return in 1731, had preached for several years. Michael Schlatter (1716–1790), a Swiss of St Gall, sent to America in 1746 by the Synods (Dutch Reformed) of Holland, immediately convened Boehm, Weiss and Rieger in Philadelphia, and with them planned a Coetus, which first met in September 1747; in 1751 he presented the cause of the Coetus in Germany and Holland, where he gathered funds; in 1752 came back to America with six ministers, one of whom, William Stoy (1726–1801), was an active opponent of the Coetus and of clericalism after 1772. Thereafter Schlatter's work was in the charity schools of Pennsylvania, which the people thought were tinged with Episcopalianism. Many churches and pastors were independent of the Coetus, notably John Joachim Zubly (1724–1781), of St Gall, who migrated to S. Carolina in 1726, and was a delegate to the Continental Congress from Georgia, but opposed independence and was banished from Savannah in 1777. Within the Coetus there were two parties. Of the Pietists of the second class one of the leaders was Philip William Otterbein (1726–1813), born in Dillenburg, Nassau, whose system of class-meetings was the basis of a secession from which grew the United Brethren in Christ, commonly called the "New Reformed Church," organized in 1800. During the War of Independence the Pennsylvania members of the Church were mostly attached to the American cause, and Nicholas Herkimer and Baron von Steuben were both Reformed; but in New York and in the South there were many German Loyalists.

Franklin College was founded by Lutherans and Reformed, with much outside help, notably that of Benjamin Franklin, at Lancaster, Pennsylvania, in 1787.

The Coetus had actually assumed the power of ordination in 1772 and formally assumed it in 1791; in 1792 a synodical constitution was prepared; and in 1793 the first independent synod met in Lancaster and adopted the constitution, thus becoming independent of Holland. Its churches numbered 178, and there were about 15,000 communicants. The strongest churches were those of Philadelphia, Lancaster and Germantown in Pennsylvania, and Frederick in Maryland. The German Reformed churches in Lunenburg county, Nova Scotia, became Presbyterian in 1837; a German church in Waldoboro, Maine, after a century, became Congregational in 1850. The New York churches became Dutch Reformed. The New Jersey churches rapidly fell away, becoming Presbyterian, Dutch Reformed, or Lutheran. In Virginia many churches became Episcopalian and others United Brethren. By 1825, 13 Reformed ministers were settled W. of the Alleghanies. The Synod in 1819 divided itself into eight Classes. In 1824 the Classis of Northampton, Pennsylvania (13 ministers and 80 congregations), became the Synod of Ohio, the parent Synod having refused to allow the Classis to ordain. In 1825 there were 87 ministers, and in the old Synod about 23,300 communicants.

A schism over the establishment of a theological seminary resulted in the organization of a new synod of the "Free German Reformed Congregations of Pennsylvania," which returned to the parent synod in 1837.

John Winebrenner (*q.v.*), pastor in Harrisburg, Pennsylvania, left the Church in 1828, and in 1830 organized the "Church of God"; his main doctrinal difference with the Reformed Church was on infant baptism.

In 1825 the Church opened a theological seminary at Carlisle, Pennsylvania, affiliated with Dickinson College. James Ross Reily (1788–1844) travelled in Holland and Germany, collecting money and books for the seminary. It was removed in 1829 to York, where an academy was connected with it; in 1835 the academy (which in 1836 became Marshall College) and in 1837 the seminary removed to Mercersburg, where, in 1840, John W. Nevin (*q.v.*) became its president, and with Philip Schaff (*q.v.*) founded the Mercersburg theology, which lost to the Church many who objected to Nevin's (and Schaff's) Romanizing tendencies. The seminary was removed in 1871 from Mercersburg to Lancaster, whither the college had gone in 1853 to form, with Franklin College, Franklin and Marshall College.

In 1842 the Western Synod (*i.e.* the Synod of Ohio) adopted the constitution of the Eastern, and divided into classes. It founded in 1850 a theological school and Heidelberg University at Tiffin, Ohio. The Synods organized a General Synod in 1863. New German Synods were: that of the North-West (1867), organized at Fort Wayne, Ind.; that of the East (1875), organized at Philadelphia; and the Central Synod (1881), organized at Galion, Ohio. New English Synods were: that of Pittsburg (1870); that of the Potomac (1873); and that of the Interior (1887), organized at Kansas City, Missouri. In 1894 there were eight district synods.

After a long controversy over a liturgy (connected in part with the Mercersburg controversy) a *Directory of Worship* was adopted in 1887.

The principal organizations of the Church are: the Board of Publication (1844); the Society for the Relief of Ministers and their Widows (founded in 1758 by the Pennsylvania Coetus; incorporated in 1810; transferred to the Synod in 1833); a Board of Domestic Missions (1826); a Board of Foreign Missions (1838; reorganized in 1873), which planted a mission in Japan (1879), now a part of the Union Church of Japan, and one in China (1900). The Church has publishing houses in Philadelphia (replacing that of Chambersburg, Pa., founded in 1840 and destroyed in July 1864 by the Confederate army) and in Cleveland, Ohio.

Colleges connected with the Church, besides the seminary at Lancaster, Franklin and Marshall College and Heidelberg University, are: Catawba College (1851) at Newton, North Carolina; and Ursinus College (1869), founded by the Low Church wing, at Collegeville, Pennsylvania, which had, until 1908, a theological seminary, then removed to Dayton, Ohio, where it united with Heidelberg Theological Seminary (until 1908 at Tiffin) to form the Central Theological Seminary.

In 1906, according to *Bulletin 103* (1909) of the Bureau of the United States Census, the Church had 1736 organizations in the

United States, 1740 churches and 292,654 communicants, of whom 177,270 were in Pennsylvania, and about one-sixth (50,732) were in Ohio. Other states in which the Church had communicants were: Maryland (13,442), Wisconsin (8386), Indiana (8289), New York (5700), North Carolina (4718), Iowa (3692), Illinois (2652), Virginia (2288), Kentucky (2101), Michigan (1666), Nebraska (1616), and (less than 1500 in each of the following, arranged in rank) S. Dakota, Missouri, New Jersey, Connecticut, Kansas, W. Virginia, N. Dakota, Minnesota, District of Columbia, Oregon, Massachusetts, Tennessee, California, Colorado, Arkansas and Oklahoma.

See James I. Good, *History of the Reformed Church in the United States, 1725–1792* (Reading, Pa., 1899), and *Historical Handbook* (Philadelphia, 1902); and the sketch by Joseph Henry Dubbs in vol. viii. (New York, 1895) of the American Church History Series.

REFORMED EPISCOPAL CHURCH, a Protestant community in the United States of America, dating from December 1873. The influence of the Tractarian movement began to be felt at an early date in the Episcopal Church of the United States, and the ordination of Arthur Carey in New York, July 1843, a clergyman who denied that there was any difference in points of faith between the Anglican and the Roman Churches and considered the Reformation an unjustifiable act, brought into relief the antagonism between Low Church and High Church, a struggle which went on for a generation with increasing bitterness. The High Church party lost no opportunity of arraigning any Churchman who conducted services in non-episcopal churches, and as the Triennial Conference gave no heed to remonstrances on the part of these ecclesiastical offenders they came to the conclusion that they must either crush their consciences or seek relief in separation. The climax was reached when George D. Cummins (1822–1876), assistant bishop of Kentucky, was angrily attacked for officiating at the united communion service held at the meeting of the Sixth General Conference of the Evangelical Alliance in New York, October 1873. This prelate resigned his charge in the Episcopal Church on November 11th, and a month later, with seven other clergymen and a score of laymen, constituted the Reformed Episcopal Church. Cummins was chosen as presiding officer of the new body, and consecrated Charles E. Cheney (b. 1836), rector of Christ Church, Chicago, to be bishop. The following Declaration of Principles (here abridged) was promulgated:—

I. An expression of belief in the Bible as the Word of God, and the sole rule of faith and practice, in the Apostles' Creed, in the divine institution of the two sacraments and in the doctrines of grace substantially as set out in the 39 Articles.

II. The recognition of Episcopacy not as of divine right but as a very ancient and desirable form of church polity.

III. An acceptance of the Prayer Book as revised by the General Convention of the Protestant Episcopal Church in 1785, with liberty to revise it as may seem most conducive to the edification of the people.

IV. A condemnation of certain positions, viz.:—

(*a*) That the Church of God exists only in one form of ecclesiastical polity.

(*b*) That Christian ministers as distinct from all believers have any special priesthood.

(*c*) That the Lord's Table is an altar on which the body and blood of Christ are offered anew to the Father.

(*d*) That the presence of Christ is a material one.

(*e*) That Regeneration is inseparably connected with Baptism.

The Church recognizes no orders of ministry, presbyters and deacons; the Episcopate is an office, not an order, the bishop being the chief presbyter, *primus inter pares*. There are some 7 bishops, 85 clergy and about 9500 communicants. £1600 annually is raised for foreign missionary work in India. The Church was introduced into England in 1877, and has in that country a presiding bishop and about 20 organized congregations. The Church has a theological seminary in Philadelphia.

REFRACTION (Lat. *refringere*, to break open or apart), in physics, the change in the direction of a wave of light, heat or sound which occurs when such a wave passes from one medium into another of different density.

I. Refraction of Light

When a ray of light traversing a homogeneous medium falls on the bounding surface of another transparent homogeneous medium, it is found that the direction of the transmitted ray in the second medium is different from that of the incident ray; in other words, the ray is refracted or bent at the point of incidence. The laws governing refraction are: (1) the refracted and incident rays are coplanar with the normal to the refracting surface at the point of incidence, and (2) the ratio of the sines of the angles between the normal and the incident and refracted rays is constant for the two media, but depends on the nature of the light employed, *i.e.* on its wave length. This constant is called the relative refractive index of the second medium, and may be denoted by μ_{ab}, the suffix *ab* signifying that the light passes from medium *a* to medium *b*; similarly μ_{ba} denotes the relative refractive index of *a* with regard to *b*. The absolute refractive index is the index when the first medium is a vacuum. Elementary phenomena in refraction, such as the apparent bending of a stick when partially immersed in water, were observed in very remote times, but the laws, as stated above, were first grasped in the 17th century by W. Snell and published by Descartes, the full importance of the dependence of the refractive index on the nature of the light employed being first thoroughly realized by Newton in his famous prismatic decomposition of white light into a coloured spectrum. Newton gave a theoretical interpretation of these laws on the basis of his corpuscular theory, as did also Huygens on the wave theory (see Light, II. *Theory of*). In this article we only consider refractions at plane surfaces, refraction at spherical surfaces being treated under Lens. The geometrical theory will be followed, the wave theory being treated in Light, Diffraction and Dispersion.

Refraction at a Plane Surface.—Let LM (fig. 1) be the surface

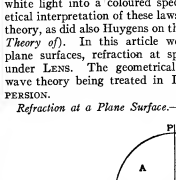

FIG. 1.

dividing two homogeneous media A and B; let IO be a ray in the first medium incident on LM at O, and let OR be the refracted ray. Draw the normal POQ. Then by Snell's law we have invariably $\sin IOP/\sin QOR = \mu_{ab}$. Hence if two of these quantities be given the third can be calculated. The commonest question is: Given the incident ray and the refractive index to construct the refracted ray. A simple construction is to take along the incident ray OI, unit distance OC, and a distance OD equal to the refractive index in the same units. Draw CE perpendicular to LM, and draw an arc with centre O and radius OD, cutting CE in E. Then EO produced downwards is the refracted ray. The proof is left to the reader.

In the figure the given incident ray is assumed to be passing from a less dense to a denser medium, and it is seen by the construction or by examining the formula $\sin\beta = \sin\alpha/\mu$ that for all values of α there is a corresponding value of β. Consider the case when the light passes from a denser to a less dense medium. In the equation $\sin\beta = \sin\alpha/\mu$ we have in this case $\mu < 1$. Now if $\sin\alpha < \mu$, we have $\sin\alpha/\mu < 1$, and hence β is real. If $\sin\alpha = \mu$, then $\sin\beta = 1$, *i.e.* $\beta = 90°$; in other words, the refracted ray in the second medium passes parallel to and grazes the bounding surface. The angle of incidence, which is given by $\sin\delta = 1/\mu$, is termed the *critical angle*. For greater values it is obvious that $\sin\alpha/\mu > 1$ and there is no refraction into the second medium, the rays being totally reflected back into the first medium; this is called *total internal reflection*.

Images produced by Refraction at Plane Surfaces.—If a luminous point be situated in a medium separated from one of less density by a plane surface, the ray normal to this surface will be unrefracted, whilst the others will undergo refraction according to their angles of emergence. If the rays in the less dense medium be produced into the denser medium, they envelop a caustic, but by restricting ourselves to a small area about the normal ray it is seen that they intersect this ray in a point which is the geometrical

image of the luminous source. The position of this point can be easily determined. If l be the distance of the source below the surface, l' the distance of the image, and μ the refractive index, then $l'=l/\mu$. This theory provides a convenient method for determining the refractive index of a plate. A micrometer microscope, with vertical motion, is focused on a scratch on the surface of its stage; the plate, which has a fine scratch on its upper surface, is now introduced, and the microscope is successively focused on the scratch on the stage as viewed through the plate, and on the scratch on the plate. The difference between the first and third readings gives the thickness of the plate, corresponding to l above, and between the second and third readings the depth of the image, corresponding to l'.

Refraction by a Prism.—In optics a prism is a piece of transparent material bounded by two plane faces which meet at a definite angle, called the refracting angle of the prism, in a straight line called the edge of the prism; a section perpendicular to the edge is called a principal section. Parallel rays, refracted successively at the two faces, emerge from the prism as a system of parallel rays, but the direction is altered by an amount called the *deviation*. The deviation depends on the angles of incidence and emergence; but, since the course of a ray may always be reversed, there must be a stationary value, either a maximum or minimum, when the ray traverses the prism symmetrically, *i.e.* when the angles of incidence and emergence are equal. As a matter of fact, it is a minimum, and the position is called the angle of minimum deviation. The relation between the minimum deviation D, the angle of the prism i, and the refractive index μ is found as follows. Let in fig. 2, PQRS be the course of the

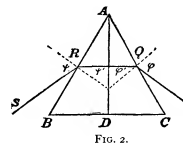

FIG. 2.

ray through the prism; the internal angles ϕ', ψ' each equal $\frac{1}{2}i$, and the angles of incidence and emergence ϕ, ψ are each equal and connected with ϕ' by Snell's law, *i.e.* $\sin\phi=\mu\sin\phi'$. Also the deviation D is $2(\phi-\phi')$. Hence $\mu=\sin\phi/\sin\phi'=\sin\frac{1}{2}(D+i)/\sin\frac{1}{2}i$.

Refractometers.—Instruments for determining the refractive indices of media are termed refractometers.

The simplest are really spectrometers, consisting of a glass prism, usually hollow and fitted with accurately parallel glass sides, mounted on a table which carries a fixed collimation tube and a movable observing tube, the motion of the latter being recorded on a graduated circle. The collimation tube has a narrow adjustable slit at its outer end and a lens at the nearer end, so that the light leaves the tube as a parallel beam. The refracting angle of the prism, i in our previous notation, is determined by placing the prism with its refracting edge towards the collimator, and observing when the reflections of the slit in the two prism faces coincide with the cross-wires in the observing telescope; half the angle between these two positions gives r. To determine the position of minimum deviation, or D, the prism is removed, and the observing telescope is brought into line with the slit; in this position the graduation is read. The prism is replaced, and the telescope moved until it catches the refracted rays. The prism is now turned about a vertical axis until a position is found when the telescope has to be moved towards the collimator in order to catch the rays; this operation sets the prism at the angle of minimum deviation. The refractive index μ is calculated from the formula given above.

More readily manipulated and of superior accuracy are refractometers depending on total reflection. The Abbe refractometer (fig. 3) essentially consists of a double Abbe prism AB to contain the substance to be experimented with; and a telescope F to observe the border line of the total reflection. The prisms, which are right-angled and made of the same flint glass, are mounted in a hinged frame such that the lower prism, which is used for purposes of illumination, can be locked so that the hypothenuse faces are distant by about 0·15 mm., or rotated away from the upper prism. The double prism is used in examining liquids, a few drops being placed between the prisms; the single prism is used when solids or plastic bodies are employed. The mount is capable of rotation about a horizontal axis by an alidade J. The telescope is provided with a reticule, which can be brought into exact coincidence with the observed border line, and is rigidly fastened to a sector S graduated directly in refractive indices. The reading is effected by a lens L. Beneath the prisms is a mirror for reflecting light

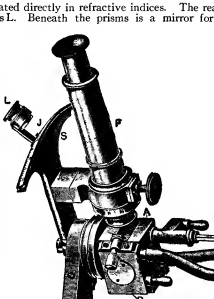

FIG. 3.

into the apparatus. To use the apparatus, the liquid having been inserted between the prisms, or the solid attached by its own adhesiveness or by a drop of monobrommaphthalene to the upper prism, the prism case is rotated until the field of view consists of a light and dark portion, and the border line is now brought into coincidence with the reticule of the telescope. In using a lamp or daylight this border is coloured, and hence a compensator, consisting of two equal Amici prisms, is placed between the objective and the prisms. These Amici prisms can be rotated, in opposite directions, until they produce a dispersion opposite in sign to that originally seen, and hence the border line now appears perfectly sharp and colourless. When at zero the alidade corresponds to a refractive index of 1·3, and any other reading gives the corresponding index correct to about 2 units in the 4th decimal place. Since temperature markedly affects the refractive index, this apparatus is provided with a device for heating the prisms. Figs. 4 and 5 show the course of the rays when a solid and liquid

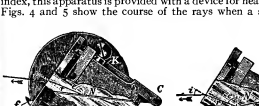

FIG. 4. FIG. 5.

are being experimented with. Dr R. Wollny's butter refractometer, also made by Zeiss, is constructed similarly to Abbe's form, with the exception that the prism casing is rigidly attached to the telescope, and the observation made by noting the point where the border line intersects an appropriately graduated scale in the focal plane of the telescope objective, fractions being read by a micrometer screw attached to the objective. This apparatus is also provided with an arrangement for heating.

This method of reading is also employed in Zeiss's "dipping refractometer" (fig. 6). This instrument consists of a telescope R having at its lower end a prism P with a refracting angle of 63°, above which and below the objective is a movable compensator A for purposes of annulling the dispersion about the border line. In

the focal plane of the objective O there is a scale Sc, exact reading being made by a micrometer Z. If a large quantity of liquid be

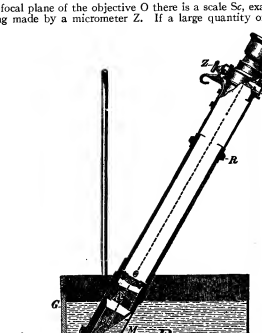

FIG. 6.—Zeiss's Dipping Refractometer.

available it is sufficient to dip the refractometer perpendicularly into a beaker containing the liquid and to transmit light into the instrument by means of a mirror. If only a smaller quantity be available, it is enclosed in a metal beaker M, which forms an extension of the instrument, and the liquid is retained there by a plate D. The instrument is now placed in a trough B, containing water and having one side of ground glass G; light is reflected into the refractometer by means of a mirror S outside this trough. An accuracy of 3·7 units in the 5th decimal place is obtainable.

The Pulfrich refractometer is also largely used, especially for liquids. It consists essentially of a right-angled glass prism placed on a metal foundation with the faces at right angles horizontal and vertical, the hypothenuse face being on the support. The horizontal face is fitted with a small cylindrical vessel to hold the liquid. Light is led to the prism at grazing incidence by means of a collimator, and is refracted through the vertical face, the deviation being observed by a telescope rotating about a graduated circle. From this the refractive index is readily calculated if the refractive index of the prism for the light used be known: a fact supplied by the maker. The instrument is also available for determining the refractive index of isotropic solids. A little of the solid is placed in the vessel and a mixture of monobromnaphthalene and acetone (in which the solid must be insoluble) is added, and adjustment made by adding either one or other liquid until the border line appears sharp, *i.e.* until the liquid has the same index as the solid.

The Herbert Smith refractometer (fig. 7) is especially suitable for determining the refractive index of gems, a constant which is

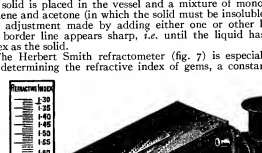

FIG. 7.

most valuable in distinguishing the precious stones. It consists of a hemisphere of very dense glass, having its plane surface fixed at a certain angle to the axis of the instrument. Light is admitted by a window on the under side, which is inclined at the same angle, but in the opposite sense, to the axis. The light on emerging from the hemisphere is received by a convex lens, in the focal plane of which is a scale graduated to read directly in refractive indices. The light then traverses a positive eye-piece. To use the instrument for a gem, a few drops of methylene iodide (the refractive index of which may be raised to 1·800 by dissolving sulphur in it) are placed on the plane surface of the hemisphere and a facet of the stone then brought into contact with the surface. If monochromatic light be used (*i.e.* the D line of the sodium flame) the field is sharply divided into a light and a dark portion, and the position of the line of demarcation on the scale immediately gives the refractive index. It is necessary for the liquid to have a higher refractive index than the crystal, and also that there is close contact between the stone and the lens. The range of the instrument is between 1·400 and 1·760, the results being correct to two units in the third decimal place if sodium light be used. (C. E.*)

II. Double Refraction

That a stream of light on entry into certain media can give rise to two refracted pencils was discovered in the case of Iceland spar by Erasmus Bartholinus, who found that one pencil had a direction given by the ordinary law of refraction, but that the other was bent in accordance with a new law that he was unable to determine. This law was discovered about eight years later by Christian Huygens. According to Huygens' fundamental principle, the law of refraction is determined by the form and orientation of the wave-surface in the crystal—the locus of points to which a disturbance emanating from a luminous point travels in unit time. In the case of a doubly refracting medium the wave-surface must have two sheets, one of which is spherical, if one of the pencils obey in all cases the ordinary law of refraction. Now Huygens observed that a natural crystal of spar behaves in precisely the same way whichever pair of faces the light passes through, and inferred from this fact that the second sheet of the wave-surface must be a surface of revolution round a line equally inclined to the faces of the rhomb, *i.e.* round the axis of the crystal. He accordingly assumed it to be a spheroid, and finding that refraction in the direction of the axis was the same for both streams, he concluded that the sphere and the spheroid touched one another in the axis.

So far as his experimental means permitted, Huygens verified the law of refraction deduced from this hypothesis, but its correctness remained unrecognized until the measures of W. H. Wollaston in 1802 and of E. T. Malus in 1810. More recently its truth has been established with far more perfect optical appliances by R. T. Glazebrook, Ch. S. Hastings and others.

In the case of Iceland spar and several other crystals the extraordinarily refracted stream is refracted away from the axis, but Jean Baptiste Biot in 1814 discovered that in many cases the reverse occurs, and attributing the extraordinary refractions to forces that act as if they emanated from the axis, he called crystals of the latter kind "attractive," those of the former "repulsive." They are now termed "positive" and "negative" respectively; and Huygens' law applies to both classes, the spheroid being prolate in the case of positive, and oblate in the case of negative crystals. It was at first supposed that Huygens' law applied to all doubly refracting media. Sir David Brewster, however, in 1815, while examining the rings that are seen round the optic axis in polarized light, discovered a number of crystals that possess two optic axes. He showed, moreover, that such crystals belong to the rhombic, monoclinic and anorthic (triclinic) systems, those of the tetragonal and hexagonal systems being uniaxal, and those of the cubic system being optically isotropic.

Huygens found in the course of his researches that the streams that had traversed a rhomb of Iceland spar had acquired new properties with respect to transmission through a second crystal. This phenomenon is called polarization (*q.v.*), and the waves are said to be polarized—the ordinary in its principal plane and the extraordinary in a plane perpendicular to its principal plane, the principal plane of a wave being the plane containing its normal and the axis of the crystal. From the facts of polarization Augustin Jean Fresnel deduced that the

vibrations in plane polarized light are rectilinear and in the plane of the wave, and arguing from the symmetry of uniaxal crystals that vibrations perpendicular to the axis are propagated with the same speed in all directions, he pointed out that this would explain the existence of an ordinary wave, and the relation between its speed and that of the extraordinary wave. From these ideas Fresnel was forced to the conclusion, that he at once verified experimentally, that in biaxal crystals there is no spherical wave, since there is no single direction round which such crystals are symmetrical; and, recognizing the difficulty of a direct determination of the wave-surface, he attempted to represent the laws of double refraction by the aid of a simpler surface.

The essential problem is the determination of the propagational speeds of plane waves as dependent upon the directions of their normals. These being known, the deduction of the wave-surface follows at once, since it is to be regarded as the envelope at any subsequent time of all the plane waves that at a given instant may be supposed to pass through a given point, the ray corresponding to any tangent plane or the direction of transport of energy being by Huygens' principle the radius-vector from the centre to the point of contact. Now Fresnel perceived that in uniaxal crystals the speeds of plane waves in any direction are by Huygens' law the reciprocals of the semi-axes of the central section, parallel to the wave-fronts, of a spheroid, whose polar and equatorial axes are the reciprocals of the equatorial and polar axes of the spheroidal sheet of Huygens' wave-surface, and that the plane of polarization of a wave is perpendicular to the axis that determines its speed. Hence it occurred to him that similar relations with respect to an ellipsoid with three unequal axes would give the speeds and polarizations of the waves in a biaxal crystal, and the results thus deduced he found to be in accordance with all known facts. This ellipsoid is called the ellipsoid of polarization, the index ellipsoid and the indicatrix.

We may go a step further; for by considering the intersection of a wave-front with two waves, whose normals are indefinitely near that of the first and lie in planes perpendicular and parallel respectively to its plane of polarization, it is easy to show that the ray corresponding to the wave is parallel to the line in which the former of the two planes intersects the tangent plane to the ellipsoid at the end of the semi-diameter that determines the wave-velocity; and it follows by similar triangles that the ray-velocity is the reciprocal of the length of the perpendicular from the centre on this tangent plane. The laws of double refraction are thus contained in the following proposition. The propagational speed of a plane wave in any direction is given by the reciprocal of one of the semi-axes of the central section of the ellipsoid of polarization parallel to the wave; the plane of polarization of the wave is perpendicular to this axis; the corresponding ray is parallel to the line of intersection of the tangent plane at the end of the axis and the plane containing the axis and the wave-normal; the ray-velocity is the reciprocal of the length of the perpendicular from the centre on the tangent plane. By reciprocating with respect to a sphere of unit radius concentric with the ellipsoid, we obtain a similar proposition in which the ray takes the place of the wave-normal, the ray-velocity that of the wave-slowness (the reciprocal of the velocity) and vice versa. The wave-surface is thus the apsidal surface of the reciprocal ellipsoid; this gives the simplest means of obtaining its equation, and it is readily seen that its section by each plane of optical symmetry consists of an ellipse and a circle, and that in the plane of greatest and least wave-velocity these curves intersect in four points. The radii-vectors to these points are called the ray-axes.

When the wave-front is parallel to either system of circular sections of the ellipsoid of polarization, the problem of finding the axes of the parallel central section becomes indeterminate, and all waves in this direction are propagated with the same speed, whatever may be their polarization. The normals to the circular sections are thus the optic axes. To determine the rays corresponding to an optic axis, we may note that the ray and the perpendiculars to it through the centre, in planes perpendicular and parallel to that of the ray and the optic axis, are three lines intersecting at right angles of which the two latter are confined to given planes, viz. the central circular section of the ellipsoid and the normal section of the cylinder touching the ellipsoid along this section: whence by a known proposition the ray describes a cone whose sections parallel to the given planes are circles. Thus a plane perpendicular to the optic axis touches the wave-surface along a circle. Similarly the normals to the circular sections of the reciprocal ellipsoid, or the axes of the tangent cylinders to the polarization-ellipsoid that have circular normal sections, are directions of single-ray velocity or ray-axes, and it may be shown as above that corresponding to a ray-axis there is a cone of wave-normals with circular sections parallel to the normal section of the corresponding tangent cylinder, and its plane of contact with the ellipsoid. Hence the extremities of the ray-axes are conical points on the wave-surface. These peculiarities of the wave-surface are the cause of the celebrated conical refractions discovered by Sir William Rowan Hamilton and H. Lloyd, which afford a decisive proof of the general correctness of Fresnel's wave-surface, though they cannot, as Sir G. Gabriel Stokes (*Math. and Phys. Papers*, iv. 184) has pointed out, be employed to decide between theories that lead to this surface as a near approximation.

In general, both the direction and the magnitude of the axes of the polarization-ellipsoid depend upon the frequency of the light and upon the temperature, but in many cases the possible variations are limited by considerations of symmetry. Thus the optic axis of a uniaxal crystal is invariable, being determined by the principal axis of the system to which it belongs: most crystals are of the same sign for all colours, the refractive indices and their difference both increasing with the frequency, but a few crystals are of opposite sign for the extreme spectral colours, becoming isotropic for some intermediate wave-length. In crystals of the rhombic system the axes of the ellipsoid coincide in all cases with the crystallographic axes, but in a few cases their order of magnitude changes so that the plane of the optic axes for red light is at right angles to that for blue light, the crystal being uniaxal for an intermediate colour. In the case of the monoclinic system one axis is in the direction of the axis of the system, and this is generally, though there are notable exceptions, either the greatest, the least, or the intermediate axis of the ellipsoid for all colours and temperatures. In the latter case the optic axes are in the plane of symmetry, and a variation of their acute bisectrix occasions the phenomenon known as "inclined dispersion": in the two former cases the plane of the optic axes is perpendicular to the plane of symmetry, and if it vary with the colour of the light, the crystals exhibit "crossed" or "horizontal dispersion" according as it is the acute or the obtuse bisectrix that is in the fixed direction.

The optical constants of a crystal may be determined either with a prism or by observations of total reflection. In the latter case the phenomenon is characterized by two angles—the critical angle and the angle between the plane of incidence and the line limiting the region of total reflection in the field of view. With any crystalline surface there are four cases in which this latter angle is 90°, and the principal refractive indices of the crystal are obtained from those calculated from the corresponding critical angles, by excluding that one of the mean values for which the plane of polarization of the limiting rays is perpendicular to the plane of incidence. A difficulty, however, may arise when the crystalline surface is very nearly the plane of the optic axes, as the plane of polarization in the second mean case is then also very nearly perpendicular to the plane of incidence; but since the two mean refractive indices will be very different, the ambiguity can be removed by making, as may easily be done, an approximate measure of the angle between the optic axes and comparing it with the values calculated by using in turn each of these indices (C. M. Viola, *Zeit. für Kryst.*, 1902, 36, p. 245).

A substance originally isotropic can acquire the optical

properties of a crystal under the influence of homogeneous strain, the principal axes of the wave-surface being parallel to those of the strain, and the medium being uniaxal, if the strain be symmetrical. John Kerr also found that a dielectric under electric stress behaves as an uniaxal crystal with its optic axis parallel to the electric force, glass acting as a negative and bisulphide of carbon as a positive crystal (*Phil. Mag.*, 1875 (4), L. 337).

Not content with determining the laws of double refraction, Fresnel also attempted to give their mechanical explanation. He supposed that the aether consists of a system of distinct material points symmetrically arranged and acting on one another by forces that depend for a given pair only on their distance. If in such a system a single molecule be displaced, the projection of the force of restitution on the direction of displacement is proportional to the inverse square of the parallel radius-vector of an ellipsoid; and of all displacements that can occur in a given plane, only those in the direction of the axes of the parallel central section of the quadric develop forces whose projection on the plane is along the displacement. In undulations, however, we are concerned with the elastic forces due to relative displacements, and, accordingly, Fresnel assumed that the forces called into play during the propagation of a system of plane waves (of rectilinear transverse vibrations) differ from those developed by the parallel displacement of a single molecule only by a constant factor, independent of the plane of the wave. Next, regarding the aether as incompressible, he assumed that the components of the elastic forces parallel to the wave-front are alone operative, and finally, on the analogy of a stretched string, that the propagational speed of a plane wave of permanent type is proportional to the square root of the effective force developed by the vibrations. With these hypotheses we immediately obtain the laws of double refraction, as given by the ellipsoid of polarization, with the result that the vibrations are perpendicular to the plane of polarization.

In its dynamical foundations Fresnel's theory, though of considerable historical interest, is clearly defective in rigour, and a strict treatment of the aether as a crystalline elastic solid does not lead naturally to Fresnel's laws of double refraction. On the other hand, Lord Kelvin's rotational aether (*Math. and Phys. Papers*, iii. 443-499)—a medium that has no true rigidity but possesses a quasi-rigidity due to elastic resistance to absolute rotation—gives these laws at once, if we abolish the resistance to compression and, regarding it as gyrostatically isotropic, attribute to it aeolotropic inertia. The equations then obtained are the same as those deduced in the electro-magnetic theory from the circuital laws of A. M. Ampère and Michael Faraday, when the specific inductive capacity is supposed aeolotropic. In order to account for dispersion, it is necessary to take into account the interaction with the radiation of the intra-molecular vibrations of the crystalline substance: thus the total current on the electro-magnetic theory must be regarded as made up of the current of displacement and that due to the oscillations of the electrons within the molecules of the crystal.

BIBLIOGRAPHY.—An interesting and instructive account of Fresnel's work on double refraction has been given by Émile Verdet in his introduction to Fresnel's works: *Œuvres d'Augustin Fresnel*, i. 75 (Paris, 1866); *Œuvres de E. Verdet*, i. 360 (Paris, 1872). For an account of theories of double refraction see the reports of H. Lloyd, Sir G. G. Stokes and R. T. Glazebrook in the *Brit. Ass. Reports* for 1834, 1862 and 1885, and Lord Kelvin's *Baltimore Lectures* (1904). An exposition of the rotational theory of the aether has been given by H. Chipart, *Théorie gyrostatique de la lumière* (Paris, 1904); and P. Drude's *Lehrbuch der Optik*, 2te Auf. (1906), the first German edition of which was translated by C. Riborg Mann and R. A. Millikan in 1902, treats the subject from the standpoint of the electro-magnetic theory. The methods of determining the optical constants of crystals will be found in Th. Liebisch's *Physikalische Krystallographie* (1891); F. Pockel's *Lehrbuch der Kristalloptik* (1906); and J. Walker's *Analytical Theory of Light* (1904). A detailed list of papers on the geometry of the wave-surface has been published by E. Wölfing, *Bibl. Math.*, 1902 (3), iii. 361; and a general account of the subject will be found in the following treatises: L. Fletcher, *The Optical Indicatrix* (1892); Th. Preston, *The Theory of Light*, 3rd ed. by C. J. Joly (1901); A. Schuster, *An Introduction to the Theory of Optics* (1904); R. W. Wood, *Physical Optics* (1905); E. Mascart, *Traité d'optique* (1889); A. Winkelmann, *Handbuch der Physik*.

III. ASTRONOMICAL REFRACTION

The refraction of a ray of light by the atmosphere as it passes from a heavcnly body to an observer on the earth's surface, is called "astronomical." A knowledge of its amount is a necessary datum in the exact determination of the direction of the body. In its investigation the fundamental hypothesis is that the strata of the air are in equilibrium, which implies that the surfaces of equal density are horizontal. But this condition is being continually disturbed by aerial currents, which produce continual slight fluctuations in the actual refraction, and commonly give to the image of a star a tremulous motion. Except for this slight motion the refraction is always in the vertical direction; that is, the actual zenith distance of the star is always greater than its apparent distance. The refracting power of the air is nearly proportional to its density. Consequently the amount of the refraction varies with the temperature and barometric pressure, being greater the higher the barometer and the lower the temperature.

At moderate zenith distances, the amount of the refraction varies nearly as the tangent of the zenith distance. Under ordinary conditions of pressure and temperature it is, near the zenith, about 1″ for each degree of zenith distance. As the tangent increases at a greater rate than the angle, the increase of the refraction soon exceeds 1″ for each degree. At 45° from the zenith the tangent is 1 and the mean refraction is about 58″. As the elevation is approached the tangent increases more and more rapidly, becoming infinite at the horizon; but the refraction now increases at a less rate, and, when the observed ray is horizontal, or when the object appears on the horizon, the refraction is about 34′, or a little greater than the diameter of the sun or moon. It follows that when either of these objects is seen on the horizon their actual direction is entirely below it. One result is that the length of the day is increased by refraction to the extcnt of about five minutes in low latitudes, and still more in higher latitudes. At 60° the increase is about nine minutes.

The atmosphere, like every other transparent substance, refracts the blue rays of the spectrum more than the red; consequently, when the image of a star near the horizon is observed with a telescope, it presents somewhat the appearance of a spectrum. The edge which is really highest, but seems lowest in the telescope, is blue, and the opposite one red. When the atmosphere is steady this atmospheric spectrum is very marked and renders an exact observation of the star difficult.

BIBLIOGRAPHY.—Refraction has been a favourite subject of research. See Dr. C. Bruhns, *Die astronomische Strahlenbrechung* (Leipzig, 1861), gives a *résumé* of the various formulae of refraction which had been developed by the leading investigators up to the date 1861. Since then developments of the theory are found in: W. Chauvenet, *Spherical and Practical Astronomy*, i.; F. Brünnow, *Sphärischen Astronomie*; S. Newcomb, *Spherical Astronomy*; R. Radau, "Recherches sur la théorie des réfractions astronomiques" (*Annales de l'observatoire de Paris*, xvi., 1882), "Essai sur les réfractions astronomiques" (ibid., xix., 1889).

Among the tables of refraction which have been most used are Bessel's, derived from the observations of Bradley in Bessel's *Fundamenta Astronomiae*; and Bessel's revised tables in his *Tabulae Regiomontanae*, in which, however, the constant is too large, but which in an expanded form were mostly used at the observatories until 1870. The constant use of the Foulkova tables, *Tabulae refractionum*, which is reduced to nearly its true value, has gradually replaced that of Bessel. Later tables are those of L. de Ball, published at Leipzig in 1906.

(S. N.)

REFRESHER, in English legal phraseology, a further or additional fee paid to counsel where a case is adjourned from one term or sittings to another, or where it extends over more than one day and occupies, either on the first day or partly on the first and partly on a subsequent day or days, more than five hours without being concluded. The refresher allowed for every clear day subsequent to that on which the five hours have expired is five to ten guineas for a leading counsel and from three to seven guineas for other counsel, but the taxing

master is at liberty to allow larger fees in special circumstances. See *Rules of the Supreme Court*, O. 65, r. 48.

REFRIGERATING and **ICE-MAKING.** "Refrigeration" (from Lat. *frigus*, frost) is the cooling of a body by the transfer of a portion of its heat to another and therefore a cooler body. For ordinary temperatures it is performed directly with water as the cooling agent, especially when well water, which usually has a temperature of from 52° to 55° F., can be obtained. There are, however, an increasingly large number of cases in which temperatures below that of any available natural cooling agent are required, and in these it is necessary to resort to machines which are capable of producing the required cooling effect by taking in heat at low temperatures and rejecting it at temperatures somewhat above that of the natural cooling agent, which for obvious reasons is generally water. The function of a refrigerating machine, therefore, is to take in heat at a low temperature and reject it at a higher one.

This involves the expenditure of a quantity of work W, the amount in any particular case being found by the equation $W = Q_2 - Q_1$, where W is the work, expressed by its equivalent in British thermal units; Q_2 the quantity of heat, also in B.Ther.U., given out at the higher temperature T_2; and Q_1 the heat taken in at the lower temperature T_1. It is evident that the discharged heat Q_2 is equal to the abstracted heat Q_1, plus the work expended, seeing that the work W, which causes the rise in temperature from T_1 to T_2, is the thermal equivalent of the energy actually expended in raising the temperature to the level at which it is rejected. The relation then between the work expended and the actual cooling work performed denotes the efficiency of the process, and this is expressed by $Q_1/(Q_2 - Q_1)$; but as in a perfect refrigerating machine it is understood that the whole of the heat Q_1 is taken in at the absolute temperature T_1, and the whole of the heat Q_2, is rejected at the absolute temperature T_2, the heat quantities are proportional to the temperatures, and the expression $T_1/(T_2 - T_1)$ gives the ideal coefficient of performance for any stated temperature range, whatever working substance is used. These coefficients for a number of cases met with in practice are given in the following table. They

TABLE I.

T_1, Temperature at which Heat is extracted in Degrees Fahr.	T_2, Temperature at which Heat is rejected in Degrees Fahr.				
	50°	60°	70°	80°	90°	100°
−10°	7·5	6·4	5·6	5·0	4·5	4·1
0°	9·2	7·7	6·6	5·8	5·1	4·6
10°	11·7	9·4	7·9	6·7	5·9	5·2
20°	16·0	12·3	9·6	8·0	6·8	6·0
30°	24·5	16·3	12·2	9·8	8·2	7·0
40°	50·0	25·0	16·7	12·5	10·0	8·3

show that in all cases the heat abstracted exceeds by many times the heat expended. As an instance, when heat is taken in at 0° and rejected at 70°, a perfect refrigerating machine would abstract 6·6 times as much heat as the equivalent of the energy to be applied. If, however, the heat is to be rejected at 100°, then the coefficient is reduced to 4·6.

By examining Table I. it will be seen how important it is to reduce the temperature range as much as possible, in order to obtain the most economical results. No actual refrigerating machine does, in fact, take in heat at the exact temperature of the body to be cooled, and reject it at the exact temperature of the cooling water, but, for economy in working, it is of great importance that the differences should be as small as possible.

There are two distinct classes of machines used for refrigerating and ice-making. In the first refrigeration is produced by the expansion of atmospheric air, and in the second by the evaporation of a more or less volatile liquid.

Compressed-air Machines.—A compressed-air refrigerating machine consists in its simplest form of three essential parts —a compressor, a compressed-air cooler, and an expansion cylinder. It is shown diagrammatically in fig. 1 in connexion with a chamber which it is keeping cool. The compressor draws in air from the room and compresses it, the work expended in compression being almost entirely converted into heat. The compressed air, leaving the compressor at the temperature T_2, passes through the cooler, where it is cooled by means of water, and is then admitted to the expansion cylinder, where it is expanded to atmospheric pressure, performing work on the piston. The heat equivalent of the mechanical work performed on the piston is abstracted from the air, which is discharged at the temperature T_1. This temperature T_1 is neces-

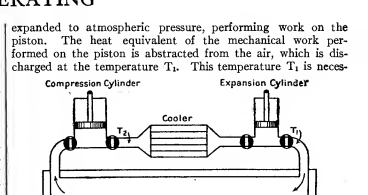

FIG. 1.—Compressed-Air Refrigerating Machine.

sarily very much below the temperature to be maintained in the room, because the cooling effect is produced by transferring heat from the room or its contents to the air, which is thereby heated. The rise in temperature of the air is, in fact, the measure of the cooling effect produced. If such a machine could be constructed with reasonable mechanical efficiency to compress the air to a temperature but slightly above that of the cooling water, and to expand the air to a temperature but slightly below that required to be maintained in the room, we should of course get a result approximating in efficiency somewhat nearly to the figures given in Table I. Unfortunately, however, such results cannot be obtained in practice, because the extreme lightness of the air and its very small heat capacity (which at constant pressure is ·2379) would necessitate the employment of a great volume, with extremely large and mechanically inefficient cylinders and apparatus. A pound of air, representing about 12 cub. ft., if raised 10° F. will only take up about 2·4 B.T.U. Consequently, to make such a machine mechanically successful a comparatively small weight of air must be used, and the temperature difference increased; in other words, the air must be discharged at a temperature very much below that to be maintained in the room.

This theory of working is founded on the Carnot cycle for a perfect heat motor, a perfect refrigerating machine being simply a reversed heat motor. Another theory involves the use of the Stirling regenerator, which was proposed in connexion with the Stirling heat engine (see AIR ENGINES). The air machine invented by Dr. A. Kirk in 1862, and described by him in a paper on the "Mechanical Production of Cold" (*Proc. Inst. C.E.*, xxxvii., 1874, 244), is simply a reversed Stirling air engine, the air working in a closed cycle instead of being actually discharged into the room to be cooled, as is the usual practice with ordinary compressed-air machines. Kirk's machine was used commercially with success on a fairly large scale, chiefly for ice-making, and it is recorded that it produced about 4 lb of ice for 1 lb of coal. In 1868 J. Davy Postle read a paper before the Royal Society of Victoria, suggesting the conveyance of meat on board ship in a frozen state by means of refrigerated air, and in 1869 he showed by experiment how it could be done; but his apparatus was not commercially developed. In 1877 a compressed-air machine was designed by J. J. Coleman of Glasgow, and in the early part of 1879 one of his machines was fitted on board the Anchor liner "Circassia," which successfully brought a cargo of chilled beef from America—the first imported by the aid of refrigerating machinery, ice having been previously used. The first successful cargo of frozen mutton from Australia was also brought by a Bell-Coleman machine in 1879. In the Bell-Coleman machine the air was cooled during compression by means of an injection of water, and further by being brought into contact with a shower of water. Another, perhaps the principal, feature was the interchanger, an apparatus whereby the compressed air was further cooled before expansion by means of the comparatively cold air from the room in its passage to the compressor, the same air being used over and over again. The object of this interchanger was not only to cool the compressed air before expansion, but to condense part of the moisture in it, so reducing the quantity of ice or snow produced during expansion. A full description of the machine may be found in a paper on "Air-Refrigerating Machinery" by J. J. Coleman (*Proc. Inst. C.E.* lxvii., 1882). At the present time the Bell-Coleman machine has practically ceased to exist. In such compressed-air machines

as are now made there is no injection of water during compression, and the compressed air is cooled in a surface cooler, not by actual mixture with a shower of cold water. Further, though the intercharger is still used by some makers, it has been found by experience that, with properly constructed valves and passages in the expansion cylinder, there is no trouble from the formation of snow, when, as is the general practice, the same air is used over and over again, the compressor taking its supply from the insulated room. So far as the air discharged from the expansion cylinder is concerned, its humidity is precisely the same so long as its temperature and pressure are the same, inasmuch as when discharged from the expansion cylinder it is always in a saturated condition for that temperature and pressure.

The ideal coefficient of performance is about 1, but the actual coefficient will be about $\frac{2}{3}$, after allowing for the losses incidental to working. In practice the air is compressed to about 50 lb per square inch above the atmosphere, its temperature rising to about 300° F. The compressed air then passes through coolers in which it is cooled to within about 5° of the initial temperature of the cooling water, and is deprived of a portion of its moisture, after which it is admitted into the expansion cylinder and expanded nearly to atmospheric pressure. The thermal equivalent of the power exerted on the piston is taken from the air, which, with cooling water at 60° F. and after allowing for friction and other losses, is discharged at a temperature of 60° to 80° below zero F. according to the size of the machine. The pistons of the compression and expansion cylinders are connected to the same crankshaft, and the difference between the power expended in compression and that restored in expansion, plus the friction of the machine, is supplied by means of a steam engine coupled to the crankshaft, or by any other source of power. For marine purposes two complete machines are frequently mounted on one bed-plate and worked either together or separately.

In some machines used in the United States the cold air is not discharged into the rooms but is worked in a closed cycle, the rooms being cooled by means of overhead pipes through which the cold expanded air passes on its way back to the compressor.

Liquid Machines.—Machines of the second class may conveniently be divided into three types: (*a*) Those in which there is no recovery of the refrigerating agent, water being the agent employed; they will be dealt with as "Vacuum machines." (*b*) Those in which the agent is recovered by means of mechanical compression; they are termed "Compression machines." (*c*) Those in which the agent is recovered by means of absorption by a liquid; they are known as "Absorption machines."

In the first class, since the refrigerating liquid is itself rejected, the only agent cheap enough to be employed is water. The boiling point of water varies with pressure; thus at one atmosphere or 14·7 lb per square inch it is 212° F., whereas at a pressure of ·085 lb per square inch it is 32°, and at lower pressures there is a still further fall in temperature. This property is made use of in vacuum machines. Water at ordinary temperature, say 60°, is placed in an air-tight glass or insulated vessel, and when the pressure is reduced by means of a vacuum pump it begins to boil, the heat necessary for evaporation being taken from the water itself. The pressure being still further reduced, the temperature is gradually lowered until the freezing-point is reached and ice formed, when about one-sixth of the original volume has been evaporated.

Vacuum machines.

The earliest machine of this kind appears to have been made in 1755 by Dr. William Cullen, who produced the vacuum by means of a pump alone. In 1810 Sir John Leslie combined with the air pump a vessel containing strong sulphuric acid for absorbing the vapour from the air, and is said to have succeeded in producing 1 to 1¼ lb of ice in a single operation. E. C. Carré later adopted the same principle. In 1878 F. Windhausen patented a vacuum machine for producing ice in large quantities, and in 1881 one of these machines, said to be capable of making about 12 tons of ice per day, was put to work in London. The installation was fully described by Carl Pieper (*Trans. Soc. of Engineers*, 1882, p. 145) and by Dr. John Hopkinson (*Journal of Soc. of Arts*, 1882, vol. xxxi. p. 20). The process, however, not being successful from a commercial point of view, was abandoned. At the present time vacuum machines are only employed for domestic purposes. The hand apparatus invented by H. A. Fleuss consists of a vacuum pump capable of reducing the air pressure to a fraction of a millimetre, the suction pipe of which is connected first with a vessel containing sulphuric acid, and second with the vessel containing the water to be frozen. Both these vessels are mounted on a rocking base, so that the acid can be thoroughly agitated while the machine is being worked. As soon as the pump has sufficiently exhausted the air from the vessel containing the water, vapour is rapidly given off and is absorbed by the acid until sufficient heat has been abstracted to bring about the desired reduction in temperature, the acid becoming heated by the absorption of water vapour, while the water freezes. The small Fleuss machine will produce about 1½ lb of ice in one operation of 20 minutes. Iced water in a carafe for drinking purposes can be produced in about three minutes. The acid vessel holds 9 lb of acid, and nearly 3 lb of ice can be made for each 1 lb of acid before the acid has become too weak to do further duty. Another machine, which can be easily worked by a boy, will produce 20 to 30 lb of ice in one hour, and is perhaps the largest size practicable with this method of freezing. The temperature attainable depends on the strength and condition of the sulphuric acid; ordinarily it can be reduced to zero F., and temperatures 20° lower have frequently been obtained.

Compression machines.

Though prior to 1834 several suggestions had been made with regard to the production of ice and the cooling of liquids by the evaporation of a more volatile liquid than water, the first machine actually constructed and to work was made by John Hague in that year from the designs of Jacob Perkins (*Journal of Soc. of Arts*, 1882, vol. xxxi. p. 77). This machine, though never used commercially, is the parent of all modern compression machines. Perkins in his patent specification states that the volatile fluid is by preference ether. In 1856 and 1857 James Harrison of Geelong, Victoria, patented a machine embodying the same principle as that of Perkins, but worked out in a much more complete and practical manner. It is stated that these machines were first made in New South Wales in 1859, but the first Harrison machine adopted successfully for industrial purposes in England was applied in the year 1861 for cooling oil in order to extract the paraffin. In Harrison's machine the agent used was ether ($C_4H_{10}O$). Improvements were made by Siebe & Company of London, and a considerable number of ether machines both for ice-making and refrigerating purposes were supplied by that firm and others up to the year 1880. In 1870 the subject of refrigeration was investigated by Professor Carl Linde of Munich, who was the first to consider the question from a thermodynamic point of view. He dealt with the coefficient of performance as a common basis of comparison for all machines, and showed that the compression vapour machine more nearly reached the theoretic maximum than any other (*Bayerisches Industrie und Gewerbeblatt*, 1870 and 1871). Linde also examined the physical properties of various liquids, and, after making trials with methylic ether in 1872, built his first ammonia compression machine in 1873. Since then the ammonia compression machine has been most widely adopted, though the carbonic acid machine, also compression, which was first made in 1880 from Linde's designs, is now used to a considerable extent, especially on board ship.

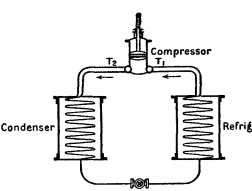

FIG. 2.—Vapour Compression Machine.

A diagram of a vapour compression machine is shown in fig. 2. There are three principal parts, a refrigerator or evaporator, a compression pump, and a condenser. The refrigerator, which

consists of a coil or series of coils, is connected to the suction side of the pump, and the delivery from the pump is connected to the condenser, which is generally of somewhat similar construction to the refrigerator. The condenser and refrigerator are connected by a pipe in which is a valve named the regulator. Outside the refrigerator coils is the air, brine or other substance to be cooled, and outside the condenser is the cooling medium, which, as previously stated, is generally water. The refrigerating liquid (ether, sulphur dioxide, anhydrous ammonia, or carbonic acid) passes from the bottom of the condenser through the regulating valve into the refrigerator in a continuous stream. The pressure in the refrigerator being reduced by the pump and maintained at such a degree as to give the required boiling-point, which is of course always lower than the temperature outside the coils, heat passes from the substance outside, through the coil surfaces, and is taken up by the entering liquid, which is converted into vapour at the temperature T_1. The vapours thus generated are drawn into the pump, compressed, and discharged into the condenser at the temperature T_2, which is somewhat above that of the cooling water. Heat is transferred from the compressed vapour to the cooling water and the vapour is converted into a liquid, which collects at the bottom and returns by the regulating valve into the refrigerator. As heat is both taken in and discharged at constant temperature during the change in physical state of the agent, a vapour compression machine must approach the ideal much more nearly than a compressed-air machine, in which there is no such change.

This will be seen by taking as an example a case in which the cold room is to be kept at 10° F., the cooling water being at 60°. Under these conditions, the actual evaporating temperature T_1 in a well-constructed ammonia compression machine, after allowing for the differences necessary for the exchange of heat, would be about 5° below zero, and the discharge temperature T_2 would be about 75°. An ideal machine, working between 5° below zero and 75° above, has a coefficient of about 5·7, or nearly six times that of an ideal compressed-air machine of usual construction performing the same useful cooling work.

A vapour compression machine does not, however, work precisely in the reversed Carnot cycle, inasmuch as the fall in temperature between the condenser and the refrigerator is not produced, nor is it attempted to be produced, by the adiabatic expansion of the agent, but results from the evaporation of a portion of the liquid itself. In other words, the liquid-refrigerating agent enters the refrigerator at the condenser temperature and introduces heat which has to be taken up by the evaporating liquid before any useful refrigerating effect can be performed. The extent of this loss is determined by the relation between the liquid heat and the latent heat of vaporization at the refrigerator temperature. If r represents the latent heat of the vapour, and q_1 and q_2 the amounts of heat contained in the liquid at the respective temperatures of T_2 and T_1, then the loss from the heat carried from the condenser into the refrigerator is shown by $(q_2-q_1)/r$ and the useful refrigerating effect produced in the refrigerator is $r-(q_2-q_1)$. Assuming, as in the previous example, that T_2 is 75° F., and that T_1 is 5° below zero, the results for various refrigerating agents are as follows:—

TABLE II.

	Latent Heat. r	Liquid Heat. q_2-q_1	Net Refrigeration. $r-(q_2-q_1)$	Proportion of Loss. $(q_2-q_1)/r$
Anhydrous ammonia	590·33	72·556	517·774	0·1225
Sulphurous acid . .	173·13	29·062	144·068	0·168
Carbonic acid . .	119·85	47·35	72·50	0·395

The results show that the loss is least in the case of anhydrous ammonia and greatest in the case of carbonic acid. At higher condenser temperatures the results are even much more favourable to ammonia. As the critical temperature (88·4° F.) of carbonic acid is approached, the value of r becomes less and less and the refrigerating effect is much reduced. When the critical point is reached the value of r disappears altogether, and a carbonic-acid machine is then dependent for its refrigerating effect on the reduction in temperature produced by the internal work performed in expanding the gaseous carbonic acid from the condenser pressure to that in the refrigerator. The abstraction of heat does not then take place at constant temperature. The expanded vapour enters the refrigerator at a temperature below that of the substance to be cooled, and whatever cooling effect is produced is brought about by the superheating of the vapour, the result being that above the critical point of carbonic acid the difference T_2-T_1 is increased and the efficiency of the machine is reduced. The critical temperature of anhydrous ammonia is about 266° F., which is never approached in the ordinary working of refrigerating machines. Some of the principal physical properties of sulphurous acid, anhydrous ammonia, and carbonic acid are given in Tables III., IV. and V.

The action of a vapour compression machine is shown in fig. 3. Liquid at the condenser temperature being introduced into the refrigerator through the regulating valve, a small portion evaporates and reduces the remaining liquid to the temperature T_1. This is shown by the curve AB, and is the useless work represented by the expression $(q_2-q_1)/r$. Evaporation then continues at the constant temperature T_1 abstracting heat from the substance outside the refrigerator as shown by the line BC. The vapour is then compressed along the line CD to the temperature T_2, when, by the action of the cooling water in the condenser, heat is abstracted at constant temperature and the vapour condensed along the line DA.

In a compression machine the refrigerator is usually a series of iron or steel coils surrounded by the air, brine or other substance it

is desired to cool. One end (generally the bottom) of the coils is connected to the liquid pipe from the condenser and the other end to the suction of the compressor. Liquid from the condenser is admitted to the coils through an adjustable regulating valve, and by taking heat from the substance outside is evaporated, the vapour being continually drawn off by the compressor and discharged under increased pressure into the condenser. The evaporator coils may be constructed of coils like

FIG. 3.—Action of Vapour Compression Machine.

the refrigerator, the cooling water being contained in a tank; frequently, however, a series of open coils is employed, the cooling water falling over the coils into a collecting tray below, and this form is perhaps the most convenient for ordinary use as it affords great facilities for inspection and painting. The compressor may be driven by a steam engine or in any other convenient manner. The pressure in the condenser varies according to the temperature of the cooling water, and that in the refrigerator is dependent upon the temperature to which the outside substance is cooled. In an ammonia machine copper and copper alloys must be avoided, but for carbonic acid they are not objectionable.

The compression of ammonia is sometimes carried out on what is known as the Linde or "wet" system, and sometimes on the "dry" system. When wet compression is used the regulating valve is opened to such an extent that a little more liquid is passed than can be evaporated in the refrigerator. This liquid enters the compressor with the vapour, and is evaporated there, the heat taken up preventing the rise in temperature during compression which would otherwise take place. The compressed vapour is discharged at a temperature but little above that of the cooling water. With dry compression, vapour alone is drawn into the compressor, and the temperature rises to as much as 180 or 200 degrees. Wet compression theoretically is not quite so efficient as dry compression, but it possesses practical advantages in keeping the working parts of the compressor cool, and it also greatly facilitates the regulation of the liquid, and ensures the full duty of the machine being continuously performed. Very exact comparative trials have been made by Professor M. Schroeter and others with compression machines using sulphur dioxide and ammonia. The results are published in *Vergleichende Versuche an Kältemaschinen*, by Schroeter, Munich, 1890, and in Nos. 32 and 51 of *Bayerisches Industrie und Gewerbeblatt*, 1892. Some of the results obtained by Schroeter in 1893 with an ordinary brine cooling machine on the Linde ammonia system are given in Table VI.:—

TABLE VI.

Pressure in refrigerator in pounds per sq. in. above atmosphere	45·2	32·6	19·8	9·6
Pressure in condenser in pounds per sq. in. above atmosphere	116·0	115·0	110·0	108·0
Heat absorbed in refrigerator. B.T.U. per hour	342192	263400	171515	121218
Heat rejected in condenser. B.T.U. per hour	377567	301200	214347	158504

The principle of the absorption process is chemical or physical rather than mechanical; it depends on the fact that many vapours of low boiling-point are readily absorbed in water, and can be separated again by the application of heat. In its simplest form an absorption machine consists of two iron vessels connected together by a bent pipe. One of these contains a mixture of ammonia and water, which on the application of heat gives off a mixed vapour containing a large proportion of ammonia, a liquid containing but little ammonia being left behind. In the second vessel, which is placed in cold water, the vapour rich in ammonia is condensed under pressure. To produce refrigeration the operation is reversed. On allowing the weak liquor to cool to normal temperature, it becomes greedy of ammonia (at 60° F. at atmospheric pressure water will absorb about 760 times its own volume of ammonia vapour), and this produces an evaporation from the liquid in the vessel previously used as a condenser. This liquid, containing a large proportion of ammonia, gives off vapour at a low temperature, and therefore becomes a refrigerator abstracting heat from water or any surrounding body. When the ammonia is evaporated the operation as described must be again commenced. Such an apparatus is not much used now. Larger and more elaborate machines were made by F. P. E. Carré in France; but no very high degree of perfection was arrived at, owing to the impossibility of getting an anhydrous product of distillation. In 1867 Rees Reece, taking advantage of the fact that two vapours of different boiling-points, when mixed, can be separated by means of fractional condensation, brought out an absorption machine in which the distillate was very nearly anhydrous. By means of vessels termed the analyser and the rectifier, the bulk of the water was condensed at a comparatively high temperature and run back to the generator, while the ammonia passed into a condenser, and there assumed the liquid form under the pressure produced by the heat in the generator and the cooling action of water circulating outside the condenser tubes.

Absorption machines.

Fig. 4 is a diagram of an absorption apparatus. The ammonia vapour given off in the refrigerator is absorbed by a cold weak solution of ammonia and water in the absorber, and the strong liquor is pumped back into the generator through an interchanger through which also the weak hot liquor from the generator passes on its way to the absorber. In this way the strong liquor is heated before it enters the generator, and the weak liquor is cooled before it enters the absorber. The generator being heated by means of a steam coil, ammonia vapour is driven off at such a pressure as to cause its condensation in the condenser. From the condenser it passes into the refrigerator through a regulating valve in the usual manner. The process is continuous, and is identical with that of the compression machine, with the exception of the return from the temperature T_1 to the temperature T_2, which is brought about by the direct application of heat instead of by means of mechanical compression. With the same temperature range, however, the same amount of heat has to be acquired in both cases, though from the nature of the process the actual amount of heat demanded from the steam is much greater in the absorption system than in the compression. This is chiefly due to the fact that in the former the heat of vaporization acquired in the refrigerator is rejected in the absorber, so that the whole heat of vaporization has to be supplied again by the steam in the generator. In the latter the vapour passes direct from the refrigerator to the pump, and power has to be expended merely in raising the temperature to a sufficient degree to enable condensation to occur at the temperature of the cooling water. On the other hand, a great advantage is gained in the absorption machine by using an the direct heat of the steam, without first converting it into mechanical work, for in this way its latent heat of vaporization can be utilized by condensing the steam in the coils and thus it escape in the form of water. Each pound of steam can thus be made to give up some 950 units of heat; while in a good steam engine only about 200 units are utilized in the steam cylinder per pound of steam, and in addition allowance has to be made for mechanical inefficiency. In the absorption machine the cooling water has to take up about twice as much heat as in the compression system, owing to the ammonia being twice liquefied—namely, once in the absorber and once in the condenser. It is usual to pass the cooling water first through the condenser and then through the absorber.

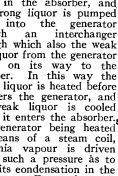

FIG. 4.

The absorption machine is not so economical as the compression; but an actual comparison between the two systems is difficult to make. Information on this head is given in papers read by Dr. Linde and by Professor J. A. Ewing before the Society of Arts (*Journal of the Society of Arts*, vol. xlii., 1894, p. 322, and Howard Lectures, January, February and March 1897).

In an absorption apparatus as applied to the cooling of liquids consists of a generator containing coils to which steam is supplied at suitable pressure, an analyser, a rectifier, a condenser either of the submerged or open type, a refrigerator in which the nearly anhydrous ammonia obtained from the condenser is allowed to evaporate, an absorber through which the weak liquor from the generator continually flows and absorbs the anhydrous vapour produced in the refrigerator, and a pump for forcing the strong liquor produced in the absorber back through an economizer into the analyser where, meeting with steam from the generator, the ammonia gas is again driven off, the process being thus carried on continuously. Sometimes an additional vessel is employed for heating liquor by means of the exhaust steam from the engine driving the ammonia pump. Absorption machines are also made without a pump for returning the strong liquor to the generator. In these cases they work intermittently. In some machines the same vessel is used alternately as a generator and absorber, while in others, in order

to minimize the loss of time, two vessels are provided which can be used alternately as generators and absorbers.

Applications.—Apart from the economical working of the machine itself, whatever system may be adopted, it is of importance that cold once produced should not be wasted, and it is therefore necessary to use some form of insulation to protect the vessels in which liquids are being cooled, or the rooms of ships' holds in which the freezing or storage processes are being carried on. This insulation generally consists of materials such as charcoal, silicate cotton, granulated cork, small pumice, hair-felt, sawdust, &c., held between layers of wood or brick, and forming a more or less heat-tight box. There is no recognized standard of insulation. For a cold store to be erected inside a brick or stone building, and to be maintained at an internal temperature of from 18° to 20° F., a usual plan is shown in fig. 5. The same insulation is used for the floors and

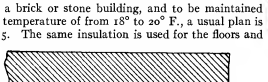

FIG. 5.—Insulation of a Cold Store.

ceilings, except that the wearing surface of the floor is generally made thicker than the inside lining of the sides. Should the walls or floor be damp, waterproof paper is added. Granulated cork has practically the same insulating properties as silicate cotton, and the same thicknesses may be used. About 10 in. of flake charcoal and vegetable silica, or 11 of small pumice, are required to give the same protection as 7 in. of good silicate cotton. Cork bricks made of compressed granulated cork are frequently used, a thickness of about 5 in. giving the same protection as 7 in. of silicate cotton. The walls and ceilings are finished off with a smooth coating of hard cement and the floors are protected by cement or asphalt, according to the nature of the traffic on them. For lager-beer cellars and fermenting rooms, for bacon-curing cellars, and for similar purposes, brick walls with single or double air spaces are used, and sometimes a space filled with silicate cotton or other insulating material. In Australia and New Zealand pumice, which is found in enormous quantities in the latter country, takes the place of charcoal and silicate cotton. In Canada air spaces are largely used either alone or in combination with silicate cotton or planer shavings. The air spaces, two or three in number, are formed between two layers of tongued and grooved wood, and the total thickness of the insulation is about the same as when silicate cotton alone is used. On board ship charcoal has been almost entirely employed, but silicate cotton and granulated cork are sometimes used. The material is either placed directly up to the skin of the vessel, and kept in place by a double lining of wood inside, in which case a thickness of about 10 in. is used depending upon the depth of the frames, or it is placed between two layers of wood, with an air space next the skin, in which case about 6 in. of flake charcoal is generally sufficient for the insulation of the holds, though for deck-houses and other parts exposed to the sun the thickness must be greater. A layer of sheet zinc or tin has frequently to be used as protection from rats. Given a certain allowable heat transmission, the principal points to be considered in connexion with insulation are, first cost, durability, weight and space occupied, the two last named being specially important factors on board ship. No exact rules can be laid down, as the conditions vary so greatly; and though experiments have been made to determine the actual heat conduction of various materials per unit of surface, thickness and temperature difference, the experience of actual practice is at present the only accepted guide.

With compressed-air machines which discharge the cold air direct into the insulated room or hold, a snow box is provided close to the outlet of the expansion cylinder to catch the snow and congealed oil. The air is distributed by means of wood air trunks with openings controlled by slides, and similar trunks are provided in connexion with the suction of the compresser to conduct the air back to the machine. With liquid machines of the compression and absorption system, the rooms are either cooled by means of cold pipes or surfaces placed in them, or by a circulation of air cooled in an apparatus separated from the rooms. The cold pipes may be direct-expansion pipes in which the liquid evaporates, or they may be pipes or walls through which circulates an uncongealable brine previously cooled to the desired temperature. The pipes are placed on the ceilings or sides according to circumstances, but they must be arranged so as to induce a circulation of air throughout the compartment and ensure every part being cooled. With what is termed the air circulation system the air is generally circulated by means of a fan, being drawn from the rooms through ducts, passed over a cooler, and returned again to the rooms by other ducts. In some coolers the cooling surfaces consist of direct-expansion pipes placed in clusters of convenient form; in others brine pipes are used; in others there is a shower of cold brine, and in some cases combinations of cold pipes and brine showers. Whether pipes in the rooms or air circulation give the best results is to some extent a matter of opinion, but at the present time the tendency is decidedly in favour of air circulation, at any rate for general cold storage purposes. Whichever system be adopted, it is important for economical reasons that ample cooling surface be allowed, and that all surfaces be kept clean and active, to make the difference between the temperature of the evaporating liquid and the rooms as small as possible. Small surfaces reduce first cost, but involve higher working expenses by decreasing the value of $T_1/(T_2-T_1)$, and thus demanding more energy, and consequently more fuel, to effect the given result than if larger surfaces were employed.

The general arrangement of an ice factory for producing can ice is shown in fig. 6. The water to be frozen is contained in galvanized

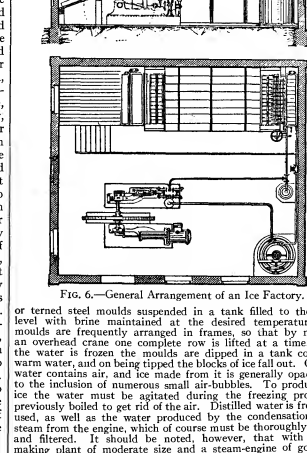

FIG. 6.—General Arrangement of an Ice Factory.

or terned steel moulds suspended in a tank filled to the proper level with brine maintained at the desired temperature. The moulds are frequently arranged in frames, so that by means of an overhead crane one complete row is lifted at a time. When the water is frozen the moulds are dipped in a tank containing warm water, and on being tipped the blocks of ice fall out. Ordinary water contains air, and ice made from it is generally opaque, due to the inclusion of numerous small air-bubbles. To produce clear ice the water must be agitated during the freezing process, or previously boiled to get rid of the air. Distilled water is frequently used, as well as the water produced by the condensation of the steam from the engine, which of course must be thoroughly purified and filtered. It should be noted, however, that with an ice-making plant of moderate size and a steam-engine of good construction the weight of steam used will not nearly equal the weight of ice produced, so that the difference must be made up either by distillation, which is a costly process, or by ordinary water. Can ice is usually made in blocks weighing 56, 112 or 224 lb, and from 4 to 8 in. thick. For cell ice ordinary water is used, agitated

during freezing. The cells are flat and constructed of galvanized iron, so as to form a hollow space of about 2 in. in width, through which cold brine is circulated by a pump. They are placed vertically in a tank, the distance between them being from 8 to 14 in., according to the thickness of the ice to be produced. The tank is filled with water, which is kept in agitation by means of a reciprocating paddle or piston; in this way the air escapes, and with proper care a block of great transparency is produced. To thaw it off, warm brine is circulated through the cells. A usual size for cell ice is 4 ft. by 3 ft. by 1 ft. mean thickness, the weight being about 6 cwt. If perfectly transparent ice is required, the two sides of the tank are hollowed to join up, and it is then called plate ice, which is often made in very large blocks, afterwards divided by saws or steam cutters. In such cases the evaporation of the ammonia or other refrigerating liquid frequently takes place in the cells themselves, brine being dispensed with. With a well-constructed can ice-plant of say 25 tons capacity per day, from 15 to 16 tons of ice should be made in Great Britain to a ton of best steam coal. For cell and plate ice the production is considerably below this, and the first cost of the plant is much greater than that for can ice.

Fig. 7 shows an arrangement of cold storage on land, refrigerated on the air circulation system. The insulated rooms, on two floors,

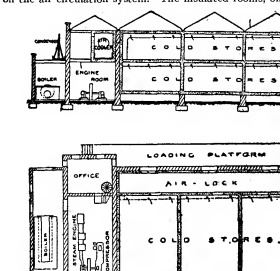

FIG. 7.—Cold Stores.

are approached by corridors, so as to exclude external air, which if allowed to enter would deposit moisture upon the cold goods. The air cooler is placed at the end, and the air is distributed by means of wood ducts furnished with slides for regulating the temperature of the rooms, which are insulated according to the method shown in fig. 5. In some cases, instead of the entrance being at the sides or ends, it is at the top, all goods being raised to the top floor in lifts and lowered by lifts into the rooms. With good machinery the cost of raising is not great, and is probably equalled by the saving in refrigeration, since the rooms hold the heavy cold air as a glass holds water.

Larger passenger vessels and yachts are now generally fitted with refrigerating machinery for preserving provisions, cooling water and wine, and making ice. Usually two insulated compartments are provided, one for frozen meats at about 20° F., and one for vegetables, &c., at about 40°. They have a capacity of from 1500 to 3000 cub. ft. or more, according to the number of passengers carried, and they are generally cooled by means of brine pipes, though direct expansion and air circulation are sometimes adopted. A passenger vessel requires from 2 to 4 cwt. of ice per day. On battleships and cruisers the British Admiralty use small compressed-air machines for ice-making, and larger machines, generally on the carbonic-acid system, for cooling the magazines. A modern frozen-meat-carrying vessel will accommodate as much as 120,000 carcases, partly sheep and partly lambs, requiring a hold capacity of about 300,000 cub. ft. In some vessels both fore and aft holds and between decks are insulated. Lloyd's Committee now issue specifications for refrigerating installations, if constructed according to their rules, and most modern cargo-carrying vessels have their refrigerating machinery classed at Lloyd's. In the meat trade between the River Plate, the United States, Canada and Great Britain, ammonia or carbonic acid machines are now exclusively used, but for the Australian and New Zealand frozen-meat trade compressed-air machines are still employed to a small extent. The holds of meat-carrying vessels are refrigerated either by cold air circulation or by brine pipes.

Though the adoption of refrigerating and ice-making machinery for industrial purposes practically dates from the year 1880, the manufacture of these machines has already assumed very great proportions; indeed, in some branch of mechanical engineering, with the exception of electrical machinery, has there been so remarkable a development in recent years. The sphere of application is extending year by year. The cooling of residential and public buildings in hot countries, though attempted in a few cases in the United States and elsewhere, is yet practically untouched, the manufacture of ice and the preservation of perishable foods (apart from the frozen and chilled meat trades) have in many countries hardly received serious consideration, but in breweries, dairies, margarine works and many other industries there is a large and increasing field for refrigerating and ice-making machinery. A recent application is in the cooling and drying of the air blast for blast furnaces. Though this matter had been discussed for some years, it was only in 1904 that the first plant was put to work at Pittsburg.

REGAL, a small late-medieval portable organ, furnished with beating-reeds and having two bellows like a positive organ; also in Germany the name given to the reed-stops (beating-reeds) of a large organ, and more especially the "vox humana" stop. The name was not at first applied to the small table instrument, but to certain small brass pipes in the organ, sounded by means of beating-reeds, the longest of the 8-ft. tone being but 5¾ in. long. Praetorius (1618) mentions a larger regal used in the court orchestras of some of the German princes, more like a positive, containing 4-ft., 8-ft. and even sometimes 16-ft. tone reeds, and having behind the case two bellows. These regals were used not only at banquets but often to replace positives in small and large churches. The very small regal, sometimes called *Bible-regal*, because it can be taken to pieces and folded up like a book, is also mentioned by the same writer, who states that these little instruments, first made in Nuremberg and Augsburg, have an unpleasantly harsh tone, due to their tiny pipes, not quite an inch long. The pipes in this case were not intended to reinforce the vibrations of the beating-reed or of its overtones as in the reed pipes of the organ, but merely to form an attachment for keeping the reed in its place without interfering with its functions. The beating-reed itself in the older organs of the early middle ages, many of which undoubtedly were reed organs, was made of wood; those of the regal were mostly of brass (hence their "brazen voices"). The length of the vibrating portion of the beating-reed governed the pitch of the pipe and was regulated by means of a wire passing through the socket, the other end pressing on the reed at the proper distance. Drawings of the reeds of regals and other reed-pipes, as well as of the instrument itself, are given by Praetorius (pl. iv., xxxviii.).

There is evidence to show that in England, and France also, the word "regal" was applied to reed-stops on the organ; Mersenne (1636) states that "now the word is applied to the vox humana stop on the organ." In England, as late as the reign of George III., there was the appointment of "tuner of the regals" to the Chapel Royal.

The reed-stops required constant tuning, according to Praetorius, who lays special emphasis on the fact that the pitch of the reed-pipes alone falls in summer and rises in winter.

During the 16th and 17th centuries the regal was a very great favourite, and although, owing to the civil wars and the ravages

of time, very few specimens now remain, the regals are often mentioned in old wills and inventories, such as the list of Henry VIII.'s musical instruments made after his death by Sir Philip Wilder (Brit. Mus. Harleian MS. 1419, fol. 200 seq.), in which no fewer than thirteen pairs of single and five pairs of double regals are mentioned. Monteverde scored for the regals in his operas, and the instrument is described and figured by S. Virdung in 1511, Martin Agricola in 1528, and Ottmar Luscinius in 1536, as well as by Michael Praetorius in 1618. (K. S.)

REGALIA (Lat. *regalis*, royal, from *rex*, king), the ensigns of royalty. The crown (see CROWN and CORONET) and sceptre (see SCEPTRE) are dealt with separately. Other ancient symbols of royal authority are bracelets, the sword, a robe or mantle, and, in Christian times, a ring. Bracelets, as royal emblems, are mentioned in the Bible in connexion with Saul (2 Sam. i. 10), and they have been commonly used by Eastern monarchs. In Europe their later use seems to have been fitfully confined to England, although they were a very ancient ornament for kings among the Teutonic races. Two coronation bracelets are mentioned among the articles of the regalia ordered to be destroyed at the time of the Commonwealth, and two new ones were made at the Restoration. These are of gold, 1¾ in. in width, and ornamented with the rose, thistle, harp and fleur-de-lis in enamel round them. They have not been used for modern coronations.

The sword is one of the usual regalia of most countries, and is girded on to the sovereign during the coronation. In England the one sword has been developed into five. The Sword of State is borne before the sovereign on certain state occasions, and at the coronation is exchanged for a smaller sword, with which the king is ceremonially girded. The three other swords of the regalia are the "Curtana," the Sword of Justice to the Spirituality, and the Sword of Justice to the Temporality. The Curtana has a blade cut off short and square, indicating thereby the quality of mercy.

The mantle, as a symbol of royalty, is almost universal, but In the middle ages other quasi-priestly robes were added to it (see CORONATION). The English mantle was formerly made of silk; latterly cloth of gold has been used. The ring, by which the sovereign is wedded to his kingdom, is not of so wide a range of usage. That of the English kings held a large ruby with a cross engraved on it. Recently a sapphire has been substituted for the ruby. Golden spurs, though included among the regalia, are merely used to touch the king's feet, and are not worn.

The orb and cross was not anciently placed in the king's hands during the coronation ceremony, but was carried by him in the left hand on leaving the church. It is emblematical of monarchical rule, and is only used by a reigning sovereign. The idea is undoubtedly derived from the globe with the figure of Victory with which the Roman emperors are depicted. The larger orb of the English regalia is a magnificent ball of gold, 6 in. in diameter, with a band round the centre edged with gems and pearls. A similar band arches the globe, on the top of which is a remarkably fine amethyst 1¾ in. in height, upon which rests the cross of gold outlined with diamonds. There is a smaller orb made for Mary II., who reigned jointly with King William III.

The English regalia, with one or two exceptions, were made for the coronation of Charles II. by Sir Robert Vyner. The Scottish regalia preserved at Edinburgh comprise the crown, dating, in part, from Robert the Bruce, the sword of state given to James IV. by Pope Julius II., and two sceptres.

Besides regalia proper, certain other articles are sometimes included under the name, such as the ampulla for the holy oil, and the coronation spoon. The ampulla is of solid gold in the form of an eagle with outspread wings. It weighs 10 oz., and holds 6 oz. of oil. The spoon was not originally used for its present purpose. It is of the 12th or 13th century, with a long handle and egg-shaped bowl. Its history is quite unknown.

See Cyril Davenport, *The English Regalia*, with illustrations in colour of all the regalia; Leopold Wickham Legg, *English Coronation Records*; *The Ancestor*, Nos. 1 and 2 (1902); Menin, *The Form, &c., of Coronations* (translated from French, 1727).

REGENERATION OF LOST PARTS. A loss and renewal of living material, either continual or periodical, is a familiar occurrence in the tissues of higher animals. The surface of the human skin, the inner lining of the mouth and respiratory organs, the blood corpuscles, the ends of the nails, and many other portions of tissues are continuously being destroyed and replaced. The hair of many mammals, the feathers of birds, the epidermis of reptiles, and the antlers of stags are shed and replaced periodically. In these normal cases the regeneration depends on the existence of special formative layers or groups of cells, and must be regarded in each case as a special adaptation, with individual limitations and peculiarities, rather than as a mere exhibition of the fundamental power of growth and reproduction displayed by living substance. Many tissues, even in the highest animals, are capable of replacing an abnormal loss of substance. Thus in mammals, portions of muscular tissue, of epithelium, of bone, and of nerve, after accidental destruction or removal, may be renewed. The characteristic feature of such cases appears to be, in the higher animals at any rate, that lost cells are replaced only from cells of the same morphological order—epiblastic cells from the epiblast, mesoblastic from the mesoblast, and so forth. It is also becoming clear that, at least in the higher animals, regeneration is in intimate relation with the central nervous system. The process is in direct relation to the general power of growth and reproduction possessed by protoplasm, and is regarded by pathologists as the chief agency of "removal of resistance to growth." It is much less common in the tissues of higher plants, in which the adult cells have usually lost the power of reproduction, and in which the regeneration of lost parts is replaced by a very extended capacity for budding. Still, more complicated reproductions of lost parts occur in many cases, and are more difficult to understand.

In Amphibia the entire epidermis, together with the slime-glands and the integumentary sense-organs, is regenerated by the epidermic cells in the vicinity of the defect. The whole limb of a Salamander or a Triton will grow again and again after amputation. Similar renewal is either rarer or more difficult in the case of Siren and Proteus. In frogs regeneration of amputated limbs does not usually take place, but instances have been recorded. Chelonians, crocodiles and snakes are unable to regenerate lost parts to any extent, while lizards and geckoes possess the capacity in a high degree. The capacity is absent almost completely in birds and mammals. In cephalopodous worms, and in crustaceans the power is exhibited in a very varying extent. In Hydra, Nais, and Lumbriculus, after transverse section, each part may complete the whole animal. In most worms the greater, and in particular the anterior part, will grow a new posterior part, but the separated posterior portion dies. In Hydra, sagittal and horizontal amputations result in the completion of the separated parts. In worms such operations result in death, which no doubt may be a mere consequence of the more severe wound. Extremely interesting instances of regeneration are what are called "Heteromorphoses," where the removed part is replaced by a dissimilar structure. The tail of a lizard, grown after amputation, differs in structure from the normal tail: the spinal cord is replaced by an epithelial tube which gives off no nerves; the vertebrae are replaced by an unsegmented cartilaginous tube; very frequently "super-regeneration" occurs, the amputated limb or tail being replaced by double or multiple new structures.

J. Loeb produced many heteromorphoses on lower animals. He lopped off the polyp head and the pedal disc of a *Tubularia*, and supported the lopped stem in an inverted position in the sand; the original pedal end, now superior, gave rise to a new polyp head, while the neck-end, on regeneration, formed a pedal disc. In *Cerianthus*, a sea-anemone, and in *Cione*, an ascidian, regeneration after his operations resulted in the formation of new mouth-openings in abnormal places, surrounded by elaborate structures characteristic of normal mouths. Other observers have recorded heteromorphoses in Crustacea, where antennulae have been regenerated in place of eyes. It appears that in the same fashion as more simply organized animals display a capacity for reproduction of lost parts greater than that of higher animals, so embryos and embryonic structures generally have a higher power of renewal than those displayed by the corresponding adult organs or organisms. Moreover, experimental work on the young stages of organisms has revealed a very striking series of phenomena, similar to the heteromorphoses in adult tissues, but more extended in range. H. Driesch, Herlitzig and others, by separating the segmentation spheres, by destroying some of them, by compressing young embryos by glass plates, and by many other means, have caused cells to develop

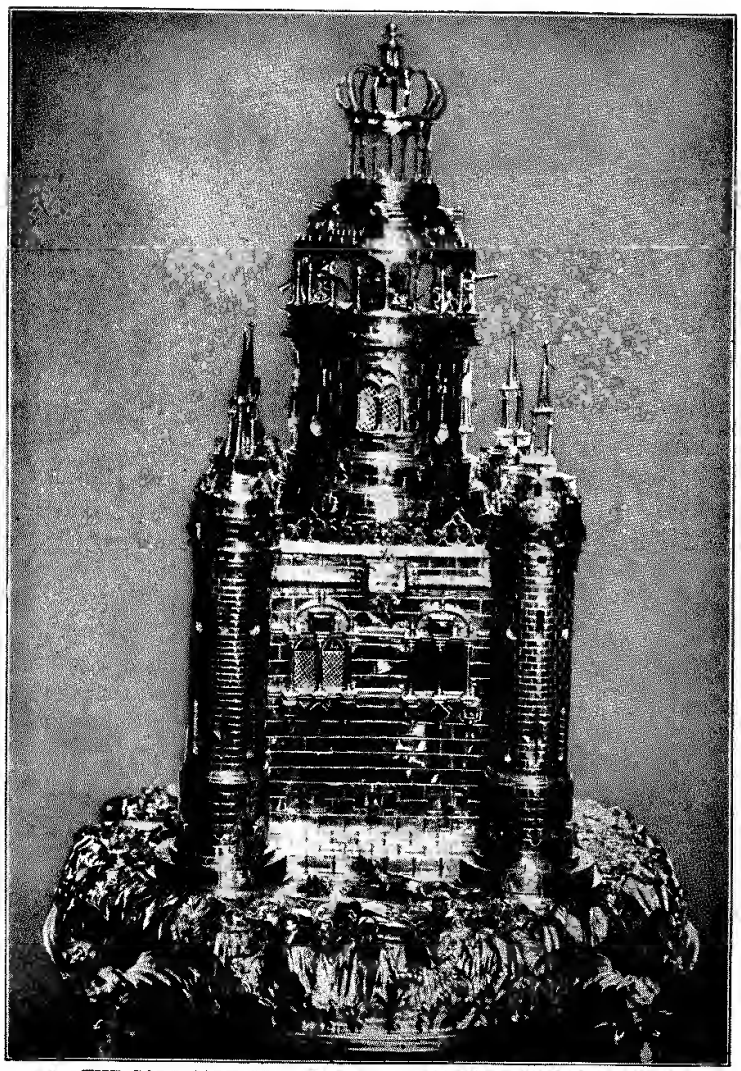
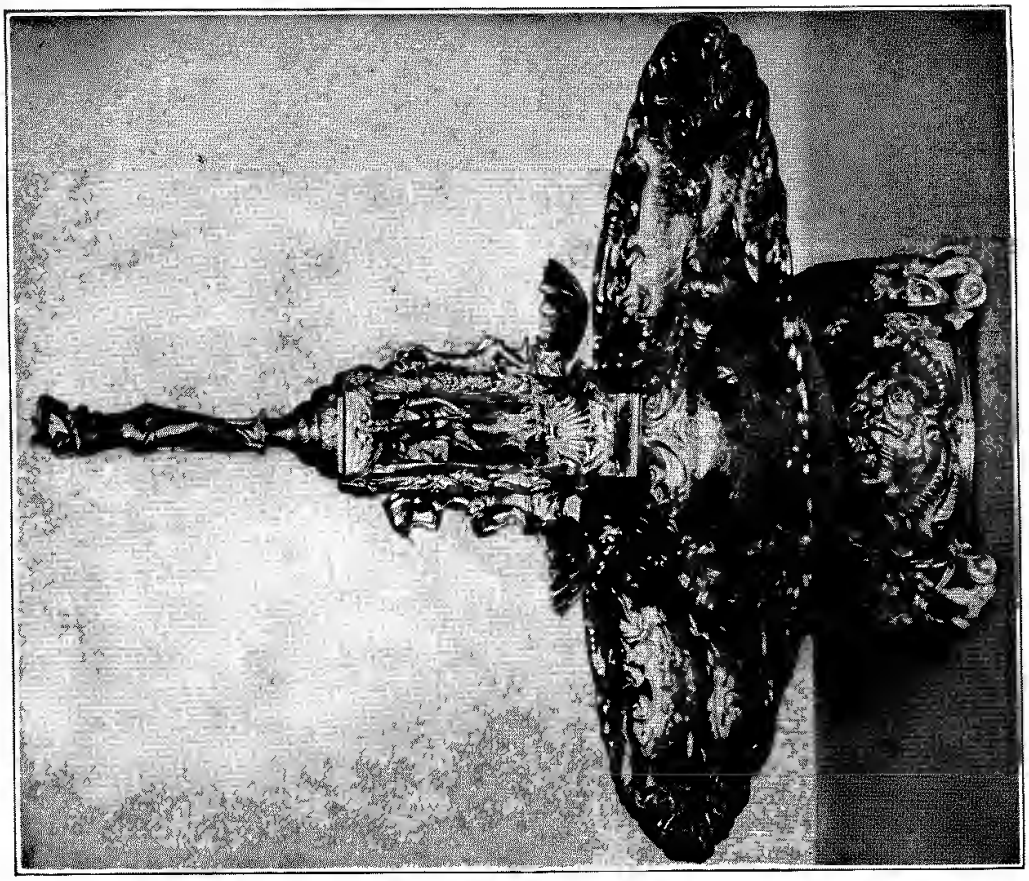
2.—QUEEN ELIZABETH'S SALT-CELLAR.

3.—SILVER-GILT ALTAR DISH, used at Christmas and Easter in the Chapel of St Peter ad Vincula, Tower of London.



4.—THE GOLD SALT-CELLAR presented to the Crown by the City of Exeter.

REGALIA



2.—THE WINE FOUNTAIN, presented to Charles II. by the Corporation of Plymouth.

1.—SILVER GILT ALTAR DISH, dated 1660 with representation of the Last Supper; it forms part of the Altar plate at the Coronation and is in the custody of the Sub-Dean of the Chapels Royal.

so as to give rise to structures which in normal development they would not have formed.

It is clear that there are at least three kinds of factors involved in regeneration. There are: (1) Regenerations due to the presence of undifferentiated, or little differentiated, cells, which have retained the normal capacity of multiplication when conditions are favourable. (2) Regenerations due to the presence of special complicated rudiments, the stimulus to the development of which is the removal of the fully formed structure. (3) Regeneration involving the general capacity of protoplasm to respond to changes in the surroundings by changes of growth. The most general view is to regard regenerations as special adaptations; and A. Weismann, following in this matter Arnold Lang, has developed the idea at considerable length, and has found a place for regenerations in his system of the germ-plasm (see HEREDITY) by the conception of the existence of "accessory determinants." Hertwig, on the other hand, attaches great importance to the facts of regeneration as evidence for his view that every cell of a body contains a similar essential plasm.

In E. Schwalbe's *Morphologie der Mibildungen* (1904), part i. chap. v., an attempt is made to associate the facts of regeneration with those of embryology and pathology. Our knowledge of the facts, however, is not yet systematic enough to allow of important general conclusions. The power of regeneration appears to be in some cases a special adaptation, but more often simply an expression of the general power of protoplasm to grow and to reproduce its kind. It has been suggested that regenerated parts always represent ancestral stages, but there is no conclusive evidence for this view. (P. C. M.)

REGENSBURG (RATISBON), a city and episcopal see of Germany, in the kingdom of Bavaria, and the capital of the government district of the Upper Palatinate. Pop. (1905) 48,412. It is situated on the right bank of the Danube, opposite the influx of the Regen, 86 m. by rail N.E. from Munich, and 60 m. S.E. of Nuremberg. On the other side of the river is the suburb Stadt-am-Hof, connected with Regensburg by a long stone bridge of the 12th century, above and below which are the islands of Oberer and Unterer Wörth. In appearance the town is quaint and romantic, presenting almost as faithful a picture of a town of the early middle ages as Nuremberg does of the later. One of the most characteristic features in its architecture is the number of strong loopholed towers attached to the more ancient dwellings. The interesting "street of the envoys" (*Gesandtenstrasse*) is so called because it contained the residences of most of the envoys to the German diet, whose coats-of-arms may still be seen on many of the houses.

The cathedral, though small, is a very interesting example of pure German Gothic. It was founded in 1275, and completed in 1634, with the exception of the towers, which were finished in 1869. The interior contains numerous interesting monuments, including one of Peter Vischer's masterpieces. Adjoining the cloisters are two chapels of earlier date than the cathedral itself, one of which, known as the "old cathedral," goes back perhaps to the 8th century. The church of St James—also called Schottenkirche—a plain Romanesque basilica of the 12th century, derives its name from the monastery of Irish Benedictines ("Scoti") to which it was attached; the principal doorway is covered with very singular grotesque carvings. The old parish church of St Ulrich is a good example of the Transition style of the 13th century, and contains a valuable antiquarian collection. Examples of the Romanesque basilica style are the church of Obermünster, dating from 1010, and the abbey church of St Emmeran, built in the 13th century, and remarkable as one of the few German churches with a detached belfry. The beautiful cloisters of the ancient abbey, one of the oldest in Germany, are still in fair preservation. In 1809 the conventual buildings were converted into a palace for the prince of Thurn and Taxis, hereditary postmaster-general of the Holy Roman Empire. The town hall, dating in part from the 14th century, contains the rooms occupied by the imperial diet from 1663 to 1806. An historical interest also attaches to the *Gasthof zum Goldenen Kreuz* (Golden Cross Inn), where Charles V. made the acquaintance of Barbara Blomberg, the mother of Don John of Austria (b. 1547). The house is also shown where Kepler died in 1630. Perhaps the most pleasing modern building in the city is the Gothic villa of the king of Bavaria on the bank of the Danube. At Kumpfmühl, in the immediate neighbourhood of the city, was discovered, in 1885, the remains of a Roman camp with an arched gateway; the latter, known as the *Porta Praetoria*, was cleared in 1887. Among the public institutions of the city should be mentioned the public library, picture gallery, botanical garden, and the institute for the making of stained glass. The educational establishments include two *gymnasia*, an episcopal clerical seminary, a seminary for boys and a school of church music. Among the chief manufactures are iron and steel wares, pottery, parquet flooring, tobacco, and lead pencils. Boat-building is also prosecuted, and a brisk transit trade is carried on in salt, grain and timber.

Near Regensburg are two very handsome classical buildings, erected by Louis I. of Bavaria as national monuments of German patriotism and greatness. The more imposing of the two is the Walhalla, a costly reproduction of the Parthenon, erected as a Pantheonic temple of fame on a hill rising from the Danube at Donaustauf, 6 m. to the east. The interior, which is as rich as coloured marbles, gilding, and sculptures can make it, contains the busts of more than a hundred German worthies. The second of King Ludwig's buildings is the Befreiungshalle at Kelheim, 14 m. above Regensburg, a large circular building which has for its aim the glorification of the heroes of the war of liberation in 1813.

The early Celtic settlement of *Radespona* (L. Lat. *Ratishona*) was chosen by the Romans, who named it *Castra Regina*, as the centre of their power on the upper Danube. It is mentioned as a trade centre as early as the 2nd century. It afterwards became the seat of the dukes of Bavaria, and one of the main bulwarks of the East Frankish monarchy; and it was also the focus from which Christianity spread over southern Germany. St Emmeran founded an abbey here in the middle of the 7th century, and St Boniface established the bishopric about a hundred years later. Regensburg acquired the freedom of the empire in the 13th century, and was for a time the most flourishing city in southern Germany. It became the chief seat of the trade with India and the Levant, and the boatmen of Regensburg are frequently heard of as expediting the journeys of the East Frank

parliament (*Inst.*, vol. iv. p. 58), and in modern times provision for a regency has always been made by act of parliament. In Scotland the appointment of regents was always either by the assent of a council or of parliament. Thus in 1315 the earl of Moray was appointed regent by Robert I. in council. At a later period appointment by statute was the universal form. Thus by an act of 1542 the earl of Arran was declared regent during the minority of Mary. By an act of 1567 the appointment by Mary of the earl of Moray as regent was confirmed. As late as 1706 provision was made for a regency after the death of Anne. The earliest regency in England resting upon an express statute was that created by 28 Hen. VIII. c. 7, under which the king appointed executors to exercise the authority of the crown till the successor to the crown should attain the age of eighteen if a male or sixteen if a female. They delegated their rights to the protector Somerset, with the assent of the lords spiritual and temporal. No other example of a statutory provision for a regency occurs till 1751. In that year the act of 24 Geo. II. c. 24 constituted the princess-dowager of Wales regent of the kingdom in case the crown should descend to any of her children before such child attained the age of eighteen. A council, called the council of regency, was appointed to assist the princess. A prescribed oath was to be taken by the regent and members of the council. Their consent was necessary for the marriage of a successor to the crown during minority. It was declared to be unlawful for the regent to make war or peace, or ratify any treaty with any foreign power, or prorogue, adjourn or dissolve any parliament without the consent of the majority of the council of regency, or give her assent to any bill for repealing or varying the Act of Settlement, the Act of Uniformity or the Act of the Scottish parliament for securing the Protestant religion and Presbyterian church government in Scotland (1707, c. 6). The last is an invariable provision, and occurs in all subsequent Regency Acts. The reign of George III. affords examples of a refusal on the part of the regent during both the infancy and incapacity of a king.

The act of 5 Geo. III. c. 27 vested in the king power to appoint a regent under the sign manual, such regent to be one of certain named members of the royal family. The remaining provisions closely followed those of the act of George II. In 1788 the insanity of the king led to the introduction of a Regency bill. In the course of the debate in the House of Lords the duke of York disclaimed on behalf of the prince of Wales any right to assume the regency without the consent of parliament. Owing to the king's recovery the bill ultimately dropped. On a return of the malady in 1810 the Act of 51 Geo. III. c. 1 was passed, appointing the prince of Wales regent during the king's incapacity. The royal assent was given by commission authorized by resolution of both Houses. By this act no council of regency was appointed. There was no restriction on the regent's authority as to treaties, peace or war, or parliament, as in the previous acts, but his power of granting peerages, offices and pensions was limited. At the accession of William IV. the duchess of Kent was, by 1 Will. IV. c. 2, appointed regent, if necessary, until the Princess Victoria should attain the age of eighteen. No council of regency was appointed. By 1 Vict. c. 72 lords justices were nominated as a kind of regency council without a regent in case the successor to the crown should be out of the realm at the queen's death. They were restricted from granting peerages, and from dissolving parliament without directions from the successor. By 3 & 4 Vict. c. 52 Prince Albert was appointed regent in case any of Queen Victoria's children should succeed to the crown under the age of eighteen. The only restraint on his authority was the usual prohibition to assent to any bill repealing the Act of Settlement, &c. When George V. came to the throne a Regency Bill was passed, as his eldest son was under age, and Queen Mary was appointed. By 10 Geo. IV. c. 7 the office of regent of the United Kingdom cannot be held by a Roman Catholic. A similar disability is imposed in most, if not all, Regency Acts.

REGGIO CALABRIA (anc. *Regium, q.v.*), a town and archiepiscopal see of Calabria, Italy, capital of the province of Reggio, on the Strait of Messina, 248 m. S.S.E. from Naples by rail. Pop. (1906) 39,041 (town); 48,362 (commune). It is the terminus of the railways from Naples along the west coast, and from Metaponto along the east coast of Calabria. The straits are here about 7 m. wide, and the distance to Messina nearly 10 m. The ferryboats to Messina therefore cross by preference from Villa S. Giovanni, 8 m. N. of Reggio, whence the distance is only 5 m. In 1894 the town suffered from an earthquake, though less severely than in 1783. It was totally destroyed, however, by the great earthquake of December 1908; in the centre of the town about 35,000 out of 40,000 persons perished. The cathedral, which dated from the 17th century, and the ancient castle which rose above it, were wrecked. Great damage was done by a seismic wave following the shock. The sea front was swept away, and the level of the land hereabouts was lowered. (See further MESSINA.)

REGGIO NELL' EMILIA, a city and episcopal see of Emilia, Italy, the capital of the province of Reggio nell' Emilia (till 1859 part of the duchy of Modena), 38 m. by rail N.W. of Bologna. Pop. (1906) 19,681 (town); 64,548 (commune). The cathedral, originally erected in the 12th century, was reconstructed in the 15th and 16th; the façade shows traces of both periods, the Renaissance work being complete only in the lower portion. S. Prospero, close by, has a façade of 1504, in which are incorporated six marble lions belonging to the original Romanesque edifice. The Madonna della Ghiara, built in 1597 in the form of a Greek cross, and restored in 1900, is beautifully proportioned and finely decorated in stucco and with frescoes of the Bolognese school of the early 17th century. There are several good palaces of the early Renaissance, a fine theatre (1857) and a museum containing important palaeo-ethnological collections, ancient and medieval sculptures, and the natural history collection of Spallanzani. Lodovico Ariosto, the poet (1474–1533), was born in Reggio, and his father's house is still preserved. The industries embrace the making of cheese, objects in cement, matches, and brushes, the production of silkworms, and printing; and the town is the centre of a rich agricultural district. It lies on the main line between Bologna and Milan, and is connected by branch lines with Guastalla and Sassuolo (hence a line to Modena).

Regium Lepidi or Regium Lepidi was probably founded by M. Aemilius Lepidus at the time of the construction of the Via Aemilia (187 B.C.). It lay upon this road, half-way between Mutina and Parma. It was during the Roman period a flourishing municipium, but perhaps never became a colony; and it is associated with no event more interesting than the assassination of M. Brutus, the father of Caesar's friend and foe. The bishopric dates perhaps from the 4th century A.D. Under the Lombards the town was the seat of dukes and counts; in the 12th and 13th centuries it formed a flourishing republic, busied in surrounding itself with walls (1229), controlling the Crostolo and constructing navigable canals to the Po, coining money of its own, and establishing prosperous schools. About 1290 it first passed into the hands of Obizzo d'Este, and in succeeding years the Este family was after many vicissitudes more formally recognized in 1409. In the contest for liberty which began in 1796 and closed with annexation to Piedmont in 1859, Reggio took vigorous part.

REGICIDE (Lat. *rex*, a king, and *caedere*, to kill), the name given to any one who kills a sovereign. Regicides is the name given in English history to the generation of 1660 to those persons who were responsible for the execution of Charles I. On the 4th of April 1660 Charles II. in the Declaration of Breda promised a free pardon to all his subjects "excepting only such persons as shall hereafter be excepted by parliament," and on the 14th of May the House of Commons ordered the immediate arrest of "all those persons who sat in judgment upon the late king's majesty when sentence was pronounced." The number of regicides was estimated at 84, this number being composed of the 67 present at the last sitting of the court of justice, 11 others who had attended earlier sittings, 4 officers of the court and the 2 executioners. Many of them were arrested or surrendered themselves, and the House of Commons in considering the proposed bill of indemnity suggested that only seven of the regicides, who were named, should forfeit their lives; but the House of Lords urged that all the king's judges, with three exceptions, and some others, should be treated in this way.

Eventually a compromise was agreed upon, and the bill as passed on the 29th of August 1660 divided the regicides into six classes for punishment: (1) Four of them, although dead—Cromwell, Ireton, Bradshaw and Pride—were to be attainted for high treason. (2) The estates of twenty others, also dead, were to be subjected to fine or forfeiture. (3) Thirty living regicides were excepted from all indemnity. (4) Nineteen living regicides were also excepted, but with a saving clause that their execution was to be suspended until a special act of parliament was passed for this purpose. (5) Six others were to be punished, but not capitally. (6) Two, Colonels Hutchinson and Thomas Lister, were simply declared incapable of holding any office. Two regicides—Ingoldsby, who declared he had only signed the warrant under compulsion, and Colonel Matthew Thomlinson—escaped without punishment. A court of thirty-four commissioners was then appointed to try the regicides, and the trial took place in October 1660. Twenty-nine were condemned to death, but only ten were actually executed, the remaining nineteen

with six others being imprisoned for life. The ten who were executed at Charing Cross or Tyburn, London, in October 1660, were Thomas Harrison, John Jones, Adrian Scrope, John Carew, Thomas Scot, and Gregory Clement, who had signed the death-warrant; the preacher Hugh Peters; Francis Hacker and Daniel Axtel, who commanded the soldiers at the trial and the execution of the king; and John Cook, the solicitor who directed the prosecution. In January 1661 the bodies of Cromwell, Ireton, and Bradshaw were exhumed and hanged at Tyburn, but Pride's does not appear to have been treated in this way. Of the nineteen or twenty regicides who had escaped and were living abroad, three, Sir John Barkstead, John Okey and Miles Corbet, were arrested in Holland and executed in London in April 1662; and one, John Lisle, was murdered at Lausanne. The last survivor of the regicides was probably Edmund Ludlow, who died at Vevey in 1692.

Ludlow's *Memoirs*, edited by C. H. Firth (Oxford, 1894), give interesting details about the regicides in exile. See also D. Masson, *Life of Milton*, vol. vi. (1880), and M. Noble, *Lives of the English Regicides* (1798). (A. W. H.*)

REGILLUS, an ancient lake of Latium, Italy, famous in the legendary history of Rome as the lake in the neighbourhood of which occurred (496 B.C.) the battle which finally decided the hegemony of Rome in Latium. During the battle, so runs the story, the dictator Postumius vowed a temple to Castor and Pollux, who were specially venerated in Tusculum, the chief city of the Latins (it being a Roman usage to invoke the aid of the gods of the enemy), who appeared during the battle, and brought the news of the victory to Rome, watering their horses at the spring of Juturna, close to which in the valley of the Forum was erected. There can be little doubt that the lake actually existed. Of the various identifications proposed, the best is that of Nibby, who finds it in a now dry crater lake (Pantano Secco), drained by an *emissarium*, the date of which is uncertain, some 2 m. N. of Frascati. Along the south bank of the lake, at some 30 or 40 ft. above the present bottom, ran the aqueducts of the Aqua Claudia and Anio Novus. Most of the other sites proposed are not, as Regillus should be, within the limits of the territory of Tusculum.

See T. Ashby in *Rendiconti dei Lincei* (1898), 103 sqq., and *Classical Review*, 1898. (T. As.)

REGIMENT (from Late Latin *regimentum*, rule, *regere*, to rule, govern, direct), originally government, command or authority exercised over others, or the office of a ruler or sovereign; in this sense the word was common in the 16th century. The most familiar instance is the title of the tract of John Knox, the *First Blast of the Trumpet against the Monstrous Regiment of Women*. The term as applied to a large body of troops dates from the French army of the 16th century. In the first instance it implied "command," as nowadays we speak of "General A's command," meaning the whole number of troops under his command. The early regiments had no similarity in strength or organization, except that each was under one commander. With the regularization of armies the commands of all such superior officers were gradually reduced to uniformity, and a regiment came to be definitely a colonel's command. In the British infantry the term has a tactical significance, as the number of battalions in a regiment is variable, and one at least is theoretically abroad at all times, while the reserve or territorial battalions serve under a different code to that governing the regular battalions. The whole corps of Royal Artillery is called "the Royal Regiment of Artillery." In the cavalry a regiment is tactically as well as administratively a unit of four squadrons. On the continent of Europe the regiment of infantry is always together under the command of its colonel, and consists of three or four battalions under majors or lieutenant-colonels.

REGINA, the capital city of the province of Saskatchewan, Canada, situated at 104° 36′ W. and 50° 27′ N., and 357 m. W. of Winnipeg. Pop. (1907) 9804. After the Canadian Pacific railway was completed in 1885, the necessity for a place of government on the railway line pressed itself upon the Dominion government. The North-West Territories were but little settled then, but a central position on the prairies was necessary, where the mounted police might be stationed and where the numerous Indian bands might be easily reached. The minister of the interior at Ottawa, afterwards Governor Dewdney, chose this spot, and for a number of years Regina was the seat of the Territorial government. The governor took up his abode on the adjoining plain, and the North-West Council met each year, with a show of constitutional government about it. On the formation of the province of Saskatchewan in 1905 the choice of capital was left to the first legislature of the province. Prince Albert, Moose Jaw and Saskatoon all advanced claims, but Regina was decided on as the capital. It probably doubled in population between 1905 and 1907. Its public buildings, churches and residences are worthy of a place of greater pretensions. It is the centre for a rich agricultural district, and for legislation, education, law and other public benefits. It remains the headquarters of the mounted police for the western provinces, and near it is an Indian industrial school of some note.

REGINON, or REGINO OF PRÜM, medieval chronicler, was born at Altripp near Spires, and was educated in the monastery of Prüm. Here he became a monk, and in 892, just after the monastery had been sacked by the Danes, he was chosen abbot. In 899, however, he was deprived of this position and he went to Trier, where he was appointed abbot of St Martin's, a house which he reformed. He died in 915, and was buried in the abbey of St Maximin at Trier, his tomb being discovered there in 1581.

Reginon wrote a *Chronicon*, dedicated to Adalberon, bishop of Augsburg (d. 909), which deals with the history of the world from the commencement of the Christian era to 906, especially the history of affairs in Lorraine and the neighbourhood. The first book (to 741) consists mainly of extracts from Bede, Paulus Diaconus and other writers; of the second book (741–906) the latter part is original and valuable, although the chronology is at fault and the author relied chiefly upon tradition and hearsay for his information. The work was continued to 967 by a monk of Trier, possibly Adalbert, archbishop of Magdeburg (d. 981). The chronicle was first published at Mainz in 1521; another edition is in Band I. of the *Monumenta Germaniae historica. Scriptores* (1826); the best is the one edited by F. Kurze (Hanover, 1890). It has been translated into German by W. Wattenbach (Leipzig, 1890). Reginon also drew up at the request of his friend and patron Radbod, archbishop of Trier (d. 915), a collection of canons, *Libri duo de synodalibus causis et disciplinis ecclesiasticis*, dedicated to Hatto I., archbishop of Mainz; this is published in Tome 132 of J. P. Migne's *Patrologia Latina*. To Radbod he wrote a letter on music, *Epistola de harmonica institutione*, with a *Tonarius*, the object of this being to improve the singing in the churches of the diocese. The letter is published in Tome I. of Gerbert's *Scriptores ecclesiastici de musica sacra* (1784), and the *Tonarius* in Tome II. of Coussemaker's *Scriptores de musica medii aevi*. See also H. Ermisch, *Die Chronik des Regino bis 813* (Göttingen, 1872); P. Schulz, *Die Glaubwürdigkeit des Liber Reginonis Prumensis* (Hamburg, 1894); J. C. Wawra, *De Reginone Prumensis* (Breslau, 1901); A. Molinier, *Les Sources de l'histoire de France*, Tome I. (1901); and W. Wattenbach, *Deutschlands Geschichtsquellen*, Band I. (1904).

REGIOMONTANUS (1436–1476), German astronomer, was born at Königsberg in Franconia on the 6th of June 1436. The son of a miller, his name originally was Johann Müller, but he called himself, from his birthplace, Joh. de Monteregio, an appellation which became gradually modified into Regiomontanus. At Vienna, from 1452, he was the pupil and associate of George Purbach (1423–1461), and they jointly undertook a reform of astronomy rendered necessary by the errors they detected in the Alphonsine Tables. In this they were much hindered by the lack of correct translations of Ptolemy's works; and in 1462 Regiomontanus accompanied Cardinal Bessarion to Italy in search of authentic manuscripts. He rapidly mastered Greek at Rome and Ferrara, lectured on Alfraganus at Padua, and completed at Venice in 1463 Purbach's *Epitome in Ci. Ptolemaei magnam compositionem* (printed at Venice in 1496), and his own *De Triangulis* (Nuremberg, 1533), the earliest work treating of trigonometry as a substantive science. A quarrel with George of Trebizond, the blunders in whose translation of the *Almagest* he had pointed out, obliged him to quit Rome precipitately in 1468. He repaired to Vienna, and was thence summoned to Buda by Matthias Corvinus, king of Hungary, for the purpose of collating Greek manuscripts at a handsome salary. He also finished his *Tabulae Directionum* (Nuremberg, 1475), essentially an astrological work, but containing a valuable table of tangents. An outbreak of war, meanwhile, diverted

the king's attention from learning, and in 1471 Regiomontanus settled at Nuremberg. Bernhard Walther, a rich patrician, became his pupil and patron; and they together equipped the first European observatory, for which Regiomontanus himself constructed instruments of an improved type (described in his posthumous *Scripta*, Nuremberg, 1544). His observations of the great comet of January 1672 supplied the basis of modern cometary astronomy. At a printing-press established in Walther's house by Regiomontanus, Purbach's *Theoricae planetarum novae* was published in 1472 or 1473; a series of popular calendars issued from it, and in 1474 a volume of *Ephemerides* calculated by Regiomontanus for thirty-two years (1474–1506), in which the method of "lunar distances," for determining the longitude at sea, was recommended and explained. In 1472 Regiomontanus was summoned to Rome by Pope Sixtus IV. to aid in the reform of the calendar; and there he died, most likely of the plague, on the 6th of July 1476.

REGISTER, a record of facts, proceedings, acts, events, names, &c., entered regularly for reference in a volume kept for that purpose, also the volume in which the entries are made. The Fr. *registre* is taken from the Med. Lat. *registrum* for *registum*, Late Lat. *regesta*, things recorded, hence list, catalogue, from *regerere*, to carry or bear back, to transcribe, enter on a roll. For the keeping of public registers dealing with various subjects see REGISTRATION and the articles there referred to, and for the records of baptisms, marriages and burials made by a parish clergyman, see section *Parish Registers* below. The keeper of a register was, until the beginning of the 19th century, usually known as a "register," but that title has in Great Britain now been superseded by "registrar"; it still survives in the Lord Clerk Register, an officer of state in Scotland, nominally the official keeper of the national records, whose duties are performed by the Deputy Clerk Register. In the United States the title is still "register." The term "register" has also been applied to mechanical contrivances for the automatic registration or recording of figures, &c. (see CASH REGISTER), to a stop in an organ, to the compass of a voice or musical instrument, and also to an apparatus for regulating the draught of air, heat, water, steam, smoke or the like. Some of these instances of the application of the term are apparently due to a confusion in etymology, with Lat. *regere*, to rule, regulate.

PARISH REGISTERS were instituted in England by an order of Thomas Cromwell, as vicegerent to Henry VIII., "supreme hedd undre Christ of the Church of Englande," in September 1538. The idea appears to have been of Spanish origin, Cardinal Ximenes having instituted, as archbishop of Toledo, registers of baptisms in 1497. They included, under the above order, baptisms, marriages and burials, which were to be recorded weekly. In 1597 it was ordered by the Convocation of Canterbury that parchment books should be provided for the registers and that transcripts should be made on parchment of existing registers on paper, and this order was repeated in the 70th canon of 1603. The transcripts then made now usually represent the earliest registers. It was further provided at both these dates that an annual transcript of the register should be sent to the bishop for preservation in the diocesan registry, which was the origin of the "bishop's transcripts." The "Directory for the publique worship of God," passed by parliament in 1645, provided for the date of birth being also registered, and in August 1653, an Act of "Barebones' Parliament" made a greater change, substituting civil "parish registers" (*sic*) for the clergy, and ordering them to record births, banns, marriages and burials. The "register" was also to publish the banns and a justice to perform the marriage. The register books were well kept under this civil system, but at the Restoration the old system was resumed.

A tax upon births, marriages and burials imposed in 1694 led to the clergy being ordered to register all births, apart from baptisms, but the act soon expired and births were not again registered till 1836. Lord Hardwicke's Marriage Act (1754), by its rigid provisions, increased the registration of marriages by the parochial clergy and prescribed a form of entry. In 1812 parish registers became the subject of parliamentary enactment, owing to the discovery of their deficiencies. Rose's Act provided for their safer custody, for efficient bishops' transcripts, and for uniformity of system. This act continued to regulate the registers till their supersession for practical purposes, in 1837, by civil registration under the act of 1836.

In age, completeness and condition they vary much. A blue book on the subject was published in 1833, but the returns it contains are often inaccurate. A few begin even earlier than Cromwell's order, the oldest being that of Tipton, Staffs, (1513). Between 800 and 900, apparently, begin in 1538 or 1539. The entries were originally made in Latin, but this usage died out early in the 17th century: decay and the crabbed handwriting of the time render the earlier registers extremely difficult to read. There is general agreement as to the shocking neglect of these valuable records in the past, and the loss of volumes appears to have continued even through the 19th century. Their custody is legally vested in the parochial clergy and their wardens, but several proposals have been made for their removal to central depositories. The fees for searching them are determined by the act of 1836, which prescribes half a crown for each certified extract, and sixpence a year for searching, with a shilling for the first year.

The condition of the "bishops' transcripts" was, throughout, much worse than that of the parish registers, there being no funds provided for their custody. The report on Public Records in 1800 drew attention to their neglect, but, in spite of the provisions in Rose's Act (1812), little or nothing was done, and, in spite of their importance as checking, and even sometimes supplementing deficient parish registers, they remained "unarranged, unindexed and unconsultable." Of recent years, however, some improvement has been made. It has also been discovered that transcripts from "peculiars" exist in other than episcopal registries.

Outside the parochial registers, which alone were official in character, there were, till 1754, irregular marriage registers, of which those of the Fleet prison are the most famous, and also registers of private chapels in London. Those of the Fleet and of Mayfair chapel were deposited with the registrar-general, but not authenticated. The registers of dissenting chapels remained unofficial till an act of 1840 validated a number which had been authenticated, and was extended to many others in 1858. Useful information on these registers, now mostly deposited with the registrar-general, will be found in Sims' *Manual*, which also deals with those of private chapels, of English settlements abroad preserved in London, and with English Roman Catholic registers. These last, however, begin only under George II. and are restricted to certain London chapels.

The printing of parish registers has of late made much progress, but the field is so vast that the rate is relatively slow. There is a Parish Register Society, and a section of the Harleian Society engaged on the same work, as well as some county societies and also one for Dublin. But

so many have been issued privately or by individuals that reference should be made to the lists in Marshall's *Genealogist's Guide* (1893) and Dr Cox's *Parish Registers* (1910), and even this last is not perfect. The Huguenot Society has printed several registers of the Protestant Refugees, and Mr Moens that of the London Dutch church. There are also several registers of marriages alone now in print, such as that of St Dunstan's, Stepney, in 3 vols. Colonel Chester's extensive MS. collection of extracts from parish registers is now in the College of Arms, London, and the parishes are indexed in Dr Marshall's book. MS. extracts in the British Museum are dealt with in Sims' *Manual*.

In Scotland registers of baptisms and marriages were instituted by the clergy in 1551, and burials were added by order of the Privy Council in 1616; but these were very imperfectly kept, especially in rural parishes. Yet it was not till 1854 that civil registration was introduced, by act of parliament, in their stead. Some 900 parish registers, beginning about 1563, have been deposited in the Register House, Edinburgh, under acts of parliament which apply to all those prior to 1819. Mr Hallen has printed the register of baptisms of Muthill Episcopal Church.

In Ireland, parish registers were confined to the now disestablished church, which was that of a small minority, and were, as in Scotland, badly kept. Although great inconvenience was caused by this system, civil registration of marriages, when introduced in 1844, was only extended to Protestants, nor was it till 1864 that universal civil registration was introduced, great difficulty under the Old Age Pensions Act being now the result. No provision was made, as in Scotland, for central custody of the registers, which, both Anglican and Nonconformist, remain in their former repositories. Roman Catholic registers in Ireland only began, apparently, to be kept in the 19th century.

In France registers, but only of baptism, were first instituted in 1539. The Council of Trent, however, made registers both of baptisms and of marriages a law of the Catholic Church in 1563, and Louis XIV. imposed a tax on registered baptisms and marriages in 1707.

REGISTRATION. In all systems of law the registration of certain legal facts has been regarded as necessary, chiefly for the purpose of ensuring publicity and simplifying evidence. Registers, when made in performance of a public duty, are as a general rule admissible in evidence merely on the production from the proper custody of the registers themselves or (in most cases) a sworn or certified copy. The extent to which registration is carried varies very much in different countries. For obvious reasons, judicial decisions are registered in all countries alike. In other matters no general rule can be laid down, except perhaps that on the whole registration is not as fully enforced in the United Kingdom and the United States as in continental states. The most important uses of registration occur in the case of judicial proceedings, land, ships, bills of sale, births, marriages and deaths, companies, friendly and other societies, newspapers, copyrights, patents, designs, trade marks and professions and occupations. In England registrars are attached to the privy council, the Supreme Court and the county courts. In the king's bench division (except in its bankruptcy jurisdiction) the duty of registrars is performed by the masters. Besides exercising limited judicial authority, registrars are responsible for the drawing up and recording of various stages of the proceedings from the petition, writ or plaint to the final decision.[1] With them are filed affidavits, depositions, pleadings, &c., when such filing is necessary. The difference between filing and registration is that the documents filed are filed without alteration, while only an epitome is usually registered. The Judicature Act 1873 created district registries in the chief towns, the district registrar having an authority similar to that of a registrar of the Supreme Court. In the admiralty division cases of account are usually referred to the registrar and merchants. The registration in the central office of the supreme court of judgments affecting lands, writs of execution, recognizances and *lites pendentes* in England, and the registration in Scotland of abbreviates of adjudications and of inhibitions, are governed by special legislation. All these are among the incumbrances for which search is made on investigating a title. Decisions of criminal courts are said to be recorded, not registered, except in the case of courts of summary jurisdiction, in which, by the Summary Jurisdiction Act 1879, a register of convictions is kept. Probates of wills and letters of administration, which are really judicial decisions, are registered in the principal or district registries of the probate division. In Scotland registration is used for giving a summary remedy on obligations without action by means of the fiction of a judicial decision having been given establishing the obligation.

Registration of Votes.—Prior to 1832 the right of parliamentary electors in England was determined at the moment of the tender of the vote at the election, or, in the event of a petition against the return, by a scrutiny, a committee of the House of Commons striking off those whose qualification was held to be insufficient, and, on the other hand, adding those who, having tendered their votes at the poll, with a good title to do so, were rejected at the time. A conspicuous feature of the Reform Act of that year was the introduction of a new mode of ascertaining the rights of electors by means of an entirely new system of published lists, subject to claims and objections, and after due inquiry and revision forming a register of voters. Registration was not altogether unknown in Great Britain in connexion with the parliamentary franchise before the Reform Acts of 1832. Thus in the Scottish counties the right to vote depended on the voter's name being upon the roll of freeholders established by an act of Charles II.; a similar register existed in Ireland of freeholders whose freeholds were under £20 annual value; and in the universities of Oxford and Cambridge the rolls of members of Convocation and of the Senate were, as they still are, the registers of parliamentary voters. But except in such cases as the above, the right of a voter had to be determined by the returning officer upon the evidence produced before him when the vote was tendered at a poll. This necessarily took time, and the result was that a contested election in a large constituency might last for weeks. The celebrated Westminster election of 1784, in which the poll began on the 1st of April and ended on the 17th of May, may be mentioned as an illustration. Moreover, the decision of the returning officer was not conclusive; the title of every one who claimed to vote was liable to be reconsidered on an election petition, or, in the case of a rejected vote, in an action for damages by the voter against the returning officer.

The inconvenience of such a state of things would have been greatly aggravated had the old practice continued after the enlargement of the franchise in 1832. The establishment of a general system of registration was therefore a necessary and important part of the reform then effected. It has enabled an election in the most populous constituency to be completed in a single day. It has also been instrumental in the extinction

[1] The antiquity of registration of this kind is proved by the age of the *Registrum Brevium*, or register of writs, called by Lord Coke "a most ancient book of the Common Law" (Coke upon Littleton, 159a).

of the "occasional voter," who formerly gave so much trouble to returning officers and election committees—the person, namely, who acquired a qualifying tenement with the view of using it for a particular election and then disposing of it. The period of qualification now required in all cases, being fixed with reference to the formation of the register, is necessarily so long anterior to any election which it could effect, that the purpose or intention of the voter in acquiring the qualifying tenement has ceased to be material, and is not investigated.

England.—The reform of parliamentary representation in 1832 was followed in 1835 by that of the constitution of municipal corporations, which included the creation of a uniform qualification (now known as the old burgess qualification) for the municipal franchise. In 1888 the municipal franchise was enlarged, and was at the same time extended to the whole country for the formation of constituencies to elect county councils; and in 1894 parochial electors were called into existence for the election of parish councils and for other purposes. Inasmuch as provision was made for the registering of persons entitled to votes for the above purposes, there are now three registers of voters, namely, the parliamentary register, the local government register (*i.e.* in boroughs under the Municipal Corporation Acts, the burgess rolls, and elsewhere the county registers) and the register of parochial electors. Under the Municipal Corporations Act 1835 the registration of burgesses, though on similar lines to that of parliamentary voters, was entirely separate from it. Since, however, the qualification for the municipal franchise covered to a great extent the same ground as that for the parliamentary franchise in boroughs which sent members to parliament, a considerable number of voters in such boroughs were entitled in respect of the same tenement to be upon both parliamentary register and burgess roll. The waste of labour involved in settling their rights twice over was put an end to in 1878, when the system of parliamentary registration was extended to the boroughs in question for municipal purposes, and the lists were directed to be made out in such a shape that the portion common to the two registers could be detached and combined with the portion peculiar to each, so as to form the parliamentary register and the burgess roll respectively. This system of registration was extended to the non-parliamentary boroughs and to the whole country in 1888, the separate municipal registration being completely abolished.

Procedure.

The procedure of parliamentary registration is to be found in its main lines in the Parliamentary Registration Act 1843, which superseded that provided by the Reform Act 1832, and has itself been considerably amended by later legislation. The acts applying and adapting the system to local government and parochial registration are the Parliamentary and Municipal Registration Act 1878, the County Electors Act 1888, and the Local Government Act 1894. Registration is carried out by local machinery, the common-law parish being taken as the registration unit; and the work of preparing and publishing the lists, which when revised are to form the register, is committed to the overseers. The selection of these officers was no doubt due to their position as the rating authority, and to their consequent opportunities for knowing the ownership and occupation of tenements within their parish. They are not always perform the duties themselves, other persons being empowered to act for them in many parishes by general or local acts of parliament; but in all or almost all cases they are entitled to act personally if they think fit, they sign the lists, and the proceedings are conducted in their name.

In order to render intelligible the following summary of the procedure, it will be necessary to refer to voters by the registered introduced classes based on the nature of their qualification, since the practice differs in regard to each class. The classes are as follows: (1) Owners, including the old forty-shilling freeholders, and the copyholders, long leaseholders and others entitled under the Reform Act of 1832 to vote at parliamentary elections for counties; (2) occupiers, including those entitled to (*a*) the £10 occupation qualification, (*b*) the household qualification and (*c*) the old burgess qualification; (3) lodgers, subdivided into (*a*) old, *i.e.* those on the previous register for the same lodgings, and (*b*) new; (4) those entitled to reserved rights, *i.e.* in addition to those (if any still remain) who were entitled to votes before the Reform Act of 1832 in respect of qualifications abolished by that act, (*a*) freeholders and burgage tenants in Bristol, Exeter, Norwich, and Nottingham, and (*b*) liverymen of the City of London and freemen of certain old cities and boroughs, whose right to the parliamentary franchise was permanently retained by the same act. In regard to these classes it may be said that the general scheme is that owners must make a claim in the first instance before they can get their names upon the register, but that, once entered on the register, the names will be retained from year to year until removed by the revising barrister; that the lists of occupiers and of freehold and burgage tenants are made out afresh every year by the overseers from their own information and inquiries, without any act being required on the part of the voters, who therefore make claims in case their names are omitted; that lodgers must make claims every year; and that liverymen and freemen are in the same position as occupiers, except that the lists of liverymen are made out by the clerks of the several companies, and not by the overseers. For the town clerks, the overseers having nothing to do with these voters, whose qualifications are personal and not locally connected with any parish.

The overseers and other officers concerned are required to perform their duties in connexion with registration in accordance with the instructions and precepts, and to use the notices and forms prescribed by Order in Council from time to time. The Registration Order, 1895, directs the clerk of every county council, on or within seven days before the 15th of April in every year, to send to the overseers of each parish in his county a precept with regard to the registration of ownership electors, and to every parish not within a parliamentary or municipal borough a precept with regard to the registration of occupation electors (which expression for this purpose includes lodgers as well as occupiers proper). The town clerk of every borough, municipal or parliamentary, is to send to the overseers of every parish in his borough a precept with regard to the registration of occupation electors. These precepts are set out in the Registration Order, and those issued by the town clerks differ according as the borough contains parliamentary or municipal only, or both parliamentary and municipal; in the cases of Bristol, Exeter, Norwich and Nottingham they contain directions as to freehold and burgage tenants. The duties of the overseers in regard to registration are set out in detail in the precepts. Along with the precepts are forwarded forms of the various lists and notices required to be used, and with the ownership precept a certain number of copies of that portion of the parliamentary register of the county as the time of the last publication of which a number, for the parish, the register being so printed that the portion relating to each parish can be detached. It is the duty of the overseers to publish on the 20th of June, in manner hereinafter described, the portion of the register common to the two registers, and to summon not already registered to send in claims by the 20th of July. Meanwhile the overseers are making the inquiries necessary for the preparation of the occupier list. For this purpose they may require returns to be furnished by owners of houses and of separate tenements, and by employers who have servants entitled to the service franchise. The registrars of births, deaths and marriages are required to furnish the overseers with returns of deaths, as must also assessed tax collectors, relieving officers and other relieving officers are to give information as to recipients of parochial relief. On or before the 31st of July the overseers are to make out and sign the lists of voters. These are the following: the list of ownership electors, consisting of those on the last register previously published with a supplemental list of those who have sent in claims by the 20th of July; the occupier list; and the old lodger list, the last being formed from claims sent in by the 25th of July. The overseers do not select the names in the first and last of these lists; they take them as supplied in the register and claims. It is, however, their duty to write "dead" or "objected" in the margin against the names of persons whom they have reason to believe to be dead or not entitled to vote in respect of the qualification described. The ownership and old lodger lists will be divided into two parts, if the register contains names of owners entitled to a parliamentary vote who have claimed to be placed thereon and been made limited to that franchise. The occupier list contains the names of persons whom the overseers believe to be qualified, and no others, and therefore will be free from marginal objections. Except in the administrative old borough of London, it is formed in three divisions—division 1 giving the names of occupiers of property qualifying for both parliamentary and local government votes, divisions 2 and 3 those of occupiers of property qualifying only for parliamentary or only for local government votes respectively. It happens so frequently that a tenement, if not of sufficient value to qualify for the £10 occupation franchise (parliamentary and local government), qualifies both for the household franchise (parliamentary) and for the old burgess franchise (local government), that division 1 would in most cases be the whole list, but for two circumstances. The service franchise is a special modification of the household franchise only; and the service occupants, being therefore restricted to the parliamentary vote, form the bulk of division 2; while peers and women, being excluded from the parliamentary vote, are consequently relegated to division 3. In the administrative county of London the local government register, being coextensive with the register of parochial electors, includes

the whole of the parliamentary register. The occupier lists are consequently there made out in two divisions only, the names which would elsewhere appear in division 2 being placed in division 1. The lists of freehold and burgage tenants in Bristol, Exeter, Norwich and Nottingham are to be made out and signed by the same date. The overseers have also to make out and sign a list of persons qualified as occupiers to be elected aldermen or councillors, but as non-residents disqualified from being on the local government register. By the same date also the clerks of the Inner Temple Societies are to make out, sign and deliver to the secondary (who performs in the City of London the registration duties which elsewhere fall on the town clerk) the lists of liverymen entitled as such to the parliamentary vote; and the town clerks are to make out and sign the lists of freemen so entitled in towns where this franchise exists.

On the 1st of August all the above lists are to be published, the livery lists by the secondary, lists of freemen by the town clerks and the rest by the overseers. In addition the overseers may have to publish a list of persons disqualified by having been found guilty of corrupt or illegal practices; this list they will receive, when it exists, from the clerk of the county council or town clerk with the precept. Publication of lists and notices by overseers is made by affixing copies on the doors of the church and other places of worship of the parish (or, if there be none, in some public or conspicuous situation in the parish), and also, with the exception to be mentioned, in the case of a parish wholly or partly within a municipal borough or urban district, in or near every public or municipal or parochial office and every post and telegraph office in the parish. The exception is that lists and notices relating to ownership electors need not be published at the offices mentioned when the parish is within a parliamentary borough, but by the secretary of the library is made by affixing copies outside the Guildhall and Royal Exchange; publication by town clerks is made by affixing copies outside their town hall, or, where there is none, in some public or conspicuous place in the borough. From the 1st to the 20th of August the revision is allowed for the sending in of claims and objections. Those whose names have been omitted from the occupier or reserved rights lists, or the non-resident list, or whose names, place of abode or particulars of qualification have been altered in such lists or any of them, may send in claims to have their names registered; lodgers who are not qualified as old lodgers, or who have omitted to claim as such, may claim as new lodgers; persons whose names are on the corrupt and illegal practices list may claim to have their names omitted. Any person whose name is on the list of parliamentary, local government or parochial electors for the same parliamentary county, administrative county, borough or parish, may object to names on the same lists. Notices of claim and objection in the case of liverymen and freemen are to be sent to the secondary and town clerk, and in other cases to the overseers; and notices of objection must also in all cases be sent to the person objected to. All notices must be sent in before the 20th of August, and on or before the 25th of August the overseers, secondary and town clerks are to make out, sign and publish lists of the claimants and persons objected to. It remains to be added that any person on a list of voters may, on one of the last two days of August (the 30th or 31st) may make a declaration before a magistrate or commissioner for oaths correcting the entry relating to him. In the case of ownership electors the correction can only deal with the place of abode; in the case of other lists it extends to all particulars stated, but is useful inasmuch as it enables the revising barrister to make corrections as to the qualification which he could not make in the absence of a declaration. The declarations must be delivered to the clerk of the county council or town clerk on or before the 5th of September.

The next stage is the revision of the lists. For this purpose revising barristers are appointed yearly. The period within which revision courts can be held is from the 8th of September to the 12th of October (all days included). The clerk of the county council attends the first court held for each parliamentary division of his county, and the town clerk the first court held for his city or borough; and they respectively produce all lists, notices and declarations in their custody, and answer any questions put to them by the revising barrister. The overseers also attend the courts held for their parish, produce the rate books, original notices of claim and objection, &c., and answer questions. The claimants, objectors and persons objected to appear personally or by representative to support their several contentions. Any person qualified to be an objector may also appear to oppose any claims, upon giving notice to the barrister before such claims are reached. The powers of the revising barristers are as follows: As regards persons whose names are on the lists of voters published on the 1st of August, he is to expunge the names, whether objected to or not, of those who are dead or subject to personal incapacity, such as infants and lunatics, or for parliamentary purposes peers and women. If an entry is imperfect, the name must be removed, unless the particulars necessary for completing it are supplied to the barrister. All names marginally objected to by overseers must be expunged, unless the voters prove to the barrister that they ought to be retained. Objections made by other objectors must be supported by prima facie proof, and if this is not rebutted the name is struck out. Claimants must be ready to support their claims. The declaration attached to a lodger claim is made prima facie proof of the facts stated in it, but other claimants require evidence to make out even a prima facie case, and if they fail to produce it their claims will be disallowed. The barrister is required to correct errors in the lists of voters, and has a discretion to rectify mistakes in claims and objections upon evidence produced to him, although his power in this respect is limited. Lastly, the barrister has to deal with duplicates, as a voter is entitled to be on the register once, but not more than once, as a parliamentary voter for each parliamentary county or borough, as a burgess for each municipal borough, as a county elector for each electoral division, and as a parochial elector for each parish in which he holds a qualification. Consequently, he deals with duplicate entries by expunging or transferring them to separate parochial lists. The decision of the revising barrister is final and conclusive on all questions of fact; but an appeal lies from him on questions of law at the instance of any person aggrieved by the removal of his name from a list of voters, by the retention of his claim or objection or by the allowance of a claim which he has opposed. Notice of the intention to appeal must be given to the barrister in writing on the day when his decision is given. The barrister may refuse to state a case for appeal; but if he does so without due cause he may be ordered by the High Court to state a case. The appeal is heard by a divisional court, from whose decision an appeal lies (by leave either of the divisional court or of the court of appeal) to the court of appeal, whose decision is final.

Revising barristers.

On the completion of the revision the barrister hands the county and borough lists (every page signed and every alteration initialled by him) to the clerk of the county council and the town clerk respectively, to be printed. With the following exceptions the revised lists are to be made up and published by the 20th of October, and come into force as the register for all purposes on the 1st of January. In the boroughs created by the London Government Act 1899, the whole register is to be made up and printed by the 20th of October, and to come into force for the purposes of the parliamentary election under the act on the 1st of November. In boroughs subject to the Municipal Corporations Acts, divisions 1 and 3 of the occupiers' list are to be made up and printed by the 20th of October, and come into force for the purposes of the parliamentary county election on the 1st of November. Corrections ordered in consequence of a successful appeal from a revising barrister are to be made by the officers having the custody of the registers, but a pending appeal does not affect any right of voting. The register in its final form will consist of the lists published on the 1st of August as corrected, with the claims which have been allowed on revision incorporated with them. It is printed in such form that each list and each division of a list for each parish can be separated from the rest for the purpose of making up the parliamentary, local government and parochial registers respectively. The alphabetical order is followed, except in London and some other large towns, where street order is adopted for all except the ownership lists and lists of liverymen and freemen. The parliamentary register for a parliamentary county will consist of the ownership lists for all parishes in the county, and of the lodger lists and divisions 1 and 2 of the occupier lists for parishes within the county and not within a parliamentary borough. The parliamentary register for a parliamentary borough will consist of the lodger lists, of the lists of freehold and burgage tenants (if any), and of divisions 1 and 2 of the occupier lists for all parishes within the borough, and also of the borough lists (if any) of liverymen or freemen. The local government register for an administrative county will consist of divisions 1 and 3 of the occupier lists for all parishes in the county, and the burgess roll of a municipal borough of divisions 1 and 3 of the occupier lists for all parishes in the borough. It will be seen, therefore, that, except in county boroughs, the burgess roll is also a part of the local government register of the administrative county within which the borough is situate. The register of parochial electors consists of the complete set of lists for each parish; but this does not include the lists of liverymen and freemen, which, as has been stated, are not parish lists.

No one whose name is on the register can vote until after an election. The fact that a man's name is on the register is now so far conclusive of his right that the returning officer is bound to receive his vote. Only two questions may be asked of him when he tenders his vote, namely, whether he is the person whose name is on the register, and whether he has voted before at the election. The Reform Act 1832 allowed him to be asked at parliamentary elections whether he retained the qualification for which he had been registered; but the Registration Act 1843 disallowed the question, and made the register conclusive as to the retention of the qualification. When, however, a petition is presented against an election, the register, although conclusive as to the retention of the qualification, does not prevent the court from inquiring into the existence of personal incapacities, arising in connexion with the election or otherwise, and striking off on scrutiny the votes of persons subject thereto, *e.g.* aliens, infants, or in parliamentary elections peers, &c.

The City of London is not within the Municipal Corporations Acts, and is not subject to the general registration law in the formation of its roll of citizens for municipal purposes. But a register of parliamentary, county and parochial electors is made in

the ordinary way. The universities are also exempt from the general law of registration. At Oxford and Cambridge the members of Convocation and the Senate respectively have always formed the parliamentary constituencies; and, as has been already stated, the registers of those members were before 1832, and still are, the parliamentary registers. Similarly, the Reform Act of 1867, which gave parliamentary representation to the university of London, simply enacted that the register of graduates constituting the Convocation should be the parliamentary register of that body.

Scotland.—In Scotland the qualifications for local government and parish electors are the same as those for parliamentary voters, the only difference in the registers being in respect of personal incapacities for the parliamentary franchise, disparagia, or the other franchises by reason of non-payment of rates, and duplicates. The principal act regulating registration in burghs is 19 & 20 Vict. c. 58, amended in some particulars as to dates by 31 & 32 Vict. c. 48, § 20. County registration, formerly regulated by 24 & 25 Vict. c. 83, has been assimilated to burgh registration by 48 & 49 Vict. c. 3, § 8 (6). The procedure consists, as in England, of the making and publication of lists of voters, the making of claims and objections, and the holding of revision courts; but there are important differences of detail. Though the parish is the registration unit, parochial machinery is not used for the formation of the register. The parliamentary lists for a county are made up yearly by one or more of the assessors for the county, and those for a burgh by one or more of the assessors for the burgh, or by the clerk of the commissioners. They are published on the 15th of September; and claims and objections must be sent in by the 21st and are published on the 25th of September. Publication is made in burghs by posting on or near the town hall, or in some other conspicuous place, in counties by posting the part relating to each parish on the parish church door, and in both cases giving notice by newspaper advertisement of a place where the lists may be perused. The revision is conducted by the sheriff, the time within which his courts may be held being from the 25th of September to the 10th of October, both days inclusive. An appeal lies to three judges of the Court of Session, taken from each division of the Inner House, and one from the Lords Ordinary of the Outer House. The revised lists are delivered in counties to the sheriff clerk, in burghs to the town clerk, or person to whom the registration duties of town clerk are assigned. The register comes into force for all purposes on the 1st of November.

The municipal register of a royal burgh which is coextensive, or of that part of a royal burgh which is coextensive with a parliamentary burgh, consists of the parliamentary register with a supplemental list of women who but for their sex would be qualified for the parliamentary vote. The municipal register for a burgh, or for that part of one which is not within a parliamentary burgh, consists of persons possessed of qualifications within the burgh which, if within a parliamentary burgh, would entitle them, or but for their sex would entitle them, to the parliamentary vote. The register of a county electoral division is a parliamentary register for a county with the supplemental list hereafter mentioned; but inasmuch as exemption from or failure to pay the consolidated county rate is a disqualification for the county electors' franchise, the names of persons so disqualified are kept in the lists as a distinctive mark on the register; as are also the names of persons whose qualifications are situated within a burgh, such marks indicating that the persons to whose names they are attached are not entitled to vote as county electors. Every third year in preparation for the triennial elections of county and parish councils (casual vacancies being filled up by co-optation), a supplemental list is to be made of peers and women possessed of qualifications which but for their rank and sex would entitle them to parliamentary votes. The register of county electors in a county and the municipal register in a burgh form the registers of parish electors for the parishes comprised in each respectively. Inasmuch, however, as a man is entitled to be registered as a parish elector in every parish where he is qualified, duplicate entries are, when required, to be made in the register, with distinctive marks to all but one, to indicate that they confer the parish vote only. These distinctive marks and the previously mentioned are to be made in the lists by the assessors, subject to revision by the sheriff. The register is conclusive to the same extent as in England, except that the vote of a parish elector who is one year in arrear in payment of a parish rate is not to be received. The clerk of the parish council is to furnish the returning officer one week before an election with the names of persons so in arrear; and the returning officer is to reject their votes except upon the production of a written certificate. Provision is made by 48 & 49 Vict. c. 23, § 2, for the formation of registers of parliamentary electors for the universities. The register for each university is to be made annually by the university registrar, with the assistance of two members of the council, from whose decisions an appeal lies to the university court.

Ireland.—There are no parish councils in Ireland, and no parochial electors. There are therefore but two registers of voters, the parliamentary and the local government registers, the latter of which consists of the former with a local government supplement containing the names of those excluded from the parliamentary register by reason of their being peers or women, and duplicate entries relating to those whose names are registered elsewhere for the same parliamentary constituency. The principal acts regulating registration are 13 & 14 Vict. c. 69, 31 & 32 Vict. c. 112, 48 & 49 Vict. c. 17, and 61 & 62 Vict. c. 2. The lord lieutenant is empowered to make by Order in Council rules for registration, and to prescribe forms; and under this power he has made the Registration (Ireland) Rules 1896, now in force. The registration unit is not the parish, but the district electoral division, except where such division is subdivided into wards, or is partly within and partly without any town or ward of a borough or town, in which cases each ward of the division or part of a division is a separate registration unit.

The procedure is as follows, subject to variation in cases where there are clerks of unions who held office on the 31st of March 1898, and have not agreed to transfer their registration duties. The clerk of the peace sends out on the 1st of June a precept in the form prescribed for county registration to the secretary of the county council and clerks of urban district councils, together with a copy of the existing register for their county or district; and a precept in the form prescribed for borough registration to town clerks of boroughs. As regards registration units not in a parliamentary or municipal borough, the secretary of the county council or clerk of the urban district council is to put marginal objections, "dead" or "objected," where required, to £10 occupiers and householders in the copy of the register, both in the parliamentary list and in the local government supplement. He is also to make out supplemental parliamentary and local government lists of £10 occupiers and householders not on the existing register, and to put marginal objections where required to these. He is to verify on oath before a commissioner the copy of the register and supplemental lists, and to return them to the clerk of the peace by the 8th of July. As regards registration units in a parliamentary borough, but outside a municipal borough, the secretary of the county council or clerk of the urban district council is to make out lists of £10 occupiers and householders with local government supplement, and transmit them to the town clerk of the municipal borough or town. The clerk of the peace is to publish the copy of the register, after himself placing marginal objections, and the lists of voters other than £10 occupiers and householders, and the supplemental lists as received, and also the corrupt and illegal practices list, if any, on the 22nd of July. On the same day the town clerk will publish the lists received as aforesaid in the same way in the wards of the municipal borough, and the lists, which he will have made out himself for the municipal borough, including the freemen's list and corrupt and illegal practices list. Freemen being entitled to the local government vote will, if resident, be published in the list of registration unit where they reside, and will, if non-resident, be affected by the revising barrister among the registration units of the borough for local government purposes in proportion to the number of freemen in each registration unit. Claims are to be sent in to the clerk of the peace and town clerk by the 4th of August, including old lodger claims and, in the case of the clerk of the peace, ownership claims. Lists of claimants with marginal objections, where objected to, are to be published by the clerk of the peace and town clerk by the 11th of August. Notices of objection to voters or claimants may be given by the 20th of August; and lists of persons objected to are to be published by the clerk of the peace and town clerk by the 24th of the same month. Publication of lists, and notices by a clerk of the peace is made by posting copies of those relating to each registration unit outside every court-house, petty sessions court, and other public offices in the unit; publication by a town clerk is made by posting copies outside the town hall, or, if there be none, in some public and conspicuous place in the borough.

Revising barristers are specially appointed for the county and city of Dublin by the lord lieutenant; elsewhere the county court judges and chairmen of quarter sessions act as such *ex officio*, assisted, when necessary, by additional barristers appointed by the lord lieutenant. The time for the holding of revision courts is between the 8th of September and the 31st of October inclusive. An appeal lies to the court of appeal, whose decision is final. The revised lists are handed to the clerk of the peace; they are to be made up by him by the 31st of December, and come into force on the 1st of January.

The registrar of the university of Dublin is to make out in December a list of the persons entitled to the parliamentary vote for the university, and to print the same in January, and to publish it in the university calendar, or in one or more public journals circulating in Ireland. He is to revise the list annually, and expunge the names of those dead or disqualified; but an elector whose name has been expunged because he was supposed to be dead is entitled, if alive, to have his name immediately restored and to vote at any election.

(L. L. S.)

REGIUM (Gr. *Ῥήγιον*: in Latin the aspirate is omitted), a city of the territory of the Bruttii in South Italy, on the east side of the strait between Italy and Sicily (Strait of Messina).

A colony, mainly of Chalcidians, partly of Messenians from the Peloponnesus, settled at Regium in the 8th century B.C. About 494 B.C. Anaxilas, a member of the Messenian party, made himself master of Regium (apparently—from numismatic evidence, for the coins assignable to this period are modelled on Samian types—with the help of the Samians: see MESSINA) and about 488 joined with them in occupying Zancle (Messina). Here they remained. (See C. H. Dodd in *Journal of Hellenic Studies*, xxviii. (1908) 56 sqq.) This coinage was resumed after the establishment of the democracy about 461 B.C., when Anaxilas' sons were driven out. In 433 Regium made a treaty with Athens, and in 427 joined the Athenians against Syracuse, but in 415 it remained neutral. An attack which it made on Dionysius I. of Syracuse in 399 was the beginning of a great struggle which in 387 resulted in its complete destruction and the dispersion of its inhabitants as slaves. Restored by the younger Dionysius under the name of Phoebias, the colony soon recovered its prosperity and resumed its original designation. In 280, when Pyrrhus invaded Italy, the Regines admitted within their walls a Roman garrison of Campanian troops; these mercenaries revolted, massacred the male citizens, and held the city till in 270 they were besieged and put to death by the Roman consul Genucius. The city remained faithful to Rome throughout the Punic wars, and Hannibal never succeeded in taking it. Up till the Social War it struck coins of its own, with Greek legends. Though one of the cities promised by the triumvirs to the veterans, Regium escaped through the favour of Octavius (hence it took the name Regium Julium). It continued, however, to be a Greek city even under the Empire, and never became a colony. Towards the end of the Empire it was made the chief city of the Bruttii.

Of ancient buildings hardly anything remains at Regium, and nothing of the archaic Greek period is *in situ*, except possibly the remains of a temple of Artemis Phacelitis, which have not yet been explored, though various inscriptions relative to it have been found. The museum, however, contains a number of terra-cottas, vases, inscriptions, &c., and a number of Byzantine lead seals. Several baths of the Greek period, modified by the Romans, have been found, and the remains of one of these may still be seen. A large mosaic of the 3rd or 4th century A.D. with representations of wild animals and the figure of a warrior in the centre was found in 1904 and covered up again. The aqueduct and various cisterns connected with it have been traced, and some tombs of the 5th or 4th century B.C. (or even later) were found in 1907.

See *Notizie degli scavi*, *passim*; P. Larizza, *Rhegium Chalcidense* (Rome, 1905). · (T. As.)

REGIUM DONUM, or ROYAL GIFT, an annual grant formerly made from the public funds to Presbyterian and other Nonconformist ministers in Great Britain and Ireland. It dates from the reign of Charles II., who, according to Bishop Burnet, after the declaration of indulgence of 1672 ordered sums of money to be paid to Presbyterian ministers. These gifts or pensions were soon discontinued, but in 1690 William III. made a grant of £1200 a year to the Presbyterian ministers in Ireland as a reward for their services during his struggle with James II. Owing to the opposition of the Irish House of Lords the money was not paid in 1711 and some subsequent years, but it was revived in 1715 by George I., who increased the amount to £2000 a year. Further additions were made in 1784 and in 1792, and in 1868 the sum granted to the Irish Presbyterian ministers was £45,000. The Regium Donum was withdrawn by the act of 1869 which disestablished the Irish church. Provision was made, however, for existing interests therein, and many Presbyterian ministers commuted these on the same terms as the clergy of the church of Ireland.

In England the Regium Donum proper dates from 1721, when Dr Edmund Calamy (1671–1732) received £500 from the royal bounty "for the use and behalf of the poor widows of dissenting ministers." Afterwards this sum was increased to £1000 and was made an annual payment "for the assisting either ministers or their widows," and later it amounted to £1695 per annum. It was given to distributors who represented the three denominations, Presbyterians, Baptists and Independents, enjoying the grant. Among the Nonconformists themselves, however, or at least among the Baptists and the Independents, there was some objection to this form of state aid, and in 1851 the chancellor of the exchequer announced that it would be withdrawn. This was done six years later.

See J. Stoughton, *History of Religion in England* (1901); J. S. Reid, *History of the Presbyterian Church in Ireland* (Belfast, 1867); and E. Calamy, *Historical Account of my own Life*, edited by J. T. Rutt (1829).

REGLA, formerly an important suburb of Havana, Cuba, opposite that city, on the bay; now a part of Havana. Pop. (1899) 11,363. It was formerly the scene of the Havana bull-fights. The church is one of the best in Cuba; the building dates substantially from 1805, but the church settlement goes back to a hermitage established in 1690. Regla is the shipping-point of the Havana sugar trade. It has enormous sugar and tobacco warehouses, fine wharves, a dry dock, foundries and an electric railway plant. It is the western terminus of the eastern line of the United Railways of Havana, and is connected with the main city of Havana by ferry. A fishing village was established here about 1733. At the end of the 18th century Regla was a principal centre of the smuggling trade, and about 1820 was notorious as a resort of pirates. It first secured an *ayuntamiento* (city council) in 1872, and after 1899 was annexed to Havana.

REGNARD, JEAN FRANÇOIS (1655–1709), French comic dramatist, was born in Paris on the 7th of February 1655. His father, a rich shopkeeper, died when Regnard was about twenty, leaving him master of a considerable fortune. He set off at once for Italy, and, after a series of romantic adventures, he journeyed by Holland, Denmark and Sweden to Lapland, and thence by Poland, Turkey, Hungary and Germany back to France. He returned to Paris at the end of 1683, and bought the place of treasurer of France in the Paris district; he had a house at Paris in the Rue Richelieu; and he acquired the small estate of Grillon near Dourdan in the department of Seine-et-Oise, where he hunted, feasted and wrote comedies. This latter amusement he began in 1688 with a piece called *Le Divorce*, which was performed at the Théâtre Italien. In four slight pieces of the same nature he collaborated with Charles Rivière Dufresny. He gained access to the Théâtre Français on the 19th of May 1694 with a piece called *Attendez-moi sous l'orme*, and two years later, on the 19th of December 1696, he produced there the masterly comedy of *Le Joueur*. The idea of the play was evolved in collaboration with Dufresny, but the authors disagreed in carrying it out. Finally they each produced a comedy on the subject, Dufresny in prose, and Regnard in verse. Each accused the other of plagiarism. The plot of Regnard's piece turns on the love of two sisters for Valère, the gambler, who loves one and pretends to love the other, really deceiving them both, because there is no room for any other passion in his character except the love of play. Other of his plays were *La Sérénade* (1694), *Le Bourgeois de Falaise* (1696), *Le Distrait* (1697), *Démocrite* (1700), *Le Retour imprévu* (1700), *Les Folies amoureuses* (1704), *Les Ménechmes* (1705), a clever following of Plautus, and his masterpiece, *Le Légataire universel* (1708).

Regnard's death on the 4th of September 1709 renews the doubtful and romantic circumstances of his earlier life. Some hint at poison, but the truth seems to be that his death was hastened by the rate at which he lived.

Besides the plays noticed above and others, Regnard wrote miscellaneous poems, the autobiographical romance of *La Provençale*, and several short accounts in prose of his travels, published posthumously under the title of *Voyages*. Regnard had written a reply to the tenth satire of Boileau, *Contre les femmes*, and Boileau had retorted by putting Regnard among the poets depreciated in his epistle *Sur mes vers*. After the appearance of *Le Joueur* the poet altered his opinion and cut out the allusion. The saying attributed to Boileau when some one, thinking to curry favour, remarked that Regnard was only a mediocre poet, "*Il n'est pas médiocrement gai*," is both true and very appropriate. His French style, especially in his purely prose works, is not considered faultless. He is often unoriginal in his plots, and, whether Dufresny was or was not justified in his complaint about *Le Joueur*, it seems likely that Regnard owed not a little to him and to others; but he had a thorough grasp of

comic situation and incident, and a most amusing faculty of dialogue.

The first edition of Regnard's works was published in 1731 (5 vols., Rouen and Paris). There is a good selection of almost everything important in the Collection Didot (4 vols., 1819), but there is no absolutely complete edition. The best is that published by Crapelet (6 vols., Paris, 1822). A selection by L. Moland appeared in 1893. See also a *Bibliographie et iconographie des œuvres de J. F. Regnard* (Paris, Rouquette, 1878); *Le Poète J. F. Regnard en son chasteau de Grillon*, by J. Guyot (Paris, 1907).

REGNAULT, HENRI (1843–1871), French painter, born at Paris on the 21st October 1843, was the son of Henri Victor Regnault (*q.v.*). On leaving school he successively entered the studios of Montfort, Lamothe and Cabanel, was beaten for the *Grand Prix* (1863) by Layraud and Montchablon, and in 1864 exhibited two portraits in no wise remarkable at the Salon. In 1866, however, he carried off the *Grand Prix* with a work of unusual force and distinction—"Thetis bringing the Arms forged by Vulcan to Achilles" (School of the Fine Arts). The past in Italy did not touch him, but his illustrations to Wey's *Rome* show how observant he was of actual life and manners; even his "Automedon" (School of Fine Arts), executed in obedience to Academical regulations, was but a lively recollection of a carnival horse-race. At Rome, moreover, Regnault came into contact with the modern Hispano-Italian school, a school highly materialistic and inclined to regard even the human subject only as one amongst many sources whence to obtain amusement for the eye. The vital, if narrow, energy of this school told on Regnault with ever-increasing force during the few remaining years of his life. In 1868 he had sent to the Salon a life-size portrait of a lady in which he had made one of the first attempts to render the actual character of fashionable modern life. While making a tour in Spain, he saw Prim pass at the head of his troops, and received that lively image of a military demagogue which he afterwards put on canvas, somewhat to the displeasure of his subject. But this work made an appeal to the imagination of the public, whilst all the later productions of Regnault were addressed exclusively to the eye. After a further flight to Africa, abridged by the necessities of his position as a pensioner of the school of Rome, he painted "Judith," then (1870) "Salome," and, as a work due from the Roman school, despatched from Tangier the large canvas, "Execution without Hearing under the Moorish Kings," in which the painter had played with the blood of the victim as if he were a jeweller toying with rubies. The war arose, and found Regnault foremost in the devoted ranks of Buzenval, where he fell on the 19th of January 1871.

See *Correspondance de H. Regnault*; Duparc, *H. Regnault, sa vie et son œuvre*; Cazalis, *H. Regnault, 1843–1871*; Baillière, *Les Artistes de mon temps*; C. Blanc, *H. Regnault*; P. Mantz, *Gazette des Beaux Arts* (1872).

REGNAULT, HENRI VICTOR (1810–1878), French chemist and physicist, was born on the 21st of July 1810 at Aix-la-Chapelle. His early life was a struggle with poverty. When a boy he went to Paris and obtained a situation in a large drapery establishment, where he remained, occupying every spare hour in study, until he was in his twentieth year. Then he entered the École Polytechnique, and passed in 1832 to the École des Mines, where he developed an aptitude for experimental chemistry. A few years later he was appointed to a professorship of chemistry at Lyons. His most important contribution to organic chemistry was a series of researches, begun in 1835, on the haloid and other derivatives of unsaturated hydrocarbons. He also studied the alkaloids and organic acids, introduced a classification of the metals according to the facility with which they or their sulphides are oxidized by steam at high temperatures, and effected a comparison of the chemical composition of atmospheric air from all parts of the world. In 1840 he was recalled to Paris by his appointment to the chair of chemistry in the École Polytechnique; at the same time he was elected a member of the Académie des Sciences, in the chemical section, in room of P. J. Robiquet (1780–1840); and in the following year he became professor of physics in the Collège de France, there succeeding P. L. Dulong, his old master, and in many respects his model. From this time Regnault devoted almost all his attention to practical physics; but in 1847 he published a four-volume treatise on *Chemistry* which has been translated into many languages.

Regnault executed a careful redetermination of the specific heats of all the elements obtainable, and of many compounds—solids, liquids and gases. He investigated the expansibility of gases by heat, determining the coefficient for air as 0·003665, and showed that, contrary to previous opinion, no two gases had precisely the same rate of expansion. By numerous delicate experiments he proved that Boyle's law is only approximately true, and that those gases which are most readily liquefied diverge most widely from obedience to it. He studied the whole subject of thermometry critically; he introduced the use of an accurate air-thermometer, and compared its indications with those of a mercurial thermometer, determining the absolute dilatation of mercury by heat as a step in the process. He also paid attention to hygrometry and devised a hygrometer in which a cooled metal surface is used for the deposition of moisture.

In 1854 he was appointed to succeed J. J. Ebelmen (1814–1852) as director of the porcelain manufactory at Sèvres. He carried on his great research on the expansion of gases in the laboratory at Sèvres, but all the results of his latest work were destroyed during the Franco-German War, in which also his son Henri (noticed above) was killed. Regnault never recovered from the double blow, and, although he lived until the 19th of January 1878, his scientific labours ended in 1872. He wrote more than eighty papers on scientific subjects, and he made important researches in conjunction with other workers. His greatest work, bearing on the practical treatment of steam-engines, forms vol. xxi. of the *Mémoires de l'Académie des Sciences*.

REGNAULT, JEAN BAPTISTE (1754–1829), French painter, was born at Paris on the 9th of October 1754, and died in the same city on the 12th of November 1829. He began life at sea in a merchant vessel, but at the age of fifteen his talent attracted attention, and he was sent to Italy by M. de Monval under the care of Bardin. After his return to Paris, Regnault, in 1776, obtained the *Grand Prix*, and in 1783 he was elected Academician. His diploma picture, the "Education of Achilles by Chiron," is now in the Louvre, as also the "Christ taken down from the Cross," originally executed for the royal chapel at Fontainebleau, and two minor works—the "Origin of Painting" and "Pygmalion praying Venus to give Life to his Statue." Besides various small pictures and allegorical subjects, Regnault was also the author of many large historical paintings; and his school, which reckoned amongst its chief attendants Guérin, Crepin, Lafitte, Blondel, Robert Lefevre and Menjaud, was for a long while the rival in influence of that of David.

REGNAULT DE SAINT JEAN D'ANGÉLY, MICHEL LOUIS ÉTIENNE, COMTE (1761–1819), French politician, was born at Saint Fargeau (Yonne) on the 3rd of December 1761. Before the Revolution he was an *avocat* in Paris and lieutenant of the maritime provostship of Rochefort. In 1789 he was elected deputy to the States General by the Third Estate of the *sénéchaussée* of Saint Jean d'Angély. His eloquence made him a prominent figure in the Constituent Assembly, where he boldly attacked Mirabeau, and settled the dispute about the ashes of Voltaire by decreeing that they belonged to the nation. But the moderation shown by the measures he proposed at the time of the flight of the king to Varennes, by his refusal to accede to the demands for the king's execution, and by the articles he published in the *Journal de Paris* and the *Ami des patriotes*, marked him out for the hostility of the advanced parties. He was arrested after the revolution of the 10th of August 1792, but succeeded in escaping, and during the reaction which followed the fall of Robespierre was appointed administrator of the military hospitals in Paris. His powers of organization brought him to Bonaparte's notice, and he took part in the *coup d'état* of 18 Brumaire, year VIII. (9th of November 1799). Under the Empire he enjoyed the confidence of Bonaparte, and was made councillor of state, president of section in the Council of State,

member of the French Academy, *procureur général* of the high court, and a count of the Empire. He was dismissed on the first restoration of the Bourbons, but resumed his posts during the Hundred Days, and after Waterloo persuaded the emperor to abdicate. He was exiled by the government of the second Restoration, but subsequently obtained leave to return to France. He died on the day of his return to Paris (11th of March 1819). *Les Souvenirs du Comte Regnault de St Jean d'Angély* (Paris, 1817) are spurious. His son, AUGUSTE MICHEL ÉTIENNE REGNAULT DE SAINT JEAN D'ANGÉLY (1794–1870), an army officer, was dismissed from the army by the Restoration government, fought for the Greeks in the Greek War of Independence, and rejoined the French army in 1830. In 1848 he was elected deputy and sat on the right. Under the Second Empire he went through the Crimean and Italian campaigns, and was made senator and marshal for bravery at the battle of Magenta.

RÉGNIER, HENRI FRANÇOIS JOSEPH DE (1864–), French poet, was born at Honfleur (Calvados) on the 28th of December 1864, and was educated in Paris for the law. In 1885 he began to contribute to the Parisian reviews, and his verses found their way into most of the French and Belgian periodicals favourable to the symbolist writers. Having begun, however, to write under the leadership of the Parnassians, he retained the classical tradition, though he adopted some of the innovations of Moréas and Gustave Kahn. His gorgeous and vaguely suggestive style shows the influence of Stéphane Mallarmé, of whom he was an assiduous disciple. His first volume of poems, *Lendemains*, appeared in 1885, and among numerous later volumes are *Poèmes anciens et romanesques* (1890), *Les Jeux rustiques et divins* (1890), *Les Médailles d'argent* (1900), *La Cité des eaux* (1903). He is also the author of a series of realistic novels and tales, among which are *La Canne de jaspe* (2nd ed., 1897), *La Double Maîtresse* (5th ed., 1900), *Les Vacances d'un jeune homme sage* (1904), and *Les Amants singuliers* (1905). M. de Régnier married Mlle. Marie de Hérédia, daughter of the poet, and herself a novelist and poet under the name of Gérard d'Houville.

See E. Gosse, *French Profiles* (1905), and *Poètes d'aujourd'hui* (6th ed., 1908), by van Bever and Léautaud.

RÉGNIER, MATHURIN (1573–1613), French satirist, was born at Chartres on the 21st of December 1573. His father, Jacques Régnier, was a bourgeois of good means and position; his mother, Simone Desportes, was the sister of the poet Desportes. Desportes, who was richly beneficed and in great favour at court, seems to have been regarded as Mathurin Régnier's natural protector and patron; and the boy himself, with a view to his following in his uncle's steps, was tonsured at eight years old. Little is known of his youth, and it is chiefly conjecture which fixes the date of his visit to Italy in a humble position in the suite of the cardinal, François de Joyeuse, in 1587. The cardinal was accredited to the papal court in that year as "protector" of the royal interests. Régnier found his duties irksome, and when, after many years of constant travel in the cardinal's service, he returned definitely to France about 1605, he took advantage of the hospitality of Desportes. He early began the practice of satirical writing, and the enmity which existed between his uncle and the poet Malherbe gave him occasion to attack the latter. In 1606 Desportes died, leaving nothing to Régnier, who, though disappointed of the succession to Desportes's abbacies, obtained a pension of 2000 livres, chargeable upon one of them. He was also made in 1609 canon of Chartres through his friendship with the lax bishop, Philippe Hurault, at whose abbey of Royaumont he spent much time in the later years of his life. But the death of Henry IV. deprived him of his last hope of great preferments. His later life had been one of dissipation, and he died at Rouen at his hotel, the Écu d'Orléans, on the 22nd of October 1613.

About the time of his death numerous collections of licentious and satirical poems were published, while others remained in manuscript. Gathered from these there has been a floating mass of licentious epigrams, &c., attributed to Régnier, little of which is certainly authentic, so that it is very rare to find two editions of Régnier which exactly agree in contents. His undoubted work falls into three classes: regular satires in alexandrine couplets, serious poems in various metres, and satirical or jocular epigrams and light pieces, which often, if not always, exhibit considerable licence of language. The real greatness of Régnier consists in the vigour and polish of his satires, contrasted and heightened as that vigour is with the exquisite feeling and melancholy music of some of his minor poems. In these Régnier is a disciple of Ronsard (whom he defended brilliantly against Malherbe), without the occasional pedantry, the affectation or the undue fluency of the Pléiade; but in the satires he seems to have had no master except the ancients, for some of them were written before the publication of the satires of Vauquelin de la Fresnaye, and the *Tragiques* of D'Aubigné did not appear until 1616. He has sometimes followed Horace closely, but always in an entirely original spirit. His vocabulary is varied and picturesque, and is not marred by the maladroit classicism of some of the Ronsardists. His verse is extraordinarily forcible and nervous, but his chief distinction as a satirist is the way in which he avoids the commonplaces of satire. His keen and accurate knowledge of human nature and even his purely literary qualities extorted the admiration of Boileau. Régnier displayed remarkable independence and acuteness in literary criticism, and the famous passage (Satire ix., *A Monsieur Rapin*) in which he satirizes Malherbe contains the best denunciation of the merely "correct" theory of poetry that has ever been written. Lastly, Régnier had a most unusual descriptive faculty, and the vividness of what he called his narrative satires was not approached in France for at least two centuries after his death. All his merits are displayed in the masterpiece entitled *Macette ou l'Hypocrisie déconcertée*, which does not suffer even on comparison with *Tartuffe*; but hardly any one of the sixteen satires which he has left falls below a very high standard.

Les Premières Œuvres ou satyres de Régnier (Paris, 1608) included the *Discours au roi* and ten satires. There was another in 1609, and others in 1612 and 1613. The author had also contributed to two collections—*Les Muses gaillardes* in 1609 and *Le Temple d'Apollon* in 1611. In 1616 appeared *Les Satyres et autres œuvres folastres du sieur Régnier*, with many additions and some poems by other hands. Two famous editions by Elzevir (Leiden, 1642 and 1652) are highly prized. The chief editions of the 18th century are that of Claude Brossette (printed by Lyon & Woodman, London, 1729), which supplies the standard commentary on Régnier, and that of Lenglet Dufresnoy (printed by J. Tonson, London, 1733). The editions of Prosper Poitevin (Paris, 1860), of Ed. de Barthélemy (Paris, 1862), and of E. Courbet (Paris, 1875), may be specially mentioned. The last, printed after the originals in italic type, and well edited, is perhaps the best. See also Viney's *Mathurin Régnier* (1896); M. H. Cherrier, *Bibliographie de Mathurin Régnier* (1884).

REGNITZ, a river of Germany, and a left-bank tributary of the Main, the most important river of the province of Lower Bavaria. It is formed by the confluence, near Fürth, of the Rednitz and Pegnitz. The united river flows north through an undulating vine-clad country, past Erlangen, Baiersdorf and Forchheim, from which point it is navigable, and falls into the Main at Bischberg, just below Bamberg, after a course of 126 m. Near Bamberg it is joined by the Ludwigskanal, which, running parallel to it from Fürth and separated by the railway, forms the water-connexion between the Main and the Danube. Its main tributaries from the right are the Gründlach and the Wiesent, and from the left the Zenn, the Aurach and the Aisch.

REGRATING (O.Fr. *regrater*, to sell by retail), in English criminal law, was the offence of buying and selling again in the same market, or within four miles thereof. (See ENGROSSING.)

REGULA, the Latin word for a rule, hence particularly applied to the rules of a religious order (see MONASTICISM). In architecture the term is applied to a rule or square, the short fillet or rectangular block, under the taenia (*q.v.*) on the architrave of the Doric entablature.

REGULAR, orderly, following or arranged according to a rule (Lat. *regula*, whence O.Fr. *reule*, whence English "rule"), steady, uniform, formally correct. The earliest and only use in English until the 16th century was in the Med. Lat. sense of *regularis*, one bound by and subject to the rule (*regula*) of a monastic or religious order, a member of the "regular" as opposed to the "secular" clergy, and so, as a substantive, a regular, *i.e.* a monk or friar. Another specific application is to that portion of the armed forces of a nation which are organized on a permanent system, the standing army, as opposed to "irregulars," levies raised on a voluntary basis and disbanded when the particular campaign or war for which they were raised is at an end. In the British army, the forces were divided into regulars, militia and volunteers, until 1906, when they were divided into regular and territorial forces.

REGULUS, MARCUS ATILIUS, Roman general and consul (for the second time) in the ninth year of the First Punic War (256 B.C.). He was one of the commanders in the Punic naval expedition which shattered the Carthaginian fleet at Ecnomus, and landed an army on Carthaginian territory (see PUNIC WARS). The invaders were so successful that the other consul, L. Manlius Vulso, was recalled to Rome, Regulus being left behind to finish the war. After a severe defeat at Adys near Carthage, the Carthaginians were inclined for peace, but the terms proposed by Regulus were so harsh that they resolved to continue the war. In 255, Regulus was completely defeated and taken prisoner by the Spartan Xanthippus. There is no further trustworthy information about him. According to tradition, he remained in captivity until 250, when after the defeat of the Carthaginians at Panormus he was sent to Rome on parole to negotiate a peace or exchange of prisoners. On his arrival he strongly urged the senate to refuse both proposals, and returning to Carthage was tortured to death (Horace, *Odes*, iii. 5). This story made Regulus to the later Romans the type of heroic endurance; but most historians regard it as insufficiently attested, Polybius being silent. The tale was probably invented by the annalists to excuse the cruel treatment of the Carthaginian prisoners by the Romans.

See Polybius i. 25–34; Florus ii. 2; Cicero, *De Officiis*, iii. 26; Livy, *Epit.* 18; Valerius Maximus ix. 2; Sil. Ital. vi. 299–550; Appian, *Punica*, 4; Zonaras viii. 15; see also O. Jäger, *M. Atilius Regulus* (1878).

REHAN, ADA (1860–), American actress, whose real name was Crehan, was born in Limerick, Ireland, on the 22nd of April 1860. Her parents removed to the United States when she was five years old, and it was in Newark, N.J., that in 1874 she made her first stage appearance in a small part in *Across the Continent*. She was with Mrs John Drew's stock company in Philadelphia, John W. Albaugh's in Albany and Baltimore, and other companies for several seasons, playing every kind of minor part, until she became connected with Augustin Daly's theatrical management in 1879. Under his training she soon showed her talents for vivid, charming portrayal of character, first in modern and then in older comedies. She was the heroine in all the Daly adaptations from the German, and added to her triumphs the parts of Peggy in Wycherly's *Country Girl*, Julia in the *Hunchback*, and especially Katharina in *The Taming of the Shrew*, besides playing Rosalind and Viola. Miss Rehan accompanied Daly's company to England (first in 1884), France and Germany (1886). Her life-size portrait as Katharina is in the picture-gallery, and her bust, with Ellen Terry's, at the entrance to the theatre in the Shakespeare Memorial at Stratford-on-Avon.

REHEARSAL (from "rehearse," to say over again, repeat, recount, O.Fr. *rehercer*, from *re*, again, and *hercer*, to harrow, cf. "hearse," the original meaning being to rake or go over the same ground again as with a harrow), a recital of words or statements, particularly the trial performance in private of a play, musical composition, recitation, &c., for the purpose of practice preparatory to the performance in public. In the theatre a "full rehearsal" is one in which the whole performance is gone through with all the performers, a "dress rehearsal" one in which the performance is carried out with scenery, costumes, properties, &c., exactly as it is to be played in public.

REHOBOAM (Heb. *rehab'ám*, probably "the clan is enlarged," see Ecclus. xlvii. 23, although on the analogy of Rehabiah and Bab. *ra'bi-ilu*, *'Am* may represent some god; Septuagint reads ροβοαμ), son of Solomon and first king of Judah. On the events which led to his accession and the partition of the Hebrew monarchy, see JEROBOAM, SOLOMON. Although his age is given as forty-one (1 Kings xiv. 21), the account of his treatment of the Israelite deputation (1 Kings xii.), as also 2 Chron. xiii. 7, give an impression of youth. He was partly of Ammonite origin (1 Kings xiv. 21), and, like his father, continued the foreign worship which his connexions involved. The chief event of his reign was the incursion of Egypt under Sheshonk (Shishak) I., who came up against Judah and despoiled the temple about 930 B.C. (see EGYPT, *History*, § "Deltaic Dynasties"). That this invasion is to be connected with the friendly relations which are said to have subsisted between the first of the Libyan dynasty and Rehoboam's rival is unlikely. Sheshonk has figured his campaign outside the great temple of Karnak with a list of some 150 places which he claims to have conquered, but it is possible that these were only tributary, and the names may be largely based upon older lists. Towns of both Judah and Israel are incorporated, and it is possible that Jerusalem once stood where now the stone is mutilated.[1] The book of Chronicles enumerates several Judaean cities fortified by Rehoboam (not necessarily connected with Sheshonk's campaign), and characteristically regards the invasion as a punishment (2 Chron. xi. 5 sqq., xii. 1–15; for the prophet Shemaiah see 1 Kings xii. 21–24). Of Rehoboam's successor Abijah (or Abijam) little is known except a victory over Jeroboam recorded in 2 Chron. xiii. See further ASA, OMRI, and JEWS (*History*), §§ 7, 9.

REICHA, ANTON JOSEPH (1770–1836), French musical theorist and teacher of composition, was born at Prague on the 27th of February 1770, and educated chiefly by his uncle, Joseph Reicha (1746–1795), a clever violoncellist, who first received him into his house at Wallerstein in Bohemia, and afterwards carried him to Bonn. Here, about 1789, he was made flutist in the orchestra of the elector. In 1794 he went to Hamburg and gave music lessons there, also producing the opera *Godefroid de Montfort*. He was in Paris in 1799 and in Vienna from 1802 to 1808, during which period he saw much of Beethoven and Haydn. In the latter year he returned to Paris, where he produced three operas without much success. In 1817 he succeeded Méhul as professor of counterpoint at the Conservatoire. In 1829 he was naturalized as a Frenchman, and in 1835 he was admitted as a member of the Institute in the place of Boieldieu. He died in Paris on the 28th of May 1836. He produced a vast quantity of church music, five operas, a number of symphonies, oratorios and many miscellaneous works. Though clever and ingenious, his compositions are more remarkable for curiosity than for the beauty of the ideas upon which they are based. His fame is, indeed, more securely based upon his didactic works. His *Traité de mélodie* (Paris, 1814), *Cours de composition musicale* (Paris, 1818), *Traité de haute composition musicale* (Paris, 1824–26), and *Art du compositeur dramatique* (Paris, 1833), are valuable and instructive essays for the student, though many of the theories they set forth are now condemned as erroneous.

REICHENAU, a picturesque island in the Untersee or western arm of the lake of Constance, 3 m. long by 1 broad, and connected with the east shore by a causeway three-quarters of a mile long. It belongs to the grand duchy of Baden. The soil

[1] The once popular view that "king of Judah" stands in no. 29 is untenable. See Petrie, *Hist. of Egypt*, ii. p. 235; L. B. Paton, *Syria and Pal.* p. 193 sq.; W. M. Müller, *Mitteil. Vorderasiat. Gesell.*, 1900, p. 19 sq., and *Ency. Bib.* col. 4486. Breasted (*Amer. Journ. of Sem. Lang.*, 1904, p. 36) has made the interesting observation that the list mentions "the field of Abram" (nos. 71 and 72): see further, *id.*, *Egypt Hist. Records*, iv. pp. 348–357.

is very fertile, and excellent wine is produced in sufficient quantity for exportation. The Benedictine abbey of Reichenau, founded in 724, was long celebrated for its wealth and for the services rendered by its monks to the cause of learning. In 1540 the abbey, which had previously been independent, was annexed to the see of Constance, and in 1799 it was secularized. The abbey church, dating in part from the 9th century, contains the tomb of Charles the Fat (d. 888), who retired to this island in 887, after losing the empire of Charlemagne. It now serves as the parish church of Mittelzell, while the churches of Oberzell and Unterzell are also interesting buildings of the Carolingian era.

REICHENBACH, GEORG VON (1772–1826), German astronomical instrument maker, was born at Durlach in Baden on the 24th of August 1772. From 1796 he was occupied with the construction of a dividing engine; in 1804, with Joseph, Liebherr and Joseph Utzschneider, he founded an instrument-making business in Munich; and in 1809 he established, with Joseph Fraunhofer and Utzschneider, optical works at Benedictbeuern, which were moved to Munich in 1823. He withdrew from both enterprises in 1814, and founded with T. L. Ertel a new optical business, from which also he retired in 1821, on obtaining an engineering appointment under the Bavarian government. He died at Munich on the 21st of May 1826.

Reichenbach's principal merit was that he introduced into observatories the meridian or transit circle, combining the transit instrument and the mural circle into one instrument. This had already been done by O. Römer about 1704, but the idea had not been adopted by any one else, except in the transit circle constructed by Edward Troughton for Stephen Groombridge in 1806. The transit circle in the form given it by Reichenbach had one finely divided circle attached to one end of the horizontal axis and read by four verniers on an "alidade circle," the unaltered position of which was tested by a spirit level. The instrument came almost at once into universal use on the continent of Europe (the first one was made for F. W. Bessel in 1819), but in England the mural circle and transit instrument were not superseded for many years.

REICHENBACH, a town of Germany, in the Prussian province of Silesia, situated on the Peile, at the foot of the Eulengebirge, a spur of the Riesengebirge, 30 m. S.W. of Breslau by rail. Pop. (1905) 15,984. Among its industries are weaving, spinning, dyeing, brewing and machine building, and there is a considerable trade in grain and cattle. Reichenbach is memorable for the victory gained here on the 16th of August 1762 by the Prussians over the Austrians. Here was held the congress which resulted in the convention of Reichenbach—signed on the 27th of July 1790 between Great Britain, Prussia, Austria, Poland and Holland—guaranteeing the integrity of Turkey. Here, too, in June 1813, was signed the treaty of alliance between Austria and the Allies for the prosecution of the war against France.

See the *Kurze Geschichte der Stadt Reichenbach* (Reichenbach, 1874).

REICHENBACH, a town in the kingdom of Saxony, situated in a hilly district, known as the Vogtland, 11 m. S.W. of Zwickau, at the junction of the main lines of railway Dresden-Leipzig-Hof. Pop. (1905) 24,915. It contains a handsome town-hall rebuilt in 1833, and a natural history museum. The industries embrace the manufacture of cloth, machinery and carriages, also dyeing and bleaching. The earliest mention of the town occurs in a document of 1212, and it acquired municipal rights in 1367. The woollen manufacture was introduced in the 15th century, and took the place of the mining industry which had been established earlier.

REICHENBERG (Czech, *Liberec*), a town of Bohemia, 87 m. N.E. of Prague by rail. Pop. (1900) 34,099, chiefly German. The most prominent buildings are the new town-hall (1893); the castle of Count Clam Gallas, built in the 17th century, with additions dating from 1774 and 1850; the Erzdekanatskirche, of the 16th century; the Protestant church, a handsome modern Romanesque edifice (1864–68) and the hall of the cloth-workers. Reichenberg is one of the most important centres of trade and industry in Bohemia, its staple industry being the cloth manufacture. Next in importance comes the spinning and weaving of wool, cotton, linen and carpet manufactures, and dyeing.

Reichenberg is first mentioned in a document of 1348, and from 1622 to 1634 was among the possessions of the great Wallenstein, since whose death it has belonged to the Gallas and Clam Gallas families, though their jurisdiction over the town has long ceased. The cloth-making industry was introduced in 1579.

REICHENHALL, a town and watering-place in the kingdom of Bavaria, finely situated in an amphitheatre of lofty mountains, on the river Saalach, 1570 ft. above sea-level, 9 m. S.W. of Salzburg. Pop. (1900) 4927, excluding visitors. Reichenhall possesses several copious saline springs, producing about 8500 tons of salt per annum. The water of some of the springs, the sources of which are 50 ft. below the surface, is so strongly saturated with salt (up to 24%) that it is at once conducted to the boiling houses, while that of the others is first submitted to a process of evaporation. Reichenhall is the centre of the four chief Bavarian salt-works, which are connected with each other by brine conduits having an aggregate length of 60 m. The surplus brine of Berchtesgaden is conducted to Reichenhall, and thence, in increased volume, to Traunstein and Rosenheim, which possess larger supplies of timber for use as fuel in the process of boiling. Since 1846 Reichenhall has become one of the most fashionable spas and climatic health resorts in Germany, and it is now visited annually by about ten thousand patients, besides many thousand passing tourists. The saline springs are used both for drinking and bathing, and are said to be efficacious in scrofula and incipient tuberculosis.

The brine springs of Reichenhall are mentioned in a document of the 8th century and were perhaps known to the Romans; but almost all trace of antiquity of the town was destroyed by a conflagration in 1834. The brine conduit to Traunstein dates from 1618. The environs abound in numerous charming Alpine excursions.

See G. von Liebig, *Reichenhall, sein Klima und seine Heilmittel* (6th ed., Reichenhall, 1889); and Goldschmidt, *Der Kurort Bad Reichenhall und seine Umgebung* (Vienna, 1892).

REICHENSPERGER, AUGUST (1808–1895), German politician, was born at Coblenz on the 22nd of March 1808, studied law and entered government service, becoming counsellor to the court of appeal (*Appellationsgerichtsrat*) at Cologne in 1849. He was a member of the German parliament at Frankfort in 1848, when he attached himself to the Right, and of the Erfurt parliament in 1850, when he voted against the Prussian Union. From 1850 to 1863 he sat in the Prussian Lower House, from 1867 to 1884 in the Reichstag, and from 1870 onwards also in the Prussian Chamber of Deputies. Originally of Liberal tendencies, he developed from 1837 onwards ultramontane opinions, founded in 1852 the Catholic group which in 1861 took the name of the Centre party (*Centrum*) and became one of its most conspicuous orators. He died on the 16th of July 1895 at Cologne. He published a considerable number of works on art and architecture, including *Die christlich-germanische Baukunst* (Trier, 1852, 3rd ed., 1860); *Fingerzeige auf dem Gebiete der christlichen Kunst* (Leipzig, 1854); *Augustus Pugin, der Neubegründer der christlichen Kunst in England* (Freiburg, 1877).

See L. v. Pastor, *August Reichensperger*, 2 vols. (Freiburg-im-Brcisgau, 1899).

His brother, PETER REICHENSPERGER (1810–1892), counsellor to the appeal court at Cologne (1850) and until 1879 to the *Obertribunal* at Berlin, was elected to the Reichstag in 1867 as a member of the Liberal Opposition, but subsequently joined the Centre party. In the *Kulturkampf* he took an active part on the ultramontane side. He had been a member of the Prussian National Assembly in 1848, and in 1888 he published his *Erlebnisse eines alten Parlamentariers im Revolutionsjahr 1848*.

REICHSTADT, NAPOLEON FRANCIS JOSEPH CHARLES, DUKE OF (1811–1832), known by the Bonapartists as Napoleon II., was the son of the Emperor Napoleon I. and Marie Louise, archduchess of Austria. He was born on the 20th of

March 1811, in Paris at the Tuileries palace. He was at first named the king of Rome, after the analogy of the heirs of the emperors of the Holy Roman Empire. By his birth the Napoleonic dynasty seemed to be finally established; but in three years it crumbled in the dust. At the time of the downfall of the empire (April 1814) Marie Louise and the king of Rome were at Blois with Joseph and Jerome Bonaparte, who wished to keep them as hostages. This design, however, was frustrated. Napoleon abdicated in favour of his son; but events prevented the reign of Napoleon II. from being more than titular. While Napoleon repaired to Elba, his consort and child went to Vienna; and they remained in Austria during the Hundred Days (1815), despite efforts made by the Bonapartists to carry off the prince to his father at Paris.

Meanwhile the congress of Vienna had carried out the conditions of the treaty of Fontainebleau (March 1814) whereby the duchies of Parma and Guastalla were to go to the ex-Empress Marie Louise and her son, although much opposition was offered to this proposal by Louis XVIII. and even (so it now appears) by Metternich. The secret treaty of the 31st of May 1815 between Austria, Russia and Prussia secured those possessions to her, her son bearing the title Prince of Parma, with hereditary rights for his descendants. But after the second abdication of Napoleon in favour of his son (22nd of June 1815)—a condition which was wholly nugatory—the powers opposed all participation of the prince in the affairs of Parma. He therefore remained in Austria, while Marie Louise proceeded to Parma. From this time onward he became, as it were, a pawn in the complex game of European politics, his claims being put forward sometimes by Metternich, sometimes by the unionists of Italy, while occasionally malcontents in France used his name to discredit the French Bourbons. The efforts of malcontents increased the resolve of the sovereigns never to allow a son of Napoleon to bear rule; and in November 1816 the court of Vienna informed Marie Louise that her son could not succeed to the duchies. This decision was confirmed by the treaty of Paris of the 10th of June 1817. Marie Louise demanded as a slight compensation that he should have a title derived from the lands of the "Bavarian Palatinate" in northern Bohemia, and the title of "duke of Reichstadt" was therefore conferred on him on the 22nd of July 1818. Thus Napoleon I., who once averred that he would prefer that his son should be strangled rather than brought up as an Austrian prince, lived to see his son reduced to a rank inferior to that of the Austrian archdukes.

His education was confided chiefly to Count Dietrichstein, who found him precocious, volatile, passionate and fond of military affairs. The same judgment was given by Marshal Marmont, duke of Ragusa, who recognized the warlike strain in his character. His nature was sensitive, as appeared on his receiving the news of the death of his father in 1821. The upheaval in France in 1830 and the disturbances which ensued led many Frenchmen to turn their thoughts to Napoleon II.; but though Metternich dallied for a time with the French Bonapartists, he had no intention of inaugurating a Napoleonic revival. By this time, too, the duke's health was on the decline; his impatience of all restraint and his indulgence in physical exercise far beyond his powers aggravated a natural weakness of the chest, and he died on the 22nd of July 1832.

See A. M. Barthelemy and J. P. A. Méry, *Le Fils de l'homme* (Paris, 1829), Baron G. I. Comte de Montbel, *Le Duc de Reichstadt* (Paris, 1832); J. de Saint-Félix, *Histoire de Napoléon II.* (Paris, 1853); Guy de Hérédia, *Histoire de Napoléon II.* (Paris, 1883); Count Anton von Prokesch-Osten, *Mein Verhältniss zum Herzog von Reichstadt* (Stuttgart, 1878); H. Welschinger, *Le Roi de Rome* (Paris, 1897); E. de Wertheimer, *The Duke of Reichstadt* (Eng. ed., London, 1905); M. Rostand's play *L'Aiglon* is a dramatic setting of the career of the prince. (J. HL. R.)

REID, SIR GEORGE (1841–), Scottish artist, was born in Aberdeen on the 31st of October 1841. He developed an early passion for drawing, which led to his being apprenticed in 1854 for seven years to Messrs Keith & Gibb, lithographers in Aberdeen. In 1861 Reid took lessons from an itinerant portrait-painter, William Niddrie, who had been a pupil of James Giles, R.S.A., and afterwards entered as a student in the school of the Board of Trustees in Edinburgh. He returned to Aberdeen to paint landscapes and portraits for any trifling sum which his work could command. His first portrait to attract attention, from its fine quality, was that of George Macdonald, the poet and novelist, now the property of the university of Aberdeen. His early landscapes were conscientiously painted in the open air and on the spot. But Reid soon came to see that such work was inherently false, painted as the picture was day after day under varying conditions of light and shade. Accordingly, in 1865 he proceeded to Utrecht to study under A. Mollinger, whose work he admired, from its unity and simplicity. This change in his method of viewing Nature was looked on as revolutionary by the Royal Scottish Academy, and for some years his work found little favour in that quarter; but other artists gradually adopted the system of tone-studies, which ultimately prevailed. Reid went to Paris in 1868 to study under the figure painter Yvon; and he worked in 1872 with Josef Israëls at the Hague. From this time forward Reid's success was continuous and marked. He showed his versatility in landscape, as in his "Whins in Bloom," which combined great breadth with fine detail; in flower-pieces, such as his "Roses," which were brilliant in rapid suggestiveness and force; but most of all in his portraits, which are marked by great individuality and by fine insight into character. His work in black-and-white, his admirable illustrations in brush-work of Edinburgh and its neighbourhood, and also his pen-drawings, about which it has been declared that "his work contains all the subtleties and refinements of a most delicate etching," must also be noted. Elected Associate of the Royal Scottish Academy in 1870, Reid attained full membership in 1877, and took up his residence in Edinburgh in 1882. In 1891 he was elected President—a post which he held until 1902—receiving also the honour of knighthood, and he was awarded a gold medal at the Paris Exhibition of 1900. His brother Samuel (b. 1854) was also a painter and a writer of tales and verse.

REID, ROBERT (1862–), American artist, was born at Stockbridge, Mass., on the 29th of July 1862. He studied at the art schools of the Boston Museum of Fine Arts, the Art Students' League, New York, and under Boulanger and Lefebvre in Paris. His early pictures were figures of French peasants, painted at Étaples, but subsequently he became best known for mural decoration and designs for stained glass. He contributed with others to the frescoes of the dome of the Liberal Arts Building at the Columbian Exposition, Chicago, in 1893. Other work is in the Congressional Library, Washington, the Appellate Court House, New York, and the State House, Boston, where are his three large panels, "James Otis Delivering his Speech against the Writs of Assistance," "Paul Revere's Ride" and the "Boston Tea Party." He executed a panel for the American Pavilion at the Paris Exhibition, 1900, and in 1906 he completed a series of ten stained glass windows for a church at Fairhaven, Mass., for the Rogers Memorial. In 1906 he became a full member of the National Academy of Design.

REID, SIR ROBERT GILLESPIE (1840–1908), Canadian railway contractor, was born at Coupar-Angus, Scotland. When a young man he spent a few years in Australia goldmining, and in 1871 he settled in America, where he began his career as a contractor. He built one section of the Canadian Pacific railway, and was responsible for the erection of the international bridge over the Niagara river, the international railway bridge over the Rio Grande river and the Lachine bridge over the St Lawrence. In 1893 Reid signed a contract with the government of Newfoundland by which he undertook to construct a railway from St John's to Port-aux-Basques and to work the line for ten years in return for a large grant of land. In 1898 he further contracted to work all the railways in Newfoundland for fifty years on condition that at the end

of this time they should become his property. This bargain, which included other matters such as steamers, docks and telegraphs, was extraordinarily favourable to Reid; who, by further enormous grants of land, became one of the largest landed proprietors in the world; public opinion was aroused against it, and at first the governor, Sir Herbert Murray, refused to ratify it. After the premier, Sir James Winter, had been replaced by Mr (afterwards Sir) Robert Bond, the terms of the contract were revised, being made more favourable to Newfoundland, and Reid's interests were transferred to a company, the Reid Newfoundland Company, of which he was the first president (see NEWFOUNDLAND, *Roads and Railways*). Reid was knighted in 1907, and he died on the 3rd of June 1908.

REID, THOMAS (1710–1796), Scottish philosopher, was born at Strachan in Kincardineshire, on the 26th of April 1710. His father was minister of the place for fifty years, and traced his descent from a long line of Presbyterian ministers on Deeside. His mother belonged to the brilliant Gregory family (*q.v.*), which, in the 18th century, gave so many representatives to literature and science in Scotland. Reid graduated at Aberdeen in 1726, and remained there as librarian to the university for ten years, a period which he devoted largely to mathematical reading. In 1737 he was presented to the living of Newmachar near Aberdeen. The parishioners, violently excited at the time about the law of patronage, received him with open hostility; and tradition asserts that his uncle defended him on the pulpit stair with a drawn sword. Though at first litigiously as a preacher, he was successful in winning the affections of his people. The publication of Hume's treatise turned his attention to philosophy, and in particular to the theory of external perception. His first publication, however, dealt with a question of philosophical method suggested by the reading of Hutcheson. The "Essay on Quantity, occasioned by reading a Treatise in which Simple and Compound Ratios are applied to Virtue and Merit," denies the possibility of a mathematical treatment of moral subjects. The essay appeared in the *Transactions* of the Royal Society (1748). In 1740 Reid married a cousin, the daughter of a London physician. In 1752 the professors of King's College, Aberdeen, elected him to the chair of philosophy, which he held for twelve years. The foundation of the Aberdeen Philosophical Society (the "Wise Club"), which numbered among its members Campbell, Beattie, Gerard and Dr John Gregory, was mainly owing to the exertions of Reid, who was secretary for the first year (1758). Many of the subjects of discussion were drawn from Hume's speculations; and during the last years of his stay in Aberdeen Reid propounded his new point of view in several papers read before the society. The results of these papers were embodied in the *Enquiry into the Human Mind on the Principles of Common Sense* (1764). The *Enquiry* does not go beyond an analysis of sense perception, and is therefore more limited in scope than the later *Essays*; but if the latter are more mature, there is more freshness about the earlier work. In this year, Reid succeeded Adam Smith as professor of moral philosophy in the university of Glasgow. After seventeen years of active teaching, he retired in order to complete his philosophical system. As a lecturer, he was inferior in charm and eloquence to Brown and Stewart; the latter says that "silent and respectful attention" was accorded to the "simplicity and perspicuity of his style" and "the gravity and authority of his character." His philosophical influence was exerted largely through the writings of Dugald Stewart and Sir William Hamilton. The *Essays on the Intellectual Powers of Man* appeared in 1785, and their ethical complement, the *Essays on the Active Powers of the Human Mind*, in 1788. These, with an account of Aristotle's *Logic* appended to Lord Kames's *Sketches of the History of Man* (1774), conclude the list of works published in Reid's lifetime. Hamilton's edition of Reid also contains an account of the university of Glasgow and a selection of Reid's letters, chiefly addressed to his Aberdeen friends the Skenes, to Lord Kames, and to Dr James Gregory. With the two last named he discussed the materialism of Priestley and the theory of necessitarianism. He reverted in his old age to the mathematical pursuits of his earlier years, and his ardour for knowledge of every kind remained fresh to the last. He died of paralysis on the 7th of October 1796, his wife and all his children save one having predeceased him. His portrait by Raeburn is the property of Glasgow University, and in the National Portrait Gallery, Edinburgh, there is a good medallion by Tassie, taken in his eighty-first year. His character was marked by independence, economy and generosity.

The key to Reid's philosophy is to be found in his revulsion from the sceptical conclusions of Hume. In several passages of his writings he expressly dates his philosophical awakening from the appearance of the *Treatise of Human Nature*. In the dedication of the *Enquiry*, he says: "The ingenious author of that treatise upon the principles of Locke—who was no sceptic—hath built a system of scepticism which leaves no ground to believe any one thing rather than its contrary. His reasoning appeared to me to be just; there was, therefore, a necessity to call in question the principles upon which it was founded, or to admit the conclusion." Reid thus takes Hume's scepticism as, on its own showing, a *reductio ad impossibile* (see HUME, *ad fin.*) of accepted philosophical principles, and refuses, accordingly, to separate Hume from his intellectual progenitors. From its origin in Descartes and onwards through Locke and Berkeley modern philosophy carried, Reid contends, the germ of scepticism. Embracing the whole philosophic movement under the name of "the Cartesian system," Reid detects its fundamental error in the unproved assumption shared by these thinkers "that all the objects of my knowledge are ideas in my own mind." This doctrine or hypothesis he usually speaks of as "the ideal system" or "the theory of ideas"; and to it he opposes his own analysis of the act of perception. In view of the results of this analysis, Reid's theory (and the theory of Scottish philosophy generally) has been dubbed natural realism or natural dualism, in contrast to theories like subjective idealism and materialism or to the cosmothetic idealism or hypothetical dualism of the majority of philosophers. But this unduly narrows the scope of Scottish philosophy, which does not exhaust itself, as is sometimes supposed, in uncritically reasserting the independent existence of matter and its immediate presence to mind. The real significance of Reid's doctrine lies in its attack upon Hume's fundamental principles, (1) that all our perceptions are distinct existences, and (2) that the mind never perceives any real connexion among distinct existences (cf. Appendix to the third volume of the *Treatise*, 1740). It is here that the danger of "the ideal system" really lies—in its reduction of reality to "particular perceptions," essentially unconnected with each other. This theory admitted, nothing is left for philosophy save to explain the illusion of necessary connexion. Reid, however, attacks the fundamental assumption. In logical language, he denies the actuality of the abstract particular. The unit of knowledge is not an isolated impression but a judgment; and in both a judgment is contained, essentially, initially, the reference to a permanent subject and to a permanent world of thought, and, implied in these, such judgments, for example, as those of existence, substance, cause and effect. Such principles are not derived from sensation, but are "suggested" on occasion of sensation, in such a way as to constitute the necessary conditions of our having perceptive experience at all. Thus we do not start with "ideas," and afterwards refer them to objects; we are not restricted to our own minds but are from the first immediately related to a permanent world. Reid has a variety of names for the principles which, by their presence, lift us out of subjectivity into perception. He calls them "natural judgments," "natural suggestions," "judgments of nature," "judgments immediately inspired by our constitution," "principles of our nature," "first principles," "principles of common sense." The last designation, which became current one, was unfortunate, and has conveyed to many a false impression of Scottish philosophy. It has been understood as if Reid had merely appealed from the reasoned conclusions of philosophers to the unreasoned beliefs of ordinary life. But Reid's actions are better than his words; his real mode of procedure is to redargue Hume's conclusions by a refutation of the premises inherited by him from his predecessors. For the rest, as regards the question of nomenclature, Reid even elsewhere uses common sense and reason, making the former "only another name for one branch or degree of reason." Reason, as judging of things self-evident, is called common sense to distinguish it from ratiocination or reasoning. Again, he regards the "consent of all" of the principles in question by reference to "the consent of ages and nations, of the learned and unlearned," it is only fair to observe that this argument assumes a much more scientific form in the *Essays*, where it is almost identified with an appeal to "the structure and grammar of all languages." "The structure of all languages," he says, "is grounded upon common sense." To take but one example, "the distinction between sensible qualities and the substance to which they belong, and between thought and the mind that thinks, is not the invention of philosophers; it is found

Common Sense.

in the structure of all languages, and therefore must be common to all men who speak with understanding" (Hamilton's *Reid*, pp. 229 and 454).

The principles which Reid insists upon as everywhere present in experience evidently correspond pretty closely to the Kantian categories and the unity of apperception. Similarly, Reid's assertion of the essential distinction between space or extension and feeling or any succession of feelings may be compared with Kant's doctrine in the *Aesthetic*. "Space," he says, "whether tangible or visible, is not so properly an object [Kant's "matter"] as a necessary concomitant of the objects both of sight and touch." Like Kant, too, Reid finds in space the source of a necessity which sense, as sense, cannot give (Hamilton's *Reid*, p. 323). In the substance of their answer to Hume, the two philosophers have therefore much in common. But Reid lacked the art to give due impressiveness to the important advance which his positions really contain. Although at times he states his principles with a wonderful degree of breadth and insight, he mars the effect by looseness of statement, and by the incorporation of irrelevant psychological matter. And, if Kant was overridden by a love of symmetry, Reid's indifference to form and system is an even more dangerous defect. Further, Reid is inclined to state his principles dogmatically rather than as logical deductions. The transcendental deduction, or proof from the possibility of experience in general, which lies at the vital centre of the Kantian scheme, is wanting in Reid; or, at all events, if the spirit of the proof is occasionally present, it is nowhere adequately developed. Nevertheless, Reid's insistence on judgment as the unit of knowledge and his sharp distinction between sensation and perception must still be recognized as of the highest importance.

Reid and Kant.

The relativism or phenomenalism which Hamilton afterwards adopted from Kant and sought to engraft upon Scottish philosophy is wholly absent from the original Scottish doctrine. One or two passages may certainly be quoted from Reid in which he asserts that we know only properties of things and are ignorant of their substances. But the exact meaning which he attaches to such expressions is not quite clear; and they occur, moreover, only incidentally and with the air of current phrases mechanically repeated. Dugald Stewart, however, deliberately emphasizes the merely qualitative character of our knowledge as the foundation of philosophical argument, and thus paves the way for the thoroughgoing philosophy of nescience elaborated by Hamilton. But since Hamilton's time the most typical Scottish thinkers have repudiated his relativist doctrine and returned to the original tradition of the school. For Reid's ethical theory, see ETHICS.

The Scottish School.

The complete edition of the works by Sir William Hamilton, published in two volumes with notes and supplementary dissertations by the editor (6th ed. 1863), contains superior editions of Reid's life see D. Stewart's *Memoir* prefixed to Hamilton's edition of Reid's works. See also McCosh, *Scottish Philosophers* (1875); Rait, *Universities of Aberdeen*, pp. 199–203, 223; A. C. Fraser, *Monograph* (1898); A. Bain, *Mental Science*, p. 237; p. 422 (for his theory of free will), and Appendix, pp. 29, 63, 88, 89.

(A. S. P.-P.; X.)

REID, THOMAS MAYNE (1818–1883), better known as MAYNE REID, British novelist, the son of a Presbyterian minister, was born at Ballyroney, Co. Down, Ireland, on the 4th of April 1818. His own early life was as adventurous as any boy reader of his novels could desire. He was educated for the church, but did not take orders, and when twenty years old went to America in search of excitement and fortune. He made trading excursions on the Red river, studying the ways of the red man and the white pioneer. He made acquaintance with the Missouri in the same manner, and roved through all the states of the Union. In Philadelphia, where he was engaged in journalism from 1843 to 1846, he made the acquaintance of Edgar Allan Poe. When the war with Mexico broke out in 1846 he obtained a captain's commission, was present at the siege and capture of Vera Cruz, and led a forlorn hope at Chapultepec, where he sustained such severe injuries that his life was despaired of. In one of his novels he says that he believed theoretically in the military value of untrained troops, and that he had found his theories confirmed in actual warfare. An enthusiastic republican, he offered his services to the Hungarian insurgents in 1849, raised a body of volunteers, and sailed for Europe, but arrived too late. He then settled in England, and began his career of a novelist with the publication, in 1850, of the *Rifle Rangers*. This was followed next year by the *Scalp Hunters*. He never surpassed his first productions, except perhaps in *The White Chief* (1859) and *The Quadroon* (1856): but he continued to produce tales of self-reliant enterprise and exciting adventure with great fertility. Simplicity of plot and easy variety of exciting incident are among the merits that contribute to his popularity with boys. His reflections are not profound, but are frequently more sensible than might be presumed at first from his aggressive manner of expressing them. He died in London on the 22nd of October 1883.

See *Memoir* (1890) by his widow, Elizabeth Mayne Reid.

REID, WHITELAW (1837–), American journalist and diplomatist, was born of Scotch parentage, near Xenia, Ohio, on the 27th of October 1837. He graduated at Miami University in 1856, and spoke frequently in behalf of John C. Frémont, the Republican candidate for the presidency in that year; was superintendent of schools of South Charleston, Ohio, in 1856–58, and in 1858–59 was editor of the Xenia *Gazette*, of which he was made city editor in 1861. He was war correspondent for the *Gazette* in 1861–62, serving also as volunteer aide-de-camp (with the rank of captain) to General Thomas A. Morris (1811–1904) and General William S. Rosecrans in West Virginia. He was Washington correspondent of the *Gazette* in 1862–68, acting incidentally as clerk of the military committee of Congress (1862–63) and as librarian of the House of Representatives (1863–66). In 1868 he became a leading editorial writer for the New York *Tribune*, in the following year was made managing editor, and in 1872, upon the death of Horace Greeley, became the principal proprietor and editor-in-chief. In 1905 Reid relinquished his active control of the *Tribune*, but retained financial control. He declined an appointment as United States minister to Germany in 1877 and again in 1881, but served as minister to France in 1889–92, and in 1892 was the unsuccessful Republican candidate for vice-president on the ticket with Benjamin Harrison. In 1897 he was special ambassador of the United States on the occasion of Queen Victoria's jubilee; in 1898 was a member of the commission which arranged the terms of peace between the United States and Spain; in 1902 was special ambassador of the United States at the coronation of King Edward VII., and in 1905 became ambassador to Great Britain. He was elected a life member of the New York State Board of Regents in 1878; and in 1902 he became vice-chancellor and, in 1904, chancellor of the university of the state of New York. In 1882 he married a daughter of Darius Ogden Mills (1825–1910), a prominent financier.

His publications include *After the War* (1867), in which he gives his observations during a journey through the Southern States in 1866; *Ohio in the War* (2 vols., 1868); *Some Consequences of the Last Treaty of Paris* (1899); *Our New Duties* (1899); *Later Aspects of Our New Duties* (1899); *Problems of Expansion* (1900); *The Greatest Fact in Modern History* (1906), and *How America faced its Educational Problem* (1906).

REID, SIR WILLIAM (1791–1858), Scottish administrator and man of science, was born on the 25th of April 1791 at the manse of Kinglassie, Fifeshire, and entered the Royal Engineers in 1809. He saw active service in the Peninsula under Wellington, and took part in the bombardment of Algiers in 1816. In 1835 and 1836 he again saw active service, in Spain against Don Carlos. In 1838 he published his *Attempt to develop the Law of Storms*, which obtained wide popularity. In 1839 he was appointed governor of the Bermudas, where he did much to develop the agricultural resources of the islands, and in 1846 he was transferred to Barbados. In 1850–51 he was chairman of the executive committee of the Great Exhibition; on the completion of the work he was made a K.C.B. and appointed governor of Malta. He died in London on the 31st of October 1858.

REIGATE, a market town and municipal borough in the Reigate parliamentary division of Surrey, England, 24 m. S. by W. of London by the South-Eastern & Chatham railway. Pop. (1901) 25,993. It is situated at the head of the long valley of Holmsdale Hollow, beneath the North Downs. A very fine prospect over a great part of Surrey and Sussex, and extending to Hampshire and Kent, is obtained from the neighbouring Reigate Hill. Of the old castle, supposed to

have been built before the Conquest to command the pass through the valley, there only remains the entrance to a cave beneath, 150 ft. long and from 10 to 12 ft. high, excavated in the sandstone, which was used as a guardroom. The grounds are laid out as a public garden. Near the market house is the site of an ancient chapel dedicated to Thomas à Becket. In the chancel of the parish church of St Mary, a building ranging from Transitional Norman to Perpendicular, is buried Lord Howard, the commander of the English navy against the Spanish Armada. Above the vestry there is a library containing choice manuscripts and rare books. The grammar school was founded in 1675. Among the other public buildings are the town hall, the public hall, the market hall, and the working men's institute. The borough includes the township of Reigate hill, adjacent on the east. The town has some agricultural trade, and in the neighbourhood are quarries for freestone, hearthstone and white sand. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 5994 acres.

Reigate (*Cherchefelle*, *Regat*, *Reygate*) owed its first settlement to its situation at a cross-road on the Pilgrim's Way, at the foot of the North Downs; and its early importance to the castle which was the stronghold of the De Warennes in the 12th, 13th and 14th centuries. On the death of Edith, the widow of Edward the Confessor, to whom it belonged, William I. secured the manor of Cherchefelle, as it was then called. It was granted by William Rufus to Earl Warenne, through whose family it passed in 1347 to the earls of Arundel. The name Reigate occurs in 1199. Burgesses of Reigate are mentioned in a close roll of 1348, but no early charter is known. The town was incorporated in 1863. It returned two members to parliament from 1295 till 1831, and afterwards one member only until 1867, when it was disfranchised for corruption. In the reign of Edward I., Earl Warenne held a weekly market on Saturdays, and fairs on Tuesday in Whitsun-week, the eve and day of St Lawrence, and the eve and day of the Exaltation of the Cross, by prescriptive right. Edward II. granted a market on Tuesdays, which is still held. The fair days are now Whit-Tuesday and the 9th of December.

REIMARUS, HERMANN SAMUEL (1694–1768), German philosopher and man of letters, was born at Hamburg, on the 22nd of December 1694. He was educated by his father and by the famous scholar J. A. Fabricius, whose son-in-law he subsequently became. He studied theology, ancient languages, and philosophy at Jena, became *Privatdozent* in the university of Wittenberg in 1716, and in 1720–21 visited Holland and England. In 1723 he became rector of the high school at Wismar in Mecklenburg, and in 1727 professor of Hebrew and Oriental languages in the high school of his native city. This post he held till his death. It offers no more lucrative positions were made to him. His duties were light, and he employed his leisure in the study of philology, mathematics, philosophy, history, political economy, natural science and natural history, for which he made large collections. His house was the centre of the highest culture of Hamburg, and a monument of his influence in that city still remains in the *Haus der patriotischen Gesellschaft*, where the learned and artistic societies partly founded by him still meet. He had seven children, only three of whom survived him—the distinguished physician Johann Albrecht Heinrich, and two daughters, one of them being Elise, Lessing's friend and correspondent. He died on the 1st of March 1768.

Reimarus's reputation as a scholar rests on the valuable edition of Dio Cassius (1750–52) which he prepared from the materials collected by J. A. Fabricius. He published a work on logic (*Vernunftlehre als Anweisung zum richtigen Gebrauche der Vernunft*, 1756, 5th ed., 1790), and two popular books on the religious questions of the day. The first of these was a collection of essays on the principal truths of natural religion (*Abhandlungen von den vornehmsten Wahrheiten der natürlichen Religion*, 1755, 7th ed., 1798); the second (*Betrachtungen über die Triebe der Thiere*, 1760, 4th ed., 1798) dealt with one particular branch of the same subject. His philosophical position is essentially that of Christian Wolff. But he is best known by his *Apologie oder Schutzschrift für die vernünftigen Verehrer Gottes* (carefully kept back during his lifetime), from which, after his death, Lessing published certain chapters under the title of the *Wolfenbüttel Fragments* (see LESSING). The original MS. is in the Hamburg town library; a copy was made for the university library of Göttingen, 1814, and other copies are known to exist. In addition to the seven fragments published by Lessing, a second portion of the work was issued in 1787 by C. A. E. Schmidt (a pseudonym), under the title *Uebrige noch ungedruckte Werke des Wolfenbüttelschen Fragmentisten*, and a further portion by D. W. Klose in *Niedner's Zeitschrift für historische Theologie*, 1850–52. Two of the five books of the first part and the whole of the second part, as well as appendices on the canon, remain unprinted. But D. F. Strauss has given an exhaustive analysis of the whole work in his book on Reimarus.

The standpoint of the *Apologie* is that of pure naturalistic deism. Miracles and mysteries are denied, and natural religion is put forward as the absolute contradiction of revealed. The essential truths of the former are the existence of a wise and good Creator and the immortality of the soul. These truths are discoverable by reason, and are such as can constitute the basis of a universal religion. A revealed religion could never obtain universality, as it could never be intelligible and credible to all men. Even supposing its possibility, the Bible does not present such a revelation. It abounds in error as to matters of fact, contradicts human experience, reason and morals, and is one tissue of folly, deceit, prevarication, falseness and crime. Moreover, it is not a doctrinal compendium, or catechism, which a revelation would have to be. What the Old Testament says of the worship of God is little, and that little worthless, while its writers are unacquainted with the second fundamental truth of religion, the immortality of the soul. The design of the writers of the New Testament, as well as that of Jesus, was not to teach true rational religion, but to serve their own selfish ambitions, in promoting which they exhibit the amazing combination of conscious fraud and enthusiasm. It is important, however, to remember that Reimarus attacked atheism with equal effect and sincerity, and that he was a man of high moral character, respected and esteemed by his contemporaries.

Modern estimates of Reimarus may be found in the works of B. Pünjer, O. Pfleiderer and H. Höffding. Pünjer states the position of Reimarus as follows: "God is the Creator of the world, and His wisdom and goodness are conspicuous in it. Immediate is founded upon the essential nature of man and upon the purpose of God in creation. Religion is conducive to our happiness and alone brings satisfaction. Miracles are at variance with the divine purpose; without miracles there could be no revelation" (Pünjer, *History of Christian Philosophy of Religion since Kant*, Engl. trans., pp. 550–57, which contains an exposition of the *Abhandlungen* and *Schutzschrift*). Pfleiderer says the errors of Reimarus were that he ignored historical and literary criticism, sources, date, origin, &c., of documents, and the narratives were said to be either purely divine or purely human. He had no conception of an immanent reason (*Philosophy of Religion*, Engl. trans., vol. i. p. 102). H. Höffding, who has a brief section on the *Schutzschrift*, stating its main position as follows: "Natural religion suffices; a revelation is therefore superfluous. Moreover, such a thing is both physically and morally impossible. God cannot interrupt His own work by miracles; nor can He favour some men above others by revelations which are not granted to all, and with which it is not even possible for all to become acquainted. But of all doctrines that of eternal punishment is most contrary, Reimarus thinks, to true ideas of God, and is upon this point which first caused him to stumble" (*History of Modern Phil.*, Eng. trans. (1900), vol. ii. pp. 12, 13).

See the "Fragments" as published by Lessing, reprinted in vol. xv. of *Lessing's Werke*, Hempel's edition; D. F. Strauss, *H. S. Reimarus und seine Schutzschrift für die vernünftigen Verehrer Gottes* (1862, 2nd ed. 1877); Charles Voysey, *Fragments from Reimarus* (London, 1879) (a translation of the life of Reimarus by Strauss, with the second part of the seventh fragment, entitled "Objects of Jesus and His disciples"); the *Lives* of Lessing by Danzel and G. E. Guhrauer, Sime, and Zimmern; Kuno Fischer, *Geschichte der neuern Philosophie* (vol. ii. pp. 759–72, 2nd ed. 1867); Zeller, *Geschichte der deutschen Philosophie* (2nd ed., 1875, pp. 243–46).

REIMS (RHEIMS), a city of north-eastern France, chief town of an arrondissement of the department of Marne, 98 m. E.N.E. of Paris, on the Eastern railway. Pop. (1906) 102,800. Reims is situated in a plain on the right bank of the Vesle, a tributary of the Aisne, and on the canal which connects the Aisne with the Marne. South and west rise the "montagne de Reims" and vine-clad hills. Reims is limited S.W. by the Vesle and the canal, N.W. by promenades which separate it from the railway and in other directions by boulevards lined with fine residences. Beyond extend large suburbs, the chief of which are Cérès to the N.E., Contures to the E., Laon to the N. and Vesle to the W. Of its squares the principal are the Place

Royale, with a statue of Louis XV., and the place du Parvis, with an equestrian statue of Joan of Arc. The rue de Vesle, the chief street, continued under other names, traverses the town from S.W. to N.W., passing through the Place Royale.

The oldest monument in Reims is the Mars Gate (so called from a temple to Mars in the neighbourhood), a triumphal arch 108 ft. in length by 43 in height, consisting of three archways flanked by columns. It is popularly supposed to have been erected by the Remi in honour of Augustus when Agrippa made the great roads terminating at the town, but probably belongs to the 3rd or 4th century. In its vicinity a curious mosaic, measuring 36 ft. by 26, with thirty-five medallions representing animals and gladiators, was discovered in 1860. To these remains must be added a Gallo-Roman sarcophagus, said to be that of the consul Jovinus (see below) and preserved in the archaeological museum in the cloister of the abbey of St Remi. The cathedral of Notre-Dame, where the kings of France used to be crowned, replaced an older church (burned in 1211) built on the site of the basilica where Clovis was baptized by St Remigius. The cathedral, with the exception of the west front, was completed by the end of the 13th century. That portion was erected in the 14th century after 13th-century designs—the nave having in the meantime been lengthened to afford room for the crowds that attended the coronations. In 1481 fire destroyed the roof and the spires. In 1875 the National Assembly voted £80,000 for repairs of the façade and balustrades. This façade is the finest portion of the building, and one of the most perfect masterpieces of the middle ages. The three portals are laden with sculpture and statuettes. The central portal, dedicated to the Virgin, is surmounted by a rose-window framed in an arch itself decorated with statuary. The "gallery of the kings" above has the baptism of Clovis in the centre and statues of his successors. The towers, 267 ft. high, were originally designed to rise 394 ft.; that on the south contains two great bells, one of which, named "Charlotte" by Cardinal de Lorraine in 1570, weighs more than 11 tons. The façades of the transepts are also decorated with sculpture—that on the north with statues of the principal bishops of Reims, a representation of the Last Judgment and a figure of Christ (*le Beau Dieu*) while that on the south side has a beautiful rose-window with the prophets and apostles. Of the four towers which flanked the transepts nothing remains above the height of the roof since the fire of 1481. Above the choir rises an elegant bell-tower in timber and lead, 59 ft. high, reconstructed in the 15th century. The interior of the cathedral is 455 ft. long, 98 ft. wide in the nave, and 85 ft. high in the vaulting, and comprises a nave with aisles, transepts with aisles, a choir with double aisles, and an apse with deambulatory and radiating chapels. It has a profusion of statues similar to those of the outside, and stained glass of the 13th century. The rose-window over the main portal and the gallery beneath are of rare magnificence. The cathedral possesses fine tapestries. Of these the most important series is that presented by Robert de Lenoncourt, archbishop under Francis I., representing the life of the Virgin. The north transept contains a fine organ in a Flamboyant Gothic case. The choir clock is ornamented with curious mechanical figures. Several paintings, by Tintoretto, Nicolas Poussin, and others, and the carved choir-stalls and the railings of the choir, also deserve notice. The treasury contains the Sainte Ampoule, or holy flask, the successor of the ancient one broken at the Revolution (see below), a fragment of which it contains.

The archiepiscopal palace, built between 1498 and 1509, and in part rebuilt in 1675, was occupied by the kings on the occasion of their coronation. The saloon (salle du Tau), where the royal banquet was held, has an immense stone chimney of the 15th century, medallions of the archbishops of Reims, and portraits of fourteen kings crowned in the city. Among the other rooms of the royal suite, all of which are of great beauty and richness, is that now used for the meetings of the Reims Academy; the building also contains a library. The chapel of the archiepiscopal palace consists of two storeys, of which the upper still serves as a place of worship. Both the chapel and the salle du Tau are decorated with tapestries of the 17th century, known as the Perpersack tapestries, after the Flemish weaver who executed them.

After the cathedral, which it almost equals in size, the most celebrated church is St Remi, once attached to an important abbey, the buildings of which are used as a hospital. St Remi dates from the 11th, 12th, 13th and 15th centuries. The nave and transepts, Romanesque in style, date mainly from the earliest, the façade of the south transept from the latest, of those periods, the choir and apse chapels from the 12th and 13th centuries. The valuable monuments which the church was at one time filled were partly destroyed during the Revolution, and even the tomb of the saint is a modern work; but there remain the 12th-century glass windows of the apse and tapestries representing the history of St Remigius, given by Robert de Lenoncourt. The churches of St Jacques, St Maurice (partly rebuilt in 1867), St André, and St Thomas (erected from 1847 to 1853, under the patronage of Cardinal Gousset, now buried within its walls), are all of minor interest. Of the fine church of St Nicaise only insignificant remains now exist.

The town hall, erected in the 17th and enlarged in the 19th century, has a pediment with an equestrian statue of Louis XIII. and a tall and elegant campanile. It contains a picture gallery, ethnographical, archaeological and other collections, and the public library. There are many old houses, the House of the Musicians (13th century) being so called from the seated figures of musicians which decorate the front.

In 1874 the construction of a chain of detached forts was begun in the vicinity, Reims being selected as one of the chief defences of the northern approaches of Paris. The ridge of St Thierry is crowned with a fort of the same name, which with the neighbouring work of Chenay closes the west side of the place. To the north the hill of Brimont has three works guarding the Laon railway and the Aisne canal. Farther east, on the old Roman road, lies the fort de Fresnes. Due east the hills of Arnay are crowned with five large and important works which cover the approaches from the upper Aisne. Forts Pompelle and Montbré close the south-east side, and the Falaise hills on the Paris side are open and unguarded. The perimeter of the defences is not quite 22 m., and the forts are a mean distance of 6 m. from the centre of the city.

Reims is the seat of an archbishop, a court of assize and a sub-prefect. It is an important centre for the combing, carding and spinning of wool and the weaving of flannel, merino, cloth and woollen goods of all kinds, these industries employing some 20,000 hands; dyeing and "dressing" are also carried on. It is the chief wool market in France, and has a "conditioning house" which determines the loss of weight resulting from the drying of the wool. The manufacture of and trade in champagne is also very important. The wine is stored in large cellars tunnelled in the chalk. Other manufactures are machinery, chemicals, safes, capsules, bottles, casks, candles, soap and paper. The town is well known for its cakes and biscuits.

History.—Before the Roman conquest Reims, as *Durocortorum*, was capital of the Remi, from whose name that of the town was subsequently derived. The Remi made voluntary submission to the Romans, and by their fidelity throughout the various Gallic insurrections secured the special favour of their conquerors. Christianity was established in the town by the middle of the 3rd century, at which period the bishopric was founded. The consul Jovinus, an influential supporter of the new faith, repulsed the barbarians who invaded Champagne in 336; but the Vandals captured the town in 406 and slew St Nicasus, and Attila afterwards put it to fire and sword. Clovis, after his victory at Soissons (486), was baptized at Reims in 496 by St Remigius. Later kings desired to be consecrated at Reims with the oil of the sacred phial which was believed to have been brought from heaven by a dove for the baptism of Clovis and was preserved in the abbey of St Remi. Meetings of Pope Stephen III. with Pippin the Short, and of Leo III. with Charlemagne, took place at Reims; and here Louis the Debonnaire was crowned by Stephen IV. Louis IV. gave the town and countship of Reims to the archbishop Artaldus in 940. Louis VII. gave the title of duke and peer to William of Champagne, archbishop from 1176 to 1202, and the archbishops of Reims took precedence of the other ecclesiastical peers of the realm. In the 10th century Reims had become a centre of intellectual culture, Archbishop Adalberon, seconded by the monk Gerbert (afterwards Pope Silvester II.), having founded schools where the "liberal arts" were taught. Adalberon was also one of the prime authors of the revolution which put the Capet house in the place of the Carolingians. The most important prerogative of the archbishops was the consecration of the kings of France—a privilege which was exercised, except in a few cases, from the time of Philip Augustus to that of Charles X. Louis VII. granted the town a communal charter in 1139. The treaty of Troyes (1420) ceded it to the English, who had made a futile attempt to take it by siege in 1360; but they were expelled on the approach of Joan of Arc, who in 1429 caused Charles VII. to be consecrated in the cathedral. A revolt at Reims, caused by the salt tax in 1461, was cruelly repressed by Louis XI. The town sided with the League (1585), but submitted to Henry IV. after the battle of

Ivry. In the foreign invasions of 1814 it was captured and recaptured; in 1870–71 it was made by the Germans the seat of a governor-general and impoverished by heavy requisitions.

See G. Marlot, *Histoire de la ville, cité et université de Reims*, 4 vols. (Reims, 1843–46); J. Justinus (Baron I. Taylor), *La Ville de Reims* (Paris, 1854).

REIN, a guiding or controlling leather strap or thong, attached to the bit of a ridden or driven horse (see SADDLERY). The word is taken from the O. Fr. *rene*, modern *rêne*, and is usually traced to a supposed Late Latin substantive *retina* formed from *retinere*, to hold back, restrain, cf. classical Latin *retinaculum*, halter. The word, usually in the plural, has been often used figuratively, as a type of that which guides, restrains or controls, *e.g.* in such phrases as the "reins of government," &c. The "reins," *i.e.* the kidneys (Lat. *renes*, cf. Gr. φρήν, the midriff), or the place where the kidneys are situated, hence the loins, also, figuratively, the seat of the emotions or affections, must be distinguished.

REINACH, JOSEPH (1856–), French author and politician, was born in Paris on the 30th of September 1856. After leaving the Lycée Condorcet he studied for the bar, being called in 1887. He attracted the attention of Gambetta by articles on Balkan politics published in the *Revue bleue*, and joined the staff of the *République française*. In Gambetta's *grand ministère* M. Reinach was his secretary, and drew up the case for a partial revision of the constitution and for the electoral method known as the *scrutin de liste*. The *République française* he waged a steady war against General Boulanger which brought him three duels, one with Edmond Magnier and two with Paul Déroulède. Between 1889 and 1898 he sat for the Chamber of Deputies for Digne. As member of the army commission, reporter of the budgets of the ministries of the interior and of agriculture he brought forward bills for the better treatment of the insane, for the establishment of a colonial ministry, for the taxation of alcohol, and for the reparation of judicial errors. He advocated complete freedom of the theatre and the press, the abolition of public executions, and denounced political corruption of all kinds. He was indirectly implicated in the Panama scandals through his father-in-law, Baron J. Reinach, though he made restitution as soon as he learned that he was benefiting by fraud. But he is best known as the champion of Captain Dreyfus. At the time of the original trial he attempted to secure a public hearing of the case, and in 1897 he allied himself with Scheurer-Kestner to demand its revision. He denounced in the *Siècle* the Henry forgery, and Esterhazy's complicity. His articles in the *Siècle* aroused the fury of the anti-Dreyfusard party, especially as he was himself a Jew and therefore open to the charge of having undertaken to defend the innocence of Dreyfus on racial grounds. He lost his seat in the Chamber of Deputies, and, having refused to fight Henri Rochefort, eventually brought an action for libel against him. Finally, the "affaire" being terminated and Dreyfus pardoned, he undertook to write the history of the case, the first four volumes of which appeared in 1901. This was completed in 1905. In 1906 M. Reinach was re-elected for Digne. In that year he became member of the commission of the national archives, and next year of the council on prisons. Reinach was a voluminous writer on political subjects. On Gambetta he published three volumes in 1884, and he also edited his speeches. For the criticisms of the anti-Dreyfusard press see Henri Dutrait-Croyon, *Joseph Reinach, historien* (Paris, 1905), a violent criticism in detail of Reinach's history of the "affaire."

His brother, the well-known *savant*, SALOMON REINACH (1858–), born at St Germain-en-Laye on the 29th of August 1858, was educated at the École normale supérieure, and joined the French school at Athens in 1879. He made valuable archaeological discoveries at Myrina near Smyrna in 1880–82; at Cyme in 1881, at Thasos, Imbros and Lesbos (1882), at Carthage and Meninx (1883–84), at Odessa (1893) and elsewhere. He received honours from the chief learned societies of Europe, and in 1886 received an appointment at the National Museum of Antiquities at St Germain; in 1893 he became assistant keeper, and in 1902 keeper of the national museums. In 1903 he became joint editor of the *Revue archéologique*, and in the same year officer of the Legion of Honour. The lectures he delivered on art at the École du Louvre in 1902–3 were published by him under the title of *Apollo*. This book has been translated into most European languages, and is one of the most compact handbooks of the subject.

His first published work was a translation of Schopenhauer's *Essay on Free Will* (1877), which passed through many editions. This was followed by many works and articles in the learned reviews of which a list—up to 1903—is available in *Bibliographie de S. R.* (Angers, 1903). His *Manuel de philologie classique* (1886–1884) was crowned by the French association for the study of Greek; his *Grammaire latine* (1886) received a prize from the Society of Secondary Education; *La Nécropole de Myrina* (1887), written with E. Pottier, and *Antiquités nationales* were crowned by the Academy of Inscriptions. He compiled an important *Répertoire de la statuaire grecque et romaine* (3 vols., 1897–98); also *Répertoire de peintures du moyen âge et de la Renaissance 1280–1580* (1905, &c.); *Répertoire des vases peints grecs et étrusques* (1900). In 1905 he began his *Cultes, mythes et religions*; and in 1909 he published a general sketch of the history of religions under the title of *Orpheus*. He also translated from the English H. C. Lea's *History of the Inquisition*.

A younger brother, THEODORE REINACH (1860–), also had a brilliant career as a scholar. He pleaded at the Parisian bar 1882–86, but eventually gave himself up to the study of numismatics. He wrote important works on the ancient kingdoms of Asia Minor—*Trois royaumes de l'Asie Mineure, Cappadoce, Bithynie, Pont* (1888), *Mithridate Eupator* (1890); also a critical edition and translation with H. Weil of Plutarch's Treatise on Music; and an *Histoire des Israélites depuis la ruine de leur indépendance nationale jusqu'à nos jours* (2nd ed., 1901). From 1888 to 1897 he edited the *Revue des études grecques*.

REINAUD, JOSEPH TOUSSAINT (1795–1867), French orientalist, was born on the 4th of December 1795 at Lambesc, Bouches du Rhône. He came to Paris in 1815, and became a pupil of Silvestre de Sacy. In 1818–19 he was at Rome as an attaché to the French minister, and studied under the Maronites in the Propaganda, but gave special attention to Mahommedan coins. In 1824 he entered the department of oriental MSS. in the Royal Library at Paris, and in 1838, on the death of De Sacy, he succeeded to his chair in the school of living oriental languages. In 1847 he became president of the Société Asiatique, and in 1858 conservator of oriental MSS. in the Imperial Library. His first important work was his classical description of the collections of the duc de Blacas (1828). To history he contributed an essay on the Arab invasions of France, Savoy, Piedmont and Switzerland (1836), and various collections for the period of the crusades; he edited (1840) and in part translated (1848) the geography of Abulfeda; to him too is due a useful edition of the very curious records of early Arab intercourse with China of which Abu Zaid Hasan Sirafi had given an imperfect translation (*Relation des voyages*, &c., 1845), and various other essays illustrating the ancient and medieval geography of the East. Reinaud died in Paris on the 14th of May 1867.

REINDEER, in its strict sense the title of a European deer distinguished from all other members of the family Cervidae (see DEER), save those of the same genus, by the presence of antlers in both sexes; but, in the wider sense, including Asiatic and North American deer of the same general type, the latter of which are locally designated caribou. Reindeer, or caribou, constitute the genus *Rangifer*, and are large clumsily built deer, inhabiting the sub-Arctic and Arctic regions of both hemispheres. As regards their distinctive features, the antlers are of a complex type and situated close to the occipital ridge of the skull, and thus far away from the sockets of the eyes, with the brow-tines in adult males palmated, laterally compressed, deflected towards the middle of the face, and often unsymmetrically developed. Above the brow-tine is developed a second palmated tine,

which appears to represent the bez-tine of the red-deer; there is no trez-tine, but some distance above the bez the beam is suddenly bent forward to form an "elbow," on the posterior side of which is usually a short back-tine; above the back-tine the beam is continued for some distance to terminate in a large expansion or palmation. The antlers of females are simple and generally smaller. The muzzle is entirely hairy; the ears and tail are short; and the throat is maned. The coat is unspotted at all ages, with a whitish area in the region of the tail. The main hoofs are short and rounded and the lateral hoofs very large. There is a tarsal, but no metatarsal gland and tuft. In the skull the gland-pit is shallow, and the vacuity of moderate size; the nasal bones are well developed, and much expanded at the spear-end. Upper canines are wanting; the cheek-teeth are small and low-crowned, with the third lobe of the last molar in the lower jaw minute. The lateral metacarpal bones are represented only by their lower extremities; the importance of this feature being noticed in the article DEER.

In spite of the existence of a number of more or less well-marked geographical forms, reindeer from all parts of the northern hemisphere present such a marked similarity that it seems preferable to regard them as all belonging to a single widespread species, to which most of the characters will be the same as those of the genus. American naturalists, however, generally regard these as distinct species. The coat is remarkable for its density and compactness; the general colour of the head and upper parts being clove-brown, with more or less white or whitish grey on the under parts and inner surfaces of the limbs, while there is also some white above the hoofs and on the muzzle, and there may be whitish rings round the eyes; there is a white area in the region of the tail, which is concealed, but not the upper surface of the latter; and the tarsal tuft is generally white. The antlers are smooth, and brownish white in colour, but the hoofs jet black. Albino varieties occasionally occur in the wild state. A height of 4 ft. to in. at the shoulder has been recorded in the case of one race.

The wild Scandinavian reindeer (*Rangifer tarandus*) may be regarded as the typical form of the species. It is a smaller animal than the American woodland race, with antlers approaching in those of the barren-ground race, but less elongated, and with a distinct back-tine in the male, the brow-tines moderately palmated and frequently nearly symmetrical, and the bez-tine not excessively expanded. Female antlers are generally much smaller than those of males, although occasionally as large, but with much fewer points. The antlers make their appearance at an unusually early age.

Mr Madison Grant considers that American reindeer, or caribou, may be grouped under two types, one represented by the barren-ground caribou *R. tarandus arcticus*, which is a small animal with immense antlers characterized by the length of the beam, and the consequent wide separation of the terminal palmation from the brow-tine; and the other by the woodland-caribou (*R. t. caribou*), which is a larger animal with shorter and more massive antlers, in which the great terminal expansions are in approximation to the brow-tine owing to the shortness of the beam. Up to 1902 seven other American races had been described, four of which are grouped by Grant with the first and three with the second type. Some of these forms are, however, more or less intermediate between the two main types, as is a pair of antlers from Novaia Zemlia described by the present writer as *R. t. pearsoni*. The Scandinavian reindeer is identified by Mr Grant with the barren-ground type.

Reindeer are domesticated by the Lapps and other nationalities of northern Europe and Asia, to whom these animals are all-important. Domesticated reindeer have also been introduced into Alaska.

See Madison Grant, "The Caribou," *7th Annual Report, New York Zoological Society* (1902); J. G. Millais, *Newfoundland and its Untrodden Ways* (1908). (R. L.*)

REINECKE, CARL HEINRICH CARSTEN (1824–1910), German composer and pianist, was born at Altona on the 23rd of June 1824; his father, Peter Reinecke (who was also his teacher), being an accomplished musician. At the age of eleven he made his first appearance as a pianist, and when scarcely eighteen he went on a successful tour through Denmark and Sweden. After a stay in Leipzig, where he studied under Mendelssohn and under Schumann, Reinecke went on tour with Königslöw and Wasielewski, Schumann's biographer, in North Germany and Denmark. From 1846 to 1848 Reinecke was court pianist to Christian VIII. of Denmark. After resigning this post he went first to Paris, and next to Cologne, as professor in the Conservatorium. From 1854 to 1859 he was music director at Barmen, in the latter year filling this post at Breslau University; in 1860 he became conductor of the famous Leipzig Gewandhaus, a post which (together with that of professor at the Conservatorium) he held with honour and distinction for thirty-five years. He finally retired into private life in 1902 and died in March 1910. During this time Reinecke continually made concert tours to England and elsewhere. His pianoforte playing belonged to a school now almost extinct. Grace and neatness were its characteristics, and at one time Reinecke was probably unrivalled as a Mozart player and an accompanist. His grand opera *König Manfred*, and the comic opera *Auf hohen Befehl*, were at one time frequently played in Germany; and his cantata *Hakon Jarl* is melodiously beautiful, as are many of his songs; while his Friedensfeier overture was once quite hackneyed. By far his most valuable works are those written for educational purposes. His sonatinas, his "Kindergarten" and much that he has ably edited will keep his name alive.

REINHART, CHARLES STANLEY (1844–1896), American painter and illustrator, was born at Pittsburg, Pennsylvania, and after having been employed in railway work and at a steel factory, studied art in Paris and at the Munich Academy under Straehuber and Otto. He afterwards settled in New York, but spent the years 1882–1886 in Paris. He was a regular exhibitor at the National Academy in New York, and contributed illustrations in black and white and in colours to the leading American periodicals. He died in 1896. Among his best-known pictures are: "Reconnoitring," "Caught Napping," "Sentinel Duty," "Morning," "Mussel Fisherwoman," "At the Ferry," "Normandy Coast," "Gathering Wood," "The Old Life Boat," "Sunday," and "English Garden"; but it is as an illustrator that he is best known.

REINHART, JOACHIM CHRISTIAN (1761–1847), German painter and etcher, was born at Hof in Bavaria in 1761, and studied under Oeser at Leipzig and under Klingel at Dresden. In 1789 he went to Rome, where he became a follower of the classicist German painters Carstens and Koch. He devoted himself more particularly to landscape painting and to aquatint engraving. Examples of his landscapes are to be found at most of the important German galleries, notably at Frankfort, Munich, Leipzig and Gotha. In Rome he executed a series of landscape frescoes for the Villa Massimi. He died in Rome in 1847.

REINHOLD, KARL LEONHARD (1758–1823), German philosopher, was born at Vienna. At the age of fourteen he entered the Jesuit college of St Anna, on the dissolution of which (1774) he joined a similar college of the order of St Barnabas. Finding himself out of sympathy with monastic life, he fled in 1783 to North Germany, and settled in Weimar, where he became Wieland's *collaborateur* on the *German Mercury*, and eventually his son-in-law. In the *German Mercury* he published, in the years 1786–87, his *Briefe über die Kantische Philosophie*, which were most important in making Kant known to a wider circle of readers. As a result of the *Letters*, Reinhold received a call to the university of Jena, where he taught from 1787 to 1794. In 1789 he published his chief work, the *Versuch einer neuen Theorie des menschlichen Vorstellungsvermögens*, in which he attempted to simplify the Kantian theory and make it more of a unity. In 1794 he accepted a call to Kiel, where he taught till his death in 1823, but his independent activity was at an end. In later life he was powerfully influenced by Fichte, and subsequently, on grounds of religious feeling, by Jacobi and Bardili. His historical importance belongs entirely to his earlier activity. The development of the Kantian standpoint contained in the "New Theory of Human Understanding" (1789), and in the *Fundament des philosophischen Wissens* (1791), was called by its author *Elementarphilosophie*.

"Reinhold lays greater emphasis than Kant upon the unity and activity of consciousness. The principle of consciousness tells us that every idea is related both to an object and a subject, and is partly to be distinguished, partly united to both. Since form cannot produce matter nor subject object, we are forced to assume a thing-in-itself. But this is a notion which is self-contradictory if consciousness be essentially a relating activity. There is there-

fore something which must be thought and yet cannot be thought" (Höffding, *History of Modern Philosophy*, Eng. trans., vol. ii.).

See R. Keil, *Wieland und Reinhold* (2nd ed., Leipzig, 1890); J. E. Erdmann, *Grundriss der Geschichte der Philosophie* (Berlin, 1866); histories of philosophy by R. Folckenberg and W. Windelband.

REINKENS, JOSEPH HUBERT (1821–1896), German Old Catholic bishop, was born at Burtscheid, near Aix-la-Chapelle, on the 1st of March 1821, his father being a gardener. In 1836, on the death of his mother, he took to manual work in order to support his numerous brothers and sisters, but in 1840 he was able to go to the gymnasium at Aix, and he afterwards studied theology at the universities of Bonn and Munich. He was ordained priest in 1848, and in 1849 graduated as doctor in theology. He was soon appointed professor of ecclesiastical history at Breslau, and in 1865 he was made rector of the university. During this period he wrote, among other treatises, monographs on Clement of Alexandria, Hilary of Poitiers and Martin of Tours. In consequence of an essay on art, especially in tragedy, after Aristotle, he was made doctor in philosophy in the university of Leipzig. When, in 1870, the question of papal infallibility was raised, Reinkens attached himself to the party opposed to the proclamation of the dogma. He wrote several pamphlets on church tradition relative to infallibility and on the procedure of the Council. When the dogma of infallibility was proclaimed, Reinkens joined the band of influential theologians, headed by Döllinger, who resolved to organize resistance to the decree. He was one of those who signed the Declaration of Nüremberg in 1871, and at the Bonn conferences with Orientals and Anglicans in 1874 and 1875 he was conspicuous. The Old Catholics having decided to separate themselves from the Church of Rome, Reinkens was chosen their bishop in Germany at an enthusiastic meeting at Cologne in 1873 (see OLD CATHOLICS). On the 11th of August of that year he was consecrated by Dr Heykamp, bishop of Deventer. Reinkens devoted himself zealously to his office, and it was due to his efforts that the Old Catholic movement crystallized into an organized church, with a definite status in the various German states. He wrote a number of theological works after his consecration, but none of them as important as his treatise on Cyprian and the Unity of the Church (1873). The chief act of his episcopal career was his consecration in 1876 of Dr Edward Herzog to preside as bishop over the Old Catholic Church in Switzerland. In 1881 Reinkens visited England, and received Holy Communion more than once with bishops, clergy and laity of the Church of England, and in 1894 he defended the validity of Anglican orders against his co-religionists, the Old Catholics of Holland. He died at Bonn on the 4th of January 1896.

See *Joseph Hubert Reinkens*, by his nephew, J. M. Reinkens (Gotha, 1906).

REISKE, JOHANN JACOB (1716–1774), German scholar and physician, was born on the 25th of December 1716 at Zörbig in Electoral Saxony. From the Waisenhaus at Halle he passed in 1733 to the university of Leipzig, and there spent five years. He tried to find his own way in Greek literature, to which German schools then gave little attention; but, as he had not mastered the grammar, he soon found this a sore task and took up Arabic. He was very poor, having almost nothing beyond his allowance, which for the five years was only two hundred thalers. But everything of which he could cheat his appetite was spent on Arabic books, and when he had read all that was then printed he thirsted for manuscripts, and in March 1738 started on foot for Hamburg, joyous though totally unprovided, on his way to Leiden and the treasures of the Warnerianum. At Hamburg he got some money and letters of recommendation from the Hebraist Wolf, and took ship to Amsterdam. Here d'Orville, to whom he had an introduction, proposed to retain him as his amanuensis at a salary of six hundred guilders. Reiske refused, though he thought the offer very generous; he did not want money, he wanted manuscripts. When he reached Leiden (June 6, 1738) he found that the lectures were over for the term and that the MSS. were not open to him. But d'Orville and A. Schultens helped him to private teaching and reading for the press, by which he was able to live. He heard the lectures of A. Schultens, and practised himself in Arabic with his son J. J. Schultens. Through Schultens too he got at Arabic MSS., and was even allowed *sub rosa* to take them home with him. Ultimately he seems to have got free access to the collection, which he re-catalogued—the work of almost a whole summer, for which the curators rewarded him with nine guilders.

Reiske's first years in Leiden were not unhappy, till he got into serious trouble by introducing emendations of his own into the second edition of Burmann's *Petronius*, which he had to see through the press. His patrons withdrew from him, and his chance of perhaps becoming professor was gone; d'Orville indeed soon came round, for he could not do without Reiske, who did work of which his patron, after dressing it up in his own style, took the credit. But A. Schultens was never the same as before to him; Reiske indeed was too independent, and hurt him by his open criticisms of his master's way of making Arabic mainly a handmaid of Hebrew. Reiske, however, himself admits that Schultens always behaved honourably to him. In 1742 by Schultens's advice Reiske took up medicine as a study by which he might hope to live if he could not do so by philology. In 1746 he graduated as M.D., the fees being remitted at Schultens's intercession. It was Schultens too who conquered the difficulties opposed to his graduation at the last moment by the faculty of theology on the ground that some of his theses had a materialistic ring. On the 10th of June 1746 he left Holland and settled in Leipzig, where he hoped to get medical practice.

But his shy, proud nature was not fitted to gain patients, and the Leipzig doctors would not recommend one who was not a Leipzig graduate. In 1747 an Arabic dedication to the electoral prince of Saxony got him the title of professor, but neither the faculty of arts nor that of medicine was willing to admit him among them, and he never delivered a course of lectures. He had still to go on doing literary task-work, but his labour was much worse paid in Leipzig than in Leiden. Still he could have lived and sent his old mother, as his custom was, a yearly present of a piece of leather to be sold in retail if he had been a better manager. But, careless for the morrow, he was always printing at his own cost great books which found no buyers. His academical colleagues were hostile; and Ernesti, under a show of friendship, secretly hindered his promotion. His unsparing reviews made bad blood with the pillars of the university.

At length in 1758 the magistrates of Leipzig rescued him from his misery by giving him the rectorate of St Nicolai, and, though he still made no way with the leading men of the university and suffered from the hostility of men like Ruhnken and J. D. Michaelis, he was compensated for this by the esteem of Frederick the Great, of Lessing, Karsten Niebuhr, and many foreign scholars. The last decade of his life was made cheerful by his marriage with Ernestine Müller, who shared all his interests and learned Greek to help him with collations. In proof of his gratitude her portrait stands beside his in the first volume of the *Oratores Graeci*. Reiske died on the 14th of August 1774, and his MS. remains passed, through Lessing's mediation, to the Danish minister Suhm, and are now in the Copenhagen library.

Reiske certainly surpassed all his predecessors in the range and quality of his knowledge of Arabic literature. It was the history, the *realia* of the literature, that always interested him; he did not care for Arabic poetry as such, and the then much praised Hariri seemed to him a grammatical pedant. He read the poets less for their verses than for such scholia as supplied historical notices. Thus for example the scholia on Jarîr furnished him with a remarkable notice of the prevalence of Buddhist doctrine and asceticism in 'Irâk under the Omayyads. In the *Annotationes historicae* to his Abulfeda (*Abulf. Annales Moslemici*, 5 vols., Copenhagen, 1789–91), he collected a veritable treasure of sound and original research; he knew the Byzantine writers as thoroughly as the Arabic authors, and was alike at home in modern works of travel in all languages and in ancient and medieval authorities. He was interested too in

numismatics, and his letters on Arabic coinage (in Eichhorn's *Repertorium*, vols. ix.–xi.) form, according to De Sacy, the basis of that branch of study. To comprehensive knowledge and very wide reading he added a sound historical judgment. He was not, like Schultens, deceived by the pretended antiquity of the Yemenite Kasidas.[1] Errors no doubt he made, as in the attempt to ascertain the date of the breach of the dam of Marib.

Though Abulfeda as a late epitomator did not afford a starting-point for methodical study of the sources, Reiske's edition with his version and notes certainly laid the foundation for research in Arabic history. The foundation of Arabic philology, however, was laid not by him but by De Sacy. Reiske's linguistic knowledge was great, but he used it only to understand his authors; he had no feeling for form, for language as language, or for metre.

In Leipzig Reiske worked mainly at Greek, though he continued to draw on his Arabic stores accumulated in Leiden. Yet his merit as an Arabist was sooner recognized than the value of his Greek work. Reiske the Greek scholar has been rightly valued only in recent years, and it is now recognized that he was the first German since Sylburg who had a living knowledge of the Greek tongue. His reputation does not rest on his numerous editions, often hasty or even made to booksellers' orders, but in his remarks, especially his conjectures. He himself designates the *Animadversiones in Scriptores Graecos as flos ingenii sui*, and in truth these thin booklets outweigh his big editions. Closely following the author's thought he removes obstacles whenever he meets them, but he is so steeped in the language and thinks so truly like a Greek that the difficulties he feels often seem to us to lie in mere points of style. His criticism is empirical and unmethodic, based on intimate and careful reading, and applied only when he feels a difficulty; and he is most successful when he has a large mass of tolerably homogeneous literature to lean on, whilst on isolated points he is often at a loss. His corrections are often hasty and false, but a surprisingly large proportion of them have since received confirmation from MSS. And, though his merits as a Grecian lie mainly in his conjectures, his realism is felt in this sphere also; his German translations especially show more freedom and practical insight, more feeling for actual life, than is common with the scholars of that age.[2]

For a list of Reiske's writings see Meusel, xi. 192 seq. His chief Arabic works (all posthumous) have been mentioned above. In Greek letters his chief works are *Comentatio Porphyr. libro II. de ceremoniis aulae Byzant.*, vols. i ii. (Leipzig, 1751–66), vol. iii. (Bonn, 1829); *Animadv. ad Graecos auctores* (5 vols., Leipzig, 1751–66) (the rest lies unprinted at Copenhagen); *Oratorum Graec. quae supersunt* (6 vols., Leipzig, 1770–73); *Opp. Crit. et Demosthenes* (3 vols., *ib.*, 1774–75); *Maximus Tyr.* (*ib.*, 1774); *Plutarchus* (11 vols., *ib.*, 1774–79); *Dionys Italic.* (6 vols., *ib.*, 1774–77); *Libanius* (4 vols., Altenburg, 1784–97). Various reviews in the *Acta eruditorum* and *Zuverl. Nachrichten* are characteristic and worth reading. Compare *D. Johann Jacob Reiskens von ihm selbst aufgesetzte Lebensbeschreibung* (Leipzig, 1783). (J. WE.)

RÉJANE, GABRIELLE [CHARLOTTE RÉJU] (1857–), French actress, was born in Paris, the daughter of an actor. She was a pupil of Regnier at the Conservatoire, and took the second prize for comedy in 1874. Her *début* was made the next year, during which she played attractively a number of light—especially soubrette—parts. Her first great success was in Henri Meilhac's *Ma camarade* (1883), and she soon became known as an emotional actress of rare gifts, notably in *Décoré, Germinie Lacerteux, Ma cousine, Amoureuse* and *Lysistrata*. In 1892 she married M. Porel, the director of the Vaudeville theatre, but the marriage was dissolved in 1905. Her performances in *Madame Sans Gêne* (1893) made her as well known in England and America as in Paris, and in later years she appeared in characteristic parts in both countries, being particularly successful in *Zaza* and *La Passerelle*. She opened the Théâtre Réjane in Paris in 1906. The essence of French vivacity and animated expression appeared to be concentrated in Madame Réjane's acting, and made her unrivalled in the parts which she had made her own.

RELAND, ADRIAN (1676–1718), Dutch Orientalist, was born at Ryp, studied at Utrecht and Leiden, and was professor of Oriental languages successively at Harderwijk (1699) and Utrecht (1701). His most important works were *Palaestina ex nateribus monumentis illustrata* (Utrecht, 1714), and *Antiquitates sacrae veterum Hebraeorum*. (See also Burman, *Traj. Erud.*, p. 296 seq.).

[2] For this estimate of Reiske as a Greek scholar the writer is indebted to Prof. U. v. Wilamowitz-Moellendorff.

RELAPSING FEVER (*Febris recurrens*), the name given to a specific infectious disease occasionally appearing as an epidemic in communities suffering from scarcity or famine. It is characterized mainly by its sudden invasion, with violent febrile symptoms, which continue for about a week and end in a crisis, but are followed, after another week, by a return of the fever.

This disease has received many other names, the best known of which are famine fever, seven-day, bilious relapsing fever, and spirillum fever. As in the case of typhoid, relapsing fever was long believed to be simply a form of typhus. The distinction between them appears to have been first clearly established in 1826, in connexion with an epidemic in Ireland.

Relapsing fever is highly contagious. With respect to the nature of the contagion, certain important observations have been made (see also PARASITIC DISEASES). In 1873 Obermeier discovered in the blood of persons suffering from relapsing fever minute organisms in the form of spiral filaments of the genus *Spirochaete*, measuring in length $\frac{1}{250}$ to $\frac{1}{150}$ inch and in breadth $\frac{1}{4000}$ to $\frac{1}{5000}$ inch, and possessed of rotatory or twisting movements. This organism received the name of *Spirillum obermeieri*. Fritz Schaudinn has brought forward evidence that it is an animal parasite. The most constantly recognized factor in the origin and spread of relapsing fever is destitution; but this cannot be regarded as more than a predisposing cause, since in many lands widespread and destructive famines have prevailed without any outbreak of this fever. Instances, too, have been recorded where epidemics were distinctly associated with overcrowding rather than with privation. Relapsing fever is most commonly met with in the young. One attack does not appear to protect from others, but rather, according to some authorities, engenders liability.

The incubation of the disease is about one week. The symptoms of the fever then show themselves with great abruptness and violence by a rigor, accompanied with pains in the limbs and severe headache. The febrile phenomena are very marked, and the temperature quickly rises to a high point, 105°–106° F., at which it continues with little variation, while the pulse is rapid (100–140), full and strong. There is intense thirst, a dry brown tongue, bilious vomiting, tenderness over the liver and spleen, and occasionally jaundice. Sometimes a peculiar bronze appearance of the skin is noticed, but there is no characteristic rash as in typhus. There is much prostration of strength. After the continuance of these symptoms for a period of from five to seven days, the temperature suddenly falls to the normal point or below it, the pulse becomes correspondingly slow, and a profuse perspiration occurs, while the severe headache disappears and the appetite returns. Except for a sense of weakness, the patient feels well and may even return to work, but in some cases there remains a condition of great debility, accompanied with rheumatic pains in the limbs. This state of freedom from fever continues for about a week, when there occurs a well-marked relapse with scarcely less abruptness and severity than in the first attack, and the whole symptoms are of the same character, but they do not, as a rule, continue so long, and they terminate in a crisis in three or four days, after which convalescence proceeds satisfactorily. Second, third and even fourth relapses, however, may occur in exceptional cases.

The mortality in relapsing fever is comparatively small, about 5% being the average death-rate in epidemics (Murchison). The fatal cases occur mostly from complications, or intercurrent to continued fevers. The treatment is essentially the same as that for typhus fever. Löwenthal and Gabritochewsky by using the serum of an immune horse succeeded in averting the relapse in 40% of cases.

RELATIVITY OF KNOWLEDGE, a philosophic term which was much used by the philosophers of the middle of the 19th century, and has since fallen largely into disuse. It deserves explanation, however, not only because it has occupied so large a space in the writings of some great British thinkers, but also because the main question for which it stands is still matter of eager debate. We get at the meaning of the term most easily by considering what it is that "relativity" is opposed to. "Relativity" of knowledge is opposed to absoluteness or positiveness of knowledge. Now there are two senses in which knowledge may claim to be absolute. The knower may say, "I *know* this absolutely," or he may say, "I know *this* absolutely." With the emphasis upon the "know" he asserts that his knowledge of the matter in question cannot be affected by anything whatever. "I know absolutely that two and two are four" makes an assertion about the knower's intellectual state: he is convinced that his certain knowledge of the result of adding two to two is independent of any other piece of knowledge. With

the emphasis upon the object of knowledge, "I know *this*," we have the other sense of absoluteness of knowledge: it is an assertion that the knower knows the "this," whatever it may be, in its essence or as it truly is in itself. The phrase "relativity of knowledge" has therefore two meanings: (*a*) that no portion of knowledge is absolute, but is always affected by its relations to other portions of knowledge; (*b*) that what we know are not absolute things in themselves, but things conditioned in their quality by our channels of knowledge. Each of these two propositions must command assent as soon as uncritical ignorance gives place to philosophic reflection; but each may be exaggerated, indeed has currently been exaggerated, into falsity. The simplest experience—a single note struck upon the piano—would not be what it is to us but for its relation by contrast or comparison with other experiences. This is true; but we may easily exaggerate it into a falsehood by saying that a piece of experience is entirely constituted by its relation to other experiences. Such an extreme relativity, as advocated by T. H. Green in the first chapter of his *Prolegomena to Ethics*, involves the absurdity that our whole experience is a tissue of relations with no points of attachment on which the relations depend. The only motive for advocating it is the prejudice of absolute idealism which would deny that sensation has any part whatever in the constitution of experience. As soon as we recognize the part of sensation, we have no reason to deny the common-sense position that each piece of experience has its own quality, which is modified indefinitely by the relations in which it stands.

The second sense of relativity, that which asserts the impossibility of knowing things except as conditioned by our perceptive faculties, is more important philosophically and has had a more interesting history. To apprehend it is really the first great step in philosophical education. The unphilosophical person assumes that a tree as he sees it is identical with the tree as it is in itself and as it is for other percipient minds. Reflection shows that our apprehension of the tree is conditioned by the sense-organs with which we have been endowed, and that the apprehension of a blind man, and still more the apprehension of a dog or horse, is quite different from ours. What the tree is in itself—that is, for a perfect intelligence—we cannot know, any more than a dog or horse can know what the tree is for a human intelligence. So far the relativist is on sure ground; but from this truth is developed the paradox that the tree has no objective existence at all and consists entirely of the conscious states of the perceiver. Observe the parallelism of the two paradoxical forms of relativity: one says that things are relations with nothing that is related; the other says that things are perceptive conditions with nothing objective to which the conditions apply. Both make the given nothing and the work of the mind everything.

To see the absurdity of the second paradox of relativity is easier than to refute it. If nothing exists but the conscious states of the perceiver, how does he come to think that there is an objective tree at all? Why does he regard his conscious states as produced by an object? And how does he come to imagine that there are other minds than his own? In short, this kind of relativity leads straight to what is generally known as "the abyss of solipsism." But, like all the great paradoxes of philosophy, it has its value in directing our attention to a vital, yet much neglected, element of experience. We cannot avoid solipsism (*q.v.*) so long as we neglect the element of force or power. If, as Hegel asserted, our experience is all knowledge, and if knowledge is indefinitely transformed by the conditions of knowing, then we are tempted to regard the object as superfluous, and to treat our innate conviction that knowledge has reference to objects as a delusion which philosophical reflection is destined to dispel. The remedy for the paradox is to recognize that the foundation for our belief in the existence of objects is the force which they exercise upon us and the resistance which they offer to our will. What the tree is in regard to its specific qualities depends on what faculties we have for perceiving it. But, whatever specific qualities it may have, it will still exist as an object, so long as it comes into dynamic relations with our minds.

In the history of thought the relativity of knowledge as just described begins with Descartes, the founder of modern philosophy: the characteristic of modern philosophy is that it lays more stress upon the subjective than upon the objective side of experience. It is a mistake to refer it back to the Greeks. The maxim of Protagoras, for example, "Man is the measure of all things," has a different purpose; it was meant to point to the truth that man rather than nature is the primary object of human study: it is a doctrine of humanism rather than of relativism. To appreciate the relativistic doctrines we find in various thinkers we must take account of the use to which they were put. By Descartes the principle was used as an instrument of scepticism, the beneficent scepticism of pulling down medieval philosophy to make room for modern science; by Berkeley it was used to combat the materialists; by Hume in the cause of scepticism once more against the intellectual dogmatists; by Kant to prepare a justification for a noumenal sphere to be apprehended by faith; by J. S. Mill and Herbert Spencer to support their derivation of all our experience from sensation. It is in Mill's *Examination of Sir William Hamilton's Philosophy* that the classical statement of the Relativity of Knowledge is to be found. The second chapter of that book sets forth the various forms of the doctrine with admirable lucidity and precision, and gives many references to other writers.

For the sake of clearness it seems desirable to keep for the future the term "relativity of knowledge" to the first meaning explained above: for the second meaning it has been superseded in contemporary philosophizing by the terms "subjectivism," "subjective idealism," and, for its extreme form, "solipsism" (*q.v.*).

RELEASE (O.Fr. *reles*, variant of *relais*, from *relaisser*, to release, let go, Lat. *relaxare*), freedom or deliverance from trouble, pain or sorrow, the freeing or discharge from some obligation or debt, the action of letting go or releasing something fixed or set in position. In law, the term is applied to the discharge of some obligation, by which it is extinguished (see DEBT), and to the conveyance of an estate or interest in real or personal property to one who has already some estate or interest therein. For the special form of conveyancing known as "lease and release," see CONVEYANCING.

RELICS (Lat, *reliquiae*, the equivalent of the English "remains" in the sense of a dead body), the name given in the Catholic Church to (1) the bodies of the saints, or portions of them, (2) such objects as the saints made use of during their lives, or as were used at their martyrdom. These objects are held by the Church in religious veneration, and by their means it hopes to obtain divine grace and miraculous benefits (*Conc. Trid.* sess. 24).

These ideas had taken shape, in all essentials, during the early days of the Church, underwent further development in the middle ages, and were maintained by the Catholic Church in the face of the opposition of the Reformers, while all the Protestant Churches rejected them.

The origins of the veneration of relics lie in the anxiety for the preservation of the bodies of the martyrs. Nothing is more natural than that the pious solicitude felt by all men for the bodies of their loved ones should in the primitive Christian Churches have been turned most strongly towards the bodies of those who had met with death in confessing their faith. The circular given by the church at Smyrna of the death of their bishop Polycarp (155) gives us an insight into these feelings. The church collected and buried the remains of the martyr, who had been burnt, in order duly to celebrate the anniversary of the martyrdom at the place of burial. The possession of the relics seemed to assure the continuation of the common life of the church with their bishop, of the living with the dead (*Mart. Polyc.* c. 17).

The custom of which we have here for the first time an account had become universal by the 3rd century. In all parts the Christians assembled on the anniversary of the martyrs' death at their graves, to celebrate the Agape and the Eucharist at this spot. It was a favourite custom to bury the dead near the graves of the martyrs; and it was the highest wish of many to "rest with the saints." It was the body lying in the tomb which was venerated (see Euseb. *Hist. ecd.* vii. 11, 24; viii. 6, 7).

But these customs soon underwent a further development. About the end of the 3rd and the beginning of the 4th century

it became customary for the bodies of the martyrs not to be buried, but preserved for the purpose of veneration. Already individual Christians began to possess themselves of portions of the bodies of martyrs, and to carry them about with them. Both these practices met with criticism and opposition, especially from the leading men of the Church. According to the testimony of Athanasius of Alexandria, the hermit Anthony decided that it should be held to be unlawful and impious to leave the bodies of the martyrs unburied (*Vita Ant.* 90). In Carthage the archdeacon and later the bishop Caecilianus severely blamed a certain Lucilla for carrying about with her a relic which she used to kiss before receiving the Eucharist (Optatus, *De schism. Donat.* i. 16). The compiler of the *Acta S. Fructuosi*, a Spanish ecclesiastic, represents the martyred bishop as himself requesting the burial of his relics. But energetic as the opposition was, it was unsuccessful, and died out. For in the meantime opinion as to the efficacy of relics had undergone a transformation, parallel with the growth of the theory, which soon predominated in the Church, that material instruments are the vehicles of divine grace. When the Christians of Smyrna decided that the bones of the martyrs were of more worth than gold or gems, and when Origen (*Exh. ad mart.* 50) spoke of the precious blood of the martyrs, they were thinking of the act of faith which the martyrs had accomplished by the sacrifice of their life. Now, on the other hand, the relic came to be looked upon as in itself a thing of value as the channel of miraculous divine powers. These ideas are set forth by Cyril of Jerusalem. He taught that a certain power dwelt in the body of the saint, even when the soul had departed from it; just as it was the instrument of the soul during life, so the power passed permanently into it (*Cat.* xviii. 16). This was coming very near to a belief that objects which the saints had used during their life had also a share in their miraculous powers. And this conclusion Cyril had already come to (*loc. cit.*).

We can see how early this estimate of relics became general from the fact that the former hesitation as to whether they should be venerated as sacred died out during the 4th century. The Fathers of the Greek Church especially were united in recommending the veneration of relics. All the great theologians of the 4th and 5th centuries may be quoted as evidence of this: Eusebius of Caesarea (*Praep. Ev.* xiii. 11), Gregory of Nazianzus (*Orat. in Cypr.* 17), Gregory of Nyssa (*Orat. de S. Theod. mart.*), Basil of Caesarea (*Ep.* ii. 197), Chrysostom (*Laud. Drosidis*), Theodoret of Cyrus (*Inps. 67*, 11), &c. John of Damascus, the great exponent of dogma in the 8th century, gave expression to the result of a uniform development which had been going on for centuries when he taught that Christ offers the relics to Christians as means of salvation. They must not be looked upon as something that is dead; for through them all good things come to those who pray with faith. Why should it seem impossible to believe in this power of the relics, when water could be made to gush from a rock in the desert? (*De fide orthod.* iv. 15).

Such was the theory; and the practice was in harmony with it. Throughout the whole of the Eastern Church the veneration of relics prevailed. Nobody hesitated to divide up the bodies of the saints in order to afford as many portions of them as possible. They were shared among the inhabitants of cities and villages, Theodoret tells us, and cherished by everybody as healers and physicians for both body and soul (*Decur. Graec. aff.* 8). The transition from the true relic to the hallowed object was especially common. Jerusalem, as early as the time of Eusebius, rejoiced in the possession of the episcopal chair of James the Just (*Hist. eccl.* vii. 19); and as late as the 4th century was discovered the most important of the relics of Christ, the cross which was alleged to have been His. Cyril of Jerusalem already remarks that the whole world was filled with portions of the wood of the cross (*Cat.* iv. 10).

The development which the veneration of relics underwent in the West did not differ essentially from that in the East. Here also the idea came to prevail that the body of the saint, or a portion of it, was possessed of healing and protective power (Paulinus of Nola, *Poem.* xix. 14 et seq., xxvii. 443). The objection raised by the Aquitanian presbyter Vigilantius (c. 400) to the belief that the souls of the martyrs to a certain extent clung to their ashes, and heard the prayers of those who approached them, appeared to his contemporaries to be frivolous; and he nowhere met with any support.

The only doubt which was felt was as to whether the bodies of the saints should be divided, and removed from their original resting-place. Both practices were forbidden by law under the emperor Theodosius I. (*Cod. Theodos.* ix. 17, 7), and the division of the bodies of martyrs into pieces was prohibited for centuries. Even Pope Gregory I., in a letter to the empress Constantia, disapproved it (*Ep.* iv. 30). Ambrose of Milan, by the discovery of the relics of Protasius and Gervasius (cf. *Ep.* 22 and Augustine, *Confess.* ix. 7), started in the West the long series of discoveries and translations of hitherto unknown relics. His example was followed, to name only the best known instances, by Bishop Theodore of Octodurum (now Martigny in the Vaud), who discovered the relics of the Theban legion which was alleged to have been destroyed by the emperor Maximian on account of its belief in the Christian faith (see *Passio Acaun. Mart.* 16), and by Clematius, a citizen of Cologne, to whom the virgin martyrs of this city revealed themselves (Kraus, *Inschriften der Rheinlande*, No. 294), afterwards to be known as St Ursula and her eleven thousand virgins.

The West was much poorer in relics than the East. Rome, it is true, possessed in the bodies of Peter and Paul a treasure the virtue of which outshone all the sacred treasures of the East. But many other places were entirely wanting in relics. By the discoveries which we have mentioned their number was notably increased. But the longing for these pledges of the divine assistance was insatiable. In order to satisfy it relics were made by placing pieces of cloth on the graves of the saints, which were afterwards taken to their homes and venerated by the pilgrims. The same purpose was served by oil taken from the lamps burning at the graves, flowers from the altars, water from some holy well, pieces of the garments of saints, earth from Jerusalem, and especially keys which had been laid on the grave of St Peter at Rome. All these things were not looked upon as mementoes, but the conviction prevailed that they were imbued by a miraculous power, which had passed into them through contact with that which was originally sacred (cf. Greg. Tur. *De Glor. mart.* i. 25; Greg. I. *Ep.* iv. 29, No. 30). A dishonest means of satisfying the craving for relics was that of forging them, and how common this became can be gathered from the many complaints about spurious relics (Sulp. Sev. *Vita Mart.* 8; Aug. *De op. mon.* 28; Greg. I. *Ep.* iv. 30, &c.).

But in the long run these substitutes for relics did not satisfy the Christians of the West, and, following the example of the Eastern Church, they took to dividing the bodies of the saints. Medieval relics in the West also were mostly portions of the bodies of saints or of things which they had used during their lives. The veneration of relics also received a strong impulse from the fact that the Church required that a relic should be deposited in every altar. Among the first of those whom we know to have attached importance to the placing of relics in churches is Ambrose of Milan (*Ep.* 22), and the 7th general council of Nicaea (787) forbade the consecration of churches in which relics were not present, under pain of excommunication. This has remained part of the law of the Roman Catholic Church.

The most famous relics discovered during the middle ages were those of the apostle James at St Jago de Compostella in Spain (see PILGRIMAGE), the bodies of the three kings, which were brought from Milan to Cologne in 1164 by the emperor Frederick I. (*Chron. reg. Colon.* for the year 1164), the so-called *sudarium* of St Veronica, which from the 12th century onwards was preserved in the Capella Santa Maria ad praesepe of St Peter's in Rome (see Dobschütz, *Christusbilder*, p. 218 sec.), and the seamless robe of Christ, the possession of which lent

renown to the cathedral of Trier since the beginning of the 12th century (*Gesta Trevir., Mon. Germ. Scr.* viii. p. 152).

The number of relics increased to a fabulous extent during the middle ages. There were churches which possessed hundreds, even thousands, of relics. In the cathedral of Eichstätt were to be found, as early as 1071, 683 relics (Gundech, *Lib. pont. Eist., Mon. Germ. Scr.* vii. p. 246 seq.); the monastery of Hirschau had 222 in the year 1091 (*De cons. mai. mon., Mon. Germ. Scr.* xiv. p. 261); the monastery of Stedernburg 515 in the year 1166 (*Ann. Sted. Scr.* xvi. p. 212 seq.). But these figures are trifling compared with those at the end of the middle ages. In the year 1520 could be counted 19,013 in the Schlosskirche at Wittenberg, and 21,483 in the Schlosskirche at Halle in 1521 (Köstlin, *Friedrich der W., und die Schlosskirche zu Wittenberg*, p. 58 seq.; Redlich, *Cardinal Albrecht und das Neue Stift zu Halle*, p. 260). There were also collections on the same scale belonging to individuals; a patrician of Nuremberg named Muffel was able to gain possession of 308 relics (*Chroniken der deutschen Städte*, xi. p. 745).

It is curious that while the popular craving for relics had passed all bounds, medieval theology was very cautious in its declarations on the subject of the veneration of relics. Thomas Aquinas based his justification of them on the idea of reverent commemoration; since we venerate the saints, we must also show reverence for their relics, for whoever loves another does honour to that which remains of him after death. On this account it is our duty, in memory of the saints, to pay due honour to their relics and especially to their bodies, which were the temples and dwellings of the Holy Ghost in which He dwelt and worked, and which in the resurrection are to be made like to the body of Christ; and in likewise because God honours them, in that He works wonders in their presence (*Summa theol.* iii. qu. 25, art. 6). The great scholastic philosopher abandoned the theory that the relics in themselves are vessels and instruments of the divine grace and miraculous power. But these ideas were revived, on the other hand, by the Catholicism of the counter-Reformation, which again taught and teaches that God grants many benefits to mankind through the sacred bodies of the martyrs (*Conc. Trid.* sess. xxv.). The doctrine has adapted itself to the popular belief. (A. H.*)

RELIEF (through Fr. from Lat. *relevare*, to lift up), an act of raising or lifting off or up. Apart from the general sense of a mitigation, cessation or removal of pain, sorrow, discomfort, &c., and the artistic use (It. *rilievo*) of the projection of a figure or design in sculpture from the ground on which it is formed, which is treated below, the term "relief" is used in the following senses; it was one of the feudal incidents between lord and vassal, and consisted of a payment to the lord in kind or money made by the heir on the death of the ancestor for the privilege of succession, for, fiefs not being hereditary, the estate had lapsed to the lord; by this payment the heir *caducum praedium relevabat* (Du Cange, *Gloss.* s.v. *Relevare*). The word is also generally used, in law, for any exemption granted by a court from the strict legal consequences of an act, &c., *e.g.* to a parliamentary candidate from the penal consequences ensuing from breaches of the regulations of the Corrupt and Illegal Practices Acts. Relief is also the term used in English law for the assistance given to the indigent poor by the Poor Law authorities (see POOR LAW).

RELIEF, a term in sculpture signifying ornament, a figure or figures raised from the ground of a flat surface of which the sculptured portion forms an inherent part of the body of the whole. The design may be in high relief—"alto-relievo" (*q.v.*), or low relief— "bas-relief" or "basso-relievo" (*q.v.*); in the former case the design is almost wholly detached from the ground, the attachment, through "under-cutting," remaining only here and there; in the latter it is wholly attached and may scarcely rise above the surface (as in the modern medal), or it may exceed in projection to about a half the proportionate depth (or thickness) of the figure or object represented. Formerly three terms were commonly employed to express the degree of relief — alto-relievo, basso-relievo and mezzo-relievo (or half-relief); but the two last-named have been merged by modern custom into "low-relief," to the disadvantage of accurate description. The term relief belongs to modern sculpture. To low relief is understood by us Pliny applied the word *anaglypta*, but it is to be observed that embossing and chasing came within the same category. It may be considered that less sculptural skill (independently of manipulative skill) is needed in high relief than in low relief, because in the former the true relative proportions in the life (whether figure or other object) have to be rendered, while in the latter, although the true height and, in a measure, breadth can be given, the thickness of the object is reduced by at least one-half, sometimes to almost nothing; and yet in spite of this departure from actuality, this abandonment of fact for a pure convention, a true effect must still be produced, not only in respect to perspective, but also of the actual shadows cast. And insomuch as the compositions are often extremely complicated and have sometimes to suggest retreating planes, the true plane of the material affords little scope for reproducing the required effect. In the beginning the essential idea of the relief was always maintained: that is to say, the sense of the flatness of the slab from which it was cut was impressed throughout the design on the mind of the spectator. Thus the Egyptians merely sunk the outlines and scarcely more than suggested the modelling of the figures, which never projected beyond the face of the surrounding ground. The Persians, the Etruscans and the Greeks carried on the art to the highest perfection, alike in sculpture and architectural ornament, and they applied it to gem sculpture, as in the case of "cameo." Similarly, the inverse treatment of relief—that is, sunk *below* the surface, in order that when used for seals a true relief is obtained—was early brought to great completeness; this form of engraving is called "intaglio." The degree of projection in relief, broadly speaking, has varied greatly with the periods of art. Thus, in Byzantine and Romanesque art the relief was low. In Gothic it increased with the increased desire to render several planes one behind the other. With the advent of the Renaissance it became still more accentuated, the heads and figures projecting greatly; but such high relief is sometimes found in early work, especially in metal-work. Although we see a return to lower relief in the Henri II. period, it becomes stronger in the Louis XIII. style, very full in Louis XIV. and Louis XV., but in Louis XVI. is considerably reduced. (M. H. C.)

RELIGION. The origin of the Latin word *religio* or *religio* has been the subject of discussion since the time of Cicero. Two alternative derivations have been given, viz. from *relĕgere*, to gather together, and *religare*, to bind back, fasten. *Relegere* meant to gather together, collect, hence to go over a subject again in thought, from *re* and *legere*, to collect together, hence to read, collect at a glance. This view is that given by Cicero (*Nat. Deor.* ii. 28, 72). He says: "Qui omnia quae ad cultum deorum pertinerent diligenter retractarent et tanquam relegerent, sunt dicti religiosi ex relegendo," "men were called 'religious' from *relegere*, because they reconsidered carefully and, as it were, went over again in thought all that appertained to the worship of the gods." He compares *elegantes* from *eligere*, *diligentes* from *diligere*, and continues, "his enim in verbis omnibus inest vis legendi eadem quae in religioso." This view is supported by the form of the word in the verse quoted by Gellius (iv. 9), "religentem esse oportet, religiosum nefas," and by the use of the Greek ἀλέγειν, to pay heed to, frequently with a negative, in the sense of the Latin *negligere* (*nec-legere*), cf. Θεῶν ὅτιν οὐκ ἀλέγοντες (Homer, *Il.* xvi. 388), regarding not the visitation of the gods, or οὐ γὰρ Κύκλωπες Διὸς . . . ἀλέγουσιν (*Od.* ix. 275). The alternative derivation, from *religare*, to fasten, bind, is that adopted by Lactantius (*Inst.* iv. 28), "Vinculo pietatis obstricti, Deo religati sumus unde ipsa religio nomen cepit." He quotes in support the line from Lucretius (i. 931), "religionum nodis animos exsolvere." Servius (on Virgil, *Aen.* viii. 349) and St Augustine (*Retract.* i. 13) also take *religare* as the source of the word. It is one that has certainly coloured the meaning of the word, particularly in that use which restricts

it to the monastic life with its binding rules. It also has appealed to Christian thought. Liddon (*Some Elements of Religion*, Lecture I. 19) says: "Lactantius may be wrong in his etymology, but he has certainly seized the broad popular sense of the word when he connects it with the idea of an obligation by which man is bound to an invisible God." Archbishop Trench (*Study of Words*) supposed that when "religion" became equivalent to the monastic life, and "religious" to a monk, the words lost their original meaning, but the *Ancren Riwle*, *ante* 1225, and the *Cursor Mundi* use the words both in the general and the more particular sense (see quotations in the *New English Dictionary*), and both meanings can be found in the *Imitatio Christi* and in Erasmus's *Colloquia*. (X.)

The study of the forms of belief and worship belonging to different tribes, nations or religious communities has only recently acquired a scientific foundation. The Greek historians early directed their attention to the ideas and customs of the peoples with whom they were brought into contact; and Herodotus has been called the "first anthropologist of religion." Theopompus described the Persian dualism in the 4th century B.C., and when Megasthenes was ambassador to the court of Chandragupta, 302 B.C., he noted the religious usages of the middle Ganges valley. The early Christian Fathers recorded many a valuable observation of the Gentile faiths around them from varying points of view, sympathetic or hostile; and Eusebius and Epiphanius in the 4th century A.D., attributed to the librarian of Ptolemy Philadelphus the design of collecting the sacred books of the Ethiopians, Indians, Persians, Elamites, Babylonians, Assyrians, Romans, Phoenicians, Syrians and Greeks. The Mahommedan Bīrūnī (b. A.D. 973) compared the doctrines of the Greeks, Christians, Jews, Manichaeans and Sufis with the philosophies and religions of India. Akbar (1542–1605) gathered Brahmans and Zoroastrians, Jews, Christians and Mahommedans at his court, and endeavoured to get translations of their scriptures. In the next century the Persian author of the *Dabistan* exhibited the doctrines of no less than twelve religions and their various sects. Meanwhile the scholars of the West had begun to work. Thomas Hyde (1636–1703) studied the religion of the ancient Persians; John Spencer (1630–1693) analysed the laws of the Hebrews; and Lord Herbert of Cherbury (*De Religione Gentilium*, 1645) endeavoured to trace all religions back to five "truly Catholic truths" of primitive faith, the first being the existence of God. The doctrine of a primeval revelation survived in various forms for two centuries, and appeared as late as the *Juventus Mundi* of W. E. Gladstone (1868, p. 207 ff.). David Hume, on the other hand, based his essay on *The Natural History of Religion* (1757) on the conception of the development of human society from rude beginnings, and all modern study is frankly founded on the general idea of Evolution.[1]

The materials at Hume's command, however, were destined to vast and speedy expansion. The Jesuit missionaries had already been at work in India and China, and a brilliant band of English students, led by Sir William Jones and H. T. Colebrooke, began to make known the treasures of Sanskrit literature, which the great scholars of Germany and France proceeded to develop. In Egypt the discovery of the Rosetta stone placed the key to the hieroglyphics within Western reach; and the decipherment of the cuneiform character enabled the patient scholars of Europe to recover the clues to the contents of the ancient libraries of Babylonia and Assyria. With the aid of inscriptions the cults of Greece and Rome have been largely reconstructed. Travellers and missionaries reported the beliefs and usages of uncivilized tribes in every part of the world, with the result that "ethnography knows no race devoid of religion, but only differences in the degree to which religious ideas have developed" (Ratzel, *History of Mankind*, i. 40). Meanwhile philosophy was at work on the problem of the religious consciousness. The great series of German thinkers, Lessing, Herder, Kant, Hegel, Fichte, Schleiermacher and their successors, sought to explain religion by means of the phenomena of mind, and to track it to its roots in the processes of thought and feeling. While ethnography was gathering up the facts from every part of the globe, psychology began to analyse the forms of belief, of action and emotion, to discover if possiole the key to the multitudinous variety which history revealed. From the historical and linguistic side attention was first fixed upon the myth, and the publication of the ancient hymns of the *Rig Veda* led Max Müller to seek in the common elements of Aryan thought for the secrets of primitive religion (essay on *Comparative Mythology*, 1856). The phenomena of day and night, of sunshine and storm, and other aspects of nature, were invoked by different interpreters to explain the conceptions of the gods, their origins and their relations. Fresh materials were gathered at the same time out of European folk-lore; the work begun by the brothers Grimm was continued by J. W. E. Mannhardt, and a lower stratum of beliefs and rites began to emerge into view beneath the poetic forms of the more developed mythologies. By such preliminary labours the way was prepared for the new science of anthropology.

Since the appearance of Dr E. B. Tylor's classical treatise on *Primitive Culture* (1871), the study of the origins of religion has been pursued with the utmost zeal. Comte had already described the primitive form of the religious consciousness as that in which man conceives of all external bodies as animated by a life analogous to his own (*Philosophie Positive*, 1842, iv. 29). This has been since designated as *polyzoism* or *panthelism*, or *panvitalism*,[2] and represents the obscure undifferentiated groundwork out of which Tylor's *Animism* arises. Many are the clues by which it has been sought to explain the secret of primitive religion. Hegel, before the anthropological stage, found it in magic. Max Müller, building on philosophy and mythology, affirmed that "Religion consists in the perception of the infinite under such manifestations as are able to influence the moral character of man" (*Natural Religion*, 1899, p. 188). Herbert Spencer derived all religion from the worship of the dead (*Principles of Sociology*, i.), like Grant Allen, and Lippert in Germany. Mr Andrew Lang, on the other hand, supposes that belief in a supreme being came first in order of evolution, but was afterwards thrust into the background by belief in ghosts and lesser divinities (*Magic and Religion*, 1901, p. 224).[3] Dr Jevons finds the primitive form in totemism (*Introd. to the History of Religion*, 1896, chap. ix.). Mr J. G. Frazer regards religion (see his definition quoted below) as superposed on an antecedent stage of magic. In *The Tree of Life* (1905), Mr E. Crawley interprets it by the vital instinct, and connects its first manifestations with the processes of the organic life. The veteran Wilhelm Wundt (*Mythus und Religion*, ii. 1906, p. 177) recurs to the primitive conceptions of the soul as the source of all subsequent development. The origin of religion, however, can never be determined archaeologically or historically; it must be sought conjecturally through psychology. (J. E. C.)

A. Primitive Religion

There is a point at which the History of Religion becomes in its predominant aspect a History of Religions. The conditions that we describe by the comprehensive term "civilization" occasion a specification and corresponding differentiation of the life of societies; whence there result competing types of culture, each instinct with the spirit of propagandism and, one might almost say, of empire. It is an age of conscious selection as between ideal systems. Instead of necessitating a wasteful and precarious elimination of inadequate customs by the actual destruction of those who practise them—this being the method of natural selection, which, like some Spanish Inquisition, abolishes the heresy by wiping out the heretics one and all—progress now becomes possible along the more direct and less

[1] This does not, of course, preclude the possibility of degeneration in particular instances.

[2] Comte's own term "fetishism" was most unfortunately misleading (see Fetishism). Marett proposed the term "Animatism," *Folk Lore* (1900), xi. p. 171.

[3] See his treatise on *The Making of Religion* (1898), and Hartland's article on "The 'High Gods' of Australia," *Folk Lore* (1898), ix. p. 290.

painful path of conversion. The heretic, having developed powers of rational choice, perceives his heresy, to wit, his want of adaptation to the moral environment, and turning round embraces the new faith that is the passport to survival.

Far otherwise is it with man at the stage of savagery—the stage of petty groups pursuing a self-centred life of inveterate custom. in an isolation almost as complete as if they were marooned on separate atolls of the ocean. Progress, or at all events change, does indeed take place, though very slowly, since the most primitive savage we know of has his portion of human intelligence, looks after and before, nay, in regard to the pressing needs of every day shows a quite remarkable shrewdness and resource. Speaking generally, however, we must pronounce him unprogressive, since, on the whole, unreflective in regard to his ends. It is the price that must be paid for social discreteness and incoherency. And the consequence of this atomism is not what a careless thinker might be led to assume, extreme diversity, but, on the contrary, extreme homogeneity of culture. It has been found unworkable, for instance, to classify the religions of really primitive peoples under a plurality of heads, as becomes necessary the moment that the presence of a distinctive basis of linked ideas testifies to the individuality of this or that type of higher creed. Primitive religions are like so many similar beads on a string; and the concern of the student of comparative religion is at this stage mainly with the nature of the string, to wit, the common conditions of mental society that make, say, totemism, or taboo, very much the same thing all the savage world over, when we seek to penetrate to its essence.

This fundamental homogeneity of primitive culture, however, must not be made the excuse for a treatment at the hands of psychology and sociology that dispenses with the study of details and trusts to an a priori method. By all means let universal characterization be attempted—we are about to attempt one here, though well aware of the difficulty in the present state of our knowledge—but they must at least model themselves on the composite photograph rather than the impressionist sketch. An enormous mass of material, mostly quite in the raw, awaits reduction to order on the part of anthropological theorists, as yet a small and ill-supported body of enthusiasts. Under these circumstances it would be premature to expect agreement as to results. In regard to method, however, there is little difference of opinion. Thus, whereas the popular writer abounds in wide generalizations on the subject of primitive humanity, the expert has hitherto for the most part deliberately restricted himself to departmental investigations. Religion, for example, seems altogether too vast a theme for him to embark on, and he usually prefers to deal with some single element or aspect. Again, origins attract the *littérateur*; he revels in describing the transition from the pre-religious to the religious era. But the expert, confining his attention to the known savage, finds him already religious, nay, encumbered with religious survivals of all kinds; for him, then, it suffices to describe things as they now are, or as they were in the comparatively recent fore-time. Lastly, there are many who, being competent in some other branch of science, but having small acquaintance with the scientific study of human culture, are inclined to explain primitive ideas and institutions from without, namely by reference to various external conditions of the mental life of peoples, such as race, climate, food-supply and so on. The anthropological expert, on the other hand, insists on making the primitive point of view itself the be-all and end-all of his investigations. The inwardness of savage religion—the meaning it has for those who practise it—constitutes its essence and meaning likewise for him, who after all is a man and a brother, not one who stands really outside.

In what follows, then, we shall, indeed, venture to present a wholesale appreciation of the religious idea as it is for primitive man in general; but our account will respect the modern anthropological method that bids the student keep closely to the actualities of the religious experience of savages, as it can with reasonable accuracy be gathered from what they do and say. We have sought to render only the spirit of primitive religion, keeping clear both of technicalities and of departmental investigations. These are left to the separate articles bearing on the subject. There the reader will find the most solid results of recent anthropological research. Here is he merely offered a flimsy thread that, we hope, may guide him through the maze of facts, but alas! is only too likely to break off short in his hand.

Definition of Primitive Religion.—In dealing with a development of culture that has no immutable essence, but is intrinsically fluid and changing, definition must consist either in a definition of type, which indicates prevalence of relevant resemblance as between specimens more or less divergent, or in exterior definition, which delimits the field of inquiry by laying down within what extreme limits this divergence holds. Amongst the numberless definitions of religion that have been suggested, those that have been most frequently adopted for working purposes by anthropologists are Tylor's and Frazer's. Dr E. B. Tylor in *Primitive Culture* (1), i. 424, proposes as a "minimum definition" of religion "the belief in spiritual beings." Objections to this definition on the score of incompleteness are, firstly, that, besides belief, practice must be reckoned with (since, as Dr W. Robertson Smith has made clear in his *Lectures on the Religion of the Semites*, 18 sqq., ritual is in fact primary for primitive religion, whilst dogma and myth are secondary); secondly, that the outlook of such belief and practice is not exclusively towards the spiritual, unless this term be widened until it mean next to nothing, but is likewise towards the transmaterial, as will be shown presently. The merit of this definition, on the other hand, lies in its bilateral form, which calls attention to the need of characterizing both the religious attitude and the religious object to which the former has reference. The same form appears in Dr J. G. Frazer's definition in *The Golden Bough* (2nd ed.), i. 63. He understands by religion "a propitiation or conciliation of powers superior to man which are believed to direct and control the course of nature and of human life." He goes on to explain that by "powers" he means "conscious or personal agents." It is also to be noted that he is here definitely opposing religion to magic, which he holds to be based on the (implicit) assumption "that the course of nature is determined, not by the passions or caprice of personal beings, but by the operation of immutable laws acting mechanically." His definition improves on Tylor's in so far as it makes worship integral to the religious attitude. By regarding the object of religion as necessarily personal, however, he is led to exclude much that the primitive man undoubtedly treats with awe and respect as exerting a mystic effect on his life. Further, in maintaining that the powers recognized by religion are always superior to man, he leaves unclassed a host of practices that display a bargaining, or even a hectoring, spirit on the part of those addressing them (see PRAYER). Threatening or beating a fetish cannot be brought under the head of magic, even if we adopt Frazer's principle (*op. cit.* i. 64) that to constrain or coerce a personal being is to treat him as an inanimate agent; for such a principle is quite inapplicable to cases of mere terrorism, whilst it may be doubted if it even renders the sense of the savage magician's typical notion of his *modus operandi*, viz. as the bringing to bear of a greater *mana* or psychic influence (see below) on what has less, and must therefore do as it is bidden. Such definitions, then, are to be accepted, if at all, as definitions of type, selective designations of leading but not strictly universal features. An encyclopaedic account, however, should rest rather on an exterior definition which can serve as it were to pigeon-hole the whole mass of significant facts. Such an exterior definition is suggested by Mr E. Crawley in *The Tree of Life*, 200, where he points out that "neither the Greek nor the Latin language has any comprehensive term for religion, except in the one *ἱερά*, and in the other *sacra*, words which are equivalent to 'sacred.' No other term covers the whole of religious phenomena, and a survey of the complex details of various worships results in showing that no other conception will comprise the whole body of religious facts." It may be added that we have here no generalization imported from a

higher level of culture, but an idea or blend of ideas familiar to primitive thought. An important consequence of thus giving the study of primitive religion the wide scope of a comparative hierology is that magic is no longer divorced from religion, since the sacred will now be found to be coextensive with the magico-religious, that largely undifferentiated plasm out of which religion and magic slowly take separate shape as society comes more and more to contrast legitimate with illicit modes of dealing with the sacred. We may define, then, the religious object as the sacred, and the corresponding religious attitude as consisting in such manifestation of feeling, thought and action in regard to the sacred as is held to conduce to the welfare of the community or to that of individuals considered as members of the community.

Aspects of the Nature of the Sacred.—To exhibit the general character of the sacred as it exists for primitive religion it is simplest to take stock of various aspects recognized by primitive thought as expressed in language. If some, and not the least essential, of these aspects are quasi-negative, it must be remembered that negations—witness the Unseen, the Unknown, the Infinite of a more advanced theology—are well adapted to supply that mystery on which the religious consciousness feeds with the slight basis of conceptual support it needs. (1) *The sacred as the forbidden.* The primitive notion that perhaps comes nearest to our "sacred," whilst it immediately underlies the meanings of the Latin *sacer* and *sanctus*, is that of a *taboo*, a Polynesian term for which equivalents can be quoted from most savage vocabularies. The root idea seems to be that something is marked off as to be shunned, with the added hint of a mystic sanction or penalty enforcing the avoidance. Two derivative senses of a more positive import call for special notice. On the one hand, since that which is tabooed is held to punish the taboo-breaker by a sort of mystic infection, taboo comes to stand for uncleanness and sin. On the other hand, since the isolation of the sacred, even when originally conceived in the interest of the profane, may be interpreted as self-protection on the part of the sacred as against defiling contact, taboo takes on the connotation of ascetic virtue, purity, devotion, dignity and blessedness. Primary and secondary senses of the term between them cover so much ground that it is not surprising to find taboo used in Polynesia as a name for the whole system of religion, founded as it largely is on prohibitions and abstinences. (2) *The sacred as the mysterious.* Another quasi-negative notion of more restricted distribution is that of the mysterious or strange, as we have it expressed, for example, in the Siouan *wakan*, though possibly this is a derivative meaning. Meanwhile, it is certain that what is strange, new or portentous is regularly treated by all savages as sacred. (3) *The sacred as the secret.* The literal sense of the term *churinga*, applied by the Central Australians to their sacred objects, and likewise used more abstractly to denote mystic power, as when a man is said to be "full of *churinga*," is "secret," and is symptomatic of the esotericism that is a striking mark of Australian, and indeed of all primitive, religion, with its insistence on initiation, its exclusion of women, and its strictly enforced reticence concerning traditional lore and proceedings. (4) *The sacred as the potent.* Passing on to positive conceptions of the sacred, perhaps the most fundamental is that which identifies the efficacy of sacredness with such mystic or magical power as is signified by the *mana* of the Pacific or *orenda* of the Hurons, terms for which analogies are forthcoming on all sides. Of *mana* Dr R. H. Codrington in *The Melanesians*, 119 *n.*, writes: "It essentially belongs to personal beings to originate it, though it may act through the medium of water, or a stone, or a bone. All Melanesian religion consists . . . in getting this *mana* for oneself, or getting it used for one's benefit." E. Tregear's *Maori-Polynesian Comparative Dictionary* shows how the word and its derivatives are used to express thought, memory, emotion, desire, will—in short, psychic energy of all kinds. It also stands for the vehicle of the magician's energy—the spell; which would seem likewise to be a meaning, perhaps the root-meaning, of *orenda* (cf. J. N. B. Hewitt, *American Anthropologist*, N.S., iv. 40). Whereas everything, perhaps, has some share of indwelling potency, whatever is sacred manifests this potency in an extraordinary degree, as typically the wonder-working leader of society, whose *mana* consists in his cunning and luck together. Altogether, in *mana* we have what is *par excellence* the primitive religious idea in its positive aspect, taboo representing its negative side, since whatever has *mana* is taboo, and whatever is taboo has *mana*. (5) *The sacred as the animate.* The term "animism," which embodies Tylor's classical theory of primitive religion, is unfortunately somewhat ambiguous. If we take it strictly to mean the belief in ghosts or spirits having the "vaporous materiality" proper to the objects of dream or hallucination, it is certain that the agency of such phantasms is not the sole cause to which all mystic happenings are referred (though ghosts and spirits are everywhere believed in, and appear to be endowed with greater predominance as religious synthesis advances amongst primitive peoples). Thus there is good evidence to show that many of the early gods, notably those that are held to be especially well disposed to man, are conceived rather in the shape of magnified non-natural men dwelling somewhere apart, such as the Mungan-ngaur of the Kurnai of S.E. Australia (cf. A. Lang, *The Making of Religion*[2], x. sqq.). Such anthropomorphism is with difficulty reduced to the Tylorian animism. The term, however, will have to be used with more vagueness so as to cover all attributions of personality, will of vitality. This can be more simply brought under the notion of *mana*. Meanwhile, since quasi-mechanical means are freely resorted to in dealing with the sacred, as when a Maori chief snuffs up the sanctity his fingers have acquired by touching his own sacred head that he may restore the virtue to the part whence it was taken (R. Taylor, *Te Ika a Maui*, 165), or when uncleanness is removed as if it were a physical secretion by washing, wiping and so forth, it is hard to say whether what we should now call a "material" nature is not ascribed to the sacred, more especially when its transmissibility after the manner of a contagion is the trait that holds the attention. It is possible, however, that the savage always distinguishes in a dim way between the material medium and the indwelling principle of vital energy, examples of pure fetishism, in the sense of the cult of the purely material, recognized as such, being hard to find. (6) *The sacred as the ancient.* The prominence of the notion of the *Alcheringa* "dreamtime," or sacred past, in Central Australian religion illustrates the essential connexion perceived by the savage to lie between the sacred and the traditional. Ritualistic conservatism may be instanced as a practical outcome of this feeling. Another development is ancestor-worship, the organized cult of ancestors marking, however, a certain stage of advance beyond the very primitive, though the dead are always sacred and have *mana* which the living may exploit for their own advantage.

The Activity of the Sacred.—The foregoing views of the sacred, though starting from distinct conceptions, converge in a single complex notion, as may be seen from the many-sided sense borne by such a term as *wakan*, which may stand not only for "mystery," but also for "power, sacred, ancient, grandeur, animate, immortal" (W J McGee, *15th Report of U. S. Bureau of Ethnology*, 182). The reason for this convergence is that, whereas there is found great difficulty in characterizing the elusive nature of the sacred, its mode of manifesting itself is recognized to be much the same in all its phases. Uniform characteristics are the fecundity, ambiguity, relativity and transmissibility of its activity. (1) *Fecundity.* The mystic potency of the sacred is no fixed quantity, but is big with possibilities of all sorts. The same sacred person, object, act, will suffice for a variety of purposes. Even where a piece of sympathetic magic appears to promise definite results, or when a departmental god is recognized, there would seem to be room left for a more or less indefinite expectancy. It must be remembered that the meaning of a rite is for the most part obscure

to the participants, being overlaid by its traditional character, which but guarantees a general efficacy. "Blessings come, evils go," may be said to be the magico-religious formula implicit in all socially approved dealings with the sacred, however specialized in semblance. (2) *Ambiguity.* Mystic potency, however, because of the very indefiniteness of its action, is a two-edged sword. The sacred is not to be approached lightly. ·It will heal or blast, according as it is handled with or without due circumspection. That which is taboo, for instance, the person of the king, or woman's blood, is poison or medicine according as it is manipulated, being inherently just a potentiality for wonder-working in any direction. Not but what primitive thought shows a tendency to mark off a certain kind of mystic power as wholly bad by a special name, *e.g.* the *arunggwillda* of Central Australia; and here, we may note, we come nearest to a conception of magic as something other than religion, the trafficker in *arunggwillda* being socially suspect, nay, liable to persecution, and even death (as amongst the Arunta tribe, see Spencer and Gillen, *Native Tribes of C. Australia*, 536), at the hands of his fellows. On the other hand, wholly beneficent powers seem hardly to be recognized, unless we find them in beings such as Mungan-ngaur ("father-our"), who derive an ethical character from their association with the initiation ceremonies and the moral instruction given thereat (cf. Lang, *l.c.*). (3) *Relativity.* So far we have tended to represent the activity of the sacred as that of a universal force, somewhat in the style of our "electricity" or "mind." It remains to add that this activity manifests itself at numerous independent centres. These differ amongst themselves in the degree of their energy. One spell is stronger than another, one taboo more inviolable than another. Dr W. H. R. Rivers (*The Todas*, 448) gives an interesting analysis of the grades of sanctity apparent in Toda religion. The gods of the hill-tops come first. The sacred buffaloes, their milk, their bells, the dairies and their vessels are on a lower plane; whilst we may note that there are several grades amongst the dairies, increase of sanctity going with elaboration of dairy ritual (cf. ibid. 232). Still lower is the dairyman, who is in no way divine, yet has sanctity as one who maintains a condition of ceremonial purity. (4) *Transmissibility.* If, however, this activity originates at certain centres, it tends to spread therefrom in all directions. Dr F. B. Jevons (in *An Introduction to the History of Religion*, vii.) distinguishes between "things taboo," which have the mystic contagion inherent in them, and "things tabooed," to which the taboo-infection has been transmitted. In the former class he places supernatural beings (including men with *mana* as well as ghosts and spirits), blood, new-born children with their mothers, and corpses; which list might be considerably extended, for instance, by the inclusion of natural portents, and animals and plants such as are strikingly odd, dangerous or useful. Any one of these can pass on its sacred quality to other persons and objects (as a corpse defiles the mourner and his clothes), nay to actions, places and times as well (as a corpse will likewise cause work to be tabooed, ground to be set apart, a holy season to be observed). Such transmissibility is commonly explained by the association of ideas, that becoming sacred which (as it were) reminds one of the sacred; though it is important to add, firstly, that such association takes place under the influence of a selective interest generated by strong religious feeling, and, secondly, that this interest is primarily a collective product, being governed by a social tradition which causes certain possibilities of ideal combination alone to be realized, whilst it is the chief guarantee of the objectivity of what they suggest.

The Exploitation of the Sacred. A. Methods.—It is hard to find terms general enough to cover dealings with the sacred that range from the manipulation of an almost inanimate type of power to intercourse modelled on that between man and man. Primitive religion, however, resorts to either way of approach so indifferently as to prove that there is little or no awareness of an inconsistency of attitude. The radical contrast between mechanical and spiritual religion, though fundamental for modern theology, is alien to the primitive point of view, and is therefore inappropriate to the purposes of anthropological description. (1) *Acquisition.* Mystic power may be regarded as innate so far as skill, luck or queerness are signs and conditions of its presence. On the whole, however, savage society tends to regard it as something acquired, the product of acts and abstinences having a traditional character for imparting magico-religious virtue. An external symbol in the shape of a ceremony or cult-object is of great assistance to the dim eye of primitive faith. Again, the savage universe is no preserve of man, but is an open field wherein human and non-human activities of all sorts compete on more or less equal terms, yet so that a certain measure of predominance may be secured by a judicious combination of forces. (2) *Concentration.* Hence the magico-religious society or individual practitioner piles ceremony on ceremony, name of power on name of power, relic on relic, to consolidate the forces within reach and assume direction thereof. The transmissibility of the sacred ensures the fusion of powers drawn from all sources, however disparate. (3) *Induction.* It is necessary, however, as it were to bring this force to a head. This would appear to be the essential significance of sacrifice, where a number of sacred operations and instruments are made to discharge their efficacy into the victim as into a vat, so that a blessing-yielding, evil-neutralizing force of highest attainable potency is obtained (see H. Hubert and M. Mauss, "Essai sur la nature et la fonction du sacrifice" in *L'Année sociologique*, ii.). (4) *Renovation.* An important *motif* in magico-religious ritual, which may not have been without effect on the development of sacrifice, is, as Dr Frazer's main thesis in *The Golden Bough* asserts, the imparting of reproductive energy to animals, plants and man himself, its cessation being suggested by such phenomena as old age and the fall of the year. To concentrate, induce and renovate are, however, but aspects of one process of acquisition by the transfusion of a transmissible energy. (5) *Demission.* Hubert and Mauss show in their penetrating analysis of sacrifice that after the rite has been brought to its culminating point there follows as a pendant a ceremony of re-entry into ordinary life, the idea of which is preserved in the Christian formula *Ite, missa est.* (6) *Insulation.* Such deposition of sacredness is but an aspect of the wider method that causes a ring-fence to be erected round the sacred to ward off casual trespassers at once in their own interest and to prevent contamination. We see here a natural outcome of religious awe supported by the spirit of esotericism, and by a sense of the need for an expert handling of that which is so potent for good or ill. (7) *Direction.* This last consideration brings to notice the fact that throughout magico-religious practice of all kinds the human operator retains a certain control over the issue. In the numberless transitions that, whilst connecting, separate the spell and the prayer we observe as the accompaniment of every mood from extreme imperiousness to extreme humility an abiding will and desire to help the action out. Even "Thy will be done" preserves the echo of a direction, and, needless to say, this is hardly a form of primitive address. At the bottom is the vague feeling that it is man's own self-directed mysterious energy that is at work, however much it needs to be reinforced from without. Meanwhile, tradition strictly prescribes the ways and means of such reinforcement, so that religion becomes largely a matter of sacred lore; and the expert director of rites, who is likewise usually at this stage the leader of society, comes more and more to be needed as an intermediary between the lay portion of the community and the sacred powers.

B. Results.—Hitherto our account of primitive religion has had to move on somewhat abstract lines. His religion is, however, anything but an abstraction to the savage, and stands rather for the whole of his concrete life so far as it is penetrated by a spirit of earnest endeavour. The end and result of primitive religion is, in a word, the consecration of life, the stimulation of the will to live and to do. This bracing of the vital feeling takes place by means of imaginative appeal to the great forces man perceives stirring within him and about him, such appeal proving effective doubtless by reason of the psychological law that to conceive strongly is

to imitate. Meanwhile, that there shall be no clashing of conceptions to inhibit the tendency of the idea of an acquired "grace" to realize itself in action, is secured by the complete unanimity of public opinion, dominated as it is by an inveterate custom. To appreciate the consecrating effect of religion on primitive life we have only to look to the *churinga*-worship of the Central Australians (as described by Spencer and Gillen in *The Native Tribes of Central Australia* and *The Northern Tribes of Central Australia*). Contact with these repositories of mystic influence "makes them glad" (*Nat. Tr.* 165); it likewise makes them "good," so that they are no longer greedy or selfish (*North. Tr.* 266); it endows them with second sight (ibid.); it gives them confidence and success in war (*Nat. Tr.* 133); in fact, there is no end to its "strengthening" effects (ibid. *n.*). Or again, we may note the earnestness and solemnity that characterize all their sacred ceremonies. The inwardness of primitive religion is, however, non-existent for those who observe it as uninitiated strangers; whilst, again, it evaporates as soon as native custom breaks down under pressure of civilization, when only fragments of meaningless superstition survive: wherefore do travesties of primitive religion abound.

It remains to consider shortly the consecration of life in relation to particular categories and departments. (1) *Education.* Almost every tribe has its initiation ceremonies, and in many tribes adult life may almost be described as a continuous initiation. The object of these rites is primarily to impart mystic virtue to the novice, and thus, in the eyes of the primitive man, being always something more than social usefulness, amounting as it does to a share in the tribal luck by means of association with all it holds sacred. Incidentally the candidate is trained to perform his duties as a tribesman, but religion presides over the course, demanding earnest endeavour of an impressionable age. (2) *Government.* Where society is most primitive it is most democratic, as in Australia, and magico-religious powers are possessed by the whole body of fully initiated males, age, however, conferring increase of sacred lore and consequently of authority; whilst even at this stage the experts tend to form an inner circle of rulers. The man with *mana* is bound to come to the top, both because his gifts give him a start and because his success is taken as a sign that he has the gift. A decisive "moment" in the evolution of chiefship is the recognition of hereditary *mana*, bound up as this is with the handing on of ceremonies and cult-objects. Invested, as society grows more complex, with a sanctity increasingly superior to that of the layman, the priest-king becomes the representative of the community as repository of its luck, whilst, as controller of all sacred forces that bear thereon, he is, as Dr Frazer puts it, "dynamical centre of the universe" (*The Golden Bough* (2nd ed.), i. 233). Only when the holy man's duty to preserve his holiness binds him hand and foot in a network of taboos does his temporal power tend to devolve on a deputy. (3) *Food-supply.* In accordance with the principle of Renovation (see above), the root-idea of the application of religion to economics is not the extorting of boons from an unwilling nature, but rather the stimulation of the sources of life, so that all beings alike may increase and multiply. (4) *Food-taking.* Meanwhile, the primitive meal is always more or less of a sacrament, and there are many food-taboos, the significance of which is, however, not so much that certain foods are unclean and poisonous as that they are of special virtue and must be partaken of solemnly and with circumspection. (5) *Kinship.* It is hard to say whether the unit of primitive society is the tribe or the group of kinsmen. Both are forms of union that are consolidated by means of religious usages. Thus in Australia the initiation ceremonies, concerned as they partly are with marriage, always an affair between the kin-groups, are tribal, whilst the totemic rites are the prime concern of the members of the totem clans. The significance of a common name and a common blood is immensely enhanced by its association with mystic rights and duties, and the pulse of brotherhood beats faster. (6) *The Family.* Side by side with the kin there is always found the domestic group, but the latter institution develops fully only as the former weakens, so that the one comes largely to inherit the functions of the other, whilst the tribe too in its turn hands over certain interests. Thus in process of time birth-rites, marriage-rites, funeral-rites, not to mention subordinate ceremonies such as those of name-giving and food-taking, become domestic sacraments. (7) *Sex.* Woman, for certain physiological reasons, is always for primitive peopies hedged round with sanctity, whilst man does all he can to inspire awe of his powers in woman by keeping religion largely in his own hands. The result, so far as woman is concerned, is that, in company with those males who are endowed with sacredness in a more than ordinary degree, she tends as a sex to lose in freedom as much as she gains in respect. (8) *Personality.* Every one has his modicum of innate *mana*, or at least may develop it in himself by communicating with powers that can be brought into answering relation by the proper means. Nagualism, or the acquisition of a mystic guardian, is a widely distributed custom, the essence of which probably consists in the procuring of a personal name having potency. The exceptional man is recognized as having *mana* in a special degree, and a belief thus held at once by others and by himself is bound to stimulate his individuality. The primitive community is not so custom-bound that personality has no chance to make itself felt, and the leader of men possessed of an inner fund of inspiration is the wonder-worker who encourages all forms of social advance.

Psychology of the Primitive Attitude towards the Sacred.—We are on firmer ground when simply describing the phenomena of primitive religion than when seeking to account for these in terms of natural law—in whatever sense the conception of natural law be applicable to the facts of the mental life of man. One thing is certain, namely, that savages stand on virtually one footing with the civilized as regards the type of explanation appropriate to their beliefs and practices. We have no right to refer to "instincts" in the case of primitive man, any more at any rate than we have in our own case. A child of civilized parents brought up from the first amongst savages is a savage, neither more nor less. Though race may count for something in the matter of mental endowment—and at least it would seem to involve differences in weight of brain—it clearly counts for much less than does *milieu*, to wit, that social environment of ideas and institutions which tends to develop the rich effectiveness on mechanical means of tradition, such as the art of writing. The outstanding feature of the mental life of savages known to psychologists as "primitive credulity" is doubtless chiefly due to sheer want of diversity of suggestiveness in their intellectual surroundings. Their notions stick fast because there are no competing notions to dislodge them. Society suffers a sort of perpetual obsession, and remains self-hypnotized as it were within a magic circle of traditional views. A rigid orthodoxy is sustained by means of purblind imitation assisted by no little persecution. Such changes as occur come about, not in consequence of a new direction taken by conscious policy, but rather in the way that fashions in dress alter amongst ourselves, by subconscious hardly pursuive drifting. The crowd rather than the individual is the thinking unit. A proof is the mysterious rapid extinction of savages the moment that their group-life is broken up; they are individually so many lost sheep, without self-reliance or initiative. And the thinking power of a crowd—that is, a mob, not a deliberative assembly—is of a very low order, emotion of a "panicky" type driving it hither and thither like a rudderless ship. However, as the students of mob-psychology have shown, every crowd tends to have its *meneur*, its mob-leader, the man who sets the cheering or starts the running-away. So too, then, with the primitive society. Grossly ignorant of all that fails outside "the daily round, the common task," they are full of panicky fears in regard to this unknown, and the primary attitude of society towards it is sheer avoidance, taboo. But the mysterious has another face. To the mob the mob-leader is mysterious in his power of bringing luck and salvation; to himself also he is a wonder, since he wills, and lo! things happen accordingly. He has

mana, power, and by means of this *mana*, felt inwardly by himself, acknowledged by his fellows, he stems the social impulse to run away from a mystery. Not without nervous dread—witness the special taboo to which the leader of society is subject—he draws near and strives to constrain, conciliate or cajole the awful forces with which the life of the group is set about. He enters the Holy of Holies; the rest remain without, and are more than half afraid of their mediator. In short, from the standpoint of lay society, the manipulator of the sacred is himself sacred, and shares in all the associations of sacredness. An anthropomorphism which is specifically a "magomorphism" renders the sacred powers increasingly one with the governing element in society, and religion assumes an ethico-political character, with correspondingly authority and law are invested with a deeper meaning.

The Abuse of the Sacred.—Lest our picture of primitive religion appear too brightly coloured, a word must be said on the perversions to which the exploitation of the sacred is liable. Envy, malice and uncharitableness are found in primitive society, as elsewhere, and in their behoof the mystic forces are not unfrequently unloosed by those who know how to do so. To use the sacred to the detriment of the community, as does, for instance, the expert who casts a spell, or utters a prayer, to his neighbour's hurt, is what primitive society understands by magic (cf. *arungquillha*, above), and anthropology has no business to attach any other meaning to the word if it undertakes to interpret the primitive point of view. On the other hand, if those in authority perpetrate in the name of what their society holds sacred, and therefore with its full approval, acts that to the modern mind are cruel, silly or revolting, it is bad science and bad ethics to speak of vice and degradation, unless it can be shown that the community in which these things occur is thereby brought nearer to elimination in the struggle for existence. As a matter of fact, the earlier and more democratic types of primitive society, uncontaminated by our civilization, do not present many features to which the modern conscience can take exception, but display rather the edifying spectacle of religious brotherhoods encouraging themselves by mystical communion to common effort. With the evolution of rank, however, and the concentration of magico-religious power in the hands of certain orders, there is less solidarity and more individualism, or at all events more opportunity for sectional interests to be pursued at other than critical times; whereupon fraud and violence are apt to infect religion. Indeed, as the history of the higher religions shows, religion tends in the end to break away from secular government with its aristocratic traditions, and to revert to the more democratic spirit of the primitive age, having by now obtained a clearer consciousness of its purpose, yet nevertheless clinging to the inveterate forms of human ritual as still adequate to symbolize the consecration of life—the quickening of the will to face life earnestly.

BIBLIOGRAPHY.—The number of works dealing with primitive religion is endless. The English reader who is more or less new to the subject is recommended to begin with E. B. Tylor, *Primitive Culture* (4th ed., Lond. 1903), and then to proceed to J. G. Frazer, *The Golden Bough* (2nd ed., Lond. 1900). The latter author's *Lectures on the Early History of the Kingship* (Lond. 1905) may also be consulted. Only second in importance to the above are W. Robertson Smith, *Lectures on the Religion of the Semites* (2nd ed., Lond. 1894); A. Lang, *Myth, Ritual and Religion* (2nd ed., Lond. 1899), and *Magic and Religion* (Lond. 1901); E. S. Hartland, *The Legend of Perseus* (Lond. 1894–1896); F. B. Jevons, *An Introduction to the History of Religion* (2nd ed., 1902); E. Crawley, *The Mystic Rose* (Lond. 1902), and *The Tree of Life* (Lond. 1905). The two last-mentioned works perhaps most fully represent the author's views in the text, which are also developed by the present writer in "Pre-Animistic Religion," *Folk-Lore* xi. (1900), "From Spell to Prayer," *Folk-Lore*, xv. (1904), and "Is Taboo a Negative Magic?" *Anthropological Essays presented to E. B. Tylor* (1907); L. R. Farnell, *The Evolution of Religion* (1905), follows similar lines. The present writer owes something to Goblet d'Alviella, *Hibbert Lectures* (Lond. 1891), and more to H. Hubert and M. Mauss, "Essai sur la nature et la fonction du sacrifice," *L'Année sociologique*, ii.; and "Esquisse d'une théorie générale de la magie," ibid. vii. If the reader wish to keep pace with the output of literature on this vast subject, he will find *L'Année sociologique* (1896 onwards) a wonderfully complete bibliographical guide.

Side by side with works of general theory, first-hand authorities should be freely used. To make a selection from these is not easy, but the following at least are very important: R. H. Codrington, *The Melanesians* (Oxford, 1891); Miss M. Kingsley, *Travels in West Africa* (Lond. 1898), and *West African Studies* (Lond. 1899); A. C. Haddon, *Reports of the Cambridge Anthropological Expedition to Torres Straits* (Cambridge, 1904, vol. v.); A. B. Ellis, *The Tshi-Speaking Peoples of the Gold Coast* (Lond. 1897); *The Ewe-Speaking Peoples of the Slave Coast* (Lond. 1890); *The Yoruba-Speaking Peoples of the Slave Coast* (Lond. 1894); Miss M. H. Kingsley, *Travels in West Africa* (Lond. 1898), and *West African Studies* (Lond. 1899); A. C. Hollis, *The Masai* (1905); W. Crooke, *The North-West Provinces of India* (Lond. 1897); W. H. R. Rivers, *The Todas* (1906). An important collection of valuable material will be obtained in the *Reports of the Bureau of Ethnology*, Smithsonian Institution, Washington. See Nos. 2, 5, 6, 7, 8, 9, 11, 13, 14, 15, 16, 18, 19, 21, 22, 23, and specially J. O. Dorsey, *A Study of Siouan Cults*, in No. 11; A. C. Fletcher, *The Hako*, in No. 22; and M. C. Stevenson, *The Zuñi Indians*, in No. 23. Though dealing primarily with a more advanced culture, J. J. M. de Groot, *The Religious System of China* (1892–1901), will be found to throw much light on primitive ideas. Finally let it be repeated that there is offered here no more than an introductory course of standard authorities suitable for the English reader.

(R. R. M.)

B. The Higher Religions

Various phenomena associated with the religions of the lower culture will be found discussed in the articles on ANIMISM; FETISHISM; MAGIC; MYTHOLOGY; PRAYER; RITUAL; SACRIFICE; and TOTEMISM. In this article religions are treated from the point of view of morphology, and no attempt can be made in the allotted limits to connect them with the phases of ritual, sociological or ethical development. See the separate articles on each religious system, and the separate headings for different forms of ritual.

1. *Developments of Animism.*—Animism is not, indeed, itself a religion; it is rather a primitive kind of philosophy which provides the intellectual form for the interpretation alike of Man and of Nature. It implies that the first great step has been taken for distinguishing between the material objects—whether the conscious body, or the rocks, trees and animals—and the powers that act in or through them. The Zuñis of New Mexico, U.S.A., supposed "the sun, moon and stars, the sky, earth and sea, in all their phenomena and elements, and all inanimate objects as well as plants, animals and men, to belong to one great system of all-conscious and interrelated life, in which the degrees of relationship seem to be determined largely, if not wholly, by the degrees of resemblance."[1] If the earliest conception is that of an obscure undifferentiated animation (*panvitalism*), the analysis of the human person into body and spirit with the corresponding doctrine of "object-souls" (*e.g.* the *tornait*, or "invisible rulers" of every object among the Eskimo)[2] constitutes an important development. Matter is no longer animated or self-acting; it is subject to the will of an agent which can enter or quit it, perhaps at its own pleasure, perhaps at the compulsion of another. The transition has usually been effected ages before the higher religions come into view; but it is sometimes traceable in races in language and custom. Thus the Vedic hymns, which exhibit the deposits of so many stages of thought, are founded ultimately on the conception of the animation of nature. The objects of the visible world are themselves mighty to hurt or help. The springs and rivers, the wind, the sun, fire, the Earth-Mother, the Sky-Father, are all active powers. The animals, domesticated or wild, like the horse or cow, the guardian dog, the bird of omen, naturally share the same life, and are approached with the same invocation. The sacred energy is also discerned in the ritual implements, in the stones for squeezing the soma-juice, and the sacrificial post to which animals were bound; nay, it was even recognized in fabricated products like the plough (the "tearer" or "divider"), the

war-car, the drum, quiver, bow and axe. The Earth-Mother and Sky-Father are to be found again and again in religions, at various stages of development, as co-ordinating conceptions which comprehend the universe.[1] Sometimes one is more prominent, sometimes the other. In many cases the Sky has been already resolved into the visible firmament and its lord and owner, like the Yoruban Olorun or the Finnic Ukko. The consort of Ukko is *Maan-emõ*, "mother of the earth," or *maan emäntä*, "mistress of the earth." But the rare expression *maan-emõ*, "Mother-earth," still used in the ancient lays,[2] points to the older type of belief in the animation of the productive soil. So the Peruvians designated the Earth as Pachamama, "mother of (all) things."[3] In Egypt the relation was curiously reversed; the earth-god Keb was the husband of Nut, the sky, represented sometimes as a woman, overarching the earth and supported on hands and feet, sometimes as a gigantic cow, upheld on the outstretched hands of Shu, the atmosphere.[4] When earth and sky were still unseparated, Shu thrust himself between them and raised Nut to the heights. So in the New Zealand myth, Rangi and Papa, Sky and Earth, who once clave together in the darkness, were rent asunder by the forest-god Tane-mahuta, who forced up the sky far above him.[4] The most elaborate presentment of this mode of thought is to be seen in the organized animism of the ancient state religion of China, where the supreme power is lodged in the living sky (Tien).[5] Tien was originally the actual firmament. In the *Shi-King* it is addressed in prayer as "great and wide," as "vast and distant"; it is even "blue" (Pt. II. v. 6, 5). So it is the ancestor of all things; and Heaven and Earth are the father and mother of the world. From the imperial point of view the sky bore the name of Ti, "ruler," or Shang Ti, "supreme ruler" (emperor); and later commentators readily took advantage of this to discriminate between the visible expanse and the indwelling spirit, producing a kind of Theism. But the older conception still holds its own. "Why" (says Edkins, *Religion in China*, 95), "they have been often asked, should you speak of those things which are dead matter, fashioned from nothing by the hand of God, as living beings? And why not? they have replied. The Sky pours down rain and sunshine; the Earth produces corn and grass. We see them in perpetual movement, and we therefore say that they are living." *Tien Ti, Fu Mu*, "Heaven and Earth, Father and Mother," are conjoined in common speech, and are the supreme objects of imperial worship. The great altar to Heaven, round in shape like the circuit of the sky, and white as the symbol of the light principle (Yang), stands in the southern suburb of Peking in the direction of light and heat. The altar to the Earth is dark and square, on the north side of the city, the region of *yin*, the principle of cold and gloom. Associated with the Sky are tablets to the sun and moon, the seven stars of the Great Bear, the five planets, the twenty-eight constellations, and all the stars of heaven; tablets to clouds, rain, wind and thunder being placed next to that of the moon. With the Earth are grouped the tablets to the five lofty Mountains, the three Hills of perpetual peace and the four Seas, the five celebrated Mountains and the four great Rivers.[6] The ancient ritual (*Chow Li*) carefully graded the right of sacrifice from the viceroys of provinces down to the humblest district-superintendent who offered to the spirits of his district, the hills, lakes and grains. With these spirits ranged in feudal order in two vast groups beneath Heaven and Earth is associated a third class, those of human beings. They are designated by the same name, *shin*; and they are inextricably mingled with the operations of nature. So in the Vedic hymns the departed "Fathers" inhabit the three zones of earth, air and sky; they are invoked with the streams and mountains of this lower earth, as well as with the dawns and the sky itself; even cosmic functions are ascribed to them; and they adorn the heaven with stars. The Chinese conception of the *Shin* under the name of *Shin-to* (Chinese *tao*) or "spirits'-way" profoundly influenced Japanese thought from the 6th century A.D. onwards; and the great Shinto revival of the 18th century brought the doctrine again into prominence. The Japanese *Kami* are the "higher" powers, the *superi*, conceived as acting through nature on the one hand and government on the other. Just as the emperor is *kami*, and provincial officers of rank, so also mountains, rivers, the sea, thunder, winds, and even animals like the tiger, wolf or fox, are all *kami*.[7] The spirits of the dead also become *kami*, of varying character and position; some reside in the temples built in their honour; some hover near their tombs; but they are constantly active, mingling in the vast multitude of agencies which makes every event in the universe, in the language of Motowori (1730–1801), the act of the Kami. They direct the changing seasons, the wind and the rain; and the good and bad fortunes of individuals, families and states are due to them.[8] Everywhere from birth to death the entire life of man is encompassed and guided by the Kami, which are sometimes reckoned at 8,000,000 in number.

iv. Transition to Polytheism.—In such ways does the Polydaemonism of early faith survive in the modern practice of religion. The process of enrolling the spirits of the dead in the ranks of what may be more or less definitely called "gods" may be seen in the popular usages of India at the present day, or traced in the pages of the *Peking Gazette* under the direction of the Board of Rites, one of the most ancient branches of Chinese administration. Whether the higher polytheisms were produced in this fashion out of the cultus of the dead, may, however, be doubted. Many influences have doubtless contributed, and different races have followed different lines of development. No definite succession like the series of ages marked by the use of stone, bronze and iron can be clearly marked. But there must always have been some correspondence between the stages of social advance (or, in certain cases, of degeneration) and the religious interpretation of the world. The formation of clans and tribes, the transitions from the hunting to the pastoral life, and from the pastoral to the agricultural—the struggle with forest and swamp, the clearings for settlement, the protection of the dwelling-place, the safety of flocks and herds, the production of corn,—the migration of peoples, the founding of colonies, the processes of conquest, fusion, and political union—have all reacted on the elaboration of the higher polytheisms, before bards and poets, priesthoods and theological speculators, began to systematize and regulate the relations of the gods. Certain phases of thought may be more or less clearly indicated; certain elements of race, of local condition, of foreign contact, may be distinguished with more or less historic probability; but no single key can explain all the wide diversity of phenomena. Broadly speaking it may be said that a distinction may be drawn between "spirits" and "gods," but it is a distinction of degree rather than of kind, obvious enough at the upper end, yet shading off into manifold varieties of resemblance in the lower forms. Some writers only recognize friendly agencies as gods; but destructive powers like the volcano, or the lords of the underworld, cannot be regarded as the protectors of the life of man, yet they seem in many mythologies to attain the full personalised stature of gods with definite names. Early Greek religion recognized a class of gods of Aversion and Riddance, ἀποτρόπαιοι and ἀποσυμπαῖοι. Neither the spirit nor the god is conceived as

[1] The Japanese name is *Ame-tsuchi*, "heaven and earth," a translation of the Chinese *ten-chi*, Aston, *Shinto* (1905), p. 35.

[3] Erman, *Handbook of Egyptian Religion* (1907), pp. 8, 12.

[4] Sir George Grey, *Polynesian Mythology* (1855), pp. 1–4.

[5] The English "Heaven" has acquired a quasi-personal meaning, and is usually employed as its equivalent, but, like the Jewish use (*e.g.* Luke xv. 18), tends to carry too definite religious associations with it.

[6] Blodget, on "The Chinese Worship of Heaven and Earth," *Journ. of the American Oriental Society*, xx. p. 58 ff.

[7] So the epithet *'El* might be applied in Hebrew to men of might, to lofty cedars, or mountains of unusual height, as well as to the Supreme Being.

[8] See E. M. Satow, "Revival of Pure Shinto," *Trans. As. Soc. of Japan*, vol. iii. pt. 1 (1875), Appendix, p. 26.

immaterial. They can take food, though the crudest form of this belief soon passes into the more refined notion that they consume the impalpable essence of the meals provided for them. The ancient Indian ritual for the sacrifice to the Fathers required the officiating priest to turn away with bated breath that he might not see the spirits engaged upon the rice-balls laid out for them. The elastic impalpable stuff of the spirit-body is apparently capable of compression or expansion, just as Athena can transform herself into a bird. The spirits can pass swiftly through the air or the water; they can enter the stone or the tree, the animal or the man. The spirit-land of the Ibo on the Lower Niger had its rivers, forests or hills, its towns and roads, as upon earth:[1] the spirits of the Mordvinian mythology, created by Chkai, not only resembled men, they even possessed the faculty of reproduction by multiplication.[2] The Finns ascribed a *haltia* or genius to each object, which could, however, guard other individuals of the same species. This is the beginning of the species-god, and implies a step of thought comparable to the production in language of general terms. These protecting spirits were free beings, having form and shape, but not individualized; while above them rose the higher deities like the forest-god Tapio and his maiden Hillervo, protectress of herds, or Ahto the water-god who gradually took the place of Vesi, the actual element originally conceived as itself divine, and ruled over the spirits of lakes and rivers, wells and springs.[3] The Finns came to apply to the upper gods the term Yumala which originally denoted the living sky; the Samoyedes made the same use of Num, and the Mongols of Tengri.[4] Above the innumerable *wongs* of the Gold Coast rose Nyongmo, the Sky-god, giver of the sunshine and the rain. The Yoruba-speaking peoples generalized the spirits of mountain and hill into Oke, god of heights; and the multitude of local sea-gods on the western half of the slave coast was fused into one god of the Ocean, Olokun.[5] The Babylonian theology recognized a *Zi* or "spirit" in both men and gods, somewhat resembling the Egyptian "double" or *ka*; spirits are classed as spirits of heaven and spirits of earth; but the original identity of gods and spirits may be inferred from the fact that the same sign stands before the names of both.[6] Out of the vast mass of undifferentiated powers certain functional deities appear; and the Kami of Japan to-day who preside over the gilds and crafts of industry and agriculture, over the trees and grasses of the field, the operations of the household, and even the kitchen-range, the saucepan, the rice-pot, the well, the garden, the scarecrow and the privy, have their counterparts in the lists of ancient Rome, the *indigitamenta* over whose contents Tertullian and Augustine made merry. The child was reared under the superintendence of *Educa* and *Potina*. *Abcona* and *Adeona* taught him to go out and in. *Cuba* guarded him when he was old enough to exchange a cradle for a bed. *Ossipaga* strengthened his bones; *Levana* helped him to get up, and *Statina* to stand.[7] There were powers protecting the threshold, the door and the hinge: and the duties of the house, the farm, the mill, had each its appointed guardian. But such powers were hardly persons. The settler who went into the woods might know neither the name nor the sex of the indwelling *numen*; "si deus si dea," "sive mas sive femina," ran the old formulae.[8] So the Baals of the Semitic peoples constituted a group of powers fertilizing the land with water-springs, the givers of corn and wine and oil, out of which under conditions of superior political development a high-god like the Tyrian Baal, the majestic City-King, might be evolved. The Celts who saw the world peopled with the spirits of trees and animals, rocks, mountains, springs and rivers, grouped them in classes like the Dervonnae (oak-spirits), the Niskai (water-spirits), the Proximae, the Matronae (earth-goddesses)[9] and the like. Below the small band of Teutonic divinities were the elves of forest and field, the water-elves or nixes and spirits of house and home. The Vedic deities of the nobler sort, the shining *devas*, the *asuras* (the "breathers" or living, perhaps to be identified with the Scandinavian *æsir*) rose above a vast multitude of demonic powers, many of them doubtless derived from the local customs and beliefs of the native races whom the immigrant Aryans subdued. In the earliest literary record of Greek religion Homer distinguishes between the θεός and the δαίμων, the personalized god and the *numen* or divine power. In Homer the element of time is definitely recognized. The gods are the "Immortals." They are born, and their parentage is known, but they do not die. Zeus is not self-existent in the sense in which the Indian Brahmā is *svayambhū*, but certain questions have been by implication asked and answered, which the demonology of the savage has not yet raised. But behind Homer stretches the dim scene of pre-Hellenic religion, and the conflict of elements "Pelasgic," ordered and Hellenic, out of which the Homeric religion emerged; and beneath the Homeric religion how many features of the religion of ghosts and nature-spirits survived in popular usage and the lower cults![10] When Herodotus (ii. 53) tried to trace the origin of the beliefs around him, he found his way back to ân age before Hesiod or Homer, when the gods were nameless. To that age the traditions preserved at Dodona bore witness; and the designations of special groups like the θεοὶ μέγιστοι, θεοὶ μειλίχιοι, θεοὶ πραξίδικαι, or, possibly, the Venerable Goddesses (θεαὶ σεμναί) of Athens, point to a mode of thought when the divine Powers were not definitely individualized. They are just at the point of transition from the ranks of spirits to the higher classes of the gods. As they had no names, they had no relations. Nor had any images yet been made of them. They were associated with hallowed trees, with sacred stones and pillars, out of which came the square rough-hewn Hermae which were anointed with oil like the sacred stone attributed by legend to Jacob at Bethel.[11] By what processes the Hellenic immigration introduced new deities and the Greek pantheon was slowly formed, can only be conjecturally traced with the help of archaeology. But Herodotus and Aeschylus were well aware that the religion of Greece had not been uniformly the same; and the gods whom they knew had been developed out of intercourse with other peoples and the succession of races in the obscure and distant past.

3. *Polytheism.*— The lower and unprogressive religions practically remain in the polydaemonistic stage, though not without occasionally feeling the stimulus of contact with higher faiths, like some of the West African peoples in the presence of the Mahommedan advance. Among the more progressive races, on the other hand, continual processes of elevation and decline may be observed, and the activities of the greater gods are constantly being enriched with new functions. Personal or social experiences of the satisfaction of some desire or escape from some danger are referred to some particular deity. Elements of race-consciousness help to shape the outlook on nature or life: and slight differences of linguistic use in the coining of descriptive terms sometimes lead to the multiplication of divine forms. Exacter observation of nature; closer attention to its contrasts of life and death, or light and darkness, or male and

female; the distinction between its permanent objects, and its occasional or recurring operations; the recognition that behind sudden manifestations of power, like the thunder-storm, there are steady forces and continuous cosmic agencies at work—lead to the gradual rise of the higher deities. And from the social side the development of law, the influence of city life, the formation of priesthoods, the connexion of particular deities with the fortunes of dynasties or the vicissitudes of nations, the processes of migration, of conquest and political change, the deportations of vanquished peoples, even the sale of slaves to distant lands and the growth of trade and travel, all contribute to the processes which expand and modify different pantheons, and determine the importance of particular deities. In the midst of the bewildering variety, where all types co-exist together and act and react on each other, it is impossible to do more than point out some obvious groups receiving their special forms chiefly from the side (1) of nature, (2) of human life, and (3) from moral or theological speculation. Divine persons, objects or powers, connected with ritual, are not here considered, such as the Brahman priests who claimed to be *manushyadevâh* (human-gods), or the sacred soma-juice which grew by strange analogies into a mysterious element, linking together heaven and earth.

I. On the side of Nature the lowest rank (1) seems to belong to what Usener has designated "momentary" or "occasional" gods.[1] They embody for the time being a vague consciousness of the divine, which is concentrated for some single act into an outward object, like a warrior's spear or the thunderbolt,[2] or the last sheaf of corn into which the Corn-Mother has been driven.[3] (2) Above these, to use again Usener's nomenclature,[4] are the "special" or "functional" gods, "departmental gods," as Mr Lang has called them. Such were some of the deities of the *Indigitamenta* already compared with the Japanese Kami. Among them, for example, were twelve deities of ploughing and harvest operations, who were invoked with Tellus and Ceres. (3) Another class may be seen in the species-deities previously named; the Samoan gods which could become incarnate as a heron or an owl, did not die with particular birds. A dead owl was not a dead god; he yet lived in all other owls.[5] (4) The worship of trees, plants and animals is a particular phase of the wider series of nature-cults, only named here because of its frequency and its obvious survivals in some of the higher polytheisms, where, as in Egypt, the Apis bulls were worshipped; or where, as in Mesopotamia, the great gods are partly symbolized by animal forms; or where, as in Israel, Yahweh might be represented as a bull; or where, as in Greece, such epithets as Dendrites and Endendros preserved traces of the association of Dionysus and Zeus with vegetation; while sacred animals like the serpents of Aesculapius were preserved in the temples.[6] (5) The higher elemental gods sometimes, like the sun, as the Indian Sûrya, the Egyptian Rê, the Babylonian Shamash (Samas), the Greek Helios, retain their distinct connexion with the visible object. It was naturally more easy for a relatively spiritual worship to gather round a god whose name did not immediately suggest a familiar body. No one ever thought of confessing sin, for instance, to a river. But the daily survey of the sun (occasionally also the function of the moon as measurer of time), together with his importance for life, secured him a high moral rank; and Rê, united with the Theban Ammon, became (under the New Empire) the leading god of Egypt for a thousand years, "He who hath made all, the sole One with many hands." Other deities, like Zeus, rise to the head of a monarchical polytheism, in which their physical base is almost, if not quite, forgotten in cosmic and moral grandeur. The gods are often arranged in groups, three, seven and twelve being frequent numbers. Egyptian summaries recognized gods in the sky, on earth and in the water; gods of the north and south, the east and west, gods of the field and the cities. Indian theologians classified them in three zones, earth, air and sky. Babylonian speculation embraced the world in a triad of divine powers. Anu the god of heaven, Bel of earth and Ea of the deep; and these became the symbols of the order of nature, the divine embodiments of physical law.[7] Sometimes the number three is reached by the distribution of the universe into sky, earth and underworld, and the gods of death claim their place as the rulers of the world to come. Among these deities all kinds of relationships are displayed; consorts must be provided for the unwedded, and the family conception, as distinct from the regal, presents a divine father, mother and child. The Ibani in Southern Nigeria recognized Adum the father-god, Okoba the mother-god and Eberebo the son-god.[8] In Egypt, Osiris, Isis and Horus proved an influential type. Perhaps at a relatively earlier stage maternity alone is emphatically asserted, as in the figure of the Cretan Mother, productive without distinctly sexual character.[9] Or, again, maternity disappears, while parenthood survives, and causation is embodied in a universal "Father of all that are and are to be," like the Indian Brahmâ in the days of Gotama the Buddha."[10]

II. On the human side polytheism receives fresh groups in connexion with the development of social institutions and national feeling. (1) In the family the hearth-fire is the scene of the protecting care of deity; the gods of the household watch over its welfare. Each Roman householder had his *Genius*, the women their *Junones*. These stood at a higher level than the "occasional gods," having permanent functions of supervision. (2) From the household a series of steps embodied the divine power in higher forms for social and political ends. Hestia presided over cities; there was even a common Hestia for all Greece. The *frawashi* or ideal type, the genius of both men and gods in the Zend Avesta (possibly connected originally with the cultus of the dead [11]), rises in successive ranks from the worshipper's own person through the household, the village, the district and the province, up to the throne of Ahura himself.[12] The Chinese Shin were similarly organized; so (less elaborately) were the Japanese *Kami*;[13] and the Roman *lares*, the old local land-gods, found their highest co-ordinating term in the *Lares Augusti*, just as the Genius was extended to the legion and the colony, and finally to Rome itself. (3) In the case of national deities the tie between god and people is peculiarly close, as when Yahweh of Israel is pitted against Chemosh of Ammon (Judges xi. 24). The great gods of Greece, in their functions as "saviours" and city-guardians, acquire new moral characters, and become really different gods, though they retain the old names. Ashur rises into majestic sovereignty as the "Ruler of all the gods," the supreme religious form of Assyrian sway: when the empire falls beneath the revived power of Babylon, he fades away and disappears. (4) The earthly counterpart of the heavenly monarch is the divine king, who may be traced back in Egypt, for example, to the remotest antiquity,[14] and who survives to-day among the civilized powers in the emperor of Japan (anciently *Arahito-gami*, "incarnate Kami"). "To the end of time,"

said Motowori (18th century), "the Mikado is the child of the Sun-goddess." (5) The dead hero (historical or mythic) signalizes his power by gracious saving acts; and Heracles, Asclepius, Amphiaraus, and others pass into the ranks of the gods, which are thus continually recruited from below.

III. A third great group rises out of the sentiments and affections of man, or the moral energies which he sees working in human life. (1) The Vedic *Craddhá*, "faith," the Greek *Metameleia*, "repentance,"[1] the Latin *Spes*, and a band of other figures, represent the dispositions of the heart; Nemesis and Nikê and Concordia and their kin belong to a somewhat different sphere. The divine powers avenging, conquering, harmonizing the counterparts of the "departmental" gods in the field of moral agencies. (2) Over these theological speculation erects a few lofty and impressive forms; sometimes below the highest, like Vohu Mano, "the Good Mind" of Ahura Mazda; or the Bodhisattva Avalokiteçvara, who vowed not to enter into final peace till every creature had received the saving truth; sometimes supreme, like Brahmâ or Prajâpati ("lord of creatures") in the early Brahmanic theology; or Âdi Buddha, or the Zervan Akarana, "boundless time," of a kind of Persian gnosticism; or the Θεὸς ὕψιστος whose worship appears among other syncretistic cults of the Roman empire.

4. *The Order of Nature.*—Polytheism is here on the way to monotheism, and this tendency receives significant support from the recognition of an order in nature which is the ground and framework of social ethics. Not only does a sky-god like Varuna, or a sun-god like the Babylonian Shamash, survey all human things, and take cognizance of the evil-doer, but the daily course of the world is itself the expression of an intellectual and moral power. In the Chinese combination of Heaven and Earth as the parents and nourishers of all things, the energy and action lie with Tien, Earth being docile and receptive. Tien is intelligent and all-observing, and its "sincerity" or steadfastness, displayed in the courses of the sun and moon and the succession of the seasons, becomes the basis of right human conduct, personal and social. The "way" of Heaven, the "course" of Heaven, the "lessons" of Heaven, the law or "decree" (*ming*) of Heaven, are constantly cited as the pattern for the emperor and his subjects. This conception is even reflected in human nature: "Heaven in giving birth to the multitude of the people, to every faculty and relationship affixed its laws" (*Shi King*, III. iii. 6; cf. IV. iii. 2, tr. Legge), and the "Grand Unity" forms the source of all moral order (*Li Ki*, in *Sacred Books of the East*, xxvii. p. 387). Indian thought presented this Order in a semi-personal form. The great elemental gods imposed their laws (*dhâman, dharman, vrata*) on the visible objects of nature, the flow of rivers, the march of the heavenly bodies across the sky. But the idea of Law was generalized in the figure of *Rita* (what is "fitted" or "fixed"; or the "course" or "path" which is traversed), whose Zend equivalent *asha* shows that the conception had been reached before the separation of the Eastern Aryans produced the migrations into India and Iran.[2] In the *Rig Veda* the gods (even those of storm) are again and again described as "born from the Rita," or born in it, according to it, or of it. Even Heaven and Earth rejoice in the womb or lap of the Rita. In virtue of the mystic identity between the cosmic phenomena and sacrifice, Rita may be also viewed as the principle of the cultus; and from that sphere it passes into conduct and acquires the meaning of morality and is equated with what is "true." The fundamental idea remains the same in the Zend Asha, its philological counterpart, but it is applied with a difference. Its form is more personal, for Asha is one of the six Holy Immortals round the throne of Ahura Mazda (Auramazda). In the primeval conflict between the powers of good and evil, the Bounteous Spirit chose Asha, the Righteous Order which knit the world together and maintained the stars.[3] The immediacy of the relation between Ahura and Asha is implied in the statements that Ahura created Asha and that he dwells in the paths which proceed from Asha; and when he created the inspired word of Reason, Asha consented with him in his deed. In its ritual form Asha becomes the principle of sacrifice, and hence of holiness, first ritual and then moral. Like Rita, it rises into an object of worship, and in its most exalted aspect (*Asha vahista*, the "best" Asha, most excellent righteousness) it is identified with Ahura himself, being fourth among his sacred names (*Ormazd Yasht*, § 7; *S.B.E.* xxiii. p. 25). Egyptian speculation, in like manner, impersonated the conceptions of physical and moral order as two sides of a fundamental unity in the goddess Maât. Derived from the verb *mâ*, "to stretch out," her name denoted the ideas of right and rule, and covered the notions of order, law, justice and truth, which remained steadfast and unalterable. Mythologically she was the daughter (or the eye) of the sun-god Rê; but she became Lady of Heaven and Queen of Earth, and even Lady of the land of the West, the mysterious habitation of the dead. Each of the great gods was said to be lord or master of Maât; but from another point of view she "knew no lord or master," and the particular quality of deity was expressed in the phrase *anχ em maât*, "living by Maât," which was applied to the gods of the physical world, the sun and moon, the days and hours, as well as to the divine king. She was solemnly offered by the sovereign to his god, and the deity replied by laying her within the heart of his worshipper "to manifest her everlastingly before the gods." So in the famous scene of the weighing of the soul, which first appears pictorially under the New Empire, she introduces the deceased before the forty-two assessors of the heavenly judge, Osiris, and presides over the scale in which his actions and life are weighed. From the zenith to the realm of the departed she is the "queen of all gods and goddesses."[4] The Hellenic polytheism of Homer and Hesiod is already at work upon similar ideas, and a whole group of mythic personifications slowly rises into view representing different phases of the same fundamental conception. Themis (root *θε*=Sanskr. *dha*, as in *dhâman*) appears in Homer as the embodiment of what is fit or right;[5] she convenes or dismisses assemblies, she even keeps order at the banquet of the gods. Next, Hesiod supplies a significant biography. She is the daughter of Ouranos and Gaia; and after Metis she becomes the bride of Zeus.[6] Pindar describes her as born in a golden car from the primeval Oceanus, source of all things, to the sacred height of Olympus to be the consort of Zeus the saviour; and she bears the same august epithet, as the symbol of social justice and the refuge for the oppressed.[7] Law was thus the spouse of the sovereign of the sky, but Aeschylus identified her with the Earth (worshipped at Athens as Gê-Themis), not only the kindly Mother, but the goddess who bound herself by fixed rules or laws of nature and life.[8] For the cultus of the earth as the source of fertility was associated with the maintenance of the family, with the operations of agriculture and the social order of marriage. So Themis became the mother of the seasons; the regular sequence of blossom and fruit was her work; and Good Order, Justice and Peace were her offspring.[9] By such conceptions the Hellenic polytheism was moralized; the physical character of the greater gods fell into the background, and the sculptor's art came to the aid of the poet by completely enduing them with personality.

5. *Transition to Monotheism.*—From the higher Polytheism an easy step leads to some form of Monotheism. The transition may be effected in various ways. Max Müller observed the Vedic poets addressing themselves to the several objects of their devotion; as if each occupied the field alone. Varuna or Indra was for the time being the only god within the worshipper's view; and to this mode of thought he gave the name Henotheism.[1] It obviously reappears elsewhere, as it is the natural attitude of prayer, and may be seen in the pious homage of the pilgrims to the Virgin of Loretto or Einsiedeln. Pfleiderer employed the word to denote a relative monotheism like that of the early religion of Israel, whose teachers demanded that the nation should worship but one god, Yahweh, but did not deny the existence of other gods for other peoples. Yet once again the term has been applied to characterize a whole group of religions, like the Indo-Germanic, which are ultimately founded on the unity of the divine nature in a plurality of divine persons. A designation of such doubtful meaning it seems better (with Chantepie de la Saussaye) to abandon. But the unifying process may advance along different lines. The deities of different local centres may be identified; many such combinations took place in Egypt, and Isis in late days served to her votaries as the unitary principle which appeared in one figure after another of whole pantheons. Again, the gods may be viewed as a collective totality, like the "All-gods" of the Vedic poets, or as at Olympia where there was a "common altar for all the gods" (cf. the less frequent Roman dedication in later days, "Jovi optimo maximo caetersique dis immortalibus"). Or the relation between the inferior deities and the most exalted may be conceived politically and explained by Tertullian's formula, "Imperium penes unum, officia penes multos." One particular god may be eminent enough, like Zeus, to rise above all others, and supply cultivated thought with a name for the supreme power; and this may be strengthened by the national motive as in the case of Israel. Or philosophic theology may penetrate to an abstract conception of deity, like the Babylonian *'ilutu*, or the Vedic *devatva* and *asuratva*; and some seer may have the courage and insight to formulate the principle that "the great *asuratva* of the *devas* is one" (*R.V.* iii. 55. 1). "The One with many names" was recognized alike in India and in Greece; "πολλῶν ὀνομάτων μορφὴ μία," says Aeschylus, almost in the words of the Vedic poet.[2] Historians have usually recognized only three monotheistic religions, Judaism, Christianity and Islām. The Christian apologists of the 2nd century, however, found plenty of testimony to their doctrine of the unity of God in the writings of Greek poets and philosophers; it was a commonplace in the revival under the Empire; and among the group of religions embraced under the name Buddhism more than one form must be ranked as monotheistic. The idealist philosophy of the Prajña Pāramitā in the system of the "Great Vehicle" declared that "every phenomenon is the manifestation of mind" (Beal, *Catena*, p. 303). In the "Lotus of the Good Law" (*S.B.E.* xxi.) the Buddha is the "Father of the World," "Self-born" or Uncreate (like the eternal Brahmā of the Hindu theology), the protector of all creatures, the Healer (Saviour) of the sickness of their sins. These types have reappeared in Japan. Nichiren taught a philosophical monism in the 13th century which is the basis of a vigorous sect at the present day; and the "True Sect of the Pure Land," founded by his older contemporary Shin-ran, and now the most numerous, wealthy and powerful of the Buddhist denominations, has dropped the original Gotama altogether out of sight, and permits worship to Amida alone, the sublime figure of "Boundless Light," whose saving power is appropriated by faith. Here is a monotheism of a definite and clear-cut type, arising apparently by spontaneous development apart from any external impulse.[3] On the other hand, the monotheism of Judaism was subject to serious qualifications. An exuberant demonology admitted all kinds of interfering causes in the field of human life. Above man on earth rose rank after rank of angels in the seven heavens. These were of course created, but they were in their turn the agents of the phenomena of nature, "the angels of the spirit of fire and the angels of the spirit of the winds, and the angels of the spirits of the clouds and of darkness and of snow and of hail and of hoarfrost, and the angels of the voices and of the thunder and of the lightning, and the angels of the spirits of cold and of heat, and of winter and of spring and of autumn and of summer" (*Jubilees*, tr. R. H. Charles, ii. 2). These powers are of a well-marked animistic type, and correspond to the Chinese Shin, save that they were not incorporated in the cultus. Higher in rank came various med ating forms, like Wisdom, Memra (the Word) or Shekinah (the Presence), more or less definitely personalized. Mahommedanism still recognizes innumerable *jinn* peopling the solitudes of the desert, and over the grave of the deceased saint a little mosque is built, and prayers are offered and miracles performed.[4] Christianity has, in like manner, in the course of its long and eventful history, admitted numerous agencies within the sphere of superhuman causation. The Virgin, the angelic hierarchy, the saints, have received the believer's homage, and answered his petitions. Theology might draw subtle distinctions between different forms of devotion; but, tried by the comparisons of the anthropologist, the monotheism even of historical Christianity cannot be strictly maintained.

6. *Classification.*—In the panorama of religious development thus briefly sketched, the different stages constantly appear to shade off into one another, and any one of the higher seems to contain elements of all the rest. This is the great difficulty of classification. All religions, even the most conservative and traditional, are in constant flux, they either advance or decay. In these processes, which do not take place at equal rates in different cases, all kinds of survivals remain lodged, and embarrass every attempt to fix the place of specific religions in any general course of development. The theologian, the philosopher, the historian, have all tried their hands at distribution. (i.) The 18th-century divine who divided religions into True and False grimly remarked that the second chapter was much the longer of the two.[5] The corresponding distinction into Natural and Revealed breaks down in view of the fact that revelation by dream and oracle, by inspired seer or divine teacher and law-giver, is a practically universal phenomenon in more or less distinctly defined forms. (ii.) Philosophy, in the person of Hegel, classified religion in a threefold form: (*a*) the religion of Nature, (*b*) the religion of Spiritual Individuality, (*c*) the Absolute Religion (Christianity).[6] The subdivisions of this scheme have been long since abandoned, as the progress of knowledge rendered them untenable. K. F. A. Wuttke, however, adopted its fundamental idea[7] and distinguished three periods or phases: (1) the objective, producing the religions of nature; (2) the subjective, God as comprehended in the individual mind; (3) God as Absolute Spirit. In the same way Dr Edward Caird[8] recognizes three similar stages: (1) objective consciousness, the divine in nature; (2) self-consciousness, the divine in man (*e.g.* Judaism, Stoicism, and modern philosophy of the type of Kant); (3) God-consciousness, where God is above the contrast of subject and object, yet is revealed in both (Christianity). (iii.) On the historical side numerous bases have been suggested. (1) Max Müller proposed to group religions ethnologically by tests of language. This had the obvious advantage of lifting two great families into prominence, the Semitic and the Indo-Germanic. The Semitic peoples were closely bound together by common types of thought and civilization, and produced three of the leading religions of the world, Judaism, Christianity and Islām. But a glance at the table of Indo-Germanic religions

drawn up by Tiele (*Ency. Brit.*, 9th ed., vol. XX. p. 360) will show what diversified products are blended together. Why should philosophical Brahmanism, or the Buddhism which reacted against it, be associated with so undeveloped a form as the religion of the ancient Latin settlers in mid-Italy? And why, on the other hand, should the religions of the lower culture, which are practically of a common type, be separated genealogically into numerous independent families? (2) Whitney[1] found the most important distinction to lie between religions which were the collective product of the wisdom of the community, race-religions as they might be called, and those which proceeded from individual founders. But, as Tiele pointed out, the "individual" element cannot be eliminated from the "race-religion," where each myth has been first uttered, each rite first performed, by some single person. And the founder who enters history with an impressive personality can only do his work through the response made to him by the insight and feeling of his time. (3) Kuenen disengaged another characteristic, the scope and aim of any given religion; was it limited to a particular people, or could it be thrown open to the world? On this foundation the higher religions were classed as national or universal, the latter group being formerly supposed to include Buddhism, Christianity and Mahommedanism. Here, once more, the student is confronted with many qualifications. A missionary religion like Mithraism, which established itself all the way from Western Asia to the borders of Scotland, was certainly not "national." Islām and Brahmanism both passed beyond the confines of race. The Confucian morality could be adopted without difficulty in Japan. In other words, there was either a definite tendency to expansion, or there was no impediment in the religion itself when circumstances promoted its transplantation. Further, there are elements of Islām, like the usages of the *hajj* (or pilgrimage to the sacred places at Mecca), the dryness of its official doctrine and the limitations of its real character as indicated in the Wahhābi revival, which so impair its apparent universalism that Kuenen found himself obliged to withdraw it from the highest rank of religions.[2] (4) Professor M. Jastrow, jun., starting from the relation of religion to life, distinguishes four groups, the religions of savages, the religions of primitive culture, the religions of advanced culture and the religions which emphasize as an ideal the coextensiveness of religion with life. It may, however, be doubted whether the fundamental assumption of such a scheme, viz. that in the life of the savage religion plays a comparatively small part, can be satisfactorily established. The evidence rather implies that, so far as the sanctions of religion affect the savage at all, they affect him with unusual force. In the absence of other competing interests his religious beliefs and duties occupy a much larger share of his attention than the votaries of many higher faiths bestow on theirs; and though his ethical range may be very limited, yet the total influence of his religion in determining for him what he may do and what he may not, brings the greater part of conduct under its control. The savage who finds himself encompassed by taboos which he dare not break, lives up to his religion with a faithfulness which many professing Christians fail to reach. (5) There remains a broad distinction between religions that are in the main founded on the relation of man to the powers of Nature, and those based on ethical ideas, which partly corresponds to the philosophical division already cited. This enabled Professor Tiele to arrange the chief religions in certain groups, starting from the primitive conception of the common life of the objects of the surrounding scene:—[3]

I. *Nature Religions*—
  1. Polyzoic Naturalism (hypothetical).
  2. Polydemonistic-magical religions under the control of Animism (religions of savages).
  3. Purified or organized magical religions. Therianthropic Polytheism.
     (*a*) Unorganized (religions of the Japanese, Dravidians, Finns, Esths, the ancient Arabs, the ancient Pelasgi, the Old-Italian peoples, the Etruscans (?), the Old-Slavs).
     (*b*) Organized (religions of the half-civilized peoples of America, ancient Chinese state-religion, religion of the Egyptians).
  4. Worship of beings in human form, but of superhuman power and half-ethical nature. Anthropomorphic polytheism (religions of the Vedic Indians, the ancient Persians, the later Babylonians and Assyrians, the advanced Semites, the Kelts, Germans, Hellenes, Greeks and Romans).

II. *Ethical Religions* (spiritualistic ethical religions of Revelation)—
  1. National Nomistic (nomothetic) Religious Communions (Yaoism and Confucianism, Brahmanism, Jainism, Mazdeism, Mosaism and Judaism, the two last already passing into 2).
  2. Universalistic Religious Communions (Buddhism, Christianity: Islām with its particularistic and nomistic elements only partially belongs to this group).[4]

7. *Revelation.*—The second group in this division practically corresponds to the second stage recognized by Caird; but it rests upon a somewhat different basis, the conception of revelation addressed to the conscience in the form of religious law. Neither Taoism nor Confucianism, indeed, makes this claim. The *Tao-teh-king*, or book of aphorisms on "the Tao and virtue" ascribed to Lao Tsze, is wholly unlike such a composition as Deuteronomy; and the disciples of Confucius carefully refrained from attributing to him any kind of supernatural inspiration in his conversations about social and personal morality. The sacred literatures of India and Israel, however, present many analogies, and emerge out of a wide range of phenomena which have their roots in the practices of the lower culture. The belief that the Powers controlling man's life are willing upon occasion to disclose something of their purpose, has led to widespread rites of divination, which Plato described as the "art of fellowship between gods and men," and the Stoics defended on grounds of a priori religious expectation as well as of universal experience. Through the dream the living was put into communication with the dead, which sometimes embodied itself in peculiar and pathetic literary forms, such as the Icelandic dream-verses imparted by the spirits of those who had been lost at sea or overwhelmed by the snow; and a whole series of steps leads up from necromancy to prophecy and oracle, as the higher gods become the teachers of men. The gods of revelation are naturally not the highest, since they appear as the interpreters of one superior to themselves. The revealing agency may be only a voice like Aius Locutius, to which the Romans raised a temple; or, like Hermes, he may be the messenger of the gods; or, like Marduk, pre-eminently the god of oracles in Babylonia, he may be the son of Ea, the mighty deep encompassing the earth, source of all wisdom and culture. To Moslems the prophet-god Nebo in his turn became son, and his consort Tashmit ("listening to hear") was the personification of Revelation. Egyptian thought ascribed this function to Thoth, who played somewhat different parts in different systems, but emerges as the representative of the immanent intelligence

[3] *Ency. Brit.*, 9th ed., art. "Religions"; *Elements of the Science of Religion*, vol. i. (1897), with some corrections communicated by letter to Professor Chantepie de la Saussaye, *Religionsgesch.* (3rd ed., 1905), vol. i. p. 11.

[4] For a long series of suggested bases of classification see Raoul de la Grasserie, *Des Religions Comparées au Point de Vue Sociologique* (1899), chap. xii.; cf. further E. von Hartmann, *Religionsphilosophie* (1888); Siebeck, *Lehrbuch der Religionsphilosophie* (1893); Dorner, *Grundrisz der Religionsphilosophie* (1903). Siebeck proposed to distribute religions in three grades: (1) Nature-Religions, i.e. those of the lower culture; (2) Morality-Religions in various grades and stages, *e.g.* Mexicans and Peruvians, Arcadians, Chinese, Egyptians, Hindus, Persians, Germans, Romans, with the Greek religion in the highest rank; (3) Religions of Redemption (Judaism forming the transition from the second group), Buddhism in the sense of world-negation, and, positively, Christianity. Bousset, *What is Religion?* (1907) reckons Platonism along with Buddhism. For criticism of Siebeck's scheme see Tiele, *Elements of the Science of Religion*, vol. i. (1897), pp. 62, 65. Pfleiderer, *Religion and Historic Faiths* (1907), p. 88, recognizes more clearly the difficulty of carrying almost any division through the whole field, without frequent breach of historical connexions.

of the world, brother of Maāt and the giver of laws and culture to man.[1] Thoth "the thrice-great" passed into Hermes Trismegistus whom Christian fathers could recognize,[2] when the supremely beautiful figure of Greek theology, Apollo, had lost his dignity and ceased to be desired. Thoth was a voluminous author, and the collection of forty-two books which bore his name was a kind of primitive cyclopaedia of theology, astronomy, geography and physiology. Apollo proclaims at his birth that he will declare the counsel of Father Zeus to men.[3] But his utterances have been only casually preserved. A special literature of oracles did indeed arise; the divine words were collected and the circumstances which produced them were recorded; and had Delphi become in fact the centre of Greece, as Plato conceived it, here might have been the nucleus of a scripture. Theories of inspiration lurk behind the rich vocabulary of Greek prophecy; the seer is ἔνθεος, θεόληπτος, θεόπνευστος, θεοφόρητος, and Bakis and Musaeus give their names to sacred verses. The story of the Sibylline books in Rome, on the other hand, shows the growth of the idea of authority. They are deposited in a temple, in charge of a small sacred college; new deities and rites are introduced under their sanction; when they are accidentally destroyed, envoys are sent to the East and fresh collections are made; these are in their turn purged, the false are discarded and the true reverently preserved. By what method the books were consulted is not known; but they exhibit the idea of a sacred canon in process of formation. The theologians of India guarded their ancient hymns with the utmost care. A special literary apparatus was devised for their protection. The famous Purusha-hymn (*R.V.* x. 90) already claimed a divine origin for the three Vedas, the Rik, the Sāman and the Yajush. The "triple knowledge" was sometimes derived from the "Lord of Creatures" Prajāpati—one of the unifying forms of Brahmanical theology—through Vāc or "speech." The Veda, that is to say, had existed in the divine mind ere it was made known to men, and as such it belonged to the realm of the deathless and the infinite. The tribal poets were supposed to have "seen" the heavenly originals; elaborate arguments were devised to explain how the names of particular objects like rivers and mountains could have existed in the Eternal; while the grounds of belief in the infallibility of the sacred verses were enforced with the double weight of philosophy and tradition. Buddhism repudiated the authority of the Veda, but found it needful to supply its place; and the word of the omniscient Teacher, faithfully reported by his disciples and guaranteed by concurrent traditions, became the rule of belief for the new Order. Nor were the authors of the scriptures whose fragments are preserved in the Zend Avesta less conscious of their divine value. The ancient Gāthās, which were supposed to be the composition of Zarathustra himself, received the homage of later worshippers.[4] Daena, the ideal personification of law and religion, is the object of praise and sacrifice. She dwells on high in the Heavenly Home, the radiant "Abode of song," but Zarathustra summons her thence, begs for her fellowship, and prays her for righteousness of thought, speech and deed.[5] She is produced by Vohu Mano, the "Good Thought" of Ahura, one of the six Holy Immortals; she thus belongs to the ideal creation before the earth and its inhabitants;[6] but how the heavenly Daena was wrought by Zarathustra into written form is nowhere stated. This conception of pre-existent spiritual counterparts was not without influence on the later theology of Israel. The sacred law (Torah) was the earthly reproduction of a heavenly Torah which had no origin in time, and constituted the sum of ideal wisdom into which God looked when he would create the world.[7]

Even Mahommedanism felt the spell of the same modes of thought. The idea of revelation was expressed by "sending down" (from *nazala*, to descend); that which passed from heaven to earth was a pre-existent word, eternal as God Himself. Allusions in particular passages of the Koran to the "mother of the scripture," the invisible originals of the prophet's speech, led to the doctrine of its uncreated being. The whole history of religion presents perhaps no more singular spectacle than the mosques of Bagdad in the middle of the 9th century filled with vast crowds of twenty and thirty thousand of the faithful, assembled to discuss the dogmas of the created and the uncreated Koran.[8]

8. *Ethics and Eschatology.*—The second distinguishing mark in Tiele's higher group is implied in the term "Ethical." By this it is not intended to assert that moral ideas are wanting in the so-called "naturist" religions. Anthropologists have, it is true, taken widely different views of the relation of ethics and religion, and the stage at which an effective alliance between them might be recognized. Like all problems of origins, the question is necessarily extremely obscure, and cannot be definitely settled by historical evidence. Broadly speaking, however, it may be said that the attempt to show that certain savages are destitute of moral feeling cannot be sustained;[9] and evidence has been already cited above (in the section on PRIMITIVE RELIGION) proving the varied and immediate effects of religion on the life of the lowest tribes. Continuous interaction marks the slow courses of advance. At a very early period in social development the rules of conduct are referred to some higher source. Thus among the tribes of south-eastern Australia described by Mr Howitt,[10] the native rites and laws handed down from generation to generation were supposed to have been first imparted by some higher being such as Nurrundere, who made all things on the earth; or Nurelli, who created the whole country, with the rivers, trees and animals; or Daramulun, who (like Nurrundere) bestowed weapons on the men, and instituted the rites and ceremonies connected with life and death. As religion advances with improved social organization, a series of figures, partly human, partly divine, embodies the idea that the command of nature implied in the progress of the arts is due to some kind of instruction from above, and that the obligations of law are of more than human origin. The Algonquin Manibozho and Quetzalcoatl of Mexico stand for a whole group of typical personalities in North and Central America. The mysterious fish-man Oannes, who taught the primitive inhabitants of Babylonia, according to Alexander Polyhistor, has been identified with Ea, god of the deep, the source of wisdom, culture and social order. Zeus gave laws to Minos; Apollo revealed the Spartan constitution to Lycurgus; Zaleucus received the laws for the Locrians from Athena in a dream; Vishnu and Manu condescended to draw up law-books in India. The worship of ancestors has again and again gathered around it powerful and ethical influences, emphasizing the parental and filial relations, and strengthening the mutual obligations of communal life. Hirata answered by anticipation the modern reproach against Shinto as founded on the absence of any definite morality connected with it, by laying down the simple rule: "Act so that you need not be ashamed before the Kami of the unseen."[11] The mythological embodiments of the connexion of law in nature with the social and moral order have already been briefly noted: a few words may be said in conclusion on another product of the union of religion and ethics, viz. the doctrine of judgment after death. That this doctrine is not essential to a highly moralized religion is clear from the fact that it formed no part of the earlier Hebrew prophecy. Judgment, indeed, was an inevitable outcome of the sovereignty of Yahweh, but it would be passed upon the nation in the immediate scene of its misdoings; and even when the scope of the divine doom

was extended to include the nations of the world, it was still upon the living that it would alight. The seers of Israel were content to dismiss their dead to a land of silence and darkness, the vast hollow gloom of the subterranean Sheol.[1] A far ruder outlook on life, however, which has again and again appealed to some form of the divine cognizance by means of the ordeal and the oath, frequently supplements the moral issues of this world by the judicial award of the next. Assuming the proper fulfilment of the ritual of death, ethics gradually extends its control over the future. At first the social distinctions of this life are simply continued hereafter: the chief remains a chief, the slave a slave; and the conditions of the future only prolong those of the present. In so far as tribal eminence depends on superior skill or courage or wisdom, the germs of ethical differentiation may be discovered even here. Evil becomes a certain further (1) in individual cases of retribution, when (as among the Kaupuis) crime within the tribe was punished, and a murderer becomes in the next life his victim's slave;[2] or (2) when service to the community received special reward, and warriors who had fallen in battle, women who had died in childbirth and merchants who had perished on a journey were sent in Mexico to the house of the sun.[3] As the social order acquires more definiteness and stability, the control of life by the gods tends to become more clearly moralized. This brings with it new standards independent of clan-customs or tribe-usage. Only the worst offences, however, at first draw down post-mortem punishment. The Celtic Jerseyes chastise outrages on the poor, injuries to guests, failure to show the respect due to parents or to recognize the rights of age, in this life; only on perjury does the divine doom extend to the next.[4] On the other hand, the Egyptian version of "the whole duty of man" in the famous 125th chapter of the *Book of the Dead* embraces a singular complex of ritual, social and personal sins, in which the inward states of lying, anger and ill-will are condemned along with murder, theft and adultery, beside violation of the times of offerings to the gods, or interference with the food of the blessed dead. The great judgment of Osiris formulates with the utmost precision the alliance between morals and religion. The doctrine established itself in Greek theology under the influence of Orphism, and supplied Plato with mythic forms for his "criticism of life." In India the union of morality and religion was effected in another manner. True, Yama, first of men to enter the world beyond, became the "King of Righteousness" before whose tribunal the dead must appear. But a new agency began to engage the speculations of thinkers, the moral values of action embodied in the Deed. "The deed does not perish," ran an early formula.[5] "A man is born into the world that he has made," said another:[6] and what was laid down first as a ritual principle survived as an ethical. Buddhism conceived men as constantly making their own world for good and ill; it took over from Brahmanism a whole series of heavens and hells to provide an exact adjustment in the future for the virtue or vice of the present; and its eschatologic confidence was one of the potent instruments of its success in countries which, like China and Japan, had developed no theories of retribution or reward beyond the grave. Along a different line of thought the Iranian teachers, beholding the world divided between hostile powers, demanded, as the fundamental postulate of religion, the victory of the good. The conflict must end with the triumph of light, truth and right. The details of this remarkable scheme must be studied elsewhere (see ZOROASTER). The award of the angel-judges at the Bridge of Assembly, soon after death, despatched the individual to his appropriate lot in the homes of Good or Evil Thought, Word and Deed. But at length the long struggle would draw to an end. The great "divine event," the *frasho-kereti*, the renovation, would set in. A new heaven and a new earth would be created: a general resurrection should take place; the powers of evil should be overthrown and extinguished; and hell should be brought back for the enlargement of the world. Eschatology has again and again expressed the alliance between ethics and religion. It remains for the future to show how long that alliance will require its support.

BIBLIOGRAPHY.—(For primitive religion see preceding section.) Only a selection of the copious and ever-increasing literature can here be named. Monographs on the scparate religions are named in their respective articles.

Much information on the growth and present condition of the study has been collected by Jordan, *Comparative Religion, its Genesis and Growth* (Edinburgh, 1905, &c.).

REMAGEN, a town of Germany, in the Prussian Rhine Province, on the left bank of the Rhine, 12 m. above Bonn, by the railway from Cologne to Coblenz, and at the junction of the Ahr valley railway to Adenau. Pop. (1900) 3534. The (Roman Catholic) parish church is remarkable for a gate (Römertor) with grotesque sculptures of animals, dating from the 12th century. Archaeologists have variously interpreted its original purpose, whether as church door, city gate or palace gate. The industry of the place is almost wholly concerned with the preparation of wine, in which a large export trade is done. Just below the town, on a height overlooking the Rhine, stands the Apollinaris church, built 1839–53 on the site of a chapel formerly dedicated to St Martin, and containing the relics of St Apollinaris. It is a favourite resort of pilgrimage from all parts of the lower Rhine. According to legend, the ship conveying the relics of the three kings and of Bishop Apollinaris from Milan to Cologne in 1164 could not be got to move away from the spot until the bones of St Apollinaris had been interred in St Martin's chapel.

Remagen (the *Rigomagus* of the Romans) originally belonged to the duchy of Jülich. Many Roman antiquities have been discovered here. In 1857 a votive altar dedicated to Jupiter, Mars and Mercury was unearthed, and is now in the Provincial Museum at Bonn.

See Kinkel, *Der Führer durch das Ahrthal nebst Beschreibung der Stadt Remagen* (and ed., Bonn, 1854).

REMAINDER, REVERSION. In the view of English law a remainder or reversion is classed either as an incorporeal hereditament or, with greater correctness, as an estate in expectancy. That is to say, it is a present interest subject to an existing estate in possession called the particular estate, which must determine before the estate in expectancy can become an estate in possession. A remainder or reversion is in strictness confined to real estate, whether legal or equitable, though a similar interest may exist in personalty. The particular estate and the remainder or reversion together make up the whole estate over which the grantor has power of disposition.[1] Accordingly a remainder or reversion limited on an estate in fee simple is void. The difference between a remainder and a reversion, stated as simply as possible, is that the latter is that undisposed-of part of the estate which after the determination of the particular estate will fall into the possession of the original grantor or his representative, while a remainder is that part of the estate which under the same circumstances will fall into the possession of a person other than the original grantor or his representative. A reversion, in fact, is a special instance of a remainder, distinguishable from it in two important respects: (1) a reversion arises by operation of law on every grant of an estate where the whole interest is not parted with, whereas a remainder is created by express words; (2) tenure exists between the reversioner and the tenant of the particular estate, but not between the latter and the remainderman. Accordingly rent service is said to be an incident of a reversion but not of a remainder, and a reversioner could distrain for it at common law. A reversion may be limited upon any number of remainders, each of them as it falls into possession becoming itself a particular estate. A remainder or reversion may be alienated either by deed or by will. A conveyance by the tenant of a particular estate to the remainderman or reversioner is called a surrender; a conveyance by the remainderman or reversioner to the tenant is a release.

Remainder.—Remainders are either vested or contingent. "An estate is vested in interest when there is a present fixed right of future enjoyment. An estate is contingent when a right of enjoyment is to accrue on an event which is distant and uncertain." A contingent remainder is a remainder limited so as to depend on an event or condition which may never happen or be performed, or which may not happen or be performed till after the determination of the particular estate, for example, a remainder to A after B's death. Contingent remainders are of two kinds, those limited to uncertain persons and those limited on uncertain events. A grant by A to B for life, followed by a remainder in fee to the heir of C is an example of a remainder limited to a person who is at the time of the gift not his heir. If C die during the lifetime of B, the contingent remainder of his heir becomes vested; if C survive B, the remainder is at common law destroyed owing to the determination of the particular estate, for every remainder must have a particular estate to support it. In the case of a contingent remainder, it must become vested during the continuance of the particular estate or at the instant of its determination. This rule of law no doubt arose from the inconvenience which the law to contingent remainders on their first introduction. They were not firmly established even when Littleton wrote in the reign of Edward IV. (see Williams, *Real Property*). The inconveniences resulting from this liability of contingent remainders to destruction were to a great extent by the device of appointing trustees to preserve contingent remainders at law. Equitable contingent remainders, it should be noticed, were indestructible, for they were supported by the legal estate. In modern times the matter has been settled by act of Parliament. By the Real Property Act 1845, § 8, a contingent remainder is rendered capable of taking effect notwithstanding the determination by forfeiture, surrender or merger of any preceding estate of freehold in the same lands or tenements by such determination had not happened. The case of determination by any other means is met by the Contingent Remainders Act 1877. The act provides that a contingent remainder which would have been valid as a springing or shifting use or executory devise or other limitation had it not had a sufficient estate to support it as a contingent remainder is, in the event of the particular estate determining before the contingent remainder becomes vested, to be capable of taking effect as though the contingent remainder had originally been created as springing or shifting use or executory devise or other executory limitation. It will accordingly only be good if the springing use, &c. (for which see Tudor), would be good. If the springing use be void as a breach of the rule against perpetuities (see PERPETUITY), the remainder will likewise be void. Apart from this act, there is some uncertainty as to the application of the rule against perpetuities to remainders. The better opinion is that it applies to executable remainders and to legal remainders expectant upon an estate for life limited to an unborn person. In the latter case the rule as applied to contingent remainders is somewhat different from that affecting executory interests. The period is different, the remainder allowing the tying up of property for a longer time than the executory interest. There is also the further difference that the rule does not affect a contingent remainder if it become vested before the determination of the particular estate. An executory interest is void if it may transgress the rule, even though it do not actually do so. For the rule in Shelley's case, important in connexion with remainders, see that title.

The state laws of the United States affecting remainders will be found in Washburn, *Real Property*, ii. bk. ii. As a general rule contingent remainders have been rendered of little practical importance by enactments that they shall take effect as executory devises or shall not determine on determination of the particular estate.

Reversion.—Unlike remainders, all reversions are present or vested estates. The law of reversion, like that of remainder, has been considerably modified by statute. It was formerly considered

[1] Compare the life-rent and fee of Scots law.

[3] A contingent remainder amounting to a freehold cannot be limited on a particular estate less than a freehold.

that on the grant of the reversion the tenant should have the opportunity of objecting to the substitution of a new landlord. It was therefore necessary that he should attorn tenant to the purchaser. Without such attornment the grant was void, unless indeed attornment were compelled by levying a fine. The necessity of attornment was abolished by 4 & 5 Anne c. 16. Its only use at present seems to be in the case of mortgage. A mortgagor in possession sometimes attorns tenant to the mortgagee in order that the latter may count him as his tenant and distrain for his interest as rent. The legal view that rent was incident to the reversion led at common law to a destruction of the rent by destruction of the reversion. This would chiefly happen in the case of an under-tenant and his immediate reversioner, if the intermediate became merged in the superior reversion. To obviate this difficulty it was provided by the Real Property Act 1845, § 9, that, on surrender or merger of a reversion expectant on a lease, the rights under it should attach to the reversion conferring the next vested right. The question as to what covenants run with the reversion is one of the most difficult in law. The rule of common law seems to have been that covenants ran with the land but not with the reversion, that is to say, the benefit of them survived to a new tenant but not to a new landlord. The effect of the act of 32 Hen. VIII. c. 34, and of the Conveyancing Act 1881, has been to annex to the reversion as a general rule the benefit of the rent and the lessee's covenants and the burden of the lessor's covenant. Merely collateral covenants, however, do not run with the reversion, but are regarded as personal contracts between lessor and lessee. At common law on the conveyance by a reversioner a grantee in part of the reversion could not take advantage of any condition for re-entry, on the ground that the condition was entire and not severable. This doctrine was abolished by one of Lord St Leonard's Acts in 1859. The Conveyancing Act 1881, § 12, now provides in wider terms than those of the act of 1859 that on severance of the reversion every condition capable of apportionment is to be apportioned. In order to guard against fraudulent concealment of the death of a *cestuy que vie*, or person for whose life any land is held by another, it was provided by 6 Anne c. 18 that on application to the court of chancery by the person entitled in remainder, reversion or expectancy, the *cestui que vie* should be produced to the court or its commissioners, or in default should be taken to be dead. In Scotland reversion is generally used in a sense approaching that of the equity of redemption of English law. A reversion is either legal, as in an adjudication, or conventional, as in a wadset. Reversions are registered under the system established by the Act 1617 c. 16.

In the United States the act of 32 Hen. VIII. c. 34 "is held to be in force in Massachusetts, Pennsylvania, Illinois, and Connecticut, but was never in force in New York till re-enacted" (Washburn, *Real Property*, i.).

REMAND (Lat. *remandare*), a term of English law meaning the return of a prisoner by order of a court to the custody from which he came to the court. Thus where an application for release is unsuccessfully made by means of *habeas corpus*, the applicant is remanded to the custody which he has challenged as illegal. Where trials or indictments are not concluded at a single sitting the court of trial has power to remand the accused into proper custody during any necessary adjournment. Where a preliminary inquiry into an indictable offence is not completed at a single sitting, the prisoner, if not released on bail, may be remanded to prison or some other lawful place of custody for a period not exceeding eight days, and so on by further remands till the inquiry is completed and the accused is discharged, or committed to prison to await his trial, or released on bail to take his trial. If the remand is for more than three days the order must be in writing (Indictable Offences Act 1848, 11 & 12 Vict. c. 42, s. 21). Similar powers of remand or committal to prison during adjournments are given to justices in the exercise of their summary criminal jurisdiction, whether as to offences punishable only on summary conviction, or as to indictable offences with which it is proposed to deal summarily (Summary Jurisdiction Acts 1848, s. 16, and 1879, s. 24).

In the case of charges against children or young persons, where the justices commit for trial or order a remand pending inquiry, or with a view to sending a child to an industrial school or a reformatory, they may remand to the workhouse or to some fit custody instead of remanding to prison (Youthful Offenders Act 1901, s. 4). For this purpose remand homes have been established.

REMBRANDT (1606–1669). REMBRANDT HARMENS VAN RIJN, Dutch painter, was born in Leiden on the 15th of July 1606. It is only within the past fifty years that we have come to know anything of his real history. A tissue of fables formerly represented him as ignorant, boorish and avaricious. These fictions, resting on the loose assertions of Houbraken (*De Groote Schouburgh*, 1718), have been cleared away by the untiring researches of Scheltema and other Dutchmen, notably by C. Vosmaer, whose elaborate work (*Rembrandt, sa vie et ses œuvres*, 1868, 2nd ed., 1877) is the basis of our knowledge of the man and of the chronological development of the artist.[1] Rembrandt's high position in European art rests on the originality of his mind, the power of his imagination, his profound sympathy with his subjects, the boldness of his system of light and shade, the thoroughness of his modelling, his subtle colour, and above all on his intense humanity. He was great in conception and in execution, a poet as well as a painter, an idealist and also a realist; and this rare union is the secret of his power. From his dramatic action and mastery of expression Rembrandt has been well called "the Shakespeare of Holland."

In the beginning of the 17th century Holland had entered on her grand career of national enterprise. Science and literature flourished in her universities, poetry and the stage were favoured by her citizens, and art found a home not only in the capital but in the provincial towns. It was a time also of new ideas. Old conventional forms in religion, philosophy and art had fallen away, and liberty was inspiring new conceptions. There were no church influences at work to fetter the painter in the choice and treatment of his subject, no academies to prescribe rules. Left to himself, each painter painted what he saw of the people among whom he lived and the subjects which interested them. It was thus a living history that he painted—scenes from the everyday life and amusements of the people, as well as the civic rulers, the "regents" or governors of the hospitals and the heads of the guilds, and the civic guards who defended their towns. So also with religious pictures. The dogmas and legends of the Church of Rome were no longer of interest to such a nation; but the Bible was read and studied with avidity, and from its page the artist drew directly the scenes of the simple narrative. Perhaps the earliest trace of this new aspect of Bible story is to be found in the pictures painted in Rome about the beginning of the 17th century by Adam Elsheimer of Frankfort, who had undoubtedly a great influence on the Dutch painters studying in Italy. These in their turn carried back to Holland the simplicity and the picturesque effect which they found in Elsheimer's work. Among these, the precursors of Rembrandt, may be mentioned Moeyaert, Ravesteyn, Lastman, Pinas, Honthorst and Bramer. Influenced doubtless by these painters, Rembrandt determined to work out his own ideas of art on Dutch soil, resisting apparently every inducement to visit Italy. Though an admirer of the great Italian masters, he yet maintained his own individuality.

Rembrandt was born at No. 3 Weddesteg, on the rampart at Leiden overlooking the Rhine. He was the fourth son of Gerrit Harmens van Rijn, a well-to-do miller. As the older boys had been sent to trade, his parents resolved that he should enter a learned profession. With this view he was sent to the High School at Leiden; but the boy soon manifested his dislike of the prospect, and determined to be a painter. Accordingly he was placed for three years under Swanenburch, a painter of no great merit, who enjoyed some reputation from his having studied in Italy. His next master was Lastman of Amsterdam, a painter of very considerable power. In Lastman's works we can trace the germs of the colour and sentiment of his greater pupil, though his direct influence cannot have been great, as it is said by Orlers that Rembrandt remained with him only six months, after which time he returned to Leiden, about 1623. During the early years of his life at Leiden Rembrandt seems to have devoted himself entirely to studies, painting and etching the people around him, the beggars and cripples, every picturesque face and form he could get hold of. Life, character,

[1] Vosmaer's first volume, on the precursors and apprenticeship of Rembrandt, was published in 1863. New light has since been thrown on important points by Dr Bode (*Hollandische Malerei*, 1883). De Roever, De Vries and others.

and above all light were the aims of these studies. His mother was a frequent model, and we can trace in her features the strong likeness to her son, especially in the portraits of himself at an advanced age. In the collection of Rembrandt's works at Amsterdam in 1898 were shown three portraits of his father, who died about 1632; nine are catalogued altogether. The last portrait of his mother is that of the Vienna Museum, painted the year before her death in 1640. One of his sisters also frequently sat to him, and Bode suggests that she must have accompanied him to Amsterdam and kept house for him till he married. This conjecture rests on the number of portraits of the same young woman painted in the early years of his stay in Amsterdam and before he met his bride. Then, again, in the many portraits of himself painted in his early life we can see with what zeal he set himself to master every form of expression, now grave, now gay—how thoroughly he learned to model the human face not from the outside but from the inner man. Dr Bode gives fifty as the number of the portraits of himself (perhaps sixty is nearer the actual number), most of them painted in youth and in old age, the times when he had leisure for such work.

Rembrandt's earliest pictures were painted at Leiden, from 1627 to 1631. Bode mentions about nine pictures as known to belong to these years, chiefly paintings of single figures, as "St Paul in Prison" and "St Jerome"; but now and then compositions of several, as "Samson in Prison" and "Presentation in the Temple." The prevailing tone of all these pictures is a greenish grey, the effect being somewhat cold and heavy. The gallery at Cassel gives us a typical example of his studies of the heads of old men, firm and hard in workmanship and full of detail, the effects of light and shade being carefully thought out. His work was now attracting the attention of lovers of art in the great city of Amsterdam; and, urged by their calls, he removed about 1631 to live and die there. At one bound he leaped into the position of the first portrait painter of the city, and received numerous commissions. During the early years of his residence there are at least forty known portraits from his hand, firm and solid in manner and staid in expression. It has been remarked that the fantasy in which he indulged through life was reserved only for the portraits of himself and his immediate connexions. The excellent painter Thomas de Keyser was then in the height of his power, and his influence is to be traced in some of Rembrandt's early portraits. Pupils also now flocked to his house in the Bloemgracht, among them Gerard Douw, who was nearly of his own age. The first important work executed by Rembrandt in Amsterdam is "Simeon in the Temple," of the Hague Museum, a fine early example of his treatment of light and shade and of his subtle colour. The concentrated light falls on the principal figure, while the background is full of mystery. The surface is smooth and enamel-like, and all the details are carefully wrought out, while the action of light on the mantle of Simeon shows how soon he had felt the magical effect of the play of colour. In the life-sized "Lesson in Anatomy" of 1632 we have the first of the great portrait subjects—Tulp the anatomist, the early friend of Rembrandt, discoursing to his seven associates, who are marked with eager heads in the foreshortened row. The subject had been treated in former years by the Mierevelts, A. Pietersen and others, for the Hall of the Surgeons. But it was reserved for Rembrandt to make it a great picture by the grouping of the expressive portraits and by the completeness of the conception. The colour is quiet and the handling of the brush timid and precise, while the light and shade are somewhat harsh and abrupt. But it is a marvellous picture for a young man of twenty-five, and it is generally accepted as marking a new departure in the career of the painter.

About 700 pictures are known to have come from Rembrandt's own hand. It is impossible to notice more than the prominent works. Besides the Pellicorne family portraits of 1632 now in the Wallace Collection, we have the caligraphist Coppenol of the Cassel Gallery, interesting in the first place as an early example of Rembrandt's method of giving permanent interest to a portrait by converting it into a picture. He invests it with a sense of life by a momentary expression as Coppenol raises his head towards the spectator while he is mending a quill. The same motive is to be found in the "Shipbuilder," 1633 (Buckingham Palace), who looks up from his work with a sense of interruption at the approach of his wife. Coppenol was painted thrice and etched twice by the artist, the last of whose portrait etchings (1661) was *the* Coppenol of large size. The two small pictures of "The Philosopher" of the Louvre date from 1633, delicate in execution and full of mysterious effect.

The year 1634 is especially remarkable as that of Rembrandt's marriage with Saskia van Uylenborch, a beautiful, fair-haired Frisian maiden of good connexions. Till her death in 1642 she was the centre of his life and art, and lives for us in many a canvas as well as in her own portraits. On her the painter lavished his magical power, painting her as the Queen Artemisia or Bathsheba, and as the wife of Samson—always proud of her long fair locks, and covering her with pearls and gold as precious in their play of colour as those of the Indies. A joyous pair we see them in the Dresden Gallery, Saskia sitting on his knee while he laughs gaily, or promenading together in a fine picture of 1636, or putting the last touches of ornament to her toilette, for thus Bode interprets the so-called "Burgomaster Pancras and his Wife." These were his happy days when he painted himself in his exuberant fantasy, and adorned himself, at least in his portraits, in scarfs and feathers and gold chains. Saskia brought him a marriage portion of forty thousand guilders, a large sum for those times, and she brought him also a large circle of good friends in Amsterdam. She bore him four children, Rumbartus and two girls, successively named Cornelia after his beloved mother, all of whom died in infancy, and Titus, named after Titia a sister of Saskia. We have several noble portraits of Saskia, a good type of the beauty of Holland, all painted with the utmost love and care, at Cassel (1633), at Dresden (1641), and a posthumous one (1643) at Berlin. But the greatest in workmanship and most pathetic in expression seems to us, though it is decried by Bode, that of Antwerp (1641), in which it is impossible not to trace declining health and to find a melancholy presage of her death.

One of Rembrandt's greatest portraits of 1634 is the superb full-length of Martin Daey, which, with that of Madame Daey, painted according to Vosmaer some years later, formed one of the ornaments of the Van Loon collection at Amsterdam. Both now belong to Baron Gustave de Rothschild. From the very detailed execution of this portrait one turns in wonder to the broader handling of the "Old Woman" (Françoise van Wasserhoven), aged eighty-three, in the National Gallery, of the same year, remarkable for the effect of refined light and still more for the sympathetic rendering of character.

The life of Samson supplied many subjects in these early days. The so-called "Count of Gueldres threatening his Father-in-law" of the Berlin Gallery has been restored to its artistic significance by M. Kolloff, who finds it to be Samson. It is forced and violent in its action. The greatest of this series, and one of the prominent pictures of Rembrandt's work, is the "Marriage of Samson," of the Dresden Gallery, painted in 1638. Here Rembrandt gives the rein to his imagination and makes the scene live before us. Except the bride (Saskia), who sits calm and grand on a dais in the centre of the feast, with the full light again playing on her flowing locks and wealth of jewels, all is animated and full of bustle. Samson, evidently a Rembrandt of fantasy, leans over a chair propounding his riddle to the Philistine lords. In execution it is a great advance on former subject pictures; it is bolder in manner, and we have here signs of his approaching love of warmer tones of red and yellow.

The story of Susannah also occupied him in these early years, and he returned to the subject in 1641 and 1653. "The Bather" of the National Gallery is another and later treatment of the same theme. In all of these pictures the woman is coarse in type and lumpy in form, though the modelling is soft and round, the effect which Rembrandt always strove to gain. Beauty of form was outside his art. But the picture of 1636 at Petersburg is a sufficient reply to those who deny his ability ever to appreciate the beauty of the nude female form. It glows with colour and life, and the blood seems to pulsate under the warm skin. In the picturesque story of Tobit Rembrandt found much to interest him, as we see in the beautiful small picture of the d'Arenberg Collection at Brussels. Sight is being restored to the aged Tobias, while with infinite tenderness his wife holds the old man's hand caressingly. The sympathetic treatment is complete. The picture goes straight to the heart. In the Berlin Gallery he paints the anxiety of the parents as they wait the return of their son. In 1637 he painted the fine picture now in the Louvre of the "Flight of the Angel"; and the same subject is grandly treated by him.

apparently about 1645, in the picture exhibited in the winter exhibition at Burlington House in 1885. Reverence and awe are shown in every attitude of the Tobit family. A similar lofty treatment is to be found in the "Christ as the Gardener," appearing to Mary, of 1638 (Buckingham Palace).

We have now arrived at the year 1640, the threshold of his second manner, which extended to 1654, the middle age of Rembrandt. During the latter part of the previous decade we find the shadows more transparent and the blending of light and shade more perfect. There is a growing power in every part of his art. The coldness of his first manner had disappeared, and the tones were gradually changing into golden-brown. He had passed through what Bode calls his "Sturm-und-Drang" period of exaggerated expression, as in the Berlin Samson, and had attained to a truer, calmer form of dramatic expression, of which the "Manoah" of Dresden is a good example (1641). The portraits painted "to order" became more rare about this time, and those which we have are chiefly friends of his circle, such as the "Mennonite Preacher" (C. C. Ansloo) and the "Gilder," a fine example of his golden tone, formerly in the Morny collection and now in America. His own splendid portrait (1640) in the National Gallery illustrates the change in his work. It describes the man well—strong and robust, with powerful head, firm and compressed lips and determined chin, with heavy eyebrows, separated by a deep vertical furrow, and with eyes of keen penetrating glance—altogether a self-reliant man that would carry out his own ideas, careless whether his popularity waxed or waned. The fantastic rendering of himself has disappeared; he seems more conscious of his dignity and position. He has now many friends and pupils, and numerous commissions, even from the stadtholder; he has bought a large house in the Breedstraat, in which during the next sixteen years of his life he gathers his large collection of paintings, engravings, armour and costume which figure afterwards in his inventory. His taste was wide and his purchases large, for he was now owner with picture-dealers of paintings by Giorgione and Palma Vecchio, while for a high-priced Marcantonio Raimondi print he gave in exchange a fine impression of his "Christ Healing the Sick," which has since been known as the "Hundred Guilder Print." The stadtholder was not a prompt payer, and an interesting correspondence took place between Rembrandt and Constantin Huygens, the poet and secretary of the prince. The Rembrandt letters which have come down to us are few, and these are therefore of importance. Rembrandt puts a high value on the picture, which he says had been painted "with much care and zeal," but he is willing to take what the prince thinks proper; while to Huygens he sends a large picture as a present for his trouble in carrying through the business. There is here no sign of the grasping greed with which he has been charged, while his unselfish conduct is seen in the settlement of the family affairs at the death of his mother in 1640.

The year 1642 is remarkable for the great picture formerly known as the "Night Watch," but now more correctly as the "Sortie of the Banning Cock Company," another of the landmarks of Rembrandt's career, in which twenty-nine life-sized civic guards are introduced issuing pell-mell from their club house. Such gilds of arquebusiers had been painted admirably before by Backereys and notably by Frans Hals, but Rembrandt determined to throw life and animation into the scene, which is full of bustle and movement. The dominant colour is the citron yellow uniform of the lieutenant, wearing a black sash, while a brilliant red uniform of a musketeer, the black velvet dress of the captain, and the varied green of the girl and drummer, all produce a rich and harmonious effect. The background has become dark and heavy by acid-bit or needle, and the sunbeam on whit hands and arms are perfect. It scarcely to be seen. It is to be observed that, as proved by the copy by Gerrit Lundens in the National Gallery, it represents not a "night watch," except in name, but a day watch.

But this year of great achievement was also the year of his great loss, for Saskia died in 1642, leaving Rembrandt her sole trustee for her son Titus, but with full use of the money till he should marry again or till the marriage of Titus. The words of the will express her love for her husband, and her confidence in him. With her death his life was changed. Bode has remarked that there is a pathetic sadness in his pictures of the Holy Family—a favourite subject at this period of his life. All of these he treats with the naïve simplicity of Reformed Holland, giving us the real carpenter's shop and the mother watching over the Infant reverently and lovingly, with a fine union of realism and idealism.

The street in which he lived was full of Dutch and Portuguese Jews, and many a Jewish rabbi sat to him. He accepted or invented their turbans and local dress as accessories of the people. But in his religious pictures it is not the costume we look at; what strikes us is the profound perception of the sentiment of the story, making them true to all time and independent of local circumstance. The "Tobit" is an example of this feeling is to be found in the "Woman Taken in Adultery" of the National Gallery, painted in 1644 in the manner of the "Simeon" of the Hague. Beyond the ordinary actions of art, it commands our attention from the grand conception of the painter who here, as in other pictures and etchings, has invested Christ with a majestic dignity which recalls Lionardo and no other. A similar lofty ideal is to be found in his various renderings of the "Pilgrims at Emmaus," notably in the Louvre picture of 1648, in which, as Mrs Jameson says, "he contrives to show the spiritual principles which were always the dowry of ancient art." From the same year we have the "Good Samaritan" of the Louvre, the story of which is told with intense pathos. The helpless suffering of the wounded man, the curiosity of the boy on tiptoe, the excited faces at the upper window, are all conveyed with masterly skill. In these last two pictures we find a broader touch and freer handling, while the tones pass into a dull yellow and brown with a marked predilection for deep rich red. Whether it was that this scheme of colour found no favour with the Amsterdamers, who, as Hoogstraten tells us, could not understand the "Sortie," it seems certain that Rembrandt was not invited to take any leading part in the celebration of the congress of Westphalia (1648).

Rembrandt touched no side of art without setting his mark on it, whether in still life, as in his dead birds or the "Slaughtered Ox" of the Louvre (with its repetition in Glasgow and Budapest), or in his drawings of elephants and lions, all of which are instinct with life. But at this period of his career we come upon a branch of his art on which he left, both in etching and in painting, the stamp of his genius, viz. landscape. Rodolphi Kaphman, but ten years his senior, evidently influenced his style, for the resemblance between their works is so great that, as at Cassel, there has been confusion of authorship. Hercules Seghers also was much appreciated by Rembrandt, for at his sale eight pictures by this master figure in the inventory, and Vosmaer discovered that Rembrandt had worked on a plate by Seghers and had added figures to an etched "Flight into Egypt." The earliest pure landscape known to us from Rembrandt's hand is that at Dresden (1638), which is very unlike in the latter year by those at Brunswick, Cracow and Boston (U.S.A.), and that dated 1638 and belonging to Mr G. Rath in Budapest. Better known is the "Winter Scene" of Cassel (1646), silvery and delicate. As a rule in his painted landscapes he aims at a grandeur and poetical effect, as in the "Repose of the Holy Family" of 1647 (formerly called the "Gipsies"), a moonlight effect, clear even in the shadows. The "Canal" of Lord Lansdowne, and the "Mountain Landscape with Approaching Storm," with sun shining out behind the heavy clouds, are both conceived and executed in this spirit. A similar poetical vein runs through the "Castle on the Hill" of Cassel, in which the beams of the setting sun strike on the castle while the valley is sunk in the shades of approaching night. More powerful still is the weird effect of Lord Lansdowne's "Windmill," with its glow of light and darkening shadows. In all these pictures light with its magical influences is the theme of the poet-painter. From his inventory of landscapes he himself in the inventory of his sale, it would appear that these grand works were not appreciated by his contemporaries. The last of the landscape series dates from 1655 or 1656, the close of the middle age or manhood of Rembrandt, a period of splendid power. In the "Joseph Accused by Potiphar's Wife" of 1654 we have great dramatic vigour and perfect mastery of expression, while the brilliant colour and perfect effect of light and shade attest his strength. To this period also belongs the great portrait he himself in the Fitzwilliam Museum at Cambridge.

But evil days were at hand. The long-continued wars and civil troubles had worn out the country, and money was scarce. Rembrandt's and doubtless Saskia's means were tied up in his house and in his large collection of valuable pictures, and we find Rembrandt borrowing considerable sums of money on the security of his house to keep things going. Perhaps, as Bode suggests, this was the reason of his extraordinary activity at this time. Then, unfortunately, in this year of 1654, we find Rembrandt involved in the scandal of having a child by his servant Hendrickje Jaghers or Stoffels, as appears by the books of the Reformed Church at Amsterdam. He recognized the child and gave it the name of Cornelia, after his much-loved mother, but there is no proof that he married the mother, and the probability is against such a marriage, as the provisions of Saskia's will would in that case have come into force, and her fortune would have passed at once to her son Titus. Hendrickje seems to have continued

to live with him, for we find her claiming a chest as her property at his sale in 1658. Doubtless she is the peasant girl of Rasdorf to whom Houbraken says Rembrandt was married. Sad as the story is, Hendrickje has an interest for us. Bode asserts that in his art there was always a woman in close relationship to Rembrandt and appearing in his work—his mother, his sister and then Saskia.

He also suggests that the beautiful portrait of the "Lady" in the Salon Carré of the Louvre and the "Venus and Cupid" of the same gallery may represent Hendrickje and her child. Both pictures belong to this date, and by their treatment are removed from the category of Rembrandt's usual portraits. But if this is conjecture, we get nearer to fact when we look at the picture exhibited at Burlington House in 1883 to which tradition has attached the name of "Rembrandt's Mistress," now in the Edinburgh National Gallery. At a glance one can see that it is not the mere head of a model, as she lies in bed raising herself to put aside a curtain as if she heard a well-known footstep. It is clearly a woman in whom Rembrandt had a personal interest. The date is clearly 165— the fourth figure being illegible; but the brilliant carnations and masterly touch connect it with the "Potiphar's Wife" of 1654 and the Jaghers period. In 1656 Rembrandt's financial affairs became more involved, and the Orphans' Chamber transferred the house and ground to Titus, though Rembrandt was still allowed to take charge of Saskia's estate. Nothing, however, could avert the ruin of the painter, who was declared bankrupt in July 1656, an inventory of all his property being ordered by the Insolvency Chamber. The first sale took place in 1657 in the Keizerskroon hotel; and the second in 1658, when the larger part of the etchings and drawings were disposed of—"collected by Rembrandt himself with much love and care," says the catalogue. The sum realized, under 5000 guilders, was but a fraction of their value. The time was unfavourable over the whole of Europe for such sales, the renowned collection of Charles I. of England having brought but a comparatively small sum in 1653. Driven thus from his house, stripped of everything he possessed, even to his table linen, Rembrandt took a modest lodging in the same Keizerskroon hostelry (the amounts of his bills are on record), apparently without friends and thrown entirely on himself.

But this dark year of 1656 stands out prominently as one in which some of his greatest works were produced, as, for example, "John the Baptist preaching in the Wilderness," in the Berlin Gallery, and "Jacob blessing the Sons of Joseph," of the Cassel Gallery. It is impossible not to respect the man who, amid the utter ruin of his affairs, could calmly conceive and carry out such noble work. Yet even in his art one can see that the tone of his mind was sombre. Instead of the brilliancy of 1654 we have for two or three years a preference for dull yellows, reds and greys, with a certain uniformity of tone. The handling is broad and rapid, as if to give utterance to the ideas which crowded his mind. There is less caressing of colour for its own sake, even less straining after vigorous effect of light and shade. Still the two pictures just named are among the greatest works of the master. To the same year belongs the "Lesson in Anatomy of Johann Deyman." The subject is similar to the great Tulp of 1632, but his manner and power of colour had advanced so much that Sir Joshua Reynolds, in his visit to Holland in 1781, was reminded by it of Michelangelo and Titian. Vosmaer ascribes to this year the portrait of Jan Six, later, the famous "Portrait of Jan Six," the future burgomaster, consummate in its ease and character, as Six descends the steps of his house drawing on his glove. The connexion between Rembrandt and the great family of Six was long and close. In 1641, the mother of Six, Anna Wymer, had been painted with consummate skill by Rembrandt, who also executed in 1647 the beautiful etching of Six standing by a window reading his tragedy of *Medea*, afterwards illustrated by Jan Vos's friend. Now he paints his portrait in the prime of manhood, and in the same year of gloom paints for him the masterly "John the Baptist." Six, if he could not avert the disaster of Rembrandt's life, at least stood by him in the darkest hour, when certainly the creative energy of Rembrandt was in full play. The same period gives us the "Master of the Vineyard," and the "Adoration of the Magi" of Buckingham Palace.

After the sale of the house in the Breedstraat, Rembrandt retired to the Rosengracht, an obscure quarter at the west end of the city. We are now drawing to the splendid close of his career in his third manner, in which his touch became broader, his impasto more solid and his knowledge more complete. We may mention the "Old Man with the Grey Beard" of the National Gallery (1657); and the "Bruyningh, the Secretary of the Insolvents' Chamber," of Cassel (1658), both leading up to the great portraits of the "Syndics of the Cloth Hall" of 1662. Nearly thirty years separate us from the "Lesson in Anatomy," years of long-continued observation and labour. The knowledge thus gathered, the problems solved, the mastery attained, are shown here in abundance. Rembrandt returns to his simplest gamut of colour, but shows his skill in the use of it, leaving on the spectator an impression of absolute enjoyment of the result, unconscious of the means. The plain burghers dealing with the simple concerns of their gild arrest our attention as if they were the makers of history. They live for ever; and we close our eyes to the strange perspective of the table.

In his old age Rembrandt continued to paint his own portrait as assiduously as in his youthful and happy days. About twenty of these portraits are known; a typical one is to be found in the National Gallery. All show the same self-reliant expression, though broken down indeed by age and the cares of a hard life.

About the year 1663 Rembrandt painted the (so-called) "Jewish Bride" of the Ryks Museum in Amsterdam, and the "Family Group" of Brunswick, the last and perhaps the most brilliant works of his life, bold and rapid in execution and marvellous in the subtle mixture and play of colours in which he seems to revel. The woman and children are painted with such love that the impression is conveyed that they represent a fancy family group of the painter in his old age. This idea received some confirmation from the supposed discovery that he left a widow Catherine Van Wyck and two children, but this theory falls to the ground, for de Roever has shown (*Oud Holland*, 1883) that Catherine was the widow of a marine painter Theunisz Blanckerhoff, who died about the same time as Rembrandt. The mistake arose from a miscopying of the register. The subject of these pictures is thus more mysterious than ever.

In 1668 Titus, the only son of Rembrandt, died, leaving one child, and on the 8th of October 1669 the great painter himself passed away, leaving two children, and was buried in the Wester Kerk. He had outlived his popularity, for his manner of painting, as we know from contemporaries, was no longer in favour with the people who purchased pictures. Some of Van der Werff and the younger Mieris, the leaders of an expiring school.

We must give but a short notice of Rembrandt's achievements in etching. Here he stands out by universal confession as first, excelling by his unrivalled technical skill, his mastery of expression and the lofty conceptions of many of his great pieces, as in the "Death of the Virgin," the "Christ Preaching," the "Christ Healing the Sick" (the "Hundred Guilder Print"[1]), the "Presentation to the People," the "Crucifixion" and others. So great is his skill simply as an etcher that one is apt to overlook the nobleness of the etcher's ideas and the depth of his nature, and this tendency has been doubtless confirmed by the enormous difference in money value between "states" of the same plate, rarity giving in many cases a factitious worth in the eyes of collectors. A single impression of one of his etchings—"Ecce Homo" (Christ Presenting," the "Christ Healing the Holford sale in 1893, when "Ephraim Bonus, with black ring" fetched £1050, and the "Hundred Guilder Print," £1750. The points of difference between these states arise from the additions and changes made by Rembrandt on the plate; and the prints taken off by him have been subjected to the closest inspection by Bartsch, Gersaint, Wilson, Daulby, De Claussin, C. Blanc, Willshire, Seymour Haden, Middleton and others, who have described them at great length, and to whom the reader is referred. The classification of Rembrandt's etchings adopted till lately was according to the subject, as Biblical, portrait, landscape, and so on; until Vosmaer attempted the more difficult task of arranging them of chronology. This method has been developed by Sir P. Seymour Haden and Middleton. But even in 1873 C. Blanc, in his fine work *L'Œuvre complet de Rembrandt*, still adheres to the older and less intelligent arrangement, resting his preference on the frequent absence of dates on the etchings and more strangely still on the equality of the work. Sir Seymour Haden's reply is "that the more important etchings which may be taken as types are dated, and that, the style of the etchings at different periods of Rembrandt's career being fully as marked as that of his paintings, no more

[1] This picture has had a strange history. It had suffered by fire and was sold to a Mr Chaplin of London in 1841, was exhibited in Leeds in 1868, and again disappeared, ultimately to be found in the storeroom of the South Kensington Museum as a doubtful Rembrandt. The patriotism of some Dutch lovers of art restored it to its native country; and it now hangs, a magnificent fragment, in the museum of Amsterdam.

difficulty attends the classification of one than of the other." Indeed Vosmaer points out in his Life of Rembrandt that there is a marked parallelism between Rembrandt's painted and etched work, his early work in both cases being timid and tentative, while he gradually gains strength and character both with the brush and the graver's tools.

In his *L'Œuvre complet de Rembrandt* (Paris, 1885), Eugène Dutuit rejects the classification of C. Blanc as dubious and unwarranted, dismisses the chronological arrangement proposed by Vosmaer and adopted by Seymour Haden and Middleton as open to discussion and lacking in possibility of proof, and reverts to the order established by Gersaint, ranging his materials under twelve heads: Portraits (real and supposed), Old Testament and New Testament subjects, histories, landscapes, &c. Sir Seymour Haden originated the theory that many of the etchings ascribed to Rembrandt up to 1640 were the work of his pupils, and seems to me the truth is not, though it may be carried too far. He argues (in his monograph on the *Etched Work of Rembrandt*, 1877) that Rembrandt's real work in etching began after Saskia's death, when he assumes that Rembrandt betook himself to Elsbroek, the country house of his "powerful friend" Jan Six. But it must be remembered that the future burgomaster was then but a student of twenty-four, a member of a great family it is true, but unmarried and taking as yet no share in public life. That Rembrandt was a frequent visitor at Elsbroek, and that the "Three Trees" and other etchings may have been produced there, may be admitted without requiring us to believe that he had left Amsterdam as his place of abode. The great period of his etching lies between 1639 and 1661, after which the painter seems to have renounced the needle. In these twenty years were produced his greatest works in portraiture, landscape and Bible story. They bear the impress of the genius of the man.

In addition to the authors named, the reader is referred to W. Bürger, (the *nom de plume* of T. Thoré), *Musées de la Hollyndе* (1858–60), E. Fromentin, *Maîtres d'autrefois*; H. Havard, *L'École Hollandaise*; Scheltema, *Rembrandt, discours sur sa vie* (1866); Ath. Coquerel fils, *Rembrandt, son individualisme dans l'art* (Paris, 1869); Dr Langbehn, *Rembrandt als Erzieher* (Leipzig, 1890); Emile Michel, *Rembrandt, sa vie, son œuvre, et son temps* (Paris, 1893); P. G. Hamerton, *Rembrandt's Etchings* (London, 1894); Malcolm Bell, *Rembrandt van Rijn and his Work* (London, 1899); Adolf Rosenberg, *Rembrandt, des Meisters Gemälde* (Stuttgart and Leipzig, 1906), a useful work, admirably reproducing 565 of the artist's pictures, and its companion volume, Hans Wolfgang Singer, *Rembrandt als Meister Radierungen* (Stuttgart and Leipzig, 1906), reproducing 402 etchings. The chronological, geographical and classifying indexes in both books are of particular utility.

(J. F. W.; P. G. K.)

REMEDIOS, or SAN JUAN DE LOS REMEDIOS, town of Santa Clara province, Cuba, in the municipality of San Juan de Los Remedios. Pop. of the town (1907), 6988; of the municipality, 21,573. The town is served by a branch of the Cuban Central railway, extending from Caibarién to Camajuaní, where it connects with the main line. The site is low and flat, and unhealthily wet in the rainy season. The port of Remedios is Caibarién (pop. in 1907, 8333), on the N. coast, about 5 m. E. Both are in the sugar country, and sugar is the base of their economic interests. The first settlement on the site of the present town was made in 1515–16, and in 1545 Remedios was created a *villa* with an ayuntamiento (council).

REMEMBRANCER, the name originally of certain subordinate officers of the English Exchequer. The office itself is of great antiquity, the holder having been termed remembrancer, memorator, rememorator, registrar, keeper of the register, despatcher of business (Maddox, *History of the Exchequer*). There were at one time three clerks of the remembrance, styled king's remembrancer, lord treasurer's remembrancer and remembrancer of first-fruits. The latter two offices have become extinct, that of remembrancer of first-fruits by the diversion of the fund (Queen Anne's Bounty Act 1838), and that of lord treasurer's remembrancer on being merged in the office of king's remembrancer (1833). By the Queen's Remembrancer Act 1859 the office ceased to exist separately, and the queen's remembrancer was required to be a master of the court of exchequer. The Judicature Act 1873, s. 77, attached the office to the Supreme Court, and the Supreme Court of Judicature (Officers) Act 1879 transferred it to the central office of the Supreme Court. By s. 8 the king's remembrancer is a master of the Supreme Court, and the office is usually filled by the senior master. The king's remembrancer department of the central office is now amalgamated with the judgments and married women's acknowledgments department. The king's remembrancer still assists at certain ceremonial functions—relics of the former importance of the office—such as the nomination of sheriffs, the swearing-in of the lord mayor of London, the trial of the pyx and the acknowledgments of homage for crown lands. Other duties are set out in the *Second Report of the Legal Departments Commission*, 1874.

"Remembrancer" is also the title of an official of the corporation of the city of London, whose principal duty is to represent that body before parliamentary committees and at council and treasury boards.

REMIGIUS, ST (*c.* 437–533), bishop of Reims and the friend of Clovis, whom he converted to Christianity. According to Gregory of Tours, 3000 Franks were baptized with Clovis by Remigius on Christmas Day, 496, after the defeat of the Alamanni. With the growing power of the papacy a good many fictions grew up around his name, *e.g.* that he anointed Clovis with oil from the sacred ampulla, and that Pope Hormisdas had recognized him as primate of France. The *Commentary on the Pauline Epistles* (ed. Villalpandus, 1699) is not his work, but that of Remigius of Auxerre.

For authorities see H. Jadart, *Bibliographie des ouvrages conc. la vie et le culte de S. Remi* . . . (Reims, 1891), which contains 126 references.

REMINGTON, FREDERICK (1861–1909), American artist, was born at Canton, New York, on the 4th of October 1861. He was a pupil of the Yale Art School, and of the Art Students' League, New York, and became known as an illustrator, painter and sculptor. Having spent much time in the West, whither he went for his health, and having been with the United States troops in actual warfare, he made a specialty of rendering the North American Indian and the United States soldier as seen on the western plains. In the Spanish-American War he was with the army under General Shafter as war correspondent. He died on the 26th of December 1909, near Ridgefield, Connecticut. His statuettes of soldiers, Indians, cowboys and trappers are full of character, while his paintings have been largely reproduced. He wrote several volumes of stories, including *Pony Tracks* (1895), *Crooked Trails* (1898), *Sundown Leflare* (1899), and *John Ermine of the Yellowstone* (1902).

REMINISCENCE (from Lat. *reminisci*, to remember), the recognized translation of the Greek *ἀνάμνησις*, which is used technically by Plato in his doctrine that the soul recovers knowledge of which it had direct intuition in a former incorporeal existence. The doctrine may be regarded as the poetical precursor of modern a priori theories of knowledge and of "race-memory" and the like. In common language "reminiscence" is synonymous with "recollection."

REMIREMONT, a town of eastern France, capital of an arrondissement in the department of Vosges, 17 m. S.S.E. of Épinal by rail, on the Moselle, a mile below its confluence with the Moselotte. Pop. town, 8782; commune, 10,548. Remiremont is surrounded by forest-clad mountains, and commanded by Fort Parmont, one of the Moselle line of defensive works. The abbey church, consecrated in 1051, has a crypt of the 11th century in which are the tombs of some of the abbesses, but as a whole belongs to the late 15th century. The abbatial residence (which now contains the mairie, the court-house and the public library) has been twice rebuilt in modern times (in 1750 and again after a fire in 1871), but the original plan and style have been preserved in the imposing front, the vestibule and the grand staircase. Some of the houses of the canonesses dating from the 17th and 18th centuries also remain. Remiremont is the seat of a sub-prefect and has a tribunal of first instance, a communal college, a board of trade-arbitration and a chamber of arts and manufactures. Its industries include cotton-spinning and weaving, the manufacture of hosiery and embroidery, iron and copper founding and the manufacture of boots and shoes and brushes.

Remiremont (*Romarici Mons*) derives its name from St Romaric, one of the companions of St Columban of Luxeuil, who in the 7th century founded a monastery and a convent on the hills above the present town. In 910 the nuns, menaced

by the invasion of the Hungarians, took refuge at Remiremont, which had grown up round a villa of the Frankish kings, and in the 11th century they permanently settled there. Enriched by dukes of Lorraine, kings of France and emperors of Germany, the ladies of Remiremont attained great power. The abbess was a princess of the empire, and received consecration at the hands of the pope. The fifty canonesses were selected from those who could give proof of noble descent. On Whit-Monday the neighbouring parishes paid homage to the chapter in a ceremony called the "Kyrioles"; and on their accession the dukes of Lorraine, the immediate suzerains of the abbey, had to come to Remiremont to swear to continue their protection. The "War of the Scutcheons" (Panonceaux) in 1566 between the duke and the abbess ended in favour of the duke; and the abbess never recovered her former position. In the 17th century the ladies of Remiremont fell away so much from the original monastic rule as to take the title of countesses, renounce their vows and marry. The town was attacked by the French in 1638 and ruined by the earthquake of 1682. With the rest of Lorraine it was joined to France in 1766. The monastery on the hill and the nunnery in the town were both suppressed in the Revolution.

REMONSTRANTS, the name given to those Dutch Protestants who, after the death of Arminius (*q.v.*), maintained the views associated with his name, and in 1610 presented to the states of Holland and Friesland a "remonstrance" in five articles formulating their points of departure from stricter Calvinism. These were: (1) that the divine decree of predestination is conditional, not absolute; (2) that the Atonement is in intention universal; (3) that man cannot of himself exercise a saving faith; (4) that though the grace of God is a necessary condition of human effort it does not act irresistibly in man; (5) that believers are able to resist sin but are not beyond the possibility of falling from grace. Their adversaries (the Gomarists) met them with a "counter-remonstrance," and so were known as the Counter-Remonstrants. Although the states-general issued an edict tolerating both parties and forbidding further dispute, the conflict continued, and the Remonstrants were assailed both by personal enemies and by the political weapons of Maurice of Orange, who executed and imprisoned their leaders for holding republican views. In 1618–19 the synod of Dort (see Dort, Synod of), the thirteen Arminian pastors headed by Simon Episcopius (*q.v.*) being shut out, established the victory of the Calvinist school, drew up ninety-three canonical rules, and confirmed the authority of the Belgic Confession and the Heidelberg Catechism. The judgment of the synod was enforced by the deposition and in some cases the banishment of Remonstrant ministers; but the government soon became convinced that their party was not dangerous to the state, and in 1630 they were formally allowed liberty to reside in all parts of Holland and build churches and schools. In 1621 they had already received liberty to make a settlement in Schleswig, where they built the town of Friedrichstadt. This colony still exists. The doctrine of the Remonstrants was embodied in 1621 in a *confessio* written by Episcopius, their great theologian, while J. Uytenbogaert gave them a catechism and regulated their churchly order. The Remonstrants adopted a simple synodical constitution; but their importance was henceforth more theological than ecclesiastical. Their seminary in Amsterdam has boasted of many distinguished names—Curcellaeus, Limborch, Wetstein, Le Clerc; and their liberal school of theology, which naturally grew more liberal and even rationalistic, reacted powerfully on the state church and on other Christian denominations. The Remonstrants first received official recognition in 1795. As a church they now number 27 communities with about 12,500 members, in a flourishing condition and respected for their traditions of scholarship and liberal thought. Their chief congregation is in Rotterdam.

REMPHAN, the Authorized Version's rendering of the Greek word variously appearing in Acts vii. 48 as 'Ρομφά, 'Ρεμφάν, 'Ρεμφάμ, 'Ραιφάν, 'Ρεφάν. It is part of a quotation from Amos v. 26, where the Septuagint 'Ραφάν or 'Ρεφάν stands for the Hebrew כִּיּוּן Chuin or Kewan. The Greek forms are probably simple mistakes for the Hebrew, ך (כ) having been replaced by ר (ר) and ph (φ) substituted for v (ו). Kewan is probably the old Babylonian *Kaiwanuu*, the planet Saturn, another (the Akkadian) name for which is *Sakkut*, which appears as *Siccuth* in the earlier part of the verse.

REMSCHEID, a town of Germany, in the Prussian Rhine Province, situated on an elevated plateau, 1100 ft. above sea-level, 6 m. by rail S. of Barmen and 20 m. N.E. of Cologne. Pop. (1905) 64,340. Remscheid is a centre of the hardware industry, and large quantities of tools, scythes, skates and other small articles in iron, steel and brass are made for export to all parts of Europe, the East, and North and South America. The name of Remscheid occurs in a document of 1132, and the town received the first impulse to its industrial importance through the immigration of Protestant refugees from France and Holland.

RÉMUSAT, CHARLES FRANÇOIS MARIE, Comte de (1797–1875), French politician and man of letters, was born in Paris on the 13th of March 1797. His father, Auguste Laurent, Comte de Rémusat, of a good family of Toulouse, was chamberlain to Napoleon, but acquiesced in the restoration and became prefect first of Haute Garonne, and then of Nord. His mother's maiden name was Claire Élisabeth Jeanne Gravier de Vergennes, born in 1780. She married at sixteen, and was attached to Josephine as *dame du palais* in 1802. Talleyrand was among her admirers, and she was generally recognized as a woman of great intellectual capacity and personal grace. After her death (1824) an *Essai sur l'éducation des femmes* was published and received an academic *couronne*. But it was not until her grandson Paul de Rémusat published her *Mémoires* (3 vols., Paris, 1879–80), which have since been followed by some correspondence with her son (2 vols., 1881), that justice could be done to her literary talent. Much light was thrown on the Napoleonic court by this book, and on the youth and education of her son Charles. He early developed political views more liberal than those of his parents, and, being bred to the bar, published in 1820 a pamphlet on trial by jury. He was an active journalist, showing in philosophy and literature the influence of Cousin, and is said to have furnished to no small extent the original of Balzac's brilliant egoist Henri de Marsay. He signed the journalists' protest against the Ordinances of July 1830, and in the following October was elected deputy for Haute Garonne. He then ranked himself with the *doctrinaires*, and supported most of those measures of restriction on popular liberty which made the July monarchy unpopular with French Radicals. In 1836 he became for a short time undersecretary of state for the interior. He then became an ally of Thiers, and in 1840 held the ministry of the interior for a brief period. In the same year he became an Académician. For the rest of Louis Philippe's reign he was in opposition till he joined Thiers in his attempt at a ministry in the spring of 1848. During this time Rémusat constantly spoke in the chamber, but was still more active in literature, especially on philosophical subjects, the most remarkable of his works being his book on *Abélard* (2 vols., 1845). In 1848 he was elected, and in 1849 re-elected, for Haute Garonne, and voted with the Conservative side. He had to leave France after the *coup d'état*; nor did he re-enter political life during the Second Empire until 1869, when he founded a moderate opposition journal at Toulouse. In 1871 he refused the Vienna embassy offered him by Thiers, but in August he was appointed minister of foreign affairs in succession to M. Jules Favre. Although minister he was not a deputy, and on standing for Paris in September 1873 he was beaten by Désiré Barodet. A month later he was elected (having already resigned with Thiers) for Haute Garonne by a great majority. He died in Paris on the 6th of January 1875.

During his abstention from politics Rémusat continued to write on philosophical history, especially English. *Saint Anselme de Cantorbéry* appeared in 1854; *L'Angleterre au XVIIIème siècle* in 1856 (2nd ed. enlarged, 1865); *Bacon, sa vie,*

son temps, &c., in 1858; *Channing, sa vie et ses œuvres*, in 1862; *John Wesley* in 1870; *Lord Herbert de Cherbury* in 1874; *Histoire de la philosophie en Angleterre depuis Bacon jusqu'à Locke* in 1875; besides other and minor works. He wrote well, was a forcible speaker and an acute critic; but his adoption of the indeterminate eclecticism of Cousin in philosophy and of the somewhat similarly indeterminate liberalism of Thiers in politics probably limited his powers, though both no doubt accorded with his critical and unenthusiastic turn of mind.

His son PAUL DE RÉMUSAT (1831–1897) became a distinguished journalist and writer. He was for many years a regular contributor to the *Revue des deux mondes*. He stood for election in Haute-Garonne in 1869 in opposition to the imperial policy and failed, but was elected to the National Assembly in 1871 and later. In 1890 he entered the Académie des sciences morales et politiques.

RÉMUSAT, JEAN PIERRE ABEL (1788–1832), French Chinese scholar, was born in Paris on the 5th of September 1788. He was educated for the medical profession, but a Chinese herbal in the collection of the Abbé Tersan attracted his attention, and he taught himself to read it by great perseverance and with imperfect help. At the end of five years' study he produced in 1811 an *Essai sur la langue et la littérature chinoises*, and a paper on foreign languages among the Chinese, which procured him the patronage of Silvestre de Sacy. In 1814 a chair of Chinese was founded at the Collège de France, and Rémusat was placed in it. From this time he gave himself wholly to the languages of the Far East, and published a series of useful works, among which his contributions from Chinese sources to the history of the Tatar nations claim special notice. Rémusat became an editor of the *Journal de savants* in 1818, and founder and first secretary of the Paris Asiatic Society in 1822; he also held various Government appointments. He died at Paris on the 4th of June 1832. A list of his works is given in Quérard's *France littéraire* s.v. Rémusat.

RENAISSANCE, THE.—The "Renaissance" or "Renascence" is a term used to indicate a well-known but indefinite space of time and a certain phase in the development of Europe.[1] On the one hand it denotes the transition from that period of history which we call the middle ages (*q.v.*) to that which we call modern. On the other hand it implies those changes in the intellectual and moral attitude of the Western nations by which the transition was characterized. If we insist upon the literal and etymological meaning of the word, the Renaissance was a re-birth; and it is needful to inquire of what it was the re-birth. The metaphor of Renaissance may signify the entrance of the European nations upon a fresh stage of vital energy in general, implying a fuller consciousness and a freer exercise of faculties than had belonged to the medieval period. Or it may mean the resuscitation of simply intellectual activities, stimulated by the revival of antique learning and its application to the arts and literatures of modern peoples. Upon our choice between these two interpretations of the word depend important differences in any treatment of the subject. The former has the disadvantage of making it difficult to separate the Renaissance from other historical phases—the Reformation, for example—with which it ought not to be confounded. The latter has the merit of assigning a specific name to a limited set of events and group of facts, which can be distinguished for the purpose of analysis from other events and facts with which they are intimately but not indissolubly connected. In other words, the one definition of Renaissance makes it denote the whole change which came over Europe at the close of the middle ages. The other confines it to what was known by our ancestors as the Revival of Learning. Yet, when we concentrate attention on the recovery of antique culture, we become aware that this was only one phenomenon or symptom of a far wider and more comprehensive alteration in the conditions of the European races. We find it needful to retain both terms, Renaissance and Revival of Learning, and to show the relations between the series of events and facts which they severally imply. The Revival of Learning must be regarded as a function of that vital energy, an organ of that mental evolution, which brought into existence the modern world, with its new conceptions of philosophy and religion, its reawakened arts and sciences, its firmer grasp on the realities of human nature and the world, its manifold inventions and discoveries, its altered political systems, its expansive and progressive forces. Important as the Revival of Learning undoubtedly was, there are essential factors in the complex called the Renaissance with which it can but remotely be connected. When we analyse the whole group of phenomena which have to be considered, we perceive that some of the most essential have nothing or little to do with the recovery of the classics. These are, briefly speaking, the decay of those great fabrics, church and empire, which ruled the middle ages both as ideas and as realities; the development of nationalities and languages; the enfeeblement of the feudal system throughout Europe; the invention and application of paper, the mariner's compass, gunpowder, and printing; the exploration of continents beyond the ocean; and the substitution of the Copernican for the Ptolemaic system of astronomy. Europe in fact had been prepared for a thoroughgoing metamorphosis before that new ideal of human life and culture which the Revival of Learning brought to light had been made manifest. It had recovered from the confusion consequent upon the dissolution of the ancient Roman empire. The Teutonic tribes had been Christianized, civilized and assimilated to the previously Latinized races over whom they exercised the authority of conquerors. Comparative tranquillity and material comfort had succeeded to discord and rough living. Modern nationalities, defined as separate factors in a common system, had learnt to co-operate upon the basis of European federation. The ideas of universal monarchy and of indivisible Christendom, incorporated in the Holy Roman Empire and the Roman Church, had so far lost their hold that scope was offered for the introduction of new theories both of state and church which would have seemed visionary or impious to the medieval mind. It is therefore obvious that some term, wider than Revival of Learning, descriptive of the change which began to pass over Europe in the 14th and 15th centuries, has to be adopted. That of Renaissance, Rinascimento, or Renascence is sufficient for the purpose, though we have to guard against the tyranny of what is after all a metaphor. We must not suffer it to lead us into rhetoric about the deadness and the darkness of the middle ages, or hamper our inquiry with preconceived assumptions that the re-birth in question was in any true sense a return to the irrecoverable pagan past. Nor must we imagine that there was any abrupt break with the middle ages. On the contrary, the Renaissance was rather the last stage of the middle ages, emerging from ecclesiastical and feudal despotism, developing what was original in medieval ideas by the light of classic arts and letters, holding in itself the promise of the modern world. It was therefore a period and a process of transition, fusion, preparation, tentative endeavour. And just at this point the real importance of the Revival of Learning may be indicated. That rediscovery of the classic past restored the confidence in their own faculties to men striving after spiritual freedom; revealed the continuity of history and the identity of human nature in spite of diverse creeds and different customs; held up for emulation masterworks of literature, philosophy and art; provoked inquiry; encouraged criticism; shattered the narrow mental barriers imposed by medieval orthodoxy. Humanism, a word which will often recur in the ensuing paragraphs, denotes a specific bias which the forces liberated in the Renaissance took from contact with the ancient world,—the particular form assumed by human self-esteem at that epoch,—the ideal of life and civilization evolved by the modern nations. It indicates the endeavour of man to reconstitute himself as a free being, not as the thrall of theological despotism, and the peculiar assistance he derived in this effort from Greek and Roman literature, the *literae humaniores*, letters leaning rather to the side of man than of divinity.

[1] For a somewhat different view of the parcelling out into such periods, see the article MIDDLE AGES.

In this article the Renaissance will be considered as implying a comprehensive movement of the European intellect and will toward self-emancipation toward reassertion of the natural rights of the reason and the senses, toward the conquest of this planet as a place of human occupation, and toward the formation of regulative theories both for states and individuals differing from those of medieval times. The Revival of Learning will be treated as a decisive factor in this process of evolution on a new plan. To exclude the Reformation and the Counter-Reformation wholly from the survey is impossible. These terms indicate moments in the whole process of modern history which were opposed, each to the other, and both to the Renaissance; and it is needful to bear in mind that they have, scientifically speaking, a quite separate existence. Yet if the history of Europe in the 16th century of our era came to be written with the brevity with which we write the history of Europe in the 6th century B.C., it would be difficult at the distance of time implied by that supposition to distinguish the Italian movemcnt of the Renaissance in its origin from the German movement of the Reformation. Both would be seen to have a common starting-point in the reaction against long dominant ideas which were becoming obsolete, and also in the excitation of faculties which had during the same period been accumulating energy.

Method of treatment.

The Renaissance, if we try to regard it as a period, was essentially the transition from one historical stage to another. It cannot therefore be confined within strict chronological limits. There is one date, however, which may be remembered with advantage as the starting-point in time of the Renaissance, after the departure from the middle ages had been definitely and consciously made by the Italians. This is the year 1453, when Constantinople, chosen for his capital by the first Christian emperor of Rome, fell into the hands of the Turk. One of the survivals of the old world, the shadow of what had been the Eastern Empire, now passed suddenly away. Almost at the same date that visionary revival of the Western Empire, which had imposed for six centuries upon the imagination of medieval Europe, hampering Italy and impeding the consolidation of Germany, ceased to reckon among political actualities; while its more robust a rival, the Roman Church, seemed likely for ink into the state of a petty Italian principality. It was demonstrated by the destruction of the Eastern and the dotage of the Western Empire, and by the new papal policy which Nicholas V. inaugurated, that the framework of society was about to be altered. Nothing remained to check those centrifugal forces in state and church which substituted a confederation of rival European powers for the earlier ideal of universal monarchy, and separate religious constitutions for the previous Catholic unity. The age was ripe for some new learning and for speculative audacities from which the schoolmen would have shrunk, and which soon possessed themselves of cosmopolitan importance. If we look a little forward to the years 1492–1500, we obtain a second date of great importance. In these years the expedition of Charles VIII. to Naples opened Italy to French, Spanish and German interference. The leading nations of Europe began to compete for the prize of the peninsula, and learned meanwhile that culture which the Italians had perfected. In these years the secularization of the papacy was carried to its final point by Alexander VI., and the Reformation became inevitable. The same period was marked by the discovery of America, the exploration of the Indian seas, and the consolidation of the Spanish nationality. It also witnessed the application of printing to the diffusion of learning. Thus, speaking roughly, the half-century between 1450 and 1500 may be termed the culminating point of the Renaissance. The transition from the medieval to the modern order was now secured if not accomplished, and a Rubicon had been crossed from which no retrogression to the past was possible. Looking yet a little farther, to the years 1527 and 1530, a third decisive date is reached. In the first of these years happened the sack of Rome, in the second the pacification of Italy by Charles V. under Spanish hegemony. The age of the Renaissance was now closed for the land which gave it birth. The Reformation had taken firm hold on northern Europe. The Counter-Reformation was already imminent.

Chronological limits.

It must not be imagined that so great a change as that implied by the Renaissance was accomplished without premonitory symptoms and previous endeavours. In the main we mean by it the recovery of freedom for the human spirit after a long period of bondage to oppressive ecclesiastical and political orthodoxy—a return to the liberal and practical conceptions of the world which the nations of antiquity had enjoyed, but upon a new and enlarged platform. This being so, it was inevitable that the finally successful efforts after self-emancipation should have been anticipated from time to time by strivings within the ages that are known as dark and medieval. It is therefore part of the present inquiry to pass in review some of the claimants to be considered precursors of the Renaissance.

Precursors of the Renaissance.

First of all must be named the Frank in whose lifetime the dual conception of universal empire and universal church, divinely appointed, sacred and inviolable, began to control the order of European society. Charles the Great (Charlemagne) lent his forces to the plan of resuscitating the Roman empire at a moment when his own power made him the arbiter of western Europe, when the papacy needed his alliance, and when the Eastern Empire had passed under the usurped regency of a female. He modelled an empire, Roman in name but essentially Teutonic, since it owed such substance as its fabric possessed to Frankish armies and the sinews of the German people. As a structure composed of divers ill-connected parts it fell to pieces at its builder's death, leaving little but the incubus of a memory, the fascination of a mighty name, to dominate the mind of medieval Europe. As an idea, the empire grew in visionary power, and remained one of the chief obstacles in the way of both Italian and German national coherence. Real force was not in it, but rather in that counterpart to its unlimited pretensions, the universal church, which had evolved it from barbarian rule, and which used her crudely theological and vaguely mystical spirit. We should, however, here remember that the study of Roman law, which was one important precursory symptom of the Renaissance, owed much to medieval respect for the empire as a divine institution. This, together with the municipal Italian intolerance of the Lombard and Frankish codes, kept alive the practice and revived the science of Latin jurisprudence at an early period.

Philosophy had attempted for itself from the trammels of theological orthodoxy in the hardy speculations of some schoolmen, notably of Scotus Erigena and Abelard. These innovators found, however, small support, and were defeated by opponents who used the same weapons as a divine institution. They to back them. Nor were the rationalistic opinions of the Averroists without their value, though the church condemned these deviators from her discipline as heretics. Such were practical materialists, moreover, had but feeble hold upon the substance of real knowledge. Imperfect acquaintance with authors whom they studied in Latin translations made by Jews from Arabic commentaries on Greek texts, together with almost total ignorance of scientific laws, condemned their sterility. Like the other schismachistics of their epoch, they fought with phantoms in a visionary realm. A similar judgment may be passed upon those Paulician, Albigensian, Paterine and Epicurean dissenters from the Catholic creed who opposed the phalanxes of orthodoxy with frail imaginative weapons, and alarmed established orders in the state by the audacity of their communistic opinions. Physical science struggled into feeble life in the cells of Roger Bacon and Albert the Great; men were accounted magicians by the vulgar; and, while the one eventually assumed the tiara, the other was incarcerated in a dungeon. The schools meanwhile resounded still to the interminable dispute upon abstractions. Is the universal real, or is it only a name a corresponding entity? From the midst of the Franciscans who had persecuted Roger Bacon because he presumed to know more than was consistent with hunan humility arose John of Parma, adopting and popularizing the mystic creed of Joachim of Flora. The reign of the Father is past; the reign of the Son is passing; the reign of the Spirit is at hand. Such was the formula of the Eternal Gospel, which, as an unconscious forecast of the Renaissance, has attracted retrospective students by its felicity of adaptation to their historical method. Yet we must remember that this bold intuition of the abbot Joachim indicated a monastic reaction against the tyrannics and corruptions of the church, rather than a fertile philosophical principle. The Fraticelli spiritualists, and similar sects who fed their imagination with his doctrine, expired in the flames to which Fra Dolcino Longino and Margharita were consigned. To what extent the accusations of profligate morals brought against the reforming Templars were justified remains doubtful; and the same uncertainty rests upon the alleged iniquities of the Templars. It is only certain that at this epoch the fabric of Catholic faith was threatened with various forms of prophetic and Oriental mysticism, symptomatic of a widespread desire to grasp at something simpler, purer and less rigid than Latin theology afforded. Devoid of criticism, devoid of sound learning, devoid of a firm hold on the realities of life, these heresies passed away without solid results and were forgotten.

Speculation and heresy in the middle ages.

We are too apt to take for granted that the men of the middle ages were immersed in meditations on the other world, and that their intellectual exercises were confined to abstractions of the schools, hallucinations of the fancy, allegories, visions. This assumption applies indeed in a broad sense to that period which was dominated by intolerant theology and deprived of positive knowledge. Yet there are abundant signs that the native human instincts, the natural human appetites, remained unaltered and alive beneath the crust of orthodoxy. In the person of a pope like Boniface VIII. those ineradicable forces of the natural man assumed, if we may trust the depositions of ecclesiastic well acquainted with his life, a form of gross and atheistic cynicism. In the person of an emperor, Frederick II., they emerged under the more agreeable garb of liberal culture and Epicurean scepticism. Frederick dreamed of remodelling society upon a mundane type, and anticipated the large tolerance and cosmopolitan enlightenment of the actual Renaissance. But his efforts were defeated by the unrelenting hostility of the church, and by the incapacity of his contemporaries to understand his aims. After having forced in his lifetime to submit to authority, he was consigned by Dante to hell. Frederick's ideal of civilization was derived in a large measure from Provence, where a beautiful culture had prematurely bloomed, filling southern Europe with the perfume of poetry and gentle living. It, if anywhere, it seemed as though the ecclesiastical and feudal fetters of the middle ages might be broken, and humanity might enter on a new stage of joyous unimpeded evolution. This was, however, not to be. The church preached Simon de Montfort's crusade and organized the papal Inquisition; what Quinet calls the "Renaissance sociale par l'Amour" was extirpated by sword, fire, famine and pestilence. Meanwhile the Provençal poets had developed their modern language with irreducible richness and decorum, creating forms of verse and modes of emotional expression which determined the latest medieval phase of literature in Europe. The naturalism of which we have been speaking found free utterance now in the fabliaux of jongleurs, lyrics of minnesingers, romances of troubadours, epics of Arthur and his knights—compositions varied in type and tone, but in all of which sincere passion and real enjoyment of life pierce through the thin veil of chivalrous mysticism or of allegory with which they were sometimes conventionally draped. The tales of Lancelot and Tristram, the lives of the troubadours and the Wachtlieder of the minnesingers, sufficiently prove with what sensual freedom a knight loved the lady whom custom and art made him profess to worship as a saint. He vowed to be constant, and that Beatrice's adorer had a wife and children, or that Laura's poet owned a son and daughter by a concubine, in order to perceive that the mystic passion of chivalry was compatible in the middle ages with commonplace matrimony or vulgar illegitimate connexions. But perhaps the most convincing testimony to the presence of this ineradicable naturalism is afforded by the Latin songs of wandering students, known as *Carmina Burana*, written by the mid-styled Goliardi. In these compositions, remarkable for their facile handling of medieval Latin rhymes and rhythms, the allegorizing mysticism which envelops chivalrous poetry is discarded. Love is treated frankly and from a pagan point of view. Bacchus and Venus go hand in hand, as in the ancient ante-Christian age. The open-air enjoyments of the wood, the field, the dance upon the village green, are sung with juvenile lightheartedness. No grain of note, warning us that the pleasures in this earth are fleeting, that the visible world is but a symbol of the invisible, that human life is a probation for the life beyond, interrupts the tinkling music as of castanets and tripping feet which gives a novel charm to these unique relics of the 13th century. Goliardic poetry is further curious as showing how the classics even at that early period were a fountain-head of pagan inspiration. In the taverns and low places of amusement haunted by those tattered songsters, on the open road and in the forests trodden by their vagrant feet, the deities of Greece and Rome were not in exile, but at home within the hearts of living men. Thus, while Christendom was still preoccupied with the Crusades, two main forces of the Renaissance, naturalism and enthusiasm for the remains of antique literature, already brought their latent potency to light, prematurely indeed and precociously, yet with a promise that was destined to be kept.

Naturalism in medieval life and literature.

Goliardic poetry.

When due regard is paid to these miscellaneous evidences of intellectual and sensual freedom which the middle ages will be seen that there were by no means lacking elements of native vigour ready to burst forth. What was wanting was not vitality and licence, not audacity of speculation, not lawless humour or rebellious impulse. It was rather the right touch on life, the right feeling for human independence, the right way of approaching the materials of philosophy, religion, scholarship and literature, that failed. The courage that is born of knowledge, the calm strength begotten by a positive attitude of mind, face to face with the dominant over-shadowing Sphinx of theology, were lacking. We may fairly say that natural and untaught people had more of the just intuition that was needed than learned folk trained in the schools. But these people were rendered licentious in revolt or impotent for salutary action by ignorance, by terror, by uneasy dread of the doom declared for heretics and rebels. The massive vengeance of the church hung over them, like a heavy sword suspended in the cloudy air. Superstition and stupidity hedged them in on every side, so that sorcery and magic seemed the only means of winning power over nature or insight into mysteries surrounding human life. The path from darkness to light was lost; thought was involved in allegory; the study of nature had been perverted into an inept system of grotesque and pious parable-mongering; the pursuit of truth had become a game of wordy dialectic. The other world, with its imagined heaven and hell, haunted the conscience like a nightmare. However sweet this world seemed, however fair the flesh, both world and flesh were abandoned as given over to the devil. It was not worth while to master and economize the resources of this earth, to utilize the good and ameliorate the evils of this life, while every one agreed, in theory at any rate, that the present was but a bad prelude to an infinitely more important and better future. To escape from these preoccupations and prejudices except upon the path of conscious and deliberate sin was impossible for all but minds of rarest quality and courage; and these were too often reduced to the recantation of their supposed errors no less by some secret clinging sense of guilt than by the church's iron hand. Man and the actual universe kept on reasserting their rights and claims, announcing their goodliness and delightfulness, in one way or another; but they were always being thrust back again into the Limbonian regions of abstractions, fictions, visions, spectral hopes and fears, in the midst of which the intellect somnambulistically moved upon an unknown way.

Medieval attitude of mind.

At this point the Revival of Learning intervened to determine the course of the Renaissance. Medieval students possessed a considerable portion of the Latin classics, though Greek had become in the fullest sense of the phrase a dead language. But what they retained of ancient literature they could not comprehend in the right spirit. Between them and the text of poet or historian hung a veil of mysticism, a vapour of misapprehension. The odour of unsanctity clung around those relics of the pagan past. Men bred in the cloister and the lecture-room of the logicians, trained in scholastic disputations, versed in allegorical interpretations of the plainest words and most apparent facts, could not find the key which might unlock those stores of wisdom and of beauty. Petrarch first opened a new method in scholarship, and revealed what we denote as humanism. In his teaching lay the twofold discovery of man and of the world. For humanism, which was the vital element in the Revival of Learning, consists mainly of a just perception of the dignity of man as a rational, volitional and sentient being, born upon this earth with a right to use it and enjoy it. Humanism implied the rejection of those visions of a future and imagined state of souls as the only absolute reality, which had fascinated the imagination of the middle ages. It involved a vivid recognition of the goodliness of man and nature, displayed in the great monuments of human power recovered from the past. It stimulated the curiosity of latent scientific faculties, provoked fresh inquisition into the groundwork of existence, and strengthened man's self-esteem by knowledge of what men had thought and felt and done in ages when Christianity was not. It roused a desire to reappropriate the whole abandoned provinces of mundane energy, and a hope to emulate antiquity in works of living loveliness and vigour. The Italians of the 14th century, more precocious than the other European races, were ripe for this emancipation of enslaved intelligence. In the classics they found the food which was required to nourish the new spirit; and a variety of circumstances, among which must be reckoned the pride of a nation boasting of its descent from the Populus Romanus, rendered them apt to fling aside the obstacles that had impeded the free action of the mind through many centuries. Petrarch not only set his countrymen upon the right method of studying the Latin classics, but he also divined the importance of recovering a knowledge of Greek literature. To this task Boccaccio addressed himself; and he was followed by numerous Italian enthusiasts, who visited Byzantium before its fall as the sacred city of a new revelation. The next step was to collect MSS., to hunt out, copy and preserve the precious relics of the past. In this work of accumulation Guarino and Filelfo, Aurispa and Poggio, took the chief part, aided by the wealth of Italian patricians, merchant-princes and despots, who were inspired by the sacred thirst for learning. Learning was then

Italy—the Revival of Learning.

no mere pursuit of a special and recluse class. It was fashionable and it was passionate, pervading all society with the fervour of romance. For a generation nursed in decadent scholasticism and stereotyped theological formulae it was the fountain of renascent youth, beauty and freedom, the shape in which the Helen of art and poetry appeared to the ravished eyes of medieval Faustus. It was the resurrection of the mightiest spirits of the past. "I go," said Cyriac of Ancona, the indefatigable though uncritical explorer of antiquities, "I go to awake the dead!" This was the enthusiasm, this the vitalizing faith, which made the work of scholarship in the 15th century so highly strung and ardent. The men who followed it knew that they were restoring humanity to its birthright after the expatriation of ten centuries. They were instinctively aware that the effort was for liberty of action, thought and conscience in the future. This conviction made young men leave their loves and pleasures, grave men quit their counting-houses, churchmen desert their missals, to crowd the lecture-rooms of philologers and rhetoricians. When Greek had been acquired, MSS. accumulated, libraries and museums formed, came the age of printers and expositors. Aldus Manutius in Italy, Froben in Basel, the Étiennes in Paris, committed to the press what the investigators had recovered. Nor were there wanting men who dedicated their powers to Hebrew and Oriental erudition, laying, together with the Grecians, a basis for those Biblical studies which advanced the Reformation. Meanwhile the languages of Greece and Rome had been so thoroughly appropriated by a final race of scholars, headed by Politian, Pontano, Valla, handled once again in verse and prose both antique dialects, and thrilled the ears of Europe with new-made pagan melodies. The church itself at this epoch lent its influence to the prevalent enthusiasm. Nicholas V. and Leo X., not to mention intervening popes who showed themselves tolerant of humanistic culture, were heroes of the classical revival. Scholarship became the surest path of advancement to ecclesiastical and political honours. Italy was one great school of the new learning at the moment when the German, French and Spanish nations were invited to her feast.

It will be well to describe briefly, but in detail, what this meeting of the modern with the ancient mind effected over the whole field of intellectual interests. In doing so, we must be careful to remember that the study of the classics did but give a special impulse to pent-up energies which were bound in one way or another to assert their independence. Without the Revival of Learning the direction of those forces would have been different; but that novel intuition into the nature of the world and man which constitutes what we describe as Renaissance must have emerged. As the facts, however, stand before us, it is impossible to dissociate the rejection of the other world as the sole reality, the joyous acceptance of this world as a place to live and act in, the conviction that "the proper study of mankind is man," from humanism. Humanism, as it actually appeared in Italy, was positive in its conception of the problems to be solved, pagan in its contempt for medieval mysticism, invigorated for sensuous enjoyment by contact with antiquity, yet holding in itself the germ of new religious aspirations, profounder science and sterner probings of the mysteries of life than had been attempted even by the ancients. The operation of this humanistic spirit has now to be traced.

Nature of Italian humanism.

It is obvious that Italian literature owed little at the outset to the Revival of Learning. The *Divine Comedy*, the *Canzoniere* and the *Decameron* were works of monumental art, deriving neither form nor inspiration immediately from the classics, but applying the originality of Italian genius to matter drawn from previous medieval sources. Dante showed both in his epic poem and in his lyrics that he had not abandoned the sphere of contemporary thought. Allegory and theology, the vision and the symbol, still determine the form of masterpieces which for perfection of workmanship and for emancipated force of intellect rank among the highest products of the human mind. Yet they are not medieval in the same sense as the song of Roland or the Arthurian cycle. They proved that, though Italy came late into the realm of literature, her action was destined to be decisive and alterative by the introduction of a new spirit, a firmer and more positive grasp on life and art. These qualities she owed to her material prosperity, to her freedom from feudalism, to her secularized church, her commercial nobility, her political independence in a federation of small states. Petrarch and Boccaccio, though they both held the medieval doctrine that literature should teach some abstract truth beneath a veil of fiction, differed from Dante in this that their poetry and prose in the vernacular abandoned both allegory and symbol. In their practice they ignored their theory. Petrarch's lyrics continue the Provençal tradition as it had been reformed in Tuscany, with a subtler and more modern analysis of emotion, a purer and more chastened style, than his masters could boast. Boccaccio's tales, in like manner, continue the tradition of the fabliaux, raising that literary species to the rank of finished art, enriching it with humour and strengthening its true substance by keen insight into all varieties of character. The *Canzoniere* and the *Decameron* distinguish themselves from medieval literature, not by any return to classical precedents, but by free self-conscious handling of human nature. So much had to be premised in order to make it clear in what relation humanism stood to the Renaissance. since the Italian work of Dante, Petrarch and Boccaccio is sufficient to indicate the new birth of the spirit after ages of apparent deadness. Had the Revival of Learning not intervened it is probable that the vigorous efforts of these writers alone would have inaugurated a new age of European culture. Yet, while noting this reservation of judgment, it must also be remarked that all three felt themselves under some peculiar obligation to the classics. Dante, medieval as his temper seems to us, chose Virgil for his guide, and ascribed his mastery of style to the study of Virgilian poetry. Petrarch and Boccaccio were, as we have seen, the pioneers of the new learning. They held their writings in the vernacular cheap, and initiated that contempt for the mother tongue which was a note of the earlier Renaissance. Giovanni Villani, the first chronicler who used Italian for the compilation of a methodical history, tells us how he was impelled to write by musing on the ruins of Rome and thinking of the vanished greatness of the Latin race. We have therefore to recognize that the four greatest writers of the 14th century, while the Revival of Learning was in its cradle, each after his own fashion acknowledged the vivifying touch upon their spirit of the antique genius. They seem to have been conscious that they could not give the desired impulse to modern literature and art without contact with the classics; and, in spite of the splendour of their achievements in Italian, they found no immediate followers upon that path.

Relation of Dante, Petrarch Boccaccio and Villani to the Revival of Learning.

Relation of humanism to scholarship and literature.

The fascination of pure study was so powerful, the Italians at that epoch were so eager to recover the past, that during the 15th century we have before our eyes the spectacle of this great living nation deviating from the course of development begun in poetry by Dante and Petrarch, in prose by Boccaccio and Villani, into the channels of scholarship and antiquarian research. The language of the *Canzoniere* and the *Decameron* was abandoned for revived Latin and discovered Greek. Acquisition supplanted invention; imitation of classical authors suppressed originality of style. The energies of the Italian people were devoted to transcribing codices, settling texts, translating Greek books into Latin, compiling grammars, commentaries, encyclopaedias, dictionaries, epitomes and ephemerides. During this century the best histories —Bruno's and Poggio's annals of Florence, for example—were composed in Latin after the manner of Livy. The best dissertations, Landino's *Camaldunenses*, Valla's *De Voluptate*, were laboured imitations of Cicero's *Tusculans*. The finest lyrics, Politian's elegies, Politian's hexameters, were in like manner Latin; public orations upon ceremonial occasions were delivered in the Latin tongue; correspondence, official and familiar, was carried on in the same language; even the Italian received, in Sannazaro's *Arcadia*, a dress of elegant Latinity. The noticeable barrenness of Italian literature at this period is referable to the fact that men of genius and talent devoted themselves to erudition and struggled to express their thoughts and feelings in a speech which was not natural. Yet they were engaged in a work of incalculable importance. At the close of the century the knowledge of Greece and Rome had been reappropriated and placed beyond the possibility of destruction: the chasm between the old and new world had been bridged; medieval modes of thinking and discussing had been superseded; the staple of education, the common culture which has brought all Europe into intellectual agreement, was already in existence. Humanism was now an authority. During the uncritical veneration for antiquity which then prevailed, it had received a strong tincture of pedantry. Its professors, in their revolt against the middle ages, made light of Christianity and paraded paganism. What was even worse from an artistic point of view, they had contracted puerilities of style, vanities of rhetoric, stupidities of wearisome citation. Still, at the opening of the 16th century, it became manifest what fruits of noble quality the Revival of Letters was about to bring forth for modern literature. Two great scholars, Lorenzo de' Medici and Politian, had already returned to the

practice of Italian poetry. Their work is the first absolutely modern work,—modern in the sense of having absorbed the stores of classic learning and reproduced those treasures in forms of simple, natural, native beauty. Boiardo occupies a similar position by the fusion of classic mythology with chivalrous romance in his *Orlando Innamorato*. But the victor's laurels were reserved for Ariosto, whose *Orlando Furioso* is the purest and most perfect extant example of Renaissance poetry. It was not merely in what they had acquired and assimilated from the classics that these poets showed the transformation effected in the field of literature by humanism. The whole method and spirit of medieval art had been abandoned. That of the Cinque Cento is positive, defined, mundane. The deity, if deity there be, that rules in it, is beauty. Interest is confined to the actions, passions, sufferings and joys of human life, to its pathetic, tragic, humorous and sentimental incidents. Of the state of souls beyond the grave we hear and are supposed to care nothing. The classical drama, the copy of the Revival, which had not injured romantic literature, made itself perniciously felt. Rules were collected from Horace and Aristotle. Seneca was chosen as the model of tragedy; Plautus and Terence supplied the groundwork of comedy. Thus in the plays of Rucellai, Trissino, Sperone and other tragic poets the nobler elements of humanism, considered as a revelation of the world and man, obtained less free development. The tragedies of the best authors are too observant of Latin precedents, although some pieces of Machiavelli, Ariosto, Arctino, Cecchi and Gelli are admirable for vivid delineation of contemporary manners.

Fine arts.

The relation of the plastic classical studies to the rise of learning is similar to that which has been sketched in the case of poetry. Cimabue started with work which owed nothing directly to antiquity. At about the same time Niccola Pisano (d. 1278) studied the style of sculptured fragments of Graeco-Roman marbles. His manner influenced Giotto, who set painting on a forward path. Fortunately for the unimpeded expansion of Italian art, little was brought to light of antique workmanship during the 14th and 15th centuries. The classical studies cultivated by painters, sculptors and architects chiefly through literature. Therefore there was narrow scope for imitation, and the right spirit of humanism displayed itself in a passionate study of perspective, nature and the nude. Yet we find in the work of Ghiberti and Luca della Robbia, we notice in the masterpieces of these men and their compeers Brunelleschi and Donatello, how even in the 15th century the minds of artists were fascinated by what survived of classic grace and science. Gradually, as the relics of Roman portraiture and antique thought, the earlier Christian motives of the arts yielded to pagan subjects. Gothic architecture, which had always flourished feebly on Italian soil, was supplanted by a hybrid Roman style. The study of Vitruvius gave strong support to this pseudo-classic manner which, when it had reached its final point in Palladio's work, overspread the whole of Europe and dominated taste during two centuries. But the perfect plastic art of Italy, the pure art of the Cinque Cento, the art of Michael Angelo, Raphael, Titian and Correggio, the sculpture of Donatello, Michelangelo and Sansovino, the architecture of Bramante, Omodeo and the Venetian Lombardi, however much imbued with the spirit of the classical revival, took its bent from the poetry of Dante as a free intelligent product of the Renaissance. That is to say, it is not so much an outcome of studies in antiquity as an exhibition of emancipated modern genius freed and illuminated by the masterpieces of the past. It indicates a separation from the middle ages, inasmuch as it is permanently natural. Its religion is joyous, sensuous, dramatic, terrible, but in each and all of its many-sided manifestations strictly human. Its treatment of classical mythology is natural, rarely imitative or pedantic. The art of the Renaissance was an apocalypse of the beauty of the world and man in unaffected spontaneity, without side thoughts for piety or erudition, inspired by pure delight in loveliness and harmony for their own sakes.

Science and philosophy.

In the fields of science and philosophy humanism wrought similar important changes. Petrarch began by waging relentless war against the logicians and matricialists of his own day. With the advance of Aristotelian middle-scholasticism, however, of thinking fell into contemptuous oblivion. The newly aroused curiosity for nature encouraged men like Alberti, Da Vinci, Toscanelli and Da Porta to make practical experiments, generally in the working physical sciences, and to invent scientific instruments. Anatomy began to be studied, and the time was not far distant when Titian should lend his pencil to the epoch-making treatise of Vesalius. The middle ages had been satisfied with absurd and visionary notions about the microcosm and man, while the body of man was regarded with too much suspicion to be studied. Now the right method of interrogating nature with patience and loving admiration was instituted. At the same time the texts of ancient authors supplied hints which led to discoveries so far-reaching in their results as those of Copernicus, Columbus and Galileo. In philosophy, properly so called, the humanistic scorn for medieval dullness and obscurity swept away theological metaphysics as valueless. But on classical ground beyond rhetoric and clumsy compilation was substituted. The ethical treatises of the scholars are deficient in substance, while Ficino's attempt to revive Platonism betrays an uncritical conception of his master's drift. It was something, however, to have shaken off the shackles of ecclesiastical authority; and, even if a new authority, that of the ancients, was accepted in its stead, still progress was being made toward sounder methods of analysis. This is noticeable in Pomponazzo's system of materialism, based on the interpretation of Aristotle, but revealing a virile spirit of disinterested and unprejudiced research. The thinkers of southern Italy, Telesio, Bruno and Campanella, at last opened the two chief lines on which modern speculation has since moved. Telesio and Campanella may be termed the predecessors of Bacon. Bruno was the precursor of the idealistic schools. All three alike strove to disengage their minds from classical as well as ecclesiastical authority, proving that the emancipation of the will had been accomplished. It must be added that their writings, like every other product of the Renaissance, except its purest poetry and art, exhibit a hybrid between medieval and modern tendencies. Childish ineptitudes are mingled with intuitions of maturest wisdom, and seeds of future thought germinate in the decaying refuse of past systems.

Criticism.

Humanism in its earliest stages was unscientific. It absorbed the relics of antiquity with omnivorous appetite, and with very imperfect sense of the distinction between worse and better work. Yet it led in process of time to criticism. The critique of literature began in the lectures-rooms of Politian, in the printing-house of Aldus, and in the school of Vittorino. The critique of Roman law started, under Politian's auspices, upon a more liberal course than that which had been followed by the powerful but narrow-sighted glossators of Bologna. Finally, the Court of Naples arose that most formidable of all critical engines, the critique of established ecclesiastical traditions and spurious historical documents. Valla by one vigorous effort destroyed the False Decretals and exposed the Donation of Constantine to ridicule, paving the way for the polemic carried on against the dubious pretensions of the papal throne by scholars of the Reformation. A similar criticism, conducted less on lines of erudition than of persiflage and irony, ransacked the abuses of the church and played around the very foundations of Christianity. This was tolerated with approval by men who repeated Leo X.'s witty epigram: "What profit has not that fable of Christ brought us!" The same critical and philosophic spirit was busy with the study of history produced a new scicnce, the honours of which belong to Machiavelli. He showed, on the one side, how the history of a people can be written with a recognition of fixed principles, and at the same time with an artistic feeling for personal and dramatic episodes. On the other side, he addressed himself to the analysis of man considered as a political being, to the anatomy of constitutions and the classification of governments, to the study of motives underlying public action, the secrets of success and the causes of failure in the conduct of affairs. The unscrupulous rigour with which he applied his scientific method, and the sinister deductions he though himself justified in drawing from the results it yielded, excited terror and repulsion. Nevertheless, a department had been added to the intellectual empire of mankind, in which fellow-workers, like Guicciardini at Florence, and subsequently Sarpi at Venice, were not slow to follow the path traced by Machiavelli.

Education.

The object of the foregoing paragraphs has been to show in what way the positive, inquisitive, secular, exploratory spirit of the Renaissance, when toned and controlled by classical studies, permeated the regions of literature, art, philosophy and science. It becomes at this point of much moment to consider how social manners in Italy were modified by the same causes, since the type developed there was in large measure communicated together with the new culture to the rest of Europe. The first subject to be noticed under this heading is education. What has come to be called a classical education was the immediate product of the Italian Renaissance. The universities of Bologna, Padua and Siena had been famous through the middle ages for the study of law, physics and medicine; and during the 15th and 16th centuries the first two still enjoyed celebrity in these faculties. But at this period no lecture-rooms were so crowded as those in which the works of antique literature and language read passages from the poets and orators, taught Greek, and commented upon the systems of philosophers. The medieval curriculum offered no defined place for the new learning of the Revival, which had hitherto had no recognized name. Chairs had therefore to be founded under the title of rhetoric, from which men like Chrysoloras and Guarino, Filelfo and Politian expounded orally to hundreds of eager students from every town of Italy and every part of Europe their accumulated knowledge of antiquity. One mass of Greek and Roman erudition, including history and metaphysics, law and science, civic institutions and the art of war, mythology and magistracies, metrical systems and oratory, agriculture and astronomy, domestic manners and religious rites, grammar and philology, biography and numismatics, formed the miscellaneous subject-matter of this so-styled rhetoric. Notes taken at these lectures supplied young scholars with hints for further acquisition, and a certain tradition of treating antique authors for the display of general learning, as well as for the elucidation of their texts, came into vogue, which has

determined the method of scholarship for the last three centuries in Europe. The lack of printed books in the first period of the Revival, and the comparative rarity of Greek erudition among students, combined with the intense enthusiasm aroused for the new gospel of the classics, gave special value to the personal teaching of these professors. They journeyed from city to city, attracted by promises of higher pay, and allured by ever-growing laurels of popular fame. Each large town established its public study, academy or university, similar institutions bearing many designations, for the public exposition of the *literae humaniores*. The humanists, or professors of that branch of knowledge, became a class of the highest dignity. They were found in the chanceries of the republics, in the papal curia, in the council chambers of princes, at the headquarters of condottieri, wherever business had to be transacted, speeches to be made and the work of secretaries to be performed. Furthermore, they undertook the charge of private education, opening schools which displaced the mediæval system of instruction, and taking engagements as tutors in the families of despots, noblemen and wealthy merchants. The academy established by Vittorino da Feltre at Mantua under the protection of Gian Francesco Gonzaga for the training of pupils of both sexes, might be chosen as the type of this Italian method. His scholars, who were lodged in appropriate buildings, met daily to hear the master read and comment on the classics. They learned portions of the best authors by heart, exercised themselves in translation from one language to another, and practised composition in prose and verse. It was Vittorino's care to see that, while their memories were duly stored with words and facts, their judgment should be formed by critical analysis, attention to style, and comparison of the authors of a decade or century with those who were acknowledged classics. During the hours of recreation suitable physical exercises, as fencing, riding and gymnastics, were conducted under qualified trainers. From this sketch it will be seen how closely the educational system which came into England during the reigns of the Tudors, and which has prevailed until the present time, was modelled upon the Italian type. English youths who spend their time at Eton halfway between athletic sports and Latin verse, and who take an Ireland with a first class in "Greats" at Oxford, are pursuing the same course of physical and mental discipline as the princes of Gonzaga or Montefeltro in the 15th century.

The humanists effected a deeply penetrating change in social manners. Through their influence as tutors, professors, orators and courtiers, society was permeated by a fresh ideal of culture in Italy. To a gentleman of any rank at this epoch to be a man acquainted with the rudiments at least of scholarship, refined in diction, capable of corresponding or of speaking in choice phrases, open to the beauty of the arts, intelligently interested in archæology, taking for his models of conduct the great men of antiquity rather than the saints of the church. He was also expected to prove himself an adept in physical exercises and in the courteous observances which survived from chivalry. The type is set before us by Castiglione in that book upon the courtier which went the round of Europe in the 16th century. It is further emphasized in a famous passage of the *Orlando Innamorato* where Boiardo compares the Italian ideal of an accomplished gentleman with the current type admired by the rest of the world. To this point the awakened intelligence of the Renaissance, instructed by humanism, polished by the fine arts, expanding in genial conditions of diffused wealth, had brought the Italians at a period when the rest of Europe was comparatively barbarous.

Social manners.

The moral attitude of the Italian Renaissance.

This picture has undoubtedly a darker side. Humanism, in its revolt against the middle ages, was, as we have seen already, mundane, pagan, irreligious, positive. The Renaissance can, after all, be regarded only as a period of transition in which much of the good of the past was sacrificed while some of the evil was retained, and neither the bad nor the good of the future was brought clearly into fact. Beneath the surface of the Italian character lurked gross superstition and savage passions, unrestrained by mediæval piety, untutored by modern experience. Italian society exhibited an almost unexampled spectacle of literary, artistic and courtly refinement crossed with cases of lust, treachery, poisonings, assassinations, violence. A succession of worldly pontiffs brought the church into flagrant discord with the principles of Christianity. Steeped in pagan learning, emulous of imitating the manners of the ancients, used to think and feel in harmony with Ovid and Theocritus, and at the same time rendered cynical by the corruption of papal Rome, the educated classes lost their grasp upon morality. Political honesty ceased almost to have a name in Italy. The Christian virtues were scorned by the more astute and the most independent of the time, while the antique virtues were themes for rhetoric rather than moving-springs of conduct. This is apparent to all students of Machiavelli and Guicciardini, the profoundest analysts of their age the bitterest satirists of its vices, but themselves infected with its incapacity for moral goodness. Not only were the Italians vitiated; but they had also become impotent for action and resistance. At the height of the Renaissance the five great powers in the peninsula formed a combination of independent **but mutually attractive and repellent states.** Equilibrium was maintained by diplomacy, in which the humanists played a foremost part, casting a network of intrigue over the nation which helped in no small measure to stimulate intelligence and create a common medium of culture, but which accustomed statesmen to believe that everything could be achieved by wire-pulling. Wars were conducted on a showy system by means of mercenaries, who played a safe game in the field and developed a system of bloodless campaigns. Meanwhile the people grew up unused to arms. What happened between the years 1494 and 1530 became the battle field of French, German and Spanish forces, it was seen to what a point of helplessness the political, moral and social conditions of the Renaissance had brought the nation.

It was needful to study at some length the main phenomena of the Renaissance in Italy, because the history of that phase of evolution in the other Western races turns almost entirely upon points in which they either adhered to or diverged from the type established there. Speaking broadly, what France, Germany, Spain and England assimilated from Italy at this epoch was in the first place the new learning, as it was then called. This implied the new conception of human life, the new interest in the material universe, the new method of education, and the new manners, which we have seen to be inseparable from Italian humanism. Under these forms of intellectual enlightenment and polite culture the renascence of the human spirit had appeared in Italy, where it was more than elsewhere connected with the study of classical antiquity. But that audacious exploratory energy which formed the motive force of the Renaissance as distinguished from the Revival of Learning took, as we shall see, very different directions in the several nations who now were sending the flower of their youth to study at the feet of Italian rhetoricians.

Diffusion of the new learning from Italy throughout Europe.

The Renaissance ran its course in Italy with strange indifference to consequences. The five great powers, held in equilibrium by Lorenzo de' Medici, dreamed that the peninsula could be maintained *in statu quo* by diplomacy. The church saw no danger in encouraging a pseudo-pagan ideal of life, violating its own principle of existence by assuming the policy of an aggrandizing secular state, and outraging Christendom openly by its acts and utterances. Society at large was hardly aware that an intellectual force of stupendous magnitude and incalculable explosive power had been created by the new learning. Why should not established institutions proceed upon the customary and convenient methods of routine, while the delights of existence were augmented, manners polished, arts developed, and a golden age of epicurean ease maintained by a state religion which no one cared to break with because no one was left to regard it seriously? This was the attitude of the Italians when the Renaissance, which they had initiated as a thing of beauty, began to operate as a thing of power beyond the Alps.

Revival of Learning in Germany.

Germany was already provided with universities, seven of which had been founded between 1348 and 1409. In these haunts of learning the new studies took root after the year 1440, chiefly through the influence of travelling professors, Peter Luder and Samuel Karoch. German scholars made their way to Lombard and Tuscan lecture-rooms, bringing back the methods of the humanists. Greek, Latin and Hebrew erudition soon found itself at home on Teutonic soil. Like Italian men of letters, these pioneers of humanism gave a class to their patronymics; unfamiliar names, Crotus Rubeanus and Pierius Graecus, Capnion and Lupambulus Ganymedes, Oecolampadius and Melanchthon, resounded on the Rhine. A few of the German princes, among whom Maximilian, the prince cardinal Albert of Mainz, Frederick the Wise of Saxony, and Eberhard of Württemberg deserve mention, exercised a not insignificant influence on letters by the foundation of new universities and the patronage of learned men. The cities of Strasburg, Nuremberg, Augsburg, Basel, became centres of learned coteries, which gathered round scholars like Wimpheling, Brant, Peutinger, Schedel, and Pirckheimer, which like Dürer and Holbein, printers of the eminence of Froben. Academies in imitation of Italian institutions came into existence, the two most conspicuous, named after the Rhine and the Danube, holding their headquarters respectively at Heidelberg and Vienna. Crowned poets, of whom the most eminent was Conrad Celtes Protucius (Pickel!), emulated the fame of Politian and Pontano. Yet, though the Renaissance was thus widely communicated to the centres of German intelligence, it displayed a different character from that which it assumed in Italy. Gothic art, which was indigenous in Germany, yielded but little to southern influences. **Such**

work as that of Dürer, Vischer, Cranach, Schöngauer, Holbein, consummate as it was in technical excellence, did not assume Italian forms of loveliness, did not display the paganism of the Latin races. The modification of Gothic architecture by pseudo-Roman elements of style was incomplete. What Germany afterwards took of the Palladian manner was destined to reach it on a circuitous route from France. In like manner the new learning failed to penetrate all classes of society with the rapidity of its expansion in Italy, nor was the pure ideal of life and customs easily substituted for the medieval. The German aristocracy, as Aeneas Sylvius had noticed, remained for the most part barbarous, addicted to gross pleasures, contemptuous of culture. The German dialects were too rough to receive that artistic elaboration under antique influences which had been so facile in Tuscany. The doctors of the universities were too wedded to their antiquated manuals and methods, too satisfied with dullness, too proud of titles and diplomas, too anxious to preserve ecclesiastical discipline and corporate mental activity, for the genial spirit of humanism to spread freely. Not in Cologne or Tübingen but in Padua and Florence did the German pioneers of the Renaissance acquire their sense of liberal studies. And when they returned home they found themselves encumbered with stupidities, jealousies and rancours. Moreover, the temper of these more enlightened men was itself opposed to Italian indifference and immorality; it was pugnacious and polemical, eager to beat down the arrogance of monks and theologians rather than to pursue an ideal of aesthetic self-culture. To a student of the origins of German humanism it is clear that something very different from the Renaissance of Lorenzo de' Medici and Leo X. was in preparation from the days of Teutonic zeal. Far less classical and more in-loving than the Italian, the German intelligence was more penetrative, earnest, disputative, occupied with substantial problems. Starting with theological criticism, proceeding to the stage of Bible studies in the three learned tongues, German humanism occupied the attention of a widely scattered sect of erudite scholars; but it did not arouse the interest of the whole nation until it was forced into a violently militant attitude by the efforts of Wycliffe and Reuchlin. The attempt to extinguish honest thought prepared the Reformation; and humanism after 1518 was absorbed in politico-religious warfare.

The point of contact between humanism and the Reformation in Germany has to be insisted on; for it is just here that the connexion of the Reformation to the Renaissance in general makes itself apparent. As the Renaissance had its precursory movements in the medieval period, so the German Reformation was foreshadowed by Wycliffe and Huss. But the discontents of the Great Schism and by the councils of Constance and Basel. These two main streams of modern progress had been proceeding upon different tracks to diverse issues, but they touched in the struggle of the Reformation and by the Revival, and they had a common origin in the struggle of the spirit after self-emancipation. Johann Reuchlin, who entered the lecture-room of Argyropoulos at Rome in 1482, Erasmus of Rotterdam, who hovered at Venice at the outset of the century, both typified their critical knowledge of Hebrew and of Greek to the elucidation and diffusion of the Bible. To the Germans, as to all nations of that epoch, the Bible came as a new book, because they now read it for the first time with eyes opened by humanism. The critical and new spirit which had evolved literature, art and culture in Italy sufficed in Germany to recreate Christianity. This new spirit in Italy emancipated human intelligence by the classics; in Germany it emancipated the human conscience by the Bible. The indignation excited by Leo X.'s sale of indulgences, the moral rage stirred in Northern hearts by papal abominations in Rome, were external causes which precipitated the schism between Teutonic and Latin Christianity. The Reformation, inspired by the same energy of resuscitated life as the Renaissance, assisted by the same engines of the printing-press and paper, using the same apparatus of scholarship, criticism, literary skill, being in truth another manifestation of the same world-movement, became of necessity at once posed itself as an irreconcilable antagonist to Renaissance Italy. It would be difficult to draw any comparison between German and Italian humanists to the disparagement of the former. Reuchlin was no less learned than Valla; Melanchthon no less scholarly than Ficino; Erasmus no less witty, and far more trenchant, than Petrarch; Ulrich von Hutten no less humorous than Folengo; Paracelsus no less fantastically learned than Cardano. But the cause in which German intellect and will were enlisted was so different that it is difficult not to make a formal separation between that movement which evolved culture in Italy and that which restored religion in Germany, establishing the freedom of intelligence in the one sphere and the freedom of the conscience in the other. The truth is that the Reformation was the Teutonic Renaissance. It was the emancipation of the reason on a line neglected by the Italians, more important indeed in its political consequences, more weighty in its bearing on rationalistic developments than the Italian Renaissance, but none the less an outcome of the same ground-influences. We have already in this century reached a point at which, in spite of stubborn Protestant dogmatism and bitter Catholic reaction, we can perceive how the ultimate affranchisement of man will be the work of both.

Relation of humanism to the German Reformation.

The German Reformation was incapable of propagating itself in Italy, chiefly for the reason that the intellectual forces which it represented and employed had already found specific outlet in that country. It was not in the nature of the Italians, sceptical and paganized by the Revival, to be keenly interested about questions which seemed to revive the scholastic disputes of the middle ages. It was not in their external conditions, suffering as they were from invasions, enthralled by despots, to use the Reformation as a lever for political revolution. Yet when a tumultuary army of so-called Lutherans sacked Rome in 1527 no sober thinker doubted that a new agent had appeared in Europe which would alter the destinies of the peninsula. The Renaissance was virtually closed, so far as it concerned Italy, when Clement VII. and Charles V. struck their compact at Bologna in 1530. This compact proclaimed the principle of monarchical absolutism, supported by papal authority, and monarchically absolutist, which influenced Europe until the outbreak of the Revolution. A reaction immediately set in both against the Renaissance and the Reformation. The council of Trent, opened in 1545 and closed in 1563, decreed a formal purgation of the church, affirmed the fundamental doctrines of Catholicism, strengthened the papal supremacy, and inaugurated that movement of resistance which is known as the Counter-Reformation. The complex onward effort of the modern nations, expressing itself in Italy as Renaissance, in Germany as Reformation, had aroused the forces of conservatism. The four main instruments of the reaction were the papacy, which had done so much by its sympathy with the revival to promote the humanistic spirit it now dreaded, the strength of Spain, and two Spanish institutions planted on Roman soil—the Inquisition and the Order of Jesus. The principle contended for and established by this reaction was absolutism as opposed to freedom—monarchical absolutism and papal absolutism—the two energies which liberated by the Renaissance and the Reformation. The partial triumph of this principle was secure, inasmuch as the majority of established powers in church and state felt threatened by the revolutionary opinions afloat in Europe. Renaissance and Reformation were, moreover, already at strife. Both, too, were spiritual and elastic tendencies toward progress, ideals rather than solid organisms.

The Catholic revival in Italy.

The part played by Spain in this period of history was determined in a large measure by ancient traditions. The Spaniards became one nation by the conquest of Granada and the union of the crowns of Castile and Aragon. The war of national aggrandizement, being in its nature a crusade, inflamed the religious enthusiasm of people. It was followed by the expulsion of Jews and Moors, and by the establishment of the Inquisition on a solid basis, with powers formidable to the freedom of all Spaniards from the highest to the throne. These events explain the decisive action of the Spanish nation on the side of Catholic conservatism, and help us to understand why their brilliant achievements in the field of culture during the 16th century were speedily followed by stagnation. It will be well, in dealing with the Renaissance in Spain, to touch first upon the arts and literature, and then to consider those qualities of character in action whereby the nation most distinguished itself from the rest of Europe. Architecture in Spain, emerging from the Gothic stage, developed the Plateresque style of bewildering richness by adopting elements of Arabic and Moorish decoration. Sculpture exhibited realistic vigour of indubitably native stamp; and the minor plastic crafts were cultivated with success in lines of striking originality. Painting began on a homely sock, until the work of Velazquez showed that Spanish masters in this branch were fully abreast of their Italian compeers and contemporaries. To dwell here upon the Italianizing versifiers, novelists and pastoral romancers who attempted to refine the vernacular of the *Romancero* would be superfluous. They are mainly noticeable as proving that certain coteries in Spain were willing to accept the Italian Renaissance. But the real force of Spanish genius was not exhausted by literary style. It expressed itself at last in the monumental work of *Don Quixote*, which places Cervantes beside Rabelais, Ariosto and Shakespeare as one of the four supreme exponents of the Renaissance. The affectations of Spanish chivalry disappear before his humour; the sentiments of a noble nation, animated by the youth of modern Europe emerging from the middle ages, were portrayed in its enduring pictures of human experience. The Spanish drama, meanwhile, untrammelled by those false canons of pseudo-classic taste which fettered the theatre in Italy and afterwards in France, rose to an eminence in the hands of Lope de Vega and Calderon which only the English, and the English only in the masterpieces of three or four dramatists, can rival. Camoens, in the *Lusiad*, if we may here group Portugal with Spain, was the first modern poet to compose an epic on a purely modern theme, vying with Virgil, but not bending to pedantic rules, and breathing the spirit of the age of heroic adventures and almost fabulous discoveries into his melodious numbers. What has chiefly to be noted regarding the achievements of the Spanish race in arts and letters at this epoch is their potent national originality. The revival of learning produced in Spain no slavish imitation as it did in Italy, no formal humanism, and, it may be added, very little of fruitful scholarship. The Renaissance here, as in England,

Spain in the Renaissance period—arts and letters.

displayed essential qualities of intellectual freedom, delight in life, exultation over rediscovered earth and man. The note of Renaissance work in Germany was still Gothic. This we feel in the penetrative earnestness of Dürer, in the homeliness of Hans Sachs, in the grotesque humour of *Eulenspiegel* and the *Narrenschiff*, the sombre pregnancy of the Faust legend, the almost stolid mastery of Holbein. It lay not in the German genius to escape from the preoccupations and the limitations of the middle ages, for this reason mainly that what we call mediæval was to a very large extent Teutonic. But on the Spanish peninsula, in the masterpieces of Velazquez, Cervantes, Camoens, Calderon, we emerge into an atmosphere of art, definitely national, distinctly modern, where solid natural forms stand before us realistically modelled, with light and shadow on their rounded outlines, and where the airiest creatures of the fancy take shape and weave a dance of rhythmic, light, incomparable intricacy. The Spanish Renaissance would in itself suffice, if other witnesses were wanting, to prove how inaccurate is the theory that limits this movement to the revival of learning. Touched by Italian influences, enriched and fortified by the new learning, Spanish genius walked firmly forward on its own path. It was only crushed by forces generated in the nation that produced it, by the Inquisition and by despotic Catholic absolutism.

In the history of the Renaissance, Spain and Portugal represent the exploration of the ocean and the colonization of the other hemisphere. The voyages of Columbus and Vespucci to America, the rounding of the Cape by Diaz and the discovery of the sea road to India by Vasco da Gama, Cortes's conquest of Mexico and Pizarro's conquest of Peru, marked a new era for the human race and inaugurated the modern age more decisively than any other series of events has done. It has recently been maintained that modern European history is chiefly an affair of competition between confederated states for the possession of lands revealed by Columbus and Da Gama. Without challenging or adopting this speculation, it may be safely affirmed that nothing so pregnant of results has happened as this exploration of the globe. To say that it displaced the centre of gravity in politics and commerce, substituting the ocean for the Mediterranean, dethroning Italy from her seat of central importance in traffic, depressing the eastern and elevating the western powers of Europe, opening a path for Anglo-Saxon expansiveness, forcing philosophers and statesmen to regard the Occidental nations as a single group in counterpoise to other groups of nations, the European community as one unit correlated to other units of humanity upon this planet, is truth enough to vindicate the vast significance of these discoveries. The Renaissance, far from being the re-birth of antiquity with its civilization confined to the Mediterranean, with its Hercules' Pillars beyond which lay Cimmerian darkness, was thus effectively the entrance upon a quite incalculably wider stage of life, on which mankind at large has since enacted one great drama.

Exploration of the ocean.

While Spanish navies were exploring the ocean, and Spanish paladins were overturning empires, Charles V. headed the reaction of Catholicism against reform. Stronger as king of Spain than as emperor, for the Empire was little but a name, he lent the weight of his authority to that system of coercion and repression which enslaved Italy, desolated Germany with war, and drowned the Low Countries in blood. Philip II., with full approval of the Spanish nation, pursued the same policy in an even stricter spirit. He was powerfully assisted by two institutions, in which the national character of Spain expressed itself, the Inquisition and the Society of Jesus. Of the former it is not needful to speak here. But we have to observe that the last great phenomenon of the Spanish Renaissance was Ignatius Loyola, who organized the militia by means of which the church worked her Counter-Reformation. His motto, *Perinde ac cadaver*, expressed that recognition of absolutism which papacy and monarchy demanded for their consolidation (see JESUITS and LOYOLA).

Dogmatic Catholicism.

The logical order of an essay which attempts to show how Renaissance was correlated to Reformation and Counter-Reformation has necessitated the treatment of Italy, Germany and Spain in succession; for these three nations were the three main agents in the triple process to be analysed. It was due to their specific qualities, and to the diverse circumstances of their external development, that the re-birth of Europe took this form of duplex action on the lines of intellectual and moral progress, followed by reaction against mental freedom. We have now to speak of France, which earliest absorbed the influence of the Italian revival, and of England, which received it latest. The Renaissance may be said to have begun in France with Charles VIII.'s expedition to Naples, and to have continued until the extinction of the house of Valois. Louis XII. and Francis I. spent a considerable portion of their reigns in the attempt to secure possession of the Italian provinces they claimed. Henry II.'s queen was Catherine of the Medicean family; and her children, Charles IX. and Henry III., were Italianated Frenchmen. Thus the connexion between France and Italy during the period 1494–1589 was continuous. The French passed to and fro across the Alps on military and peaceful expeditions. Italians came to France as courtiers, ambassadors, men of business, captains and artists. French society assumed a strong Italian colouring, nor were the manners of the court very different from those of an Italian city, except that externally they remained ruder and less polished. The relation between the crown and its great feudatories, the military bias of the aristocracy, and the marked distinction between classes which survived from the middle ages, rendered France in many vital points unlike Italy. Yet the annals of that age, and the anecdotes retailed by Brantôme, prove that the royalty and nobility of France had been largely Italianized.

France in the Renaissance period.

It is said that Louis XII. brought Fra Giocondo of Verona back with him to France, and founded a school of architects. But we need not have recourse to this legend for the explanation of such Italian influences as were already noticeable in the Renaissance buildings on the Loire. Without determining the French style, Italian intercourse helped to stimulate its formation and development. There are students of the 15th century in France who resent this intrusion of the Italian Renaissance. But they forget that France was bound by inexorable laws of human evolution to obey the impulse which communicated itself to every form of art in Europe. In the school of Fontainebleau, under the patronage of Francis I, that Italian influence made itself distinctly felt; yet a true French manner had been already formed, which, when it was subsequently applied at Paris, preserved a marked national quality. The characteristic of the style developed by Bullant, De l'Orme and Lescot, in the royal or princely palaces of Chenonceaux, Chambord, Anet, Écouen, Fontainebleau, the Louvre and elsewhere, is a blending of capricious fancy and inventive richness of decoration with purity of outline and a large sense of the beauty of extended masses. Beginning with the older castles of Touraine, and passing onward to the Tuileries, we trace the passage from the medieval fortress to the modern pleasure-house, and note how architecture obeyed the special demands of that new phenomenon of Renaissance civilization, the court. In the general distribution of parts these monumental buildings express the peculiar conditions which French society assumed under the influence of Francis I. and Diane de Poitiers. In details of execution and harmonic combinations they illustrate the precision, logic, lucidity and cheerful spirit of the national genius. Here, as in Lombardy, a feeling for serene beauty derived from study of the antique has not interrupted the evolution of a style indigenous to France and eminently characteristic of the French temperament.

French architecture.

During the reign of Francis I. several Italian painters of eminence visited France. Among these, Del Rosso, Primaticcio, Del Sarto and Da Vinci are the most famous. But their example was not productive of a really great school of French painting. It was left for the Poussins and Claude Lorraine in the next century, acting under mingled Italian and Flemish influences, to embody the still active spirit of the classical revival. These three masters were the contemporaries of Corneille, and do not belong to the Renaissance period. Sculpture, on the contrary, in which art, as in architecture, the medieval French had been surpassed by no other people of Europe, was practised with originality and power in the reigns of Henry II. and Francis I. Ponzio and Cellini, who quitted Italy for France, found themselves outrivalled in their own sphere by Jean Goujon, Cousin and Pilon. The decorative sculpture of this epoch, whether combined with architecture or isolated in monumental statuary, ranks for grace and suavity with the best of Sansovino's. At the same time it is unmistakably inspired by a sense of beauty different from the Italian—more piquant and pointed, less languorous, more mannered perhaps, but with less of empty rhythmical effect. All this while, the minor arts of enamelling, miniature, glass-painting, goldsmith's work, jewellery, engraving, tapestry, wood-carving, pottery, &c., were cultivated with a spontaneity and freedom which proved that France, in the middle point between Flanders and Italy, was able to use both influences without a sacrifice of native taste. It may indeed be said in general that what is true of France is likewise true of all countries which felt the artistic impulses of the Renaissance. Whether we regard Spain, the Netherlands, or Germany at this epoch, we find a national impress stamped upon the products of the plastic and the decorative arts, notwithstanding the prevalence of certain forms derived from the antique and Italy. It was only at a later period that the formalism of pseudo-classic pedantry reduced natural and national originality to a dead unanimity.

French painting and sculpture.

French literature.

French literature was quick to respond to Renaissance influences. De Comines, the historian of Charles VIII.'s expedition to Naples, differs from the earlier French chroniclers in his way of regarding the world of men and affairs. He has the perspicuity and analytical penetration of a Venetian ambassador. Villon, his contemporary, may rather be ranked, so far as artistic form and use of knowledge are concerned, with poets of the middle ages, and in particular with the Goliards; but he is essentially modern in the vividness of his self-portraiture, and in what we are wont to call realism. Both De Comines and Villon indicate the entrance of a new quality into literature. The Rhétoriqueurs, while practicing medieval traditions by their use of allegory and complicated metrical systems, sought to improve the French language by introducing Latinisms. Thus the Revival of Learning began to affect the vernacular in the last years of the 15th century. Marot and the school round him immediately preceded The Renaissance displayed itself in their effort to purify the form and diction of poetry. But the decisive revolution was effected by Ronsard and his comrades of the Pléiade. It was their professed object to enrich French to a level with the classics, and to naturalize Italian species of verse. The humanistic movement led these learned writers to engraft the graces of the antique upon their native literature, and to refine it by emulating the lucidity of Petrarch. The result of their endeavours is immediately apparent in the new force added to French rhythm, the new pomp, richness, colouring and polish conferred upon poetic diction. French style gradually attained to fixity, and the alexandrine came to be recognized as the standard line. Rabelais bridged the interval and Regnier's satire, at the close of the 16th century, are as modern as Voltaire's. Meanwhile the drama was emerging from the medieval mysteries; and the classical type, made popular by Garnier's genius, was elaborated, as in Italy, upon the model of Seneca and the canons of the three unities. The tradition thus formed was continued and fortified by the illustrious playwrights of the 17th century. Translation from Greek and Latin into French progressed rapidly at the commencement of this period. It was a marked characteristic of the Renaissance in France to appropriate the spoils of Greece and Rome for the profit of the mother tongue. Amyot's *Plutarch* and *Daphnis and Chloe* rank among the most exquisite examples of beautiful French prose. Prose had now the charm of simplicity combined with grace. To mention Brantôme is to mention the most entertaining of gossips. To speak of Montaigne is to speak of the best writer of the first century. In all the literary work which has been mentioned, the originality and freshness of the French genius are no less conspicuous than its saturation with the new learning and with Italian studies. But the greatest name in French, the name which is synonymous with the Renaissance in France, has yet to be uttered. That, of course, is Rabelais. His incommensurable and indescribable masterpiece of mingled humour, wisdom, satire, learning, tenderness, and animal vivity, of imagination, realism, reflects the whole age in its mirror of hyper-Aristophanic farce. What Ariosto is for Italy, Cervantes for Spain, Erasmus for Holland, Luther for Germany, Shakespeare for England, that is Rabelais for France. The Renaissance cannot be comprehended in its true character without familiarity with these six representatives of its manifold and many-sided inspiration.

French scholarship. The Reformation in France.

The French Renaissance, so rich on the side of arts and letters, was hardly less rich on the side of classical studies. The revival of learning has a noble muster-roll of names in France: Turnebus, the patriarch of Hellenistic studies; the Etiennes of Paris, Adrian and Henry; Lambinus, and equally learning their Venetian rivals; the two Scaligers; impassioned Dolet; eloquent Muret; learned Cujas; terrible Calvin; Ramus, the intrepid antagonist of Aristotle; De Thou and De Bèze; good-natured Casaubon; brilliant young Saumaise. The distinguishing characteristics of French humanism are vivid intelligence, critical audacity and polemical acumen, propriety of exposition, and strong direction to its applications by logical sense rather than by artistic ideals of taste. Some of the names just mentioned remind us that in France, as in Germany and Holland, the Reformation was closely connected with the revival of learning. Humanism has never been in the narrow sense of that term Protestant; still less has it been strictly Catholic. In Italy it fostered a temper of mind decidedly averse to theological speculation and religious earnestness. In Holland and Germany, with Erasmus, Reuchlin and Melanchthon, it developed types of character, urbane, humane, eminently intelligently critical, which, left to themselves, would not have plunged the north of Europe into the whirlpool of belligerent reform. Yet none the less was the new learning, through the open spirit of inquiry it nourished, its vindication of the private reason, its enthusiasm for republican antiquity, and its proud assertion of the rights of human independence, linked by a strong and subtle chain to that turbid revolt of the individual consciousness against spiritual despotism draped in fallacies and throned upon authority, in this reflection we give the name of Reformation. But, while the necessities of antagonism to papal Rome made it assume at first the form of narrow and sectarian opposition, it marked in fact a vital struggle of the intellect towards truth and freedom, involving future results of scepticism and rationalistic audacity from which its earlier champions would have shrunk. It marked, moreover, in the condition of armed resistance against established authority which was forced upon it by the Counter-Reformation, a firm resolve to assert political liberty, leading in the course of time to a revolution with which the rebellious spirit of the Revival was sympathetic. Thus being the relation of humanism in general to reform, French learning in particular displayed such innovating boldness as threw many of its most conspicuous professors into the camp at war with Rome. Calvin, the French student of Picard origin, created the type of Protestantism to which the majority of French Huguenots adhered. This too was a moment at which philosophical seclusion was hardly possible. In a nation so tumultuously agitated one side or the other had to be adopted. Those of the Revival men humanists who did not proclaim Huguenot opinions found themselves obliged with Muretus to lend their talents to the Counter-Reformation, or to suffer persecution for heterodoxy, like Dolet. The church, terrified and infuriated by the progress of reform, suspected learning on its own account. To be an eminent scholar was to be accused of immorality, heresy and atheism in a single indictment; and the defence of weaker minds lay in joining the Jesuits, as Heinsius was fain to do. France had not yet passed above the earlier Renaissance in an Italianizing spirit before the Reformation made itself felt as a political actuality. This fact, together with the strong Italian bias of the Valois, serves to explain in some degree the peculiar character why the Reformation entailed fierce entangled civil wars, massacres of St Bartholomew, murders of the Guises, regicides, treasons and empoisonments that terminated with the compromise of Henry IV. It is no part of the present subject to analyse the political, religious and social interests of that struggle. The upshot was the triumph of the Counter-Reformation, and the establishment of its principle, absolutism, as the basis of French government. It was in the reign of Louis XIV. when that nation had been reduced to order, uttered the famous word of absolutism, "L'Etat, c'est moi."

The Netherlands—Flemish and Dutch painting.

The Renaissance in the Low Countries, as elsewhere, had its brilliant age of arts and letters. During the middle ages the wealthy free towns of Flanders flourished under conditions not dissimilar to those of the Italian republics. They raised splendid specimens of architectural beauty, which were modified in the 15th and 16th centuries by the artistic elements of the new style. The Van Eycks, followed by Memling, Metsys, Mabuse, Lucas van Leyden, struck out a new path in the revival of painting and taught Europe the secret of oil-colouring. But it was reserved for the 17th century to witness the flower and fruit time of this powerful art in the work of Porbus, Rubens and Vandyck, in the Dutch schools of landscape and homely life, and in the unique masterpieces of Rembrandt. We have a right to connect this later period with the Renaissance, because the distracted state of the Netherlands during the 16th century suspended, while it could not extinguish, their artistic development. The various schools of the 17th century, moreover, are animated with the Renaissance spirit no less surely than the Florentine school of the 15th or the Venetian of the 16th. The animal vigour and carnal enjoyment of Rubens, the stately Italianizing beauty of Vandyck, the mystery and light and gloom on Rembrandt's panels, the love of nature in Ruysdael, Cuyp and Van Hooghe, with their luminously misty skies, silvery daylight and broad expanse of landscape, the interest in common life displayed by Ter Borch, Van Ostade, Jan Steen, Teniers, the instinct for the beauty of animals in Potter, the vast sea spaces of Vanderveldt, the grasp on reality, the acute intuition into character in portraits, the scientific study of the world and man, the robust sympathy with all things human displayed throughout the whole art of the Low Countries, are a direct emanation from the Renaissance.

Flemish and Dutch scholarship.

The vernacular in the Netherlands profited at first but little by the impulse which raised Italian, Spanish, French and English to the rank of classic languages. But humanism, first of all in its protagonist Erasmus, afterwards in the long list of critical scholars and editors, Lipsius, Heinsius and Grotius, in the printing Elzevirs and Plantin, developed itself from the centre of the Leiden university with massive energy, and proved that it was still a motive force of intellectual progress. The labours of classical learning the students of the Low Countries broke new ground chiefly by methodical collection, classification and comprehensive criticism of previously accumulated stores. Their works were solid and substantial edifices, forming the substratum for future scholarship. In addition to this they brought philosophy and scientific thoroughness to bear on studies which had been pursued in a more literary spirit. It would, however, be uncritical to pursue this subject further: for the encyclopaedic labours of Dutch philologers belong to a period when the Renaissance was overpast. For the same reason it is inadmissible to do more than mention the name of Spinoza here.

The Netherlands became the battlefield of Reformation and Counter-Reformation in even a stricter sense than France. Here the antagonistic principles were plainly posed in the course of struggle against foreign despotism. The conflict ended in the assertion of political independence as opposed to absolute dominion. Europe in large measure owes the modern ideal of political liberty to that spirit of stubborn resistance which broke the power of Spain. Recent history, and in particular the history of democracy, claims for its province the several stages whereby this principle was developed in England and America, and its outburst in the frenzy of the French Revolution. It is enough here to have alluded to the part played by the Low Countries in the genesis of a motive force which may be described as the last manifestation of the Renaissance striving after self-emancipation.

Dutch wars of independence.

The insular position of England, combined with the nature of the English people, has allowed us to feel the vibration of European movements later and with less of shock than any of the continental nations. Before a wave of progress has reached our shores we have had the opportunity of watching it as spectators, and of considering how we shall receive it. Revolutions have passed from the tumultuous stages of their origin into some settled and recognizable state before we have been called upon to cope with them. It was thus that England took the influences of the Renaissance and Reformation simultaneously, and almost at the same time found herself engaged in that struggle with the Counter-Reformation which, crowned by the defeat of the Spanish Armada, stimulated the sense of nationality and developed the naval forces of the race. Both Renaissance and Reformation had been anticipated by at least a century in England. Chaucer's poetry, which owed so much to Italian examples, gave an early foretaste of the former. Wickliffe's teaching was a vital moment in the latter. But the French wars, the Wars of the Roses and the persecution of the Lollards deferred the coming of the new age; and the year 1536, when Henry VIII. passed the Act of Supremacy through parliament, may be fixed as the date when England entered definitively upon a career of intellectual development abreast with the foremost nations of the continent. The circumstances just now insisted on explain the peculiar character of the English Renaissance. The Reformation had been adopted by consent of the king, lords and commons; and this change in the state religion, though it was not confirmed without reaction, agitation and bloodshed, cost the nation comparatively little disturbance. Humanism, before it affected the bulk of the English people, had already permeated Italian and French literature. Classical erudition had been adapted to the needs of modern thought. The hard work of collecting, printing, annotating and translating Greek and Latin authors had been accomplished. The masterpieces of antiquity had been interpreted and made intelligible. Much of the learning popularized by our poets and dramatists was derived at second hand from modern literature. This does not mean that England was deficient in ripe and sound scholars. More, Colet, Ascham, Cheke, Camden were men whose familiarity with the classics was both intimate and easy. Public schools and universities conformed to the modern methods of study; nor were there wanting opportunities for youths of humble origin to obtain an education which placed them on a level with Italian scholars. The single case of Ben Jonson sufficiently proves this. Yet learning did not at this epoch become a marked speciality in England. There was no class corresponding to the humanists. It should also be remembered that the best works of Italian literature were introduced into Great Britain together with the classics. Phaer's *Virgil*, Chapman's *Homer*, Harrington's *Orlando*, Marlowe's *Hero and Leander*, Fairfax's *Jerusalem Delivered*, North's *Plutarch*, Hoby's *Courtier*—to mention only a few examples—placed English readers simultaneously in possession of the most eminent and representative works of Greece, Rome and Italy. At the same time Spanish influences reached them through the imitators of Guevara and the dramatists; French influences in the versions of romances; German influences in popular translations of the Faust legend, *Eulenspiegel* and similar productions. The authorized version of the Bible had also been recently given to the people—so that almost at the same period of time England obtained in the vernacular an extensive library of ancient and modern authors. This was a privilege enjoyed in like measure by no other nation. It sufficiently accounts for the richness and variety of Elizabethan literature, and for the enthusiasm with which the English language was cultivated.

Combined influences of Renaissance and Reformation.

England in the Renaissance period.

Speaking strictly, England borrowed little in the region of the arts from other nations, and developed still less that was original. What is called Jacobean architecture marks indeed an interesting stage in the transition from the Gothic style. But, compared with Italian, French, Spanish, German and Flemish work of a like period, it is both timid and dry. Sculpture was represented in London for a brief space by Torrigiani; painting by Holbein and Antonio More; music by Italians and Frenchmen of the Chapel Royal. But no Englishmen rose to European eminence in these departments. With literature the case was very different. Wyat and Surrey began by engrafting the forms and graces of Italian poetry upon the native stock. They introduced the sonnet and blank verse. Sidney followed with the sestine and terza rima and with various experiments in classic metres, none of which took root on English soil. The sonnet he handled the octave stanza. Marlowe gave new vigour to the couplet. The first period of the English Renaissance was one of imitation and assimilation. Academies after the Italian type were established. Tragedies in the style of Seneca, rivalling Italian and French dramas of the epoch, were produced. Attempts to Latinize ancestral rhythms, similar to those which had failed in Italy and France, were made. Tentative essays in criticism and dissertations on the art of poetry abounded. It seemed as though the Renaissance ran a risk of being throttled in its cradle by superfluity of foreign and pedantic nutriment. But the natural vigour of the English genius resisted influences alien to itself, and showed a robust capacity for digesting the varied diet offered to it. As there was nothing despotic in the temper of the ruling classes, nothing oppressive in English culture, the literature of that age evolved itself freely from the people. It was under these conditions that Spenser gave his romantic epic to the world, a poem which deals with allegory from the middle ages, its decorative richness from the Italian Renaissance, its sweetness, purity, harmony and imaginative splendour from the most creative nation of the modern world. Under the same conditions the Elizabethan drama, which in its totality is the real exponent of the English Renaissance, came into existence. This drama very early freed itself from the pseudo-classic mannerism which imposed on tragedy in Italy and France. Depicting feudalism in the vivid colours of an age at war with feudal institutions, breathing into antique histories the breath of actual life, embracing the romance of Italy and Spain, the mysteries of German legend, the fictions of poetic tradition, the facts of daily life, the humours of the moment and abstractions of philosophical speculation, in a homogeneous anarchical instinct with intense vitality, this extraordinary birth of time, with Shakespeare for the master of all ages, left a monument of the Renaissance unrivalled for its creative power by any other product of that epoch. To complete the sketch, we must add Bacon, the expositor of modern scientific method, beside Spenser and Shakespeare, as the third representative of the Renaissance in England. Nor should Raleigh, Drake, Hawkins, the semi-buccaneer explorers of the ocean, be omitted. They, following the lead of Portuguese and Spaniards, combating the Counter-Reformation on the seas, opened for England her career of colonization and planted the germs of that world-wide political policy of Tudors and Stewarts tended towards monarchical absolutism, while the Reformation in England, modified by contact with the Low Countries during their struggles, grew narrowing into strict reactionary intolerance. Puritanism indicated a revolt of the religious conscience of the nation against the arts and manners of the Renaissance, against the encroachments of belligerent Catholicism, against the corrupt and Italianized court of James I., against the absolutist pretensions of his son Charles. In its final manifestation during the Commonwealth, Puritanism won a transient victory over the mundane forces of both Reformation and Renaissance, as these had already shaped England. It also secured the eventual triumph of constitutional independence. Milton, the greatest humanistic poet of the English race, lent his pen and moral energies during the best years of his life to securing that principle of liberty which modern political systems at present rest. Thus the geographical isolation of England, and the comparatively late adoption by the English of matured Italian and German influences, give peculiar complexity to the phenomena of Reformation and Renaissance simultaneously developed on our island. The period of our history between 1536 and 1642 shows how difficult it is to separate these two factors in the re-birth of Europe, both of which contributed so powerfully to the formation of modern English nationality.

Arts, letters and the drama.

English reaction against Catholicism, monarchical absolutism, and Renaissance culture.

It has been impossible to avoid an air of superficiality, and the repetition of facts known to every schoolboy, in this sketch of so complicated a subject as the Renaissance,—embracing many nations, a great variety of topics and an indefinite period of time. Yet no other treatment was possible upon the lines laid down at the outset, where it was explained why the term Renaissance cannot now be confined to the Revival of Learning and the effect of antique studies upon literary and artistic ideals. The purpose of this article has been to show that, while the Renaissance implied a new way of regarding the material world and human nature, a new conception of man's destiny and duties on this planet, a new culture and new intellectual perceptions penetrating every sphere of thought and energy, it also involved new reciprocal relations between the members of the European group of nations. The Renaissance closed the middle ages and opened the modern era, —not merely because the mental and moral ideas which then sprang into activity and owed their force in large measure to the revival of classical learning were opposed to medieval modes of thinking and feeling, but also because the political and international relations specific to it as an age were at variance with fundamental theories of the past. Instead of empire and church, the sun and moon of the medieval system, a federation of peoples, separate in type and divergent in interests, yet bound together by common tendencies, common culture and common efforts, came into existence. For obedience to central authority was substituted balance of power. Henceforth the hegemony of Europe attached to no crown, imperial or papal, but to the nation which was capable of winning it, in the spiritual region by mental ascendancy, and in the temporal by force.

New political relations in Europe dating from the Renaissance.

That this is the right way of regarding the subject appears from the events of the first two decades of the 16th century, those years in which the humanistic revival attained its highest point in Italy. Luther published his theses in 1517, sixty-four years after the fall of Constantinople, twenty-three years after the expedition of Charles VIII. to Naples, ten years before the sack of Rome, at a moment when France, Spain and England had only felt the influences of Italian culture but feebly. From that date forward two parties wrestled for supremacy in Europe, to which may be given the familiar names of Liberalism and Conservatism, the party of progress and the party of established institutions. The triumph of the former was most signal among the Teutonic peoples. The Latin races, championed by Spain and supported by the papacy, fought the battle of the latter, and succeeded for a time in rolling back the tide of revolutionary conquest. Meanwhile that liberal culture which had been created for Europe by the Italians before the contest of the Reformation began continued to spread, although it was stifled in Italy and Spain, retarded in France and the Low Countries, well-nigh extirpated by wars in Germany, and diverted from its course in England by the counter-movement of Puritanism. The *autos da fé* of Seville and Madrid, the flames to which Bruno, Dolet and Paleario were flung, the dungeon of Campanella and the seclusion of Galileo, the massacre of St Bartholomew and the faggots of Smithfield, the desolated plains of Germany and the cruelties of Alva in the Netherlands, disillusioned Europe of those golden dreams which had arisen in the earlier days of humanism, and which had been so pleasantly indulged by Rabelais. In truth the Renaissance was ruled by no *Astraea redux*, but rather by a severe spirit which brought no peace but a sword, reminding men of sternest duties, testing what of moral force and tenacity was in them, compelling them to strike for the old order or the new, suffering no lukewarm halting between two opinions. That, in spite of retardation and retrogression, the old order of ideas should have yielded to the new all over Europe,—that science should have won firm standing-ground, and political liberty should have struggled through those birth-throes of its origin,—was in the nature of things. Had this not been, the Renaissance or re-birth of Europe would be a term without a meaning. (J. A. S.)

Conservative and progressive parties in modern Europe.

LITERATURE.—The special articles on the several arts and the literatures of modern Europe, and on the biographies of great men mentioned in this essay, will give details of necessity here omitted. Of works on the Renaissance in general may be mentioned Jacob Burckhardt, *Die Cultur der Renaissance in Italien* (Eng. trans., 1878); G. Voigt, *Wiederbelebung des Classischen Alterthums* (2 vols. 3rd ed., by M. Lehnerdt, 1893); J. A. Symonds, *Renaissance in Italy*; Marc Monnier, *Renaissance de Dante à Luther*; Eugène Müntz, *Précurseurs de la Renaissance* (1882), *Renaissance en Italie et en France* (1885), and *Hist. de l'art pendant la Renaissance* (1889–95); Ludwig Geiger, *Humanismus und Renaissance in Italien und Deutschland* (1882), and *Cambridge Modern History*, vol. i., "The Renaissance" (Cambridge, 1903), where full bibliographies will be found.

RENAIX, a town of Belgium in the province of East Flanders, 8 m. S. of Oudenarde. It has extensive dyeworks, bleaching grounds and manufactories for linen and woollen goods. Pop. (1904) 20,760.

RENAN, ERNEST (1823–1892), French philosopher and Orientalist, was born on the 27th of February 1823 at Tréguier. His father's people were of the fisher-clan of Renans or Ronans; his grandfather, having made a small fortune by his fishing smack, bought a house at Tréguier and settled there, and his father, captain of a small cutter and an ardent Republican, married the daughter of Royalist trading-folk from the neighbouring town of Lannion. All his life Renan was divided between his father's and his mother's political beliefs. He was only five years old when his father died, and his sister Henriette, who was seven years older than he, a girl of remarkable energy, was henceforth morally the head of the household. Having in vain attempted to keep a school for girls at Tréguier, she left her native place and went to Paris as teacher in a young ladies' boarding-school. Ernest meanwhile was educated in the ecclesiastical seminary of his native place. His good-conduct notes for this period describe him as "docile, patient, diligent, painstaking, thorough." We do not hear that he was brilliant, but the priests cared little for such qualities. While the priests were grounding him in mathematics and Latin, his mother completed his education. She was only half a Breton. Her paternal ancestors came from Bordeaux, and Renan used to say that in his own nature the Gascon and the Breton were constantly at odds.

In the summer of 1838 Renan carried off all the prizes at the collège of Tréguier. His sister in Paris told the doctor of the school in which she taught about the success of her brother, and he carried the news to F. A. P. Dupanloup, then engaged in organizing the ecclesiastical college of St Nicholas du Chardonnet, a school in which the young Catholic nobility and the most gifted pupils of the Catholic seminaries were to be educated together, with a view to cementing the bond between the aristocracy and the priesthood. Dupanloup sent for Renan at once. He was fifteen and a half. He had never been outside his Breton province. "I learned with stupor that knowledge was not a privilege of the church . . . I awoke to the meaning of the words talent, fame, celebrity." Above all, religion seemed there wholly different in Tréguier and in Paris. The superficial, brilliant, pseudo-scientific Catholicism of the capital did not satisfy Renan, who had accepted the austere faith of his Breton masters.

In 1840 Renan left St Nicholas to study philosophy at the seminary of Issy. He entered with a passion for Catholic scholasticism. The rhetoric of St Nicholas had wearied him, and his serious intelligence hoped to satisfy itself with the vast and solid material of Catholic theology. Reid and Malebranche first attracted him among the philosophers, and after these he turned to Hegel, Kant and Herder. Renan began to perceive the essential contradiction between the metaphysics which he studied and the faith that he professed, but an appetite for truths that can be verified restrained his scepticism. "Philosophy excites and only half satisfies the appetite for truth; I am eager for mathematics," he wrote to his sister Henriette. Henriette had accepted in the family of Count Zamoyski an engagement more lucrative than her former place. She exercised

the strongest influence over her brother, and her published letters reveal a mind almost equal, a moral nature superior, to his own

It was not mathematics but philology which was to settle the gathering doubts of Ernest Renan. His course completed at Issy, he entered the college of St Sulpice in order to take his degree in philology prior to entering the church; and here he began the study of Hebrew. He saw that the second part of Isaiah differs from the first not only in style but in date; that the grammar and the history of the Pentateuch are posterior to the time of Moses; that the book of Daniel is clearly apocryphal. It followed from his training that, if you admit one error in a revealed text, you incriminate the whole. Secretly, Renan felt himself cut off from the communion of saints, and yet with his whole heart he desired to live the life of a Catholic priest Hence a struggle between vocation and conviction; owing to Henriette, conviction gained the day. In October 1845 Renan left the seminary of St Sulpice for Stavistas, a lay college of the Oratorians. Finding himself even there too much under the domination of the church, a few weeks later he reluctantly broke the last tie which bound him to the religious life and entered M. Crouzet's school for boys as an usher.

It is always dangerous to educate a really great mind in only one order of truth. Renan, brought up by priests in a world ruled by authority and curious only of feeling and opinion, was to accept the scientific ideal with an extraordinary expansion of all his faculties. His life was henceforth ravished by the splendour of the cosmos. At the end of his life he wrote of Amiel, "The man who has time to keep a private diary has never understood the immensity of the universe." The certitudes of physical and natural science were revealed to Renan in 1846 by the chemist Marcellin Berthelot, then a boy of eighteen, his pupil at M. Crouzet's school. To the day of Renan's death their friendship continued. Renan was occupied as usher only in the evenings. In the daytime he continued his researches in Semitic philology. In 1847 he obtained the Prix Volney—one of the principal distinctions awarded by the Academy of Inscriptions—for the manuscript of his "General History of Semitic Languages." In 1848 he took his degree as Agrégé de Philosophie; that is to say, fellow of the university, and was offered a place as master in the lycée of Vendôme. In 1848 a small temporary appointment to the lycée of Versailles permitted him to return to the capital and resume his studies.

The revolution of 1848 aroused in Renan that side of him which loved the priesthood because "the priest lives for his fellows." He for the first time confronted the problems of Democracy. The result was an immense volume, *The Future of Science*, which remained in manuscript until 1890. *L'Avenir de la science* is an attempt to conciliate the privileges of a necessary *élite* with the diffusion of the greatest good of the greatest number. The difficulty haunted Renan throughout his life. By the time he had finished his elaborate scheme for regenerating society by means of a devoted aristocracy of knowledge, and the diffusion of culture, the year 1848 was past, and with it his fever of Democracy. In 1849 the French government sent him to Italy on a scientific mission. He remained eight months abroad, during which he forgot his anxiety about the toilers' lot. Hitherto he had known nothing of art. In Italy the artist in him awoke and triumphed over the savant and the reformer. On his return to Paris Renan lived with his sister Henriette. A small post at the National Library, together with his sister's savings, furnished him with the means of livelihood. In the evenings he wrote for the *Revue des deux mondes* and the *Débats* the exquisite essays which appeared in 1857 and 1859 under the titles *Études d'histoire religieuse* and *Essais de morale et de critique*. In 1852 his book on *Averroès* had brought him not only his doctor's degree, but his first reputation as a thinker. In his two volumes of essays Renan shows himself a Liberal, but no longer a Democrat. Nothing, according to his philosophy, is less important than prosperity. The greatest good of the greatest number is a theory as dangerous as it is illusory. Man is not born to be prosperous, but to realize, in a little vanguard of chosen spirits, an ideal superior to the ideal of yesterday. Only the few can attain a complete development. Yet there is a solidarity between the chosen few and the masses which produce them; each has a duty to the other. The acceptance of this duty is the only foundation for a moral and just society The aristocratic idea has seldom been better stated.

The success of the *Études d'histoire religieuse* and the *Essais de morale* had made the name of Renan known to a cultivated public. While Mademoiselle Renan remained shut up at home copying her brother's manuscripts or compiling material for his work, the young philosopher began to frequent more than one Parisian salon, and especially the studio of Ary Scheffer, at that time a noted social centre. In 1856 he proposed to marry Cornélie Scheffer, the niece and adopted daughter of the great Dutch painter. Not without a struggle Henriette consented not only to the marriage, but to make her home with the young couple, whose housekeeping depended on the sum that she could contribute. The history of this romance has been told by Renan in the memorial essay which he wrote some six years later, entitled *Ma Sœur Henriette*. His marriage brought much brightness into his life, a naturalness into his style and a greater attention to the picturesque. He did not forsake his studies in Semitic philology, and in 1859 appeared his translation of the *Book of Job* with an introductory essay, followed in 1859 by the *Song of Songs*.

Renan was now a candidate for the chair of Hebrew and Chaldæan languages at the Collège de France, which he had desired since first he studied Hebrew at the seminary of St Sulpice. The death of the scholar Quatremère had left this post vacant in 1857. No one in France save Renan was capable of filling it. The Catholic party, upheld by the empress, would not appoint an unfrocked seminarist, a notorious heretic, to a chair of Biblical exegesis. Yet the emperor wished to conciliate Ernest Renan. He offered to send the young scholar on an archaeological mission to Phoenicia. Renan immediately accepted. Leaving his wife at home with their baby son, Renan left France, accompanied by his sister, in the summer of 1860. Madame Renan joined them in January 1861, returning to France in July. The mission proved fruitful in Phoenician inscriptions which Renan published in his *Mission de Phénicie*. They form the base of that *Corpus Inscriptionum Semiticarum* on which he used in later years to declare that he founded his claim to remembrance. He wished to complete his exploration of the upper range of Lebanon; he remained, therefore, with Henriette to affront the dangerous miasma of a Syrian autumn. At Amshit, near Byblos, Henriette Renan died of intermittent fever on the 24th of September 1861. Her brother, himself at death's door, was carried unconscious on board a ship waiting in harbour and bound for France. The sea air revived him, but he reached France broken apparently in heart and health. His sister in her last days had entreated him not to give up his candidature for the chair of Hebrew, and on the 11th of January 1862 the Minister of Public Instruction ratified Renan's election to the post. But his opening lecture, in which, amid the applause of the students, Renan declared Jesus Christ "an incomparable Man," alarmed the Catholic party. Renan's lectures were pronounced a disturbance of the public peace, and he was suspended. On the 2nd of June 1864, on opening the newspaper, Renan saw that he had been transferred from the chair of Hebrew at the College of France to the post of sub-librarian at the National Library. He wrote to the Minister of Public Instruction: "Pecunia tua tecum sit!" He refused the new position, was deprived of his chair, and henceforth depended solely upon his pen.

Henriette had told him to write the life of Jesus. They had begun it together in Syria, she copying the pages as he wrote them, with a New Testament and a *Josephus* for all his library. The book bears the mark of its origin—it is filled with the atmosphere of the East. It is the work of a man familiar with the Bible and theology, and no less acquainted with the inscriptions, monuments, types and landscapes of Syria. But it is scarcely the work of a great scholar: Renan's debt to the school

of Tübingen has been exaggerated, in so far as regards the *Life of Jesus*. The book appeared on the 23rd of June 1863; before November sixty thousand copies of it were in circulation. Renan still used his literary gifts to pursue a scientific ideal. In the days when he had composed his huge, immature treatise on the *Future of Science*, he had written: "I envy the man who shall evoke from the past the origins of Christianity. Such a writer would compose the most important book of the century." He set to work to realize this project, and produced the *Apostles* in 1866, and *St Paul* in 1869, after having visited Asia Minor with his wife, where he studied the scenes of the labours of St Paul as minutely as in 1861 he had observed the material surroundings of the life of Jesus.

Renan was not only a scholar. In *St Paul*, as in the *Apostles*, he shows his concern with the larger social life, his sense of fraternity, and a revival of the democratic sentiment which had inspired *L'Avenir de la science*. In 1869 he presented himself as the candidate of the liberal opposition at the parliamentary election for Meaux. While his temper had become less aristocratic, his Liberalism had grown more tolerant. On the eve of its dissolution Renan was half prepared to accept the Empire, and, had he been elected to the Chamber of Deputies, he would have joined the group of *l'Empire libéral*. But he was not elected. A year later war was declared with Germany, the Empire fell, and Napoleon III. went into exile. The Franco-German War was a turning-point in Renan's history. Germany had always been to him the asylum of thought and disinterested science. Now he saw the land of his ideal overrun and ruin the land of his birth; he beheld the German no longer as a priest, but as an invader. His heart turned to France. In *La Réforme intellectuelle et morale* (1871) he endeavoured at least to bind her wounds, to safeguard her future. Yet he was still under the influence of Germany. The ideal and the discipline which he proposed to his defeated country were those of her conqueror—a feudal society, a monarchical government, an *élite*, which the rest of the nation exists merely to support and nourish; an ideal of honour and duty imposed by a chosen few on the recalcitrant and subject multitude. The errors of the Commune confirmed Renan in this reaction. At the same time the irony always perceptible in his work grows more bitter. His *Dialogues philosophiques*, written in 1871, his *Ecclesiastes* (1882) and his *Antichrist* (1876) (the fourth volume of the *Origins of Christianity*, dealing with the reign of Nero) are incomparable in their literary genius, but they are examples of a disenchanted and sceptical temper. He had vainly tried to make his country follow his precepts. He resigned himself to watch her drift towards perdition. The progress of events showed him, on the contrary, a France which every day left a little stronger, and he aroused himself from his disbelieving, disillusioned mood, and observed with genuine interest the struggle for justice and liberty of a democratic society. For his mind was the broadest of the age. The fifth and sixth volumes of the *Origins of Christianity* (the *Christian Church* and *Marcus Aurelius*) show him reconciled with democracy, confident in the gradual ascent of man, aware that the greatest catastrophes do not really interrupt the sum of imperceptible progress of the world—reconciled also in some measure, if not with the truths, at least with the moral beauties of Catholicism, and with the remembrance of his pious youth.

On the threshold of old age the philosopher cast a glance at the days of his childhood. He was nearly sixty when, in 1883, he published those *Souvenirs d'enfance et de jeunesse* which, after the *Life of Jesus*, are the work by which he is chiefly known. They possess that lyric note of personal utterance which the public prizes in a man already famous. They showed the *blasé* modern reader that a world no less poetic, no less primitive than that of the *Origins of Christianity* exists, or still existed within living memory, on the north-western coast of France. They have the Celtic magic of ancient romance and the simplicity, the naturalness, the veracity which the 19th century prized so highly. But his *Ecclesiastes*, published a few months earlier, his *Drames philosophiques*, collected in 1888, give a more adequate image of his fastidious critical, disenchanted, yet not unhopeful spirit. These books are often bitter and melancholy, yet not destitute of optimism. They show the attitude towards uncultured Socialism of a philosopher liberal by conviction, by temperament an aristocrat. We learn in them how Caliban (democracy), the mindless brute, educated to his own responsibility, makes after all an adequate ruler; how Prospero (the aristocratic principle, or, if we will, the mind) accepts his dethronement for the sake of greater liberty in the intellectual world, since Caliban proves an effective policeman, and leaves his superiors a free hand in the laboratory; how Ariel (the religious principle) acquires a firmer hold on life, and no longer gives up the ghost at the faintest hint of change. Indeed, Ariel flourishes in the service of Prospero under the external government of the many-headed brute. For the one thing needful is not destined to succumb. Religion and knowledge are as imperishable as the world they dignify. Thus out of the depths rises unvanquished the essential idealism of Ernest Renan.

Renan was a great worker. At sixty years of age, having finished the *Origins of Christianity*, he began his *History of Israel*, based on a lifelong study of the Old Testament and on the *Corpus Inscriptionum Semiticarum*, published by the Académie des Inscriptions under Renan's direction from the year 1881 till the end of his life. The first volume of the *History of Israel* appeared in 1887, the third and finest volume in 1891, the last two only after the historian's decease. As a history of facts and documents the book has many faults; as an essay on the evolution of the religious idea it is (despite some passages of frivolity, irony, or incoherence) of extraordinary importance; as a reflection of the mind of Ernest Renan it is the most lifelike of images. In a volume of collected essays, *Feuilles détachées*, published also in 1891, we find the same mental attitude, an affirmation of the necessity of piety independent of dogma. On the 12th of October 1892 he died after a few days' illness. In his last years he received many marks of honour, being made an administrator of the Collège de France and grand officer of the Legion of Honour. Two volumes of the *History of Israel*, his correspondence with his sister Henriette, his *Letters to M. Berthelot*, and the *History of the Religious Policy of Philippe-le-Bel*, which he wrote in the years immediately before his marriage, all appeared during the last eight years of the 19th century.

(A. M. F. D.; X.)

RENARD, ALPHONSE FRANÇOIS (1842–1903), Belgian geologist and petrographer, was born at Renaix, in Eastern Flanders, on the 27th of September 1842. He was educated for the church of Rome, and from 1866 to 1869 he was superintendent at the Collège de la Paix, Namur. In 1870 he entered the Jesuit Training College at the old abbey of Maria Laach in the Eifel, and there, while engaged in studying philosophy and science, he became interested in the geology of the district, and especially in the volcanic rocks. Thenceforth he worked at chemistry and mineralogy, and qualified himself for those petrographical researches for which he was distinguished. In 1874 he became professor of chemistry and geology in the college of the Belgian Jesuits at Louvain, a few years later he was appointed one of the curators of the Royal Natural History Museum at Brussels, and in 1882 he relinquished his post at Louvain. In 1888 he was chosen professor of geology at the university of Ghent, and retained the post until the close of his life. Meanwhile he had been ordained priest in 1877, and had intended to enter the Society of Jesus. He was known as the Abbé Renard; but, as remarked by Sir A. Geikie, "As years passed, the longing for mental freedom grew ever stronger, until at last it overmastered all the traditions and associations of a lifetime, and he finally separated himself from the church of Rome." His first work,

written in conjunction with Charles de la Vallée-Poussin (1827–1904), was the *Mémoire sur les caractères mineralogiques et stratigraphiques des roches dites plutoniennes de la Belgique et de l'Ardenne française* (1876). In later essays and papers he dealt with the structure and mineral composition of many igneous and sedimentary rocks, and with the phenomena of metamorphism in Belgium and other countries. In acknowledgment of his work the Bigsby Medal was in 1885 awarded to him by the Geological Society of London. Still more important were his later researches connected with the Challenger Expedition. The various rock specimens and oceanic deposits were submitted to him for examination in association with Sir John Murray, and their detailed observations were embodied in the *Report on the Scientific Results of the Voyage of H.M.S. "Challenger." Deep Sea Deposits* (1891). The more striking additions to our knowledge included "the detection and description of cosmic dust, which as fine rain slowly accumulates on the ocean floor; the development of zeolitic crystals on the sea-bottom at temperatures of 32° and under; and the distribution and mode of occurrence of manganiferous concretions and of phosphatic and glauconite deposits on the bed of the ocean" (Geikie). Renard died at Brussels on the 9th of July 1903.

Obituaries by Sir A. Geikie in *Quart. Journ. Geol. Soc.*, lx. 1904, and in *Geol. Mag.*, Nov. 1903.

RENAUD DE MONTAUBAN (Rinaldo di Montalbano), one of the most famous figures of French and Italian romance. His story was attached to the *geste* of Doon of Mayence by the 13th-century *trouvère* who wrote the *chanson de geste* of *Renaus de Montauban*, better known perhaps as *Les quatre fils Aymon*. The four sons of Aymon give their name to inns and streets in nearly every town of France, and the numerous prose versions show what a hold the story gained on the popular imagination. Renaud's sword Floberge, and his horse Bayard passed with him into popular legend. The poem of *Renaus de Montauban* opens with the story of the dissensions between Charlemagne and the sons of Doon of Mayence, Beuves d'Aigremont, Doon de Nanteuil and Aymon de Dordone. The rebellious vassals are defeated by the imperial army near Troyes, and, peace established, Aymon rises in favour at court, and supports the emperor, even in his persecution of his four sons, Renaud, Alard, Guichard and Richard. A second feud arises from a quarrel between Renaud and Bertolai, Charlemagne's nephew, over a game of chess, in the course of which Renaud kills Bertolai with the chess-board. The hero then mounts his steed Bayard, and escapes with his brothers to the Ardennes, where they build the castle of Montessor overlooking the Meuse. At Château Renaud, near Sédan, there existed in the 18th century a ruined castle with a tower called the "tour Maugis" and the reputed stable of Bayard. The outlaws are eventually persuaded to seek their fortune outside Charlemagne's kingdom, and cross the Loire to take service with King Yon of Gascony against the Saracens, accompanied by their cousin, the enchanter Maugis. Yon, however, is compelled by Charlemagne to withdraw his protection, and the castle of Montauban, which the brothers have built on the Dordogne, is besieged by the emperor. They next seek refuge beyond the Rhine, and sustain a third siege at Trémoigne (Dortmund), after which the emperor is persuaded by the barons to make peace. Bayard is abandoned to Charlemagne, and thrown into the Meuse, only to rise again. He still gallops over the hills of the Ardennes on St John's Eve. Renaud, who throughout the story is a type of the Christian and chivalric virtues, makes a pilgrimage to the Holy Land and is invested with some of the exploits of Godfrey de Bouillon. On his return he gives himself up to religion, working as a mason on the church of St Peter at Cologne, where he receives martyrdom at the hands of his jealous fellow-labourers.

The story is closely connected with the legend of Girard de Roussillon. The *chanson de geste* of *Renaus de Montauban* falls into sections which had probably been originally the subject of separate recitals. These may have arisen at different dates, and were not necessarily told in the first instance of the same person, the account of Renaud on the crusade being obviously a late interpolation. The outlaw life of the brothers in the Ardennes bears the marks of trustworthy popular tradition, and it was even at one time suggested that the Gascon and Rhenish episodes were reduplications of the story of Montessor. The connexion of the four brothers with Montessor, Dortmund, Mayence and Cologne, and the abundant local tradition, mark the heroes as originating from the region between the Rhine and the Meuse. Nevertheless, their adventures in Gascony are corroborated by historical evidence, and this section of the poem is the oldest. The enemy of Renaud was Charles Martel, not Charlemagne; Yon was Odo of Gascony, known indifferently as duke, prince, or king; the victory over the Saracens at Toulouse, in which the brothers are alleged to have taken part, was won by him in 721, and in 719 the sheltered refugees from the dominions of Charles Martel, Chilperic II., king of Neustria, and his mayor of the palace, Raginfred, whom he was compelled to abandon. In a local chronicle of Cologne it is stated that Saint Reinoldus died in 697, and in the Latin rhythmical *Vita* his martyrdom is said to have taken place under Bishop Agilolf (d. 717). Thus the romance was evidently composite before it took its place in the Carolingian cycle.

In Italy Renaud had his greatest vogue. His connexion with the treacherous family of Mayence was thrust into the background, and many episodes were added, as well as the personage of the hero's sister, Bradamante. Rinaldo di Montalbano had been the subject of many Italian poems before *Il Rinaldo* of Tasso.

BIBLIOGRAPHY.—The *chanson of Maugis d'Aigremont* and the prose romance of the *Conqueste de Trebizonde* belong to the same cycle. The prose *Ystoire de Regnault de Montauban* (Lyons, *c.* 1480) had a great vogue. It was generally printed as *Les quatre fils Aymon*, and was published in English, *The Foure Sonnes of Aymon*, by William Caxton, and subsequently by Wynkyn de Worde and William Copland. See *Hist. litt. de la France*, xxii., analysis by Paulin Paris; *Renaus de Montauban* (Stuttgart, 1862), edited by Hermann Michaelsen; F. Wulff, *Recherches sur les sagas de Magus et de Geirard* (Lund, 1873); *Magus saga*, ed. G. Cederschiöld (Lund, 1876); *Renout von Montalbaen*, ed. J. C. Matthis (Groningen, 1873); A. Longnon, in *Revue des questions historiques* (1879); and Wm. Ulser *die Sprache von Renaut von Montalbaen* (Halle, 1884); F. Pfaff, *Das deutsche Volksbuch von den Heymonskindern* (Freiburg in Breisgau, 1887), with a general introduction to the study of the saga: *The Four Sonnes of Aimon* (E. E. Text. Soc., ed. Octavia Richardson, 1884); a special bibliography of the printed editions of the prose romance in L. Gautier's *Bibl. des chansons de geste* (1897); rejuvenations of the story by Karl Simrock (Frankfort, 1845), and by Richard Steel (London, 1897); *Storia di Rinaldino*, ed. C. Minutoli (Bologna, 1865). Stage versions are: *Renaud de Montauban*, a play translated from Lope de Vega was played at the Théâtre italien, Paris, in 1717; *Les quatre fils Aymon*, opéra comique by MM. de Leuven and Brunswick, music by Balfe, in 1884.

RENAUDOT, EUSÈBE (1646–1720), French theologian and Orientalist, was born in Paris in 1646, and educated for the church. Notwithstanding his taste for theology and his title of abbé, much of his life was spent at the French court, where he attracted the notice of Colbert and was often employed in confidential affairs. The oriental learning in Eastern tongues which he acquired in his youth and maintained amid the distractions of court life did not bear fruit till he was sixty-two. His best-known books are *Historia Patriarcharum Alexandrinorum* (Paris, 1713) and *Liturgiarum orientalium collectio* (2 vols., 1715–16). The latter was designed to supply proofs of the "perpetuity of the faith" of the church on the subject of the sacraments, the topic on which most of his theological writings turned, and which was then, in consequence of the controversies attaching to Arnauld's *Perpétuité de la foi*, a burning one between French Catholics and Protestants. Renaudot was not a fair controversialist, but his learning and industry are unquestionable. He died in 1720.

RENAUDOT, THÉOPHRASTE (1586–1653), French physician and philanthropist, was born at Loudun (Vienna), and studied surgery in Paris. He was only nineteen when he received, by favour apparently, the degree of doctor at Montpellier. After some time spent in travel he began to practise in his native town. In 1612 he was summoned to Paris by

Richelieu, partly because of his medical reputation, but more because of his philanthropy. He received the titles of physician and councillor to the king, and was desired to organize a scheme of public assistance. Many difficulties were put in his way, however, and he therefore returned until 1624 to Poitou, where Richelieu made him "commissary general of the poor." It was six years before he was able to begin his work in Paris by opening an information bureau at the sign of the Grand Coq near the Pont Saint-Michel. This *bureau d'adresse* was labour bureau, intelligence department, exchange and charity organization in one; and the sick were directed to doctors prepared to give them free treatment. Presently he established a free dispensary in the teeth of the opposition of the faculty in Paris. The Paris faculty refused to accept the new medicaments proposed by the heretic from Montpellier, restricting themselves to the old prescriptions of blood-letting and purgation. In addition to his *bureau d'adresse* Renaud established a system of lectures and debates on scientific subjects, the reports of which from 1633 to 1642 were published in 1651 with the title *Recueil des conférences publiques*. Under the protection of Richelieu he started the first French newspaper, the *Gazette* (1631), which appeared weekly and contained political and foreign news. He also edited the *Mercure français* and published all manner of reports and pamphlets. In 1637 he opened in Paris the first Mont de Piété, an institution of which he had seen the advantages in Italy. In 1640 the medical faculty, headed by Guy Patin, started a campaign against the innovations of the Grand Coq. After the death of Richelieu and of Louis XIII. the victory of Renaudot's enemies was practically certain. The parlement of Paris ordered him to return the letters patent for the establishment of his bureau and his Mont de Piété, and refused to allow him to practise medicine in Paris. The *Gazette* remained, and in 1646 Renaudot was appointed by Mazarin historiographer to the king. During the first Fronde he had his printing presses at Saint-Germain. He died on the 25th of October 1653. His difficulties had been increased by his Protestant opinions. His sons Isaac (d. 1688) and Eusèbe (d. 1679) were students for ten years before they could obtain their doctorates from the faculty. They carried on their father's work, and defended the virtues of antimony, laudanum and quinine against the schools.

See E. Hatin, *Théodore Renaudot* (Poitiers, 1883), and *La Maison du Coq* (Paris, 1895); Michel Empy, *Renaudot et l'introduction de la médication chimique* (Paris, 1889); and G. Bonnefont, *Un Oublié. Théophraste Renaudot* (Limoges, n.d.).

RENDEZVOUS, a place of meeting appointed or arranged for the assembling of troops, ships or persons. The word was adopted in English at the end of the 16th century from the French substantival use of the imperative *rendez vous, i.e.* "render or betake yourselves."

RENDSBURG, a town of Germany, in the Prussian province of Schleswig-Holstein, situated on the Eider and on the Kaiser Wilhelm canal, in a flat and sandy district, 20 m. W. of Kiel, on the Altona-Vamdrup railway. Pop. (1905) 15,577. It consists of three parts—the crowded Altstadt, on an island in the Eider; the Neuwerk, on the south bank of the river; and the Kronwerk, on the north bank. Rendsburg is the chief place in the basin of the Eider, and when in the possession of Denmark was maintained as a fortress. Its present importance, however, rests on the commercial facilities afforded by its connexion with the North Sea and the Baltic through the Kaiser Wilhelm canal, by which transit trade is carried on in grain, timber, Swedish iron and coals. The principal industries are cotton-weaving, tanning and the manufacture of artificial manures.

Rendsburg came into existence under the shelter of a castle founded by the Danes about the year 1100 on an island of the Eider, and was an object of dispute between the Danish kings and the counts of Holstein. In 1252 it was adjudged to the latter. The town was surrounded with ramparts in 1530, but the fortifications of the Kronwerk were not constructed till the end of the 17th century. During the Thirty Years' War Rendsburg was taken both by the Imperialists and the Swedes, but in 1645 it successfully resisted a second siege by the latter. The war of 1848–50 began with the capture of Rendsburg by the Holsteiners by a *coup de main*, and it formed the centre of the German operations. On the departure of the German troops in 1852 the Danes demolished the fortifications on the north side. Immediately after the death of King Frederick VII. (15th of November 1863) the town was occupied by the Saxon troops acting as the executive of the German Confederation, and it was the base of the operations of the Austrians and Prussians against Schleswig in the spring of the following year. On the termination of the Danish war in 1864 Rendsburg was jointly occupied by Austrian and Prussian military until 1866, when it fell to Prussia.

See Warmstedt, *Rendsburg* (Kiel, 1850).

RENÉ I. (1409–1480), duke of Anjou, of Lorraine and Bar, count of Provence and of Piedmont, king of Naples, Sicily and Jerusalem, was born at Angers on the 16th of January 1409, the second son of Louis II., king of Sicily, duke of Anjou, count of Provence, and of Yolande of Aragon. Louis II. died in 1417, and his sons, together with their brother-in-law, afterwards Charles VII. of France, were brought up under the guardianship of their mother. The elder, Louis III., succeeded to the crown of Sicily and to the duchy of Anjou, René being known as the count of Guise. By his marriage treaty (1419) with Isabel, elder daughter of Charles II., duke of Lorraine, he became heir to the duchy of Bar, which was claimed as the inheritance of his mother Yolande, and, in right of his wife, heir to the duchy of Lorraine. René, then only ten, was to be brought up in Lorraine under the guardianship of Charles II. and Louis, cardinal of Bar, both of whom were attached to the Burgundian party, but he retained the right to bear the arms of Anjou. He was far from sympathizing with the Burgundians, and, joining the French army at Reims in 1429, was present at the coronation of Charles VII. When Louis of Bar died in 1430 René came into sole possession of his duchy, and in the next year, on his father-in-law's death, he succeeded to the duchy of Lorraine. But the inheritance was claimed by the heir-male, Antoine de Vaudémont, who with Burgundian help defeated René at Bulgnéville in July 1431. The Duchess Isabel effected a truce with Antoine de Vaudémont, but the duke remained a prisoner of the Burgundians until April 1432, when he recovered his liberty on parole on yielding up as hostages his two sons, Jean and Louis of Anjou. His title as duke of Lorraine was confirmed by his suzerain, the Emperor Sigismund, at Basel in 1434. This proceeding roused the anger of the Burgundian duke, Philip the Good, who required him early in the next year to return to his prison, from which he was released two years later on payment of a heavy ransom. He had succeeded to the kingdom of Naples through the deaths of his brother Louis III. and of Jeanne II. de Duras, queen of Naples, the last heir of the earlier dynasty. Louis had been adopted by her in 1431, and she now left her inheritance to René. The marriage of Marie de Bourbon, niece of Philip of Burgundy, with John, duke of Calabria, René's eldest son, cemented peace between the two princes. After appointing a regency in Bar and Lorraine, he visited his provinces of Anjou and Provence, and in 1438 set sail for Naples, which had been held for him by the Duchess Isabel. René's captivity, and the poverty of the Angevin resources due to his ransom, enabled Alphonso of Aragon, who had been first adopted and then repudiated by Jeanne II., to make some headway in the kingdom of Naples, especially as he was already in possession of the island of Sicily. In 1441 Alphonso laid siege to Naples, which he sacked after a six months' siege. René returned to France in the same year, and though he retained the title of king of Naples his effective rule was never recovered. Later efforts to recover his rights in Italy failed. His mother Yolande, who had governed Anjou in his absence, died in 1442. René took part in the negotiations with the English at Tours in 1444, and peace was consolidated by the marriage of his younger daughter, Margaret, with Henry VI. at Nancy. René now made over the government of Lorraine to John, duke of Calabria, who was, however, only formally installed as duke of Lorraine on the death of Queen Isabel in

1453. René had the confidence of Charles VII., and is said to have initiated the reduction of the men-at-arms set on foot by the king, with whose military operations against the English he was closely associated. He entered Rouen with him in November 1449, and was with him at Fourmigny and Caen. After his second marriage with Jeanne de Laval, daughter of Guy XIV., count of Laval, and Isabel of Brittany, René took a less active part in public affairs, and devoted himself more to artistic and literary pursuits. The fortunes of his house declined in his old age. The duke of Calabria, after repeated misfortunes in Italy, was offered the crown of Aragon in 1467, but died, apparently by poison, at Barcelona on the 16th of December 1470; the duke's eldest son Nicholas perished in 1473, also under suspicion of poisoning; René's daughter Margaret was a refugee from England, her son Prince Edward was murdered in 1471, and she herself became a prisoner, to be rescued by Louis XI. in 1476. His only surviving male descendant was then René II., duke of Lorraine, son of his daughter Yolande, comtesse de Vaudémont, who was gained over to the party of Louis XI., who suspected the king of Sicily of complicity with his enemies, the duke of Brittany and the Constable Saint-Pol. René retired to Provence, and in 1474 made a will by which he left Bar to his grandson René II., duke of Lorraine; Anjou and Provence to his nephew Charles, count of Le Maine. Louis seized Anjou and Bar, and two years later sought to compel the king of Sicily to exchange the two duchies for a pension. The offer was rejected, but further negotiations assured the lapse to the crown of the duchy of Anjou, and the annexation of Provence was only postponed until the death of the count of Le Maine. René died on the 10th of July 1480, his charities having earned for him the title of "the good." He founded an order of chivalry, the Ordre de Croissant, which was anterior to the royal foundation of St Michael, but did not survive René.

The king of Sicily's fame as an amateur of painting has led to the attribution to him of many old paintings in Anjou and Provence, in many cases simply because they bear his arms. These works are generally in the Flemish style, and were probably executed under his patronage and direction, so that he may be said to have formed a school of the fine arts in sculpture, painting, gold work and tapestry. Two of the most famous works formerly attributed to René are the triptych, the "Burning Bush," in the cathedral of Aix, showing portraits of René and his second wife, Jeanne de Laval, and an illuminated book of Hours in the bibliothèque nationale, Paris. The "Burning Bush" was in fact the work of Nicolas Froment, a painter of Avignon. Among the men of letters attached to his court was Antoine de la Sale, whom he made tutor to his son, the duke of Calabria. He encouraged the performance of mystery plays; on the performance of a mystery of the Passion at Saumur in 1462 he remitted four years of taxes to the town, and the representations of the Passion at Angers were carried out under his auspices. He exchanged verses with his kinsman, the poet Charles of Orleans. The best of his poems is the idyl of Regnault and Jeanneton, representing his own courtship of Jeanne de Laval. *Le Livre des tournois*, a book of ceremonial, and the allegorical romance, *Conqueste qu'un chevalier nommé le Cuer d'amour espris feist d'une dame appellée Doulce Mercy*, with other works ascribed to him, were perhaps dictated to his secretaries, or at least compiled under his direction. His *Œuvres* were published by the comte de Quatrebarbes (4 vols., Paris and Angers, 1845–46).

See A. Lecoy de la Marche, *Le Roi René* (2 vols., 1875); A. Vallet de Viriville, in the *Nouvelle Biographie générale*, where there is some account of the MSS. of his works; and J. Renouvier, *Les Peintres et enluminеurs du roi René* (Montpellier, 1857).

RENÉE OF FRANCE (1510–1575), second daughter of Louis XII. and Anne of Brittany, was born at Blois on the 25th of October 1510. After being betrothed successively to Gaston de Foix, Charles of Austria (the future emperor Charles V.), his brother Ferdinand, Henry VIII. of England, and the elector Joachim II. of Brandenburg, she married in 1528 Hercules of Este, son of the duke of Ferrara, who succeeded his father six years later. Renée's court became a rendezvous of men of letters and a refuge for the persecuted French Calvinists. She received Clément Marot and Calvin at her court, and finally embraced the reformed religion. Her husband, however, who viewed these proceedings with disfavour, banished her friends, took her children from her, threw her into prison, and eventually made her abandon at any rate the outward forms of Calvinism. After his death in 1559, Renée returned to France and turned her duchy of Montargis into a centre of Protestant propaganda. During the wars of religion she was several times molested by the Catholic troops, and in 1562 her château was besieged by her son-in-law, the duke of Guise. She died at Montargis.

See B. Fontana, *Renata di Francia* (Rome, 1889 seq.); and E. Rodocanachi, *Renée de France* (Paris, 1896).

RENEVIER, EUGÈNE (1831–), Swiss geologist, was born at Lausanne on the 26th of March 1831. In 1857 he became professor of geology and palaeontology in the university at Lausanne. He is distinguished for his researches on the geology and palaeontology of the Alps, on which subjects he published numerous papers in the proceedings of the scientific societies in Switzerland and France. With F. J. Pictet he wrote a memoir on the *Fossiles du terrain aptien de la Perte-du-Rhone* (1854). In 1894 he was appointed president of the Swiss Geological Commission, and also of the International Geological Congress held that year at Zürich, in the previous meetings of which he had taken a prominent part. He published a noteworthy *Tableau des terrains sédimentaires* (1874); and a second more elaborate edition, accompanied by an explanatory article *Chronographe géologique*, was issued in 1897 as a supplement to the Report of the Zürich Congress. This new table was printed on coloured sheets, the colours for each geological system corresponding with those adopted on the International geological map of Europe.

RENFREW, a royal, municipal and police burgh and county town of Renfrewshire, Scotland, near the southern bank of the Clyde, 7 m. W. by N. of Glasgow, via Cardonald, by the Glasgow & South-Western and Caledonian railways (5 m. by road). Pop. (1891) 6777; (1901) 9296. Industries include shipbuilding (the construction of dredgers and floating docks is a speciality), engineering, dyeing, weaving, chemicals and cabinet-making. The Clyde trust has constructed a large dock here. Renfrew belongs to the Kilmarnock district group of parliamentary burghs (with Kilmarnock, Dumbarton, Rutherglen and Port Glasgow). Robert III. gave a charter in 1396, but it was a burgh (Renifry) at least 250 years earlier. About 1160 Walter Fitzalan, the first high steward of Scotland, built a castle on an eminence by the side of the Clyde (still called Castle Hill), the original seat of the royal house of Stewart. Close to the town, on the site of Elderslie House, Somerled, lord of the Isles, was defeated and slain in 1164 by the forces of Malcolm IV., against whom he had rebelled. In 1404 Robert II. bestowed upon his son James (afterwards James I.) the title of Baron of Renfrew, still borne by the prince of Wales.

RENFREWSHIRE, a south-western county of Scotland, bounded N. by the river and firth of Clyde, E. by Lanarkshire, S. and S.W. by Ayrshire and W. by the firth of Clyde. A small detached portion of the parish of Renfrew, situated on the northern bank of the Clyde, is surrounded on the landward side by Dumbartonshire. The county has an area of 153,332 acres, or 239·6 sq. m. Excepting towards the Ayrshire border on the south-west, where the principal heights are Hill of Stake (1711 ft.), East Girt Hill (1673), Misty Law (1663) and Creuch Hill (1446), and the confines of Lanarkshire on the south-east, where a few points attain an altitude of 1200 ft.—the surface is undulating rather than rugged. Much of the higher land in the centre is well wooded. The Clyde forms part of the northern boundary of the shire. In the N.W. Loch Thom and Gryfe Reservoir provide Greenock with water, and Balgray Reservoir and Glen Reservoir reinforce the water-supply of a portion of the Glasgow area. The other lakes are situated in the S. and S.E. and

include Castle Semple Loch, Long Loch, Brother Loch, Black Loch, Binend Loch and Dunwan Dam. The Glasgow, Paisley and Johnstone canal has been converted since 1882 into the track of the Glasgow & South-Western railway. Strathgryfe is the only considerable vale in the shire. It extends from the reservoir to below Bridge of Weir, a distance of 10 m. The scenery at its head is somewhat wild and bleak, but the lower reaches are pasture land. The wooded ravine of Glenkillock, to the south of Paisley, is watered by Killock Burn, on which are three falls.

Geology.—Carboniferous rocks form the substratum of this county. The hilly ground from the neighbourhood of Eaglesham northwestward is formed of volcanic rocks, basalts, porphyrites, tuffs and agglomerates of the age of the Cementstone group of the Calciferous Sandstone series. Here and there the sites of the volcanic cones are distinguishable. The best basing those between Misty Law and Queenside Muir. Beneath the volcanic rocks are some red sandstones and conglomerates which occupy a small tract between Loch Thom and the neighbourhood of Inverkip. Resting upon the volcanic rocks is the Carboniferous Limestone series which at the base consists of ashy sandstones and grits followed by the three subdivisions prevalent in southern Scotland. With unimportant exceptions, all the area north of the volcanic rocks is occupied by the Carboniferous Limestone series. The beds lie in a faulted basin around Linwood, and the following strata may be distinguished from below upwards: the Hurlet coal and limestone, Lillies oil shale, Hosie limestone, Johnstone clay ironstone and Rowglass limestone along with other beds of ironstone and coal. The sandstone of Giffnock, used for building; the limestone and coal of Orchard with a very fossiliferous shale bed; and the limestone and coal of Arden all belong to the same series. Besides the contemporaneous volcanic rocks numerous intrusive sheets are found in the Carboniferous rocks such as the large mass of basalt south of Johnstone; and doleritic sheet of Quarrelton and the similar sheets N.E. of Paisley. In the eastern part of the county, near the border the coals and ironstones of this series near Shawlands and Crossmyloof are faulted directly against the coal measures of Rutherglen. Tertiary basalt dikes cut the older rocks in a S.E.-N.W. direction, for example those on Misty Law. Glacial striæ abound on the hilly ground, those in the north indicating that the ice took a south-easterly direction which farther south became south-westerly. Boulder clays, gravels and sands also cover considerable areas. Copper ore has been worked in the volcanic rocks near Lochwinnoch and in the grey sandstones near Gourock.

Climate and Agriculture.—The climate is variable. As the prevailing west and south-west winds come in from the Atlantic warm and full of moisture, the land under the hilly and heavy rains, and the western area of the shire is one of the wettest districts in Scotland, the mean annual rainfall exceeding 60 in. The temperature for the year averages about 48° F., for January 38°.5 F., and for July 58°.5 F. The hilly ground is much peat-moss and moorland, but over those areas which are not thus covered the soil, which is a light earth on a substratum of gravel, is deep enough to produce good pasture. In the undulating central region the soil is better, particularly on the basins of the streams, while on the flat lands adjoining the Clyde there is a rich alluvium which, except when soured by excessive rain, yields heavy crops. Of the total area three-fifths is under cultivation, more than half of this being permanent pasture. Oats are grown extensively, and wheat and barley are also cultivated. Potatoes, turnips and swedes, and beans are the leading green crops. Near the populous centres orchards and market gardens are found, and an increasing acreage is under wood. Horses are bred mostly for farming operations and the bulk of the cattle are maintained in connexion with dairying. Sheep-farming, though on the increase, is not prosecuted so vigorously as in the other southern counties of Scotland, and pig-rearing is on the decline.

Other Industries.—Coal, iron, oil-shale and fireclay are the principal minerals. Limestone is largely quarried for smelting purposes, and for the manufacture of lime. Sandstone is also quarried. The thread industry at Paisley is the most important in the world. Cotton spinning, printing, bleaching and dyeing are carried on at Paisley, Pollokshaws, Renfrew, Barrhead and elsewhere; woollens and worsteds are produced at Paisley, Greenock and Renfrew. Engineering works and iron and brass foundries are found at Greenock, Port-Glasgow, Paisley, Renfrew, Barrhead and Johnstone. Sugar is a staple article of trade in Greenock and there are chemical works at Hurlet, Nitshill and Renfrew. Brewing and distilling are carried on at Greenock, Paisley and other places. Shipbuilding is especially important at Greenock and Port-Glasgow. Paper mills are established in Greenock, Cathcart and Johnstone, and tanneries in Paisley and Kilbarchan. Numerous miscellaneous industries—such as the making of starch, cornflour and preserves—have also grown up in Paisley and elsewhere. The sea and river ports are Greenock, Port-Glasgow and Renfrew.

Railway communication is ample in the north, the centre and towards the south-west. The Caledonian railway runs westwards from Glasgow by Paisley to Greenock, Gourock and Wemyss Bay; south-westwards to Barrhead and other stations; and southwards to Busby. The Glasgow & South-Western railway runs to Greenock by Paisley, Johnstone and Kilmalcolm; to Nitshill and other places south-westwards; by Lochwinnoch (for Dalry and Ardrossan in Ayrshire); and to Renfrew jointly with the Caledonian. The Clyde and the railway steamers call at Renfrew, Prince's Pier (Greenock), Gourock and Wemyss Bay.

Population and Administration.—In 1891 the population numbered 230,812, and in 1901 it was 268,980, or 1123 to the sq. m. In 1901 there were 40 persons who spoke Gaelic only and 5585 Gaelic and English. This though the shire is but twenty-seventh in point of size of the 33 Scottish counties, it is fifth in respect of population, and only Lanarkshire and Mid Lothian are more densely populated. The county is divided into the upper ward, embracing the easterly two-thirds, with Paisley as district centre, and the lower ward, consisting of the parishes of Inverkip, Greenock, Port-Glasgow and Kilmalcolm, with Greenock as district centre. The chief towns are Paisley (pop. 79,363), Greenock (68,142), Port-Glasgow (16,857), Pollokshaws (11,369), Johnstone (11,331), Barrhead (9855), Renfrew (9296), Gourock (5261), Cathcart (5808). The shire returns one member to parliament for the eastern, and another for the western division. Paisley and Greenock return each one member, and Renfrew and Port-Glasgow belong to the Kilmarnock district group of parliamentary burghs. Renfrewshire forms a sheriffdom with Bute, and there is a resident sheriff-substitute at Paisley and one at Greenock. The county is under school-board jurisdiction. For secondary and specialized education there are an academy at Greenock and a grammar school and technical school at Paisley, while some of the schools in the county earn grants for higher education. The county secondary committee also makes provision for the free education of Renfrewshire children in Glasgow High School and the Spier School at Beith. The Paisley Technical School and the Glasgow and West of Scotland Technical College are subsidized out of the "residue" grant, part of which also defrays the travelling expenses of students and supports science and art and technological classes in the burghs and towns in the county.

History.—At the time of the Roman advance from the Solway the land was peopled by the British tribe of Damnonii. To hold the natives in check the conquerors built in 84 the fort of Vanduara on high ground now covered by houses and streets in Paisley; but after the Romans retired (410) the territory was overrun by Cumbrian Britons and formed part of the kingdom of Strathclyde, the capital of which was situated at Alclyde, the modern Dumbarton. In the 7th and 8th centuries the region practically passed under the supremacy of Northumbria, but in the reign of Malcolm Canmore became incorporated with the rest of Scotland. During the first half of the 12th century, Walter Fitzalan, high steward of Scotland, ancestor of the royal house of Stuart, settled in Renfrewshire on an estate granted to him by David I. Till their accession to the throne the Stuarts identified themselves with the district, which, however, was only disjoined from Lanarkshire in 1404. In that year Robert III. erected the barony of Renfrew and the Stuart estates into a separate county, which, along with the earldom of Carrick and the barony of King's Kyle (both in Ayrshire), was bestowed upon his son, afterwards James I. From their grant are derived the titles of earl of Carrick and baron of Renfrew, borne by the eldest son of the sovereign. Apart from such isolated incidents as the defeat of Somerled near Renfrew in 1164, the battle of Langside in 1568 and the capture of the 9th earl of Argyll at Inchinnan in 1685, the history of the shire is scarcely separable from that of Paisley or the neighbouring county of Lanark.

Millar, *Castles and Mansions of Renfrew* (Glasgow, 1889).

RENNELL, JAMES (1742–1830), British geographer, was born on the 3rd of December 1742, near Chudleigh in Devonshire. His father, an officer in the Artillery, was killed in action shortly after the birth of his son. He entered the navy as a midshipman in 1756, and was present at the attack on Cherbourg (1758), and the disastrous action of St Cast in the same year. At the end of the Seven Years' War, seeing no chance of promotion, he entered the service of the East India Company, and was appointed surveyor of the Company's dominions in Bengal (1764), with the rank of captain in the Bengal Engineers. To this work he devoted the next thirteen years. In 1766 he received a severe wound in an encounter with some Sannyasis, or religious fanatics, from which he never thoroughly recovered; and in 1777 he retired as major on a pension of £600 a year. The remaining fifty-three years of his life were spent in London, and were devoted to geographical research chiefly among the materials in the East India House. His most valuable works include the *Bengal Atlas* (1779), the first approximately correct map of India (1783), the *Geographical System of Herodotus* (1800), the *Comparative Geography of Western Asia* (1831), and important studies on the geography of northern Africa—in introductions to the *Travels* of Mungo Park and Hornemann—and the currents of the Atlantic and Indian Oceans. He also contributed papers to *Archaeologia* on the site of Babylon, the island of St Paul's shipwreck, and the landing-place of Caesar in Britain. He was elected F.R.S. in 1781; and he received the Copley medal of the Royal Society in 1791, and the gold medal of the Royal Society of Literature in 1825. While in India he had married (1772) Jane Thackeray, a great-aunt of the novelist. He died on the 29th of March 1830, and was buried in the nave of Westminster Abbey.

See Sir Clements Markham *Major James Rennell and the Rise of Modern English Geography* (London, 1895).

RENNES, a town of western France, formerly the capital of Brittany and now the chief town of the department of Ille-et-Vilaine. Pop. town, 62,024; commune, 75,640. Rennes is situated at the meeting of the Ille and the Vilaine and at the junction of several lines of railway connecting it with Paris (232 m. E.N.E.), St Malo (51 m. N.N.W.), Brest (155 m. W.N.W.). A few narrow winding streets with old houses are left in the vicinity of the cathedral, but the town was for the most part rebuilt on a regular plan after the seven days' fire of 1720. Dark granite was used as building material. The old town or Ville-Haute, where the chief buildings are situated, occupies a hill bounded on the south by the Vilaine, on the west by the canalized Ille. The Vilaine flows in a deep hollow bordered with quays and crossed by six bridges leading to the new town or Ville-Basse on its left bank. The cathedral of Rennes was rebuilt in a pseudo-Ionic style between 1787 and 1844 on the site of two churches dating originally from the 4th century. The west façade with its twin towers was finished in 1700 and is in the Renaissance style. The interior is richly decorated, a German altar-piece of the 15th century being conspicuous for its carving and gilding. The archbishop's palace occupies in part the site of the abbey dedicated to St Melaine, whose church is the sparkling 11th-century architecture among the numerous churches in the town. A colossal statue of the Virgin was placed above its dome in 1867. The Mordelaise Gate, by which the dukes and bishops used to make their state entry into the town, is a curious example of 15th-century architecture, and preserves a Latin inscription of the 3rd century, a dedication by the Redones to the emperor Gordianus. The finest building in Rennes is the old parliament house (now the law-court), designed by Jacques Debrosse in the 17th century, and decorated with statues of legal celebrities, carving, and paintings by Jean Jouvenet and other well-known artists. The town hall was erected in the first half of the 18th century. It contains the library and the municipal archives, which are of great importance for the history of Brittany. In the Palais Universitaire, a modern building occupied by the university, there are scientific collections and important galleries of painting and sculpture, the chief work being the "Perseus delivering Andromeda" of Paul Veronese. About 2 m. from the town is the castle (16th century) of La Prévalaye, a hamlet famous for its butter.

Rennes is the seat of an archbishop and a prefect, headquarters of the X. army corps and centre of an *académie* (educational division). Its university has faculties of law, science and letters, and a preparatory school of medicine and pharmacy, and there are training colleges, a *lycée* and schools of agriculture, dairying, music, art, architecture and industry (*École pratique*). The town is also the seat of a court of appeal, of a court of assizes, of tribunals of first instance and commerce, and of a chamber of commerce, and has a branch of the Bank of France. Tanning, iron-founding, timber-sawing and the production of furniture and wooden goods, flour-milling, flax-spinning and the manufacture of tenting and other coarse fabrics, bleaching and various smaller industries are carried on. Trade is chiefly in butter made in the neighbourhood, and in grain, flour, leather, poultry, eggs and honey.

Rennes, the chief city of the Redones, was formerly (like some other places in Gaul) called Condate (hence *Condat*, Condé), probably from its position at the confluence of two streams. Under the Roman empire it was included in Lugdunensis Tertia, and became the centre of various Roman roads still recognizable in the vicinity. The name *Urbs Rubra* given to it on the oldest chronicles is explained by the bands of red brick in the foundations of its first circuit of walls. About the close of the 10th century Conan le Tort, count of Rennes, subdued the whole province, and his son and successor Geoffrey first took the title duke of Brittany. The dukes were crowned at Rennes, and before entering the city by the Mordelaise Gate they had to swear to preserve the privileges of the church, the nobles and the commons of Brittany. During the War of Succession the city more than once suffered siege, notably in 1356–57, when Bertrand du Guesclin saved it from capture by the English under Henry, first duke of Lancaster. The parlement of Brittany, founded in 1551, held its sessions at Rennes from 1561, they having been previously shared with Nantes. During the troubles of the League Philip Emmanuel, duke of Mercœur, attempted to make himself independent at Rennes (1589), but his scheme was defeated by the loyalty of the parlement. Henry IV. entered the city in state on the 9th of May 1598. In 1675 an insurrection at Rennes, caused by the taxes imposed by Louis XIV. in spite of the advice of the parlement, was cruelly suppressed by Charles, duke of Chaulnes, governor of the province. The parlement was banished to Vannes till 1689, and the inhabitants crushed with forfeits and put to death in great numbers. The fire of 1720, which destroyed eight hundred houses, completed the ruin of the town. At the beginning of the Revolution Rennes was again the scene of bloodshed, caused by the discussion about doubling the third estate for the convocation of the states-general. In January 1789, Jean Victor Moreau (afterwards general) led the law-students in their demonstrations on behalf of the parlement against the royal government. During the Reign of Terror Rennes suffered less than Nantes, partly through the courage and uprightness of the mayor, Jean Leperdit. It was soon afterwards the centre of the operations of the Republican army against the Vendeans. The bishopric, founded in the 5th century, in 1859 became an archbishopric, a rank to which it had previously been raised from 1790 to 1802. In 1899 the revision of the sentence of Captain Alfred Dreyfus was carried out at Rennes.

See Orain, *Rennes et ses environs* (Reims, 1904).

RENNEVILLE, RENÉ AUGUSTE CONSTANTIN DE (1650–1723), French writer, was born at Caen in 1650. In consequence of his Protestant principles, he left France for Holland in 1699, and on his return three years later he was denounced as a spy and imprisoned in the Bastille, where he remained until 1713. During his imprisonment he wrote on the margins of a copy of *Auteurs déguisés* (Paris, 1690) poems which he called *Oiia bastilicа*. These were rediscovered by Mr James Tregaski in 1906. Renneville was set at liberty through the intercession of Queen Anne, and made his way to England, where he published

his *Histoire de la Bastille* (7 vols., 1713–24), dedicated to George I. At the time of his death in 1723 he was a major of artillery in the service of the elector of Hesse. His other important work is a *Recueil des voyages qui ont servi à l'établissement de la Compagnie des Indes Orientales aux Provinces Unies* (10 vols., new ed., Rouen, 1725).

RENNIE, JOHN (1761–1821), British engineer, was the youngest son of James Rennie, a farmer at Phantassie, Haddingtonshire, where he was born on the 7th of June 1761. On his way to the parish school at East Linton he used to pass the workshop of Andrew Meikle (1719–1800), the inventor of the threshing machine, and its attractions were such that he spent there much of the time that was supposed to be spent at school. In his twelfth year he was placed under Meikle, but after two years he was sent to Dunbar High School, where he showed marked aptitude for mathematics. On his return to Phantassie he occasionally assisted Meikle, and soon began to erect corn mills on his own account. In 1780, while continuing his millwright's business, he began to attend the classes on physical science at Edinburgh University. Four years later he was commissioned by Boulton and Watt, to whom he was introduced by Professor John Robison (1739–1805), his teacher at Edinburgh, to superintend the construction of the machinery for the Albion flour mills, which they were building at the south end of Blackfriars Bridge, London, and a feature of his work there was the use of iron for many portions of the machines which had formerly been made of wood. The completion of these mills established his reputation as a mechanical engineer, and soon secured him a large business as a maker of millwork of all descriptions. But his fame chiefly rests on his achievements in civil engineering. As a canal engineer his services began to be in request about 1790, and the Avon and Kennet, the Rochdale and the Lancaster canals may be mentioned among his numerous works in England. His skill solved the problem of draining and reclaiming extensive tracts of marsh in the eastern counties and on the Solway Firth. As a bridge engineer he was responsible for many structures in England and Scotland, among the most conspicuous being three over the Thames—Waterloo Bridge, Southwark Bridge and London Bridge—the last of which he did not live to see completed. A noteworthy feature in many of his designs was the flat roadway. Among the harbours and docks in the construction of which he was concerned may be mentioned those at Wick, Torquay, Grimsby, Holyhead, Howth, Kingstown and Hull, together with the London dock and the East India dock on the Thames, and he was consulted by the government in respect of improvements at the dockyards of Portsmouth, Sheerness, Chatham and Plymouth, where the breakwater was built from his plans. He died in London on the 4th of October 1821, and was buried in St Paul's. In person he was of great stature and strength, and a bust of him by Chantrey (now in the National Gallery), when exhibited at Somerset House, obtained the name of Jupiter Tonans. Of his family, the eldest son George, who was born in London on the 3rd of September 1791 and died there on the 30th of March 1866, carried on his father's business in partnership with the second son John, who was born in London on the 30th of August 1794 and died near Hertford on the 3rd of September 1874. George devoted himself especially to the mechanical side of the business. John completed the construction of London Bridge, and at its opening in 1831 was made a knight. He succeeded his father as engineer to the Admiralty, and finished the Plymouth breakwater, of which he published an account in 1848. He was also the author of a book on the *Theory, Formation and Construction of British and Foreign Harbours* (1851–54), and his *Autobiography* appeared in 1875. He was elected president of the Institution of Civil Engineers in 1845, and held the office for three years.

RENO, a city and the county-seat of Washoe county, Nevada, U.S.A., in the W. part of the state, on the Truckee river, and about 244 m. E. of San Francisco. Pop. (1890) 3593; (1900) 4500 (915 foreign-born); (1910 census) 10,867. It is served by the Southern Pacific, the **Virginia** & Truckee and the Nevada-California-Oregon railways. The city lies near the foot of the Sierra Nevada Mountains, 4484 ft. above the sea, and is in the most humid district of a state which has little rainfall. Among the public institutions are the university of Nevada (see NEVADA), a United States Agricultural Experiment Station, a public library (1903), the Nevada Hospital for Mental Diseases (1882), the City and County Hospital and the People's Hospital. At Reno are railway shops (of the Nevada-California-Oregon railway) and reduction works, and the manufactures include flour, foundry and machine-shop products, lumber, beer, plaster and packed meats. Farming and stock-raising are carried on extensively in the vicinity. On the site of the present city a road house was erected in 1859 for the accommodation of travellers and freight teams on their way to and from California. By 1863 this place had become known as Lake's Crossing, and five years later it was chosen as a site for a station by the Central (now the Southern) Pacific railway, then building through the Truckee Valley. The new station was then named Reno, in honour of Gen. Jesse Lee Reno (1823–1862), a Federal officer during the Civil War, who was commissioned brigadier-general of volunteers in November 1861 and major-general of volunteers in July 1862, and led the Ninth Corps at South Mountain, where he was killed. The city twice suffered from destructive fires, in 1873 and 1879. Reno was incorporated as a town in 1879 and chartered as a city in 1899. Its city charter was withdrawn in 1901, but it was rechartered in 1903.

RENOIR, FIRMIN AUGUSTE (1841–), French painter, was born at Limoges in 1841. In his early work he followed, with pronounced modern modifications, certain traditions of the French 18th-century school, more particularly of Boucher, of whom we are reminded by the decorative tendency, the pink and ivory flesh tints and the facile technique of Renoir. In the 'seventies he threw himself into the impressionist movement and became one of its leaders. In some of his paintings he carried the new principle of the division of tones to its extreme, but in his best work, notably in some of his paintings of the nude, he retained much of the refined sense of beauty of colour of the 18th century. Renoir has tried his skill almost in every genre—in portraiture, landscape, flower-painting, scenes of modern life and figure subject; and though he is perhaps the most unequal of the great impressionists, his finest works rank among the masterpieces of the modern French school. Among these are some of his nude "Bathers," the "Rowers' Luncheon," the "Ball at the Moulin de la Galette," "The Box," "The Terrace," "*La Pensée*," and the portrait of "Jeanne Samary." He is represented in the Caillebotte room at the Luxembourg, in the collection of M. Durand-Ruel, and in most of the collections of impressionist paintings in France and in the United States. Comparatively few of his works have come to England, but the full range of his capacity was seen at the exhibition of impressionist art held at the Grafton Galleries in London in 1905. At the Viau sale in Paris in 1907, a garden scene by Renoir, "*La Tonnelle*," realized 26,000 frs., and a little head, "*Ingénue*," 25,100 frs.

RENOUF, SIR PETER LE PAGE (1822–1897), Egyptologist, was born in Guernsey, on the 23rd of August 1822. He was educated at Elizabeth College there, and proceeded to Oxford, which, upon his becoming a Roman Catholic, under the influence of Dr Newman, he quitted without taking a degree. Like many other Anglican converts, he proved a thorn in the side of the Ultramontane party in the Roman Church, though he did not, like some of them, return to the communion of the Church of England. He opposed the promulgation of the dogma of Papal Infallibility, and his treatise (1868) upon the condemnation of Pope Honorius for heresy by the council of Constantinople in A.D. 680 was placed upon the index of prohibited books. He had been from 1855 to 1864 professor of ancient history and Oriental languages in the Roman Catholic university which Newman vainly strove to establish in Dublin, and during part of this period edited the *Atlantis* and the *Home and Foreign Review*, which latter had to be discontinued on account of the hostility of the Roman Catholic hierarchy. In 1864 he was appointed a government inspector of schools, which position he

held until 1886, when his growing celebrity as an Egyptologist procured him the appointment of Keeper of Oriental Antiquities in the British Museum, in succession to Dr Samuel Birch. He was also elected in 1887 president of the Society of Biblical Archaeology, to whose *Proceedings* he was a constant contributor. The most important of his contributions to Egyptology are his Hibbert Lectures on "The Religion of the Egyptians," delivered in 1879; and the translation of *The Book of the Dead*, with an ample commentary, published in the *Transactions* of the society over which he presided. He retired from the Museum under the superannuation rule in 1891, and died in London on the 14th of October 1897. He had been knighted the year before his death. He married in 1857 Ludovica von Brentano, member of a well-known German literary family.

RENOUVIER, CHARLES BERNARD (1815–1903), French philosopher, was born at Montpellier on the 1st of January 1818, and educated in Paris at the École Polytechnique. In early life he took an interest in politics, and the approval extended by Hippolyte Carnot to his *Manuel républicain de l'homme et du citoyen* (1848) was the occasion of that minister's fall. He never held public employment, but spent his life writing, retired from the world. He died on the 1st of September 1903. Renouvier was the first Frenchman after Malebranche to formulate a complete idealistic system, and had a vast influence on the development of French thought. His system is based on Kant's, as his chosen term "Néo-criticisme" indicates; but it is a transformation rather than a continuation of Kantianism. The two leading ideas are a dislike to the Unknowable in all its forms, and a reliance on the validity of our personal experience. The former accounts for his acceptance of Kant's phenomenalism, combined with rejection of the thing in itself. It accounts, too, for his polemic on the one hand against a Substantial Soul, a Buddhistic Absolute, an Infinite Spiritual Substance; on the other hand against the no less mysterious material or dynamic substratum by which naturalistic Monism explains the world. He holds that nothing exists except presentations, which are not merely sensational, and have an objective aspect no less than a subjective. To explain the formal organization of our experience he adopts a modified version of the Kantian categories. The insistence on the validity of personal experience leads Renouvier to a yet more important divergence from Kant in his treatment of volition. Liberty, he says, in a much wider sense than Kant, is man's fundamental characteristic. Man's free deeds are in the phenomenal, not in an imaginary noümenal sphere. Belief is not intellectual merely, but is determined by an act of will affirming what we hold to be morally good. In his religious views Renouvier makes a considerable approximation to Leibnitz. He holds that we are rationally justified in affirming human immortality and the existence of a finite God who is to be a constitutional ruler, but not a despot, over the souls of men. He would, however, regard atheism as preferable to a belief in an infinite Deity.

His chief works are: *Essais de critique générale* (1854–64), *Science de la morale* (1869), *Uchronie* (1876), *Esquisse d'une classification systématique des doctrines philosophiques* (1885–86), *Philosophie analytique de l'histoire* (1896–97), *Histoire et solution des problèmes métaphysiques* (1901); *Victor Hugo: Le Poète* (1893), *Le Philosophe* (1900); *Les Dilemmes de la métaphysique pure* (1901); *Le Personnalisme* (1903); *Critique de la doctrine de Kant* (1906, published by L. Prat).

See L. Prat, *Les Derniers entretiens de Charles Renouvier* (1904); M. Ascher, *Renouvier und der französische Neu-Kriticismus* (1900); E. Janssens, *Le Néocriticisme de C. R.* (1904); A. Darlu, *La Morale de Renouvier* (1904); G. Séailles, *La Philosophie de C. R.* (1905); A. Arnal, *La Philosophie religieuse de C. R.* (1907).

RENSSELAER, a city of Rensselaer county, New York, U.S.A., in the eastern part of the state, on the E. bank of the Hudson river, opposite Albany. Pop. (1900) 7466, of whom 1089 were foreign-born; (1910 census) 10,711. It is served by the New York Central and the Boston & Albany railways, which have shops here, and is connected with Albany by three bridges across the Hudson. Rensselaer, originally called Greenbush, was first settled in 1631, and the site formed part of the large tract bought from the Indians by the agents of Killian van Rensselaer and known as Rensselaerwyck. In 1810 a square mile of land within the present city limits was acquired by a land speculator, was divided into lots and offered for sale. Development followed, and five years later the village was incorporated. In 1897 Greenbush was chartered as a city, and its name was changed to Rensselaer. Its limits were extended in 1902 by the annexation of the village of Bath (pop. in 1900, 2504) and the western part of the township of East Greenbush. Rensselaer manufactures knit-goods, wool shoddy, felt, &c.

RENT. Various species of rent appear in Roman Law: rent (*canon*) under the long leasehold tenure of Emphyteusis; rent (*reditus*) of a farm; ground-rent (*solarium*); rent of state lands (*vectigal*); and the annual rent (*pensio*) payable for the *jus superficiarum* or right to the perpetual enjoyment of anything built on the surface of land. (See ROMAN LAW.)

ENGLISH LAW. (As to the rent of apartments, &c., see LODGER AND LODGINGS.)—Rent is a certain and periodical payment or service made or rendered by the tenant of a corporeal hereditament and issuing out of (the property of) such hereditament. Its characteristics, therefore, are (1) certainty in amount; (2) periodicity in payment or rendering; (3) the fact that rent is *yielded* and is, therefore, said "to lie in *render*," as distinguished from *profits à prendre* in general, which are taken, and are, therefore, said to lie in *prendre*; (4) that it must issue out of (the profits of) a corporeal hereditament. A rent cannot be reserved out of incorporeal hereditaments such as advowsons (Co. *Litt.* 47a, 142a). But rent may be reserved out of estates in reversion or remainder (see REAL PROPERTY) which are not purely incorporeal. It is not essential that rent should consist in a payment of money. Apart from the rendering of services, the delivery of hens, horses, wheat; &c., may constitute a rent. But, at the present day, rent is generally a sum of money paid for the occupation of land. It is important to notice that this conception of rent was attained at a comparatively late period in the history of the law. The earliest rent seems to have been a form of personal service, generally labour on land, and was fixed by custom. The exaction of a competition or rack rent beyond that limited by custom was, if one may judge from the old Brehon law of Ireland, due to the presence upon the land of strangers in blood, probably at first outcasts from some other group.[1] The strict feudal theory of rent admitted labour on the lord's land as a lower form, and developed the military service due to the crown or a lord as a higher form. Rent service is the oldest and most dignified kind of existing rent. It is the only one to which the power of distress attaches at common law, giving the landlord a preferential right over other creditors exercisable without the intervention of judicial authority (see DISTRESS). The increasing importance of socage tenure, arising in part from the convenience of paying a certain amount, whether in money or kind, rather than comparatively uncertain services, led to the gradual evolution of the modern view of rent as a sum due by contract between two independent persons. At the same time the primitive feeling which regarded the position of landlord and tenant from a social rather than a commercial point of view is still of importance.

Classes of Rents.

Rents, as they now exist in England, are divided into two great classes—rent service and rent charge.

Rent Service.—A rent service is so called because by it a tenure by means of services is created between the landlord and the tenant. The service is now represented by fealty, and is nothing more than nominal. Rent service is said to be incident to the reversion—that is, a grant of the reversion carries the rent with it (see REMAINDER). A power of distress is incident

[1] "The three rents are: rack rent from a person of a strange tribe, a fair rent from one of the tribe, and the stipulated rent which is paid equally by the tribe and the strange tribe."—*Senchus Mor*, p. 150, cited by Maine, *Village Communities*, p. 187. See also Vinogradoff, *Villainage in England* (Oxford, 1892), pp. 181, 188, 215; *The Growth of the Manor* (by the same author) (London, 1905), pp. 230, 328; Pollock and Maitland, *Hist. Eng. Law* (Cambridge, 1895), ii. 128–134.

at common law to this form of rent. Copyhold rents and rents reserved on lease fall into this class.

Rent Charge.—A rent charge is a grant of an annual sum payable out of lands in which the grantor has an estate. It may be in fee, in tail, for life—the most common form—or for years. It must be created by deed or will, and may be either at common law or under the Statute of Uses (1536). The grantor has no reversion, and the grantee has at common law no power of distress, though such power may be given him by the instrument creating the rent charge. The Statute of Uses (1536) gave a power of distress for a rent charge created under the statute. The Conveyancing Act 1881, § 44, has given a power of distress for a sum due on any rent charge which is twenty-one days in arrear. By § 45 a power of redemption of certain perpetual rents in the nature of rent charges is given to the owner of the land out of which the rent issues. Rent charges granted since April 26th, 1855, otherwise than by marriage settlement or will for a life or lives or for any estate determinable on a life or lives must, in order to bind lands against purchasers, mortgagees or creditors, be registered in the Land Registry in Lincoln's Inn Fields (Judgments Act 1855 and Land Charges Act 1900). In certain other cases it is also necessary to register rent charges, for instance, under the Improvement of Land Act 1864 and the Land Transfer Acts 1875 and 1897. Rent charges are barred by non-payment or non-acknowledgment for twelve years. The period of limitation for the arrears of such rent is six years.

Various Forms of Rent Charge.—Forms of rent charge of special interest are *tithe rent charge* (see TITHES), and the rent charges formerly used for the purpose of creating "faggot votes." The device was adopted of creating parliamentary voters by splitting up freehold interests into a number of rent-charges of the annual value of 40s., so as to satisfy the freeholders' franchise. But such rent charges are now rendered ineffective by the Representation of the People Act 1884, § 4, which enacts (subject to a saving for existing rights and an exception in favour of owners of tithe rent charge) that a man shall not be entitled to be registered as a voter in respect of the ownership of any rent charge.

A rent charge reserved without power of distress is termed a *rent-seck* (*reditus siccus*) or "dry rent," from the absence of the power of distress. But, as power of distress for rents-seck was given by the Landlord and Tenant Act 1736, the legal effect of such rents has been since the act the same as that of a rent charge.

Other Varieties of Rent.—Rents of assize or Quit rents are a relic of the old customary rents. They are presumed to have been established by usage, and cannot be increased or diminished. A *Quit rent* (*quietus reditus*) is a yearly payment made from time immemorial by freeholders or copyholders of a manor to the lord. The name implies that the tenant thereby becomes free and quit from all other services. Owing to the change in the value of money, these rents are now of little value. Under the Conveyancing Act 1881 (s. 45) they may be compulsorily redeemed by the freeholder's tenant; and the Copyhold Act 1894 provides similarly for their extinction in the case of manors. Quit rents, like ordinary rent charges, are barred by non-payment, or non-acknowledgment, for twelve years. Those paid by freeholders are called *chief rents*. *Fee farm rents* are rents reserved on grants in fee. According to some authorities, they must be at least one-fourth of the value of the lands. They, like quit rents, now occur only in manors, unless existing before the Statute of *Quia Emptores* or created by the crown (see REAL PROPERTY). A rent which is equivalent or nearly equivalent in amount to the full annual value of the land is a *rack rent*. A rent which falls appreciably short of a rack rent is usually styled a *gradual rent* (*q.v.*). It is generally reserved on land which the lessee agrees to cover with buildings, and is calculated on the value of the land, though the buildings to be erected increase the security for the rent and revert to the lessor at the end of the term. A *dead rent* is a fixed annual sum paid by a person working a mine or quarry, in addition to royalties varying according to the amount of minerals taken.

The object of a dead rent is twofold—first, to provide a specified income on which the lessor can rely; secondly (and this is the more important reason), as a security that the mine will be worked, and worked with reasonable rapidity. *Rents in kind* still exist to a limited extent; thus the corporation of London is tenant of some lands in Shropshire by payment to the crown of an annual rent of a fagot. All *peppercorn*, or nominal, rents seem to fall under this head.[1] The object of the peppercorn rent is to secure the acknowledgment by the tenant of the landlord's right. In modern building leases a peppercorn rent is sometimes reserved as the rent for the first few years. Services rendered in lieu of payment by tenants in *grand* and *petit* serjeanty may also be regarded as examples of rents in kind. Grand serjeanty is a form of tenure in chivalry under which the king's tenants (*servientes*) in chief owed special military or personal services to the king; *e.g.* carrying his banner. Petit serjeanty—a form of tenure in socage—was usually applied to tenure of the king or a mesne lord by some fixed service of trivial value, *e.g.* feeding his hounds. These forms of tenure were abolished in 1660. *Labour rents* are represented by those cases, not unfrequent in agricultural leases, where the tenant is bound to render the landlord a certain amount of team work or other labour as a part of his rent. It was held in the court of queen's bench in 1845 that tenants who occupied houses on the terms of sweeping the parish church and of ringing the church bell paid rent within the meaning of the Limitation Act of 1833 (see *Doe v. Benham* (1845), 7 Q.B. 976).

As to the apportionment of rents, see APPORTIONMENT.

Payment of Rent.—Rent is due in the morning of the day appointed for payment, but a tenant is not in arrears until after midnight on that day. Rent made payable in advance by agreement between a landlord and his tenant is called *forehand rent*. It is not uncommon in letting a furnished house, or as to the last quarter of the term of a lease of unfurnished premises, to stipulate that the rent shall be paid in advance. As soon as such rent is payable under the agreement the landlord has the same rights in regard to it as he has in the case of ordinary rent. If a tenant pays his rent before the day on which it is due, he runs the risk of being called upon in certain circumstances to pay it over again. Such payment is an advance to the landlord, subject to an agreement that, when the rent becomes due, the advance shall be treated as a fulfilment of the tenant's obligation to pay rent. The payment is, therefore, generally speaking, a defence to an action by the landlord or his heirs. But if the landlord mortgages his reversion, either before or after the advance, the assignee will, by giving notice to the tenant, before the proper rent-day, to pay rent to him, become entitled to the rent then falling due. Payment by cheque is conditional payment only, and if the cheque is dishonoured the original obligation revives. Where a cheque in payment of rent is lost in the course of transmission through the post, the loss falls on the tenant, unless the landlord has expressly or impliedly authorized it to be forwarded in that way: and the landlord's consent to take the risk of such transmission will not be inferred from the fact that payments were ordinarily made in this manner in the dealings between the parties. A tenant may deduct from his rent (i) the "landlord's property tax" (on the annual value of the premises for income tax purposes), which is paid by the tenant, if the statute imposing the tax authorizes the deduction (which should be made from the rent next due after the payment); (ii) taxes or rates which the landlord had undertaken to pay but had not paid, payment having thereupon been made by the tenant; (iii) payments made by the tenant which ought to have been made by the landlord, *e.g.* rent due to a superior landlord; (iv) compensation under the Agricultural Holdings Acts 1883–1900.

Laws as to payment.

Remedies for Non-payment of Rent.—A landlord's main remedy for non-payment of rent is *distress* (Lat. *distringere*, to draw asunder, detain, occupy), *i.e.* the right to seize all goods found upon the demised premises, whether those of the tenant or of a stranger, except goods specially privileged, and to detain and, if need be, to sell them, in satisfaction of his claim. The requisites of a valid distress are these: (*a*) There must be "a certain and proper rent," *i.e.* rent due in respect of an actual tenancy of corporeal hereditaments: (*b*) the rent must be in arrear; (*c*) there must be a reversion in the person distraining; and (*d*) there must be goods on the premises liable to be distrained.

[1] When peppercorn rents were instituted, in the middle ages, they were not, however, nominal, the cost of spices being then very great. A peppercorn rent, generally an obligation to pay 1 lb of pepper at the usual rent days, constituted a substantial impost even as late as the 18th century.

All personal chattels are distrainable with the following exceptions: (i) *Goods absolutely privileged*—(*a*) fixtures (*q.v.*); (*b*) goods sent to the tenant in the way of trade; (*c*) things which cannot be restored, *e.g.* meat and milk; growing corn and corn in sheaves formerly fell within this category, but the Distress for Rent Act 1737 (s. 8) abolished this exemption in the case of the former, and a statute of 1690 abolished it in that of the latter; (*d*) things in actual use, *e.g.* a horse while it is drawing a cart; (*e*) animals *ferae naturae* (dogs and tame deer or deer in an enclosed park may be distrained); (*f*) things in the custody of the law, *e.g.* in the possession of a sheriff under an execution (*q.v.*); (*g*) straying cattle; (*h*) in the case of agricultural holdings under the Agricultural Holdings Acts 1883–1900 hired agricultural machinery and breeding stock; (*i*) the wearing apparel and "bedding"—a term which includes "bedstead"—of tenant and his family, and the tools and implements of his trade to the value of £5 (Law of Distress Amendment Act 1888); (*j*) the goods of ambassadors and their suites (Diplomatic Privileges Act 1708). (ii) *Goods conditionally privileged*, *i.e.* privileged if there are sufficient goods of other kinds on the premises to satisfy the distress—(*a*) implements of trade not in actual use; (*b*) beasts of the plough and sheep; (*c*) agisted cattle; (*d*) growing crops sold under an execution (Landlord and Tenant Act 1851, s. 2); (*e*) lodgers' goods. The Lodgers' Goods Protection Act 1871 provides that where a lodger's goods have been seized by the superior landlord the lodger may serve him with a notice stating that the intermediate landlord had no interest in the property seized, but that it is the property, or in the lawful possession, of the lodger, setting forth the amount of the rent due by the lodger to his immediate landlord. On payment or tender of such rent the landlord cannot proceed with the distress against the goods in question.

In general, a landlord cannot distrain except upon the premises demised, but he has a statutory right to follow things clandestinely or fraudulently removed from the premises within 30 days after their removal, unless they have been in the meantime sold *bona fide* and for valuable consideration. A landlord may, by statute (Landlord and Tenant Act 1709, s. 2), distrain within six months after the determination of the lease provided that the tenant has remained in possession. A distress must be made in the daytime, *i.e.* not before sunrise or after sunset. Six years' arrears of rent only are recoverable by distress (Real Property Limitation Act 1833, s. 12): the Real Property Limitation Act 1874 (s. 1), which bars distress for rent after twelve years, applies to rent-charges and not to rent under a lease, and the six years' arrears may be recovered in spite of the lapse of time. In the case of agricultural tenancies falling within the Agricultural Holdings Acts 1883–1900, the right of distress is confined to one year's arrears of rent. Where the tenant is bankrupt, a distress levied after the bankruptcy is limited to six months' rent accrued due prior to the date of adjudication; see Bankruptcy Act 1883 (s. 42) and 1890 (s. 28). Where a company is being wound up, the landlord may not distrain without the leave of the court. Where a distress is illegal, in those cases where in the ordinary course of dealing between landlord and tenant the payment of rent has been allowed to be deferred for a quarter or half year after the rent became legally due (act of 1883, s. 4). The landlord may distrain in person or may employ a certificated bailiff (Law of Distress Amendment Act 1888, s. 7). An uncertificated person levying a distress is liable to a fine of £10, without prejudice to his civil liability (Law of Distress Amendment Act 1895, s. 2). The seizure must precede the statute of Henry III. (1267); but enough must be taken to satisfy the claim, for the landlord cannot distrain twice for the same rent where he could have taken sufficient in the first instance. After being seized, the goods must be impounded (Distress for Rent Act 1737, s. 10) and see the statute of 1690, s. 3, on impounding of corn, straw, hay; the Distress for Rent Act 1737, s. 8, on impounding of growing crops; and the statute of 1554 and the Cruelty to Animals Act 1849, s. 5, on impounding of cattle); and if the landlord has a statute of Henry III., 1267); but enough must be taken to satisfy the claim, for the landlord cannot distrain twice for the same rent where he could have taken sufficient in the first instance. After being seized, the goods must be impounded (Distress for Rent Act 1737, s. 10) and see the statute of 1690, s. 3, on impounding of corn, straw, hay; the Distress for Rent Act 1737, s. 8, on impounding of growing crops; and the statute of 1554 and the Cruelty to Animals Act 1849, s. 5, on impounding of cattle); and if the landlord has a sale (statute of 1690, s. 5). It is illegal to proceed with a distress if the tenant tenders the rent before the impounding; and a tenant has, by statute (1690, c. 5), five clear days' grace, excluding the date of seizure, between impounding and sale. The written request of the tenant, this period will be extended to fifteen days (Law of Distress Amendment Act 1888, s. 6). A tenant may, before sale, recover goods illegally distrained by an action of *replevin* (L. Lat. *replegiare*, to redeem a thing taken by another). Where no rent was due to the distrainer the tenant may recover by action double the value of the goods sold (statute 1690, s. 5); and summary remedies for the recovery of the proceeds of sale are provided by modern enactments (Law of Distress Amendment Act 1895, s. 4, on distress of privileged goods; Agricultural Holdings Act 1883, s. 46). Where rent was due, but the distress was irregular, the tenant can only recover special damage (Distress for Rent Act 1737, s. 19).

Goods taken under an execution (*q.v.*) are not removable till one year's rent has been paid to the landlord (Landlord and Tenant Act 1709).

The landlord has, besides distress, his ordinary remedy by action. In addition, special statutory remedies are given in the case of tenants holding over after the expiration of their tenancy. By the Distress for Rent Act 1737 any tenant giving notice to quit, and holding over, is liable to pay double rent for such time as he continues in possession (see further under EJECTMENT).

Ireland.—The main differences between Irish and English law have been caused by legislation (see EJECTMENT; LANDLORD AND TENANT).

Scotland.—Rent is properly the payment made by tenant to landlord for the use of lands held under lease (see LANDLORD AND TENANT). In agricultural tenancies the legal terms for the payment of rent are at Whitsunday after the crop has been shown, and at Martinmas after it has been reaped. But a landlord and tenant may substitute conventional terms of payment, either anticipating (*fore*, or *forehand rent*) or postponing (*back*, or *backhand rent*) the legal term. The rent paid by vassal to superior is called *feu-duty* (see FEU). Its nearest English equivalent is the *fee farm rent*. The remedy of distress does not exist in Scots law. Rents are recovered (i) by summary diligence, proceeding on a clause, in the lease, of consent to registration for execution; (ii) by an ordinary petition; (iii) by an action of "maills and duties" (the rents of an estate in money or grain: "maills" was a coin at one time current in Scotland) in the Sheriff Court or the Court of Session; and (iv) in non-agricultural tenancies by procedure under the right of hypothec, where that still exists; the right of hypothec over land exceeding 2 acres in extent let for agriculture or pasture was abolished as from November 11, 1881 (see HYPOTHEC); (v) by action of removing (see EJECTMENT). Arrears of rent prescribe in five years from the time of the tenant's removal from the land.

Labour or service rents were at one time very frequent in Scotland. The events of 1715 and 1745 showed the vast influence over their tenantry that the great proprietors acquired by such means. Accordingly acts of 1716 and 1746 provided for the commutation of services into money rents. Such services may still be created by agreement, subject to the summary power of commutation by the sheriff given by the Conveyancing Act 1874 (§§ 20, 21). "In the more remote parts of Scotland it is understood that there still exist customary returns in produce of various kinds, which being regulated by the usage of the district or of the barony or estate cannot be comprehended under any general rule" (Hunter, *Landlord and Tenant*, ii. 298). Up to 1848 or 1850 there existed in Scotland "steelbow" leases—analogous to the *chetel de fer* of French law (see LANDLORD AND TENANT)—by which the landlord stocked the farm with corn, cattle, implements, &c., the tenant returning similar articles at the expiration of his tenancy and paying in addition to the ordinary rent a steelbow rent of 5 % on the value of the stock.

As to the rent of apartments, &c., see LODGER AND LODGINGS.

United States.—The law is in general accordance with that of England. The tendency of modern state legislation is unfavourable to the continuance of distress as a remedy. In the New England states, attachment on mesne process has, to a large extent, superseded it. In New York and Missouri it has been abolished by statute; in Mississippi the landlord has a claim for one year's rent on goods seized under an execution and a lien on the growing crop. In Ohio, Tennessee and Alabama it is not recognized, but in Ohio the landlord has a share in the growing crops in preference to the execution creditor. The legislatures of nearly all the states agree with the law of England as to the exemption from distress of household goods, wearing apparel, &c. (see Dillon's *Laws and Jurisprudence of England and America*, pp. 360, 361; also HOMESTEAD). As to the rent of apartments, &c., see LODGER AND LODGINGS. Few farm rents exist in some states. In Pennsylvania, which have not adopted the statute of *Quia Emptores* is a part of their common law (Washburn's *Real Property*, ii. 252).

Other Laws.—Under the French Code Civil (art. 2102) the landlord is a privileged creditor for his rent. If the lease is by authentic act, or under private signature for a fixed term, he has a right over the year's harvest and produce, the furniture of the house and everything employed to keep it up, and (if a farm) to work it, in order to satisfy all rent due up to the end of the term. If the lease is not by authentic act nor for a specified term, the landlord's claim is limited to the current year and the year next following (see law of 12th Feb. 1872). The goods of a sub-lessee are protected: and goods bailed or deposited with the tenant are in general not

liable to be seized. The French law is in force in Mauritius, and has been reproduced in substance in the Civil Codes of Quebec (arts. 2005 et seq.) and St Lucia (arts. 1888 et seq.). There are analogous provisions in s. 22, giving Civil Code (art. 1922). The subject of privileges and hypotheca is regulated in Belgium by a special law of the 16th Dec. 1851; and in Germany by ss. 1113 et seq. of the Civil Code. The law of British India as to rent (Transfer and Property Act 1882) and distress (cf., e.g., Act 15 of 1882) is similar to English law. The British dominions generally tend in the same direction. See, *e.g.*, New South Wales (the consolidating Landlord and Tenant Act 1899); Newfoundland (Act 4 of 1899); Ontario (Act 1 of 1902, s. 22, giving five days for tender of rent and expenses after distress); Jamaica (Law 17 on 1900, certification of landlord's bailiffs); Queensland (Act 15 of 1904).

"Distress" in "Ruling Cases"; *Landlord and Tenant* (American Notes) (London and Boston, 1894–1901). (A. W. R.)

RENTON, a manufacturing town of Dumbartonshire, Scotland. Pop. (1901) 5067. It is situated on the Leven, 2 m. N.N.W. of Dumbarton by the North British and Caledonian railways. The leading industry is Turkey red dyeing, and calico-printing and bleaching are also carried on. Renton stands on the site of Dalquhurn House, the birthplace of Tobias Smollett the novelist, to whose memory a Tuscan column was erected in 1774, the inscription for which was revised by Dr Johnson when he visited Bonhill in that year with Boswell. The town was founded in 1782 by Mrs Smollett—previously Mrs Telfer—of Bonhill (sister of Tobias Smollett), who resumed her maiden name when she succeeded to the Smollett estates; it was named after Cecilia Renton, daughter of John Renton of Blackadder, who had married Mrs Smollett's son, Alexander Telfer.

RENWICK, JAMES (1662–1688), Scottish covenanting leader, was born at Moniaive in Dumfriesshire on the 15th of February 1662, being the son of a weaver, Andrew Renwick. Educated at Edinburgh University, he joined the section of the Covenanters known as the Cameronians about 1680, soon became prominent among them. Afterwards he studied theology at the university of Groningen and was ordained a minister in 1683. Returning to Scotland "full of zeal and breathing forth threats of organized assassination," says Mr Andrew Lang, he became one of the field-preachers and was declared a rebel by the privy council. He was largely responsible for the "apologetical declaration" of 1684 by which he and his followers disowned the authority of Charles II.; the privy council replied by ordering every one to abjure this declaration on pain of death. Unlike some of his associates, Renwick refused to join the rising under the earl of Argyll in 1685; in 1687, when the declarations of indulgence allowed some liberty of worship to the Presbyterians, he and his followers, often called Renwickites, continued to hold meetings in the fields, which were still illegal. A reward was offered for his capture, and early in 1688 he was seized in Edinburgh. Tried and found guilty of disowning the royal authority and other offences, he refused to apply for a pardon and was hanged on the 17th of February 1688. Renwick was the last of the convenanting martyrs.

See R. Wodrow, *History of the Sufferings of the Church of Scotland*, vol. iv. (Glasgow, 1838); and A. Smellie, *Men of the Covenant* (1904); also Renwick's life by Alexander Shields in the *Biographia Presbyteriana* (1827).

REP, REPP, or REPS, a cloth made of silk, wool or cotton. The name is said to have been adapted from the French *reps*, a word of unknown origin; it has also been suggested that it is a corruption of "rib." It is woven in fine cords or ribs across the width of the piece. In silk it is used for dresses, and to some extent for ecclesiastical vestments, &c. In wool and cotton it is used for various upholstery purposes.

REPAIRS (from Lat. *reparare*, to make ready again), acts necessary to restore things to a sound state after damage; the question of repairs is important in the relations between landlord and tenant. (See the articles FLAT; LANDLORD AND TENANT.)

REPEAL (O.F. *rapel*, modern *rappel*, from *rapeler*, *rappeler*, revoke, *re* and *appeler*, appeal), the abrogation, revocation or annulling of a law (see ABROGATION and STATUTE). The word is particularly used in English history of the movement led by Daniel O'Connell (*q.v.*) for the repeal of the act of Union between Great Britain and Ireland in 1830 and 1841–46, which in its later development became known as the Nationalist or Home Rule movement (see IRELAND, *History*).

REPIN, ILIA JEFIMOVICH (1844–), Russian painter, was born in 1844 at Tschuguev in the department of Charkov, the son of parents in straitened circumstances. He learned the rudiments of art under a painter of saints named Bunakov, for three years gaining his living at this humble craft. In 1863 he obtained a studentship at the Academy of Fine Arts of St Petersburg, where he remained for six years, winning the gold medal and a travelling scholarship which enabled him to visit France and Italy. He returned to Russia after a short absence, and devoted himself exclusively to subjects having strong national characteristics. In 1894 he became professor of historical painting at the St Petersburg Academy. Repin's paintings are powerfully drawn, with not a little imagination and with strong dramatic force and characterization. A humorous artist, and a portrait-painter of the first rank, he also became known as a sculptor and etcher of ability. His chief pictures are "Procession in the Government of Kiev," "Home-coming," "The Arrest," "Ivan the Terrible's murder of his Son," and, best known of all, "The Reply of the Cossacks to Sultan Mahmoud IV." The portraits of the Baroness V. I. Ülskül, of Anton Rubinstein and of Count Leo Tolstoy are among his best achievements in this class. The Tretiakov gallery at Moscow contains a very large collection of his work.

See "Professor Repin," by Prince Bojidar Karageorgevich, in the *Magazine of Art*, xxiii. p. 783 (1899); "Russian Art," a paper by E. Brayley Hodgetts in the *Proceedings of the Anglo-Russian Literary Society* (5:h of May 1896); "Ilja Jefimovich Repin," by Julius Norden, in Velhagen and Klasing's *Monatshefte*, xx. p. 1 (1905): also R. Muther, *History of Modern Painting* (ed. 1907), iv. 172. (E. F. S.)

REPINGTON (or REPYNGDON), **PHILIP** (d. 1424), English bishop and cardinal, was educated at Oxford and became an Augustinian canon at Leicester before 1382. A man of some learning, he came to the front as a defender of the doctrines taught by John Wycliffe; for this he was suspended and afterwards excommunicated, but in a short time he was pardoned and restored by Archbishop William Courtenay, and he appears to have completely abandoned his unorthodox opinions. In 1394 he was made abbot of St Mary de Pré at Leicester, and after the accession of Henry IV. to the English throne in 1399 he became chaplain and confessor to this king, being described as "clericus specialissimus domini regis Henrici." In 1404 he was chosen bishop of Lincoln, and in 1408 Pope Gregory XII. made him a cardinal. He resigned his bishopric in 1419. Some of Repington's sermons are in manuscript at Oxford and at Cambridge.

REPLEVIN, an Anglo-French law term (derived from *replevir*, to replevy; see PLEDGE for further etymology) signifying the recovery by a person of goods unlawfully taken out of his possession by means of a special form of legal process; this falls into two divisions—(1) the "replevy," the steps which the owner takes to secure the physical possession of the goods, by giving security for prosecuting the action and for the return of the goods if the case goes against him, and (2) the "action of replevin" itself. The jurisdiction in the first case is in the County Court; in the second case the Supreme Court has also jurisdiction in certain circumstances. The proceedings are now regulated by the County Courts Act 1888. At common law, the ordinary action for the recovery of goods wrongfully taken would be one of detinue; but no means of immediate recovery

was possible till the action was tried, and until the Common Law Procedure Act 1854 the defendant might exercise an option of paying damages instead of restoring the actual goods. The earliest regulations with regard to the action of replevin are to be found in the Statute of Marlborough (Marlebridge), 1267, cap. 21. For the early history, see Blackstone's *Commentaries*, iii. 145 seq. Only goods and cattle can be the subjects of an action for replevin. Although the action can be brought for the wrongful taking of goods generally, as long as the initial taking was wrongful and it was from the possession of the owner, it is practically confined to goods taken by an illegal as opposed to an excessive distress (see DISTRESS and RENT, § *Legal*).

REPNIN, the name of an old Russian princely family, the first of whom to gain distinction was

PRINCE ANIKITA IVANOVICH REPNIN (1668–1726), Russian general, and one of the collaborators of Peter the Great, with whom he grew up. On the occasion of the Sophian insurrection of 1689, he carefully guarded Peter in the Troitsa monastery, and subsequently took part in the Azov expedition, during which he was raised to the grade of general. He took part in all the principal engagements of the Great Northern War. Defeated by Charles XII. at Holowczyn, he was degraded to the ranks, but was pardoned as a reward for his valour at Lyesna and recovered all his lost dignities. At Poltava he commanded the centre. From the Ukraine he was transferred to the Baltic Provinces and was made the first governor-general of Riga after its capture in 1710. In 1724 he succeeded the temporarily disgraced favourite, Menshikov, as war minister. Catherine I. created him a field-marshal

See A. Bauman, *Russian Statesmen of the Olden Time* (Rus.), vol. i. (Petersburg, 1877).

His grandson, PRINCE NIKOLAI VASILEVICH REPNIN (1734–1801), Russian statesman and general, served under his father, Prince Vasily Anikitovich, during the Rhenish campaign of 1748 and subsequently resided for some time abroad, where he acquired "a thoroughly sound German education." He also participated in the Seven Years' War in a subordinate capacity. Peter III. sent him as ambassador in 1763 to Berlin. The same year Catherine transferred him to Warsaw as minister plenipotentiary, with especial instructions to form a Russian party in Poland from among the dissidents, who were to receive equal rights with the Catholics Repnin convinced himself that the dissidents were too poor and insignificant to be of any real support to Russia, and that the whole agitation in their favour was factitious. At last, indeed, the dissidents themselves even petitioned the empress to leave them alone. It is clear from his correspondence that Repnin, a singularly proud and high-spirited man, much disliked the very dirty work he was called upon to do. Nevertheless he faithfully obeyed his instructions, and, by means more or less violent or discreditable, forced the diet of 1768 to concede everything. The immediate result was the Confederation of Bar, which practically destroyed the ambassador's handiwork. Repnin resigned his post for the more congenial occupation of fighting the Turks. At the head of an independent command in Moldavia and Walachia, he prevented a large Turkish army from crossing the Pruth (1770); distinguished himself at the actions of Larga and Kagula; and captured Izmail and Kilia. In 1771 he received the supreme command in Walachia and routed the Turks at Bucharest. A quarrel with the commander-in-chief, Rumyantsev, then induced him to send in his resignation, but in 1774 he participated in the capture of Silistria and in the negotiations which led to the peace of Kuchuk-Kainarji. In 1775–76 he was ambassador at the Porte. On the outbreak of the war of the Bavarian Succession he led 30,000 men to Breslau, and at the subsequent congress of Teschen, where he was Russian plenipotentiary, compelled Austria to make peace with Prussia. During the second Turkish war (1787–92) Repnin was, after Suvarov, the most successful of the Russian commanders. He defeated the Turks at Salcha, captured the whole camp of the *serashier*, Hassan Pasha, shut him up in Izmail, and was preparing to reduce the place when he was forbidden to do so by Potemkin (1789). On the retirement of Potemkin (*q.v.*) in 1791, Repnin succeeded him as commander-in-chief, and immediately routed the grand vizier at Machin, a victory which compelled the Turks to accept the truce of Galatz (31st of July 1791). In 1794 he was made governor-general of the newly acquired Lithuanian provinces. The emperor Paul raised him to the rank of field-marshal (1796), and, in 1798, sent him on a diplomatic mission to Berlin and Vienna in order to detach Prussia from France and unite both Austria and Prussia against the Jacobins. On his return unsuccessful, he was dismissed the service.

REPORT (O.Fr. *report* or *raport*, modern *rapport*, from O.Fr. *reporter*, mod. *rapporter*, Lat. *reportare*, to bring back, in poetical use only, of bringing back an account, news, &c.), an account or statement of events, speeches, proceedings, the results of investigations, &c., "brought back" by one who was present either casually or sent for the specific purpose, hence reputation, rumour. A special sense, that of a loud noise, as of the explosion of firearms, appears as early as the end of the 16th century. For the reports of speeches, parliamentary debates, &c., in the daily press see REPORTING below, and for the particular form of law reporting see ENGLISH LAW; AMERICAN LAW.

REPORTING, the art or business of reproducing in readable form, mainly for newspapers, but also for such publications as the *Parliamentary* or *Law Reports*, the words of speeches, or describing in narrative form the events, in contemporary history, by means of the notes made by persons known generally as reporters. The special business of reporting is a comparatively modern one, since it must not be confounded with the general practice of quoting, or of mere narrative, which is as old as writing. There was no truly systematic reporting until the beginning of the 19th century, though there was parliamentary reporting of a kind almost from the time when parliaments began, just as law reporting (which goes back to 1292) began in the form of notes taken by lawyers of discussions in court. The first steps in parliamentary reporting, in the sense of seeking to make known to the public what was done and said in parliament, began in a pamphlet published monthly in Queen Anne's time called *The Political State*. Its reports were mere indications of speeches. Later, the *Gentleman's Magazine* began to publish reports of parliamentary debates. Access to the Houses of Parliament was obtained by Edward Cave (*q.v.*), the publisher of this magazine, and some of his friends, and they took surreptitiously what notes they could. These were subsequently transcribed and brought into shape for publication by another hand. Dr Johnson for some years wrote the speeches, and he took care, as he admitted, not to let the "Whig dogs" get the best of it; the days of verbatim reporting were not yet come, and it was considered legitimate to make people say in print what substantially was supposed to represent their opinions. There was a strict parliamentary prohibition of all public reporting; but the *Gentleman's Magazine* appears to have continued its reports for some time without attracting the attention or rousing the jealousy of the House of Commons. The publisher, encouraged by immunity from prosecution by parliament, grew bolder, and began in his reports to give the names of the speakers. Then he was called to account. A standing order was passed in 1728, which declared "that it is an indignity to, and a breach of, the privilege of this House for any person to presume to give, in written or printed newspapers, any account or minute of the debates or other proceedings; that upon discovery of the authors, printers or publishers of any such newspaper this House will proceed against the offenders with the utmost severity." Under this and other standing orders, Cave's reports were challenged, with the result that they appeared without the proper names of the speakers, and under the guise of "Debates in the Senate of Lilliput,"

or some other like title. France was Blefuscu; London was Mildendo; pounds were sprugs; the duke of Newcastle was the Nardac secretary of state; Lord Hardwicke was the Hurgo Hickrad; and William Pulteney was Wingul Pulnub.

In the latter half of the century the newspapers began to report parliamentary debates more fully, with the result that, in 1771, several printers, including those of the *Morning Chronicle* and the *London Evening Post*, were ordered into custody for publishing debates of the House of Commons. A long and bitter struggle between the House and the public ensued. John Wilkes took part in it. The lord mayor of London and an alderman were sent to the Tower for refusing to recognize the Speaker's warrant for the arrest of certain printers of parliamentary reports. But the House of Commons was beaten. In 1772 the newspapers published the reports as usual; and their right to do so has never since been really questioned. Both Houses of Parliament, indeed, now show as much anxiety to have their debates fully reported as aforetime they showed resentment at the intrusion of the reporter. Elaborate provision is made in the House of Lords and in the House of Commons for reporters. They have a Press Gallery in which they may take notes, writing rooms in which those notes may be extended, and a special dining-room. Reporting is nowhere carried to such an extent as in the United Kingdom, since in most other countries the newspapers do not find it sufficiently interesting "copy" for their readers to justify the amount of space required. Consequently the verbatim reports, though now no longer hindered by law, and made possible by shorthand (which was first employed in the service of parliament in 1802) and by all the arts of communication and reproduction, are considerably restricted.

But parliamentary work is only a small part of newspaper reporting. The newspapers in the beginning of the 19th century rarely contained more than the barest outline of any speech or public address delivered in or in the neighbourhood of the towns where they were published. After the peace of 1815 a period of much political fermentation set in, and the newspapers began to report the speeches of public men at greater length. It was not, however, until well into what may be called the railway era that any frequent effort was made by English newspapers to go out of their own district for the work of reporting. The London newspapers had before this led the way. Early in the 19th century, greater freedom of access to both Houses was given, and the manager of the *Morning Chronicle* established a staff of reporters. Each reporter took his "turn"—that is, he took notes of the proceedings for a certain time, and then gave place to a colleague. The reporter who was relieved at once extended his notes, and thus prompt publication of the debates was made possible. The practice grew until there was a good deal of competition among the papers as to which should first issue a report of any speech of note in the country. Reporters had frequently to ride long distances in post-chaises, doing their best as they jolted along the roads to transcribe their notes, so that they might be ready for the printer on arrival at their destination. Charles Dickens, whose efforts in the way of reporting were celebrated, used to tell several stories of his adventures of this kind while he held an engagement on the *Morning Chronicle*. One result was that the provincial newspapers were stimulated to greater efforts, and as daily newspapers sprang up in all directions, and the electric telegraph provided greater facilities for reporting, the old supremacy of the London journals in this department of newspaper work gradually disappeared. No public man made a speech but it was faithfully reproduced in print. Local governing bodies, charitable institutions, political associations, public companies —all these came in a short time to furnish work for the reporter, and had full attention paid to them. By the second half of the 19th century, parliamentary reporting was a leading feature of the London newspapers. They had a monopoly of it. All the reporting arrangements in the House of Lords and in the House of Commons were made with sole regard to their requirements. There had indeed been a long battle between *The Times* and some of the other London newspapers as to which should have the best parliamentary report, and *The Times* had established its supremacy, which has never been shaken. The provincial newspapers were in the main obliged to copy the London reports, and rarely made any attempt to get reports of their own. When the electric telegraph came into use for commercial purposes a change began. The company which first carried wires from London to the principal towns in the country started a reporting service for the country newspapers. In addition, it procured admission to the parliamentary galleries for reporters in its employment, and began to send short accounts of the debates to the newspapers in the country. These newspapers were thus enabled to publish in the morning some account of the parliamentary proceedings of the previous night, instead of having to take like reports a day later from the London journals. The telegraph companies (not yet taken over by the state) for a long time could or would do no more than they had begun by doing; and they offered no inducements to the provincial newspapers to telegraph speeches. The public meanwhile wanted to know more fully what their representatives were saying in parliament, and gradually the leading provincial newspapers adopted the practice of employing reporters in the service of the London journals to report debates on subjects of special interest in localities; and these reports, forwarded by train or by post, were printed in full, but of course a day late. The London papers paid little attention to debates of local interest, and thus the provincial papers had parliamentary reporting which was not to be found elsewhere. But by this feature was developed. It was greatly accelerated by a movement which the *Scotsman* was the first to bring about. About 1865, a new company having come into existence, it was agreed that wires from London should be put at the disposal of such newspapers as desired them. Each newspaper was to have the use of a wire—of course on payment of a large subscription—from six o'clock at night till three o'clock in the morning. This was the beginning of the "special wire" which now plays so important a part in the production of almost all newspapers. The arrangement was first made by the *Scotsman* and by other newspapers in Scotland. The special wires were used to their utmost capacity to convey reports of the speeches of leading statesmen and politicians; and, instead of bare summaries of what had been done, the newspapers contained pretty full reports.

When the telegraphs were taken over by the state in 1870 the facilities for reporting were increased in every direction. The London papers, with the exception of *The Times*, had given less and less attention to parliamentary debates, while on the other hand several of the provincial newspapers were giving more space than ever to the debates. These newspapers had to get their reports as best they could. The demand for such reporting had led, on the passing of the telegraphs into the hands of the state, to the formation of news agencies, which undertook to supply the provincial papers. These agencies were admitted to the reporters' galleries in the Houses of Parliament, but the reports which any agency supplied were identical; that is to say, all the newspapers taking a particular class of report had exactly the same material supplied to them —the reporter producing the number of copies required by means of manifold copying paper. Accordingly attempts were made to get separate reports by engaging the services of some of the reporters employed by the London papers. The "gallery" was shut to all save the London papers and the news agencies. The *Scotsman* sought in vain to break through this exclusiveness. The line, it was said, must be drawn somewhere, and the proper place to draw it was at the London Press. Once that line was departed from every newspaper in the kingdom must have admission. But in 1880 a select committee of the House of Commons was appointed to consider the question. It took evidence, and it reported in favour of the extension of the gallery and of the admission of provincial papers. The result was that three or four papers which would be satisfied with the same report joined in providing the necessary reporting

staff. In other cases individual newspapers put themselves on the same footing as the London newspapers by engaging separate staffs of reporters.

The effect of telegraphic improvements may be partially gauged by the fact that in 1871 the number of words handed in for transmission through the British Post Office for Press purposes (special rates being allowed) was 22,000,000, and that in 1900 it had risen to 835,000,000. Meanwhile the evolution of the modern newspaper had brought many other kinds of reporting, besides parliamentary, into play.

What is commonly called "descriptive reporting" has in some cases nearly shouldered the reporting of speeches out of newspapers. The special correspondent or the war correspondent is a "descriptive reporter." The "interviewer" came into great prominence during the "eighties" and "nineties," and the influence of American journalistic methods, which made smart reporting the most valuable commercial asset of the popular newspaper, and the reporter correspondingly important, spread to other countries. No daily newspaper now confines its reporting to the affairs of the part of the country in which it is published. The electric telegraph has made the work of the reporter more arduous and his responsibility greater. The variety of work open to reporting causes considerable difference, of course, in the professional status of the journalists who do such work. This subject generally is discussed in the article NEWSPAPERS, but one instance of the recognition of the reporter's responsibility is worth special mention. In the year 1900, in the English case of *Walter* v. *Lane* (see COPYRIGHT), it was decided, on the final appeal to the House of Lords, that the reporter of a speech, printed verbatim in a newspaper, was under the Copyright Act of 1842 to be considered the "author." Absurd as it might seem to call the reporter the author of another man's speech, the decision gave effect to the fact that it is his labour and skill which bring into existence the "copy" to which alone exists right of property attach. Strictly speaking, he is the author of the *report* of the speech; but for literary purposes the report *is* the speech. It must, however, be borne in mind that there may be more than one verbatim report, and therefore more than one "author."

See also NEWSPAPERS; SHORTHAND; PRESS LAWS; TELEGRAPH.

REPOUSSÉ (Fr. "driven back"), the art of raising designs upon metal by hammering from the back, while the "ground" is left relatively untouched (see METAL WORK and PLATE). The term is often loosely used, being applied indifferently to "embossing." Embossing is also called "*repoussé sur coquille*" and "estampage," but the latter consists of embossing by mechanical means and is therefore not to be considered as an art process. Moreover, it reverses the method of repoussé, the work being done from the front, and by driving down the ground leaving the design in relief. Gold, silver, bronze, brass, etc., being easily malleable metals, are spontaneously suitable to repoussé which at the present day, in its finer forms, is mainly employed for silverplate and jewelry. The silver-plate in repoussé of Gilbert Marks (d. 1905) in England, and the portrait-plaques from life by Stephan Schwartz (b. in Hungary, 1851) in Austria, are noteworthy modern examples of the art.

Repoussé—a term of relatively recent adoption, employed to differentiate the process from embossing—has been known from remote antiquity. Nothing has ever excelled, and little has ever approached, the perfection of the bronzes of Siris (4th century B.C., in the British Museum), of which the armour-plate—especially the shoulder-pieces—presents heroic figure-groups beaten up from behind with punches from the flat plate until the heads and other portions are wholly detached—that is to say, in high relief from the ground of which they form a part. Yet the metal, almost as thin as paper, is practically of constant thickness, and nowhere is there any sign of puncture. The "Bernay treasure," in the Bibliothèque Nationale, Paris, discovered in 1830, belongs to the 2nd century B.C., and includes silver vases of Roman execution decorated with groups in mezzo-relief, beaten up in sections and soldered together. The best of these, of which perhaps the finest is that known from its subject as "La nymphe de la fontaine Pirène et Pégase," belong to the noblest period of Roman art. The Hildesheim treasure (discovered 1868) comprises a *patera* on the ground of which is a superb *emblema* representing Minerva in high relief. These repoussé *emblemata* were usually of another metal and applied to the vase which they decorated; indeed repoussé was of leading importance in *caelatura*, or the metallic art (statuary excepted) of classic times. Thus the *patera* of Hildesheim, the *patera* of Rennes, and the earlier shoulder-plate of the Siris bronze may be accepted as illustrative of the highest development of repoussé.

The art was not only Greek and Graeco-Roman in its early practice; it was pursued also by the Assyrians, the Phoenicians, and other oriental peoples, as well as in Cyprus and elsewhere, and was carried forward, almost without a break, although with much depreciation of style and execution, into medieval times. In the 11th century the emperor Henry II. presented as a thank-offering to the Basel cathedral the altar-piece, in the Byzantine style, decorated with fine repoussé panels of gold (representing Jesus Christ with two angels and two saints), which is now in the Cluny Museum in Paris. Up to this time, also, repoussé instead of casting in metal was practised for large work, and Limoges became a centre for the manufacture and exportation of sepulchral figures in repoussé bronze. These were affixed to wooden cores. By the time of Benvenuto Cellini the art was confined almost entirely to goldsmiths and silversmiths (who, except Cellini himself, rarely cast their work); and to them the sculptors and artists of to-day are still content to relegate it.

The elementary principle of the method, after the due preparation and annealing of the plate, was to trace on the back of it the design to be beaten up, and to place it face downwards upon a stiff yet not entirely unresisting ground (in the primitive stage of development this was wood), and then with hammers and punches to beat up the design into relief. According to Cellini, his master Caradosso da Milano would beat up his plate on a metal casting obtained from a pattern he had previously modelled in wax; but he is not sufficiently explicit to enable us to judge whether his casting was hollow mould, which would result in true repoussé, or in the round, which is tantamount to *repoussé sur coquille*, or embossing.

Nowadays the plate is laid upon and affixed to a "pitch-block," a resinous ground docile to heat, usually composed of pitch mixed with pounded fire-brick, or, for coarser work such as brass, with white sand, with a little tallow and resin. This compound, while being sufficiently hard, is elastic, solid, adhesive and easy to apply and remove. Gold and silver are not only the densest and most workable but the most ductile metals, admitting of great expansion without cracking if properly annealed. The tools include hammers, punches (in numerous shapes for tracing, raising, grounding, chasing and finishing the surface together with a special anvil called in French a *recingle* or *ressing*, in English "snarl." The *recingle*, or small anvil with projecting upturned point, was known in the 16th century. This point is introduced into the hollow of the vase or other vessel such as punch and hammer cannot freely enter, which it is desired to ornament with reliefs. A blow of a hammer on that part of the anvil where the prolongation first projects from it, produces, by the return spring, a corresponding blow at the point which the operator desires to apply within the vase. The same effect is produced by the modern "snarl" or "snarling iron"—a bar of steel, with an inch or two of the smaller end upturned and ending in a knob—held firmly in a tightly screwed-up vice, whereby the blow is similarly repeated and varied by the operator's hand. The repoussé work, when complete, is afterwards finished at the front and chased up. The same vase, to be worked up by embossing, would be filled with "cement" and laid on a sand-bag, and finally the whole would be heated and the cement run out. In the case of repoussé the vase itself may be beaten up out of the metal on the pitch-block. It must be understood that in order to obtain a result not merely excellent in technique but artistic and unmechanical in effect, the blows of the hammer must be made with feeling and "sentiment," otherwise the result cannot be a work of art.

See C. G. Leland, *Repoussé Work* (New York, 1885); and Gawthorp, *A Manual of Instruction in the Art of Repoussé* (London, 2nd ed., 1899). (M. H. S.)

REPRESENTATION, a term used in various senses in different connexions, but particularly in a political meaning, which has developed out of the others.

The word "represent" comes from Lat. *re-praesentare*, to "make present again," or "bring back into presence," and its history in English may be traced fairly well by the citations given in the *New English Dictionary* of its earliest uses in literature in senses which are still common. Thus we find the verb meaning (1380) simply to "bring into presence," and Barbour uses it (1375) in the sense of bringing clearly before the mind, whence the common sense of "explain," "exhibit," "portray." In 1513 it is used as synonymous with "describe," or "allege to be." In 1460 we find it employed for the performance of a play or a part in a play, whence comes the sense of symbolizing, standing in the place of some one, or corresponding to something; and in 1655 for acting as authorized agent or deputy of some one. This is a notable point in the development of the word. In Cromwell's speech to the parliament, January 22, 1655, he says: "I have been careful of your safety, and the safety of those you represented." This strictly political use of the verb developed, it will be seen, comparatively late.

The word.

The noun "representation" passed through similar stages. In 1425 we find it equivalent to "image," "likeness," "reproduction," "picture," from which is derived a meaning hardly distinguishable from "pretence." In 1553 it means a "statement" or "account," a sense which leads later (1679) to that of a formal and serious plea or remonstrance. In 1589 it occurs for a performance of a play. In 1647 it is used in psychology for the action of mental reproduction, a technical sense which applies especially to the "immediate object of imagination" (Sir W. Hamilton), and in Kantian language becomes the generic term for percepts, concepts and ideas. In 1624 it comes to mean "substitution of one thing or person for another," "substituted presence" as opposed to "actual presence," or "the fact of standing for, or in place of, some other thing or person," especially with a right or authority to act on their account. Its application to a political assembly then becomes natural, but for some time it is not so found in literature, the sense remaining rather formal. Good instances of this use are: Gataker, *Transubst.* 4: "The Rocke was Christ onely symbolically and sacramentally, by representation or resemblance"; and R. Coke, *Power and Subj.* iii.: "So cannot these members be formed into one body but by the king, either by his Royal Presence or representation." Thus "presence" and "representation" are used in distinctive meanings. In Scots law (1693) it obtains the technical meaning of the assumption by an heir of his predecessor's rights and obligations.

The term "representative," now specially applied to an elected member of a national or other assembly, deriving his authority from the constituency which returns him, appears to have been first used to denote not the member but the assembly itself. In the act abolishing the office of king, after Charles I.'s execution, 1649, section iv. runs: "And whereas by the abolition of the kingly office provided for in this Act, a most happy way is made for this nation (if God see it good) to return to its just and ancient right of being governed by its own Representatives or national meetings in council, from time to time chosen and entrusted for that purpose by the people, it is therefore resolved and declared by the Commons assembled in Parliament," &c., "and that they will carefully provide for the certain choosing, meeting and sitting of the next and future Representatives," &c. But the application of the term to the persons who sat in parliament was at all events very soon made, for in 1651 Isaac Penington the younger published a pamphlet entitled "The fundamental right, safety and liberty of the People; which is radically in themselves, derivatively in the Parliament, their substitutes or representatives."

It is worth while to dwell on the historical evolution of the various meanings of "it is represent," "representation" and "representative," because it is at least curious that it was not till the 17th century that the modern political or parliamentary sense became attached to them; and it is well to remember that though the idea of political representation is older and thus afterwards is expressed by the later meaning of the word, the actual use of "representation" in such a sense is as modern as that. In Burke's speeches of 1769[1] and 1774–1775, relating to taxation, we find the word in this sense already in common use, but the familiar modern doctrine of "no taxation without representation," however far back the idea may be traced, is not to be found in Burke in those very words. The "originator of that immortal dogma of our (*i.e.* American) national greatness" was, according to the American writer M. C. Tyler (*Amer. Lit.* i. 154), the politician and philanthropist Daniel Gookin (1612–1687), an Irish settler in Virginia, who, moving to Boston and becoming speaker of the Massachusetts legislature, became prominent in standing up for popular rights in the agitation which resulted in the withdrawal of the colonial charter (1686). But it was "the vogue of the" dogma "in America, not the phrase, that he seems to have originated; and while the precise form of the phrase does not appear to be attributable to any single author, the principle itself was asserted in England long before the word "representation," in a political sense, was current. In English constitutional history the principle was substantially established in 1297 by the declaration *De Tallagio non concedendo*,[2] confirmed by the Petition of Right in 1628.

The growth of the parliamentary system in England is traced in the article PARLIAMENT, but the account there given may be supplemented here by a more precise reference to the evolution of the idea of political "representation" as such, and of its embodiment in the word now employed to express it. The simple idea of the *substitution* of one person for another, of one person, *e.g.* hostage, pledge, victim, is so old as to be only describable as primitive; it is found in the proxy system, *e.g.* in marriage, and in diplomacy, the legate or ambassador being the *alter ego* of his sovereign; but, so far as general political legislative action, by one man in an assembly on behalf of others, is concerned, no systematic employment of a "deputy" (the word still used both in a general sense and in politics as a synonym for "representative") is known among the ancients. So long as political power rests in a small privileged class, such an idea must be slow to develop; and the primitive notion of a law-making body is that of all the members present in person, as in ancient Greece. But, as Stubbs (*Const. Hist.* i. 586) points out, the early English jury system (see JURY) shows the germ of the true idea of representation in England; it was the established practice of electing or selecting juries to present criminal matters before the king's judges, and assessors to levy taxes on the county, that suggested the introduction of popular representation in the English political system, and thus brought "the commons" into play in addition to the Crown and the nobles. Under Henry III., in 1254, we have the writ (see PARLIAMENT) requiring the sheriff of each county to "cause to come[3] before the King's Council two good and discreet Knights of the Shire, whom the men of the county shall have chosen for this purpose in the stead of all and of each of them, to consider along with knights of other shires what aid they will grant the king." But the definite establishment of the principle of political representation, in a shape from which the later English system of representation lineally descended, may be traced rather to the year 1295, in Edward I.'s famous writ of summons to parliament, of which the following is the important part. In the volume of *Select Documents of English Constitutional History* (1901), selected by G. B. Adams and H. M. Stephens, whose version from the Latin we quote, the section is headed (ante-dating the use of the vital word), "Summons of representatives of the counties and boroughs":—

The idea of political representation.

"The king to the sheriff of Northamptonshire. Since we intend to have a consultation and meeting with the earls, barons and other principal men of our kingdom with regard to providing remedies

[1] The *New English Dictionary*, for its first citation of "representative" in an assembly, quotes Burke, *Late St Nat.*, Works, ii. 138, *i.e.* in 1769.

[2] "No tallage or aid shall be laid or levied by us or our heirs in our realm, without the goodwill and assent of the archbishops, bishops, earls, barons, knights, burgesses and other freemen of our realm."

[3] "Venire facias," not "elegi facias."

against the dangers which are in these days threatening the same kingdom: and on that account have commanded them to be with us on the Lord's Day next after the feast of St Martin in the approaching winter, at Westminster, to consider, ordain and do as may be necessary for the avoidance of these dangers: we strictly require you to cause two knights from the aforesaid county, two citizens from each city in the same county and two burgesses from each borough, of those who are especially discreet and capable of labouring, to be elected without delay, and to cause them to come to us at the aforesaid time and place. Moreover, the said knights are to have full and sufficient power for themselves and for the community of the aforesaid county, and the said citizens and burgesses for themselves and the communities of the aforesaid cities and boroughs separately, and there, for doing what shall then be ordained according to the Common Council in the premises, so that the aforesaid business shall not remain unfinished in any way for defect of this power. And you shall have there the names of the knights, citizens and burgesses, and this writ."

The words "Elegi facias," instead of "venire facias" (which were retained in 1275; see PARLIAMENT), still appear to make the parliament of 1295 the model, rather than that of 1275, though in other respects the latter appears now to have established the summoning of county and borough representatives.

In this summoning by the king of the two knights and two burgesses with full and sufficient power *for themselves and for the community*, we find therefore the origin of continental representation of the commons, as opposed to the actual presence and personal attendance of the peers. The older English national assembly had consisted of the privileged class fully summoned as individuals.

Growth of representation in England.

The change involved has been well explained by E. A. Freeman (*Ency. Brit.*, 9th ed., viii. 297), when he says: "The national assemblies changed their character . . . by no cause so much as by the growth of the practice of summons. . . . In the great assembly at Salisbury (1086), where all the landowners of England became the men of the king (William the Conqueror), we see the first germs of Lords and Commons. The Witan are distinguished from them by the 'land-sitting men.' By the Witan, so called long after the Conquest, we are doubtless to understand those great men of the realm who were usually summoned to every assembly. The vast multitude who came to do their homage to the king were summoned only for that particular occasion. The personal right of summons is the essence of the peerage. . . . The earls and bishops of England, by never losing their right to the personal summons, have kept that right to personal attendance in the national assembly which was once common to all freemen, but which other freemen have lost. The House of Lords represents[1] by unbroken succession the Witan of the assembly of Salisbury; that is, it represents by unbroken succession the old assemblies of the Teutonic democracy. . . . The 'land-sitting men,' on the other hand, not summoned personally or regularly, but summoned in a mass when their attendance was specially needed, gradually lost the right of personal attendance, till in the end they gained the more practical right of appearing by their representatives."

From the same authority the account of the intermediate stages in the adoption of the representative principle may be further quoted:—

"By the time of Henry II. the force of circumstances, especially the working of the practice of summons, had gradually changed the ancient assembly of the whole nation into a mere gathering of the great men of the realm. . . . It is in the reign of Richard I. that we begin to see the first faint glimmerings of parliamentary representation. . . . The object of his wise ministers, of Archbishop Hubert among the first, was to gain the greatest amount of money for their master with the least amount of oppression towards the nation. Under Hubert's administration, chosen bodies of knights or other lawful men, acting in characters which became more and more distinctly representative, were summoned for every kind of purpose. How far they were nominated, how far freely elected, is not always clear. It seems most likely that in one stage they were nominated by the sheriff in the county court, while at a later stage they were chosen by the county court itself. In other words, the principle of representation was first established, and then the next stage naturally was that the representatives should be freely chosen. Summoned bodies of knights appear in characters which are the forerunners of grand jurors and of justices of the peace. They appear also in a character which makes them distinctly forerunners of the knights of the shire which were soon to come. A chosen body of knights have to assess the imposts on each shire. From assessing the taxes the next stage was to vote or to refuse them. In 1213 the sheriffs are called on to summon four discreet men from each shire, to come to the king with the king about the affairs of the realm. When we have reached this stage, we have come very near to a *parliament*, name and thing. The reign of John, in short, is marked by common consent as the time from which Englishmen date the birth of their personal freedom in its later form. . . . The (Great) Charter (1215) is the first solemn act of the united English nation after Norman conquerors and Norman settlers had become naturalized Englishmen. . . . Representation was already fast growing up; but it had hardly yet reached such a stage that it could be summoned in legal form. But rules are laid down out of which, even if it had not begun already, representation in the strictest sense could not fail shortly to arise. The distinction which had been growing up ever since the Conquest, and indeed before, between the *Witan* and the *land-sitting men*, now receives a legal sanction. The practice of summons makes the distinction. Certain great men, prelates, earls and greater barons, are to receive the personal summons. The rest of the king's tenants-in-chief are to be summoned only in a body. Here we have almost come to a separation of Lords and Commons. But in modern ideas those names imply two distinct houses; and it was not yet settled, it had yet come into men's minds to consider, whether the national council should consist of one house or a dozen. But it is decreed in so many words that the acts of those who came would bind those who stayed away. On such a provision, representation, that is to say only representation by part of the representatives, follows almost as a matter of course. The mass stay away: a few appear, specially commissioned to act in the name of the rest. The Charter mentions only the king's tenants-in-chief; so far had things been ripened or fenalized by the influence of the Conquest. But as the election could only be made in the ancient county court, every freeholder at least, if not every freeman, won back his ancient right. If he could not come himself to say Yea or Nay, he at least had a voice in choosing those who could do so with greater effect."

(*Ibid.* pp. 307, 308.)

"The constitution of the (national) assembly, as defined in the Great Charter, did not absolutely imply representation; but it showed that the full establishment of representation would not be long delayed. The work of the period 1217–1340 was to call up, alongside of the gathering of prelates, earls and other great men specially summoned, into which the ancient Witanagemot had grown, another assembly representing all other classes of the nation which enjoyed political rights. This assembly, chosen by various local bodies, *communitates* or *universitates*, having a quasi corporate being, came gradually to bear the name of the *commons*. The knights of the shire, the lesser barons, and burgesses of the towns, were severally chosen by the *communa* or *communitas* of that part of the people which they represented."[2]

"The notion of local representation, by which shires and boroughs chose representatives of their own communities, had to contend to strive with another doctrine, that of the representation of *estates* or classes of men. The 13th century was the age when the national assemblies, not only of England but of most other European countries, were putting on their definite shape. In most of them the system of *estates* prevailed. These in most countries were three,—clergy, nobles and commons. By these last were commonly meant only the communities of the chartered towns, while the *noblesse* of foreign countries answered to the lesser barons and knights, who in England were reckoned among the commons. The English system thus went far to take in the whole free population, while the estates of other countries, the commons no less than the clergy and nobles, must be looked on as privileged bodies. In England we had in truth no estates: we had no nobility in the foreign sense. . . . Yet the continental theory of estates so far prevailed in the development of our parliamentary system that the 'Three Estates of England' became a familiar phrase. It was meant to denote the lords, the commons and the clergy in their parliamentary character. For it is plain that it was the intention of Edward I. to organize the clergy as a parliamentary estate, alongside of the lords and commons. This scheme failed, mainly through the unwillingness of the clergy themselves to attend in a secular assembly. This left, so far as there were any estates at all, two estates only,—lords and commons. This led to the common

[1] The inevitable use of the word "represent" in its wider sense ("corresponds to"), is worth noting in this passage from Freeman; side by side with the more technical one in "representative" ("chosen delegate").

[2] Professor Masterman, lecturing (1908) on the House of Commons, has pointed out how fortunate it was that this beginning of the organization of the communes into a central body did not come earlier than it did. Had there been one assembly representing the local *communitates* at any earlier time it would have been far too sectional in character and too little conscious of any common interest. The organization did not begin till England had become a self-conscious body, realizing its common interests and the common destiny that belonged to it as a nation.

mistake of fancying the three estates to be king, lords and commons. The ecclesiastical members of the House of Lords kept their seats there; but the parliamentary representation of the clergy as an estate came to nothing. So far as the clergy kept any parliamentary powers, they exercised them in the two provincial convocations. These anomalous assemblies, fluctuating between the character of an ecclesiastical synod and of a parliamentary estate, kept, from Edward I. to Charles II., the parliamentary power of self-taxation. For a long time lords and commons taxed themselves separately. So did the clergy; so sometimes did other bodies. . . .

"During the reign of Henry III. assemblies were constantly held, and their constitution is often vaguely described. But in a great many cases phrases are used which, however vague, imply a popular element. We read of knights, of tenants in chief, of freemen, sometimes even of freemen and villeins, sometimes more vaguely still, of 'universi,' 'universitas Angliae,' and the like. In some cases we are able better to interpret these vague phrases. For instance, in 1224 each shire sends four knights chosen by the 'milites et probi homines.' Whether these knights were or were not to vote along with the magnates, they were at all events to transact business with them. We must always remember that in these times formal voting in the modern sense is not to be looked for." [1] (*Ibid.* pp. 314, 315.)

This summary shows clearly how the idea of "representation" as opposed to "presence in person" was applied to the English parliament, so as to give the commons a proper voice in it as well as the lords. It is unnecessary to trace further the gradual increase in power by which the House of Commons till it became the predominant partner in the English bicameral constitution (see PARLIAMENT). But from the point of view of historical theory it is important to note that its representative character does not essentially depend upon the particular method (election *by vote*) by which its members have for so long been chosen. It is a common error to regard the House of Commons as having a national authority higher than that of the House of Lords merely on the ground that it is composed of elected members, and to stigmatize the House of Lords as "unrepresentative" because it is not elected. But in strictness the question of election, as such, has nothing to do with the matter.[2] The proper distinction (ignoring for the moment the later inclusion in the House of Lords of a limited representative element—strictly so regarded—in the Scotch and Irish peers) is that the House of Lords, as still constituted in 1910, remained a *presentative* chamber, while the House of Commons was essentially a *representative* one; in the former the members, summoned personally as individuals, were entitled to speak in the great council of the nation, while in the latter the members were returned as the mouthpieces of whole *communitates*, to whom, in the person of the sheriffs, the summons had been directed to send persons to speak for them.[3] The preponderant authority of the House of Commons is due not to its members being elected—that is only one way of settling who the mouthpieces of the commons shall be—but to the progress of popular government. The two British houses have historically existed as assemblies of the separate estates of the realm—the House of Lords of the two estates of lords spiritual and temporal, and the House of Commons of the commons. The third estate has so increased in power as to become predominant in the country; but the authority of its own assembly simply depends on the powers of those it represents. If the balance of political power had not been shifted in the country itself, the authority and competence of the peers, speaking for themselves in a primary assembly, would in theory actually appear higher, so far as their order is concerned, than that of members of the House of Commons, who can only "represent" the popular constituencies. Moreover, the fact that most members of the House of Commons are elected by a party vote is apt to make them very often even less authoritative spokesmen of their constituencies—the *communitates*—than if they were selected by some method which would indicate that they had the full confidence of the whole body they "represent." It is notorious that many members of a modern House of Commons, or of any other "representative" assembly, have only been elected by the votes of a minority of their constituency, or (where there have been more than two candidates) a minority even of those who voted; and there always comes a time when it is certain that if a representative has to come again before the electorate for their votes he will be defeated; he, in fact, no longer reflects their views, while he still sits and legislates. The real desires of the commons in a certain British constituency may even be more faithfully, even if only accidentally, reflected by a local peer whose only right to speak in parliament is basically presentative. In his *Vindication of the British Constitution* (1835), Disraeli, writing of the Reform Bill of 1832, observed that "in the effort to get rid of representation without election, it will be well if eventually we do not discover that we have only obtained election without representation." A truer word was never spoken. A man may be representative, practically *consensu omnium*, although no vote, resulting from a division of opinion, has been taken for the purpose of selecting him. The vote is merely a method of selection when there is a definite division of opinion involving an uncertainty; and even in the modern House of Commons many members are returned "unopposed," no actual voting taking place. A well-recognized representative character (as regards the functions involved) attaches, for instance, in British public life to other persons in whose selection the method of popular voting has had no place; such as the king himself, the Cabinet (in relation to the political party in power), or the bishops (as regards the Church of England).

The Theory of Representation.

The question of remodelling the constitution of the British House of Lords was prominently before the country in 1910; and a large number even of those who were prepared to defend its actions in the past were ready to accept changes which would make it in form and composition a Second Chamber representative of the nation rather than presentative of its historic order. But it is important to remember, in connexion with the House of Lords question, that, in a country like England, where the constitution has provided for a Second Chamber which is composed of members of an estate or estates distinct in the nation from the estate of the commons, these persons may to a predominant degree nevertheless be really representative men by common consent; while their being so, though not theoretically the reason for their legislative power, is substantially the reason why it has so long persisted. In the absence of a written constitution, theoretical considerations have in England always been second to the force of circumstances. Most people regarded the House of Lords, as still unreformed in 1910, as purely a *hereditary* body; its members had been summoned to parliament as peers (the important question of their right to a summons need not here be discussed), and most peers enjoyed their titles by hereditary succession. But the constant creation of peers by both political parties had in fact introduced even into the constitution of the House of Lords

The British Houses of Parliament.

[1] "Election" in these early times has its simple meaning of "choice." "We must guard ourselves from supposing that the citizens and burgesses, who were summoned to Parliament, were absolutely elected by the inhabitants of the towns as their representatives. Their presence in Parliament is another instance of representation without election. They were often nominated by the sheriff of the county, and even when that great officer, from negligence or favour, permitted the return to be made by those interested in the transaction, the nomination was confined to the small governing body, who returned two of their members, in general very unwilling missionaries, to the great council" (Disraeli, *Vindication of the British Constitution*, 1835).

[2] In the American federal system the bicameral legislature is divided into a "House of Representatives," composed of members elected by popular vote in each state, and a "Senate," composed of members elected by the legislature in each state. In spite of this nomenclature, both houses are really composed of "representatives." But under a republican system there is no room for a purely presentative assembly, and the term "representative" comes to imply a more direct choice by the "commons."

[3] There was at one time, it may be noted, a sort of "representative" element even in the case of the House of Lords, in so far as peers (including peeresses in their own right, abbesses, &c.) could send deputies or proxies. But it must be remembered that the privilege flowed directly from the personal and presentative character of the summons to a peer, who as such could name a deputy. It is quite illegitimate to strain from it an analogy with the election of a representative by the commons, who had no personal right to a summons.

an essentially representative element (though not resulting from direct election), apart altogether from the fact that heredity maintained there a number of persons whose title had descended from men who were originally representative Englishmen, and whose successors, on the whole, were no less so. In the days when kings really governed in England, the most powerful check on the king, in the interest of the nation at large, was the peerage; the earls and barons, in parliament, were the chief bulwark of the people against tyranny. It was they who stood for the nation in extorting Magna Carta from King John; and as time went on, the representation of the commons in parliament was largely due, not to any direct popular pressure, but to the desire of the kings to influence the lower ranks of society independently of the nobles. Up to the reign of Charles I., at all events, the House of Lords was actually the predominant partner in parliament; the House of Commons was recruited from and returned by only a small section of the commons as now understood; and Oliver Cromwell—certainly a "popular" leader in the ordinary sense—made as short work of it as he did of the king himself. Up to 1832, when the first modern Reform Act was passed, the House of Commons was an oligarchical body, and the electors themselves were a small and privileged class. It is only since then—except in the granting of supplies—that first equality, and then predominance, in respect of the House of Lords, has been asserted by the House of Commons, owing to the fact that an extended suffrage has made the estate of the commons more adequately coincident with the nation as a whole. Prior to 1832 it was the king who directly made and unmade ministries; in 1835 for the first time the result of a general election caused a change of ministry; and the modern view of the House of Lords as purely a revising chamber dates only from then. But the very fact that the responsibility for creating new peerages now passed to ministers dependent on popular suffrage may well justify the contention that henceforth it indirectly included a select number of representative men of the nation, holding their seats in virtue of authoritative nomination and not by heredity. In the sixty years preceding 1906 no fewer than 419 new peerages were created, 238 by the Liberal party, 181 by the Conservative, or a balance of 57 creations on the Liberal side.[1] It is fair to assume that all these new peers were created as being representative men in the nation for one reason or another. And an analysis of the composition of the House of Lords in 1906 would have led an unprejudiced outside observer to suppose that its competence to speak on national affairs had not been weakened by any dependence on the hereditary title. It included 166 men who had been M.P.'s (*i.e.* had been elected by popular vote to the House of Commons), 172 who had held government office, 140 who had been mayors of county councils, 207 who had served in the army or navy, 40 who had been judges or lawyers, 7 ex-viceroys, 16 ex-governors of colonies, 50 who had been eminent in art, letters, manufactures or trade, and 21 archbishops or bishops (appointed by ministerial recommendation, but only after they had worked up to eminence from being curates, and therefore had wide experience of the social life of the people).

It is possible to compare a chamber so composed somewhat favourably with a modern House of Commons, if the point at issue—the provision of "representative men" (*i.e.* men generally accepted as national spokesmen)—be strictly considered, apart from the method of selecting them by direct popular vote.[2] In the House of Lords the method is heredity *plus* selection by the political party which the popular vote has put in power; while in the election of members of the House of Commons the popular choice is doubly limited—first, by the fact that only the enfranchised commons can vote (in 1910 about 7½ millions out of 43); and secondly, because the choice must be made from among candidates who are themselves not disqualified for various reasons (for instance they must not be clergymen, nor entitled to seats in the House of Lords). Now, to carry out the real "will of the nation" in parliament must require (1) a reasonable knowledge of the wishes of the nation, and (2) an understanding of the best ways of expressing those wishes in legislation and administration. In the case of the peers, those who sit as having been originally created and therefore selected for the purpose—a considerable section of those actively attending—the qualifications are obvious: and it is only necessary to deal with those qualified by inheritance of title. Here too, in a number of cases, preceding experience in the House of Commons, to which the popular vote has returned them while they were only in the succession to a peerage, is a frequent factor; but, apart from that, the art of legislation is one which may well be considered to require a certain special disposition and mental equipment. Though allowance must be made for exceptional cases, it is obvious that the son of a man who has been responsible for legislating, who has himself been brought up as one who will have to take his part in legislating, is most likely, in any society, to have qualified himself for the business, as in the case of any profession or trade. He has been accustomed to breathe the parliamentary atmosphere, and as one of a governing class has had the opportunity to study the subject of legislation, and to obtain experience of its conditions. This is so generally accepted that, in fact, the same theory is commonly applied to candidates for the House of Commons, and predominantly to members of that House who are given office. The names of more than one generation are writ large in English history in the case of the Pitts, Foxes, Grenvilles, Cannings, Cecils, Stanleys and Cavendishes. The sons of famous political commoners, a Gladstone, a Harcourt, a Churchill, a Primrose, a Chamberlain, have by consent a superior claim, even within the radical or popular party, by no means resting originally or primarily on known personal merit or proved experience, for selection as candidates and then for preferment to office; and it is a very common occurrence for younger sons of peers to be selected as candidates (liberal as much as conservative) for parliament, even though from general intellectual considerations they may appear in no way the equals of other men. They have been brought up to the business; and they are therefore adapted for it by heredity. If the House of Commons were deprived of those members who obtained their seats or their offices primarily for reasons of heredity, it would lose many of its best men—as indeed it occasionally does, to its disadvantage and possibly to the chagrin of the individuals themselves, when succession to a peerage forces a prominent parliamentarian to relinquish his seat in the Lower House and to take his place in the "unrepresentative" chamber.

It remains nevertheless the fact that, in politics, "representative" government is not so much government by men really representative of the nation as government in the name of the whole body of citizens (and predominantly the estate of the commons) through a chamber or chambers composed of elected deputies. The object in view is the expression of the "will of the people"—the people, that is, who are sovereign. Clearly the only pure case of such government can be in a republic, where there is only one "estate," the free citizens. The home and historical type of representative government, the United Kingdom, is strictly no such case, since the monarchy and the House of Lords exist and work on lines constitutionally independent of any direct contact with the electorate. British practice, however, is of vital importance for the theory of representative institutions, and it is worth while to point out that the "will of the people" may even so be effectively expressed—some people may think even more effectively expressed than in a pure republic. The king and the House of Lords, *qua*

Expression of the "Will of the People."

[1] Between January 1906 and January 1910 thirty-five more new peers were created by Liberal premiers, and seven more in June 1910.

[2] Speaking at Oldham on December 15, 1909, Lord Curzon said: "I have taken out the figures of the past 200 years, and I tell you this, that during that time 41 of our prime ministers have sat in the Lords and only 17 in the Commons; of our foreign secretaries, 56 in the Lords and only 8 in the Commons; of our colonial secretaries, 46 in the Lords and 25 in the Commons; of our war ministers, 29 in the Lords and 31 in the Commons; of first lords of the Admiralty, 48 in the Lords and 28 in the Commons."

estates of the realm, are just as much part of "the people," in the widest sense, as "the commons" are; they are an integral part of the nation. In a republic they would as individuals be equal citizens, able to become candidates for the representative chamber or chambers; but as it is, since they are expressly debarred from taking part in elections to the House of Commons, they remain entitled and expected to use their historic method of playing a part in the government of the state. They assist to constitute "the people" in the wider sense, and in the narrower sense "the people" (*i.e.* the commons) know it and rely on it. Under the British constitution the commons have habitually relied on the monarchy and the House of Lords to play their part in the state, and on many occasions it has been proved, by various methods by which it is open to the commons themselves to show their real feeling, that action on the part of the monarch (*e.g.* in foreign affairs) or the House of Lords (in rejecting or modifying bills sent up by the House of Commons), in which a popular vote has played no initiating or controlling part, is welcomed and ratified, by consent of a large majority, on the part of the nation at large. So much is this so that it is notorious, in the case of the House of Lords, that elected members of the House of Commons, tied by purely party allegiance and pledges, have constantly voted for a measure they did not want to see passed, relying on the House of Lords to throw it out. Ultimately, no doubt, the reconciliation of this "presentative" element in the British form of constitution with the growth of democracy and the predominance of the "representative" system depends purely on the watching and historical theory both by king and peers, and its adaptation to the fact of popular government through the recognition that their action rests for its efficient authority upon conformity with the "will of the people." Thus it has become an established maxim in England that while it is the proper function of the House of Lords to reject a measure which in their opinion is not in accordance with the wishes of the nation, they could not repeat such a rejection after a general election had shown that its authors in the House of Commons were supported by the country. The experience of politics from 1832 to 1910 gave abundant justification to the House of Lords for supposing that in such cases they were interpreting the desire of the country better than the House of Commons; the case of the Irish Home Rule bill of 1893 is, of course, the classical example. So that in practice the House of Lords only acts in opposition to the House of Commons, subject to the remedy of a dissolution of parliament (which depends strictly on the prerogative of the Crown, but in practice on the advice of the leader of the majority in the House of Commons), at which the view of the House of Commons might be confirmed and reasserted, and in that case would prevail. The violent attacks made on the House of Lords by the Liberal party, on occasions when that party has had a majority in the commons and has had its measures rejected or distastefully amended, have always been open to the criticism that if the majority in the House of Commons were really supported by the electorate in the country they had the remedy in their own hands. If it were shown by the result of a general election that their defeated measure were the "will of the people," the House of Lords, as was generally understood, must give way. Such a position, though naturally objectionable to a party in power in the House of Commons (because general elections are uncertain things in every respect but that of trouble and expense), could clearly be strong only in view of the confidence of the House of Lords in its action being more truly representative of public opinion. It therefore must be said to have acted, however clumsily and indirectly—and no direct way would be feasible except that of the Referendum—as a "representative" body, *i.e.* as carrying out what it judged to be the national will and not merely the will of the peers, although not constituted as such in the narrower sense. In practice, and in accordance with this view, it has on more than one occasion (*e.g.* in the case of the Trades Disputes Act of 1906) accepted and passed measures which it was notorious, and indeed avowed, that the peers themselves regarded as bad.

The immense extension of the "representative principle" in government, by means of popular election, and its adaptation to municipal as well as national councils, has in recent times resulted in attracting much attention to the problem of making such elected bodies more accurately representative of public opinion than they frequently are. There are three distinct problems involved—(1) that of making the number of enfranchised citizens correspond to a real embodiment of the nation; (2) that of getting candidates to stand for the office of representative who are competent and incorruptible exponents of the national will, and (3) that of adopting a system of voting which shall result in the elected representatives forming an assembly which shall adequately reflect the balance of opinion in the electorate.

Difficulties in obtaining Representation by Election.

(1) The history of the gradual extension of the franchise in the United Kingdom is given under PARLIAMENT, and the conditions for other countries under their respective headings. But while, in countries with a representative system at all, the question as to the extent to which the male citizens shall have the vote is mainly one of degree—as to property or other qualification, up to the inclusion of all adults (see VOTE AND VOTING)—the question of the incapacity of women, as a sex, raises a distinction which is more radical. The facts as to the progress of the movement for women's suffrage are given in the article WOMEN. It is only necessary to say here that, where the franchise is limited to the male sex, the theory of "no taxation without representation" is under modern conditions of life carried out in a decidedly one-sided way. The question of women's suffrage is, however, one of public policy, in whatever state it is raised; and even where, as in Great Britain, it has been adopted for municipal affairs, a distinction is commonly made as regards the national assembly. So far as the historical facts as to the disability of women are concerned, it has been unanimously decided in England by the highest law-court of the realm (judgment of the House of Lords in the Edinburgh University case, December 1908), presided over on this occasion by a Liberal Lord Chancellor (Lord Loreburn), that, according to their authoritative statement of the common law, women never had in earlier times any legal right to vote for members of parliament; this judgment is therefore entirely adverse to such ingenious arguments to the contrary as are ably expressed in Mrs Charlotte Carmichael Stopes's *British Freewomen* (1907).

The Suffrage.

Sex, however, apart, there are various interesting questions as to the principles which should govern the extension of the suffrage and its limitations, to which a brief reference may here be made. It is noteworthy that John Stuart Mill, the philosophical radical whose work on *Representative Government* (first published in 1861) is a classic on the subject, and who regarded the representative system as the highest ideal of polity, made a good many reservations which have been ignored by those who frequently quote him. Mill's ideal was by no means that popular government should involve a mere counting of heads, or absolute equality of value among the citizens. While holding that "no arrangement of the suffrage can be permanently satisfactory in which any person or class is peremptorily excluded, or in which the electoral privilege is not open to all persons of full age who desire to obtain it," he insisted on "certain exclusions." Thus he demanded that universal education should precede universal enfranchisement, and laid it down that if education to the required amount had not become universally accessible and thus a hardship arose, this was "a hardship that had to be borne." He would not grant the suffrage to any one who could not read, write and perform a sum in the rule of three. Further, he insisted on the electors being taxpayers, and emphasized the view that, as a condition annexed to representation, such taxation should descend to the poorest class

[1] The result of the general election of January 1910, following on the rejection of the Budget by the House of Lords, cannot properly be said to show anything to the contrary. It was notorious that there was no genuine majority in the new House of Commons for the Budget, and that the Irish Nationalists only voted for it as part of an arrangement for ulterior purposes.

"in a visible shape," by which he explained that he did *not* mean "indirect taxes," a "mode of defraying a share of the public expenses which is hardly felt." He advocated for this purpose "a direct tax, in the simple form of a capitation" on every grown person. But even more than this, he was in favour of a form of plural voting, so that the intellectual classes of the community should have more proportionate weight than the numerically larger working-classes: "though every one ought to have a voice, that every one should have an equal voice is a totally different proposition." The well-informed and capable man's opinion being more valuable than that of the barely qualified elector, it should be given more effect by a system of plural voting, which should give him more votes than one. As to the test of value of opinion, Mill was careful to say he did not mean property—though the principle was so important that he would not abolish such a test where it existed—but individual mental superiority, which he would gauge by the rough indication afforded by occupation in the higher forms of business or profession, or by such a criterion as a university degree or the passing of an examination of a fairly high standard.

"Until there shall have been devised some mode of plural voting, which may assign to education as such the degree of superior influence due to it, and sufficient as a counterpoise to the numerical weight of the least educated class, for so long the benefits of completely universal suffrage cannot be obtained without bringing with them, as it appears to me, more than equivalent evils." "Equal voting," he repeated, "is in principle wrong, because recognizing a wrong standard, and exercising a bad influence on the voter's mind. It is not useful, but hurtful, that the constitution of the country should declare ignorance to be entitled to as much political power as knowledge."

Modern democracy may ignore Mill's emphatic plea for plural voting, as it ignores his equally strong arguments against the ballot[1]—his contention being that secret voting violated the spirit of the suffrage, according to which the voter was a trustee for the public, whose acts should be publicly known—but Mill's discussion of the whole subject proceeds on high grounds which are still worth careful consideration. Where a representative system, as such, is extolled as the ideal polity, the reservations made by Mill, a liberal thinker who cannot be dismissed as a prejudiced reactionary, should be remembered. Mill postulated, in any event, a state of society which was worthy of such a system, no less than the necessary checks and balances which should make it correspond to the real conditions of rational government. "Representative institutions," he pointed out, "are of little value, and may be a mere instrument of tyranny or intrigue, when the generality of electors are not sufficiently interested in their own government to give their vote, or, if they vote at all, do not bestow their suffrages on public grounds, but sell them for money, or vote at the bidding of some one who has control over them, or whom for private reasons they desire to propitiate. Popular election, as thus practised, instead of a security against misgovernment, is but an additional wheel in its machinery." When, in modern days, advocates of representative institutions seem ready to extend them to all countries, they become doctrinaires who depart widely from the standpoint of Mill, and forget that democracy is itself only a "form of government," as Sir Henry Maine insisted, for which all communities may not be ripe or fitted. The ideal form of government must be relative to a certain state of civilization and certain conditions of national life, and its advantages can only be tested by results and practical working.

(2) As regards the important question of the selection of candidates (which depends partly on their willingness to stand, and partly on the means available for discovering suitable persons), modern practice is entirely dominated by the organization of political parties and the requirements of party allegiance. Though much has been said as to the desirability or not of paying members for their services (see PAYMENT OF MEMBERS), this is certainly overshadowed by the question of the availability of really capable men at all to the number required, for all candidates become "professional" politicians, whether paid or not. The ideal of having a "representative man" in the broader sense as a "representative" in the narrower is only very roughly attained where the conditions of public life make a capacity for electioneering a necessity. To a large extent the political candidate depends purely upon the support of a party organization. His choice rests with party wire-pullers, and the average individual elector is confronted with the task of voting for some one of whom he may personally know very little, except that, if returned, the candidate will in parliament vote for measures embodying certain general principles as indicated in some vague party programme. Since the elector as a rule himself supports a party, he votes accordingly, but there are always a good many electors who under such a system fail to get a chance of voting for a candidate who fully represents their views. The supremacy of party interests, resulting from the difficulty of having any other form of electoral organization, is apt to bring many evils in its train, including the corruption of the electorate, and the practice of "lobbying," *i.e.* the pressure upon members in parliament of important "interests" whose electoral assistance is indispensable.

Selection of Candidates.

(3) The more important point to be considered here is the third. When a representative assembly is to be elected by a direct popular vote, it is obviously necessary (*a*) that either there should be some system by which the whole body as a unit should elect all the members *en bloc*, or, as this usually appears impracticable, that the mass of electors should be divided within defined areas, or "constituencies"; and (*b*) that in the latter case voting shall take place for the purpose of electing one or more representatives of each such area according to some method by which due effect shall be given to the preferences of the electors. In theory there can be no perfectly fair arrangement as between constituency and constituency, where a single representative is to be returned, except on the terms that they are exactly equal in the number of electors; each elector's voice would then count equally with that of any other in the nation (or *mutatis mutandis* in the municipality, &c.). But in practice it is difficult to the point of impossibility to attempt more than an arbitrary distribution of electoral areas, more or less approximating to equality; and recourse is had to the formation of constituencies out of geographical districts taken as units for historical or practical reasons, and necessarily fluctuating from time to time in population or influence. It may become necessary periodically to revise these areas by what in England are called Redistribution Acts, but it has to be admitted that any perfect system of representation is always stultified by the necessary inequalities involved; and what is known as "gerrymandering" is sometimes the result, when a party in power so recasts the electoral districts as to give more opportunity for its own candidates to be returned than for those of its opponents. This flaw is particularly noticeable when the arrangement for the method of voting is that which allots only one member or representative to each district (*scrutin d'arrondissement*). One essential vice of this single-member system, which prevails in the United Kingdom[2] and the United States, is the lack of correspondence between the proportions in which the elected members of each party stand to one another and the proportions in which the numbers of the electors who returned them similarly stand; and it may well be that the minority party in the country obtains a majority of representatives in the assembly, or at any rate that a substantial minority obtains an absurdly small representation. "As a result of the district system," writes Professor J. R. Commons of Wisconsin (*Proportional Representation*, 1907), "the national House of Representatives (in America) is scarcely a representative body. In the Fifty-first Congress, a majority of representatives were elected by a minority of the voters"; the figures being 5,348,379 Republican votes with 164 elected, and 5,502,581 Democratic votes with 161 elected. In

[1] Before 1872, when the Ballot Act was passed, voting was public.

[2] The House of Commons in 1910 was elected by 643 constituencies, of which 27 (including three universities) returned two members each, and the rest one; and the Royal Commission, which reported in that year, recommended the abandonment of the existing two member constituencies "at the earliest convenient opportunity."

the case of the Fifty-second Congress, the Democrats, with 50·6% of the votes, returned 71·1% of the representatives; the Republicans, with 42·9% of the votes, returning 26·5% of the representatives. Lord Avebury (*Proportional Representation*, 1890; new ed. 1906) has given various similar experiences in England; thus, at the general election of 1886, the Liberals, with 1,333,400 votes, only obtained 176 seats, while the Unionists, with 1,423,500, obtained 283 (not counting 99 unopposed returns on the Liberal side, and 111 on the Unionist). In the general election of 1895, at which 132 Unionist seats and 57 Liberal were unopposed, the result in the 481 seats contested was the return of 279 Unionists and 202 Liberals; yet the actual votes given were 1,800,000 for the Liberals, and 1,775,000 for the Unionists. Again, in 1906, the Unionist vote, though 44% of the total cast, returned only 28% of the members, and the Liberal majority, which in strict proportion would have been 68, actually was 256.

The establishment of mere party majority rule, which is characteristic of a representative system, is a necessity, no doubt, in popular government; but the way in which a substantial minority of voters may only obtain a contemptible minority of members, and may in practice be tyrannized over in consequence, somewhat detracts from its blessings, and leads to extreme party measures. The division of the whole electoral body into constituencies is, after all, only a device for getting over the difficulty of the electors voting *en bloc*, and it does not seem to justify the conversion of a real majority in the country into a minority as represented in parliament, nor the complete exclusion of a substantial number of the electorate from parliamentary representation—so far as their views are concerned—at all. Yet under the English system such results are possible as the capture of every seat in Wales (34), in 1906, by the Liberal party, with 217,462 votes, the 100,547 Unionist voters having no representation in parliament; while in Warwickshire, though 22,490 votes were given to the Unionist candidates against 22,021 for the Liberal, three Liberals were returned against one Unionist.

The attempt to rectify this flaw in the representative method has led to the suggestion of various devices by the adoption of which the elected members may correspond more equally to the divisions of opinion in the electorate. Under the plan of *scrutin de liste* (or "general ticket") larger districts are created, each returning several members, and each voter has as many votes as there are members to elect; but while this system apparently provides the opportunity for the return of candidates with different views, it only requires a solid party vote to capture the whole of the representation for a majority. What is known as the "limited vote" is a form of *scrutin de liste* by which the elector has less votes than there are seats to be filled; with (say) three to be elected, the elector has only two votes. Systems of "limited vote" are in force in Portugal, Spain and Japan. A somewhat better plan is the "cumulative vote," which gives each elector as many votes as there are members to be elected, but allows him to divide them as he pleases (instead of giving only one vote to any one candidate). This enables an organized minority, by concentrating their votes, to elect at all events some representative; but the "cumulative vote" works rather capriciously, and is commonly defeated by careful party organization.

Proportional representation.

A more elaborate plan, but depending like the "limited" vote and the "cumulative" vote on the formation of constituencies returning three or more members each, is that of the "transferable vote." By this device an elector can indicate on his ballot paper not only his first choice, but also his second or third, &c. To ensure election a candidate need not obtain a majority of the votes polled, but only a certain number, so fixed that it can be obtained by a number of candidates equal to the number of seats to be filled, but by no more; this number of votes is called the "quota." At the first count first choices only are reckoned, and those candidates who have received a "quota" or more are declared duly elected. If all the seats have not then been filled up, the surplus votes of those candidates who have received more than the "quota" are transferred according to the names marked (2) on them. If these transfers still do not bring the requisite number of candidates up to the "quota," the lowest candidate is eliminated and his votes transferred according to the next preferences, and so on till the seats are filled. This system, which is the one usually associated with the term "proportional representation" was first suggested by Thomas Hare, who published in 1857 a pamphlet on *The Machinery of Representation*, and in 1859 a more complete scheme in his treatise on *The Election of Representatives*. John Stuart Mill, in *Representative Government* (1861) warmly endorsed Hare's proposal. Hare wished to treat the whole country as one constituency, but by later supporters of the "transferable vote" that plan was abandoned as impracticable; and the principle will work so long as the constituencies adopted each return several members. Lord Courtney, in his evidence before the British Royal Commission in 1909, said that his *minimum* constituency would be a three-membered one, but he would create a fifteen-membered constituency without hesitation. The simple "transferable vote" has been adopted in Tasmania for all elections (1907), after experimental adoption in the constituencies of Hobart and Launceston in 1896–1901, and in the election of the Tasmanian members of the Commonwealth leglislature in 1900. It was proposed in the draft of the South African constitution, but abandoned. The principle has also been adopted in the "list system" of Belgium, some Swiss cantons, Sweden, Finland and parts of Denmark, Württemberg and Servia, where candidates are grouped in lists and all votes given to individual candidates on the list count first as votes for the list itself, the seats being divided among the lists in proportion to the total number of votes obtained by the list. The use of the general term "proportional representation" for all of these is, however, somewhat misleading; people often suppose that only one identical system of voting is meant, whereas in fact some 300 possible varieties have been proposed, and each of the states mentioned has a different one from all the others. The only common element is the device of the "transferable vote," *i.e.* the method of having an "electoral quota," and the filling up of seats, where a quota is not provided by the first choices, by successively transferred votes, the lowest, and so on. It may be noted here that the "transferable vote" is calculated to multiply candidates to a point at which the minds of the electorate may well be embarrassed as to their preferences (the largest Belgian constituency returns 22 members), and, while undoubtedly providing for "minority representation," to encourage what may be called "minority thinking" and particularist politics. The "transferable vote" is commonly objected to as puzzling to the electors and too complicated for the scrutineers, while it is not much favoured by "machine" party organizations, which generally prefer the simpler plan of rough-and-ready majorities; but it has received a growing amount of theoretical support, as well as success in practical experiment, in recent years.

The second ballot.

The "second ballot" is a device for securing absolute majority, instead of relative majority, representation. Where the two-party system prevails, it is usual for only two candidates, one for each party, to stand for each single-member constituency. But there is nothing to prevent a third or even a fourth candidate standing, and this multiplication of candidates becomes the more common in proportion as parliamentary organization is split up into groups. The consequence is that the candidate who heads the poll may well have only a relative, not an absolute, majority of votes, and to meet this objection the "second ballot" has been introduced, and is in operation in Austria-Hungary, France, Germany, Italy and Russia. Under this system, if no candidate receives an absolute majority of all the votes, a second election is held, at which, as a rule, only the two candidates compete who received most; or in cases where more than one seat is to be filled, twice as many candidates compete as there

are seats. In principle the second ballot has much in its favour, though it does not necessarily reflect the real opinion of the electorate, but only what is practicable; and while leading to political bargaining it does nothing for minority representation.

In England the importance of the whole subject of the method of elections was recognized at the end of 1908 by the appointment of a Royal Commission to inquire and report. Its conclusions were published in 1910, after much interesting evidence had been taken, but they attracted little attention, being in the main adverse to innovation. The one positive recommendation was for the adoption of the "alternative vote" (already in use in Queensland and Western Australia) by which the electors might mark their choices 1, 2, 3, &c.; this would not be for the purpose already discussed as part of the method of the "transferable vote," but the indications of preference would only be used for the same purpose as the "second ballot," while saving the voters the trouble of further elections. One objection to this "alternative vote," however, as compared with the "second ballot," is that it does not allow the voter to change his mind as to his preference, as he well might do after he knew the result of the original voting.

It may be said broadly that all the devices which have been proposed for mitigating or redressing the defects of electoral methods ignore the essential fact that in any case a representative system can only result in a rather arbitrary approximation to correspondence with the opinions of the electorate. It is by no means certain even that "proportional representation" in any of its forms would always result in the return of a representative assembly reflecting with mathematical accuracy the balance of opinion in the electorate; and even if it did, the electors have a way of changing their opinions long before their representatives come up for re-election. It was stated before the British Royal Commission that in Belgium, in spite of "proportional representation," both in 1900 and in 1902 a majority of members was returned by a minority of votes. While under majority rule, as Mr Augustine Birrell once remarked, "minorities must suffer"—even large minorities—it is on the other hand not likely to conduce to the popularity of representative government that minorities should obtain too great a share of political power. The fact is that no "representation" can reflect the views of those "represented" as accurately as "presentation" by those entitled personally to speak. This conclusion, while in no necessary degree qualifying the importance of "popular government," undoubtedly detracts from the value of the representative method. The result is seen in the increasing desire in really democratic countries to supplement representative government by some form of Referendum, or direct appeal to the electors for their own personal opinion on a distinct issue—a method which involves fundamentally the addition of a "presentative" element to the representative system.

LITERATURE.—The number of separate works on various aspects of the theory, history and practice of political representation—a much wider subject than representative government—is too large for detailed mention. A general reference can only be made here to the standard treatises on constitutional law. The chapter in Sir G. Cornewall Lewis's *Remarks on the Use and Abuse of some Political Terms* (Sir T. Raleigh's edition, 1898) should also be noted. In addition to works cited above, a valuable account of all parts of the electoral "machine" is given in M. Ostrogorski's *Democracy and the Organization of Political Parties* (1902). The Congressional Library, Washington, U.S.A., issued in 1904 a "List of Books relating to Proportional Representation," which constitutes a complete bibliography of that subject up to that date. The best discussion of the various methods for securing adequate representation is, however, now to be found in the *Report* (1910) of the British Royal Commission on Systems of Election (Parliamentary Paper, Cd. 5163). It is chiefly valuable for its description of the devices in use in different countries and for its weighty criticism of the proposals for minority representation. (H. CH.)

REPRIEVE (*reprise*, from Fr. *reprendre*), in English law, a term which originally meant remand to prison: later and more usually, the suspension for a time of the execution of a sentence passed on conviction of crime. The term is now seldom or never used except with reference to sentences of death. In the case of capital felonies other than murder the recording of sentence of death has the effect of a reprieve by the court. The court which can award a sentence is said to possess as of common right a discretionary power of granting a reprieve. Courts of justice, however, do not grant reprieves by way of dispensation from the penalties of the law, which is not for the judicial department, but for temporary purposes, *e.g.* of appeal or inquiry as to the state of mind or health of the convict, or to enable him to apply for a pardon. Under the old system of transportation it was a common practice to reprieve convicted felons as a step to induce them to consent to transportation to the American colonies (see the *Old Bailey Regulations of 1662*, J. Kelyng, ed. 1873, p. 1). In cases of conviction of wilful murder the reprieve, if any, is granted by the home secretary on behalf of the crown, and on convictions of murder the court seems now to have no power to reprieve except in the case of a pregnant woman.

See Hawkins, *P.C.* bk. 2, c. 51; Blackstone, *Commentaries*.

REPRISALS (Fr. *représailles*, from *reprendre*; Lat. *reprehendere*, to take back), properly speaking, the act of forcibly seizing something belonging to another state by way of retaliation, but currently used for the retaliation itself. They are acts of violence which are a *casus belli* according to the manner in which the state against which they are exercised regards them and is able to resist or resent them. Two comparatively recent cases have occurred in which this form of redress was resorted to. In the one case a demand by the British government for an indemnity for injuries inflicted on the British vice-consul and certain other British subjects by Nicaraguan authorities in the Mosquito reserve not having been complied with, British naval forces were landed on April 27th, 1895, at Corinto, where they occupied the customs house and other public buildings till an agreement was arrived at. In the other case the French government in November 1901 ordered the occupation by French naval forces of the customs house at Mytilene until redress was obtained for divers claims of French citizens. A Hague Convention of 1907 now places limitations on the employment of force for the recovery of contract debts, and forbids recourse to armed force unless "the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer prevents any *compromise* from being agreed on, or after arbitration fails to submit to the award" (*art.* 1). (T. BA.)

REPRODUCTION, in biology, the generation of new organisms from existing organisms more or less similar. It is a special case of growth, and consists of an increase of living substance in such fashion that the new substance is either set free as a new individual, or, whilst remaining attached to the parent organism, separated by some sort of partition so as to have a subordinate individuality. Y. Delage has distinguished as *multiplication* those cases in which the new individual arises from a mass of cells which remain a part of the maternal tissues during differentiation, reserving the term *reproduction* for those cases in which the spore or cell which is the starting-point of the new individual begins by separating from the maternal tissues; but the distinction is inconvenient in practice and does not appear to carry with it any fundamental biological significance. The general relation between parent and filial organisms is discussed under HEREDITY and EMBRYOLOGY; many of the details of the cellular processes are dealt with under CYTOLOGY, and the modes of reproduction exhibited by different kinds of animals and plants are treated of in the various articles describing individual groups. Finally, some of the special problems involved are discussed under the heading SEX. As reproduction is a general biological phenomenon, its manifestations should be dealt with simultaneously in the case of animals and plants, but many of the special details differ so much that it is practically convenient to make two headings.

REPRODUCTION OF ANIMALS

A. Asexual.—Many animals possess a more or less limited capacity to repair portions of the body that have been accidentally removed (see REGENERATION), and this capacity may be so

extensive that, if the whole body be cut in pieces, each portion may grow into a new organism. Such a mode of artificial propagation, familiar in horticultural operations, has been made use of in such animals as sponges, and has been performed experimentally in hydroids and some worms. In many Protozoa asexual reproduction by simple division is a normal event. In Coelentera it is common, the plane of division usually passing through the long axis of the body, as in Actinians and many Hydroids, or being horizontal, as in the repeated divisions by which medusae are produced from an asexual polyp; the new individual may separate completely, or serve to build up a colonial or compound organism. In some Turbellarians (*Microstomum*) and Chaetopods (*Syllis*, *Myrianida*, *Nereis*, *Eunice viridis* (the palolo-worm of Samoa), asexual reproduction occurs in a form that is partly fission and partly budding; portions are constricted transversely or laterally, very much smaller than the whole animal, and these grow out into new animals which may separate or remain attached in chains. In Salps, chains are formed sometimes by transverse constriction, sometimes by budding. True budding is much more common than fission; it occurs in Protozoa, Coelentera, Sponges, Polyzoa, Tunicates and some Flatworms and Chaetopods, the bud being a multicellular portion of the tissues which is partly or completely separated from the parent before it proliferates into the new form. In various larval stages of many animals, asexual reproduction by fission or budding may be produced experimentally or may occur naturally. It has been observed that cases of identical twins in vertebrates and many monstrous forms, including even dermoid cysts, are due to embryonic asexual fission or budding. The artificial subdivision of young embryos has been performed successfully by several investigators (see HEREDITY). In *Lumbricus trapezoides* the gastrula stage of the embryo divides and each half produces a complete individual; and multiplication by budding is common at various stages of the life-history of many parasitic worms. Spore formation, or cellular budding, appears to be limited to the Protozoa amongst animals.

B. Sexual.—Apart from the special and probably secondary cases presently to be considered under the subheading *parthenogenesis*, sexual reproduction or amphimixis may be defined as the production of a new organism from a zygote, and a zygote may be defined as the cell resulting from the conjugation of two gametes or sexual cells derived from the specialized reproductive tissue of the parent or parents. In asexual reproduction by spore formation, the spore proliferates without the aid of another spore; in true sexual reproduction the gametes may be regarded as special kinds of spores which appear in two forms, the egg-cell, ovum or female gamete not proceeding to proliferate into a new organism until it has been stimulated by partial or complete fusion with the other form, the spermatozoon or male gamete. The act of fusion or conjugation in question is usually spoken of as fertilization, and the zygote, or starting-point of the new organism, is the fertilized egg-cell. Among protozoa and the lower plants there occur a series of forms of conjugation leading towards the specialized form characteristic of the sexual reproduction of higher animals. The conjugation may be *isogomous*, that is to say the conjugating cells may be actually or at least apparently indistinguishable. The fusion between the cells may be complete, or may concern only the nuclei. The conjugation may be followed by reproduction, or may apparently have no relation to reproduction. In true sexual reproduction the conjugation is *heterogamous*, *i.e.* the gametes are unlike; the fusion is chiefly nuclear, and the process is the prelude of the development of the zygote into the new organism.

In all the Metazoa the gametes arise from special reproductive tissues which are supposed to contain (see HEREDITY) the reproductive material or germ-plasm. In the lower (or simpler and possibly degenerate Metazoa) the reproductive or germinal tissue consists of a few cells, sometimes in a group, sometimes scattered and sometimes migratory; in the vast majority of the Metazoa the germinal tissue becomes aggregated in distinct organs, of which those that give rise to ova or female gametes are known as the ovaries, and those that give rise to the spermatozoa or male gametes are known as the testes. The ovary and the testis are the primary reproductive organs; the details of their anatomy and position in the various groups need not be discussed here (see REPRODUCTIVE SYSTEM).

The male gamete or spermatozoon was first seen in 1677 by Ludwig van Hammen, a pupil of A. Leeuwenhoek, with the microscope that had been constructed by his master. Leeuwenhoek, under the influence of the current preformationist ideas, interpreted these actively moving bodies in the seminal fluids as preformed germs and described them as animalculae spermetia or spermatozoa. Throughout the 18th century the general tendency was to regard them as parasites of no consequence in fertilization. In 1837 R. Wagner established that they were present in all sexually mature males and absent in infertile male hybrids, and in 1841 A. Kölliker showed that they were cells proliferated in the testes. The spermatozoon is one of the smallest of known cells, frequently being no more than one hundred thousandth of the size of the ovum, although the extraordinary case of a small *Cypris* has been recorded in which the spermatozoa are longer than the animal. It is produced in enormous quantities and relatively to other minute cells is extremely tenacious of life. It may retain its vitality in the male organism for a long time after it has become a separate cell, and may exist for lengthy periods in the female organism. The queen-bee is impregnated only once, and the spermatozoa may remain active within her body for three years. Lord Avebury (Sir J. Lubbock) has described the case of a female ant which laid fertile eggs thirteen years after she had been impregnated. It is undoubted that in snakes, birds and many mammals, fertilization may not take place for many days after impregnation. The spermatozoa, with a few exceptions, are actively motile, being elongated in shape, with a vibratile tail sometimes provided with a swimming membrane. In a few cases, chiefly of crustaceans, the spermatozoa are spherical with radiating processes, but are capable of amoeboid movements. The cell nucleus is generally situated near the rounded or pointed extremity, with a centrosome immediately behind it, whilst the scanty protoplasm forms the body and vibratile tail; but there appears to be no general significance in the various configurations that occur in different animals. The process of spermatogenesis, or production of spermatozoa from the permanent cells of the testis, varies extremely amongst different animals and has been the subject of many elaborate investigations and much confusing nomenclature. Two factors are involved: first, the arrangements to produce a very large crop of cells so to provide for the enormous numbers of spermatozoa produced by most animals; and second, the final changes of shape and of nucleus by which the ripe spermatozoa arise from the indifferent testis-cells, and these processes may to a certain extent overlap. The point of general significance relates to the nuclear changes. The nuclear matter that occurs in the tissue cells of animals, when these cells divide, breaks up into a number of chromosomes constant for each kind of animal, and the final stage of cell division is such that each chromosome splits and contributes a half to each daughter cell, so that the latter come to contain the number of chromosomes peculiar to the animal in which they occur. In the case of spermatozoa, however, a "reducing" division occurs, in which the chromosomes instead of dividing distribute themselves equally between the two daughter cells, with the result that each of the latter contains only half the number peculiar to the species. In its simplest form, what occurs in the last stage of spermatogenesis is that one cell breaks up into four spermatozoa by two successive divisions, the first of which is normal and the second reducing. The nuclear matter of spermatozoa, therefore, contains half the number of chromosomes normal to the tissue cells of the species, and we shall see later that a similar reduction takes place in the formation of the egg. Further complications, however, exist, at least in certain forms. In 1891 H. Henking showed that in a Hemipteran insect of the genus *Pyrrochoris*, two kinds of spermatozoa are produced in equal numbers, and F. C. Paulmier

confirmed the observation in the case of some other insects a few years later, whilst other observers have extended the observation to over a hundred species. In all these cases half the spermatozoa differ from the other half by the presence of what E. B. Wilson calls the " X-element," and which, in the simplest cases, occurs as an unpaired chromosome of the mother cell which passes into one and not the other of the two spermatozoa formed from that mother cell. The matter is still obscure, and it is not certain whether the facts are peculiar to insects or have a parallel in spermatogenesis universally. According to E. B. Wilson, the facts demonstrate that eggs fertilized by spermatozoa with the X-element invariably produce females (see SEX). The female gamete or ovum is in a large number of cases expanded by the presence of food-yolk and protective swathings to form the visible mass known as an egg, and the production of embryos from eggs has been studied from the time of Aristotle and Pliny. Galen had described the human ovaries as *testes mulicbres*, and W. Harvey in 1651 showed that the chick arose from the cicatricula of the yolk of the egg, compared these early stages with corresponding stages in the uterus of mammals, and laid down the general proposition—*ovum esse primordium commune omnibus animalibus*—that the ovum is a starting-point common to all animals. In 1664 N. Steno identified the sexual organ of the mammalian female with that of sharks, and first named it the ovary. In 1672 R. De Graaf described the structure of the ovary in birds and mammals, observed the ovum in the oviduct of the rabbit, and repeated Harvey's statement as to the universal occurrence of ova, although he mistook for ova the follicles that now bear his name. In 1825 J. E. Purkyne described the germinal vesicle in the chick, thus distinguishing between the structure of the egg as a whole and the essential germinal area, and in 1827 K. E. von Baer definitely traced the ovum back from the uterus to the oviduct and thence to its origin within the Graafian follicle in the ovary, and thus paved the way for identification of the ovum as a distinct cell arising from the germinal tissue of the ovary. The ovum or female gamete, unlike the spermatozoon, is a large cell, in most cases visible to the naked eye even in the ovary. Also, in definite contrast with the spermatozoon, it is a passive non-motile cell, although in certain cases it is capable of protruding pseudopodia. It is usually spherical, contains a large nucleus, a centrosome and abundant protoplasm, and is generally enclosed in a stout membrane which may or may not have a special aperture known as the micropyle. The protoplasm of all eggs contains nutritive material for the nourishment of the future embryo, and this material may be sufficient in quantity to make the whole cell, although remaining microscopic, conspicuously large, or to expand it to the relatively enormous mass of the yellow yolk of a fowl's egg. Finally, the cellular nature of the ovum is frequently further disguised by its being enclosed in a series of membranes such as the albumen and shell of the fowl's egg. Such complexities are ancillary to the growth or protection of the future embryo, and from the general biological point of view the ovum is to be regarded as a specialized cell derived from the germinal tissue of the ovary, just as the spermatozoon is a specialized cell derived from the corresponding stock of germinal material in the testis. The number of ova produced varies from a very few, as in mammals and birds, to a very large number, as in the herring and many invertebrates, but in all cases the number is relatively small compared with that of the spermatozoa produced by the male of the same species. The details of ovogenesis are more sharply divided than in the case of spermatogenesis into processes connected with the production of a crop of large cells bloated with food-yolk, and the peculiar nuclear changes. The latter changes are generally spoken of as the maturation of the ovum, and in most cases do not begin until the full size has been attained. As in the nuclear changes of spermatogenesis, the details differ in different animals, but the salient feature is that the mature ovum contains, like the ripe spermatozoon, half the number of chromosomes normal to the tissue cells of the animal to which it belongs. The simplest form in which the reduction takes place is that the nucleus of the ovum divides by an ordinary division, each chromosome splitting and sharing itself between the daughter nuclei. Of these nuclei one is extruded from the egg, forming what is called a polar body, and this polar body may again divide by a reducing division, so as to form two polar bodies, each with half the normal number of chromosomes. Finally, the daughter nucleus, remaining in the ovum, also divides by a reducing division, and one of the segments remains to form the nucleus of the ripe ovum, with half the normal number of chromosomes, whilst the other is extruded as a polar body. Very many suggestions as to the meaning of the extrusion of the polar bodies have been made, but the least fanciful of these is to regard the ovum ready for maturation as homologous with the cell about to divide into four spermatozoa; in each case the nucleus divides twice and one of the divisions is a reducing division, so that four daughter nuclei are formed each with half the normal number of chromosomes. Many spermatozoa are required, and each of the four becomes the nucleus of a complete active cell; relatively few ova are required, but each has a large protoplasmic body, and only one of the four becomes a functional mature egg, the other three being simply extruded and so to say wasted. It must be remembered, however, that there is no inherent probability in favour of the apparently simplest explanation of a very complex biological process. It is also to be noted that in many cases the first polar body does not divide, and it is not clearly established that when the first polar body remains single, it is always the result of a normal nuclear division.

When the mature ova and spermatozoa come together in one of the various ways to be discussed later, fertilization, the conjugation of the gametes to form the zygote, occurs. Alcmaeon (580 B.C.) is believed first to have laid down that fertilization in animals and plants consisted in the material union of the sexual products from both sexes, but it was not until 1761 that it was established experimentally by J. T. Kölreuter's work on the hybridization of plants. In 1780 L. Spallanzani artificially fertilized the eggs of the frog and tortoise, and successfully introduced seminal fluid into the uterus of the bitch, but came to the erroneous conclusion that it was the fluid medium and not the spermatozoa that caused fertilization. This error was corrected in 1824 by J. L. Prevost and J. B. Dumas, who showed that filtration destroyed the fertilizing power of the fluid. In 1843 M. Barry observed spermatozoa within the egg of the rabbit, whilst in 1849 R. Leuckart observed the fertilization of the frog's egg, and in 1851 H. Nelson noticed the entrance of spermatozoa to the egg of *Ascaris*, whilst in 1854 a series of observations published independently by T. L. W. Bischoff and Allen Thomson finally and definitely established the fact that ova were fertilized by the actual entrance of spermatozoa. Further advances in microscopical methods enabled a series of observers, of whom the most notable were E. van Beneden, H. Fol and O. Hertwig, to follow and record the details of the process. They made it clear that the chief event in fertilization was entrance into the ovum of the nucleus or head of the spermatozoon where it formed the " male pronucleus," which gradually approached and fused with the female pronucleus or residual nucleus of the ovum. Still later observers, of whom E. B. Wilson is the most conspicuous, have studied the details of the process in many different animals and have shown that the nucleus of the spermatozoon invariably enters the ovum, that the centrosome generally does so, and that the cytoplasm usually plays no part. The nucleus of the zygote or fertilized ovum, then, possesses the number of chromosomes normal in the tissue cells of the animal to which it belongs, but of these half belong to the female gamete and are derived from the germ plasm of the parental ovary, and half to the male gamete or spermatozoon, derived from the germ plasm of the parental testis. The stimulus which leads to and induces the conjugation of the gametes appears to be chemotactic and to consist of some substance positively attractive to the male gamete, liberated by the mature female gamete, but the attraction is mutual, and in the final stages of approach a protoplasmic outgrowth of the ovum towards the spermatozoon frequently occurs. The

fertilized zygote proceeds to form the embryo (see EMBRYOLOGY).

Parthenogenesis is the production of the new organism from the female gamete without previous conjugation with the male gamete, and is to be regarded as secondary to and degenerate from true sexual reproduction. Aristotle recognized that it occurred in the bee. In 1745 C. Bonnet showed that it must occur in the case of Aphides or plant-lice, in which throughout the summer there were developed a series of generations consisting entirely of females. R. A. F. de Réaumur repeated the observations, but evaded the difficulty by suggesting that the Aphides were hermaphrodite, an explanation soon afterwards disproved by L. Dufour. In 1849 (Sir) R. Owen brought together the facts as they were then known and made a remarkable suggestion regarding them. "Not all the progeny of the primary impregnated germ cell are required for the formation of the body in all animals; certain of the derivative germ cells may remain unchanged and become included in that body which has been composed of their metamorphosed and diversely combined or confluent brethren; so included, any derivative germ cell or the nucleus of such may begin and repeat the same processes of growth by imbibition, and of propagation by spontaneous fission, as those to which itself owed its origin." Taking hold of the recently published views of J. J. S. Steenstrup on alternation of generations, he correlated the sexual and asexual alternation in hydroids and so forth with the virgin births of insects and Crustacea, and regarded the one and the other as instances of the subsequent proliferation of included germ cells, applying the word parthenogenesis to the phenomenon. His theory was a very remarkable anticipation of the germ-plasm theory of A. Weismann, but further knowledge showed that there was an important distinction between the reproduction of the asexual generations described by Steenstrup and the cases of Aphides and Crustacea, the germinal cells in the latter instances being true ova produced from the ovaries of true females, but capable of development without fertilization. In 1856 C. T. E. von Siebold established this fact and limited Owen's term parthenogenesis to the sense in which it is now used, the development without fertilization of ova produced in ovaries. True parthenogenesis occurs frequently amongst Rotifers, and in certain cases (Philodinadae) males either do not exist or are so rare that they have not been discovered. Amongst Crustacea it is common in Branchiopoda and Ostracoda; in the case of Daphnids, large thick-shelled ova are produced towards winter, which develop only after fertilization and produce females; the latter, throughout summer, produce thin-shelled ova which do not require fertilization, and from which towards autumn both males and females are produced. Amongst insects it occurs in many forms in many different groups, sometimes occasional, sometimes as a regular occurrence. Apart from Aphides the classical instance is that of the bee, where eggs that are not fertilized develop parthenogenetically and produce only drones. What is known as pathological parthenogenesis has been observed occasionally in higher animals, *e.g.* the frog, the fowl and certain mammals, whilst in the case of human beings, ovarian cysts in which hair and other structures are produced have been attributed to the incomplete development of parthenogenetic ova. Finally, it has been shown in a number of different instances, notably by J. Loeb, that artificial parthenogenesis may be induced by various mechanical and chemical stimulations. It has been shown that ova may be induced to segment by the presence of spermatozoa belonging even to different classes of the animal kingdom—as, for instance, the ova of echinoderms by the spermatozoa of molluscs. In such cases the resulting embryos have purely maternal characters. A possible interpretation is that spermatozoa have two functions which may be exercised independently; they may act as stimulants to the ovum to segment, and they may convey the paternal qualities. The former function may be replaced by the chemical substances employed in producing artificial parthenogenesis. Juvenile or precocious parthenogenesis, in which there takes place reproduction without fertilization in immature larvae, has been observed chiefly in insects (Dipterous midges), and to this the term *paedogenesis* has been applied.

The theory of parthenogenesis remains doubtful. When Weismann and others began to study the polar bodies, they made the remarkable discovery that in some parthenogenetic eggs only one polar body was extruded, but the meaning of this distinction was blurred when other cases were described in which two polar bodies were formed. Later on, Weismann drew attention to the difference between normal and reducing divisions, and it now appears to be clear that, with one set of exceptions, ova which develop without fertilization are those in which no reducing division takes place and which, accordingly, contain the number of chromosomes normal to the tissue cells of the species. Such eggs, in fact, resemble the zygote except that all their chromosomes are of maternal origin and the centrosome which becomes active in the first segmentation is that of the ovum and not, as in normal fertilized eggs, that which came in with the spermatozoon. The case of the bee and other insects in which parthenogenetic development results in the production of males, is doubtful; it appears to be the case that a reduction division has taken place in the maturation of the egg. A. Petrunkévitch has made the ingenious suggestion, that after the reducing division the normal number of chromosomes is restored by the splitting of each into two. Cases of pathological and artificial parthenogenesis would fall into line, on the supposition that the stimulus acted by preventing the occurrence of a reducing division in an ovum otherwise mature. It is to be noticed, however, that such explanations of parthenogenesis are not much more than a formal harmonizing of the behaviour of the chromosomes in the respective cases of fertilized and parthenogenetic development; they do not provide a theory as to why the process occurs.

Accessory Reproductive Organs and Processes.—It has been already stated that the primary organs of reproduction in animals are the germinal tissues producing respectively spermatozoa and ova, and that in most cases these are aggregated to form testes and ovaries. In certain animals there are no accessory organs, and when the reproductive products are ripe, they are discharged directly to the exterior if the gonads are external, as in some Coelenterа, or if they are internal, break through into some cavity of the body and escape by rupture of the body-wall or through some natural aperture. In a majority of cases, however, special ducts are developed, which in the male serve primarily for the escape of the spermatozoa, but secondarily may be associated with intromittent organs. Similarly, in the female, the primary function of the gonad ducts is to provide a passage for the ova, but in many cases they serve also for the reception of spermatozoa, for the development of embryos and for the subsequent exit of the young. Associated with the ovary and the oviducts are many kinds of yolk-glands and shell-glands, the function of which is to form nutritive material for the future embryo, to discharge this into or around the ovum, and to provide protective wrappings. Although, in the last resort, fertilization depends on impulses attracting the spermatozoa to the ova, probably chemical in their nature, the necessary proximity is secured in a number of ways. In many simple cases the ripe products are discharged directly into the surrounding water, and impregnation is a matter of accident highly probable because such animals discharge enormous quantities of ova and spermatozoa, are frequently sessile and live in colonies, and are mature about the same time. In other cases, as, for instance, Tunicates and many Molluscs, the spermatozoa are discharged, and, being drawn into the body of the female with the inhalent currents, there fertilize the ova. In yet a number of other cases, there is sexual congress without intromittence. The males of many fish, such as salmon, attend the females about to discharge their ova, and afterwards pour the male fluid over the liberated eggs; whilst amongst other fish the males seek out a suitable locality and prepare some kind of nest to which the female is enticed and which receives first the ova and then the milt. In many other animals, again, as for instance the frog, the male grasps the ripe female, embracing

her firmly for a prolonged period, during which ova and spermatozoa are discharged simultaneously. Where internal fertilization occurs, there are usually special accessory organs. In the female, the terminal portion of the gonad-duct, or of the cloaca, is modified to receive the intromittent organ of the male, or to retain and preserve the seminal fluid. In the male, the terminal portion of the gonad-duct may be modified into an intromittent organ or penis, grooved or pierced to serve as a channel by which the semen is passed into the female. In arthropods, ordinary limbs may be modified for this purpose, or special appendages developed; in spiders, the terminal joints of the pedipalps, or second pair of appendages, are enlarged, and are dipped into the semen, which is sometimes shed into a special web, and are used as intromittent organs; in cuttlefish, one of the "arms" is charged with spermatozoa, is inserted into the mantle cavity of the female and there broken off. In many cases there is a temporary apposition of the apertures of the male and female, with an injection from the male without a special intromittent organ. The females are usually passive during coitus, and there are innumerable varieties of clasping organs developed by the male to retain hold of the female. Finally, the various secondary sexual characters which are developed in males and females and induce association between them by appeals to the senses, must be regarded as accessory reproductive organs and processes (see SEX).

Another set of accessory organs and processes are concerned with what may be termed in the widest sense of the phrase "brood-care." In many cases the relation between parent and offspring ceases with the extrusion of the fertilized ovum, whilst others display every possible grade of parental care. Many of the lower invertebrates choose special localities in which to deposit the ova or embryos, and glands, the viscid secretion of which serves to bind the ova together or to attach them to some external object, are frequently present. In many insects, elaborate preparations are made; special food-plants are selected, cocoons are woven, or, by means of the special organ known as the ovipositor, the eggs are inserted in the tissues of a living or dead host, or in other cases a supply of food is prepared and stored with the young larvae. The eggs or larvae may be attached to the parent and carried about with it, as in the galls of bivalves, in the brood-pouches of the smaller Crustacea, the back of the Surinam toad, the vocal sacs of the frog *Rhinoderma*, the expanded ends of the oviducts or the marsupial pouch. In a large number of cases the young are nourished directly from the blood of the mother by some kind of placental connexion, as in some of the sharks, in *Anableps*, a bony fish, in some lizards and in mammals. In other cases, the young after birth or hatching are fed by the parents, by the special secretion of the mammary glands in the case of mammals, by regurgitated food in many birds and mammals, by salivary secretions or by food obtained and brought to the young by the parents.

Reproductive Period.—In general way, reproduction begins when the limit of growth has been nearly attained, and the instances of paedogenesis, whether that be parthenogenetic as in midges, or sexual as in the axolotl, must be regarded as an exceptional and special adaptation. In lower animals, where the period of growth is short or indefinite, reproduction begins earlier and is more variable. But, in all cases, surrounding conditions play a great part in hastening or retarding the onset of reproduction. Increased temperature generally accelerates reproductive maturity, excess of food retards it, and sudden privation favours it. In a majority of cases it endures to the end of life, but in some of the higher forms, such as birds and mammals, there is a marked decrease or a cessation of reproductive activity, especially in the case of females, as life advances. In most animals, moreover, periods of reproductive activity alternate with periods of quiescence in a rhythmical series. In its simplest form, the rhythm is seasonal; but although at first associated with actual seasonal changes, it persists in the absence or alteration of these. Many animals brought to Europe from the southern hemisphere come into reproductive activity at the time of year corresponding to the spring or summer of their native home. "Heat," menstruation and ovulation in the higher mammals, including man, are rhythmical, and probably physiologically linked, but the ancestral meaning of the periodicity is unknown.

Reproduction and Increase of the Race.—Two distinct factors are involved in this question—the potential fecundity of organisms, and the chances of the young reaching maturity. The first varies with the actual output of zygotes, and is determined partly by the reproductive drain on the individual, and especially the female in cases where the ova are provided with much food-yolk, partly on the duration of reproductive maturity, and partly on the various adaptive and environmental conditions which regulate the chances of the gametes meeting for fertilization. It is to be noted that as the gametes are simply cells proliferating from the germinal tissue, the potential number that can be produced is almost indefinite; and as it is found that in very closely allied forms the actual number produced varies within very wide limits, it may be assumed that potential fecundity is indefinite. The possibility of zygotes reaching maturity varies first with the individuation of the organism concerned—that is to say, the degree of complexity of its structure—and the duration of the period of its growth; and secondly, with the incidence of mortality on the eggs and immature young. It is plain that a parasite capable of living only on a particular host may give rise to myriads of progeny, and yet, from the difficulty of these reaching the only environment in which they can become mature, might not increase more rapidly than an elephant which carries a single foetus for about two years, and guards it for many years after birth. The probable adaptation of the variable reproductive processes to the average conditions of the race is discussed under the heading LONGEVITY. It may be added here that the adaptation, in all successful cases, appears to be in excess of what would be required merely to replace the losses caused by death, and that there is ample scope for the Malthusian and Darwinian factors. The rate of reproduction tends to outrun the food-supply.

LITERATURE.—Almost any zoological publication may contain matter relating to reproduction, but text-books on Embryology must be specially consulted. The annual volumes of the *Zoological Record*, under the heading "General Subject" until 1906, and thereafter under "Comprehensive Zoology," give a classified subject-index of the literature of the year in which references to the separate parts of the subject are given. Amongst the older memoirs referred to in this article the following are the most important: A. Leeuwenhoek, *Epistolae ad societatem regiam Anglium* (1719); M. F. de Réaumur, *Mémoires pour servir à l'histoire des insectes* (Paris, 1734–1742); C. Bonnet, *Œuvres d'histoire naturelle et de philosophie* (Neuchâtel, 1779–1783); L. Spallanzani, *Dissertations relative to the Natural History of Animals and Vegetables* (Eng. trans., 2nd ed., London, 1789); J. L. Prévost et J. B. Dumas, "Observations relatives à l'appareil générateur des animaux mâles," *Ann. Sci. Nat.* i. (1824); K. E. von Baer, *Epistola ad Academiam Scient. Petropolitanam*; Heusinger, *Zeitschrift*, ii. (1828); Léon Dufour, *Recherches anatomiques et physiologique sur les Hémérobes* (Paris 1833); R. Wagner, "Recherches sur la génération," *Ann. Sci. Nat.* viii. (1837); A. Kölliker, *Über das Wesen der sogenannten Zwischenkörper*, Froriep, Notizen xix. (1841); M. Barry, "Spermatozoa observed within the Mammalian Ovum," *Phil. Trans.* (1843); J. J. S. Steenstrup, *On the Alternation of Generations* (Eng. trans., Ray Society, London, 1845); R. Leuckart, *Beiträge zur Lehre der Fortpflanzung* (Göttingen Nachrichten, 1849); (Sir) R. Owen, *On Parthenogenesis* (London, 1849); H. Nelson, "The Reproduction of Ascaris mystax," *Phil. Trans.* (1852); C. T. E. von Siebold, *On a True Parthenogenesis in Moths and Bees* (Eng. trans., London, 1857); von Beneden, "Recherches sur la maturation de l'œuf et la fécondation," *Arch. de biol.* (1883); O. Hertwig, "Das Problem der Befruchtung," *Jen. Zeitsch.* xviii. (1885). (P. C. M.)

REPRODUCTION OF PLANTS

The various modes in which plants reproduce their species may be conveniently classified into two groups, namely, *vegetative propagation* and *true reproduction*, the distinction between them being roughly this, that whereas in the former the production of the new individual may be effected by the most various parts of the body, in the latter it is always effected by means of a specialised reproductive cell.

I. *Vegetative Propagation.*

The simplest case of vegetative multiplication is afforded by unicellular plants. When the cell which constitutes the body of the plant has attained its limit of size it gives rise to two either by division or gemmation; the two cells then grow, and at the same time become separated from each other, so that eventually two new distinct individuals are produced, each of which precisely resembles the original organism. A good example of this is to be found in the germination of the yeast plant. This mode of multiplication is simply the result of the ordinary processes of growth. All plant-cells grow and divide at some time or other of their life; but whereas in a multicellular plant the products of division remain coherent, and add to the number of the cells of which the plant consists, in a unicellular plant they separate and constitute new individuals. In more highly organized plants vegetative propagation may be effected by the separation of the different parts of the body from each other, each such part developing the missing members and thus constituting a new individual. This takes place spontaneously in rhizomatous plants, in which the main stem gradually dies away from behind forwards; the lateral branches thus become isolated and constitute new individuals.

The remarkable regenerative capacity of plant-members is largely made use of for the artificial propagation of plants. A branch removed from a parent-plant will, under appropriate conditions, develop roots, and so constitute a new plant; this is the theory of propagation by "cuttings." A portion of a root will similarly develop one or more shoots, and thus give rise to a new plant. An isolated leaf will, in many cases, produce a shoot and a root, that is, a new plant; it is in this way that new begonias, for instance, are propagated. The production of plants from leaves occurs also in nature, as, for instance, in certain so-called "viviparous" plants, of which *Bryophyllum calycinum* (Crassulaceae) and many ferns [*Nephrodium* (*Lastraea*) *Filix-mas, Asplenium* (*Athyrium*) *Filix-foemina* and other species of *Asplenium*] are examples. But it is in the mosses, of all plants, that the capacity for vegetative propagation is most widely diffused. Any part of a moss, whether it be the stem, the leaves, the rhizoids, or the sporogonium, is capable, under appropriate conditions, of giving rise to filamentous protonema, on which new moss-plants are then developed as lateral buds.

In a large number of plants provision is made for vegetative propagation by the development of more or less highly specialized organs. In lichens, for instance, there are the *soredia*, which are minute buds of the thallus containing both algal and fungal elements; these are set free on the surface in large numbers, and each grows into a thallus. In the Characeae there are the *bulbils* or "starch-stars" of *Chara stelligera*, which are under-ground nodes, and the branches with naked base and the pro-embryonic branches found by Pringsheim on old nodes of *Chara fragilis*. In the mosses small tuberous bulbils frequently occur on the rhizoids, and in many instances (*Bryum annotinum, Aulacomnion androgynum, Tetraphis pellucida*, &c.) stalked, fusiform or lenticular multicellular bodies containing chlorophyll, termed *gemmae*, are produced on the shoots, either in the axils of the leaves or in special receptacles at the summit of the stem. Gemmae of this kind are produced in vast numbers in *Marchantia* and *Lunularia* among the liverworts. Similar gemmae are also produced by the protha'llia of ferns. In some ferns (e.g. *Nephrolepis tuberosa* and *undulata*) the buds borne on the leaves or in their axils become swollen and filled with nutritive materials, constituting *bulbils* which fall off and give rise to new plants. This conversion of buds into bulbils, which subserve vegetative multiplication, occurs also occasionally among Phanerogams, as for instance in *Lilium bulbiferum*, species of *Poa, Polygonum viviparum*, &c. But many other adaptations of the same kind occur among Phanerogams. Bulbous plants, for instance, produce each year at least one bulb or corm from which a new plant is produced in the succeeding year. In the potato, tubers are developed from subterranean shoots, each of which in the following year gives rise to a new individual. In the dahlia, *Thladiantha dubia*, &c., tuberous swellings are found on the roots, from each of which a new individual may spring.

II. *True Reproduction.*

This is effected by cells formed by the proper reproductive organs. These cells are of two principal kinds. There are, first, those cells each of which is capable of developing by itself into a new organism: these are the *asexual* reproductive cells, known generally as *spores*. Secondly, there are the cells which are incapable of independent germination; it is not until these cells have fused together in pairs that a new organism can be developed: these are the *sexual* reproductive cells or *gametes*.

In some exceptional cases the normal mode of reproduction, sexual or asexual, does not take place: instead, the new organism is developed vegetatively from the parent. When sexual reproduction is suppressed the case is one of *apogamy*; when asexual reproduction by spores is suppressed the case is one of *apospory*. (Apogamy and apospory are discussed below in the section on *Abnormalities of Reproduction.*)

Asexual Reproduction.—Reproduction by means of some kind of spore (using the term in its widest sense, so as to include all asexually produced reproductive cells) is common to nearly all families of plants; it is wanting in certain Algae (Conjugatae, Fucaceae, Characeae), and in certain fungi (*e.g.* some Peronosporeae). The structure of a spore is essentially this: it consists of a nucleated mass of protoplasm, enclosing starch or oil as reserve nutritive material, usually invested by a cell-wall. In those cases in which the spore is capable of germinating immediately on its development the cell-wall is a single delicate membrane consisting of cellulose; but in those cases in which the spore may or must pass through a period of quiescence before germination the wall becomes thickened and may consist of two layers, an inner, the *endospore*, which is delicate and consists of cellulose, and an outer, the *exospore*, which is thick and rigid, frequently darkly coloured and beset externally with spines or bosses, and which consists of cutin. In some few cases among the fungi, multicellular or septate spores are produced; these approximate somewhat to the gemmae mentioned above as highly specialized organs for vegetative propagation. In some cases, particularly among the algae, and also in some fungi (Peronosporeae, Saprolegnieae, Chytridiaceae, and the Myxomycetes), spores are produced which are usually destitute of any cell-wall, and are further peculiar in that they are motile, and are therefore termed *zoospores*; they move sometimes in an amoeboid manner by the protrusion of pseudopodia, but more frequently they are provided with one, two, or many delicate vibratile protoplasmic filaments, termed *cilia*, by the lashing of which the spore is propelled through the water. The zoospore eventually comes to rest, withdraws its cilia, surrounds itself with a cell-wall, and then germinates.

In the simplest case a single spore is developed from the cell of the unicellular plant, the protoplasm of which surrounds itself with the characteristic thick wall. This occurs only in plants of low organization such as the Schizophyta.

In other cases the contents of the cell undergo division, each portion of the protoplasm constituting a spore. Examples of this are afforded, among unicellular plants, by yeast and the Protococcaceae; and in multicellular plants by the Pandorineae, Confervaceae, Ulvaceae, &c., where any cell of the body may produce spores.

In such cases the spore-producing cell may be regarded as a rudimentary reproductive organ of the nature of a *sporangium*. In more highly organized plants special organs are differentiated for the production of spores. In the majority of cases the special organ is a sporangium, that is, a capsule in the interior of which the spores are developed; but in many fungi the spores are formed by abstriction from an organ termed a *sporophore*. In the Thallophyta the sporangium is commonly a single cell. In the Bryophyta it is a multicellular capsule. In the Pteridophyta the sporangium is multicellular, but simple in structure. and this is true also of the Phanerogams.

It is important to note that in all the Bryophyta and in some of the Pteridophyta (most of the Filicinae, all existing Equisetinae, and the Lycopodiaceae and Psilotaceae) there is but one kind of sporangium and spore, the plants being *homosporous* or *isosporous*, whereas the rest of the Pteridophyta (Hydropterideae, Selaginellaceae) and the Phanerogams are *heterosporous*, having sporangia of two kinds; some produce one or a few large spores (*megaspores*), and are hence termed *megasporangia*, while others give rise to a larger number of small spores (*microspores*) and are hence termed *microsporangia*. In the Phanerogams the two kinds of sporangia have received special names: the megasporangium, which produces as a rule only one mature spore (*embryo-sac*), is termed the *ovule*; the microsporangium, which produces a large number of microspores (*pollen-grains*), is termed the *pollen-sac*.

The development of spores, except in the simpler Thallophyta, is more or less restricted to definite parts of the body. Thus in the Red Algae (Florideae) there are the organs known as *stichidia*, *nemathecia*. In the fungi the number and variety of such organs is very great; they may be described generally as simple and compound *sporophores*: but for a description the article FUNGI should be consulted. In the higher plants the organs are less various. In the Bryophyta the production of spores is restricted to the sporogonium. In the vascular plants (Pteridophyta, Phanerogams) the development of sporangia, speaking generally, is confined to the leaves. In most ferns the sporangiferous leaves (*sporophylls*) do not differ in appearance from the foliage leaves, but in other Pteridophyta (Equisetaceae, Marsiliaceae, some species of *Lycopodium* and *Selaginella*) they present considerable adaptation, and notably in the Phanerogams. In the Phanerogams the specialization is so great that the sporophylls have received special names; those which bear the microsporangia (pollen-sacs) are termed the *stamens*, and those which bear the megasporangia (ovules) are termed the *carpels*. The sporophylls are usually aggregated together on a short stem, forming a shoot that constitutes a flower.

Many terms are employed to indicate the nature of the various kinds of spores, especially among the fungi, but the endless varieties of asexual (and asexually produced) reproductive cells may be grouped under two heads—(1) *Gonidia*, (2) *Spores proper*.

The distinction between these two kinds of asexual reproductive cells is as follows.

The *gonidium* is a reproductive cell that gives rise, on germination, to an organism resembling the parent. For instance, among the algae, the "zoospore" of *Vaucheria* develops into a Vaucheria-plant. There is thus a close connexion between vegetative multiplication and multiplication by means of gonida. The production of gonida is entirely limited to the Thallophyta, and is especially marked in the fungi, though the nature of all the many kinds of reproductive cells formed in this group has not yet been fully investigated. It is, however, wanting in certain algae (Conjugatae, Fucaceae, Characeae) and fungi (some Peronosporeae and Ascomycetes).

The *spore proper* is a reproductive cell that as a rule gives rise, on germination, to an organism unlike that which produced it. For instance, the spore of a fern when it germinates gives rise, not to a fern-plant, but to a prothallium. The apparent exceptions to this rule occur only among the Thallophyta, and are explained below in the section on *Life-history*.

The true spore is developed, usually in a sporangium, after a process of division which presents certain features that call for special notice.

Observation of the process of division of the nucleus (*karyokinesis*) in plants generally has shown (for details see CYTOLOGY) that the linin-reticulum of the resting nucleus breaks up into a definite number of segments, the *chromosomes*, each of which bears a series of minute bodies, the *chromatin-disks* or *chromomeres*, consisting largely of a substance termed *chromatin*. In the ordinary *homotype* divisions of the nuclei the characteristic number of chromosomes is always observable: but when the spore-mother-cells are being formed the number of chromosomes is reduced to one-half. This, if the number of chromosomes of the parent plant be expressed as $2x$ the number in the spore will be x. To take a concrete case: it has been observed by Guignard and others that in the early divisions taking place in the developing anther and ovule of the lily the number of chromosomes is 24; whereas in the later divisions which give rise to the pollen-mother-cells in the one case and to the mother-cell of the embryo-sac in the other, the number of chromosomes is only 12. Thus the development of a spore (as distinguished from a gonidium) is always preceded by a *reducing-* or *heterotype-division*, a process now more generally termed *meiosis* (Farmer). The reduced number of chromosomes in the nucleus of the spore-mother-cell persists in the spore, and in all the cells of the organism to which the spore may give rise. (Meiosis is discussed below in the section on *Sexual Reproduction*.)

It should be explained that cells, to which the name "spore" has also been applied, are formed as the result of a sexual act: such are *zygospores*, *oospores*, and some *carpospores*. But these cells differ from spores proper not only in their mode of origin but also in that their nuclei contain the full double number ($2x$) of chromosomes; hence they may be distinguished as *diplospores*.

Sexual Reproduction.—Sexual reproduction involves the development of sexual organs (*gametangia*) and sexual cells (*gametes*). When the organism is unicellular, as in the lower Green Algae (*e.g.* Protococcaceae, Conjugatae), the cell becomes a sexual organ and its whole protoplasm gives rise to one or more sexual cells: in the higher forms certain parts of the body are specialized as sexual organs. In many of the lower plants the organs present no external distinction of sex (*e.g.* lower Green Algae: the Chytridiaceae, Mucorinae, and some Ascomycetes among the fungi): it is impossible to distinguish between the male and female organs, although it cannot be doubted that the essential physiological difference exists; consequently the organs are merely described as gametangia. The gap between these plants and those with differentiated sexual organs is, however, bridged over by intermediate forms, as explained in the article ALGAE.

When the sexual organs are more or less obviously differentiated into male and female, they present considerable variety of form in different groups of plants, and accordingly bear different names. Thus the male organ is a *pollinodium* in most of the fungi, a *spermogonium* in others (certain Ascomycetes, Uredineae); in all other plants it is an *antheridium*. Similarly the female organ is an *oogonium* in various Thallophyta (Green and Brown Algae: Oomycetous Fungi); a *procarp* in the Red Algae; an *archicarp* in certain Ascomycetous Fungi and in the Uredineae; an *archegonium* in all the higher plants.

It is generally the case that the protoplasm of the sexual organ is differentiated into one or more sexual cells. Thus the gametangium usually gives rise to cells which, as they are externally similar, are termed *isogametes* or simply *gametes*. Certain forms of the male organ, the spermogonium and the antheridium, give rise to male cells which are termed *spermatia* when they are non-ciliate, *spermatozoids* when they are ciliated and free-swimming. Again, the female organs termed oogonia and archegonia produce one or more female cells called *oospheres*. But there are important exceptions to this rule. Thus the protoplasm is not differentiated into cells in the gametangium of the Mucorinae; in the male organ (pollinodium), of fungi generally; and in the female organ (procarp) of the Red Algae and (archicarp) of the Ascomycetes and Uredineae.

The immediate product of the fusion of cells, or of undifferentiated protoplasm, derived from sexual organs of opposite sex may be generally termed the *zygote*; but it is not always of the same kind. Thus when two isogametes, or the undifferentiated contents of two gametangia, fuse together, the process is designated *conjugation*, and the product is usually a single cell termed *zygospore*. When an oosphere fuses with a male cell, or with the undifferentiated contents of a male organ, the process is *fertilization*, and the product is a single cell termed *oospore*. When, finally, a female organ with undifferentiated contents receives a male cell, the process again is fertilization; here the

product is not a single cell, but a fructification termed *cystocarp* (Red Algae), or *ascocarp* (Ascomycetes) or *aecidium* (Urdineae), containing many spores (*carpospores*).

As a consequence of the diversity in the sexual organs and cells, in the details of the sexual act, and in the product of it, several modes of the sexual process have to be distinguished, which may be conveniently summarized as follows:—

I. *Isogamy*: the sexual process consists in the fusion of either two similar sexual cells (*isogametes*), or two similar sexual organs (*gamentangia*): it is termed conjugation, and the product is a *zygospore*. Its varieties are:—

(*a*) Gametes ciliated and free-swimming (*planogametes*), set free into the water where they meet and fuse: lower Green Algae (Protococcaceae, Pandorineae, most Siphonaceae and Confervaceae); some Brown Algae (Phaeosporeae);

(*b*) Gamentangia fuse in pairs, and a gamete is differentiated in each: the gametes of each pair fuse, but are not set free and are not ciliated (the Conjugate Green Algae): or, no gametes are differentiated, the undifferentiated contents of the gamentangia fusing (Mucorinae among the Fungi).

II. *Oogamy*: male and female organs distinct: the protoplasm of the female organ is differentiated into one or (rarely) more oospheres which usually remain enclosed in the female organ: the contents of the male organ are usually differentiated into one or more male cells: the process is fertilization, the product is an *oospore*.

(A) The sexual organs are unicellular (or coenocytic as in certain Siphonaceous Green Algae and in the Oomycetous Fungi); the female organ is an *oogonium*.

(*a*) The male organ is an *antheridium* giving rise to one or more free-swimming ciliated spermatozoids:

(1) The oogonium contains a single oosphere which is fertilized *in situ*: higher Green Algae (*Volvox*, *Vaucheria*, *Oedogonium*, *Coleochaete*, Characeae); some Brown Algae (*Tilopteris*); among the Fungi, *Monoblepharis*, the only fungus known to have spermatozoids:

(2) The oogonium produces a single oosphere which is extruded and is fertilized in the water: *Dictyota* and some Fucaceae (Brown Algae):

(3) The oogonium contains several oospheres which are fertilized *in situ*: *Sphaeroplea* (Siphonaceous Green Alga):

(4) The oogonium produces more than one oosphere (2–8) which are extruded and are fertilized in the water: certain Brown Algae (*Pelvetia*, *Ascophyllum*, *Fucus*):

(*β*) The male organ is a *pollenchamber* which applies itself closely to the oogonium: the amorphous male cell is not ciliated and is not set free:

(1) The oogonium contains a single oosphere which is fertilized *in situ*: Peronosporaceae (Oomycetes):

(2) The oogonium contains several oospheres; Saprolegniaceae: but it is debated whether or not fertilization actually takes place.

(B) The male and female organs are (as a rule) multicellular; the male organ is an *antheridium*, the female an *archegonium*: the archegonium always contains a single oosphere which is fertilized *in situ*.

(*a*) The male cell is a free-swimming ciliated spermatozoid: the antheridium produces more than one (usually very many) spermatozoids, each of which is developed in a single cell: all Bryophyta (mosses, &c.) and Pteridophyta (ferns, &c.): the only Phanerogam in which spermatozoids have been observed are the gymnospermous species *Ginkgo biloba*, *Cycas revoluta*, *Zamia integrifolia*.

(*β*) The male cell is amorphous and passes directly from the pollen-tube into the oosphere (*siphonogamy*): all Phanerogams except the species just mentioned.

It must be explained that in the angiospermous Phanerogams, the male and female organs are so reduced that each is represented by only a single cell: the male, by the *generative cell*, formed in the pollen-grain, which usually divides into two male cells: the female, by the oosphere. The gradual reduction can be traced through the Gymnosperms.

Attention may here be drawn to the fact (see ANGIOSPERMS) that, in several cases, the second male cell has been seen to enter the embryo-sac from the pollen-tube, and its nucleus to fuse with the definitive nucleus (endosperm-nucleus) or with one of the polar nuclei. The significance of this remarkable observation is discussed in the section on the *Physiology of Reproduction*.

III. *Carpogamy*: the sexual organs are (as a rule) differentiated into male and female: the protoplasm of the unicellular or multicellular female organ (archicarp, procarp) is never differentiated into an oosphere: in many cases definite male cells, *spermatia*, are produced and are set free, but these are not ciliated, and frequently have a cell-wall: the process is *fertilization*: the product is a fructification derived essentially from the female organ containing several (sometimes very many) spores (*carpospores*): characteristic of the Red Algae and of the Ascomycetous Fungi.

(A) There are definite male cells (*spermatia*):

(*a*) The female organ is a *procarp*, consisting of an elongated, closed, receptive filament, the *trichogyne*, and of a basal fertile portion, the *carpogonium*: on fertilization the latter grows and gives rise directly or indirectly to a *cystocarp*: the spermatia are each formed in a unicellular antheridium and have no cell-wall at first: they fuse with the tip of the trichogyne: Red Algae (Rhodophyceae or Florideae):

(*β*) The female organ (*archicarp*) resembles the preceding: in fertilization the fertile portion (*ascogonium*) develops into an *ascocarp* containing one or more asci (sporangia) each containing usually eight *ascospores*: the spermatia are formed by abstraction from the filaments (*sterigmata*) lining special receptacles, the *spermogonia*, which are the male organs: certain Ascomycetous Fungi (*e.g.* Laboulbeniaceae, some Lichen-Fungi, *Polystigma*). For the Uredineae, see *Abnormalities of Reproduction*, below).

(B) There are no definite male cells: the more or less distinct male and female organs come into contact, and their undifferentiated contents fuse: the product is an *ascocarp*:

(*a*) The male and female organs are obviously different: the female organ is an *ascogonium*, the male a *pollinodium*: *e.g. Pyronema*, *Sphaerotheca* (Ascomycetes):

(*β*) The male and female organs are quite similar: *e.g. Eremascus*, *Dipodascus* (Ascomycetes).

It may be explained that carpogamy is the expression of sexual degeneration. In the cases last mentioned, when the sexual organs are quite similar, they have reverted to the condition of gametangia. Still further reduction is discernible in other Ascomycetes in which one of the sexual organs, presumably the male, is either much reduced or is altogether wanting. Again in the rusts (Uredineae), there are spermatia, but they are functionless (see section on *Abnormalities of Reproduction*). In the Fungi, the Autobasidiomycetes, no sexual organs have been discovered.

Details of the Sexual Act.—It has been already stated that the sexual act consists in the fusion of two masses of protoplasm, commonly cells, derived from two organs of opposite sex: but this is only the first stage in the process. The second stage is the fusion of the nuclei, which usually follows quickly upon the fusion of the cells; but nuclear fusion may be postponed so that the two sexual nuclei may be observed in the zygote, as "conjugate" nuclei, and even in the cells of the organism developed from the zygote (*e.g.* Uredineae). The result of nuclear fusion is that the nucleus of the zygote contains the double number of chromosomes—that is, if the number of chromosomes in each of the fusing sexual nuclei be x, the number in the nucleus of the zygote will be $2x$. Moreover, this double number persists in all the cells of the organism developed from the zygote, until it is reduced to one-half by meiosis preceding either the development of the spores, or, less commonly, the development of the sexual cells. But there is yet a third stage, which consists in the temporary fusion of the chromosomes belonging to the two sexual nuclei. This always takes place as a preliminary to meiosis; it may be in the germinating zygote, or after many generations of cells have been formed from it. At the onset of meiosis the ($2x$) chromosomes are seen to be double, one of each pair having been derived from the male and the female cell respectively: the chromosomes of each pair then fuse so that their chromeres unite along their length, constituting the *pseudo-chromosomes*. The paired chromosomes separate and eventually go to form the two daughter-nuclei, one to each, which thus have half (x) the original number of chromosomes. The daughter-nuclei at once divide homotypically, retaining the reduced (x) number of chromosomes to form the four nuclei of a tetrad of spores (more rarely, *e.g. Fucus*, of sexual cells).

III. *Life-history.*

It will have been gathered from the foregoing sections that plants generally are capable of both sexual and asexual reproduction; and, further, that in different stages of their life-history they possess the diploid ($2x$) number of chromosomes in their nuclei, or the haploid (x) number. It may be at once stated that, in all plants in which sexual reproduction and true meiotic spore-formation exist, these two modes of reproduction are restricted to distinct forms of the plant; the sexual form bears only the sexual organs and is haploid; the asexual form only

produces spores and is diploid. Hence all such plants are to this extent *polymorphic*—that is, the plant assumes these two forms in the course of its life-history. When, as in many Thallophyta, one or other of these forms can reproduce itself by means of gonidia, additional forms may be introduced into the life-history, which becomes the more complicated the more pronounced the polymorphism.

The most straightforward life-histories are those presented by the Bryophyta and the Pteridophyta, where there are but the two forms, the sexual and the asexual. In the life-history of a moss, the plant itself bears only sexual organs: it is the sexual form, and is distinguished as the *gametophyte*. The zygote (oospore) formed in the sexual act develops into an organism, the *sporogonium*, which is entirely asexual, producing only spores: it is distinguished as the *sporophyte*. When these spores germinate, they give rise to moss-plants. Thus the two forms, the sexual and the asexual, regularly alternate with each other—that is, the life-history presents that simple form of polymorphism which is known as *alternation of generations*. Similarly, in the life-history of a fern, there is a regular alternation of a sporophyte, which is the fern-plant itself, with a gametophyte, which is the fern-prothallium.

It is pointed out in the preceding section that, as the result of the sexual act, the nucleus of the zygote contains twice as many chromosomes as those of the fusing sexual cells. This $2x$ number of chromosomes persists throughout all the cell-generations derived from the zygote, that is, in the cells constituting the sporophyte up to the time that it begins to produce spores, when meiosis takes place. Again, the cell-generations derived from the spore, that is, the cells constituting the gametophyte, all have the reduced x number of chromosomes in their nuclei up to the sexual act. Hence the sporophyte may also be designated the *diplophyte* and the gametophyte the *haplophyte* (Strasburger): in other words, the sporophyte is the *pre-meiotic*, the gametophyte the *post-meiotic* generation. Twice in its life-history the plant is represented by a single cell: by the spore and by the zygote. The turning-points in the life-history, the transitions from the one generation to the other, are (1) meiosis, (2) the sexual act.

The course of the life-history in Phanerogams and in those Thallophyta which have been adequately investigated is essentially the same as that of the Bryophyta and of the Pteridophyta as described above, though it is less easy to trace on account of the peculiar relation of the two generations to each other in the Phanerogams and on account of various irregularities that present themselves in the Thallophyta.

In the Phanerogams, as in the Pteridophyta, the preponderating generation is the sporophyte, the plant itself. Inasmuch as they are heterosporous, the gametophyte is represented by a male and a female organism or prothallium, both rudimentary. The male prothallium consists of the few cells formed by the germinating pollen-grain (microspore); and though it is quite independent, since the microspores are shed, it grows parasitically in the tissues upon which the microspore has been deposited in pollination. The female prothallium may consist of many cells in well-developed archegonia, as in the Gymnosperms, or of only a few cells with the female organ reduced to the oosphere, as in the Angiosperms. In either case it is the product of the germination of a megaspore (embryo-sac) which is not shed from its sporangium (ovule): hence it never becomes an independent plant, and was long regarded as merely a part of the sporophyte until its true nature was ascertained, chiefly by the researches of Hofmeister, who first explained the alternation of generations in plants. This intimate and persistent connexion between the two generations affords the explanation of the characteristic features of the Phanerogams, the seed and the flower. The ovule containing the embryo-sac, which eventually contains the embryo, persists as the seed—a structure that is distinctive of Phanerogams, which have, in fact, on this account been also termed Spermatophyta. With regard to the flower, it has been already mentioned that it is, like the cone of an Equisetum or a Lycopodium, a shoot adapted to the production of spores. But it is something more than this: for whereas in Equisetum or Lycopodium the function of the cone comes to an end when the spores are shed, the flower of the Phanerogam has still various functions to perform after the maturation of the spores. It is the seat of the process of *pollination*—that is, the bringing of the pollen-grain by one of various agencies into such a position that a part (the pollen-tube) of the male prothallium developed from it may reach and fertilize the oosphere in the embryo-sac. Thus the flower of Phanerogams is a reproductive shoot adapted not only for spore-production, but also for pollination, for fertilization, and for the consequences of fertilization, the production of seed and fruit. However, in spite of these complications, it is possible to determine accurately the limits of the two generations by the observation of the nuclei. The meiosis preceding the formation of the spores marks the beginning of the (haploid) gametophyte, male and female; and the sexual act marks that of the (diploid) sporophyte.

The difficult task of elucidating the life-histories of the Thallophyta has been successfully performed in certain cases by the application of the method of chromosome-counting, with the result that alternation of generations has been found to be of general occurrence. To begin with the Algae. In the Dictyotaceae (Brown Algae) there are two very similar forms in the life-history, the one bearing asexual reproductive organs (tetrasporangia), the other bearing sexual organs (oogonia and antheridia). It has been shown (Lloyd Williams) that the former is undoubtedly the sporophyte and the latter the gametophyte, since the nuclei of the former contain 32 chromosomes, and those of the latter 16. Meiosis takes place in the mother-cell of the tetraspores, which, on germination, give rise to the sexual form. Quite a different life-history has been traced in *Fucus*, another Brown Alga. Here no spores are produced: there is but one form in the life-history, the *Fucus*-plant, which bears sexual organs and has, on that account, been regarded as a gametophyte. The investigation of the nuclei has, however, shown (Farmer) that the *Fucus*-plant is actually diploid, that it is, in fact, a sporophyte; but since there is no spore-formation, meiosis immediately precedes the development of the sexual cells, which alone represent the gametophyte (see below, *Apospory*).

Similarly, two types of life-history have been discovered in the Red Algae. In *Polysiphonia violacea*, a species in which the tetraspores and the sexual organs are borne by similar but distinct individuals, it has been ascertained (Yamanouchi) that, as in *Dictyota*, meiosis takes place in the mother-cell of the tetraspores, so that the nuclei of these spores, as also those of the sexual plants to which they give rise, contain 20 chromosomes: and further, that the nuclei of the carpospores (diplospores) produced in the cystocarp as the result of fertilization, contain 40 chromosomes, as do also those of the asexual plant to which the carpospores give rise. Hence the sporophyte is represented by the cystocarp and the resulting tetrasporangiate plants: the gametophyte, by the sexual plants. Though it is the rule in the Red Algae that the tetrasporangia and the sexual organs are borne on distinct individuals, yet cases are known in which both kinds of reproductive organs are borne upon the same plant; and to those the above conclusions obviously cannot apply. They have yet to be investigated.

The second type of life-history has been traced in *Nemalion*. Here there is no tetrasporangiate form, consequently meiosis takes place at a different stage in the life-history. It has been observed (Wolfe) that the nuclei of the sexual plant contain 8 chromosomes; those of the gonimoblast-filaments of the developing cystocarp contain 16, whilst those of the carpospores contain 8: hence meiosis takes place in the carposporangia. Here the plant is the gametophyte; the sporophyte is only represented by the cystocarp. The carpospores here are true spores (haplospores).

Among the Green Algae, *Coleochaete* is the only form that has been fully investigated (Allen). Here meiosis takes place in the germinating oospore: consequently the plant is the

gametophyte, and the sporophyte is represented only by the oospore, so that the life-history resembles that of *Nemalion*. It is probable that this conclusion is generally true of the whole group; at any rate of those forms (Desmids, *Spirogyra*, *Oedogonium*, *Chara*) which have been more or less investigated.

Turning to the Fungi, somewhat similar results have been obtained in the few forms that have been studied from this point of view. In the sexual Ascomycetes it appears (Harper) that meiosis takes place in the ascocarp just before the development of the spores, so that the life-history essentially resembles that of *Nemalion*. Again, in certain Uredineae, having an aecidium-stage and a teleutospore-stage, which is apparently a sexual process has been observed (Blackman, Christman) which is described in the section on *Abnormalities of Reproduction*, and the life-history is as follows. The sexual act having taken place, a row of aecidiospores is developed in the aecidium, each of which contains two conjugate nuclei derived from the sexual nuclei. The mycelium developed from the aecidiospore, as well as the uredospores and the teleutospores that it bears, shows two conjugate nuclei. When, however, the teleutospore is about to germinate, the two nuclei fuse (thus completing the sexual act) and meiosis takes place. As a result the promycelium developed from the teleutospore, and the sporidia that it produces, are uninuclеate: so are also the mycelium developed from the sporidium, and the female organs (archicarps) borne upon it. Hence the limits of the sporophyte are the aecidiospore and the teleutospore: those of the gametophyte, the teleutospore and the aecidiospore.

Similar observations have been made upon other Uredineae with a more contracted life-history. *Phragmidium Potentillae-canadensis* is a rust that has no aecidium-stage: consequently the primary uredospores are borne by the mycelium produced on infection of the host by a sporidium. It has been observed (Christman) that the sporogenous hyphae fuse in pairs, suggesting a sexual act; then the primary uredospores are developed in rows from the fused pairs of hyphae which thus behave as sexual organs (archicarps), and each such uredospore contains two conjugate nuclei. Although the research has not been carried beyond this point, it may be inferred that in this case, as in the preceding, nuclear fusion and meiosis take place in the teleutospore. Here the sporophyte is represented by the uredo-form.

Finally, in some of the fungi in which no sexual organs have yet been discovered, this method of investigation has made it probable that some kind of sexual act takes place nevertheless. Thus in the Uredine *Puccinia malvacearum*, which has only teleutospore- and sporidium-stages, it has been observed (Blackman) that the formation of the teleutospores is preceded by a binucleate condition of the hyphae. The same idea is suggested by the binucleate basidia of the Basidiomycetes, which correspond to the teleutospores of the Uredineae.

The life-histories sketched in the preceding paragraphs show that one of the complexities met with in the Thallophyta is that meiosis does not always take place at the same point in the life-history. In the higher plants the incidence of meiosis is generally, though not absolutely, constant: it may be stated as a rule that in the Bryophyta, Pteridophyta and Phanerogams it takes place in the spore-mother-cells. In the Thallophyta this rule does not hold. In some of them, it is true, meiosis immediately precedes, as in the higher plants, the formation of certain spores, the tetraspores (Dictyotaceae, *Polysiphonia*), the teleutospores (Uredineae): but in others it immediately precedes the development of the sexual organs (Fucaceae), or follows more or less directly upon the sexual act (Green Algae, *Nemalion*, Ascomycetes).

The life-history of most Thallophyta is further complicated by the capacity of the gametophyte of the, sporophyte to reproduce themselves by cells termed gonidia, a capacity that is wholly lacking in the higher plants. The karyology of gonidia has not yet been sufficiently investigated: but when, as in the Green Algae and the Oomycetous Fungi, the gonidia are developed by and reproduce the gametophyte, it may be inferred that they, like the gametophyte, are haploid. One case, at any rate, of the reproduction of the sporophyte by gonidia is fully known, that of the Uredineae just described, in which the uredo-form, which is a phase of the sporophyte, is reproduced by the uredo-spores which are binucleate, that is diploid, and may be distinguished as *diplogonidia*. In any case the result is that whereas in the higher plants each of the alternating generations occurs but once in the life-history, in these Thallophyta the life-history may include a succession of gametophytic or of sporophytic forms This is, in fact, a distinguishing feature of the group. The higher plants present a *regular* alternation of generations: whereas, in the Thallophyta, though they probably all present some kind of alternation of generations, yet it is *irregular* in the various ways and for the various reasons mentioned above

Sufficient information has been given in the preceding pages to render possible the consideration of the *origin* of alternation of generations. To begin quite at the beginning, it may be assumed that the primitive form of reproduction was purely vegetative, merely division of the unicellular organism when it had attained the limits of its own growth. Following on this came reproduction by a gonidium: that is, the protoplasm of the cell, at the end of its vegetative life, became quiescent, surrounded itself with a proper wall, or was set free as a motile ciliated cell, having in some unexplained way become capable of originating a new course of life (*rejuvenescence*) on germination. Then, as can be well traced in the Brown and Green Algae (see ALGA), these primitive reproductive cells (gonidia) began to fuse in pairs: in other words, they gradually became sexual. This stage can still be observed in some of these Algae (*e.g. Ulothrix*, *Ectocarpus*) where the zoospores (gonidia) may either germinate independently, or fuse in pairs to form a zygote. Gradually the sexuality of these cells became more pronounced: losing the capacity for independent germination, they acquired the external characters of more or less differentiated sexual cells, and the gametangia producing them developed into male and female sexual organs. But this advancing sexual differentiation did not necessarily deprive the plant of the primitive mode of propagation: the sexual organism still retained the faculty of reproduction by gonidia. The loss of this faculty only came with higher development: it is entirely wanting in some of the higher Thallophyta (*e.g.* Fucaceae, Characeae), and in all plants above them in the evolutionary series.

With the introduction of the sexual act, a new kind of reproductive cell made its appearance, the zygote. This cell, as already explained, differs from other kinds of spores and from the sexual cells, in that its necleus is diploid; and with it the sporophyte (diplophyte) was introduced into the life-history. It has been mentioned that in some plants (*e.g.* Green Algae) the zygote is all that there is to represent the sporophyte, giving rise, or germination and after meiosis, to one or more spores. Passing to the Bryophyta, in the simpler forms (*e.g. Riccia*), the zygote develops into a multicellular capsule (sporogonium); and in the higher forms into a more elaborate sporogonium, producing many spores. In the Pteridophyta and the Phanerogams, the zygote gives rise to the highly developed sporophytic plant.

Thus the evolution of the sporophyte can be traced from the unicellular zygote, gradually increasing in bulk and in independence until it becomes the equal of the gametophyte (*e.g.* in *Dictyota* and *Polysiphonia*), and eventually far surpasses it (Pteridophyta, Phanerogams). Moreover, the increase in size was attended by the gradual limitation of spore-production to certain parts only, the rest of the tissues being vegetative, assuming the form of stems, leaves, &c. These facts have been formulated in the theory of "progressive sterilization" (Bower), which states that the sporophytic form of the higher plants has been evolved from the simple, entirely fertile, sporophyte of the lower, by the gradually increasing development of the sterile vegetative tissue at the expense of the sporogenous, accompanied by increase in total bulk and in morphological and histological differentiation.

In connexion with the study of the evolution of the sporophyte,

the question arose as to its morphological significance; whether it is to be regarded as a modified form of the gametophyte, or as an altogether new form intercalated in the life-history: in other words, whether the alternation is "homologous" or "antithetic." In certain plants there is a succession of forms which are undoubtedly homologous: for instance, in *Coleochaete* where a succession of individuals without sexual organs is produced by zoospores (gonidia). The main fact that has been established is that the sporophyte, from the simple zygote of the Thallophyta to the spore-bearing plant of the Phanerogams, is characterized by its diploid nuclei; that it is a diplophyte, in contrast to the haplophytic gametophyte. Were these nuclear characters absolutely universal, there could be no question but that the sporophyte is an altogether new antithetic form, and not an homologous generation. But certain exceptions to the rule have been detected, which are described under *Abnormalities of Reproduction*: at present it will suffice to say that such things as a diploid gametophyte and a haploid sporophyte have been observed in certain ferns. It can only be inferred that alternation of generations is not absolutely dependent upon the periodic halving in meiosis and the subsequent doubling by a sexual act, of the number of chromosomes in the nuclei, though the two sets of phenomena usually coincide. It must not, however, be overlooked that these exceptional cases occur in plants presenting an abnormal life-history: the fact remains that where there is both normal spore-formation with meiosis, and a subsequent sexual act, the haploid form is the gametophyte, the diploid the sporophyte. But the actual observation of a haploid sporophyte and of a diploid gametophyte makes it clear that however generally useful the nuclear characters may be in the distinction of sporophyte and gametophyte, they do not afford an absolute criterion, and therefore their value in determining homologies is debatable.

IV. *Abnormalities of Reproduction.*

In what may be regarded as the type of normal life-history, the transition from the one generation to the other is marked by definite processes: there is the mciotic development of spores by the sporophyte, and the sexual production of a zygote, or something analogous to it, by the gametophyte. But it has been mentioned in the preceding pages that the transition may, in certain cases, be effected in other ways, which may be regarded as abnormal, though they are constant enough in the plants in which they occur, in fact as manifestations of reproductive degeneration.

In the first place, the sporophyte may be developed either after an abnormal sexual act, or without any preceding sexual act at all, a condition known as *apogamy*. In the second, the gametophyte may be developed otherwise than from a post-meiotic spore, a condition known as *apospory*.

Abnormality.—The cases to be considered under this head may be arranged in two groups:—

1. *Pseudapogamy: sexual act abnormal.*—The following abnormalities have been observed:—
   (*a*) Fusion of two female organs: observed (Christman) in certain Uredineae (*Caeoma nitens, Phragmidium speciosum, Uromyces Caladii*) where adjacent archicarps fuse: male cells (spermatia) are present but functionless.
   (*b*) Fusion between nuclei of the same female organ: observed in the ascogonium of certain Ascomycetes, *Humaria granulata* (Blackman), where there is no male organ; *Lachnea stercorea* (Fraser), where the male organ (pollinodium) is present but is apparently functionless.
   (*c*) Fusion of a female organ with an adjacent tissue-cell: observed (Blackman) in the archicarp of some Uredineae (*Phragmidium violaceum, Uromyces Poae, Puccinia Poarum*): male cells (spermatia) present but functionless.
   (*d*) There is no female organ: fusion takes place between two adjacent tissue-cells of the gametophyte; the sporophyte is developed from diploid cells thus produced, but there is no proper zygote as there is in *a*, *b* and *c*: observed (Farmer) in the prothallium of certain ferns (*Lastraea pseudo-mas*, var. *polydactyla*): male organs (and sometimes female) present but functionless. Another such case is that of *Humaria rutilans* (Ascomycete), in which nuclear fusion has been observed (Fraser) in hyphae of the hypothecium: the asci are developed from these hyphae, and in them meiosis takes place; there are no sexual organs.

2. *Eu-apogamy: no kind of sexual act*—
   (*a*) The gametophyte is haploid:
      (*α*) The sporophyte is developed from the unfertilized oosphere: no such case of *true parthenogenesis* has yet been observed.
      (*β*) The sporophyte is developed vegetatively from the gametophyte and is haploid: observed in the prothallia of certain ferns, *Lastraea pseudo-mas*, var. *cristata-apospora* (Farmer and Digby), and *Nephrodium molle* (Yamanouchi).
   (*b*) The gametophyte is diploid (see under *Apospory*):
      (*α*) The sporophyte is developed from the diploid oosphere: observed in some Pteridophyta, viz. certain ferns (Farmer), *Athyrium Filix-foemina*, var. *clarissima, Scolopendrium vulgare*, var. *crispum-Drummondae*, and *Marsilia* (Strasburger); also in some Phanerogams, viz. Compositae (*Taraxacum*, Murbeck; *Antennaria alpina*, Juel; sp. of *Hieracium* (Rosenberg): Rosaceae (*Eu-Alchemilla* sp., Murbeck, Strasburger): Ranunculaceae (*Thalictrum purpurascens*, Overton).
      (*β*) The sporophyte is developed vegetatively from the gametophyte: observed (Farmer) in the fern *Athyrium Filix-foemina*, var. *clarissima*.

      In all the cases enumerated under *Eu-apogamy*, apogamy is associated with some form of apospory except *Nephrodium molle*, full details of which have not yet been published.

      Many other ferns are known to be apogamous, but they are not included here because the details of their nuclear structure have not been investigated.

Apospory.—The known modes of apospory may be arranged as follows:—

1. *Pseudapospory: a spore is formed but without meiosis, so that it is diploid*—observed only in heterosporous plants, viz. certain species of *Marsilia* (*e.g. Marsilia Drummondii*) where the megaspore has a diploid nucleus (32 chromosomes) and the resulting prothallium and female organs are also diploid (Strasburger); and in various Phanerogams, some Compositae (*Taraxacum* and *Antennaria alpina*, Juel), some Rosaceae (*Eu-Alchemilla*, Strasburger), and occasionally in *Thalictrum purpurascens* (Overton), where the megaspore (embryo-sac) is diploid; in some species of *Hieracium* it has been found (Rosenberg) that adventitious diploid embryo-sacs are developed in the nucellus: these plants are also apogamous.

2. *Eu-apospory: no spore is formed*—of this there are two varieties:
   (*a*) With meiosis: this occurs in some Thallophyta which form no spores; the sporophyte of the Fucaceae bears no spores, consequently meiosis takes place in the developing sexual organs; the Conjugate Green Algae also have no spores, meiosis taking place in the germinating zygospore which develops directly into the sexual plant.
   (*b*) Without meiosis: the gametophyte is developed upon the sporophyte by budding; that is, spore-reproduction is replaced by a vegetative process: for instance, in mosses it has been found possible to induce the development of protonema, the first stage of the gametophyte, from tissue-cells of the sporogonium: similarly, in certain ferns (varieties of *Athyrium Filix-foemina, Scolopendrium vulgare, Lastraea pseudo-mas, Polystichum angulare*, and in the species *Pteris quadriaurita* and *Asplenium dimorphum*), the gametophyte (prothallium) is developed by budding on the leaf of the sporophyte, and in some of these cases it has been ascertained that the gametophyte so developed has the same number (32) of chromosomes in its nuclei as the sporophyte that bears it—that is, it is diploid.

   Apospory has been found to be frequently associated with apogamy; in fact, in the absence of meiosis, this association would appear to be inevitable.

Combined Apospory and Apogamy.—Instances have been given of the occurrence of both apospory and apogamy in the same life-history; but in all of them there is a regular succession of sporophyte and gametophyte. The cases now to be considered are those in which one or other of the generations gives rise directly to its like, sporophyte to sporophyte, gametophyte to gametophyte, the normally intervening generation being omitted.

It is possible to conceive of this abbreviation of the life-history taking place in various ways. Thus, a sporophyte might be developed from a haploid spore instead of a gametophyte as is the normal case, but this has not been observed: again, a sporophyte might be developed from a diploid spore (as distinguished from a zygote or a diploid oosphere), a possibility that is to some extent realized in the life-history of some Uredineae in which successive forms of the polymorphic spore-phyte are developed from diplogonidia. Similarly a gametophyte might be developed from a fertilized or an unfertilized

female cell: the latter possibility is to some extent realized in those Algae (*e.g. Ulothrix, Ectocarpus*) in which the sexual cells (isogametes), if they fail to conjugate, germinate independently as gonidia, giving rise to gametophytes.

The more familiar mode is that of vegetative budding, as already mentioned. When a "viviparous" fern or Phanerogam reproduces itself by a bud or a bulbil, both spore-formation and the sexual act are passed over: sporophyte springs from sporophyte. Remarkable cases of this have been observed in certain Phanerogams (*Coelebogyne ilicifolia, Funkia ovata, Nothoscordum fragrans, Citrus*, sp. of *Euonymus, Opuntia vulgaris*) in the ovule of which adventitious embryos are formed by budding from cells of the nucellus: with the exception of *Coelebogyne*, it appears that this only takes place after the oosphere has been fertilized. In other plants it is the gametophyte that reproduces itself by means of gemmae or bulbils, as commonly in the Bryophyta, the prothallia of ferns, &c.

The abnormalities described are all traceable to reproductive degeneration; the final result of which is that true reproduction is replaced more or less completely by vegetative propagation. It may be inquired whether degeneration may have proceeded so far in any plant of sufficiently high organization to present spore-formation, or sexual reproduction, or both, as to cause the plant to reproduce itself entirely and exclusively by the vegetative method. The only such case that suggests itself is that of *Caulerpa* and possibly some other Siphonaceous Green Algae. In this plant no special reproductive organs have yet been discovered, and it certainly reproduces itself by the breaking off of portions of the body which become complete plants: but it is quite possible that reproductive organs may yet be discovered.

V. *Physiology of Reproduction.*

The reproductive capacity of plants, as of animals, depends upon the fact that the whole or part of the protoplasm of the individual can develop into one or more new organisms in one or other of several possible ways. Thus, in the case of unicellular plants, the whole of the protoplasm of the parent gives rise, whether by simple division or otherwise, to one or more new plants. Reproduction necessarily closes the life of the individual: here, as August Weismann long ago pointed out, there is no natural death, for the whole of the protoplasm of the parent continues to live in the progeny. In multicellular plants, on the contrary, the reproductive function is mainly discharged by certain parts of the body, the reproductive organs, the remainder of the body being essentially vegetative—that is, concerned with the maintenance of the individual. In these plants it is only a part of the protoplasm that continues to live in their progeny; the remainder, the vegetative part, eventually dies. It is therefore possible to distinguish in them, on the one hand, the essentially reproductive protoplasm, which may be designated by Weismann's term *germ-plasm*, though without necessarily adopting all that his use of it implies, and the essentially vegetative, mortal protoplasm, the *somatoplasm*, on the other. In the unicellular plant no such distinction can be drawn, for the whole of the protoplasm is concerned in reproduction. But even in the most highly organized multicellular plant this distinction is not absolute: for, as already explained, plants can, in general, be propagated by the isolation of almost any part of the body, that is vegetatively, and this implies the presence of germ-plasm elsewhere than in the special reproductive organs.

If the attempt be made to distinguish between the organs of vegetative propagation and those of true reproduction, the nearest approach would be the statement that the former contain both germ-plasm and somatoplasm, whereas the latter, or at least the reproductive cells, consist entirely of germ-plasm.

The question now arises as to the exact seat of the germ-plasm, and the answer is to be looked for in the results of the numerous researches into the structure and development of the reproductive cells that form so large a part of the biological work of recent years. The various facts already mentioned suffice to prove that the nucleus plays the leading part in the reproductive processes of whatever kind: the general conclusion is justified that no reproductive cell can develop into a new organism if deprived of its nucleus. It may be inferred that the nucleus either actually contains the germ-plasm, or that it controls and directs the activities of the germ-plasm present in the cell. It is not improbable that both these inferences may be true. At any rate there is no sufficient ground for excluding the co-operation of the cytoplasm, especially of that part of it distinguished as *kinoplasm*, in the reproductive processes.

Pursuing the ascertained facts with regard to the nucleus, it is established that the part of it especially concerned is the linin-network which consists of the chromosomes. The behaviour, as already described, of the chromosomes in the various reproductive processes has led to the conclusion that the hereditary characters of the parent or parents are transmitted in and by them to the progeny: that they constitute, in fact, the material basis of heredity (see HEREDITY). They can hardly, however, be regarded as the ultimate structural units, for the simple reason that their number is far too small in relation to the transmissible characters. It has been suggested (Farmer) that the chromomeres are the units, but the number of these would seem to be hardly sufficient. It seems necessary to fall back upon hypothetical ultimate particles, as suggested by Darwin, de Vries and Weismann, which may be generally termed *pangens*. The chromomeres may be regarded as aggregates of such particles, the "ids" of Weismann.

The foregoing considerations make it possible to attempt an explanation of the various reproductive processes.

Vegetative Propagation.—It is easily intelligible that the two individuals produced by the division of a unicellular plant should resemble the parent and each other; for, the division of the parent-nucleus being homotypic, the chromosomes which go to constitute the nucleus of each daughter-cell are alike both in number and in nature, and exactly repeat the constitution of the parent-nucleus.

In the more complicated cases of propagation by bulbils, cuttings, &c., the development of the new individual, or of the missing parts of the individual (roots, &c.), may be ascribed to the presence in the bulbil or cutting of the necessary pangens.

Reproduction by Gonidia.—In this case a single cell gives rise to a complete new organism resembling the parent. The inference is that the gonidium is a portion of the parental germ-plasm, in which all the necessary pangens have been accumulated.

Reproduction by Spores.—In this case, also, an entire organism is developed from a single cell, but with this peculiarity that the resulting organism is unlike that which bore the spore, a peculiarity which has not yet been explained. It has been already stated that the development of true spores involves meiosis, and this process is no doubt related to the behaviour of the spore on germination; but the nature of this relation remains obscure. It might be assumed that, as the result of meiosis, the nucleus of the spore receives only gametophytic pangens. But the assumption is rendered impossible by the fact that the spore gives rise to a sexual organism, the reproductive cells of which, after the sexual act, produce a sporophyte. Clearly sporophytic pangens must be present as well in the spore as in the gametophyte and in its sexual cells. It can only be surmised that they exist there in a latent condition, dominated, as it were, by the gametophytic pangens.

Sexual Reproduction.—Here, again, as yet unanswered questions present themselves. The essence of a sexual cell is that it cannot give rise by itself to a new organism, it is only truly reproductive after the sexual act: this peculiarity is just what constitutes its *sexuality*. Minute investigation has not yet detected any essential structural difference between a sexual cell and a spore; on the contrary, the results so far obtained have established that they essentially agree in being post-meiotic (haploid). Why then do they differ so fundamentally in their reproductive capacities? Again, sexual cells differ in *sex*; but there are as yet no facts to demonstrate any essential structural difference between male

and female cells. What is known about them tends to prove their structural similarity rather than their difference. But it is possible that their difference may be chemical, and so not to be detected by the microscope.

The normal *sexual act* has been described as consisting in the fusion, first, of two cells, then of their nuclei, and finally, often after a long interval, of their chromosomes and of their chromomeres in meiosis. What causes determined these fusions is a question that is only partly answered. It is known in certain cases (*e.g.* ferns and mosses) that the male cell is attracted to the female by chemical substances secreted for the purpose by the female organ; that it is a case of *chemiotaxis*. Probably this is more common than experiment has yet shown it to be. It is quite conceivable that the consequent cell-fusion, as also the subsequent fusions of nuclei and of chromosomes, are likewise cases of chemiotaxis, depending upon chemical differences between the fusing structures.

The sexual process can only take place between cells which are related to each other in a certain degree (see HYBRIDISM); that is, it depends upon *sexual affinity*. It is the general rule that it takes place between cells derived from different individuals of the same species; that is, *cross-fertilization* is the rule. This is necessarily the case when the male and female organs are developed upon different individuals, when the plant is said to be *dioecious*. When both kinds of organs are developed upon the same individual (*monoecious*), self-fertilization may and often does occur; but it is commonly hindered by various special arrangements, of which *dichogamy* is the most common; that is, that the male and female organs are not mature at the same time. But though these arrangements favour cross-fertilization, they do not absolutely prevent self-fertilization. In some cases, *cleistogamic* flowers, for instance, self-fertilization alone is possible (see ANGIOSPERMS). The general conclusion is that though cross-fertilization is the more advantageous form of sexual reproduction, still self-fertilization is more advantageous to the species than no fertilization at all.

In considering this subject, it must be borne in mind that the terms used have different meanings when applied to certain heterosporous plants from those which they convey when applied to isosporus plants. In the latter cases their meaning is direct and simple: in the former it is indirect and somewhat complicated. In heterosporous plants generally the actual sexual organs are never borne upon the same individual, these is always necessarily a male and a female gametophyte; so that, strictly speaking, self-fertilization is impossible. But in the Phanerogams, where there is a process preliminary to fertilization, that of *pollination*, which is unknown in other plants, the terms and the conceptions expressed by them are applied, not to the real sexual organs, but to the spores. Thus a dioecious Phanerogam is one in which the microspores are developed by one individual, the megaspores by another; and again, self-fertilization is said to occur when the microspores (pollen) fall upon the stigma of the same flower (see ANGIOSPERMS); but this is really only *self-pollination*.

To return to the sexual process itself. Whatever its nature, two sets of results follow upon the sexual act—(1) a zygote is formed, which is capable of developing into a new organism; from two cells, neither of which could so develop; (2) the hereditary sporophytic characters of the two parents are possessed by the organism so developed. These two results will now be considered in some detail.

(1) *The Relation between the Sexual Act and Reproductive Capacity.*—In the early days of the discovery of the sexual process, it was thought that the capacity for development imparted to the female cell was to be attributed to the doubling of its nuclear substance by the fusion with the male cell. Reproductive capacity does not, however, depend upon the bulk of the nuclear substance, for a spore, like an unfertilized female cell, contains but the x number of chromosomes, and yet it can give rise to a new organism. Again, it has been observed (Winkler) that a non-nucleated fragment of an oosphere of *Cystosira* (Fucaceae) can be "fertilized" by a spermatozoid and will then grow and divide to form a small embryo, though it necessarily contains only the x number of chromosomes. From this it would appear that some stimulating influence had been exerted by the male cell, and it is probably in this direction that the desired explanation is to be sought. Some important confirmatory facts have been recorded with regard to certain animals (sea-urchins). It has been observed (Loeb) that treatment with magnesium chloride will cause the ova to grow and segment; and similar results have been obtained (Winkler) by treating the ova with a watery extract of the male cells. Hence it may be inferred that the male cell carries with it, either in its cytoplasm (kinoplasm), or in its nucleus, extractable substances, perhaps of the nature of enzymes, that stimulate the female cell to growth.

It may be mentioned that the stimulating effect of fertilization is not necessarily confined to the female cell; very frequently adjacent tissues are stimulated to growth and structural change. In a Phanerogam, for instance, the whole ovule grows and develops into the seed: the development of endosperm in the embryo-sac is initiated by another nuclear fusion, taking place between the second male nucleus and the endosperm-nucleus: the ovary, too, grows to form the fruit, which may be dry and hard or more or less succulent: the stimulating effect may extend to other parts of the flower; to the perianth, as in the mulberry; to the receptacle, as in the strawberry and the apple: or even beyond the flower to the axis of the inflorescence, as in the fig and the pine-apple. Analogous developments in other groups, are the calyptra of the Bryophyta, the cystocarps of the Red Algae, the ascocarps of the Ascomycetes, the aecidia of the Uredineae, &c.

(2) *The Relation of the Sexual Act to Heredity.*—The product of the sexual act is essentially a diploid cell, the zygote, which actually is or gives rise to a sporophyte. The sexual heredity of plants consequently presents the peculiar feature that the organism resulting from the sexual act is quite unlike its immediate parents, which are both gametophytes. But it is clear that the sporophytic characters must have persisted, though in a latent condition, through the gametophyte, to manifest themselves in the organism developed from the zygote.

The real question at issue is as to the exact means by which these characters are transmitted and combined in the sexual act. There is a considerable amount of evidence that the hereditary characters are associated with the chromomeres, and that it is rather their linin-constituent than their chromatin which is functional (Strasburger): that they constitute, in fact, the material basis of heredity. From this point of view it is probable that the last phase of the sexual act, the fusion of the chromomeres in meiosis, represents the combination of the two sets of parental characters. What exactly happens in the pseudo-chromosome stage is not known; at any rate this stage offers an opportunity for a complete redistribution of the substance of the chromomeres—in other words, of the parental pangens. It is a striking fact that, in the subsequent nuclear division, the distribution of the chromosomes derived from the male and female parents (when they can be distinguished) seems to be a matter of indifference: they are not equally distributed to the two daughter-nuclei. The explanation would appear to be this, that they are not any longer male and female as they were before meiotic fusion; and that it is because they now contain both male and female nuclear substance that their equal distribution to the daughter-nuclei is unimportant.

The nature of this redistribution of the substance of the chromomeres is still under discussion. Some regard it as essentially a chemical process, resulting in the formation of new compounds: others consider it to be rather a physical process, a new material system being formed in the rearrangement of the pangens; here it must be left for the present.

The various ways in which the parental characters manifest themselves in the progeny are fully dealt with in the articles HEREDITY, HYBRIDISM, MENDELISM. It will suffice to say that the progeny, though maintaining generally the characters of the species, do not necessarily exactly resemble either of the parents, nor do they necessarily present exactly intermediate characters:

they may vary more or less from the type. It is an interesting fact, the full significance of which has not yet been worked out, that, as a rule, plants that vary profusely are those in which the characteristic $2x$ number of chromosomes is high (60–100).

Brief reference may be made to the cases of abnormal sexual or pseudo-sexual reproduction described above under *Apogamy*. Taking first the cases of true apogamy, there is clearly no need for any sexual process, for, since no meiotic division has taken place, the gametophyte is diploid; its cells, whether vegetative or contained in female organs, possess the capacity for both development and the transmission of the sporophytic characters. It is not remarkable that such a gametophyte should be able to give rise directly to a sporophyte; but it is remarkable, in the converse case of apospory, that a sporophyte should give rise to a diploid gametophyte rather than to another sporophyte. In the latter case the tendency to the regular development of the alternate form appears to override the influence of the diploid nucleus.

Turning to the various forms of pseudo-apogamy, there are first those in which fusion takes place between two apparently female organs (some Uredineae; Christman), and those in which it takes place between nuclei within the same female organ (*Humaria*; Blackman). If these are to be regarded physiologically as sexual acts, it must be inferred that the fusing organs or nuclei have come to differ from each other to some extent; for it is unthinkable that equivalent female organs or cells should be able to fertilize, or to be fertilized by, one another. There are finally those cases in which apparently vegetative cells take part in the sexual act, as in *Phragmidium* (Blackman), where the female organ fuses with an adjacent vegetative cell, and in the fern-prothallium (Farmer), where the nuclei of two vegetative cells fuse. They would seem to indicate that vegetative cells may, in certain circumstances, contain sufficient germ-plasm to act as sexual organs without being differentiated as such.

An interesting question is that of the origin of apogamy. It is no doubt the outcome of sexual degeneration; but this general statement requires some explanation. In certain cases apogamy seems to be the result of the degeneration of the male organ; as in *Humaria*, where there is no male organ, and in *Lachnea*, where the male organ is rudimentary. In others, as in the Uredineae, it is apparently the female organ that has degenerated, losing its receptive part, the trichogyne; the male cells (spermatia) are developed normally, and there is no reason to believe that they might not fertilize the female organ were there the means of penetrating it. In yet other cases the degeneration occurs at a different stage in the life-history, in the development of the spores. In the apogamous ferns investigated, meiosis is suppressed and apogamy results. In the heterosporous plants which have been investigated (*e.g. Marsilia, Eu-Alchemilla*) it has been observed that the microspores are so imperfectly developed as to be incapable of germinating, so that fertilization is impossible; and it is perhaps to this that the occurrence of apogamy is to be attributed. This abnormal development of the spores may be regarded as a variation; and in most cases it occurs in plants that are highly variable and often have a high $2x$ number of chromosomes.

It will be observed that such physiological explanation as can be given of the phenomena of reproduction is based upon the results of the minute investigation of the changes in nuclear structure associated with them. The explanation is often rather suggested than proved, and some fundamental facts still remain altogether unexplained. But it may be anticipated that a method of research which has already so successfully justified itself will not fail in the future to elucidate what still remains obscure.

BIBLIOGRAPHY.—This article should be read in connexion with the following: ALGAE, ANGIOSPERMS, BRYOPHYTA, CYTOLOGY, FUNGI, GYMNOSPERMS, HEREDITY, HYBRIDISM, MENDELISM, PLANTS, PTERIDOPHYTA.

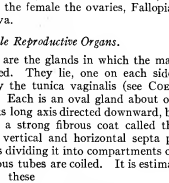
As the bibliographies to these articles include all the publications containing the facts and theories mentioned here, it will suffice to append only a few papers of general importance: Blackman and Fraser. "Further Studies on the Sexuality of the Uredineae," *Ann. Bot.* (1906) vol. xx.; Farmer, "On the Structural Constituents of the Nucleus, and their Relation to the Organization of the Individual" (Croonian Lecture), *Proc. Roy. Soc.* (1907) vol. 79, series B; Farmer and Digby, "Studies in Apospory and Apogamy in Ferns," *Ann. Bot.* (1907) vol. xxi.; Strasburger, *Die stofflichen Grundlagen der Vererbung* (1905); "*Apogamie bei Marsilia*," *Flora* (1907), vol. 97; D. M. Mottier, *Fecundation in Plants* (1904), Carnegie Institution, Washington.

(S. H. V.*)

REPRODUCTIVE SYSTEM, IN ANATOMY.—The reproductive system in some parts of its course shares structures in common with the urinary system (*q.v.*). In this article the following structures will be dealt with. In the male the testes, epididymis, vasa deferentia, vesiculae seminales, prostate, penis and urethra. In the female the ovaries, Fallopian tubes, uterus, vagina and vulva.

Male Reproductive Organs.

The *testes* or *testicles* are the glands in which the male reproductive cells are formed. They lie, one on each side, in the scrotum surrounded by the tunica vaginalis (see COELOM and SEROUS MEMBRANES).* Each is an oval gland about one and a half inches long with its long axis directed downward, backward and inward. There is a strong fibrous coat called the *tunica albuginea*, from which vertical and horizontal septa penetrate into the substance, thus dividing it into compartments or lobules in which the seminiferous tubes are coiled. It is estimated that the total length of these seminiferous tubes in the two glands is little short of a mile. (See fig. 1.)



From A. F. Dixon, Cunningham's *Text-book of Anatomy.*

FIG. 1.—Diagram to illustrate the structure of the testis and epididymis.

c.v.	Coni vasculosi.	*s.t.*	Seminiferous tubule.
g.m.	Globus major.	*v.d.*	Vas deferens.
g.m.	Globus minor.	*v.e.*	Vas efferens.
r.t.	Rete testis.	*t.v.*	Tubuli recti.
t.	Septula testis.		

At the posterior part of the testis the fibrous sheath is greatly thickened to form the *mediastinum testis*, and contains a plexus of tubules called the *rete testis* (see fig. 1), into which the seminiferous tubes open. In this way the secretion of the gland is carried to its upper and back part, whence from fifteen to twenty small tubes (*vasa efferentia*) pass to the epididymis. Each of these is convoluted before opening, and forms what is known as a *conus vasculosus*.

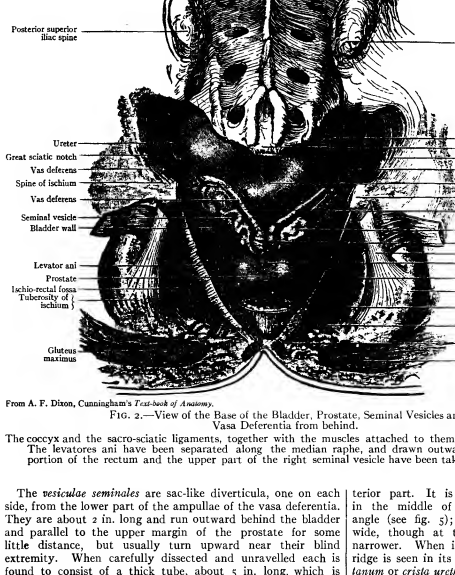
Under the microscope the seminiferous tubules are seen to consist of a basement membrane surrounding several layers of epithelial cells, some of which are constantly being transformed into spermatozoa or male sexual cells.

The *epididymis* (see fig. 1) is a soft body lying behind the testis; it is enlarged above to form the *globus major* or head, while below is a lesser swelling, the *globus minor* or tail. The whole epididymis is made up of a convoluted tube about 20 ft. long, from which one long diverticulum (*vas aberrans*) comes off. Between the globus major and the testis two small vesicles called the *hydatids of Morgagni* are often found.

The *vas deferens* is the continuation of the tube of the epididymis and starts at the globus minor; at first it is convoluted, but soon becomes straight, and runs up on the inner (mesial) side of the epididymis to the external abdominal ring in the abdominal wall. On its way up it is joined by several other structures, to form the *spermatic cord*; these are the artery (spermatic) and veins (*pampiniform plexus*) of the testis, the artery of the vas, the ilio-inguinal, genito-crural and sympathetic nerves, and the testicular lymphatics. After entering the external abdominal ring, these structures pass obliquely through the abdominal wall, lying in the inguinal canal for an inch and a half, until the internal abdominal ring is reached. Here they separate and the vas passes down the side of the pelvis and turns

inward to meet its fellow at the back of the bladder, just above the prostate. The whole length of the vas is 12 to 18 in. and it is remarkable for the great thickness of its muscular walls, which gives it the feeling of a piece of whipcord when rolled between the finger and thumb.

A little above the globus major a few scattered tubules are found in children in front of the cord; these form the rudimentary structure known as the *organ of Giraldès* or *paradidymis*. As the vas deferens approaches the prostate it enlarges and becomes slightly sacculated to act as a reservoir for the secretion of the testis; this part is the *ampulla* (see fig. 2).



From A. F. Dixon, Cunningham's *Text-book of Anatomy*.

FIG. 2.—View of the Base of the Bladder, Prostate, Seminal Vesicles and Vasa Deferentia from behind.

The coccyx and the sacro-sciatic ligaments, together with the muscles attached to them, have been removed. The levatores ani have been separated along the median raphe, and drawn outwards. A considerable portion of the rectum and the upper part of the right seminal vesicle have been taken away.

The *vesiculae seminales* are sac-like diverticula, one on each side, from the lower part of the ampullae of the vasa deferentia. They are about 2 in. long and run outward behind the bladder and parallel to the upper margin of the prostate for some little distance, but usually turn upward near their blind extremity. When carefully dissected and unravelled each is found to consist of a thick tube, about 5 in. long, which is sharply bent upon itself two or three times, and also has several short, sac-like pouches or diverticula. The vesiculae seminales are muscular sacs with a mucous lining which is thrown into a series of delicate net-like folds. The convolutions are held together by the pelvic cellular tissue, and by involuntary muscle continuous with that of the bladder. It is probable that these vesicles are not reservoirs, as was at one time thought, but form some special secretion which mixes with that of the testes. Where the vesiculae join the ampullae of the vasa deferentia the *ejaculatory ducts* are formed; these are narrow and thin-walled, and run, side by side, through the prostate to open into the floor of the prostatic urethra.

The *prostate* is partly a muscular and partly a glandular structure, situated just below the bladder and traversed by the urethra; it is of a somewhat conical form with the base upward in contact with the bladder. Both vertically and transversely it measures about an inch and a quarter, while antero-posteriorly it is only about three-quarters of an inch, though its size is liable to great variation. It is enclosed in a fibrous capsule from which it is separated by the *prostatic plexus of veins* anteriorly. It is often described as formed of three lobes two lateral and a median or posterior, but careful sections and recent research throw doubt on the existence of the last.

Microscopically the prostate consists of masses of long, slender, slightly branching glands, embedded in unstriped muscle and fibrous tissue; these glands open by delicate ducts (about twenty in number) into the prostatic urethra, which will be described later. In the anterior part of the gland are seen bundles of striped muscle fibres, which are of interest when the comparative anatomy of the gland is studied: they are better seen in young than in old prostates.

The *male urethra* begins at the bladder and runs through the prostate and perineum to the penis, which it traverses as far as the tip. It is divided into a prostatic, membranous and spongy part, and is altogether about 8 inches in length. The *prostatic urethra* runs downward through the prostate rather nearer the anterior than the posterior part. It is about an inch and a quarter long, and in the middle of the gland it bends forward forming an angle (see fig. 5); here it is from a third to half an inch wide, though at the base and apex of the prostate it is narrower. When it is slit open from in front a longitudinal ridge is seen in its posterior wall, which is called the *verumontanum* or *crista urethra*, and on each side of this is a longitudinal depression, the *prostatic sinus*, into which numerous ducts of the prostate open, though some of them open on to the antero-lateral surface. Near the lower part of the verumontanum is a little pouch, the *utriculus masculinus*, about one-eighth of an inch deep, the opening of which is guarded by a delicate membranous circular fold, the *male hymen*. Close to the opening of the utriculus the ejaculatory ducts, already mentioned, open into the urethra by very small apertures. The part of the urethra above the openings of these ducts really belongs to the urinary system only, though it is convenient to describe it here. After leaving

the prostate the urethra runs more forward for about three-quarters of an inch, lying between the two layers of the triangular

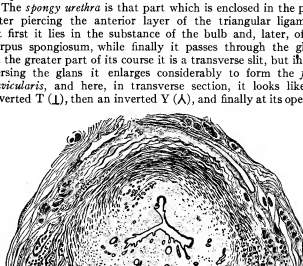
FIG. 3.—Coronal Section through the Pelvis, showing the relations of the bladder above, prostate and bulb below.

ligament, both of which it pierces. This is known as the *membranous urethra*, and is very narrow, being gripped by the compressor urethrae muscle.

The *spongy urethra* is that part which is enclosed in the penis after piercing the anterior layer of the triangular ligament. At first it lies in the substance of the bulb and, later, of the corpus spongiosum, while finally it passes through the glans. In the greater part of its course it is a transverse slit, but in traversing the glans it enlarges considerably to form the *fossa navicularis*, and here, in transverse section, it looks like an inverted T (⊥), then an inverted Y (Λ), and finally at its opening



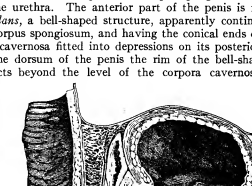
From C. S. Wallace's *Prostatic Enlargement*.

FIG. 4.—Transverse Section of a young Prostate, showing wavy striped muscle in front, urethra in the middle, and the two ejaculatory ducts behind.

(external meatus) a vertical slit. Into the whole length of the urethra mucous glands (*glands of Littré*) open, and in the roof of the fossa navicularis the mouth of one of these is sometimes so large that it may engage the point of a small catheter and is known as the *lacuna magna*. As a rule the meatus is the narrowest part of the whole canal.

Opening into the spongy urethra where it passes through the bulb are the ducts of two small glands known as Cowper's glands, which lie on each side of the membranous urethra and are best seen in childhood.

The *penis* is the intromittent organ of generation, and is made up of three cylinders of erectile tissue, covered by skin and subcutaneous tissue without fat. In a transverse section two of these cylinders (the *corpora cavernosa*) are placed above, side by side, while one, the *corpus spongiosum*, is below. Posteriorly, at what is known as the root of the penis, the two corpora cavernosa diverge, become more and more fibrous in structure, and are attached on each side to the rami of the ischium, while the corpus spongiosum becomes more vascular and enlarges to form the bulb. It has already been pointed out that the whole length of the corpus spongiosum is traversed by the urethra. The anterior part of the penis is formed by the *glans*, a bell-shaped structure, apparently continuous with the corpus spongiosum, and having the conical ends of the corpora cavernosa fitted into depressions on its posterior surface. On the dorsum of the penis the rim of the bell-shaped glans projects beyond the level of the corpora cavernosa, and is



From C. S. Wallace's *Prostatic Enlargement*.

FIG. 5.—Sagittal Median Section of Bladder, Prostate and Rectum, showing one of the ejaculatory ducts.

known as the *corona glandis*. The skin of the penis forms a fold which covers the glans and is known as the *prepuce* or foreskin; when this is drawn back a median fold, the *frenulum praeputii*, is seen running to just below the meatus. After forming the prepuce the skin is reflected over the glans and here looks like mucous membrane. The structure of the corpora cavernosa consists of a strong fibrous coat, the *tunica albuginea*, from the deep surface of which numerous fibrous trabeculae penetrate the interior and divide it into a number of spaces which are lined with endothelium and communicate with the veins. Between the two corpora cavernosa the sheath is not complete and, having a comb-like appearance, is known as the *septum pectinatum*. The structure of the corpus spongiosum and glans resembles that of the corpora cavernosa, but the trabeculae are finer and the network closer.

Female Reproductive Organs.

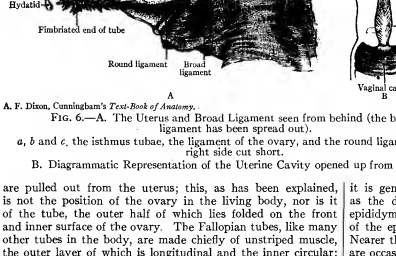
The *ovary* is an organ which in shape and size somewhat resembles a large almond, though its appearance varies considerably in different individuals, and at different times of life. It lies in the side wall of the pelvis with its long axis nearly vertical and having its blunt end (tubal pole) upward. Its more pointed lower end is attached to the uterus by the ligament of the ovary, while its anterior border has a short reflection of peritoneum, known as the *mesovarium*, running forward to the broad ligament of the uterus. It is through this anterior border that the vessels and nerves enter and leave the gland.

Under the microscope the ovary is seen to be covered by a

[1] Figs. 3, 4, 5 and 9 of this article are redrawn from Cuthbert S. Wallace's *Prostatic Enlargement* by permission of the managers of The Oxford Medical Publications.

layer of cubical cells, which are continuous near the anterior border with the cells of the peritoneum. Deep to these is the ovarian stroma, composed of fibrous tissue, and embedded in it are numerous nests of epithelial cells, the *Graafian follicles*, in various stages of development. During the child-bearing period of life some of these will be nearing the ripe condition, and if one such be looked at it will be seen to contain one large cell, the *ovum*, surrounded by a mass of small cells forming the *discus proligerus*. At one point this is continuous with a layer of cells called the *stratum granulosum* which lines the outer wall of the follicle, but elsewhere the two layers are separated by fluid, the *liquor folliculi*. When the follicle bursts, as it does in time, the ovum escapes on to the surface of the ovary.

The *Fallopian tubes* receive the ova and carry them to the uterus. That end of each which lies in front of the ovary is called the fimbriated extremity, and has a number of fringes (*fimbriae*) hanging from it; one of the largest of these is the ovarian fimbria and is attached to the upper or tubal pole of the ovary. The small opening among the fimbriae by which the tube communicates with the peritoneal cavity is known as the *ostium abdominale*, and from this the lumen of the tube runs from four to four and a half inches, until it opens into the cavity of the uterus by an extremely small opening. In the accompanying figure (fig. 6) the Fallopian tube and ovary



A. F. Dixon, Cunningham's *Text-Book of Anatomy*.

FIG. 6.—A. The Uterus and Broad Ligament seen from behind (the broad ligament has been spread out).

are pulled out from the uterus; this, as has been explained, is not the position of the ovary in the living body, nor is it of the tube, the outer half of which lies folded on the front and inner surface of the ovary. The Fallopian tubes, like many other tubes in the body, are made chiefly of unstriped muscle, the outer layer of which is longitudinal and the inner circular; deep to this are the submucous and mucous coats, the latter being lined with ciliated epithelium (see EPITHELIAL TISSUES), and thrown into longitudinal pleats. Superficially the tube is covered by a serous coat of peritoneum. The calibre gradually contracts from the peritoneal to the uterine opening.

The *uterus* or *womb* is a pear-shaped, very thick-walled, muscular bag, lying in the pelvis between the bladder and rectum. In the non-pregnant condition it is about three inches long and two in its broadest part, which is above. The upper half or body of the uterus is somewhat triangular with its base upward, and has an anterior surface which is moderately flat, and a posterior convex. The lower half is the neck or cervix and is cylindrical; it projects into the anterior wall of the vagina, into the cavity of which it opens by the *os uteri externum*. This opening in a uterus which has never been pregnant is a narrow transverse slit, rarely a circular aperture, but in those uteri in which pregnancy has occurred the slit is much wider and its lips are thickened and gaping and often scarred. The interior of the body of the uterus shows a comparatively small triangular cavity (see fig. 6, B), the anterior and posterior walls of which are in contact. The base of the triangle is upward, and at each lateral angle one of the Fallopian tubes opens. The apex leads into the canal of the cervix, but between the two there is a slight constriction known as the *os uteri internum*. The canal of the cervix is about an inch long, and is spindle-shaped when looked at from in front; its anterior and posterior walls are in contact, and its lining mucous membrane is raised into a pattern which, from its likeness to a cypress twig, is called the *arbor vitae*. This arrangement is obliterated after the first pregnancy. On making a mesial vertical section of the uterus the cavity is seen as a mere slit which is bent about its middle to form an angle the opening of which is forward. A normal uterus is therefore bent forward on itself, or anteflexed. In addition to this, its long axis forms a marked angle with that of the vagina, so that the whole uterus is bent forward or anteverted. As a rule, in adults the uterus is more or less on one side of the mesial plane of the body. From each side of the uterus the peritoneum is reflected outward, as a two-layered sheet, to the side wall of the pelvis; this is the *broad ligament*, and between its layers lie several structures of importance. Above, there is the Fallopian tube, already described; below and in front is the round ligament; behind, the ovary projects backward, and just above this, when the broad ligament is stretched out as in fig. 6, are the epoöphoron and paroöphoron with the duct of Gärtner.

The *round ligament* is a cord of unstriped muscle which runs from the lateral angle of its own side of the uterus forward to the internal abdominal ring, and so through the inguinal canal to the upper part of the labium majus.

The *epoöphoron* or *parovarium* is a collection of short tubes which radiate from the upper border of the ovary when the broad ligament is pulled out as in fig. 6. It is best seen in very young children and represents the vasa efferentia in the male. Near the ovary the tubes are closed, but nearer the Fallopian tube they open into another tube which is nearly at right angles to them, and which runs toward the uterus, though in the human subject it is generally lost before reaching that organ. It is known as the duct of Gärtner, and is the homologue of the male epididymis and vas deferens. Some of the outermost tubules of the epoöphoron are sometimes distended to form hydatids. Nearer the uterus than the epoöphoron a few scattered tubules are occasionally found which are looked upon as the homologue of the organ of Giraldès in the male, and are known as the *paroöphoron*.

The *vagina* is a dilatable muscular passage, lined with mucous membrane, which leads from the uterus to the external generative organs; its direction is, from the uterus, downward and forward, and its anterior and posterior walls are in contact, so that in a horizontal section it appears as a transverse slit. As the orifice is neared the slit becomes H-shaped. Owing to the fact that the neck of the uterus enters the vagina from in front, the anterior wall of that tube is only about $2\frac{1}{2}$ in., while the posterior is $3\frac{1}{2}$. The mucous membrane is raised into a series of transverse folds or rugae, and between it and the muscular wall are plexuses of veins forming erectile tissue. The relation of the vagina to the peritoneum is noticed under COELUM and SEROUS MEMBRANES.

The *vulva* or *pudendum* comprises all the female external generative organs, and consists of the mons Veneris, labia majora and minora, clitoris, urethral orifice, hymen, bulbs of the vestibule, and glands of Bartholin. The *mons Veneris* is the

elevation in front of the pubic bones caused by a mass of fibro-fatty tissue; the skin over it is covered by hair in the adult. The *labia majora* are two folds of skin, also containing fibro-fatty tissue and covered on their outer surfaces by hair, running down from the mons Veneris to within an inch of the anus and touching one another by their internal surfaces. They are the homologues of the scrotum in the male. The *labia minora* are two folds of skin containing no fat, which are usually hidden by the labia majora and above enclose the clitoris, they are of a pinkish colour and look like mucous membrane.

The *clitoris* is the representative of the penis, and consists of two corpora cavernosa which posteriorly diverge to form the crura clitoridis, and are attached to the ischium; the organ is about an inch and a half long, and ends anteriorly in a rudimentary glans which is covered by the junction of the labia minora; this junction forms the prepuce of the clitoris.

The *orifice of the urethra* is about an inch below the glans clitoridis and is slightly puckered.

The *hymen* is a fold of mucous membrane which surrounds the orifice of the vagina and is usually only seen in the virgin. As has been pointed out above, it is represented in the male by the fold at the opening of the uterus masculinus. Occasionally the hymen is imperforate and then gives rise to trouble in menstruation.

The *bulbs of the vestibule* are two masses of erectile tissue situated one on each side of the vaginal orifice: above they are continued up to the clitoris; they represent the bulb and the corpus spongiosum of the male, split into two, and the fact that they are so divided accounts for the urethra failing to be enclosed in the clitoris as it is in the penis.

The *glands of Bartholin* are two oval bodies about half an inch long, lying on each side of the vagina close to its opening; they represent Cowper's glands in the male, and their ducts open by minute orifices between the hymen and the labia minora.

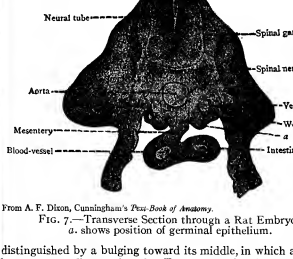
From the above description it will be seen that all the parts of the male external genital organs are represented in the female, though usually in a less developed condition, and that, owing to the orifice of the vagina, they retain their original bi-lateral form.

For further details see Quain's *Anatomy* (London: Longmans, Green & Co.); Gray's *Anatomy* (London: Longmans, Green & Co.); Cunningham's *Text-Book of Anatomy* (Edinburgh: Young J. Pentland), or Macalister's *Anatomy* (London: Griffin & Co.).

Embryology.

The development of the reproductive organs is so closely interwoven with that of the urinary that some reference from this article to that on the URINARY SYSTEM is necessary. It will here be convenient to take up the development at the stage depicted in the accompanying figure (fig. 7), in which the genital ridge (*a*) is seen on each side of the attachment of the mesentery; external to this, and forming another slight ridge of its own, is the Wolffian duct, while a little later the Müllerian duct is formed and lies ventral to the Wolffian. The early history of these ducts is indicated in the article on the URINARY SYSTEM. Until the fifth or sixth week the development of the genital ridge is very much the same in the two sexes, and consists of cords of cells growing from the epithelium-covered surface into the mesenchyme, which forms the interior of the ridge. In these cords are some large germ cells which are distinguishable at a very early stage of development. It must, of course, be understood that the germinal epithelium covering the ridge, and the mesenchyme inside it, are both derived from the mesoderm or middle layer of the embryo. About the fifth week of human embryonic life the tunica albuginea appears in the male, from which septa grow to divide the testis into lobules, while the epithelial cords form the seminiferous tubes, though these do not gain a lumen until just before puberty. From the adjacent mesonephros cords of cells grow into the attached part of the genital ridge, or testis, as it now is, and from these the rete testis is developed. Recent research, however, points to these cords of the rete testis et ovarii as being derived from the coelomic epithelium instead of from the mesonephros.

In the female the same growth of epithelial cords into the mesenchyme of the genital ridge takes place, but each one is



From A. F. Dixon, Cunningham's *Text-Book of Anatomy*.

FIG. 7.—Transverse Section through a Rat Embryo
a. shows position of germinal epithelium.

distinguished by a bulging toward its middle, in which alone the large germ cells are found. Eventually this bulging part is broken up into a series of small portions, each of which contains one germ cell or ovum, and gives rise to a Graafian follicle. Mesonephric cords appear as in the male; they do not enter the ovary, however, but form a transitory network (*rete ovarii*) in the mesovarium. As each genital gland enlarges it remains attached to the rest of the intermediate cell mass by a constricted fold of the coelomic membrane, known as the *mesorchium* in the male, and the *mesovarium* in the female. Lying dorsal to the genital ridge in the intermediate cell mass is the *mesonephros*, consisting

of numerous tubules which open into the Wolffian duct. This at first is an important excretory organ, but during development becomes used for other purposes. In the male, as has been shown, it may form the rete testis, and certainly forms the vasa efferentia and globus major of the epididymis: in addition to these, some of its separate tubes probably account for the vas aberrans and the organ of Giraldès (see fig. 8, E. and O.G.). In the female the tubules of the epoöphoron represent the main part,

while the paroöphoron, like the organ of Giraldès in the male, is probably formed from some separate tubes (see fig. 8, Ep. O. and Par. O.).

The Wolffian duct, which, in the early embryo, carries the excretion of the mesonephros to the cloaca, forms eventually the body and tail of the epididymis, the vas deferens, and ejaculatory duct in the male, the vesicula seminalis being developed as a pouch in its course. In the female this duct is largely done away with, but remains as the collecting tube of the epoöphoron, and in some mammals as the duct of Gärtner, which runs down the side of the vagina to open into the vestibule.

The Müllerian duct, as it approaches the cloaca, joins its fellow of the opposite side, so that there is only one opening into the ventral cloacal wall. In the male the lower part only of it remains as the uterus masculinus (fig. 8, U.M.), but in the female the Fallopian tubes, uterus, and probably the vagina, are all formed from it (fig. 8, F.T. and U.). In both sexes a small hydatid or vesicle is liable to be formed at the beginning of both the Wolffian and Müllerian duct (fig. 8, P.H. and S.H.); in the male these are close together in front of the globus major of the epididymis, and are known as the sessile and pedunculated hydatids of Morgagni. In the female there is a hydatid among the fimbriae of the Fallopian tube which of course is Müllerian and corresponds to the sessile hydatid in the male, while another is often found at the beginning of the collecting tube of the epoöphoron and is probably formed by a blocked mesonephric tubule. This is the pedunculated hydatid of the male. The development of the vagina, as Berry Hart (*Journ. Anat. and Phys.* xxxv. 330) has pointed out, is peculiar. Instead of the two Müllerian ducts joining to form the lumen of its lower third, as they do in the case of the uterus and its upper two-thirds, they become obliterated, and their place is taken by two solid cords of cells, which Hart thinks are derived from the Wolffian ducts and are therefore probably of ectodermal origin, though this is open to doubt. These cords later become canalized and the septum between them is obliterated.

The common chamber, or cloaca, into which the alimentary, urinary and reproductive tubes open in the foetus, has the urinary bladder (the remains of the allantois) opening from its ventral wall (see PLACENTA and URINARY SYSTEM).

During development the alimentary or anal part of the cloaca is separated from the urogenital, and in the article ALIMENTARY SYSTEM the hitherto accepted method of this separation is described. The question has, however, lately been reinvestigated by F. Wood Jones, who says that the anal part is completely shut off from the urogenital and ends in a blind pouch which grows toward the surface and meets a new ectodermal depression, the main point being that the permanent anus is not, according to him, any part of the original cloacal aperture, but a new perforation. This description is certainly more in harmony with the malformations occurring in this region than the old one, and only awaits confirmatory evidence to be generally accepted.

The external generative organs have at first the same appearance in the two sexes, and consist of a swelling, the genital eminence, in the ventral wall of the cloaca. This in the male becomes the penis and in the female the clitoris. Throughout the generative system the male organs depart most from the undifferentiated type, and in the case of the genital eminence two folds grow together and enclose the urogenital passage, thus making the urethra perforate the penis, while in the female these two folds remain separate as the labia minora or nymphae. Sometimes in the male the folds fail to unite completely, and then there is an opening into the urethra on the under surface of the penis—a condition known as hypospadias.

In the undifferentiated condition the integument surrounding the genital opening is raised into a horseshoelike swelling with its convexity over the pubic symphysis and its concavity toward the anus; the lateral parts of this remain separate in the female and form the labia majora, but in the male they unite to form the scrotum. The median part forms the mons Veneris or mons Jovis.

The Descent of the Testis.—It has been shown that the testis is formed in the loin region of the embryo close to the kidney, and it is only in the later months of foetal life that it changes this position for that of the scrotum. In the lower part of the genital ridge a fibro-muscular cord is formed which stretches from the lower part of the testis to the bottom of the scrotum; it is known as the gubernaculum testis, and by its means the testis is directed into the scrotum. Before the testis descends, a pouch of peritoneum called the processus vaginalis passes down in front of the gubernaculum through the opening in the abdominal wall, which afterwards becomes the inguinal canal, into the scrotum, and behind this the testis descends, carrying with it the mesonephros and mesonephric duct. These, as has already been pointed out, form the epididymis and vas deferens. At the sixth month the testis lies opposite the abdominal ring, and at the eighth reaches the bottom of the scrotum and invaginates the processus vaginalis from behind. Soon after birth the communication between that part of the processus vaginalis which now surrounds the testis and the general cavity of the peritoneum disappears, and the part which remains forms the tunica vaginalis. Sometimes the testis fails to pass beyond the inguinal canal, and the term "cryptorchism" is used for such cases.

In the female the ovary undergoes a descent like that of the testis, but it is less marked owing to the fact that the gubernaculum becomes attached to the Müllerian duct where that joins its fellow to form the uterus; hence the ovary does not descend lower than the level of the top of the uterus, and the part of the gubernaculum running between it and the uterus remains as the ligament of the ovary, while the part running from the uterus to the labium is the round ligament. In rare cases the ovary may be drawn into the labium just as the testis is drawn into the scrotum.

Comparative Anatomy.—In the Urochorda, the class to which Salpa, Pyrosoma and the sea squirts (Ascidians) belong, male and female generative glands (*gonads*) are present in the same individual; they are therefore hermaphrodite.

In the Acrania (Amphioxus) there are some twenty-six pairs of gonads arranged segmentally along the side of the pharynx and intestine and bulging into the atrium. Between them and the atrial wall, however, is a rudimentary remnant of the coelom, through which the spermatozoa or ova (for the sexes are distinct) burst into the atrial cavity. There are no genital ducts.

In the Cyclostomata (lampreys and hags) only one median gonad is found, and its contents (spermatozoa or ova) burst into the coelom and then pass through the genital pores into the urogenital sinus and so to the exterior. It is probable that the single gonad is accounted for by the fact that its fellow has been suppressed.

In the Elasmobranchs or cartilaginous fishes there are usually two testes or two ovaries, though in the dogfish one of the latter is suppressed. From each testis, which in fish is popularly known as the soft roe, vas efferentia lead into the mesonephros, and the semen is conducted down the vas deferens or mesonephric duct into the urogenital sinus, into which also the ureters open. Sometimes one or more thin-walled diverticula—the sperm sacs—open close to the aperture of the vas deferens. In the female the ova are large, on account of the quantity of yolk, and they burst into the coelum, from which they pass into the large Müllerian ducts or oviducts. In the oviparous forms, such as the common dogfish (Scyllium), there is an oviducal gland which secretes a horny case for the egg after it is fertilized, and these cases have various shapes in different species. Some of the Elasmobranchs, *e.g.*, the spiny dogfish (Acanthias), are viviparous, and in these the lower part of the oviduct is enlarged and acts as a uterus. In male elasmobranchs the anterior part of the Müllerian duct persists. Paired intromittent organs (claspers) are developed on the pelvic fins of the males; these conduct the semen into the cloaca of the female.

In the teleostean and ganoid fishes (Teleostomi) the nephridial

ducts are not always used as genital ducts, but special coelomic ducts are formed (see COELOM and SEROUS MEMBRANES).

In the Dipnoi or mudfish long coiled Müllerian ducts are present, but the testes either pour their secretion directly into the coelom or, as in Protopterus, have ducts which are probably coelomic in origin.

In both the Teleostomi and Dipnoi the testes and ovaries are paired.

True hermaphroditism is known among fishes, the hag (Myxine) and the sea perch (Serranus) being examples. In many others it occurs as an abnormality.

In the Amphibia both ovaries and testes are symmetrical. In the snakelike forms which are found in the order Gymnophiona the testes are a series of separate lobules extending for a long distance, one behind the other, and joined by a connecting duct from which vasa efferentia pass into the Malpighian capsules of the kidneys, and so the sperm is conducted to the mesonephric duct, which acts both as vas deferens and ureter. The Müllerian ducts or oviducts are long and often coiled in Amphibia, and usually open separately into the cloaca. There is no penis, but in certain forms, especially the Gymnophiona, the cloaca is protrusible in the male and acts as an intromittent organ. Corpora adiposa or fat bodies are present in all Amphibians, and probably nourish the sexual cells during the hibernating period.

In Reptilia two testes and ovaries are developed, though they are often asymmetrical in position. In Lizards the vas deferens and ureter open into the cloaca by a common orifice; as they do in the human embryo. In these animals there are two penes, which can be protruded and retracted through the vent; but in the higher reptiles (Chelonia and Crocodilia) there is a single median penis rising from the ventral wall of the cloaca, composed of erectile tissue and deeply grooved on its dorsal surface for the passage of the sperm.

In birds the right ovary and oviduct degenerates, and the left alone is functional. In the male the ureter and vas deferens open separately into the cloaca, and in the Ratitae (ostriches) and Anseres (ducks and geese) a well-developed penis is present in the male. In the ostrich this is fibrous, and bifurcated at its base, suggesting the crura penis of higher forms.

Among the Mammalia the Monotremata (Ornithorhynchus and Echidna) have bird-like affinities. The left ovary is larger than the right, and the oviducts open separately into the cloaca and do not fuse to form a uterus. The testes retain their abdominal position; and the vasa deferentia open into the base of the penis, which lies in a separate sheath in the ventral wall of the cloaca, and shows an advance on that of the reptiles and birds in that the groove is now converted into a complete tunnel. In the female there is a well-developed clitoris, having the same relations as the penis.

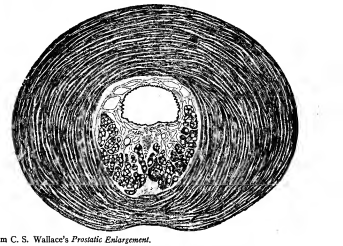
In the marsupials the cloaca is very short, and the vagina and rectum open separately into it. The two uteri open separately and three vaginae are formed, two lateral and one median. The two lateral join together below to form a single median lower vagina, and it is by means of these that the spermatozoa pass up into the oviducts. The upper median vagina at first does not open into the lower one, but during parturition a communication is established which in some animals remains permanent (see J. P. Hill, *Proc. Linn. Soc. N.S. Wales*, 1899 and 1900). This tripartite arrangement of the upper part of the marsupial vagina is of especial interest in connexion with the views of the embryology of the canal detailed by Berry Hart and already referred to.

When, as in marsupials, the two uteri open separately into the vagina by two ora, the arrangement is spoken of as uterus duplex. When the two uteri join below and open by one os externum, it is known as uterus bipartitus. When the uterus bifurcates above and has two horns for the reception of the Fallopian tubes (oviducts), but is otherwise single, the term uterus bicornis is given to it, while the single uterus of man and other Primates is called uterus simplex. From the marsupials upward the ovarian end of the Fallopian tube has the characteristic fimbriated appearance noticed in human anatomy.

In some mammals, such as the sow and the cow, the Wolffian duct is persistent in the female and runs along the side of the vagina as the duct of Gärtner. It is possible that the lateral vaginae of the marsupials are of Wolffian origin.

In marsupials the testes descend into the scrotum, which lies in these animals in front of instead of behind the penis. In some mammals, such as the elephant, they never reach the scrotum at all; while in others, *e.g.* many rodents, they can be drawn up into the abdomen or lowered into the scrotum. The subject of the descent of the testicles has been very fully treated by H. Klaatsche, "Ueber den Descensus testiculorum," *Morph. Jahrb.*, Bd. xvi.

The prostate is met with in its most simple forms in marsupials, in which it is a mere thickening of the mucous membrane of the urethra; in the sheep it forms a bilateral elongated mass of gland tissue lying behind the urethra and surrounded by a well-developed layer of striped muscle. In the sloth it is said to be altogether absent, while in many of the insectivores and rodents it consists of many lobes which usually show a bilateral arrangement. The vesiculae seminales are usually present in the Eutheria or higher mammals, and sometimes, as in the hedgehog, are very large, though they are absent in the Carnivora. Cowper's glands are usually present and functional throughout



From C. S. Wallace's *Prostatic Enlargement.*

FIG. 9.—Transverse Section of Sheep's Prostate.

life. The uterus masculinus is also usually present, but there is grave doubt whether the large organ called by this name in the rabbit should not rather be regarded as homologous with part of the vesiculae seminales. The penis shows many diversities of arrangement; above the marsupials its two crura obtain an attachment to the ischium. In many mammals it is quite hidden by the skin in the flaccid condition, and its external orifice may range from the perineum in the marsupials to the middle of the ventral wall of the abdomen in the ruminants. In the Marsupialia, Rodentia, Chiroptera, Carnivora and some Primates an os penis is developed in connexion with the corpora cavernosa.

The clitoris is present in all mammals; sometimes, as in the female hyena, it is very large, and at others, as in the lemur, it is perforated by the urethra.

For further details and literature, see Oppel's *Lehrbuch der vergleich. mikroskop. Anatomie der Wirbelthiere*, Bd. iv. (Jena, 1904); also Gegenbaur's *Vergleich. Anat. der Wirbelthiere*, and Wiedersheim's *Comparative Anatomy of Vertebrates*, translated by W. N. Parker (London, 1907). (F. G. P.)

REPSOLD, JOHANN GEORG (1771–1830), German instrument maker, was born at Wremen in Hanover on the 23rd of September 1771, and became an engineer and afterwards chief of the fire brigade in Hamburg, where he started business as an instrument maker early in the 19th century. He was killed by the fall of a wall during a fire at Hamburg on the 14th of January 1830. The business was continued by his sons Georg (1804–1884)

and Adolf (1806–1871), and his grandsons Johann Adolf and Oskar Philipp.

J. G. Repsold introduced essential improvements in the meridian circles by substituting microscopes (on Jesse Ramsden's plan) for the verniers to read the circles, and by making the various parts perfectly symmetrical. For a number of years the firm furnished meridian circles to the observatories at Hamburg, Königsberg, Pulkova, &c.; later on its activity declined, while Pistor and Martins of Berlin rose to eminence. But after the discontinuance of this firm that of Repsold again came to the front, not only in the construction of transit circles, but also of equatorial mountings and more especially of heliometers (see MICROMETER).

REPTILES (Lat. *Reptilia*, creeping things, from *reptilis*; *refero*, to creep; Gr. ἕρπειν, whence the term "herpetology," for the science dealing with them). In the days before Linnaeus, writers comprised the animals which popularly are known as tortoises and turtles, crocodiles, lizards and snakes, frogs and toads, newts and salamanders, under the name of oviparous quadrupeds or four-limbed animals which lay eggs. Linnaeus, desirous of giving expression to the extraordinary fact that many of these animals pass part of their life in the water and part on land,[1] substituted the name of Amphibia for the ancient term. Subsequent French naturalists (Lyonnet[2] and Brisson[3]) considered that the creeping mode of locomotion was a more general characteristic of the class than their amphibious habits, and consequently proposed the scarcely more appropriate name of *Reptiles*.

As naturalists gradually comprehended the wide gap existing between frogs, toads, &c., on the one hand, and the other oviparous quadrupeds on the other, they either adopted the name of Batrachia for the former and that of Amphibia for the latter, or they restricted the term Amphibia to Batrachians, calling the remainder of these creatures reptiles. Thus the term Amphibia, as used by various authors, may apply (1) to all the various animals mentioned, or (2) to Batrachians only (see BATRACHIA). The term Reptiles (Reptilia) is used (1) by some for all the animals mentioned above, and (2) by others, as in the present article, for the same assemblage of animals after the exclusion of Batrachians.

Equally varying are the limits of the term Saurians, which occurs so frequently in every scientific treatise on this subject. At first it comprised living crocodiles and lizards only, with which a number of fossil forms were gradually associated. As the characters and affinities of the latter became better known, some of them were withdrawn from the Saurians, and at present it is best to abandon the term altogether.

I. HISTORY OF HERPETOLOGY

Certain kinds of reptiles are mentioned in the earliest written records or have found a place among the fragments of the oldest relics of human art. Such evidences, however, form no part of a succinct review of the literature of the subject such as it is proposed to give here. We distinguish in it six periods: (1) the Aristotelian; (2) the Linnaean (formation of a class Amphibia, in which reptiles and Batrachians are mixed); (3) the period of the elimination of Batrachians as one of the reptilian orders (Brongniart); (4) that of the separation of reptiles and Batrachians as distinct subclasses; (5) that of the recognition of a class Reptilia as part of the Sauropsida (Huxley); (6) that of the discovery of fossil skeletons sufficiently well preserved to reveal, in its general outlines, the past history of the class.

1. *The Aristotelian Period.*—Aristotle was the first to deal with the reptiles known to him as members of a distinct portion of the animal kingdom, and to point out the characteristics by which they resemble each other and differ from other vertebrate and invertebrate animals. The plan of his work, however, was rather that of a comparative treatise of the anatomical and physiological characters of animals than their systematic arrangement and definition, and his ideas about the various groups of reptiles are not distinctly expressed, but must be gleaned from the terms which he employs. Moreover, he paid less attention to the study of reptiles than to that of other classes. This is probably due to the limited number of kinds he could be acquainted with, to which only very few extra-European forms, like the crocodile, were added from other sources. But while we find in some respects a most remarkable accuracy of knowledge, there is sufficient evidence that he neglected everyday opportunities of information. Thus, he has not a single word about the metamorphoses of Batrachians, which he treats of in connexion with reptiles.

Aristotle.

Aristotle makes a clear distinction between the scute or scale of a reptile, which he describes as φολίς, and that of a fish, which he designates as λεπίς. He mentions reptiles (1) as oviparous quadrupeds with scutes, viz. Saurians and Chelonians; (2) as oviparous apodals, viz. Snakes; (3) as oviparous quadrupeds without scutes, viz. Batrachians. He considered the first and second of these three groups as much more nearly related to each other than to the third. Accurate statements and descriptions are sadly mixed with errors and stories of, to our eyes, the most absurd and fabulous kind. The most complete accounts are those of the crocodile (chiefly borrowed from Herodotus) and of the chameleon, which Aristotle evidently knew from personal observation, and had dissected himself. The other lizards mentioned by him are (1) the common lizards (σαῦρα), the common seps (χαλκίς or ζητνίς) and the gecko (ἀσκαλαβώτης or κορδύλος). Of snakes (of which he generally speaks as ὄφεις) he knew the vipers (ἔχεις or ἔχιδνα), the common snake (ὕδρος), and the blindworm (τυφλίνης ὄφις), which he regards as a snake; he further mentions the Egyptian cobra and dragons (δράκων)—North-African serpents of fabulous size. Of Chelonians he describes in a perfectly recognizable manner land tortoises (χελώνη), freshwater turtles (ἐμύς) and marine turtles (χελώνη ἡ θαλαττία).

Passing over eighteen centuries, we find the knowledge of reptiles to have remained as stationary as other branches of natural history, perhaps even more so. The reptile fauna of Europe was not extensive enough to attract the energy of a Belon or Rondelet; popular prejudice and the difficulty of preserving these animals deterred from their study; nor was man sufficiently educated not to give implicit credence to the fabulous tales of reptiles in the 15th and 16th centuries. The art of healing, however, was developing into a science based upon rational principles, and consequently not only those reptiles which formed part of the *materia medica* but also the venomous snakes became objects of study to the physician, though the majority of the writers were ignorant of the structure of the venom-apparatus, and of the distinction between non-venomous and venomous snakes.

Wotton.

Nothing can show more clearly the small advance made by herpetology in this long post-Aristotelian period than a glance at the celebrated work, *De Differentiis Animalium Libri decem* (Paris, 1552), by Edward Wotton (1492–1555). Wotton treats of the reptiles which he designates as *Quadrupedes oviparae et Serpentes* in the sixth book of his work. They form the second division of the *Quadrupedes quae sanguinem habent*, and are subdivided in the following "genera":—

Crocodilus et scincus (cap. cv.); *Testudinum genera* (cvi.); *Ranarum genera* (cvii.); *Lacertae* (cviii.); *Salamandra et seps quadrupes* (cix.); *Stellio* (cx.); *Chamaeleo* (cxi.); *Serpentes* (cxii.), a general account, the following being different kinds of serpents: *Hydrus et alii quidam serpentes aquatiles* (cxiii.); *Serpentes terrestres et primo aspidum genera* (cxiv.); *Vipera, dipsas, cerastes, et hammodytes* (cxv.); *Haemorrhus, sepedon, seps, cenchris, et cenchries* (cxvi.); *Basiliscus et alii quidam serpentes quorum venenum remedio curri* (cxvii.); *Draco, amphisbaena, et alii quidam serpentes quorum morsus minus affert periculi* (cxviii.).

Wotton's work might with propriety be termed "Aristoteles redivivus." The plan is the same, and the observations of the Greek naturalist are faithfully, sometimes literally, reproduced.

[1] "Polymorpha in his amphibiis natura duplicem vitam plerisque concessit."

[2] *Théologie des insectes de Lesser* (Paris, 1745), i. 91, note 5.

[3] *Règne animal divisé en neuf classes* (Paris, 1756).

It is surprising that even the reptiles of his native country were most imperfectly known to the author.

With the enlargement of geographical knowledge that of reptiles was also advanced, as is sufficiently apparent from the large encyclopaedic works of Gesner, Aldrovandi and Johnston. The last-named author especially, who published the various portions of his Natural History in the middle of the 17th century, was able to embody in his compilations notices of numerous reptiles observed by Francisco Hernandez in Mexico and by Marcgrave and Piso in Brazil. As the author had no definite idea of the Ray-Linnaean term "species," it is not possible to give the exact number of reptiles mentioned in his work. But it may be estimated at about fifty, not including some marine fishes and fabulous creatures. He figures (or rather reproduces the figures of) about forty—some species being represented by several figures.

Johnston.

2. *Linnaean Period: Formation of a Class Amphibia.*—Within the century which succeeded these compilatory works (1650–1750) fall the labours which prepared the way for and exerted the greatest influence on Ray and Linnaeus. Although original researches in the field of herpetology were limited in extent and in number, the authors had freed themselves from the purely literary or scholastic tendency. Men were no longer satisfied with reproducing and commenting on the writings of their predecessors; the pen was superseded by the eye, the microscope and the knife, and statements were tested by experiment. This spirit of the age manifested itself, so far as the reptiles are concerned, in Chara's and Redi's admirable observations on the viper, in Major's and Vallisnieri's detailed accounts of the anatomy of the chameleon, in the researches of Jacobaeus into the metamorphoses of the Batrachians and the structure of lizards, in Dufay's history of the development of the salamander (for Batrachians are invariably associated with reptiles proper); in Tyson's description of the anatomy of the rattle-snake, &c. The natural history collections formed by institutions and wealthy individuals now contained not merely skins of crocodiles or serpents stuffed and transformed into a shape to correspond with the fabulous descriptions of the ancient dragons, but, with the discovery of alcohol as a means of preserving animals, reptiles entire or dissected were exhibited for study; and no opportunity was lost of obtaining them from travellers or residents in foreign countries. Fossils also were now acknowledged to be remains of animals which had lived before the Flood, and some of them were recognized as those of reptiles.

Precursors of Linnaeus.

The contributions to a positive knowledge of the animal kingdom became so numerous as to render the need of a methodical arrangement of the abundance of new facts more and more pressing. Of the two principal systematic attempts made in this period the first ranks as one of the most remarkable steps of the progress of natural history, whilst the second can only be designated as a signal failure, which ought to have been a warning to all those who in after years classified animals in what is called an, "artificial system." As the latter attempt, originating with Klein (1685–1750), did not exercise any further influence on herpetology, it will be sufficient to have merely mentioned it. John Ray (1628–1705) had recognized the necessity of introducing exact definitions for the several categories into which the animals had to be divided, and he maintained that these categories ought to be characterized by the structure of animals, and that all zoological knowledge had to start from the "species" as its basis. His definition of reptiles as "animalia sanguinea pulmone respirantia cor unico tantum ventriculo instructum habentia ovipara" fixed the class in a manner which was adopted by the naturalists of the succeeding hundred and fifty years. Nevertheless, Ray was not a herpetologist; his knowledge of reptiles is chiefly derived from the researches of others, from whose accounts, however, everything not based upon reliable demonstration is critically excluded. He begins with a chapter treating of frogs (*Rana*, with two species), toads (*Bufo*, with one species) and tortoises[1] (*Testudo*, with fourteen species). The second group comprises the *Lacertae*, twenty-five in number, and includes the salamander and newts; and the third the *Serpentes*, nine species, among which the limbless lizards are enumerated.

Ray.

Except in so far as he made known and briefly characterized a number of reptiles, our knowledge of this class was not advanced by Linnaeus. That he associated in the 12th edition cartilaginous and other fishes with the reptiles under the name of *Amphibia Nantes* was the result of some misunderstanding of an observation by Garden, and is not to be taken as a premonitory token of the recent discoveries of the relation between Batrachians and fishes. Linnaeus places reptiles, which he calls Amphibia, as the third class of the animal kingdom; he divides the genera thus:—

Linnaeus.

ORDER 1. REPTILES.—*Testudo* (15 species); *Rana* (17 sp.); *Draco* (2 sp.); *Lacerta* (48 sp., including 6 Batrachians).
ORDER 2. SERPENTES.—*Crotalus* (5 species); *Boa* (10 sp.); *Coluber* (96 sp.); *Anguis* (15 sp.); *Amphisbaena* (2 sp.); *Caecilia* (2 sp.).

None of the naturalists who under the direction or influence of Linnaeus visited foreign countries possessed any special knowledge of or predilection for the study of reptiles; all, however, contributed to our acquaintance with tropical forms, or transmitted well-preserved specimens to the collections at home, so that Gmelin, in the 13th edition of the *Systema Naturae*, was able to enumerate three hundred and seventy-one species.

The man who, with the advantage of the Linnaean method, first treated of reptiles monographically, was Laurenti. In a small book[2] he proposed a new division of these animals, of which some ideas and terms have survived into our times, characterizing the orders, genera and species in a much more precise manner than Linnaeus, giving, for his time, excellent descriptions and figures of the species of his native country. Laurenti might have become for herpetology what Artedi was for ichthyology, but his resources were extremely limited.

Laurenti.

The circumstance that Chelonians are entirely omitted from his *Synopsis* seems due rather to the main object with which he engaged in the study of herpetology, viz. that of examining and distinguishing reptiles reputed to be poisonous, and to want of material, than to his conviction that tortoises should be relegated to another class. He divides the class into three orders:—

1. SALIENTIA, with the genera *Pipa, Bufo, Rana, Hyla*, and one species of "*Proteus*," viz. the larva of *Pseudis paradoxa*.
2. GRADIENTIA, the three first genera of which are Tailed Batrachians, viz. two species of *Proteus* (one being the *P. anguinus*), *Triton* and *Salamandra*; followed by true Saurians—*Caudiverbera, Gecko, Chamaeleo, Iguana, Basiliscus, Draco, Cordylus, Crocodilus, Scincus, Stellio, Seps*.
3. SERPENTIA, among which he continues to keep *Amphisbaena, Caecilia* and *Anguis*, but the large Linnaean genus *Coluber* is divided into twelve, chiefly from the scutellation of the head and form of the body.

The work concludes with an account of the experiments made by Laurenti to prove the poisonous or innocuous nature of those reptiles of which he could obtain living specimens.

The next general work on reptiles is by Lacépède. It appeared in the years 1788 and 1790 under the title *Histoire naturelle des quadrupèdes ovipares et des serpens* (Paris, 2 vols. 4to). Although as regards treatment of details and amount of information this work far surpasses the modest attempt of Laurenti, it shows no advance towards a more natural division and arrangement of the genera. The author depends entirely on conspicuous external characters, and classifies the reptiles into (1) oviparous quadrupeds with a tail, (2) oviparous quadrupeds without a tail, (3) oviparous

Lacépède.

[1] In associating tortoises with toads, Ray could not disengage himself from the general popular view as to the nature of these animals, which found expression in the German *Schildkröte* ("Shield-toad").

[2] *Specimen medicum exhibens Synopsin Reptilium emendatam cum experimentis circa venena et antidota Reptilium Austriacorum* (Vienna, 1768, 8vo, pp. 214, with 5 plates).

bipeds (*Chirotes* and *Pseudopus*), (4) serpents,—an arrangement in which the old confusion of Batrachians and reptiles and the imperfect definition of lizards and snakes are continued, and which it is worthy of remark we find also adopted in Cuvier's *Tableau élémentaire de l'histoire naturelle des animaux* (1798), and nearly so by Latreille in his *Histoire naturelle des reptiles* (Paris, 1801, 4 vols. 12 mo). Lacépède's monograph, however, remained for many years deservedly the standard work on reptiles. The numerous plates with which the work is illustrated, are, for the time, well drawn, and the majority readily recognizable.

Brongniart.

3. *The Period of Elimination of Batrachians as one of the Reptilian Orders.*—A new period for herpetology commences with Alex. Brongniart,[1] who in 1799 first recognized the characters by which Batrachians differ from the other reptiles, and by which they form a natural passage to the class of fishes. *Caecilia* (as also *Langaha* and *Acrochordus*) is left by Brongniart with hesitation in the order of snakes, but newts and salamanders henceforth are no more classed with lizards. He leaves the Batrachians, however, in the class of reptiles, as the fourth order. The first order comprises the Chelonians, the second the Saurians (including crocodiles and lizards), the third the Ophidians—terms which have been adopted by all succeeding naturalists. Here, however, Brongniart's merit on the classification of reptiles ends, the definition and disposition of the genera remaining much the same as in the works of his predecessors.

Daudin.

The activity in France in the field of natural science was at this period, in spite of the political disturbances, so great that only a few years after Lacépède's work another, almost identical in scope and of the same extent, appeared, viz. the *Histoire naturelle générale et particulière des reptiles* of F. M. Daudin (Paris, 1802–3, 8 vols. 8vo). Written and illustrated with less care than that by Lacépède, it is of greater importance to the herpetologists of the present day, as it contains a considerable number of generic and specific forms described for the first time. Indeed, at the end of the work, the author states that he has examined more than eleven hundred specimens, belonging to five hundred and seventeen species, all of which he has described from nature. The system adopted is that of Brongniart, the genera are well defined, but ill arranged; it is, however, noteworthy that *Caecilia* takes now its place at the end of the Ophidians, and nearest to the succeeding order of Batrachians.

Duméril, Oppel and Cuvier.

The next step in the development of the herpetological system was the natural arrangement of the genera. This involved a stupendous amount of labour. Although many isolated contributions were made by various workers, this task could be successfully undertaken and completed in the Paris Museum only, in which, besides Seba's and Lacépède's collections, many other herpetological treasures from other museums had been deposited by the victorious generals of the empire, and to which, through Cuvier's reputation, objects from every part of the world were attracted in a voluntary manner. The men who devoted themselves to this task were A. M. C. Duméril, Oppel and Cuvier himself. Oppel was a German who, during his visit to Paris (1807–1808), attended the lectures of Duméril and Cuvier, and at the same time studied the materials to which access was given to him by the latter in the most liberal manner. Duméril [2] maintains that Oppel's ideas and information were entirely derived from his lectures, and that Oppel himself avows this to be the case. The passage,[3] however, to which he refers is somewhat ambiguous, and it is certain that there is the greatest possible difference between the arrangement published by Duméril in 1806 (*Zoologie Analytique*, Paris, 8vo) and that proposed by Oppel in his *Ordnungen, Familien, und Gattungen der Reptilien* (Munich, 1811, 4to). There is no doubt that Oppel profited largely by the teaching of Duméril; but, on the other hand, there is sufficient internal evidence in the works of both authors, not only that Oppel worked independently, but also that Duméril and Cuvier owed much to their younger fellow-labourer, as Cuvier himself indeed acknowledges more than once.

Oppel's classification may be shortly indicated thus:—

Order 1. TESTUDINATA or CHELONIENS.
Fam. 1. Chelonii (gen. *Mydas, Coriacea*).
Fam. 2. Amydae (gen. *Trionyx, Chelys, Testudo, Emys*).
Order 2. SQUAMATA.
Sect. A. Saurii.
Fam. 1. Crocodilini (gen. *Crocodilus, Gavialis, Alligator*).
Fam. 2. Geckoides (gen. *Gecko, Stellio, Agama*).
Fam. 3. Iguanoides (gen. *Camaeleo, Draco, Iguana, Basiliscus, Lophyrus, Anolis*).
Fam. 4. Lacertini (gen. *Tupinambis, Dracaena, Lacerta, Tachydromus*).
Fam. 5. Scincoides (gen. *Scincus, Seps, Scheltopusik, Anguis*).
Fam. 6. Chalcidici (gen. *Chalcides, Bimanus, Bipes, Ophisaurus*).
Sect. B. Ophidii.
Fam. 1. Anguiformes (gen. *Tortrix, Amphisbaena, Typhlops*).
Fam. 2. Constrictores (gen. *Boa, Eryx*).
Fam. 3. Hydri (gen. *Platurus, Hydrophis*).
Fam. 4. Pseudo-viperae (gen. *Acrochordus, Erpeton*).
Fam. 5. Crotalini (gen. *Crotalus, Trigonocephalus*).
Fam. 6. Viperini (gen. *Vipera, Pseudoboa*).
Fam. 7. Colubrini (gen. *Coluber, Bungarus*).
Order 3. NUDA or BATRACII.

In this classification we notice three points, which indicate a decided progress towards a natural system. (1) The four orders proposed by Brongniart are no more considered coordinate in the class, but the Saurians and Ophidians are associated as sections of the same order, a view held by Aristotle but abandoned by all following naturalists. The distinction between lizards and snakes is carried out in so precise a manner that one genus only, *Amphisbaena*, is wrongly placed. (2) The true reptiles have now been entirely divested of all heterogeneous elements by relegating positively *Caecilia* to the Batrachians, a view for which Oppel had been fully prepared by Duméril, who pointed out in 1807 that "les cécilies se rapprochent considerablement des batraciens auxquels elles semblent lier l'ordre entier des serpens."[4] (3) An attempt is made at arranging the genera into families, some of which are still retained at the present day.

In thus giving a well-merited prominence to Oppel's labours we are far from wishing to detract from the influence exercised by the master spirit of this period, Cuvier. Without his guidance Oppel probably never would have found a place among the promoters of herpetological science. But Cuvier's principal researches on reptiles were incidental or formed part of some more general plan; Oppel concentrated his on this class only. Cuvier adopts the four orders of reptiles proposed by Brongniart as equivalent elements of the class, and restores the blindworms and allied lizards and, what is worse, also the Caecilias, to the Ophidians. The chameleons and geckos are placed in separate groups, and the mode of dividing the latter has been retained to the present day. Also a natural division of the snakes, although the foreign elements mentioned are admitted into the order, is sufficiently indicated by his arrangement of the "vrais serpens proprement dits" as (1) non-venomous snakes, (2) venomous snakes with several maxillary teeth, and (3) venomous snakes with isolated poison-fangs. He distinguishes the species of reptiles with a precision not attained in any previous work.

Cuvier's researches into the osteology of reptiles had also the object of discovering the means of understanding the fossil remains which now claimed the attention of French, English and German naturalists. Extinct Chelonian and Crocodilian

[2] *Erpét. génér.*, i. p. 259.
[3] "Wäre es nicht die Ermunterung . . . dieser Freunde gewesen, so würde ich überzeugt von den Mängeln, denen eine solche Arbeit bei aller möglichen Vorsicht doch unterworfen ist, es nie gewagt haben, *meine* Eintheilung bekannt zu machen, obwohl *selbe* Herr Duméril in seinen Lectionen vom Jahre 1809 schon vorgetragen, und die Thiere im Cabinet darnach bezeichnet hat" (preface, p. viii). A few lines further on he emphatically declares that the classification is based upon his own researches.
[4] *Memoires de zoologie et d'anatomie comparée* (Paris, 1807, 8vo), p. 45.

remains, *Pterodactylus*, *Mosasaurus*, *Iguanodon*, *Ichthyosaurus*, *Teleosaurus*, became the subjects of Cuvier's classical treatises, which form the contents of the 5th volume (part 2) of his *Recherches sur les ossemens fossiles, où l'on rétablit les caractères des plusieurs animaux dont les révolutions du globe ont détruit les espèces* (new ed., Paris, 1824, 4to).

All the succeeding herpetologists adopted either Oppel's or Cuvier's view as to the number of orders of reptiles, or as to the position Batrachians ought to take in their relation to reptiles proper, with the single exception of D. DE BLAINVILLE. He divided the "oviparous subtype" of Vertebrates into four classes, Birds, Reptiles, Amphibians and Fishes,[1] a modification of the system which is all the more significant as he designates the reptiles "*Squamifères Ornithoides, Scailleux*," and the amphibians "*Nudipellifères, Ichthyoides nus*." In these terms we perceive clear indications of the relations which exist to the class of birds on the one hand, and to that of fishes on the other; but, unfortunately, Blainville himself did not follow up the ideas thus expressed, and abandoned even the terms in a later edition of his systematic tables. *Blainville.*

The direct or indirect influence of the work of French anatomists manifested itself in the systems of the other herpetologists of this period. The Crocodiles, especially, which hitherto (strange to say, even in Cuvier's classification) had been placed as one of the families of Saurians, now commence to be separated from them. MERREM (*Versuch eines Systems der Amphibien*, Marburg, 1820, 8vo) distinguishes two classes of "Amphibians," Pholidota and Batrachia. *Merrem.*

The Pholidota (or Reptiles) are divided into three orders, distinguished chiefly by osteological and splanchnological characters:—

1. TESTUDINATA.
2. LORICATA (=Crocodiles).
3. SQUAMATA (=Oppel's *Squamata*, excluding Crocodiles).

Merrem's subdivision of the *Squamata* into (1) *Gradientia* (=limbed *Lacertilia*), (2) *Repentia* (=limbless *Lacertilia*), (3) *Serpentia* (=Snakes and *Amphisbaena*), (4) *Incedentia* (=*Chirotes*), and (5) *Predentia* (=Chamaeleons) was based chiefly on the modifications of the limbs, and not adopted by his successors. The greater part of his work is occupied with a synopsis of all the species of Reptiles known, each being shortly characterized by a diagnosis; but, as only a small proportion (about one hundred and seventy) were known to him from autopsy, this synopsis has all the faults of a compilation.

LATREILLE, who commenced the study of reptiles as early as 1801, had kept pace with the progress of science when he published, in 1825, his *Familles naturelles du règne animal* (Paris, 1825, 8vo). He separated the Batrachians as a *class* from the Reptiles, and the latter he divides into two sections only, Cataphracta and Squamosa—in the former Crocodiles being associated with the Chelonians. He bases this view on the development of a carapace in both, on the structure of the feet, on the fixed quadrate bone, on the single organ of copulation. None of the succeeding herpetologists adopted a combination founded on such important chaacters except J. E. GRAY, who, however, destroyed Latreille's idea of Cataphracta by adding the Amphisbaenians[2] as a third order. *Latreille.* *Gray.*

A mass of new materials now began to accumulate from all parts of the world in European museums. Among others, Spix had brought from Brazil a rich spoil to the Munich Museum, and the Bavarian Academy charged JOH. WAGLER to prepare a general system of reptiles and batrachians. His work,[3] the result of ten years' labour, is a simple but lasting monument to a young naturalist,[4] who, endowed with an ardent imagination, only too frequently misinterpreted the evidence of facts, or forced it into the service of preconceived ideas. Cuvier had drawn attention to certain resemblances in some parts of the osseous structure of *Ichthyosaurus* and *Pterodactylus* to dolphins, birds, crocodiles, &c. Wagler, seizing upon such analogical resemblances, separated those extinct Saurians from the class of Reptiles, and formed of them and the Monotremes a distinct class of Vertebrates, intermediate between mammals and birds, which he called Gryphi. We must admit that he made free use of his imagination by defining his class of Gryphi as "vertebrates with lungs lying free in the pectoral cavity; oviparous development of the embryo (within or) without the parent; the young fed (or suckled?) by the parents." By the last character this Waglerian class is distinguished from the reptiles. *Wagler.*

Reptiles (in which Wagler includes Batrachians) are divided into eight orders: Testudines, Crocodili, Lacertae, Serpentes, Angues, Caeciliae, Ranae and Ichthyoli. He has great merit in having employed, for the subdivision of the families of lizards, the structure of the tongue and the mode of insertion of the teeth in the jaws. On the other hand, Wagler entirely failed in arranging snakes in natural families, venomous and non-venomous types being mixed in the majority of his groups.

L. FITZINGER was Wagler's contemporary; his first work[5] preceded Wagler's system by four years. As he says in the preface, his object was to arrange the reptiles in "a natural system." Unfortunately, in order to attain this object, Fitzinger paid regard to the most superficial points of resemblance; and in the *tabula affinitatum generum* which he constructed to demonstrate "the progress of nature" he has done much more successful in placing closely allied genera forms in contiguity than in tracing the relationships of the higher groups. That table is prepared in the form of a genealogical tree, but Fitzinger wished to express thereby merely the amount of morphological resemblance, and there is no evidence whatever in the text that he had a clear idea of genetic affinity. The Batrachians are placed at the bottom of the scheme, leading through Hyla to the Geckos (clearly on account of the digital dilatations) and through Caecilia to Amphisbaena. At the top Draco leads through Pterodactylus to the Bats (Pteropus), Ichthyosaurus to the Cetaceans (Delphinus), Emys to the Monotremes, Testudo to Manis, and the Marine Turtles to the Divers and Penguins. *Fitzinger.*

In Fitzinger's system the higher groups are, in fact, identical with those proposed by Merrem, while greater originality is shown in the subdivision of the orders. He differed also widely from Wagler in his views as to the relations of the extinct forms. The order of Loricata consists of two families, the Ichthyosauroidea and Crocodiloidea, the former comprising Iguanodon, Plesiosaurus, Sauropelalus and Ichthyosaurus. In the order Squamata Lacertilians and Ophidians are combined and divided into twenty-two families, almost all based on the most conspicuous external characters: the first two, viz. the Geckos and Chameleons, are natural enough, but in the three following Iguanoids and Agamoids are sadly mixed, Pterodactyles and Draco forming one family; Megalosaurus, Mosasaurus, Varanus, Tejus, &c., are associated in another named Ameivoidea; the Amphisbaenidae are correctly defined; the Colubroidea are a heterogeneous assemblage of thirty genera; but with his family of Bungaroidea Fitzinger makes an attempt to separate at least a part of the venomous Colubrine Snakes from the Viperines, which again are differentiated from the last family, that of Crotaloidea.

If this little work had been his only performance in the field of herpetology his name would have been honourably mentioned among his fellow-workers. But the promise of his early labours was not justified by his later work, and if we take notice of the latter here it is only because his name has become attached to many a reptile through the pedantic rules of zoological nomenclature. The labours of Wiegmann, Müller, Duméril and Bibron exercised no influence on him, and when he commenced to publish a new system of reptiles in 1843,[6] of which fortunately one fasciculus only appeared, he exhibited a classification in which morphological facts are entirely superseded by fanciful ideas of the vaguest kind of physiosophy, each class of vertebrates being divided

into five "sense" series, and each series into three orders, one comprising forms of superior, the second of medium and the third of inferior development. In the generic arrangement of the species, to which Fitzinger devoted himself especially in this work, he equally failed to advance science.

We have now arrived at a period distinguished by the appearance of a work which superseded all its predecessors, which formed the basis for the labours of many succeeding years, and which will always remain one of the classical monuments of descriptive zoology—the *Erpétologie générale ou histoire naturelle complète des reptiles* of A. M. C. Duméril and G. Bibron (Paris, 8vo). The first volume appeared in 1834, and the ninth and last in 1854. No naturalist of that time could have been better qualified for the tremendous undertaking than C. Duméril, who almost from the first year of half a century's connexion with the then largest collection of Reptilia had chiefly devoted himself to their study. The task would have been too great for the energy of a single man; it was, therefore, fortunate for Duméril that he found a most devoted fellow-labourer in one of his assistants, G. Bibron, whose abilities equalled those of the master, but who, to the great loss of science, died (in 1848) before the completion of the work. Duméril had the full benefit of Bibron's knowledge for the volumes containing the Snakes, but the last volume, which treats of the Tailed Batrachians, had to be prepared by Duméril alone.

Duméril and Bibron.

The work is the first which gives a comprehensive scientific account of reptiles generally, their structure, physiology and literature, and again each of the four orders admitted by the authors is introduced by a similar general account. In the body of the work 121 Chelonians, 468 Saurians, 586 Ophidians and 218 Batrachians are described in detail and with the greatest precision. Singularly enough, the authors revert to Brongniart's arrangement, in which the Batrachians are co-ordinate with the other three orders of reptiles. This must appear all the more strange as Von Baer[1] in 1828, and J. Müller[2] in 1831, had urged, besides other essential differences, the important fact that no Batrachian embryo possesses either an amnion or an allantois, like a reptile.

4. *Period of the Separation of Reptiles and Batrachians as Distinct Classes or Subclasses.*—In the chronological order which we have adopted for these historical notes, we had to refer in their proper places to two herpetologists, Blainville and Latreille, who advocated a deeper than merely ordinal separation of Reptiles from Batrachians, and who were followed by F. S. Leuckart. But this view only now began to find more general acceptance. J. Müller and Stannius were guided in their classification entirely by anatomical characters, and consequently recognized the wide gap which separates the Batrachians from the Reptiles; yet they considered them merely as subclasses of the class Amphibia. The former directed his attention particularly to those forms which seemed to occupy an intermediate position between Lacertilians and Ophidians, and definitely relegated Anguis, Pseudopus, Acontias to the former, and Typhlops, Rhinophis, Tortrix, but also the Amphisbaenoids to the latter. Stannius interpreted the characteristics of the Amphisbaenoids differently, as will be seen from the following abstract of his classification:[3]—

J. Müller and Stannius.

Subclassis: **AMPHIBIA MONOPNOA** (Leuckart).

Sect. 1. *STREPTOSTYLICA* (Stann.). Quadrate bone articulated to the skull; copulatory organs paired, placed outside the cloacal cavity.

Ordo 1. OPHIDIA.

Subordo 1. Eurystomata or Macrostomata (Müll.). The facial bones are loosely connected to admit of great extension of the wide mouth.

Subordo 2. Angiostomata or Microstomata (Müll.). Mouth narrow, not extensile; quadrate bone attached to the skull and not to a mastoid.

Ordo 2. SAURIA.

Subordo 1. Amphisbaenoidea.

Subordo 2. Kionocrania (Stann.) = Lizards.

Subordo 3. Chamaeleonidea.

Sect. 2. *MONIMOSTYLICA* (Stann.). Quadrate bone suturally united with the skull; copulatory organ simple, placed within the cloaca.

Ordo 1. CHELONIA.

Ordo 2. CROCODILIA.

This classification received the addition of a fifth Reptilian order which with many Lacertilian characters combined important Crocodilian affinities, and in certain other respects differed from both, viz. the New Zealand Hatteria, which by its first describers had been placed to the Agamoid Lizards. A. Günther,[4] who pointed out the characteristics of this reptile, considered it to be co-ordinate with the other four orders of reptiles, and characterizes it thus:—

Rhynchocephalia.—Quadrate bone suturally and immovably united with the skull and pterygoid; columella present. Rami of the mandible united as in Lacertilians. Temporal region with two horizontal bars. Vertebrae amphicoelian. Copulatory organs, none.

5. *Period of the Recognition of a Class of Reptilia as Part of the Sauropsida.*—Although so far the discovery of every new morphological and developmental fact had prepared naturalists for a class separation of Reptiles and Batrachians, it was left to T. H. Huxley to demonstrate, not merely that the weight of facts demanded such a class separation, but that the reptiles hold the same relation to birds as the fishes to Batrachians. In his *Hunterian Lectures* (1863) he divided the vertebrates into Mammals, Sauroids and Ichthyoids, subsequently substituting for the last two the terms Sauropsida and Ichthyopsida.[5] The Sauropsida contain the two classes of birds and reptiles, the Ichthyopsida those of Batrachians and fishes.

6. *Period of the Consideration of Skeletons of Extinct Reptiles.*—Sir R. Owen, while fully appreciating the value of the osteological characters on which Huxley based his division, yet admitted into his consideration those taken from the organs of circulation and respiration, and reverted to Latreille's division of warm- and cold-blooded (haematothermal and haematocryal) vertebrates, thus approximating the Batrachians to reptiles, and separating them from birds.[6] The reptiles (or Monopnoa, Leuck.) thus form the highest of the five subclasses into which, after several previous classifications, Owen[7] finally divided the Haematocrya. His division of this subclass, however, into nine orders, makes a considerable step in the progress of herpetology, since it takes into consideration for the first time the many extinct groups whose skeletons are found fossil. He shows that the number of living reptilian types bears but a small proportion to that of extinct forms, and therefore that a systematic arrangement of the entire class must be based chiefly upon osteological characters. His nine orders are the following:

Owen.

a. Ichthyopterygia (extinct)—*Ichthyosaurus.*
b. Sauropterygia (extinct)—*Plesiosaurus, Pliosaurus, Nothosaurus, Placodus.*
c. Anomodontia (extinct)—*Dicynodon, Rhynchosaurus, Oudenodon.*
d. Chelonia.
e. Lacertilia (with the extinct *Mosasaurus*).
f. Ophidia.
g. Crocodilia (with the extinct *Teleosaurus* and *Streptospondylus*).
h. Dinosauria (extinct)—*Iguanodon, Scelidosaurus* and *Megalosaurus.*
i. Pterosauria (extinct)—*Dimorphodon, Rhamphorhynchus* and *Pterodactylus.*

Owen was followed by Huxley and E. D. Cope, who, however, restricted still more the selection of classificatory characters by relying for the purposes of arrangement on a few parts of the

skeleton only. They attempted a further grouping of the orders which in Owen's system were merely serially enumerated as cosubordinate groups. HUXLEY used for this purpose almost exclusively the position and character of the rib-articulations to the vertebral centra, the orders themselves being the same as in Owen's system:— *Huxley.*

A. *PLEUROSPONDYLIA*. Dorsal vertebrae devoid of transverse processes and not movable upon one another, nor are the ribs movable upon the vertebrae. A plastron. Order 1, CHELONIA.

B. The dorsal vertebrae (which have either complete or rudimentary transverse processes) are movable upon one another, and the ribs upon them. No plastron.

a. The dorsal vertebrae have transverse processes which are either entire or very imperfectly divided into terminal facets (*EPETOSPONDYLIA*).

α. Transverse processes long; limbs well developed, paddles; sternum and sternal ribs absent or rudimentary. Order 2, PLESIOSAURIA (= *Sauropterygia*, Ow.).

β. Transverse processes short.

aa. A pectoral arch and urinary bladder. Order 3, LACERTILIA.

bb. No pectoral arch and no urinary bladder. Order 4, OPHIDIA.

b. The dorsal vertebrae have double tubercles in place of transverse processes (*PERONOSPONDYLIA*). Limbs paddle-shaped. Order 5, ICHTHYOSAURIA (= *Ichthyopterygia*, Ow.).

c. The anterior dorsal vertebrae have elongated and divided transverse processes, the tubercular being longer than the capitular division (*OPISTHOCOELIA*).

α. Only two vertebrae in the sacrum. Order 6, CROCODILIA.

β. More than two vertebrae in the sacrum.

aa. Manus without a prolonged ulnar digit.

αα. Hind limb Saurian. Order 7, DICYNODONTIA (= *Anomodontia*, Ow.).

ββ. Hind limb Ornithic. Order 8, ORNITHOSCELIDA (= *Dinosauria*, Ow.).

bb. Manus with an extremely long ulnar digit. Order 9, PTEROSAURIA.

COPE,[1] by combining the modifications of the quadrate and supporting bones with the characters used by Huxley, further developed Owen's classification, separating the *Pythonomorpha* and *Rhynchocephalia* as distinct orders from the Lacertilia. He eventually[2] elaborated the following classification, based entirely on osteological characters: *Cope.*

I. The quadrate bone immovably fixed to the adjacent elements by suture.

A. Scapular arch external to ribs; temporal region with a complex bony roof; no longitudinal postorbital bars.

A. A tabular and supramastoid bones and a presternum; limbs ambulatory; vertebrae amphicoelous. Order 1, COTYLOSAURIA.

AA. Scapular arch internal to ribs; temporal region with complex roof and no longitudinal bars.

A. presternum; limbs ambulatory. Order 2, CHELYDOSAURIA.

AAA. Scapular arch internal to ribs; sternum extending below coracoids and pelvis; one postorbital bar.

No supramastoid; a paroccipital; clavicle not articulating with scapula. Order 3, TESTUDINATA.

AAAA. Scapular arch external to ribs; one longitudinal postorbital bar (*Symposaurida*).

A supramastoid and paroccipital bones; ribs two-headed on centrum; carpals and tarsals not distinct in form from metapodials; vertebrae amphicoelous. Order 4, ICHTHYOPTERYGIA.

A supramastoid; paroccipital not distinct; a postorbitosquamosal arch; ribs two-headed; a clavicle; obturator foramen small or none; vertebrae amphicoelous. Order 5, THEROMORA.

No supramastoid; paroccipital not distinct; a quadratojugal arch; scapula triradiate; no clavicle; ribs one-headed. Order 6, PLESIOSAURIA.

[A] AAAA. Scapular arch external to ribs; two longitudinal postorbital bars (paroccipital arch distinct) (*Archosauria*).

a. A supramastoid bone.

Ribs two-headed; a clavicle and interclavicle; acetabulum closed; no obturator foramen; ambulatory; vertebrae amphicoelous. Order 7, PELYCOSAURIA.

aa. No supramastoid.

Ribs two-headed; interclavicle not distinct; external digits greatly elongated to support a patagium for flight. Order 8, ORNITHOSAURIA.

Ribs two-headed; no interclavicle; acetabulum open; ambulatory. Order 9, DINOSAURIA.

Ribs two-headed; an interclavicle; acetabulum closed; ambulatory. Order 10, LORICATA.

Ribs one-headed; an interclavicle; acetabulum closed, a large obturator foramen; ambulatory. Order 11, RHYNCHOCEPHALIA.

II. The quadrate bone loosely articulated to the cranium and at the proximal end only (*Streptostylica*).

No distinct supramastoid, nor oplsthotic; one or no postorbital bar; scapular arch, when present, external to ribs; ribs one-headed. Order 12, SQUAMATA.

While this classification was being considered and prepared, both Cope and G. Baur made a special study of the bones which surround the quadrate and arch over the biting muscles in the various groups of reptiles. This led to a series of discussions which ended in the idea, that the class could be most naturally divided into two great subclasses, the one culminating in tortoises and mammals, the other in crocodiles, lizards, snakes and birds. Professor H. F. OSBORN in 1903[3] therefore proposed the following classification:— *Osborn.*

Subclass SYNAPSIDA. Primarily with single or undivided temporal arches. Giving rise to the mammals through some unknown member of the *Anomodontia*.

Orders *Cyclosauria*, *Anomodontia*, *Testudinata* and *Sauropterygia*.

Subclass DIAPSIDA. Primarily with double or divided temporal arches. Giving rise to the birds through some unknown type transitional between *Protorosauria* and *Dinosauria*.

Orders *Phytosauria* (= *Proterosauria*, *Palycosauria* and *Rhynchocephalia*), *Phytosauria* (= *Belodon*, &c.), *Ichihyosauria*, *Crocodilia*, *Dinosauria*, *Squamata* and *Pterosauria*.

The most exhaustive and modern general work on reptiles is by Dr C. K. HOFFMANN in Bronn's *Klassen und Ordnungen des Thierreichs* (1879–90). A most useful and less technical treatise is the volume on Amphibia and Reptiles contributed by Dr H. Gadow to the *Cambridge Natural History* (London, 1902). *Hoffmann.*

(A. C. G.; A. S. Wo.)

II. GENERAL CHARACTERS OF THE CLASS REPTILIA

Reptiles, as known in the existing world, are the modified, and in many respects degenerate, representatives of a group of lung-breathing vertebrate animals which attained its maximum development in the Mesozoic period. So far as can be judged from the skeleton, some of the members of this group then living might have become mammals by very slight change, while others might as readily have evolved into birds. It is therefore probable that the class Reptilia, as now understood, comprises the direct ancestors both of the Mammalia and Aves. Assuming that its extinct members, which are known only by skeletons, were organized essentially like its existing representatives, the class ranks higher than that of the lowest five-toed vertebrates (class Batrachia) in the investment of the foetus by two membranous envelopes (the amnion and allantois), and in the total absence of gills even in the earliest embryos. It ranks below both the Mammalia and Aves in the partial mixture of the arterial blood with the venous blood as it leaves the heart, thus causing the organism to be cold-blooded; it also differs both from Mammalia and Aves in retaining a pair of aortic arches, of which only the left remains in the former, while the right one is retained in the latter. No feature in the endoskeleton is absolutely distinctive, except possibly the degeneration of the parasphenoid bone, which separates the Reptilia from the Amphibia. In the exoskeleton, however, the epidermis forms horny scales, such as never occur in Amphibia, while there are no traces of any structures resembling either hairs or feathers, which respectively characterize Mammalia and Aves.

There is little doubt that true reptiles date back to the latter part of the Palaeozoic period, but at that epoch the Amphibia approached them so closely in the characters of the skeleton that it is difficult to distinguish the members of the two classes among the fossils. Some of the Palaeozoic Amphibia—a few of the so-called Labyrinthodonts—are proved to have had well-developed gill-arches in their immature state, while there are conspicuous marks of slime-canals on their skulls. Others are

[1] *Proc. Amer. Assoc. for the Advancement of Science*, 10th meeting (Cambridge, 1871, 8vo), pp. 230 sq.; *Amer. Naturalist* (1889), vol. xxiii. p. 863.

[2] *Syllabus of Lectures on the Vertebrata* (Philadelphia, 1898, 8vo), p. 54.

[3] *Mem. American Mus. Nat. Hist.* (November 1903), vol. i. art. viii.

merely regarded as Amphibia because they closely resemble the genera which are proved to have been gill-breathers when immature. All these genera, however, so far as known, agree with the existing Amphibia in the production of their large parasphenoid bone as far forwards as the vomers to form a rigid and complete basicranial axis (fig. 1, A). Those genera

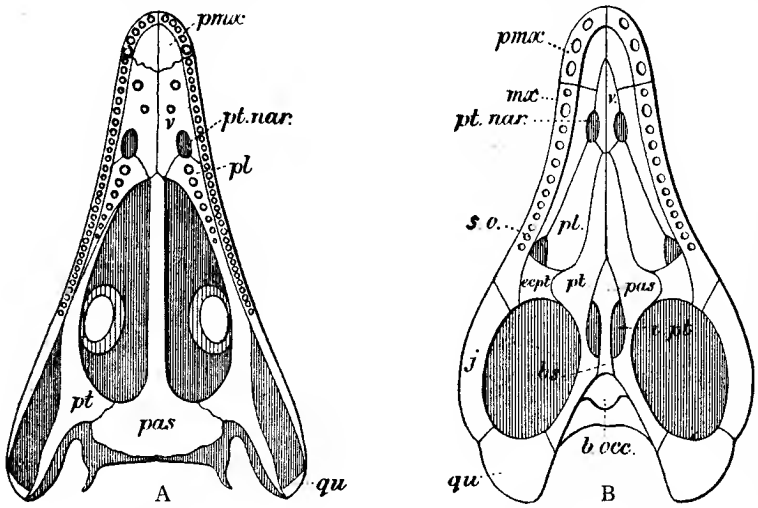

FIG. 1.—A, Palate of Palaeozoic Amphibian (*Archegosaurus decheni*). B, Palate of Mesozoic Reptile (*Plesiosaurus macrocephalus*).
b.occ, basioccipital; *bs*, basisphenoid; *eept*, ectopterygoid; *i.pt*, interpterygoid vacuity; *j*, jugal; *mx*, maxilla; *pas*, parasphenoid; *pl*, palatine; *pmx*, premaxilla; *pt*, pterygoid; *pt. nar*, posterior nares; *qu*, quadrate; *s.o*, suborbital vacuity; *v*, vomer.

which less resemble the typical Labyrinthodonts are characterized by the reduction of the parasphenoid bone so that it no longer reaches the vomers; in these animals the weakened skull exhibits a secondary basicranial axis formed by the approximation of the pterygoids to the median line (fig. 1, B). The latter condition is universal in existing reptiles, and may therefore perhaps be regarded as a diagnostic feature. If so, the oldest known undoubted reptile is *Palaeohatteria*, from the Lower Permian of Saxony.

In the structure of the skull *Palaeohatteria* is much like the existing *Sphenodon*, the cheek-plates which cover the temporal and masseter muscles on each side being pierced by two great vacuities, one superior-temporal, the other lateral-temporal. The majority of the earliest reptiles, however, either resemble the Labyrinthodonts in having the biting muscles completely covered with a roof of bony plates, or exhibit a slight shrinkage of this investment so that a superior-temporal vacuity appears. As the various groups or orders become differentiated, this shrinkage or reduction continues, while the shape of the ossifying ear-capsule changes, and the squamosal bone, which covers the organ of hearing in the fishes, and presumably also in the Palaeozoic Batrachia, is gradually thrust outwards from all connexion with this capsule except at its hinder angle. The resultant modifications are diagrammatically represented in fig 2. In one series of orders, comprising the Anomodontia, Chelonia, Sauropterygia and Ichthyopterygia (fig. 2, B, C), the superior-temporal vacuity (*s*) first appears, and the cheek-plates in the broad temporal arch thus formed may be variously fused together, sometimes even irregularly perforated—showing at first, indeed, the usual inconstancy of a new and not completely established feature. From the earliest members of this series of reptiles, palaeontology seems to demonstrate that the Mammalia (with one robust temporal arcade or zygomatic arch) arose. In a second series, comprising the orders Rhynchocephalia, Dinosauria, Crocodilia and Ornithosauria (fig. 2, D), the broad arch of cheek-plates is regularly pierced by a lateral-temporal vacuity, which leaves a narrow bar above, another narrow bar below, and uncovers the middle part of the quadrate bone. By the constant loss of the lower, and the frequent loss of the upper, bar, some members of this series eventually pass into the order Squamata (Lacertilia+Ophidia), in which the quadrate bone is completely exposed and loosely attached to the skull (fig. 2, E); other reptiles exhibiting a similar modification may readily have acquired the typical Avian skull (fig. 2, F) by the loss of the upper and the retention of the lower temporal bar in question.

In view of these and other palaeontological considerations, the Reptilia may be classified into orders as follows:—

ORDERS OF CLASS REPTILIA

1. **Anomodontia.**—Bones of postero-lateral region of skull forming a complete roof over the temporal and masseter muscles, or contracted into a single broad zygomatic arch, leaving a superior-temporal vacuity. Pineal foramen present. Ribs completely or imperfectly double-headed. No abdominal ribs. A large separately ossified epicoracoid. Limbs for support as well as progression; third and fourth digits with not more than three phalanges. Dermal armour feeble or absent. *Range.*—Permian and Triassic.

2. **Chelonia.**—Postero-lateral region of skull as in Anomodontia, except bones of ear-capsule more modified. No pineal foramen. Ribs single-headed. No sternum. Pectoral and pelvic arches unique in being situated completely inside the ribs. No epicoracoid. Abdominal ribs replaced by three or four pairs of large plates, which, with the clavicles and interclavicle, form a plastron. Limbs only for progression; third and fourth digits with not more than three phalanges. A regular dorsal carapace of bony plates intimately connected with the neural spines, and ribs of seven to nine dorsal vertebrae. *Range.*—Upper Triassic to Recent.

3. **Sauropterygia.**—Bones of postero-lateral region of skull contracted into a single broad zygomatic arch, leaving a superior-temporal vacuity. Pineal foramen present. No fused sacral vertebrae. All dorsal ribs single-headed, articulating with transverse processes of the neural arches. Abdominal ribs forming dense plastron. Apparently no sternum. Coracoid, pubis and ischium in form of much-expanded plates. Limbs modified as paddles, with not more than five digits, of which the third and fourth always have more than three phalanges; all digits usually consisting of numerous phalanges. No dermal armour. *Range.*—Upper Triassic to Cretaceous.

4. **Ichthyopterygia.**—Bones of postero-lateral region of skull contracted into a single broad zygomatic arch, leaving a superior-temporal vacuity. Pineal foramen present. Vertebral centra short and deeply biconcave, with feeble neural arches which are almost or completely destitute of zygapophyses. No fused sacral vertebrae. Cervical and dorsal ribs double-headed, articulating with tubercles on the vertebral centra. Abdominal ribs forming dense plastron. Apparently no sternum. Coracoid an expanded plate, probably with cartilaginous epicoracoid. Pelvis very small, not connected with vertebrae. Limbs modified as paddles, with digits of very numerous short phalanges, which are closely pressed together, sometimes with supplementary rows of similar ossicles. No dermal armour. A vertical triangular caudal fin, not supported by skeletal rays. *Range.*—Triassic to Cretaceous.

5. **Rhynchocephalia.**—Bones of postero-lateral region of skull contracted into two slender zygomatic bars, leaving a superior-temporal and a lateral-temporal vacuity, and partly exposing the quadrate bone from the side. Pineal foramen present or absent. Ribs single-headed. Abdominal ribs present. Sternum present. Epicoracoid cartilaginous. Limbs only for progression; third and fourth digits with four or five phalanges. Dermal armour feeble or absent. *Range.*—Lower Permian to Recent.

6. **Dinosauria.**—Postero-lateral region of skull as in Rhynchocephalia. No pineal foramen. Cervical and dorsal ribs double-headed. Rarely abdominal ribs. Sternum present, but apparently no clavicular arch. Limbs for support as well as progression; third and fourth digits with four and five phalanges respectively. Dermal armour variable. *Range.*—Triassic to Cretaceous.

7. **Crocodilia.**—Postero-lateral region of skull as in Rhynchocephalia. No pineal foramen. Cervical and dorsal ribs double-headed. Abdominal ribs present. Sternum present; also interclavicle, but no clavicles. Limbs only for progression on land or swimming; third and fourth digits with four or five phalanges. Dermal armour variable. *Range.*—Lower Jurassic to Recent.

8. **Ornithosauria.**—All bones extremely dense, light and hollow, the organism being adapted for flight. Postero-lateral region of skull as in Rhynchocephalia. No pineal foramen. Cervical and dorsal ribs double-headed. Abdominal ribs present. Sternum present, and keeled for attachment of pectoral muscles; no clavicular arch. Fifth digit of hand much elongated to support a wing-membrane, but with only four phalanges. Hind limb feeble. No dermal armour. *Range.*—Lower Jurassic to Cretaceous.

9. **Squamata.**—Bones of postero-lateral region of skull much reduced and partly absent, never forming more than a slender superior-temporal bar, thus completely exposing the quadrate, which is only loosely attached to the cranium at its upper end. Pineal foramen present. Ribs single-headed. No abdominal ribs. Sternum present when there are limbs. Limbs, when present, only for progression; third and fourth digits at least with more than three phalanges. Dermal armour feeble or absent. *Range.*—Cretaceous to Recent.

Order 1. ANOMODONTIA.—The Anomodonts are so named in allusion to the peculiar and unique dentition of the first-discovered genera. They are precisely intermediate between the Labyrinthodont Batrachia and the lowest or Monotreme Mammalia. They flourished at the period when the former are known to have reached their culmination, and when the latter almost certainly began to appear. Many of them would, indeed, be regarded as primitive Mammalia, if they did not retain a pineal foramen, a free quadrate bone, and a complex mandible. The term Theromorpha or Theromora is thus sometimes applied to the order they represent. So far as known, they are all land-reptiles, with limbs adapted for habitual support of the body, and their feet are essentially identical with those of primitive mammals. Most of them are small, and none attain a gigantic size. They first appear in the Permian of Europe and North America, and also occur in the Triassic both of Europe and India, but they are best represented in the Karoo formation (Permian and Triassic) of South Africa. The Pariasauria most closely resemble the Labyrinthodont Amphibia, but have a single occipital condyle. *Pariasauria* itself is a massive herbivorous reptile, with a short tail, and the limbs adapted for excavating in the ground. It is known by several nearly complete skeletons, about 3 metres in length, from South Africa and northern Russia. *Elginia*, found in the Elgin sandstones of Morayshire, Scotland, is provided with horn-like bony bosses on the skull. Another apparently allied genus (*Otocoelus*) has a carapace suggesting that it may be an ancestral Chelonian. The Therio-

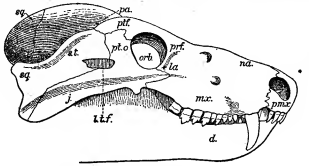
Vacuities shaded with vertical lines, cartilage bones dotted.

dontia exhibit the marginal teeth differentiated (in shape) into incisors, canines and molars (fig. 3). They have two occipital condyles, as in mammals. They seem to have been all carnivorous, or at least insectivorous, but the malariform teeth vary much in shape in the different genera. *Cynognathus* (fig. 3) and *Lycosaurus* have cutting teeth, while *Tritylodon* and *Gomphognathus* possess powerful grinders. The *Dicynodontia* have one pair of upper tusks or are toothless: their occipital condyle is trefoil-shaped, as in Chelonia. *Dicynodon* itself occurs in the Karoo formation of S. Africa, while other genera are represented in India, N. Russia and Scotland.

Order 2. CHELONIA.—This order occurs first in the Upper Triassic of Württemberg, where a complete "shell" has been

found (*Proganochelys*). Its members are proved to have been toothless since the Jurassic period, and have only changed very slightly since their first appearance. The marine turtles seem to have first acquired elongated paddles and vacuities in the shell during the Cretaceous period, and the Trionychia, destitute of epidermal shields, apparently arose at the same time.



From A. S. Woodward, *Outlines of Vertebrate Palaeontology*.

Order 3. SAUROPTERYGIA.—These are amphibious or aquatic reptiles (fig. 4). The head is comparatively small in most genera, and the neck is usually elongated though not flexible. The tail is insignificant, generally short, and both pairs of paddles seem to have been concerned in progression. The order appears to have arisen from a group of land-reptiles, for its earliest members, from the Triassic of Europe (*Lariosaurus*) and from the Permo-Carboniferous of S. Africa (*Mesosaurus*) and Brazil (*Stereosternum*), are all amphibious animals. They are comparatively small, and their limbs are only just becoming paddle-like. The skull suggests affinities with the terrestrial effective paddles with elongated digits, and as the genera are traced upwards in the geological formations it is possible to observe how the arches supporting the limbs become more rigid until the maximum of strength is reached. A few genera, such as *Pliosaurus* from the Jurassic and *Polyptychodon* from the Cretaceous of Europe, are distinguished by their relatively large head and stout neck. Some of the largest Upper Jurassic and Cretaceous species must have been 10 metres in length. They were cosmopolitan in their distribution, but became extinct before the dawn of the Tertiary period.

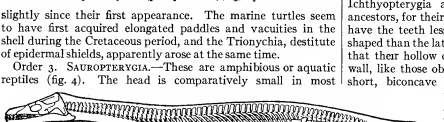

FIG. 4.—*Plesiosaurus rostratus*: restoration of skeleton by W. G. Ridewood.—Lower Lias, Dorsetshire.

Order 4. ICHTHYOPTERYGIA.—The Ichthyosaurians are all fish-shaped, with a relatively large head and very short neck. Both pairs of paddles are retained, but the hinder pair is usually very small, and locomotion seems to have been chiefly effected by a large caudal fin. This fin, as shown in impression by certain fossils from Württemberg and Bavaria, is a vertical, triangular, dermal expansion, without any skeletal support except the hindermost part of the attenuated vertebral column, which extends along the border of its lower lobe (fig. 5). Another triangular fin, without skeletal support, is known to occur on the back, at least in one species (fig. 5). Some of the genera are proved to have been viviparous. Like the Sauropterygia, the Ichthyopterygia appear to have originated from terrestrial ancestors, for their earliest Triassic representatives (*Mixosaurus*) have the teeth less uniform and the limbs slightly less paddle-shaped than the latter genera. In this connexion it is noteworthy that their hollow conical teeth exhibit curious infoldings of the wall, like those observed in many Labyrinthodonts, while their short, biconcave vertebrae almost exactly resemble those of the Labyrinthodont *Mastodonsaurus* and its allies. As the Ichthyosaurs are traced upwards in geological time, some genera become almost, or quite, toothless, while the paddles grow wider, and are rendered more flexible by the persistence of cartilage round their constituent bones (*Ophthalmosaurus*). They were cosmopolitan in distribution, but disappeared from all seas at the close of the Cretaceous period. The largest forms, with a skull 2 metres in length, occur in the Lower Lias.

Order 5. RHYNCHOCEPHALIA.—These are small lizard-shaped reptiles, which have scarcely changed since the Triassic period. Though now represented only by *Sphenodon* or *Hatteria*, which survives in certain islands off New Zealand, in the Mesozoic epoch they ranged at least over Europe, Asia and North America. They comprise the earliest known reptile, *Palaeohatteria*, from the Lower Permian of Saxony, which differs from the Triassic and later genera in having an imperfectly ossified pubis and ischium, more numerous abdominal ribs, and the fifth metatarsal bone normal. They are also represented in the Permian, chiefly of North America, by the so-called Pelycosauria, which have sharp teeth in sockets, and are remarkable for the extreme

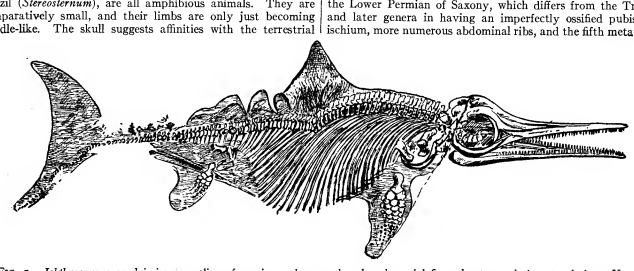

FIG. 5.—*Ichthyosaurus quadriscissus*: outline of specimen showing dorsal and caudal fins, about one-sixth natural size.—Upper Lias, Württemberg. (After E. Fraas.) The irregularities behind the triangular dorsal fin are torn pieces of skin.

Anomodontia, and the shape of the scapula seems to show some connexion with the Chelonia. The truly aquatic Sauropterygians of the Jurassic (fig. 4) and Cretaceous periods possess most

elongation of the spines of their cervical and dorsal vertebrae (*Dimetrodon*, fig. 6). They seem to include various Triassic

genera (*e.g. Aetosaurus, Belodon*), which may perhaps belong to the ancestral stock of the Dinosauria and Crocodilia. Other Triassic genera (*Hyperodapedon, Rhynchosaurus*) scarcely differ from *Sphenodon*, except in the dentition and in the absence of the pineal foramen in the skull. In the late Cretaceous and early Eocene periods one genus (*Champsosaurus*) was truly aquatic, with gavial-shaped head.

Order 6. DINOSAURIA.—The dinosaurs are land reptiles which flourished on all the continents during the Jurassic and Cretaceous periods, in the interval between the decline of the Anomodontia and the dominance of the Mammalia. They first appeared as carnivorous reptiles in the Triassic period in Europe, India, S. Africa, and N. America, but afterwards comprised numerous massive herbivores in nearly all parts of the world except the Australian and New Zealand regions. The skeleton in the carnivorous dinosaurs, or Theropoda, is of very light construction, the vertebrae and limb bones being hollow, with thin, dense walls and often perfectly fitting joints. The fore limbs are small, and the hind limbs are adapted for running, jumping or hopping on the toes. The sabre-shaped cutting teeth are fixed in sockets, and all the claws are sharp. *Anchisaurus* and *Hallopus*, from the Trias of N. America, and *Scleromochlus* from the Elgin sandstones of Scotland, are comparatively small animals. *Ceratosaurus* and *Megalosaurus*, from the Jurassic of North America and western Europe respectively, must have attained a length of from 5 to 6 metres. *Tyrannosaurus*, from the Cretaceous of Montana, U.S.A., has a skull more than a metre in length. The herbivorous Dinosaurs of the suborder Ornithopoda resemble the Theropoda in general shape, but are heavier in build, with a pelvis constructed more nearly on the plan of that of a running bird. It has, indeed, been suggested that certain arboreal Dinosaurs of bipedal gait may have been the ancestors of the class Aves. The best-known Ornithopod is *Iguanodon* (fig. 7), from the Wealden of W. Europe, with species from 5 to 10 metres in length. *Claosaurus*, from the Cretaceous of N. America, is nearly similar, and is represented by at least one complete skeleton in the Yale University Museum. There are also members of the same group with a heavy armour of bony plates and spines, sometimes termed Stegosauria. *Stegosaurus* itself occurs in the Upper Jurassic of Colorado, and *Omosaurus*, from the Kimmeridge and Oxford clays of England, is a nearly similar reptile. *Polacanthus*, from the Wealden of the Isle of Wight, has the hip-region armoured with a continuous bony shield. *Triceratops* (fig. 8) and its allies, from the Upper Cretaceous (Laramie) of western N. America, are the latest members of the group, with a bony frill over the neck, a pair of bony horn-cores above the eyes, and a median bony horn-core on the nose. The skull with the bony frill sometimes measures nearly two metres in length. Another suborder of herbivorous Dinosaurs, that of Sauropoda, comprises the largest known land animals of any age, some measuring from 17 to 25 metres in total length. They have a small head, long neck, and long tail, and must have been quadrupedal in gait. Their teeth are adapted for feeding on succulent water weeds, perhaps with an admixture of small animals living among these; and their vertebrae are of very light construction, while the ribs are raised high on the neural arches to increase the size of the body cavity, perhaps for unusually large lungs or air sacs. Their massive limbs have five toes, of which the three inner alone bear outwardly curved claws. *Diplodocus* and *Brontosaurus*, from the Jurassic of Wyoming and Colorado, U.S.A., are the best-known genera. *Atlantosaurus*, from the same formation, is usually noteworthy for size. *Cetiosaurus*, from the Jurassic of England, is also known by large parts of the skeleton in the British Museum and the Oxford Museum, indicating species nearly 20 metres in length.

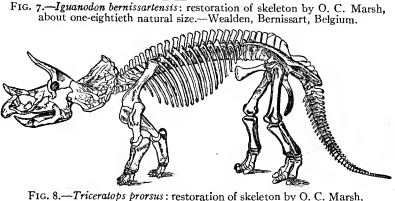

FIG. 8.—*Triceratops prorsus*: restoration of skeleton by O. C. Marsh, about one-eighteenth natural size.—Cretaceous, Wyoming.

Order 7. CROCODILIA.—Typical crocodiles can be traced downwards to the Lower Lias at the base of the Jurassic

formations, but all the Jurassic and some of the Cretaceous genera have the secondary bony plate less extended backwards than that in the Tertiary and existing genera, while their vertebrae have flattened or concave ends, instead of exhibiting a ball-and-socket articulation. Some of the Upper Jurassic crocodiles (*Metriorhynchus*) were more truly aquatic than any now living, with the fore limbs degenerate, the hind limbs much enlarged for swimming, and the dermal armour lacking. The end of the vertebral column is bent downwards, as in *Ichthyosaurus*, so they doubtless possessed a similar triangular tail-fin. Typical crocodiles and alligators date back to the close of the Cretaceous period, and they did not become extinct in Europe until the beginning of the Miocene period. Remains of an extinct alligator (*Diplocynodon*) are common in the Upper Eocene sands of the Hordwell cliffs, Hampshire.

Order 8. ORNITHOSAURIA.—The flying reptiles or Pterodactyls (fig. 9) are completely evolved at their earliest known

FIG. 9.—*Pterodactylus spectabilis*, natural size, from the Lithographic Stone. *h*, humerus; *ru*, radius and ulna; *mc*, metacarpals; *pt*, pteroid bone; 2, 3, 4, digits with claws; 5, elongated digit for support of wing-membrane; *st*, sternum, crest not shown; *is*, ischium; *pp*, prepubis. The teeth are not shown. (After H. von Meyer.)

appearance in the Lower Lias (*Dimorphodon*), and exhibit little essential change as they are traced upwards through the Mesozoic formations. The latest Cretaceous genera, however, comprise the largest species, which have been found in Europe, N. America and Brazil. Some of these (*Pteranodon*) are toothless, and their wings are so large that for adequate support the pectoral arch is fixed to the vertebrae like a pelvis. The wings occasionally have a span of from 5 to 6 metres. The wing-membranes are only known in the European Jurassic genus, *Rhamphorhynchus* (fig. 10), found well preserved in the fine-grained lithographic stone of Bavaria. In this genus there is also a rhomboidal flap of membrane at the end of the tail.

Order 9. SQUAMATA.—The ancestors of the lizards and snakes can only be traced back definitely to the latter part of the Cretaceous period. They were then represented by two suborders of aquatic reptiles, the Dolichosauria and Pythonomorpha (or Mosasauria), which are in many respects intermediate between the existing Lacertilia and Ophidia. The Dolichosauria, from the Upper Cretaceous of Europe, are small and snake-like in shape, but with completely formed limbs. The Pythonomorpha are known from Europe, N. and S. America and New Zealand, and sometimes attained a very large size, the typical *Mosasaurus camperi* from Maastricht being about 15 metres in length. Their limbs are powerful paddles. Their trunk and

tail are often much elongated, so that their shape is snake-like, as shown by *Clidastes* (fig. 11), from the Chalk of Kansas, U.S.A. The Lacertilia and Ophidia, so far as known, are exclusively Tertiary and Recent reptiles. Marine snakes (*Palaeophis*) occur in the Eocene of the London and Hampshire basins.

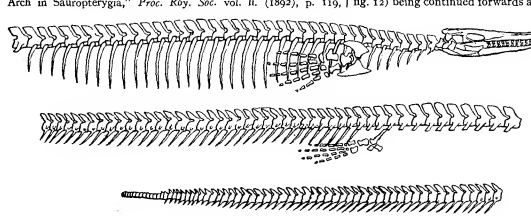

FIG. 11.— Skeleton of *Clidastes*. (After Cope.)

III. ANATOMY OF REPTILES

The Skull.

Sphenodon has the most primitive and still most complex skull, the salient features of which it is easy to derive from Stegocephalian and early, generalized reptilian conditions; whilst in other directions, mostly by reduction, the skull of this "living fossil" affords the key to that of all the other groups of at least recent reptiles. The main features are the following. There are, in the temporal region, three complete bony arches, the supra-, infra-, and post-temporal, which subdivide the whole temporal fossa into four foramina. The supratemporal bridge is formed by the squamosal and post-orbital, the latter (*j* in fig. 12) being continued forwards and fused with the post-frontal. These three bones, with the parietal, enclose the supra-*temporal* foramen. The postorbital joins an ascending branch of the jugal, both together forming the hinder border of the orbit, and this is bordered below chiefly by the maxillary. The posteriortemporal bridge is formed by the parietal and squamosal, extends laterally over the quadrate and encloses a wide space between itself and the buttress-like transverse expansion of the lateral occipital bone (these "parotic processes" are made up of the lat. occipital, parotic and opisthotic bones); this is the post-temporal foramen. The space enclosed between this occipital buttress, the quadrate and the pterygoidal support of the latter represents the wide and large cavity of the middle ear,

After Günther.

FIG. 12.—Skull of *Sphenodon*.

1, Ventral aspect; 2, lateral aspect; 3, lateral aspect of mandible. *ar*, articular; *bo*, basiocipital; *bs*, basisphenoid; *c*, coronoid; *ca*, columella auris; *d*, dentary; *j*, postorbital; *m*, maxilla; *n*, nasal; *pa*, parietal; *pl*, palatine; *pm*, premaxilla; *pr*, prefrontal; *ps*, *postfrontal*; *pt*, pterygoid; *q*, quadrate in the upper figure, quadrato-jugal in the middle figure; *qj*, jugal; *s*, squamosal; *sp*, splenial; *v*, vomer.

and as such is crossed by the auditory columellar chain. The infra-temporal bridge or jugal arch is formed by the jugal (*qj* in fig. 12), which joins the descending process of the squamosal, and the quadrato-jugal, which is very small and partly fused with the lateral side of the quadrate. Now, between the quadrate on the one side and the squamoso+quadrato-jugal+jugal on the other, is enclosed a gap, met with only in *Sphenodon* of recent reptiles. This fourth, or quadrato-squamosal foramen, with its squamoso-quadrato-jugal bridge, is, as a rule, not mentioned, being too small to be obvious. The quadrate is very firmly fixed. On the ventral side of the cranium we notice the broad and long bony palate, the large vomers, and the pterygoids meeting in the middle line; aside of the vomers are the long posterior nares; posteriorly the pterygoids diverge to rest upon short basi-sphenoid processes, and they articulate by short flanges with the quadrates.

The occipital condyle is kidney-shaped, triple, composed of the basi and the lateral occipitals. The dorsal median roof of the cranium is formed by the paired parietals, near their anterior symphysis with the large pineal foramen, the paired frontals, nasals and premaxillaries. The outer nares are surrounded by the premaxillaries, maxillaries and nasals. Prefrontals and postfrontals exist. There is a complete cartilaginous, inter-orbital septum, and a cranial columella, a pair of upright buttresses arising in the alisphenoidal walls, connecting the parietals with the pterygoids. The hyoid apparatus consists of a narrow base, with three pairs of arches; of these the first or hyoid arch is variously connected with the cranium near the paroccipital process, or with the extracolumella (see *Middle Ear*, below); the others are a long and stout pair of first and a smaller pair of second branchial arches.

Crocodiles.—The temporal region is still bridged over by three arches, dividing the whole fossa into three, very much as in *Sphenodon*. The supratemporal foramen is bordered by the parietal, postfrontal (postorbital absent) and squamosal. The posttemporal foramen is very much reduced, sometimes to a narrow passage between the parietal, occipitals and squamosal, because the latter bone forms an extensive suture with the paroccipital process. The infratemporal or lateral fossa is wide and rather shallow, bordered above by the postfrontal and squamosal, in front by the postfrontal and jugal, below by the jugal and quadrato-jugal, behind by the latter, the quadrate, tip of the paroccipital and the squamosal. The quadrato-jugal being long and in an almost horizontal position, being wedged in between the jugal and nearly the whole length of the lateral edge of the quadrate, and there being no squamoso-quadrato-jugal bridge, the fourth foramen of *Sphenodon* is absent. The middle-ear cavity is reduced to a complicated system of narrow passages; one for the passage of the extra-columellar-mandibular string of the auditory chain (see *Ear*, below), between the quadrate, paroccipital and lateral occipital bones; another passage (*Eustachian*) opens in the roof of the mouth, between basiocciptal and basisphenoid; a third joins that of the other side and forms with it a median opening between the same bones, just behind the posterior pterygoid border of the choanae. These nares, being in the recent crocodiles shifted as far back as possible, communicate with the outer nostrils by very long passages, formed by the whole length of the pterygoids, palatines, maxillaries, vomers and pre-maxillaries, all of which form a long median suture. But this long bony palatal roof is interrupted by a pair of large palatal foramina, bordered usually by palatine, pterygoid, ectopterygoid, or transverse bone and maxillary. On the dorsal side of the cranium we notice the parietals fused into an unpaired bone, without a pineal hole and the likewise unpaired frontal. There are a pair of postfrontals, prefrontals and lacrymals perforated by the naso-lacrymal duct. The nasals vary much in length, mostly in conformity with that of the maxillaries; as a rule they reach the short premaxillaries, but not always the nasal groove. (For taxonomic detail see under CROCODILE.)

The occipital condyle is formed mainly by the basiocciptal, which always borders part of the foramen magnum, but the lateral occipitals each send a flange to it, which in immature specimens still partakes of the articulation with the atlas. The opisthotic and epiotic bones fuse early with the lateral and with supraoccipital bones; only the proötic remains longer as a separate element, anteriorly with a large hole for the exit of the third branch of the trigeminal nerve. The basisphenoid is scarcely visible, being overlaid by the pterygoids. The pre-sphenoid is larger, continued forwards and upwards into the inter-orbital septum, which remains mostly cartilaginous. Near the anterior and upper margin of the pre-sphenoid is a large notch on either side for the passage of the optic nerve, the three eye-muscle nerves and the first branch of the trigeminal. The place of the orbitosphenoids is taken by membrane or cartilaginous continuations of the interorbital septum, but the alisphenoids are large and abut upwards against the frontals and with a lateral flange against the postfrontals. These send down a conspicuous process which forms sutures with an upward process of the jugal and another of the ectopterygoid; it is this compound pillar which partly divides the orbit from the infratemporal or lateral fossa. The size of these and the upper temporal fossae stand in an inverse ratio to each other. The upper fossae are still comparatively large in the long-snouted *Gavialis* and *Tomistoma*, whilst these holes almost completely disappear in the alligators, namely, in the broad- and short-snouted members of the order, which chew their prey. In extinct Crocodilians the upper fossae were the larger. The temporo-mandibular muscle which lifts or shuts the lower jaw arises from the walls of the temporal fossa, passes beneath the jugal-arch and is inserted upon the supra-angular portion of the lower jaw. In the more recent crocodiles this muscle is more and more superseded by the pterygo-mandibular muscle, which, arising chiefly from the dorsal surface of the much-broadened pterygoid, fills the widened space between the latter and the quadrate, and is inserted into the outer surface of the angular bone. The arrangement of this muscle secures a more advantageous leverage of the jaw, and is capable of more powerful development than the other, which is consequently on the wane—a nice illustration of onward, ortho-genetic evolution. The dentary bones of the under jaw form a suture, later a symphysis; this is very long in the long-snouted genera, in which the splenials likewise form a long symphysis; in the others the mandibular symphysis is much shorter and the splenials remain widely separated. The articular bone is short, forms a transverse cup for the quadrate, or a saddle-shaped cup, and is perforated by the *Siphonium* (see below under *Ear*). The angle is upturned, formed by the articular, angular and, laterally, by the supra-angular bone; the opercular or counter-part of the splenial lies on the outer side, forming part of the anterior border of the oval foramen in the jaw.

The Chelonian skull agrees in many important features with that of *Sphenodon* and of the crocodiles, but it is composed of fewer bones, the ectopterygoids, lacrymals and postorbitals being absent, often also the nasals, unless they are fused with the prefrontals. The vomer is unpaired and forms a septum between the nasal passages, which, except in *Sphargis*, are ventrally roofed over to a variable extent by wings sent out by the palatines, joining the sides of the vomer. Most of the configurations of the other cranial bones are well represented in the accompanying figures. The palatines form a continuous broad floor with the pterygoids, which are extensively and firmly joined to the quadrates and to the basisphenoid. There are no Eustachian tubes. The occipital condyle is distinctly triple and the basiocciptal is frequently excluded from the foramen magnum. The lateral occipitals early send out a pair of stout wings, the ventral of which joins a stout ventrilateral process of the basiocciptal, both forming a thick knob especially in *Chelone*, and a dorsolateral wing, which broadly joins the large opisthotic bone. This connects the lateral occipital and the supraoccipital with the upper portion of the quadrate. On the top of the quadrate and upon the lateral dorsal portion of this compound transverse process (which of course corresponds to the paroccipital process of crocodiles, &c.) lies the squamosal, about which more presently. The two wings of the lateral

occipital, part of the opisthotic, the quadrate, and part of the pterygoids, form the bony borders of the middle ear-cavity, which is open behind; through it extends horizontally the columellar rod, received with its outer portion by a notch on the posterior side of the quadrate. This is of very complicated shape. Its outer margins form most of the tympanic frame; the posterior margins being curved backwards leave a wide notch behind in the Cryptodira and in *Sphargis*, but in the Pleurodira this part of the quadrate is transformed into a trumpet, the rim of which, forming a complete ring, carries the tympanic membrane. The tympanic cavity thus formed often leads into a deep recess which extends into the hollowed-out squamosal (*e.g.* in *Testudo*) towards the opisthotic and bears some resemblance to the intricate tympanic recesses which pervade that region of the crocodile's skull. With its upper anterior and

inner portion the quadrate joins the large proötic bone which is usually completely fused with the rest of the opisthotic, but in *Sphargis* it remains separate, and in this turtle the sutures between the otic bones and the supraoccipital also persist. In front of the proötics the bony lateral walls of the brain-case end in *Sphargis*, but in most of the other Chelonians bony alisphenoids are represented by a pair of epipterygoids which rest upon short upward processes of the pterygoids and are joined by much longer, rather thin, but broad descending lamellae from the parietals. They represent of course the columellae cranii or pterygoidal columellae; if they are of alisphenoidal origin the term epipterygoids is a misnomer; the same applies to these structures in other reptiles. Through the space enclosed by the pterygoid, basioccipital, opisthotic and quadrate, enters the cranial carotid artery, sometimes piercing the posterior rim of the pterygoid; then the canal runs along the dorsal side of this bone and opens near the cranial columella. The arcades over the temporal region are most variable. Potentially Chelonians possess all the three arcades of the crocodiles, but it so happens that never more than one fenestra is present. The false roof over the temporal region is most complete in *Sphargis* and in the *Chelonidae*. Excepting *Sphargis* the supraoccipital extends far beyond the back of the cranium in shape of a long unpaired crest, which never diverges, or sends out lateral processes, but it is joined, and partly overlaid for a great part of its length, by the parietals in *Chelonidae* and *Sphargis*. In these genera the much-enlarged parietal, the equally large postfrontal, with the squamosal behind, the jugal below, and a large quadrato-jugal, form one continuous bony roof over the whole temporal fossa, which is widely open behind, the space being bordered by supraoccipital, opisthotic, squamosal and parietal. All other Chelonians show a great reduction of this roof. The parietal does not send out dorsolateral expansions; and the postfrontal likewise forms no expansions. It joins the rather short malar, forming the posteriororbital bridge, which posteriorly is connected by the quadrato-jugal with the upper portion of the quadrate and with the squamosal. The latter rests upon the quadrate and is in no connexion with the parietal. Consequently the whole temporal fossa is quite open. The horizontal bridge or arcade is to a certain extent homologous with the infra-temporal arcade. All the bones which border the temporal fossa vary much in extent. The greatest reduction has taken place in *Cistudo* and in *Geomyda*, the latter an Indian genus of Testudinidae, in which the quadrato-jugal is lost, leaving a wide gap in the horizontal arcade.—The Chelonians form an instructive parallel to mammalian conditions by the broad contact of the squamosal with the malar, *e.g.* in *Chelone*, whilst the quad-

rato-jugal, having in all Chelonians lost its original ventral connexion with the jugal, may actually get lost as in all the

Lacertilia. The zygomatic arch of the Mammalia is formed (cf. also Agamidae) out of the supratemporal arch of *Sphenodon*,

after the loss of the postorbital element and of the quadrato-jugal, the squamosal gaining connexion with the upper, not posterior and ventral, branch of the jugal or malar bone.

The mandibular halves form a complete osseous symphysis, the only instance in reptiles; all the other elements retain their sutures. The articular portion of the articular bone forms several shallow cups and a slight anterior knob, best developed in *Chelone*. The angular bone does not help to form the posterior upper angle. The coronoid, or complementary element, is often small; the supra-angular and the splenial or opercular are always present, mostly also a pre-splenial wanting in Testudinidae (cf. G. Baur).

The hyoid apparatus is well developed, and sometimes assumes large dimensions, especially in *Chelys*. The two pairs of "horns" are the first and second branchial arches, whilst the hyoid arches are reduced to a pair of small, frequently only cartilaginous nodules, attached near the anterior corners of the basis linguae, which generally fuses with the os entoglossum in the tip of the tongue. In Chelydidae the long median basal or copular piece forms a semi-canal for the reception of the trachea.

In the skull of the Lacertilia the arcades over the temporal region vary much in composition and numbers. There are at most two arcades and two windows. First the posttemporal arcade, enclosing the posttemporal fenestra, which is framed mainly by the large paroccipital process below and the long parietal process above, both meeting distally, and the quadrate is carried by the paroccipital process. In the corner, in front, where the three bones meet, lies the squamosal, connecting parietal and quadrate. This squamosal, when not too much reduced, has an upper parietal and an anterior horizontal arm; the latter is essential for the formation of the second horizontal arcade, which makes the lower border of the supra-temporal window. The infra-temporal arcade, namely a quadrato-jugal +jugal arch, is absent in all Lacertilians owing to the complete absence of the quadrato-jugal element.

In *Heloderma* and Geckos the posttemporal is the only arcade. In the Amphisbaenids and in *Aniella*, practically also in *Anelytropsis*, all the arcades are lost. All the other families

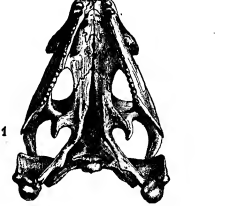

FIG. 19.—Skull of *Chlamydosaurus kingii* (old male), showing much differentiated teeth. 1. ventral aspect; 2, posterior; 3, profile, showing the enormous process at the hinder end of the lower jaw.

of lizards and the chameleons have two arcades. We begin the description of the horizontal arcade with those families in which it is most complete, and most like that of *Sphenodon*. In *Varanus* it is formed by four bones. The postfrontal is short; to it is attached the postorbital, which sends a long horizontal process to join the squamosal[1] splint, and this connects with the

[1] There is a much-debated question of the homologies of the one or two elements, both apparently membrane bones, which connect the upper end of the quadrate with the parietal and with the supra-temporal arch. The question becomes acute in the snakes, whether the single element connecting skull and quadrate has to be called squamosal or supratemporal. Space forbids here to expound the matter, which has been very ably reviewed by S. W. Williston ("Temporal Arches in the Reptilia," *Biolog. Bulletin*, vii. No. 4, 1904, pp. 175–192; cf. also F. W. Thyng, *Tufts College Studies*, II. 2, 1906). About ten different names have been applied to these two elements, and two, namely, squamosal and supratemporal, are being used quite promiscuously. When only one element is present, the present writer uses the term squamosal, and there are reasons making it probable that this element is the squamosum of mammals. When both elements are present, the more ventral or lateral of the two is termed squamosal, that which always helps to form the

upper anterior end of the quadrate; between the quadrate, the squamosal and the long parietal process lies the likewise splint-like supratemporal, attached by most of its length to the parietal process. The jugal has only one arm, and this connects the maxilla with the postorbital, completing the posterior orbital border. There is a wide gap between jugal and quadrate. In Tejidae the arcade is the same, but the squamosal reaches the jugal, both meeting the postorbital. In *Lacerta* the arcade is essentially the same, but the window is completely filled up by the postfrontal, which extends so far back as to reach the supratemporal. In the Agamidae the arcade is strong and simplified. Postfrontal and postorbital are represented by one forked piece. This squamosal and the postfrontal mass are connected by the upper, much up-curved end of the jugal, which is thrust between them. This arrangement is further emphasized in *Iguana*, the upper end of the jugal being much enlarged so as to form the greater portion of the arcade, and keeping the postfrontal mass and the simple squamosal widely asunder. In Heloderma post- and prefrontals are in contact with each other, separating the frontal bone from the orbit; the jugal joins only the prefrontal, and there is no further arcade whatever. A vestige of a supratemporal (?) lies on the outside of the base of the squamosal, between *s* and *q* in fig. 20.

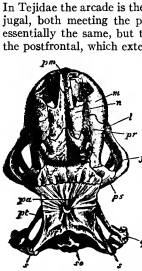

FIG. 20.—Dorsal aspect of skull of *Helodermahorridum*. *f*, frontal; *j*, jugal; *l*, lachrymal; *m*, maxilla; *n*, nasal; *pa*, parietal, *pm*, premaxillia; *pr*, prefrontal; *ps*, postfrontal; *pt*, pterygoid; *q*, quadrate; *s*, squamosal; *so*, supraoccipital.

The chameleons are peculiar. The posttemporal arcade, spanning a wide space, is formed by a long process of the supratemporal - squamosal, which is directed upand backwards to join the parietal, which extends back by a long unpaired process. The horizontal arch is broad and short, squamosal and postfrontal, forming a broad suture; below they are joined by the jugal; above the suture lies, in chameleon, a tiny piece, perhaps a vestige of the dislodged postorbital.

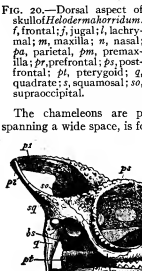

FIG. 21.—Skull of *Chamaeleon vulgaris*. *ag*, angular; *ar*, articular; *bs*, basisphenoid; *d*, dentary; *j*, jugal; *m*, maxilla; *me*, median ethmoid; p^1 and p^2, parietals; *pl*, palatine; *pr*, prefrontal; *pt*, pterygoid; *q*, quadrate; *sg*, supra-angular; *so*, supraoccipital; *sq*, squamosal.

The jugal bones, to continue the description of the appendicular parts of the skull, are firmly joined to lateral processes of the pterygoids by the ectopterygoids; further forwards they are extensively connected with the maxillaries. These rest against strong transverse palatine processes. The palatines form a medium symphysis; posteriorly they diverge together with the pterygoids, which articulate with the quadsupratemporal bridge, generally with the postorbital, sometimes also with the jugal. The more dorsal element is mentioned as supratemporal; it is always smaller, and mostly restricted to the corner between the squamosal and the parietal process against which it rests. Either of these two elements articulate with the quadrate. Both elements are present in Labyrinthodonts and in most of the extinct groups of reptiles; among recent forms in Lacertidae, Varanidae, Tejidae; one three-armed piece in *Sphenodon*, chameleons and crocodiles, without, in *Sphenodon* at least, any trace of a compound nature; one piece, forked, in Agamidae; one simple piece in most of the other Lacertilia, and in snakes.

rates and with the basisphenoid by a pair of strong basipterygoid processes. A slender vertical rod of bone, the columella cranii, arises from the dorsal surface of each pterygoid and, passing at a distance from the cranial capsule, is sutured to a short lateroventral process of the parietals Such a pair of columellæ exists in nearly all Lacertilia (distinguished by many systematists as *Kionocrania*) with the exception of the chameleons and the Amphisbaenidae. In many lizards, however, this columella, or epipterygoid, does not quite reach the parietal, leaning instead against the proötic; possibly it has been evolved out of the alisphenoid, and Chelonians seem to support this view. The premaxillary bone is single, except in the Skinks and in some Geckos; ventrally it touches the vomers which vary much in size; they are always paired although suturally connected; posteriorly they pass into, and fuse with, the palatines before these send off their maxillary processes. Between the vomer and its maxillary is a longitudinal hole. Often, *e.g.* in *Lacerta*, the vomers enclose a median hole near their anterior end, for Jacobson's organ. Dorsally the premaxilla sends a median process backwards to the nasals. These are paired, and fuse together only in *Uroplates* and in *Varanus*. The external nasal fossae are sometimes very large, and their anterior half appears blocked by the ossified turbinals, *e.g.* in *Varanus* and *Tejus*. Prefrontals are always present, often fused with the lacrymals; in Heloderma, in Aniella and in chameleons the prefrontals extend so far back as to meet the postfrontals, excluding thereby the frontals from the orbital rim. The frontals are either paired, as in Varanus, Lacertidae, Heloderma, Anguidae, Scincidae, Anelytropsidae, Aniella, Amphisbaenidae, and in some Geckoninae; or they are fused into one bone, as in the Eublepharinae, chameleons, Tejidae, Iguanidae, Agamidae, *Xenosaurus*. The parietals are double in the Geckos, in *Uroplates* and *Xantusia*; in all the others they form one cössified mass, generally with a pineal foramen, except in Eublepharinae, Amphisbaenidae, Tejidae, in Aniella and other degraded forms. In the majority the pineal foramen lies in the middle of the parietal, but in the Iguanidae it is near the frontal, and actually in the frontal in chameleons.

As regards the brain-case, there is a cartilaginous interorbital septum, connected posteriorly with the slender, bony presphenoid; ventrally on to this is fused a vestige of the parasphenoid, a narrow and thin splint which sometimes can be dislodged. The whole of the anterior wall of the brain-case is membranous, excepting a pair of separate ossifications, which do but rarely touch any of the cranial bones, as frontal, parietal or proötics. The ossifications are irregular in shape, each sending out a downward process which curves inwards almost to meet its fellow; between these issue the olfactory lobes. W. K. Parker recognized them as the alisphenoids; E. D. Cope named them postoptics, and remarked that in *Sphenodon* they coexist with an orbitosphenoid bone. The proötic has a notch in its anterior lateral margin for the passage of the trigeminal nerve. The opisthotic portion of the petrosal mass is intimately fused with the lateral occipital bones and their paroccipital process, and sometimes, *e.g. Tejus*, encloses with them many intricate recesses of the middle ear-chamber, which extend also into hollow and swollen thick downward processes of the basiocciptal. These cavities of both sides communicate with each other through the cancellous substance of the basiocciptal and basisphenoid. There are no Eustachian tubes opening into the mouth through the base of the skull.

The occipital condyle is tripartite, the lateral occipitals partaking of the articulation; very rarely, *e.g.* in Amphisbaenidae (see fig. 22), the basiocciptal portion is so much reduced that the skull articulates by two very broad condyles.

The halves of the under jaw are but loosely united, either by ligament only or by an at least very movable suture. The jaw is compound and the numerous constituent bones mostly retain their sutures. Besides the dentary and articular, angular and supra-angular on the lateral side, and the opercular or splenial on the inner side, there lies on the dorsal side the coronoid, six pairs in all. The posterior angle of the jaw

is always formed by the articular bone, which lies on the ventral side, about the middle of the jaw; it is fused with the articular in Geckos, some Tejidae, Amphisbaenidae, and some other burrowing kinds. The splenial is absent in chameleons; near the vanishing point in some of the Agamidae. The coronoid is always present, for the insertion of masseter muscles. In the pleurodont lizards the outer wall of the dentary forms a ledge, against the inner side of which are fixed the teeth with cementum.

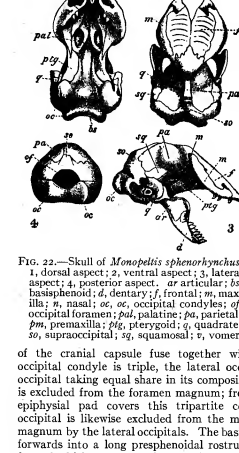

FIG. 22.—Skull of *Monopeltis sphenorhynchus*. 1, dorsal aspect; 2, ventral aspect; 3, lateral aspect; 4, posterior aspect. *ar* articular; *bs*, basisphenoid; *d*, dentary; *f*, frontal; *m*, maxilla; *n*, nasal; *oc*, *oc'*, occipital condyles; *of*, occipital foramen; *pal*, palatine; *pa*, parietal; *pm*, premaxilla; *ptg*, pterygoid; *q*, quadrate; *so*, supraoccipital; *sq*, squamosal; *v*, vomer.

The snakes' skull shows many peculiarities, and most of the bones of the cranial capsule fuse together without sutures. The occipital condyle is triple, the lateral occipitals and the basi-occipital taking equal share in its composition; the basioccipital is excluded from the foramen magnum; frequently one common epiphysial pad covers this tripartite condyle. The supra-occipital is likewise excluded from the margin of the foramen magnum by the lateral occipitals. The basisphenoid is prolonged forwards into a long presphenoidal rostrum, on the upper surface of which the trabeculae cranii, which persist as cartilages, extend forwards to blend with the median ethmoidal cartilage. There are no ali- and no orbitosphenoids, their places being taken by downward extensions of the frontal bones, which descend to this sphenoidal rostrum and then turn inwards to meet together on the floor of the cranial cavity. There is consequently no interorbital septum. The parietals also descend laterally, but unite with the basisphenoid by suture. On which projects a little beyond the occiput; there is no parietal or pineal foramen. There are paired frontals, postfrontals, prefrontals and nasals; the latter are said to coössify in *Charina* only. The position of the prefrontals is variable. In the boas, for instance, they meet, separating the nasals from the frontals; they are in contact with the nasals in the boas, burrowing snakes and in *Xenopeltis*, but more or less widely separated from them, and often from each other, in the Colubridae and Viperidae. The premaxillary is single, and only in Glauconiidae connected with the maxillaries; in the others it is but loosely connected with the ethmoidal end of the skull, for instance, with the turbinals, which are osseous and well developed in pythons.

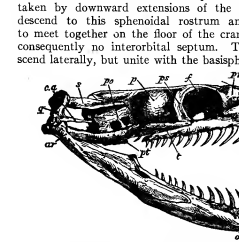

FIG. 23.—Skull of *Python sebae*. *ar*, articular; *ca*, columella auris; *d*, dentary; *f*, frontal; *m*, maxilla; *p*, parietal; *pm*, premaxilla; *po*, prootic; *pr*, prefrontal; *ps*, postfrontal; *pt*, pterygoid; *q*, quadrate; *s*, squamosal; *t*, transversum; *tb*, turbinal.

The whole appendicular apparatus is most loosely attached to the skull, at least in the typical snakes, and since they do not chew their prey but only hook it in, so to speak, during the act of swallowing, the whole apparatus is as movable as possible.

The whole palatal apparatus shows many modifications, but the maxillaries, palatines and pterygoids always remain widely asunder, and from the mid-line. Some of the modifications, so far as they are used for taxonomic purposes, are mentioned in the article SNAKES: *Classification*. In the majority of snakes the maxillaries form the borders of the mouth, and they are but loosely attached to the other bones, to their palatine processes, to the palatines, and with their posterior ends, by the ectopterygoids to the pterygoids. In the Viperidae the maxillaries are much shortened and articulate extensively with the prefrontals; they (so be erected, or rather pushed forwards, by the ectopterygoids (see SNAKES); they are not connected with the palatines. The pterygoids diverge posteriorly and articulate loosely with the quadrates; in the original condition the articulation is near the distal end of the quadrate, *e.g.* in Boidae, and the pterygoids may form an additional attachment with the mandibles; in the Viperidae the pterygoids are somewhat shortened and are attached to about the middle of the quadrate shafts; in the Amblycephalidae they are still shorter and do not reach these bones. The ectopterygoids are lost by the burrowing Typhlopidae and Glauconiidae. The quadrate is always extremely movable; besides being in a most curious way connected with the outer end of the columellar rod (see below, *Ear*), it is suspended from the skull by the squamosal. The squamoso-quadrate connexion is very loose; that of the squamosal with the skull varies much. In the majority of snakes it slides quite freely upon the parietal; it is much longer than the quadrate in the boas, much shorter than the elongated and slender quadrate in most of the poisonous snakes. Lastly, in most of the ancient burrowing snakes, *e.g.* *Typhlops*, *Glauconia*, *Ilysia* and *Uropeltis*, the squamosal has worked its way into the cranial wall so that the quadrate, itself also much shortened, rests directly upon the cranium.

The Vertebral Column.

The vertebrae of all reptiles are gastrocentrous, that is to say, the centra or bodies of the vertebrae are formed by the originally paired, interventral cartilages, while the basiventrals are reduced, persisting either as so-called intercentra or wedge-bones, or as intervertebral pads, or disappearing altogether; the basidorsal elements form the neural arch. At the earlier stages of development the gastrocentrous vertebrae behave in the same way as in the Urodela, except that the interdorsal pair of elements is suppressed from the beginning (the very elements which in

the base of the skull we note various processes for the insertion of ventral cervicooccipital muscles, much used during the act of vigorous striking. Boidae have a long sphenoidal ridge and thick basipterygoid processes; others have one or more median knobs or crests, and the Viperidae have a very prominent and large ridge. The parietals fuse together into an unpaired mass whence arises mostly a strong median crest

Stegocephali and most Anura form the centre), therefore the typical batrachian vertebrae are notocentrous. If the remaining three pairs of constituent elements of each vertebra (the neural arch, the centrum and the intercentra) remain separate, the vertebrae are called temnospondylous (*τέμνω*, I cut, *σπόνδυλος*, a vertebra). If the neural arches and the centra are suturally united, or are fused with each other, the vertebrae are called stereospondylous (*στερεός*, solid). In many fossil reptiles most or many of the vertebrae are temnospondylous; in most of the recent Amniota[1] they are consolidated, but the atlas or first vertebra remains usually in a relatively primitive condition, and is temnospondylous but for the usual modification that its centrum becomes attached to that of the second vertebra and forms its odontoid process. The composition of gastrocentrous vertebrae is best illustrated by the first and second cervical vertebrae of crocodiles, whence by reduction and fusion the structure of every other vertebra can be explained. We have only to add that the ribs are genetically derived from lateral outgrowths of the basiventral elements, whilst the chevron bones are mere ventral outgrowths from the same basal cartilages. The most primitive vertebral column is that of the Geckos. The

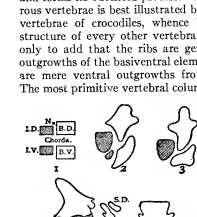

FIG. 25.—Composition of Vertebrae of Reptiles. In all the figures the right side looks towards the head.

1. Diagram showing the relative position of the four pairs of arcualia which constitute a complete quadripartite vertebra. B.D., Basidorsal; B.V., basiventral; I.D., interdorsal; I.V., interventral, shaded vertically in all figures; N., position of axil of the spinal nerve, *i.e.* behind the neural arch of its vertebra. 2, 3. Side views of the constituent cartilaginous blocks of a caudal vertebra (2) and a trunk vertebra (3) of Archegosaurus, as typical examples of temnospondylous quadripartite and tripartite vertebrae. For comparison with Reptilian vertebrae. 4. Temnospondylous tripartite vertebra of the trunk of *Eryops*, a Permian reptile. 5. Composition of the second vertebra of a crocodile. 6. A vertebra of which the vasiventrals are reduced to an "interventrum." 7. Side view of the first and second cervical vertebra of a crocodile. 8. The same analysed. N1, N2 and N3, position of the first, second and third spinal nerves; S.D., occasionally called Proatlas, the detached spinous process, or supradorsal, of the atlas or first vertebra. 9. The first three vertebrae of *Sphenodon*. 10. The complete atlas vertebra of an adult *Trionyx*, still typically temnospondylous.

vertebra consists chiefly of a large neural arch which rests broadly upon the centrum; this is a tube, more or less calcified and ossified, with a narrow waist in the middle, widening head- and tailwards. The tube is hollow, the chorda dorsalis passing through the whole column, and there are no proper joints between the centra, which are amphicoelous. Between the centra lies a separate element, the so-called intercentrum, which is ring-shaped and acts as an interarticular pad instead of a joint. The first of these rings forms the ventral half of the atlas ring; the second is attached to the cranial surface of the second centrum, and produces, like some of the next following ones, a vertical median blade of bone, a true hypapophysis. Such intercentra exist throughout the length of the vertebral column; in the tail they are enlarged and carry a pair of chevrons, which are cartilaginous and have the tendency of fusing by superficial ossification on to the caudal ends of the centrum next in front, to which they do not belong genetically. Exactly in the middle of each vertebra the thin shell of the centrum forms a cartilaginous septum, of what is often wrongly called chordal cartilage. When this septum is complete, and this seems to be the normal condition in the tail, the chorda is here rent asunder, otherwise it is only constricted. This septum is but slightly invaded by ossification, and consists of large cells which retain the appearance of young or embryonic cartilage. It coincides exactly with the line of transverse division of most of the caudal vertebrae into an anterior and a posterior half, the division gradually extending right through the bone of the neural arch. The same kind of division, and from the same causes, exists in *Sphenodon* and in many lizards, in fact in all those reptiles which can reproduce their broken-off tail. It is from the septal cartilage that the regeneration starts[2] (fig. 26).

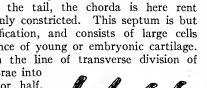

FIG. 26.—Vertical section of four (7th to 10th) caudal vertebrae of *Sphenodon*. *a*, line passing through the middle of centrum and through part of the neural arch, where the vertebrae break off. (After Günther.)

Sphenodon also has biconcave vertebrae owing to the persistence of the chorda dorsalis in the intervertebral region; otherwise the vertebrae are solid. Intercentra occur from the atlas regularly into the tail, where they carry chevron bones. The atlas-ring (fig. 25, 9) is composed of the first intercentrum and a pair of neural arches which remain quite separate and carry on the dorsal side a pair of ossicles, the disconnected supradorsal elements of the atlas, erroneously supposed to be the remnants of the "proatlas."

Crocodiles.—Remnants of the chorda persist in the middle of the centra, which, in recent species, are mostly procoelous, and with a convex knob behind, but the first caudal is strongly biconvex. Cartilaginous intercentral rings, pads or menisci, occur throughout the column; in the tail they carry chevrons. For the instructive detail of the composition of the first and second cervical vertebrae see fig. 25, 7 and 8. Some of the posterior neck and anterior thoracic vertebrae have an unpaired hypapophysis arising from the centrum. The vertebrae have two mid-dorsal processes, viz. spinous process, a pair of anterior and posterior zygapophyses arising from the neural arch, diapophyses likewise from this arch for the articulation with the tubercular portion of the rib; short parapophyses from the centra for the capitular ends of the ribs; the transverse processes of the 12th vertebra, and following, carry the whole rib, and are like the processes of the lumbar vertebrae diapapophyses; the so-called transverse processes of the tail are mainly the anchylosed or fused ribs themselves.

Chelonians.—The vertebrae are sometimes in the various regions of the same column opistho-pro- or amphicoelous, or even biconvex. Intercentra occur regularly on the first two or three cervicals, and on the tail as paired or unpaired nodules, or as chevrons, which articulate mostly with the previous centra and occasionally fuse with them. Intercentral, fibrocartilaginous disks occur regularly, mostly in the shape of rings; the first is the transverse ligament of the atlas-ring. In the Trionychidae (fig. 25, 10), but also in some other tortoises, the various pieces of the atlas do not anchylose, and the first centrum remains also movably attached to the second, although it sometimes carries,

[1] There remained a flaw in the correctness of the view that the bodies of the amniotic vertebrae are formed by the paired intervertebral pieces, since the bodies were known always to appear from the first as unpaired, cartilaginous masses, until G. B. Howes found them to consist of a right and left pair in the embryos of *Sphenodon*.

[2] Regeneration of the tail can take place in *Sphenodon*, all Geckos, Anguidae, Gerrhosauridae, Lacertidae, most Scincidae, and in many Tejidae and Iguanidae; certainly not in chameleons, *Varanus*, Agamidae, snakes, crocodiles and tortoises. Often the tail is so brittle and the muscular cones are so loosely connected that part can be thrown off by the muscular exertion of the creature itself. The reproduced tail is, however, only a sham tail, since neither centra nor arches, but only a non-segmented rod or tube of fibrocartilage is produced. It is, however, invested with new muscles and with skin, but the scales often differ considerably from those of the normal organ, sometimes showing reversion to an ancestral form. For further detail see G. A. Boulenger, *P.Z.S.* (1888), p. 351, and (1891), p. 466.

and fuses with, the second intercentral piece. The entire atlas remains in a primitive, typically temnospondylous condition. On the other hand, in some Pleurodira, *e.g. Platemys* and *Chelys*, all the constituent parts of the atlas coössify and form a complete, solid vertebra, which articulates by a concave-convex joint with the true centrum of the second vertebra. The normal number of cervical vertebrae is eight in all Chelonians. The last cervical has sometimes, *e.g. Chelydra*, a very peculiar shape with strangely modified articular facets, in correlation with the retractile neck. The neural spines of the trunk vertebrae broaden out and fuse with the neural plates of the carapace. A tertiary modification takes place in many Pleurodira with the reduction of the neurals by the costal plates, which then meet in the dorsal line and cover the neural spinal processes. The caudal vertebrae are often much reduced in size, although not always in numbers, when the tail is very short, as in the marine turtles. In various species of *Testudo* about half a dozen of the last caudal vertebrae fuse together into a veritable urostyle, which is covered with a claw- or nail-shaped sheath of horn. In some of the gigantic tortoises of Mauritius this caudal vertebral complex is fully 3 in. long and 2 in. broad, of an extraordinary appearance.

The vertebrae of the *Lacertae*, or Lizards proper, are a direct further development of those of *Sphenodon*. The chorda disappears; the vertebrae are procoelous, with an articulating knob behind. Intercentrals, in the shape of osseous, unpaired nodules or wedges, persist on most of the cervical vertebrae; they are absent in the trunk and reappear in the tail, either as wedges or with chevrons. The first intercentral forms the central half of the atlas, with the neural half of which it is connected by suture. The second fuses mostly with the cranial end of the second centre and with the caudal and ventral surface of the odontoid, forming a downward-directed hook. Frequently the fusion remains incomplete, or the wedges may completely merge into the epistrophеal mass without leaving any outward traces. Boulenger has made the important observation that the intercentra of the tail are sometimes paired, *e.g.* in *Heloderma*. When the caudal vertebrae are strongly procoelous, the knob is very long and the chevrons are attached to its neck, having shifted on to the vertebra in front, while their basal intercentral piece, or pieces, remain in the original position. In *Ophisaurus* the chevrons are absolutely fused with the caudal ends of the centra and thus assume a superficial resemblance to the vertebrae of Urodela. The splitting of the tail-vertebrae and regeneration have been described on a previous page. The trunk-vertebrae of the Tejidae and the larger Iguanidae possess additional articulating processes and facets, besides the usual processes. The *Zygosphene* is a wedge-shaped process with two articular facets, which projects forward from the anterior side of each neural arch. The *Zygantrum* forms a corresponding excavation with a pair of articular surfaces on the hinder side of the arch. The crests on the tail and trunk of many lizards, *e.g.* Iguanidae, are entirely tegumentary structures and not supported by the axial skeleton, except in some chameleons, *e.g. Ch. cristatus*, and in the peculiar genus *Brookesia*; in these the accessory much-complicated processes are enormously elongated and support the high cutaneous crest which arises from the back, especially in *B. ebenaud*.

The vertebrae of the snakes are procoelous (figs. 27, 28, 29). Besides the zygapophyses, they have zygosphenes on the neural arches; the ribs articulate with the parapophyses. Long, unpaired hypapophyses arise from the centre of the anterior neck and trunk vertebrae to a variable extent. In *Dasypeltis* and *Rhachiodon* a considerable number of these processes perforate the oesophagus and act as crushers of the shell of the eggs which these snakes swallow. The often-repeated statement that these processes are capped with enamel is erroneous. The caudal vertebrae are devoid of chevron bones, but they carry paired hypapophyses, and they have transverse processes which also are generally bent downwards.

Lastly, the numbers of vertebrae composing the whole column and its various regions. In the snakes we can distinguish only between atlas and epistropheus, trunk and tail. The numbers vary exceedingly, in the trunk up to several hundred.

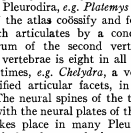

FIG. 27.—Lateral aspect of two trunk vertebrae of *Python*. *a*, articular processes of the zygapophyses; *na*, neural arches; *ns*, neural spines; *t*, parapophyses. *zs*, zygosphene.

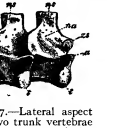

FIG. 28.—Posterior aspect of a trunk vertebra of *Python* (from nature). *a*, zygapophyses; *b*, ball on the surface of the centrum; *t*, parapophysis; *zg*, zygantrum.

The tail may contain only a few, *e.g.* in the burrowing *Typhlops*, *Glauconia*, *Uropeltis*; or it may be very long, as for instance in *Boa*. There is no obvious reciprocal correlation between the length of the trunk and the tail. In the other orders of reptiles the neck is well marked, except in the snake-shaped lizards. If we define as first thoracic vertebra that which is the first connected with the sternum, all those anterior being cervical, the neck-vertebrae number 5 in chameleons, 7 in *Sphenodon*, 8 in the Chelonians and in the lizards, with the exception of the majority of *Varanus*, which have 9 like the *Crocodilia*.

The *ribs*, having arisen as lateral, separated off processes from the basiventral elements, show many modifications in their proximal attachments. These can be best studied on the skeleton of a young crocodile (fig. 25, 7 and 8). The first pair of ribs is very long and broad, attached to the unpaired ventral piece of the atlas-ring; the tubercular portion is indicated by a very small rugosity. The second pair of ribs is still larger; the capitulum attached to the second intercentral piece which fuses with the odontoid process; the tubercular process is weak or represented only by a ligamentous connexion with a small knob of the odontoid process; consequently the tuberculum has shifted its attachment away from the second vertebra. The other cervical, and the anterior thoracic, ribs have complete

capitular and tubercular processes, the bodies and with dorsolateral

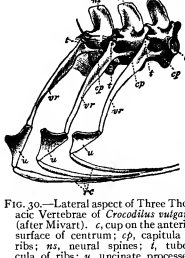

FIG. 30.—Lateral aspect of Three Thoracic Vertebrae of *Crocodilus vulgaris* (after Mivart). *c*, cup on the anterior surface of centrum; *cp*, capitula of ribs; *ns*, neural spines; *t*, tuberculа of ribs; *u*, uncinate processes; *vr*, dorsal or vertebral portions of the ribs; *rc*, ventral or sternal cartilaginous portions of ribs.

nective tissue only, with similar attachments as in crocodiles. The other cervical ribs are osseous; their short capitula retain their partly intercentral attachment, while the tubercula are carried by low processes of the centra. In the thorax both capitulum and tuberculum merge into one facet, which is gradually shifting farther tailwards and upwards until the attachment reaches them, and then lies upon the neuro-central suture. The first caudal vertebrae also possess ribs, very short and soon fusing with the diapophyses of the neural arches. In the cervical region of the *Chelonia* the ribs seem to be absent. In the thorax they retain their primitive intercentral position throughout life, assuming (except the first pair, which remains short and least modified) an absolutely intervertebral position. From the lumbar or presacral region backwards the capitula are gradually shifting upon short processes of the centra, until in the tail the vestigial ribs are carried by the diapophyses of the neural arches. In *Sphargis* (fig. 31) all the ribs are free; in

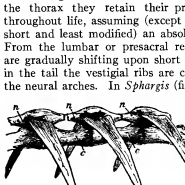

FIG. 31.—Three Vertebrae of *Sphargis coriacea*. *c*, vertebral centra; *n*, neural arches; *r*, ribs.

Ultimately this is resorbed and its place is taken by the dermal bone, which forms, so to speak, a cast of the rib. Several of the short presacral ribs, and of course the postsacrals, are not drawn into these enormous changes, although the carapace covers, and indirectly affects, them.

Certain changes initiatcd in *Sphenodon* are more marked in the ribs of the Lacertilia; cervical ribs are often long in the lower neck. In the trunk the capitular portions are often much reduced, and in these cases the ribs are suspended mainly by their tubercular portions, usually from the diapophyses of the neural arches near the anterior end.

In the snakes all the vertebrae, from the second cervical to the tail, carry ribs. These are very movable, articulating with a rather large, more or less vertically placed facet, which is borne by the parapophysis or transverse process; sometimes the

which, articulating with processes of the neural arches of their vertebrae, enclose typical transverse canals. In the posterior thoracic region the ribs are attached entirely to transverse processes of the neural arches, both capitular and tubercular portions having left the bodies or centra; the same arrangement prevails in the tail, but the ribs are very short and soon fuse with the processes. The two sacral ribs are very thick, articulating with the centra and the bases of their neural arch, and they even form part of the intervertebral joint! In *Sphenodon* the first three ribs are represented by bands of con-

rib retains traces of the original division into a capitular and tubercular portion. The ribs of the snakes, although long, consist only of their dorsal portions. In snake-shaped lizards, *e.g. Pseudopus*, rather long ribs begin with the fourth vertebra.

Uncinate processes are developed only in *Sphenodon* and in the Crocodilia. They are not homologous structures, arising in the former from the posterior margin of the middle of the dorsal portions of the ribs, overlapping the shaft of the next following rib; in the crocodiles they arise out of the middle portion of the ribs, remaining cartilaginous, whilst the middle portion coössifies with the dorsal. Only in *Sphenodon* and Crocodiles the thoracic ribs consist of three successive pieces; in the Lacertilia they consist only of the dorsal and the ventral or costosternal. The latter remain cartilaginous, or they calcify, but they never ossify.

The sternum and further modifications of the ribs of the trunk. —The sternum of most reptiles consists (1) of an anterior portion (presternum, Parker; prosternum, Fürbringer; mesosternum of Gegenbaur), which is generally broad, more or less rhomboid and carries the shoulder-girdle, and on its posterior sides several pairs of ribs; (2) of a posterior portion (mesosternum and xiphisternum of Parker; xiphisternum of Fürbringer; metasternum of Gegenbaur), which is narrow, sometimes metameric, carries several pairs of ribs, and generally divides into a right and left xiphoidal half, each of which is continued into one or more ribs. These ribs tend to lose their connexion, and in these cases the sternum ends in two typical xiphoid processes. The distinction between pre- and metasternum is arbitrary. In *Sphenodon* the broad sternal plate carries only three pairs of ribs, the 8th to 10th, and there is no xiphisternum. The other ribs of the trunk are long and compound, but they remain free and do not approach the mid-line. From the posterior edge of the sternum to the pelvis extends the complicated *parasternum*, embedded in the abdominal wall; it is composed of about two dozen sets of abdominal ribs, each set containing a right and a left and a median chevron-shaped piece. In the Crocodilia the presternum carries only two or one pair of ribs, always that of the 10th vertebra. The narrow, more or less metameric metasternum carries seven or eight ribs, the last one to three being xiphoidal. The post-thoracic ribs gradually decrease in length; about three presacral vertebrae have no ribs, and so are typically lumbar. The sacral ribs are generally the 25th and 26th in *Crocodilus* and *Alligator*; sometimes the 24th and 25th in *Gavialis*. The parasternum consists of only seven or eight transverse sets, each composed of two right and two left narrow splint-bones. All these parasternal elements belong to the category of dermal bones, together with those of the plastron of tortoises, inherited from Stegocephalian conditions.

The Lacertilia present an almost endless variety. The presternum is rhomboid and broad; it carries from three to six pairs of ribs, mostly four or five; the first thoracic rib is that of the 9th vertebra, the only exceptions being the chameleons with only five cervical vertebrae, and *Varanus*, which has usually nine cervicals like the crocodiles. The last cervical rib in these long-necked lizards is very long and has all the appearance of having but recently severed its connexion with the sternum. The presternum of Lacertilia sometimes has a window, *e.g.* some species of *Lacerta*, *Phrynosoma*, *Iguana*, or a pair of windows, *e.g. Agama*, *Liolepis*, *Goniocephalus*. The xiphisternum carries a variable number of ribs; it is either scarcely distinguished from the anterior plate, or it is long, and in these cases either double, *e.g. Iguana*, *Gerrhonotus*, *Varanus*, *Zonurus*, *Agama*, *Cyclodus*, *Lacerta*; or single, *e.g. Zonosaurus*. The post-sternal ribs shorten gradually in the majority of the Lacertae, and there is sometimes a ribless lumbar vertebra, *e.g.* in *Iguana*; in many Lacertilia, however, the ventral cartilaginous halves of the ribs are connected with those of the other side, either by ligaments, or they join together, forming complete hoops of thin cartilages. Such ribs occur in all Geckones and Chameleons, but also in many Iguanidae, Scincidae, and even in the Anelytropidae; their numbers vary much, from 27 in the Scincoid *Acontias meleagris*, 7–10 in *Polychrus*, 8 in *Chamaeleo*

vulgaris, 4 or 5 in *Anolis*, to 1–3 in some other iguanids, skinks and geckos. *Uroplates fimbriatus* has 14, and the last four pairs are separated from the dorsal portions of their ribs; similar discontinuity occurs in geckos, the median portions bearing a striking, although not fundamental, resemblance to parasternal ribs.

In the lizards with much reduced fore limbs, the sternum loses its connexion with the ribs from behind forwards; two sternal ribs existing in the Tejid *Ophiodes* and in the Scincoid *Acontias*, one only in *Pygopus*, none in *Ophisaurus* s. *Pseudopus* and *Anguis* (in the latter one rib is still connected in the embryo). The sternum is likewise quite free in *Chirotes* in spite of its functional limbs; the sternum is still a large plate, with a window, and ending in two long, xiphoid processes.

FIG. 32.—Rudiments of pectoral arch—1, of *Acontias meleagris*; 2, of *Typhlosaurus aurantiacus* (after Fürbringer).

Lastly, the sternum has vanished without a trace, as in the snakes, in some species of *Acontias*, in the Anelytropidae, *Dibamus* and *Aniella* (Fürbringer). In the limbless genera of Amphisbaenidae the sternum is very much reduced; in *Trogonophis* alone it is still represented by a narrow transverse bar connecting the ossicular vestiges of the shoulder-girdle; in the other genera the sternum has shrunk to a pair of nodules or to a single nodule.

The *pectoral* or *shoulder-girdle* in its completest condition consists of a right and left scapula, coracoid, precoracoid and clavicles, and an unpaired interclavicle or episternum. The dorsal portion of the scapula remains cartilaginous, with or without calcification, and is usually distinguished as supra-scapula. The ventral portion of the precoracoidal and coracoidal mass remains likewise more or less cartilaginous, rather unnecessarily distinguished as epicoracoid. Ossification begins near the glenoid cavity and thence spreads, eventually with the formation of a dorsal and a ventral centre. The resulting suture separates the dorsal or scapular from the ventral or coraco-precoracoidal mass. A kind of landmark, not always reliable, between coracoid and precoracoid is the exit of the supra-coracoidal nerve. The ventral margins of the coracoids articulate in tenon and mortice fashion with the antero-lateral margins of the sternum. The interclavicle, usually T-shaped, is a dermal bone and rests upon the ventral side of the girdle. The paired clavicles, sometimes fused together, rest upon the anterior end of the interclavicle and extend transversely to the acromial process of the scapula; the detail of the attachments varies much.

The girdle is most complete in *Sphenodon* and in Lacertilia. In *Sphenodon* the coracoid forms one continuous mass with the precoracoid, without further differentiation; the clavicles are fused with the interclavicle into one T-shaped mass, the cross-arms of which are attached to the acromia by ligaments. In the lizards (except *Heloderma*) the much-broadened central and anterior halves of the girdle are fenestrated; the windows, always closed by membranes, are bordered by bony processes, distally by unossified cartilage. The first window to appear, or the most constant, lies between the coracoid and its precoracoid; in *Anguis* it is the only window, in this case not a primary feature. In other lizards, *e.g. Uromastix*, a second window occurs between precoracoid and scapula, and even a third window can appear in the scapula itself, causing in many Iguanidae, *e.g. Amblyrhynchus* (see fig. 33, *ms.*), the so-called mesoscapula; an analogous window within the coracoid produces the mesocoracoid; unnecessary distinctions of little morphological value considering the great variability of these fenestrations in closely allied genera.

The chameleons have lost the clavicles and the interclavicle, and the scapula, which is very slender and long, is devoid of an acromial process. The coracoid forms one mass with the precoracoid, through the middle of which passes the supra-coracoidal nerve; the coracoids articulate by their whole bases with the sternum.

Geckos possess a complete shoulder-girdle; the ventral portion shows, *e.g. Hemidactylus*, three pairs of windows; only

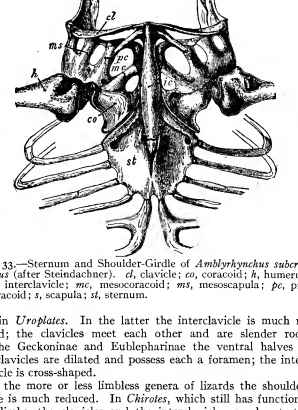

FIG. 33.—Sternum and Shoulder-Girdle of *Amblyrhynchus subcristatus* (after Steindachner). *cl*, clavicle; *co*, coracoid; *h*, humerus; *ic*, interclavicle; *mc*, mesocoracoid; *ms*, mesoscapula; *pc*, precoracoid; *s*, scapula; *st*, sternum.

one in *Uroplates*. In the latter the interclavicle is much reduced; the clavicles meet each other and are slender rods. In the Geckoninae and Eublepharinae the ventral halves of the clavicles are dilated and possess each a foramen; the interclavicle is cross-shaped.

In the more or less limbless genera of lizards the shoulder-girdle is much reduced. In *Chirotes*, which still has functional fore limbs, the clavicles and the interclavicle are absent, the coracoids are not divided from the precoracoids; in the limbless Amphisbaenidae the girdle is reduced to a pair of cylindrical ossicles in *Amphisbaena*, *Blanus* and *Trogonophis*; no vestiges exist in *Rhineura*, *Lepidosternon* and *Anops*.

Foramina in the broadened clavicles occur also in various Lacertae, for instance in the Iguanid *Laemanctus*, in the Scincoid *Trachysaurus*, in *Plestiodon*, *Zonosaurus* and in *Lacerta simonyi*, but not in *L. agilis*. In *Mabuia* the median portions are especially broad and show each two foramina. Their presence can be of but very doubtful taxonomic value.

The girdle of the Crocodiles is considerably simplified. Scapula and coracoidae, movably united, at least in younger specimens. The precoracoid is slightly indicated by a process of the coracoid, which is perforated by the supra-coracoidal nerve near the glenoid cavity. Clavicles are absent. The interclavicle is reduced to a long, flat splint-bone, which is firmly fused on to the sternal cartilage. The Chelonian shoulder-girdle shows several very remarkable modifications. Instead of lying outside the trunk, it has been transferred into the cavity of the trunk, the carapace with the ribs covering it from the outside. An explanation of the changes implied in this transposition is still extant. Chelonians are, moreover, the only reptiles besides Pterosauria in which the scapula is attached to the skeleton of the trunk. The scapulae stand in a more or less vertical position, and their dorsal end rests against the inside of the nuchal plate, where this is sutured to the first neural and the first costal plate, a little in front of and sidewards from the first short rib. From near its ventral end the scapula sends off a long process, which converges transversely with its fellow. This process, the clavicle(!) or the precoracoid of many authors, is the acromial process, the Plesiosauri giving the clue as to how an acromion can assume such an abnormal position. The coracoid, with a suture between it and the scapula, is very long and extends horizontally backwards, not meeting that of the other side. The sternum being

absent, and clavicles and interclavicles forming the epi-and endo-plastral elements of the plastron, the shoulder-girdle is nowhere in contact with the skeleton except at its dorsal end.

The Fore Limbs.—The humerus has near its upper end a median process, and at a variable distance a lateral process, near which is the biceps-fossa. Above the radial or outer condyle exists a foramen for the passage of the radial nerve in *Sphenodon*, in the Lacertilia, and in many Chelonians, *e.g. Cholone* and *Sphargis*; such an ectepicondylar foramen is absent in crocodiles. Above the ulnar condyle exists, but only in *Sphenodon*, the entepicondylar foramen, for the passage of the nervus medianus and brachial vessels. Thus *Sphenodon* alone possesses both foramina, the crocodiles neither.

Ulna and radius always remain distinct; the former is generally the stouter although not always the larger bone. The carpus may contain as many as 12 separate elements ulnare, intermedium, radiale, 2 centralia, a pisiform on the ulnar and a small nodule in a corresponding position on the medial side, and 5 distal carpals. In *Sphenodon* the centralia are sometimes fused into one, and the radial nodule is absent; the numbers of phalanges are, 2, 3, 4, 4 and 3 proceeding from the first to the fifth finger. The carpus of the Chelonia is likewise primitive, with various unimportant reductions; *Chelydra* possesses one or two centralia, whilst pisiform and extra radial are absent; both these bones are present in *Emys*, but the centrale fuses with the radial carpal, and the fourth and fifth distal carpal are fused together. In *Testudo* the pisiform is small; intermedium, centrale and radiale are represented by one bone only, and the first, second and third distal carpals are fused, whilst the two remaining are free. In the marine turtles the fore limbs are transformed into paddles; the ulna is considerably shorter than the radius; all the normal nine carpal elements remain distinct; the pisiform is much enlarged, helping to increase the paddling surface, and it has moved from the ulnar carpal to the side of the fifth distal carpal. The three middle fingers and toes have mostly 3 phalanges; the pollex and hallux have always 2; the number of phalanges of the fifth finger varies from 3 to 1, of the fifth toe from 2 to 0. The greatest reduction occurs in *Testudo* and its allied genera of typical land-tortoises, *Homopus*, *Pyxis* and *Cinixys*, the formula for the fingers being 2, 2, 2, 2, or 1, and 2, 2, 2, 2, or 0 for the toes. In *Pelomedusa* all the fingers possess 2 free phalanges only, owing to fusion of the first and second phalanges with each other.

Considerable advance is marked by the Crocodiles. The intermedium and centrale are lost, the pisiform is small, ulnar and radiale are considerably elongated and enlarged. Of the distal carpals the two last are fused into one bone, and the three first, together with the central, are transformed into a pad-like cartilaginous and ligamentous piece between the large radial and the first and second finger, to which the pad is firmly attached. The other fingers articulate with the "humatum" The result of the whole arrangement is the formation of two main joints, one between fore arm and carpus, the other intercarpal. The number of phalanges is 2, 3, 4, 4, 3.

The conditions prevailing in Lacertilia are connected with those of *Sphenodon*. The intermedium is lost, the other normal carpalia are present, also the pisiform; the first distal carpal is much reduced and the correspondingly enlarged radial carpal comes into articulating contact with the first metacarpal. The numbers of phalanges are 2, 3, 4, 4, and 2 or 3 for the fifth finger. The hand of the chameleons is most modified; the first three fingers form an inner bundle opposed to the outer or fourth and fifth fingers; in correlation herewith the third and fourth distal carpals are fused into one rather large mass; the other elements remain free, and A. Stecker has found a small intermedium present in the young, in a position which indicates that its subsequent absence is due to loss, not fusion with neighbouring elements.

The Pelvic Girdle.—The ilium is attached to the vertebral column by means of the two sacral ribs.[1] The ischia and the pubic bones join the ilium at the acetabulum, which is not perforated, except in crocodiles. The ischia and pubes invariably form symphyses at their ventral ends, except the so-called pubes of the crocodiles, and these two symphyses are further continuous with each other, dividing the pubo-ischiadic space into a right and left foramen obturatum of very variable size. They are small and round in *Testudo*, divided by a broad, bony bridge, larger in *Chelone*, separated by a chiefly ligamentous, partly cartilaginous string; largest they are in *Sphenodon* and in the Lacertilia. Frequently the symphysial portion at the anterior end of the pubic symphysis remains cartilaginous, unpaired, *e.g.* in most Chelonians and Lacertilians, comparable with the epipubis of Urodela. A corresponding cartilage, the os cloacae or hypoischium, is continued backwards, from the ischiadic symphysis towards the vent, serving for the attachment of sphincter muscles; it occurs in many lizards and tortoises. In the Chelonians the pubic bones are generally much stronger than the ischia, and they send out each a strong lateral pubic process, directed forwards and outwards; the obturator nerve passes through the wide obturator foramen. In the pleurodirous tortoises the ends of the ilia and those of the lateral processes of the pubes are much broadened and firmly anchylosed with the posterior costal plates and with the xiphiplastron respectively. The whole pelvis, like the shoulder-girdle, lies inside the body. The pelvis of *Sphenodon* is essentially like that of the Lacertilia. The pubes are slender; they send out a pair of lateral processes, near the base of which the obturator nerve pierces the shaft of its pubis. This lateral process is the homologue of the long, slender pubis of birds. The chameleons' pelvis is peculiar. The pubes are devoid of lateral processes, but from their anterior end arises a pair of small cartilages, in a transverse direction; their ends are connected by ligament with the median anterior portion of the ischiadic symphysis. The crocodilian pelvis is very aberrant. The ilium is broad and sends two processes to the acetabulum, which retains a foramen; the posterior process articulates movably with the ischium; the preacetabular process fuses in very young specimens with a separate, ossifying, cartilaginous piece, which then forms a rough joint with the anterior portion or process of the ischium, which closes the acetabulum on its ventral side. To this anterior ischiadic process is attached the freely-movable, club-shaped bone, generally called pubis. The homologies of these club-shaped bones and of the small bone mentioned above are not clear. The club-shaped bones remain asunder; the ischia form a long and firm symphysis. The obturator nerve passes out of the pelvis between the ischium and the club-shaped bone, close to the posterior margin of the latter.

The posterior limbs show essentially the same composition as the fore limbs, but the modifications in the various reptilian orders are much greater. The femur has generally a well-marked neck. Fibula and tibia remain distinct; the former usually shows a reduction in thickness. In the tarsus we observe never more than two proximal tarsal elements, a reduction due either to the suppression of the intermedium or to its enlargement and consequent loss of the tibiale element. The least-modified foot-skeleton is that of the Chelydridae, the lowest Chelonians. The proximal row is composed of a fibulare, and a much larger piece articulates with both tibia and fibula, the "astragalus"; the centrale is present; the first three distal tarsals remain separate, each carrying a toe. The fused fourth and fifth tarsals carry the fourth toe, and, laterally attached, the hook-shaped fifth metatarsal. *Chelone* shows the same arrangement, except that the centrale is fused with the astragalus; in *Testudo*, *Emys*, the fibulare, astragalus and centrale are fused into one broad mass, with the result of forming a crurotarsal and an intertarsal joint. The same arrangement reached by the Testudinidae is universal in the Lacertae, with the further modification that the three first distal tarsals fuse on to the proximal ends of their respective metatarsals. Most aberrant is the tarsus of Chameleons, in which the first and second toe one passing through the acetabulum. In birds it is likewise post- in mammals pre-acetabular.

[1] In all reptiles, except a few fossil groups, the ilio-sacral connexion is post-acetabular, *i.e.* it lies in a transverse plane tailwards from

form a bundle opposed to the rest; the fibulare and tibiale are fused into one bone; the fused fifth and fourth distal tarsals form a very large half-globular piece for the three outer toes, whilst the second toe is carried by the third distal tarsal, besides which there are three more small cartilages, one of which may be the displaced second tarsal or the still independent central. The tarsus of *Sphenodon* is like that of typical lizards, but none of its distal tarsals are fused on to metatarsals. The Crocodilian foot marks an advance. The astragalus is large, articulating well with tibia and fibula, and against the fibulare, which forms a typical, heel-shaped calcaneum. The fifth and fourth distal tarsals carry the fourth toe and the hook-shaped fifth metatarsal to which the fifth toe is reduced. The third, second and first distal tarsalia scarcely contain osseous nodules; they form together a wedge-shaped cartilaginous pad between the astragalus and the first and second toes. This attachment of the distal tarsals to the metatarsals reminds us of the Lacertilian condition, the result in either case being a still more marked intertarsal joint in addition to the cruro-tarsal.

Most well-footed reptiles retain all the five toes; only the crocodiles and a few tortoises have lost all the phalanges of the fifth toe. The phalangeal numbers are in the Lacertilia 2, 3, 4, 5 and 3 in the fifth toe; in chameleons 2, 3, 4, 4, 3; in most tortoises 2, 3, 3, 3, 2; but in *Homopus*, *Pyxis* and *Cinixys* 2, 2, 2, 2, 0; in the crocodiles 2, 3, 4, 4, 0. The embryos of crocodiles are said to be hyperphalangeal; *i.e.* as many as 7 phalanges in the fourth; 5 or 6 on the fifth finger; 6 on the fourth toe, and there are traces of the fifth toe. In the adult the fourth toe remains without a claw. Burrowing and living in sand, or humus, is in many lizards correlated with reduction of the limbs and their girdles. The vestiges of the hind limbs come to lie as near the vent as possible. The reduction occurs in various families, independently. In most cases the fore limbs disappear first, but in the Amphisbaenidae, cf. *Chirotes*, and in the Tejidae, the reverse takes place. Whilst degeneracy of the shoulder-girdle is delayed long after the loss of the anterior limbs, that of the pelvic arch precedes the loss of the hind limbs. Cope has drawn up a tabular statistic of the loss of digits, limbs and their girdles on pp. 202–3 of his work, *Crocodiles, Lizards and Snakes of North America* (Washington, 1900). The peculiar hind limbs of the Dibamidae are described in the article LIZARD.

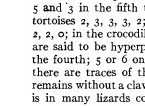

FIG. 34.—Vestiges of pelvic limb—1, of *Lialis burtonii*; 2, of *Anguis fragilis*; 3, of *Amphisbaena fuliginosa*. *f*, femur; *il*, ilium; *ip*, iliopectineum; *p*, pubis; *t*, tibia.

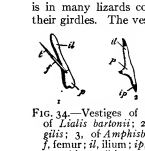

FIG. 35.—1, Vestigial pelvis and limb of *Glauconia macrolepis*. 2, The same parts of *Boa* (after Fürbringer). *f*, femur; *il*, ilium; *ip*, bone called "iliopectineum" by Fürbringer; *p*, pubis; *t*, tibia.

The majority of snakes have lost all traces of the limbs and their girdles, except the so-called Peropoda (see SNAKES: *Classification*). The vestiges of a *Boa* and of a *Glauconia* are shown in fig. 35.

Tegumentary System.

The skin of reptiles is characterized by the strong development of its horny stratum; on the outside of it exists a thin cuticular or epitrichial layer. An important feature in most lizards and in the snakes is the existence of a "subepidermoidal" or transitional layer which is produced by the migration of ectodermal cells into the cutis. The immigration takes place during the embryonic development, observed first by Kerschner, who, however, misinterpreted the process. Pigment cells, black chromatophores also, make their first appearance in the epiderm and then migrate into the transitional stratum, as has been first correctly stated by F. Maurer. The horny stratum is shed periodically, several times during the year, and as one entire piece in snakes and a few lizards, *e.g.* Anguidae; in most lizards, chameleons, geckos and in *Sphenodon* the thin, transparent colourless layer comes off in flakes. In crocodiles it is not shed except for the usual wear and tear, nor in tortoises, although in some *e.g. Chrysemys*, a periodical peeling of the large shields has been observed.

In all reptiles the cutis is raised into papillae, or folds. When the papillae are small the skin appears granular; when they are large, flat, mostly imbricating, they form scales; when they are very broad-based and still larger, they are called scutes or shields. The overlying epidermal covering partakes of these elevations, often *e.g.* in many snakes, with a very fine system of ridges of its own. Such a scale, cutis and horny sheath, may form spikes, or crests. They all have only basal growth. Thus, for instance, a shield of a tortoise-shell is a much flattened scale, or cone, with the apex more or less in the centre, surrounded by marginal ridges which indicate the continuous additional growth at the base. The central "areola" represents in fact the size of the shield at the time of hatching.

Of very common occurrence is the development of bone in the cutaneous portion of the scales; such osteoderms occur in many lizards, very strongly developed in the scutes of the crocodiles, especially on the back; they also occur in the skin of tortoises especially on their legs and on the tail, and they moreover constitute the peculiar shell of *Spargis* the leathery turtle (see TORTOISE). *Sphenodon* and chameleons are devoid of such osteoderms, in geckos they are likewise absent, but calcifications occur in their tubercular skin. A similar process seems to have produced the egg-tooth of crocodiles and tortoises (see under *Teeth* below). Calcareous deposits, or at least deposits of guanine and more commonly of carbonate of lime, play a considerable rôle in the skin of lizards and snakes. These waste products of the metabolism are always deposited within cells, and a favourite place is the subepidermal layer. In combination with superimposed yellow or red pigment, and with the black chromatophores as a foil, partial or complete screen to the light, as the case may be, these mineral deposits are to a great extent answerable for the colours and their often marvellous changes in the skin (see CHAMELEON).

Peculiar pits in the scales of snakes and crocodiles are described under *Sense-Organs* below.

The skin of reptiles is very poor in glands, but the few which exist are well developed. Crocodiles possess a pair of glandular musk bags which open by rather large slits on the under jaw, against the inner side of the jaw. Another pair of musk glands are the anal glands. During great excitement all these glands can be everted by the crocodiles. *Sphenodon* and snakes have only the anal pair. Water tortoises have inguinal glands, which secrete a strongly scented fluid, opening near the posterior rim of the bridge. *Trionyx* has additional glands opening near the anterior part of the plastron. Peculiar glandular structures are the femoral pores of many lizards. They lie in a line from the inner side of the knee to the anterior margin of the anal region, to which they are restricted in the limbless Amphisbaenidae. Each pore leads into a subcutaneous pocket, sometimes with slightly acinous side chambers, the walls of which produce a smeary, yellowish matter consisting chiefly of the *débris* of disintegrated cells which dries or hardens on the surface in the shape of a little projecting rod. They occur in both sexes, but are most active in males during the pairing season. Their use is unknown. It would be far-fetched to liken them to forerunners of the sebaceous portions of milk glands, although not so imaginary as to see in them and in the sensory pits of snake scales the forerunners of the mammalian hairs!

Claws, scarcely indicated in Batrachia, are fully developed in all limbed reptiles. The base is sunk into the skin like our own finger nails; the dorsal and ventral halves are differentiated into a harder, more curved dorsal sheath-like portion, and into the beginning of a sole, especially in crocodiles and in blunt-toed tortoises. The first claw to be reduced is that of

the fifth digit. The claws of many geckos are "retractile," like those of cats; the adhesive lamellae on the under side of their digits have already been described (see GECKO).

Nervous System.

The hemispheres are still much longer than broad, and pass, especially in lizards, gradually into the olfactory lobes, into which continue the ventricles of the hemispheres. The dorsal walls of these are thin, especially in crocodiles, although they possess already a considerable amount of grey matter. The basal masses of the fore-brain bulge into the roomy ventricles like cushions. Fibres referable to a corpus callosum are scarcely separated from those of the still much stronger anterior commissure. The epiphysis comes to the surface between the hinder parts of the hemispheres. The pineal eye is described below under *Sense Organs*. The hypophysis has but a shallow infundibulum. The mid-brain shows a pair of dorsal globular swellings, each with a cavity; they separate the hemispheres from the cerebellum. Of the hind-brain, the middle portion is by far the largest; although the dorsal wall of this cerebellum is thick, and rich in grey matter, its surface is still quite smooth and it shows no trace of an arbor vitae. It covers but a small portion of the wide fourth ventricle.

The spinal cord shows a brachial and a lumbar longitudinal swelling, especially marked in tortoises, but without a rhomboidal sinus. The cord is continued into the end of the tail.

The cranial nerves of the reptiles agree in their arrangement and distribution more with those of birds and mammals than with those of the Batrachia. The facial nerve sends a palatine branch to the palate and to the superior maxillary of the trigeminus, and a strong mandibular branch joins the third of the trigeminal, and further ramifications supply the sphincter muscle of the neck. The vagus and glossopharyngeus leave the cranium separately. The vagus then goes towards the

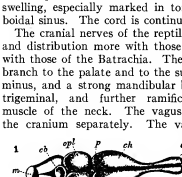

FIG. 36.—Brain of *Lacerta agilis*. (After Leydig.) 1, Dorsal aspect; 2, vertical longitudinal section. *ch*, cerebellum; *ch*, cerebral hemisphere; *m*, medulla oblongata; *olf*, olfactory lobes; *on*, optic nerve; *opl*, optic lobes; *p*, pineal body or epiphysis; *py*, base of pituitary body.

heart, which in the Sauropsida is far removed from the head, and there possesses another ganglion, variously called ganglion trunci vagi or g. nodosum. It is connected by a nerve with the large ganglion supremum of the sympathetic. From the cardiac ganglion, and from the continuation of the vagus, are sent off several branches in succession, which, having to pass below or tailwards from the transverse carotic, aortic and Botallian vessels, have to take again a headward course to the larynx and pharynx; a side branch enters the heart by its truncus. The main mass of the vagus then supplies lungs, stomach and further viscera. The accessory or 11th cranial nerve arises with about half a dozen roots which extend often beyond the second cranial nerve; they collect into a thin stem which leaves the cranium together with the vagus, with which it is often fused; it supplies the cucullaris s. trapezius muscle.

The hypoglossus arises by two ventral roots, leaving the skull by two holes through the lateral occipital bone, near the condyle. The united stem is invariably joined by strong branches from cervical nerves, always from the first, mostly also from the second, sometimes also from the third. The details vary much; occasionally there are three cranial roots and foramina, and then only the first cervical joins the hypoglossus; this often fuses with the glossopharyngeal or with the vagus. In the broad and well-muscularized tongue of the crocodiles the right and left hypoglossal branches form a complete ansa, an arrangement in which A. Schneider saw the infraoesophageal nerve ring of Invertebrata!

The spinal nerves each issue behind, or through, the neural arch of the vertebra to which they belong genetically. The first spinal, or suboccipital, nerve has no dorsal roots, and, having lost its vertebra, an apparently anomalous arrangement has come to pass, in this way, that there are x cervical vertebrae, but $x + 1$ cervical nerves, a condition prevailing in, and characteristic of, all Amniota. The hypoglossal-cervical plexus is separated from the brachial plexus by several metameres, according to the length of the neck. The brachial plexus is composed of about 5 nerves; the variations have been studied chiefly by M. Fürbringer. It is interesting to note that the brachial plexus still persists in snakes, although they have completely lost the anterior girdle and the limbs (Albertina Carlsson). A disturbance in the pelvic region likewise indicates in snakes the former existence of a pelvic or lumbo-sacral plexus, which in limbed reptiles is composed of about 5 nerves, the last of which is weak and in many cases (by no means the rule) issues between the two sacral vertebrae, sending one branch to the ischiadic, another to the public plexus which supplies the cloacal region. (For details of these plexuses see the papers by Mivart, Jhering and Gadow.)

The sympathetic system shows considerable modifications in the various orders and even families of the reptiles. In the neck region, in *Sphenodon* and most lizards it is on the right and left side, composed of two portions. One, more lateral and placed deeply, runs along the side of the vertebral column, starting from the first and second spinal nerves, with which it is connected by so-called rami communicantes; it is not connected with the other spinal nerves until it reaches, in the thorax, the first stem of the brachial plexus, and hereabout lies the so-called second thoracic ganglion. The other, superficial and more ventral, portion arises from the petrosal ganglion of the glossopharyngeal, and from the vagus ganglion, and then forms a long loop which joins the second thoracic ganglion. In its long course it sometimes, *e.g.* in *Varanus*, forms one common stem with the vagus before it splits off. At a variable distance, but not far above the heart, the vagus possesses a big swelling, the ganglion trunci vagi, and the sympathetic stem, in the same level, or farther down, has likewise a large ganglion, the g. supremum vagi, or first thoracic ganglion. The vagus ganglion receives several nerve strands from this big sympathetic ganglion, and then divides as described above.

In the crocodiles the deep portion of the sympathetic begins at the vagus and extends in rope-ladder fashion into the thorax, there being, as in birds, regular transverse communicating branches with the spinal nerves, and the longitudinal strands run through the transverse foramina between the capitular and tubercular portions of the cervical ribs. The other, ventral, portion starts by a right and a left branch from the vagus ganglia, but both branches unite at once into one unpaired stem, which is deeply embedded in the middle line between the ventral muscles of the cervical vertebrae. Very thin branches connect this unpaired stem with the right and left sympathetic portions; small ganglia are embedded in the unpaired nerve.

The so-called second thoracic ganglion is in reality a compound of all the sympathetic ganglia of the four or five metameres of the brachial plexus. It forms the point of juncture of the deep and the superficial cervical sympathetic portions. From the posterior region of the thorax backwards the right and left strands run along their side of the vertebral column, with a communicating branch and a ganglion for each metamere; sometimes one or more successive ganglia are combined, for instance near the cloaca. After having supplied the latter, the sympathetic system appears exhausted and is continued into the tail by but a very thin strand, which runs between the caudal vein and artery. The best illustrations of the sympathetic system are those by Vogt (neck of crocodile), J. G. Fischer (many

lizards), H. Gadow (cloaca of crocodile), J. F. v. Bemmelen (*Sphenodon* and others), W. H. Gaskell and H. Gadow (heart of tortoise).

Sense Organs.

1. *Tegumentary Organs of some Tactile or other Sense.*—Reptiles possess apparently no traces of those tegumentary sense organs which, belonging to the domains of the trigeminal and vagus nerves, have spread far over the body in fishes and batrachia. They were developed by those classes in correlation with their essentially aquatic life. This does not apply to the reptiles which, as a class, are of absolutely terrestrial origin. Nevertheless all recent reptiles possess numerous low sense-organs, "tactile bodies," in most parts of the skin, connected with the regional, spinal nerves. They are most obvious in snakes, appearing as one or more little colourless spots near the apex of each scale on the back. The spot is formed by a little cluster of epidermal cells, connected with a sensory nerve. Their lowest stage they show in *Sphenodon* and in lizards, whilst in crocodiles they have reached a higher stage, at the bottom of the pit, since the tactile bodies, mostly several together, have sunk into the cutis, below the epiderm, forming a little pit, mostly near to the anterior margin of the flat scutes. They are most obvious on the belly of crocodiles, whilst in the American alligator such pits are scarcer, not because the organs are absent, but because these have sunk still farther into the skin. The last stage is that met with in tortoises, which possess such tactile bodies in considerable numbers in the softer subepidermal layers, beneath the large horny shields which themselves show no traces of them.

2. *Taste.*—The respective organs do not seem to have been investigated. That they exist is amply proved by the careful predilection for certain kinds of food which is shown especially by vegetarian tortoises and lizards, independent of smell. Many lizards are, for instance, very fond of sugar.

3. *Nose.*—The sense of smell is well developed in all reptiles. In none is the olfactory organ degraded; that the nasal passages, the nose itself, are never degraded is explained by the fact that all reptiles invariably breathe through the nose, except snakes during the act of swallowing their prey. The nostrils, always paired, are frequently provided with valves, to shut out the water, or sand. In some water tortoises, *e.g.* *Trionyx*, *Chelys*, the nostrils are prolonged into a soft, unpaired proboscis. Double tubes exist in the snake *Herpeton* (see SNAKES, Opisthoglypha). The nostril leads into an antrum or vestibulum, this again into the nasal cavity proper, at the dorsal farther end enters the olfactory nerve, whilst ventrally it leads into the naso-laryngeal duct, with its posterior narial opening, or choana. The ducts are short in snakes and lizards, the choanae lying in the front part of the palate, but in tortoises and crocodiles they are placed far backwards, as has been described under *Skull* above. Into the nasal cavity projects, from the septum, a concha, least developed in tortoises, most in lizards and snakes. Crocodiles show a beginning of separation into several conchae as in birds and mammals. A large nasal gland lies against the lateral, or ventral, side of the outer wall of the nasal cavity, into which also opens the naso-lacrymal duct. Jacobson's organ, of uncertain function, is present in most reptiles. It is paired. In tortoises it is still placed within its nasal cavity, against the median wall, and is still nothing but a recess of the same and its mucous lining. In lizards and snakes the organ has become completely separated from the nasal cavity, lying below it and opening, each by a separate passage, into the palate mouth, close to or still within the choanae. In snakes it is mushroom-shaped, with a very short stalk. It lies immediately below the floor of the nasal capsule, and the membranous wall of the cavity on which it lies is covered and protected by a bone, commonly called the turbinal, which extends out from the median nasal system to the maxilla. In crocodiles these organs are vestigial and soon disappear.

4. *Ear.*—In crocodiles the outer ear lies in a recess, dorsally overhung by the lateral edge of the bony squamoso-frontal bridge; it carries a flap of skin, provided with muscles, to close the ear tightly. In lizards the outer ear is quite unprotected, and when the meatus is very short and wide, the drum is quite exposed. No reptiles possess cartilages comparable to the mammalian outer ear. *Sphenodon*, chameleons, snakes have no outer ear, the skin passing over the region. So also in tortoises, but in some of the aquatic kinds its position is well indicated by softer and thinner skin; in others, for instance marine turtles, a thick leathery plug, or a bigger scale marks the former position. In various lizards, chiefly burrowing in sand, the ear passage is very narrow, or closed. The middle ear or tympanic cavity is quite obliterated in snakes, Amphisbaenas and some other snake-shaped lizards. In *Anguis* may exist individual traces. The cavity communicates with the mouth. In lizards the communication is a wide recess, lined with black pigment, so that in these creatures the whole auditory chain can easily be inspected from the opened mouth. In tortoises the recesses are contracted into the Eustachian tubes, each of which opens by a separate aperture into the roof of the mouth. In the crocodiles part of the cavities is transformed into an intricate system of canals and passages. The two Eustachian tubes open together in the mid-lines protected by a valve, between the basiocciptal and basisphenoid; thence arises a median passage which with lateral arms and loops extends upward through the occiput into the cranial roof, communicating with the tympanic cavity, and further continued through the quadrates and beyond into the mandibles, by the siphonium.

In spite of the obliterated tympanic cavity of snakes, and the closed up outer ear passage and absence of a tympanic membrane in snakes and tortoises, these creatures can hear very well. The same applies to *Sphenodon*, but it seems doubtful whether chameleons can hear.

Through the whole middle ear, from the fenestra ovalis to the drum-membrane, stretches the chain of auditory ossicles or cartilages, partly attached to the posterior wall by the common lining membrane. The arrangement appears simplest in snakes, in chameleons and in tortoises, not because it is primitive but because it is so much reduced, partly in correlation with the abolition of the outer ear. In these creatures the columella goes as a bony, slender rod straight to the middle of the quadrate, against which it leans, or with which it articulates by a short piece of cartilage, the extra-columella. Here the whole chain ends. It looks like a proof that columella = stapes, extra-columella = incus, and quadrate = malleus; or, with the usual ignoring of the little extra-columellar piece, that quadrate = incus, Gegenbaur's favourite impossibility. In those lizards which have a tympanic membrane conditions are far less reduced. The extra-columellar piece sends out three distal processes; one leans on to the middle of the tympanic membrane, the second usually is fastened to the bony dorsal rim of the meatus, the third is directed downwards and is continued as a thin ligament towards the inner angle of the articular of the mandible, but before reaching this it comes to grief, being squeezed in between the quadrate and the posterior end of the pterygoid. The columella proper is of no account in snakes and tortoises, since it is reduced to very short distal pieces attached to the base of the tongue; but in lizards it remains in its original length, or it even lengthens, and shows many vagaries in its position and attachments. In embryos of *Sphenodon* and lizards it arises from near the junction of the columella with the extra-columella. It becomes very long, too long for the available space (perhaps correlated with lingual functions), and it forms a high loop, thereby causing the peculiar loop of the chorda tympani; the upward bend of the hyoid becomes connected with the parotic process of the cranium. Next aborts the portion between this connexion and the original proximal end of the hyoid, near the columellar mass. The upper end of the hyoid *either* remains attached to the parotic process (various lizards and *Sphenodon*) whence the lingual apparatus remains suspended, *or* the hyoid, having broken loose, leaves a little cartilage, Versluy's cartilage, behind, at the end of the parotic process, and the hyoid horn remains free, in the majority of lizards. In *Sphenodon*, whilst

passing the distal portion of the extra-columella, part of the hyoid fuses with it, often forming thereby a little hole, the remnant of imperfect fusion.

In the crocodiles the arrangement is at first complete and diagrammatically clear, not obscured by vagaries of the hyoid, which is free and much reduced. In the embryo the large extra-columellar cartilage, abutting against the tympanic membrane, and with another process against the quadrate, sends its third, downward, process as a thick rod of cartilage to the posterior inner angle of the mandible with which it is directly in cartilaginous continuity. It was W. K. Parker's mistake to call this cartilage the cerato-hyal. In young embryos it looks like an upward continuation of Meckel's cartilage, much resembling mammalian conditions. But in nearly ripe embryos this stage is already reduced to a string of connective tissue, cartilage remaining only at the upper end, and where this string enters the mandible lies the *siphonium*, the tube which connects the air cavities of the mandible with the Eustachian passages, the long connecting channel becoming—side by side with the extracolumellar-mandibular ligament—embedded into a canal of the quadrate, so that in older stages, and above all in the adult, the proper display of the whole arrangement requires a

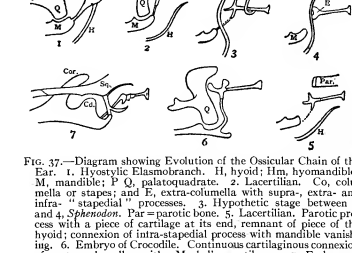

FIG. 37.—Diagram showing Evolution of the Ossicular Chain of the Ear. 1. Hyostylic Elasmobranch. H, hyoid; Hm, hyomandible; M, mandible; P Q, palatoquadrate. 2. Lacertilian. little anatomical skill. The whole string, whether cartilaginous or ligamentous, which connects the downward extracolumellar process with the articulare, is of course homologous with the continuation of Meckel's cartilage into the malleus of foetal and young mammals; and the chain of bones and cartilages between the auditory capsule, fenestra ovalis, and the proximal part of the mandible is also homologous wherever such a chain occurs; lastly, fenestra ovalis and membrana tympani are fixed points. Consequently columella=stapes, extracolumella of Sauropsida=lentiform+incus+malleus of Mammalia.

The *inner ear* has been studied minutely and well by C. Hasse, E. Clason and G. Retzius. It is enclosed by the periotic bones. The fenestra rotunda is surmounted by the opisthotic, the fenestra ovalis by the same and by the pro-otic, and this protects also the anterior vertical semicircular canal. The posterior canal is opisthotic, the horizontal is pro- and opisthotic. The anterior canal is the largest of the three, a feature characteristic of the Sauropsida. The *lagena*, with its own acoustic papilla, begins to show a basilar membrane with papilla, at the expense of that in the sacculus. In *Sphenodon* and lizards a slight curving of the lagena indicates the beginning of a cochlea, and a scala is developed in crocodiles, but neither cochlea nor scala is specially twisted. The endo-lymphatic ducts end as closed sacs, in lizards and snakes, in the roof of the skull, between the occipital and parietal bones. They reach an enormous development in many geckos, where they form large twisted sacs beneath the skin, covering the sides of the neck, which then assumes a much swollen appearance. They contain white otolithic masses, with lymph. It is remarkable that the extent of these sacs varies not only in allied species, but even individually, independent of sex and age, although they are naturally liable to increase with age.

5. *Eyes* are present in all reptiles, although in many of the burrowing snakes and lizards they may be so completely covered by the skin as to have lost their function. Most reptiles have upper and lower lids, moved by palpebral muscles, and a third lid, the nictitating membrane, which can be drawn over the front of the cornea from the inner angle obliquely up and backwards. Its mechanism is simplest in lizards. A muscle, a split from the retractor muscle of the eyeball, arises from the posterior part of the orbit, is attached to the posterior wall of the eyeball, and there forms a pulley for the long tendon which arises from the median side of the orbit and passes over the back of the ball forwards into the nictitating membrane. Contraction of this muscle draws the membrane backwards and over the eye. In crocodiles and tortoises the tendon of the nictitating membrane broadens out into a muscle (*M. pyramidalis*), which arises from the median side of the posterior portion of the ball; above the optic nerve it crosses over the broad insertion of the retractor of the ball, without being much guided by it, although this muscle by its contraction slightly prevents the nictitating tendon and muscle from touching the optic nerve.

It is easy to recognize the mechanism of birds as a combination of the two types just described; their musc. quadrates s. bursalis is of course the single muscle of the lizards, but now restricted to, and broadened out upon, the eyeball.

Special Modifications of the Lids.—In the snakes the upper and lower lids are reduced to the rim, and the nictitating membrane has become the permanent cover, which protects the eye like a watch-glass, leaving between itself and the cornea a space, drained by the naso-lacrymal duct, and behind this space the eyeball moves as freely as in other animals. A similar arrangement exists in the true geckos, not in the Eublepharidae, which still possess the outer lids. In some lizards, especially such as live in deserts, the middle of the lower lid has a transparent disk, and it is always the lower lid which is drawn over the eye, the upper in nearly all Sauropsida being much smaller and less movable; for instance, some specimens of the Lacertine genus *Eremias* in Africa and India. In the Indian genus *Cabrita*, and in *Ophiops* of Africa and India, the lower lid is permanently fused with the rim of the shrunken upper lid and forms a transparent window superficially looking like that of the snakes. Exactly the same arrangement has been developed by *Ablepharus*, one of the Scincidae.

The eyeball is provided with the usual rectus and obliquus muscles, in addition to a retractor oculi. Apparently all reptiles possess a pair of Harderian or nictitating glands, which open in front, in the nasal, inner corner, and lacrymal glands which open likewise into the conjunctival sac, but near the outer or temporal corner. The secretion of both is drained off through the lacrymal canals, which in lizards open below in the outer wall of the posterior nares; in snakes they open into the mouth by a narrow aperture on the inner side of the palatine bone.

The walls of the anterior half of the sclerotic of lizards, tortoises and *Sphenodon* contain numerous cartilaginous or osseous plates, which imbricate in ring shape; they are absent in snakes and crocodiles. Internally the eye of most reptiles possesses at least traces of a pecten; very small indeed in tortoises, or in crocodiles where it is represented by only a few mosslike, pigmented vessels. In many lizards these vessels, arising from near the optic nerve, form a network which extends right up to the posterior side of the lens; in others, especially in Iguanidae, is developed a typical, large pecten, deeply pigmented with black, fan-shaped or umbrella-shaped, sometimes folded. In chameleons it is a short cone; apparently

quite absent in *Sphenodon*. A falciform process and other remnants of a campanula are absent. In most of those reptiles which have but a rudimentary pecten, the retina is supplied by hyaloid vessels which spread over the surface of the vitreous body; such superficial vessels disappear with a greater development of the pecten, and the retina receives a choroid supply; special retinal arteries from the a. centralis retinae, and veins, exist in snakes.

Ciliary processes of the choroid are usually small, a proper ciliary body being least developed in crocodiles; all reptiles have a ciliary muscle. The shape of the contracted pupil varies from round to a vertical slit; the latter is most marked in *Sphenodon*.

The retina shows usually a fovea centralis, sometimes but slightly indicated by a shallow depression; it is well marked in chameleons. The retina contains only cones, rods being absent; fat-drops on the apex of the cones are common; their usual colours are green and blue.

6. *The pineal, median* or *parietal eye* is the terminal organ of the epiphysis of the brain, with which it is connected by a nerve-containing string. Among recent reptiles it exists in *Sphenodon* and in the Lacertilia, with vestiges in snakes. It is embedded in the median parietal foramen. Externally its presence is generally marked by the scales being arranged in a rosette, with a transparent central scale. The organ itself is distinctly a dioptric apparatus, with all the essential features of an eye; a pigmented retina of the arthropodous simple type surrounds an inner chamber which is nearly filled by a cellular globular mass which projects into it from above; this is the so-called lens, in reality much more like the corpus vitreum in its still cellular condition, while the real lens has to be looked for in the superimposed tissue. The whole organ is best developed in *Sphenodon*, even in the adult; but whether it is still functional, and what its function is, remain unknown. The throwing of a beam of light upon this eye, by means of a lens, produces no effect. Whilst in *Sphenodon* the "lens" is rather dull and the efferent nerve is still present, in various lizards the "lens" is more perfect, but the nerve is degenerated. We conclude that the whole organ is now without the least visual function, whilst in various extinct groups of reptiles and Stegocephali it was fully developed. It has been well investigated by de Graaff, W. B. Spencer and A. Dendy.

The Muscular System.

A useful account of the differentiation of the muscles in the main reptilian groups, with their almost endless modifications in correlation with walking, climbing, swimming, gliding and burrowing, with limbs complete or absent, would fill several pages of this article and would necessitate many illustrations. The literature is great; it comprises many good detailed descriptions of various kinds of reptiles, and several monographs. M. Fürbringer has devoted a whole series to the muscles of the neck, shoulder-girdle and fore limbs. Hand in hand with these investigations went that of the innervation, without which myology would lack scientific value. The present writer has devoted much time to the muscles and nerves of the pelvis and hind limbs, and has, in tabular form, compared them with those of other vertebrates. The results of all these labours are rather disappointing, except for the study of myology as such, which raises many interesting questions. Broadly speaking, the muscles of typical reptiles, crocodiles and lizards are more highly differentiated (by no means always more numerous, but more individualized by origin and insertion, the behaviour of the tendons), more effectively disposed according to mechanical principles, than in Batrachia, and less than in birds and mammals. This can easily be proved, whether we take for comparison the muscles of the neck, of the larynx or hyoid, or limbs. Lowest in general stands *Sphenodon*, next to it the lizards, highest the crocodiles, while tortoises and snakes show the greatest reduction and specialization. In the tortoises it is the non-yielding box of carapace and plastron which has caused great changes within the region of the trunk proper. First, all the epiaxial muscles have vanished; the same applies to the costal muscles; but traces of dorso-lateral muscles occur on the inside of the posterior half of the carapace, extending as a longitudinal system from one transverse process to the next in many of the lower aquatic tortoises, as perfectly useless vestiges; or more striking, these muscles exist in the young, and disappear with age, for instance in *Testudo*. Secondly, it is rather surprising that the rigid shell has offered so little or no inducement to the muscles of the girdles, neck and tail to transfer their origins upon it. Thirdly, the retractile neck of the typical cryptodirous tortoises is correlated with a pair of long retractor muscles, which in the shape of a pair of broad, vertical ribbons (between which is received the S-kinked neck) extend far back along the vertebral column, almost to the level of the pelvis.

In snakes, owing to the loss of limbs and girdles, only the spinal and costal muscles remain, besides of course those of the abdomen and the visceral arches. The vestigial muscles of the limbless lizards and of the peropodous snakes have been monographed by Fürbringer in much detail without great results.

Respiratory Organs.

All reptiles breathe by lungs, and they possess no vestiges of gills, not even during their embryonic stages, although gill clefts are invariably present in the embryo. Nor does any part of the outer skin assist respiration, as is so commonly the case in Batrachia; yet, strictly speaking, the lungs are not the only organs of respiration in the class of reptiles, since various tortoises possess additional breathing apparatus in the anal sacs and in certain recesses of the throat, to be mentioned farther on.

The *Larynx*, instead of lying at the bottom and far back in the throat, as in the Batrachia, is considerably moved forwards so as to rest upon the hyoid and to project into the pharyngeal cavity. A pair of arytenoid cartilages, enclosing the glottis, rest upon several more or less fused tracheal cartilages, which thus represent the cricoid, but there is no thyroid cartilage. A small process from the anterior median edge of the cricoid is the beginning of an epiglottis. Vocal chords are indicated by lateral projecting folds of the inner membranous lining of the larynx, and are in a few cases effective in producing a voice. Crocodiles and alligators have a powerful, loud, bellowing voice; many tortoises utter weak, piping sounds, especially during the pairing season; and also various lizards can emit a feeble squeak, for instance, *Psammodromus hispanicus*, and the geckos. *Sphenodon*, at least the males, can grunt. Snakes have no voice; they can only hiss like all other reptiles, but a curious modification exists in the larynx of the North American *Coluber s. Pityophis*, e.g. *C. melanoleucus*: the epiglottis is more enlarged, and laterally compressed so that the hissing sound is much strengthened by the vibration of the epiglottis. The larynx possesses a constrictor and a dilator muscle, which arise from the arytenoids and from the cricoid respectively, and are attached to the hyoid. Chameleons have bladder-shaped sacs which can be filled with air from a slit immediately below the larynx. For further modifications see G. Tornier.

The *Trachea* is furnished with cartilaginous rings and semirings, which extend to the lungs. As a rule the trachea is straight; in *Crocodilus americanus* it forms a loop; and similar curvings occur in various tortoises in correlation with the retractile neck. The two *bronchi* are shortest in *Sphenodon*, very long in most tortoises, where they begin frequently already half down the neck. In *Sphargis* most of the trachea is divided by a longitudinal partition. It is an advance upon amphibian conditions that the bronchus enters its lung no longer at its apex, since an anterior, pre-bronchial lung-portion has come into existence. This is still very short in *Sphenodon*, while in crocodiles, tortoises and in the highly developed Varanidae the bronchus enters near the middle of its lung, so that the anterior portion is nearly as long as the posterior. The shape of the trunk influences that of the lungs. In the snake-shaped forms, both snakes and lizards alike, the lungs have become

very asymmetrical, one of them being much larger than the other, which is often quite aborted.

The simplest form of lungs is that of *Sphenodon*; the pre-bronchial part is still small. Each lung is still a sac with one large lumen, the walls being honeycombed. In the lizards the walls are more spongy, and several septa begin to extend more or less far from the walls into the lumen, towards each bronchus. Some of these septa begin to cut the lung into lobes, especially in *Varanus* and in chameleons. In the latter exists a further specialization, a side-departure, in the shape of several long, hollow processes which are sent out from the posterior portions of the lungs and extend far into the body-cavity and between the viscera. By means of them these creatures can "blow" themselves out. They are of morphological interest since they are first stages of air-sacs so marvellously developed in birds, and possibly also in various Dinosaurs. In the Amphisbaenids the left lung alone remains.

The lungs of crocodiles have reached a considerably higher stage. They alone in reptiles are, on the ventral side, completely shut off from the viscera by a pleural, partly muscularized, membrane. From each bronchus extend a number of broad septa towards the periphery, dividing the originally single lumen into many chambers, perhaps a dozen, from the walls of which wide secondary or parabronchial canals extend into the alveolar meshwork, in very regular arrangement, in series like organ-pipes.

The lungs of the tortoises are, in adaptation to the peculiar shape of the body, stowed away along the back, as far as the pelvis, and only their ventral surface is covered by a strong peritoneal membrane which receives muscular, diaphragmatic fibres. The inner division of the lungs into chambers has progressed so much that a sort of mesobronchus has become discernible; the arrangement of the side-bronchi is far less regular than in crocodiles; the whole lung is much more honeycombed, meshy and spongy.

The mechanism of breathing of tortoises is not such a puzzle as it is sometimes stated to be. Of course the rigid box of the trunk excludes any costal, or abdominal breathing, but by protruding the limbs or the neck, piston-like, an effective vacuum is produced in the box. Moreover, the throat is distended and worked considerably by the unusually large and very movable hyoid apparatus, by which air is pumped into the lungs.

The lungs of the snakes are very thin-walled, with a very wide lumen, and only for about the first half from the heart backwards the walls are alveolar enough for actual respiratory function, while towards the blind end the sacs are so thin and sparsely vascularized that they act mainly as reservoirs of a large amount of air. Frequently their posterior portions receive blood vessels not from the pulmonary arteries but directly from those of the trunk. In correlation with the long, cylindrical body, the lungs are much elongated and they are not equally developed. The asymmetry shows great differences in the various groups, consequently the asymmetry has been developed independently in those groups. It is usually stated that the left lung is much smaller than the right. This is but rarely the case. The most recent observations are those of E. D. Cope (*Proc. Am. Phil. Soc.* (1894), xxxiii. 217). In Boidae both lungs are large, although unequal: the left or more dorsally placed one being the larger. In *Ilysia* the right is functional, the left is ventral and vestigial. In *Rhinophis* the right is very small, the left larger. In *Glauconia* and *Typhlops* the right lung alone is developed: the left is quite aborted. In Colubridae the left lung alone is functional, while the right is vestigial. There is no trace of the right in Elapinae and Hydrophinae and most Viperidae. In the Colubridae the right, or ventral, lung is, when present at all, reduced to a length of from 2–5 mm., and it then communicates with the anterior portion of the left lung by a foramen, in level of the heart, whilst the right bronchus is aborted.

A further complication is the so-called tracheal lung, which is present in Typhlopidae, *Ungalia* of the Boidae, in *Chersydrus* of the Acrochordinae, in the Hydrophinae and Viperidae. This peculiar organ is a continuation of the anterior portion of the functional lung, extending far headwards, along the trachea, with the lumen of which it communicates by numerous openings. In *Chersydrus* this mysterious organ is "composed of coarse cells and without lumen, extends from the heart to the head, and is discontinuous with the true lung; the trachea communicates with it by a series of symmetrical pores on each side." In *Typhlops* it extends likewise from the heart to the throat, as a cellular body but without lumen or connexion with either trachea or lung.

Thyroid and Thymus.

The *Thyroid* of the reptiles is a single, unpaired organ, placed ventrally upon the trachea and one or other of the arterial trunks, more or less distant from the heart. In snakes it lies on the mid-line near the heart; a little farther up in *Sphenodon*; still farther in lizards, and chameleons near the root of their gular sac. In tortoises it is globular, at the division of the carotic trunk. In crocodiles it is bilobed.

The *Thymus* is paired. It is largest in crocodiles, extending on either side of nearly the whole neck, along the carotids and jugulars. In the tortoises they are much shorter; in *Sphenodon* and lizards are two pairs, more or less elongated; in the snakes are sometimes as many as three pairs, elongated but small, attached to the carotis near the heart. As usual the thymus bodies become much reduced with age.

The Spleen.

The *Spleen* varies much in shape and position. In lizards it is mostly roundish, elongated in *Sphenodon*, and placed near the stomach; in crocodiles it lies in the duodenal loop behind the pancreas; similarly situated in snakes, but in the tortoises it is much concentrated, large and attached to the hind-gut.

The Body Cavity.

The *body cavity* of the reptiles is subdivided into several sacs or cavities by serous membranes of peritoneal origin. The number of these subcavities differs much in the various groups. The pericardial sac is always complete. In tortoises the lungs are retro-peritoneal, a dense serous membrane spreading over their ventral surface from the walls of the carapace forwards to the liver and shutting off a saccus hepato-pulmonalis from the rest of the peritoneal cavity. Snakes possess, besides the modifications mentioned above, separate chambers for the stomach, right and left liver, and for the gut, whilst the pleural cavities as such have been destroyed. In lizards a "post-hepatic septum" divides liver, lungs and heart from the rest of the intestines. This transverse vertical septum is best developed, almost complete, in some of the Tejidae, in others it seems to be more imperfect, and it is probably a further development of the suspensorial ligament of the liver, which is ultimately inserted upon the ventral wall of the body.

The subdivisions have reached their highest development in the crocodiles, there being, besides the pericardial and the two pleural cavities and the usual peritoneal room, a right and left hepato-pericardiac, an hepato-gastric, and an hepato-pulmonal sac. The caudal and ventral edges of these liver-sacs are fused on to the ventral body-wall, thus producing a complete transverse partition, headwards of which lie the lungs, liver and heart. This partition, morphologically not homologous with the mammalian diaphragm, more resembling the imperfect structure in birds, acts, however, as a perfect diaphragm, since it is well furnished with muscular fibres. These are attached to its whole periphery, with centripetal direction, especially on the ventral half. These fibres are transgressors upon this septum from a broad sheet of muscles, which, inserted together with the septum upon the body-wall, arise from the iliac bones, the pubes, and the greater portion of the last pair of abdominal ribs. This broad muscular sheet, covering the intestines, is the so-called abdominal diaphragm or peritoneal muscle. Its continuation upon the transverse septum is the crocodilian musc. diaphragmaticus, and in functional effect very similar

to that of the Mammalia, whilst the abdominal diaphragm undoubtedly causes abdominal respiration. We have seen that these crocodilian conditions do not stand quite alone, but are connected with simpler features in the other reptiles. Two recent, very lengthy papers have been written on this subject by I. Bromann (1904) and by F. Hochstetter (1906), besides two in 1902 by G. Butler.

The Heart.

The *Heart* of all reptiles is removed from the head and is placed well in the thorax, in the Varanidae even a little beyond it. Only in snakes the heart lies headwards from the hilus of the lungs, not caudalwards, generally at about the end of the first fifth of the body. The batrachian sinus arteriosus is reduced, one set of semilunar valves guarding the entrances into the truncus arteriosus which now issues directly from the heart. A sinus venosus exists still in *Sphenodon* and Chelonians, in which it may even receive separate hepatic veins, but in crocodiles, lizards and snakes the sinus as such exists no longer, forming part of the right atrium. All the hepatic veins enter the stem of the posterior vena cava, which henceforth enters the heart as inferior vena cava. This, the largest, and the right and left anterior vena cavae, are the only three veins which enter the right atrium. Into the left open the two pulmonary veins. Right and left atrium have in all reptiles a complete septum between them. The ventricular portion shows considerable steps towards the differentiation into a right and a left ventricle, but the partition is very incomplete in tortoises, lizards and snakes, quite complete only in the crocodiles. The most important character of the reptilian heart, absolutely diagnostic of it, is the fact that the systemic vessel which leaves the right ventricle turns to the left to form the left aorta, while the stem which comes from the left ventricular half arches over to the right as the right aorta. It is not at all necessary to conclude that this fact excludes the reptiles from the mammalian ancestry and to hark back to conditions as indifferent as are those of the batrachia. The Foramen Panizzae shows the way to a solution, how ultimately all the arterial blood from the left ventricle may pass, first through the root of the right arch, then through this hole into the left, whilst the rest of the right arch, and the root of the left, obliterate. The difficulty is not much greater than that of deriving the birds' condition from the reptilian. The Foramen Panizzae, which exists only in the Crocodilia, lies exactly where the right crosses dorsally over the left aorta. The whole is *not* the last remnant of the originally undivided truncus, as is taught generally, but it is a new foramen, a hole dug by the left arterial blood into the venous right aorta. According to the recent observations made by F. Hochstetter the foramen comes into existence in a very late embryonic stage.

Whilst the batrachian single ventricle possesses only one ostium ventriculare or outlet into the truncus, in the reptiles the inter-atrial septum extends considerably downwards into the base of the ventricle, so as to produce a right and a left niche, and correspondingly two ostia instead of one. The atrio-ventricular valves are still membranous, even in crocodiles; attached to them are muscles, trabeculae carneae, from the very trabecular walls of the ventricle; they are especially spongy in tortoises. By means of the arrangement of some of these trabeculae, perhaps still more through the confluence of their basal portions, an imperfect ventricular septum is initiated. Certainly even in tortoises, which represent the lowest stage, the venous blood is received into and sent out by the same right side of the ventricle, while the arterial blood is correspondingly managed and dodged by the left side. That there is not very much mixture of the two kinds of blood, in spite of the wide communication in the ventricle, is further due to the peristaltic systole and diastole of the various divisions of the heart.—The heart of Chelonians is broader than long. In correlation with the very much flattened body of *Trionyx* and its allied genera, the whole heart is dislodged from the middle line, far over to the right side; the vessels of the left side are correspondingly much elongated and have to cross the neck, trachea and oesophagus.—The apex of the heart is attached to the pericardium by a special ligament in the Crocodilia and in many Chelonia, *e.g. Testudo*, but it is absent in *Clemmys*. Sometimes this little ligament sends a tiny blood vessel into the liver.

Arterial System.

Crocodiles.—The *left* aorta crosses obliquely beneath the right and gives off only the coeliac, just before joining the right aorta in the level of the eighth thoracic vertebra. The aorta descendens sends off, besides intercostals and other segmentals into the body-wall, the mesenteric, right and left iliac, a pair of renal and ischiadics, a cloacal and the caudal artery. The *right* aorta forms the main root of the a. descendens. Close to the heart it sends off two coronaries and a short carotis primaria which divides at once into two anonymae, the left of which is the stronger. The right anonyma divides into the subclavia and collateralis colli, the left into subclavia and carotis subvertebralis. Each subclavia sends off an a. vertebralis communis, which runs headwards and, with another longer branch, downwards, giving off intercostals, and then joins the descending aorta.

Tortoises.—The *left* aorta is rather more separated from the truncus, which it crosses ventrally in an oblique forward direction; it sends off a left cardiac to stomach and oesophagus, a coeliac and mesenteric, and then a communicating branch to the right aorta. The a. descendens gives off paired suprarenals, spermatics, very large iliacs, then a pair of renals, hypogastrics and the caudal. Each iliac artery divides into a recurrent intercostal anastomosing with the axillaries, an epigastric (sending off the crural and anastomosing with thoracics and humerals), and other arteries to abdominal muscles and to the shell. The hypogastrics supply the cloacal region and then continue as the ischiadics. But there are many anastomoses which cause great variation in the different tortoises. The *right* aorta sends off a right cardiac, the coronary, and the right and left anonymae which are quite symmetrical, each dividing into subclavia and carotis; in the angle lies the thymus.

Lizards.—Two common carotids arise either side by side, or by one carotis primaria, from the right aortic root. In the majority each common carotis ascends the neck and then divides into the vessels for the head and another branch which turns back and goes into the descending part of the aortic arch. In chameleons two carotid stems ascend the neck and there is no recurrent vessel. In the Varanidae the two common carotids start from a long carotis primaria; there is no recurrent vessel. The vertebral arteries come from the origin of the subclavians and run to the head in a very lateral position. The subclavian arteries (which occur also in limbless lizards) arise far away from the carotids out of the descending arch of the right aorta, in a level often far behind the heart. "Anonymous" arteries are consequently absent in lizards.

Snakes.—The left aorta is stronger than the right, both combining soon to form the descending aorta. Owing to the absence of fore limbs and shoulder-girdle the conditions are much simplified. In most snakes the right aorta sends off but one strong carotic vessel which represents the left carotis communis whilst the right is much reduced or even quite absent; further, there is only one vertebral artery, which either runs along the right side of the vertebral column or it divides soon into a right and a left vessel along the neck. In conformity with the reduction of one lung there is usually but one pulmonary vessel.

Venous System.

Crocodiles.—Each, right and left, anterior vena cava is composed of a subclavian (axillary and external jugular), an internal jugular, common vertebral and an internal mammary vein. The posterior vena cava is composed of the two revehent renals, veins from the genital glands and ducts, revehent veins of the suprarenals (which, like birds, still have a portal system), and the big vein from the fat body. Thus the vena cava posterior

perforates the right liver, receiving from it many hepatic revehent veins and also the big revehent vessel from the left lobe; next it receives the coronary vein and then enters the heart as inferior vena cava. The portal vein arises out of the coccygo-mesenteric (which comes out of the bifurcation of the caudal), collecting the blood from most abdominal viscera and from the thorax and breaks up in the right liver. The rest of the venous system is rather complicated. The big caudal vessel divides near the vent, receives an unpaired cloacal and a rectal vessel, and goes off to the right and left, each of which trunks receives an ischiadic and an inter-sacral vein and then divides into the v. renalis advehens which breaks up in the kidney, and the abdominal vein. The latter are interesting; they run in the abdominal wall, receive the obturator and other pelvic veins, intervertebrals and intercostals, the crurals, and the epigastrics out of the body-wall. Then these two abdominals (Rathke's internal epigastrics) go to the liver, which they enter to either side of the gall bladder, collecting also blood from the stomach and from the vertebral column. Both break up in the liver. Consequently all the blood from "below the heart" passes through some portal system—renal or hepatic—except that which comes from the genital glands and ducts and from the fat body.

Tortoises.—The venous system much resembles that of the crocodiles, but many and wide anastomoses, especially on the inside of the carapace and plastron, exist between often distant vessels, so that one lucky injection may fill the whole system. There are three advehent renal veins which collect on the back of their kidney into one stem; they dissolve completely into a portal system, and leave the kidney on its ventral surface as one v. renalis revehens. The right and left then form the v. c. posterior which perforates the posterior margin of the right liver, then headwards of the liver takes up the hepatic and enters the heart. The three pairs of afferent renal veins are composed as follows. The externa collects from the shell and the abdominal muscles; the posterior collects along the rectum from the genital glands, the bladder, and from parts of other pelvic viscera; the anterior comes from the anterior part of the shell and runs backwards to the kidney, with frequent anastomoses with the other advehent renal veins. The abdominals arise, as in the crocodiles, with the external advehent renal from the lateral continuation of the bifurcated caudal, which takes up vessels from the pelvis, the shell and the crural. The abdominal itself takes up a femoral vein, vessels from the abdominal and pelvic muscles, and from the plastron, and then dives into the body-cavity, receives veins from the fore limbs, and enters the right lobe of the liver, there to break up. The hepatic portal collects from the intestinal tract, spleen and pancreas. Consequently in tortoises all the blood from below the heart passes through some portal system.

The most important peculiarity of the Lizards is the condition of the abdominal veins; they combine into a single stem (after having collected the blood from the fat body and from the ventral body-wall of the pelvic region) which dives into the body-cavity to join, embedded in the ventral hepatic ligament, the left branch of the portal vein. The chief characteristic of the abdominal is that it does not communicate directly with the caudal, and that it forms an unpaired stem. The renal portal system receives its blood from the tail, the hind limbs, the abdominal wall and the urino-genital organs, all the blood passing into a right and a left advehent vein. The suprarenal portal system drains from the abdominal wall and the suprarenal bodies, and issues into the revehent renals. These, with some intervertebrals and with hepatics, constitute the inferior vena cava.

Lymphatic System.

The lymphatic vessels frequently accompany the big arteries of the trunk, either surrounding them with a meshwork or ensheathing them completely, especially in tortoises. The lymphatics from the head and neck combine with stems which accompany the veins of the fore limbs; they join the thoracic ducts and these open into the brachio-cephalic veins, as they do in birds. The lymph from the tail flows into the ischiadic veins or into the advehent renal veins. Reptiles possess only a posterior pair of lymph-hearts; they are placed near the root of the tail against the ends of one of the transverse processes. In snakes they lie in a space protected by the ribs and transverse processes of the original sacral vertebrae. Lymph glands proper are not developed in reptiles, except in the shape of the so-called mesenteric gland of crocodiles.

Blood.

The red corpuscles are invariably oval, and, since they still possess a nucleus, biconvex. Numerous measurements have been made by G. Gulliver (*P.Z.S.*, 1845, pp. 93–102), their long and short axes range between 0·015–0·023 and 0·006–0·21 mm. respectively. That means to say they are very much larger than those of mammals, considerably larger than those of most birds, and in turn much smaller than those of amphibia.

Digestive System.

Teeth.—All the groups of recent reptiles have teeth, except the tortoises, which have lost even embryonic traces of them. In the under jaw they are restricted to the dentary bones. In the upper they are almost universal in the maxilla and premaxilla, although the latter has lost them in most of the snakes. The pterygoids are toothed in most snakes and in a few lizards, *e.g. Lacerta* and *Iguana*. The palatines are toothed in *Sphenodon* and in some lizards.

Only the young of *Sphenodon* and the chameleons have a few small teeth on the vomer. The teeth themselves consist of dentine with a cap of enamel and with cementum around their base. In the crocodiles they are planted into separate alveoles in the maxilla, premaxilla and under jaw. In lizards they are either pleurodont, *i.e.* they stand in a series upon a longitudinal ridge which projects from the lingual side of the supporting bone, or they stand upon the upper rim of the bone, acrodont. In either case they are, when full grown, cemented on to the bone. Acrodont are amongst lizards only the Agamidae; the Tejidae are intermediate, almost acrodont. All the snakes and *Sphenodon* are acrodont. The latter is in so far peculiar as its broad-based, somewhat triangular teeth are much worn down in old specimens; originally there are several in the premaxilla, but the adults bite with the somewhat curved-down portions of the premaxillaries themselves, or with what remains of the anchylosed bases of the original teeth, which then, together with the bone, look like a pair of large chisel-shaped incisors. The lateral edges of the palatines of *Sphenodon* likewise carry teeth, those of the mandibles fit into a long slit-like space between the palatine and the maxillary teeth. This is a unique arrangement. Further, it is surprising that in this old, Rhynchocephalian type the supply of teeth has become exhausted, whilst in the other recent reptiles the supply is continuous and apparently inexhaustible. The new teeth lie on the lingual side of the old set, and long before the new tooth is finished part of the base of its older neighbour is absorbed, so that the pulp-cavity which persists in nearly all reptilian teeth becomes free. Ultimately the old tooth is pushed off and the new is cemented into its place. In the crocodiles it has come to pass that several sets of teeth are lodged more or less into one another's bases. Where crocodiles and alligators collect habitually the ground is sometimes found strewn with thousands of teeth, large and small, every creature shedding about seventy teeth many times during its long life.

Some or all teeth of various families of lizards and snakes have a more or less pronounced groove or furrow along their anterior convex curve. The usefulness of this furrow in facilitating the entering of saliva into the bitten wound is merely incidental, but this preformed feature has in many snakes been improved into a fearful weapon. In the Opisthoglypha a few of the most posterior teeth in the maxilla are enlarged, have deeper furrows, and lie in the vicinity of the poison ducts. In the Proteroglypha one or two of the most anterior maxillary

teeth are enlarged and furnished with a deep groove for the reception of poison. In the Solenoglypha or Viperidae the enlarged teeth of the Opisthoglypha have moved to the front, owing to reduction of the anterior portion of the maxilla. The latter, much shortened, moves with the firmly anchylosed poison fang upon the prefrontal as its pivot, being pushed forward, or "erected," by the ectopterygoid bone, which connects it with the pterygoid, and this in turn can be moved forwards and backwards, together with the quadrate. (See fig. 24, skull of *Vipera nasicornis* and the diagram of the mechanism in article SNAKES.) The still unfinished fang the furrow is open, later the edges close together and the end of the duct of the gland itself is surrounded by the substance of the growing basal portion of the tooth, so that the furrow is converted into a canal continuous with that of the gland. The poison is now sure to be projected into the very deepest part of the wound with the precision of a surgical instrument. The Proteroglypha, with their long, non-erectile maxillae, bite, or, like *Elaps*, deliberately chew their victim; the Viperidae rather strike with the mouth widely open. The teeth of snakes and lizards are often of irregular size; but it is rare that a kind of differentiation into incisors, canines and molars occurs. In many lizards, especially in Iguanidae, some teeth are multicuspid, trilobed, or somewhat serrated; in *Tiliqua*, universally known as *Cyclodus*, most of the hinder teeth are roundish crushers.

FIG. 38.—Two Aspects of a Tooth of *Heloderma horridum* (after Bocourt). 1, antero-internal aspect of the tooth, showing a very deep longitudinal groove; 2, postero-external aspect of the same tooth, showing a very faint longitudinal groove.

Lizards and snakes are born with an "egg-tooth" which is lost a day or two after hatching. Its function is the filing through of the eggshell. This tooth, always unpaired, is in *Tropidonotus natrix* one millimetre long and half a millimetre broad at its base, which rests upon a middle depression of the premaxillary bone; it stands forward above the mouth and is curved upwards. In crocodiles and tortoises the same effect is produced by another organ, which, as in birds, lies well outside the mouth on the top of the end of the snout and consists of a little cone of calcified epidermis.

Tongue.—The tongue of the crocodiles is very broad and flat, and with nearly its whole broad base attached to the floor of the mouth; however, in its whole circumference its edge is well marked, and it arises on its hinder border as a transverse fold which meets a similar fold descending from the palate in front of the posterior nares. By these folds the mouth can be completely shut off from the nasal passages into the trachea. The upper surface of the tongue contains several dozen large flat papillae, each with a central pit-like opening; it is not known whether they are gustatory organs. Besides scarce mucous glands in the tongue, there is an absence of salivary glands in the mouth. The tongue of tortoises is likewise short, broad, and not protractile, and there appears to be only a sublingual gland; the surface of the tongue is covered with velvety papillae in the terrestrial, with larger folds in the marine Chelonians. In the Lacertilia the tongue presents a number of variations which have been referred to as diagnostic characters of the various families of LIZARDS (*q.v.*). The chief modifications are the following: Either flat and broad, not protractile, *e.g.* Agamidae; or the body of the tongue is somewhat cylindrical, elongated, and the whole organ can be protruded; lastly, the anterior half of the tongue, which can be protruded, is retractile or telescoped into the posterior portion, *e.g.* Anguidae. In nearly all cases the posterior dorsal end of the body of the tongue is well marked off by a margin raised above the root, a character which does not occur in any snake. The upper surface is either smooth or curved with velvety, flat, or scaly, always soft; papillae. In the majority the tip of the tongue is bifid, either slightly niched or deeply bifid. The tips contain tactile corpuscles, although sometimes covered with a horny epithelium. The most specialized is the tongue of the chameleon. The body of this tongue is very thick, club-shaped, fleshy and full of large mucous glands which cover it with a sticky secretion. The base or root is very narrow, composed of extremely elastic fibres and supported by a much elongated copular piece of the hyoid. This elastic part is, so to speak, telescoped over the style-shaped copula, and the whole apparatus is kept in a contracted state like a spring in a tube. A pair of wide blood vessels and elastic bands extend from the base into the thick end, which in an ordinary chameleon can be shot out to a distance of about 8 in.

The tongue of the snakes is invariably slender, smooth and almost entirely retractile into its posterior sheath-like portion. It is always bifid and contains many tactile and other sensory corpuscles by which these creatures seem to investigate. The tongue is always protruded during excitement. How this is done is not very obvious, since the hyoid apparatus itself is much reduced. There is a niche in the middle of the rostral shield to permit protrusion of the tongue whilst the mouth is shut, and probably herewith is correlated the almost universal absence of teeth in the premaxilla. The tongue and the larynx are placed very far forwards in the mouth and, during the act of swallowing, the larynx approaches the chin, or it may even protrude out of the mouth to secure breathing during the often painfully protracted act.

Of *Glands*, sublingual glands are of general occurrence in reptiles; they open near the root or in the sheath of the tongue. Labial glands seem to be absent in crocodiles and tortoises, but upper and lower labial glands exist in lizards and snakes, generally in considerable numbers. *Heloderma* is the only lizard in which some of these glands—those along the lower jaw—produce a poisonous secretion, each small gland conducting its secretion towards the base of one of the somewhat furrowed teeth. In the snakes, upper and lower labial glands are well developed for salivation. It is the upper series which attracts our interest by its eventual modification into the deadly poison glands. Probably the saliva of most snakes, like their serum, possesses toxic properties. In most of the harmless Colubrine snakes the glands extend in a continuous row from behind the premaxilla along the whole of the upper jaw, with numerous openings. In the Opisthoglypha a gradual differentiation takes place into an anterior, middle and posterior portion; the middle, extending from below and behind the eye backwards, is the thickest and yellowish in colour; behind it follows a small portion, reddish grey like the anterior portion, with which it is more or less continuous below the middle complex. Thus, still rather indifferent, is *Dryophis*. In *Dipsas, e.g. D. fusca*, the middle portion has become predominant; some of its enlarged ducts lead to the pair of posterior, enlarged and well-grooved, maxillary teeth. It is this middle portion which becomes the characteristic poison gland with one long duct. The gland itself retains its position, all the other upper labials, except the anterior series, abort. In the Viperidae the poison duct opens near the base of the perforated fangs, which, owing to the shortening of the anterior portion of the maxilla with its teeth, have come to be the only teeth in the upper jaw. In the Elapine, still more in the Hydrophine snakes, the position of the gland and its duct is the same, but the duct has been carried past the smaller harmless teeth which stand in the maxilla and open at the base of the anterior maxillary teeth. The effect is the same, although the poison fangs are not homologous, in the one case the most posterior, in the other the most anterior, of the maxillary series. In *Doliophis*, one of the Malay genera of Elapine snakes, each poison gland sends an enormously elongated recess far into the body-cavity. (For some other details see SNAKES; VIPER; and RATTLESNAKE. The best account of the buccal glands and teeth of poisonous snakes is that by G. S. West, *P.Z.S.*, 1895, pp. 812–826.)

Stomach, &c.—In lizards and in *Sphenodon* the wide pharynx and oesophagus passes gradually into the stomach, which is

more or less spindle-shaped, never transversely placed. The walls of the stomach are thrown into longitudinal folds which contain the specific gastric glands, whilst glands are absent in the oesophagus, excepting scattered and very simple slime glands. The circular muscular fibres of the stomach are much stronger than the longitudinal fibres. The end of the stomach is generally marked by a pyloric valve. The walls of the mid gut are said to be devoid of glands. The end gut, marked by a circular valve, is considerably wider and there is a caecum, mostly left-sided, largest in leaf-eating lizards, rarely absent, as, for instance, in *Anguis*. The absorbent portion of the rectum is always strongly marked off from the cloaca by a circular fold or sphincter, which projects into the widened coprodaeum of the cloaca. In those lizards which, like *Varanus*, have no urinary bladder, there are two successive sphincters, marking off two chambers, one, the upper or innermost, for the reception of the faeces, the lower for that of the urine. In adult crocodiles the stomach is transformed into a gizzard; it is more or less oval, with a wide fundus and with two opposite apo-neurotic or tendinous disks whence radiate the muscular fibres. The muscular walls remain, however, comparatively thin, like those of birds of prey. There is a distinct pyloric stomach and then follows the pylorus. The inner lining of the stomach is velvet-like with numerous gastric glands which form groups with net-like interstices. There is a distinct duodenal loop which contains the pancreas. The more convoluted mid gut is lined with net-like meshes which farther back assume a longitudinal zigzag arrangement; towards the end gut the walls become quite smooth, but in the end gut the walls again show a very narrow-meshed structure. None of these folds of the mid and hind gut is said to contain digestive glands; they seem to be entirely absorbent. The oesophagus of most tortoises shows longitudinal folds with very numerous mucous glands. In the Chelonidae the pharynx and adjoining part of the gullet are covered with little tubercles upon each of which opens a small gland. Farther down they give way to large, more or less conical papillae, which assume a considerable size, point backwards, and are covered with a somewhat horny epithelium. Similar conical, horny papillae exist also in *Sphargis*, in which the oesophagus, moreover, makes a long loop half round the stomach before passing into it, an absolutely unique feature. The transition into the stomach is quite gradual. The latter is strongly muscular, partly transversely placed, and possesses often a very distinct pyloric stomach. In *Chelone* conical papillae extend into the cardiac portion. In the majority of tortoises the inner lining shows longitudinal folds with numerous small glands, mucous and gastric, but their distribution differs much in the various families and even genera. The lining of the mid gut shows either longitudinal folds or a network, without glands, except in some cases, Lieberkühn crypts, *e.g.* in *Trionyx*, not in *Testudo* and *Chelone*. The hind gut begins suddenly, but there is no caecum; its inner walls contain numerous glands in *Testudo, Emys*, not in *Chelys, Trionyx, Cinosternum*.

In the snakes the oesophagus is very thin-walled and passes imperceptibly into the stomach, which curves in a longitudinal direction, scarcely wider in the middle. Its muscular coating is surprisingly weak. There is a small pyloric portion. Mucous and especially long-bodied gastric glands are numerous. The wall of the mid gut carries numerous papillae variably arranged, velvet-like, or densely crowded little blades supported by longitudinal or by meshy folds. The hind gut is short, often constricted into several successive chambers, mostly smooth inside; there is a short, rather wide caecum which seems best developed in Viperidae; sometimes absent. The total length of the snakes' gut is always short, there being only short folds possible or necessary in the body cavity, which itself is of extra-ordinary length. Yet, while in *Typhlops* the gut is almost straight, it forms numerous convolutions in *Tortrix*.

Whilst in all other reptiles the gut, at least stomach, liver and mid gut, are suspended by the mesentery from the vertebral column and hang free into the body cavity, in some snakes, especially often described in *Boa* and *Python*, the body cavity is cut up into numerous spaces, by peritoneal folds which connect neighbouring twists of the canal into bundles and attach them to the ventral surface of the body-wall. Probably the gut is thereby secured against dislocations in adaptation to the peculiar twisting contortions of the body, especially in the act of climbing. The mesentery of reptiles is remarkable for the possession of smooth, non-striated, muscular fibres. In most lizards, not in other orders, the peritoneum so far as it covers the abdominal cavity shows a deep black pigmentation; this pigment is situated in the connective tissue, not in the epithelial layer; it stops suddenly towards the thorax. In some lizards, *e.g.* in *Anguis*, the black pigment extends, more or less scattered, upon the mesentery and thence upon the intestines. The same pigment colours the pharynx with its recesses entirely black in many lizards. There is no compensating correlation between this internal pigment and that in the outer skin.

The *Liver* of lizards is more or less bilobed; more so in crocodiles; while in tortoises the broad right and left lobes are connected by a narrow isthmus. In the snakes it is much elongated and extends from the heart backwards along the right side of the oesophagus, closely connected in its long course with numerous short branches into, or from, the inferior vena cava and the portal vein. A gall bladder is always present. The ducts into and from the cyst sometimes form a complicated network, for instance in *Varanus* (F. E. Beddard); the bile is carried by one or more ducts into the duodenal portion of the gut. The microscopic structure of the reptilian liver has been compared with that of monotremes by M. Fürbringer.

The *Pancreas* is a compact body attached to the duodenal region, which surrounds it by a loop in the crocodiles, as is the case in birds and mammals.

The *Cloaca* of the reptiles shows a great advance upon the simple batrachian arrangement. It is no longer one common chamber, but consists of three successive chambers with the further tendency of separating the temporary retention and the passage of the faecal, urinary and genital products from each other. The arrangement is simplest and most typical in the lizards. There is first the *proctodaeum* or vestibulum of the cloaca, epiblastic in origin. Its outer boundary is formed by the cloacal lips, covered so far by the usual scaly integument. Just within this chamber arise the paired copulatory organs, and, when they are present, as in *Sphenodon* and snakes, the two anal glands. Secondly, the *urodaeum*, middle or urino-genital chamber, hypoblastic in origin. It is separated from the proctodaeum by a more or less circular fold which is provided with sphincter muscles, which form the true vent, and this is always round; whilst the outermost opening in lizards and snakes is a transverse slit. Farther inwards, headwards, the urodaeum is shut off by another circular fold, generally very well marked, especially in its dorsal half, which is higher and thicker. Into the dorsal, and innermost, recess of this urodaeum open the genital and urinary ducts; on the ventral side arises the urinary bladder. The whole chamber is always empty, being only a passage room, and in the female the copulatory chamber. The urine is of course collected in the bladder; when this is absent the fluid is pressed into the third chamber, the *coprodaeum*, which is often subdivided into two, or even three, successive rooms by circular folds. This coprodaeum serves for the temporary storage of the faeces, eventually mixed with the urine. Micturition and defaecation are in most lizards two successive separate acts.

The snake's arrangement is a side-departure of that prevailing in lizards. The urodaeum is transformed into a dorsal recess into which open above the oviducts, while the ureters open below, in the caudal corner. A horizontal fold imperfectly shuts off the wide urino-genital chamber or recess from the ventral half of the original urodaeum. The coprodaeum is marked above and below by strong sphincters. There is no urinary bladder.

In crocodiles the protodaeum is rather shallow, but long; from its ventral wall arises the unpaired copulatory organ, the basal investing membranes of which continue into the ventral

half of the uro-proctodaeal fold, near which open the male ducts. Very young crocodiles possess a typical middle chamber or urodaeum, into the dorso-lateral corners of which open the ureters, but soon the strong circular fold between urodaeum and coprodaeum disappears completely, so that both chambers now form one large oval room, which is used solely for the storage of the urine, there being no bladder. The faeces are kept in the not specially dilated rectum.

The cloacal arrangement of the Chelonia is a further development of early crocodilian conditions, but it has become rather complicated and shows a surprising resemblance to that which still prevails in the Monotremes. The proctodaeum is deep and very long, especially in the males. From its innermost and ventral walls arises the large copulatory organ. From the urodaeum is separated off a deep ventral recess into which open the ureters and the genital ducts, and it is continued by a long neck into the large bladder. Between the dorsal wall of this recess and the ventral wall of the main portion of the urodaeum arises a horizontal fold which, diverging, is continued on to the investing skin of the penis, helping to form the edges of the deep longitudinal furrow on its morphologically dorsal surface. If the lips of this furrow were closed, urine and all the genital products would pass through this urethral canal, but in reality only the semen is conducted through it (the furrow during the state of turgescence being transformed into a closed tube), whilst urine and eggs escape through the wide slit near its inner end. This is an arrangement almost the same as that of *Ornithorhynchus*. The urodaeum is separated from the rectum by a strong sphincter, and there is, as in the crocodiles and mammals, no special coprodaeum. The Chelonian urodaeum is further complicated by the occurrence of a pair of large anal sacs, thin-walled diverticula on the dorsal side. Such sacs, not to be confounded with the anal glands of other reptiles, exist in many water tortoises, especially in the Chelydidae, also in various aquatic Testudinidae, *e.g. Emys*, in *Platysternum*, and sometimes in *Trionyx*; they are absent in the Chelonidae and in the typically terrestrial tortoises. These sacs have highly vascularized walls and a considerable layer of circular and longitudinal non-striped muscular fibres; their inside is sometimes villous, never glandular. They are incessantly filled and emptied with water through the vent, and act as additional respiratory organs, like a kind of water lungs. When such a tortoise is suddenly taken out of the water it squirts out a stream of water, which is not, as is usually supposed, the urine from the bladder.

In connexion with the cloaca may be mentioned the frequent occurrence of *peritoneal* canals. In the tortoises their abdominal openings are situated in a recess of the peritoneal cavity close to either side of the neck of the bladder; in the females they extend as funnels, generally blind, into the cloaca on or near the base of the clitoris. In the males they extend, without having communication with the cavities of the corpora cavernosa, and without ramifications, as canals along the dorsum penis and *either* terminate blindly in the glans (*Testudo*, *Chelone*), *or* they open, each by a small orifice, in the groove at the base of the glans. In crocodiles these canals are short and open near the base of the copulatory organ, protected by a small papilla. They are present in both sexes, but are still closed in newly hatched and very immature specimens. In an adult Nile crocodile they are wide enough to pass an ordinary lead pencil. The function of these outlets from the body cavity is obscure. In *Sphenodon* the writer has found them as closed funnels which project as soft papillae into the proctodaeum a little to the right and left and caudalwards from the urino-genital papillae.

Urinary Organs.

The *kidneys* of the reptiles show, like those of the birds and mammals, a considerable advance upon those of the Batrachia. They are, in the adult, represented entirely by the metanephros; the segmental tubes have no longer any nephrostomes opening into the body cavity, not even during any time of their development, and it has come to a complete separation of the efferent genital ducts from the kidneys and from their ureters. Yet these differences are but of degree, there being a continuous bridge from Batrachian to Lacertilian conditions. In *Lacerta*, for instance, in which these features have been studied most thoroughly, the mesonephros continues as the only functional excretory organ during the first year of the young creature until and during its first hibernation, when the formation of the metanephros takes place, and with it the complete separation of the vasa deferentia from the kidneys. Until then the segmental canals remain in the male as common carriers of semen and urine, at least morphologically, not physiologically, since in the immature there is no occasion for the conduction of semen. The kidneys of these young lizards show precisely the same arrangement as that of the Batrachia, excluding the Discoglossidae.

Clearly the metanephros is developed from, and is part of, the posterior portion of the mesonephros, the glomeruli of which no longer open into the segmental duct, but become connected with a new canal, the future ureter, which sprouts from the distal portion of the segmental duct and grows headwards. Or let us put these important changes in another way. Since there are originally several segmental ducts (permanent in the male newt) which tailwards more and more lose their connexion with the testes, until—in the posterior portion of the mesonephros—they become entirely urinary ducts, the hindmost of these sprouts (in lizards postembryonic, much earlier in birds and mammals) independently, but at the same time as the neighbouring mass of the mesonephros, the growing glomeruli of which then connect with the sprouting processes of the ureter. Phylogenetically and ontogenetically it is evident enough that the kidneys are essentially one organ, the anterior portion of which is the oldest and decays, whilst farther backwards new and more differentiated portions continue to grow. Pro-, meso- and metanephros and successive wave-like stages of the same organ with morphological and functional continuity, until the next, improved portion is ready. It is important that in the Discoglossidae, especially in the male *Alytes*, an arrangement has come to pass which much resembles that of the Amniota. The mesonephros has, by a simple contrivance, become a metanephros, provided we define the former as a kidney which is still connected with true segmental ducts.

The *supra-renal bodies*, adrenals, head-kidneys or Nebennieren, are yellowish bodies which lie more in connexion with the generative glands than with the kidneys, always closely attached to the vena cava posterior just above the kidneys. They are very elongated in the snakes, in a 10-foot python they measure about one inch in length; they are flattened in tortoises, roundish in crocodiles.

In all reptiles the kidneys are retroperitoneal, and they do not project into the body cavity. Their position is different in the various groups, and their general shape is much affected by the shape of the body. In the *Ophidia* they are much elongated, and of course far in front of the pelvic region, which has been moved to the cloaca. They are placed asymmetrically, the right extending farthest forwards. They consist of many transverse lobes, sometimes in such a way as to appear spirally twisted. Each terminates considerably in front of the cloaca. Each ureter begins at the anterior end of the kidney, and thence proceeds on its inner and dorsal border, receiving ducts from the interspaces of the numerous lobes. In the male each ureter opens upon a papilla, together with the vas deferens; in the female the ureter is joined by a blind canal, the vestige of the male duct. No snake has a urinary bladder. The urinary excretion is white, chalky, consisting mainly of uric acid in crystals, with very little fluid.

In the *Lacertilia* the kidneys are more posteriorly placed than in snakes. They lie between the pelvis and the cloaca and are generally close together, sometimes partly fused with each other. Only in the Amphisbaenids the right kidney extends more forwards. They are usually transversely furrowed. The ureters open dorso-laterally into the urodaeum upon papillae as in the snakes. In the females the remnants of the segmental

ducts, or vestigial representatives of the vasa efferentia, are often of considerable length, persistent in chameleon and *Uromastix*, much reduced in geckos, or disappearing with age as in *Lacerta*. The urine of most lizards contains much solid uric acid, which is retained in the urodaeum and voided as a rather solid, white mass, not united with the faeces. Those which have a greater amount of fluid urine have a bladder which receives the fluid portion. The opening of this bladder is on the ventral side of the cloaca, not in direct connexion with the ureters. The bladder is very rarely absent, *e.g.* in Varanidae and Amphisbaenidae.

The *Crocodilia* have the kidneys placed below the pelvis; their surface shows meandering convolutions separated by furrows. The ureters are for the greater part of their length deeply sunk into the substance of the kidneys, which they leave near the hinder ends, to run freely for a short distance along the dorsal sides of the cloaca, and they open, each separately, and away from the vasa deferentia, into the dorsal side of the urodaeum, which, together with the coprodaeum, forms a large oval chamber, and this being filled with the very fluid urine, functionizes instead of the absent bladder.

In *Chelonia* the kidneys lie in the pelvis, short and thick, more or less trihedral; the surface is marked with many shallow meandering grooves and fewer deeper furrows. Each ureter, composed of several large successive canals, leaves its kidney near the inner hinder end, and then runs free for a short space, crossing the gut to open into the neck of the urinary bladder, which arises ventrally out of the urodaeum, which itself has become a recess of the cloaca. The bladder is large, often more or less two-horned, attached to the pelvic wall by a peritoneal fold, and it contains very fluid urine.

The kidneys of *Sphenodon* are very small and far removed from the generative organs. The ureters open, each close to the vas deferens of its side, beneath a little papilla, on the dorsal side, rather near the midline of the urodaeum, whence arises a long-necked bladder.

Reproductive System.

The *Ovaries* are always in pairs, placed headwards at a distance from the kidneys in *Sphenodon*, lizards and snakes; in the latter the right ovary lies farther forward. In tortoises, and especially in the crocodiles, where they are very long and much twisted or lobated, they are situated close to the kidneys and even accompany them. The ovaries of lizards and snakes contain many and large lymph spaces; those of the other reptiles are much denser in structure. The ripening eggs always cause them to assume the shape of a bunch of grapes. The *oviducts* are each held by a peritoneal fold which arises from near the dorsal midline. The abdominal ostia are long slits and are turned towards the side, away from the ovaries. The walls of the ducts gradually become thicker, glandular and much folded. Whilst the ripe eggs, often in considerable numbers, receive their shell, each egg lies in a separate chamber; in the geckos, which lay only one pair of eggs, the two respective chambers have become permanent features. In *Sphenodon* each oviduct opens together with the ureter of its side near the dorsomedian line of the urodaeum. In most lizards the two oviducts and the two ureters have four separate openings in the dorsal wall of the rather deep dorsal recess of the urodaeum. But in *Lophura* both oviducts unite (like the ureters) and have only one opening, which is placed a little nearer towards the pelvis than the urinary opening, but they are divided by a longitudinal septum which extends almost to their common orifice. In the snakes the oviducts likewise open into the dorsal recess, sometimes by a common ostium, which is provided with a strong sphincter. The whole recess acts like a vagina for the reception of one of the copulatory organs. The oviducts of the crocodiles open in a decidedly ventral position, on either side close to the base of the clitoris, a considerable distance from the openings of the ureters. In the tortoises the oviducts open separately into a wide ventral urino-genital sinus, at the base of the neck of the bladder.

The *Testes* correspond in position with the ovaries; in snakes and Amphisbaenids the right is placed farther headwards than the left. The usual shape is elongated, sometimes pointed forwards. The *Epididymis* is sometimes of the same size as the testis and then consists of many meandering convolutions of the vas deferens which is composed of several canals from the testis. The convolutions are held together by a peritoneal lamella. Towards the cloaca they become much smaller and shorter, and the vas deferens passes along the median side of the ureter. In *Sphenodon* these open separately, each near and below the same papilla near which opens the ureter of the same side. In most lizards the vas deferens unites with its ureter into one short canal which opens beneath or upon a small papilla in the upper corner of the urodaeal recess, far away from the penis. In snakes vas deferens and ureter of each side are likewise commonly united. In the crocodiles each vas deferens passes from the dorsal side of the cloaca to the ventral side, not accompanied by the ureter, and opens into the blind sac which forms the basal continuation of the deep groove on the dorsal side of the penis. In the tortoises the epididymis is very large and the vas deferens is also much convoluted; each opens separately near the neck of the large urinary bladder close to the backward continuation of the deep longitudinal groove of the copulatory organ.

Remnants of the Müllerian ducts run parallel with the vasa deferentia, and similar remnants of the Wolffian ducts accompany the oviducts in crocodiles and tortoises, least degenerated of course in young specimens. Such reciprocal vestiges occur probably also in lizards, and in female snakes a vestige of the male duct joins its ureter. In a nearly adult male *Sphenodon* the present writer missed the female remnants.

The copulatory organs show very important modifications. *Sphenodon* is the only recent reptile which is devoid of such an organ; its imperfect substitute is an unpaired, thin, but high membranous fold which arises from the dorsal middle of the circular fold between urodaeum and coprodaeum. During copulation this part of the cloaca is probably everted to secure conception, a striking resemblance to the arrangement found in the Caecilia. The organs of all lizards and snakes are paired, in their quiescent state withdrawn into deep pockets which open on the right and left posterior corners of the proctodaeum or outer chamber of the cloaca, which for this reason has assumed the shape of a transverse slit in all lizards and snakes. Hence these have sometimes been called *Plagiotremata*. Each organ can be everted and tucked in like the finger of a glove, a muscle being attached to the inside of the apex; when everted, the muscle extends through the length of the organ; each muscle arises from the ventral side of several transverse processes of the tail vertebrae, at a considerable distance from the cloaca. In the embryo each organ arises as a conical protuberance, or papilla, which projects out of the vent. Later it becomes inverted. Probably this ontogenetic feature recapitulates the phylogeny of these organs, which have to be looked upon as swelling flaps or portions of the walls of the cloaca which were protruded during copulation, and which in time borrowed, and specialized, muscular fibres from the ventral tail muscles. On the outer everted side of each organ is a furrow for the reception of the semen. The apex is either single or more or less deeply bifurcated, each arm being followed by the likewise divided furrow. The outer investing membrane of these very muscular erectile bodies is epidermal; often, especially in snakes, provided with numerous papillae, folds or other excrescences. In

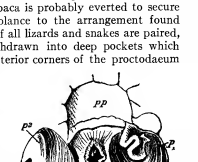

FIG. 39.—Male copulatory organs of *Lacerta agilis* (after Leydig). p_1, p_2, organs of right and left sides—between them is the anal aperture; *pp*, preanal plate.

many snakes these are spiny and hard, but according to Leydig this hardness is not due to a horny substance but to the deposition of calcifying matter. E. D. Cope has investigated the almost endless minor modifications of these penial features and uses them for taxonomic purposes in the snakes. Vestiges of these organs occur in females of snakes and lizards. Close to these organs of the snakes lies a pair of anal glands of some size, which pour their very offensive secretion through an opening close to the base of each penis. The same glands occur in the same position in *Sphenodon*, which has no copulatory organs, and in crocodiles they appear as evertible musk glands. Hence J. E. V. Boas, not knowing of their existence in both sexes of snakes, tried to homologize them with the paired penes of reptiles, an error which has been repeated in C. Gegenbaur's *Lehrbuch*, vol. ii. p. 533.

The crocodiles and tortoises possess a single, median copulatory organ; it lies on the ventral or anterior end of the cloaca, the outer opening of which is therefore a longitudinal slit, hence the term *ucthotremata*. In the crocodiles the organ is attached to the caudal corner of the ischiadic symphysis by a strong and roundish fibrous band, which arises single from the ventral sides and forms partly the continuation of the two fibrous halves of the organ; the bulk of the crura, comparable to corpora cavernosa, is not attached to the pelvis, as generally stated, but projects backwards towards and into the pelvic cavity. This portion is especially rich in venous cavernosities. The outer coating of the glans possesses various papillary projections, which are furnished with sensory, hedonic corpuscles. On the morphologically dorsal side of the organ, not on the dorsum penis, is a deep groove which ends towards the crura in a blind sac, into the farther corner of which open the vasa deferentia. In a full-grown Nile crocodile the whole organ is about 10 in. long. In young females up to a total length of 3 or 4 ft. the clitoris is nearly of the same size as the male organ, but it remains stationary and appears very small in large specimens.

The organ of the tortoises is essentially of the same type as that of the crocodiles, but it is nowhere directly attached to the pelvis or to any other skeletal part. The whole organ, when withdrawn, lies in a ventral, long recess of the wide outer cloacal chamber, and its crura extend so far back as to form the continuation of the ventral and lateral walls of the recessus which is continued into the neck of the urinary bladder. Its orifice and those of the seminal ducts are enclosed by the walls of the deep groove which runs along the underside of the organ. This is always of considerable size, surprisingly large in *Trionyx*. The clitoris is small, sometimes tiny.

The sexual act is extremely prolonged in Chelonians and still more so are the preliminaries, but in crocodiles it is the deed of a few seconds. Lizards and snakes insert only one side.

There remains the question whether the unpaired organ of the crocodiles and tortoises, which is the prototype of the mammalian organ in every essential point, and the paired organs of the lizards and snakes, are to a certain extent homologous organs in so far as they can both be derived from the same indifferent condition. With this view we assume that originally the protrusible walls of the outer cloacal chamber became specialized into a right and left imperfect intromittent organ, that subsequently, in lizards, those hemipenes were shifted back towards the tail and were henceforth bound to develop separately, while in the crocodiles, tortoises, mammals and birds the two primitive lateral evertile flaps approached each other towards the ventral anterior side of the cloaca, and that this led to a fusion, beginning probably at the basal part, which at the same time was farther withdrawn from the surface and secured the reception of the sperma from both vasa deferentia into one canal. This hypothesis has been objected to by Boas, but accepted by Gegenbaur (p. 538) after having been rejected on p. 533 of his *Lehrbuch*.

The *Fat bodies* belong at least physiologically to the generative system. They are placed outside the peritoneum. In lizards they appear as two masses in the pelvic region, the black peritoneal lining covering only their dorsal side. They consist of a network of arteries and connective tissue, the meshy spaces of which are filled with "fat"; they each receive an artery from the femoral vessel which enters them in the inguinal region; the veins collect into the abdominal. In snakes the fat bodies are very long, extending from the cloaca to the liver. Tortoises seem to have only traces of them, but in *Sphenodon* and in crocodiles they resemble those of lizards.—The peculiar organ suspended from the right abdominal wall of crocodiles, variously mentioned as mesenteric gland or body, or fatty spleen, by Butler, is possibly related to the same category. The fat bodies of reptiles are sometimes vaguely alluded to as hibernating bodies; like the fat bodies which are attached to the generative glands of Amphibia they do not become reduced during the eventual hibernation but are largest before the pairing season, by the end of which they are exhausted, looking reddish or grey after the loss of their stores of fat and probably other important contents

The Embryonic Development.

Fertilization of the egg always takes place internally, and the egg containing a large amount of food-yolk is of course meroblastic. It is sufficient to mention that many lizards, some chameleons and many snakes (not *Sphenodon*, geckos, crocodiles and chelonians) retain their, in these cases very thin-shelled, eggs in the oviducts until the embryo is ready to burst the egg-membrane during the act of parturition or immediately after it. Such species are usually called ovoviviparous, although there is no difference between them and other viviparous creatures, for instance the marsupials. The majority of reptiles are oviparous and the egg is enclosed in a strong parchment shell, with or without calcareous deposits. Only gas exchange can take place between such an egg and the outside, and it loses by evaporation, whilst in the batrachian egg various other exchanges are easy through the thin membrane. The salamander embryo, within its thin egg-membrane, even grows to a size many times larger than the original egg, it does not only breathe, but it is also nourished through the gills, and by some means or other the waste products are partly eliminated without filling the bladder. The amphibia are born as larvae and live as such for a long time, often in a most imperfect condition. Nothing of all this applies to the reptile, which leaves the egg as a perfect little imago. A great amount of yolk supplying the material, and a large "bladder" to receive the waste products and to act as respiratory organ, have made this possible. That the allantois and the amnion behave precisely in the same way in the mammals with their much reduced yolk, only testifies to the superior value of these organs, and after all there is no difference in this respect between a monotreme and a reptile. These two organs seem to have come into existence with the reptiles and constitute the most reliable diagnostic feature between higher and lower vertebrates. All reptiles, birds and mammals have a navel, a feature unknown and impossible in Batrachia and fishes. A few remarks on these important embryonic organs may not be superfluous, especially concerning their possible origin.

Whilst the urinary bladder of the Batrachia remains within the body throughout the embryonic stage, this organ undergoes in the higher vertebrates, reptiles, birds and mammals, considerable modifications, and it assumes, henceforth as *Allantois*, new important functions besides that of being the receptacle of the embryonic urine. The development of the Allantois is in intimate causal connexion with that of the *Amnion*. All the *Allantoidea* are also *Amniota* and vice versa, but the term Amniota is preferable, since the basal portion of the Allantois remains in the adult as the urinary bladder, as an organ henceforth equivalent to and homologous with that of the Anamnia. The primary feature seems to be the allantois which leaves the body cavity, remains without the amniotic folds, even after these have enclosed the body within the amniotic bag, and

then spreads nearly all over the inner side of the egg-shell. Having thus come into the closest possible contact with the atmospheric air, the vessels of the allantois can exchange their carbon dioxide for oxygen and the allantois becomes the respiratory organ of the embryo. Herewith stands in direct correlation the complete absence of any internal and of external gills in the embryonic reptiles. The blood vessels of the allantois are fundamentally the same as those of the batrachian bladder, namely, branches from the pelvic arteries (later hypogastrics) and veins which return from the base of the bladder to the abdominal wall and thence to the liver.

In the normal reptilian egg, surrounded by its non-yielding shell, space is absolutely limited, and whilst the yolk is being diminished and increased secretion of urine distends the bladder this soon comes to fill out the body cavity proper into the extra-embryonal coelomatic space between the true amnion and the false amnion or serous membrane. It fills this space so far as the yolk-sac allows it. It seems reasonable to suppose that this growth of the allantois has been one of the causes of the caudal amniotic fold; the sinking of the embryo into the space of the diminishing yolk-sac is no doubt another cause, but the fact remains that the amnion is the chief hindrance to the closing of the body-wall at the region of the future navel.

The life-histories of embryonic reptiles are the most complete of the embryographers. They are the imperfect accounts of the ways and means (often crooked and blurred, owing to short cuts and in adaptation to conditions which prevail during the embryonic period) by which the growing creature arrives at those features which form the account of the anatomical structure of the adult. Comparative anatomy, with physiology, alone lead through the maze of the endless embryonic vagaries and afford the clues for the reconstruction of the real life-history of an animal and its ancestry. For detail the reader is referred to numerous papers quoted in the list of literature, and to the various text-books, above all to the *Handbuch d. vergleichenden Entwicklungsgeschichte d. Wirbelthiere*, edited by O. Hertwig, Berlin.

AUTHORITIES ON ANATOMY: *Bibliography*.—The appended list of papers (many with shortened titles) represents but a fraction of the enormous literature dealing with the anatomy of reptiles. Special stress has been laid upon the more recent publications. A great amount of information, general and detailed, is contained in Bronn's *Klassen u. Ordnungen d. Thierreichs*, the three volumes concerning reptiles having been written by C. K. Hoffmann (Leipzig, 1878–1890); E. D. Cope's *Crocodilians, Lizards and Snakes of North America*, U.S. Nat. Mus., Washington, 1900; H. Gadow's "Amphibia and Reptiles," vol. xiii. of *The Cambridge Natural History* (London, 1901); above all in C. Gegenbaur's *Vergleichende Anatomie d. Wirbelthiere* (Leipzig, 1898–1901).

Skeletal.—J. F. v. Bemmelen, "Schaedelbau v. Dermochelys coriacea," *Festschr. f. Gegenbaur* (1896); E. Gaupp, "Morphologie d. Schaedels," *Morphol. Arbeiten* (1894), iv. pp. 77–128, pls.; *ibid.* ("Problems Concerning the Skull"), *Anat. Ergebn.* (1901), x. pp. 847–1001. W. K. Parker, "Skull of Lacertilia," *Phil. Trans.* 170 (1880), pp. 595–640, pls. 37–45; "of Tropidonotus," *ibid.* (1879), 169, pp. 385–417, pls.; "Crocodilia," *Trans. Zool. Soc.* (1885), xi. pp. 263–308, pls.; "Chamaeleons," *ibid.* (1885), xi. pp. 77–105, pls. 15–19; F. Siebenrock, "Kopfskelet d. Scincoiden, Anguiden u. Gerrhosauriden," *Ann. Nat. Hofmuseum* (1892), vii. 73. On the extremely still increasing literature concerning the homologies of the auditory ossicles, a few only can be mentioned; the papers by Kingsley and Versluys contain most of the previous literature: W. Peters, several most important papers in *Monatsber. d. Berliner Akad.* from 21st Nov. 1867, 5th Dec. 1867, 7th Jan. 1869, 17th Jan. 1870, 15th Jan. 1874). H. Gadow, "Modifications of the First and Second Visceral Arches, and Homologies of the Auditory Ossicles," *Phil. Trans.* 179 (1888), B. pp. 451–488, pl. 21–24; "Evolution of the Auditory Ossicles," *Anat. Anz.* (1901), xix. No. 16. J. Versluys, "Mittlere u. äussere Ohrsphäre d. Lacertilia u. Rhynchocephalia," *Zool. Jahrb. Anat.* (1898), 12, pp. 161–406, pls. (most exhaustive and critical); *ibid.*, "Entwickl. d. Columella auris b. Lacertidren," *ibid.* (1903), 18, pp. 107–188, pls. J. S. Kingsley, "The Ossicula auditus," *Tufts College Studies*, No. 6 (1900). E. Gaupp, "Columella auris," *Anat. Anz.* (1891), vi. p. 107. T. H. Huxley, "The Representatives of the Malleus and Incus of the Mammalia in the other Vertebrata," *P.Z.S.*, 1869. W. K. Parker, "Struct. and Development of Crocodilian Skull," *Trans. Zool. Soc.* (1883), xi., especially pls. 68 and 69. H. Gadow," Evolution of the Vertebral Column of Amphibia and Amniota," *Phil. Trans.* (1896), 187, pp. 1–79 (with a list of ninety-three papers). G. B. Howes and H. H. Swinnerton, "Development of the Skeleton of Sphenodon," *Trans. Zool. Soc.* (1901), xvi. pp. 1–86, pls. 1–6. G. A. Boulenger, *Catalogue of Chelonians, Rhynchocephalians and Crocodiles*, Brit. Mus. 1889; *Cat. of Lizards* (3 vols., 1885–1887); *Cat. of Snakes* (3 vols., 1893–1896); these volumes contain a great deal of osteological observations, ignored by most compilers of anatomical text-books; "Osteol. of Heloderma, and Vertebrae of Lacertilia," *P.Z.S.*, pp. 109–118 (1891). A. Calori, "Skeleton of Varanus, Lacerta," *Mem. Acc. Sci. Instit. Bologna* (8, 1857, and 9, 1859). E. D. Cope, "Osteology of Lacertilia," *Proc. Am. Phil. Soc.*, (1892), 30, pp. 185–221; "Degeneration of Limbs and Girdles," *Journ. Morph.* (1892), vii. pp. 223–244. E. Fischli, *Osteologie del Plasidattilo* (Pisa, 1882). A. Goette, "Beiträge z. Skelettsystem," *Arch. micr. Anat.* (1877), 14, pp. 502–620. A. Günther, "Anatomy of Hatteria," *Phil. Trans.* (1867), 157, pp. 595–629, pls. S. Orlandi, "Sviluppo anatomiche s. Macrosaurus," *Soc. Lig. Geneva, Boletta*, v. 2; "Skelet d. Scinc. Anguid. Gerrhosaurid," *Ann. Naturhist. Hofmus.* (1895), x. pp. 17–41; "Skelet d. Agamidae," *Sitzb. Ak. Wiss. Wien* (1895), 104, pp. 1089–1196. F. IV. Distribution in Space

This zoo-geographical review deals only with modern reptiles. We begin with a survey of the faunas of some of the most obvious land-complexes which bear close resemblance to the now classical "regions" of P. L. Sclater and A. R. Wallace. None of these "regions" has definable frontiers, and what acts as a bar to one family may be totally ignored by another. According to the several orders of reptiles the world is mapped out in very different ways. The African fauna does not stop at the Suez Canal, nor even at the Red Sea; there is a transitional belt noticeable in the countries from Syria to Arabia, Persia and India. To the north, Indian influence extends right into Turkestan, or vice versa; the Central Asiatic fauna passes into that of India. On the Chinese side prevailing zoo-conditions are still unknown; Wallace's line is more or less rigidly respected by Trionychidae, hooded *Elaps*, vipers and Lacertidae, while it has not the slightest influence upon crocodiles, pit vipers, Varanidae, Agamidae, &c. In the western hemisphere we have a grand illustration of the interchange of two faunas and of the fact that it is neither a narrow strait nor an equally narrow isthmus which decides the limitation of two regions. Central America and the Antilles form one complex with S. America. The nearctic region ends at the edge of the great Mexican plateau, which itself is a continuation of the north continent. Many nearctic forms have passed southwards into the tropics, even into far-off S. America, but the majority of the southerners, in their northern extension, have been checked by this plateau and have surged to the right and left along the Pacific and Atlantic tropical coastlands. The present writer happens to have made a special study of this part of the world (cf. "The Distribution of Mexican Amphibians and Reptiles," *P.Z.S.*, 1905, pp. 191–204); the N. and S. American faunas have therefore been more fully treated in the following review of the various faunas. No doubt others can be treated in a similar manner, but the physical features between N. and S. America are unique, and the results are closely paralleled by those of the fauna of birds. The narrow and long neck of the isthmus of Panama (once no doubt much broader) is no boundary; if the meeting of N. and S. had taken place there, that narrow causeway would be crowded, and this is not the case.

NEW ZEALAND.—The only recent reptiles are *Sphenodon* (*q.v.*), which testifies to the great age of these islands; about half a dozen Scincidae of the genus *Lygosoma*, members of a cosmopolitan family; and some few geckos, *e.g. Naultinus*, of a family of great

age, world-wide distribution and with exceptional facilities of distribution.

AUSTRALIAN REGION.—Of crocodiles only *C. johnstoni* in N. Australia and Queensland; *C. porosus* on the N. coast, and occurring on various Pacific islands, as far E. as the Fiji Islands. Tortoises are represented only by the pleurodirous Chelydidae, *e.g. Chelodina*; they are absent in Tasmania and on the Pacific islands. New Guinea possesses the aquatic *Carettochelys*, sole type of a family.

The bulk of the Lacertilian fauna is composed of skinks, geckos, agamoids and Varanidae, with the addition of a small family which is peculiar to the region, the Pygopodidae. A peculiar type, *Dibamus*, inhabits the borderlands, namely, New Guinea, the Moluccas, Celebes and the Nicobar Islands; and, finally, a single iguanoid, *Brachylophus*, is common in the Fiji Islands; how it came there, or how it survived its severance from the American stock, is a mystery. The skinks are represented by highly developed and more specialized than in any other part of the world; they exceed in numbers the geckos, which generally accompany the skinks in their range over the smaller islands of the Pacific; in these islands members of these two families represent the whole of the Lacertilian fauna. The Australian agamoids are chiefly peculiar and partly much differentiated forms (*e.g. Moloch* and *Chlamydosaurus*), but some have distinct affinities to, or are even identical with, Indian genera. The Varanidae are also closely allied to Indian species.

Of snakes, amounting to about one hundred species only, we note about one dozen Typhlopidae, and of Pythonidae simply *Python*, and of the Boa *Tropyrus* in the forests of New Guinea and Fiji. There are but surprisingly few innocuous colubrine snakes, scarcely a dozen, and all belonging to Indian genera. The bulk of the snakes belong to the poisonous Elapinae, all of genera peculiar to the region, *e.g. Acanthophis*, *Pseudechis*, *Notechis*. Such a preponderance of poisonous over harmless snakes is found nowhere else in the world. Tasmania is tenanted by poisonous snakes only. In Australia we meet, therefore, with the interesting fact that, whilst it is closely allied to S. and S.E. Asia and totally distinct from India by its Chelonians, its lizards and colubrine snakes connect it with this latter region. With regard to the other Ophidians, they have their nearest allies partly in India, partly in Madagascar, partly in S. America; and the character of the Australian snake fauna consists chiefly in its peculiar composition, differing thereby more from the other equatorial regions than those do among themselves. Wallace's line marks the boundary between India and Australia only as far as the Chelonians are concerned, but it is quite effaced by the distribution of lizards and snakes. Thus in New Guinea lizards of the Indian region are mixed with Pygopodidae, and an island as far E. as Timorlaut possesses Indian genera of which are peculiarly Indian, whilst the others are as decidedly Australian. The islands N. of New Guinea and of Melanesia are not yet occupied by the Ophidian type, and only species of *Emyprus* have penetrated eastwards as far as the Admiralty Archipelago, whilst the Fiji Islands and the larger islands of Melanesia have sufficiently long been raised above the level of the sea to develop quite peculiar genera of snakes.

INDIAN REGION.—Of Crocodilia *C. palustris*, the "mugger" or marsh crocodile, and *C. porosus*; *Gavialis gangeticus*; *Tomistoma schlegeli* in Borneo, Malacca and Sumatra. Of tortoises *Platysternum megacephalum*, type of a family from Siam to S. China; many Trionychidae and Testudinidae, mostly aquatic; whilst the terrestrial *Testudo* is very scantily represented. One species which is common in the Indian peninsula (*T. stellata*) is so similar to an African species as to have been considered identical with it; the Burmese tortoise is also closely allied to it, and the two others extend into western central Africa. Thus the Ethiopian, which is to be considered rather an immigrant from its present headquarters, Africa, than a survivor of the Indian Tertiary fauna, which comprised the most extraordinary forms of land tortoises. Wallace's line marks the E. boundary of Trionyx, species of this genus are common in Java and Borneo, and occur likewise in the Philippine Islands, but are not found in Celebes, Amboyna or any of the other islands E. of Wallace's line. Agamidae are exceedingly numerous, and are represented chiefly by arboreal forms, *e.g. Draco* (q.v.) is peculiar to the region, *Ceratophora* and *Lyriocephalus* exclusively Ceylonese; terrestrial forms, like *Agama* and *Uromastix*, inhabit the hot and sandy plains of N.W. India, and pass extensively into the fauna of western-central Asia and Africa. The Geckonidae, Scincidae and Varanidae are likewise well represented, but without giving a characteristic feature to the region by special modification of the leading forms except the gecko *Hemidactylus homalocephalum* in Malaya. The Lacertidae are represented by one characteristic genus, *Tachydromus—Ophiops* and *Cabrita* being more developed beyond the limits assigned to this region. Finally, the Eublepharidae and Anguidae, families whose living representatives are probably the scattered remains of once widely and more generally distributed types, have retained respectively two species in W. India, and one in the Khasi Hills, whilst the presence of a single species of chameleon in S. India and Ceylon reminds us again of the relations of this part of the fauna to that of Africa.

The Indian region excels all the other tropical countries in the great variety of genuine types and numbers of species of snakes. Boulenger[1] recognizes 267 species, *i.e.* about one-fifth of the total number of snakes known. India is the only region in the world possessing viperine, crotaline and elapine poisonous snakes (their proportion to harmless snakes being about 1 : 10), *e.g. Vipera russelli*, the "daboia (see VIPER); *Lachesis*, *e.g. gramineus*, an arboreal pit viper; *Naja tripudians*, the "cobra"; *Bungarus coeruleus*, the "krait"; *Callophis*; and Hydrophinae along the coasts of the whole region. Several sub-families and families are peculiar to the region; the Uropeltidae with *Rhinophis* in southern India, and *Uropeltis* confined to Ceylon; Ilysiidae in Ceylon and Malay Islands, elsewhere only in S. America; the opisthoglyphous *Elachistodon westermanni* of Bengal; the Homalopsinae, with many species from Bengal to N. Australia; further the Amblycephalidae; *Xenopeltis unicolor*, sole type of a family; the Acrochordinae, a sub-family of aglyphous Colubridae, ranging from the Khasi Hills to New Guinea. Of other Colubridae, we notice numerous *Tropidonotus*, *Coronella* and *Zamenis*, the latter one of the most characteristic types of the warmer parts of Eurasia. Tree-snakes, *e.g. Dipsas* and *Dendrophis*, are common. Of other families we note a great number of Typhlopidae, of which *T. braminus* occurs even on Christmas Island. Lastly various species of *Python*, but no Glauconiidae, the only family not represented in the Indian region, which claims the Uropeltidae, Xenopeltidae and Amblycephalidae as peculiar to itself.

Günther remarks that to this region Japan has to be referred. This is clearly shown by the presence of species of *Ophites*, *Callophis*, *Trimeresurus* s. *Lachesis*, *Tachydromus*, characteristically Indian forms, with which species of *Clemmys*, *Trionyx*, *Gecko*, *Halys*, and some Colubrines closely allied to Chinese and Central Asiatic species are associated. *Halys* is a central Asiatic pit viper. The few reptiles inhabiting the northern part of Japan are probably of palaearctic origin.

THE AFRICAN CONTINENT.—Of crocodiles, *C. vulgaris* in the E., *C. cataphractus* and *Osteolaemus tetraspis* in the W. There are many Chelonians, especially small land tortoises of *Testudo*, and with *Cinyxis* which is peculiar to this continent; the freshwater *Clemmys* only in the N.W. corner; several genera of the pleurodirous Pelomedusidae, *Pelomedusa galeata* which is widely spread southern, with an outlying occurrence in the Sinai peninsula, and *Sternothaerus* with several tropical and southern species; of Trionychidae the tropical *Cyclanorbis* and *Cyclanorbis* peculiar to the country, and the large *Trionyx triunguis* which ranges from the Senegal and Congo into the Nile system with its big lakes, but occurring also in Syria.

Of Lacertilia the geckos and skinks, and the typically of world families of Lacertidae and Varanidae well represented; also Amphisbaenidae; Gerrhosauridae and Zonuridae, peculiar to Africa and Madagascar; a few Eublepharinae and a few of the so-called Anelytropidae in West Africa. But the most important feature of this Lacertilian fauna is the almost universal distribution of chameleons in numerous and some highly specialized forms, *Chameleon* and *Rhampholeon*. We note the entire absence of Iguanidae and of Anguidae, the latter represented by *Ophisaurus* only in the north-western corner.

Of snakes only one sub-family is peculiar, the Rhachiodontinae with the sole species *Dasypeltis scabra*, the egg-swallowing snake. Many Typhlopidae and Glauconiidae, but no Ilysiidae; large pythons, *Python* in the N., and the boa, *Eryx jaculus* in the N. of Africa. Of poisonous snakes there is an abundance, notably the Viperinae have their centre in this continent; besides *Echis*, which is also Indian, there are peculiar to the continent *Bitis*, the puffadder, *Causus*, *Atractaspis*, *Cerastes*, and *Atheris* which is an arboreal genus, all of which see under VIPER. The pit vipers are entirely absent. Elapinae are numerous, *e.g.* hooded cobras like *Naja haje* and *Sepedon* the "ringhals." Many opisthoglyphous tree snakes and a considerable number of innocuous colubrines, *e.g. Lycodon*, *Psammophis* and *Coronella* or closely allied genera all also in India, but *Coluber*-like forms and *Tropidonotus* are very scantily represented, chiefly in the N.

On the whole the reptilian fauna of Africa is not rich, considering the huge size of the continent, but this may be accounted for by the great expanse of desert in the N. half and of veld in the S. Lastly, the enormous central forests are still scarcely explored.

MADAGASCAR and certain other islands have a fauna which is as remarkable for its deficiencies as it is for its present forms. The following well-defined groups are absent: Trionychidae and Chelydidae; Agamidae, Lacertidae, Anguidae, Amphisbaenidae, Varanidae and Eublepharinae; all the Colubrines, save a few forms. Thus this large island enjoys perfect absence of poisonous snakes, not counting the practically harmless opisthoglyphous tree snakes; there are further no pythons and no ilysias.

The actual fauna consists of: *Crocodilus vulgaris*, which is said to be extremely abundant; of Chelonians, *Pelomedusa galeata* and

[1] The same authority enumerates 536 species of reptiles for British India, *i.e.* about one-sixth of all the known species of reptiles (*Fauna of British India*, edit. W. T. Blanford, London, 1890).

Sternotherus, both also in Africa, *Podocnemis*, which elsewhere occurs in South America only, and several Testudinidae; of these *Pyxis* is peculiar to Madagascar, while *Testudo* has furnished the gigantic tortoises of Aldabra, the Seychelles, and recently extinct in Mauritius and Madagascar. Of lizards are present a few Gerrhosauridae and Zonuridae, both African types; the remarkable occurrence of two iguanid genera *Chalarodon* and *Oplurus*, both peculiar to the island; skinks, many geckos, and *Uroplates*, sole type of the Uroplatinae, and an abundance of chameleons, of the genera *Chameleon*, with *Ch. parsoni*, the giant of the family, and the small species of *Brookesia*, a genus peculiar to Madagascar. Of snakes we note Typhlopidae and Xenopeltidae, and the remarkable occurrence of Boinae, two of the genus *Boa* (*Pelophilus*), one of *Corallus* on the main island and *Casarea* on Round Island. There are opisthoglyphous mostly arboreal snakes, and the rest are innocuous colubrines, some few with Indian and African affinities, *e.g. Zamenis* s. *Ptyas*, more with apparently S. American relationship, or at least with resemblance in taxonomic characters.

An analysis of this peculiarly compound and deficient fauna gives surprising results, namely, the almost total absence of affinity with the Indian region, close connexion with Africa by the possession of Gerrhosauridae, Zonuridae, Chameleons and Polemedusidae; lastly, the presence of several tree boas, of *Podocnemis* and of Iguanidae, a set of families and genera which we should consider as typically neo-tropical. Peculiar to Madagascar, autochthonous and very ancient, is only *Uroplates*. Ancient are also the tortoises, chameleons, geckos, boas, typhlops, gerrhosaurids and zonurids. The absent families as among the others, the almost total absence of them, notably *Varanus*, lacertids and agamids are of distinctly northern, palaeotropical origin, and we can conclude with certainty that they had not spread into S. Africa before Madagascar and its satellites were severed from the Ethiopian region.

EUROPE AND TEMPERATE ASIA.—The present reptilian fauna of this vast area is composed almost entirely of the leavings of those groups which are now flourishing with manifold differentiations under more genial climes, in Africa and India. Where certain numerous, tell us that it was not always thus, since crocodiles, alligators and long-snouted gavials, all the main groups of chelonians, iguanoids, &c., existed in England, the crocodilians persisting even into tertiaries of the Tertiary Period.

There are no crocodiles now in the Eurasian sub-region, excepting small survivors in the Jordan basin, on the borderland of Africa; but the Yang-tse-Kiang is inhabited by an alligator, *A. sinensis*, while all the congeners are now in America. This finds, to a certain extent, a parallel in *Trionyx*, of which one species lives in the Euphrates basin, likewise borderland, and another, *T. maachi*, in rivers of N. China, *e.g.* in the Amoor. Of other Chelonians we note several species of *Testudo*, two of them Transcaspian; *Emys europea*, chiefly in Europe, with the other species *E. blandingi* in the eastern United States; and a few species of *Clemmys*, a truly periarctic genus.

Of Lacertilia we include the chameleon, the geckos *Hemidactylus turcicus* extending from Portugal to Karachi; *Platydactylus facetanus* is at home in most S. Mediterranean countries; *Teratoscincus* is peculiar to the steppes and deserts of Turkestan and Persia; other geckos in the transitional region from Asia Minor to India. Of lacertas we have Anguidae, Agamidae, Lacertidae, Amphisbaenidae and Scincidae, most of them in Europe represented by but one or two species. Thus *Blanus cinereus* in Mediterranean countries, Asia Minor and Syria, representing Amphisbaenidae which are found nowhere else in Europe or Asia, but plentiful in Africa and both Americas. Of the Anguidae, *Anguis fragilis* is peculiar to Europe, *Ophisaurus apus* in S.E. Europe, another in Indo-Burman countries, and the rest of the species in N. America. Of Scincidae few in Europe, *e.g. Chalcides* s. *Seps* s. *Gongylus*, others from Asia Minor eastwards, *e.g. Scincus*, and *Ablepharus* in Turkestan. Agamidae do not occur in Europe but they exist in considerable numbers from Asia Minor and Syria, representing India, *Phrynocephalus* peculiar to central Asia. Lastly, the Lacertidae, of which several species of *Lacerta*, *Psammodromus*, *Acanthodactylus* in Europe, but the majority in Africa and warmer parts of India; in a similar manner the Varanidae are related to those countries.

The total number of palaearctic snakes amounts to about sixty, the majority living in the Mediterranean countries and in W. Asia. One *Typhlops* in the Balkan peninsula and in W. Asia, in Persia also *Eryx jaculus* extending from Turkestan to China, with *Eryx* as sole representative of the Boidae. Several vipers, the common viper, *V. berus*, from Wales to Saghalien Island, *V. aspis*, *V. latastei* and *V. ammodytes* in S. Europe; a pit viper, *Ancistrodon*, *e.g. halys*, in the Caspian district, Persia and in Japan and China; another one in N. America. *Echis* extends N. into Turkestan. The Indian cobra ranges N. to Transcaspia and far into China. All the other snakes belong to the aglyphous and opisthoglyphous Colubridae; of the latter *Coelopeltis* is peculiar to S. Europe and S.W. Asia; *Macroprotodon cucullatus* to S. Spain, the Balearic Islands and N. Africa; *Tephrometopon* peculiar to Turkestan and neighbouring countries; none extending into E. Asia. Of the aglyphous colubrines the most characteristic genus is *Coluber*, with the very widely spread and including more species than any other palaearctic genus; several species of the wide-ranging genus *Tropidonotus*, besides *Coluber*, with *Rhinechis scalaris* in S.W. Europe. There are, besides, other genera, especially in the debatable countries of S.W. Asia, Persia and Afghanistan, and speaking generally the colubrines show less affinity to African than to Indian forms, just as we should expect from the prevailing geographical conditions. If it were not for the N.W. corner of Africa and portion of its N. coast, the European fauna would have very little in common with Africa.

NORTH AMERICA.—Of this huge continent only the United States and Mexico come into consideration, since S. of 45° latitude reptilian life is very scarce. The area, however, with these restrictions, is larger than the Indian and Malay countries, and larger than the Australian region. Yet the fauna is comparatively poor, very poor indeed, if it were not for Mexico and the Sonoran province, which seems to be the ancient centre of distribution of much of the present typically N. American fauna.

Characteristic of the area is the abundance of Chelonians and Iguanidae, to which Tejidae have to be added in the S.; equally characteristic is the complete absence of Pleurodirous Chelonians, of Chameleons, Agamidae, Lacertidae, Varanidae and Viperinae. The fauna is composed as follows: Crocodilia, with *Crocodilus americanus* and *Alligator mississippiensis* in the S. Of Chelonians the Chelydridae, peculiar to the E. half but for the reappearance of a species of *Chelydra* in Central America; many Clinostemidae likewise almost peculiar to the east of Transcontinental Mexico; Eublepharinae are absent. Of Iguanidae we have a typically Sonoran set, *e.g. Crotaphytus*, *Holbrookia*, *Uta*, *Phrynosoma*, *Sceloporus*, and a S. set of which only *Anolis* extends out of the tropics. It is significant that only a few species of *Sceloporus* and *Phrynosoma* extend into the United States, although far N.; of the large genus *Anolis* only *A. carolinensis* enters Texas to Carolina. *Sceloporus* may be called the most characteristic genus of Sonoraland and Mexico. Of the tropical family of Tejidae only *Cnemidophorus*, with many species in Mexico, a few in the adjoining N. states, and with *C. sexlineatus* over the greater part of the Union. *Angusdae*: *Ophisaurus ventralis* in the United States; the other species in the Old World. *Diploglossus* are confined to mountains of *Pheresporus* and *Xantusia* in Mexico, but *G. coeruleus* ranges from Costa Rica along the Pacific side right into British Columbia, the most northern instance of a New World reptile.

Xenosaurus grandis of Mexican mountains is the monotype of a family, and the same would apply to *Heloderma* (*H. suspectum*, the Gila monster of the hottest lowland parts of Arizona and New Mexico; and *H. horridum* of Mexico) if it were not for *Lanthanotus* of Borneo. *Scincidae* are a cosmopolitan family America possesses the smallest number, and it is significant that the number of species decreases from N. to S.; *Eumeces* from Minnesota and Massachusetts through Mexico, with many species, and *Lygosoma* s. *Mocoa Baileyae* from S.E. and Central States to Mexico.

Xantusiidae, a small family, is composed of a N. or Sonoran and a S. or Central American-Antillean group; *e.g. Xantusia* of the deserts of Nevada and California and Arizona, *Amalila*, monotype of a family on El Paso, Texas, *i.e.* peculiar to Sonoraland, Amphisbaenidae with *Rhineura* in Florida and the marvellous *Chirotes* in Lower California and the Pacific side of Mexico; the other members of this family are trespassers so far as America is concerned.

Snakes: of Typhlopidae only *Anomalepis mexicana*, peculiar to Nuevo Leon; of Glauconiidae several extending N. into Texas and Florida. Boinae continue N. as the arenicolous *Lichanura* of Lower California and Arizona, and the likewise arenicolous *Charina bottae* which extends from California to the state of Washington; the other members of the family are all tropical, extra-regional. Of Viperidae only pit vipers occur, but of them rattlesnakes cover the whole of the habitable area of the continent, without a break, at the moccasin snake and the water viper, has other species in central and E. Asia. Of Elapinae, far into the E. United States only the genus *Elaps* with a few species, of which *E. fulvius*, the commonest, ranges from S. Brazil far into the S. and E. states. A few opisthoglyphous, terrestrial, snakes just enter the United States from Mexico, *e.g. Trimorphodon*. Of aglyphous colubrines species of genera like or resembling *Tropidonotus*, *Coronella* and *Coluber*, including *Elaphis* and *Spilotes* and *Oxybelis*, and the very characteristic; *Ischnognathus* and *Contia*, *Ficimia* and *Zamenis* likewise are clearly nearctic, or Sonoran.

The *Greater Antilles* have essentially neotropical, *i.e.* Central American and S. American affinities, but there is also some Sonoran infusion.—There is *Crocodilus americanus*; no Chelonians are natives except one or two *Chrysemys*. Of Lacertilia, geckos are abundant; of Iguanidae several arboreal forms, notably the large *Enyaus*, and *Metopoceros* of Haiti, and, the very, both peculiar; of Anguidae *Celestus*, peculiar, but closely allied to *Diploglossus*; of Xantusiidae the peculiar genus *Cricosaura* s. *Cricolepis*. Of

Amphisbaenidae *Amphisbaena* itself occurs in Puerto Rico and on the Virgin Islands. Of Tejidae only *Ameiva*, not *Cnemidophorus*. Snakes: a *Typhlops* in Puerto Rico; of boas *Epicrates*, *Ungalia* and *Coralius*, the latter re-occurring in Madagascar. Absent are: Viperidae, Elapinae and Opisthoglyphs: of aglyphous colubrines the Central American genera *Urotheca*, *Dromicus*, *Drymobius* and *Leptophis*; the genera of distinctly northern origin.

SOUTH AND CENTRAL AMERICA.—The fauna is very rich. It is advisable first to mention those groups which are either confined to Central America (including the hot lowlands of Mexico), *e.g.* the Dermatemydidae, Eublepharinae, Anelytropsis and the aglyphous colubrines: *Urotheca*, *Dromicus*, *Drymobius*, *Leptophis*, *Rhadinea*, *Streptophorus*, or which, from their N. centre have sent some genera into Central America, or beyond into the S. continent: *e.g. Chelydra rossignoni*, ranging from Guatemala to Ecuador; one *Cinosternum* extending into Guiana; *Testudo tabulata*, the only terrestrial tortoise of S. America, besides the gigantic creatures of the Galapagos Islands; a few Eublepharinae reaching Ecuador; of Anguidae *Gerrhonotus coeruleus*, extending S. to Costa Rica; of Scincidae, *Mabuia* and *Lygosoma*, which extend far into S. America, and the same applies to the Amphisbaenidae. Immigrants from the N. are probably also the Iguanidae, although they have found a congenial home in the S. countries, where they are now represented by an abundance of genera and species, *e.g. Laemanctus* and *Corythophanes* of Mexico, *Anolis*, *Iguana*, *Basiliscus*, *Ctenosaura*, *Polychrus*, *Hoplurus*, *Chalarodon*. Amongst snakes the following appear to be of N. origin: Boïdae (with the Pythonine *Loxocaemus bicolor* in Mexico), in spite of their great development of boas and anacondas in the S.; certainly Crotalidae, of which only one species, *C. terrificus*, is found in S. America; further, some aglyphous colubrines, which have sent a few species only into Central, and still fewer into S. America, *e.g. Tropidonotus*, *Ischnognathus*, *Contia*,* *Ficimia*, *Coluber*, *Spilotes*, *Pityophis*, *Coronella** and *Zamenis*.

After these numerous restrictions we should expect the genuine autochthonous fauna of the S. American continent to be very scanty, especially if we remember those important Old World groups which are absent in America, *e.g.* Varanidae, Lacertidae, Amphisbaenidae and chameleons, and that Central and S. America have no Trionychidae. The oldest S. American reptilian fauna is composed as follows. It is the only part of the world which possesses Chelydidae in abundance, *e.g.* of the *Platys* the *Matamata*, *Hydromedusa*, and of Pelomedusidae, *Podocnemis*, which re-occurs in Madagascar. Crocodilia are represented by *Crocodilus americanus* and *C. moreleti* in the N. and by about five species of *Caiman*. Of Lacertilia geckos are rather few, mostly in the N.W. of the continent, more numerous in Central America and the Antilles. The Tejidae are clearly a neotropical family, with several dozen genera in S. America; of all these, only *Ameiva* and the closely allied *Cnemidophorus* extend through and beyond Central America: *Ameiva* in the E. and W. hot lands of Mexico and into the Antilles, *Cnemidophorus* through Mexico far into most of the United States with a few species. Of snakes there is an abundance. Typhlopidae and Glauconiidae are well represented. Of aglyphous colubrines many genera, some of these extending northwards into Mexico, but not to the Antilles, *e.g. Atractes*, *Tropidodipsas*, *Dirosema*, *Geophis*, *Xenodon*.

Opisthoglypha are very numerous in genera and species both in S. and Central America, whereas Amerosa: of the arboreal forms extend into the hot countries of Mexico, while a few terrestrials have spread over the plateau and thence into the United States, none entering the Antilles; such typical neotropical genera are *Himantodes*, *Dipsas*, *Oxyrhopus*, *Erythrolamprus*, *Conophis*, *Scolecophis*, *Homalocranium*, *Petalognathus*, *Leptognathus*. Most of the Amblycephalidae are neotropical, the others in S.E. Asia. Of Elapinae only the genus *Elaps* occurs, but with many species. Of the Crotalinae, *Lachesis* is the only essentially neotropical genus with many species, some of which enter the hot lands of Mexico, *e.g. L. lansbergi s. lanceolatus*, a very widely distributed species, the only pit viper which has entered the Lower Antilles.

The above survey will have shown that but very few of the principal families of reptiles are peculiar to only one of the main "regions." The occurrence of some freak, constituting a little family or sub-family by itself in some small district, and therefore put down as peculiar to a whole wide region, cannot be much of a criterion, *e.g. Rhachiodon*, *Elachistodon*, Acrochordinae, *Uropeltes*, *Xenosaurus*, *Heloderma*, Aniellidae, *Dibamus*, Anelytropidae, *Platysternum*. They are mostly relics of large countries, but rather local freaks. Quite a number of very ancient families have such a wide distribution that they also are of little critical value, notably the peropodous snakes, which have survivors in almost any tropical country, such monopodous forms as geckos and skinks.

A difficulty which is ever present in such zoogeographical investigations is the uncertainty as to whether our zoological families and sub-families and even genera are genuine units, or heterogeneous compounds, as for instance the Anelytropidae, of which degraded skinks there is one in Mexico, two others in W. Africa. *Heloderma* in Mexico and *Lanthanotus* in Borneo are both without much doubt descendants of some Anguid stock, but when we now combine them, in deference to our highest authority, as one family, we thereby raise the tremendous problem of the present distribution of this family. Boas and pythons are likewise not above suspicion, cf. some boas in Madagascar and the python *Loxocaemus* in Mexico. The opisthoglyphous colubrines are almost certainly not a natural group, not to speak of numerous genera of the aglyphous assembly. To avoid arguing in a circle, such doubtful units had better be avoided whilst building hypotheses.

G. Pfeffer has recently endeavoured to show by an elaborate card paper ("Zoogeographische Beziehungen Südamerikas," *Zool. Jahrb.*, Suppl. viii., 1905), "that nearly all the principal groups of reptiles, amphibians and fishes had formerly a universal or subuniversal distribution, and that therefore it is not necessary to assume a direct land connexion of S. America with either Africa or Australia, with or without an Antarctic." Many cases of such a former universal distribution are undoubtedly true, but the question remains how the respective creatures managed to attain it.

A precise characterization of large areas we must resort to the combination of some of the large wide-ranging families, and equally important is the absence of certain large groups; both to be selected from the following table.

	Antilles	South America	North America	Eurasia	Africa	Madagascar, Indo-Malaya	Australia
Chelydridae [1]	o	+	+	o	o	o	o
Pelomedusidae .	o[2]	+	o	o	+	o	o

[1] Including the related Dermatemydidae and Cinosternidae.
[2] With an exception.
[3] Entering, or in the borderland.
[4] Mediterranean countries.
[5] Rhineura; formerly wider distribution.
[6] In Asia.

Deductions from this table show, for instance, that Australia is quite sufficiently characterized by the possession of Chelydidae and Varanidae; Madagascar by the presence of chameleons and Pelomedusidae. On the other hand, the separation of the whole of Africa and Southern Asia, or the synthesis of the palaearctic "region," would require the combination of several positive and negative characters.

Chelonians are very diagnostic, expressed by the following combinations of families:—

America as a whole: Chelydridae and Cinosternidae and Dermatemydidae.

N. America: Chelydridae and Trionychidae, but only E. of the Rockies.

S. America: Chelydidae and Pelomedusidae.

Africa: Trionychidae and Pelomedusidae.

Madagascar: Pelomedusidae and Testudinidae.

India and Eurasia: Trionychidae and Testudinidae.

Australia: Chelydidae only.

That the Chelonians are regionally so very diagnostic that their main families are still in rational agreement with the main divisions of land, is perhaps due, first, to their being an ancient group; secondly, to their limited means of distribution (none across the sea, omitting of course Cheloniidae, &c.); and lastly, to their being neither indifferent to climate. Note, for instance, *Trionyx ferox* from the Carolines; Sules to the Gulf of Mexico, *Cinosternum pennsylvanicum* from New York to New Orleans. It may be taken for certain that wherever a *Testudo* occurs as a genuine native, it has got there by land, be the locality the Galapagos, Aldabra, Madagascar or some Malay islands. The Trionychidae reveal themselves as of perfarctic origin, being debarred from Australia, Madagascar and the neotropical region (alleged from Eocene Patagonia). Testudinidae are cosmopolitan, excluding Australia, and practically also the Antilles; and *Testudo* is most instructive with its almost similar distribution: but something has gone wrong with this genus in America, where it flourished in mid-Tertiary times.

Pleurodira are less satisfactory than they appear to be from a merely statistical point of view. The Pelomedusidae, being known from European Trias and from nearctic cretaceous formations,

may have had a world-wide distribution; but Chelydidae may well have centred in an antarctic continent. Chelydridae were periarctic and have disappeared from Eurasia; N. American offshoots are the Cinosternidae and Dermatemydidae, the latter now restricted to Central American countries.

Crocodilia, probably once universal, afford through the Chinese *alligator* an instance of the original intimate connexion of the whole holarctic region, paralleled by many other groups which now happen to be restricted to E. Asia and to eastern N. America.

Lacertilia are less satisfactory for short diagnoses. America alone combines Iguanidae and Tejidae:—

N. America: Iguanidae, Anguidae, Tejidae (and Rhineura in Florida).

S. America: Iguanidae, Anguidae, Tejidae and many Amphisbaenidae.

Africa and Madagascar: Chameleons and Zonuridae and Gerrhosauridae.

Madagascar: Chameleons and Iguanidae.

India: Varanidae, Agamidae and Lacertidae, all of which also in Africa.

Australia alone has Pygopodidae.

The Lacertilia are now distributed upon principles very different from those of the tortoises. According to the lizards the world is divided into an E. and a W. half. The W. alone has Iguanidae and Tejidae, the E. alone that important combination of Varanidae and Agamidae. Further subdivision is in most cases possible only by exclusion, *e.g.* exclusion of Lacertilia and chameleons from Australia of Varanidae and Agamidae from Madagascar. Lizards are rather susceptible to climatic conditions, infinitely more than water tortoises.

As regards *Ophidia*, America has Crotalinae and Elapinae, but no Viperinae. Eurasia and India alone combines Viperinae, Crotalinae and Elapinae. Africa, Viperinae and Elapinae but no Crotalinae. Australia only Elapinae. Madagascar none of these groups.

The Viperinae must have had their original centre in the palaearctic countries, and they have been debarred only from Australia and Madagascar. Both vipers and pit vipers are still in Asia, but true vipers are absent in America, with their fullest development now in Afrca, whilst pit vipers went E., covering now the whole of America, and having developed the rattlesnakes in consequence. The Elapinae are undoubtedly of Asiatic origin; they have overrun Africa, were too late for Madagascar, but early enough for Australia, where they are only poisonous snakes; and only one genus, *Naja*, has got into, or rather, has differentiated from America, in the S. of which it is abundant.

Opisthoglypha are useless for our purpose; they are cosmopolitan, with the exception of Australia, but probably they have one ancient centre in S. America and another in the old world.

Amblycephalidae afford another of those curious instances of apparent affinity between S.E. Asia and Central America; paralleled by *Pelamis bicolor*, which ranges from Madagascar to Australia, while all the other Hydrophiinae belong to the Indian Ocean and the E. Asiatic seas. Aglyphous Colubrines show undoubted affinity between N. America and Eurasia; the whole group is absolutely cosmopolitan, many of the genera, *e.g. Coluber*, *Tropidonotus* and *Coronella*, have proved their success by having acquired an enormous range. Snakes have comparatively few enemies, and they possess exceptional means of distribution. It is rare for a terrestrial species to have such a wide range as *Crotalus terrificus*, from Arizona to Argentina, or as the India cobra, which, like the tiger, is equally at home in Malay islands, Manchuria and Turkestan.

The tortoises divide the habitable world into a S. and a N. world, much as do the anurous Batrachians; the lizards split it into an E. and a W. hemisphere. The poisonous' snakes, the most recent of reptiles in their full development and distribution, allow us to distinguish between Australia, America and the rest of the world.

(H. F. G.)

REPTON, a village in the S. parliamentary division of Derbyshire, England, 8 m. S.W. of Derby, on the Midland railway. Pop. (1901) 695. It is famous for its school, founded in 1557 by Sir John Port, of the neighbouring village of Etwall, which has valuable entrance scholarships, and two leaving exhibitions to the universities annually. The number of boys is about 300. The school buildings are modern, but incorporate considerable portions of an Augustinian priory established in 1172. There was an ecclesiastical establishment on this site in the 7th century, the first bishop of Mercia being established here. This was destroyed by the Danes in 874. In the second half of the 10th century, during the reign of Edgar, another church was founded. The existing parish church of St Wystan retains pre-Conquest work in the chancel, beneath which is a remarkably fine vaulted crypt, probably dating from the reign of Edgar, its roof supported on fluted columns. The monastery was dissolved by Henry VIII.

REPUBLIC (Lat. *respublica*, a commonweal or commonwealth), a term now universally understood to mean a state, or polity, in which the head of the government is elective, and in which those things which are the interest of all are decided upon by all. This is notoriously a very modern interpretation of the term. In the ancient world of Greece and Rome the franchise was in the hands of a minority, who were surrounded by, and who governed, a majority composed of men personally free but not possessed of the franchise, and of slaves. Modern writers have often used *respublica*, and literal translation, as meaning only the state, even when the head was an absolute king, provided that he held his place according to law and ruled by law. "Republic," to quote one example only of many, was so used by Jean Bodin, whose treatise, commonly known by its Latin name *De Republica Libri Sex*, first appeared in French in 1577. Englishmen of the middle ages habitually spoke of the commonwealth of England, though they had no conception that they could be governed except by a king with hereditary right. The coins of Napoleon bear the inscription "*République française, Napoléon Empereur.*" Except as an arbitrary term of art, or as a rhetorical expression, "republic" has, however, always been understood to mean a state in which the head holds his place by the choice of his subjects. Poland was a republic because its king had in earlier times to be accepted, and in later times was chosen by a democracy composed of gentry. Venice was a republic, though after the "closing of the great council" the franchise was confined to a strictly limited aristocracy, which was itself in practice dominated by a small oligarchy. The seven states which formed the confederation of the United Netherlands were republics from the time they renounced their allegiance to Philip II., though they chose to be governed by a stadtholder to whom they delegated large powers, and though the choice of the stadtholder was made by a small body of burghers who alone had the franchise. The varieties are many. What, however, is emphatically not a republic is a state in which the ruler can truly tell his subjects that the sovereignty resides in his royal person, and that he is king, or tsar, "pure and absolute," by the grace of God, even though he may hasten to add that "absolute" is not "despotic," which means government without regard to law. The case of Great Britain, where the king reigns theoretically by the grace of God, but in fact by parliamentary title and under the Act of Settlement, like the whole British constitution, unique.

There is in fact a fundamental incompatibility between the conceptions of government as a commonwealth and as an institution based on a right superior to the people's will. Where the two views endeavour to live together one of two things must happen. The ruler will confiscate the rights of the community to himself and will become the embodiment of sovereignty, which is what happened in most of the states of Europe at the close of the middle ages; or the community, acting through some body politic which is its virtual representative, will confine the head of the government to defined functions.

The question of representation is dealt with separately (see REPRESENTATION), but the conception of a republic in which all males, whether do not belong to an inferior and barbarous race, share in the suffrage is one which would never have been accepted in the ancient or medieval world, for it is based on a foundation of which they knew nothing, —the political rights of man. When the Scottish reformer John Knox based his claim to speak on the government of the realm on the fact that he was "a subject born within the same" he advanced a pretension very new to his generation. But it was one which was fated to achieve a great fortune. The right of the subject, simply as a member of the community, to a voice in the community in which he was born, and on which his happiness depended, implied all "the rights of man" as they were to be stated by the American Declaration of Independence, and again by the French in 1789. As they could be vindicated only by revolt against monarchical governments in the old world and the new, and as they were incompatible with all the convictions which make monarchy possible, they embodied

themselves in the modern democratic republics of Europe and America. It is a form of government not much more like the republic of antiquity and the middle ages than the French *sans-culottes* was like Harmodius and Aristogeiton, whom he admired for being what they most decidedly were not—believers in equality and fraternity. But it does, subject to the imperfections of human nature, set up a government in which all, theoretically at least, have a voice in what concerns all.

REPUBLICAN PARTY. Of the three important American parties which have called themselves Republican,[1] this article deals only with that one which was organized during the years 1854 to 1856 and has been in control of the government of the United States during the larger portion of the half century since the presidential election of 1860

Origin and Character.—Sectionalism, the movement which tended to break the Union into two separate republics, one based on free labour, the other on that of slaves, had gained before the middle of the 19th century such headway as to compel a reconstruction of the party system. The beginning of this reconstruction was heralded by the rise of the Liberty party (*q.v.*), in 1840, its completion by the disruption in 1860 of the Democratic party along sectional lines, and the election of Abraham Lincoln by a sectional vote.

The event which determined the date of the birth of the Republican party was the repeal by the Kansas-Nebraska Bill of 1854 of that provision of the Compromise of 1820 which excluded slavery from national territory N. of the geographical line 36° 30′ and the formal substitution in that bill of "squatter" for national sovereignty, in deciding the question of slavery in the Territories. The enactment of this bill introduced a new and highly critical stage in the relations between North and South. Down to 1850 the differences of the two sections over slavery had always been arranged by mutual concessions. In 1854 this expedient was set aside. Without giving anything in return, Douglas and his supporters took from the free-labour section an invaluable barrier against the extension of slavery: and through the doctrine of "squatter sovereignty" denied to Congress the power to erect such barriers in the future. But this only hastened a crisis that could not have been greatly delayed. Call it hour had already discerned the true sequence and deadly nature of the growing sectional estrangement, and Lincoln was soon to utter the prophetic words: "This government cannot endure permanently, half slave and half free."

The immediate result of the agitation over the repeal was to convince a large number—which soon became a majority—of the best citizens of the North, irrespective of party, that the restriction of slavery was essential to the well-being both of the North and of the Union as a whole. In order to give effect to this conviction it was necessary to form a new party. The agitation which prepared the way for its rise began in Congress during the debates on the Kansas-Nebraska Bill, and spread thence throughout the North. The West was more quickly responsive than the East. But everywhere large elements of the existing parties came together and agreed to unite in resisting the extension of slavery. Before the discussion of the repeal in Congress had reached its later stages, a mass meeting of Whigs, Democrats and Free Soilers at Ripon, Wisconsin, resolved that if the Kansas-Nebraska Bill should pass: "They would throw old party organizations to the winds and organize a new party on the sole issue of the non-extension of slavery." The name Republican was formally adopted at a state convention of the new party held at Jackson, Michigan, on the 6th of July 1854, and by other Western state conventions on the 13th of the same month.

The great majority of the new party had been either Whigs or Democrats. In two cardinal points they were agreed, namely, opposition to slavery and belief in the national, as opposed to the federative, nature of the Union. In other points there was at the beginning much disagreement. Fortunately the issues on which there was agreement overshadowed all others long enough to bring about a fusing of the two elements. It was the union of the Whig who believed in making government strong and its sphere wide, with the Democrat who believed in the people and the people's control of government, that made the Republican party both efficient and popular.

History.—Before its advent to power, from 1854 to 1860, the tasks of the Republican party were three: to propagate the doctrine of slavery restriction by Congressional action; to oppose the extension of slavery under the operation of the doctrine of squatter sovereignty; and to obtain control of the Federal government. In each it was successful. Throughout the North and under such leaders as Seward, Lincoln, Chase, Sumner, Henry Ward Beecher and Horace Greeley, all the resources of the press, the platform, the pulpit and (an institution then powerful but now forgotten) the lyceum or citizens' debating club, were fully enlisted in the propaganda. Other events that turned to the advantage of the Republicans were the brutal assault upon Charles Sumner in the Senate Chamber in 1856, the Ostend Manifesto, advising in the interest of slavery the acquisition of Cuba by force if Spain should refuse to sell, the enforcement—sometimes brutal and always hateful—of the Fugitive Slave Law (*q.v.*), and the quarrel of Douglas with the administration and the South over the application of squatter sovereignty to Kansas. On the other hand, the decision of the Supreme Court in the case of Dred Scott, while the Republicans refused to accept as good law, and the raid of John Brown at Harper's Ferry, which they condemned, brought them into serious embarrassment.

In the prosecution of the third task, the attainment of office, the party followed wise counsels and was fortunate. In its first national platform, that of 1856, the party affirmed its adherence to the principles of Washington and Jefferson, denied the constitutional right of Congress or a Territory to establish slavery, and declared that it was "both the right and duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery." At the close of the resolutions there was a demand for government aid to a Pacific railway and for the improvement of rivers and harbours.

The platform of 1860 was more comprehensive. It added to the planks of the first, an arraignment of the administration and the Dred Scott decision, and demands for a protective tariff and a homestead act. Although the popular vote for Abraham Lincoln was more than a half-million greater than that for John C. Frémont, the party's candidate in 1856, nevertheless it was the disruption of the Democratic party that made the Republican triumph possible. On the other hand, the Republican party was the strongest member of the new party system as reorganized on the sectional principle. Moreover, in character and purpose, as well as numerical strength, it was better qualified than its rivals to meet the impending crisis.

The War Period, 1861–1865.—Between the election of Mr Lincoln in November 1860, and his inauguration on the following 4th of March, seven of the slave-holding states seceded, formed a Confederacy and withdrew their representatives from the national legislature. All attempts to arrange a compromise failed. The vacillation of President Buchanan, and the position taken in his annual message that the national government had no right to coerce a seceding state, gave strong support to the disunion movement. These events forced upon the Republican party a change of policy. Hitherto its efforts had been directed chiefly to excluding slavery from the Territories. Now the first duty was to save the Union from disruption. In order to do this it was necessary to unite the North, and to bring to the support of the Union a large proportion of those border slave states, Delaware, Maryland, Virginia, Kentucky, Tennessee and Missouri, in which there was considerable Union sentiment. Hence the party laid aside completely the earlier issue of slavery restriction and accepted as the sole issue of the hour the maintenance of the Union. Indeed, in order to secure more easily the co-operation of loyal Democrats, it even gave up its own name for a time and called itself the Union party.

[1] The party organized by Thomas Jefferson; the National Republicans, 1824–1834; and the Republican party of the present.

During the early period of the war the President checked all efforts on the part of zealous subordinates, civil and military, to make the war for the Union even incidentally a war upon slavery. In his efforts to unionize the border states Mr Lincoln in March 1862 urged that Congress should co-operate with any state in providing for a voluntary, gradual and compensated emancipation. Congress acceded, but not one of the border states would undertake emancipation. Many of the Republican leaders rejected the border state policy of the President and urged a more radical course towards slavery. In replying to Horace Greeley, who voiced the discontent in a public letter, to which he gave the title, *The Prayer of Twenty Millions of People*, Mr Lincoln in August 1862 wrote: "*My paramount object is to save the Union and not either to save or destroy slavery.*"

But as evidence accumulated that slavery was a strong military support of the Confederacy the policy of destroying slavery as a means of saving the Union grew in favour. To this policy Mr Lincoln on the 22nd of September 1862 committed himself, the Republican party and the cause of the Union. The first response was distinctly unfavourable. The immediate effect was "to unite the South and divide the North." A considerable element of the Democratic party became disloyal, while the party as a whole opposed all measures looking to the destruction of slavery. The autumn elections greatly reduced the Republican majority in Congress. But the new policy steadily gained ground until the Republican party in its third national convention, which met on the 7th of June 1864, resolved: "that as slavery was the cause and now constitutes the strength of this rebellion, justice and national safety demand its utter and complete extirpation from the soil of the republic." In the following year slavery was finally abolished by the Thirteenth Amendment.

On the Republican party, since it had an effective majority in each house of Congress, rests the responsibility for the legislation of the war period. The theory of loose construction of the Constitution was accepted. Throughout the Civil War, Congress, proceeding upon this theory, made prompt provision for the prosecution of the war. It passed Legal Tender Acts; it established a system of national banks; greatly raised the tariff rates; and in order to hasten the settlement of the Far West and to make that section more integral part of the Union, it passed a Homestead Act and an act providing for a railway to the Pacific. For a time, while disloyalty was most rife in the North, there was a sharp curtailment of the rights of the individual citizen through the suspension, initiated by the President and approved by Congress, of the writ of Habeas Corpus. Most of the acts, which their opponents held to be violations of the Constitution, were in general acts of questionable utility. The results of the war, which came to a close early in 1865, vindicated in a signal way the principles, policies and leadership of the Republican party. It had saved the Union; it had established the national character of the Union so firmly as to bring to an end the doctrine of the right of secession; and it had destroyed slavery.

The party had been singularly fortunate in its founders and leaders. Of these three were pre-eminent: Horace Greeley, William H. Seward and Abraham Lincoln—Greeley in the field of journalism, Seward in the two realms of idealistic and practical politics, and, greatest of all, Abraham Lincoln who won and held the people.

Reconstruction.—The larger tasks of the period from the close of the Civil War in 1865 to the inauguration of Rutherford B. Hayes in 1877 were three: first, to accomplish with the least possible disturbance the transition from war to peace; second, to settle certain matters of dispute with France and England that had arisen during the progress of the war; and third, to reconstruct the South. Full responsibility for the way in which these tasks were discharged rests upon the Republican party, for it was in control of the presidency and the Senate throughout the period and of the House until December 1875. In the first and second it was notably successful. The soldiers of North and South returned at once to the fields of productive labour. The colossal war establishment was quickly reduced to the requirements of peace. The French withdrew from Mexico. The Alabama Claims were submitted to arbitration. But the reconstruction of the South proved difficult in the extreme. The strain of a prolonged and exhausting war, the upheaval of emancipation, and the utter collapse of the Confederate government, had thrown the elements of social, economic and civil life in the South into almost hopeless disorder. To restore these to normal relations and working was but part of the task; the other and more important part was to apply those methods of reconstruction which would tend to make one nation out of hitherto discordant sections. In his third annual message, Dec. 8th, 1863, Lincoln brought forward the so-called presidential plan of reconstruction. This was rejected on the ground that reconstruction was a Congressional rather than an executive function; and on the 4th of July 1864 Congress passed a bill making Congress instead of the president the chief agent in the work of reconstruction. President Johnson adopted Lincoln's plan, and put it into operation with such vigour that when Congress met in December 1865 all the states that had seceded were quite or nearly ready to demand the readmission of their representatives to the House and Senate.

From the standpoint of party the situation was highly critical. The men whom the newly reconstructed states had sent to Washington represented the old South and would naturally join the opposition. Although the ratification of the Thirteenth Amendment, which abolished slavery, was accomplished a fortnight later was officially proclaimed, nevertheless the reconstructed legislatures were busy enacting police regulations which, in the opinion of most Republicans, threatened to reenslave the freedmen. With an earnestness like that which the party in earlier days had shown in opposing the extension of slavery, it now resolved to secure full civil rights to the freedmen. Another consideration of great weight in shaping party policy was the need of maintaining the rights of Congress against executive encroachment. Owing to the war and Lincoln's masterful personality, the presidency had gained in prestige at the expense of Congress. The tendency thus established would be strengthened to a dangerous degree, it was thought, if the President were to take the leading part in reconstructing as well as in saving the Union. There was took place within the party a change of great importance. Hitherto the conservatives, represented by such leaders as Lincoln and Seward, had always won in struggles with the radical elements; but now the tide changed, and the radicals who were more narrowly national and more strongly partisan gained control, and ruled the party to the end of the period. This revolution within the Republican party between the years 1865 and 1867 was fostered by a marked recrudescence of sectional feeling in the North, and by the character of the successor of President Lincoln and of the party leaders in Congress. President Johnson while eminently patriotic and courageous, was tactless and imprudent to the last degree. Mr Sumner, the leader of the Senate, was not conciliatory in manner, and while incapable of revengeful feeling seemed more considerate of the freedman than of the Southern white. Thaddeus Stevens, whose influence over the House of Representatives was stronger than that of Sumner over the Senate, regarded the South as "a conquered province," and his personal feelings towards the ruling class of the South were harshly vindictive. The policy adopted by the Republican majority in each house of Congress was to refuse admission to the men chosen by the states that had been reconstructed under the presidential plan, until a joint-committee of both houses should investigate conditions in the South. In this rebuff there was distinct intimation of a purpose to set aside altogether the reconstructive work of the President. Congress proceeded at once to enact measures to continue and extend the earlier temporary provision for helpless freedmen whom emancipation had set adrift, and to give them full civil rights. By passing the Fourteenth Amendment in June 1866 Congress committed itself to the policy of securing the civil rights of the negro by constitutional guarantee. Each of these acts was vetoed by the President, between whom and

Congress political disagreement ripened soon into bitter enmity. As the quarrel developed Congress ignored the recommendations of the President, repassed by the requisite majority and without due consideration of his objections each measure that he vetoed, took from him the power to remove subordinates which had been exercised by his predecessors, deprived him of his constitutional rights as commander-in-chief of the army, and finally in 1868 undertook to drive him from office by impeachment.

In 1867 Congress, under the control of the radical wing of the Republican party, set aside nearly all reconstructive work that had been accomplished previously and put into execution a plan of its own, under which the Southern States were reconstructed anew and admitted to representation in Congress between the years 1867 and 1870. Inevitable consequences of the Congressional plan of reconstruction were: first, the erection of state governments that were inefficient, corrupt, ruinously wasteful and shamefully oppressive; second, the extreme demoralization of the freedmen suddenly transformed from slaves into rulers of their former masters; third, the demoralization, in many cases also extreme, of the great body of the Southern whites by the expedients to which they resorted in order to escape from the rule of the freedman, led by the "Carpet Bagger" his Northern, and the "Scalawag" his Southern, white ally; fourth, the alienation of the white and coloured races in the South,—an alienation which was to each a source of immeasurable evils; fifth, the speedy overthrow on the withdrawal of military support of the governments set up under the Congressional plan, and the creation of a South "solid" in resentful opposition to the North and the Republican party. And sixth, as the outcome of all these results, an unfortunate delay in reuniting North and South. The Republican party suffered during this period a moral decline, seen in the frequent efforts to gain party advantage by kindling anew the earlier sectional animosities, a growing arrogance, the increasing weight of the partisan and spoilsman in party management, and the widespread corruption that came to light in the "scandals" of the second administration of General Grant. The mismanaged Liberal Republican movement of 1870–1872 was a reaction against this moral decline and a protest against the Southern policy of the party and the support of the "Spoils" system. The service of the Liberal Republicans consisted mainly in the aid they gave to the reform of the Republican party and in the influence they exerted to induce the Democratic party to accept the results of the war.

But despite the warnings it received, the prestige it had gained during the war and the popularity of President Grant, the Republican party lost ground steadily during the second half of the period. In the election of 1874 the Democratic party gained control of the House of Representatives; and in the election of 1876 came within a hair's breadth of winning the presidency.

Election of Mr Hayes to that of Mr McKinley, 1876–1896.—During these twenty years the subsidence of old and the rise of new issues led to a reconstruction of the party system, which, although less radical than that of 1840 to 1860, brought into existence several new parties and changed in important respects the character and policies of those already in the field. From the standpoint of party history the chief interest of these twenty years lies in the answer to the question, How did the discredited Republican party secure in 1896 a new and prolonged lease of power? The task was not easy. The reconstruction policy of the party had alienated many Northern supporters and had made the South solidly Democratic. The prevalence of the spoils system and the scandals of the second administration of General Grant had hurt the prestige of the party as a guardian of public morals and of the national honour. What gave the Republicans a fighting chance were: its record down to the close of the Civil War; its proven aptitude for the tasks of government; and the growth among the people of a more vital national feeling which turned instinctively to the party that had saved the nation. Despite these substantial advantages over their Democratic rivals the Republicans lost the presidential elections of 1884 and 1892, and the entire Democratic party—some Republicans agreeing—has always held that a just decision of the contested election of 1876 would have seated Samuel J. Tilden, the Democratic candidate, instead of Mr Hayes. In the Senate the Republicans were in a majority during fourteen years. In the House, whose members are chosen by popular vote, these figures were reversed, the Democrats having control during fourteen years. In each of five successive presidential elections, those of 1876, 1880, 1884, 1888 and 1892, the Democratic popular vote was larger than the Republican. Marked features of the party situation were the apparent similarity for a time of the principles of the two great parties, the influence on their policy exerted by the stronger minor parties, and the rise of the Mugwumps (not strictly a party), who claimed the right to vote for the best candidate independently of party and were in the main of Republican origin.

Of the issues of the period one, the reform of the civil service, was served by both of the great parties with imperfect fidelity. Each of the Republican presidents, Hayes, Garfield, Arthur and Harrison gave it efficient and steadfast support; and so did Cleveland, the Democratic president, although under stronger pressure from party hunger. The same was true in the case of the more important questions of foreign policy and, to a degree in its early stage, of the question of silver coinage. It was not so in the treatment of the South. President Hayes withdrew the national troops from S. Carolina and Louisiana and thus brought to an end Federal military interference with state governments. For this course a considerable section of the Republican party gave him thereafter a support which was half-hearted and inconstant. Further disaffection resulted from efforts to reform the civil service of New York which brought the President into conflict with the powerful Republican party machine in that state.[1] The high character of the President and his firm, wise and upright course raised the reputation of the party. His veto of the Silver Bill and the resumption of specie payments tended to the same result. The failure in 1889 of the third term movement for General Grant worked for the health of the party. The struggle of President Garfield with New York spoilsmen and his assassination by a disappointed office-seeker, gave a fresh impetus to the movement for the reform of the civil service. President Arthur maintained the high standard established by Presidents Hayes and Garfield.

In the election of 1884 the old parties were competitors for the confidence of the conservative and reforming elements of the country. Mr Blaine, the Republican candidate, who in brilliancy, popularity, patriotism, and disappointing personal fortunes recalled the Whig leader, Henry Clay, lost the election by a narrow margin because, while meeting the requirements of the conservatives, he had lost in a measure the confidence of the reformers.

In the election of 1888 Mr Cleveland, by making tariff reform the issue, turned the manufacturing interests to the support of Mr Harrison, the candidate of the Republicans, who thereby won the election. Mr Harrison, while not personally popular, maintained the best traditions of his Republican predecessors. The highly protective McKinley tariff, framed in obedience to the people's mandate in 1888, proved somewhat disappointing, and in the election of 1892, Mr Cleveland, as the champion of lower tariff rates, was successful for the second time. Mr Cleveland, at the beginning of his second term, secured the repeal of the act for the purchase of silver, and thus strengthened himself with the conservatives of both parties. Democratic defection in the Senate nullified largely the downward revision of the tariff urged by the President and supported by the House.

The election of 1896 marked the close of the period of party

[1] In the course of this conflict, which continued to disturb the harmony of the Republican party until the death of President Garfield, the term "Stalwarts" was used to designate the supporters of Senator Conkling, who was in control of the Republican machine in New York state, and the term "Half-Breeds" to designate the supporters of the administration.

readjustment. The leading issue was the free coinage of silver under conditions which would have made the monetary standard silver instead of gold, and would have lowered its value. The Democratic convention repudiated Mr Cleveland, accepted free coinage, and nominated W. J. Bryan. The Republicans, at the cost of a formidable party defection, endorsed the gold standard and a highly protective tariff, and nominated William McKinley, whose record and character made him an exceptionally strong candidate. In doing this the Democratic organization became the party of radicalism, the Republican, the party of conservatism. The committal of the Republican party to the maintenance of the gold standard far more than its continued support of high protection, established its position in the reconstructed party system. In doing this it allied its fortunes with those of all the property-holding classes of the country, while retaining in a high degree the confidence of the wage-earners.

Period 1897–1910.—During this period there was first a rapid recovery from economic depression, and then ten years of almost unexampled prosperity, followed by two years of moderate depression. But the period is chiefly memorable for the war of 1898 with Spain; for the oversea territorial expansion that followed; for the rise of the so-called policy of imperialism; for the assumption of a far more prominent international rôle; for wide-reaching measures of internal reform; and, lastly, for the establishment of the policy of conserving the natural resources of the nation.

Throughout this period the Republican party had undisputed control of the national government. One of the earliest acts in the administration of Mr McKinley was the enactment in 1897 of the highly protective Dingley Tariff. The provision for Reciprocity proved at first of little use. But the need of foreign markets for the rapidly growing output of manufactured products, the rising demand that the interests of the home consumer, as well as those of the producer, should be considered, and the conviction that high protection fostered monopolies, brought about a change of sentiment in the party. Mr McKinley, in his last speech, made at the Buffalo Exposition on the 5th of September 1901, gave voice to this change: "The period of exclusiveness is past. The expansion of our trade and commerce is the pressing problem. Commercial wars are unprofitable. A policy of good will and friendly trade relations will prevent reprisals. Reciprocity treaties are in harmony with the spirit of the times. Measures of retaliation are not." These views gained headway against the strenuous opposition of the "stand-patters,"[1] until revision of the tariff downward was demanded in the platform of 1908, and achieved to a moderate degree in the Tariff Act of 1909. The party has also fulfilled its promise to establish the gold monetary standard on a firm basis. During the war with Spain and in meeting the new problems of colonial empire, the Republican party has again justified its reputation for efficiency. Not less noteworthy has been the policy of the party initiated and urged by President Theodore Roosevelt and developed by President W. H. Taft for the regulation of railways and all corporations and trusts engaged in interstate business. The latest important event in the history of the Republican party is the rise of the "Insurgents," a group of senators and congressmen whose professed aims are to resist centralization in both party and national government, to lessen the influence of the money power over public policy, to regulate tariff schedules largely in the interest of the consumer, and in brief to emphasize anew the subordination of party and government to the will and service of the people.

[1] Those members of the Republican party who would maintain as far as possible the high protective duties of the Dingley Tariff.

REQUENA, a town of E. Spain, in the province of Valencia; on the left bank of the river Magro, and on the railway from Valencia to Utiel. Pop. (1900) 16,236. The town was formerly a Moorish fortress, occupying a strong position in the mountainous region of Las Cabrillas (3400 ft). It is dominated by the ancient citadel of the Moors, and still has traces of the original town walls. There are three ancient parish churches; San Nicolas, the oldest, dates from the 13th century, but was partly restored in 1727. Near the town are the sulphurous springs of Fuentepodrida. The chief industries are the cultivation of grain, fruit and saffron, and the manufacture of wine and silk.

REQUESENS, LUIS DE ZUNIGA Y (? –1576), Spanish governor of the Netherlands, had the misfortune to succeed the duke of Alva (*q.v.*) and to govern amid hopeless difficulties under the direction of Philip II. His early career was that of a government official and diplomatist. In 1563 he gained the king's confidence as his representative at Rome. In 1568 he was appointed lieutenant-general to Don John of Austria during the suppression of the Morisco revolt in Granada, and he likewise accompanied Don John during the Lepanto campaign, his function being to watch and control his nominal commander-in-chief, whose excitable temperament was distrusted by the king. Philip must have been satisfied with Requesens, for he named him viceroy in Milan, a post usually given to a great noble. Requesens was only "a gentleman of cloak and sword" (*caballero de capa y espada*), though by the king's favour he was "grand commander" of the military order of Santiago in Castile. He was credited with having shown moderation at Milan, but it is certain that he came into sharp collision with the archbishop, Saint Charles Borromeo, who took up the cause of his flock. His docility rather than his capacity marked him out to succeed Alva. The king wished to pursue a more conciliatory policy, without, however, yielding upon one of the points in dispute between himself and the revolted Netherlanders. Requesens came to Brussels on the 17th of November 1573, and till his death on the 5th of March 1576 was plunged into insuperable difficulties. With an empty treasury and unpaid mutinous troops, no faculty could have helped Requesens to succeed; and he was only an honest official who was worn out in trying to do the impossible.

REQUEST, LETTERS OF. The legal terms "letters rogatory," or "of request" (*commission rogatoire*), express a request made by one judge for the assistance of another in serving a citation, taking the deposition of a witness, executing a judgment, or the performance of any other judicial act. The later law of Rome imposed a duty of mutual assistance on the courts of the Empire, and this was extended to the courts of different states when, and so far as, Roman law came to rule the modern world. Consequently, outside ecclesiastical law (see below), the only trace of such a practice to be found in England or the United States, independent of statutory enactment, is in the admiralty doctrine that the sentence of a foreign court of admiralty may be executed on letters of request from the foreign judge or on a libel by a party for its execution. See the authorities collected by Sir R. Phillimore in *The City of Mecca*, 5 P.D. 28. The need of assistance in taking the depositions of witnesses outside their jurisdiction was long in being felt by the British and United States courts, because they issued commissions for that purpose to private persons, sometimes to foreign judges in their private capacities. But an increasing sensitiveness as to the rights of sovereignty led to

objection being taken to the execution of such commissions by persons who in that employment were officers of courts foreign to the countries in which they acted, besides which those commissions could give no power to compel the attendance of witnesses abroad. Consequently both in the mother country and in the United States acts have been passed empowering the courts to issue commissions for taking evidence to colonial or foreign courts, and to execute such commissions when received by them from the courts of the colonies or of foreign countries. The British statutes are 13 Geo. III. c. 63; 1 Will. IV. c. 22; 3 & 4 Vict. c. 105, 6 & 7 Vict. c. 82, 22 Vict. c. 20 and 48 & 49 Vict. c. 74. But neither in England nor in the United States have commissions of the old kind been entirely disused. In the practice under the Anglo-American statutes, the leading rules are that all the acts of the judge whose services are required, and all things done before him, are governed by the law of the country in which the execution takes place (*locus regit actum*), while the admissibility of the evidence and all else which concerns the conduct of the action is governed by the law of the country in which it is pending (*lex fori*). Details may be seen for England and the United States in the usual books of practice, and in Wharton's *Conflict of Laws* (2nd ed., 1881), §§ 722–31, and Sir R. Phillimore's *International Law* (3rd ed., 1889), v. 4, §§ 882–85; for other countries in von Bar's *Private International Law*, translated by Guthrie (2nd ed., 1892), §§ 391, 392, 409, 410. In ecclesiastical law, letters of request are issued for the purpose of sending causes from one court to another. Where a diocesan court within a province has jurisdiction over the parties concerned, the plaintiff may apply to the judge of such court for letters of request, in order that the cause may be instituted either in the court of arches or the chancery court of York, as the case may be. When the judge of the diocesan court consents to sign such letters and they have been accepted by the judge of the higher court, a decree issues under his seal, calling upon the defendant to answer to the plaintiff in the suit instituted against him. Letters of request are also issued for other purposes, being sometimes sent from one judge to another to request him to examine witnesses who are out of the jurisdiction of the former, but in that of the latter; to enforce a monition, &c.

REQUESTS, COURT OF, a minor court of the king's council in England, under the presidency of the lord keeper of the privy seal. Its possible origin has been assigned to an order in council of 1390 directing the lords of the council to form a committee to examine the petitions of the humble people. Its jurisdiction was chiefly equitable, and owing to the small expenses of procedure it grew in popularity, especially for cases not of sufficient importance to bring into the court of chancery itself. Under Wolsey the court was fixed permanently at Whitehall. The judges of the court were styled masters of requests. In the reign of Queen Elizabeth there were two masters ordinary and two masters extraordinary. In James I.'s reign there were four masters ordinary. In Henry VIII.'s reign the judges of the court had ceased to be privy councillors, and towards the end of Elizabeth's reign the court incurred the hostility of the common law courts, as having neither a statutory nor prescriptive title to jurisdiction. Notwithstanding a decision in 1598 as to the illegality of its jurisdiction, and subsequent decisions to the same effect in the reigns of James I. and Charles I., it continued to flourish until the suppression of the Star Chamber in 1640 virtually put an end to it. Although it sat until 1642, and masters of requests were appointed even after the Restoration, it ceased to exercise judicial functions. There were also courts of requests or, as they were sometimes called, courts of conscience, established in London in the reign of Henry VIII. with jurisdiction in matters of debt under forty shillings. These courts were extended in the reigns of George I. and George II. to various places in England, but they were abolished by an act of 1846 (County Courts Act), which established in their place the tribunal of the county court (*q.v.*).

REQUIEM, the name of a solemn mass for the dead (*Missa pro defunctis*) in the Roman Church, appointed to be sung on All Souls' Day, in memory of all "faithful departed," at funeral services, and at the anniversaries of the death of particular persons. The name is taken from the first words of the Introit, *Requiem aeternam dona eis, Domine.* The term is specially applied to the musical setting of the mass. The most celebrated Requiem Masses are those of Palestrina, Mozart and Cherubini The word has been also used of memorial services held in honour of a deceased person in churches other than the Roman.

REREDOS (Anglo-Fr. *areredos*, from *arere*, behind, and *dos*, back), an ornamental screen of stone or wood built up, or forming a facing to the wall behind an altar in a church. Reredoses are frequently decorated with representations of the Passion, niches containing statues of saints, and the like. In England these were for the most part destroyed at the Reformation or by the Puritans later; a few medieval examples, however, survive, *e.g.* at Christchurch, Hants. In some large cathedrals *e.g.* Winchester, Durham, St Albans, the reredos is a mass of splendid tabernacle work, reaching nearly to the groining. In small churches the reredos is usually replaced by a hanging or parament behind the altar, known as a dossal or dorsal. (See also ALTAR.) For the legality of images on reredoses in the Church of England, see IMAGE.

The use of the word reredos for the iron or brick back of an open fire-place is all but obsolete.

RESCHEN SCHEIDECK. This Alpine pass is in some sort the pendant of the Brenner Pass, but leads from the upper valley of the Inn or Engadine to the upper valley of the Adige. It is 5906 ft. in height. Near the summit is the hamlet of Reschen, while some way below is the former hospice of St Valentin auf der Haid, mentioned as early as 1140. Starting from Landeck, the carriage road runs up the Inn valley to Pfunds, whence it mounts above the gorge of Finstermünz to the village of Nauders ($27\frac{1}{4}$ m.) where the road from the Swiss Engadine falls in ($53\frac{1}{2}$ m. from St Moritz). Thence the road mounts gently to the pass, and then descends, with the infant Adige, to Mals ($15\frac{1}{2}$ m.), whence the pass is sometimes wrongly named Malserheide. The road now descends the upper Adige valley, or Vintschgau, past Meran ($37\frac{1}{2}$ m.) to Botzen (20 m. from Meran, or 100 m. from Landeck) where the Brenner route is joined. (W. A. J.)

RESCUE (in Middle Eng. *rescous*, from O. Fr. *recousse*, Low Lat. *rescussa*, from *reexcussa*, *reexcutere*, to shake off again, *re*, again, *ex*, off, *quatere*, to shake), the forcible setting at liberty of a person or thing. To constitute the legal offence of rescue, the person rescued must be in the custody of a constable or private individual, but in the latter case the rescuer must know that the prisoner is in lawful custody. The punishment for the offence is fine and imprisonment, with or without hard labour, if the party rescued has not been convicted of the offence for which he was in custody. But if the prisoner has been imprisoned on a charge of, or under sentence for, high treason, felony or misdemeanour, the rescue is high treason, felony or misdemeanour. The punishment for a felonious rescue may be penal servitude for not more than seven or less than three years, imprisonment for not more than two years, with or without hard labour. The forcible rescue of goods legally distrained or the rescuing of cattle by pound breach are misdemeanours indictable at common law, but the more usual procedure is a civil action under 2 W. & M. c. 5, s. 3 (1690), which makes an offender liable for treble damages.

RESEARCH (O. Fr. *recerche*, from *recercher*, *re-* and *cercer*, mod. *chercher*, to search; Late Lat. *circare*, to go round in a circle, to explore), the act of searching into a matter closely and carefully, inquiry directed to the discovery of truth, and in particular the trained scientific investigation of the principles and facts of any subject, based on original and first-hand study of authorities or experiment. Investigations of every kind which have been based on original sources of knowledge may be styled "research," and it may be said that without "research" no authoritative works have been written, no scientific discoveries or inventions made, no theories of any value propounded; but the word also has a somewhat restricted

meaning attached to it in current usage. It is applied more particularly to the investigations of those who devote themselves to the study of pure as opposed to applied science, to the investigation of causes rather than to practical experiment; thus while every surgeon or physician who treats an individual case of cancer may add to our sum of knowledge of the disease, the body of trained investigators which is endowed by the Cancer Research Fund are working on different lines. Again, the practical engineers who are building aeroplanes, and those who are making practical tests by actual flight in those machines, cannot be called "researchers"; that term should be confined to the members, for example, of the scientific committee appointed by the British Government in 1909 to make investigations regarding aerial construction and navigation. Further, the term is particularly used of a course of post-graduate study at a university, for which many universities have provided special Research Studentships or Fellowships. These act as endowments for a specific period, and are conditional on the holder devoting his time to the investigation at first hand of some specified subject.

RESENDE, ANDRÉ DE (1498–1573), the father of archaeology in Portugal, began life as a Dominican friar, but about 1540 passed over to the ranks of the secular clergy. He spent many years travelling in Spain, France and Belgium, where he corresponded with Erasmus and other learned men. He was also intimate with King John III. and his sons, and acted as tutor to the Infante D. Duarte. Resende enjoyed considerable fame in his lifetime, but modern writers have shown that he is neither accurate nor scrupulous. In Portuguese he wrote: (1) *Historia da antiguidade da cidade de Evora* (*ibid.* 1553); (2) *Vida do Infante D. Duarte* (Lisbon, 1789). His chief Latin work is the *De Antiquitatibus Lusitaniae* (Evora, 1593).

See the "Life" of Resende in Farinha's *Collecção das antiguidades de Evora* (1785), and a biographical-critical article by Rivara in the *Revista Litteraria* (Oporto, 1839), iii. 340–62; also Cleynarts, *Latin Letters*. (E. PR.)

RESENDE, GARCIA DE (1470–1536), Portuguese poet and editor, was born at Evora, and began to serve John II. as a page at the age of ten, becoming his private secretary in 1491. He was present at his death at Alvor on the 25th of October 1495. He continued to enjoy the same favour with King Manoel, whom he accompanied to Castile in 1498, and from whom he obtained a knighthood of the Order of Christ. In 1514 Resende went to Rome with Tristão da Cunha, as secretary and treasurer of the famous embassy sent by the king to offer the tribute of the East at the feet of Pope Leo X. In 1516 he was given the rank of a nobleman of the royal household, and became *escrivão de fazenda* to Prince John, afterwards King John III., from whom he received further pensions in 1525. Resende built a chapel in the monastery of Espinheiro near Evora, the pantheon of the Alemtejo nobility, where he was buried.

He began to cultivate the making of verses in the palace of John II., and he tells us how one night when the king was in bed he caused him (Resende) to repeat some "trovas" of Jorge Manrique, saying it was as needful for a man to know them as to know the Pater Noster. Under these conditions, Resende grew up no mean poet, and moreover distinguished himself by his skill in drawing and music; while he collected into an album the best court verse of the time. The *Cancioneiro Geral*, probably begun in 1483 though not printed until 1516, includes the compositions of some three hundred *fidalgos* of the reigns of kings Alphonso V., John II. and Manoel. The main subjects of its pieces are love, satire and epigram, and most of them are written in the national redondilha verse, but the metre is irregular and the rhyming careless. The Spanish language is largely employed, because the literary progenitors of the whole collection were Juan de Mena, Jorge Manrique, Boscan and Garcilasso. As a rule the compositions were improvised at palace entertainments, at which the poets present divided into two bands, attacking and defending a given theme throughout successive evenings. At other times these poetical soirées took the form of a mock trial at law, in which the queen of John II. acted as judge. Resende was much twitted by other rhymesters on his corpulence, but he repaid all their gibes with interest.

The artistic value of the *Cancioneiro Geral* is slight. Conventional in tone, the greater part are imitations of Spanish poets and show no trace of inspiration in their authors. The *Cancioneiro* is redeemed from complete insipidity by Resende himself, and his fine verses on the death of D. Ignez de Castro inspired the great episode in the *Lusiads* of Camoens (*q.v.*). Resende is the compiler of a gossiping chronicle of his patron John II., which, though plagiarized from the chronicle by Ruy de Pina (*q.v.*), has a value of its own. The past lives again in these pages, and though Resende's anecdotes may be unimportant in themselves, they reveal much of the inner life of the 15th century. Resende's *Miscellanea*, a rhymed commentary on the most notable events of his time, which is annexed to his *Chronicle*, is a document full of historical interest, and as a poem not without merit. The editions of his *Chronicle* are those of 1545, 1554, 1596, 1607, 1622, 1752 and 1798.

His *Cancioneiro* appeared in 1516, and was reprinted by Kausler at Stuttgart in 3 vols., 1846–52. A new edition has recently come from the university press at Coimbra. For a critical study of his work, see *Excerptos, seguidos de uma noticia sobre sua vida e obras, um juizo critico, apreciação de bellezas e defeitos e estudo da lingua*, by Antonio de Castilho (Paris, 1865). Also *As sepulturas do Espinheiro*, by Anselmo Braamcamp, Freire Lisbon, 1901, *passim*, and pp. 67–80, where the salient dates in Resende's life are set out from documents recently discovered; and Dr Sousa Viterbo, *Diccionario dos Architectos . . . Portuguezes*, ii. 361–74. (E. PR.)

RESERVATION (Lat. *reservare*, to keep back), the act or action of keeping back or withholding something. There are some technical uses of the term. In English law "reservation" is used of the retention by the vendor or lessor, in a conveyance or lease, of some right or interest, which without such reservation would have passed to the purchaser or tenant; such "reservations" usually are concerned with rights of way or other easements or sporting rights. In ecclesiastical usage, the term is applied to the practice of preserving unconsumed a portion of the consecrated elements after the celebration of the Eucharist. For the history of this practice and its usage in the Roman, Greek and English churches, see EUCHARIST,§ *Reservation of the Eucharist*. In the Roman Church, where the pope retains for himself the right to nominate to certain benefices, that action is termed, technically, "reservation." When in making a statement, taking an oath, &c., a person qualifies that statement in his mind, or withholds some fact, word or expression which, if expressed, would materially alter the effect of his statement or oath, such qualification is termed a "mental reservation," or, in the technical language of casuistry, "mental restriction" (see LIGUORI). The system of providing special tracts of land exclusively for the tribes of American Indians, adopted in the United States of America and in Canada, is known as the Reservation system, and such tracts are styled Indian Reservations. (See UNITED STATES and CANADA.)

RESHT, the capital of the province of Gilan in Persia, in 37° 17′ N., and 49° 36′ E., on the left bank of the Siah-rud (Black river), which is a branch of the Sefid-rud (White river), and flows into the Murdab, lagoon of Enzeli. The distance from Enzeli, the port of disembarcation from Russia, on the S. shore of the Caspian, to Resht is 14 m. in a direct line, and is accomplished in an open boat, or (since 1892), depth of water permitting, in a small steamboat to Pir-i-Bazar and thence 6 m. on a good road by carriage. Resht has a population of 60,000 and is the residence of English, Russian, French and Turkish consuls and the seat of the governor-general of the province of Gilan. The town is situated in low, malarious ground, and was originally buried in jungle, but the Russians during their occupation of the place in 1723–34 cleared much timber and jungle and made some open spaces. The houses are red-tiled and raised from the ground, with broad verandahs and overhanging eaves. Conflagrations are frequent, particularly in the months of January and December, when hot, dry winds resembling the Föhn of the Alps come down from the snow-capped Elburz. A good carriage

road constructed and worked by a Russian company and opened to traffic in 1899 connects Resht with Teheran via Kazvin.

The value of trade probably exceeds £2,000,000, principal exports being rice, raw silk, dry fruit, fish, sheep and cattle, wool and cotton, and cocoons, the principal imports sugar, cotton goods, silkworm "seed" or eggs (£70,160 worth in 1906–7), petroleum, glass and china. The trade in dried silkworm cocoons has increased remarkably since 1893, when only 76,150 lb valued at £6475 were exported; during the year 1906–7 ending 20th March, 2,717,540 lb valued at £238,000 were exported. There are telegraph and post offices and branches of the Imperial Bank of Persia and Banque d'Escompte.

ENZELI, the port of Resht in the S.E. corner of the Caspian, is 14 m. N. of Resht, in 37° 29′ N., 49° 28′ E. Pop. 4000. Between it and other ports in the Caspian communication is maintained by the mail-steamers of the Caucasus and Mercury Steam Navigation Company and many vessels of commercial firms with head offices chiefly at Baku. (A. H.-S.)

RESIDENCE (Latin *residere*, to remain behind, to dwell, reside), in general, a place of abode. In law, it usually means continuance in a place. The ordinary meaning of the word has been defined as "the place where an individual eats, drinks and sleeps, or where his family or his servants eat, drink and sleep" (*R. v. North Curry*, 1825, 4 B. & C. 959). For certain purposes, however, a man may be said to have his residence not only where he sleeps, but also at his place of business. See ABODE; DOMICILE. In ecclesiastical law residence is the continuance of a spiritual person upon his benefice. As a general rule, it is necessary for every rector or vicar to reside within his parish, even though there may be no house of residence annexed to the benefice. But under certain circumstances the bishop of the diocese may grant a licence of non-residence (Pluralities Act 1838).

RESIDENT, a political agent or officer representing the Indian government in certain native states in India. He resides in the state and advises on all matters of government, legislative or executive. Residents are divided into three classes or ranks. In certain other dependencies or protectorates of the British Empire the representative of the government is styled a resident or political agent, notably in Nepaul, Aden, Sarawak, British North Borneo, &c. In general, where the state to which a resident is attached is not an independent one, he exercises consular and magisterial functions.

For "Resident" as the title of a diplomatic agent see DIPLOMACY.

RESIDUE (through the French, from the Lat. *residuum*, a remainder, from *residere*, to remain), in law, that which remains of a testator's estate after all debts and legacies are discharged, and funeral, administration and other expenses paid. The person to whom this residue or surplus is left is termed the residuary legatee; should none be mentioned in the will the residue goes to the next of kin (see EXECUTORS AND ADMINISTRATORS; LEGACY; WILL).

RESIN (through O.Fr. *resine*, modern *résine*, from Lat. *resina*, prob. ably Latinized from Greek ῥητίνη, resin), a secretion formed in special resin canals or passages of plants, from many of which, such as, for example, coniferous trees, it exudes in soft tears, hardening into solid masses in the air. Otherwise it may be obtained by making incisions in the bark or wood of the secreting plant. It can also be extracted from almost all plants by treatment of the tissue with alcohol. Certain resins are obtained in a fossilized condition, amber being the most notable instance of this class; African copal and the kauri gum of New Zealand are also procured in a semi-fossil condition. The resins which are obtained as natural exudations are in general mixtures of different, peculiar acids, named the *resin acids*, which dissolve in alkalis to form resin soaps, from which the resin acids are regenerated by treatment with acids. They are closely related to the terpenes, with which they occur in plants and of which they are oxidation products. Examples of resin acids are abietic (sylvic) acid, $C_{19}H_{28}O_2$, occurring in colophony, and pimaric acid, $C_{19}H_{30}O_2$, a constituent of gallipot resin. Abietic acid can be extracted from colophony by means of hot alcohol; it crystallizes in leaflets, and on oxidation yields trimellitic, isophthalic and terebic acid. Pimaric acid closely resembles abietic acid into which it passes when distilled in a vacuum; it has been supposed to consist of three isomers. Resins when soft are known as oleo-resins, and when containing benzoic or cinnamic acid they are called balsams. Other resinous products are in their natural condition mixed with gum or mucilaginous substances and known as gum-resins. The general conception of a resin is a noncrystalline body, insoluble in water, mostly soluble in alcohol, essential oils, ether and hot fatty oils, softening and melting under the influence of heat, not capable of sublimation, and burning with a bright but smoky flame. A typical resin is a transparent or translucent mass, with a vitreous fracture and a faintly yellow or brown colour, inodorous or having only a slight turpentine odour and taste. Many compound resins, however, from their admixture with essential oils, are possessed of distinct and characteristic odours. The hard transparent resins, such as the copals, dammars, mastic and sandarach, are principally used for varnishes and cement, while the softer odoriferous oleo-resins (frankincense, turpentine, copaïba) and gum-resins containing essential oils (ammoniacum, asafoetida, gamboge, myrrh, scammony) are more largely used for therapeutic purposes and incense. Amber (*q.v.*) is a fossil resin.

RESOLUTION, a word used in the two main senses, separation and decision, of the verb "to resolve" (Lat. *resolvere*, to loose, unfasten), to separate anything into its constituent elements or component parts, hence, through the subsidiary meaning of to clear up doubts or difficulties, to settle, determine. The principal applications of the term in its first sense are to the separation of a body into its component parts by chemical process, or, to the eye, by the lens of a microscope or telescope; similarly, in mathematics, to the analysis of a velocity, force, &c., into components. In the second sense, beyond the general meaning of determination, firmness of character, a "resolution" is specifically a decision of opinion formally submitted to a legislative or other assembly and adopted or rejected by votes.

RESORCIN (meta-dioxybenzene), $C_6H_4(OH)_2$, one of the dihydric phenols. It is obtained on fusing many resins (galbanum, asafoetida, &c.) with caustic potash, or by the distillation of Brazil-wood extract. It may be prepared synthetically by fusing meta-iodophenol, phenol meta-sulphonic acid, and benzene meta-disulphonic acid with potash; by the action of nitrous acid on meta-aminophenol; or by the action of 10% hydrochloric acid on meta-phenylene diamine (J. Meyer, *Ber.*, 1897, 30, p. 2569). Many ortho and para-compounds of the aromatic series (for example, the brom-phenols, benzene para-disulphonic acid) also yield resorcin on fusion with caustic potash. It crystallizes from benzene in colourless needles which melt at 119° C. and boil at 276-5° C. (L. Calderon), or 280° C. (C. Graebe), and is readily soluble in water, alcohol and ether, but insoluble in chloroform and carbon bisulphide. It reduces Fehling's solution, and ammoniacal silver solutions. It does not form a precipitate with lead acetate solution, as the isomeric pyrocatechin does. Ferric chloride colours its aqueous solution a dark violet, and bromine water precipitates tribromresorcin. Sodium amalgam reduces it to dihydroresorcin, which when heated to 150–160° C. with concentrated baryta solution gives γ-acetylbutyric acid (D. Vorländer); when fused with caustic potash, resorcin yields phloroglucin, pyrocatechin and diresorcin. It condenses with acids or acid chlorides, in the presence of dehydrating agents, to oxyketones, *e.g.* with zinc chloride and glacial acetic acid at 145° C. it yields resacetophenone $(HO)_2C_6H_3{\cdot}CO{\cdot}CH_3$ (M. Nencki and N. Sieber, *Jour. prak. Chem.*, 1881 [2], 23, p. 147). With the anhydrides of dibasic acids it yields fluorescеins (*q.v.*). When heated with calcium chloride-ammonia to 200° C. it yields meta-dioxydiphenylamine (A. Seyewitz, *Bull. Soc. Chim.*, 1890 [3], 3, p. 811). With sodium nitrite it forms a water-soluble blue dye, which is turned red by acids, and is used as an indicator, under the name of *lacmoid*

(M. C. Traub and C. Hock, *Ber.*, 1884, 17, p. 2615). It condenses readily with aldehydes, yielding with formaldehyde, on the addition of a little hydrochloric acid, methylene diresorcin $[(HO)_2\cdot C_6H_3]_2\cdot CH_2$, whilst with chloral hydrate, in the presence of potassium bisulphate, it yields the lactone of tetra-oxydiphenyl methane carboxylic acid (J. T. Hewitt and F. G. Pope, *Jour. Chem. Soc.*, 1897, 71, p. 1084). In alcoholic solution it condenses with sodium acetoacetate to form β-methylumbelliferone, $C_{10}H_8O_3$ (A. Michael, *Jour. prak. Chem.*, 1888 [2], 37, 470). With concentrated nitric acid, in the presence of cold concentrated sulphuric acid, it yields *trinitro-resorcin* (*styphnic acid*), which forms yellow crystals, exploding violently on rapid heating.

In medicine, resorcin, which is official in the United States under the name of resorcinol, was formerly used as an antipyretic, but it has been given up. The dose is 2 to 8 grs. Used externally it is an antiseptic and disinfectant, and is used 5 to 10% in ointments in the treatment of chronic skin diseases such as psoriasis and eczema of a sub-acute character. Weak, watery solutions of resorcin (10 or 15 grs. to the ounce) are useful in allaying the itching in erythematous eczema. A 2% solution used as a spray has been used with marked effect in hay fever and in whooping-cough. In the latter disease 10 minims of the 2% solution has been given internally. It has also been employed in the treatment of gastric ulcer in doses of 2 to 4 grs. in pill, and is said to be analgesic and haemostatic in its action. In large doses it is a poison causing giddiness, deafness, salivation, sweating and convulsions. It is also worked up in certain medicated soaps. Mono-acetyl resorcin, $C_6H_4(OH)\cdot O\cdot COCH_3$, is used under the name of "euresol."

Resazurin, $C_{12}H_7NO_4$, obtained by the action of nitrous acid on resorcin (P. Weselsky and R. Benedikt, *Monats.*, 1880, 1, p. 880), forms small dark red crystals possessing a greenish metallic glance. When dissolved in concentrated sulphuric acid and warmed to 210° C., the solution on pouring into water yields a precipitate of *resorufin*, $C_{12}H_7NO_3$, an oxyphenoxazone, which is insoluble in water, but is readily soluble in hot concentrated hydrochloric acid, and in solutions of caustic alkalis. The alkaline solutions are of a rose-red colour and show a cinnabar-red fluorescence. A tetrabromresorufin is used as a dye-stuff under the name of *Fluorescent Resorcin Blue*.

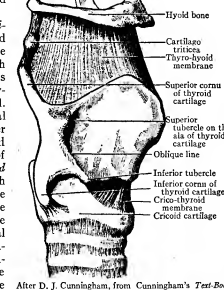
Thioresorcin is obtained by the action of zinc and hydrochloric acid on the chloride of benzene meta-disulphonic acid. It melts at 27° C. and boils at 243° C. *Resorcin disulphonic Acid* $(HO)_2C_6H_2(HSO_3)_2$, is a deliquescent mass obtained by the action of sulphuric acid on resorcin (H. Fischer, *Monats.*, 1881, 2, p. 321). It is easily soluble in water and decomposes when heated to 100° C.

RESPIRATORY SYSTEM. (1). ANATOMY—The respiratory tract consists of the nasal cavities, the pharynx, the larynx, the trachea, the bronchi and the lungs, but of these the two first parts have been treated in separate articles (see OLFACTORY SYSTEM and PHARYNX).

The *larynx* is the upper part of the air tube which is specially modified for the production of notes of varying pitch, though it is not responsible for the whole of the voice. Its framework is made up of several cartilages which are moved on one another by muscles, and it is lined internally by mucous membrane which is continuous above with that of the pharynx and below with that of the trachea or windpipe. The larynx is situated in the front of the neck and corresponds to the fourth, fifth and sixth cervical vertebrae. For its superficial anatomy see ANATOMY, *Superficial and Artistic*.

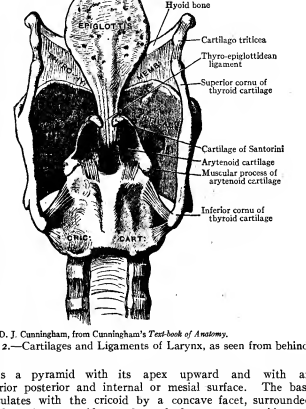
The *thyroid cartilage* (see fig. 1) is the largest, and consists of two plates or *alae* which are joined in the mid-ventral line. At the upper part of their junction is the *thyroid notch* and just below that is a forward projection, the *pomum Adami*, best marked in adult males. From the upper part of the posterior border of each ala the *superior cornu* rises up to be joined to the tip of the great cornu of the hyoid bone by the *lateral thyro-hyoid ligament*, while from the lower part of the same border the *inferior cornu* passes down to be fastened to the cricoid cartilage by the *crico-thyroid* capsule. From the upper border of each ala the *thyro-hyoid membrane* runs up to the hyoid bone, while near the back of the outer surface of each the *oblique line of the thyroid cartilage* runs downward and forward.

The *cricoid cartilage* (see figs. 1 and 2) is something like a signet ring with the seal behind; its lower border, however, is horizontal. To the mid-ventral part of its upper border is attached the mesial part of the *crico - thyroid membrane*, which attaches it to the lower border of the thyroid cartilage though the lateral parts of this membrane pass up externally to the thyroid cartilage and their upper free edges form the true *vocal cords*. On the summit of the signet part of the cricoid are placed the two *arytenoid cartilages* (see fig. 2), each of which



After D. J. Cunningham, from Cunningham's *Text-Book of Anatomy*.

FIG. 1.—Profile View of the Cartilages and Ligaments of the Larynx.



After D. J. Cunningham, from Cunningham's *Text-book of Anatomy*.

FIG. 2.—Cartilages and Ligaments of Larynx, as seen from behind.

forms a pyramid with its apex upward and with an anterior posterior and internal or mesial surface. The base articulates with the cricoid by a concave facet, surrounded by the *crico-arytenoid capsule*, and the two arytenoids are able to glide toward or away from one another, in addition to which each can rotate round a vertical axis. From the front of the base a delicate process projects which, as it is attached to the true vocal cord, is called the *vocal process*, while from the outer part of the base another stouter process

attaches the two crico-arytenoid muscles and so is known as the *muscular process*. Above each arytenoid are two smaller cartilages known as the *cornicula laryngis* or *cartilages of Santorini* and the *cuneiform cartilages*, but they are not of any practical importance.

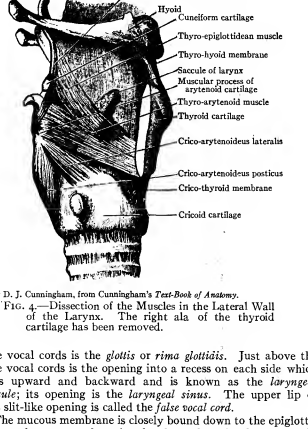
The *epiglottis* (see fig. 3), on the other hand, is a very important structure, since it forms a lid to the larynx in swallowing: only the box moves up to the lid instead of the lid moving down to the box. It is leaf-shaped, the stalk (thyro-epiglottidean ligament) being attached to the junction of the thyroid cartilages inside the larynx, while the anterior surface of the leaf is closely attached to the root of the tongue and body of the hyoid bone. The posterior or laryngeal surface is pitted for glands, and near the point where the stalk joins the leaf is a convexity which is known as the *cushion of the epiglottis*. All the cartilages of the larynx are of the hyaline variety except the epiglottis, the cornicula laryngis and the cuneiform cartilages, which are yellow elastic. The result is that all except these three tend to ossify as middle age is approached.

After D. J. Cunningham, from Cunningham's *Text-Book of Anatomy.*

FIG. 3.—Mesial Section through Larynx to show the outer wall of the right half.

The *muscles of the larynx* are: (1) the *crico-thyroids*, which are attached to the lower border of the thyroid and the anterior part of the cricoid, by pulling up which they make the upper part of the signet, with the arytenoids attached to it, move back and so tighten the vocal cords. (2) The *thyro-arytenoids* (see fig. 4), which run back from the junction of the thyroid alae to the front of the arytenoids and side of the epiglottis; they pull the arytenoids toward the thyroid and so relax the cords. (3) The single *arytenoideus* muscle, which runs from the back of one arytenoid to the other and approximates these cartilages. (4) The *lateral crico-arytenoids* (see fig. 4) which draw the muscular processes of the arytenoids forward toward the ring of the cricoid and, by so doing, twist the vocal processes, with the cords attached, inward toward one another; and (5) the *posterior crico-arytenoids* (see fig. 4) which run from the back of the signet part of the cricoid to the back of the muscular processes of the arytenoid and, by pulling these backward, twist the vocal processes outward and so separate the vocal cords. All these muscles are supplied by the recurrent laryngeal nerve, except the crico-thyroid which is innervated by the external branch of the superior laryngeal (see NERVES, *Cranial*).

The *mucous membrane of the larynx* is continuous with that of the pharynx at the *aryteno-epiglottidean folds* which run from the sides of the epiglottis to the top of the arytenoid cartilages (see fig. 3). To the outer side of each fold is the *sinus pyriformis* (see PHARYNX). From the middle of the junction of the alae of the thyroid cartilage to the vocal processes of the arytenoids the mucous membrane is reflected over, and closely bound to, the true vocal cords which contain elastic tissue and, as has been mentioned, are the upper free edges of the lateral parts of the crico-thyroid membrane. The chink between the two true vocal cords is the *glottis* or *rima glottiidis*. Just above the true vocal cords is the opening into a recess on each side which runs upward and backward and is known as the *laryngeal saccule*; its opening is the *laryngeal sinus*. The upper lip of this slit-like opening is called the *false vocal cord*.



After D. J. Cunningham, from Cunningham's *Text-Book of Anatomy.*

FIG. 4.—Dissection of the Muscles in the Lateral Wall of the Larynx. The right ala of the thyroid cartilage has been removed.

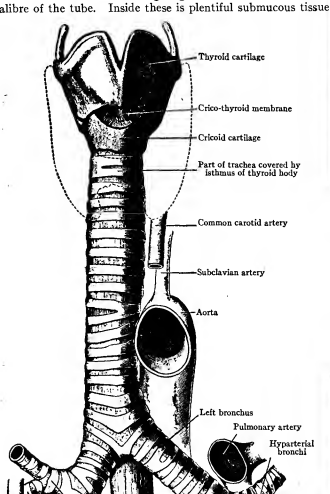
The mucous membrane is closely bound down to the epiglottis and to the true vocal cords, elsewhere there is plenty of submucous tissue in which the products of inflammation may collect and cause "oedema laryngis," a condition which is mechanically prevented from passing the true vocal cords. In the upper part of the front and sides of the larynx and over the true vocal cords the mucous membrane is lined by squamous epithelium, but elsewhere the epithelium is of the columnar ciliated variety: it is supplied by the superior laryngeal branch of the vagus nerve and above the glottis is peculiarly sensitive.

The *Trachea* or windpipe (see fig. 5) is the tube which carries the air between the larynx and the bronchi; it is from four to four and a half inches long and lies partly in the neck and partly in the thorax. It begins where the larynx ends at the lower border of the sixth cervical, and divides into its two bronchi opposite the fifth thoracic vertebra. The tube is kept always open by rings of cartilage, which, however, are wanting behind, and, as it passes down, it comes to lie farther and farther from the ventral surface of the body, following the concavity of the thoracic region of the spinal column. In the whole of its downward course it has the oesophagus close behind it, while in front are the isthmus of the thyroid, the left innominate vein, the innominate artery and the arch of the aorta. On each side of it and touching it is the vagus nerve.

The cervical part of the tube is not much more than an inch in length, but it can be lengthened by throwing back the head. This, of course, is the region in which tracheotomy is performed, and it should be remembered that in children, and sometimes in adults, the great left innominate vein lies above the level of the top of the sternum.

In transverse section the trachea is rather wider from side to side than from before backward. In life the former measurement is said to be about 12·5 mm. and the latter 11 mm. It is made up of an external fibro-elastic membrane in which the cartilaginous rings lie, while behind, where these rings are wanting, is a layer of unstriped muscle which, when it contracts,

draws the hind ends of the rings together and so diminishes the calibre of the tube. Inside these is plentiful submucous tissue



After D. J. Cunningham, from Cunningham's *Text-Book of Anatomy.*

FIG. 5.—The Trachea and Bronchi: The thyroid body is indicated by a dotted line.

containing mucous glands and quantities of lymphoid tissue, while the whole is lined internally by columnar ciliated epithelium.

The *Bronchi* (see fig. 5) are the two tubes into which the trachea divides, but, since the branches, which these tubes give off later, are also called bronchi, it may be clearer to speak of primary, secondary and tertiary bronchi. Each primary bronchus runs downward and outward, but the right one is more in a line with the direction of the trachea than the left. The right primary bronchus has also a greater calibre than the left because the right lung is the larger, and for these two reasons when a foreign body enters the trachea it usually enters the right bronchus.

The first secondary bronchus comes off about an inch from the bifurcation of the trachea on the right side and, as it lies above the level of the pulmonary artery, it is known as the *eparterial bronchus*. On the left side the first branch is about two inches from the bifurcation and, like all the remaining secondary bronchi, is hyparterial: the left primary bronchus is therefore twice as long as the right. After the eparterial secondary bronchus is given off the direction of the right primary bronchus is carried on by the hyparterial secondary bronchus, and this, just before reaching the hilum of the lung, divides into upper and lower tertiary bronchi, while the left lower secondary hyparterial bronchus does not divide before reaching the hilum of its lung. Into the hilum or root of the right lung, therefore, three bronchial tubes enter, while on the left side there are only two. The firmly rooted habit of associating the term bronchi with those parts of the main tubes which lie between the bifurcation of the trachea and the point where the first branch comes off makes it very difficult to suggest a nomenclature which calls up any picture of the actual state of things to the mind. Certainly the classification into primary, secondary and tertiary bronchi only goes a very little way toward this, and it should be realized that, call them what we may, there are two long tapering tubes which run from the bifurcation of the trachea to the lower and back part of each lung, and give off a series of large ventral and small dorsal branches. The upper part of each of these long tubes or *stem bronchi* is outside the lung and in the middle mediastinum of the thorax, the lower part embedded in the substance of the lung. The structure of the bronchi is practically identical with that of the trachea. (See G. S. Huntington's "Eparterial Bronchial System of the Mammalia," *Am. Journ. Med. Sci.* (Phila. 1898). See also Quain's *Anatomy*, London, last edition.)

The *Lungs* are two pyramidal, spongy, slate-coloured, very vascular organs in which the blood is oxygenated. Each lies in its own side of the thorax and is surrounded by its own pleural cavity (see COELOM and SEROUS MEMBRANES), and has an *apex* which projects into the side of the root of the neck, a *base* which is hollowed for the convexity of the diaphragm, an outer surface which is convex and lies against the ribs, an inner surface concave for the heart, pericardium and great vessels, a sharp anterior border which overlaps the pericardium and a broad, rounded posterior border which lies at the side of the spinal column. Each lung is nearly divided into two by a *primary fissure* which runs obliquely downward and forward, while the right lung has a *secondary fissure* which runs horizontally forward from near the middle of the primary fissure. The left lung has therefore an *upper* and *lower or basal lobe*, while the right has *upper, middle* and *lower lobes*. On the inner surface of each lung is the *root* or *hilum* at which also its vessels, nerves and ducts (bronchi) can enter and leave it. The structures contained in the root of each lung are the branches and tributaries of (1) the *pulmonary artery*, (2) the *pulmonary veins*, (3) the *bronchi*, (4) the *bronchial arteries*, (5) the *bronchial veins*, (6) the *bronchial lymphatic vessels and glands*, (7) the *pulmonary plexuses of nerves*. Of these the first three are the largest and, in dividing the root from in front, the veins are first cut, then the arteries and last the bronchi. As has been pointed out already, the eparterial bronchus on the right side is above the level of the artery, but all the others (hyparterial) are on a lower level.

The *bronchial arteries* supply the substance of the lung; there are usually two on each side, and they lie behind the bronchi. The blood which they carry is chiefly returned by the pulmonary veins bringing oxidized blood back to the heart, so that here there is a normal and harmless mixture of arterial and venous blood. If there are any *bronchial veins* (their presence is doubted by some, and the writer has himself carefully but unsuccessfully searched for them several times), they open into the azygos veins of their own side. The *bronchial lymphatic vessels* lie behind the pulmonary vessels and open into several large glands which are black from straining off the carbon left in the lungs from the atmosphere.

There is an *anterior* and *posterior pulmonary plexus of nerves* on each side, the fibres of which are derived from the vagus and the upper thoracic ganglia of the sympathetic.

Structure of the Lungs.—As the bronchi become smaller and smaller by repeated division, the cartilage completely surrounds them and tends to form irregular plates instead of rings—they are therefore cylindrical, but when the terminal branches (*lobular bronchi*) are reached, the cartilage disappears and hemispherical bulgings called alveoli occur (fig. 6 A). At the very end of

each lobular bronchus is an irregular chamber, the *atrium* (fig. 6 At), and from this a number of thin-walled sacs, about 1 mm. in diameter, open out. These are called the *infundibula* (fig. 6 I), and their walls are pouched by hemispherical air-cells or alveoli like those in the lobular bronchi. Each lobular bronchus with its atrium and infundibula forms what is known as a *lobule* of the lung, and these lobules are separated by connective tissue, and their outlines are evident on the surface of the lung.

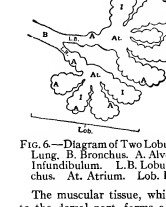


FIG. 6.—Diagram of Two Lobules of the Lung. B. Bronchus. A. Alveolus. I. Infundibulum. L.B. Lobular bronchus. At. Atrium. Lob. Lobule.

The muscular tissue, which in the larger tubes was confined to the dorsal part, forms a complete layer in the smaller; but when the lobular bronchi are reached, it stops and the mucous membrane is surrounded by the elastic layer. In the lobular bronchi, too, the lining epithelium gradually changes from the ciliated to the stratified or pavement variety, and this is the only kind which is found in the infundibula and alveoli. Surrounding each alveolus is a plexus of capillary vessels so rich that the spaces between the capillaries are no wider than the capillaries themselves, and it is here that the exchange of gases takes place between the air and the blood.

Embryology.—The respiratory system is developed from the ventral surface of the foregut as a long gutter-like pouch which reaches from just behind the rudiment of the tongue to the stomach. Limiting the anterior or cephalic end of this is a ∩-shaped elevation in the ventral wall of the pharynx which separates the ventral ends of the third and fourth visceral bars and is known as the *furcula*; it is from this that the epiglottis, aryteno-epiglottidean folds and arytenoid cartilages are developed. Later on the respiratory tube is separated from the digestive by two ridges, one on each side, which, uniting, form a transverse partition. In the region of the furcula, however, the partition stops and here the two tubes communicate. The caudal end of the respiratory tube buds out into the two primary bronchi, and the right one of these, later on, bears three buds, while the left has only two; these are the secondary bronchi, which keep on dividing into two, one branch keeping the line of the parent stem to form the stem bronchus, while the other goes off at an angle. By the repeated divisions of these tubes the complex "bronchial tree" is formed and from the terminal shoots the infundibula bud out. The alveoli only develop in the last three months of foetal life. The thyroid cartilage is probably formed from the fourth and fifth branchial bars, while the cricoid seems to be the enlarged first ring of the trachea. Before birth the lungs are solid and much less vascular than after breathing is established. Their slaty colour is gradually gained from the deposit of carbon from the atmosphere. (For further details see Quain's *Anatomy*, vol. i., Lond. 1908.)

Comparative Anatomy.—It has been shown (see PHARYNX) that in the lower vertebrates respiration is brought about by the blood vessels surrounding the gill clefts. In the higher fishes (Ganoids and Teleosteans) the "*swim bladder*" appears as a diverticulum from the dorsal wall of the alimentary canal, and its duct (*d. pneumaticus*) sometimes remains open and at others becomes a solid cord. In the former case it is probable that the blood is to some extent oxidized in the vascular wall of this bladder. In the Dipnoi (mud-fish) the opening of the swim bladder shifts to the ventral side of the pharynx and the bladder walls become sacculated and very vascular, so that, when the rivers are dried up, the fish can breathe altogether by means of it. In the S. American and African species of mud-fish the bladder or lung, as it may now be called, is divided by a longitudinal septum in its posterior (caudal) part into right and left halves. In this sub-class of Dipnoi, therefore, a general agreement is seen with the embryology or ontogeny of Man's lungs. In the Amphibia the two lungs are quite separate though they are mere sacculated bags without bronchi. A trachea, however, appears in some species (*e.g.* Siren) and a definite larynx with arytenoid cartilages, vocal cords and complicated muscles is established in the Anura (frogs and toads). In most of the Reptilia the bag-like lungs are elaborated into spongy organs with arborizing bronchi in their interior. From the crocodiles upward a main or stem bronchus passes to the caudal end of the lung, and from this the branches or lateral bronchi come off. The larynx shows little advance on that of the Anura.

The respiratory organs of birds are highly specialized. The larynx is rudimentary, and sound is produced by the *syrinx*, a secondary larynx at the bifurcation of the trachea; this may be tracheal, bronchial or, most often, tracheo-branchial. The lungs are small and closely connected with the ribs, while from them numerous large air sacs extend among the viscera, muscles and into many of the bones, which, by being filled with hot air, help to maintain the high temperature and lessen the specific gravity of the body. This pneumaticity of the bones is to a certain extent reproduced by the air sinuses of the skull in crocodiles and mammals, and it must be pointed out that the amount of air in the bones does not necessarily correspond with the power of flight, for the Ratitae (ostriches and emeus) have very pneumatic bones, while in the sea-gulls they are hardly pneumatic at all.

In mammals the thyroid cartilage becomes an important element in the larynx, and in the Echidna the upper and lower parts of it, derived respectively from the fourth and fifth branchial bars, are separate (R. H. Burne, *Journ. Anat. and Phys.* xxxviii. p. xxvii.). The whole larynx is much nearer the head than in Man, and in young animals the epiglottis is intra-narial, *i.e.* projects up behind the soft palate. This prevents the milk trickling into the larynx during suckling, and is especially well seen in the Marsupials and Cetacea, though evidences of it are present in the human embryo. In the lower mammals an inter-arytenoid cartilage is very frequent (see J. Symington, "The Marsupial Larynx," *J. Anat. and Phys.* xxxiii. 31, also "The Monotreme Larynx," *ib.* xxxiv. 90).

The lungs show a good deal of variation in their lobulation; among the porcupines as many as forty lobes have been counted in the right lung, while in other mammals no lobulation at all could be made out. The *azygous lobe* of the right lung is a fairly constant structure and is situated between the post-caval vein and the oesophagus. It is supplied by the terminal branch of the right stem bronchus and, although it is usually absent in Man, the bronchus which should have supplied it is always to be found.

(F. G. P.)

(2) PHYSIOLOGY

So far as is known, the intake of oxygen, either free or combined, and the output of carbon dioxide, are an essential part of the life of all organisms. The two processes are so closely associated with one another that they are always included together under the designation of respiration, which may thus be defined as the physiological process which is concerned in the intake of oxygen and output of carbon dioxide. According to the evidence at present available, it is only within living cells that the respiratory oxygen is consumed and the carbon dioxide formed. The mere conveying of oxygen from the surrounding air or water to these cells, and of carbon dioxide from them to the air or water, is, however, in itself a complex process in the higher animals; and accordingly an account of animal respiration naturally falls into two divisions, the first of which (I.) is concerned with the manner in which oxygen and carbon dioxide are conveyed to and from the living tissues, and the second (II.) with the consumption of oxygen and formation of carbon dioxide by the living tissues themselves.

I. In all the more highly organized animals there are special respiratory organs: the lungs in the higher vertebrates; the gills in fishes; the tracheae in insects; and various rudimentary forms of lungs or gills in other higher invertebrates. In the

present article attention will be specially confined to the case of the higher vertebrates, and in particular to man.

Air is brought into the lungs by the movements of breathing (see above, *Movements of Respiration*). Oxygen from this air passes through the delicate lining membrane of the air-cells of the lungs into the blood, where it enters into loose chemical combination with the haemoglobin of the red corpuscles (see BLOOD). In this form it is conveyed onwards to the heart, and thence through the arteries to the capillaries, where it again parts from the haemoglobin, and passes through the capillary walls to the tissues, where it is consumed. Carbon dioxide passes out from the tissues into the blood in a corresponding manner, enters into loose combination as bicarbonate, and possibly in other ways, in the blood, and is conveyed by the veins to the lungs, whence it passes out in the expired air. Pure atmospheric air contains 20·93% of oxygen, ·03% of carbon dioxide and 79·04% of nitrogen (with which is mixed about 0·9% of argon). The dried expired air in man contains about 3·5% of carbon dioxide and 17% of oxygen, so that roughly speaking the carbon dioxide is increased by about 3·5% and the oxygen diminished by 4%. Expired air as it leaves the body contains about 6% of moisture, compared with usually about 1% in the inspired air. The added moisture and higher temperature of expired air make it decidedly lighter than pure air.

Owing to the unpleasant effects often produced in badly ventilated rooms it was for long supposed that some poisonous volatile "organic matter" is also given off in the breath. Careful investigation has shown that this is not the case. The unpleasant effects are partly due to heat and moisture, and partly to odours which are usually not of respiratory origin. The carbon dioxide present in the air of even very badly ventilated rooms is present in far too small proportions to have any sensible effect.

The average volume of air inspired per minute by healthy adult men during rest is about 7 litres or ·25 cub. ft. In different individuals the frequency of breathing varies considerably—from about 7 to 25 per minute, the depth of each breath varying about inversely as the frequency. During muscular work the volume of air breathed may be six or eight times as much as during rest. The volume of carbon dioxide given off varies from about half a cubic foot per hour during complete rest to 3 cub. ft. during severe exertion, but averages about 0·9 cub. ft. per hour, and will reach or exceed 1 cub. ft. per hour during even very light exertion. The volume of oxygen consumed is about a seventh greater than that of the carbon dioxide given off.

The breathing is regulated from a nervous centre situated in the medulla oblongata, which is the lowest part of the brain. If this centre is destroyed or injured the breathing stops and death rapidly results. From the respiratory centre rhythmic efferent impulses proceed down the motor nerves supplying the diaphragm, intercostals and other respiratory muscles. Afferent impulses through various nerves may temporarily affect the rhythm of the respiratory centre. Of these afferent impulses by far the most important are those which proceed up the vagus nerves from the lungs themselves. On distention of the lungs with air the inspiratory impulses from the respiratory centre are suddenly arrested or "inhibited"; on the other hand, collapse of the lung strongly excites to inspiratory effort. On section of the vagus nerve these effects disappear, and the breathing becomes less frequent and much more laboured. The vagus nerve is thus the carrier of both inhibitory and exciting stimuli.

As the physiological function of breathing is to bring oxygen to and remove carbon dioxide from the blood, it would naturally be expected that breathing would be regulated in accordance with the amount of oxygen required and of carbon dioxide formed; but until quite recently the actual mode of regulation was by no means clear. It was commonly supposed that afferent nervous impulses in some way regulated the otherwise automatic action of the centre, want of oxygen or excess of CO_2 in the blood being only an occasional and relatively unimportant factor in the regulations. The phenomenon of "apnoea" or complete cessation of natural breathing which occurs after forced breathing, was attributed mainly to the already mentioned distension effect through the vagus nerves. To go further back still, it was even supposed that the rate and depth of breathing, and the percentage of oxygen in the inspired air, determine the consumption of oxygen and formation of carbon dioxide in the body, just as the air-supply to a fire determines the rate of its combustion. This old belief is still often met with—for instance, in the reasons given for recommending "breathing exercises" as a part of physical training.

It is evident that if the breathing did not increase correspondingly with the greatly increased consumption of oxygen and formation of CO_2 which occurs, for instance during muscular work, the percentage of oxygen in the air contained in the lung cells or alveoli (alveolar air) would rapidly fall, and the percentage of carbon dioxide increase. The inevitable result would be a very imperfect aeration of the blood. Investigation of the alevolar air has furnished the key to the actual regulation of breathing. Samples of this air can be obtained by making a sudden and deep expiration through a piece of long tube, and at once collecting some of the air contained in the part of this tube nearest the mouth. By this means it has been found that during normal breathing at ordinary atmospheric pressure the percentage of carbon dioxide (about 5·6% on an average for men) is constant for each individual, though different persons vary slightly as regards their normal percentage. The breathing is so regulated as to keep the percentage of carbon dioxide constant; and under normal conditions this regulation is surprisingly exact. The ordinary expired air is a mixture of alveolar air and air from the "dead space" in the air passages. The deeper the breathing happens to be, the more alveolar air there will be in the expired air, and the higher, therefore, the percentage of carbon dioxide in it, so that the expired air is not constant in composition, though the alveolar air is. If air containing 2 or 3% of carbon dioxide is breathed, the breathing at once becomes deeper, in such a way as to prevent anything but a very slight rise in the alveolar carbon dioxide percentage. The difference is scarcely appreciable subjectively, except during muscular exertion. The effect of 1% of carbon dioxide in the inspired air is so slight as to be negligible, and there is no foundation for the popular belief that even this or even smaller percentages of carbon dioxide are injurious. With 4 or 5% or more of carbon dioxide, however, much panting is produced, and the alveolar carbon dioxide percentage begins to rise appreciably, since compensation is no longer possible. As a consequence, headache and other symptoms are produced. If, on the other hand, the percentage of carbon dioxide in the alveolar air is abnormally reduced by forced breathing, the condition of apnoea is produced and lasts until the percentage again rises to normal, but no longer. Forced breathing with air containing more than about 4% of carbon dioxide causes no apnoea, as the alveolar carbon dioxide does not fall.

If oxygen is breathed instead of air there is no appreciable change in the percentage of carbon dioxide in the alveolar air, and no tendency towards apnoea. Want of oxygen is thus not a factor in the regulation of normal breathing. During muscular work the depth and frequency of breathing increase in such a way as to prevent the alveolar carbon dioxide from rising more than very slightly. It is still the carbon dioxide stimulus that regulates the breathing, although with excessive muscular work other accessory factors may come in to some extent.

Under increased barometric pressure the percentage of carbon dioxide in the alveolar air no longer remains constant; it diminishes in proportion to the increase of pressure. For instance, at a pressure of 2 atmospheres it is reduced to half, and at 6 atmospheres to a sixth; while at less than normal atmospheric pressure it rises correspondingly unless symptoms of want of oxygen begin to interfere with this rise. These results show that it is not the mere percentage, but the pressure (or "partial pressure") of carbon dioxide in the

alveolar air that regulates breathing. The pressure exercised by the carbon dioxide in the alveolar air is of course proportional to its percentage, multiplied by the total atmospheric pressure. It follows from this law that at a pressure of 6 atmospheres 1% of carbon dioxide in the inspired air would have the same violent effect as 6% at the normal pressure of 1 atmosphere. To take a concrete practical application, if a diver whose head was just below water were supplied with sufficient air to keep the carbon dioxide percentage in the air of his helmet down to 3% at most, he would be quite comfortable. But if, with the same air supply as measured at surface, he went down to a depth of 170 ft., where the pressure is 6 atmospheres, he would at once experience great distress culminating in loss of consciousness, owing, not to the pressure of the water, which has trifling effects, but to the pressure of carbon dioxide in the air he was breathing. The air supply must be increased in proportion to the increase of pressure if these effects are to be avoided, and ignorance of this has led to the common failure of diving work at considerable depths.

The foregoing facts enable us to understand the regulation of breathing under normal conditions. The pressure of carbon dioxide in the alveolar air evidently determines that of the carbon dioxide in the arterial blood, and the latter in its turn determines the carbon dioxide pressure in the respiratory centre, which is very richly supplied with blood. The centre itself is extremely sensitive to the slightest increase or diminution in carbon dioxide pressure; and thus it is that the alveolar carbon dioxide pressure is so important. That the stimulus of carbon dioxide is from the blood and not through nerves is proved by many experiments. The function of the vagus nerves in regulating the breathing is apparently to, as it were, guide the centre in the expenditure of each separate inspiratory or expiratory effort; for as soon as inspiration or expiration is completed the inspiratory or expiratory effort is cut short by impulse proceeding up the vagus nerve, and much waste of muscular work and risk of injury to the lungs is thereby prevented.

Under ordinary conditions the regulation of carbon dioxide pressure in the alveolar air ensures at the same time a normal pressure of oxygen, since absorption of oxygen and giving off of carbon dioxide normally run parallel to one another. If, however, air containing abnormally little oxygen is breathed, the normal relation between oxygen and carbon dioxide in the alveolar air is disturbed. A similar state of affairs is brought about by any considerable diminution of atmospheric pressure. Not only does the partial pressure of oxygen in the inspired air fall, but this fall is proportionally much greater in the alveolar air; and the effects of want of oxygen depend on its partial pressure in the alveolar air. It has been known for long that any great deficiency in the proportion of oxygen in the air breathed increases the depth and frequency of the breathing; but this effect is not apparent until the percentage of oxygen or the barometric pressure is reduced by more than a third, which corresponds to a reduction of more than half in the alveolar oxygen pressure. In contrast with this an increase of a fifth in the alveolar carbon dioxide pressure has a marked effect on the breathing. Along with the increased breathing caused by deficiency of oxygen there is more or less blueness of the skin and abnormal effects of various kinds, such as partial loss of sensibility, memory and power of thinking. Long exposure often causes headache, nausea, sleeplessness, &c.—a train of symptoms known to mountaineers as "mountain sickness." That the primary cause of "mountain sickness" is lack of oxygen owing to the low atmospheric pressure there is not the slightest doubt. Lack of oxygen is thus not only an important, but also an abnormal form of stimulus to the respiratory centre, since it is accompanied by quite abnormal symptoms. A further analysis of the special effect of lack of oxygen on the respiratory centre has shown that this effect still depends on the partial pressure of carbon dioxide in the alveolar air. The lack of oxygen appears, in fact, to have simply increased the sensitiveness of the centre to carbon dioxide, so that a lower partial pressure of carbon dioxide excites the centre, and the breathing is correspondingly increased. By prolonged forced breathing so much carbon dioxide is washed out of the body that the subsequent apnoea lasts until the oxygen in the alveolar air is nearly exhausted. The subject of the experiment becomes very blue in the face and is partially stupefied by want of oxygen before he has any desire to breathe. The probable explanation of these facts is that want of oxygen does not itself excite the centre, but that some substance—very probably lactic acid, which is known to be formed abundantly—is produced abnormally in the body during exposure to want of oxygen and aids the carbon dioxide in exciting the centre. It is known that the blood becomes less alkaline at high altitudes, and that acids in general excite the centre. A person on a high mountain thus gets out of breath much more easily than at sea-level. The extra stimulus to the centre during work still comes from the extra carbon dioxide formed, but has a greater effect than usual on the breathing. If the extra stimulus came directly from want of oxygen the person on the mountain would probably turn blue and lose consciousness on the slightest exertion. By analysing the alveolar air it can be shown that after a time even a height of 5000 to 6000 ft., or a diminution of only a sixth in the barometric pressure, distinctly increases the sensitiveness of the respiratory centre to carbon dioxide, so that there seems to be a slow accumulation of acid in the blood. The effect also passes off very slowly on returning to normal pressure, although the lack of oxygen is at once removed.

The blueness of the skin ("cyanosis") produced by lack of oxygen is due to the fact that the haemoglobin of the red corpuscles is imperfectly saturated with oxygen. Haemoglobin which is fully saturated with oxygen has a bright red colour, contrasting with the blue colour which it assumes when deprived of oxygen. According to the existing evidence the saturation of the haemoglobin is practically complete under normal conditions in the lungs, or when thoroughly shaken at the body temperature and normal atmospheric pressure with air of the same composition as normal alveolar air. As the partial pressure of the oxygen in this air falls, however, the saturation of the haemoglobin becomes less and less complete, and the arterial blood assumes a more and more blue tinge, which imparts a blue or leaden colour to the skin, accompanied by the symptoms, already referred to, of lack of oxygen. Normal arterial blood in man yields about 19 volumes of physiologically available oxygen for each 100 volumes of blood. Of these 19 volumes about 18½ are loosely combined with the haemoglobin of the red corpuscles, the small remainder being in simple solution in the blood. Venous blood, on the other hand, yields only about 12 volumes. The combination of haemoglobin with oxygen is only stable in the presence of free oxygen at a pressure of about that in normal alveolar air. As this pressure falls the compound is progressively dissociated. From this it can be readily understood why the blood loses its oxygen in passing through the tissues, which are constantly absorbing free oxygen, and regains it in the lungs. The marked effects produced by abnormal deficiency in the pressure of oxygen in the alveolar air are also readily intelligible; for even although the arterial blood still contains sufficient oxygen to cover the normal difference between the oxygen content of arterial and that of venous blood, yet this oxygen is given off to the tissues less readily—*i.e.* at a lower pressure, and thus fails to supply their demands completely. It is evident also that in pure air at normal pressure increased ventilation of the lungs does not appreciably increase the supply of oxygen to the blood, whereas in air largely deprived of its oxygen, or at low pressure, the increased alveolar oxygen pressure produced by deep breathing helps greatly in saturating the blood with oxygen, and may thus relieve the symptoms of want of oxygen. Hence it is that the increased sensitiveness of the respiratory centre to carbon dioxide, and consequent increased depth of breathing, at high altitudes compensates to a large extent for deficiency in the oxygen pressure. Addition of carbon dioxide to the inspired air produces exactly the same result. Indeed

Professor Angelo Mosso was led by observation of the beneficial effects of carbon dioxide at low atmospheric pressure to attribute mountain sickness to lack of carbon dioxide, a condition which he designated by the word "acapnia." When impure air is vitiated, not only by deficiency of oxygen, but also by carbon dioxide, the carbon dioxide causes panting, which not only gives warning of any danger, but prevents the alveolar oxygen percentage from falling in the way it would do if the carbon dioxide were absent. In this way the carbon dioxide greatly lessens the danger. To give instances, air progressively and very highly vitiated by respiration is much less likely to cause danger if the carbon dioxide is not artificially absorbed, and not nearly so dangerous as the great diminution of atmospheric pressure (and consequently of oxygen pressure) which occurs in a very high balloon ascent. Indeed the dangers of a very high balloon ascent are notorious, and a number of deaths or very narrow escapes are on record.

Just as oxygen forms a dissociable compound with the haemoglobin of the blood, so does carbon dioxide form dissociable compounds. One of these compounds appears to be with haemoglobin itself, and another is sodium bicarbonate, which is far more easily dissociated in the blood than in a simple watery solution, owing to the presence of proteid and possibly other substances which act as weak acids and thus help the dissociation process. The whole of the carbon dioxide can therefore be removed from the blood by a vacuum pump, just as the whole of the oxygen can. Venous blood contains roughly speaking about 40 volumes of carbon dioxide per 100 of blood, and arterial blood about 34 volumes. Of this carbon dioxide only about 3 volumes can be in free solution, the rest being loosely combined. The conveyance of carbon dioxide from the blood to the lungs is thus readily intelligible, as well as the fact that any increase or diminution of the pressure of carbon dioxide in the alveolar air will naturally lead to a damming back or increased liberation of carbon dioxide from the blood, and that by forced breathing carbon dioxide can be washed out of the blood to such an extent that a prolonged cessation of natural breathing (*apnoea*) follows, since even in the venous blood the partial pressure of carbon dioxide has become too low to excite the respiratory centre.

It will be evident from the foregoing that in order to supply efficiently the respiratory requirements of the tissues not only must the breathing, but also the circulation, be suitably regulated. In hard muscular work the consumption of oxygen and output of carbon dioxide may be increased eight or ten times beyond those of rest. Unless, therefore, the blood supply to the active tissues were correspondingly increased, deficiency of oxygen would at once arise, since the amount of oxygen carried by a given volume of the arterial blood is very limited, as already explained. It is known that the supply of blood to each organ is always increased during its activity. This increase can, for instance, readily be seen and measured in the case of contracting muscles or secreting glands; and the volume and frequency of the pulse are greatly increased during muscular work. But while it is evident enough that the flow of blood through the body is determined in accordance with the metabolic activities of each tissue, our knowledge is as yet very scanty as to the means by which this determination is brought about. Probably, however, carbon dioxide may be nearly as important a factor in the regulation of the circulation as in that of breathing. Just as the rate of breathing was formerly supposed to determine, and not to be determined by, the fundamental metabolic processes of the body, so the circulation was supposed to be another independent determining factor; and under the influence of these mechanistic conceptions the direction of investigation into the phenomena of respiration and circulation has been largely diverted to side issues.

Since the circulation, no less than the breathing, is concerned in the supply of oxygen to and removal of carbon dioxide from the tissues, it can readily be understood that defective circulation, such as occurs, for instance, in uncompensated valvular affections of the heart, may affect the breathing and hinder the normal respiratory exchange. Conversely, also, defects in the aeration or oxygen-carrying power of the blood may be compensated for by increase in the circulation. For instance, in the very common condition known as anaemia, where the percentage of haemoglobin, and consequently the oxygen-carrying power of the blood, is often reduced to a third or less, the respiratory disturbances may be so slight that the patient is going about his or her ordinary work. A miner suffering from the now well-known "worm-disease," or ankylostomiasis (*q.v.*), may be working underground, or a housemaid suffering from chlorosis may be doing her work, with only a third of the normal oxygen-carrying power of the blood. There seems to be no doubt that in such cases an increased rate of blood circulation compensates for the diminished oxygen-carrying power of the blood. It is well known that at high altitudes a gradual process of adaptation to the low pressure occurs, and the shortness of breath and other symptoms experienced for the first few days gradually become less and less. This adaptation is, partly, at least, due to a marked increase in the percentage of haemoglobin in the blood, though probably circulatory and perhaps other compensatory changes are also involved.

In connexion with respiration the action of certain poisons is of great interest. One of these, carbon monoxide, is of very common occurrence, and causes numerous cases of poisoning. Like oxygen, it has the property of combining with the haemoglobin of the blood, but its affinity for haemoglobin is far more strong than that of oxygen. In presence of air containing as little as ·05% of carbon monoxide, the haemoglobin will become about equally shared between oxygen and carbon monoxide, so that, since air contains 20.9% of oxygen, the affinity of carbon monoxide for haemoglobin may be regarded as about 400 times greater than that of oxygen. The blood of a person breathing even a small percentage of carbon monoxide may thus become gradually saturated to a dangerous extent, since the haemoglobin engaged by the carbon monoxide is for the time useless as an oxygen-carrier. Air containing more than about 0.1% of carbon monoxide is thus more or less dangerous if breathed for long; but the blood completely recovers in the course of a few hours if pure air is again breathed. The poisonous action of carbon monoxide can be abolished by placing the animal exposed to it in oxygen at an excess pressure to about an atmosphere. The reason for this is that, in consequence of the increased partial pressure of the oxygen, the amount of this gas in free solution in the blood is greatly increased in accordance with Dalton's law, and becomes sufficient to supply the tissues with oxygen quite independently of the haemoglobin. Even at ordinary atmospheric pressure the extra oxygen dissolved in the blood when pure oxygen is breathed is of considerable importance. Carbon-monoxide poisoning is the chief cause of death in colliery explosions and fires, and the sole cause in poisoning by lighting gas and fuel gas of various kinds. Its presence in dangerous proportions may be readily detected with the help of a small bird, mouse or other small warm-blooded animal. In such animals the respiratory exchange is so rapid that symptoms of carbon-monoxide poisoning are shown far more quickly than in man. The small animal can thus be employed in mines, &c., to indicate danger from carbon monoxide. A lamp is useless for this purpose. There are various other poisons, such as nitrites, chlorates, dinitrobenzol, &c., which act by disabling the haemoglobin, and so cutting off the oxygen supply to the tissues.

Between the air in the air-cells of the lungs and the blood of the lung capillaries there intervenes nothing but a layer of very thin, flattened cells, and until recently it was very generally believed that it was by diffusion alone that oxygen passes inwards and carbonic acid outwards through this layer. Similar simple physical explanations of processes of secretion and absorption through living cells have, however, turned out to be incorrect in the case of other organs. It is known, moreover, that in the case of the swimming-bladder of fishes oxygen is secreted into

the interior against enormous pressure. Thus, in the case of a fish caught at a depth of 4500 ft., the partial pressure of the oxygen present in the swimming bladder at this depth was 127 atmospheres, whereas the partial pressure of oxygen in sea-water is only about 0·2 atmosphere. Diffusion can therefore have nothing to do with the passage of gas inwards, which is known to be under the control of the nervous system. The cells lining the interior of the swimming bladder are developed from the same part of the alimentary tract as those lining the air-cells of the lungs, so that it seems not unlikely that the lungs should possess the power of actively secreting or excreting gases. The question whether such a power exists, and is normally exercised, has been investigated by more than one method; and although it is not possible to go into the details of the experiments, there can be no doubt that the balance of the evidence at present available is in favour of the view that diffusion alone is incapable of explaining either the absorption of oxygen or the excretion of carbon dioxide through the lining cells of the lungs. The partial pressure of oxygen appears to be always higher, and of carbon dioxide often lower, in the blood leaving the lungs than in the air of the air-cells; and this result is inconsistent with the diffusion theory. As to the causes of the passage of oxygen and carbonic acid through the walls of the capillaries of the general circulation, we are at present in the dark. Possibly diffusion may explain this process.

II. Although we cannot trace the exact changes which occur when oxygen passes into living cells, yet it is possible to obtain a clear general view of the origin and destiny of the material concerned in the process, and of the physiological conditions which determine it.

The oxidizable material within the body consists, practically speaking, of proteids (albumen-like substances, with which the collagen of connective tissue may be included), fats and carbohydrates (sugars and glycogen). All of these substances contain carbon, hydrogen and oxygen in known, though different, proportions, and the former also contains a known amount of nitrogen and a little sulphur. Nitrogen is constantly leaving the body as urea and other substances in the urine and faeces; and a small but easily measurable proportion of carbon passes off in the same manner. The rest of the carbon passes out as carbon dioxide in respiration. Now carbohydrates and fats are oxidized completely in the body to carbon dioxide and water. This follows from the fact that, practically speaking, no other products into which they might have been converted leave the body except carbon dioxide and water. Moreover, a given weight of carbohydrate requires for its oxidation a definite weight of oxygen, and produces a definite weight of carbon dioxide. There is thus a definite relation between the weight of oxygen used up and the weight of carbon dioxide formed in this oxidation. The same is true for the oxidation of fat and of proteid, allowing in the latter case for the fact that the nitrogen, together with part of the carbon and hydrogen, passes out as urea, &c., in an incompletely oxidized form. From all this it follows that if we measure over a given period (1) the discharge of nitrogen from the body, (2) the intake of oxygen and (3) the output of carbonic acid, we can easily calculate exactly what the ultimate destiny of the oxygen has been, and at the ultimate expense of what material the carbonic acid has been formed. What the intermediate stages may have been we cannot say, but this in no way affects the validity of the calculation. If, during the period of measurement, food is taken, the basis of the calculation is still substantially the same, as the oxidizable material in food consists of practically nothing else except proteids, carbohydrates and fats.

Liberation of Energy.—From experiments made outside the body, we know that in the oxidation of a given weight of proteid, carbohydrate or fat, a definite amount of energy is liberated. In the article on DIETETICS it is shown that precisely the same liberation of energy occurs in the living body, due allowance being made for the fact that the oxidation of proteid is not quite complete. The following table shows the respiratory quotients (the respiratory quotient being the ratio between the volume of carbon dioxide formed and that of oxygen used up) and energy expressed in units of heat (calories) liberated per gramme of carbon dioxide produced and oxygen consumed in the living body during the oxidation of proteid, fat and a typical carbohydrate:—

Substance oxidized.	Respiratory quotient.	Calories per gramme of CO_2 produced.	Calories per gramme of oxygen consumed.
Proteid . .	·78	2·78	3.00
Fat . . .	·71	3·35	3·27
Cane-sugar .	1·00	2·59	3·56

In the oxidation of non-living substances the rate varies, within wide limits, according to that at which oxygen is supplied. Thus a fire burns the faster the more air is supplied, and the higher the percentage of oxygen in the air. It was for long believed that in the living body also the rate of oxidation must vary according to the oxygen supply. It has been found, however, that this is not the case. Provided that a certain minimum of oxygen is present in the air breathed, or in the blood supplied to the tissues, it is, practically speaking, indifferent whether the oxygen supply be increased or diminished: only a certain amount is consumed. It might be supposed that the reason for this is that the available oxidizable material in the body is limited, and that if the food supply were increased there would be a corresponding increase in the rate of oxidation. This hypothesis is apparently supported by the fact that, when an increased supply of proteid is given as food, the amount of nitrogen discharged in the urine is almost exactly correspondingly increased, so that evidently the oxidation of proteid increases correspondingly with the supply. Similarly, when carbohydrate food is given, the alteration in the respiratory quotient shows that more carbohydrate than before is being oxidized. Closer investigation in recent times has, however, brought out the very striking fact that, if oxidation be measured in terms of energy liberated by it in the body, it makes but little difference, other things being equal, whether the animal is fasting or not. If more proteid or carbohydrate is oxidized at one time, correspondingly less fat is oxidized, but the total energy liberated as heat, &c., in the body is about the same, unless the diet is very excessive, when there is a slight increase of oxidation. Even after many days of starvation, the rate of oxidation per unit of body weight has been found to remain sensibly the same in man. When more food is taken than is required, the excess is stored up, chiefly in the form of fat, into which carbohydrate and possibly also proteid are readily converted in the body. When less food is taken than is needed, the stock of fat is drawn upon, and supplies by far the greater proportion of the energy requirements of the body.

During the performance of muscular work oxidation is greatly increased, and may amount to ten times the normal or more. Even the slight exertion of easy walking increases oxidation to about two times. When the energy represented by the external work done in muscular exertion is compared with the extra energy liberated by oxidation in the body, it is found, as would be expected, that the latter value largely exceeds the former. In other words, much of the energy liberated is wasted as heat. Nevertheless the muscles are capable of working with less waste than any steam or gas engine. In the work of climbing, for instance, it has been found in the case of man that 35 % of the energy liberated is represented in the work done in raising the body. Muscular work, if at all excessive, leads to fatigue, and consequent rest. On the other hand, unnatural abstinence from muscular activity leads to restlessness and consequent muscular work. Hence on an average of the twenty-four hours the expenditure of energy by different individuals, with different modes of life, does not as a rule differ greatly.

The rate of oxidation per unit of body weight varies considerably according to size and age. If we compare different warm-blooded animals, we find that the rate of oxidation is relatively

to their weight far higher in the smaller ones. In a mouse or small bird, for instance, the rate is about twenty times as great as in a man. The difference is in part due to the fact that the smaller an animal is the greater is its surface relatively to its mass, and consequently the more heat does it require to keep up its temperature. The smaller animal must therefore produce more heat. Even in cold-blooded animals, however, oxidation appears to be more rapid the smaller the animal. In the case of man, oxidation is relatively more than twice as rapid in children than in adults, and the difference is greater than would be accounted for by the difference in the ratio of surface to mass. Allowing for differences in size, oxidation is about equally rapid in men and women.

It was for long believed that the special function of respiratory oxidation was (1) the production of heat, and (2) the destruction of the supposed "waste products." Further investigation has, however, tended to show more and more clearly that in reality respiratory oxidation is an essential and intimate accompaniment of all vital activity. To take one example, secretion and absorption, which were formerly explained as simple processes of filtration and diffusion, are now known to be accompanied, and necessarily so, by respiratory oxidation in the tissues concerned. The respiratory oxidation of an animal is thus a very direct index of the activity of its vital processes as a whole. Looking at what is known with regard to respiratory oxidation, we see that what is most striking and most characteristic in it is its tendency to persist—to remain on the whole at about a normal level for each animal, or each stage of development of an animal. The significance of this cannot be over-estimated. It indicates clearly that just as an organism differentiates itself from any non-living material system by the manner in which it actually asserts and maintains its specific anatomical structure, so does it differentiate itself from any mere mechanism by the manner in which it asserts and maintains its specific physiological activities.

(3) MOVEMENTS OF RESPIRATION

Normal Respiration.—If the naked body of a person asleep or in perfect inactivity be carefully watched, it will be found that the anterior and lateral walls of the chest move rhythmically up and down, while air passes into and out of the nostrils (and mouth also if this be open) in correspondence with the movement. If we look more closely we shall find that with every uprising of the chest walls the membranous intercostal portions sink slightly as if sucked in, while at the same time the flexible walls of the abdomen bulge as if protruded by some internal force. If respiration be in the slightest degree hurried, these motions become so marked as to escape the attention of no one. The elevation of the chest walls is called *inspiration*, their depression *expiration*. Inspiration is slightly shorter than expiration, and usually there is a slight pause or momentary inaction of the chest between expiration and the following inspiration. Apparatuses for measuring the excursion of a given point of the chest wall during respiration are called *thoracometers* or *stethometers*. Apparatuses for recording the movements of the chest are called *stethographs* or *pneumographs*.

Frequency of Respiration.—The frequency of respiration during perfect rest of the body is 16 to 24 per minute, the pulse rate being usually four times the rate of respiration; but the respiratory rhythm varies in various conditions of life. The following are the means of many observations made by Lambert Adolphe Quételet (1796–1874): at the age of one year the number of respirations is 44 per minute; at 5 years, 26; from 15 to 20 years, 20; from 25 to 30, 16; from 30 to 50, 18·1. Muscular exertion always increases the frequency of respiration. The higher the temperature of the environment the more frequent is the respiration. Paul Bert (1833–1886) has shown that with higher atmospheric pressures than the normal the frequency of respiration is diminished while the depth of each inspiration is increased. The frequency of respiration diminishes until dinner-time, reaches its maximum within an hour of feeding, and thereafter falls again; if dinner is omitted, no rise of frequency occurs. The respiratory act can be interrupted at any stage, reversed, quickened, slowed and variously modified at will, so long as respiration is not stopped entirely for more than a short space of time; beyond this limit the will is incapable of suppressing respiration.

Depth of Respiration.—The depth of respiration is measured by the quantity of air inspired or expired in the act; but the deepest expiration possible does not suffice to expel all the air the lungs contain. The following measurements have been ascertained, and are here classified according to the convenient terminology proposed by John Hutchinson (1811–1861). (1) *Residual air*, the volume of air remaining in the chest after the most complete expiratory effort, ranges from 100 to 130 cub. in. (2) *Reserve* or *supplemental air*, the volume of air which can be expelled from the chest after an ordinary quiet expiration, measures about 100 cub. in. (3) *Tidal air*, the volume of air taken in and given out at each ordinary respiration may be stated at about 20 cub. in. (4) *Complemental air*, the volume of air that can be forcibly inspired over and above what is taken in at a normal inspiration, ranges from about 100 to 130 cub. in. By *vital capacity*, which once had an exaggerated importance attached to it, is meant the quantity of air which can be expelled from the lungs by the deepest possible expiration after the deepest possible inspiration; it obviously includes the complemental, tidal and reserve airs, and measures about 230 cub. in. in the Englishman of average height, *i.e.* 5 ft. 8 in. (Hutchinson). It varies according to the height, body weight, age, sex, position of the body and condition as to health of the subject of observation.

Vital capacity is estimated by means of a *spirometer*, a graduated gasometer into which air may be blown from the lungs. The residual air, which for obvious reasons cannot be actually measured, may be estimated in the following way (Emil Harless, 1820–1862; Louis Gréhant, b. 1838). At the end of ordinary expiration, apply the mouth to a mouthpiece communicating with a vessel filled with pure hydrogen, and breathe into and out of this vessel half a dozen times—until, in fact, there is reason to suppose that the air in the lungs at the time of the experiment has become evenly mixed with hydrogen. Then ascertain by analysis the proportion of hydrogen to expired air in the vessel and estimate the amount of the air which the lungs contained by the following formula:—

$$v : V + v = p : 100 ;$$

$$V = \frac{v(100 - p)}{p},$$

where V = volume of air in the lungs at the time of experiment, v = volume of the vessel containing hydrogen, p = proportion of air to hydrogen in the vessel at the end of the experiment. V, then, is the volume of air in the lungs after an *ordinary* expiration; that is, it includes the residual and the reserve air; if we subtract from this the amount of reserve air ascertained by direct measurement, we obtain the 100–130 cub. in. which Hutchinson arrived at by a study of the dead body.

Volume of Respiration.—It is clear that the ventilation of the lungs in ordinary breathing does not merely depend on

the quantity of air inspired at each breath, but also on the number of inspirations in a given time. If these two values be multiplied together we get what might be called the *volume* of respiration (*Athmungsgrösse*, Isidore Rosenthal, b. 1836), in contradistinction to depth of respiration and frequency of respiration. Various instruments have been devised to measure the volume of respiration, all more or less faulty for the reason that they compel respiration under somewhat abnormal conditions (Rosenthal, Gad, Peter Ludwig, Panum (1820–1885), Ewald Hering (b. 1834). From the data obtained we may conclude that the respiratory volume per minute in man is about 366 cub. in. (6000 cub. centim.). In connexion with this subject it may be stated that, after a single ordinary inspiration of hydrogen gas, 6–10 respirations of ordinary air must occur before the expired air ceases to contain some trace of hydrogen.

Types of Respiration.—The visible characters of respiration in man vary considerably according to age and sex. In men, while there is a moderate degree of upheaval of the chest, there is a considerable although not preponderating degree of excursion of the abdominal walls. In women the chest movements are decidedly most marked, the excursion of the abdominal walls being comparatively small. Hence we may distinguish two types of respiration, the costal and the abdominal, according to the preponderance of movement of one or the other part of the body wall. In forced respiration the type is costal in both sexes, and so it is also in deep sleep. The cause of this difference between men and women has been variously ascribed (*a*) to constriction of the chest by corsets in women, (*b*) to a natural adaptation to the needs of child-bearing in women, and (*c*) to the greater relative flexibility of the ribs in women permitting a wider displacement under the action of the inspiratory muscles.

Certain Concomitants of Normal Respiration.—If the ear be placed against the chest wall during ordinary respiration we can hear with every inspiration a sighing or rustling sound, called "vesicular," which is probably caused by the expansion of the air vesicles; and with every expiration a sound of a much softer sighing character. In children the inspiratory rustle is sharper and more pronounced than in adults. If a stethoscope be placed over the trachea, bronchi or larynx, so that the sounds generated there may be separately communicated to the ear, there is heard a harsh to-and-fro sound during inspiration and expiration which has received the name of "bronchial."

In healthy breathing the mouth should be closed and the ingoing current should all pass through the nose. When this happens the nostrils become slightly expanded with each inspiration, probably by the action of the M. dilatatores naris. In some people this movement is hardly perceptible unless breathing be heavy or laboured. As the air passes at the back of the throat behind the soft palate it causes the velum to wave very gently in the current; this is a purely passive movement. If we look at the glottis or opening into the larynx during respiration, as we may readily do with the help of a small mirror held at the back of the throat, we may notice that the glottis is wide open during inspiration and that it becomes narrower by the approximation of the vocal chords during expiration. This alteration is produced by the action of the laryngeal muscles. Like the movements of the nostril, those of the larynx are almost imperceptible in some people during ordinary breathing, but are very well marked in all during forced respiration.

The Mechanics of Respiration.—The thorax is practically a closed box entirely filled by the lungs, heart and other structures contained within it. If we were to freeze a dead body until all its tissues were rigid, and then were to remove a portion of the chest wall, we should observe that every corner of the thorax is accurately filled by some portion or other of its contents. If we were to perform the same operation of removing a part of the chest wall in a body not first frozen we should find, on the other hand, that the contents of the thorax are not by any means in such circumstances bulky enough to fill up the space provided for them. If we were to measure the organs carefully we should find that those which are hollow and whose cavities communicate with the regions outside the thorax are all larger in the frozen corpse than in that which was not frozen. In other words, the organs in the thorax are distended somewhat in order that they may completely fill the chest cavity; and the nature of this curious and important condition may best be illustrated by the simple diagrams, figs. 7 and 8 (from Hermann's *Physiologie des*

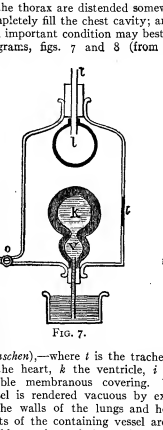

FIG. 7.

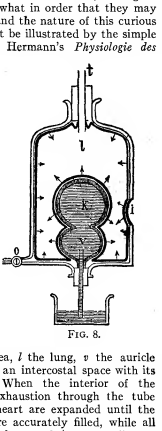

FIG. 8.

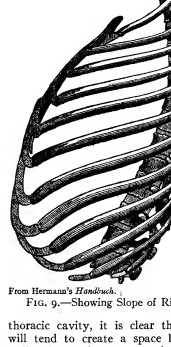
Menschen),—where *t* is the trachea, *l* the lung, *v* the auricle of the heart, *k* the ventricle, *i* an intercostal space with its flexible membranous covering. When the interior of the vessel is rendered vacuous by exhaustion through the tube *o*, the walls of the lungs and heart are expanded until the limits of the containing vessel are accurately filled, while all flexible portions of the walls of the vessel (corresponding to the intercostal membranes and the diaphragm of the thorax) are sucked inwards.

From this description it follows that the lungs, even when the thorax is most contracted, are constantly over-distended, and that, when the cause of this over-distension is removed, the lungs, being elastic, collapse. It further follows that if the thorax is dilated, the flexible hollow organs it contains must perforce be still more distended—a distension which in the case of the lungs is followed by an indrawing of air through the trachea in all cases where the trachea is open. Thus, as the act of respiration is primarily a dilatation of the thorax, the part played by the lungs is, as Galen knew, a purely passive one.

How is dilatation of the thorax effected? It has been pointed out that the rib-planes decline from the horizontal in two directions, viz. from behind forwards, and from the antero-posterior mesial plane outwards; a glance at fig. 9 will make this double sloping clear to the reader. It has, moreover, been explained that the diaphragm arches upwards into the thorax in such a manner that the lateral parts of the arch are vertical and in contact with the inner face of the thoracic walls. This being the structure of the thorax, the enlargement of its cavity is brought about (1) by raising the rib-planes until they approach the horizontal, and (2) by depressing the diaphragm and making its rounded dome more cone-like in outline. A moment's consideration will show how these actions enlarge the boundaries of the thorax. (*a*) When the postero-anterior slope of the rib-planes is diminished by the raising of the anterior ends of the ribs, the whole sternum is thrust upwards and forwards, and the antero-posterior diameter of the thorax is increased. (*b*) When the lateral slope of the rib-planes is diminished by the ribs being moved

upwards about an axis passing through their sternal and vertebral extremities, it is evident that the lateral diameter of the thorax must be increased. (*c*) When the muscular portion of the diaphragm contracts, the curves of its dome-like shape are straightened, the whole diaphragm comes to look more conical on section, and the apposition of its lateral parts to the inner surface of the thorax is destroyed; the two apposed surfaces are drawn apart much as the leaves of a book might be, and a space is formed between them, into which some portion of the lung slips. (*d*) When the diaphragm descends it draws with it the whole contents of the thorax; inasmuch as the contents as a whole are conical in shape with the apex upward and are fitted into the conical space of the thoracic cavity, it is clear that the descent of the contents will tend to create a space between them and the thoracic walls; for each stratum of lung, &c., which is adapted to fit a certain level of thorax, will thereby be brought into a lower and (as the thorax is conical) a more spacious level. Hence the descent of the diaphragm causes a much greater enlargement of the thorax than is measured by the mere elongation of the vertical diameter. In this manner the thorax is distended and air is drawn into the lungs. The contraction of the thorax in expiration is brought about by the return of the ribs and diaphragm to their original position of rest.



From Hermann's *Handbuch.*

FIG. 9.—Showing Slope of Ribs.

How the Inspiratory Movements are Produced.—*The Rib Movements.*—These are caused by the contraction of muscles which are fixed either to the central axis of the body (including under that term the head and vertebral column) or to some point rendered sufficiently stable for the purpose by the action of other adjuvant muscles. Thus the M. levatores costarum arise from the transverse processes of the 7th cervical and eleven upper dorsal vertebrae, and are attached to the ribs below in series; the M. scaleni spring from the cervical vertebrae, and are attached to the anterior parts of the first and second ribs; the M. sternocleido-mastoidei arise from the side and back of the skull, and are inserted into the upper part of the sternum and the clavicle; the M. pectoralis minor arises from the coracoid process of the scapula, and is inserted into the anterior ends of some of the ribs; the M. serratus posticus superior arises from certain of the cervical and dorsal vertebrae, and is inserted into the posterior part of certain of the ribs; the M. cervicalis ascendens (part of the M. erector spinae) arises from certain of the cervical vertebrae, and is inserted into the posterior part of certain ribs. The M. serratus magnus and the M. pectoralis major, which are affixed on the one hand to the upper arm and to the scapula respectively, and on the other to the ribs and to the sternum respectively, may in certain elevated positions of the arm and shoulder act as inspiratory muscles. When all these muscles contract, the ribs are raised in the twofold way already described, some pulling up the anterior ends of the ribs, and others causing the arched ribs to rotate about an axis passing through their vertebral and sternal joints.

In addition to the muscles just enumerated, the M. intercostales externi are undoubtedly inspiratory muscles. Every external intercostal muscular fibre between a pair of ribs must, when it contracts, of necessity raise *both* ribs, as is clearly shown by the accompanying diagram (fig. 10). Here *a'b'* must be shorter than *ab*, for if angle BA*a* = *x*, then

$$ab^2 = AB^2 + (Bb - Aa)^2 + 2AB(Bb - Aa)\cos x;$$

hence *ab* will be larger the smaller the angle *x*, for the cosine increases as the angle diminishes.

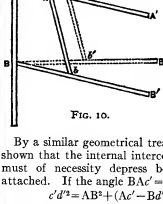


FIG. 10.

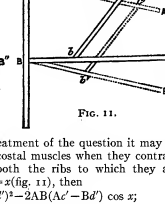

FIG. 11.

By a similar geometrical treatment of the question it may be shown that the internal intercostal muscles when they contract must of necessity depress both the ribs to which they are attached. If the angle BA*c'* = *x* (fig. 11), then

$$c'd'^2 = AB^2 + (Ac' - Bd')^2 - 2AB(Ac' - Bd')\cos x;$$

hence *c'd'* will be larger the larger the angle *x*.

The case, however, is not so clear with reference to the anterior portions of the internal intercostals which lie between the cartilages; for it is evident that these fibres have the same direction with regard to the sternum as an axis as the external intercostals have with regard to the vertebral column as an axis; that is to say, the geometrical diagram in fig. 10 applies to the inter-cartilaginous internal intercostals as perfectly as it does to the inter-osseous parts of the external intercostals, the inference being that the inter-cartilaginous internal intercostals tend to elevate the pair of ribs between which they stretch. The geometrical argument is, however, overborne by physiological experiment: Martin and Hartwell have observed in the dog and the cat that the internal intercostals throughout their whole extent contract (not synchronously) but alternately with the diaphragm; hence we must conclude that their function throughout is not inspiratory like that of the diaphragm, but expiratory.

The Movements of the Diaphragm.—The muscular fibres of the diaphragm are arranged in a radial manner, or, more strictly speaking, in a manner like the lines of longitude on a terrestrial globe. The central tendon of the diaphragm corresponds to the pole of such a globe. The contraction of the fibres is expended on straightening the longitudinal curves rather than on pulling down the central tendon to a lower level; in fact, the central tendon moves very little in ordinary respiration.

How the Expiratory Movements are Produced.—The action of inspiration disturbs many organs from the position of rest into which gravity and their own physical properties have thrown them. The ribs and sternum are raised from the position of lowest level; the elastic costal cartilages are twisted; the elastic lungs are put upon the stretch; the abdominal organs, themselves elastic, are compressed and thrust against the elastic walls of the belly, causing these to bulge outwards. In short the very act of inspiration stores up, as it were, in sundry ways the forces which make for expiration. As soon as the inspiratory muscles cease to act these forces come into play, and the position of rest or equilibrium is regained. It is very doubtful whether any special expiratory muscles are called into action during ordinary respiration. The internal intercostals may in man be exercised in ordinary expiration (although they are certainly not so exercised in the dog and the cat); but in laboured expiration many muscles assist in the expulsive effort. The muscles forming the belly-walls contract and force the abdominal contents against the relaxed diaphragm in such a manner as to drive it farther and farther into the thorax. At the same time by their attachment to the lower edge of the

thorax these same muscles pull down the ribs and sternum. The M. triangularis sterni, which arises from the back or thoracic aspect of the sternum and lower costal cartilages and is inserted into the costal cartilages higher up, can obviously depress the ribs. So also can the M. serratus posticus inferior, which arises from the thick fascia of the loins and is inserted into the last four ribs. So also can the M. quadratus lumborum, which springs from the pelvis and is attached to the last rib. Indeed there is hardly a muscle of the body but may be called into play during extremely laboured respiration, either because it acts on the chest, or because it serves to steady some part and give a better purchase for the action of direct respiratory muscles.

Certain Abnormal Forms of Respiration.

Coughing.—There is first a deep inspiration followed by closure of the glottis. Then follows a violent expiratory effort which bursts open the glottis and drives the air out of the lungs in a blast which carries away any light irritating matter it may meet with. The act is commonly involuntary, but may be imitated exactly by a voluntary effort.

Hawking, or Clearing the Throat.—In this act a current of air is driven from the lungs and forced through the narrow space between the root of the tongue and the depressed soft palate. This action can only be caused voluntarily.

Sneezing.—There is first an inspiration which is often unusually rapid; then follows a sudden expiration, and the blast is directed through the nose. The glottis remains open all the time. The act is generally involuntary, but may be more or less successfully imitated by a voluntary effort.

Snoring is caused by unusually steady and prolonged inspirations and expirations through the open mouth,—the soft palate and uvula being set vibrating by the currents of air.

Crying consists of short deep inspirations and prolonged expirations with the glottis partially closed. Long-continued crying leads to sobbing, in which sudden spasmodic contractions of the diaphragm cause sudden inspirations and inspiratory sounds generated in larynx and pharynx.

Sighing is a sudden and prolonged inspiration following an unusually long pause after the last expiration.

Laughing is caused by a series of short expiratory blasts which provoke a clear sound from the vocal chords kept tense for the purpose, and at the same time other inarticulate but very characteristic sounds from the vibrating structures of the larynx and pharynx. The face has a characteristic expression. This act is essentially involuntary, and often is beyond control; it can only be imitated very imperfectly.

Yawning is a long deep inspiration followed by a shorter expiration, the mouth, fauces and glottis being kept open in a characteristic fashion. It is involuntary, but may be imitated.

Hiccough is really an inspiration suddenly checked by closure of the glottis; the inspiration is due to a spasmodic contraction of the diaphragm. The closure of the glottis generally leads to a characteristic sound. (A. G.*)

(4) Pathology of the Respiratory System

In the following article we have to give an account of the more important pathological processes which affect the lungs, pleurae and bronchial tubes. In the aetiology of pulmonary affections, the relations between the lungs and the external air, and also between them and the circulatory system, are important. The lungs are, so to speak, placed between the right and left cavities of the heart, and the only way for the blood to pass from the right ventricle to the left side of the heart, except in cases of a patent foramen ovale or other congenital defect forming a communication between the two sides of the organ, is by passing through them. The result is that not only may they become diseased by foreign material carried into them by the blood, but any obstruction to the flow of blood through the left side of the heart tends sooner or later to engorge or congest them, and lead to further changes. Through the nose and mouth they are in direct connexion with the external atmosphere. Hence the variable condition of the air as regards temperature, degree of moisture, and density, is liable to produce directly various changes in the lungs, or to predispose them to disease; and the contamination of the air with various pathogenic germs and irritating particles in the shape of dust, is a direct source of many lung affections.

Bronchitis, or inflammation of the mucous membrane of the bronchial tubes, has been generally attributed to exposure to atmospheric changes. It occurs with great frequence in the extremes of life, and it is in early childhood and in old age that it is more liable to be fatal. Bronchitis may often follow exposure to cold, but that low temperature in itself is not sufficient to cause it is shown by the fact that the crews of arctic expeditions have been singularly free from diseases usually attributed to cold, but on their return to moist germ-laden atmospheres have at once been affected. Children reared in heated rooms with lack of ventilation are peculiarly susceptible to attacks on the slightest change of temperature. Bronchitis is also frequently caused by cardiac and renal diseases, and by the extension of inflammatory diseases of the upper air passages (as rhinitis, laryngitis or pharyngitis), while blockage of the nasal passages by adenoid or other growths may, by causing persistent mouth-breathing, lead to bronchial infection. Before the bacterial origin of disease was understood, bronchitis was attributed solely to what is termed "catching cold," and the exact relation of the chill to the bacterial infection is still unknown. It is probable that the chilling of the surface of the body by exposure causes congestion of the mucous membrane, the presence of a virulent micro-organism being then all that is necessary to produce bronchitis. It is generally accepted that in persons living in the pure air of the country the small bronchi and air-cells are sterile (Barthel in the *Zentralblatt für Bakteriologie*, vol. xxiv.). Bacteria are arrested on their way by the leucocytes of the nasal mucous membrane and by the vibration of the ciliated epithelium of the upper air passages. The mucous membrane of the upper bronchi is, however, tenanted by various micro-organisms such as the diplo-bacillus of Friedländer, bacillus coli communis, micrococcus tetragenus, &c., and it is considered by William Ewart that these organisms may in certain conditions of their host become virulent. "Specific" bronchitis occurs in the course of a specific infective disease (*e.g.* influenza, measles or whooping cough) and is due to the specific micro-organism gaining access by the mucous membrane of the respiratory tract. Cases have been known in which the diphtheria bacillus has been so localized. In glanders, small-pox, syphilis and pemphigus, the infective micro-organism is carried to the bronchi by the blood stream. In common or "non-specific" bronchitis, streptococci, pneumococci and staphylococci are found in the sputum together with Friedländer's bacillus and the bacillus coli communis. Microscopically the bronchi show hyperaemia of the mucous and submucous coats, and the whole wall becomes infiltrated with polymorphonuclear leucocytes and round cells. Many cells undergo mucoid degeneration, and there is abundant epithelial proliferation. A large quantity of mucus is secreted by the glands, and the lumen of the bronchi contains an exudate consisting of mucus, degenerated leucocytes and cast-off epithelial cells.

In the rare form of bronchitis known as fibrinous or plastic bronchitis a membranous exudate is formed which forms casts of the bronchi, which may be coughed up. The casts vary from an inch to six or seven inches in length, with branches corresponding to the divisions of the bronchi from which they come. The cast consists of mucus and fibrin in varying proportions. The exact pathology of this variety is still undetermined.

Bronchitis may affect the whole bronchial tract, or more especially the larger or the smaller tubes. It may occur as an acute or as a chronic affection. In the acute form the inflammation may remain limited to the bronchial tubes and gradually subside, or it may lead to inflammation of the surrounding lung tissue, giving rise to disseminated foci of inflammation of greater or less extent throughout the lungs (catarrhal or bronchopneumonia). This is a common complication of bronchitis, especially where the smaller tubes are affected, and is more

frequently seen in children than adults. In cases of chronic bronchitis the affection, as a rule, begins as a slight ailment during the winter, and recurs in succeeding winters. The intervals of freedom from the trouble get shorter, and in the course of a few years it persists during the summer as well as the winter months. A condition of chronic bronchitis is thus established. The persistent cough which this occasions is one of the chief causes of the development of the condition of *emphysema*, where there is a permanent enlargement of the air-cells of the lungs with an atrophy of the walls of the air vesicles. The emphysema occasions an increase in the shortness of breath from which the person had previously suffered, and later, in consequence of the greater difficulty with which the blood circulates through the emphysematous lungs, the right side of the heart becomes dilated, and from that we have the development of a general dropsy of the subcutaneous tissues, and less and less perfect aeration of the blood.

The death rate from bronchitis in England and Wales during 1908 was: males 1102, females 1083 per million living. The death rate for the five years 1901–1905 was 1237 per million for all sexes. The death rate for the twenty years 1888–1908 consistently showed a slight decline.

Diseases of Occupations.—We all inhale a considerable amount of carbonaceous and other foreign particles, which in health are partly got rid of by the action of the ciliated cells lining the bronchial tubes, and are partly absorbed by cells in the wall of the tubes, and carried in the lymph channels to the bronchial lymphatic glands, where they are deposited, and cause a more or less marked pigmentation of the tissues. Part of such pigment is also deposited in the walls of the bronchial tubes and the interstitial tissue of the lungs, giving rise to the grey appearance presented by the lungs of all adults who live in large cities. In certain dusty occupations, such as those of stone masons, knife-grinders, colliers, &c., the foreign particles inhaled cause trouble. The most common affection so produced is chronic bronchitis, to which becomes added emphysema. In some cases not only is bronchitis developed, but the foreign particles lead to an increase of the fibrous tissue round the bronchi and in the interstitial tissue of the lungs, and so to a greater or lesser extent of fibroid consolidation. As this fibrous tissue may later undergo softening and cavities be formed, a form of consumption is produced, which is named according to the particular occupation giving rise to it; *e.g.* stonemasons' phthisis, knife-grinders' phthisis, colliers' phthisis. It should, however, be pointed out that these dusty occupations are probably not so frequently the cause as was at one time taught of these simple inflammatory fibroid changes in the lungs with their subsequent cavity formation; individuals engaged in such occupations are apt to suffer from a chronic tuberculosis of the lung associated with the formation of much fibrous tissue, and the occupation simply predisposes the lung to the attacks of the tubercle bacillus.

Pneumonia.

The term pneumonia is frequently used of different forms of inflammation of the lungs, and includes affections which run different clinical courses, present diverse appearances after death, and probably have different exciting causes. It would be better if the term *acute pneumonia* or *pneumonic fever* were reserved for that form of acute inflammation of the lungs which is usually characterized by sudden onset, and runs an acute course, which terminates generally by crisis from the fifth to the tenth day, the inflammation leading to the consolidation by fibrinous effusion of the greater part or whole of one lobe of a lung. Acute pneumonia usually occurs in a sporadic form, and is most prevalent in the United Kingdom from November to March. Occasionally it is epidemic, and there is evidence to show that sometimes it is an infective disease. There is great difficulty, however, in being quite certain that the occurrence of the disease in those who have been attending upon or brought into intimate connexion with sufferers from pneumonia is the result of infection, for such cases may be due to an epidemic of the disease, or to the various individuals attacked having been exposed to the same cause.

Formerly acute croupous or lobar pneumonia was thought to be due to "catching cold"; we now know it to be an infectious disease resultant on the invasion of one or more specific micro-organisms. The chief micro-organisms which have been found to be present during an attack of acute pneumonia are the micrococcus lanceolatus or pneumococcus of Fränkel and Weichselbaum, which is found in the inflamed lung in a large majority of cases and is capable of producing pneumonia when inoculated into guinea-pigs. Sternberg demonstrated the presence of the pneumococcus in the saliva of healthy individuals; it tends, however, in this case to vary in form. The micro-organism differs in virulence in given strains; thus one epidemic may be more severe than another; and it tends to increase in virulence in its passage through the human subject. The exact conditions necessary for the production of increased virulence in the organism causing an attack of lobar pneumonia are not yet determined, but are usually ascribed to lowered states of the health and to atmospheric conditions. The pneumococcus produces in the human organism an intracellular toxin, but the question as to whether it can also produce a soluble toxin in the living body is still debated. The difficulty of obtaining sufficient quantities of the toxins of this organism has prevented the production of antisera of high potency. In lower animals, less potent sera have proved successful in protecting against a fatal dose of pneumococci. The change effected by the administration of a serum is produced by causing a change in the pneumococci, which causes them to be more easily destroyed by the phagocytes. The element which brings about this change is termed an opsonin; see BLOOD and BACTERIOLOGY (ii). The bacillus pneumoniae of Friedländer is also said to be found in a certain percentage of cases, but a number of observers deny its presence in pure culture in primary croupous pneumonia.

Unlike many acute diseases, pneumonia does not render a person less liable to future attacks; on the contrary, those who have been once attacked must be looked upon as more prone to be affected again. Acute pneumonia usually attacks the whole or greater part of one lobe of one lung, but more than one lobe may be affected, or both lungs may be involved. The disease produces a solid and airless condition of the affected part owing to a fibrinous exudation taking place into the air-cells and smaller bronchial passages. In favourable cases the exudation is partly absorbed and partly expectorated, and the lung returns to its normal healthy condition; in others, death may ensue from the extent of lung affected, or from the spread of the inflammation to other parts, as for instance the pericardium or meninges of the brain. In such cases it is interesting to note that the same micro-organism has been found in the inflammatory exudation in the pericardium or on the meninges as in the pneumonic lung; probably the organism had been absorbed from the lung, and was the cause of the secondary inflammations. In cases of death from uncomplicated pneumonia a very variable extent of lung is involved. In some cases this result may be ascribed to the weakness of the individual and especially of the heart, but in others the virulence of the micro-organisms and the toxins which they have produced is probably the more correct explanation. The improvement in a patient suffering from pneumonia usually commences suddenly, with a rapid fall in the temperature. The day on which this "crisis" takes place varies, but most commonly it appears to be the seventh from the initial rigor (22 % of the cases, Jürgensen). It may, however, occur a few days earlier or later, being observed in about 74% between the fifth and the ninth day of the disease (Jürgensen). The disease occasionally ends in the formation of an abscess, in gangrene, or in fibroid induration of the lung, but these terminations are rare.

The death rate of acute pneumonia for England and Wales in 1908 was 1383 per million living of the population.

Broncho-pneumonia.—It is usual to recognize a form of inflammation of the lungs which differs from the above lobar pneumonia.

and in which small patches of consolidation are usually scattered throughout the lower lobes of both lungs. This broncho- or catarrhal[1] pneumonia is usually preceded by an attack of bronchitis, to which it bears an intimate relation. In some cases the small foci of inflammation may run together so as to affect the greater part of a lobe of a lung, and the distinction between such a form of broncho-pneumonia and lobar pneumonia presents such difficulties in the view of some observers, that they have refused to recognize any essential difference between the two. Usually, however, it is not difficult to distinguish the two affections both clinically and anatomically. Broncho-pneumonia is especially seen as a complication of bronchitis, and while it more frequently attacks children than young adults, it is not uncommon in old people, especially secondary to bronchitis. It is frequent in children after acute infectious fevers, especially measles and diphtheria, and in cases of whooping-cough. It differs from the above-mentioned pneumonia in that it does not usually attack the whole of a lobe of a lung, but occurs in small disseminated patches more especially throughout the lower lobe of both lungs. The accompanying fever is more irregular than in the preceding form, and the disease usually runs a more prolonged course. It is an extremely fatal affection in both the very young and old. Young persons who have suffered from it are not unfrequently attacked by pulmonary tuberculosis subsequently. It must be admitted that we are even less certain of its bacteriology than we are of that of lobar pneumonia. In some cases Fränkel's pneumococcus is found, and in others various other micro-organisms. Many of the latter are doubtless saprophytic, and are not the essential cause of the disease, but it is not probable that any one particular form of organism accounts for all forms of broncho-pneumonia.

The bacteriology of broncho-pneumonia presents no one micro-organism which can be definitely said to cause the disease. The micro-organism most frequently found, either alone or associated with other bacteria, is the pneumococcus, which occurred in 67% of a series investigated by Wollstein. Other organisms found are the streptococcus, particularly in broncho-pneumonia following infectious fevers, the staphylococcus aureus and albus, and Friedländer's bacillus. In some cases the bacillus influenzae alone has been found, and the Klebs-Löffler bacillus in cases following upon diphtheria. When the disease is associated with pulmonary tuberculosis the tubercle bacillus is found.

The tuberculous virus, the tubercle bacilli, may gain entrance to the lungs through the inspired air or by means of the blood or lymph currents. Also in some cases it has been demonstrated that tubercle bacilli may infect the glands of the mesentery following the ingestion of the milk of tuberculous cattle. In this the Government Commissions of Great Britain and Germany as well as the United States Bureau of Animal Industry confirm the findings of private investigators. It may be well here to summarize the views generally held as to infection. In the first place, the doctrine of inherited disease is discredited, and the doctrine of specific susceptibility is in doubt. Infants are known to be extremely susceptible, and this susceptibility lessens with increasing age, adults requiring prolonged exposure. As a mode of infection the sputum of diseased persons is of great importance. Infected food, especially milk, comes next, together with food infected by flies; and the mother's milk is a minor source. Infection is not often received through the skin, but most frequently through the mucous membrane of the mouth, air passages and intestine; occasionally the infection is alveolar. Pulmonary tuberculosis is often secondary to a latent lymphatic form. The tubercle bacillus was discovered by Koch in 1882, and since then it has become generally accepted that the bacillus varies in type. The bacilli have been classified by A. G. Foullerton into (*a*) occurring in fishes and cold-blooded animals, (*b*) in birds, (*c*) in rats, (*d*) in cattle, (*e*) in man. Exactly how far they are interchangeable and can affect the human race is not definitely settled. They may be different varieties of the same species caused by differentiated strains of a common stock, or may be distinct but generically allied species. Von Behring considers that the bovine type may undergo modification in the human body, a theory which may lead to a complete change in our beliefs in the mode of entry of the bacillus. Recent investigators have put forward the view that the tubercle bacillus is not a bacterium, but belongs to the higher group known as streptotricheae or mould fungi.

Tuberculosis.

The action of the tubercle bacillus upon the tissues, like most other infectious agents, gives rise to inflammatory processes and anatomical changes, varying with the mode of entry and virulence of the micro-organism. The most characteristic result is the formation throughout the lungs in the form of small scattered foci forming the so-called miliary tubercles. Such miliary tuberculosis of the lungs is frequently only a part of a general tuberculosis, a similar tuberculous affection being found in other organs of the body. In other cases the lungs may be the only or the principal seat of the affection. The source whence the tuberculous virus is derived varies in different cases. Old tubercular glands in the abdomen, neck and elsewhere, and tuberculous disease of bones or joints, are common sources whence tubercule bacilli may become absorbed, and occasion a general dissemination of miliary tubercles in which the lungs participate. Where the source of infection is an old tuberculous bronchial gland or a focus of old tubercle in the lung, the pulmonary organs may be the only seat of the development of miliary tuberculosis for a time; but even then, if life is sufficiently prolonged, other parts of the body become involved. Acute miliary tuberculosis of the lungs is not infrequently a final stage in the more chronic tuberculous lesions of the different forms of pulmonary pbthisis.

In pulmonary phthisis, or consumption, the disease usually commences at the apex of one lung, but runs a very variable course. In a large majority of cases it remains confined to one small focus, and not only does not spread, but undergoes retrograde changes and becomes arrested. In such cases fibrous tissue develops round the focus of disease and the tuberculous patch dries up, often becoming the seat of the deposit of calcareous salts. This arrest of small tuberculous foci in the lung is doubtless of very frequent occurrence, and in *post mortem* examinations of persons who have died from injuries or various diseases other than tubercle it is common to find in the lungs arrested foci of tubercle, which in the majority of instances have never been suspected during life, and probably have occasioned few, if any, symptoms. It has been shown that in more than 37% of persons, over 21 years of age, dying in a general hospital of various diseases, there is evidence of arrested tubercle in the lungs. As such persons are chiefly drawn from the poorer classes, among whom tubercle is more common than among the well-to-do, this high percentage may not be an accurate indication of the frequency with which pulmonary tubercle does become arrested. It does, however, show that the arrest and the healing of tuberculosis of the lungs is by no means unfrequent, and that it occurs among those who are not only prone to become infected, but whose circumstances are least favourable to the arrest of the disease. These facts indicate that the human organism does offer a resistance to the growth of the tubercle bacilli.

A focus of pulmonary tubercle may become arrested for a time and then resume activity. In many cases it is difficult to say why this is so, but often it is clearly associated with a lowering in the general health of the individual. It cannot be too strongly insisted that the arrest of a tuberculous focus in the lung is a slow process and requires a long time. Commonly a person in the early stage of phthisis goes away to a health resort, and in the course of a few weeks or months improves so much that he returns to a densely populated town and resumes his former employment. In a short time the disease shows renewed activity, because the improved

[1] The term catarrhal pneumonia has been usually regarded as synonymous with the term broncho-pneumonia, and this usual nomenclature has been maintained in the present article. We must, however, recognize that all simple acute broncho-pneumonias are not purely catarrhal in the strict pathological sense. For instance, a considerable amount of fibrinous exudation is not unfrequently present in the patches of broncho-pneumonia, and some of the cases of septic broncho-pneumonia can scarcely be accurately termed *catarrhal.*

conditions were not maintained long enough to ensure the complete arrest of the disease.

Instead of the tuberculous focus becoming arrested, it may continue to spread. The original focus and the secondary ones are at first patches of consolidated lung. Later, their central parts soften and burst into a bronchus; then the softened portion is coughed up, and a small cavity is left, which tends gradually to increase in size by peripheric extension and by merging with other cavities. This process is repeated again and again, and sooner or later the other lung becomes similarly affected. At any stage of the softening process the blood vessels may become involved and give rise by rupture to a large or a small haemorrhage (*hæmoptysis*). It not unfrequently happens that such haemoptysis may be the first symptom that seriously attracts attention. At a later period haemorrhage frequently takes place in large or small amounts from the rupture of vessels, which frequently are dilated and form small aneurysms in the walls of cavities. A fatal termination may be hastened by the absorption by means of the blood vessels and lymphatics of the tuberculous virus from some of the foci of disease, and the occurrence therefrom of a local miliary tuberculosis of the lungs or a general tuberculosis of other organs. The rapidity with which the destructive process spreads throughout the lung varies considerably. We therefore recognize acute phthisis, or galloping consumption, and chronic phthisis. In the acute cases the softening progresses rapidly and is associated with the development of very little fibrous tissue; probably various forms of micro-organisms other than the tubercle bacilli assist in the rapid softening. In the more chronic cases there is development of much fibroid tissue, and the disease is associated with periods of temporary arrest of the tubercular process.

The expectoration from cases of pulmonary phthisis contains tubercle bacilli, and is a source of danger to healthy individuals, in whom it may produce the disease. Attendance on persons suffering from pulmonary phthisis involves very little risk of infection if proper care is taken to prevent the expectoration becoming dry and disseminated as dust; perfect cleanliness is therefore to be insisted upon in the rooms inhabited by a phthisical person. The tubercle bacilli soon lose their virulence in the presence of fresh air and sunshine, and therefore these agents are not only desirable for the direct benefit of the phthisical patient, but also are agents in preventing the development of fresh disease in healthy individuals.

Although the tubercle bacilli are the essential agents in the development of pulmonary tuberculosis, there are other conditions which must be present before they will produce the disease. It is probable that large numbers of individuals are exposed to the action of tubercle bacilli which gain entrance to the pulmonary tract, and yet do not give rise to the disease, because the conditions of their growth and multiplication do not exist. In such cases we may consider that the seed is present, but that the soil is unsuitable for its growth. Certain families appear more predisposed to tuberculosis than others.

The most important circulatory disturbances met with in the lungs are those seen in cases of dilated heart, with or without disease of the mitral valve, when engorgement of the pulmonary vessels sets up a condition of venous engorgement of the lungs. This may lead to various changes. After it has lasted a variable time, and if it is very intense, serous transudation occurs into the substance of the lung and the alveoli, and thus a condition of pulmonary dropsy or oedema is established. The venous engorgement also predisposes the subjects of such heart affections to bronchitis and pneumonia. In disease of the mitral valve, in cardiac dilatation and in simple feebleness of the heart, such as is seen in old age and after debilitating fevers, especially typhoid, there is commonly developed a venous congestion of the bases of the lungs, forming the so-called hypostatic congestion of those organs, and to this is frequently added pneumonia. In long-standing cases of pulmonary congestion brought about by disease of the mitral valve and dilatation of the heart, a certain amount of fibrous tissue may be found in the interstitial tissue of the lungs, and from transudation of certain elements of the blood we get the formation in the newly formed fibrous tissue of blood pigment. In these cases blood pigment is found in the cells, in the pulmonary alveoli, and such cells also carry the pigment into the interstitial tissue. This condition constitutes the state known as *brown induration of the lungs*. Acute congestion of the lungs occurs as part of the first stage of pneumonia. It also probably exists during violent exertion, and may possibly be brought about by excitement.

Congestion.

Another circulatory disturbance of great importance is that arising from blocking of the pulmonary artery or its branches by an embolus or a thrombus. Where the obstruction takes place in the main vessel, death rapidly ensues. Where, however, a small branch of the vessel is occluded, as frequently occurs from a coagulum forming in the right side of the heart, or in the pulmonary vessels in cases of disease of the mitral valve, or in dilatation of the heart, or from the detachment of a small vegetation from disease of the tricuspid or pulmonary valves, a haemorrhagic exudation takes place, forming a patch of consolidation in the lung (*haemorrhagic infarct*). As this haemorrhagic exudation takes place not only into the substance of the lung, but also into the bronchial tubes, such lesions are usually associated with spitting of blood (*haemoptysis*). The increased tension produced in the pulmonary vessels in cases of mitral disease may also probably lead to the formation of haemorrhagic exudations into the lungs, apart from the occurrence of embolism or thrombosis. Usually the occurrence of pulmonary embolism and the formation of haemorrhagic infarcts in the lungs mark an important epoch in the course of a case of heart disease. It usually occurs at a late stage of the affection, and not unfrequently contributes materially to a fatal termination. It is probable that many of the cases of pneumonia and pleuritic effusion, coming on in cases of valvular heart disease and of cardiac dilatation, owe their origin to an embolus and to the formation of a haemorrhagic infarct.

Embolism and Thrombosis.

The term asthma is commonly applied to a paroxysmal dyspnoea of a special type which is associated with a variety of conditions. In true spasmodic asthma there may be no detectable organic disease, and the paroxysms are generally believed to be due to a nervous influence which, acting upon the bronchial muscles, produces a spasm of the tubes, or, acting through the vaso-motor branches of the sympathetic, produces a congestion of the bronchial mucous membrane. The most probable theory is that lately advanced, that it is caused by a profound toxaemia. An organism has been isolated, which is said to be the cause of certain cases of asthma, and the fact that benefit has been said to follow treatment by a vaccine is in favour of this view. The exciting cause may not be at all apparent, even on the most careful observation and examination of the sufferer, but in other cases the attacks may be brought about by some reflex irritation. Nasal polypi and other diseases of nasal mucous membrane have been shown in some cases to be a cause of asthma. Irritation of the bronchial mucous membrane appears to be one of the most common, but it is usually difficult to say exactly in what the irritation consists.

Asthma.

The sputum in true asthma is typical, consisting of white translucent pellets like boiled tapioca. These pellets consist of mucus arranged in a twisted mariner and known as Curschmann spirals; they also contain Charcot-Leyden crystals, degenerated epithelium and leucocytes, of which the majority are eosinophiles. The spirals consist of a central solid thread round which the mucus is arranged in spiral form. The twisting has been attributed to a rotatory motion of the cilia, helped by the spasm of the bronchial muscles. Allied to true asthma is the bronchial asthma frequently met with in the subjects of bronchitis and emphysema. In such cases the irritation evidently proceeds from the inflamed bronchial mucous membrane. Hay asthma is the variety in which the pollen of certain plants, especially grasses, is the exciting cause of the paroxysms. In cardiac feebleness, in valvular disease of the heart, and in cardiac dilatation, we may get dyspnoeic attacks of a more or less

paroxysmal nature, to which the term cardiac asthma has been applied. Similarly, to a form of dyspnoea met with occasionally as a manifestation of uraemia in chronic Bright's disease the term of renal asthma has been given.

Pleurisy.

Pleurisy, or inflammation of the pleura, is a very common affection, and is met with under different forms. In many instances we have simply the pouring out, over a greater or less area of the surface of the pleura, of a fibrinous exudation which may become absorbed or undergo organisation, a certain amount of thickening of the pleura, and adhesions of the two layers resulting. Such cases form the group known as cases of dry pleurisy. In other instances a greater or lesser amount of serous exudation takes place into one or other pleural cavity, forming the cases of serous pleuritic effusion. In others the exudation into the pleural cavity is purulent, giving rise to the condition known as empyema or purulent pleuritic effusion. The occurrence of dry pleurisy is probably very frequent, and leads to small pleural adhesions which cause little or no inconvenience. In post-mortem examinations of persons who have died from various diseases it is common to find such pleural adhesions present, although they have never been suspected during life. Pleurisy in one or other of the above forms may come on in a person apparently in good health (idiopathic pleurisy), or it may follow a fracture of the ribs or other injury to the chest. It is not uncommonly secondary to some other disease; thus it is almost a constant accompaniment of acute lobar pneumonia. In such cases the effusion is most commonly a simple fibrinous one, which with the subsidence of the primary disease is in great part absorbed. In other cases of pneumonia we get a certain amount of serous effusion into the pleura; and sometimes, especially in children, the pneumonia is followed by the development of an empyema. Pleurisy with effusion is also frequently a complication of valvular heart disease and dilatation of the heart, and in such cases is often associated with the formation of superficial pulmonary infarcts. It is also seen in many other diseases of the lungs. For instance, in chronic pulmonary phthisis pleuritic adhesions over various parts of the lungs are the rule; and we also frequently get serous effusion into the pleura as a complication of the various forms of pulmonary tuberculosis. Purulent effusion is less common in phthisis, but it is the rule where the pleura is perforated by the necrosis of a tuberculous focus in the lung and the establishment of a communication between the pleura and a tuberculous cavity and the bronchial tubes (*pyopneumothorax*), a combination in which there is both air and pus in the pleural cavity. Secondary pleurisy is also seen in an extension of the disease from neighbouring parts, as from peritonitis, sub-diaphragmatic abscess, and suppuration in the liver or spleen. As a secondary disease, pleurisy is also known in the course of various forms of nephritis, rheumatism, and the acute specific diseases.

Cases formerly classed as idiopathic pleurisy are now known to be caused by certain micro-organisms. These vary in relation to the character of the effusion. The most frequent is the tubercle bacillus, which is generally present in sero-fibrinous effusions. In this case the pleurisy is really secondary to a possibly unrecognized tuberculous infection either of the lung or pleura. In purulent effusions the pneumococcus may occur as a pure infection, or the streptococcus pyogenes or the staphylococcus may be present. Mixed infections occur in 21% of purulent effusions, and varieties of other organisms, such as the influenza bacillus, the typhoid bacillus, the Klebs-Löffler bacillus and the colon bacillus, have been occasionally found.

There are at least five types of pulmonary emphysema; (1) hypertrophic, idiopathic or large-lunged emphysema; (2) senile or small-lunged emphysema; (3) compensatory emphysema; (4) acute vesicular emphysema; (5) interstitial or interlobular emphysema. Two points are usually admitted: that emphysema appears only in lungs that are congenitally weak, and that the exciting cause is increased intravesicular tension. When one or more lobules are cut off from the working part of the lung the neighbouring vesicles become distended. Should the plugging of the lobule remain permanent, typical emphysema results. This happens in illnesses inducing violent respiratory efforts, such as chronic bronchitis, whooping cough and asthma. In large-lunged emphysema the lung is excessively large, and does not collapse on opening the chest wall. Microscopically two lesions are notable. The septa between the vesicles are atrophied, many have disappeared and the vesicles have coalesced; the loss in lung tissue diminishes the vascular field of the lung and tends to imperfect aeration, whence the dyspnoea. The elastic tissue of the lung is also lost. In small-lunged emphysema there is a condition of senile atrophy. The lung is smaller than normal, and the intravesicular septa are destroyed. In this case the primary cause is atrophy of the bronchi, and increased air pressure is not a factor. Compensatory emphysema is that which develops in a portion of a lung in which the other portion is the seat of a lesion, such as pneumonia. Occasionally it is merely physiological, but sometimes here too the septa undergo atrophic changes. Acute vesicular emphysema is hardly a pathological variety, and is really rapid distension coming on during an attack of asthma or angina pectoris. The variety is temporary only. Interstitial emphysema is characterized by the presence of air in the interstitial connective tissue of the lung. It is usually due to rupture of the air vesicles during paroxysms of coughing.

(T. H.*; H. L. H.)

(5) Surgery of the Respiratory System

About the middle of the 19th century, Manuel Garcia demonstrated the working of the vocal cords in the living subject, by placing a flat mirror of about the size of a shilling at the back of the mouth, and throwing strong light on to it from a concave mirror fixed upon the observer's forehead. By the use of a laryngoscope and a cocaine spray the most irritable throat can now be made tolerant of the presence of the small mirror, and thus the medical man is enabled to make a prolonged and thorough examination of the interior of the larynx and even to perform delicate operations upon it. Foreign bodies which have become caught in the larynx can thus be seen and extracted, and small growths can be satisfactorily removed even from the vocal cords themselves.

A foreign body in the air-passages may be impacted above the vocal cords, and the prompt thrusting down of a finger may dislodge it and save the person from death by suffocation. If there is doubt as to the site of the impaction, and the symptoms are urgent (as is likely to be the case) immediate *laryngotomy* should be done. In this operation a tube is introduced through the crevice which can easily be felt in the middle line of the neck, between the thyroid and cricoid cartilages. The procedure is easily and quickly accomplished. It is, moreover, often resorted to when the surgeon is about to perform some extensive operation in the mouth which must needs be accompanied by free haemorrhage. Laryngotomy having been done, and the pharynx having been plugged with gauze, the air passages can be kept free of blood during the whole operation.

If the foreign body be such a thing as a button, cherry-stone, sugar-plum or coin, it may at once set up alarming symptoms of spasmodic suffocation. But when the first alarm has quieted down, the attacks are likely to be only occasional, as when the article, drawn up with the expired air, comes in contact with the under aspect of the vocal cords. It may be that in a violent fit of coughing it will be expelled, but, if not, the surgeon must be at hand ready to perform tracheotomy when the urgency of the symptoms demands it. *Tracheotomy* is the making of an opening into the trachea, the air-tube below the larynx. It is unsafe to leave a child with a foreign body loose in its windpipe, on account of the risk of sudden and fatal asphyxia. Possibly the X-rays may show its exact position and give help in its removal. But, in any case, the safest thing will be to perform tracheotomy and to leave the edges of the opening into the windpipe wide asunder, so that the object may be coughed out —the nurse being on guard all the while. The operation of tracheotomy is sometimes urgently called for in the case in

which the air-way has become blocked by a child having sucked hot water from the spout of a kettle or teapot, or in the case of obstruction by the swelling of the acute inflammation of laryngitis or of diphtheria. Should the air-way through the larynx become narrowed by the presence of a growth which does not diminish under the influence of iodide of potassium, the question may arise as to whether it should be dealt with by splitting the thyroid cartilage and holding the wings apart, or by the removal of the whole larynx. For such growths are often malignant. If the wide infection of the lymphatic glands of the neck suggests that no radical operation should be undertaken, a bent silver tube may be introduced below the growth (tracheotomy) in order to provide for the entrance of air. This will get over the difficulty of breathing, but it cannot, of course, do more than that.

Acute laryngitis is very often due to diphtheria. The symptoms are those of laryngeal obstruction, together with constitutional disturbances of various kinds. The old-fashioned nurse called the disease "croup"—a term devoid of scientific meaning (see DIPHTHERIA). In an ordinary catarrhal case, leeches and fomentations may suffice, though sometimes tracheotomy or intubation is called for. But if bacteriological examination shows the presence of diphtheritic bacilli, antitoxin must at once be injected. (See also LUNG.) (E. O.*)

RESPITE (O. Fr. *respit*, modern *répit*, Lat. *respectus*, regard, consideration, *respicere*, to look back at), properly a delay, given for the further consideration of some matter, hence relief. In law the term is used of the postponement of the immediate execution of the law in criminal cases, *e.g.* by binding a convicted prisoner over to come up for judgment when called upon, or when a case is "respited" from one quarter sessions to another. The word is loosely used in the sense of a "reprieve" (*q.v.*).

RESPOND, in architecture, the term given to the half-pier or semi-detached column at the end of a range of piers or columns carrying an architrave or arcade. In Greek temples the respond is known as the *anta*. The term is also given to the wall pilaster which in Roman and Renaissance work is frequently placed behind the detached columns forming the decoration of a wall.

RESPONDENT (from Lat. *respondere*, to answer), strictly, one who answers; in law one called upon to answer a petition or other proceeding. In a matrimonial cause the defendant in the suit is called the respondent. The defendant to a quarter sessions appeal is called the respondent, and so generally in appeals is the party, whether plaintiff or defendant, against whom the appeal is brought.

REST (O. Eng. *ræst*, *reste*, bed, cognate with other Teutonic forms, *e.g.* Ger. *Rast*, *Rüste*, rest, and probably Gothic *Rasta*, league, *i.e.* resting or stopping place), a cessation from active or regular work, hence a time of relief from mental or manual labour. Specific meanings are for an interval of silence in music, marked by a sign indicating the length of the pause; for the forked support with iron-shod spike carried by the soldier till the end of the 17th century as a rest for the heavy musket; and for the support for the cue in billiards to be used when the striking ball is out of reach of the natural rest formed by the hand. In the medieval armour of the horsed man-at-arms, and later in the armour of the tournament, a contrivance was fixed to the side of the body-armour near the right arm-pit, in which the butt-end of the lance was placed to prevent the lance being driven back after striking the opponent at full charge; hence a knight, as a preliminary to the charge, "laid his lance in rest." This "rest" is a shortened form of "arrest," to check, stop, as is seen by the French equivalent, *arrêt*. Further, "rest," that which remains over and above, is derived from the French *rester*, to remain over, Lat. *restare*, to remain, literally, to stay behind. The principal specific use of this word is in commerce for the balance of undivided profit; it has thus always been the term used by the Bank of England for that which in other banks and companies is called the "reserve" (Hartley Withers, *The Meaning of Money* (1000), p. 298). The Bank of England "rest" is never allowed to fall below £3,000,000 (see BANKS AND BANKING).

RESTIF, NICOLAS EDME (1734–1806), called RESTIF DE LA BRETONNE, French novelist, son of a farmer, was born at Sacy (Yonne) on the 23rd of October 1734. He was educated by the Jansenists at Bicêtre, and on the expulsion of the Jansenists was received by one of his brothers, who was a curé. Owing to a scandal in which he was involved, he was apprenticed to a printer at Auxerre, and, having served his time, went to Paris. Here he worked as a journeyman printer, and in 1760 he married Anne or Agnes Lebègue, a relation of his former master at Auxerre. It was not until five or six years after his marriage that Restif appeared as an author, and from that time to his death, on the 3rd of February 1806, he produced a bewildering multitude of books, amounting to something like two hundred volumes, many of them printed with his own hand, on almost every conceivable variety of subject. Restif suffered at one time or another the extremes of poverty and was acquainted with every kind of intrigue. He drew on the episodes of his own life for his books, which, in spite of their faded sentiment, contain truthful pictures of French society on the eve of the Revolution. The most noteworthy of his works are *Le Pied de Fanchette*, a novel (1769); *Le Pornographe* (1769), a plan for regulating prostitution which is said to have been actually carried out by the Emperor Joseph II., while not a few detached hints have been adopted by continental nations; *Le Paysan perverti* (1775), a novel with a moral purpose, though sufficiently horrible in detail; *La Vie de mon père* (1779); *Les Contemporaines* (42 vols., 1780–1785), a vast collection of short stories; *Ingénue Saxancour*, also a novel (1785); and, lastly, the extraordinary autobiography of *Monsieur Nicolas* (16 vols., 1794–1797; the last two are practically a separate and much less interesting work), in which at the age of sixty he has set down his remembrances, his notions on ethical and social points, his hatreds, and above all his numerous loves, real and fancied. The original editions of these, and indeed of all his books, have long been bibliographical curiosities owing to their rarity, the beautiful and curious illustrations which many of them contain, and the quaint typographic system in which most are composed. In 1795 he received a gratuity of 2000 francs from the government, and just before his death Napoleon gave him a place in the ministry of police, which he did not live to take up.

Restif de la Bretonne undoubtedly holds a remarkable place in French literature. He was inordinately vain, of extremely relaxed morals, and perhaps not entirely sane. His books were written with haste, and their licence of subject and language renders them quite unfit for general perusal.

The works of C. Monselet, *Rétif de la Bretonne* (1853), and P. Lacroix, *Bibliographie et iconographie* (1875), J. Assézat's selection from the *Contemporaines*, with excellent introductions (3 vols., 1875), and the valuable reprint of *Monsieur Nicolas* (14 vols., 1883–1884), will be sufficient to enable even curious readers to form a judgment of him. His life, written by his contemporary Cubières-Palmezeaux, was republished in 1875. See also Eugen Dühren, *Rétif de la Bretonne, der Mensch, der Schriftsteller, der Reformator* (Berlin, 1906), and a bibliography, *Rétif-Bibliothek* (Berlin, 1906), by the same author.

RESTOUT, JEAN (1692–1768), French painter, born at Rouen on the 26th of March 1692, was the son of Jean Restout, the first of that name, and of Marie M. Jouvenet, sister and pupil of the well-known Jean Jouvenet. In 1717, the Royal Academy having elected him a member on his work for the *Grand Prix*, he remained in Paris, instead of proceeding to Italy, exhibited at all the salons, and filled successively every post of academical distinction. He died on the 1st of January 1768. His works, chiefly altar-pieces (Louvre Museum), ceilings and designs for Gobelin tapestries, were engraved by Cochin, Drevet and others; his diploma picture may still be seen at St Cloud.

His son, JEAN BERNARD RESTOUT (1732–1797), won the *Grand Prix* in 1758, and on his return from Italy was received into the Academy; but his refusal to comply with rules led to a quarrel with that body. Roland appointed him keeper of the Garde Meuble, but this piece of favour nearly cost him his life during the Terror. The St Bruno painted by him at Rome is in the Louvre.

RESTRAINT (from "to restrain," Lat. *restringere*, to hold back, prevent), in law, a restriction or limitation. The word is used particularly in three connexions: 1. *Restraint on Anticipation.* Although it is a principle of English law that there can be no restriction of the right of alienation of property vested in any person under an instrument, equity makes an exception in the case of a married woman, and has laid down the rule that property may be so settled to the separate use of a married woman that she cannot, during coverture, alienate it or anticipate the income. Restraint on anticipation attaches only during coverture and is therefore removed on widowhood, but it may attach again on remarriage. By the Conveyancing Act 1881, s. 39, a court may however, if it thinks fit, by judgment or order bind a married woman's interest in her property, with her consent, if it appears to be for her benefit, notwithstanding that she is restained from anticipating.

2. *Restraint of Marriage.*—A gift or bequest to a person may have a condition attached in restraint of marriage. This condition may be either general or partial. A condition in general restraint of marriage is void, as being contrary to public policy, although a condition in restraint of a second marriage is not void. A condition in partial restraint of marriage is valid, and may be either to restrain marriage with a particular class of persons, *e.g.* a papist, a domestic servant, or a Scotsman, or under a certain age.

3. *Restraint of Trade.*—A contract in general restraint of trade is void as being against public policy. In the leading case of *Mitchell* v. *Reynolds*, 1711, 1 Smith L.C., it was laid down that "it is the privilege of a trader in a free country, in all matters not contrary to law, to regulate his own mode of carrying it on according to his own discretion and choice. If the law has regulated or restrained his mode of doing this, the law must be obeyed. But no power short of the general law ought to restrain his free discretion." It has been suggested that the rule dates from a time when a covenant by a man not to exercise his own trade meant a covenant not to exercise any trade at all—every man being obliged to confine himself to the trade to which he had been apprenticed. However, contracts which are only in partial restraint of trade are good. A contract not to carry on the business of an ironmonger would be bad; but a contract made by the seller of an ironmonger's business not to compete with the buyer would be good. To make such a contract binding it must be founded on a valuable consideration and must not go beyond what is reasonably necessary for the protection of the other party. This is the tendency also of the law in the United States.

See Matthew on *Restraint of Trade* (1907).

RESZKE, JEAN DE (1850–), operatic singer, was born at Warsaw on the 14th of January 1850. His parents were Poles; his father was a state official and his mother a capable amateur singer, their house being a recognized musical centre. After singing as a boy in the Cathedral of Warsaw, he studied law in the university there, but in a few years he abandoned this and went to Italy to study singing. He made his first public appearance, as a baritone, at Venice in January 1874, as Alfredo in *La Traviata*, and in the following April he sang for the first time in London, appearing at Drury Lane Theatre, and a little later in Paris. He was not entirely successful and retired for a further period of study, during which his voice gained remarkably in the upper register; so that when he made his first reappearance at Madrid in 1879 it was as a tenor, in the title-rôle of *Robert le Diable*. Jean de Reszke's great fame as a singer dates from this time. For several seasons he sang regularly in Paris, and he reappeared at Drury Lane in 1887 as Radames. In the next year he was again in London, this time at Covent Garden as Vasco da Gama; this appearance was mainly responsible for the revival of the opera as a fashionable amusement in London. He appeared in London nearly every year from this date until 1900. In 1891 he visited America, and from 1893 to 1899 he was welcomed each year at the Metropolitan Opera House in New York. Jean de Reszke's most successful parts were the title-rôle of *Le Cid*, which was written for him by Massenet, and those of Romeo, Lancelot in *Elaine*, and Lohengrin, Walther von Stolzing, Siegfried and Tristan in Wagner's operas. In 1904 illness compelled him to retire from the stage, and he subsequently divided his time between teaching singing in Paris and breeding race-horses in Poland.

Jean de Reszke's younger brother, EDOUARD, born at Warsaw on the 23rd of December 1855, is also famous as an operatic singer. He appeared for the first time in Paris in April 1896, and has since sung with his brother for many seasons both in London and in New York. His magnificent bass voice and admirable technique earned him fame in such parts as those of Mephistopheles in *Faust*, Charles V. in Marchetti's *Don Giovanni d' Austria*, Walter in *Tell*, the Count in *Sonnambula*, Prince Gudal in *Dame Blanche*, and Hans Sachs, King Mark, Hunding and Hagen in Wagner's operas.

RETABLE (Fr. *rétable*, a shortened form derived from Med. Lat. *retrotabulum*), a term of ecclesiastical art and architecture, applied in modern English usage to an altar-ledge or shelf, raised slightly above the back of the altar or communion table, on which are placed the cross, ceremonial candlesticks and other ornaments. Retables may be lawfully used in the church of England (*Liddell & Beale*, 1860, 14 P.C.).

Foreign usage of the term, as in French, is different, and where the word is kept with this foreign application, the distinction should be observed. The Med. Lat. *retrotabulum* (modernized *retabulum*) was applied to an architectural feature set up at the back of an altar, and generally taking the form of a screen framing a picture, carved or sculptured work in wood or stone, or mosaic, or of a movable feature such as the famous *Pala d' Oro* in St Mark's, Venice, of gold, jewels and enamels. The foreign "rétable" is, therefore, what should in English be called a "reredos" (*q.v.*), though that is not in modern usage a movable feature.

RETAIL, the sale of goods or commodities in small quantities to the immediate consumer, opposed to a sale wholesale or in gross. The O. Fr. *retaille*, from which the word is taken, meant a piece cut off, from *tailler*, to cut, Med. Lat. *taleare*, Lat. *talea*, a rod, cutting for planting. The English meaning appears in Anglo-French and in the Italian *retaglio*, selling by the piece. The other meaning of "retail," to repeat a story, is a transferred sense of an early meaning, "to sell at second hand." The Latin source is also seen in the related words "entail," "tailor," "detail" and "tally."

RETAINER (from "retain," Lat. *retinere*, to hold back, keep), properly the act of retaining or keeping for oneself, or a person or object which retains or keeps; historically, a follower of a house or family, and particularly used of armed followers attached to the barons of the middle ages. John Cowell, in *The Interpreter* (1607), defines "retainer" as a "servant not meniall nor familiar, that is, not continually dwelling in the house of his lord or master, but onely using or bearing his name or livery."

Retainer of Counsel.—When it is considered desirable by a litigant that the services of any particular counsel (barrister) should be obtained for the conduct of his case, it is necessary to deposit with counsel a form of retainer together with the necessary fee in cash, from which time counsel is bound to give the party who has thus retained him the first call on his services in the matter in which he has been retained. Retainers are either *general* or *special*. A general retainer is one which retains counsel for all proceedings in which the person retaining is a party, and lasts for the joint lives of client and counsel. If any other person offers a special retainer or brief against the general retainer, counsel must give the general retainer notice of such offer—and if after a reasonable time the general retainer does not himself specially retain or brief counsel, the general retainer is forfeited. A special retainer is one which only applies to some particular cause or action. It can only be delivered after the action is begun, and gives the client a right to the services of counsel throughout the course of the action, and counsel is entitled to be briefed on all occasions to which the retainer applies. Retainer rules were drawn up in 1901 by the Bar Committee, read by the Bar Council and approved by the Attorney-General and the Council

of the Incorporated Law Society in 1902. They may be found in the *Annual Practice*.

Retainer of Debt.—In connexion with the administration of an estate under a will, it is the right of the personal representative—whether executor or administrator—of a deceased person to retain legal assets which have come into his hands towards the payment of a debt due to himself as against creditors of an equal degree, and this even though his debt is barred by the Statutes of Limitation. The privilege arose in all probability from the inability of the representative to sue himself, though it has been suggested that it is merely a corollary to the right of the representative to prefer one creditor to another of equal degree.[1] The principle of retainer is not looked upon with favour by courts of equity, and consequently it has long been the rule that there is no right to retain out of equitable assets. It was thought that the effect of the Land Transfer Act 1897 was to make all the assets of the deceased legal assets, and so extend the privilege to reality which had till then been exempt; this view, however, has been repudiated by the courts of equity, and it must now be taken that there is still no right to retain out of real estate.[2] It is a rule of the probate division to require a creditor administrator, to whom letters of administration are granted, to enter into a bond with two sureties not to prefer himself. This course, however, is not followed where administration is granted to a person as next of kin who happens also to be a creditor.

The privilege is not lost by judgment for an account being given in a suit by other creditors for the administration of assets, and the representative may retain out of assets which come to his hand subsequent to such judgment. On the other hand, the appointment of a receiver deprives the representative of his right except as regards assets which come to his hands prior to the appointment of the receiver.

RETALIATION, repayment of like with like, especially the return of hostile action, injuries or wrongs by similar action or injury, as in the primitive theory of punishment, an "eye for an eye," "tooth for a tooth." The Late Lat. *retaliare* was formed from *talis*, such as, of the same quality as; and this source also gave *talio*, *talionis*, the name of this type of punishment. (See PUNISHMENT, THEORY OF, and ROMAN LAW, § *The Twelve Tables*.) A special form of retaliation is familiar in the imposition of differential import duties against the goods of a particular country (see TARIFFS and PROTECTION).

RETENE (methyl isopropyl phenanthrene), $C_{18}H_{18}$, a hydrocarbon present in the coal-tar fraction, boiling above 360° C.; it also occurs in the tars obtained by the distillation of resinous woods. It crystallizes in large plates, which melt at 98·5° C. and boil at 390° C. It is readily soluble in warm ether and in hot glacial acetic acid. Sodium and boiling amyl alcohol reduce it to a tetrahydroretene, whilst if it be heated with phosphorus and hydriodic acid to 260° C. a dodecahydride is formed. Chromic acid oxidizes it to retene quinone, phthalic acid and acetic acid. It forms a picrate which melts at 123–124° C.

RETFORD (officially EAST RETFORD), a market town and municipal borough in the Bassetlaw parliamentary division of Nottinghamshire, England, 138¾ m. N. by W. from London by the Great Northern railway, the station being a junction with the Great Central railway. Pop. (1901) 12,340. The church of St Swithin dates from the 13th century, but was rebuilt in 1658 by a brief granted by Richard Cromwell. Modern buildings are the town hall, the corn exchange, the court house, and the covered markets. There is a large trade in corn and cheese, and the town possesses iron foundries, paper and corn mills, and india-rubber works. The town is governed by a mayor, 6 aldermen, and 18 councillors. Area, 4656 acres.

The situation of Retford (*Redforde, Ratford*), near one of the Roman roads and on the river Idle, where there was possibly a ford, may account for its origin. In 1086 the archbishop of York owned a mill at Retford, and Roger de Busli had rights here. Retford was a borough by prescription, and was in the hands of the crown when, in 1276, Edward I. granted it to the burgesses in fee-farm with the right of electing bailiffs. This charter was confirmed by Edward III., Henry VI. and Elizabeth. In 1607 James I. granted a charter of incorporation to the bailiffs and burgesses, under which the town was governed until 1835, when it was reincorporated under a mayor. East Retford returned two members to parliament in 1315, and again from 1572 till 1885, when it was disfranchised. Henry III. granted the burgesses an eight-days' fair at Holy Trinity, altered by Edward II. to St Gregory. Edward III. granted a six-days' fair at St Margaret, and Henry VI. a four-days' fair at St Matthew. Fairs are now held in March, June, July and December. The market held on Saturdays by prescription was sanctioned by Edward III. and still exists.

RETHEL, ALFRED (1816–1859), German historical painter, was born at Aix-la-Chapelle in 1816. He very early showed an interest in art, and at the age of thirteen he executed a drawing which procured his admission to the academy of Düsseldorf. Here he studied for several years, and produced, among other works, a figure of St Boniface which attracted much attention. At the age of twenty he removed to Frankfort, and was selected to decorate the walls of the imperial hall in the Römer with figures of famous men. At the same period he produced a series of designs illustrative of Old Testament history. Four years later he was the successful competitor for the work of ornamenting the restored council house of his native city with frescoes depicting prominent events in the career of Charlemagne, but the execution of this work was delayed for some six years. Meanwhile Rethel occupied himself with the production of easel pictures and of drawings; and in 1842 he began a striking series of designs dealing with the "Crossing of the Alps by Hannibal," in which the weird power which animates his later art becomes first apparent. In 1844 Rethel visited Rome, executing, along with other subjects, an altar-piece for one of the churches of his native land. In 1846 he returned to Aix, and commenced his Charlemagne frescoes. But mental derangement, remotely attributable, it is believed, to an accident from which he suffered in childhood, began to manifest itself. While he hovered between madness and sanity, Rethel produced some of the most striking, individual and impressive of his works. Strange legends are told of the effect produced by some of his weird subjects. He painted "Nemesis pursuing a Murderer"—a flat stretch of landscape, on a slaughtered body, while in front is the assassin speeding away into the darkness, and above an angel of vengeance. The picture, so the story goes, was won in a lottery at Frankfort by a personage of high rank, who had been guilty of an undiscovered crime, and the contemplation of his prize drove him mad. Another design which Rethel executed was "Death the Avenger," a skeleton appearing at a masked ball, scraping daintily, like a violinist, upon two human bones. The drawing haunted the memory of his artist friends and disturbed their dreams; and, in expiation, he produced his pathetic design of "Death the Friend." Rethel also executed a powerful series of drawings—"The Dance of Death"—suggested by the Belgian insurrections of 1848. It is by such designs as these, executed in a technique founded upon that of Dürer, and animated by an imagination akin to that of the elder master, that Rethel is most widely known. He died at Düsseldorf on the 1st of December 1859.

His picture of "Peter and John at the Beautiful Gate of the Temple," is preserved in the Leipzig Museum, and his "St Boniface" and several of his cartoons for the frescoes at Aix in the Berlin National Gallery. His Life, by Wolfgang Müller von Königswinter, was published in 1861. See also *Art Journal*, November 1865.

RETHEL, a town of N. France, capital of an arrondissement in the department of Ardennes, on the right bank of the Aisne and the Ardennes canal, 31 m. S.W. of Mézières by rail. Pop. (1906) 5254. The church of St Nicholas was formed by the amalgamation of two churches, the oldest of which dates from the 13th century. Rethel has a subprefecture, a tribunal of first instance, a board of trade arbitration, a chamber of arts and manufactures and a school of agriculture, and carries on

[1] Per Jessel, M.R. *Talbot* v. *Frere* (1879), L.R. 9. C.D. 568, 574.

wool-spinning, the weaving of light woollen fabrics, and the manufacture of millboard and farm implements.

Rethel (*Castrum Retectum*), of Roman origin, was from the end of the 10th century the seat of a countship which passed successively to the families of Flanders, Burgundy, Cleves, Foix and Gonzaga. In 1581 it was erected into a duchy in favour of the latter. In 1663 it was sold by Charles VI. de Gonzaga to Mazarin, whose family held it till the Revolution.

RETINITE (Gr. ῥητίνη, resin), a general name applied to various resins, particularly those from beds of brown coal, which are near amber in appearance, but contain little or no succinic acid. It may conveniently serve as a generic name, since no two independent occurrences prove to be alike, and the indefinite multiplication of names, no one of them properly specific, is not to be desired.

RETINUE (O. Fr. *retenue*, from *retenir*, Lat. *retenere*, hold back, retain), a body of persons "retained" in the service of a noble or royal personage, a suite of "retainers." Such retainers were not in the domestic service of their lord, but were his "livery" and claimed his protection. They were a source of trouble and abuse in the 15th and early 16th century (see LIVERY and MAINTENANCE).

RETORT (Lat. *retorquere*, to twist or turn back), a word used in two distinct meanings: (1) a sharp reply, answer to an argument, statement or charge; (2) a vessel used in chemistry and manufacture. The chemical retort is a flask-shaped or bulbous vessel made of glass, earthenware or metal, with a neck, bent downwards, which leads to a receiver; such vessels are particularly used for distillation (*q.v.*). The name is also given to the apparatus, varying in size and shape, used in the distinctive distillation of various substances, such as coal, in the manufacture of gas (*q.v.*).

RETREAT (O. Fr. *retrete*, mod. *retraite*, from Lat. *retrahere*, to draw back), a withdrawal, especially of a body of troops after a defeat or in face of a superior enemy. In military usage "retreat" is also the term for a signal, given by bugle and drum at or about sunset. It is the last general signal before "tattoo." In religious usage, a "retreat" is a period and place set apart for prayer, self-examination and other spiritual exercises. Such "retreats" conducted by a director have long been the practice in the Roman Church. They were introduced into the English Church by Pusey. The word is also used of an institution or home where insane persons or habitual inebriates may be treated. For the law relating to "licensed retreats" for inebriates, see INEBRIETY, LAW OF.

RETRENCHMENT (Fr. *retrenchement*, an old form of *retranchement*, from *retrancher*, to cut down, cut short), an act of cutting down or reduction, particularly of expenditure; the word is familiar in this, its most general sense, from the motto of the Gladstonian Liberal party in British politics, "Peace, Retrenchment and Reform." A special technical use of the term is in fortification, where it is applied to a work or series of works constructed in rear of existing defences in order to bar the further progress of the enemy should he succeed in breaching or storming these. A modern example may be found in the siege of Port Arthur in 1904, when early in the siege Fort Panlung fell into the hands of the Japanese, the Russians connected up the two adjacent first-line forts to a fort in the rear by means of new works, the whole forming a rough semicircle facing the lost fort. This retrenchment prevented the Japanese from advancing, and remained in the hands of the defenders up to the fall of the whole line of forts.

RETRO-COGNITION (from Lat. *retro*, back, *cognitio*, the acquiring of knowledge), a word invented by F. W. H. Myers to denote a supposed faculty of acquiring direct knowledge of the past beyond the reach of the subject's ordinary memory. The alleged manifestations of the faculty are of several kinds, of which the most important are as follows: (1) There are many recorded cases in which an impression has been received in dream or vision representing some recent event—shipwreck, death-bed scene, railway accident—outside the knowledge of the percipient. (2) Analogous to the transmission of habits and physical peculiarities in particular families, it is alleged that there are also cases of the transmission of definite memories of scenes and events in the life of some ancestor. (3) It is asserted that pictures of past scenes may be called up in certain cases by the presence of a material object associated with those scenes—*e.g.* a vision of the destruction of Pompeii by a piece of cinder from the buried city, or the scene of a martyrdom by a charred fragment of bone—the percipient being unaware at the time of the nature of the object. For this supposed faculty the American geologist, Professor Denton, has suggested the name "psychometry." There are also cases recorded in which pictures of historical scenes unknown to the seer have been described in the crystal. (4) Some spirit mediums profess to realise incidents belonging to their previous incarnation. Thus Flournoy's medium, Hélène Smith, represented herself as having been successively incarnated as a Hindoo Princess, Simandini, and as Marie Antoinette, and gave vivid descriptions of scenes in which she had figured in these capacities.

It will be gathered that the facts afford little warrant for the assumption of a faculty of retro-cognition. The cases described in the first class, though apparently exhibiting knowledge not within the range of the percipient's ordinary faculties, hardly call for such an extreme hypothesis. In the other cases the result recorded may plausibly be attributed to the imagination of the percipient, working upon hints given by bystanders, or aided by the emergence of forgotten knowledge.

RETROGRADE (from the Lat. *retro*, backwards, *gradiri*, to go), in astronomy, the direction of the apparent motion of a planet from E. to W.; the opposite of its regular motion around the sun, and due to the motion of the earth.

RETZ, SEIGNEURS AND DUKES OF. The district of Retz or Rais, in S. Brittany, belonged in early times to a house which bore its name, and of which the eldest branch became extinct in the 13th century in the Chabot family. From the Chabot family the lordship passed to the Lavals. Gilles de Laval, sire de Retz (1404–1440), the comrade-in-arms of Joan of Arc and marshal of France, gave himself over to the most revolting debauchery, and was strangled and burned at Nantes. The barony of Retz passed successively to the families of Tournemine, Annebaut and Gondi. In 1581 it was erected into a duchy in the peerage of France (*duché-pairie*) for Albert de Gondi, marshal of France and general of the galleys. Pierre de Gondi, brother of the first duc de Retz, became bishop of Paris in 1570 and cardinal in 1587. He was succeeded by his nephews, Henri (d. 1622) and Jean François de Gondi (d. 1654), for whom the episcopal see of Paris was erected into an archbishopric in 1622, and by his great-nephew, Jean François Paul de Gondi, the famous cardinal de Retz. With the death of the last male of the house of Gondi in 1676 the *duché-pairie* became extinct; the lordship passed to the house of Neuville-Villeroy.

(M. P.*)

RETZ, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1614–1679), French churchman and agitator, was born at Montmirail in 1614. The family was one of those which had been introduced into France by Catherine de' Medici, but it acquired great estates in Brittany and became connected with the noblest houses of the kingdom. It may be added that Retz himself always spelt his designation "Rais." He was the third son, and according to Tallemant des Réaux was made a knight of Malta on the very day of his birth. The death of his second brother, however, destined him for a closer connexion with the church. The family of Retz had military traditions, but it had also much church influence, and, despite the very unclerical leanings of the future cardinal, which were not corrected by the teachings of his tutor St Vincent de Paul, the intentions of his family never varied respecting him. By unanimous consent his physical appearance was not that of a soldier. He was

short, near-sighted, ugly and exceptionally awkward. Retz, however, despite the little inclination which he felt towards clerical life, entered into the disputes of the Sorbonne with vigour, and when he was scarcely eighteen wrote the remarkable *Conjuration de Fiesque*, a little historical essay, of which he drew the material from the Italian of Augustino Mascardi, but which is all his own in the negligent vigour of the style and the audacious insinuation, if nothing more, of revolutionary principles. Retz received no preferment of importance during Richelieu's life, and even after the minister's death, though he was presented to Louis XIII. and well received, he found a difficulty in attaining the coadjutorship with reversion of the archbishopric of Paris. But almost immediately after the king's death Anne of Austria appointed him to the coveted post on All Saints' Eve, 1643. Retz, who had, according to some accounts, already plotted against Richelieu, set himself to work to make the utmost political capital out of his position. His uncle, who was old, indolent and absurdly proud, had lived in great seclusion; Retz, on the contrary, gradually acquired a very great influence with the populace of the city. This influence he gradually turned against Mazarin. No one had more to do than Retz with the outbreak of the Fronde in October 1648, and his history for the next four years is the history of that confused and, as a rule, much misunderstood movement. Of the two parties who joined in it Retz could only depend on the bourgeoisie of Paris. The fact, moreover, that although he had some speculative tendencies in favour of popular liberties, and even perhaps of republicanism, he represented no real political principle, inevitably weakened his position, and when the break up of the Fronde came he was left in the lurch, having more than once in the meanwhile been in no small danger from his own party. One stroke of luck, however, fell to him before his downfall. He was made cardinal almost by accident, and under a misapprehension on the pope's part. Then, in 1652, he was arrested and imprisoned, first at Vincennes, then at Nantes; he escaped, however, after two years' captivity, and for some time wandered about in various countries. He made his appearance at Rome more than once, and had no small influence in the election of Alexander VII. He was at last, in 1662, received back again into favour by Louis XIV. and on more than one occasion formally served as envoy to Rome. Retz, however, was glad in making his peace to resign his claims to the archbishopric of Paris. The terms were, among other things, his appointment to the rich abbacy of St Denis and his restoration to his other benefices with the payment of arrears.

The last seventeen years of Retz's life were passed partly in his diplomatic duties (he was again in Rome at the papal election of 1668), partly at Paris, partly at his estate of Commercy, but latterly at St Mihiel in Lorraine. His debts were enormous, and in 1675 he resolved to make over to his creditors all his income except twenty thousand livres, and, as he said, to "live for" them. This plan he carried out, though he did not succeed in living very long, for he died at Paris on the 24th August 1679. One of the chief authorities for the last years of Retz is Madame de Sévigné, whose connexion he was by marriage.

Retz and La Rochefoucauld, the greatest of the Frondeurs in literary genius, were personal and political enemies, and each has left a portrait of the other. La Rochefoucauld's character of the cardinal is on the whole harsh but scarcely unjust, and one of its sentences formulates, though in a manner which has a certain recoil upon the writer, the great defect of Retz's conduct: "Il a suscité les plus grands désordres dans l'état sans avoir un dessein formé de s'en prévaloir." He would have been less, and certainly less favourably, remembered if it had not been for his *Memoirs*. They were certainly not written till the last ten years of his life, and they do not go further than the year 1655. They are addressed in the form of narrative to a lady who is not known, though guesses have been made at her identity, some even suggesting Madame de Sévigné herself. In the beginning there are some gaps. They display, in a rather irregular style and with some oddities of dialect and phrase, extraordinary narrative skill and a high degree of ability in that special art of the 17th century—the drawing of verbal portraits or characters. Few things of the kind are superior to the sketch of the early barricade of the Fronde in which the writer had so great a share, the hesitations of the court, the bold adventure of the coadjutor himself into the palace and the final triumph of the insurgents. Dumas, who has drawn from this passage one of his very best scenes in *Vingt ans après*, has done little but throw Retz into dialogue and amplify his language and incidents. Besides these memoirs and the very striking youthful essay of the *Conjuration de Fiesque*, Retz has left diplomatic papers, sermons, Mazarinades and correspondence in some considerable quantity.

The *Memoirs* of the cardinal de Retz were first published in a very imperfect condition in 1717 at Nancy. The first satisfactory edition was that which appeared in the twenty-fourth volume of the collection of Michaud and Poujoulat (Paris, 1836). They were then re-edited from the autograph manuscript by Géruzez (Paris, 1844), and by Chantelauze-Figeac with the Mazarinades, &c. (Paris, 1859). In 1870 a complete edition of the works of Retz was begun by M. A. Feillet in the collection of *Grands Écrivains*. The editor dying, this passed into the hands of M. Gourdault and then into those of M. Chantelauze, who had already published studies on the connexion of St Vincent de Paul with the Gondi family, &c. (1882).

(G. Sa.)

REUBEN, a tribe of Israel named after the eldest "son" of Jacob and of Leah. Both the meaning of the name (see Gen. xxix. 32) and the history of the tribe are extremely obscure. In one version of the story of Joseph, Reuben appears in a somewhat favourable light (Gen. xxxvii. 22, 29, xlii. 37), but in Gen. xxxv. 22 he is charged with a grave offence, which in Gen. xlix. 4 is given as a reason why the tribe which took him father did not take in Hebrew history the place proper to its seniority (cp. 1 Chron. v. 1). Dathan and Abiram were Reubenites (Num. xvi.; Deut. xi. 6), and in Deut. xxxiii. 6 the tribe appears as threatened with extinction. In Judg. v. 15 seq. it is described as a pastoral tribe which took no share in the patriotic movement under Barak and Deborah. The district allotted to Reuben (Josh. xiii. 15–23; Num. xxxii. 37 seq.) is detailed in late passages which have little historical value for the age to which they are attributed. The tribe is represented as settled E. of the Jordan on the Moabite border, but no mention is made of it in the inscription of the Moabite king Mesha (see GAD; MOAB). The references to the tribe's wars against Arabians (1 Chron. v. 10, 18 sqq.) in the time of Saul have caused much fruitless speculation.

For mythological elements in the tribe's history, see especially E. Stucken, *Mitheil. d. vorderasiat. Gesell.* (1902), pt. iv. pp. 46 sqq., and for a full discussion of the biblical data, see H. W. Hogg, *Ency. Bib. s.v.*, also E. Meyer, *Die Israeliten und ihre Nachbarstämme*, pp. 530 sqq.

REUCHLIN, JOHANN (1455–1522), German humanist and Hebraist, was born on the 22nd of February 1455 at Pforzheim in the Black Forest, where his father was an official of the Dominican monastery. In the pedantic taste of his time the name was graecicized by his Italian friends into Capnion, a form which Reuchlin himself uses as a sort of transparent mask when he introduces himself as an interlocutor in the *De Verbo Mirifico*. For his native place Reuchlin always retained an affection; he constantly writes himself Phorcensis, and in the *De Verbo* he does not forget to ascribe to Pforzheim his first disposition to letters. Here he began his Latin studies in the monastery school, and, though in 1470 he was a short time in Freiburg, that university seems to have taught him little. Reuchlin's career as a scholar appears to have turned almost on an accident; his fine voice gained him a place in the household of Charles I., margrave of Baden, and by-and-by, having already some reputation as a Latinist, he was chosen to accompany to the university of Paris Frederick, the third son of the prince, a lad some years his junior, who was destined for an ecclesiastical career. This new connexion lasted but a year or so, but it determined the course of Reuchlin's life. He now began to learn Greek, which had been taught in the French capital since 1470, and he also attached himself to the leader of the Paris realists, Jean Heynlin, or à Lapide (d. 1496), a

worthy and learned man, whom he followed to the vigorous young university of Basel in 1474. At Basel Reuchlin took his master's degree (1477), and began to lecture with success, teaching a more classical Latin than was then common in German schools, and also explaining Aristotle in Greek. His studies in this language had been continued at Basel under Andronicus Contoblacas, and here too he formed the acquaintance of the bookseller, Johann Amorbach, for whom he prepared a Latin lexicon (*Vocabularius Breviloquus*, 1st ed., 1475–76), which did good service in its time and ran through many editions. This first publication and Reuchlin's account of his teaching at Basel in a letter to Cardinal Adrian (Adriano Castellesi) in February 1518 show that he had already found the work which in a larger sphere occupied his whole life. He was no original genius, but a born teacher. But this work of teaching was not to be done mainly from the professor's chair. Reuchlin soon left Basel to seek further Greek training with George Hieronymus at Paris, and to learn to write a fair Greek hand that he might support himself by copying MSS. And now he felt that he must choose a profession. His choice fell on law, and he was thus led to the great school of Orleans (1478), and finally to Poitiers, where he became licentiate in July 1481. From Poitiers Reuchlin went in December 1481 to Tübingen with the intention of becoming a teacher in the university, but his friends recommended him to Count Eberhard of Württemberg, who was about to journey to Italy and required an interpreter. Reuchlin was selected for this post, and in February 1482 left Stuttgart for Florence and Rome. The journey lasted nearly a few months, but it brought the German scholar into contact with several learned Italians, especially at the Medicean Academy in Florence; his connexion with the count became permanent, and after his return to Stuttgart he received important posts at Eberhard's court. About this time he appears to have married, but little is known of his married life. He left no children; but in later years his sister's grandson Melanchthon was almost as a son to him till the Reformation estranged them. In 1490 he was again in Italy. Here he saw Pico della Mirandola, to whose Cabbalistic doctrines he afterwards became heir, and also made the friendship of the pope's secretary, Jakob Questenberg, which was of service to him in his later troubles. Again in 1492 he was employed on an embassy to the emperor Frederick at Linz, and here he began to read Hebrew with the emperor's Jewish physician Jakob ben Jehiel Loans. He knew something of this language before, but Loans's instruction laid the basis of that thorough knowledge which he afterwards improved on his third visit to Rome in 1498 by the instruction of Obadja Sforno of Cesena. In 1494 his rising reputation had been greatly enhanced by the publication of *De Verbo Mirifico*.

In 1496 Eberhard of Württemberg died, and enemies of Reuchlin had the ear of his successor, Duke Eberhard. He was glad, therefore, hastily to follow the invitation of Johann von Dalberg (1445–1503), the scholarly bishop of Worms, and flee to Heidelberg, which was then the seat of the "Rhenish Society." In this court of letters Reuchlin's appointed function was to make translations from the Greek and Hebrew, in which his reading was already extremely wide. Though Reuchlin had no public office as teacher, and even at Heidelberg was prevented from lecturing, he was during a great part of his life the real centre of all Greek teaching as well as of all Hebrew teaching in Germany. To carry out this work he found it necessary to provide a series of helps for beginners and others. He never published a Greek grammar, though he had one in MS. for use with his pupils, but he put out several little elementary Greek books. Reuchlin, it may be noted, pronounced Greek as his native teachers had taught him to do, *i.e.* in the modern Greek fashion. This pronunciation, which he defends in *Dialogus de Recta Lat. Graecique Serm. Pron.* (1519), came to be known, in contrast to that used by Erasmus, as the Reuchlinian.

At Heidelberg Reuchlin had many private pupils, among whom Franz von Sickingen is the best known name. With the monks he had never been liked; at Stuttgart also his great enemy was the Augustinian Conrad Holzinger. On this man he took a scholar's revenge in his first Latin comedy *Sergius*, a satire on worthless monks and false relics.

Through Dalberg, Reuchlin came into contact with Philip, elector palatine of the Rhine, who employed him to direct the studies of his sons, and in 1498 gave him the mission to Rome which has been already noticed as fruitful for Reuchlin's progress in Hebrew. He came back laden with Hebrew books, and found when he reached Heidelberg that a change of government had opened the way for his return to Stuttgart, where his wife had remained all along. His friends had now again the upper hand, and knew Reuchlin's value. In 1500, or perhaps in 1502, he was given a very high judicial office in the Swabian League, which he held till 1512, when he retired to a small estate near Stuttgart.

For many years Reuchlin had been increasingly absorbed in Hebrew studies, which had for him more than a mere philological interest. Though he was always a good Catholic, and even took the habit of an Augustinian monk when he felt that his death was near, he was too thorough a humanist to be a blind follower of the church. He knew the abuses of monkish religion, and was interested in the reform of preaching as shown in his *De Arte Predicandi* (1503)—a book which became a sort of preacher's manual; but above all as a scholar he was eager that the Bible should be better known, and could not tie himself to the authority of the Vulgate. The key to the *Hebraea veritas* was the grammatical and exegetical tradition of the medieval rabbins, especially of David Kimhi, and when he had mastered this himself he was resolved to open it to others. It accordingly appeared his epoch-making *De Rudimentis Hebraicis*—grammar and lexicon—mainly after Kimhi, yet not a mere copy of one man's teaching. The edition was costly and sold slowly. One great difficulty was that the wars of Maximilian I., in Italy prevented Hebrew Bibles coming into Germany. But for this also Reuchlin found help by printing the Penitential Psalms with grammatical explanations (1512), and other helps followed from time to time. But his Greek studies had interested him in those fantastical and mystical systems of later times with which the Cabbala has no small affinity. Following Pico, he seemed to find in the Cabbala a profound theosophy which might be of the greatest service for the defence of Christianity and the reconciliation of science with the mysteries of faith—an unhappy conception indeed, but one not surprising in that strange time of ferment. Reuchlin's mystico-cabbalistic ideas and objects were expounded in the *De Verbo Mirifico*, and finally in the *De Arte Cabbalistica* (1517).

Unhappily many of his contemporaries thought that the first step to the conversion of the Jews was to take from them their books. This view had for its chief advocate the bigoted Johann Pfefferkorn (1469–1521), himself a baptized Hebrew. Pfefferkorn's plans were backed by the Dominicans of Cologne; and in 1509 he got from the emperor authority to confiscate all Jewish books directed against the Christian faith. Armed with this mandate, he visited Stuttgart and asked Reuchlin's help as a jurist and expert in putting it into execution. Reuchlin evaded the demand, mainly because the mandate lacked certain formalities, but he could not long remain neutral. The execution of Pfefferkorn's schemes led to difficulties and to a new appeal to Maximilian. In 1510 Reuchlin was summoned in the name of the emperor to give his opinion on the suppression of the Jewish books. His answer is dated from Stuttgart, October 6, 1510; in it he divides the books into six classes—apart from the Bible which no one proposed to destroy—and, going through each class, he shows that the books openly insulting to Christianity are very few and viewed as worthless by most Jews themselves, while the others are either works necessary to the Jewish worship, which was licensed by papal as well as imperial law, or contain matter of value and scholarly interest which ought not to be sacrificed because they are connected with another faith than that of the Christians. He proposed that the emperor should decree that for ten years there be two Hebrew chairs at every German university for which the Jews should furnish books. The other experts proposed that all books

should be taken from the Jews; and, as the emperor still hesitated, the bigots threw on Reuchlin the whole blame of their ill success. Pfefferkorn circulated at the Frankfort fair of 1511 a gross libel (*Handspiegel wider und gegen die Juden*) declaring that Reuchlin had been bribed; and Reuchlin retorted as warmly in the *Augenspiegel* (1511). His adversary's next move was to declare the *Augenspiegel* a dangerous book; the Cologne theological faculty, with the inquisitor Jakob von Hochstraten (d. 1527) took up this cry, and on the 7th of October 1512 they obtained an imperial order confiscating the *Augenspiegel*. Reuchlin was timid, but he was honesty itself. He was willing to receive corrections in theology, which was not his subject, but he could not unsay what he had said; and as his enemies tried to press him into a corner he met them with open defiance in a *Defensio contra Calumniatores* (1513). The universities were now appealed to for opinions, and were all against Reuchlin. Even Paris (August 1514) condemned the *Augenspiegel*, and called on Reuchlin to recant. Meantime a formal process had begun at Mainz before the grand inquisitor, but Reuchlin by an appeal succeeded in transferring the question to Rome. Judgment was not finally given till July 1516; and then, though the decision was really for Reuchlin, the trial was simply quashed. The result had cost Reuchlin years of trouble and no small part of his modest fortune, but it was worth the sacrifice. For far above the direct importance of the issue was the great stirring of public opinion which had gone forward. And if the obscurantists escaped easily at Rome, with only a half condemnation, they received a crushing blow in Germany. No party could survive the ridicule that was poured on them in the *Epistolae Obscurorum Virorum*, the first volume of which written chiefly by Crotus Rubeanus appeared in 1514, and the second by Hutten in 1517. Hutten and Franz von Sickingen did all they could to force Reuchlin's enemies to a restitution of his material damages; they even threatened a feud against the Dominicans of Cologne and Spires. In 1520 a commission met in Frankfort to investigate the case. It condemned Hochstraten. But the final decision of Rome did not indemnify him. The contest ended, however; public interest had grown cold, absorbed entirely by the Lutheran question, and Reuchlin had no reason to fear new attacks. Reuchlin did not long enjoy his victory in peace. In 1519 Stuttgart was visited by famine, civil war and pestilence. From November of this year to the spring of 1521 the veteran statesman sought refuge in Ingolstadt and taught there for a year as professor of Greek and Hebrew. It was forty-one years since at Poitiers he had last spoken from a public chair; but the old man of sixty-five had not lost his gift of teaching, and hundreds of scholars crowded round him. This gleam of autumn sunshine was again broken by the plague; but now he was called to Tübingen and again spent the winter of 1521–22 teaching in his own systematic way. But in the spring he found it necessary to visit the baths of Liebenzell, and here he was seized with jaundice, of which he died on the 30th of June 1522, leaving in the history of the new learning a name only second to that of his younger contemporary Erasmus.

The authorities for Reuchlin's life are enumerated in L. Geiger, *Johann Reuchlin* (1871), which is the standard biography. The controversy about the books of the Jews is well sketched by D. F. Strauss, *Ulrich von Hutten*. See also S. A. Hirsch, "John Reuchlin, the Father of the Study of Hebrew among the Christians," and his "John Pfefferkorn and the Battle of Books," in his *Essays* (London, 1905). Some interesting details about Reuchlin are given in the autobiography of Conrad Pellicanus (*q.v.*), which was not published when Geiger's book appeared. See also the article on Reuchlin in Herzog-Hauck, *Realencyklopädie*, and literature there cited.

(W. R. S.)

REUMONT, ALFRED VON (1808–1887), German scholar and diplomatist, the son of Gerhard Reumont (1765–1829), was born on the 15th of August 1808 and was named Alfred after the English king, Alfred the Great. Educated at the universities of Bonn and Heidelberg, he obtained a position in Florence through the influence of an Englishman, William Craufurd, but soon he entered the Prussian diplomatic service and was employed in Florence, in Constantinople and in Rome. He also spent some time in the Foreign Office in Berlin. From 1851 to 1860 he represented his country in Florence. Reumont was the friend and adviser of Frederick William IV. In 1879 he founded the *Aachener Geschichtsverein*, and having spent his concluding years at Bonn and at Aix-la-Chapelle, he died in the latter city on the 27th of April 1887.

Reumont's numerous writings deal mainly with Italy, in which country he passed many years of his life. On the history of Florence and of Tuscany he wrote *Tavole cronologiche e sincrone della storia fiorentina* (1841; Supplement, 1875); *Geschichte Toscanas seit dem Ende des Florentinischen Freistaats* (Gotha, 1876–77); and *Lorenzo de' Medici* (Leipzig, 1874, and again 1883). This last book has been translated into English by R. Harrison (1876). He remembered his connexion with Florence when he wrote *Römische Briefe von einem Florentiner* (Leipzig, 1840–44), and his residence in Rome was also responsible for his *Geschichte der Stadt Rom* (3 vols., 1867–70). Turning his attention to the history of Naples, he wrote *Die Carafa von Maddaloni: Neapel unter spanischer Herrschaft* (1851; Eng. trans., 1854), and more general works on Italian history are: *Beiträge zur italienischen Geschichte* (6 vols., Berlin, 1853–57), and *Charakterbilder aus der neueren Geschichte Italiens* (1886). More strictly biographical in their nature are: *Die Jugend Caterinas de' Medici* (1854), which has been translated into French by A. Baschet (1866); *Die Gräfin von Albany* (1860) and a life of his close friend Capponi, *Gino Capponi, ein Zeit- und Lebensbild* (Gotha, 1880). His *Quellenbeiträge: Papst Clemens XIV. seine Zeit und seine Zeit* (Berlin, 1847) is valuable for the relations between this pope and the Jesuits. Other works which may be mentioned are *Zeitgenossen, Biografien und Charakteristiken* (Berlin, 1862); *Bibliografia dei lavori pubblicati in Germania sulla storia d'Italia* (Berlin, 1863); *Biographische Denkblätter nach persönlichen Erinnerungen* (Leipzig, 1878); and *Saggi di storia e letteratura* (Florence, 1880). Reumont's other important work, one which he was peculiarly fitted to write, was *Aus Friedrich Wilhelms IV. gesunden und kranken Tagen* (Leipzig, 1888).

See H. Hüffer, *Alfred von Reumont* (Cologne, 1904); and the same writer's article in the *Allgemeine Deutsche Biographie*, Band xxviii. (1889).

RÉUNION, known also by its former name BOURBON, an island and French colony in the Indian Ocean, 400 m. S.E. of Tamatave, Madagascar, and 130 S.W. of Port Louis, Mauritius. It is elliptic in form; its greatest length is 45 m. and its greatest breadth 32 m., and it has an area of 965 sq. m. It lies between 20° 51′ and 21° 22′ S. and 55° 15′ and 55° 54′ E.

The coast-line (about 130 m.) is little indented, there are no natural harbours and no small islets round the shore. The narrow coast-lands are succeeded by hilly ground which in turn gives place to mountain masses of the Malabarla, which occupy the greater part of the island. The main axis runs N.W. and S.E., and divides the island into a windward (E.) district and a leeward (W.) district, the dividing line being practically that of the watershed. The form of the mountains is the result of double volcanic action. First there arose from the sea a mountain whose summit is approximately represented by Piton des Neiges (10,069 ft.), a denuded crater of immense proportions, and at a later date another crater opened towards the E., which, piling up the mountain mass of Le Volcan, turned what was till then a circle into an ellipse. The oldest erupted rocks belong to the type of the andesites; the newest are varieties of basalt. The two massifs are united by high table-lands. But the most striking features are presented by the three areas of subsidence—the cirques of Salazie, Rivière des Galets and Cilaos—which lie N.W. and S. of the Piton des Neiges. The first, which may be taken as typical, is surrounded by high almost perpendicular walls of basaltic lava, and its surface is rendered irregular by hills and hillocks of débris fallen from the heights. Towards the S. lies the vast stratum of rocks (150 to 200 ft. deep) which, on the 26th of November 1875, suddenly sweeping down from the Piton des Neiges and the Gros Morne (a "shoulder" of the *piton*), buried the little village of Grand Sable and nearly a hundred of its inhabitants. Besides the Piton des Neiges and the Gros Morne the chief heights in this part of the island are the pyramidical Cimandef (7300 ft.), another shoulder of the piton, and the Grand Bernard (9400 ft.), separating the cirques of Mafate and Cilaos.

The second massif, Le Volcan, is cut off from the rest of the island by two "enclosures," each about 500 or 600 ft. deep.

The outer enclosure runs across the island in a N. and S. direction; the inner forms a kind of parabola with its arms (Rempart du Tremblet on the S. and Rempart du Bois Blanc on the N.) stretching E. to the sea and embracing not only the volcano proper but also the great eastward slope known as the Grand Brûlé. The 30 m. of mountain wall round the volcano is perhaps unique in its astonishing regularity. It encloses an area of about 40 sq. m. known as the Grand Enclos. There are two principal craters, each on an elevated cone,—the more westerly, now extinct, known as the Bory Crater (8612 ft.), after Bory de St Vincent, the geologist, and the more easterly called the Burning Crater or Fournaise (8294 ft.). The latter is partially surrounded by an "enclosure" on a small scale with precipices 200 ft. high. Eruptions, though not infrequent (thirty were registered between 1735 and 1860), are seldom serious; the more noteworthy are those of 1745, 1778, 1791, 1812, 1860, 1870, 1881. Hot mineral springs are found on the flanks of the Piton des Neiges; the Source de Salazie (discovered in 1831) lies 2860 ft. above sea-level, has a temperature of 60°, and discharges 200 to 220 gallons per hour of water impregnated with bicarbonate of soda, and carbonates of magnesium and lime, iron, &c.; that of Cilaos (discovered in 1826) is 3650 ft. above the sea with a temperature of 100°; and that of Mafate 2238 ft. and 87°.

Vertically Réunion may be divided into five zones. The first or maritime zone contains all the towns and most of the villages, built on the limited areas of level alluvium occurring at intervals round the coast. In the second, which lies between 2600 and 4000 ft., the sugar plantations made a green belt round the island and country houses abound. The third zone is that of the forests; the fourth that of the plateaux, where European vegetables can be cultivated; and above this extends the region of the mountains.

Climate.—The year divides into two seasons—that of heat and rain from November to April, that of dry and more bracing weather from May to October. The prevailing winds are from the S.E., sometimes veering round to the S., and more frequently to the N.E.; the W. winds are not so boisterous as in Mauritius (and only days of E. to fifty-eight of W. wind in the course of the year). It is seldom calm during the day, but there is usually a period of complete repose before the land wind begins in the evening. Several years sometimes pass without a cyclone visiting the island, at other times they occur more than once in a single "winter." The *ras de marée* occasionally does great damage. On the leeward side of the island the winds are generally from the W. and S.W., and bring little rain. Mist hangs almost all day on the tops of the mountains, but usually clears off at night. On the coast and lower zones on the windward side the mean temperature is about 73° F. in the "winter" and 78° F. in the "summer." On the leeward side the heat is somewhat greater. In the Salazie cirque the mean annual average is 66° F.; at the Plaine des Palmistes 62° F. The rainfall is very heavy on the windward side, some stations registering 160 in. a year, while on the "dry" side of the island not more than 50 in. are registered. In the mountain heights snow falls every year, and ice is occasionally seen. In general the island is healthy, but fever is prevalent on the coast.

Fauna and Flora.—The fauna of Réunion is not very rich in variety of species. The mammals are a brown maki (*Lemur mongoz*, Linn.) from Madagascar, *Pteropus edwardsii* now nearly extinct, several bats, a wild cat, the tang or tamec (*Centetes setosus*, Denn.), several rats, the hare, and the goat, among the more familiar birds are the "oiseau de la vierge" (*Muscipeta borbonica*), the tec tec (*Pratinecola sybilla*), *Certhia borbonica*, the cardinal (*Foudia madagascariensis*), various swallows, ducks, &c. The visitants from Madagascar, Mauritius and even India, are very numerous. Lizards and frogs of more than one species are common, but there is only one snake (*Lycodon aulicum*) known in the island. Various species of *Gobius*, a native species of mullet, *Nestis cyprinoides*, *Osphromenus olfax* and *Doules rapaces* are among the freshwater fishes. Turtles, formerly common, are now very rare.

In the forest region of the island there is a belt, 4500–5000 ft. above the sea, characterized by the prevalence of dwarf bamboo (*Bambusa alpina*); and above that is a similar belt of *Aacuria heterophylla*. Besides this last the best timber-trees are *Casuarina laterifolia*, *Foetida mauritiana*, *Imbricaria petiolaris*, *Elaeodendron orientale*, *Calophyllum spurium* (red tacamahac), *Terminalia bornonica*, *Parkia speciosa*. The gardens of the coast districts display a marvellous wealth of flowers and shrubs, partly indigenous and partly gathered from all parts of the world. Among the indigenous varieties may be noted the vacoa (*Pandanus utilis*) and the aloe. A species of coffee plant is also indigenous. Fruits grown in the island are: the banana, the coco-nut, bread-fruit and jack-fruit, the bilimbi, the carambola, the guava, the litchi, the Japanese medlar, the mango-steen, the tamarind, the *Abelmoschus esculentus*, the chirimoya, the papaya, &c. Forests originally covered nearly the whole island; the majority of the land has been cleared by the inhabitants, but there are still some 200 sq. m. of forest land and the administration has in part replanted the higher districts, such as Salazie, with eucalyptus and caoutchouc trees.

Inhabitants.—The inhabitants are divided into various classes, the creoles, the mulattoes, the negroes, and Indians and other Asiatics. The creole population is descended from the first French settlers, chiefly Normans and Bretons, who married Malagasy women. Later settlers included Europeans, but apart from the presence of non-European blood is so common among the creoles that the phrase "Bourbon white" was given in Mauritius to linen of doubtful cleanness. Three kinds of creoles are recognized—those of the town and coasts, those of the mountains, and the *petits blancs*, originally a class of small farmers living in the uplands, now reduced to a condition of poverty and dependence on the planters. The *créoles blancs de villes*, the typical inhabitants of the island, are in general of a somewhat weak physique, quick-witted and of charming manners, brave and very proud of their island, but not of strong character. The mixed races tend to approximate to a single type, one in which the European strain predominates. The creole patois is French mixed with a considerable number of Malagasy and Indian words, and containing many local idioms. The population, about 35,000 towards the close of the 18th century, was in 1849, at the period of the liberation of the slaves, 120,000, of whom 60,800 were newly freed negroes. Thereafter Indians were introduced from India, and in 1870 the population had increased to 212,000. In 1882 the government of India ceased to authorize the emigration of coolies to Réunion, and in consequence of that and other economic causes the population has decreased. In 1900 the inhabitants numbered 173,315. Of these 13,492 were British Indians, 4496 Malagasy, 9457 foreign-born negroes, and 1378 Chinese. Of the native born the creoles numbered about 3000, the remainder being negroes or mixed races. Among the Indian population the males are as three to one to the females, and the birth-rate is lower than the death-rate.

Towns and Communication.—St Denis, the capital of the island, lies on the N. coast. It had in 1900 a population of 27,392. It is built in the form of an amphitheatre, and has several fine public buildings and centrally situated botanic gardens. It is the seat of a bishopric, a court of first instance and an appeal court. It has a considerable supply of water, but the roadstead for vessels is an open roadstead. St Pierre (pop. 28,885), the chief town on the leeward side of the island, has a small artificial harbour. Between St Pierre and St Denis, and both on the leeward shore, are the towns of St Louis (pop. 12,297) and St Paul (pop. 19,647). A few miles N. of St Paul on the S. side of Cape Pointe des Galets is the port of the same name, the only considerable harbour in the island. It was completed in 1886 at a cost of £2,700,000, covers 200 acres, is well protected, and has 36 ft. of water. A railway serving the port goes round the coast from St Pierre, by St Paul, St Denis, &c., to St Benoît (a town on the E. side of the island with a pop. of 12,523), a distance of 83¼ m. This line is carried through at least nearly 63 m. long tunnels. Possession Island, St Denis. Besides the railway the lower parts of the island are well provided with roads. There is regular steamship communication between Pointe des Galets, Marseilles, Havre and Madagascar. Telegraphic communication with all parts of the world was established in 1900 when a cable connecting Réunion with Tamatave and Mauritius was laid.

Industries.—The Sugar Plantations.—The area of the cultivated lands is estimated at 148,200 acres (or 230 sq. m.), of which 86,450 acres are under sugar-cane, the remainder being under either maize, manioc, potatoes, haricots, or coffee, vanilla and cocoa. The sugar-cane, introduced in 1711 by Pierre Parat, is now the staple crop. In the 18th century the first place belonged to coffee (introduced from Arabia in 1715) and to the clove tree, brought from the Dutch Indies by Poivre at the risk of his life. Both are now cultivated on a very limited scale. Vanilla, introduced in 1818, was not successfully cultivated till after 1850. Réunion vanilla, as it is called, is of high character, and next to sugar is the most important article of cultivation in the island. There are small plantations of cocoa and cinchona; cotton-growing was tried, but proved unsuccessful.

The sugar industry has suffered greatly from the competition with beet sugar and the effects of bounties, also from the scarcity of labour, from the ravages of the phylloxera (which made its appearance in 1878) and from extravagant methods of manufacture. It was not until 1906 that steps were taken for the creation of central sugar mills and refineries, in consequence of the compulsory shutting down of many small mills. Rum is largely distilled, the forms an important article of export. There are also manufactories for the making of geranium essence, St Pierre being the centre of this industry. Other articles exported are aloe fibre and vacoa casks. The mineral wealth of the island has not been

exploited, except for the mineral springs which yield waters highly esteemed. Almost all the products of the island are exported, so that the import trade is very varied. Cattle are imported from Madagascar; rice, the chief article of food, from Saigon or India; petroleum, largely used in manufactories, from America and Russia; almost everything else comes from France, to which country go the great majority of the exports. Over 75% of the shipping is under the French flag.

Commerce.—The total trade amounted in 1860 to the value of £4,464,000 (the highest during the century); in 1900, to £1,533,240. In 1905 the imports were valued at £727,000 and the exports at £428,000. Of the imports £200,000 were from France, £100,000 from colonies of the empire, £388,000 went to France or French colonies. The currency consists of notes of the Banque de la Réunion (guaranteed by the government) and nickel token money. Neither the notes nor the token money have any currency outside Réunion; the rate of exchange varies from 5 to 20%.

Administration and Revenue.—Réunion is regarded practically as a department of France. It sends two deputies and one senator to the French legislature, and is governed by laws passed by that body. All inhabitants, not being aliens, enjoy the franchise, no distinction being made between whites, negroes or mulattoes, all of whom are citizens. At the head of the local administration is a governor who is assisted by a secretary-general, a *procureur général*, a privy council and a council-general elected by the suffrages of all citizens. The governor has the right of direct communication and negotiation with the government of South Africa and all states east of the Cape. The council-general has wide powers, including the fixing of the budget. For administrative purposes the island is divided into two arrondissements, the Windward, with five cantons and nine communes, and the Leeward, with three cantons and seven communes. The total revenue goes to the French municipal law. The revenue, largely dependent on the prosperity of the sugar trade, declined from an average of £163,765 in the five years 1895–99 to an average of £147,225 in the five years 1900–4. The chief item in the budget is the colonial expenditure, which includes the loss incurred in maintaining the harbour and railway, increased from £224,508 to £225,088. Deficits are made good by grants from France.

History.—Réunion is usually said to have been first discovered in April 1513 by the Portuguese navigator Pedro Mascarenhas, and his name, or that of Mascarene Islands, is still applied to the archipelago of which it forms a part; but it seems probable that it must be identified with the island of Santa Apollonia discovered by Diego Fernandes Pereira on the 9th of February 1507. It was visited by the Dutch towards the close of the 16th century, and by the English early in the 17th century. When in 1638 the island was taken possession of by Captain Gaubert, or Gaubert, and Dieppe it was still uninhabited; a more formal annexation in the name of Louis XIII. was effected in 1643 by Jacques Pronis, agent of the *Compagnie des Indes* in Madagascar; and in 1649 Étienne de Flacourt, Pronis's more energetic successor, repeated the ceremony at a spot which he named La Possession. He also changed the name of the island from Mascarenhas to Bourbon. By decree of the Convention in 1793, Bourbon in turn gave place to Réunion, and, though during the empire it was discarded in favour of Île Bonaparte, and at the Restoration people naturally went back to Bourbon, Réunion has been the official designation since 1848.

The first inhabitants were a dozen mutineers deported from Madagascar by Pronis, but they remained only three years (1646–49). Other colonists went thither of their own will in 1654 and 1662. In 1664 the *Compagnie des Indes orientales de Madagascar*, to whom a concession of the island was granted, initiated a regular colonization scheme. Their first commandant was Étienne Régnault, who in 1689 received from the French crown the title of governor. The growth of the colony was very slow, and in 1717 there were only some 1000 inhabitants. It is recorded that they lived on excellent terms with the pirates, who from 1684 onward infested the neighbouring seas for many years. In 1735 Bourbon was placed under the governor of the Île de France (Mauritius), at that time the illustrious Mahé de Labourdonnais. The *Compagnie des Indes orientales* gave up its concession in 1767, and under direct administration of the crown liberty of trade was granted. The French Revolution effected little change in the island and occasioned no bloodshed; the colonists successfully resisted the Convention's decree to proclaim to abolish slavery, which continued until 1848 (when over 60,000 negroes were freed), the slave trade being, however, abolished in 1817. During the Napoleonic wars Réunion, like Mauritius, served the French corsairs as a rendezvous from which attacks on Indian merchantmen could be directed. In 1809 the British attacked the island, and the French were forced to capitulate on the 8th of July 1810; the island remained in the possession of Great Britain until April 1815, when it was restored to France. From that period the island has had no exterior troubles. The negro population, upon whom in 1870 the Third Republic conferred the full rights of French citizenship including the vote, being unwilling to labour in the plantations, the immigration of Indian coolies began in 1882 the government of India prohibited the further emigration of labourers from that country in consequence of the inconsiderate treatment of the coolies by the colonists. Réunion has also suffered from the disastrous effects of cyclones. A particularly destructive storm swept over the island in March 1879, and in 1904 another cyclone destroyed fully half of the sugar crop and 75% of the vanilla crop.

See A. G. Garsault, *Notice sur la Réunion* (Paris, 1900), a monograph prepared for the Paris exhibition of that year; E. Jacob de Cordemoy, *Étude sur l'île de la Réunion, geographie, richesses naturelles, &c.* (Marseilles, 1905); W. D. Oliver, *Crags and Craters; Rambles in the island of Réunion* (London, 1896); C. Keller, *Natur und Volksleben der Insel Reunion* (Basel, 1888); J. D. Brunet, *Histoire de l'association générale des francs créoles de l'île Bourbon* (St Denis, Réunion, 1885); Trouette, *L'Île Bourbon pendant la période révolutionnaire* (Paris, 1888). Of earlier works consult Demanet, *Nouv. Hist. de l'Afrique française* (1767); P. U. Thomas, *Essai sur statistique de l'île Bourbon* (1828); Dejean de la Batie, *Notice sur l'île Bourbon* (1847); J. Mauran, *Impressions d'un voy. de Paris à Bourbon* (1850); Maillard, *Notes sur l'île de la Réunion* (1862); Azéma, *Hist. de l'île Bourbon* (1862). The geology and volcanoes of Réunion were the object of elaborate study by Bory de St Vincent in 1801 and 1802 (*Voyages dans les quatre principales îles des mers d'Afrique*, Paris, 1804), and have since been examined by R. von Drasche (see *Die Insel Réunion, &c.*, Vienna, 1878, and C. Vélain, *Description géologique de . . . l'île de la Réunion . . .*, Paris, 1878). The best map is Pau Lépervanche's *Carte de la Réunion 1·100,000* (Paris, 1906).

REUS, a city of N.E. Spain, in the province of Tarragona, on the Saragossa-Tarragona railway, 4 m. N. of Salou, its port and 6 m. S.W. of Tarragona. Pop. (1900) 26,681. Reus consists of two parts, the old and the new, separated by the Calle Arrabal, which occupies the site of the old city wall. The old town centres in the Plaza del Mercado, from which narrow and tortuous lanes radiate in various directions; the new one dates from about the middle of the 18th century, and its streets are wide and straight. There is an active trade in the agricultural products of the fertile region around the city. The local industries developed considerably between 1875 and 1905, and the city has important flour, wine and fruit export houses. There is a model farm belonging to the municipality in the suburbs. Reus has excellent primary, normal and higher-grade state schools, many private schools, an academy of fine arts and a public library. The hospitals and foundling refuge, the institute and the town hall are handsome modern buildings.

The earliest records of Reus date from about the middle of the 13th century. Its modern prosperity is traced to about the year 1750, when a colony of English settled here and established a trade in woollens, leather, wine and spirits. The principal incidents in its political history arose out of the occurrences of 1843 (see SPAIN, *History*), in connexion with which the town received the title of city, and Generals Zurbano and Prim were made counts of Reus. The city was the birthplace of General Prim (1814–1870) and of the painter Mariano Fortuny (1839–1874).

REUSCH, FRANZ HEINRICH (1823–1900), old Catholic theologian, was born at Brilon, in Westphalia, on 4th December 1823. He studied general literature at Paderborn, and theology at Bonn, Tübingen and Munich. The friend and pupil of Döllinger, he took his degree of Doctor in Theology at Munich, the university of which Döllinger was so long an ornament. He was ordained priest in 1849, and was immediately afterwards made chaplain at Cologne. In 1854 he became *Privatdozent* in the exegesis of the Old Testament in the Catholic Theological Faculty at Bonn; in 1858 he was made extraordinary, and in 1861 ordinary, professor of theology in the same university. From 1866 to 1877 he was editor of the *Bonner Theologisches Literaturblatt*. In the controversies on the Infallibility of the Pope, Reusch attached himself to Döllinger's party, and he and his colleagues Hilgers, Knoodt and Langen were interdicted by the archbishop of Cologne in 1871 from pursuing their courses of lectures. In 1872 he was excommunicated. For many years after this he held the post of Old Catholic *curé* of Bonn, as well as the position of vicar-general to the Old Catholic Bishop Reinkens, but resigned both in 1878, when, with Döllinger, he disapproved of the permission to marry granted by the Old Catholic Church in Germany to its clergy. From that time he retired into lay communion,

but continued to give lectures as usual in the Old Catholic Faculty of Theology in the university of Bonn, and to write on theological subjects. He was made rector of that university in 1873. In 1874 and 1875 he was the official reporter of the memorable Reunion Conferences held at Bonn in those years and attended by many distinguished theologians of the Oriental and Anglican communions.

Reusch was a profound scholar, an untiring worker and a man of lovable character. Among his voluminous works were contributions to the *Revue internationale de théologie*, a review started at Bern at the instance of the Old Catholic Congress at Lucerne. He wrote also works on the Old Testament; a pamphlet on *Die Deutschen Bischöfe und der Aberglaube*; and another on the falsifications to be found in the treatise of Aquinas against the Greeks; as well as essays on the history of the Jesuit Order, and a book of prayers. But his fame will mainly rest on the works which he and Döllinger published jointly. These consisted of a work on the Autobiography of Cardinal Bellarmine, the *Geschichte der Moralstreitigen in der Römisch-Katholischen Kirche seit dem XVI. Jahrhundert*, and the *Erörterungen über Leben und Schriften des hl. Liguori*. During the last few years of his life he was smitten with paralysis. He died on the 3rd of March 1900, leaving behind him in manuscript a collection of letters to Bunsen about Roman cardinals and prelates, which has since been published. (J. J. L. *)

REUSCH, HANS HENRIK (1852–), Norwegian geologist, was born at Bergen on the 5th of September 1852. He was educated at Christiania, Leipzig and Heidelberg, and graduated Ph.D. at Christiania in 1883. He joined the Geological Survey of Norway in 1875, and became Director in 1888. He is distinguished for his researches on the crystalline schists and the Palaeozoic rocks of Norway. He discovered Silurian fossils in the highly altered rocks of the Bergen region; and in 1891 he called attention to a palaeozoic conglomerate of glacial origin in the Varanger Fiord, a view confirmed by Mr A. Strahan in 1896, who found glacial striae on the rocks beneath the ancient boulder-bed. Reusch has likewise thrown light on the later geological periods, on the Pleistocene glacial phenomena and on the sculpturing of the scenery of Norway. Among his separate publications are *Silur fossiler og pressede Konglomerater* (1882); *Det nordlige Norges Geologi* (1891).

REUSS, AUGUST EMANUEL VON (1811–1873), Austrian geologist and palaeontologist, the son of Franz Ambrosius Reuss (1761–1830), was born at Bilin in Bohemia on the 8th of July 1811. He was educated for the medical profession, graduating in 1834 at the university of Prague, and afterwards practising for fifteen years at Bilin. His leisure was devoted to mineralogy and geology, and the results of his researches were published in *Geognostische Skizzen aus Böhmen* (1840–44) and *Die Versteinerungen der Böhmischen Kreideformation* (1845–46). In 1849 he gave up his medical practice, and became professor of mineralogy at the university of Prague. There he established a fine mineralogical collection, and he became the first lecturer on geology. In 1863 he was appointed professor of mineralogy in the university of Vienna. He investigated the Cretaceous fauna of Gosau, and studied the Crustacea, including entomostraca, the corals, bryozoa, and especially the foraminifera of various geological formations and countries. He died at Vienna on the 26th of November 1873.

REUSS, ÉDOUARD GUILLAUME EUGÉNE (1804–1891), Protestant theologian, was born at Strassburg on the 18th of July 1804. He studied philology in his native town (1819–22), theology at Göttingen under J. G. Eichhorn; and Oriental languages at Halle under Wilhelm Gesenius, and afterwards at Paris under Silvestre de Sacy (1827–28). In 1828 he became *Privatdozent* at Strassburg. From 1829 to 1834 he taught Biblical criticism and Oriental languages at the Strassburg Theological School; he then became assistant, and afterwards, in 1836, regular professor of theology at that university. The sympathies of Reuss were German rather than French, and after the annexation of Alsace to Germany he remained at Strassburg, and retained his professorship till, in 1888, he retired on a pension. Amongst his earliest works were: *De libris veteris Testamenti apocryphis plebi non negandis* (1829), *Ideen zur Einleitung in das Evangelium Johannis* (1840) and *Die Johanneische Theologie* (1847). In 1852 he published his *Histoire de la théologie chrétienne au siècle apostolique*, which was followed in 1863 by *L'Histoire du canon des saintes écritures dans l'église chrétienne*. In 1874 he began to publish his translation of the Bible, *La Bible, nouvelle traduction avec commentaire*. It was the criticism and exegesis of the New Testament which formed the subject of Reuss's earlier labours—in 1842, indeed, he had published in German a history of the books of the New Testament, *Geschichte der heiligen Schriften N. Test.*; and though his own views were liberal, he opposed the results of the Tübingen school. After a time he turned his attention also to Old Testament criticism, for which he was especially fitted by his sound knowledge of Hebrew. In 1881 he published in German his *Geschichte der heiligen Schriften A. Test.*, a veritable encyclopaedia of the history of Israel from its earliest beginning till the taking of Jerusalem by Titus. He died at Strassburg on the 15th of April 1891.

Reuss belonged to the more modern section of the Liberal party in the Lutheran Church. His critical position was to some extent that of K. H. Graf and J. Wellhausen, allowing for the circumstances that he was in a sense their forerunner, and was actually for a time Graf's teacher. Indeed, he was really the originator of the new movement, but hesitated to publish the results of his studies. For many years Reuss edited with A. H. Cunitz (b. 1812) the *Beiträge zu den theologischen Wissenschaften*. With A. H. Cunitz and J. W. Baum (1809–1878), and after their death alone, he edited the monumental edition of Calvin's works (38 vols., 1863 ff.). His critical edition of the Old Testament appeared a year after his death. His son, ERNST RUDOLF (b. 1841), was in 1873 appointed city librarian at Strassburg.

See the article in Herzog-Hauck, *Realencyklopädie*, and cf. Otto Pfleiderer, *Development of Theology in Germany since Kant* (1890).

REUSS, the name of two small principalities of the German empire, called Reuss, elder line, or Reuss-Greiz, and Reuss, younger line, or Reuss-Schleiz-Gera. With a joint area of 441 sq. m. they form part of the complex of Thuringian states, and consist, roughly speaking, of two main blocks of territory, separated by the Neustadt district of the duchy of Saxe-Weimar. The more southerly, which is much the larger of the two portions, belongs to the bleak, mountainous region of the Frankenwald and the Vogtland, while the northern portion is hilly, but fertile. The chief rivers are the Weisse Elster and the Saale. About 35% of the total surface is occupied by forests, while about 40% is under tillage and about 19% under meadow and pasture. Wheat, rye and barley are the principal crops grown, and the breeding of cattle is an important industry.

Reuss-Greiz, with an area of 122 sq. m., belongs to the larger of the two divisions mentioned above, and consists of three large and several small parcels of land. On the whole, the soil is not favourable for agriculture, but the rearing of cattle is carried on with much success. About 63% of the inhabitants maintain themselves by industrial pursuits, the chief products of which are the making of woollen fabrics at Greiz, the capital, and of stockings at Zeulenroda. Other industries are machine-building, printing and the making of paper and porcelain. In 1905 the population of the principality was 70,603. The constitution of Reuss-Greiz dates from 1867, and provides for a representative chamber of twelve members, of whom three are appointed by the prince, while two are chosen by the landed proprietors, three by the towns and four by the rural districts. The revenue and expenditure amount to about £76,000 a year, and there is no public debt. The reigning prince is Henry XXIV. (b. 1878), but as he is incapable of discharging his duties, these are now undertaken by a regent.

Reuss-Schleiz-Gera, with an area of 319 sq. m., includes part of the southern and the whole of the northern of the two main divisions mentioned above; it touches Bavaria on the south

and Prussian Saxony on the north. The former portion is known as the Oberland and the latter as the Unterland. Owing to the fertility of the Unterland, quite one-quarter of the people are supported by agricultural pursuits, although there is also much industrial activity. The chief industrial product consists of woollen goods, and the manufacture centres in the capital Gera, the largest of the six towns of the principality. Other industries are jute-spinning, dyeing and brewing, and the manufacture of musical instruments, chemicals, tobacco, cigars, porcelain and machinery. A considerable trade is carried on in these goods and also in timber, cattle and slate. Iron is mined in the Oberland, and large quantities of salt are yielded by the brine springs of Heinrichshall. In 1905 Reuss-Schleiz contained 144,584 inhabitants. Its annual revenue and expenditure amount to about £130,000, and in 1908 it had a public debt of £52,027. The constitution, which rests on laws of 1852 and 1856, provides for a representative assembly of 16 members which possesses limited legislative powers, the administrative duties being discharged by a cabinet of three members. The reigning prince is Henry XIV. (b. 1832), but since 1892 his duties have been undertaken by a regent. The states of Reuss return one member each to the Bundesrat, and one each to the Reichstag of the German empire.

History.—The history of Reuss stretches back to the times when the German kings appointed vogts, or bailiffs (*advocati imperii*), to administer their lands. One of these vogts was a certain Henry, who died about 1120, after having been entrusted by the emperor Henry IV. with the vogtship of Gera and of Weida, and he is generally recognized as the ancestor of the princes of Reuss. His descendants called themselves lords of Weida, and some of them were men of note in their day, serving the emperors and German kings and distinguishing themselves in the ranks of the Teutonic order. The land under their rule gradually increased in size, and it is said that the name of Reuss was applied to it owing to the fact that one of its princes married a Russian princess, their son being called "der Russe," or the Russian. Another version is that the prince received this sobriquet because he passed many years in Russia. The district thus called Reuss was at one time much more extensive than it is at present, and for some years its rulers were margraves of Meissen. In 1564 the family was divided into three branches by the sons of Henry XVI. (d. 1535). One of these became extinct in 1616, but the remaining ones are those of Reuss-Greiz and Reuss-Schleiz-Gera, which are flourishing to-day. Although there have been further divisions these have not been lasting, and the lands of the former family have been undivided since 1768 and those of the latter since 1848. The lords of Reuss took the title of count in 1673; and the head of the elder line became a prince of the Empire in 1778, and the head of the younger line in 1806. In 1807 the two princes joined the Confederation of the Rhine and in 1815 the German confederation. In 1866 Reuss-Greiz was compelled to atone for its active sympathy with Austria by the payment of a fine. In 1871 both principalities became members of the new German empire. The princes of Reuss are very wealthy, their private domain including a great part of the territory over which they rule. In the event of either line becoming extinct, its possessions will fall to the other.

A curious custom prevails in the house of Reuss. The male members of both branches of the family all bear the name of Henry (Heinrich), the individuals being distinguished by numbers. In the elder line, according to an arrangement made in 1701, the enumeration continues until the number one hundred is reached when it begins again. In the younger line the first prince born in a new century is numbered I., and the numbers follow on until the end of the century when they begin again. Thus Henry XIV. of Reuss younger line, who was born in 1832, was the son of Henry LXVII. (1789–1867), the former being the 14th prince born in the 19th century, and the latter the 67th prince born in the 18th.

See B. Schmidt, *Die Reussen, Genealogie des Gesamthauses Reuss* (Schleiz, 1903); H. von Voss, *Die Ahnen des reussischen Hauses* (Lobenstein, 1882); C. F. Collmann, *Reussische Geschichte. Das Vogtland im Mittelalter* (Greiz, 1892), and O. Liebmann, *Das Staatsrecht des Fürstenthums Reuss* (1884).

REUTER, FRITZ (1810–1874), German novelist, was born on the 7th of November 1810, at Stavenhagen, in Mecklenburg-Schwerin, a small country town where his father was burgomaster and sheriff (*Stadtrichter*), and in addition to his official duties carried on the work of a farmer. He was educated at home by private tutors and subsequently at the gymnasiums of Friedland in Mecklenburg-Strelitz, and of Parchim. In 1831 he began to attend lectures on jurisprudence at the university of Rostock, and in the following year went to the university of Jena. Here he was a member of the political students' club, or German Burschenschaft, and in 1833 was arrested in Berlin by the Prussian government; although the only charge which could be proved against him was that he had been seen wearing its colours, he was condemned to death for high treason. This monstrous sentence was commuted by King Frederick William III. of Prussia to imprisonment for thirty years in a Prussian fortress. In 1838, through the personal intervention of the grand-duke of Mecklenburg, he was delivered over to the authorities of his native state, and the next two years he spent in the fortress of Dömitz, but in 1840 was set free, an amnesty having been proclaimed after the accession of Frederick William IV. to the Prussian throne.

Although Reuter was now thirty years of age, he went to Heidelberg to resume his legal studies; but he soon found it necessary to return to Stavenhagen, where he aided in the management of his father's farm. After his father's death, however, he abandoned farming, and in 1850 settled as a private tutor at the little town of Treptow in Pomerania. Here he married Luise Kunze, the daughter of a Mecklenburg pastor. Reuter's first publication was a collection of miscellanies, written in Plattdeutsch, and entitled *Läuschen un Riemels* ("anecdotes and rhymes," 1853; a second collection followed in 1858). The book, which was received with encouraging favour, was followed by *Polterabendgedichte* (1855), and *De Reis' nah Belligen* (1855), the latter a humorous poem describing the adventures of some Mecklenburg peasants who resolve to go to Belgium (which they never reach) to learn the secrets of an advanced civilization. In 1856 Reuter left Treptow and established himself at Neubrandenburg, resolved to devote his whole time to literary work. His next book (published in 1858) was *Kein Hüsung*, an epic in which he presents with great force and vividness some of the least attractive aspects of village life in Mecklenburg. This was followed, in 1860, by *Hanne Nüte un de lütte Pudel*, the best of the works written by Reuter in verse. In 1861 Reuter's popularity was largely increased by *Schurr-Murr*, a collection of tales, some of which are in High German, but this work is of slight importance in comparison with the series of stories, entitled *Olle Kamellen* ("old stories of bygone days"). The first volume, published in 1860, contained *Woans ick tau'ne Fru kam* and *Ut de Franzosentid*. *Ut mine Festungstid* (1861) formed the second volume; *Ut mine Stromtid* (1864) the third, fourth and fifth volumes; and *Dörchläuchting* (1866) the sixth volume—all written in the Plattdeutsch dialect of the author's home. *Woans ick tau 'ne Fru kam* is a bright little tale, in which Reuter tells, in a half serious half bantering tone, how he wooed the lady who became his wife. In *Ut de Franzosentid* the scene is laid in and neai Stavenhagen in the year 1813, and the characters of the story are associated with the great events which then stirred the heart of Germany to its depths. *Ut mine Festungstid* is of less general interest than *Ut de Franzosentid*, a narrative of Reuter's hardships during the term of his imprisonment, but it is not less vigorous either in conception or in style. *Ut mine Stromtid* is by far the greatest of Reuter's writings. The men and women he describes are the men and women he knew in the villages and farmhouses of Mecklenburg, and the circumstances in which he places them are the circumstances by which they were surrounded in actual life. As in *Ut de Franzosentid* he describes the deep national impulse in obedience to which Germany rose against

Napoleon, so in *Ut mine Stromtid* he presents many aspects of the revolutionary movement of 1848.

In 1863 Reuter transferred his residence from Neubrandenburg to Eisenach; and here he died on the 12th of July 1874. In the works produced at Eisenach he did not maintain the high level of his earlier writings.

Reuter's *Sämtliche Werke*, in 13 vols., were first published in 1863–68. To these were added in 1875 two volumes of *Nachgelassene Schriften*, with a biography by W. Wilbrandt; and in 1878 two supplementary volumes to the works appeared. A popular edition in 7 vols. was published in 1877–78 (last edition, 1902); there are also editions by K. F. Müller (18 vols., 1905), and W. Seelmann (7 vols., 1905–6). See O. Glagau, *F. Reuter und seine Dichtungen* (1866, 2nd ed., 1875); H. Ebert, *F. Reuter und seine Werke* (1874); F. Latendorf, *Zur Erinnerung an F. Reuter* (1879); K. T. Gädertz, *Reuter-Studien* (1890); by the same, *Aus Reuters alten und jungen Tagen* (3 vols., 1894–1900); *Briefe F. Reuters an seinen Vater*, edited by F. Engel (2 vols., 1895); A. Römer, *F. Reuter in seinem Leben und Schaffen* (1895); G. Raatz, *Wahrheit und Dichtung in Reuters Werken* (1895); E. Brandes, *Aus F. Reuters Leben* (1899); K. F. Müller, *Der Mecklenburger Volksmund und F. Reuters Schriften* (1902). A complete bibliography of F. Reuter will be found in the *Niederdeutsche Jahrbuch* for 1896 and 1902.

REUTER, PAUL JULIUS, BARON DE (1821–1899), founder of Reuter's News Agency, was born at Cassel, Germany. At the age of thirteen he became a clerk in his uncle's bank at Göttingen, where he chanced to make the acquaintance of Professor Gauss, whose experiments in telegraphy were then attracting some attention. Reuter's mind was thus directed to the value of the speedy transmission of information, and in 1849, on the completion of the first telegraph lines in Germany and France, he found an opportunity of turning his ideas to account. There was a gap between the termination of the German lines at Aix-la-Chapelle and that of the French and Belgian lines at Verviers. Reuter organized a news-collecting agency at each of these places, his wife being in charge of one, himself at the other, and bridged the interval by a pigeon-post. On the establishment of through telegraphic communication, Reuter endeavoured to start a news agency in Paris, but finding that the French government's restrictions would render the scheme unworkable, removed in 1851 to England and became a naturalized British subject. The first submarine cable—between Dover and Calais—had just been laid, and Reuter opened an office in London for the transmission of intelligence between England and the continent. At first, however, his business was practically confined to the transmission of private commercial telegrams to places not connected with the new telegraph system. He appointed agents at the various telegraph termini on the continent to take these despatches off the wires and forward them by rail or pigeon-post to the addresses. Simultaneously he endeavoured to induce the English papers to publish the foreign news telegrams supplied by his various agents. These efforts were for some years unsuccessful, until in 1858 *The Times* published the report of an important speech by Napoleon III. forwarded by Reuter's Paris agent. Reuter now extended his sphere of operations all over the world, and in 1859 obtained leave for the presence of representatives at the headquarters of the Austrian and French armies during the war. In 1866 he laid down a special cable from Cork to Crookhaven, which enabled him to circulate news of the American Civil War several hours before the steamer could reach Liverpool. A concession for a cable beneath the North Sea to Cuxhaven was granted him by the king of Hanover in 1865, and in the same year a concession was granted him for a cable between France and the United States, the line being worked jointly by Reuter (whose business had just been converted into a limited liability company) and the Anglo-American Telegraph Company. In 1872 he obtained from the shah of Persia an exclusive concession to develop the internal resources of that country, but the concession was annulled and its privileges transferred to the Imperial Bank of Persia. Reuter was in 1871 given the title of baron by the duke of Saxe-Coburg and Gotha, and by a special grant of Queen Victoria he and his heirs were authorized to have the privileges of this rank in England. Baron Reuter died at Nice on the 25th of February 1899.

REUTERHOLM, GUSTAF ADOLF, BARON (1756–1813), Swedish statesman. After a brief military career he was appointed *Kammerherr* to Sophia Magdalena, queen consort of Gustavus III., and subsequently became intimately connected with the king's brother, Charles, then duke of Sudermania. He remained in the background throughout the reign of Gustavus III., whom he constantly opposed and by whom he was imprisoned along with the other malcontents in 1789. He was abroad at the time of the king's death, but a summons from his friend, now duke regent, speedily recalled him, and in 1793 he was made a member of the council of state and one of the "lords of the realm." At first he seemed inclined to adopt a liberal system, and reintroduced the freedom of the press. He did this solely, however, to reverse the Gustavian system, and persecuted the stalwarts of the late king (*e.g.* G. M. Armfelt, J. K. Toll) with a petty vindictiveness which excited general disgust. Towards the end of the regency, Reuterholm inclined towards an alliance with Russia on the basis of a marriage between the young king, Gustavus IV., and the empress Catherine's granddaughter, Alexandra Pavlovna, an alliance frustrated by the bigotry of the intended groom. At home the Swedish government ended as ultra-reactionary, owing to an insignificant riot in Stockholm which so alarmed Reuterholm that he threatened all printers who printed anything relating to the constitutions of the French republic or the United States of America with the loss of their privileges. In March 1795 he closed the Swedish Academy because A. G. Silfverstolpe in his inaugural address had ventured to disapprove of the *coup d'état* of 1789. On the accession of Gustavus IV. (November 1st, 1796) Reuterholm was expelled from Stockholm. For the next twelve years he lived abroad under the name of Tempelcrentz. After the revolution of 1809 he returned to Sweden, but was denied all access to Charles XIII., and quitted his country for good. He died in Schleswig on the 27th of December 1813.

See *Sveriges Historia* (Stockholm, 1877–1881), vol. v. (R. N. B.)

REUTLINGEN, a town of Germany, in the kingdom of Württemberg, situated on the Echatz, an affluent of the Neckar, near the base of the Achalm and 36 m. by rail S. of Stuttgart. Pop. (1905) 23,850. It is a quaintly built town, with many picturesque houses and a fine Gothic church of the 13th and 14th centuries dedicated to St Mary, which was restored in 1893–1901; it contains in the choir a replica of the Holy Sepulchre and a sculptured stone font, and has a tower 240 ft. high. Reutlingen has three other Evangelical churches, a Roman Catholic church, a town hall, and several monuments, including one to the emperor William I. and another to Friedrich List. The industries of the town are numerous, and include the spinning and weaving of cotton, dyeing and bleaching; also the manufacture of leather, machinery, furniture, shoes, paper, clothing, hardware, bricks, beer and woollen goods. Hops, vines and fruit are grown in the neighbourhood. Reutlingen has several schools and educational establishments, including a celebrated pomological institute. It is also famous as the place where Pastor Gustav Werner (1809–1887) founded his Christian Socialist refuge, which has become widely known in philanthropic circles.

Reutlingen, which is first mentioned in 1213, became a free imperial town in the 13th century and was fortified by the emperor Frederick II., remaining loyal to him and to his son, Conrad IV. A member of the league of Swabian towns, its citizens defeated Count Ulrich of Württemberg on the 14th of May 1377. Later it joined the Swabian League and was favoured by the emperor Maximilian I. It came into the possession of Württemberg in 1802. An explosion which took place on the 27th of December 1852 destroyed many houses in the town.

See Rupp, *Aus der Vorzeit Reutlingens und seiner Umgegend* (Stuttgart, 1869); Hochstetter, *Führer durch Reutlingen und Umgebung* (Reutlingen, 1901); and Zwiesele, *Geognostischer Führer in der Umgegend von Reutlingen* (Stuttgart, 1897).

REVAL, or REVEL (Russ. *Revel*, formerly *Kolyvañ*; Esthonian, *Tallina* and *Tannilin*), a fortified seaport town of Russia, capital of Esthonia, situated on a bay on the S. coast of the gulf of Finland, 230 m. W. of St Petersburg by rail. Pop. (1900) 66,292, of whom half were Esthonians and 30%

Germans. The city consists of two parts—the Domberg or Dom, which occupies a hill, and the lower town on the beach. The Dom contains the castle (first built in the 13th century, rebuilt in 1772), where the provincial administration has its seat, and a cathedral (1304–1900) with five gilded domes. It has its own administration, separate from that of the lower town. The church of St Nicholas, built in 1317, contains many antiquities of the former Roman Catholic times and old German paintings. The Dom church contains many interesting shields, as also the graves of the circumnavigator Baron A. J. von Krusenstern (1770–1846), of the Swedish soldiers Pontus de la Gardie (d. 1585) and Carl Horn (d. 1601), and of the Bohemian Protestant leader Count Matthias von Thurn (1580–1640). The church of St Olai, first erected in 1240, and often rebuilt, was completed in 1840 in Gothic style; it has a bell tower 456 ft. high. The oldest church is the Esthonian, built in 1219. The public institutions include a good provincial museum of antiquities; an imperial palace, Katharinenthal, built by Peter the Great in 1710; and very valuable archives, preserved in the town hall (14th century). The pleasant situation of the town attracts thousands of people for sea-bathing. It is the seat of a branch board of the Russian admiralty and of the administration of the Baltic lighthouses. Its port has a depth of 4 to 6 fathoms, and a roadstead $3\frac{1}{2}$ m. wide, which freezes nearly every winter. The exports consist chiefly of grain, timber, flax, hides, wool, a species of anchovy, and hemp, and the imports of manufactured goods and machinery. The value of the aggregate trade amounts to an average of seven to nine millions sterling annually. There is considerable trade with Finland. Baltic Port, 30 m. W., is a sort of annex to the port of Reval.

The high Silurian crag now known as Domberg was early occupied by an Esthonian fort, Lindanissa. In 1219 the Danish king Valdemar II. erected here a strong castle and founded the first church. In 1228 the castle was taken by the Livonian Knights, but nine years later it returned to the Danes. About the same time Lübeck and Bremen merchants settled there, and their settlement became an important seaport of the Hanseatic League. It was fortified early in the 14th century, and in 1343 sustained a siege by the revolted Esthonians. Valdemar III. sold Reval and Esthonia to the Teutonic Knights in 1346, but on the dissolution of the order, in 1561, Esthonia and Reval surrendered to the Swedish king Erik XIV. A great conflagration in 1433, the pestilence of 1532, the bombardment by the Danes in 1569, and the Russo-Livonian War, destroyed its trade. The Russians besieged Reval twice, in 1570 and 1577. It was still an important fortress, having been enlarged and fortified by the Swedes. In 1710 it was surrendered to Peter the Great, who immediately began the erection of a military port for his Baltic fleet. His successors continued to fortify the access to Reval from the sea, large works being undertaken, especially in the early years of the 19th century.

REVEILLÉ (Fr. *réveillez*, imperative of *réveiller*, to awaken, Lat. *re-* and *vigilare*, to watch), the signal by call of bugle or beat of drum to announce to soldiers the time to awake and begin duty.

REVELATION, BOOK OF, in the Bible, the last book of the New Testament.

Title.—According to the best authorities ℵ CA (in the subscription) 2, 8, 82, 93, the title of this book is ἀποκάλυψις Ἰωάννου. Some cursives (1, 14, 17, 25, 28, 31, 38, 51, 90, 91, 94, 97) read ἀπ. (+ τοῦ ἁγίου 1, 25, 28, 31, 38, 51, 90, 94) Ἰωάννου τοῦ θεολόγου; Q and 12, ἀπ. Ἰ. τοῦ θεολ. καὶ εὐαγγελίστου; P and 42, ἡ ἀπ. τοῦ ἀποστόλου Ἰ. καὶ εὐαγγελίστου [The word "apocalypse" gives the current title not only to this book, but to a large body of Jewish and Christian writings. This is one of the first instances of its use in this sense in existing literature. An earlier use is probably to be found in the title of the Syriac Apocalypse of Baruch, which = *γραφὴ τῆς ἀποκαλύψεως τοῦ βαρούχ υἱοῦ τοῦ Νηρίαν*. The title is different from what the New Testament use of the term would have led us to expect, *i.e.* Ἀποκάλυψις Ἰησοῦ, which are indeed the opening words of this book. With the latter phrase we might compare Gal. i. 12, where we have ἀποκαλύψεως Ἰησοῦ Χριστοῦ, "revelation from Jesus Christ." For the book is a revelation made by God to Jesus Christ, who through His angel made it known to John for transmission to the churches. Instead of this the Church substituted the name of the disciple through whom the message was delivered for that of his Master, and designated our Apocalypse "The Apocalypse of John." This title was familiar before the end of the 2nd century.

MSS. and Versions.—There are six uncials, ℵ, A, C, P, Q, 2, the last of which has not been edited or collated. Of the rest, P and Q are imperfect. The known cursives amount to 229, according to von Soden (*Die Schriften des Neuen Testamentes*, I. i. 289). There are six ancient versions of various values. (*a*) The best is the Latin, which is found in the Old Latin (*g h m* and the text used by Primasius) and the Vulgate, of which there are eight MSS. written between the 6th and 15th centuries. (*b*) The Syriac version appears in two forms, the Philoxenian (A.D. 508), recently discovered and edited by Gwynn, and the Harclean (A.D. 616). The true Peshitta did not contain the Apocalypse. (*c*) The Armenian version. The Apocalypse was admitted to the canon, according to Conybeare, in the 12th century through the influence of Nerses, who revised an older version traceable to the opening of the 5th century. (*d*) The Egyptian version is found in two forms, *i.e.* the Bohairic and Sahidic. The former has been edited by Horner, who is now also engaged on an edition of the latter. (*e,f*) The Ethiopic and Arabic versions have not yet been critically edited.

External Evidence and Canonicity, and Century.—It is possible that the Apocalypse was known to Ignatius, *Eph.* xv. 3 (Rev. xxi. 3); *Philad.* vi. 1 (Rev. iii. 12). Some have thought also that Barnabas (vi. 13, xxi. 3) was acquainted with our text, but this is highly improbable. Andreas of Cæsarea mentions Papias as attesting the credibility of Revelation, and cites two of his remarks on Rev. xii. 7. The fact that Eusebius does not mention Revelation among the New Testament books known to Papias (*H.E.* iii. 39) may be due to the historian's unfriendly attitude to the book. Moreover, Papias may be one of the presbyters to whom, as having actually seen John, Irenaeus (v. 30 = Eusebius, *H.E.* v. 8) appeals on behalf of the number 666. From these possible and highly probable references we pass on to the clear testimony of Justin Martyr, who is the first to declare that Revelation is by "John, one of the Apostles of Christ" (*Dial.* lxxxi. 15), and a book of canonical standing (i. 28). In the latter half of this century it meets with very wide recognition. Thus a treatise of some description was written upon it by Melito of Sardis in Asia Minor (Eus. *H.E.* iv. 26), and quoted by the anti-Montanist Apollonius (*H.E.* v. 18) and Theophilus of Antioch (*H.E.* iv. 24). In Carthage its currency is proven by the references of Tertullian, and the phraseology of the Acts of Perpetua and Felicitas (§§ 4, 12); in Alexandria by the citations of Clement (*Paed.* i. 6. 36; ii. 10. 108, &c.); in Rome by its inclusion in the Muratorian canon, and in Gaul by its use in the Epistle of the churches of Vienne and Lyons (Eus. *H.E.* v. 10. 58), and in Irenaeus, who defends the apostolic authorship of the Revelation of John (*Haer.* iv. 14. 1, 17. 6, 18. 6, 20. 11, 21. 3; v. 26. 1, &c.).

But in certain quarters the authority of the book was denied. Thus Marcion rejected it on the ground of its Jewish character (Tertullian, *c. Marcion*, iv. 5), and the Alogi assigned both Revelation and the Gospel to Cerinthus (Epiphanius, *Haer.* li. 3). This attitude is more widely represented in the next century.

Third Century.—The attack on Revelation was resumed by ablер antagonists in this century. The objections of the Alogi were restated and maintained by the Roman presbyter Caius in his controversy with the Montanist Proclus (Eus. *H.E.* ii. 25. 6; iii. 28. 2), but met with such overwhelming refutation at the hands of Hippolytus (see Gwynn, *Hermathena*, vi. 397–418) that no church writer in the West subsequently except Jerome seriously called in question the authorship of our book.

Dionysius of Alexandria (A.D. 255) wrote a moderate and effective criticism, in which he rejects the hypothesis of the

Cerinthian authorship and urges that it was not written by the apostle, on the ground of its difference in language, style and contents from the other Johannine writings. Its author was some inspired man bearing the same name as the son of Zebedee. The arguments of Dionysius were repeated by Eusebius, who ascribed the work to the presbyter John mentioned by Papias (Eus. *H.E.* iii. 39) and was in doubt whether he should place Revelation among the spurious (ῥᾴθ᾽α)works (*H.E.* iii. 25.4) or the accepted (ὁμολογούμενα).

Eastern Church.—In the Eastern Church the views of Dionysius and Eusebius were generally accepted. With the exception of Methodius and Pamphilus the book was not received by Eastern scholars. Thus it was either not mentioned or disowned by Cyril of Jerusalem, Chrysostom, Theodore of Mopsuestia, Theodoret and Amphilochus of Iconium. It is absent from the so-called Synopsis of Athanasius, the Stichometry of Nicephorus, the List of Sixty Books and other authoritative documents. It formed no part of the Peshîtta New Testament. It was apparently unknown to Ephraem. Even when later it found a place in the Philoxenian and Harclean versions it never became a familiar book to the Syrian Churches, while it was unhesitatingly rejected by the Nestorian and Jacobite Churches.

But though the Syrian Church maintained this unconciliatory attitude to the book, opposition to it began gradually to disappear in the rest of the East. Thus it came to be acknowledged by Athanasius, Isidore of Pelusium, Gregory of Nyssa, and others. Commentaries on the book were written by Andreas, archbishop of Caesarea, in the 5th century, and Arethas in the 9th.

Western Church.—In the Western Church, Revelation was accepted by all writers from Hippolytus onward with the exception of Jerome, who relegated it to the class lying between the canonical and apocryphal. The authenticity of the book was unquestioned thenceforward till the Reformation, when the view of Jerome was revived by Erasmus, Carlstadt, Luther and others under various forms. In the Lutheran Church this opposition lasted into the next century, but in the Reformed it gave way much earlier. That Revelation has retained its place in the canon is due not to its extravagant claims to inspiration or its apocalyptical disclosures, but to its splendid faith and unconquerable hope, that have never failed to awake the corresponding graces in every age of the Church's history.

The History of Interpretation.—This is a most fruitful subject, and the study of it helps to settle other related questions. We first of all might divide the methods of interpretation into two classes: I. Methods which presuppose the literal unity of the book; II. Methods which presuppose some breach of this unity either in the plan of the book as a whole or in some of its details.

I. *Methods presupposing the Literal Unity of the Book.*—Where the book was accepted the problem of its interpretation was differently dealt with according to the age and environment of the interpreter. The book was first taken in a severely literal sense, and particularly in its chiliastic doctrine.

i. *Chiliastic Interpretation.*—Revelation was held to teach chiliasm, or the doctrine of the literal reign of 1000 years. Amongst the chiliasts were Cerinthus, Papias, Justin, Irenaeus, Hippolytus, Tertullian and Victorinus.[1] When the Church obtained the mastery of the world this method came naturally to be abandoned in favour of a spiritualistic interpretation, to which we shall presently refer. But the growing secularism of the Church led to a revival of the former method in the beginning of the 13th century amongst the Franciscans. Thus Joachim of Floris in his *Expositio magni abbatis Ioachimi in Apoc.* teaches that Babylon is Rome, the Beast from the Sea Islam, the False Prophet the heretical sects of the day, and that on the close of the present age which was at hand the millennium would ensue. This method of interpretation was pursued to extravagant lengths by other Franciscans and was subsequently adopted by the Protestant reformers, who could justify their identification of the papacy with the Antichrist from books written within the Roman communion. Joachim was the first to apply the "recapitulation" theory to Revelation.

ii. *Spiritualistic Interpretation.*—The founder of this school of interpretation was Ticonius the Montanist (*floruit* A.D. 380), though he followed therein the precedent set by Origen. His interpretation is on the whole mystical. Historical fulfilments, if not excluded, are not sought for. The millennium is the period between the first and second comings of Christ. The method of Ticonius was dominant in the Church down to the middle ages, amongst his followers being such notable churchmen as Augustine, Primasius, Cassiodorus, Bede, Anselm.

iii. *Universal Historical Method of Interpretation.*—A counter-attempt over against Joachim to interpret Revelation in the light of history was made by Nicolas of Lyra (1329, in his *Postilla*), following (?) therein the lead of Petrus Aureolus (1317). Here for the first time a consistently elaborated world-historical interpretation is carried out from the reign of Domitian to Lyra's own period. Under this method might be classed the expositions of Luther, Osiander, Striegel, Flacius, Gerhard and Calovius; and English writers such as Napier, Mede and Newton. Throughout these later commentaries a strong antipapal interest which identified the pope with the Antichrist holds a central place—a doctrine which, as we have seen, goes back historically to the immediate disciples of Joachim and like-minded Franciscans.

iv. *Contemporary-Historical Method.*—Under the stress of the Protestant attack there arose new methods on the papal side, and their authors were the Spanish Jesuits, Ribeira (*ob.* 1591) and Alcasar (*ob.* 1614). With these writers we have the beginning of a scientific method of interpretation. They approach the book from the standpoint of the author and seek the clue to his writings in the events of his time. It is from these scholars that subsequent writers of Revelation have learnt how to study this book scientifically.[2] This method was adopted and developed by Grotius,[3] Hammond, Clericus, Semler, Corredi and Eichhorn, Lücke, Bleek and Ewald, and the consciousness that Rome and not Jerusalem was the object of attack in Revelation became increasingly clear in the works of these scholars. The work of Ramsay, *The Letters to the Seven Churches* (1904) is a pure representation of this method.

v.–vii. *Continuously Historical, Eschatological*[4] *and Symbolical Methods.*—These methods are now generally regarded as unscientific, and call for no further notice here save to mention that the first was upheld by Hengstenberg, Ebrard, Maitland, Elliott, &c.; the second by Kliefoth, Beck, Zahn, and the third by Auberlen, Luthardt, Milligan and Benson.

The learned Cambridge Commentary by Swete (*The Apocalypse of John*, 2nd ed., 1907) makes use of several of the methods of interpretation enumerated above. Thus Dr Swete writes (p. ccxviii) of his work: "With the 'preterists' (contemporary-historical) it will take its stand on the circumstances of the age and locality to which the book belongs, and will connect the greater part of the prophecy with the destinies of the empire under which the prophet lived; with the 'futurists' (eschatological) it will look for fulfilments of St John's pregnant words in times yet to come. With the school of Auberlen and Benson it will find in the Apocalypse a Christian philosophy of history; with the 'continuous-historical' school it can see

[1] The oldest Latin commentary was written by this scholar (*ob.* 303). He was the first in extant literature to interpret certain passages in Revelation of Nero.

[2] The Jesuit Juan Mariana was the first after Victorinus to explain "the wounded head" as referring to Nero. This interpretation was introduced into Protestant exegesis by Corrodi.

[3] The beginnings of the literary-critical method are to be found in Grotius. Starting from the different dates assigned by tradition to the exile to Patmos and the different chronological relations implied in the book itself, he conjectured that the Apocalypse was composed of several works of St John, written in different places and at different times, some before, some after A.D. 70. Herein he was followed by Hammond and Lakemacher, but the idea was before its time and practically died stillborn.

[4] Or *futurist.* While it is impossible to interpret the Apocalypse scientifically as a whole by the eschatological method, there are undoubtedly some sections in it which must be so interpreted.

in the progress of events ever new illustrations of the working of the great principles which are revealed. And . . . it will gladly accept all that research and discovery can yield for the better understanding of the conditions under which the book was written." The chief value of this very scholarly book is to be found in its textual side.

The greater number of the methods discussed above have made no permanent contribution to the exegesis of Revelation; the method among them that has done most in this direction is the contemporary-historical. But, though this method has been applied in its fullness, and that by the keenest exegetes, there remains a consciousness that it has failed to solve many of the problems of the book. In many important points, however, its upholders are agreed, *i.e.* that the book is directed against Rome, that Nero *redivivus* is to be recognized in the wounded head, that the number 666 denotes Nero Caesar, and that in chap. xi. the preservation of the temple is foretold. Consequently the date of the composition of the book is placed before A.D. 70. Against the date assigned to the opening verses of this chapter modern scholars can make no objection, but, if this be the date of the entire work, then many passages in it are hopelessly inexplicable; for the latter just as certainly demand a date subsequent to A.D. 70 as xi. 1–2, a date prior to it. If, therefore, the possibilities of exegesis were exhausted in the list of methods already enumerated, science would have to put the New Testament Apocalypse aside as a hopeless enigma. But there is no such *impasse*. For in the New Testament Apocalypse there is not that rigid consistency and unity in detail that the past presupposed. The critical studies of recent years have shown that most of the Old Testament prophetical books are composite. And this holds true in no less a degree of most of the Jewish apocalypses. Such works are to be explained on what might be called the "fragmentary hypothesis." Other books, like the Ethiopic Enoch, exhibit a series of independent sources connected more or less loosely together. Such are to be explained on the "sources hypothesis." Others, like the Ascension of Isaiah, betray the handiwork of successive editors, and are accordingly to be explained on the "redaction hypothesis." Now modern scholars have with varying success used in turn these three hypotheses with a view to the solution of the problems of the New Testament Apocalypse. To these we shall now address ourselves.

II. *Methods—Literary-Critical—presupposing some Degree of Compositeness in the Book.*

i. *Redaction Hypothesis.*—Suggestions, as we have already observed, had been made in this direction, but it was not till Weizsäcker (*Theol. Litteraturzeitung*, 1882, p. 78 seq.) reopened the question that the problem was seriously undertaken. In the same year his pupil Völter (*Die Entstehung der Apok.*, 1882, 1885) put forward the bold theory that the original Apocalypse consisted of i. 4–6, iv. 1–v. 10, vi. 1–17, vii. 1–8, viii. 1–13, ix. 1–21, xi. 14–19, xiv. 1–3, 6, 7, xiv. 14–20, xviii. 1–24, xix. 1–4, xix. 5–10a, which he assigned to the year A.D. 66 (so the second edition). To this the original author added as an appendix x. 1–xi. 13, xiv. 8, xvii. 1–18, in A.D. 68–70. The work underwent three later redactions at the hands of successive editors in the reigns of Trajan and Hadrian. Instead of the above complex theory this writer now offers another (*Die Offenbarung Johannis*, 1904),[1] in which he distinguishes an apocalypse of John, A.D. 65, i. 4–6, iv. 1–v. 10, vi. 1–vii. 8, viii.–ix., xi. 14–19, xiv. 1–3, 6–7, xiv. 14–20, xviii. 1–xix. 4, xix. 5–10 (pp. 3–56), an apocalypse of Cerinthus A.D. 70, x. 1–11, xvii. 1–18, xi. 1–13, xii. 1–16, xv. 5–6, 8, xvi. 1–21, xix. 11–xxi. 8, xxi. 9–xxii. 6 (pp. 56–129), a redaction of the work in A.D. 114–15, i. 7–8, v. 6b, 11–14, vii. 9–17, xii. 11, 18–xiii. 18, xiv. 4–5, 9–12, xv. 1–4, 7, xvi. 19b, xvii. 14, 16, 17, xxi. 14, 22–27, xxii. 1–2, 8–9 (pp. 129–48), and certain additions, i. 1–3, 9–iii. 22, xiv. 13, xvi. 15, xxii. 7, 10–20, made in the time of Hadrian (pp. 148–171). First of all it should be observed that Völter was the first to call attention to the radical difference in outlook between vii. 1–8 and vii. 9–17—a difference now generally recognized. Next it is noteworthy that in the second scheme here given Völter has abandoned his theory of a redaction hypothesis in favour of a sources hypothesis+a redactor. The earlier view of Völter was rejected on every side: the later will not prove more acceptable, though individual suggestions of this scholar will be occasionally helpful. The problem was next dealt with by Vischer (*Die Offenbarung Johannis, eine Jüdische Apokalypse in Christlicher Bearbeitung*, 1886, 2nd ed., 1895), who took iv. 1–xxii. 5 to be a Jewish apocalypse revised and edited by a Christian, to whom he assigned i.–iii., v. 9–14, vii. 9–17, xi. 8b, xii. 11, xiii. 9, 10, xiv. 1–5, 12, 13, xvi. 15, xvii. 14, xix. 9, 10, 13b, xx. 4b–5a, 6, xxi. 5b–8, 14b, xxii. 6–21, together with some isolated expressions and all references to the Lamb. This scheme met with a better reception than that of Völter, but it also has failed to solve the problem. In 1891 Erbes (*Offenbarung Johannis*, 1891) maintained that the book was entirely of Christian origin. The groundwork was written about A.D. 62. In this an editor incorporated a Caligula apocalypse, and a subsequent editor revised the existing work in many passages and made considerable additions, especially in the later chapters. Another attempt, mainly from this standpoint, has recently been made by J. Weiss of Marburg (*Offenbarung des Johannis*, 1904). This writer seeks to establish the existence of an original Christian apocalypse written about A.D. 60. This included (see p. 111) i. 4–6 (7, 8), 9–19, ii.–vii., ix., xii. 7–12, xiii. 11–18, xiv. 1–5, 14–20, xx. 1–15, xxi. 1–4, xxii. 3–5, 8 sqq. With this a Jewish apocalypse (x.–xi. 13, xii. 1–6, 14–17, xiii. 1–7, xv.–xix., xxi. 9–27—see p. 115), written A.D. 70, was incorporated by the redactor. This latter apocalypse consisted of a series of independent prophecies which appeared to have the same crisis in view. This redactor, moreover, was the first who gave to the Apocalypse the character of an attack on the Roman Empire and the imperial cult by means of a series of small additions. In the above work we have a combination of the redaction and sources hypotheses.

ii. *Sources Hypothesis.*—The same year Weyland (*Theol. Tijdsch.*, 1886, 454–70; *Omwerkings en Compilatie-Hypothesen toegepast op de Apoc. van Johannis*, 1888) advanced the theory of two Jewish sources (+ and 3), which were subsequently worked over by a Christian redactor. Such a theory as that just mentioned hopelessly fails to account for the linguistic unity of the book.

A very elaborate form of this theory was issued in 1884 (*Offenbarung Johannis*) by Spitta, who found three main sources in the Apocalypse. First, there was the primitive Christian apocalypse embracing the letters and the seals written by John Mark soon after A.D. 60,—i. 4–6, 9–19, ii. 1–iii. 22, iv.–vi., viii. 1, vii. 9–17, xix. 9b, 10, xxii. 8, 10–13, 16a, 17, 18a, 20b–21. Secondly, the trumpet source of the time of Caligula (*circa* 40),—vii. 1–8, viii. 2–ix., x. 1–7, xi. 15, 19, xii.–xiii. 18, xiv. 1–11, xvi. 13–20, xix. 11–21, xx. 1–3, 8–15, xxi. 1, 5a, 6a. Thirdly, the vials source from the time of Pompey (*circa* 63),—x. 1–xi. 13, xiv. 8a, 9b, 10–11, xi. 1–13b, 17, 18, xiv. 14–20, xv. 2–6, 8, xvi. 1–12, 17a, 21, xvii. 1–6a, xviii. 1–23, xix. 1–8, xxi. 9–xxii. 3a, 15. The rest of the book is from the hands of the redactor.

In 1891 Schmidt resolved the book into three independent sources which were put together by a redactor (*Anmerkungen über d. Komposition der Offenb. Johannis*).

In 1895 Briggs (*Messiah of the Apostles*, 1895) developed this theory to a still more extreme degree.

iii. *Fragment Hypothesis.*—The previous theories have brought to light and emphasized the fact that within the Apocalypse there are passages inconsistent with the tone and character of the whole. But, notwithstanding this fact, the Apocalypse gives a strong impression of its unity. Thus apparently the only remaining theory which can account for both these phenomena is that at which we have now arrived, *i.e.* the fragment hypothesis. To Weizsäcker we owe the first statement of this theory. In 1882 (*Theol. Litteratura.* pp. 78–9) he suggested

[1] Besides the works mentioned here Völter wrote two other works on the Apocalypse: *Die Offenbarung Johannis*, 1886; *Das Problem der Apokalypse*, 1893.

that while the book is a unity the author made free use of older materials. Later, in his *Apostolic Age* (1886, and ed. 1892), he specifies these additions as vii. 1–8 (A.D. 64–66), x.–xi. 1–13 (*circa* A.D. 67), xii. 1–11, 12–17 (*circa* 69), xiii. (time of Vespasian), xvii. (time of Domitian).

Sabatier (*Les Origines littéraires . . . de l'apocalypse*, 1888) regards the book as a unity into which its author had introduced older Jewish materials not always consistent with their new contexts, such as xi. 1–13, xii.–xiii., xiv. 6–20, xvi. 13, 14, 16, xvii. 1–xix. 2, xix. 11–xx. 10, xxi. 9–xxii. 5. The author wrote x. with a view to adapting xi. 1–13 to its new context. Schoen (*L'Origine de l'apocalypse*, 1887) attached himself in the main to the scheme of Sabatier. Both these writers assign the Apocalypse to the reign of Domitian.

The labours of these scholars, though to the superficial student they seem to prove that everything is possible and nothing certain, have certainly thrown great light on the literary character of the Apocalypse. Though differing in detail, they tend to show that, while the book is the production of one author, all its parts are not of the same date, nor are they one and all his first-hand creation. For many of the facts, the discovery of which we owe to the literary critics, have made the assumption of an absolute unity in the details of the Apocalypse a practical impossibility. Incongruities manifest themselves not only between certain sections and the main scheme of the book, but also between these and their immediate contexts. These sections are vii. 1–8a, xi. 1–13, xiii., xiv., xvii., xviii., xx. 1–xxii. 5. Some of these sections (xi., xiii., xiii., xvii.) contain elements that cannot be explained from any of the above methods. The symbols and myths in these are not the creation of the writer, but borrowed from the past, and in not a few instances the materials are too foreign to his subject to lend themselves to his purpose without the help of artificial and violent expedients. For the elucidation of these foreign elements a new method—the traditional-historical—is necessary, and to the brilliant scholar Gunkel we owe its origination.

iv. *Traditional-historical Method.*—Gunkel (*Schöpfung und Chaos in Urzeit und Endzeit; eine religionsgeschichtliche Untersuchung über Gen. 1 und Joh. 12*, 1895) opened up new lines of investigation. He criticizes sharply (pp. 173 sqq., 233 sqq.) former methods of interpretation, and with the ardour of a discoverer of a new truth seeks to establish its currency throughout the entire field of apocalyptic. To such an extreme does he carry his theory that he denies obvious references to historical personages in the Apocalypse, when these are clothed in apocalyptic language. Thus he refuses to recognize Nero in the beast and its number. But apart from its extravagances, his theory has undoubted elements of truth. It is true that tradition largely fixes the form of figures and symbols in apocalyptic. Yet each new apocalypse is to some extent a reinterpretation of traditional material, which the writer uses not wholly freely but with reverence from the conviction that they contained the key to the mysteries of the present and the past. From this standpoint it may be argued that every apocalypse is in a certain sense pseudonymous; for the materials are not the writer's own, but have come down to him as a sacred deposit —full of meaning for the seeing eye and the understanding heart. On the other hand, since much of the material of an apocalypse is a reinterpretation, it is necessary to distinguish between its original meaning and the new turn given to it in the Apocalypse. At times details in the transmitted material are unintelligible to our author, and these in some cases he omits referring to in his interpretation. The presence of such details is strong evidence of the writer's use of foreign material.

As an illustration of his theory Gunkel seeks at great length to establish the Babylonian origin of chap. xii. of the Apocalypse. His investigation tends to show that in the course of tradition cosmological myths are transformed into eschatological dogmas.

The above method was adopted by Bousset in his work *Der Antichrist in der Überlieferung des Judenthums, des Neuen Testaments, und der alten Kirche* (1895), in which he sought to show that a fixed tradition of the Antichrist originating in Judaism can be traced from New Testament times down to the middle ages, and that this tradition was in the main unaffected by the Apocalypse, though in chap. xi. the Apocalypse shows dependence on it. Next in 1896 he published his commentary *Die Offenbarung Johannis* (2nd ed. 1906). In this work he availed himself of the results of the past and followed the three approved methods—the contemporary-historical, the fragmentary and the traditional-historical.

Julicher (*Einleitung in das Neue Testament*[1], 1901, pp. 204–29) adopts the same three methods of interpretation.

Holtzmann (*Einleitung in das N.T.*[3], 1892; *Hand-Commentar*[2], 1893; *Lehrbuch der NTlichen Theol.*, i. 463–76) holds mainly to the contemporary-historical method in his earlier works, though recognizing signs of a double historical background; but in his last work the importance of tradition as a source of the writer's materials is fully acknowledged.

In 1902 O. Pfleiderer in the second edition of his *Urchristentum* (1902, pp. 281–335) abandoned his former view on the Apocalypse and followed essentially the lines adopted by Bousset, though the details are differently treated.

In the same year Porter's able article on "Revelation" appeared in Hastings' *Bible Dictionary* (iv. 239–66), and in 1905 his still fuller treatment of the same subject in *The Messages of the Apocalyptical Writers*, 169–294. To these works the present writer is indebted for many a suggestion.

A small commentary (no date) by Anderson Scott follows in some measure the lines laid down by Bousset and Porter.

Psychological Method.—It might be supposed that all possible methods had now been considered, and that a combination of the three methods which have established their validity in relation to the interpretation of the Apocalypse would be adequate to the solution of all the problems of the book, but this is not so; for even when each in turn has vindicated the provinces in the book that rightly belong to it, and brought intelligibility into these areas, there still remain outlying regions which they fail to illumine. It is not indeed that these methods have not claimed to solve the questions at issue, but that their solutions have failed to satisfy the larger body of reasonable criticism. The main problem, which so far has not been satisfactorily solved, may be shortly put as follows: Are the visions in the Apocalypse the genuine results of spiritual experience, or are they artificial productions, mere literary vehicles of the writer's teaching? Weizsäcker unhesitatingly advocates the latter view. But the serious students of later times find themselves unable to follow in his footsteps. The writer's belief in his prophetic office and his obvious conviction of the inviolable sanctity of his message make it impossible to accept Weizsäcker's opinion. Nor is it possible to accept Gunkel's theory in *Schöpfung und Chaos* as an adequate explanation, who explained the author's conviction of the truth of his message as springing always from the fact that he was dealing with traditional material. This theory, which we have already dealt with in other connexions, is undoubtedly helpful, but here we require something more, and Gunkel has in consequence of Weinel's work (*Wirkungen des Geistes und der Geister*, 1899) subsequently acknowledged that actual spiritual experiences lie behind some of the visions in apocalyptic (Kautzsch, *Pseud. des A.T.*, ii. 341 sqq.). The fact of such visionary experience can hardly be questioned: the only difficulty lies in determining to what extent it underlies the revelations of apocalyptic. For a short discussion of this question we might refer to Bousset's *Offenbarung Johannis*[2], pp. 8 sqq., and Porter's article on "Revelation" in Hastings' *Bible Dictionary*, iv. 248 sqq.

Methods of Interpretation.—As a result of the preceding inquiry we conclude that the student of the Apocalypse must make use of the following methods—the contemporary-historical, the literary-critical (fragmentary hypothesis), the traditional-historical and the psychological. Each of these has its legitimate province, and the extent of this province can in most cases be defined with reasonable certainty.

Plan and Detailed Criticism of the Book.—Two theories have been advanced to explain the plan and order of the book. The

first of these is the *recapitulation theory* which Tyconius originated and Augustine adopted, and which has been revived in later times by Hofmann, Hengstenberg and others. This theory holds that no progress is designed in the successive visions of the seven seals, the seven trumpets and the seven bowls; for that in the vision of the seals we have already an account of the last judgment (vi. 12–17) and the blessed consummation (vii. 9–17). Thus the three groups form parallel accounts and contain the same or closely related material. But such a view is in conflict with the fact that the Apocalypse exhibits a steady movement from a detailed account of the condition of actual individual churches on an ever-widening sweep to the catastrophes that will befall every nation and country till at last evil is finally overthrown and the blessedness of the righteous consummated. Accordingly later exegetes[1] hold that the seventh in each series is unfolded in the series of seven that follows. But to this theory also it has been objected (Holtzmann, *Hand-Commentar*. p. 294) that the bowls are in the main a repetition—in parts weaker, in others stronger—of what has already been put forward in the trumpets; that before the seventh member of each hebdomad there is a pause occasioned by the insertion of visions of a different nature; that the final judgment has already been depicted in vi. 17, and yet further descriptions recur in x. 6, 7, xi. 15–18, xiv. 7, xix. 11: the temple in heaven is opened in xi. 19 and yet again in xv. 5: heaven itself has already been rent in sunder in vi. 12–17, and yet in viii. 7–12 is supposed to be in its ancient order: all green grass is burnt up in viii. 7, yet in ix. 4 the locusts are not permitted to injure the grass, and other like inconsistencies.

The impossibility of logically carrying out either theory has given rise to doubts as to the unity of the book. Holtzmann (*Hand-Comment.* 295) represents its structure as follows:—

i. 1–8 . . Introduction.
i. 9–iii. 22 . . Group of seven letters.
iv.–v. 14 . . Heavenly scene of the Vision.
vi. 1–17 . . Six seals.
vii. 1–17 . . The sealed and the blessed.
viii. 1–5 . . The emergence of the trumpets from the seventh seal.
viii. 6.–ix. 21 . Six trumpets.
x. 1–xi. 14 . Destiny of Jerusalem.
xi. 15–19 . . The seventh trumpet.
xii. 1–xiv. 5 . The great visions of the three chief enemies and of the Kingdom of the Messiah.
xiv. 6–20 . . Return to the earlier connexion.
xv. 1–xvi. 1 . Transition to the bowls.
xvi. 2–21 . . Seven bowls.
xvii. 1–xix. 10 The great Babylon.
xix. 11–xx. 15 Final catastrophes.
xxi.–xxii. 5 . The New Jerusalem.
xxii. 6–21 . . Conclusion.

It is noteworthy that the sections on the right hand correspond in the main to the elements which have been those to which the latest critics have assigned either an earlier date or a different authorship.

Chaps. i.–iii.—These chapters open with a prologue, i. 1–3, which defines the source, character and contents of the book, followed by a greeting, i. 4–8, in which the writer salutes the Seven Churches of Asia. Having so introduced his work the author describes a vision of the ascended Christ, i. 9–20, who sends His messages to the angels of the Seven Churches, ii.–iii. With the conclusion of these epistles the Apocalypse proper really begins. But the way has been prepared for it. Its contents are "the things which must quickly happen," i. 1. The visions are not for John's personal benefit, but for transmission to the church at large, i. 11, and the writer is bidden to write down what he has seen and "the things which are and the things which shall be hereafter," i. 19.

iv.–vi.—The first three chapters show great artistic skill, and the power of the artist is no less conspicuous in what follows. First of all John is bidden to come up into heaven and see the things that should be hereafter, the vision of iv. 1. Then he beholds the Almighty on His throne surrounded by the four and twenty elders and the four living creatures. Before Him they all bow in worship and acknowledge that by Him were created all things and of His own free will were all created. In the next chapter (v.) the seer has a vision of a roll in the hand of Him that sat on the throne which none could open or look upon, till the Lion of the tribe of Judah, the mighty one with seven horns and seven eyes, appeared. Before Him all the elders and the living creatures fell down and acknowledged that He had power to open the seven seals thereof, and their song was re-echoed by every thing alike in heaven and earth. The contrast between these two chapters and those that follow is striking in the extreme. The time of the seer's vision is one of direst need. The life and death struggle between the church and the empire has now entered on its final stage, and fear and trouble and woe are rife in the hearts of the faithful. But when the seer is exalted to heaven he sees no trace of the turmoil on earth. The vision of the Almighty is full of majesty and peace. All things do Him service; for all are the free creation of His will. The next vision serves to connect the Source and Sustainer of all things with the world and its history. The closing of the intermediate stage of the history of created things is committed to the Christ who will also be Lord of the age to come. The future of the saints is assured: what can avail against Him that hath "glory and dominion for ever and ever" the wild attacks of Rome and even of Satan and his hosts? The Lamb that was slain has taken upon Himself the burden of the world's history.

In vi. we have the opening of the six seals, and the horrors of the future begin. The choice of three series of seven seals, seven trumpets and seven bowls, to form the framework in which the history of the last woes is to be given, shows the same hand that addressed the churches as seven. But between the sixth and seventh seals and the sixth and seventh trumpets the connexion is more or less disturbed by the insertion of certain interludes containing material foreign in certain aspects to the Apocalypse. These are vii. 1–17 and x. 1–xi. 14.

vii. 1–17.—These verses, which interrupt the plan of the book, fall into two independent fragments, 1–8 and 9–17, which are inconsistent in their original meaning with each other. For while 1–8 was most probably a Jewish apocalyptical fragment and strongly particularistic, 9–17 is clearly universalist in character and is probably from the hand of our author. The foreign origin of vii. 1–8 may be concluded with Spitta, Bousset and others from the fact that the four winds, which in vii. 1 are said to be held fast lest they should break in elemental fury on land and sea, are not let loose or referred to in the subsequent narrative, and also from the mention of the 144,000 Israelites of the twelve tribes, to whom no further reference is made; for these can no more be identified with the countless multitudes in vii. 9–17 than with those who are "sealed" in ix. 4 sq. nor with the 144,000 in xiv. 1; for in both these cases the sealed are not Jews but elect Christians. The object of both fragments was to encourage the faithful in the face of the coming strife. In the

[1] Swete divides the Apocalypse first of all into forty-two minor sections. Next he groups these sections into fourteen larger masses of apocalyptic matter, and by a process of synthesis seeks to arrive at the plan on which the author constructed his book. In so doing he points out that we become conscious of a great cleavage which practically divides the book into two parts, i. 9–xi. 14 and xii. 1–xxii. 5, independently of the prologue and greeting, i. 1–8, and the epilogue and benediction, xxii. 6–21. A further study of the leading thoughts of the above parts enables him to set forth the scheme of the book as follows:—

Prologue and Greeting, i. 1–8.
Part I. Vision of Christ in the midst of the churches, i. 9–iii. 22.
Vision of Christ in Heaven, iv. 1–v. 14.
Preparations for the End, vi. 1–xi. 19.
Part II. Vision of the Mother of Christ (*i.e.* the Church) and her enemies, xii. 1–xiii. 18.
Preparations for the End, xiv. 1–xx. 15.
Vision of the Bride of Christ arrayed for her husband, xxi. 1–xxii. 5.
Epilogue and benediction, xxii. 6–21.

latter, in which the Apocalyptist looks forward prophetically to the issue, the assurance held out is of ultimate victory, but of victory through death or martyrdom. In the former (Jewish or Christian-Jewish fragment) the sealing seemed to have carried with it the assurance of deliverance from physical death, as in Ezek. ix. 4 sqq. But in its *new* context this meaning can hardly be retained. Not improbably the sealing means to our author the preservation not from death, but through death from unfaithfulness, and the number 144,000 would signify mystically the entire body of true Christians, which formed the true people of God.

Chapter vii., then, interrupts the development of the author's plan, but the interruption is deliberate. He wishes to encourage the persecuted church not only to face without fear, but also to meet with triumphant assurance the onset of those evils which would bring panic and despair on the unbelieving world.

viii.–ix.—These chapters, though presenting some minor difficulties, do not call for discussion here. They recount the six partial judgments which followed the opening of the seventh seal and the blasts of the six trumpets.

x.–xi. 1–13.—This section bristles with difficulties. Chapter x. forms an introduction to xi. 1–13. In it the prophet receives a new commission, x. 11: "Thou must prophesy again over many peoples and nations and tongues and kings." This new commission explains his departure from the plan pursued in the earlier chapters of developing the seventh in each series into a new series of seven. The seer has a vision of the seven thunders, but these he is bidden to seal and not commit to writing. He is instead to write down the new book of prophecies. The end is at hand. It is noteworthy that in the earlier visions it was Christ who spoke to the seer. Here and in the later visions, especially those drawn from foreign sources, it is an angel.

In xi. 1–13 we have a characteristic illustration of our author's dependence on traditional materials and his free adaptation of them to meanings other than originally belonged to them. For it is generally agreed among critics that xi. 1–13 is borrowed from Jewish sources, and that this fragment really consists of two smaller fragments, xi. 1–2 and xi. 3–13. The former oracle referred originally to the actual Temple, and contained a prediction of the preservation of the Temple. It must have been written before A.D. 70 and probably by a Zealot.[1] But our author could not have taken it in this literal sense if he wrote after A.D. 70 or even anterior to that date, owing to the explicit declaration of Christ as to the coming destruction of Jerusalem. The passage, then, must have a spiritual meaning, and its purpose is the encouragement of the faithful by the assurance of their deliverance not necessarily from physical death but from the dominion of the evil one. In xi. 3–13 we have another Jewish fragment of a very enigmatic character. Bousset has shown with much probability that it is part of the Antichrist legend. The prophecy of the two witnesses and their martyrdom belongs to this tradition. The fragment was apparently written before A.D. 70, since it speaks of the fall of only a tenth of the city, xi. 13.[2] The significance of this fragment in our author's use of it is similar to that of xi. 1–2. The details defy at present any clear interpretation, but the incorporation of the fragment may be due in general to the emphasis it lays on the faithful witness, martyrdom and resurrection of the saints.

xi. 14–19.—The seventh trumpet, xi. 15, ushers in the third woe, xi. 14. Its contents are given in xii.–xx. In xi. 15–19 the seer hears great voices in heaven singing a triumphal song in anticipation of the victory that is speedily to be achieved. This song forms a prelude to the chapters that follow.

[1] The Zealots occupied the inner court of the Temple during its siege by the Romans.

[2] The linguistic evidence, as Bousset has pointed out, confirms the critical conclusion that xi. 1–13 were independent sources. For whereas in ix.–x. the verb almost regularly begins the sentence and the object follows the verb, in xi. 1–13 the object frequently precedes the verb and the subject nearly always. The order of the genitive in xi. 4 is elsewhere unknown in the Apocalypse, and in xi. 2, 3 the construction of *δώσω* followed by *καί* instead of infinitive or *ἵνα* is unique in this book.

xii.—This is the most difficult chapter in the book. Its main intention in its present context is apparently to explain Satan's dominion over the world and the bitterness of his rage against the church and against Christ. Christ, indeed, escapes him and likewise the Jewish Christians (" the woman," xii. 16) but " the rest of her seed," xii. 17 (the Gentile Christians?), are exposed to his fury. But his time is at hand; together with his hosts he has been cast down from heaven, and on the earth he " hath but a short time." The attribution of the seven heads and ten horns to the dragon, xii. 3, points forward to Rome, which is regarded as a temporary incarnation of Satan, xiii. 1, xvii. 3.

But, though a few of the leading thoughts of this chapter may be obvious, we are plunged into problems that all but defy solution when we essay to discover its origin or interpret its details. Most scholars are agreed that this chapter is not, except in the case of a few sentences, the work of our author. In other words, it has been taken over from pre-existing material—either Christian or Jewish—and the materials of which it is composed are ultimately derived from non-Jewish sources—either Babylonian, Greek or Egyptian—and bore therein very different meanings from those which belong to them in their present connexion. Furthermore, the materials are fragmentary and the order irregular.

(*a*) First of all, the chapter is not the free creation of a Christian writer. Such an one could never have so represented the life of Christ—a child persecuted by a dragon and carried off to God's throne. No mention of Christ's earthly life and crucifixion. Furthermore, the victory over Satan is ascribed to Michael. Again, a Christian could not represent Christ as the son of the wife of the sun-god; for such is the natural interpretation of the woman crowned with the twelve stars and with her feet upon the moon. Finally, even if " the woman " who is the mother of Christ be taken to be the ideal Israel in the beginning of the chapter, at its close she is clearly the Christian community founded by Him. We conclude, therefore, that the present chapter is not the work of our author. There are, however, traces of his hand. Thus 7–12, which is really a Jewish fragment recounting the victory of Michael over Satan, has to a certain degree been adapted to a Christian environment by the insertion of the 10b–11.

(*b*) The order is not original. The flight of the woman is mentioned in verse 6 to a place of refuge prepared for her by God. Then comes an account of the casting down of Satan from heaven. Then again in 13–16 the flight of the woman is described. This fact has been variously accounted for by different critics. Wellhausen regards 1–6 and 7–14 as doublets, and differentiates two actions in the original account which are here confused. Spitta takes verse 6 to be an addition of the redactor, which describes proleptically what follows, while Gunkel sees in 6 and 7–16 parallel accounts. In any case we should probably agree with the contention of J. Weiss, supported by Bousset in the second edition of his commentary, that 7–12 is a fragment of a Jewish apocalypse, of which 10b–11 is an addition of our author. Next that 6 is a doublet of 13 sqq. What then is to be made of 1–5, 13–17? Different explanations have been offered. Gunkel traces it to a Babylonian origin. He urges that an adequate explanation is impossible on the assumption of a Jewish or Christian origin. At the base of this account lies the Babylonian myth of the birth of the sun-god Marduk, his escape from the dragon who knows him to be his destined destroyer, and the persecution of Marduk's mother by the dragon. But Gunkel's explanation is an attempt to account for one *ignotum per ignotius*; for hitherto no trace of the myth of the sun-god's birth and persecution and the flight into the wilderness has been found in Babylonian mythology. Moreover, Gunkel no longer lays emphasis on the Babylonian, but merely on the mythical origin of the details. A more satisfactory explanation has been offered by Dieterich (*Abraxas*, 117 sqq.), who finds in this chapter an adaptation of the birth of Apollo and the attempt of the dragon Pytho to kill his mother

[1] *Schöpfung und Chaos* § 3, *Religionsgesch. Verständniss d. N.T.*, 54 sqq.

Leto, because it was foretold that Leto's son would kill the dragon. Leto escapes to Ortygia, which Poseidon covers with the sea in order to protect Leto. Here Apollo is born, who four days later slays the dragon. Yet another explanation from Egyptian mythology is given by Bousset (*Offenbarung Johannis*, 2nd ed., pp. 354, 355) in the birth of the sun-god Horus. Here the goddess mother is represented with a sun upon her head. Typhon slays Horus. Hathor, his mother, is persecuted by Typhon and escapes to a floating island with the bones of Horus, who revives and slays the dragon.[1] There are obvious points of similarity, possibly of derivation, between the details in our text and the above myths, but the subject cannot be further pursued here, save that we remark that in the sun myth the dragon tries to kill the mother before the child's birth, whereas in our text it is after his birth, and that neither in the Egyptian nor in the Greek myth is there any mention of the flight into the wilderness.

The insertion of the alien matter 7–12 between 1–5 and 13–17 may be due to our author's wish to show that the expulsion of Satan from heaven after Christ's birth and ascension to heaven was owing in some measure to Christ, although he has allowed Michael's name to remain in the borrowed passage, 7–12—a fact which shows how dependent the writer was on tradition.

xiii.—In this chapter we have the two beasts[2] which symbolize respectively Rome and the Roman provincial priesthood of the imperial cult. Thus the world powers of heathen statesmanship and heathen religion are leagued in a confederacy against the rising Christian Church. Against these the church is not to attempt to use physical force; its only weapon is to be passive endurance and loyalty to God.

That this chapter must be interpreted by the contemporary-historical method is now generally admitted. Even Gunkel is obliged to abandon his favourite theory here, though he contests strongly the recognition of any allusion to Nero. Various solutions have been offered as to the seven emperors designed by the seven heads of the beast, xiii. 1. But the details of this passage are not sufficiently definite to determine the question here. It will return in chapter xvii. There are, however, two facts pointing to a late date. The first is the advanced stage of development of this, the Neronic-Antichrist legend. One of the heads "is smitten unto death," but is healed of the death stroke. This points, we may here assume, to the Nero *redivivus* legend, which could not have arisen for a full generation after Nero's death, and the assumption receives large confirmation from the most probable interpretation of the enigmatical words, xiii. 18, "the number of the beast . . . is six hundred and sixty six." Four continental scholars, Fritzsche, Benary, Hitzig and Reuss, independently recognized that Nero was referred to under the mystical number 666. For by transliterating Καῖσαρ Νερών into Hebrew קסר נרון and adding together the sums denoted by the Hebrew letters we obtain the number 666. This solution is confirmed by the fact that it is possible to explain by it an ancient (Western?) variant for the number 666, *i.e.* 616. This latter, which is attested by Irenaeus (v. 30, 1), the commentary of Ticonius, and the uncial C, can be explained from the Latin form of the name Nero, which by its omission of the final *n* makes the sum total 616 instead of 666.

The above solution may be regarded as established, though several scholars, as Oscar Holtzmann (Stade's *Geschichte des Volkes Israel*, ii. 661), Spitta and Erbes, have contended that 616 was the original reading (Γάϊος Καῖσαρ=616) and that

[1] On the possibility of other points of contact between the Apocalypse and Egyptian mythology, see Mrs Grenfell's article, "Egyptian Mythology and the Bible," in the *Monist* (1906), pp. 169–200.

[2] In xiii. 2 the description of the beast unites the features of the four beasts in Daniel's vision (vii.). It is clear that our author identified the fourth beast (vii. 23) with Rome, as did also the author of 4 Ezra xii. 10. But this was not the original significance of the fourth beast, for the author of Daniel referred thereby to the Greek empire; but, since the prophecy was not realized, it was subsequently reinterpreted, and applied, as we have observed, to Rome.

chapter xiii. was part of a Jewish apocalypse written under Caligula between the years 39 and 41. But this Caligula hypothesis cannot be carried out unless by a vigorous use of the critical knife, in the course of which more than a third of the chapter is excised. Moreover the number 616 is too weakly supported to admit of its being recognized as the original.

The figure of the first beast presents many difficulties, owing to the fact that it is not freely invented but largely derived from traditional elements and is by the writer identified with the seventh wounded head. The second beast, signifying the pagan priesthood of the imperial cult, called "the false prophet" in xvi. 13, appears to be an independent development of the Antichrist legend.

xiv.–xvi.—These chapters contain a vision of Christ on Mount Zion and the 144,000 of the undefiled that follow Him, xiv. 1–5, the last warnings relating to the harvest and vintage of the world, xiv. 6–20: the vision of the wrath of God in the outpouring of the seven bowls containing the seven last plagues, xv.–xvi.

In the above section most critics are agreed that xiv. 14–20 originally represented the final judgment and was removed from its rightful place at the close of an apocalypse to its present position. In its original setting "the one like unto a Son of Man, having on his head a golden crown" (xiv. 14), undoubtedly designated the Messiah, but the transformation of the final judgment into a preliminary act of judgment by a reaper necessarily brought with it the degradation of the Son of Man to the level of a mere angel. Some critics hold that this apocalypse was the apocalyptic groundwork, but Bousset is of opinion that it stood originally in connexion with xi. 1–13.

As regards xvi. the views of critics take different directions, but that of Bousset followed by Porter seems the most reasonable. This is that this chapter forms an introduction to xvii., which was an independent fragment. The writer throws this introduction into his favourite scheme of seven acts, in this case symbolized by seven bowls. The earlier verses, 2–11, do not amount to much beyond a repetition of what is found in viii.–ix., save that as a preparation for xvii. references are inserted to the beast and Antichrist (ver. 2) and to Rome (ver. 10). In xvi. 12–16 is a revised form of an older tradition.

xvii.—This chapter presents great difficulties, especially if with the older and some of the recent exegetes we regard it as written at the same time and by the same author. Even so strong an upholder of the unity of the book as Swete is ready to admit that portions of xvii., as well as of xiii., show signs of an earlier date than the rest of the book. He writes: "The unity of the Book . . . cannot be pressed so far as to exclude the possibility that the extant book is a second edition of an earlier work, or that it incorporates earlier materials, and either hypothesis would sufficiently account for the few indications of a Neronic or Vespasianic date that have been found in it" (*Apoc. of St John*[2], p. civ.). This chapter cannot be interpreted apart from the Neronic myth. Of this there appear to be two stages attested here. Of the earlier we have traces in xvii. 16–17 and xvi. 12, where there are allusions to Nero's confederacy with the Parthian kings with a view to the destruction of Rome. Of the later stage, when the myth of Nero *redivivus* was fused with that of the Antichrist, we have attestation in xvii. 8, 12–14, where Nero is regarded as a demon coming up from the abyss to war not with Rome but with Christ and the elect. This development of the Neronic myth belongs to the last years of the 1st century, and is decidedly against a Vespasianic date. To meet this difficulty a recent interpreter—Anderson Scott—though he assigns the book to the year A.D. 77, is yet willing to admit that the book though composed in the reign of Vespasian was "reissued with additions by the same hand after the death of Domitian" (*Revelation*, p. 56). Our author represents himself as writing under the sixth emperor. Five have already died, the seventh is yet to come, to be followed by yet an eighth, who is one of the seven (*i.e.* Nero). In order to arrive at the date here implied, we can

begin the reckoning from Julius Caesar or Augustus, we can include or exclude Galba, Otho and Vitellius, and, finally, when we have drawn our conclusions from these data, there remains the possibility that the book was after all not written under the sixth emperor, but was really a *vaticinium ex eventu*. According to the different methods pursued, some have concluded that Nero was the sixth emperor, and thus dated the Apocalypse before A.D. 70; others Vespasian, and yet others Domitian. No solution of the difficulties of the chapter is wholly satisfactory, but the best yet offered seems to be that of Bousset (*Offenbarung*[2], 410–18). He holds that 1–7, 9–11, 15–18, belong to an original source, which was written in the reign of Vespasian and represents the earlier stage of the Neronic myth. To a reviser in Domitian's reign we owe 8.12–14 and 6b, a clause in 9, ἑστὰ ὅρη . . . αὐτῶν, and another in 11, ὃ ἦν καὶ οὐκ ἔστιν. If the clause *καὶ ἐκ τοῦ αἵματος τῶν μαρτύρων Ἰησοῦ* in 6 is an addition, then he thinks the source was Jewish and the "blood of the saints" was that shed at the destruction of Jerusalem, and the forecast of the author related to the destruction of Rome. When the reviser recast the passage it dealt not with the destruction of Jerusalem, but with the persecution of the Christians. Nero was now a demonic monster from the abyss, and the ten kings no longer Parthians but ghostly helpers of Nero. The destruction of Rome has now become a secondary event: the reviser's thought is fixed on the final strife between the Lamb and the Antichrist.

xviii.–xix. 10.—This section describes in prophetic language borrowed almost wholly from Isaiah and Jeremiah the coming judgment of Rome, and gives the ten lamentations of the kings and the merchants and the seamen over her, and the thanksgivings in heaven for her overthrow.

xix. 11–21.—The victory of the warrior Messiah over the two beasts, the Roman Empire and the imperial cultus and the kings of the earth. Many of the ideas set forth in earlier chapters here coalesce and find their consummation. The Messiah, whose birth and escape from the dragon was recounted in xii. 5, and who was to rule the nations with a rod of iron, at last appears in discharge of His office. The beast and the false prophet who are described in xiii. are cast alive into the lake of fire, and the kings of the earth who had assembled for this conflict, xvi. 14, xvii. 14, were slain by the sword of Him that sat on the horse.

The conception of the Messiah may be Jewish: at all events it is not distinctively Christian. The title "Word of God" can hardly be said to establish any connexion with the prologue of the Fourth Gospel; for the conceptions of the Messiah in that Gospel and in these chapters belong to different worlds of thought.

It is to be observed that our author follows the apocalyptic scheme of two judgments which is first attested about 100 B.C. The first judgment precedes the establishment of the temporary Messianic kingdom, as here in xix. 19–21; and the final judgment follows at its close, as here in xx. 7–10.

xx. 1–6.—The millennium, or the period between the first and final judgments, when Christ, with His chosen, reigns and Satan is imprisoned. Rome has been overthrown, but, as Rome is only the last secular manifestation of Satan, there is yet the final struggle with Satan and his adherents. But the time for this struggle has not yet arrived. Satan is bound[1] and cast into the abyss, and the kingdom of Christ and of the martyrs and faithful confessors established for a thousand years. Thus it is shown that evil will be finally overcome; for that the true and ultimate power even in this world belongs to Christ and those that are His.

The main features of this section have been borrowed from Judaism. The Messianic kingdom was originally conceived of as of everlasting duration on the present earth, but about 100 B.C. this idea was abandoned and the hopes of the faithful were directed to a temporary earthly kingdom of 400 or 1000 years or of indefinite duration (see R. H. Charles, *Critical History of the Doctrine of a Future Life*, pp. 201–4, 261, 286, 288). Moreover, the expectation that the saints would rise to share in the blessedness of this kingdom is also found in Judaism, 4 Ezra vii. 28 (*op. cit.* p. 285).

xx. 7–10.—Release of Satan and final assault on the city of God by the hosts of Gog and Magog at the instance of Satan. Satan and the beasts condemned to eternal torment.

xx. 11–14.—The Final Resurrection and Judgment.

xxi. 1–8.—The new heavens and the new earth. The language in this and the following section is highly figurative; but as Porter has well remarked: "Figurative language is the only language in which we can express our hope of heaven, and no figures can have greater power to suggest this hope than those taken from the literal longings of exiled Israel for the recovery of its land and city."

xxi. 9–xxii. 5.—The vision of the New Jerusalem. There are several grounds for regarding this section as an independent source possibly of Jewish origin and subsequently submitted to a Christian revision. This view is taken by Vischer, Weyland, Spitta, Sabatier, J. Weiss, Bousset and others. Our author has incorporated it as describing the consummation of the prevision contained in xi. 15–18, in which he foresaw the time when the kingdom of the world would become the kingdom of our Lord and of His Christ, and the saints should enter on their reward. Moreover, he has already hinted at its contents in xix. 7 and xxi. 2, where he speaks of the church as a bride and the marriage supper of the Lamb. But the section betrays inconsistent conceptions. The standpoint of the heavenly Jerusalem is abandoned in xxi. 24–27, xxii. 2, and the context implies an earthly Jerusalem to which the Gentiles go up as pilgrims. Outside the gates of this city are unclean and abominable things. These inconsistencies are best explained by the hypothesis that our author was drawing upon a literary fixed tradition. The doublets in xxi. 23 and xxii. 5b, in xxi. 25 and xxii. 5a, and in xxi. 27 and xxii. 3, point in the same direction. Various additions were introduced, according to Bousset, by the last redactor, such as the frequently recurring reference to the Lamb, xxi. 9, 22, 23, 27, xxii. 1, 3. In xxii. 3 the fact that the words "of the Lamb" are an addition is clear from the context; for, after the clause "the throne of God and of the Lamb shall be therein" the singular follows, "His servants shall do Him service."

xxii. 6–21.—The conclusion. The promises are sure, the end is near and the judgment at hand. The words of the book are the message of Christ Himself and are inviolable.

Unity.—From the preceding sections it follows that we cannot ascribe a strict literary unity to the book. The book is most probably the work of a single author, but it was not written wholly at one date, nor have all the parts come directly from one brain. We have several good grounds, for regarding vii. 1–8, xi. 1–13, xii., xiii., xvii., as wholly or in part independent sources, which our author has laid under contribution and adapted more or less adequately to his purpose. He appears to have taken over with but slight modification xx. and xxi. 9–xxii. 5. Furthermore, while certain fragments such as xi. 1–2 presuppose a date anterior to A.D. 70, others, as xvi. 12 and xvii. 12, require a date not later than Vespasian's time; other parts of xvii. postulate a Vespasianic date as the earliest admissible, and, finally, the composition of the book in its present form cannot be placed before the closing years of Domitian. But to this question we shall return presently.

Nevertheless, the book exhibits a relative unity; for, whatever digressions occur in the development of its theme, the main object of the writer is never lost sight of. This relative unity is manifested also in the uniform character of the language, a uniformity, however, which is occasionally conspicuous by its absence in the case of independent sources, as in xi. 1–13. The author or the final redactor has impressed a certain linguistic character on the book, which differentiates it not only from all secular writings of the time, but also from all the New Testament books, including the Johannine. And yet the Apocalypse shows in many of its phrases an undoubted affinity to the latter—

[1] This idea appears as early as the 2nd century B.C. Cf. Test. Levi xviii. 12.

a fact which requires for its explanation the assumption that the book emanated from certain literary circles influenced by John.

Date.—There are many indications of the date, which may be summarized as follows: (*a*) Condition of the Asian churches. (*b*) Persecution of the church. (*c*) Attitude of the author to Rome. (*d*) The Antichrist legend. (*e*) Primitive tradition and its confirmation through the discovery of references in the text to certain edicts of Domitian. As a result of these considerations we may arrive at the date of the work with almost greater certainty than that of any other New Testament book.

(*a*) *Condition of the Churches.*—Christianity appears to have already had a long history behind it. The fact that St Paul founded the church of Ephesus seems to have been forgotten. The ardent zeal has passed away and heathen ways of thought and life are tolerated and practised at Pergamum and Ephesus, and faith is dying or dead at Laodicea and Sardis. These phenomena belong to a period considerably later than the time of Nero.

(*b*) *Persecution of the Church.*—Persecution is the order of the day. Each of the seven letters concludes with praise of those who have been victorious therein. There had been isolated instances of persecution at Ephesus, ii. 3, Philadelphia, iii. 8, 10, and at Smyrna, ii. 9, and of an actual martyrdom at Pergamum, ii. 13. But now a storm of persecution was about to break upon the universal church, iii. 10, and in the immediate future. Already the seer beholds the destined number of the martyrs complete, vi. 9–11: the great multitude whom no man can number, clothed in white before the throne of God, vii. 9: he exhorts his readers to patient endurance unto death, xiv. 12, and already sees them as victors in heaven, xv. 2. Over the true witnesses and martyrs he pronounces the final beatitude of the faithful: "Blessed are those who die in the Lord," xiv. 13.

Such an expectation of persecution is inexplicable from Nero's time. There is not a trace of any declaration of war on the universal church in his period such as the Apocalyptist anticipates and in part experiences. Christian persecution under Nero was an imperial caprice. The Christians were attacked on slanderous charges of superstition and secret abominations, but not as a church. Not till the last years of Domitian is it possible to discover conditions which would explain the apprehensions and experiences of our writer. So far as we can discover, no persecution was directed against Christians as Christians till Domitian's time. In the year A.D. 92 Flavius Clemens was put to death and his wife banished, on the ground that they were adherents of the new faith. Thus the temper of the book on this question demands some date after A.D. 90. It marks the transition, from the earlier tolerant attitude of Rome towards Christianity, to its later hostile attitude.

(*c*) *Attitude of the Author towards Rome.*—In earlier times the church had strongly impressed the duty of loyalty to Rome, as we see from the Epistle to the Romans and 1 Peter. This was before the pressure of the imperial cult was felt by the Christian church. But in the Apocalypse we have the experiences of a later date. The writer manifests the most burning hatred towards Rome and the worship of its head—the beast and the false prophet, who are actual embodiments of Satan. Such an attitude on the part of a Christian is not explicable before the closing years of Domitian; for, apart from Caligula, he was the first Roman emperor who consistently demanded divine honours.

(*d*) *The Antichrist Legend.*—We find at least two stages of the Neronic and Antichrist myth in the Apocalypse. The earliest form is not attested here, that Nero had not really been slain, but would speedily return and destroy his enemies. The first pretender appeared in A.D. 69, and was put to death in Cythnus. The second stage of this legend was that Nero had taken refuge in the Far East, and would return with the help of his Eastern subjects for the overthrow of Rome. Two pretenders arose in conformity with this expectation among the Parthians in A.D. 80 and 88. This widespread expectation has left its memorial in our book in xvi. 12 and in xvii. 16–17, which point to the belief that Rome would be destroyed by Nero and the Parthian kings. Finally, in xiii. and xvii. 8, 12–14, we have a later phase of the myth, in which there is a fusion of the Antichrist myth with that of Nero *redivivus*. This fusion could hardly have taken place before the first half of Domitian's reign, when the last Neronic pretender appeared. As soon as the hope of the living Nero could no longer be entertained, the way was prepared for this transformation of the myth. The living Nero was no longer expected to return from the East, but Nero was to be restored to life from the abyss by the dragon, *i.e.* Satan. This expectation is recounted in xiii., but it appears most clearly in the additions to xvii. Thus in xvii. 8 the reference to Nero *redivivus* as the Antichrist is manifest: "The beast that thou sawest was, and is not, and is about to come up out of the abyss and to go into perdition."[1] Thus again we are obliged to postulate a date not earlier than A.D. 90 for the book in its present form.

(*e*) *Primitive Church Tradition and its Confirmation through the Discovery of References in the Text to Certain Edicts of Domitian.*—The earliest external evidence is practically unanimous in ascribing the Apocalypse to the last years of Domitian. The oldest testimony is that of Irenaeus v. 30. 3: δι' ἐκείνου ἂν ἐρρέθη τοῦ καὶ τὴν Ἀποκάλυψιν ἑωρακότος οὐδὲ γὰρ πρὸ πολλοῦ χρόνου ἐφάνη, ἀλλὰ σχεδὸν ἐπὶ τῆς ἡμετέρας γενεᾶς, πρὸς τῷ τέλει τῆς Δομετιανοῦ ἀρχῆς. The rest of the patristic evidence from Clement of Alexandria, Origen, Victorinus, Eusebius and Jerome will be found in Swete's *Apocalypse of John*, xcix. seq. Though a few later authorities, such as Epiphanius and Theophylact, assign the book to earlier or later periods, the main body of early Christian tradition attests the date of its composition in the closing years of Domitian. Notwithstanding, on various critical grounds, Baur, Hilgenfeld, Lightfoot, Westcott, Hort and Beyschlag assigned the book to the reign of Nero, or to the years immediately following his death, while Weiss, Dusterdieck and Mommsen assign it to the time of Vespasian. When, however, we combine the preceding arguments with that of the early church tradition, the evidence for the Domitian date outweighs that for any other. And this conclusion receives remarkable confirmation from a recent fact brought forward by S. Reinach in an article in the *Revue archéologique*, sér. III. t. xxxix. (1901), pp. 357–74, and reprinted in *Cultes, mythes et religions*, ii. 356–80 (1906). This fact explains a passage which has hitherto been a total enigma to every expounder, *i.e.* vi. 6: "A choenix of wheat for a denarius, and three choenikes of barley for a denarius, and the oil and the wine hurt thou not." Swete writes here: "The voice fixes a maximum price for the main food-stuffs. The denarius . . . was the daily wage . . . and a choenix of wheat

[1] Verse 11 postulates either a Vespasianic or Domitianic date: "And the beast that was, and is not, is himself also an eighth, and is of the seven; and he goeth into perdition." In verse 10 it is stated that five of the seven had fallen, "the one is and another is not yet come, and when he cometh he must continue a little while." If we reckon from Augustine and omit Galba, Otho and Vitellius, each of whom reigned only a few months, we arrive at Vespasian, Titus, Domitian, Nerva, Trajan, his reign A.D. 69–79. Verse 11, with the exception of the words "which was and is not," leads to the identification of the eighth with Nero *redivivus*. But what then is to be made of the above reckoning when it was taken over by the Apocalyptist who wrote in Domitian's reign? Some scholars are of opinion that this writer identified Domitian with the eighth emperor, the Nero *redivivus*, the beast from the abyss. But this is unlikely, notwithstanding the fact that even some pagan writers, such as Tacitus, Pliny and Martial (?), discovered a resemblance between Domitian and Nero. On the other hand, if we refuse to accept this identification, and hold that the beast from the abyss is yet to come, any attempt at a strict exegesis of the text plunges us in hopeless difficulties. For Domitian in that case would be the sixth, and the preceding five would have to begin with Galba—a most improbable supposition. But futhermore, since this new reckoning would exclude Nero, how could the eighth be said to be one of the seven, *i.e.* Nero? Bousset thinks that the Apocalyptist, knowing not what to make of this reckoning, left it standing as it was and attempted a new interpretation of the seven heads by taking them to refer to the seven hills of Rome in the additions he made to verse 9.

the average daily consumption of the workman. . . . Barley was largely the food of the poor." According to the words just quoted from the Apocalypse, there was to be a dearth of grain and a superfluity of wine; the price of the wheat was to be seven times the ordinary, according to Reinach's computation, and that of the barley four times. This strange statement suggested some historical allusion, and the discovery of the allusion was made by Reinach, who points out that Domitian by an edict in A.D. 92 prohibited the planting of new vineyards in Italy, and ordered the reduction of those in the provinces by one-half. As Asia Minor suffered specially under this edict, an agitation was set on foot which resulted in the revocation of the edict. In this revocation the Apocalyptist saw the menace of a famine of the necessaries of life, while the luxuries would remain unaffected. From his ascetic standpoint the revocation of the edict could only pander to drunkenness and immorality. Reinach's explanation of this ancient *crux interpretum*, which has been accepted by Harnack, Bousset, Porter, Sanday, Swete and others, fixes the earliest date of the composition of the Apocalypse as A.D. 93. Since Domitian died in 96, the book was therefore written between A.D. 93 and 95.

Author.—Before entering on the chief data which help towards the determination of this question, we shall first state the author's standpoint. His book exhibits a Christianity that is—as Harnack (*Ency. Brit.*[9], xx. 498) writes—"free from the law, free from national prejudices, universal and yet a Christianity which is independent of Paul. . . . The author speaks not at all of the law[1]—the word does not occur in his work; he looks for salvation from the power and grace of God and Christ alone . . . nowhere has he made a distinction between Gentile and Jewish Christians. . . . The author of the Apocalypse has cast aside all national religious prejudices." The writer is not dependent, consciously or unconsciously, on the Pauline teaching. He has won his way to universalism, not through the Pauline method, but through one of his own. He has no serious preference for the people of Israel as such, but only for the martyrs and confessors, who shall belong to every tribe and tongue and people and nation (vii. 9 seq.). The unbelieving Jews are "a synagogue of Satan" (ii. 9).

Yet, on the other hand, our author's attitude to the world reflects the temper of Judaism rather than that of Christianity. He looks upon the enemies of the Christian Church with unconcealed hatred. No prayer arises within his work on their behalf, and nothing but unalloyed triumph is displayed over their doom. The Christian duty of love to those that wrong us does not seem to have impressed itself on our Apocalyptist.

Is the Apocalypse pseudonymous?—All the Jewish apocalypses are pseudonymous, and all the Christian with the exception of the *Shepherd of Hermas*. Since our book undoubtedly belongs to this category, the question of its pseudonymity must arise. In the articles on Apocalyptic Literature and Apocryphal Literature (*qq.v.*) we have shown the large lines of differentiation between apocalyptic and prophecy. The chief ground for resorting to pseudonymous authorship in Judaism was that the belief in prophecy was lost among the people. Hence any writer who would appeal to them was obliged to do so in the name of some great figure of the past. Furthermore, this belief that prophecy had ceased led the religious personalities of the later time to authenticate their message by means of antedated prophecy. They procured confidence in their actual predictions by appealing to the literal fulfilment of such antedated prophecy. In such literature we find the characteristic words or their equivalents: "Seal up the prophecy: it is not for this generation," which are designed to explain the late appearance of the works in which they are found. But this universal characteristic of apocalyptic is almost wholly lacking in the New Testament Apocalypse. The *vaticinium ex eventu* plays but a very small part in it. Moreover, the chief ground for the development of a pseudonymous literature was absent in the early Christian church. For with the advent of Christianity prophecy had sprung anew into life, and our author distinctly declares that the words of the book are for his own generation (xxii. 10). Hence we conclude that the grounds are lacking which would entitle our assuming a priori that the Apocalypse is pseudonymous.

Was the Author the Son of Zebedee, the Apostle?—The evidence of the book is against this assumption. The writer demands a hearing as a prophet (xxii. 6), and in no single passage makes any claim to having been an apostle. Nay more, the evidence of the text, so far as it goes, is against such a view. He never refers to any previous intercourse with Christ such as we find frequently in the Fourth Gospel, and when he speaks of "the twelve apostles of the Lamb" (xxi. 14) he does so in a tone that would seem to exclude him from that body. Here internal and external evidence are at strife; for from the time of Justin onwards the Apocalypse was received by the church as the work of the Apostle John (see Swete, *op. cit.*[2], p. clxxv). If the writer of the Fourth Gospel was the Apostle John, then the difficulties for the assumption of an apostolic authorship of the Apocalypse become well-nigh insuperable. Nay more, the difficulties attending on the assumption of a common authorship of the Gospel and Apocalypse, independently of the question of the apostolic authorship of the Gospel, are practically insuperable. Some decades ago these difficulties were not insurmountable, which is independent of Paul. . . . The author speaks not at when the Apocalypse was assigned a Neronic date to the Apocalypse and a Domitianic or later date to the Gospel. It was from such a standpoint conceivable that the thoughts and diction of the writer had undergone an entire transformation in the long interval that intervened between the composition of the two books, on the supposition that both were from the same hand. But now that both books are assigned to the last decade of the 1st century A.D. by a growing body of critics, the hypothesis of a common authorship can hardly be sustained. The validity of such an hypothesis was attacked as early as the 4th century by Dionysius of Alexandria in the fragment of his treatise περὶ ἐπαγγελιῶν, in Eusebius, *H.E.* vii. 24 seq. His arguments, as summed up by Swete (*op. cit.*, p. cxiv seq.), are as follows: "John the Evangelist abstains from mentioning his own name, but John the Apocalyptist names himself more than once at the very outset of his book, and again near its end. Doubtless there were many who bore the name of John in the early Christian communities; we read, for instance, of 'John, whose surname was Mark,' and there may have been a second John in Asia, since at Ephesus, we are told, there were two tombs said to be John's. . . . Again, while the Gospel and the Epistle of John show marks of agreement which suggest a common authorship, the Apocalypse differs widely from both in its ideas and in its way of expressing them; we miss in it the frequent references to 'life,' 'light,' 'truth,' 'grace' and 'love' which are characteristic of the Apostle and find ourselves in a totally different region of thought. . . . Lastly, the linguistic eccentricities of the Apocalypse bar the way against the acceptance of the book as the work of the Evangelist. The Gospel and the First Epistle are written in correct and flowing Greek, and there is not a barbarism, a solecism, or a provincialism in them; whereas the Greek of the Apocalypse is inaccurate, disfigured by unusual or foreign words and even at times by solecisms."

All subsequent criticism has more or less confirmed the conclusions of Dionysius. On the other hand, it is impossible to ignore the signs of a relationship between the Apocalypse and the Gospel in the minor peculiarities of language.[2] These, Swete holds, "create a strong presumption of affinity" between the two books, while Bousset infers that they "justify the assumption that the entire circle of Johannine writings spring from circles which stood under the influence of the John of Asia Minor."

We conclude, therefore, that the Gospel and the Apocalypse

[1] His freedom from legal bondage is as undeniable as his universalism. He lays no further burden on his readers than those required by the Apostolic Decree of Acts xv. 28 seq.

[2] See Bousset, *Offenbarung Johannis*[3], pp. 177–179; Swete[3], pp. cxxv–cxxix.

are derived from different authors who moved in the same circles.[1]

As regards the John mentioned in the Apocalypse, he is now identified by a majority of critics with John the Presbyter, and further the trend of criticism is in favour of transferring all the Johannine writings to him, or rather to his school in Asia Minor.[2]

For an independent discussion of the authorship of the Fourth Gospel, see JOHN, GOSPEL OF ST. (R. H. C.)

REVELS, MASTER OF THE.—The history of the Revels office has an interesting place in that of the English stage (see also DRAMA, and THEATRE). Among the expenses of the royal Wardrobe we find provision made for *tunicae* and *viseres* in 1347 for the Christmas *ludi* of Edward III.; during the reign of Henry VII. payments are also recorded for various forms of court revels; and it became regular, apparently, to appoint a special functionary, called Master of the Revels, to superintend the royal festivities, quite distinct from the Lord of Misrule (*q.v.*). In Henry VII.'s time he seems to have been a minor official of the household. In Henry VIII.'s time, however, the post became more important, and an officer of the Wardrobe was permanently employed to act under the Master of the Revels. With the patent given to John Farlyon in 1534 as Yeoman of the Revels, what may be considered as an independent office of the Revels (within the general sphere of the lord chamberlain) came into being; and in 1544 Sir Thomas Cawarden received a patent as Master of the Revels, he being the first to become head of an independent office, *Magister Jocorum, Revelorum et Mascorum omnium et singularium nostrorum vulgariter nuncupatorum Revells and Masks*. Cawarden was Master till 1559. Soon after his appointment, the office and its stores were transferred to a dissolved Dominican monastery at Blackfriars, having previously been housed at Warwick Inn in the city, the Charterhouse, and then at the priory of St John of Jerusalem in Clerkenwell, to which a return was made after Cawarden's death. Sir Thomas Benger succeeded Cawarden, and Edmund Tylney followed him (1579–1610); it was the appointment of the latter's nephew, Sir George Buck, as deputy-master, with the reversion to the mastership, which led to so much repining on the part of the dramatist, John Lyly, who was himself a candidate. Under Tylney, the functions of Master of the Revels gradually became extended to a general censorship of the stage, which in 1624 was put directly in the hands of the lord chamberlain, thus leading to the licensing act of 1737 (see DRAMA).

See E. K. Chambers, *The Mediaeval Stage* (1904); and his *Notes on the History of the Revels Office under the Tudors* (1906), with authorities quoted.

REVELSTOKE, an incorporated town of British Columbia, on the Columbia river and the Canadian Pacific railway, 381 m. E. of Vancouver. Pop. (1907) 3526. It is the capital of Kootenay county, and the shipping centre for the mining and lumbering district. It contains large railway shops, several breweries, and saw and shingle mills.

REVENTLOW, CHRISTIAN DITLEV FREDERICK, COUNT (1748–1827), Danish statesman and reformer, the son of Privy Councillor Christian Ditlev Reventlow, born on March 11, 1748. After being educated at the academy of Sorö and at Leipzig, Reventlow, in company with his younger brother Johan Ludwig and the distinguished Saxon economist Carl Wendt (1731–1815), the best of cicerones on such a tour, travelled through Germany, Switzerland, France and England, to examine the social, economical and agricultural conditions of civilized Europe. A visit to Sweden and Norway to study mining and metallurgy completed the curriculum, and when Reventlow in the course of 1770 returned to Denmark he was an authority on all the economic questions of the day. In 1774 he held a high position in the *Kammercollegiet*, or board of trade, two years later he entered the Department of Mines, and in 1781 he was a member of the *Overskattedirectionen*, or chief taxing board. He had, in 1774, married Frederica Charlotte von Beulwitz, who bore him thirteen children, and on his father's death in 1775 inherited the family estate in Laaland. Reventlow overflowed with progressive ideas, especially as regards agriculture, and he devoted himself, heart and soul, to the improvement of his property and the amelioration of his serfs. Fortunately, the ambition to play a useful part in a wider field of activity than he could find in the country ultimately prevailed. His time came when the ultra-conservative ministry of Hoegh Guldberg was dismissed (April 14th, 1784) and Andreas Bernstorff, the statesman for whom Reventlow had the highest admiration, returned to power.

Reventlow was an excellently trained specialist in many departments, and was always firm and confident in those subjects which he had made his own. Moreover, he was a man of strong and warm feelings, and deeply religious.

The condition of the peasantry especially interested him. He was convinced that free labour would be far more profitable to the land, and that the peasant himself would be better if released from his thraldom.

His favourite field of labour was thrown open to him when, on the 6th of August 1784, he was placed at the head of the *Rentekammeret*, which took cognisance of everything relating to agriculture. His first step was to appoint a small agricultural commission to better the condition of the crown serfs, and amongst other things enable them to turn their leaseholds into freeholds. Observing that the Crown Prince Frederick was also favourably disposed towards the amelioration of the peasantry, Reventlow induced him, in July 1786, to appoint a grand commission to take the condition of all the peasantry in the kingdom into immediate consideration. This celebrated agricultural commission continued its labours for many years, and introduced a whole series of reforms of the highest importance. Thus the ordinance of 8th June 1787 modified the existing leaseholds, greatly to the advantage of the peasantry; the ordinance of 20th June 1788 abolished villenage and completely transformed the much-abused *hoveri* system whereby the feudal tenant was bound to cultivate his lord's land as well as his own; and the ordinance of 6th December 1799, which did away with *hoveri* altogether. Reventlow was also instrumental in starting the public credit banks, for enabling small cultivators to borrow money on favourable terms. In conjunction with his friend, Heinrich Ernst Schimmelmann (1747–1831), he also procured the passing of the ordinances permitting free trade between Denmark and Norway,

[1] There are several analogies in Jewish literature. Thus the *Testaments of the XII. Patriarchs*—a universalist work—and the *Book of Jubilees*—a particularistic work—are from different authors, though they are written within a few years of each other by Pharisees and use much common material. Similarly with regard to the Apocalypse of Baruch and 4 Ezra.

[2] Several converging lines of testimony tend to prove that John the son of Zebedee was, like his brother James, put to death by the Jews. First, we have the express testimony of Papias to this effect, which is preserved in George Hamartulus and in an epitome of Philip of Side. Attempts have been made to explain away this testimony by Lightfoot, Harnack, Drummond, and Bernard (*Irish Church Quarterly*, 1908, 52 sqq.). Secondly, Papias's testimony receives support from Jesus's own words in Mark x. 39, for, as Wellhausen remarks on this passage, "the prophecy refers not only to James but also to John; and if it had remained only half fulfilled, it would hardly have kept its place in the Gospel." The third strand of evidence is found in the Martyrologies of Carthaginian, Armenian and Syrian. Bernard (*op. cit.*) has tried to prove that the Martyrologies do not imply the martyrdom but only the faithful witness of John. Finally, Clement of Alexandria (Bousset, *Die Offenbarung*, p. 90) furnishes evidence in the same direction; for in Clem. Alex. *Strom.* iv. 9, 71, the Gnostic Heracleon gives a list of the Apostles who had not been martyred, and these were: "Matthew, Philip, Thomas and Levi" (corrupt for Lebbaeus). If we accept this evidence, the martyrdom cannot have been later than A.D. 69, and may have been considerably earlier. In either case such a fact, if it is a fact, is against an Apostolic origin of the Johannine writings. John the Presbyter is in that case "the disciple whom the Lord loved" and the founder of the Johannine school in Asia Minor. But the question is still at issue.

[3] The word "revel" meant properly a noisy or riotous tumult or merry-making, and is derived from O. Fr. *reveler*, to rebel, to riot, make a noise; Lat. *rebellare*.

the free importation of corn from abroad, and the abolition of the mischievous monopoly of the Iceland trade.

But the financial distress of Denmark, the jealousy of the duchies, the ruinous political complications of the Napoleonic period, and, above all, the Crown Prince Frederick's growing jealousy of his official advisers, which led him to rule, or rather misrule, for years without the co-operation of his Council of State—all these calamities were at last too much even for Reventlow. On 7th December 1813 he received his dismissal and retired to his estates, where, after working cheerfully among his peasantry to the last, he died on the 11th of October 1827.

See Adolph Frederik Bergsöe, *Grev. C. D. F. Reventlows Virksomhed* (Copenhagen, 1837); Louis Theodor Alfred Bobe, *Efterl. Papirer fra den Reventlowske Familiekreds* (Copenhagen, 1895–97).

REVENUE (O. Fr. *revenu*, from *revenir*, to return), income, return, or profit; more particularly the receipts from all sources of a government or state. The revenue of a state is largely made up of taxation, and the general principles of taxes are discussed in TAXATION and FINANCE. In some countries the public or state domain may contribute substantially to the revenue, as do the crown forests in Russia, while in other countries important contributions are made from the state railways, post and telegraph services, &c. For the historical development of the English revenue see ENGLISH FINANCE, and for other countries see the sections on finance in the articles dealing with the various countries. In the United Kingdom the term inland revenue is used to denote that part of the revenue which is derived from death duties, stamps and other taxes, such as income tax, land tax, inhabited house duty, &c. The Board of Inland Revenue is a special department of the English civil service, with headquarters at Somerset House. The Board consists of a chairman, deputy chairman, and two commissioners, with joint secretaries, assistant secretaries and a staff of officials. The other important department engaged in the collection of the English revenue is the Board of Customs and Excise. The excise department was formerly a branch of the inland revenue, but was amalgamated with the customs department on the 1st of April 1909. The Board of Customs and Excise is constituted as is the Board of Inland Revenue.

In the United States the greater proportion of the national revenue ($547,086,902 out of $663,217,677 in 1909) is derived from customs and internal revenue. The internal revenue consists for the most part of receipts from taxes on spirits, tobaccos and fermented liquors. In 1909 the amount derived from customs revenue was $300,077,438, and internal revenue, $246,109,554.

REVERE, PAUL (1735–1818), American engraver and patriot, was born in Boston, Massachusetts, on the 1st of January 1735. He had a meagre schooling, and in his father's shop learned the trade of a gold- and silversmith. In 1756 he was second lieutenant of artillery in the expedition against Crown Point, and for several months was stationed at Fort Edward, in New York. He became a proficient copper engraver, and engraved several anti-British caricatures in the years before the War of Independence. He was one of the Boston grand jurors who refused to serve in 1774 because parliament had made the justices independent of the people for their salaries; was a leader in the Boston Tea Party; was one of the thirty North End mechanics who patrolled the streets to watch the movements of the British troops and Tories; and in December 1774 was sent to Portsmouth, New Hampshire, to urge the seizure of military stores there, and induced the colonists to attack and capture Fort William and Mary—one of the first acts of military force in the war. His midnight ride from Charlestown to Lexington on the 18th–19th of April 1775, to give warning of the approach of British troops from Boston, is Revere's most famous exploit; it is commemorated by Longfellow, who, however, has "paid little attention to exactness of fact" (Justin Winsor). In 1775 Revere was sent by the Massachusetts provincial congress to Philadelphia to study the working of the only powder mill in the colonies, and although he was allowed only to pass through the building, obtained sufficient information to enable him to set up a powder mill at Canton. He was commissioned a major of infantry in the Massachusetts militia in April 1776; was promoted to the rank of lieutenant-colonel of artillery in November; was stationed at Castle William, defending Boston harbour, and finally received command of this fort. He served in an expedition to Rhode Island in 1778, and in the following year participated in the unsuccessful Penobscot expedition. After his return he was accused of having disobeyed the orders of the commanding officer, was tried by court-martial, and was acquitted. After the war he engaged in the manufacture of gold and silver ware, and became the pioneer in the production in America of copper plating and copper spikes for ships. In 1795, as grandmaster of the Masonic fraternity, he laid the cornerstone of the new State House in Boston, and in this year also founded the Massachusetts Charitable Mechanic Association, becoming its first president. He died in Boston on the 10th of May 1818.

See Charles F. Gettemy, *The True Story of Paul Revere* (Boston, 1905).

REVERE, a township and a coast resort of Suffolk county, Massachusetts, U.S.A., immediately N.E. of Boston on Massachusetts Bay. Pop. (1910, U.S. census), 18,219. Area, 4·56 sq. m. The township is served by the Boston & Maine and the Boston, Revere Beach & Lynn railways, and by several electric railways connecting with Boston, Chelsea, Lynn, Malden, and Medford. Revere Beach, a crescent-shaped beach of white sand extending from the promontory of Winthrop on the S. to the Point of Pines on the N., is a popular bathing resort, and has been called the Coney Island of Boston. The township has a Carnegie library and a handsome town hall. The first settlement here was made about 1626, and, under the name of Rumney Marsh, it was a part of Boston until 1739, when it became a part of the new township of Chelsea. The northern part of Chelsea was organized as the township of North Chelsea in 1846; part of it was separated as Winthrop in 1852; and in 1871 the name North Chelsea was changed to Revere, in honour of Paul Revere.

REVEREND (Lat. *reverendus*, gerundive of *revereri*, to revere, pay respect to), a form of respect or courtesy, now especially used as the ordinary prefix of address to the names of ministers of religion of all denominations. The uses of Med. Lat. *reverendus* do not confine the term to those in orders; Du Cange (*Gloss. s.v.*) defines it as *titulus honorarius, etiam mulieribus potioris dignitatie concessus*, and in the 15th century in English it is found as a general term of respectful address. The usual prefix of address of a parson was "sir," representing Lat. *dominus* (see SIR), or "master." It has been habitually used of the parochial clergy of the Church of England since the end of the 17th century. It is not, however, a title of honour or dignity, and no denomination has any exclusive right to use it. A faculty was ordered to be issued for the erection of a tombstone, the inscription on which contained the name of a Wesleyan minister prefixed by "reverend"; this the incumbent had refused (*Keat v. Smith*, 1876, 1 P.D. 73). In the Church of England deans are addressed as "very reverend," bishops as "right reverend," archbishops as "most reverend." The Moderator of the Church of Scotland is also styled "right reverend."

REVERIE, a condition of mental abstraction, a fit of musing, a "brown study" ("brown" in the sense of "gloomy," and not to be referred to Germ. *Braune*, brow). The word appears in the 14th or 15th centuries in its original meaning in Old French, of joy, delight, also wildness, anger. The French *rever*, later *resver*, modern *rêver*, to dream, meant originally to wander in speech or thought, and is derived from the Lat. *rabiare*, cf. "rabies," "rage" and "rave." The French *réverie* (*resverie*) was adopted again in the 17th and 18th centuries as meaning a state of dreaminess; thus Locke (*Essay on the Human Understanding*, 1695, ii. xix.) says: "When ideas float in our minds

without any reflection or regard of the understanding, it is that which the French call *revery*; our language has scarce a word for it."

REVIEW (Fr. *revue*, from *revoir*, to see again, Lat. *re* and *videre*), an inspection or critical examination; it is chiefly used as a military or naval term for an inspection on a large or formal scale of a fleet or body of troops by the sovereign or other person holding a high official position, or for a critical account of a recently published literary work in a magazine or periodical. The earliest use of the word for the title of such a periodical was in the paper begun by Defoe in 1704, the full title of which was *A Review of the Affairs of France and of all Europe, as influenced by that Nation* (see PERIODICALS and NEWSPAPERS). In France there is a particular application of the term *revue*, or, more fully, *revue de fin d'année* to a form of dramatic performance, acted or sung, in which the chief events of the past year, and the personages who have been prominently before the public, are satirically and critically passed under review. Attempts have been made to trace such performances to an early origin. In their modern form, however, they date from the reign of Louis Philippe. *L'An 1841 et l'an 1941*, by the brothers Cogniard, was one of the earliest.

REVILLAGIGEDO, an isolated, uninhabited group of rocky islands in the N. Pacific, lat. 18° N., long. 112° W., belonging to Mexico, and forming part of the state of Colima. They are about 420 m. from the Mexican coast and comprise the large island of Socorro (San Tomás), 24 m. long by an average of 9 m. wide, and the three widely separated islets of San Benedicto, Roca Partida and Clarion, with a total area of 320 sq. m. The island of Socorro has an extinct volcano 3660 ft. high. The islands have certain remarkable zoological features, comprising several birds and reptiles allied to those of the Mexican mainland but differing from them in species. The archipelago derives its name from the Spanish viceroy who governed Mexico from 1746 to 1755.

RÉVILLE, ALBERT (1826–), French Protestant theologian, was born at Dieppe on the 4th of November 1826. After studying at Geneva and Strassburg, he became in 1849 pastor at Lunerai near Dieppe, and in 1851 of the Walloon Church at Rotterdam, where he remained until 1872. In 1880 he was made professor of the history of religions in the Collège de France at Paris. Six years later he was appointed president of the section of religious studies in the École des hautes études at the Sorbonne. He is one of the leaders of the French school of advanced critical theology.

Works.—Besides contributing to the *Revue de théologie* (Paris), the *Revue de l'histoire des religions* (Paris), the *Revue des deux mondes*, the following works are important: *Manuel d'histoire comparé de la philosophie et de la religion* (1859; Eng. trans., 1864); *Histoire du dogme de la divinité de Jésus Christ* (1869, 3rd ed., 1904; Eng. trans., 1905); *Prolegomènes de l'histoire des religions* (1881, 4th ed., 1886; Eng. trans., 1884); *Théodore Parker, sa vie et ses œuvres* (1865; Eng. trans., 1865, 2nd ed., 1877); *Lectures on the Origin and Growth of Religion as illustrated by the native religions of Mexico and Peru* (the "Hibbert Lectures" for 1884); *Jésus de Nazareth* (1897, 12th ed., 1906).

His son, JEAN RÉVILLE, was born on the 6th of November 1854, studied at Geneva, Paris, Berlin and Heidelberg, and became professor of patristic literature and secretary of the section of religious studies in the École des hautes études at the Sorbonne. In 1884 he became co-editor of the *Revue de l'histoire des religions* (Paris).

His books include: *La Doctrine du logos* (1881); *La Religion à Rome sous les Sévères* (1886); *Les Origines de l'épiscopat* (1895); and *Le Protestantisme libéral, ses origines, sa nature, sa mission* (1903; Eng. trans., 1903).

REVOLUTIONARY TRIBUNAL, THE (*le tribunal révolutionnaire*), a court which was instituted in Paris by the Convention during the French Revolution for the trial of political offenders, and became one of the most powerful engines of the Terror. The news of the failure of the French arms in Belgium gave rise in Paris to popular movements on the 9th and 10th of March 1793, and on the 10th of March, on the proposal of Danton, the Convention decreed that there should be established in Paris an extraordinary criminal tribunal, which received the official name of the Revolutionary Tribunal by a decree of the 29th of October 1793. It was composed of a jury, a public prosecutor, and two substitutes, all nominated by the Convention; and from its judgments there was no appeal. With M. J. A. Hermann as president and Fouquier-Tinville as public prosecutor, the tribunal terrorized the royalists, the refractory priests and all the actors in the counter-revolution. Soon, too, it came to be used for personal ends, particularly by Robespierre, who employed it for the condemnation of his adversaries. The excesses of the Revolutionary Tribunal increased with the growth of Robespierre's ascendancy in the Committee of Public Safety; and on the 10th of June 1794 was promulgated, at his instigation, the infamous Law of 22 Prairial, which forbade prisoners to employ counsel for their defence, suppressed the hearing of witnesses and made death the sole penalty. Before 22 Prairial the Revolutionary Tribunal had pronounced 1220 death-sentences in thirteen months; during the forty-nine days between the passing of the law and the fall of Robespierre 1376 persons were condemned, including many innocent victims. The lists of prisoners to be sent before the tribunal were prepared by a popular commission sitting at the museum, and signed, after revision, by the Committee of General Security and the Committee of Public Safety jointly. Although Robespierre was the principal purveyor of the tribunal, we possess only one of these lists bearing his signature. The Revolutionary Tribunal was suppressed on the 31st of May 1795. Among its most celebrated victims may be mentioned Marie Antoinette, the Hébertists, the Dantonists and several of the Girondists. Similar tribunals were also in operation in the provinces.

See H. A. Wallon, *Histoire du tribunal révolutionnaire de Paris* (Paris, 6 vols., 1880–82); E. Campardon, *Le Tribunal révolutionnaire de Paris* (Paris, 2nd ed., 2 vols., 1866); C. Berriat Saint-Prix, *La Justice révolutionnaire à Paris, Bordeaux, Brest, Lyon, Nantes, . . .* (Paris, 1861), and *La Justice révolutionnaire (août 1792–prairial an II.) d'après des documents originaux* (Paris, 1870); also G. Lenôtre, *Le Tribunal révolutionnaire* (1908). For a bibliography of its records see M. Tourneux, *Bibliog. de la ville de Paris . . .* (1890, vol. i. Nos. 3925–3974).

REWA, or RIWA, a native state of Central India in the Bagelkhand agency. It is the only large state in Bagelkhand, and the second largest in Central India, having an area of about 13,000 sq. m. It is bounded N. by the United Provinces, E. by Bengal and S. by the Central Provinces. On the W. it meets other petty states of Bagelkhand. Rewa is divided into two well-defined portions. The northern and smaller division is the plateau lying between the Kaimur range of hills and that portion of the Vindhyas known as Binjh, which overlook the valley of the Ganges. This plateau is for the most part cultivated and well peopled; rich harvests both of *kharif* and *rabi* crops are generally obtained. Water is plentiful, and the country is full of large tanks and reservoirs, which, however, are not used for irrigation purposes; the only system of wet cultivation which has any favour with the villagers is that of *bunds*, or mounds of earth raised at the lower ends of sloping fields to retain the rain water for some time after the monsoon rains cease. The country to the S. of the Kaimur hills comprises by far the largest portion of the state; but here cultivation is restricted to the valley between the hills and the Sone river, and to a few isolated patches in scattered parts of the forest wastes. The principal river is the Sone, which flows through the state in a N.E. direction into Mirzapur district. Another important river is the Tons, but neither is navigable. The annual rainfall averages about 41 in. The population in 1901 was 1,327,385, showing a decrease of 12% in the decade. Many of the inhabitants of the hilly tracts are Gonds and Kols. Estimated revenue, £200,000. The staple crops are rice, millets and wheat; but more than one-third of the area is covered with forests, yielding timber and lac.

The S. of the state is crossed by the branch of the Bengal-Nagpur railway from Bilaspur to Katni, which taps the Umaria coal-field. The state suffered from famine in 1896–97, and again to a less

extent in 1899–1900; but on both occasions adequate measures of relief were provided.

The state first came under British influence in 1812. The chief, Venkat Raman Singh, was born in 1876, succeeded in 1880 and was created G.C.S.I. in 1897. During his minority the administration was reformed. He is Rajput of the Baghela branch of the Solanki race, and is descended from the founder of the Anhilwara Patan dynasty in Gujarat.

The town of Rewa is 131 m. S. of Allahabad. Pop. (1901) 24,608. It has a high school, also the Victoria and zenana hospitals and a model gaol. The political agent for Bagelkhand resides at Satna, on the East Indian railway: pop. (1901) 7471.

REWA KANTHA, a political agency or collection of native states in India, subordinate to the government of Bombay. It stretches for about 150 m. between the plain of Gujarat and the hills of Malwa, from the river Tapti to the Mahi, crossing the Nerbudda or Rewa, from which it takes its name. The number of separate states is 61, many of which are under British jurisdiction. The only important one is Rajpipla (*q.v.*). It includes also five second-class states entitled Chota Udaipur, Bariya, Sunth, Lunawada and Balaimor. Total area, 4972 sq. m. In 1901 the population was 479,065, showing a decrease of 35 % in the decade, due to the results of famine. Estimated revenue, £140,000; tribute (mostly to the Gaekwar of Baroda), £10,000. Many of the inhabitants belong to the wild tribes of Bhils and Kolis. The political agent, who is also collector of the British district of the Panch Mahals, resides at Godhra.
