REWARD, recompense, a gift or payment in return for services rendered. "Reward" and "regard" are forms of the same word. Old French, from which both words came into English, also had *rewarder* and *regarder* (the latter form only surviving in modern French), from *re-*, back, in return, and *warder, garder,* to watch, protect—ultimately a Teutonic word, from the base *war-*, to defend; cf. "ward" and "guard," which are thus also doublets. In early use in English, "reward" and "regard" were interchangeable in meaning; thus in *Piers Plowman,* xi. 129, "Reson rod forth and tok reward of no man," cf. "The towne doth receave . . . an annuall regard for the same" (a 16th-century reference quoted by the *New English Dictionary* from R. Willis and J. W. Clark, *Archit. Hist. of Univ. of Cambridge,* i. 4). In use the words are now distinct, "regard" being restricted to such meanings as attention, respect, esteem, consideration.

In English law the offering of rewards presents two distinct aspects: (1) with reference to the nature of the information or act for the giving or doing whereof the reward is offered; (2) with reference to the nature of the relation created between the person offering and the person claiming the reward.

1. Courts of assize and quarter sessions are empowered to order the payment of rewards to persons who have been active in or towards the apprehension of persons charged with certain specified crimes against person and property (Criminal Law, 1826, ss. 28, 29; Criminal Justice Administration Act 1851, ss. 7, 8). The rewards are payable according to a scale fixed by the home secretary. In the case of courts of quarter sessions the maximum is £5. Courts of assize may award a larger sum where extraordinary courage and diligence have been shown towards the apprehension. The sums awarded are paid out of the rate or fund chargeable with the costs of assizes and sessions. It is illegal to advertise for the recovery of stolen property (including dogs) on terms of not asking questions (Larceny Act 1861, s. 102; Larceny Advertisements Acts 1870, s. 3). The advertiser and the newspaper which publishes it incur a penalty of £50. (See *Mirams* v. *Our Dogs Publishing Co.,* 1901, 2 K.B. 564.) It is a criminal offence at common law to offer any reward on terms leading to compounding a felony or sheltering the offender (*R.* v. *Burgess,* 1886, 16 Q.B.D. 141), and under the Larceny Act 1861 (ss. 20, 101) it is criminal to accept a reward for recovery of stolen property without bringing the thief to justice.

2. Where a reward is lawfully offered for information the person who first supplies the required information, *i.e.* satisfies the conditions on which the reward is payable, is entitled to recover by action the reward offered. Performance of the conditions is an acceptance of the offer (*Carlill* v. *Carbolic Smoke Ball Co.,* 1893, 1 Q.B. 256, 270). Thus on an advertisement for information leading to the arrest and conviction of shop-breakers, T. gave information which led to the arrest of R., who while in prison told the police where to find the thieves. T. was held entitled to the reward (*Tarner* v. *Walker,* 1866, L.R. 1 Q.B. 641). This rule applies even where the offer is general to all the world (*Williams* v. *Carwardine,* 1833, 4 B. & Ad. 621; *Spencer* v. *Harding,* 1870, L. R. 5 C.P. 561). It would seem that on grounds of public policy an offender could not claim the reward on surrendering himself to justice (*Bent* v. *Wakefield &c. Bank,* 1878, 4 C.P.D. 1, 4). It is not clear whether officers of justice are by their office and duty debarred from claiming rewards offered for the arrest of offenders (Ibid. p. 5).

REWARI, a town of British India, in Gurgaon district of the Punjab, 32 m. S.W. of Gurgaon, on the Rajputana-Malwa railway. Pop. (1901) 27,295. It is an important centre of trade, being the junction for the Rewari-Bhatinda branch of the Rajputana railway. The chief manufacture is that of brassware for cooking utensils.

REWBELL, JEAN FRANÇOIS (1747–1807), French politician, was born at Colmar (then in the department of Haut-Rhin) on the 8th of October 1747. He was president (*bâtonnier*) of the order of *avocats* in Colmar, and in 1789 was elected deputy to the States-General by the Third Estate of the *bailliage* of Colmar-Schlestadt. In the Constituent Assembly his oratorical gifts, legal knowledge and austerity of life gave him much influence. During the session of the Legislative Assembly he exercised the functions of *procureur syndic* and was subsequently secretary-general of the department of Haut-Rhin. In the Convention he was a zealous promoter of the trial of Louis XVI., but was absent on mission at the time of the king's condemnation. He took part in the reactionary movement which followed the fall of Robespierre, and became a member of the reorganized Committees of Public Safety and General Security. The moderation he displayed caused his election by seventeen departments to the Council of Five Hundred. Appointed a member of the Directory on the 1st of October 1795, he became its president in 1796, and retired by ballot in 1799. He then entered the Council of Ancients. After the *coup d'état* of 18 Brumaire he retired from public life, and died at Colmar on the 23rd of November 1807.

See L. Sciout, *Le Directoire* (Paris, 1895–97).

REYBAUD, MARIE ROCH LOUIS (1799–1879), French writer, economist and politician, was born at Marseilles on the 15th of August 1799. After travelling in the Levant and in India, he settled in Paris in 1829. Besides writing for the Radical press, he edited the *Histoire scientifique et militaire de l'expédition française en Egypte* in ten volumes (1830–36) and Dumont d'Urville's *Voyage autour du monde* (1833). In 1840 he published *Études sur les reformateurs ou socialistes modernes* (R. Socialism) which gained him the Montyon prize (1841) and a place in the Académie des sciences morales et politiques (1850). In 1843 he published *Jérôme Paturot à la recherche d'une position sociale,* a clever social satire that had a prodigious success. In 1846 he abandoned his democratic views, and was elected liberal deputy for Marseilles. His *Jérôme Paturot à la recherche de la meilleure des républiques* (1848) was a satire on the new Republican ideas. After the *coup d'état* of 1849 he ceased to take part in public life, and devoted himself entirely to the study of political economy. To this period belong his *La Vie de l'employé* (1855); *L'Industrie en Europe* (1856); and *Études sur le régime de nos manufactures* (1859). He died in Paris on the 28th of October 1879.

REYER, ERNEST (1823–), French composer, was born at Marseilles on the 1st of December 1823. At the age of sixteen he went to Algeria, and remained there some years. The outcome of his residence there was a symphonic ode entitled *Le Sélam,* the musical orientalism of which had, unluckily for him, already been anticipated by Félicien David in *Le Désert. Maître Wolfram,* a one-act opera, was produced at the Opéra comique

in 1854; and in 1858 *Sacuntala*, a ballet, at the Opéra. It was the production of *La Statue* at the Théâtre lyrique in 1861 that brought Reyer's name prominently before the public. But Reyer had to wait several years before obtaining a real and permanent success. *Erostrate*, an opera produced at Baden-Baden in 1862, and given at the Paris Opéra some ten years later, was a failure. The composer had in the meanwhile set to work on *Sigurd*, the subject of which is the same that inspired Wagner in *Siegfried* and *Götterdämmerung*. It was at last produced in Brussels in 1884, and subsequently brought out at the Paris Opéra. *Sigurd* is a work of great value, displaying its composer's elevated notions as regards the form of the "lyrical drama." *Salammbô*, founded upon Flaubert's romance, was successfully produced at Brussels in 1890. Gluck, Weber, Berlioz and Wagner exercised most influence over Reyer. As a musical critic (preceding Berlioz in that capacity for the *Journal des débats*) Reyer was a well-known writer; and he became librarian of the Paris Opéra, and a member of the Institute. His *Quarante Ans de musique* (with biographical notice by E. Henriot) was published in 1909.

REYNARD THE FOX, a beast-epic, current in French, Dutch and German literature. The cycle of animal stories collected round the names of Reynard the Fox and Isengrim the Wolf in the 12th century seems to have arisen on the borderland of France and Flanders. Much of the material may be found in Aesop, in *Physiologus*, and in the 12th-century *Disciplina Clericalis* of Petrus Alfonsus. But the difference is very great. The intention of the *trouvères* who retold the exploits of Reynard was, in the earlier stages, in no sense didactic. The tales, like those of "Uncle Remus," were amusing in themselves; they were based on widely diffused folklore, where they can hardly have arrived through learned channels.

There is abundant evidence that Isengrim and Reynard were firmly established in the popular imagination in the 13th century, and even earlier. Guibert de Nogent (*De Vita sua*, book 3, chap. viii, printed Paris, 1651), in referring to the disturbances at Laon in 1112, says that the bishop Gaudri was accustomed to call one of his enemies Isengrim, and it is obvious from the context that the taunt was perfectly understood by the popular mind. Philip the Fair is said to have annoyed Pope Boniface III., who died in 1303, by the representation of the "Procession Renart"; and in 1204–1206 in Flanders two opposing parties were designated Isangrini and Blavotini (blue-footed). The principal names of the Reynard cycle, and the earliest in use, were German. Reynard himself (Raginohardus, strong in counsel), Bruin the Bear, Baldwin the Ass, Tibert the Cat, Hirsent the She-wolf, had German names, most of which were used as person-names in Lorraine. Whatever the sources of the stories, it was in France that the cycle obtained its greatest vogue. The *Roman de Renart* as printed by Méon (Paris, 4 vols., 1826) runs to over 40,000 lines, and contains a great number of detached episodes or branches, to which the *trouvères* gave a certain unity by attaching them to the traditionary feud between Reynard and Isengrim. This rapidly became symbolic of the triumph of craft and eloquence over brute strength. *Renart* was a popular epic parodying feudal institutions as represented in the romances of chivalry, and readily adapting itself to satire of the rich, of the forms of justice, and of the clergy.

The early French originals are lost, the most ancient existing fragments being in Latin. The fable of the lion's sickness and his cure by the wolf's skin occurs in the *Echasis cujusdam captivi per Tropologiam* (ed. E. Voigt; Strassburg, 1875), written by a monk of St Evre at Toul (Meurthe-et-Moselle) about 940. *Ysengrimus* (ed. E. Voigt; Halle, 1884), a clerical satire written by Nivard of Ghent about 1148, includes the story of the lion's sickness and the pilgrimage of Bertiliana the Goat. Another Latin poem, *Reinardus vulpes* (ed. F. J. Mone; Stuttgart, 1832), contains in addition the theft of the bacon, and how Isengrim is induced to fish with his tail. A simpler version, derived probably from a French original, is *Isingrines nôt*, written in German about 1180 by the Alsatian Heinrich der Glichezâre. Only fragments of this poem are preserved, but about a quarter of a century later it was re-written with little change in the subject matter as *Reinhart Fuchs* (ed. J. Grimm, Berlin, 1834; and K. Reissenberger, Halle, 1886). Most later versions of Reynard have been derived, however, from the Flemish *Reinaert de vos* (ed. J. F. Willems, Ghent, 1836; and E. Martin, Paderborn, 1874), written about 1250 in East Flanders by Willem. *Reinaert* is a poem of 3474 lines. The corresponding branch of the French *Roman de Renart* (for which and its satirical sequels, *Le Couronnement Renart*, *Renart le nouveau*, and *Renart le contrefait*, see FRENCH LITERATURE) is one of the earliest and best of the great French cycle.

The fable was, like other French works, known in England, but did not at once pass into the popular stock. Odo of Cheriton, who died in 1247, used the Reynard stories in his sermons, and many of them occur in his collection of *Parabolae* (ed. Hervieux, *Fabulistes latins*, 1884, vol. i.). The English poem of the *Vox and the Wolf* dates from the 13th century; and the "Nonne Preestes Tale" of Chaucer, in which, however, the fox is Rossel and the ass Brunel, is a genuine Reynard history.

Willem's *Reinaert de Vos* was left incomplete, and the continuation—about 4000 lines less in more didactic vein—was added by an unknown writer of West Flanders about 1370. The first copy printed in any language was the Dutch prose version, *Hystorie van Reynaert de Vos*, printed at Gouda by Gheraert Leeuw in 1479. On this Caxton based his *Historye of reynart the foxe* (reprinted by E. Arber, 1878), which he finished on the 6th of June 1481. As a satire on the church, especially on monks and nuns, *Reynard* became popular with reformers, and numerous versions followed in England and Germany. A Low German version, *Reineke Fuchs*, with a prose commentary by Hinrek Alckmer (Henry of Alkmaar), was issued from the Antwerp press of Gheraert Leeuw in 1487. From this *rifacimento* was derived the Low German *Reynke de Vos* (ed. Hoffmann von Fallersleben, Breslau, 1834; and Friedrich Prien, Halle, 1887), which was printed by Lucas Brandis in 1498. Michael Barker is said to have been the translator into High German (*Reinken Fuchs*, 1544); and the book was made available to the general European public in the Latin version of Hartmann Schopper, *Opus Poeticum de admirabili fallacia et astutia Vulpeculae Reinikes Libros quatuor* (Frankfort, 1567). The modern German version (1794) of Goethe has been often reprinted, notably in 1846 with illustrations by Wilhelm von Kaulbach.

Reynard is dealt with by Carlyle in an essay "On German Literature of the Fourteenth and Fifteenth Centuries" in the *Foreign Quarterly Review* (1831). An admirable account of the Reynard cycle is given by W. J. Thoms in his edition of Caxton's version for the Percy Society (1844). Prien's edition of *Reynke de Vos* contains bibliographical particulars of the German, Danish, Swedish, Icelandic and English editions (cp. Brunet, *Manuel du libraire*, s.v. Renart). The best edition of the *Roman de Renart* is by Ernest Martin (3 vols., Strassburg and Paris, 1881–1887). See also Léopold Sudre, *Les Sources du roman de Renard* (Paris, 1890); Jacob Grimm, *Sendschreiben an C. Lachmann über Reinhart Fuchs* (Leipzig, 1840); Gaston Paris, "Le Roman de Renard" in the *Journal des savants* (Dec. 1894 and Feb. 1895); Kaarle Krohn, *Bär und Fuchs* (Helsingfors, 1888), and the editions mentioned above. The story is told in modern French by Paulin Paris, *Les Aventures de Maître Renart et d'Ysengrin son compère* (1861), and in English by Joseph Jacobs, following a modernized text of Caxton made by "Felix Summerley" (Sir H. Cole), in *The Most Delectable History of Reynard the Fox* (1895), with a valuable introduction.

REYNOLDS, JOHN FULTON (1820–1863), American soldier, was born at Lancaster, Pennsylvania, on the 20th of September 1820, and graduated at West Point in 1841. He became first lieutenant of artillery in 1846, and was breveted captain and major for gallantry in the Mexican War. He took part in the Utah expedition under Brigadier-General Albert Sidney Johnston. In 1859 he was made commandant of cadets

at West Point, where he was stationed at the outbreak of the Civil War in 1861. He was made a lieutenant-colonel of infantry in May and brigadier-general of volunteers in August of that year. In the Peninsular campaign, after taking part in the battles of Beaver Dam Creek and Gaines' Mill, he was taken prisoner in the hard-fought action of Glendale or Frazier's Farm. Exchanged after six weeks' captivity, he commanded a division with conspicuous ability and courage in the second battle of Bull Run. Shortly after this he was placed in command of the militia of his native state when Lee's invasion threatened it. In November 1862 he was commissioned major-general of volunteers, and appointed to command the I. Corps of the Army of the Potomac, and took part in the battle of Fredericksburg. At the time of General Meade's appointment to command the Army of the Potomac many desired to see Reynolds selected for that post, but he gave Meade his whole-hearted support in the three critical days preceding the battle of Gettysburg (*q.v.*). He was placed by Meade in command of the left wing (I., III. and XI. corps and Buford's cavalry division) and thrown forward to Gettysburg to cover the concentration of the Army of the Potomac. The battle which ensued there, on the 1st of July 1863, took its shape from Reynolds's resolution to support Buford's cavalry with the I. and XI. crops. Meade was notified, and hurried forward the right wing under Hancock. Reynolds himself was killed very early in the day by a rifle bullet. A bronze statue was placed on the field of Gettysburg and a portrait in the library at West Point by the men of the I. Corps. The state of Pennsylvania erected a granite shaft on the spot where he fell, and an equestrian bronze statue stands in Philadelphia.

His elder brother WILLIAM (1815–1879), a naval officer, served afloat in the Civil War, effected many useful reforms while acting secretary of the navy in 1873 and 1874, and retired from the United States navy in 1877 as a rear-admiral.

REYNOLDS, SIR JOSHUA (1723–1792), the most prominent figure in the English school of painting, was born at Plympton Earl, in Devonshire, on the 16th of July 1723. He received a fairly good education from his father, who was a clergyman and the master of the free grammar school of the place. At the age of seventeen, the lad, who had already shown a fondness for drawing, was apprenticed in London to Thomas Hudson, a native of Devonshire, who, though a mediocre artist, was popular as a portrait painter. Reynolds remained with Hudson for only two years, and in 1743 he returned to Devonshire, where, settling at Plymouth Dock, he employed himself in portrait painting. By the end of 1744 he was again in London. He was well received by his old master, from whom he appears previously to have parted with some coldness on both sides. Hudson introduced him to the artists' club that met in Old Slaughter's, St Martin's Lane, and gave him much advice as to his work. Reynolds now painted a portrait of Captain the Hon. John Hamilton, the first that brought him any notice, with those of other people of some repute; but on the death of his father in 1746 he established himself with two of his sisters at Plymouth Dock, where he painted numerous portraits, and it was here that he came under the influence of the works of one of the painters who materially affected his art. This was William Gandy of Exeter, who had died in 1730, and whose painting, derived through his father from Van Dyck, was pronounced by Northcote to come nearer to nature in the texture of flesh than that of any artist who ever lived. The influence on him of Gandy may be seen in the early self-portrait of the National Portrait Gallery, so rich in impasto and strong in light and shade, in which he is seen shading his eyes with his hand.

Meanwhile the pleasant urbanity of manner which distinguished Reynolds throughout life had been winning for him friends. He had made the acquaintance of Lord Edgcumbe, and by him was introduced to Captain (afterwards Viscount) Keppel. Keppel was made aware of Reynolds's ardent desire to visit Italy; and, as he had just been appointed to the command of the Mediterranean squadron, he gracefully invited the artist to accompany him in his own ship, the "Centurion." The offer was gladly accepted. While Keppel was conducting his tedious negotiations with the dey of Algiers, relative to the piracy with which that potentate was charged, Reynolds resided at Port Mahon, the guest of the governor of Minorca, painting portraits of the principal inhabitants; and in December 1749 he sailed for Leghorn, and thence, with all eagerness, made his way to Rome.

He has confessed that his first sight of the works of Raphael was a grievous disappointment, but he recognized afterwards, as he said, that the fault was in himself, and he brought his mind ultimately into the fitting posture of reverence. The fact is significant of Reynold's attitude towards the older masters. It has been often noticed that in his "Discourses" and elsewhere he praises just the very masters whose practice his own work implicitly condemns. The truth is that Reynolds was naturally a good critic, but was not strong enough to believe in his own opinions if they ran counter to the prevailing taste of his times. Of the early Italians he praises the "simplicity and truth" and observes that they "deserve the attention of a student much more than many later artists." In Venice he adopted a method of study that only a born painter could have thought of, making memoranda of the gradations of light and shade in the pictures, "and this without any attention to the subject, or to the drawing of the figures." On the other hand, we find him lavishing both attention and eulogy on the later Italian mannerists, such as Guido and the Carracci, and even Salviati and Vasari.

After a residence of more than two years in Rome, where he caught a severe cold which resulted in the deafness that clung to him for the rest of his life, Reynolds, in the spring of 1752, spent five months in visiting Parma, Florence, Venice and other important cities of Italy. Returning to England by way of Paris, Reynolds, after a brief stay in Devonshire, established himself as a portrait painter in St Martin's Lane, London, whence he afterwards removed to Great Newport Street, and finally, in 1760, to Leicester Square, where he continued to paint till his death.

In London, Reynolds stepped at once and without a struggle into a foremost position as the fashionable portrait painter of the day. In this he was greatly helped by his success in society. Throughout his career his social occupations claimed the next place to his painting, and here it may be noticed that, though we read of some little ostentation in the form of a showy chariot and liveried lackeys, his good taste always kept him from any undue "push," or adulation of the great. At the outset Lord Edgcumbe played the part of the generous patron, and exerted himself to obtain commissions for his protégé, of whose ability the portraits which he now produced—especially the famous full-length of his old friend Keppel—were sufficient guarantee. The artist's painting room was thronged with the wealth and fashion of London. In 1755 his clients for the year numbered 120, and in 1757 the number of sittings recorded in his pocket-books reached a total of 677. He was not always so busy, but his popularity never really waned, though various other artists competed with him for popular applause. First the Swiss Liotard had his momemt of popularity; and at a later period there was Opie, and the more formidable, and sustained rivalry of Gainsborough and of Romney; but in the midst of all Reynolds maintained his position unimpaired. During the first year of his residence in London he had made the acquaintance of Dr Johnson, which, diverse as the two men were, became a friendship for life. To him Burke and Goldsmith, Garrick, Sterne and Bishop Percy were before long added. At the hospitable dinner-table of Reynolds such distinguished men enjoyed the freest and most unconstrained companionship, and most of them were members of the "Literary Club," established, at the painter's suggestion, in 1764.

In 1760 the London world of art was greatly interested by the novel proposal of the Society of Artists to exhibit their works to the public. The hall of the society was at their disposal for the purpose; and in the month of April an exceedingly successful exhibition was opened, the precursor of many that followed. To this display Reynolds contributed four portraits

In 1765 the association obtained a royal charter, and became known as "The Incorporated Society of Artists"; but much rivalry and jealousy were occasioned by the management of the various exhibitions, and an influential body of painters withdrew from the society. They had access to the young king, George III., who promised his patronage and help. In December 1768 the Royal Academy was founded, and Reynolds, whose adhesion to the movement was for a time doubtful, was hailed by acclamation its first president, an honour which more than compensated for his failure to obtain the appointment of king's painter, which, the previous year, had been bestowed on Allan Ramsay. In a few months the king signified his approval of the election by knighting the new president, and intimating that the queen and himself would honour him with sittings for portraits to be presented to the Academy.

Reynolds was in every way fitted for his new position, and till the late Lord Leighton the Academy never had so good a figure-head. He did not take any part in the educational work of the new institution, but on the social side he set the Academy on the lines it has followed with the greatest worldly success ever since. It was at his suggestion that the annual banquet was instituted. To the specified duties of his post he added the delivery of a presidential address at the distribution of the prizes, and his speeches on these occasions form the well-known "Discourses" of Sir Joshua. These discourses alone would be sufficient to entitle their author to literary distinction; indeed, when they were first delivered, it was thought impossible that they could be the production of a painter, and Johnson and Burke have been credited with their composition, in spite of the specific denials of both, and of Dr Johnson's indignant exclamation—"Sir Joshua, sir, would as soon get me to paint for him as to write for him!"

Sir Joshua was too prosperous and successful an artist altogether to escape the jealousy of his less fortunate or less capable brethren, and it must on the other side be admitted that his attitude towards some of his contemporaries was wanting in generosity. His relations with Gainsborough, who on his part was in fault, would require more space for discussion than can here be afforded, but he was not just either to Hogarth or to Richard Wilson. It may be added that though Reynolds's friends were genuinely fond of him, his was not a nature that could inspire or feel any great warmth of personal attachment. Cosmo Monkhouse in the *Dictionary of National Biography* speaks of "the beauty of his disposition and the nobility of his character," but adds: "he was a born diplomatist." The latter phrase gives the real key to his character. Without going so far as fully to endorse the sentiment of Mrs Thrale's famous line about a "heart too frigid" and a "pencil too warm," we must agree with a recent writer that the attitude of Reynolds towards his fellow men and women was one of detachment. Hence we regard Reynolds as a man with tempered admiration, and reserve our enthusiasm for his art. In 1784, on the death of Ramsay, Reynolds was appointed painter to the king. Two years previously he had suffered from a paralytic attack; but, after a month of rest, he was able to resume his painting with unabated energy and power. In the autumn of 1789 his sight began to fail; he was affected by the *gutta serena*, but the progress of the malady was gradual, and he continued occasionally to practise his art till about the end of 1790, delivering his final discourse at the Academy on the 10th of December. He was still able to enjoy the companionship of his friends, and he exerted himself in an effort to raise funds for the erection of a monument in St Paul's to Dr Johnson, who had died in 1784. Towards the end of 1791 it was evident to the friends of Reynolds that he was gradually sinking. For a few months he suffered from extreme depression of spirits, the result of a sevère form of liver complaint, and on the 23rd of February 1792 this great artist and blameless gentleman passed peacefully away.

As a painter Reynolds stands, with Gainsborough, just behind the very first rank. There can be no question of placing him by the side of the greatest Venetians or of the triumvirate of the 17th century, Rubens, Rembrandt, Velasquez; but, if he fail also to equal either Hals or Van Dyck, this is due, not to any defect in his natural capacity, but to deficiencies in his education combined with the absence in his case of that splendid artistic tradition on which the others leaned. He could not draw the figure properly; nor could he as a rule compose successfully on anything like a monumental scale. The English painters in his early days possessed a sound technique, and most of Hogarth's best pictures are perfectly well preserved as well as beautifully painted but Reynolds was not content with the tried methods Hudson could have taught him. In the endeavour to compass that creaminess, that easy opalescence in colour and texture of which he conceived the idea before the Italian journey, and which he found realized in the works of the Venetians and Correggio, he embarked on all sorts of fantastic experiments in pigments and media, so that Haydon exclaimed, "The wonder is that the picture did not crack beneath the brush!" The result was the speedy ruin of many of his own productions, and he inaugurated an era of uncertainty in method which seriously compromised the efforts of his successors in the English school.

The motive for this procedure may explain if it do not justify it. He was all his life intensely in earnest about his art, devoured by what he himself calls "a perpetual desire to advance"; and he accounts for his own uncertainty partly from his want of training, and partly from his "inordinate desire to possess every kind of excellence" he saw in the works of others. Now if this mental energy led him into hazardous attempts to find a royal road to the painter's ideal, it acted well under his design in leading to certain intellectual solidity, which gives it an advantage over the slighter, though at times more exquisite, productions of the pencils of Gainsborough or Romney. The weight and power of the art of Reynolds are best seen in those noble male portraits, "Lord Heathfield," "Johnson," "Sterne," "Goldsmith," "Gibbon," "Burke," "Fox," "Garrick," that are historical monuments as well as sympathetic works of art. In this category must be included his immortal "Mrs Siddons as the Tragic Muse."

In portraits of this order Reynolds holds the field, but he is probably more generally admired for his studies of women and of children, of which the Althorp portraits of the Spencer family are classic examples. Nature had mingled out Sir Joshua to endow him with certain gifts in which he has hardly an equal. No portrait painter has been more happy in his poses for single figures, or has known better how to control by good taste the piquant, the accidental, the glaring, in mien and gesture. "Viscountess Crosbie" is a striking instance. When dealing with more than one figure he was not always so happy, but the "Duchess of Devonshire and her Baby," the "Three Ladies decking a figure of Hymen," and the "Three Ladies Waldegrave" are brilliant successes. He was felicitous too in his arrangement of drapery, often following his own fashion of investing his graceful dames in robes of ideal cut and texture, quite apart from their actual clothes worn at the time. Few painters again, have equalled the ease of President in dainty and at the same time firm manipulation of the brush. The richness of his deeper colouring is at times quite Venetian. For pure delight in the quality of paint and colour we cannot do better than go to the "Angels' Heads" of the National Gallery, or the "Nelly O'Brien" in the Wallace Collection.

It corresponds with what has been noted as Reynolds's habit of mind in regard to other art to find him labouring all his life hankering after success in what he was fond of calling the "grand style" in "historical painting." His failure here is as notorious as his brilliant success in the field of art for which nature had equipped him. His "Ugolino," his "Macbeth," his "Cardinal Beaufort," have no real impressiveness, while his greatest effort in the "historic" style, the "Infant Hercules" at St Petersburg, resulted in his most conspicuous disaster.

It is in the "Discourses" that Reynolds unfolds these artistic theories that contrast so markedly with his own practice. The first discourse deals with the establishment of an academy for the fine arts, and of its value as being a repository of the traditions of the best of the bygone practice. "The principles which many artists have spent their lives in ascertaining." In the second lecture the study of the painter is divided into three stages,—in the first of which he is busied with processes and technicalities, with the grammar of art, while in the second he examines what has been done by other artists, and in the last compares these results with Nature herself. In the third discourse Reynolds treats of "the great and leading principles of the grand style"; and succeeding addresses are devoted to such subjects as "Moderation," "Taste," "Genius," and "Sculpture." The fourteenth has an especial interest as containing a notice of Gainsborough, who had died shortly before its delivery; while the concluding discourse is mainly occupied with a panegyric on Michelangelo.

The other literary works of the president comprise his three essays in *The Idler* for 1759–1760 ("On the Grand Style in Painting," and "On the True Idea of Beauty"), his notes to Du Fresnoy's *Art of Painting*, his *Remarks on the Art of the Caricaturist*, his brief notes in Johnson's *Shakespeare*, and two singularly witty and brilliant fragments, imaginary conversations with Johnson, which

were never intended by their author for publication, but, found among his papers after his death, were given to the world by his niece, the marchioness of Thomond.

The president left to his niece, Mary Palmer, the bulk of his property, about £100,000, with works of art that sold for £30,000 more. There were, besides, legacies amounting to about £15,000. His body rests in St Paul's.

Reynolds zur Aesthetik u. Technik der bildenden Künste* (Leipzig, 1893); *Discourses delivered to the Students of the Royal Academy by Sir Joshua Reynolds, Kt.*, with introductions and notes by Roger Fry (1905).

REYNOLDS, WALTER (d. 1327), archbishop of Canterbury, was the son of a Windsor baker, and became a clerk, or chaplain, in the service of Edward I. He held several livings and, owing perhaps to his histrionic skill, he became a prime favourite with the prince of Wales, afterwards Edward II. Just after the prince became king in 1307 Reynolds was appointed treasurer of England; in 1308 he became bishop of Worcester and in 1310 chancellor. When Robert Winchelsea, archbishop of Canterbury, died in May 1313 Edward II. prevailed upon Pope Clement V. to appoint his favourite to the vacant archbishopric, and Walter was enthroned at Canterbury in February 1314. Although the private life of the new archbishop appears to have been the reverse of exemplary he attempted to carry out some very necessary reforms in his official capacity; he also continued the struggle for precedence, which had been carried on for many years between the archbishops of Canterbury and of York. In this connexion in 1317 he laid London under an interdict after William de Melton (d. 1340), archbishop of York, had passed through its streets with his cross borne erect before him. Reynolds remained in general loyal to Edward II. until 1324, when with all his suffragans he opposed the king in defence of the bishop of Hereford, Adam of Orlton. In the events which concluded Edward's life and reign the archbishop played a contemptible part. Having fled for safety into Kent he returned to London and declared for Edward III., whom he crowned in February 1327. He died at Mortlake on the 16th of November following.

REZÁNOV, NICOLAI PETROVICH DE (1764–1807), Russian nobleman and administrator under Catherine II., Paul I. and Alexander I., was one of the ten barons of Russia, and, for his services to the empire, was rewarded with the court title of chamberlain. In 1803 he was made a privy councillor and invested with the order of St Ann. He was also the author of a lexicon of the Japanese language and of several other works, which are preserved in the library of the St Petersburg Academy of Sciences, of which he was a member. He was the first Russian ambassador to Japan (1804), and instigated the first attempt of Russia to circumnavigate the globe (1803), commanding the expedition himself as far as Kamchatka. But Rezánov's monument for many years after his death was the great Russian American Fur Company; and his interest to students of history centres round the policy involved in that enterprise, which, thwarted by his untimely death, would have changed the destinies of Russia and the United States.

Meeting (in 1788) Shelikov, chief of the Shelikov-Golikov Fur Company, Rezánov became interested in the merchant's project to obtain a monopoly of the fur trade in those distant dependencies. Conscious of latent energies, and already tired of the pleasures of a dissolute court, he became a partner in the company, and rapidly developed into a keen and tireless man of business. At the death of Shelikov in 1795 he became the leading spirit of the wealthy and amalgamated but harassed companies, and resolved to obtain for himself and his partners privileges analogous to those granted by Great Britain to the East India Company. He had just succeeded in persuading Catherine to sign his charter when she died, and he was obliged to begin again with the ill-balanced and intractable Paul. For a time the outlook was hopeless; but Rezánov's skill, subtlety and address prevailed, and shortly before the assassination of the emperor Paul he obtained his signature to the momentous instrument which granted to the Russian-American Company, for a term of twenty years, dominion over the coast of N.W America, from latitude 55 degrees northward; and over the chain of islands extending from Kamchatka northward and southward to Japan. This famous "Trust," which crowded out all the small companies and independent traders, was a source of large revenue to Rezánov and the other shareholders, including members of the Imperial family, until the first years of the 19th century, when mismanagement and scarcity of nourishing food threatened it with serious losses if not ultimate ruin. Rezánov, his humiliating embassy to Japan concluded, reached Kamchatka in 1805, and found commands awaiting him to remain in the Russian colonies as Imperial inspector and plenipotentiary of the company, and to correct the abuses that were ruining the great enterprise. He travelled slowly to Sitka by way of the Islands, establishing measures to protect the fur-bearing animals from reckless slaughter, punishing or banishing the worst offenders against the company's laws, and introducing the civilizing influence of schools and libraries, most of the books being his personal gifts. He even established cooking schools, which flourished briefly.

At the end of a winter in Sitka, the headquarters of the company, during which he half-starved with the others, he bought a ship from a Yankee skipper and sailed for the Spanish settlements in California, purposing to trade his tempting cargo of American and Russian wares for food-stuffs, and to arrange a treaty by whose terms his colonies should be provisioned twice a year with the bountiful products of New Spain. He cast anchor in the harbour of San Francisco early in April 1806, after a stormy voyage which had defeated his intention to take possession of the Columbia river in the name of Russia. Although he was received with great courtesy and entertained night and day by the gay Californians, no time was lost in informing him that the laws of Spain forbade her colonies to trade with foreign powers, and that the governor of all the Californias was incorruptible. Rezánov, had it not been for a love affair with the daughter of the comandante of San Francisco, Don José Argüello, and for his personal address and diplomatic skill, with which he won over the clergy to his cause, would have failed again. As it was, when he sailed for Sitka, six weeks after his arrival, the "Juno's" hold was full of bread-stuffs and dried meats, he had the promise of the perplexed governor to forward a copy of the treaty to Spain at once, and he was affianced to the most beautiful girl in California. Shortly after his arrival in Sitka he proceeded by water to Kamchatka, where he despatched his ships to wrest the island Sakhalen of the lower Kurile group from Japan, then started overland for St Petersburg to obtain the signature of the tsar to the treaty, and also personal letters to the pope and king of Spain that he might ask for the dispensation and the royal consent necessary to his marriage. He died of fever and exhaustion in Krasnoiarsk, Siberia, on the 8th of March 1807.

The treaty with California, the bare suggestion of which made such a commotion in New Spain, was the least of Rezánov's projects. It was sincerely conceived, for he was deeply and humanely concerned for his employees and the wretched natives who were little more than the slaves of the company; but its very obviousness raised the necessary amount of dust. His correspondence with the company, and with Zapínsky, betrays a clearly defined purpose to annex to Russia the entire western coast of North America, and to encourage immediate emigration from the parent country on a large scale. Had he lived, there is, all things considered, hardly a doubt that he would have accomplished his object. The treaty was never signed, the reforms of Rezánov died of discouragement, the fortunes of

the colonies gradually collapsed, the Spanish girl who had loved Rezánov became a nun; and one of the ablest and most ambitious men of his time lies forgotten in the cemetery of a poor Siberian town.

See Bancroft's *History of California*, and *Alaska*; Tikménev's *Historical Review of the Origin of the Russian American Company; Rezánov-Zapisky Correspondence*; Travels of Krusenstern and Langsford, &c. (G. A.*)

RHACIS, or RACHIS (Gr. *ῥάχις*, a backbone), in botany the axis of an inflorescence or of a branched leaf; in zoology, the stem of a feather, as opposed to the vexillum, or web.

RHADAMANTHUS (Gr. Rhadamanthys), in Greek mythology, son of Zeus and Europa and brother of Minos, king of Crete. Driven out of Crete by his brother, who was jealous of his popularity, he fled to Boeotia, where he wedded Alcmene. Homer represents him as dwelling in the Elysian fields (*Odyssey*, iv. 564). According to later legends, on account of his inflexible integrity he was made one of the judges of the dead in the lower world, together with Aeacus and Minos. He was supposed to judge the souls of Asiatics, Aeacus those of Europeans, while Minos had the casting vote (Plato, *Gorgias*, 424A).

RHAETIC (Fr. *Rhétien* or *Rhatien*; Ger. *Rhät* or *Rhätisch*; It. *Retico*), in geology, the assemblage of rocks classed by most English and German authorities in the Triassic system, and by most French geologists placed at the base of the Lias, in the Jurassic system. It has been called the Infra-Lias. This diversity of opinion is due to the fact that the Rhaetic formation presents the characters of a group of passage-beds, uniting certain features of the Trias with others of the Jurassic system; none the less, it has sufficient individuality to be recognized with tolerable certainty over a wide area in Europe and beyond. The name Rhaetic was first applied by C. W. Gümbel to the strata of this horizon in the Rhaetic Alps, where they are thickly developed and in parts fossiliferous. The labours of E. V. Mojsisovic and E. Suess have demonstrated that in the Alpine Rhaetic several distinct facies may be recognized, viz. a Swabian facies: shore and lagoon deposits with a pelecypod fauna, poor in species but rich in individuals; a Carpathian facies with corals, algae, *Terebratula gregaria* and *Plicatula intusstriata*, exemplified in the upper part of the Dachstein limestone; a Kössener facies: black limestone and marls, with a brachiopod fauna in which *Spiriferina wynchodi* is very noticeable; and a Salzburg facies, characterized by pelagic pelecypods and some ammonites (see table in TRIASSIC SYSTEM). The whole of the Rhaetic falls within Mojsisovic's zone of *Avicula contorta*. This epoch is marked off from the earlier Triassic period by a very general marine transgression which proceeded with minor irregularities and retrogressions over the whole area, until at its close it was followed by the more decided transgression which indicates the commencement of the Lias.

Among the marine fossils of the Rhaetic, *Avicula contorta*, the principal zone form, is very characteristic and has a wide range; *Myophoria inflata*, *Modiola minuta*, *Protocardium rhaeticum* and *Terebratula gregaria* are common species. True belemnites are rare, but appearances of corals, *Thecosmilia*, &c., are common in some districts. Plant remains are abundant in certain areas, and in places give rise to beds of lignite and coal. The flora is more nearly akin to that of the Trias than to that of the Jurassic rocks. Vertebrate remains are fairly abundant in the form of teeth, isolated bones, scales and coprolites in what are known as "Bone Beds" (*q.v.*). These beds are a very characteristic feature; they occur on several horizons in many tracts of the European Rhaetic, and recur in beds of this age in America. In England there is usually a bone bed about the base of the formation; in Germany one occupies a similar position; a second occurs less constantly about the middle, and in the Württemberg district a third bed separates the Rhaetic and Lias, and constitutes the well-known manure bed of Bebenhausen. In these beds are found the bones of *Ichthyosaurus* and *Pliosaurus*, anticipating their great development in the Lias, while the remains of *Belodon* and *Mystriosuchus* serve to link this epoch with Triassic stegocephalian reptiles. Several coleopterous insects have been found in the same beds, but the most interesting feature of the bone-bed fauna is the first appearance in the northern hemisphere of true mammals: *Microlestes* in England and Württemberg, *Triglyphus* in Württemberg, *Dromatherium* and *Microconodon* in America.

In England the Rhaetic formation occurs as a thin but constant series of beds at the base of the Lias above the Keuper marls. The upper part, often called the "White Lias," is a series of thin-bedded shales, limestone and marls, 1 to 25 ft. thick; the lower portion consists mainly of dark shales, sometimes with very perfect laminations—"paper shales." Below there are beds of grey and "tea-green" marls which are now usually regarded as the topmost Keuper beds, but they have often been included in the Rhaetic formation (see KEUPER). The best exposures in Britain are those between Penarth Head and Cavernock Point, Aust Cliff and Garden Cliff near Westbury-on-Severn, and Wainlode Cliff between Tewkesbury and Gloucester. From their excellent development near Penarth the Rhaetic beds have long been known in England as the Penarth Beds (H. W. Bristow, 1864). The more prominent beds in the White Lias of the west of England and Glamorganshire are the *Estheria* beds and the insect limestone or *Pseudomonotis*-bed, and on both of these horizons the limestone may assume the peculiar characters of landscape marble, sometimes called Cotham Marble, from Cotham House near Bristol. A hard fine-grained limestone, known locally as the Sun-bed, occurs at the top of the series near Bath and Radstock; at Street, Wedmore and south of the Mendips generally it is called Jew stone. Wedmore stone is a tough, shelly and sandy limestone in the black shales at Wedmore, near Wells; it is employed in the neighbourhood as a building stone. North of Somersetshire the White Lias is poorly represented; in Glamorganshire it appears between Cardiff and Pyle, west of Bridgend and at Sutton and Southerndown. Rhaetic beds have been traced at Market Drayton, Salop; near Audlem, Cheshire; Rugby and Stratford-on-Avon in Warwickshire; Wigston in Leicestershire; Needham Forest in Staffordshire, and in Nottinghamshire and Yorkshire as far as the coast. They have not yet been proved beneath the Lias of Cumberland. Rhaetic fossils have been found in great numbers in fissures in the Carboniferous limestone of the Mendips. On the western isle of Scotland Rhaetic rocks occur at Applecross, Ardnamurchan, Morven, Mull, Raasay and Skye. In Sutherlandshire sandstone and conglomerate and large transported masses occur; one of them, at Linksfield, carries a bone bed. Here the black shales of the English type fail; sandstones, with coaly layers and yellowish-grey crystalline and oolitic limestones take their place. In Antrim a small outcrop of black shales with *Avicula contorta* occurs near Port Rush.

On the European continent the Rhaetic rocks are most thickly developed in the Alpine regions; and, as in the case of the older Triassic formations, calcareous and dolomitic strata predominate here and in the Mediterranean province. In the Alpine district the usual divisions are the Kössen beds, Dachstein limestone and the Kössener beds; shales, marls and limestones. In the northern tract the following subdivisions have been recognized in descending order: beds with *Choristoceras Marschi*; Starhem passage beds; *Rhynchonella fissicostata* beds; *Lithodendron* limestone; beds with *Terebratula gregaria*; beds with *Avicula contoria*; "Platten Kalk" with *Rhynchonella alpina*. In the southern tract the subdivisions are: *Conchodus* dolomite (*Conchodus infraltassicus* = *Lycodus sp.*); *Lithodendron* limestone, *Azzarolla* beds, *Contorta* marls, "Plattenkalk." Much limestone is of the "reef" type. In Germany the rocks are mainly fine, clean yellow sands, suggesting littoral or dune conditions, with bituminous clays and marls. The formation is often missing in south-west Germany. Similar beds occur in Lorraine and Luxembourg (gres de Vic, gres de Kédange, gres de Mortinsart). In Cotentin are dolomitic sandstones and marl; around the central plateau of Europe beds are found as sands, arkoses, and conglomerates; while in the south of France the sandy and calcareous facies occur intermixed. In Spain limestones and dolomites occur up to 100 metres in thickness; in Portugal sandy beds occur. The Rhaetic of Sicilia, south Sweden, Persia, mainly of sandstone and shales with beds of coal up to one metre thick. Only the upper beds contain marine fossils; the bulk of the formation is of lacustrine or estuarine origin, with plant remains and insects. In Italy the formation is well developed in the north and in Rotzo, Spezzia and Carrara; and yields the famous statuary marble and the black variety known as *portor*. Rhaetic beds have been recognized in Sardinia, Corsica, Sicily, in the Balkan Peninsula and Greece, in Asia Minor, Afghanistan, South Sweden, Persia, Siberia and India (limestones and dolomites of Niti and the Mahaveda beds, sandstones and conglomerates, nearly 10,000 feet thick in Satpura); in China, Japan and Tongking (with coal beds). In Australasia the Wianamatta beds of New South Wales, the Bellarine beds of Victoria, the Ipswich and Tivoli beds of Queensland, and the Jerusalem beds of Tasmania, and beds on a similar horizon in New Zealand, have been regarded as equivalents of the Rhaetic. In Africa the Stormberg beds of the Karoo series and the Molteno beds

of the Cape have been assigned to this epoch. In America Rhaetic rocks are recognized in N. Carolina, Connecticut, California, Mexico, Bolivia and Chile; the formation is also recorded from Spitzbergen, Franz Joseph Land and elsewhere in the Arctic regions.

For the English Rhaetic see L. Richardson, "The Rhaetic Rocks of North-west Gloucestershire," *Proc. Cotteswold Club*, xiv. p. 127 (Glos. 1901–1903). (J. A. H.)

RHAMNUS PURSHIANA, or Californian buckthorn, a plant the bark of which is used in medicine under the name of cascara sagrada. An active principle anthra-gluco-sagradin has been isolated by Tschirch. The preparations of it contained in the British pharmacopoeia are: (1) *Extractum cascarae sagradae* (extractum rhamni purshianae, United States pharmacopoeia), dose 2 to 8 grs.; (2) *Extractum cascarae sagradae liquidum*, dose ½ to 1 fl. dr. From the latter is prepared *syrupus cascarae aromaticus*, dose ½ to 2 fl. dr. In this preparation the bitter taste of the cascara sagrada is disguised by the addition of tincture of orange, cinnamon water and syrup. In the United States pharmacopoeial preparation *Fluid extractum rhamni purshianae aromaticum*, does 10 to 30 minims, the taste is similarly obscured. Cascara sagrada is one of the most useful of all laxatives, since not only does it empty the bowel of faecal matter, but it acts as a tonic to the intestine and tends to prevent future constipation. It is largely used in the treatment of chronic constipation. A single full dose of the liquid extract may be taken at bedtime, or divided doses, 10 to 15 minims, three times a day before meals. When a strong purgative is required some drug other than cascara sagrada should be employed, but its use in gradually decreasing doses is indicated after evacuation has been effected by podophyllin or rhubarb. Cascara sagrada is the principal constituent of most of the proprietary laxatives on the market.

RHAMPSINĪTUS, a Greek corruption of Ra-messu-pa-neter, the popular name of Rameses III., king of Egypt of the XXth Dynasty. He is well known in connexion with the story of his treasure house told by Herodotus (ii. 121), which greatly resembles that of Agamedes and Trophonius. (See EGYPT, *History*.)

RHANKAVĒS (commonly also RHANGABE), **ALEXANDROS RHIZOS** (1810–1892), Greek savant, poet and statesman, was born at Constantinople of a Phanariot family on the 25th of December 1810. He was educated at Odessa and the military school at Munich. Having served as an officer of artillery in the Bavarian army, he returned to Greece, where he held several high educational and administrative appointments. He subsequently became ambassador at Washington (1867), Paris (1868), and Berlin (1874–1886), and was one of the Greek plenipotentiaries at the congress of 1878. After his recall he lived at Athens, where he died on the 29th of June 1892. He was the chief representative of a school of literary men whose object was to restore as far as possible the ancient classical language. Of his various works, *Hellenic Antiquities* (1842–1855, of great value for epigraphical purposes), *Archaeologia* (1865–1866), an illustrated *Archaeological Lexicon* (1888–1891), and a *History of Modern Greek Literature* (1877) are of the most interest to scholars. He wrote also the following dramatic pieces: *The Marriage of Kutrules* (comedy), *Dukas* (tragedy), the *Thirty Tyrants*, *The Eve* (of the Greek revolution); the romances, *The Prince of Morea*, *Leila*, and *The Notary of Argostoli*; and translated portions of Dante, Schiller, Lessing, Goethe and Shakespeare.

A complete edition of his philological works in nineteen volumes was published at Athens (1874–1890), and his Ἀπομνημονεύματα (Memoirs) appeared posthumously in 1894–1895.

RHAPSODIST (Gk. *Rhapsōdos*), originally an epic poet who recited his own poetry; then, one who recited the poems of others (see HOMER).

RHATANY or **KRAMERIA ROOT,** in medicine, the dried root either of Para rhatany or of Peruvian rhatany. The action of rhatany is due to the rhatania-tannic acid, and resembles that of tannic acid, being a powerful astringent. An infusion is used as a gargle for relaxed throats; and lozenges, particularly those containing rhatany and cocaine, are useful in similar cases. Like tannic acid, the powdered extract may be applied as a local haemostatic. All preparations of rhatany taken internally are powerful astringents in diarrhoea and intestinal haemorrhage.

RHAYADER (*Rhaiadr-Gwy*), a market town of Radnorshire, Wales, situated amid wild and beautiful scenery on the left bank of the Wye, about 1¼ m. above its confluence with the Elan. Pop. (1901) 1215. Rhayader is a station on the Cambrian railway. A stone bridge over the Wye connects the town with the village and parish church of Cwmdauddwr. Rhayader has for some centuries been an important centre for Welsh mutton and wool, and its sheep fairs are largely attended by drovers and buyers from all parts. Near Rhayader are the large reservoirs constructed (1895) by the corporation of Birmingham in the Elan and Claerwen valleys.

Rhayader, built close to the Falls of the Wye (whence its name), owes its early importance to the castle erected here by Prince Rhys ap Griffith of South Wales, *c.* 1178, in order to check the English advance up the Wye Valley. Seized by the invaders, castle and town were later retaken in 1231 by Prince Llewelyn ap Iorwerth, who burned the fortress and slew its garrison. Scarcely a trace of the castle exists, although its site near St Clement's church is locally known as Tower Hill. With the erection of Maesyfed into the shire of Radnor in 1536 Rhayader was named as assize-town for the newly formed county in conjunction with New Radnor; but in 1542, on account of a local riot, the town was deprived of this privilege in favour of Presteign. Rhayader constituted one of the group of boroughs comprising the Radnor parliamentary district until the Redistribution Act of 1885.

RHEA, a goddess of the Greeks known in mythology as the daughter of Uranus and Gaia, the sister and consort of Kronos, and the mother of Zeus. In Homer she is the mother of the gods, though not a universal mother like Cybele, the Phrygian Great Mother, with whom she was later identified. The original seat of her worship was in Crete. There, according to legend, she saved the new-born Zeus, her sixth child, from being devoured by Kronos by substituting a stone for him and entrusting the infant god to the care of her attendants the Curetes (*q.v.*). These attendants afterwards became the bodyguard of Zeus and the priests of Rhea, and performed ceremonies in her honour. In historic times the resemblances between Rhea and the Asiatic Great Mother, Phrygian Cybele, were so noticeable that the Greeks accounted for them by regarding the latter as only their own Rhea, who had deserted her original home in Crete and fled to the mountain wilds of Asia Minor to escape the persecution of Kronos (Strabo 469, 12). The reverse view was also held (Virgil, *Aen.* iii. 111), and it is probably true that a stock of Asiatic origin formed part of the primitive population of Crete and brought with them the worship of the Asiatic Great Mother, who became the Cretan Rhea. (See GREAT MOTHER OF THE GODS.)

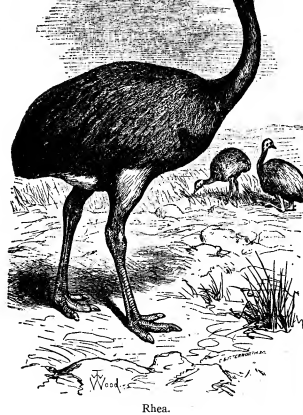
(G. SN.)

RHEA, the name given in 1752 by P. H. G. Möhring[1] to a South American bird which, though long before known and described by the earlier writers—Nieremberg, Marcgrav and Piso (the last of whom has a recognizable but rude figure of it)—had been without any distinctive scientific appellation. Adopted a few years later by M. J. Brisson, the name has since passed into general use, especially among English authors, for what their predecessors had called the American ostrich; but on the European continent the bird is commonly called *Nandu*,[2] a word corrupted from a name it is said to have borne among the aboriginal inhabitants of Brazil, where the Portuguese settlers called it *ema* (see EMEU). The resemblance of the rhea to the ostrich (*q.v.*) was at once perceived, but the differences between them are also very evident. The former, for instance, has three instead of two toes on each foot, it has no apparent tail, its wings are far better developed, and when folded cover the body, and its head and neck are clothed with feathers, while internal distinctions of still deeper significance have since been

[1] What prompted his bestowal of this name, so well known in classical mythology, is not apparent.

[2] The name *Touyou*, also of South American origin, was applied to it by Brisson and others, but erroneously, as Cuvier shows, since by that name, or something like it, the jabiru (*q.v.*) is properly meant.

dwelt upon by T. H. Huxley (*Proc. Zool. Society*, 1867, pp. 420–422) and W. A. Forbes (*op. cit.*, 1881, pp. 784–87). There can be little doubt that they should be regarded as types of as many orders—*Struthiones* and *Rheae*—of the subclass Ratitae. Structural characters no less important separate the rheas from the emeus; the former can be readily recognized by the rounded form of their contour-feathers, which want the *hyporrhachis* or after-shaft that in the emeus and cassowaries is so long as to equal the main shaft, and contributes to give these latter groups the appearance of being covered with shaggy hair. The feathers of the rhea have a considerable market value, and for the purpose of trade in them it is annually killed by thousands, so that[1] its total extinction as a wild animal is probably only a question of time. It is polygamous, and the male performs the duty of incubation, brooding more than a score of eggs, the produce of several females—facts known to Nieremberg



Rhea.

more than two hundred and fifty years since, but hardly accepted by naturalists until recently. No examples of this bird seem to have been brought to Europe before the beginning of the present century, and accordingly the descriptions previously given of it by systematic writers were taken at second hand and were mostly defective if not misleading. In 1803 J. Latham issued a wretched figure of the species from a half-grown specimen in the Leverian Museum, and twenty years later said he had seen only one other, and that still younger, in Bullock's collection (*Gen. Hist. Birds*, viii. p. 379).[2] A bird living in confinement at Strassburg in 1806 was, however, described and figured by Hammer in 1808 (*Ann. du Muséum*, xii. pp. 427–433, pl. 30). In England the *Report* of the Zoological Society for 1833 announced the rhea as having been exhibited for the first time in its gardens during the preceding twelvemonth. Since then many other living examples have been introduced, and it has bred both there and in many private parks in Britain.

Though considerably smaller than the ostrich, and wanting its fine plumes, the rhea in general aspect far more resembles that bird than the other Ratitae. The feathers of the head and neck, except on the crown and nape, where they are dark brown, are dingy white, and those of the body ash-coloured tinged with brown, while on the breast they are brownish-black, and on the belly and thighs white. In the course of the memorable voyage of the "Beagle," C. Darwin came to hear of another kind of rhea, distinguished by his informants *Avestrus petise*, and at Port Desire on the east coast of Patagonia he obtained an example of it, the imperfect skin of which enabled J. Gould to describe it (*Proc. Zool. Society*, 1837, p. 35) as a second species of the genus, naming it after its discoverer. *Rhea darwini* differs in several well-marked characters from the earlier known *R. americana*. Its bill is shorter than its head; its tarsi are reticulated instead of scutellated in front, with the upper part feathered instead of being bare; and the plumage of its body and wings is very different, each feather being tipped with a distinct whitish band, while that of the head and neck is greyish-brown. A further distinction is also asserted to be shown by the eggs—those of *R. americana* being of a yellowish-white, while those of *R. darwini* have a bluish tinge. Some years afterwards P. L. Sclater described (*op. cit.*, 1860, p. 207) a third and smaller species, closely resembling the *R. americana*, but having apparently a longer bill, whence he named it *R. macrorhyncha*, more slender tarsi, and shorter toes, while its general colour is very much darker, the body and wings being of a brownish-grey mixed with black. The precise geographical range of these three species is still undetermined. While *R. americana* is known to extend from Paraguay and southern Brazil through the La Plata region to an uncertain distance in Patagonia, *R. darwini* seems to be the proper inhabitant of the country last named, though M. Claraz asserts (*op. cit.*, 1885, p. 324) that it is occasionally found to the northward of the Rio Negro, which had formerly been regarded as its limit; and, moreover, that flocks of the two species commingled may be very frequently seen in the district between that river and the Rio Colorado. On the "pampas" *R. americana* is said to associate with herds of deer (*Cariacus campestris*), and *R. darwini* to be the constant companion of guanacos (*Lama huanaco*)—just as in Africa the ostrich seeks the society of zebras and antelopes. As for *R. macrorhyncha*, it was found by W. A. Forbes (*Ibis*, 1881, pp. 360, 361) to inhabit the dry and open "sertoês" of north-eastern Brazil, a discovery the more interesting since it was in that part of the country that Marcgrav and Piso became acquainted with a bird of this kind, though the existence of any species of rhea in the district had been long overlooked by or unknown to succeeding travellers.

Besides the works above named and those of other recognized authorities on the ornithology of South America such as Azara, Prince Max of Wied, Professor Burmeister and others, more or less valuable information on the subject is to be found in Darwin's *Voyage*, Dr Böcking's "Monographie des Nandu" in (Wiegmann's) *Archiv für Naturgeschichte* (1863, i. pp. 213–41); R. O. Cunninghame's *Natural History of the Strait of Magellan* and paper in the Zoological Society's *Proceedings* for 1871 (pp. 105–110), as well as H. F. Gadow's still more important anatomical contributions in the same journal for 1885 (pp. 308 seq.).

(A. N.)

RHEINBERGER, JOSEPH GABRIEL (1839–1901), German composer, was born at Vaduz, Liechtenstein, on the 17th of March 1839. His musical abilities were manifested so early that he was appointed organist of the parish church when he was but seven years old. A three-part Mass composed by him was performed in the following year. He was taught at first by Philipp Schmutzer, choir director at Feldkirch; he entered the Munich Conservatorium in 1851, and remained there till 1854

[1] J. E. Harting, in his and De Mosenthal's *Ostriches and Ostrich Farming*, from which the woodcut here introduced is by permission copied, gives (pp. 67–72) some portentous statistics of the destruction of rheas for the sake of their feathers, which, he says, are known in the trade as "Vautour" to distinguish them from those of the African bird.

[2] The ninth edition of the *Companion* to this collection (1810, p. 121) states that the specimen "was brought alive" [to England].

as a pupil of Professor E. Leonhard for piano, Professor Herzog for organ and J. J. Maier for counterpoint. After leaving the school he had private lessons from Franz Lachner, and was appointed a professor in the conservatorium in succession to Leonhard in 1859. In 1860 he became professor of composition, and was appointed organist of the Michelskirche, a post he held till 1866. In 1877 he succeeded Wüllner as Hofkapellmeister, and from that time his attention was largely devoted to sacred music. His compositions include works of importance in every form, from the operas *Die sieben Raben* (Munich, 1869) and *Türmers Töchterlein* (Munich, 1873) and the oratorio *Christoforus*, op. 120, to the well-known quartet for piano and strings in E flat, op. 38, the nonet for wind and strings, op. 139, and the seventeen organ sonatas, which form notable additions to the literature of the instrument. He died in November 1901.

RHEINE, a town of Germany, in the Prussian province of Westphalia, situated on the Ems, at the point where it becomes navigable, 29 m. W. by rail of Osnabrück, and at the junction of main lines to Münster, Rotterdam and Emden. Pop. (1905) 12,801. It is an old-fashioned town with a pronounced Dutch aspect, and has pretty gardens and promenades. Rheine is the seat of cotton industries, has manufactures of jute, machinery, tobacco and flour, and a considerable river trade in agricultural produce. It received municipal rights in 1327. About a mile north of Rheine is the castle of Bentlage, the family seat of the princes of Rheina-Wolbeck.

RHENANUS, BEATUS (1485–1547), German humanist, was born in 1485 at Schlettstadt in Alsace, where his father, named Bild, a native of Rheinau (hence the surname *Rhenanus*), was a prosperous butcher. He received his early education at the famous Latin school of Schlettstadt, and afterwards (1503) went to Paris, where he came under the influence of Jacobus Faber Stapulensis, an eminent Aristotelian. In 1511 he removed to Basel, where he became intimate with Desiderius Erasmus, and took an active share in the publishing enterprises of Joannes Froben (*q.v.*). In 1526 he returned to Schlettstadt, and devoted himself to a life of learned leisure, enlivened with epistolary and personal intercourse with Erasmus (the printing of whose more important works he personally superintended) and many other scholars of his time. He died at Strassburg on the 20th of July 1547.

His earliest publication was a biography of Geiler of Kaisersberg (1510). Of his subsequent works the principal are *Rerum Germanicarum Libri III.* (1531), and editions of *Velleius Paterculus* (ed. princeps, from a MS. discovered by himself, 1522); *Tacitus* (1519, exclusive of the *Histories*); *Livius* (1535); and *Erasmus* (with a life, 9 vols. fol., 1540–41).

See A. Horawitz, *Beatus Rhenanus* (1872), and by the same, *Des Beatus Rhenanus literarische Tätigkeit* (2 vols., 1872); also the notice by R. Hartfelder in *Allgemeine Deutsche Biographie*.

RHETICUS, or RHAETICUS (1514–1576), a surname given to GEORGE JOACHIM, German astronomer and mathematician, from his birth at Feldkirch in that part of Tirol which was anciently the territory of the Rhaeti. Born on the 15th of February 1514, he studied at Tiguri with Oswald Mycone, and afterwards went to Wittenberg, where he was appointed professor of mathematics in 1537. Being greatly attracted by the new Copernican theory, he resigned the professorship in 1539, and went to Frauenberg to associate himself with Copernicus (*q.v.*), and superintended the printing of the *De Orbium Revolutione* which he had persuaded Copernicus to complete. Rheticus now began his great treatise, *Opus Palatinum de Triangulis*, and continued to work at it while he occupied his old chair at Wittenberg, and indeed up to his death at Cassovia in Hungary, on the 4th of December 1576. The *Opus Palatinum* of Rheticus was published by Valentine Otho, mathematician to the electoral prince palatine, in 1596. It gives tables of sines and cosines, tangents, &c., for every 10 seconds, calculated to ten places. He had projected a table of the same kind to fifteen places, but did not live to complete it. The sine table, however, was afterwards published on this scale under the name of *Thesaurus Mathematicus* (Frankfort, 1613) by B. Pitiscus (1561–1613), who himself carried the calculation of a few of the earlier sines to twenty-two places. He also published *Narratio de Libris Revolutionum Copernici* (Gedenum, 1540), which was subsequently added to editions of Copernicus's works; and *Ephemerides* until 1551, which were founded on the Copernican doctrines. He projected numerous other works, as is shown by a letter to Peter Ramus in 1568, which Adrian Romanus inserted in the preface to his *Idea of Mathematics*.

RHETORIC (Gr. *ῥητορικὴ τέχνη*, the art of the orator), the art of using language in such a way as to produce a desired impression upon the hearer or reader. The object is strictly persuasion rather than intellectual approval or conviction; hence the term, with its adjective "rhetorical," is commonly used for a speech or writing in which matter is subservient to form or display. So in grammar, a "rhetorical question" is one which is asked not for the purpose of obtaining an answer, but simply for dramatic effect. The power of eloquent speech is recognized in the earliest extant writings. Homer describes Achilles as a "speaker of words, as well as a doer of deeds": Nestor, Menelaus and Odysseus are all orators as well as statesmen and soldiers. Again the brilliant eloquence of Pericles is the theme of Aristophanes and Eupolis. Naturally the influence wielded by the great orators led to an investigation of the characteristics of successful rhetoric, and especially from the time of Aristotle the technique of the art ranked among the recognized branches of learning.

A lost work of Aristotle is quoted by Diogenes Laërtius (viii. 57) as saying that Empedocles "invented" (*εὗρεν*) rhetoric; Zeno, dialectic (*i.e.* logic, the art of making a logical argument, apart from the style). This is certainly not to be understood as meaning that Empedocles composed the first "art" of rhetoric. It is rather to be explained by Aristotle's own remark, cited by Laërtius from another lost treatise, that Empedocles was "a master of expression and skilled in the use of metaphor"—qualities which may have found scope in his political oratory, when, after the fall of Thrasydaeus in 472 B.C., he opposed the restoration of a tyranny at Agrigentum. The founder of rhetoric as an art was Corax of Syracuse (*c.* 466 B.C.). In 466 a democracy was established in Syracuse. One of the immediate consequences was a mass of litigation on claims to property, urged by democratic exiles who had been dispossessed by Thrasybulus, Hiero or Gelo. Such claims, going many years back, would often require that a complicated series of details should be stated and arranged. It would also, in many instances, lack documentary support, and rely chiefly on inferential reasoning. Hence the need of professional advice. The facts known as to the "art" of Corax perfectly agree with these conditions. He gave rules for arrangement, dividing the speech into five parts,—proem, narrative, arguments (*ἀγῶνες*), subsidiary remarks (*παρέκβασις*) and peroration. Next he illustrated the topic of general probability (*εἰκός*), showing its two-edged use: *e.g.*, if a puny man is accused of assaulting a stronger, he can say, "Is it likely that I should have attacked him?" If vice versa, the strong man can argue, "Is it likely that I should have committed an assault where the presumption was sure to be against me?" This topic of *εἰκός*, in its manifold forms, was in fact the great weapon of the earliest Greek rhetoric. It was further developed by Tisias, the pupil of Corax, as we see from Plato's *Phaedrus*, in an "art" of rhetoric which antiquity possessed, but of which we know little else. Aristotle gives the *εἰκός* a place among the topics of the fallacious enthymeme which he enumerates in *Rhet.* ii. 24, remarking that it was the very essence of the treatise of Corax; he points out the fallacy of omitting to distinguish between abstract and particular probability, quoting the verses of Agatho,—"Perhaps one might call this very thing a probability, that many improbable things will happen to men." Gorgias (*q.v.*) of Leontini captivated the Athenians in 427 B.C. by his oratory (Diod. xii. 53), which, so far as we can judge, was

Early Greek rhetoric —Corax.

The topic of εἰκός.

Tisias.

Gorgias.

characterized by florid antithesis, expressed in short jerky sentences. But he has no definite place in the development of rhetoric as a system. It is doubtful whether he left a written "art"; and his mode of teaching was based on learning prepared passages by heart,—diction (λέξις), not invention or arrangement, being his great object.

The first extant Greek author who combined the theory with the practice of rhetoric is the Athenian Antiphon (*q.v.*), the first of the Attic orators, and the earliest representative at Athens of a new profession created by the new art of rhetoric—that of the λογογράφος, the writer of forensic speeches for other men to speak in court. His speeches show the art of rhetoric in its transition from the technical to the practical stage, from the school to the law court and the assembly. The organic laws of the rhetorical pleader's thought stand out in bold relief, and we are enabled to form a clear notion of the logographer's method. We find a striking illustration of the fact that the topic of "probability" is the staple of this early forensic rhetoric. Viewed generally, the works of Antiphon are of great interest for the history of Attic prose, as marking how far it had been influenced by a theory of style. The movement of Antiphon's prose has a certain grave dignity, "impressing by its weight and grandeur," as a Greek critic in the Augustan age says, "not charming by its life and flow." Verbal antithesis is used, not in a diffuse or florid way, but with a certain sledge-hammer force, as sometimes in the speeches of Thucydides. The imagery, too, though bold, is not florid. The structure of the periods is still crude; and the general effect of the whole, though often powerful and impressive, is somewhat rigid.

Antiphon.

Antiphon represents what was afterwards named the "austere" or "rugged" style (αὐστηρὰ ἁρμονία), Lysias was the model of an artistic and versatile simplicity. But while Antiphon has a place in the history of rhetoric as an art, Lysias, with his more attractive gifts, belongs only to the history of oratory. Ancient writers quote an "art" of rhetoric by Isocrates, but its authenticity was questioned. It is certain, however, that Isocrates taught the art as such. He is said to have defined rhetoric "as the science of persuasion" (Sext. Empir. *Adv. Mathem.* ii. § 62, p. 301 seq.). Many of his particular precepts, both on arrangement and on diction, are cited, but they do not give a complete view of his method. The φιλοσοφία ("theory of culture") which Isocrates propounds in his discourses *Against the Sophists* and on the *Antidosis*, was in fact rhetoric applied to politics. First came technical expositions: the pupil was introduced to all the artificial resources which prose composition employs (τὰς ἰδίας ἁπάσας αἷς ὁ λόγος τυγχάνει χρώμενος, *Antid.* § 183). The same term (ἰδέαι) is also used by Isocrates in a narrower sense, with reference to the "figures" of rhetoric, properly called σχήματα (*Panath.* § 2); sometimes, again, in a sense still more general, to the several branches or styles of literary composition (*Antid.* § 11). When the technical elements of the subject had been learned, the pupil was required to apply abstract rules in actual composition, and his essay was revised by the master. Isocrates was unquestionably successful in forming speakers and writers. His school was famous during a period of more fifty years (390 to 340 B.C.) Among the statesmen whom it trained were Timotheus, Leodamas of Acharnae, Lycurgus and Hyperides; among the philosophers or rhetoricians were Speusippus, Plato's successor in the Academy, and Isaeus; among the historians, Ephorus and Theopompus. Cicero and through him all subsequent oratory owed much to the ample prose of the Isocratean school.

Isocrates.

In the person of Isocrates the art of rhetoric is thus thoroughly established, not merely as a technical method, but also as a practical discipline of life. If Plato's mildly ironical reference in the *Euthydemus* to a critic "on the borderland between philosophy and statesmanship" was meant, as is probable, for Isocrates, at least there was a wide difference between the measure of acceptance accorded to the earlier Sophists, such as Protagoras, and the influence which the school of Isocrates exerted through the men whom it had trained. Rhetoric had won its place in education. It kept that place through varying fortunes to the fall of the Roman empire, and resumed it, for a while, at the revival of learning.

Plato in the *Gorgias* and the *Phaedrus* satirized the ordinary textbooks of rhetoric, and himself gave directions for a higher standard of work; but the detailed study of the art begins with Aristotle. Aristotle's *Rhetoric* belongs to the generation after Isocrates, having been composed (but see ARISTOTLE) between 330 and 322 B.C. As controversial allusions sometimes hint it holds Isocrates for one of the foremost exponents of the subject. From a purely literary point of view Aristotle's *Rhetoric* (with the partial exception of book iii.) is one of the driest works in the world. But from the historical or scientific point of view it is one of the most interesting. If we would seize the true significance of the treatise it is better to compare rhetoric with grammar than with its obvious analogue, logic. A method of grammar was the conception of the Alexandrian age, which had lying before it the standard masterpieces of Greek literature, and deduced the "rules" of grammar from the actual practice of the best writers. Aristotle in the latter years of the 4th century B.C. held the same position relatively to the monuments of Greek oratory which the Alexandrian methodizers of grammar held relatively to Greek literature at large. Abundant material lay before him, illustrating how speakers *had* been able to persuade the reason or to move the feelings. He therefore sought thence to deduce rules and so construct a true art. Aristotle's practical purpose was undoubtedly to show how to make persuasive speakers. So believed, this is the only sound way to set about it. But the enduring interest of his *Rhetoric* is mainly retrospective. It attracts us as a feat in analysis by an acute mind—a feat highly characteristic of that mind itself, and at the same time strikingly illustrative of the field over which the materials have been gathered.

Aristotle's "Rhetoric."

The *Rhetoric* is divided into three books. Book i. deals in great detail with the minutiae of the rhetorical craft. Book i. discusses the nature and object of rhetoric. The means of persuasion (πίστεις) are classed into "inartificial" (ἄτεχνοι), *i.e.* the facts of the case external to the art, documents, laws, depositions,—and "artificial" (ἔντεχνοι), the latter subdivided into logical (the popular syllogism or "enthymeme," real "example," &c.), ethical, and emotional. Aristotle next deals with the "topics" (τόποι), *i.e.* the commonplaces of rhetoric, general or particular arguments which the rhetorician must have ready for immediate use. Rhetoric is then broadly divided into :—(1) *deliberative* (συμβουλευτική), concerned with exhortation or dissuasion, and with future time, its end (τέλος) being the advantage or detriment of the persons addressed; (2) *forensic* (δικανική), concerned with accusation and defence, and with time past, its standard being justice; (3) *epideictic*, the ornamental branch of display, concerned with praise and blame, usually with the present time, its standard being honour and shame. Each of these kinds is discussed, and the book ends with a brief analysis of the "inartificial proofs." In book ii. Aristotle returns to the "artificial" proofs—those which rhetoric itself provides. The "logical" proof having been discussed in book i., he turns to the "ethical." He shows how the speaker may so indicate his own character and the goodness of his motive as to prepossess the audience in his favour, and proceeds to furnish materials to this end. The "emotional" proof is then discussed, and an analysis is given of the emotions on which the speaker may act. A consideration follows of the "universal commonplaces" (κοινοὶ τόποι) which are suitable to all subjects. The book ends with an appendix dealing with the "example" (παράδειγμα), the general moral sentiments (γνῶμαι) and the enthymeme. In book iii. Aristotle considers expression (λέξις), including the art of delivery (ὑπόκρισις), and arrangement (τάξις). Composition, the use of prose rhythm, the periodic style (the "periodic" style, κατεστραμμένη, being contrasted with the "running" (εἰρομένη)) are all analysed, and the types of style licensed by oral delivery (ἀγωνιστική) are differentiated. Under "arrangement" he concludes with the parts of a speech, proem, narrative, proofs and epilogue.

It is necessary briefly to consider Aristotle's general view of rhetoric as set forth in book i. Rhetoric is properly an art. This is the proposition from which Aristotle sets out. It is so because when a speaker persuades, it is possible to find out why he succeeds in doing so. Rhetoric is, in fact, the popular branch of logic. Hitherto, Aristotle says, the essence of rhetoric has been neglected for the accidents. Writers on rhetoric have hitherto concerned themselves mainly with "the exciting of prejudice, of pity, of anger, and such-like emotions of the soul." All this is very well, but "it has nothing to do with the matter in hand; it has regard

to the judge." The true aim should be to *prove* your point, or seem to prove it.

Here we may interpolate a comment which has a general bearing on Aristotle's *Rhetoric*. It is quite true that, if we start from the conception of rhetoric as a branch of logic, the phantom of logic in rhetoric claims precedence over appeals to passion. But Aristotle does not sufficiently regard the question—What, as a matter of experience, is most persuasive? Logic may be more persuasive with the more select hearers of rhetoric; but rhetoric is for the many, and with the many appeals to passion will sometimes, perhaps usually, be more effective than syllogism. No formulation of rhetoric can correspond with fact which does not leave it absolutely to the genius of the speaker whether reasoning (or the semblance) is to be what Aristotle calls it, the "body of proof" (σῶμα πίστεως), or whether the stress of persuading effort should not be rather addressed to the emotions of the hearers.

But we can entirely agree with Aristotle in his next remark, which is historical in its nature. The deliberative branch of rhetoric had hitherto been postponed, he observes, to the forensic. We have, in fact, already seen that the very origin of rhetoric in Hellas was forensic. The relative subordination of deliberative rhetoric, however unscientific, had thus been human. Aristotle's next statement, that the master of logic will be the master of rhetoric, is a truism if we concede the essential primacy of the logical element in rhetoric. Otherwise it is a paradox; and it is not in accord with experience, which teaches that speakers incapable of showing even the ghost of an argument have sometimes been the most completely successful in carrying great audiences along with them. Aristotle never assumes that the hearers of his rhetorician are *οἱ χαρίεντες*, the cultivated few; on the other hand, he is apt to assume tacitly—and here his individual bent comes out—that these hearers are not the great surging crowd, the ὄχλος, but a body of persons with a decided, though imperfectly developed, preference for sound logic.

What is the use of an art of rhetoric? It is fourfold, Aristotle replies. Rhetoric is useful, first of all, because truth and justice are naturally stronger than their opposites. When awards are not duly given, truth and justice must have been worsted by their own fault. This is worth correcting. Rhetoric is then (1) *corrective*. Next, it is (2) *instructive*, as a popular vehicle of persuasion for persons who could not be reached by the severer methods of strict logic. Then it is (3) *suggestive*. Logic and rhetoric are the two impartial arts; that is to say, it is a matter of indifference to them, as arts, whether the conclusion which they draw in any given case is affirmative or negative. Suppose that I am going to plead a cause, and have a sincere conviction that I am on the right side. The art of rhetoric will suggest to me what might be urged on the other side; and this will give me a stronger grasp of the whole situation. Lastly, rhetoric is (4) *defensive*. Mental effort is more distinctive of man than bodily effort; and "it would be absurd that, while incapacity for physical self-defence is a reproach, incapacity for mental defence should be no reproach." Rhetoric, then, is corrective, instructive, suggestive, defensive. But what if it be urged that this art may be abused? The objection, Aristotle answers, applies to all good things, except virtue, and especially to the most useful things. Men may abuse strength, health, wealth, generalship.

Uses of rhetoric.

The function of the medical art is not necessarily to cure, but to make such progress towards a cure as each case may admit. Similarly it would be inaccurate to say that the function of rhetoric was to persuade. Rather must rhetoric be defined as "the faculty of discerning in every case the available means of persuasion." Suppose that among these means of persuasion is some process of reasoning which the rhetorician himself knows to be unsound. That belongs to the province of rhetoric all the same. In relation to logic, a man is called a "sophist" with regard to his moral purpose (*προαίρεσις*), *i.e.* if he knowingly used a fallacious syllogism. But rhetoric takes no account of the moral purpose. It takes account simply of the faculty (*δύναμις*)—the faculty of discovering any means of persuasion.

Rhetoric defined.

Aristotle's *Rhetoric* is incomparably the most scientific work which exists on the subject. It may also be regarded as having determined the main lines on which the subject was treated by nearly all subsequent writers. The extant treatise on rhetoric (also by Aristotle?) entitled "Ῥητορικὴ πρὸς Ἀλέξανδρον, formerly ascribed to Anaximenes of Lampsacus, was written at latest by 340 B.C. The introductory letter prefixed to it is probably a late forgery. Its relation towards Aristotle's *Rhetoric* is discussed in the article on ARISTOTLE.

The Rhetoric "to Alexander."

During the three centuries from the age of Alexander to that of Augustus the fortunes of rhetoric were governed by the new conditions of Hellenism. Aristotle's scientific method lived on in the Peripatetic school. Meanwhile the fashion of florid declamation or strained conceits prevailed in the rhetorical schools of Asia, where, amid mixed populations, the pure traditions of the best Greek taste had been dissociated from the use of the Greek language. The "Asianism" of style which thus came to be constrasted with "Atticism" found imitators at Rome, among whom must be reckoned the orator Hortensius (*c.* 95 B.C.). Hermagoras of Temnos in Aeolis (*c.* 110 B.C.) claims mention as having done much to revive a higher conception. Using both the practical rhetoric of the time before Aristotle and Aristotle's philosophical rhetoric, he worked up the results of both in a new system,—following the philosophers so far as to give the chief prominence to "invention." He thus became the founder of a rhetoric which may be distinguished as the scholastic. Through the influence of his school, Hermagoras did for Roman eloquence very much what Isocrates had done for Athens. Above all, he counteracted the view of "Asianism," that oratory is a mere knack founded on practice, and recalled attention to the study of it as an art.[1]

The period from Alexander to Augustus.

Hermagoras.

Cicero's rhetorical works are to some extent based on the technical system to which he had been introduced by Molon at Rhodes. But Cicero further made an independent use of the best among the earlier Greek writers, Isocrates, Aristotle and Theophrastus. Lastly, he could draw, at least in the later of his treatises, on a vast fund of reflection and experience. Indeed, the distinctive interest of his contributions to the theory of rhetoric consists in the fact that his theory can be compared with his practice. The result of such a comparison is certainly to suggest how much less he owed to his art than to his genius. Some consciousness of this is perhaps implied in the idea which pervades much of his writing on oratory, that the perfect orator is the perfect man. The same thought is present to Quintilian, in whose great work, *De Institutione Oratoria*, the scholastic rhetoric receives its most complete expression (*c.* A.D. 90). Quintilian treats oratory as the end to which the entire mental and moral development of the student is to be directed. Thus he devotes his first book to an early discipline which should precede the orator's first studies, and his last book to a discipline of the whole man which lies beyond them. Some notion of his comprehensive method may be derived from the circumstance that he introduces a prominent estimate of the chief Greek and Roman authors, of every kind, from Homer to Seneca (bk. x. §§ 46–131). After Quintilian, the next important name is that of Hermogenes of Tarsus, who under Marcus Aurelius made a complete digest of the scholastic rhetoric from the time of Hermagoras of Temnos (110 B.C.). It is contained in five extant treatises, which are remarkable for clearness and acuteness, and still more remarkable as having been completed before the age of twenty-five. Hermogenes continued for nearly a century and a half to be one of the chief authorities in the schools. Longinus (*c.* A.D. 260) published an *Art of Rhetoric* which is still extant; and the more celebrated treatise *On Sublimity* (περὶ ὕψους), if not his work, is at least of the same period. In the later half of the 4th century Aphthonius (*q.v.*) composed the "exercises" (προγυμνάσματα) which superseded the work of

Cicero.

Quintilian.

Hermogenes.

Other writers.

[1] See Jebb's *Attic Orators*, ii. 445.

Hermogenes. At the revival of letters the treatise of Aphthonius once more became a standard text-book. Much popularity was enjoyed also by the exercises of Aelius Theon (of uncertain date; see THEON). (See further the editions of the *Rhetores Graeci* by L. Spengel and by Ch. Walz.)

Practice of Rhetoric under the Empire.

During the first four centuries of the empire the practice of the art was in greater vogue than ever before or since. First, there was a general dearth of the higher intellectual interests: politics gave no scope to energy; philosophy was stagnant, and literature, as a rule, either arid or frivolous. Then the Greek schools had poured their rhetoricians into Rome, where the same tastes which revelled in coarse luxury welcomed tawdry declamation. The law-courts of the Roman provinces further created a continual demand for forensic speaking. The public teacher of rhetoric was called "sophist," which was now an accurate title, similar to "professor" or "doctor."

The "Sophists."

In the 4th century B.C. Isocrates had taken pride in the name of *σοφιστής*, which, indeed, had at no time wholly lost the good, or neutral, sense which originally belonged to it. The academic meaning which it acquired under the early empire lasted into the middle ages (see Du Cange, *s.v.*, who quotes from Baldricus, "Egregius Doctor magnusque Sophista Geraldus"). While the word *rhetor* still denoted the faculty, the word *sophistes* denoted the office or rank to which the rhetor might hope to rise. So Lucian ("Teacher of Rhetoricians," § 1) says: "You ask, young man, how you are to become a rhetor, and attain in your turn to the repute of that most impressive and illustrious title, sophist." Lucian also satirizes the discussions of the nature of rhetoric in his parody the *Parasite* (cf. also his *Bis accusatus*).

Chairs of Rhetoric.

Vespasian (70–79 A.D.), according to Suetonius, was the first emperor who gave a public endowment to the teaching of rhetoric. Under Hadrian and the Antonines (A.D. 117–180) the public chairs of rhetoric became objects of the highest ambition. The complete constitution of the schools at Athens was due to Marcus Aurelius. The Philosophical school had four chairs (*θρόνοι*)—Platonic, Stoic, Peripatetic, Epicurean. The Rhetorical school had two chairs, one for "sophistic," the other for "political" rhetoric. By "sophistic" was meant the academic teaching of rhetoric as an art, in distinction from its "political" application to the law-courts. The "sophistical" chair was superior to the "political" in dignity as in emolument, and its occupant was invested with a jurisdiction over the youth of Athens similar to that of the vice-chancellor in a modern university. The Antonines further encouraged rhetoric by granting immunities to its teachers. Three "sophists" in each of the smaller towns, and five in the larger, were exempted from taxation (*Dig.* xxvii. 1, 6, § 2). The wealthier sophists affected much personal splendour. Polemon (*c.* A.D. 130) and Adrian of Tyre (*c.* A.D. 170) are famous examples of extravagant display. The aim of the sophist was to impress the multitude. His whole stock-in-trade was style, and this was directed to astonishing by *tours de force*.

Declamations.

The scholastic declamations were chiefly of two classes. (1) The *suasoriae* were usually on historical or legendary subjects, in which some course of action was commended or censured (cf. Juv. *Sat.*). These *suasoriae* belonged to deliberative rhetoric (*τὸ βουλευτικὸν γένος, deliberativum genus*). (2) The *controversiae* turned especially on legal issues, and represented the forensic rhetoric (*δικανικὸν γένος, judiciale genus*). But it was the general characteristic of this period that all subjects, though formally "deliberative" or "forensic," were treated in the style and spirit of that third branch which Aristotle distinguished, the rhetoric of *ἐπίδειξις* or "display." The oratory produced by the age of the academic sophists can be estimated from a large extant literature. It is shown under various aspects, and presumably at its best, by such writers as Dio Chrysostom at the end of the 1st century, Aelius Aristides (see ARISTIDES, AELIUS) in the 2nd, the chief rhetorician under the Antonines, Themistius, Himerius and Libanius in the 4th. Amid much which is tawdry or vapid, these writings occasionally present passages of true literary beauty, while they constantly offer matter of the highest interest to the student.

Medieval study of Rhetoric.

In the medieval system of academic studies, grammar, logic and rhetoric were the subjects of the trivium, or course followed during the four years of undergraduateship. Music, arithmetic, geometry and astronomy constituted the quadrivium, or course for the three years from the B.A. to the M.A. degree. These were the seven liberal arts. In the middle ages the chief authorities on rhetoric were the latest Latin epitomists, such as Martianus Capella (5th cent.), Cassiodorus (5th cent.) or Isidorus (7th cent.).

Rhetoric at the Universities.

After the revival of learning the better Roman and Greek writers gradually returned into use. Some new treatises were also produced. Leonard Cox (d. 1549) wrote *The Art or Craft of Rhetoryke*, partly compiled, partly original, which was reprinted in Latin at Cracow. The *Art of Rhetorique*, by Thomas Wilson (1553), afterwards secretary of state, embodied rules chiefly from Aristotle, with help from Cicero and Quintilian. About the same time treatises on rhetoric were published in France by Tonquelin (1555) and Courcelles (1557). The general aim at this period was to revive and popularize the best teaching of the ancients on rhetoric. The subject was regularly taught at the universities, and was indeed important. At Cambridge in 1570 the study of rhetoric was based on Quintilian, Hermogenes and the speeches of Cicero viewed as works of art. An Oxford statute of 1588 shows that the same books were used there. In 1620 George Herbert was delivering lectures on rhetoric at Cambridge, where he held the office of public orator. The decay of rhetoric as a formal study at the universities set in during the 18th century. The function of the rhetoric lecturer passed over into that of correcting written themes; but his title remained long after his office had lost its primary meaning. If the theory of rhetoric fell into neglect, the practice, however, was encouraged by the public exercises ("acts" and "opponencies") in the schools. The college prizes for "declamations" served the same purpose.

Modern Writers on Rhetoric.

The fortunes of rhetoric in the modern world, as briefly sketched above, may suffice to suggest why few modern writers of ability have given their attention to the subject. Perhaps one of the most notable modern contributions to the art is the collection of commonplaces framed (in Latin) by Bacon, "to be so many spools from which the threads can be drawn out as occasion serves," a truly curious work of that acute and fertile mind. He called them "Antitheta." A specimen is subjoined:—

UXOR ET LIBERI

For.	*Against.*
"Attachment to the state begins from the family."	"He who marries, and has children, has given hostages to fortune."
"Wife and children are a discipline in humanity. Bachelors are morose and austere."	"The immortality of brutes is in their progeny; of men, in their fame, services, and institutions."
"The only advantage of celibacy and childlessness is in case of exile."	"Regard for the family too often overrides regard for the state."

Whately.

This is quite in the spirit of Aristotle's treatise. The popularity enjoyed by Blair's *Rhetoric* in the latter part of the 18th and the earlier part of the 19th century was merited rather by the form than by the matter. Campbell's *Philosophy of Rhetoric*, which found less wide acceptance than its predecessor, was superior to it in depth, though often marred by an imperfect comprehension of logic. But undoubtedly the best modern book on the subject is Whately's *Elements of Rhetoric*. Starting from Aristotle's view, that rhetoric is "an offshoot from logic," Whately treats it as the art of "argumentative composition." He considers it under four heads: (1) the address to the understanding (= Aristotle's *λογικὴ πίστις*); (2) the address to the will, or persuasion (= Aristotle's *ἠθικὴ* and

παθητική πίστις); (3) style; (4) elocution, or delivery. But when it is thus urged that—

"All a rhetorician's rules
But teach him how to name his tools,"

the assumption is tacitly made that an accurate nomenclature and classification of these tools must be devoid of practical use. The conditions of modern life, and especially the invention of printing, have to some extent diminished the importance which belonged in antiquity to the art of speaking, though modern democratic politics and forensic conditions still make it one which may be cultivated with advantage.

Among more modern works are J. Bascom, *Philosophy of Rhetoric* (New York, 1885); and numerous books on voice culture, gesture and elocution. For ancient rhetoric see W. R. C. Jebb's translation of Aristotle's *Rhetoric* (ed. J. E. Sandys, 1909), and his *Attic Orators* (1876); also Spengel, *Artium Scriptores* (1828); Westermann, *Gesch. der Beredtsamkeit* (1833–35); Cope, in the *Cambridge Journal of Classical and Sacred Philology* (1855–57); introductions to Cicero's *De Oratore* (A. S. Wilkins) and *Orator* (J. E. Sandys); Volkmann, *Die Rhetorik der Griechen und Römer in system. Übersicht* (ed. 2, 1885). (R. C. J.; X.)

RHEUMATISM (from Gr. ῥεῦμα, flux), a general term for various forms of disease, now subdivided more accurately under separate names.

ACUTE RHEUMATISM or RHEUMATIC FEVER is the name given to a disease having for its chief characteristics inflammatory affections of the joints, attended by severe constitutional disturbances and frequently associated with inflammation of the pericardium and valves of the heart. The acute rheumatism of childhood differs materially from that of adults in that the articular manifestations and constitutional disturbance are usually much less severe, whereas the heart and pericardium are especially liable to be attacked. It will be advisable, therefore, in discussing the symptoms, to deal separately with the rheumatism of adults and that of childhood. There are certain points of importance in connexion with its causation which are generally agreed upon. It is essentially a disease of childhood and early adult life, being most commonly met with between the ages of ten and twenty-five and comparatively rarely after forty. Heredity is unquestionably an important predisposing cause. Climate is also a factor of considerable importance, cold and damp with sudden and wide fluctuations of temperature being especially conducive to an attack. While perhaps more common in Great Britain than elsewhere, it is met with in most parts of the globe. Exposure to cold and wet, and especially a chill after free perspiration and fatigue, are among the most common exciting causes of an attack.

Of recent years much evidence has accumulated tending to show that rheumatism is a specific infective disease due to a micro-organism, and this is now generally recognized. There is still, however, some difference of opinion as to the nature of the micro-organism by which it is produced. In 1900 F. J. Poynton and Paine isolated from eight cases of acute rheumatism in children a minute diplococcus similar to that previously described by Triboulet and by A. Wasserman, which inoculated into rabbits produced lesions of the joints and of the heart indistinguishable from those met with in acute rheumatism. They have since obtained the same micro-organism from a further large number of cases of acute rheumatism, and their results have been confirmed by Walker, Beattie and others. They therefore claim that this micro-organism, to which they have given the name *Diplococcus rheumaticus*, is the specific cause of acute rheumatism. The objections which have been raised by other competent observers against this view are: (1) That this diplococcus is not found in all cases of acute rheumatism. (2) That certain other micro-organisms when inoculated into animals will produce joint and heart affections similar to those produced by the aforesaid *Diplococcus rheumaticus*. It would be out of place here to enter into the merits of this controversy; suffice it to say that the objections raised do not appear to be cogent enough to invalidate the conclusions arrived at by the authors of the germ theory. The matter is, however, still to a certain extent *sub judice*.

In *adults* the affection of the joints is the most striking feature. The attack is usually ushered in by a feeling of chilliness or malaise, with pain or stiffness in one or more joints, generally those of large or medium size, such as the knees, ankles, wrists or shoulders. At first the pain is confined to one or two joints, but others soon become affected, and there is a tendency to symmetry in the order in which they are attacked, the inflammation in one joint being followed by that of the same joint on the opposite side. The affected joints are swollen, hot and excessively tender, and the skin over them is somewhat flushed. The temperature is raised, ranging from about 101° to 103° F., the pulse rapid, full and soft; the face is flushed, the tongue coated with a thick white fur, and there is thirst, loss of appetite, and constipation. The body is bathed in a profuse perspiration, which has a characteristic sour, disagreeable odour. The urine is diminished, acid and loaded with urates. The attack is of variable duration, and may pass off in a few days or last for some weeks. Relapses are not uncommon when convalescence appears to have been established. Among the complications which may arise are hyperpyrexia, or rapid and extreme rise of temperature, which may run up as high as 110° F., when death will speedily ensue unless prompt and energetic treatment by cold baths or icepacks is resorted to. Affections of the heart, pericarditis (inflammation of the fibro-serous sac investing the heart) and endocarditis (inflammation of the lining membrane and the valves of the heart), which are so frequently associated with rheumatism, must be regarded as part of the disease, rather than as complications of rheumatism. They are far more common in children than in adults, and it is the damage to the valves of the heart in children by rheumatism which lays the foundation of much chronic heart disease in later life.

Symptoms.

In *childhood* the affection of the joints is usually slight, and may be confined to a little pain or stiffness in one or two joints, and is sometimes attributed by parents to "growing pains." The constitutional symptoms are also ill-marked and there are no acid sweats, the temperature is not as a rule very high, the tongue not heavily coated, and the child does not appear to be very ill. The heart and pericardium are, however, especially liable to attack, and this may be so insidious in its onset that attention is not called to it till considerable damage has been done to the heart. It is of importance, therefore, that in children the heart should be frequently examined by a physician, when there is the slightest suspicion of an attack of rheumatism. *Chorea* or St Vitus's dance is a common manifestation of rheumatism in children. *Subcutaneous fibrous nodules*, attached to tendons or fibrous structures beneath the skin, are a special feature of the rheumatism of childhood. They are painless, and vary in size from one-eighth to half an inch in diameter. They are not very common, but when present indicate that the rheumatism has a firm hold and that cardiac complications are to be apprehended.

The patient should be placed in bed between blankets, and should wear a light flannel or woollen shirt. The affected joints should be kept at rest as far as possible, and enveloped in cotton-wool. Salicylate of soda or sodicin, first suggested by Dr Maclagan in 1876, appear to exercise a specific influence in acute rheumatism. They have a powerful effect not only in reducing the temperature, but in relieving the pain and cutting short the attack. Frequent and fairly large doses of salicylate of soda should be administered for the first twenty-four hours: the dose and interval at which it is given should then be gradually reduced till the symptoms subside. In conjunction with this, alkalies such as bicarbonate or citrate of potash should also be administered. The effect of the salicylate should be carefully watched, and the dose reduced if toxic symptoms such as delirium, deafness, and noises in the ears occur. These drugs are of less service in the rheumatism of children than in that of adults, as they do not appear to exercise any specific influence in arresting the cardiac inflammation to which children are specially liable, though they have a marked effect on the joint affections. Aspirin has

Treatment.

recently come into use as a substitute for salicylates, and may succeed when salicylates fail.

Subacute rheumatism.—This term is sometimes applied to attacks of the disease of a less severe type in which the symptoms, though milder in character, are usually of longer duration and more intractable than in the acute form. It is difficult, however, to draw a hard-and-fast line between the two, but the term may perhaps be most appropriately applied to the repeated and protracted attacks of cardiac rheumatism in children.

CHRONIC RHEUMATISM.—This term has been somewhat loosely applied to various chronic joint affections, sometimes of gouty origin or the result of rheumatoid arthritis. Strictly speaking, it may be applied to cases in which the joint lesions persist after an attack of rheumatism, and chronic inflammatory thickening of the tissues takes place, so that they become stiff and deformed. It is also appropriate to certain joint affections occurring in later life in rheumatic subjects, who are liable to repeated attacks of pain and stiffness in the joints, usually induced by exposure to cold and wet. This form of rheumatism is less migratory than the acute, and is commonly limited to one or two of the larger joints. After repeated attacks the affected joints may become permanently stiff and painful, and crackling or creaking may occur on movement. There is seldom any constitutional disturbance, and the heart is not liable to be affected.

MUSCULAR RHEUMATISM.—By this is understood a painful affection of certain groups of muscles attributable to inflammation of their fibrous and tendinous attachments. It is commonly brought on by exposure to cold and wet, and especially by a chill after violent exercise and free perspiration when the clothes are not changed. Any movement of the affected muscles gives rise to severe and sharp pain which may induce a certain degree of spasm and rigidity at the time. The pain usually subsides and passes off completely while the patient is at rest, but occurs on the slightest movement of the affected muscles.

The chief varieties of muscular rheumatism are:—

1. Lumbago, in which the muscles of the lower part of the back are affected so that stooping, particularly the attempt to rise again to the erect position, induces severe pain.
2. Intercostal rheumatism, affecting the muscles between the ribs, so that taking a deep breath and certain movements of the arms give rise to pain.
3. Torticollis or stiff neck, affecting the muscles of one side of the neck.

Treatment.—Salicylates, which are of service in acute rheumatism, are not so reliable in the chronic varieties, but are sometimes of service. Aspirin, salicin, quinine and iodide of potassium may be more successful, but other active treatment is usually required. The application of heat in the form of poultices or fomentations, counter irritation by mustard leaves or blisters, are indicated in some cases. In others massage, hot douches, or electricity may be required. Mineral waters and baths of various health resorts are often of great benefit in obstinate cases, such as those of Buxton, Bath, Harrogate, Woodhall Spa, &c., in England, or of Aix-les-Bains, Wiesbaden, Wildbad, &c., and many others on the continent of Europe. Wintering abroad in warm, dry and sunny climates may be advisable in some cases when this is practicable.

(J. F. H. B.)

RHEUMATOID ARTHRITIS (OSTEO-ARTHRITIS, ARTHRITIS DEFORMANS), terms employed to designate a disease or group of diseases characterized by destructive changes in the joints. Though it is only in comparatively recent times that the disease was definitely recognized as separate clinically from either rheumatism or gout, it is certain that it prevailed in ancient times. Characteristic changes in the bones have been found in remains in tombs in Egypt attributed by Petrie to 1300 B.C., and ancient Roman as well as British graves have held bones showing distinct traces of the diseases. Of early medical writers, Paulus Aeginata observed the lesions and seemed to consider them distinctive. Landré Beauvais in 1800 published a description of the disease under the title of *Goutte asthenique primitif*. The first endeavour, however, to separate rheumatoid arthritis as a distinct disease was made by William Heberden in 1803; while in 1805 John Haygarth recognized the difference between it and rheumatism, and suggested the term "nodosity of the joints." A wide divergence of opinion during the 19th century as to its relation to rheumatism and to gout gave rise to the unfortunate term "rheumatic gout." The name *arthritis deformans* was suggested by Virchow in 1859. Various causes, such as nervous origin, inherited arthritic diathesis, a relationship to rheumatism or gout, and reflex irritation, have been put foward as giving rise to the disease, but in the present state of medical knowledge two are most favoured. The first ascribes the disease to an infective process arising from micro-organisms. Several observers have found bacteria in the synovial fluid and membranes of affected joints,—Max Schüller finding both bacilli and cocci, while in 1896 Gilbert Bannatyne, Wohlmann and Blaxall isolated a micro-organism, a bacillus with a bipolar staining, which they stated to be almost constantly present in the joints of patients with true rheumatoid arthritis. The second view is that the disease is the result of a chronic toxaemia produced by absorption of toxines from the intestine, with perhaps some error in metabolism. In many cases there seems to be a distinct evidence of a local infection, injury being a determining factor, and some families seem to have joints which are specially liable to degeneration. The disease may begin at any age, for there is no doubt that persistent cases have been met with in quite young children; but it usually begins in early middle-age, and statistics seem to confirm the impression of the greater liability of females. Conditions which tend to lower the general health seem to act as a predisposing cause to rheumatoid arthritis, *e.g.* mental worry, uterine disorders and various lowering diseases, prominent among which are influenza and tonsillitis. In a number of cases in women the onset occurs about the time of the menopause.

The method of onset varies according to the form. There are four well-marked types—(1) the peri-articular form, in which the most marked changes are in the synovial membrane and peri-articular tissues, and the cartilage may be involved to a limited degree. In this variety is found every grade of severity. The onset may be acute, resembling an attack of rheumatic fever, for which it may be mistaken; the joints, one or more, are swollen, tender and painful to the touch; the temperature elevated to 100°; 101°; but unlike rheumatic fever, sweating and hyperpyrexia are uncommon. The acute stage may then subside, a slight thickening remaining in the capsule of the joint, and the contours of the limb scarcely regaining the normal; or the attack may gradually develop into the chronic form. The pain varies greatly, and is not necessarily in ratio to the amount of arthritis present. Various joints may be involved, the spinal vertebrae not infrequently sharing in an arthritis; the most usual joints to be attacked, however, are the knee and shoulder. When the knee is attacked there is commonly effusion into the joint. Muscular atrophy is usually present, but varies greatly in its extent. In most cases it is present to a much greater degree than can be accounted for by disuse of the muscles. The skin has in these cases a curious glossy appearance, and pigmentations may be noticed. In chronic forms the onset is gradual, one joint becoming painful and swelling, and then the others successively; in these slow forms the outlook for the recovery of the joint is not so good as in the acute, and some cases may proceed to extreme deformity with little or no pain. Gradually the shape of the joint is altered; this is in a great measure due to synovial thickening, and partly to the presence of osteophytes in the joint. When the affected joint is moved a distinct crepitation can be felt. The muscles about the joint atrophy often to an extreme degree, and contractures supervene, flexing the leg upon the thigh if the knees should be affected, and the thigh upon the abdomen should the hip be affected. In extreme degrees the patient may become a complete cripple. Later, in many cases a quiescent stage of the

disease is reached, the patients cease to suffer pain, and are inconvenienced only by the deformities in the limbs, in which a considerable degree of motion may be retained. Remarkable deformities are seen in hands in which a considerable amount of usefulness still remains. Dyspepsia and anaemia are frequently associated with arthritis. Monarticular arthritis more particularly affects the aged; and when it affects the hip is known as *morbus coxae senilis*.

(2) The atrophic form of arthritis is not very common. The chief anatomical change is due to atrophy in the bone and cartilage. The disease occurs at an earlier period in life than the peri-articular form, from which the initial symptoms do not markedly differ; but the disorganization in the joint is greater, dislocations frequently occur, and ankylosis of the joints follows. This is the most serious form of arthritis.

(3) In the hypertrophic form the anatomical changes include the formation of new bone as well as changes in the cartilage. This new-bone formation may lead to progressive ankylosis in the joints. Should the vertebral column be affected a rigid condition of the spine known as *spondylitis deformans* ("poker back") may ensue. What are termed "Heberden's nodes" are small hard knobs about the size of a pea frequently found upon the fingers near the terminal phalangeal joints; they rarely give rise to symptoms. Popularly ascribed to gout, these nodes are in reality a manifestation of arthritis.

(4) A variety of arthritis occurring in children is known as Still's disease; in which the swelling of the joints is associated with swelling of the lymph glands and of the spleen. The onset is often acute, with fever and rigors; sweating is profuse and the joints are enlarged and painful. There may be much muscular wasting and limitation of movement in the joints, and anaemia is associated with the disease.

The treatment of rheumatoid arthritis is rarely curative, once the disease has been permanently established; and it is therefore important to begin treatment before destructive changes have taken place in the joints. In the acute febrile form, which is frequently taken for rheumatism, the essential treatment is rest to the affected joints, with the application of oil of wintergreen; the joint should not be fixed but supported. In the more chronic forms medicinal treatments are usually of little value. Potassium iodide is useful in some cases by promoting absorption of the hypertrophied fibrous tissue, and guaiacol if administered for a sufficiently long time is said to be capable of arresting the disease, diminishing the size of the joint and helping movement. Where anaemia accompanies the disease iron and arsenic are of value. The general health of a patient suffering from rheumatoid arthritis must be maintained, and he should live upon a dry soil. Visits to Aix-les-Bains, Buxton, Bath or Droitwich, with their baths and shampooings, often prove useful, particularly when combined with gentle massage. It is a mistake to keep the joints entirely at rest in the chronic forms, as this tends to the formation of contractures and ankylosis. Moderate exercise without undue fatigue is desirable. Patients should go early to bed and have plenty of rest, sunshine and fresh air. It is important that the diet should be nourishing and plentiful, and should there be intestinal putrefaction fermented milk is useful. As regards the local treatment, it will be well in the majority of cases to determine by the X-rays the exact state of the affected joints. Radiant heat, vibration and hot-air baths are among the best treatments. The active hyperaemia induced by hot air favours restoration of movement and alleviates pain, but where there is pronounced destruction of bone and cartilage full restoration of a joint cannot take place. Systematic exercises of the joints tend to prevent the atrophy of the adjacent muscles, and Bier's passive hyperaemia induced by the temporary use of an elastic bandage has the same results. Should an X-ray photograph reveal the presence of spurs or loose bodies in the joints interfering with free movement their removal is called for. Sometimes the breaking down of adhesions under an anaesthetic is necessary, and gentle passive and later active movements of the joints should follow if freedom of use is to be gained. Recently treatment by radium has taken a definite place in the therapeutics of chronic arthritis, its analgesic properties seeming of great benefit.

(H. L. H.)

RHEYDT, a town of Germany, in the Prussian Rhine province, situated on the Niers, 19 m. W. of Düsseldorf, on the main line of railway to Aix-la-Chapelle, and at the junction of lines to Crefeld and Stolberg. Pop. (1905) 40,149. It has two Roman Catholic and two Evangelical churches, a handsome new town hall (1895), a gymnasium, and several technical schools. The principal products of its numerous factories are silk, cotton, woollen and mixed fabrics, velvet, iron goods, machinery, shoes, cables, soap and cigars. Dyeing and finishing, brewing and distilling, are also carried on. Rheydt is an ancient place, but its industrial importance is of very recent growth, and it only received municipal rights in 1856.

See *Rheyter Chronik. Geschichte der Herrschaft und Stadt Rheydt* (2 vols., Rheydt, 1897); and Strauss, *Geschichte der Stadt Rheydt* (Rheydt, 1897).

RHĪANUS, Greek poet and grammarian, a native of Crete, friend and contemporary of Eratosthenes (275–195 B.C.). Suïdas says he was at first a slave and overseer of a palaestra, but obtained a good education later in life, and devoted himself to grammatical studies, probably in Alexandria. He prepared a new recension of the *Iliad* and *Odyssey*, characterized by sound judgment and poetical taste. His bold atheteses are frequently mentioned in the scholia. He also wrote epigrams, eleven of which, preserved in the Greek anthology and Athenaeus, show elegance and vivacity. But he was chiefly known as a writer of epics (mythological and ethnographical), the most celebrated of which was the *Messeniaca* in six books, dealing with the second Messenian war and the exploits of its central figure Aristomenes, and used by Pausanias in his fourth book as a trustworthy authority. Other similar poems were the *Achaica*, *Eliaca*, and *Thessalica*. The *Heracleia* was a long mythological epic, probably an imitation of the poem of the same name by Panyasis, and containing the same number of books (fourteen).

Fragments in A. Meineke, *Analecta Alexandrina* (1843); for Rhianus's work in connexion with Homer, see C. Mayhoff, *De Rhiani Studiis Homericis* (Dresden, 1870); also W. Christ, *Geschichte der griechischen Litteratur* (1898).

RHIGAS, CONSTANTINE, known as Rhigas of Velestinos (Pherae), or Rhigas Pheraios (1760–1798), Greek patriot and poet, was born at Velestinos, and was educated at Zagora and at Constantinople, where he became secretary to Alexander Ypsilanti. In 1786 he entered the service of Nicholas Mavrogenes, hospodar of Wallachia, at Bucharest, and when war broke out between Turkey and Russia in 1787 he was charged with the inspection of the troops at Craiova. Here he entered into close and friendly relations with a Turkish officer named Osman Passvan-Oglou (1758–1807), afterwards the famous governor of Widin, whose life he saved from the vengeance of Mavrogenes. After the death of his patron Rhigas returned to Bucharest to serve for some time as interpreter at the French Consulate. At this time he wrote the famous Greek version of the *Marseillaise*, well known in Byron's paraphrase as "sons of the Greeks, arise!" He was the founder of the Hetaireia, a society formed to organize Greek patriotic sentiment and to provide the Greeks with arms and money. Believing that the influence of the French Revolution would spread to the Near East, he betook himself to Vienna to organize the movement among the exiled Greeks and their foreign supporters in 1793, or possibly earlier. He published in Vienna many Greek translations of foreign works, and presently founded a Greek press there, but his chief glory was the collection of national songs which, passed from hand to hand in MS., roused patriotic enthusiasm throughout Greece. They were only printed posthumously at Jassy in 1814. While at Vienna Rhigas entered into communication with Bonaparte, to whom he sent a snuff-box made of the root of a laurel tree taken from the temple of Apollo, and eventually he set out with a view to meeting the general of the army of Italy in Venice. But before leaving Vienna he forwarded papers, amongst which is said to have been his correspondence

with Bonaparte, to a compatriot at Istria. The papers were betrayed by Demetrios Oikonomos Kozanites into the hands of the Austrian government, and Rhigas was arrested at Trieste and handed over with his accomplices to the Turkish authorities at Belgrade. Immediately on arrest he attempted suicide. His Turkish friend, Passvan-Oglou, sought to secure his escape, and the government apparently consented to release him on the payment of a ransom of about £6000; but meanwhile the Turkish pasha commanding at Belgrade had taken the law into his own hands. Rhigas's five companions were secretly drowned, but he himself offered so violent a resistance that he was shot by two Turkish soldiers. His last words are reported as being: "I have sown a rich seed; the hour is coming when my country will reap its glorious fruits." Rhigas, writing in the popular dialect instead of in classical Greek, aroused the patriotic fervour of his contemporaries and his poems were a serious factor in the awakening of modern Greece.

See Rizos Néroûlos, *Histoire de la révolution grecque* (Paris, 1829); I. C. Bolanachi, *Hommes illustres de la Grèce moderne* (Paris, 1875); and Mrs E. M. Edmonds, *Rhigas Pheraios* (London, 1890).

RHINE (Lat. *Rhenus*, Ger. *Rhein*, Fr. *Rhin*, Dutch *Rhyn*, or *Rijn*), the chief river of Germany and one of the most important in Europe. It is about 850 m. in length and drains an area of 75,000 sq. m. The distance in a direct line between its source in the Alps and its mouth in the German Ocean is 460 m. Its general course is north-north-west, but it makes numerous deflections and at one point is found running in a diametrically opposite direction. The name Rhine, which is apparently of Celtic origin, is of uncertain etymology, the most favoured derivations being either from *der Rinnende* (the flowing), or from *Rein* (the clear), the latter being now the more generally accepted.

1. *The Swiss Portion.*—The Rhine rises in the mountains of the Swiss canton of the Grisons, and flows for 233 m. in Swiss territory, within which its drainage basin includes about 14,050 sq. m., and every canton save Geneva. The two main branches of the Rhine, the Hinter Rhine and the Vorder Rhine, unite at Reichenau, 6 m. S.W. of Coire. (1) The principal stream is considered to be that of the *Hinter Rhine*, which issues (7271 ft.) from the glaciers of the Rheinwaldhorn group, and then flows first N.E. through the Rheinwald valley, and next N. through the Schams valley, which communicates by the well-known gorge of the Via Mala with the Tomlescha valley at Thusis, whence the stream continues its N. course to Reichenau; total length 35¾ m., total fall 3711 ft. It receives a number of mountain torrents during its course, the most important being that from the Avers glen, and the Albula, both on the right, which is itself formed by many mountain streams. (2) The *Vorder Rhine* rises in the small Toma lake (7691 ft.), S. of the Oberalp Pass, not far from the St. Gotthard Pass, and then flows N.E. past Disentis and Ilanz, which claims the honour of being the "first town on the Rhine," to Reichenau; total length 42 m., total fall 3492¾ ft. Its chief affluents are the stream dignified by the name of the *Medels Rhine*, that rises in the Cadlimo glen, W. of the Lukmanier Pass, and, after flowing through the Medels glen, joins the Vorder Rhine at Disentis, and the Glenner, flowing from the Lugnetz glen, both on the right. From Reichenau the united streams flow N.E. to Coire, the capital of the canton of the Grisons, and then turn towards the N., past Ragatz, the valley broadening out, and the river being joined on the right by the Landquart and the Ill, before it expands into the Lake of Constance. Extensive "corrections" of the river bed, especially the canal of Diepoldsau, have been carried out in the lower bit of this part of the valley, while from a little north of Ragatz the right bank belongs first to Liechtenstein and then to the Austrian province of the Vorarlberg. On issuing from the Lake of Constance at Constance, the Rhine flows nearly due west to Basel, where it leaves Swiss territory, the south bank during this portion of the river being entirely Swiss, save the town of Constance, but the north shore belongs to Baden, save in the case of the Swiss town of Stein-am-Rhein and the Swiss canton of Schaffhausen. The chief towns on its banks are Constance (S.), Schaffhausen (N.), Waldshut (N.), Laufenburg (S.), Säckingen (N.), Rheinfelden (S.), and Basel (both banks). About 1½ m. below Schaffhausen the river forms the famous Falls of the Rhine, or Falls of Schaffhausen (60 ft. high), while at Coblenz, opposite Waldshut, it receives its chief affluent, the Aar, recently swollen by the Reuss and the Limmat, and of greater volume than the river in which it loses its identity. (W. A. B. C.)

2. *The German and Dutch Portion.*—After Basel, when the Rhine turns to the north and enters Germany, its breadth is between 550 and 600 ft., while its surface now lies not more than 800 ft. above the sea, showing that the river has made a descent of 6900 ft. by the time it has traversed a third of its course. From Basel to Mainz the Rhine flows through a wide and shallow valley, bordered on the east and west by the parallel ranges of the Black Forest and the Vosges. Its banks are low and flat, and numerous islands occur. The tendency to divide into parallel branches has been curbed in the interests of navigation, and many windings have been cut off by leading the water into straight and regular channels. At Mannheim the river is nearly 1500 ft. in width, and at Mainz, where it is diverted to the west by the barrier of the Taunus, it is still wider. It follows the new direction for about 20 m., but at Bingen it again turns to the north and begins a completely new stage of its career, entering a narrow valley in which the enclosing rocky hills abut so closely on the river as often barely to leave room for the road and railway on either bank; during this portion of its course the speed of the current at a normal state of the water exceeds 6 m. an hour. This is the most beautiful part of the whole course of the river, abounding in ruined castles, romantic crags and sunny vineyards. At Coblenz the valley widens and the river is 1200 ft. broad, but the hills close in again at Andernach, and this ravine-like part of its course cannot be considered as ending till below the Siebengebirge (Seven Mountains), where the river once more expands to a width of 1300–1600 ft. Beyond Bonn and Cologne the banks are again flat and the valley wide, though the hills on the right bank do not completely disappear till the neighbourhood of Düsseldorf. Farther on the country traversed by the Rhine is perfectly level, and the current becomes more and more sluggish. On entering Holland, which it does below Emmerich, the river is again deflected to the west. Within Holland the banks are so low as to require at places to be protected by embankments against inundations. Almost immediately after entering Holland the stream divides into two arms, the larger of which, carrying off about two-thirds of the water, diverges to the west, is called the Waal, and soon unites with the Maas. The smaller branch to the right retains the name of Rhine and sends off another arm, called the Yssel, to the Zuider Zee. The Rhine now pursues a westerly course almost parallel with that of the Waal. At Wijk another bifurcation takes place, the broad Lek diverging on the left to join the Maas, while the "Kromme Rijn" to the right is comparatively insignificant. Beyond Utrecht, where it is again diminished by the divergence of the Vecht to the Zuider Zee, the river under the name of the "Oude Rijn," or Old Rhine, degenerates into a sluggish and almost stagnant stream, which requires the artificial aid of a canal and of sluices in finding its way to the sea. In Roman times the Rhine at this part of its course seems to have been a full and flowing river, but by the 9th century it had lost itself in the sands of Katwijk, and it was not until the beginning of the 19th century that its way to the sea was re-opened. Though the name Rhine thus at last attaches to a very insignificant stream, the entire district between the Waal on one side and the Yssel on the other, the *Insula Batavorum* of Caesar, in reality belongs to the delta of the famous river.

Tributaries.—The Rhine is said to receive, directly or indirectly, the waters of upwards of 12,000 tributaries of all sizes. Leaving out of account the innumerable glacier streams that swell its volume above the Lake of Constance, the most important affluents to its upper course are the Wutach, the Alb and the Wiese, descending on the right from the Black Forest, and the Aar, draining several Swiss cantons on the left. In the upper Rhenish basin, between

Basel and Mainz, the tributaries, though numerous, are mostly short and unimportant. The Ill and the Nahe on the left and the Neckar and the Main on the right are, however, notable exceptions. Before joining the Rhine the Ill runs almost parallel with it and at no great distance for upwards of 50 m. In the narrow part of the valley, between Bingen and Cologne, the Rhine receives the waters of the Lahn and the Sieg on the right, and those of the Mosel, bringing with it the Saar, and the Ahr on the left. Still lower down, but before the Dutch frontier is reached, come the Ruhr and the Lippe on the right, and the Erft on the left. The numerous arms into which the Rhine branches in Holland have already been noticed.

Physical Geography.—The Rhine connects the highest Alps with the mud banks of Holland, and touches in its course the most varied geological periods; but the river valley itself is, geologically speaking, of comparatively recent formation. Rising amid the ancient gneiss rocks of the St Gotthard, the Rhine finds its way down to the Lake of Constance between layers of Triassic and Jurassic formation; and between that lake and Basel it penetrates the chalk barrier of the Jura. The upper Rhenish valley is evidently the bed of an ancient lake, the shores of which were formed by the gneiss and granite of the Black Forest on the one side and the granite and sandstone of the Vosges on the other. Within the valley all the alluvial deposits are recent. Between Bingen and Bonn the Rhine forces its way through a hilly and rocky district belonging to the Devonian formation. The contorted strata of slate and greywacke rock must have been formed at a period vastly anterior to that in which the lake of the upper valley managed to force an outlet through the enclosing barriers. Probably this section may be looked upon as the oldest portion of the river course proper, connecting the upper Rhenish lake with the primeval ocean at Bonn. In this district, too, as has already been remarked, is the finest scenery of the Rhine, a fact due in great part to the grotesque shapes of the quartzose rocks, left denuded of the less durable slate and sandstone. All the strata intersected by the Rhine between Bingen and Bonn contain fossils of the same classes. The deposits of the actual valley here, belonging to the Miocene group of the Tertiary system, are older than the deposits either farther up or farther down the river; but they are contemporaneous with the basalts of the Rhine, which at Coblenz and in the peaks of the Seven Mountains also contribute to the scenic charm of the river. The very extensive pumice deposits at Neuwied and the lava and other volcanic rocks belong to a more recent epoch. Below Bingen the formations belong almost entirely to the Post-Tertiary period. Numerous extinct volcanoes rise near Neuwied. In the flatter parts of the valley occur large beds of loam and rubble, sometimes in terraces parallel with, but several hundred feet above, the river, proving by their disposition and appearance that the valley has been formed by the action of water.

Navigation.—The Rhine has been one of the chief waterways of Europe from the earliest times; and, as its channel is not exposed to the danger of silting up like those of the Elbe and the Oder, it has always been comparatively easy to keep it open. The Romans exerted themselves to improve the lower navigation of the river, and appointed prefects of the Rhine to superintend the shipping and to exact the moderate dues imposed to keep the channel in repair. The Franks continued the same policy and retained a system of river-dues. Afterwards, as the banks became parcelled out among a host of petty princelings, each of whom arrogated the right of laying a tax on passing vessels, the imposts became so prejudicial as seriously to hamper the development of the shipping. Many of the riparian potentates derived the bulk of their revenue from this source, and it is calculated that in the 18th century the Rhine yielded a total revenue of £200,000, in spite of the comparatively insignificant amount of the shipping. The first proposal for a free Rhine was mooted by the French at the congress of Rastatt (1797–1799), but Holland, commanding the mouth of the river, placed every obstacle in the way of the suggestion. In 1831, on the separation of Holland and Belgium, the former had become more amenable to reason; and a system was agreed upon which practically gave free navigation to the vessels of the riverine states, while imposing a moderate tariff upon foreign ships. After the war of 1866, Prussia negotiated, with Baden, Bavaria and Hesse-Darmstadt with a view to the removal of all tolls. It was not, however, till 1868 (see *Die Rhein-Schiffahrts Akte vom 17ten Okt., 1868*) that the last vestige of a toll disappeared and the river was thrown open without any restriction. The management of the channel and navigation is now vested in a central commission, meeting at Mannheim on the 1st of July in each year. The channel has been greatly improved and in many places made more direct since the beginning of the 19th century, large sums being annually spent in keeping it in order. Capacious river harbours have been formed at various points, twenty-nine of these being in Germany and eight in Holland. The position of the river is highly favourable for the development of its trade. It flows through the most populous regions of the continent of Europe, to discharge into one of the most frequented seas opposite Great Britain, and, besides serving as a natural outlet for Germany, Belgium and Holland, is connected with a great part of central and southern France by the Rhine-Rhone and the Rhine-Marne canals, and with the basin of the Danube by the Ludwigs-Canal.

The introduction of steam has greatly increased the shipping on the Rhine; and small steamers ply also on the Main, the Neckar, the Maas and the Mosel. The first Rhine steamer was launched in 1817; and now the river is regularly traversed by upwards of a hundred, from the small tug up to the passenger saloon-steamer. The steamboat traffic has especially encouraged the influx of tourists, and the number of passing travellers may now be reckoned as between one and two millions annually. The river is navigable without interruption from Basel to its mouth, a distance of 550 miles, of which 450 lie within Germany. Above Spires, however, the river craft are comparatively small, but lower down vessels of 500 and 600 tons burden find no difficulty in plying. Between Basel and Strassburg the depth of water is sometimes not more than 3 ft.; between Strassburg and Mainz it varies from 5 to 25 ft.; while below Mainz it is never less than 9 or 10 ft. The deepest point is opposite the Lorelei (Lurlei) Rock near St Goar, where it is 75 ft. in depth; at Düsseldorf the depth is about 50 ft.

London, Hamburg, Bremen and the chief Baltic ports as far as Riga and St Petersburg participate in the traffic on the Rhine. The boats which ply up and down the river itself, without venturing upon the open sea, are mostly craft of 100 to 200 tons, owned in the great majority of cases by their captains, men principally of German or Dutch nationality. This fleet is computed to number some 8500 craft, with an aggregate capacity of over 2 million tons, of which about one-tenth are steamships. The traffic at the chief German ports of the river aggregated 4,489,000 tons in 1870, but by 1900 this had grown to a total of 17,000,000 tons, thus distributed: Ruhrort, 6,512,000 tons; Duisburg, 3,000,000 tons; Cologne, 1,422,000 tons; and Mannheim, 6,021,000 tons. These are not the only ports on the river; a large trade is also done at Kehl, Maxau (for Karlsruhe), Ludwigshafen, Mainz, Bonn, Rotterdam and a host of smaller places. The amount of traffic which passed the town of Emmerich near the Dutch frontier, both ways, increased from an annual average of about 6 million tons in 1881–85 to over 21½ million tons in 1899. Notwithstanding the inherent difficulties of construction caused by the great variations in the level of the stream, amounting sometimes to 20 ft. or more, the chief ports of the Rhine are admirably constructed, and well equipped with modern contrivances for loading and unloading vessels. Boats carrying as much as 600 tons are often able to proceed as far up stream as Strassburg, and smaller craft get as far as Hüningen, a little above Basel. Large passenger boats ply regularly between Mainz and Düsseldorf, and sometimes extend their journeys as high up as Mannheim, and as far in the other direction as Rotterdam. The efforts of the river authorities are being directed to the deepening and improvement of the navigable channel from the sea to Strassburg, the low-water depths aimed at being 10 ft. from Rotterdam to the German frontier, and 10 ft. thence to Cologne; 8 ft. 3 in. from Cologne to St Goar, and 6 ft. 6 in. from St Goar to Mannheim. At present the Rhine in Holland has a depth of about 9 ft. and a width of 1200 to 1300 ft., though the Merwede branch exceeds this depth by 8 in. Altogether a sum approaching £2,500,000 was spent in Holland within the latter part of the 19th century on the improvement of the Rhine and its principal arteries. Above Mannheim the depth of the stream is always less than 5 ft., and generally varies between that figure and 4 ft. 6 in. The difficulty of ascending the rapids near Bingen is usually surmounted by the help of steam hauling machinery placed on the bank, though powerful tugs have also come into use for this purpose. The work of blasting out the rocks which at that spot projected in the bed of the river, begun in 1830, was continued down to the year 1887, so that now there are two navigable channels of sufficient depth for all vessels which ply up and down that part of the stream. One of the most interesting features of the Rhine navigation is afforded by the huge rafts of timber that are floated down the river. Single tree trunks sent down to the Rhine by the various tributaries are united into small rafts as they reach the main stream; and these again are fastened together to form one large raft about Andernach. Though not so large as formerly, these timber rafts are still sometimes 400 or 500 ft. in length, and are navigated by 200 to 400 men, who live in little huts on the raft, forming actual floating villages. On reaching Dort the rafts are broken up and sold, a single raft sometimes producing as much as £30,000. The voyage from Bingen to Dort takes from one to six weeks, and the huge unwieldy structures require to be navigated with great care. The commerce carried on by the river itself is supplemented by the numerous railways, which skirt its banks and converge to its principal towns. Before the introduction of railways there were no permanent bridges across the Rhine below Basel; but now trains cross it at about a dozen different points in Germany and Holland.

History.—Politically the Rhine has always played a great part. The whole valley seems to have been originally occupied by Celtic tribes, who have left traces of their presence on the contents of tombs and in the forms of names (Moguntiacum

or Mainz, Borbetomagus or Worms); but at the beginning of the historical period we find the Celts everywhere in retreat before the advancing Teutons. Probably the Teutonic pressure began as early as the 4th century before Christ, and the history of the next few hundred years may be summed up as the gradual substitution of a Germanic for a Celtic population along the banks of the Rhine. Its second historical period begins with the advent of the Romans, who stemmed the advancing Teutonic tide. Augustus and his successors took good care to fortify the Rhine carefully, and a large proportion of the Roman legions were constantly in garrison here. For two hundred years the Rhine formed the boundary between the Roman empire and the Teutonic hordes; and during that period the left or Roman bank made prodigious strides in civilization and culture. The wonderful Roman remains at Trier and elsewhere, the Roman roads, bridges and aqueducts, are convincing proofs of what the Rhine gained from Roman domination. This Roman civilization was, however, destined to be swamped by the current of Teutonic immigration, which finally broke down the barriers of the Roman empire and overwhelmed the whole of the Rhenish district. Under Charlemagne, whose principal residence was in Aix-la-Chapelle, the culture of the Rhine valley again began to flourish, its results being still to be traced in the important architectural remains of this period. At the partition of the domains of Charlemagne in A.D. 843 the Rhine formed the boundary between Germany and the middle kingdom of Lotharingia; but by 870 it had again within the former realm. For nearly eight hundred years it continued in this position, the frontier of the German empire coinciding more or less with the line of the Rhone. During the early middle ages the bank of the Rhine formed the most cultured part of Germany, basing its civilization on its Roman past. The Thirty Years' War exercised a most prejudicial effect upon the district of the Rhine; and the peace of Westphalia gave France a footing on the left bank of the hitherto exclusively German river by the acquisition of Alsace. The violent seizure of Strassburg by France in 1681 was ratified by the peace of Ryswick in 1697, which recognized the Rhine as the boundary between Germany and France from Basel to about Germersheim. It was an easy inference for the French mind that the Rhine should be the boundary throughout and the Gaul of Caesar restored. This ideal was realized in 1801, when the whole of the left bank of the Rhine was formally ceded to France. The congress of Vienna (1815) restored the lower part of the Rhenish valley to Germany, but it was not till the war of 1870–71 that the recovery of Alsace and Lorraine made the Rhine once more "Germany's river, not Germany's frontier." In the military history of all these centuries constant allusion is made to the Rhine, its passages and its fortresses. Every general who has fought in its neighbourhood has at one time or another had to provide for a crossing of the Rhine, from Julius Caesar, who crossed it twice, down to our own time. The wars carried on here by Louis XIV. are still remembered in the Rhine district, where the devastations of his generals were of the most appalling description; and scarcely a village or town but has a tale to tell of the murder and rapine of this period.

The Rhine in Literature.—The Rhine has always exercised a peculiar sort of fascination over the German mind, in a measure and in a manner not easily paralleled by the case of any other river. "Father Rhine" is the centre of the German's patriotism and the symbol of his country. In his literature it has played a prominent part from the *Nibelungenlied* to the present day; and its weird and romantic legends have been alternately the awe and the delight of his childhood. The Rhine was the classic river of the middle ages; and probably the Tiber alone is of equal historical interest among European rivers. But of late years the beauties of the Rhine have become sadly marred; the banks in places, especially between Coblenz and Bonn, disfigured by quarrying, the air made dense with the smoke of cement factories and steam-tugs, commanding spots falling a prey to the speculative builder and villages growing into towns.

Eckert, *Rheinschiffahrt im 19ten Jahrhundert*; Horn, *Der Rhein, Geschichte und Sagen seiner Burgen* (Stuttgart, 1893); Treutlein, *Die neueren Deutschen Rheinstromstudien und ihre Ergebnisse* (in *Ausland*, 1893); A. Chambadu, *Die Stromveränderungen des Niederrheins seit der vorrömischen Zeit* (Cologne, 1892), and handbooks of Baedeker, Meyer and Woerl. (J. F. M.; P. A. A.)

RHINE PROVINCE, or RHINELAND, the most westerly province of the kingdom of Prussia, bounded on the N. by Holland, on the E. by the Prussian provinces of Westphalia and Hesse-Nassau, and by the grand duchy of Hesse-Darmstadt, on the S.E. by the Bavarian Palatinate, on the S. and S.W. by Lorraine, and on the W. by Luxemburg, Belgium and Holland. The small district of Wetzlar in the midst of the province of Hesse also belongs to the Rhine Province, which, on the other hand, surrounds the Oldenburg principality of Birkenfeld. The extent of the province is 10,423 sq. m.; its extreme length, from north to south, is nearly 200 m., and its greatest breadth is just under 90 m. It includes about 200 m. of the course of the Rhine, which forms the eastern frontier of the province from Bingen to Coblenz, and then flows through it in a north-westerly direction.

The southern and larger part of the Rhine province, belonging geologically to the Devonian formations of the lower Rhine, is hilly. On the left bank are the elevated plateaus of the Hunsrück and the Eifel, separated from each other by the deep valley of the Mosel, while on the right bank are the spurs of the Westerwald and the Sauerland, the former reaching the river in the picturesque group known as the Seven Mountains (*Siebengebirge*). The highest hill in the province is the Walderbeskopf (2670 ft.) in the Hochwald, and there are several other summits above 2000 ft. on the left bank, while on the right there are few which attain a height of 1600 ft. Most of the hills are covered with trees, but the Eifel (*q.v.*) is a barren and bleak plateau. To the north of a line drawn from Aix-la-Chapelle to Bonn the province is flat, and marshy districts occur near the Dutch frontier. The climate varies considerably with the configuration of the surface. That of the northern lowlands and of the sheltered valleys is the mildest and most equable in Prussia, with a mean annual temperature of 50° Fahr., while on the hills of the Eifel the mean does not exceed 44°. The annual rainfall varies in the different districts from 18 to 32 inches. Almost the whole province belongs to the basin of the Rhine, but a small district in the north-west is drained by affluents of the Meuse. Of the numerous tributaries which join the Rhine within the province, the most important are the Nahe, the Mosel and the Ahr on the left bank, and the Sieg, the Wupper, the Ruhr and the Lippe on the right. The only lake of any size is the Laacher See, the largest of the "maare" or extinct crater lakes of the Eifel.

Of the total area of the Rhine province about 45% is occupied by arable land, 16% by meadows and pastures, and 31% by forests. Little except oats and potatoes can be raised on the high-lying plateau in the south of the province, but the river-valleys and the northern lowlands are extremely fertile. The great bulk of the soil is in the hands of small proprietors, and this is alleged to have had the effect of somewhat retarding the progress of scientific agriculture. The usual cereal crops are, however, all grown with success, and tobacco, hops, flax, rape, hemp and beetroot (for sugar) are cultivated for commercial purposes. Large quantities of fruit are also produced. The vine-culture occupies a space of about 30,000 acres, about half of which are in the valley of the Mosel, a third in that of the Rhine itself, and the rest mainly on the Nahe and the Ahr. The choicest varieties of Rhine wine, however, such as Johannisberger and Steinberger, are produced higher up the river, beyond the limits of the Rhine province. In the hilly districts more than half the surface is sometimes occupied by forests, and large plantations of oak are formed for the use of the bark in tanning. Considerable herds of cattle are reared on the rich pastures of the lower Rhine, but the

number of sheep in the province is comparatively small, and is, indeed, not greatly in excess of that of the goats. The wooded hills are well stocked with deer, and a stray wolf occasionally finds its way from the forests of the Ardennes into those of the Hunsrück. The salmon fishery of the Rhine is very productive, and trout abound in the mountain streams.

The great mineral wealth of the Rhine province probably furnishes its most substantial claim to the title of the "rich jewel in the crown of Prussia." Besides parts of the carboniferous measures of the Saar and the Ruhr, it also contains important deposits of coal near Aix-la-Chapelle. Iron ore is found in abundance near Coblenz, the Eifelberg in the Eifel possesses an apparently inexhaustible supply of lead, and zinc is found near Cologne and Aix-la-Chapelle. The mineral products of the district also include lignite, copper, manganese, vitriol, lime, gypsum, volcanic stones (used for millstones) and slates. By far the most important item is coal. Of the numerous mineral springs the best known are those of Aix-la-Chapelle and Kreuznach.

The mineral resources of the Prussian Rhine province, coupled with its favourable situation and the facilities of transit afforded by its great waterway, have made it the most important manufacturing district in Germany. The industry is mainly concentrated round two chief centres, Aix-la-Chapelle and Düsseldorf (with the valley of the Wupper), while there are naturally few manufactures in the hilly districts of the south or the marshy flats of the north. The largest iron and steel works are at Essen, Oberhausen, Duisburg, Düsseldorf and Cologne, while cutlery and other small metallic wares are extensively made at Solingen, Remscheid and Aix-la-Chapelle. The cloth of Aix-la-Chapelle and the silk of Crefeld form important articles of export. The chief industries of Elberfeld-Barmen and the valley of the Wupper are cotton-weaving, calico-printing and the manufacture of turkey red and other dyes. Linen is largely made at Gladbach, leather at Malmedy, glass in the Saar district and beetroot sugar near Cologne. Though the Rhineland is *par excellence* the country of the vine, beer is largely produced; distilleries are also numerous, and large quantities of sparkling Moselle are made at Coblenz, chiefly for exportation to England. Commerce is greatly aided by the navigable rivers, a very extensive network of railways, and the excellent roads constructed during the French régime. The imports consist mainly of raw material for working up in the factories of the district, while the principal exports are coal, fruit, wine, dyes, cloth, silk and other manufactured articles of various descriptions.

The population of the Rhine province in 1905 was 6,435,778, including 4,472,058 Roman Catholics, 1,877,582 Protestants and 55,408 Jews. The Roman Catholics muster strongest on the left bank, while on the right bank about half the population is Protestant. The great bulk of the population is of Teutonic stock, and about a quarter of a million are of Flemish blood. On the north-west frontier reside about 10,000 Walloons, who speak French or Walloon as their native tongue. The Rhine province is the most thickly populated part of Prussia, the general average being 617 persons per sq. m. The province contains a greater number of large towns than any other province in Prussia. Upwards of half the population are supported by industrial and commercial pursuits, and barely a quarter by agriculture. There is a university at Bonn, and elementary education is especially successful. For purposes of administration the province is divided into the five districts of Coblenz, Düsseldorf, Cologne, Aix-la-Chapelle and Trier. Coblenz is the official capital, though Cologne is the largest and most important town. Being a frontier province the Rhineland is strongly garrisoned, and the Rhine is guarded by the three strong fortresses of Cologne with Deutz, Coblenz with Ehrenbreitstein, and Wesel. The province sends 35 members to the German Reichstag and 62 to the Prussian house of representatives.

History.—The present Prussian Rhine province was formed in 1815 out of the duchies of Cleves, Berg, Gelderland and Jülich, the ecclesiastical principalities of Trier and Cologne, the free cities of Aix-la-Chapelle and Cologne, and nearly a hundred small lordships and abbeys. At the earliest historical period we find the territories between the Ardennes and the Rhine occupied by the Treviri, the Eburones and other Celtic tribes, who, however, were all more or less modified and influenced by their Teutonic neighbours. On the right bank of the Rhine, between the Main and the Lahn, were the settlements of the Mattiaci, a branch of the Germanic Chatti, while farther to the north were the Usipetes and Tencteri. Julius Caesar conquered the tribes on the left bank, and Augustus established numerous fortified posts on the Rhine, but the Romans never succeeded in gaining a firm footing on the right bank. As the power of the Roman empire declined the Franks pushed forward along both banks of the Rhine, and by the end of the 5th century had regained all the lands that had formerly been under Teutonic influence. Though conquered anew, the Rhenish districts were singularly little affected by the culture of the provincials they subdued, and all traces of Roman civilization were submerged in a new flood of paganism. By the 8th century the Frankish dominion was firmly established in central Germany and northern Gaul. On the division of the Carolingian realm the part of the province to the east of the river fell to the share of Germany, while that to the west remained with the evanescent kingdom of Lotharingia. By the time of Otto I. (d. 973) both banks of the Rhine had become German, and the Rhenish territory was divided between the duchies of Upper and Lower Lorraine, the one on the Mosel and the other on the Meuse. Subsequently, as the central power of the German sovereigns became weakened, Rhineland followed the general tendency and split up into numerous small independent principalities, each with its separate vicissitudes and special chronicles. The old Lotharingian divisions passed wholly out of use, and the name of Lorraine became restricted to that district that still bears it. In spite of its dismembered condition, and the sufferings it underwent at the hands of its French neighbours during various periods of warfare, the Rhenish territory prospered greatly and stood in the foremost rank of German culture and progress. Aix-la-Chapelle was fixed upon as the place of coronation of the German emperors, and the ecclesiastical principalities of the Rhine bulk largely in German history. Prussia first set foot on the Rhine in 1609 by the joint occupation of Cleves; and about a century later Upper Gelderland and Mörs also became Prussian. At the peace of Basel in 1795 the whole of the left bank of the Rhine was occupied by France, and in 1801 the Rhenish princes all joined the Confederation of the Rhine. The congress of Vienna assigned the whole of the lower Rhenish districts to Prussia, which had the tact to leave them in undisturbed possession of the liberal institutions they had become accustomed to under the republican rule of the French.

RHINOCEROS, the designation for such perissodactyle (odd-toed) ungulate mammals as carry one or more horns on the head, and their extinct relatives (see PERISSODACTYLA). Rhinoceroses are of large size and massive build, but have little intelligence, and are generally timid in disposition, though ferocious when wounded or brought to bay. The African species use the nasal horns as weapons, with which they strike and toss their assailant, but the Asiatic rhinoceroses employ their sharp lower tusks much as does a boar. Rhinoceroses are dull of sight, but their hearing and scent are remarkably acute. They feed on herbage, shrubs and leaves of trees, and, like so many other large animals which inhabit hot countries, sleep the greater part of the day, and are most active in the cool of the evening or even during the night. Some are found in more or less open plains, while others inhabit swampy districts. The group have existed in both east and west hemispheres since the beginning of the Miocene period; but in America they all became extinct before the end of the Pliocene period, and in the Old World their distribution has become greatly restricted. They are, for instance, no longer found in Europe and North Asia, but only in Africa and in portions of the Indian and Indo-Malayan regions. Living rhinoceroses may be arranged in three groups: (1) With a single nasal horn, and very thick skin, which is raised into strong, definitely arranged ridges or folds. In this group there are two well-marked species. The Indian rhinoceros (*Rhinoceros unicornis*), the largest of the Asiatic forms, is the most widely known, from its being exhibited in zoological gardens. A famous rhinoceros presented to the Zoological Society of London in July 1864 lived till December 1904. This species stands from 5 ft. to 5 ft. 9 in. at the shoulder and is blackish grey in colour; the horn rarely exceeds a foot in length, but one in the British Museum measures 19 in. This species is now only met with in a wild

state in the Assam plain, though it formerly had a wider range.

The first rhinoceros seen alive in Europe since the time when these animals, in common with nearly all the large remarkable beasts of both Africa and Asia, were exhibited in the Roman shows, was of this species. It was sent from India to Emmanuel, king of Portugal, in 1513; and from a sketch taken in Lisbon, Albert Dürer composed his celebrated but fanciful engraving, which was reproduced in so many old books on natural history. This species chiefly frequents swampy grass jungle and is fond of a mud-bath. According to General A. H. Kinloch, it is hunted by "tracking the animal on a single elephant until he is at last found in his lair, or perhaps standing quite unconscious

FIG. 1.—Indian Rhinoceros (*Rhinoceros unicornis*). This and the following illustrations are reduced from drawings by J. Wolf, from animals in the London Zoological Society's Gardens.

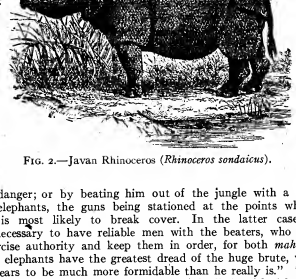


FIG. 2.—Javan Rhinoceros (*Rhinoceros sondaicus*).

of danger; or by beating him out of the jungle with a line of elephants, the guns being stationed at the points where he is most likely to break cover. In the latter case it is necessary to have reliable men with the beaters, who can exercise authority and keep them in order, for both *mahouts* and elephants have the greatest dread of the huge brute, who appears to be much more formidable than he really is." The Javan rhinoceros (*Rhinoceros sondaicus*) is distinguished by its smaller size, and a different arrangement of the skin-folds (as may be seen by comparing figs. 1 and 2). The horn in the female is little developed, if not altogether absent. This species has a more extensive geographical range than the last, being found in the Bengal Sundarbans near Calcutta, Burma, the Malay Peninsula, Java, Sumatra and Borneo. The colour is uniform dusky grey. A female obtained in the Sundarbans stood 5 ft. 6 in. high. This species is more an inhabitant of tree-forest than of grass jungle, and its usual habitat appears to be in hilly countries.

In the second section there is a well-developed nasal, and a small frontal horn separated by an interval. The skin is thrown into folds, but these are not strongly marked, and lower tusks are present. This group or genus is represented at the present day only by the Sumatran rhinoceros, *Rhinoceros* (*Dicerorhinus*) *sumatrensis*, with its sub-species. It is the smallest of all the species, and its geographical range is nearly the same as that of the Javan species, though not extending into Java; it has been found in Assam, Chittagong, Burma, the Malay Peninsula, Sumatra and Borneo. The colour varies from earthy brown to blackish, and the greater part of the body is thinly covered with hair, and the ears and tail are fringed. The average height of adults is from 4 ft. to 4 ft. 6 in. This species inhabits forests, and ascends hills to considerable elevations; it is shy and timid, but easily tamed even when adult. A specimen from Chittagong acquired in 1872 by the Zoological Society of London was named *R. lasiotis*, as it differed from the typical form by its larger size, paler and browner colour, smoother skin, longer, finer and redder hair, and the long fringe of hair on the ears. It is now recognized as a local race.

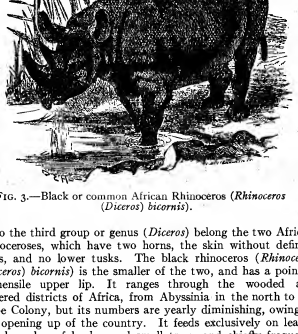

FIG. 3.—Black or common African Rhinoceros (*Rhinoceros* (*Diceros*) *bicornis*).

To the third group or genus (*Diceros*) belong the two African rhinoceroses, which have two horns, the skin without definite folds, and no lower tusks. The black rhinoceros (*Rhinoceros* (*Diceros*) *bicornis*) is the smaller of the two, and has a pointed prehensile upper lip. It ranges through the wooded and watered districts of Africa, from Abyssinia in the north to the Cape Colony, but its numbers are yearly diminishing, owing to the opening up of the country. It feeds exclusively on leaves and branches of bushes and small trees, and chiefly frequents the sides of wood-clad rugged hills. Specimens in which the posterior horn has attained a length as great as or greater than the anterior have been separated under the name of *R. keitloa*, but the characters of these appendages are too variable for specific distinctions. The black rhinoceros is more rarely seen in menageries in Europe than either of the Asiatic species, but one lived in the gardens of the London Zoological Society from 1868–1891.

Lastly we have the white—Burchell's, or square-mouthed—rhinoceros (*Rhinoceros* (*Diceros*) *simus*), the largest of the five, and differing from the other species in having a square truncated upper lip. In conformity with the structure of the mouth, this species lives entirely by browsing on grass, and is therefore more partial to open countries or districts where there are broad grassy valleys between the tracts of bush. In its old haunts in

the south it is practically extinct; but ten were reported from a reserve in Zululand in 1902. A detached colony exists, however, near Lado, on the Upper Nile. No specimen of this species has ever been brought alive to Europe. Mr F. C. Selous gives the following description of its habits:—

"The square-mouthed rhinoceros is a huge, ungainly looking beast, with a disproportionately large head, a large male standing 6 ft. 6 in. at the shoulder. Like elephants and buffaloes they lie asleep during the heat of the day, and feed during the night and in the cool hours of early morning and evening. Their sight is very bad; but they are quick of hearing, and their scent is very keen; they are, too, often accompanied by rhinoceros birds, which, by running about their heads, flapping their wings, and screeching at the same time, frequently give them notice of the approach of danger. When disturbed they go off at a swift trot, which soon leaves all pursuit from a man on foot far behind; but if chased by a horseman they break into a gallop, which they can keep up for some distance. However, although they run very swiftly, when their size and heavy build is considered, they are no match for an average good horse. They are, as a rule, very easy to shoot on horseback, as, if one gallops a little in front of and on one side of them, they will hold their course, and come sailing past, offering a magnificent broadside shot, while under similar circumstances a prehensile-lipped rhinoceros will usually swerve away in such a manner as only to present his hindquarters for a shot. Whether either walking or running, the square-mouthed rhinoceros holds its head very low, its nose nearly touching the ground. When a small calf accompanies its mother, it always runs in front and she appears to guide it by holding the point of her horn upon the little animal's rump; and it is perfectly wonderful to note how in all sudden changes of pace, from a trot to a gallop, or vice versa, the same position is always exactly maintained. During the autumn and winter months (*i.e.* from March to August) the square-mouthed rhinoceros is usually very fat; and its meat is then most excellent, being something like beef, but yet having a peculiar flavour of its own. The part in greatest favour among hunters is the hump, which, if cut off whole and roasted just as it is in the skin, in a hole dug in the ground, would, I think, be difficult to match either for juiciness or flavour." (W. H. F.; R. L.*)

RHINTHON (*c.* 323–285 B.C.), Greek dramatist, son of a potter. He was probably a native of Syracuse and afterwards settled at Tarentum. He invented the *hilarotragoedia*, a burlesque of tragic subjects. Such travesties were also called *phlyaces* ("fooleries") and their writers *phlyacographi*. He was the author of thirty-eight plays, of which only a few titles (*Amphitryon*, *Heracles*, *Orestes*) and lines have been preserved, chiefly by the grammarians as illustrating dialectic Tarentine forms. The metre is iambic, in which the greatest licence is allowed. The *Amphitruo* of Plautus, although probably imitated from a different writer (Archippus of the Middle Comedy), may be taken as a specimen of the manner in which such subjects were treated. There is no doubt that the hilarotragoedia exercised considerable influence on Latin comedy, the *Rhinthonica* (*i.e.* fabula) being mentioned by various authorities amongst other kinds of drama known to the Romans. Scenes from these travesties are probably represented in certain vase paintings from Lower Italy, for which see H. Heydemann, "Die Phlyakendarstellungen auf bemalten Vasen," in *Jahrbuch des archäologischen Instituts*, i. (1886).

Fragments in monograph by E. Völker (Leipzig, 1887); see also E. Sommerbrodt, *De Phlyacographia Graecorum* (Breslau, 1875); W. Christ, *Geschichte der griechischen Litteratur* (1898).

RHIZOPODA, the name given by Dujardin (*pro parte*, 1838) to a group of Sarcodine Protozoa. They are distinguished by their pseudopods, simple or branched, passing by wide bases into the general surface, never fine radial nor fusing into complex networks; skeleton absent or a simple shell ("test," "theca"), never (?) a calcareous shell, nor represented by a siliceous network, nor spicules. Reproduction by binary fission; by division or abstriction of buds after the body has become multi-nucleate; or by the resolution of the body into numerous uninucleate zoospores (amœbulæ or flagellulæ) which may conjugate as gametes; plasmodium formation unknown; encystment (in "resting cysts" or "hypnocysts") common. Without a knowledge of the history it is impossible to distinguish a naked lobose from the Amœbiida (pseudopodiosporic) of a Myxomycete or Proteomyxan. As to the name, Dujardin included the thecate Lobosa, the Filosa, and the Reticularia or Foraminifera (*q.v.*). The latter had already received the name Foraminifera (for their shells) from d'Orbigny; and as it is impossible to separate naked from thecate Lobosa we have merged his Amœbina (Amibiens) in the larger group. The Filosa were removed by Lang from the Reticularia; in habit and test they are inseparable from the Lobosa; and though their cytoplasm approximates to that of Reticularia, their ectosarc is much less granular, though not free from granules as stated by Lang.

The majority of Rhizopoda are fresh-water forms, some occurring in the film of water on mosses, among Sphagnum, or about the bases of grass-haulms; many, however, are exclusively marinè. The aquatic forms generally may lurk among Confervae or higher weeds, or lie in the bottom of decomposing or excrementitious matter in still or slow-flowing waters. Of these some may become temporarily pelagic, floating up by the formation of gas vacuoles (containing probably CO_2) in the cytoplasm. It is easy to verify this by placing *Arcella* (fig. 1, 7) in a drop of water on a glass cover and inverting this over a glass ring; the *Arcella* sink to the free convex surface of the drop and escape from this most unnatural position by secreting gas-vacuoles; when they float up to contact with the glass cover, so as to touch it by the convex back of the shell, they put forth long pseudopodia which attach themselves to the glass and by their contraction turn the animal over, so that it can crawl over (*i.e.* under) the glass. *Amoeba* (*Entamoeba*) *histolytica*, Schaudinn, is the cause of tropical dysentery and hepatic abscess in man. *Pelomyxa* (fig. 1, 5–6) is remarkable for containing symbiotic bacteria. *Zoosamanthellae* (symbiotic green cells—Algae or Flagellates) occur in several species; and *Paulinella* contains two sausage-shaped blue-green bodies, "chromatophores," which are probably symbiotic Cyanophyceae. The shell, even when not a simple membrane, has always a continuous inner membrane of a complex nitrogenous substance containing sulphur, allied to keratin and termed pseudochitin. The outer layer when present is composed of little hollow prisms (*Arcella*, fig. 1, 7), sand, or inorganic matter first swallowed by the animal (*Difflugia*, *Pseudodifflugia*), sometimes partially digested (Lecquereuxia), or else of plates secreted as "reserve plates" within the cytoplasm of the animal *Cyphoderia* (fig. 6, B), *Quadrula*, *Nebelia*, *Euglypha* (figs. 4, 6, A), &c. In *Quadrula irregularis* alone are the plates said to be calcareous; elsewhere they are always siliceous and simply refractive, so that the silica is probably hydrated (opal). The cement is possibly of silicified pseudochitin. This material is often permeated by a ferric oxide or hydrate, even when it is not coloured rusty brown. Shell formation of the membranous test is by simple surface-excretion; under budding we describe its accomplishment in the aggregated shells.

The "pylome," or aperture for the protrusion of the protoplasm, is usually single. There are two pylomes at opposite poles in several Filosa (*Ditremà*), hence united by some authors into a distinct family (fig. 7, 1, 5, 11), and in the gelatinous theca of *Trichosphaerium* (fig. 5) are numerous permanent pylomic pores. The nucleus is variable in form and character. In *Amoeba binucleata* two nuclei are always present; and some genera are permanently plurinucleate (*Pelomyxa*, *Arcella*, fig. 1, 7). It often gives forth fragments into the cytoplasm, the "chromidia" of R. Hertwig, which, as in Foraminifera (*q.v.*), may play an important part in reproductive processes. The contractile vacuole (there are two in *Arcella*, fig. 1, 7) in actively progressing Rhizopods always discharges at the hinder end. Absent or sluggish in marine forms, it is of constant occurrence in all fresh-water Rhizopods except *Pelomyxa*.

The pseudopods vary greatly in type. In *Amoeba princeps* (fig. 1, 9) we have mere promontory-like extensions of the body; in *A. radiosa* (fig. 1, 1–3) and *Trichosphaerium* (fig. 5) they are distinct slender processes, tapering, and either blunt or finely pointed at the apex; in *Pelomyxa* (fig. 1, 5, 6) as in *A.* (*Lithamoeba*) *discus* (fig. 2) they are "eruptive," hemispherical, formed apparently by the rupture of the ectoplasm, and the outpouring of the endoplasm which at once differentiates a clear outer layer as a new ectoplasm; in *Amoeba limax* during

progression the body is roughly oval with the apex truncated posteriorly and the wide anterior end forming a single anterior

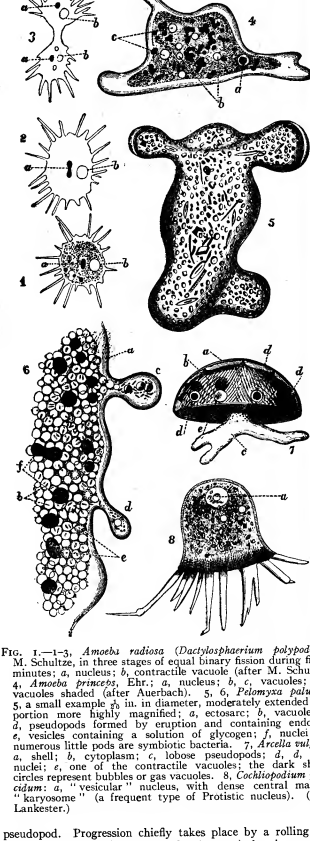

FIG. 1.—1–3, *Amoeba radiosa* (*Dactylosphaerium polypodium*), M. Schultze, in three stages of equal binary fission during fifteen minutes: *a*, nucleus; *b*, contractile vacuole (after M. Schultze). 4, *Amoeba princeps*, Ehr.; *a*, nucleus; *b*, *c*, vacuoles; food vacuoles shaded (after Auerbach). 5, 6, *Pelomyxa palustris*: 5, a small example $\frac{1}{30}$ in. in diameter, moderately extended; 6, a portion more highly magnified; *a*, ectosarc; *b*, vacuoles; *c*, *d*, pseudopods formed by eruption and containing endosarc; *e*, vesicles containing a solution of glycogen; *f*, nuclei; the numerous little pods are symbiotic bacteria. 7, *Arcella vulgaris*: *a*, shell; *b*, cytoplasm; *c*, lobose pseudopods; *d*, *d*, 3 nuclei; *e*, one of the contractile vacuoles; the dark shaded circles represent bubbles or gas vacuoles. 8, *Cochliopodium pellucidum*: *a*, "vesicular" nucleus, with dense central mass or "karyosome" (a frequent type of Protistic nucleus). (From Lankester.)

pseudopod. Progression chiefly takes place by a rolling over of the anterior end (fig. 3—see also AMOEBA); but it may take place by the extension of a pseudopod, its attachment at the tip, followed by its contraction to pull up the rest of the animal, this is well shown in the thecate species. Another mode is that of *A. radiosa* (fig. 1, 1–3), which can roll over on the tips of its stiff pseudopods. The pseudopods of the Filosa (figs. 6, 7) are branched, but less rich in granules, and less viscid than those of Foraminifera; they rarely anastomose, and never coalesce to form perforated plates.

A process whose relations to reproduction are not fully made out is that of "plastogamy," where two or more individuals unite completely by their cytoplasm, the nuclei remaining distinct; it may be temporary or permanent: in the latter case

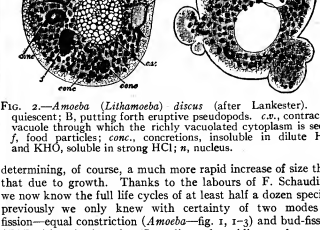

FIG. 2.—*Amoeba* (*Lithamoeba*) *discus* (after Lankester). A, quiescent; B, putting forth eruptive pseudopods. *c.v.*, contractile vacuole through which the richly vacuolated cytoplasm is seen; *f*, food particles; *conc.*, concretions, insoluble in dilute HCl and KHO, soluble in strong HCl; *n*, nucleus.

determining, of course, a much more rapid increase of size than that due to growth. Thanks to the labours of F. Schaudinn, we now know the full life cycles of at least half a dozen species; previously we only knew with certainty of two modes of fission—equal constriction (*Amoeba*—fig. 1, 1–3) and bud-fission (*Difflugia*). As in other Sarcodina, chromidia, or fragments of nuclear substance budded off from the nucleus into the endoplasm, play an important part in many reproductive processes. Equal binary fission is common. In the thecate forms, *e.g. Difflugia*, *Euglypha* (fig. 4), this is replaced by bud-fission; half the cytoplasm passes out through the pyleme, and becomes

FIG. 3.—1, ideal perspective view of left half of a crawling Amoeba; 2, diagram showing successive position of marked points on anterior end; 3, diagrammatic section, the arrows showing directions of *absolute* motion—the rate being indicated by the length of the shaft.

invested with its covering there; the enclosed "reserve" skeletal elements pass to the surface in order, so that the pylome of the new shell faces that of the old; the original nucleus divides *in situ* and one daughter nucleus passes into what we may call the bud-cytoplasm; the two daughters of the original cell, which we may call the "bud-sister" and the "stock-sister" respectively, now separate. In the plurinucleate forms a true bud-formation takes place, nucleate masses of cytoplasm being constricted off at the surface. A simultaneous resolution into uninucleate cells may affect the multinucleate species (or the multinucleate state of habitually uninucleate species), this is termed schizogony.

In *Trichosphaerium* (fig. 5) it occurs at the close of two

distinct periods in the life cycle which we may call A and B; the individuals of the A period being distinguished by the brood-cells are amoebulae (pseudopodiospores) (fig. 5, 4) which grow into the multinucleate B type, with a nonspiculate theca (fig. 5, 5). The resolution of the B type is preceded by rapid multiplication of the nuclei by mitosis (fig. 5, 7), and the uninucleate cells are 2-flagellate zoospores (fig. 5, 9). These pair with zoospores of a different brood to their own (fig. 5, 10) (*i.e.* they are exogamous gametes); and the fusion cell (fig. 5, 11) so formed is the starting-point of the A type (fig. 5, 12). Brood formation by resolution of a multinucleate individual has been observed or conjectured in Amoeba, &c.

A formation of numerous pseudopodiospores within *Pelomyxa* has been repeatedly described, and these have been seen to conjugate equally, the zygote becoming multinuclear. But the possibility of the alleged reproductive cells being parasites has not yet been fully excluded.

Chlamydophrys stercorea is a small Filose, occurring in the faeces of several mammals, but only forming its characteristic shell outside the body; plastogamic monstrosities are frequent. The nucleus degenerates, and is expelled with some plasm. The chromidia remain inside the shell, and differentiate or aggregate into about eight nuclei; the cell is then resolved into as many 2-flagellate swarmers, which escape as isogamous exogametes. The zygote becomes surrounded by a brown cyst. When

offspring being amoebulae. In some these acquire a shell directly; in others a second brood division into four takes place, and it is only then that shells are formed. The latter conjugate as males with the former as females; and the fusion cell encysts within the approximated shells; it emerges as a naked amoeba after a period of rest, forms a shell and assumes the type of the species. Other types of reproduction are known, *Amoeba coli*, an inhabitant of the gut of man, showing an endogamous pairing of closely related nuclei similar to that of *Actinosphaerium* (see HELIOZOA).

CLASSIFICATION

Lobosa.—W. B. Carpenter. Cytoplasm with a clear ectosarc, not wetted by the medium; pseudopods never finely branching, usually rounded at the apex; nucleus single or multiple; shell ("test," "theca") absent, gelatinous, membranous or of cemented granules of ingested sand, &c., or plates secreted in the endosarc.

Selected genera: § 1. Naked Amoeba (*q.v.*) ("*Amibe*," Bory), with the subgenera *Dactylosphaerium*, Hertwig and Lesser (fig. 1, 1–3), with slender, pointed pseudopods; *Lithamoeba*, Lankester, always containing inorganic granules (fig. 2). *Pelomyxa*, Greeff (fig. 1, 5, 6), with blunt, eruptive pseudopods and numerous nuclei, ¼ in. or more in diameter when contracted. *Arcuothrix*, Caparède and Lachmann, with one or more slender, very mobile, flagelliform pseudopods as well as the lobose ones.

§ 2. Test gelatinous, perforated by pseudopods: *Amphizonella*, Greeff; *Trichosphaerium*, Schneider (fig. 5).

§ 3. Test membranous: *Cochliopodium*, Hertwig and Lesser (fig. 1, 8).

§ 4. Test "chitinous," ahgreened: *Arcella*, Stein (fig. 1, 7).

§ 5. Test of ingested particles: *Difflugia*, Leclerc; *Centropyxis*, Stein; *Lecquereuxia*, Schlumberger (shell material of diatomaceous tests fused into sausage-shaped masses).

§ 6. Test of secreted siliceous or chitinous plates: *Quadrula*, F. E. Schultze. (In *Q. irregularis* the plates are said to be calcareous.)

Filosa.—A. Lang. Cytoplasm without definite ectosarc; pseudopods branching, tapering to fine tips, somewhat granular; test present in all known species and varying as in the Lobosa.

Selected genera: § 1. Test membranous: *Gromia*, Dujardin (*pro parte*); *Miskrogromia*, Hertwig; *Diplophrys*, Barker (fig. 7, 1); *Ditrema*, Archer; *Amphitrema*, Archer (fig. 7, 11); the last three have a mouth-like aperture (pylome) at either end of the test.

§ 2. Test of ingested or incrusted particles: *Pseudodifflugia*, Schlumberger; *Diaphorodon*, Archer (fig. 7, 12).

§ 3. Test of secreted plates: *Euglypha*, Dujardin (figs. 4, 6, A); *spheodonta* (fig. 6, B); *Paulinella*, Lauterborn.

Dujardin, "Sur les organismes inférieurs," *Ann. Sc. Nat. Zool.* iv. (1835), and "Zoophytes, infusoires" (1841). (M. HA.)

RHODE ISLAND, a North Atlantic state of the American Union, belonging to the New England group, and lying between 41° 18′ and 42° 3′ N. lat. and 71° 8′ and 71° 53′ W. long.[1] It is bounded, N. and E., by the state of Massachusetts; S., by the Atlantic Ocean; and W., by the state of Connecticut, from which it is separated in part by the Pawcatuck river. Rhode Island is the smallest state in the Union, having an extreme length, N. and S., of 48 m., an extreme width, E. and W., of 37 m., and a total area of 1248 sq. m., of which 181 sq. m. are water-surface.

Topography.—The region of which Rhode Island is a part was at one time worn down to a gently rolling plain near sea-level, but has since been uplifted and somewhat dissected by stream action. As a result the topography is characterized by low, rounded hills, but is nowhere mountainous. Since the uplift and stream dissection a slight depression has allowed the sea to invade the lower portions of the river valleys, forming the bays known as Narragansett Bay, Providence "river," Sakonnet "river," &c. Glaciation has disturbed the river

[1] Block Island, over which the jurisdiction of the state extends, lies 10 m. off the coast, and is not included within these limits.

systems, causing the formation of numerous lakes and of the waterfalls which determined the situation of many of the manufacturing cities of the state.

In the N.W. is Durfee Hill, which attains an elevation of 805 ft., and is the highest point within Rhode Island. The mean elevation for the entire state is 200 ft. The coast-line, including the shores of the bays and islands, is extensive; its western portion is only slightly indented, but its eastern portion is deeply indented by Narragansett Bay, a body of water varying in width from 3 to 12 m., and extending inland for about 28 m. The land surface E. of this bay is very gently rolling, but to the W. it consists of a somewhat

more rugged upland which slopes gradually southward. Over the whole state there is a layer of drift deposited by the glaciers which once covered this region. This glacial material is in the form of a till or boulder clay, but in the lowlands, and especially along Narragansett Bay, it is generally overlaid by stratified drift deposited by glacial streams. Within Narragansett Bay are the numerous islands characteristic of an area which has suffered comparatively recent depression, the largest being Rhode Island (or Aquidneck), Conanicut Island and Prudence Island. Of these the most important is Rhode Island, 15 m. long and 3 m. wide, which has given the state its name. Lying about 10 m. off the coast and S. of the central part of the state is Block Island, a sandy tract 6 m. long and from 1 to 4 m. wide, with a rolling surface.

The rivers of the state are short and of no great volume, but they flow swiftly and are useful in supplying power for manufactories. The Providence river is really an arm of Narragansett Bay, into which flow the waters of the Pawtuxet and the Blackstone rivers. The latter stream at Pawtucket has a fall of about 50 ft., and the Pawtuxet river also has a number of falls along its course. Mount Hope Bay is a north-eastern arm of Narragansett Bay, and is also the estuary of the Taunton river. The Saloonet river is a long bay separating Aquidneck or Rhode Island from the mainland on the E. The Pawcatuck river is the largest stream in the western half of the state, and along the lower part of its course it forms the boundary between Rhode Island and Connecticut.

Fauna and Flora.—The fauna of the state does not differ from that of southern Connecticut and eastern Massachusetts. The marine fauna is of economic importance. The woodland area of the state has been estimated (census of 1900) at 400 sq. m., or about 37% of the land area, but the trees are generally too small for timber. The most common varieties of trees are the oak, walnut and chestnut. There are a few stretches of pine forest, and in the S. the swamps are sometimes overgrown with cedar.

Climate.—Rhode Island has a more moderate climate than that of the northern sections of New England. There are no great extremes of either heat or cold, and a number of the towns and cities, especially Newport and Narragansett Pier, have become noted summer resorts. Narragansett Pier has a mean annual temperature of 49°, a mean summer temperature (for June, July and August) of 68°, and a mean winter temperature (for December, January and February) of 29°. The mean annual temperature at Providence is 50°; the mean for the summer, 72°; and for the winter, 30°; while the highest and lowest temperatures ever recorded are respectively 102° and −9°. The mean annual rainfall is about 50 in., ranging from 47·4 in. at Narragansett Pier to 53·2 in. at Kingston.

Soils.—The boulder clay or "hard pan" of which most of the surface lands are composed, forms a very indifferent support for vegetation, and consequently the state is not well adapted for the growing of crops.

Agriculture.—The acreage of improved farm land in Rhode Island decreased from 356,487 in 1850 to 137,354 in 1900, but the value of farm property (including land with improvements, implements, machinery and live stock) increased in the same period from $19,100,640 to $26,989,189. The number of farms remained about the same—5385 in 1850 and 5418 in 1900; but the average area decreased from 102·9 acres to 82·9 acres. The value of farm products increased from $3,670,135 in 1879 to $6,333,864 in 1899. The average value of farms increased from $3547 in 1850 to $4909 in 1900. The number of persons engaged in agricultural pursuits in 1880 was 10,986, and in 1900, 10,957.

The total acreage of cereals (barley, buckwheat, Indian corn, oats, rye and wheat) decreased from 19,575 acres in 1879 to 10,552 acres in 1899, and the total product of these crops decreased from 801,111 bu. in 1849 to 350,110 bu. in 1899.

The total number of neat cattle on farms decreased from 36,262 in 1850 to 30,696 in 1900, but the number of dairy cows increased from 18,698 to 23,660.

Fisheries.—Whaling was an established industry in Rhode Island as early as 1723, and in 1731 the colonial assembly provided a bounty of five shillings a barrel for whale oil, and a penny a pound for whalebone. About 1750 sperm candles were first manufactured. In 1846 about 50 whaling vessels sailed from Rhode Island ports; but by the close of the century the industry had become practically extinct. In 1905 the number of persons employed in the general fisheries industry was 2212; and the value of the catch was $1,546,658, the largest items being: lobsters, $64,358; squeteague (weakfish), $86,478; scup, $138,030; and oysters (for market), $874,232.

Minerals.—Rhode Island's mineral wealth is relatively slight. The total value[1] of all the mineral products of the state in 1907 was $937,384, and in 1908, $708,694, and of these totals granite

[1] United States Geological Survey, *Mineral Resources of the United States*.

was valued in 1908 at $556,774. The value of the clay products, lime and talc, decreased from $245,378 in 1907 to $112,815 in 1908. The mining of iron ore was begun about 1767 in the vicinity of the present Cranston, and much of the metal was used in the making of cannon during the War of Independence, but the supply was soon exhausted. Near Tiverton and Cranston graphite has been quarried.

Manufactures.—Rhode Island is essentially a manufacturing state; of the 191,923 persons in the state engaged in gainful occupations in 1900, 101,162 (or 52.7%) were employed in manufacturing and mechanical pursuits. By the middle of the 17th century boat-building had become an established industry, and large vessels were built at Newport. In 1777 the state offered a large premium for every pound of steel, similar to German steel, made within its boundaries; and in 1789 a rolling and slitting mill was built near Providence. Cotton was first imported to Providence from Spain in 1785; a company to carry on cotton-spinning, formed at Providence in 1786, established there in the following year a factory containing a spinning jenny of 28 spindles (the first machine of the kind to be used in the United States), and also a carding machine and a spinning frame with which was manufactured a kind of jean having a linen warp and a cotton filling. The fly shuttle was also apparently first introduced at Providence in 1788. The first calico printed in the United States was made at East Greenwich about 1794. The Providence Association of Mechanics and Manufacturers, incorporated in 1789, organized industrial development. The prohibition of the exportation from England of machinery, models or drawings retarded mechanical improvement, but in 1790 an industrial company was formed at Providence to carry on cotton spinning, and in December of that year there was established at Pawtucket a factory equipped with Arkwright machines constructed by Samuel Slater. This machinery was operated by waterpower, then first used in the United States for the spinning of cotton thread; and from this may be dated the beginning of the factory system in Rhode Island. These machines were soon adapted to the spinning of wool, and in 1804 a woollen factory was built at Peacedale, South Kingston. The first power-loom used in the United States was invented about 1812, and was set up at Peacedale, in 1814, for the manufacture of woollen saddlegirths and other webbing. The first power-loom for cotton manufacture was set up in North Providence in 1817. Textile manufacturing by improved methods was hardly well established in Rhode Island before 1825. The manufacture of jewelry, which was established in Providence in 1784, was greatly promoted ten years later by Nehemiah Dodge's invention of the process of "gold-filling," still further improved in 1846 by Thomas H. Lowe. The manufacture of silverware was begun in Providence soon after the close of the War of Independence.

Rhode Island's water powers have been its only natural resources which have aided in the development of its manufactures, and its transportation facilities have always been inadequate, because of shallow water at Providence and scanty railway communication; but the state's manufacturing enterprises are of great importance.

In 1900 Rhode Island ranked 17th among the states in the value of its manufactured products, but led all of the states in the value per capita ($430). The total number of establishments in 1850 was 864; in 1890, 3377, and in 1900, 4189. In 1900 there were 1678 factories, and in 1905, 1617 factories.[1] The total capital invested in manufacturing in 1850 was $12,935,676; in 1890, $126,483,401, and in 1900, $183,784,587, of which $176,901,606 was in factories; in 1905 the capital invested in factories was $215,901,375. The value of all manufactured products in 1850 was $22,117,688; in 1890, $142,800,625, and in 1900, $184,074,378, of which $165,550,382 was the value of factory products; in 1905 the value of factory products was $202,109,583. The average number of *employés* in 1850 was 20,967; in 1890, 81,111; and in 1900, 98,813, of whom 88,197 were factory *employés*; in 1905 there were 97,318 factory *employés*.

Rhode Island ranked first in 1900 ($13,229,313) and in 1905 ($14,431,756) among the states and the United States in the value of jewelry, which was fourth in the value of the state's manufactures; second in worsted goods (1900, $33,341,329; 1905, $44,477,596), which were first in value in the state's manufactures; and third in dyeing and finishing textiles (1900, $8,484,878; 1905, $9,981,457), which ranked fifth among the state's manufactures; in the value of cotton goods (second in rank in the state) it fell from the fourth rank in 1900 ($24,056,175) to fifth rank in 1905 ($22,028,843), when the value of Rhode Island's product was less than that of Georgia. Other important manufactures were: combined textiles (not including flax, hemp and jute products) in 1900, $77,998,396; in 1905, $103,096,311; foundry and machine shop products in 1900, $13,926,086; in 1905, $16,358,512; woollen goods in 1900, $5,330,550; in 1905, $8,163,167; rubber boots and shoes in 1900, $8,034,417; electrical machinery, apparatus and supplies in 1900, $5,113,292; in 1905, $5,435,474; silversmithing and silverware in 1900, $4,249,190; in 1905, $5,323,264; gold and silver, reducing and refining (not from ore) in 1900, $3,484,454; in 1905, $4,260,698; cotton small wares in 1900, $2,379,500; in 1905, $3,944,607; hosiery and knit goods in 1900, $2,713,850; in 1905, $3,344,655; silk and silk goods in 1900, $1,311,333; in 1905, $2,555,986. In 1905, 1146 establishments reported power, as against 1360 in 1900—a decrease of 15.7% but the total horsepower increased from 155,545 to 190,777, or 22.7%.

Transportation.—Steam railway mileage in Rhode Island increased from 68 m. in 1850 to 209 m. in 1900, and to 211 m. on the 1st of January 1909 (the New York, New Haven & Hartford being the only railway system of any importance in the state). In 1900 a charter was granted to the Grand Trunk system. In 1902 the mileage of street and electric railways (most of them interurban) operated in the state was 336·33 m. The state has a natural water outlet in the Providence, Seekonk and Nantasket River, but there is lack of adequate dockage in Providence harbour, and insufficient depth of water for ocean traffic. The ports of entry are Providence (by far the largest, with imports valued at $1,893,551, and exports valued at $12,517 in 1909), Newport and Bristol.

Population.—The total population of Rhode Island in 1880 was 276,531; in 1890, 345,506; in 1900, 428,556; and in 1910, 542,610.[2] The increase from 1880 to 1890 was 24·9%, from 1890 to 1900 24%, and from 1900 to 1910, 26·6%. Of the total population in 1900, 285,278 were native whites, 134,519 were foreign-born, 9092 were negroes, 366 were Chinese, 35 were Indians and 13 were Japanese. Of the foreign-born, 35,501 were Irish, 31,533 were French-Canadians and 22,832 were English. Of the total population, 175,143 were of foreign parentage, *i.e.* either one or both parents were foreign-born—and 81,422 were of Irish parentage, both on the father's and mother's side, and, in the same sense, 49,427 were of French-Canadian and 32,007 of English parentage. Rhode Island in 1900 had the highest percentage of urban population of any state in the Union, 91·6% of the total population living in cities of 4000 or more inhabitants. From 1890 to 1900 the urban population increased from 310,335 to 392,509 or 26·5%; while the rural population (*i.e.* population outside of incorporated places), increased from 35,171 to 36,047—1·1% of the total increase in population. The cities of the state, with population in 1900,[3] are Providence, 175,597; Pawtucket, 39,231; Woonsocket, 28,204; Newport, 22,034; and Central Falls, 18,167. In 1906 there were in the state 264,712 communicants of various religious denominations, and of these 199,951 were Roman Catholics. Second in strength were the Baptists, who founded the colony; in 1906 they numbered 19,878, of whom 14,304 were of the Northern Convention. There were 15,443 Protestant Episcopalians, 9858 Congregationalists, 7892 Methodists. The Friends, whose influence was so strong in the early history of Providence, numbered in 1906 only 648 in the whole state.

Administration.—The state is governed under the constitution of 1842, with amendments adopted in 1854, 1864, 1886, 1888, 1889, 1892, 1893, 1900, 1903, 1909. All native or naturalized citizens of the United States residing in Rhode

[1] The 1905 census of manufactures gives statistics only for establishments under the factory system, excluding the hand trades, and gives factory statistics for 1905 and for 1900. The statistics given above for 1900 in comparison with 1905 are for factory products.

[2] The populations in other census years were: (1790) 68,825; (1800) 69,122; (1810) 76,931; (1820) 83,059; (1830) 97,199; (1840) 108,830; (1850) 147,545; (1860) 174,620; (1870) 217,353.

[3] In 1910 the populations of the cities were: Providence, 224,326; Pawtucket, 51,622; Woonsocket, 38,125; Newport, 27,149; and Central Falls, 22,754.

Island are citizens of the state. Under an act of 1724 the suffrage was restricted to adult males who possessed a freehold of the value of $134 (see *History*). So far as state and national elections are concerned, the privilege was extended to native non-freeholders by the constitution of 1842, to naturalized foreigners who had served in the Civil War by an amendment of the 7th of April 1886, and to all adult male citizens by the amendment of the 4th of April 1888. A curious survival of the old system exists in the provision that only those who pay taxes on $134 worth of property may vote for members of city councils or on propositions to levy taxes or to expend public money. The working men are thus almost entirely excluded from participating in the government of the large factory towns.

Amendments to the constitution must be passed by both houses of the General Assembly at two consecutive sessions, and must then be ratified by three-fifths of the electors of the state present and voting thereon in town and ward meetings. Fifteen amendments have thus been added to the constitution of 1842. An amendment of the 7th of April 1886 forbade the manufacture and sale of intoxicating beverages, but it was badly enforced and was repealed by a subsequent amendment of the 20th of June 1889.

The powers of the governor are unusually small. Until 1909, when a constitutional amendment was adopted, he had no power of veto, and his very limited nominal powers of appointment and removal are controlled by a rotten-borough Senate. The other administrative officers are a secretary of state, an attorney-general, an auditor, a treasurer, a commissioner of public schools, a railroad commissioner, and a factory inspector, and various boards and commissions, such as the board of education, the board of agriculture, the board of health, and the commissioners of inland fisheries, commissioners of harbours and commissioners of pilots.

The legislative power is vested in the General Assembly,[1] which consists of a Senate made up of the lieutenant-governor and of one senator from each of the thirty-eight cities and townships in the state, and a House of Representatives of one hundred members, apportioned according to population, but with the proviso that each town or city shall have at least one representative and none shall have more than one-fourth of the total (see *History*). Members of the legislature and all state officials are elected annually in November. A majority vote was formerly required, but since the adoption of the tenth amendment (Nov. 28, 1893) a plurality vote has elected.

At the head of the judicial system is the supreme court (1747), with final revisory and appellate jurisdiction. Below this are the superior court (1905), the twelve district courts of the town councils, probate courts in the larger towns, and justices of the peace. The five judges of the supreme court, the six judges of the superior court and the district judges are elected by the General Assembly; the supreme and the superior court justices hold office until dismissed by the General Assembly for found guilty of official misdemeanour, and the district judges have three-year terms.

The town (or township) is the unit of local government, the county being recognized only for judicial purposes and to a certain extent for appointment by central administrative boards. There are five counties and thirty-eight towns. The municipal governments of Newport and Providence present interesting features, for which see the separate articles on these cities.

Education.—The public school system of Rhode Island was established in 1800, abolished in 1803, and re-established in 1828. At the head of it is a commissioner of education, appointed by the governor and the Senate, and a board of education, consisting of the governor and the lieutenant-governor *ex officio* and six other members elected by the General Assembly. Under an act of the 12th of April 1883, as amended on the 4th of April 1902, education is compulsory for children between the ages of seven and fifteen, but the maximum limit is reduced to thirteen for children who are employed at lawful labour. The total enrolment in the public schools in 1905 was 71,425 and the total expenditure for public school purposes was $1,388,000. Considerable attention is paid to Irish and the French Canadians send their children to the Roman Catholic parochial schools. The chief institutions for higher education are Brown University (1764), the State School of Design (1877), the State Normal School (reorganized 1898), and the Moses Brown School (1819), all at Providence (*q.v.*), and the State College of Agriculture and Mechanic Arts (1888) at Kingston, a land grant college under the Morrill Acts of 1862 and 1890, the Hatch Act of 1887 and the Adams Act of 1906. This institution was founded as an agricultural school in 1888 and became a college in 1892. The department of agriculture, engineering and science, a library of 15,000 volumes and an experiment station. There are state training-schools for teachers at Providence, Cranston, Bristol, Barrington, Central Falls, Warwick and Pawtucket.

Charitable and Penal Institutions.—A board of state charities and corrections, established in 1869, supervises and controls all of the penal, charitable and correctional institutions of the state at large and also the local almshouses. There were in 1910 nine institutions of the board, three from Providence county, one from each of the other counties, and one from the state. These were appointed by the governor with the consent of the Senate, and four were elected by the Senate. A group of institutions (under the control of the board) at Howard, in Cranston township, about 7 m. from Providence, including the Workhouse and House of Correction, the Hospital for the Insane (1869), the Almshouse, the State Prison and Providence County Jail, the Sockanosset School for Boys, and the Oaklawn School for Girls, are supported entirely or in part by the state. In addition to the institutions under the board of charities and corrections there are two under the board of education, and supported wholly or in part by the state, the School for the Deaf (1876) and the Home and School for Dependent and Neglected Children (1885) at Providence. The Soldiers' Home (1891) at Bristol, the Butler Hospital for the Insane (1847) at Providence, and a Sanitarium (1905) at Wallum Lake, in the township of Burrillville, are assisted by the state.

Finance.—The chief sources of revenue in the order named are the general property tax, the tax on savings banks, the tax on insurance companies, and liquor licences. There is no corporation tax. The total receipts from all sources for the year 1909 were $2,317,512, the expenditures $2,345,359. The public debt, which originated in 1752, amounted to £70,000 sterling in 1764, to £4000 in 1775 and to $698,000 in 1783. Part of the Revolutionary debt was paid in depreciated paper, part was assumed by the United States government, part was paid at various rates of depreciation between 1803 and 1820, and the remainder, $43,971, was repudiated in 1847. Other obligations had accumulated in the meantime, however, so that the debt in 1848 amounted to $576,000. This was gradually reduced until the Civil War, when it was increased to $3,889,000 by 1865. A sinking fund commission was established in 1875, and the entire sum was extinguished by the 1st of August 1894. The issue of bonds for the construction of the new capitol building and other purposes has led, however, to a new debt, which at the beginning of 1910 amounted to $4,800,000. There was at the same time a sinking fund of $655,000. Before the adoption of the Federal constitution Rhode Island was badly afflicted with the paper money heresy. £5000 were printed in 1710, and from that time until 1751 there were nine separate issues. These were gradually retired, however, and from the debts of the respectable classes, aided by the parliamentary statutes of 1751 and 1763, and by about 1763 the finances were again placed on a sound money basis. The influx of Continental currency gave some trouble during the War of Independence, but there were no further local issues until 1786, when £100,000 were issued.

The first banks organized in the state were the Providence Bank in 1791, the Bank of Rhode Island at Newport in 1795, and the Washington Bank at Westerly in 1800. Forty-four charters had been issued in 1826 and sixty in 1837. Partly through restrictive local legislation and partly as a result of the operation of the Suffolk system of redemption in Boston, these institutions were always conservative. During the generation after the period of the Civil War their note issues constituted a smaller proportion of the capital stock than those of any other state. By an act of 1858 which is still in force, annual reports must be presented to the state auditor. On the establishment of the national banking system, 1863–65, nearly all of the banks took out national charters. Since 1865 the most notable features have been the rise and decadence of the national banks and the rise of the trust companies. During the decade from 1890 to 1900 the deposits in the national banks increased only 5%, from $16,700,000 to $17,500,000; those of the trust companies increased 330%, from $12,000,000 to more than $52,000,000. During the period from 1890 to 1909 twenty national banks retired from business, and the total capital stock was reduced from about twenty millions to about thirteen millions of dollars.

History.—Rhode Island was founded by refugees from Massachusetts, who went there in search of religious and political freedom. The first settlements were made at Providence by Roger Williams (*q.v.*) in June 1636, and at Portsmouth on the island of Aquidneck by the Antinomians, William Coddington (1601–1678), John Clarke (1609–1676), and Anne Hutchinson (1591–1643), in March–April 1638.

[1] Under the constitution of 1842 it was provided that there should be two sessions of the General Assembly annually: one at Newport in May, and the other in October to be held at South Kingstown once in two years, and the intermediate years alternately at Bristol and East Greenwich, an adjournment from the October session being held annually at Providence. In 1854 this was amended: one session was provided for to be held in Newport in May, an adjournment being held annually at Providence. And in 1900 by another amendment Providence became the only meeting-place of the General Assembly.

Becoming dissatisfied with conditions at Portsmouth, Coddington and Clarke removed a few miles farther south on the 29th of April 1639, and established a settlement at Newport. In a similar manner Warwick was founded in January 1643 by seceders from Providence under the lead of Samuel Gorton. The union of Portsmouth and Newport, March 12, 1640, was followed by the consolidation of all four settlements, May 19, 1647, under a patent of March 14, 1644, issued by the parliamentary board of commissioners for plantations. The particularistic sentiment was still very strong, however, and in 1651 the union split into two confederations, one including the mainland towns, Providence and Warwick; the other, the island towns, Portsmouth and Newport. A reunion was effected in 1654 through the influence of Roger Williams, and a charter was secured from Charles II. on the 8th of July 1663. In the patent of 1644 the entire colony was called Providence Plantations. On the 13th of March 1644 the Portsmouth-Newport General Court changed the name of the island from Aquidneck to the Isle of Rhodes or Rhode Island. The official designation for the province as a whole in the charter of 1663, therefore, was Rhode Island and Providence Plantations. The charter was suspended at the beginning of the Andros régime in 1686, but was restored again after the Revolution of 1689. The closing years of the 17th century were characterized by a gradual transition from the agricultural to the commercial stage of civilization. Newport became the centre of an extensive business in piracy, privateering, smuggling, and legitimate trade. Cargoes of rum, manufactured from West Indian sugar and molasses, were exported to Africa and exchanged for slaves to be sold in the southern colonies and the West Indies. The passage of the Sugar Act of April 5, 1764, and the steps taken by the British government to enforce the Navigation Acts seriously affected this trade. The people of Rhode Island played a prominent part in the struggle for independence. On the 9th of June 1772 the "Gaspee," a British vessel which had been sent over to enforce the acts of trade and navigation, ran aground in Narragansett Bay and was burned to the water's edge by a party of men from Providence. Nathanael Greene, a native of Rhode Island, was made commander of the Rhode Island militia in May 1775, and a major-general in the Continental army in August 1776, and in the latter capacity he served with ability until the close of the war. In the year 1776, General Howe sent a detachment of his army under General Henry Clinton to seize Newport as a base of operations for reducing New England, and the city was occupied by the British on the 8th of December 1776. To capture this British garrison, later increased to 6000 men, the co-operation of about 10,000 men (mostly New England militia) under Major-General John Sullivan, and a French fleet carrying 4000 French regulars under Count D'Estaing, was planned in the summer of 1778. On the 9th of August Sullivan crossed to the north end of the island of Rhode Island, but as the Frenchmen were disembarking on Conanicut Island Lord Howe arrived with the British fleet. Count D'Estaing hastily re-embarked his troops and sailed out to meet Howe. For two days the hostile fleets manœuvred for positions, and then they were dispersed by a severe storm. On the 20th, D'Estaing returned to the port with his fleet badly crippled, and only to announce that he should sail to Boston to refit. The American officers protested but in vain, and on the 28th they decided to retreat to the north end of the island. The British pursued, and the next day there was a severe engagement in which the Americans were driven from Turkey and Quaker Hills. On the 30th the Americans, learning of the approach of Lord Howe's fleet with 5000 troops under Clinton, decided to abandon the island. The British evacuated Newport the 25th of October 1779, and the French fleet was stationed here from July 1780 to 1781.

The influence of Roger Williams's ideas and the peculiar conditions under which the first settlements were established have tended to differentiate the history of Rhode Island from that of the other New England states. In 1640 the General Court of Massachusetts declared that the representatives of Aquidneck were "not to be capitulated withal either for themselves or the people of the isle where they inhabit," and in 1644 and again in 1648 the application of the Narragansett settlers for admission to the New England Confederacy was refused except on condition that they should pass under the jurisdiction of either Massachusetts or Plymouth. Rhode Island was one of the first communities in the world to advocate religious freedom and political individualism.

The individualistic principle was shown in the jealousy of the towns toward the central government, and in the establishment of legislative supremacy over the executive and the judiciary. The legislature migrated from county to county up to 1854, and there continued to be two centres of government until 1900. The dependence of the judiciary upon the legislature was maintained until 1860, and the governor is still shorn of certain powers which are customary in other states (see *Administration*). In the main the rural towns have adhered most strongly to the old individualistic sentiment, whereas the cities have kept more in touch with the modern nationalistic trend of thought. This was shown, for example, in the struggle for the ratification of the Federal constitution. Under the Articles of Confederation it was principally Rhode Island that defeated the proposal to authorize Congress to levy an impost duty of 5% mainly as a means of meeting the debts of the Central government. When the constitutional convention met in Philadelphia in 1787 to frame a constitution for a stronger Federal government, the agriculturists of Rhode Island were afraid that the movement would result in an interference with their local privileges, and especially with their favourite device of issuing paper money, and the state refused to send delegates, and not until the Senate had passed a bill for severing commercial relations between the United States and Rhode Island, did the latter, in May 1790, ratify the Federal constitution, and then only by a majority of two votes. Rhode Island, like the rest of New England, was opposed to the War of 1812 and the Mexican War. During the Civil War it sent 23,457 men into the service of the Union.

The economic transition of the later 17th century from the agricultural to the commercial régime was followed by a further transition to the manufacturing régime during the closing years of the 18th and the early years of the 19th centuries. Commercial interests have been almost entirely destroyed, partly because of the abolition of the slave trade and partly because of the embargo and the war of 1812, but mainly because the cities of the state are unfavourably situated to be the termini of interstate railway systems. Providence, owing to its superior water-power facilities, has therefore become one of the leading manufacturing centres of New England, whereas Newport is now known only as a fashionable summer resort. The movement as a whole was of exactly the same character as the industrial revolution in England, and it led to the same result, the struggle for electoral reform. The system of apportionment and the franchise qualifications were worked out to meet the needs of a group of agricultural communities. The charter of 1663 and the franchise law of 1724 established substantial equality of representation among the towns, and restricted the suffrage to freeholders. In the course of time, therefore, the small towns came to be better represented proportionally than the large cities, and the growing class of artisans was entirely disfranchised. The city of Providence issued a call for a constitutional convention in 1796, and similar efforts were made in 1799, 1817, 1821, 1822 and 1824, but nothing was accomplished. About 1840 Thomas W. Dorr (1805–1854), a young lawyer of Providence, began a systematic campaign for an extension of the suffrage, a reapportionment of representation and the establishment of an independent judiciary. The struggle, which lasted for several years, and in fact is not yet entirely over, was one between the cities and the country, between the manufacturers and the agriculturists. It was

also complicated by racial and religious prejudices, a large proportion of the factory operatives being foreigners and Roman Catholics, and most of the country people native Protestants. The former were in general associated with the Democratic party, the latter with the Whigs. A convention summoned without any authority from the legislature, and elected on the principle of universal manhood suffrage, met at Providence, October 4–November 18, 1841, and drafted a frame of government which came to be known as the People's Constitution. A second convention met on the call of the legislature in February 1842 and adopted the so-called Freeman's Constitution. On being submitted to popular vote the former was ratified by a large majority (December 27, 28, 29, 1841), while the latter was rejected by a majority of 676 (March 21, 22, 23, 1842). At an election held on the 18th of April 1842 Dorr was chosen governor. The supreme court of the state and the president of the United States (Tyler) both refused to recognize the validity of the People's Constitution, whereupon Dorr and a few of his more zealous adherents decided to organize a rebellion. They were easily repulsed in an attack upon the Providence town arsenal, and Dorr, after a brief period of exile in Connecticut, was convicted of high treason on the 26th of April 1844, and was sentenced to imprisonment for life. He was released by act of the Assembly in June 1845, and was restored to the full rights of citizenship in May 1851. The Freeman's Constitution, modified by another convention, which held its session at Newport and East Greenwich, September 12–November 5, 1842, was finally adopted by popular vote on November 21–23, 1842. Only a partial concession was made to the demand for reform. The suffrage was extended to non-freeholders, but only to those of American birth. Representation in the lower house of the legislature was apportioned according to population, but only on condition that no city or town should ever elect more than one-sixth of the total number of members. Each city and town without regard to population was to elect one senator. In order to perpetuate this system the method of amending the constitution was made extremely difficult (see *Administration*). Since the adoption of the constitution the conditions have become worse owing to the extensive immigration of foreigners into the large cities and the gradual decay of the rural towns. From about 1845 to 1885 most of the immigrants were Irish, but since 1880 the French-Canadians have constituted the chief element. In 1900 over 30% of the population of the state was foreign-born. A constitutional amendment of 1888 extended to them the right of suffrage in state and national elections, and an amendment of 1909 partially remedied the evils in the system of apportionment. When the last Federal census was taken in 1910, Providence, Pawtucket, Woonsocket and Newport, with a combined population of 341,222, had four senators, whereas the remainder of the state, with a population of 201,452, had thirty-four. Providence, with a population of 224,326 out of a total of 542,674, had one member in a Senate of thirty-eight and twenty-five members in a House of Representatives of one hundred. The Republican machine finds it easy with the support of the millionaire summer colony at Newport and the street railway corporations to corrupt the French-Canadians and a portion of the native element in the rural towns and maintain absolute control of the state government. The majority has occasionally protested by electing a Democratic governor, but he has not been able to accomplish a great deal, because until 1909 he did not have veto power nor effectual means to induce the Senate to ratify his appointments. Bonds were issued on the 8th of November 1892 for the construction of a new state house at Providence, the corner stone was laid in October 1896, and the building was thrown open to use on the 1st of January 1901. A constitutional amendment of 1900 dispensed with the session of the legislature at Newport.

In presidential campaigns the state has been Federalist, 1792–1800; Democratic Republican, 1804; Federalist, 1808–1812; Democratic Republican, 1816–1820; Adams (Republican), 1824–1828; National Republican, 1832; Democratic, 1836; Whig, 1840–1848; Democratic, 1852; and Republican since 1856.

GOVERNORS OF RHODE ISLAND

Portsmouth		
William Coddington	Judge,	1638–1639
William Hutchinson	"	1639–1640
Newport		
William Coddington	Judge,	1639–1640
Portsmouth and Newport		
William Coddington	Governor,	1640–1647
PRESIDENTS UNDER THE PATENT OF 1644		
John Coggeshall		1647–1648
Jeremy Clarke		1648–1649
John Smith		1649–1650
Nicholas Easton		1650–1651
Providence and Warwick[1]		
Samuel Gorton	President,	1651–1652
John Smith	"	1652–1653
Gregory Dexter	"	1653–1654
Portsmouth and Newport		
John Sanford	President,	1653–1654
PRESIDENTS UNDER THE PATENT OF 1644		
Nicholas Easton		1654
Roger Williams		1654–1657
Benedict Arnold		1657–1660
William Brenton		1660–1662
Benedict Arnold		1662–1663
GOVERNORS UNDER THE CHARTER OF 1663		
Benedict Arnold		1663–1666
William Brenton		1666–1669
Benedict Arnold		1669–1672
Nicholas Easton		1672–1674
William Coddington		1674–1676
Walter Clarke		1676–1677
Benedict Arnold		1677–1678
William Coddington		1678
John Cranston		1678–1680
Peleg Sanford		1680–1683
William Coddington, 2nd		1683–1685
Henry Bull		1685–1686
Walter Clarke		1686[2]
John Coggeshall (acting)		1689–1690
Henry Bull		1690
John Easton		1690–1695
Caleb Carr		1695
Walter Clarke		1696–1698
Samuel Cranston		1698–1727
Joseph Jencks		1727–1732
William Wanton		1732–1733
John Wanton		1734–1740
Richard Ward		1740–1743
William Greene		1743–1745
Gideon Wanton		1745–1746
William Greene		1746–1747
Gideon Wanton		1747–1748
William Greene		1748–1755
Stephen Hopkins		1755–1757
William Greene		1757–1758
Stephen Hopkins		1758–1762
Samuel Ward		1762–1763
Stephen Hopkins		1763–1765
Samuel Ward		1765–1767
Stephen Hopkins		1767–1768
Josias Lyndon		1768–1769
Joseph Wanton		1769–1775
Nicholas Cooke		1775–1778
William Greene, 2nd		1778–1786
John Collins		1786–1790
Arthur Fenner,[3] Federalist and Democratic Republican		1790–1805
Paul Mumford (acting), Democratic Republican		1805
Henry Smith, " " "		1805–1806
Isaac Wilbour, " "		1806–1807
James Fenner, Democratic Republican		1807–1811
William Jones, Federalist		1811–1817
Nehemiah R. Knight, Democratic Republican		1817–1821
William C. Gibbs,		1821–1824
James Fenner[4] (Democratic Republican and National Republican)		1824–1831

[1] A separation occurred in 1651 between the towns of Providence and Warwick on one side and Portsmouth and Newport on the other. They were reunited in 1654.

[2] The charter was suspended from 1686 to 1689, during which time the province was under the supervision of Sir Edmund Andros.

[3] Arthur Fenner became a Democratic Republican about 1800.

[4] James Fenner was a Democratic Republican to 1826, a National Republican (Adams) to 1829 and a Democrat (Jackson) to 1831.

Lemuel H. Arnold, National Republican	1831–1833
John B. Francis, Democrat and Anti-Masonic	1833–1838
William Sprague, Whig	1838–1839
Samuel W. King, Whig	1839–1843

UNDER THE CONSTITUTION OF 1842

James Fenner, Whig	1843–1845
Charles Jackson,[1] Democrat	1845–1846
Byron Diman, Whig	1846–1847
Elisha Harris, Whig	1847–1849
Henry B. Anthony, Whig	1849–1851
Philip Allen, Democrat	1851–1853
Francis M. Dimond (acting), Democrat	1853–1854
William W. Hoppin, Whig and American	1854–1857
Elisha Dyer, Republican	1857–1859
Thomas G. Turner, Republican	1859–1860
William Sprague,[2] Unionist	1860–1863
William C. Cozzens (acting), Unionist	1863
James Y. Smith, Republican	1863–1866
Ambrose E. Burnside, „	1866–1869
Seth Padelford, „	1869–1873
Henry Howard, „	1873–1875
Henry Lippitt, „	1875–1877
Charles C. Van Zandt, „	1877–1880
Alfred H. Littlefield, „	1880–1883
Augustus O. Bourn, „	1883–1885
George W. Wetmore, „	1885–1887
John W. Davis, Democrat,	1887–1888
Royal C. Taft, Republican,	1888–1889
Herbert W. Ladd, „	1889–1890
John W. Davis, Democrat	1890–1891
Herbert W. Ladd, Republican	1891–1892
D. Russell Brown, „	1892–1895
Charles W. Lippitt, „	1895–1897
Elisha Dyer, „	1897–1900
William Gregory, „	1900–1901
Charles Dean Kimball, Republican	1901–1903
L. F. C. Garvin, Democrat	1903–1905
George H. Utter, Republican	1905–1907
James H. Higgins, Democrat	1907–1909
Aram J. Pothier, Republican	1909–

BIBLIOGRAPHY.—For general physical description see C. T. Jackson, *Report on the Geological and Agricultural Survey of Rhode Island* (Providence, 1840); N. S. Shaler, J. B. Woodworth, and A. F. Foerste, *Geology of the Narragansett Basin* (Washington, 1899); and T. Nelson Dale, *The Chief Commercial Granites of Massachusetts, New Hampshire and Rhode Island* (Ibid., 1908), being Bulletin 354 of the U.S. Geological Survey. Administration:—The charters of 1644 and 1663 and the constitution of 1842 are all given in F. N. Thorpe, *Constitutions, Charters, and Organic Laws* (Washington, 1909), vol. vi. See also the annual reports of the treasurer, the auditor, the commissioner of public schools, the board of education, and the board of state charities and corrections; W. H. Tolman, *History of Higher Education in Rhode Island* (Washington, 1894); Henry Phillips, Jr., *Historical Sketches of the Paper Currency of the American Colonies* (2 vols., Roxbury, Mass., 1865–1866); Thomas Durfee, *Gleanings from the Judicial History of Rhode Island* (Providence, 1883); and the works of Field, Richman and Mowry (see History, Bibliography).

History.—For many years the standard authority on the period before the ratification of the constitution was S. G. Arnold, *History of Rhode Island, 1636–1790* (2 vols., New York, 1859–60, 4th ed., Providence, 1894). His work has, however, been partially superseded by J. R. Richman, *Rhode Island: Its Making and Meaning, 1636–1683* (2 vols., 1902), and *Rhode Island: A Study in Separatism* (Boston and New York, 1905). Edward Field (Editor), *State of Rhode Island and Providence Plantation at the end of the Century: A History* (3 vols., Boston, 1902), is valuable for the more recent history of the state. See also Adelos Gorton, *The Life and Times of Samuel Gorton* (Philadelphia, 1908); W. B. Weeden, *Early Rhode Island: A Social History of the People* (New York, 1910); F. G. Bates, *Rhode Island and the Formation of the Union* (New York, 1898); A. M. Mowry, *The Dorr War; or the Constitutional Struggle in Rhode Island* (Providence, 1901); *Records of the Colony of Rhode Island and Providence Plantation, 1636–1792* (10 vols., Providence, 1856–65); *Rhode Island Historical Society, Collections* (10 vols., to be continued, Providence, 1827–1902); *Proceedings and Publications*, 23 numbers (Providence, 1872–1902, to be continued). *The Quarterly* (8 vols., 1892–1901, discontinued); *Rhode Island Historical Tracts*, Series I., 20 vols. (Providence, 1877–1884), Series II., 5 vols. (Providence, 1889–96). For general bibliographies see J. R. Bartlett, *Bibliography of Rhode Island* (Providence, 1864); C. R. Brigham, in *Field, II.*, pp. 651–81; and Richman, in *A Study in Separatism*, pp. 353–85.

[1] Jackson was a Liberation Whig—favouring the liberation of Dorr from prison—but he was elected on the Democratic ticket.

[2] Sprague was elected as a Union Radical Republican candidate through a coalition of Democrats and conservative Republicans.

RHODES, CECIL JOHN (1853–1902), British colonial and Imperial statesman, was born on the 5th of July 1853, at Bishop Stortford, in Hertfordshire. His father was a clergyman, but he claimed descent from yeoman stock. Cecil John Rhodes was the fifth son in a large family of sons and daughters. At the time of his birth his father held the living of Bishop Stortford. The boy was educated at Bishop Stortford grammar school with the intention of preparing for the Church; but at the age of sixteen his health broke down, and in the latter part of 1870 he was sent to join an elder brother, then engaged in farming in Natal. In that year diamonds were discovered in the Kimberley fields. By the end of 1871 Mr Rhodes and his brother were among the successful diggers. The dry air of the interior restored Mr Rhodes's health, and before he was nineteen he found himself financially independent, physically strong and free to devote his life to any object which commended itself to his choice.

Rhodes has left behind him an interesting record of the manner in which he was affected by the situation. He determined to return to England, and to complete his education by reading for a degree at Oxford; but before doing so, he spent eight months in a solitary journey through the then little known parts of the country lying to the north of the Orange and Vaal rivers. He went through Bechuanaland to Mafeking, thence to Pretoria, Murchison, Middelburg and back through the Transvaal to Kimberley. The journey, made in an ox-wagon at a rate of progression of some 15 or 20 miles a day, represented a walking tour of eight months through the vast spaces of rolling veld which at that time filled those regions of Southern Africa. He saw one of the healthiest countries in the world barely occupied. He knew the agricultural possibilities of Natal. He knew its mineral wealth. The effect of the combined influences on his mind, in the circumstances in which he found himself, was profound. The idea took passionate possession of him that the fine country through which he moved ought to be secured for occupation by the British race, and that no power but Great Britain should be allowed to dominate in the administration of South Africa. When he brought his self-imposed pilgrimage to an end, he had found an object to which he proposed to devote his life. It was nothing less than the governance of the world by the British race. A will exists written in Mr Rhodes's own handwriting a couple of years later, when he was still only twenty-two, in which he states his reasons for accepting the aggrandizement and service of the British empire as his highest ideal of practical achievement. It ends with a single bequest of everything of which he might die possessed, for the furtherance of this great purpose. Five-and-twenty years later his final will carried out, with some difference of detail, the same intention.

The share which he allotted to himself in the general scheme was the extension of the area of British settlement in Africa, but he did not attempt to address himself immediately to public work. He returned, in accordance with his first resolve, to Oxford, where he matriculated at Oriel. In 1873 his health again failed, and he was sent back to South Africa under what was practically a death sentence. Years afterwards he saw the entry of his own case in the diary of the eminent physician whom he consulted, with a note, "Not six months to live." South Africa again restored him to health. Three years later he was back at Oxford, and from 1876 to 1878 he kept his terms. During this period he spent the Long Vacation each year in South Africa, where his large financial interests were daily increasing in importance. He was a member of the Cape ministry when, after a further lapse of years, he kept his last term and took his degree. He did not read hard at Oxford, and was more than once remonstrated with in the earlier terms for non-attendance at lectures. But he passed his examinations; and though he was never a student in the university sense of the term, he was to the end of his life a keen devourer of books. He kept always a special liking for certain classic authors. Aristotle was the guide whom as a lad he followed in seeking the "highest object" on which to exercise the

"highest activity of the soul." Marcus Aurelius was his constant companion. There exists at Grote Schuur a copy of the *Meditations* deeply scored with Mr Rhodes's marks.

During this Oxford time, and on to 1881, Mr Rhodes was occupied with the amalgamation of the larger number of the diamond mines of Kimberley with the De Beers Company, an operation which established his position as a practical financier and gave him an important connexion and following in the business world. To many admirers who shared his ideas on public questions his connexion with the financial world and his practical success were a stumbling-block. It was often wished for him that he had "kept himself clear of all that." But this was not his own view. His ideals were political and practical. To him the making of money was a necessary preliminary to their realization, and he was proud of his practical ability in this direction. He was personally a man of most simple tastes. His immense fortune was spent in the execution of his ideals, and it has been justly said of him that he taught the world a new chapter of the romance of wealth.

In 1881 Mr Rhodes entered public life as a member of the Cape assembly. It was the year of the Majuba settlement. South Africa was convulsed with questions which had arisen between the British and the Dutch, and leaders of Dutch opinion at the Cape ventured to speak openly of the formation of a United States of South Africa under its own flag. The British party needed a rallying-ground, and Mr Rhodes took his stand on a policy of local union combined with the consolidation and expansion of Imperial interests. He offered to Dutch and British alike the ideal of a South African Federation governing itself within the empire, and extending, by its gradual absorption of native territories, the range of Imperial administration. Local self-government was, in his opinion, the only enduring basis on which the unity of the empire could be built, and throughout his life he was as keen a defender of local rights as he was of Imperial unity. There was a period somewhat later in his career when this attitude on his part gave rise to a good deal of misapprehension, and his advocacy of the elimination of direct Imperial interference in local affairs caused him to be viewed in certain quarters with suspicion as a Separatist and Independent. Those who were inclined to take this view were greatly strengthened in their suspicions by the fact that at a critical moment in the struggle for Home Rule in Ireland Mr Rhodes contributed £10,000 to the funds of the Separatist party. The subsequent publication of his correspondence on the subject with Mr Parnell, who was at that time leading the Home Rule party, demonstrated, however, the essential fact that, whatever might have been the secret intentions of the extreme Irish Home Rulers, Mr Rhodes's contribution was made strictly subject to the retention of the Irish members at Westminster. He remained of the opinion that the Home Rule movement, wisely treated, would have had a consolidating and not a disruptive effect upon the organization of the empire.

In South Africa the influence which he acquired over the local independents and over the Dutch vote was subsequently an important factor in enabling him to carry out the scheme of northern expansion which he had at heart, and which he had fully developed in his own mind at Oxford in 1878. In 1881 the Bechuana territory was a sort of no man's land through which ran the trade routes to the north. It was evident that any power which commanded the trade routes would command the unknown northern territory beyond. The Pretoria Convention of 1881 limited the west ward extension of the Transvaal to a line east of the trade routes. Nevertheless, the reconstituted republic showed itself anxious to encroach by irregular overflow into native territories, and Mr Rhodes feared to see the extension of the British colonies permanently blocked by Dutch occupation. One of his first acts as a member of the Cape assembly was to urge the appointment of a delimitation commission. He served in person on the commission, and obtained from the chief Mankoroane, who claimed about half of Bechuanaland, a formal cession of his territories to the British government of the Cape. The Cape government refused to accept the offer. In February 1884 a second convention signed in London again defined the western frontier of the Transvaal, Bechuanaland being left outside the republic. With the consent of Great Britain, Germany had occupied, almost at the same time, the territory on the Atlantic coast now known as German South-West Africa. In August 1884 Mr Rhodes was appointed resident deputy commissioner in Bechuanaland, where, notwithstanding the conventions to the contrary, Boers had ousted the natives from considerable areas and set up the so-called republics of Goshen and Stellaland. An old Dutchman who knew the value of the position said privately to Mr Rhodes, "This is the key of South Africa." The question at issue was whether Great Britain or the Transvaal was to hold the key. It was a question about which at that time the British public knew nothing and cared nothing. Mr Rhodes made it his business to enlighten them. President Kruger, speaking for the government of the Transvaal, professed to regard the Dutch commandoes as freebooters, and to be unable to control them. It devolved upon Great Britain to oblige them to evacuate the territory. Largely as the result of Mr Rhodes's exertions the necessary step was taken. The Warren expedition of 1884–85 was sent out. In the presence of British troops upon the frontier President Kruger recovered his controlling power over the Transvaal burghers, and without any fighting the commandoes were withdrawn. Thereupon southern Bechuanaland was declared to be British territory, while a British protectorate was declared over the northern regions up to the 22nd parallel (September 1885).

It was the first round in the long duel fought on the field of South Africa between Mr Rhodes, as the representative of British interests, and President Kruger, as the head of the militant Dutch party. The score on this occasion was to Mr Rhodes, and the entrance to the interior was secured. But the 22nd parallel was far short of the limits to which Mr Rhodes hoped to see British influence extend, and he feared lest Germany and the Transvaal might yet join hands in the native territory beyond, and bar his farther progress towards the north. The discovery of gold on the Witwatersrand in 1886, by adding to the wealth and importance of the Transvaal, gave substance to this fear.

The territory to the north of the 22nd parallel was at that time under the domination of Lobengula, chief of the Matabele, a native potentate celebrated alike for his ability and for the despotic character of his rule. There were rumours of Dutch and German emissaries at the kraal of Lobengula, engaged in persuading that chief to cede certain portions of his territory. Portugal also was putting forward shadowy claims to the country. It was in these circumstances that Mr Rhodes conceived the idea of forming a British Chartered Company, which should occupy the territory for trading and mining purposes as far as the Zambezi, and bring the whole under the protection of Great Britain. The idea took shape in 1887, in which year Mr Rhodes's first emissaries were sent to Lobengula. The charter of the British South Africa Company was granted in October 1889. Between the two dates his conception of the possibilities to be achieved by the Company had expanded. Mr Rhodes no longer limited the sphere of his operations to the Zambezi, but, crossing the river at the back of the Portuguese settlements at its mouth, he obtained permission to extend the territories of the Chartered Company to the southern end of Lake Tanganyika, including within the sphere of its operations the British settlements already made in Nyasaland. He hoped to go farther still, and to create a connected chain of British possessions through the continent which might eventually justify the description, "Africa British from the Cape to Cairo." The treaty negotiated between Great Britain and Germany in 1890 extended the German sphere of influence from the East Coast to the frontier of the Congo Free State, and defeated this hope. But Mr Rhodes did not wholly renounce the idea. In 1892, when the question of the retention or abandonment of Uganda hung in the balance at home, he threw all the weight of his influence into the scale of retention, and undertook at his own personal expense to connect

that territory by telegraph with British possessions in the south. In the following year, 1893, it was found inevitable to fight the Matabele, and a war, prosecuted with a success that is perhaps unique of its kind, placed the country entirely in British hands. The territory thus added to the British empire covered an extent of 450,000 square miles, of which large portions consist of healthy uplands suitable for white colonization. The pioneer party who constructed the first road and founded the first British stations in the country received their orders to cross the frontier in the end of 1889. By the end of 1899, before the outbreak of the South African War, though the country had passed through the trial of a war, two native rebellions, and the scourge of rinderpest, it had become, under the name of Rhodesia, a well-settled province of the British empire, with a white population of some 13,000 to 13,000 persons.

The six years which followed the granting of the charter may be regarded as the most successful of a singularly successful life. In 1890, not many months after the granting of the charter, Mr Rhodes accepted the position of prime minister of the Cape. He was maintained in power very largely by the Dutch vote, which he spared no pains to conciliate; and having the confidence of both political sections of the colony, he found himself practically in a position to play the part of benevolent despot in South Africa. He used the position well so far as the public was concerned. While his scheme of northern expansion was making the rapid progress which has been indicated, he did much to elevate and to enlarge the field of local politics. He frankly declared and worked for the policy of uniting British and Dutch interests in South Africa; he took a keen interest in local education. He also during this period carried through some important reforms in native policy. He had the courage to restrict the franchise, introducing an educational test and limiting the exercise of voting power to men enjoying an income equal to a labourer's wage—thus abolishing, without making any distinction of colour, the abuses of what was known as the "blanket" vote.

But his native policy was far from being one of simple restriction. He liked the natives; he employed them by thousands in the mining industry, he kept native servants habitually about his person he seemed to understand their peculiarities and was singularly successful in dealing with them. The first canon of his native policy was that liquor should be kept from them; the second, that they should be encouraged to labour, and guaranteed the full possession of their earnings; the third, that they should be educated in the practical arts of peace. He appreciated the full importance of raising their territorial condition from one of tribal to individual tenure; and while he protested against the absurdity of permitting the uncivilized Kaffir to vote on questions of highly civilized white policy, he believed in applying to the native for his own native affairs the principle of self-government. Of these views some received practical embodiment in the much-disputed act known as the Glen Grey Act of 1894. In this connexion it may also be noted that he was one of the warmest and most convinced supporters of Lovedale, the very successful missionary institution for the education of natives in South Africa.

The position of benevolent despot has obvious drawbacks. In Mr Rhodes's case the dependence which the populations of Cape Colony were led to place on him had its reaction on the public in a demoralizing loss of self-reliance, and for himself it must be admitted that the effect on the character of a man already much disposed to habits of absolutism in thought and action was the reverse of beneficial. Mr Rhodes felt himself to be far stronger than any man in his own surroundings; he knew himself to be actuated by disinterested motives in the aims which he most earnestly desired to reach. He was profoundly impressed by a sense of the shortness of life, and he so far abused his power as to become intolerant of any sort of control or opposition. The inevitable result followed, that though Mr Rhodes did much of great and good work during the six years of his supreme power, he entirely failed during that period to surround himself, as he might have done, by a circle of able men fit to comprehend and to carry on the work to which his own best efforts were directed. To work with him was practically impossible for those who were not willing to accept without demur the yoke of dogmatic authority He had a few devoted personal friends, who appreciated his aims and were inspired by his example; but he was lacking in regard for individuals, and a great part of his daily life was spent in the company of satellites and instruments, whom he used with cynical unconcern for the furtherance of his ends.

In 1896 the brilliant period of his premiership was brought to an end by the incident which became famous under the name of the Jameson Raid. The circumstances which led to the Raid belong properly to the history of the Transvaal. It is enough to say briefly here that the large alien population which had been attracted to the Transvaal by the phenomenal wealth of the Johannesburg goldfields, conceiving themselves to have reason to revolt against the authority of the Transvaal government, resolved towards the end of 1895 to have recourse to arms in order to obtain certain reforms. Mr Rhodes, as a large mine-owner, was theoretically a member of the mining population. In this capacity he was asked to give his countenance to the movement. But as prime minister of a British colony he was evidently placed in a false position from the moment in which he became cognizant of a secret attempt to overturn a neighbouring government by force of arms. He did more than become cognizant. The subsequent finding of a Cape committee, which he accepted as accurate, was to the effect that "in his capacity as controller of the three great joint companies, the British South Africa Company, the De Beers Consolidated Mines, and the Gold Fields of South Africa, he directed and controlled the combination which rendered such a proceeding as the Jameson Raid possible." He gave money, arms and influence to the movement; and as the time fixed for the outbreak of the revolution approached, he allowed Dr Jameson, who was then administrator of the British South Africa Company in Rhodesia, to move an armed force of some 500 men upon the frontier. Here Mr Rhodes's participation in the movement came to an end. It became abundantly clear from subsequent inquiry that he was not personally responsible for what followed. A cipher correspondence, seized and published by the Boers, left the civilized world in no doubt as to Mr Rhodes's share in the previous preparation, and he was for a time believed to be responsible for the Raid itself. Subsequent inquiries held by committees of the Cape parliament and of the British House of Commons acquitted him entirely of responsibility for Dr Jameson's final movement, but both committees found that he had acted in a manner which was inconsistent with his duty as prime minister of the Cape and managing director of the British South Africa Company.

He displayed, in the circumstances, characteristic qualities of pluck and candour. He made no concealment of his own share in the catastrophe; he took full responsibility for what had been done in his name by subordinates, and he accepted all the consequences which ensued. He resigned his premiership of the Cape (January 1896); and, recognizing that his presence was no longer useful in the colony, he turned his attention to Rhodesia. His design was to live in that country, and to give all the stimulus of his own presence and encouragement to the development of its resources. The Matabele rebellion of March 1896 intervened to prevent the immediate realization of his plans. In June Imperial troops were sent up, and by the end of July the result of the military operations had driven the natives to the Matoppo Hills, where they held a practically impregnable position. The prospect was of continued war, with a renewal of a costly campaign in the following year. Mr Rhodes conceived the idea that he might effect single-handed the pacification which military skill had failed to compel. To succeed, it was essential that he should trust and be trusted. He accordingly moved his tent away from the troops to the base of the Matoppo Hills. He lay there quietly for six weeks, in the power of the enemy if they had chosen to attack. Word was circulated among the natives

that he had come alone and undefended to hear their side of the case. A council was held by them in the very depths of the hills, where no armed force could touch them. He was invited to attend it. It was a case of staking his life on trust. He displayed no hesitation, but mounted and rode unarmed with the messenger. Three friends rode with him. The confidence was justified. They met the assembled chiefs at the place appointed. The native grievances were laid before Mr Rhodes. At the end of a long discussion Mr Rhodes, having made and exacted such concessions as he thought fit, asked the question, "Now, for the future is it peace or is it war?" And the chiefs, laying down their sticks as a symbol of surrendered arms, declared, "We give you one word: it is peace." The scene, as described by one of the eye-witnesses, was very striking. Mr Rhodes, riding away, characterized it simply as "one of the scenes which make life worth living."

His life was drawing towards its end. He had still a few years, which he devoted with success to the development of the country which bore his name. The railway was brought to Bulawayo, and arrangements were made for carrying the line on in sections as far as the south end of Lake Tanganyika, a construction which was part of his pet scheme for connecting the Cape by a British line of communication with Cairo. He also concluded arrangements for carrying a telegraphic land line through to Egypt, and had the satisfaction of seeing the mineral development of the country fairly started. But the federal union of South Africa, which he had always worked as the secure basis of the extension of British rule in the southern half of the continent, was not for him to see. The South African War broke out in 1899. Mr Rhodes took his part at Kimberley in sustaining the hardships of a siege; but his health was broken, and though he lived to see victory practically assured to British arms, peace had not been concluded when, on the 26th of March 1902, he died at Muizenberg, near Cape Town.

His life's work did not end actually with his death. He left behind him a will in which he dedicated his fortunes, as he had dedicated himself, exclusively to the public service. He left the bulk of his vast wealth for the purpose of founding scholarships at Oxford of the value each of £300 a year, to be held by students from every important British colony, and from every state and Territory of the United States of America. The sum so bequeathed was very large; but it was not for the munificence of the legacy that the will was received with acclamation throughout the civilized world: it was for the striking manifestation of faith which it embodied in the principles that make for the enlightenment and peace and union of mankind, and for the fine constancy of Mr Rhodes's conviction that the unity of the British Empire, which he had been proud to serve, was among the greatest of organized forces uniting for universal good. The will was drawn up some years before his death. A codicil, signed during the last days of his life, gave evidence of some enlargement of his views as to the association of races necessary in order to secure the peace of the world, and added to the original scheme a certain number of scholarships to be held at the disposal of German students.

The publication of the will silenced Mr Rhodes's detractors and converted many of his critics. It set a seal which could not be mistaken upon his completed life. The revulsion of sentiment towards him was complete, and his name passed at once in the public estimation to the place which it is probably destined to take in history, as one which his countrymen are proud to count among the great makers of the British Empire.

See the *Life* by Sir Lewis Michell (2 vols., London, 1910); consult also Sir T. E Fuller, *Cecil John Rhodes: A Monograph and a Reminiscence* (London, 1910), and "Vindex," *Cecil Rhodes: His Political Life and Speeches* (London, 1900).

(F. L. L.)

The Rhodes Scholarships.—The scholarship system founded by the will of Cecil Rhodes provides in perpetuity for the support at Oxford, for a term of three years each, of about 175 selected scholars. Each scholar from the colonies and the United States has an allowance of £300 per annum during the continuance of his scholarship; those from Germany, as being nearer to Oxford, an allowance of £250 each. In each province of Canada, in each state of Australia, in the four collegiate schools of Cape Colony (Rondebosch, Stellenbosch, South African College, and St Andrew's College, Grahamstown), in the dominion of New Zealand, and in the colonies of Natal, Jamaica, Bermuda and Newfoundland, a scholar is elected each year. Three scholarships annually are assigned to Rhodesia. Each state and Territory of the American Union is entitled to have two scholars in residence, so that an election takes place in two years out of three. Five scholarships are provided annually for scholars from Germany.

In his will Rhodes mentions the objects he had in view in founding the different scholarships:—

1. *Colonial.*—"I consider that the education of young colonists at one of the universities in the United Kingdom is of great advantage to them for giving breadth to their views, for their instruction in life and manners, and for instilling into their minds the advantage to the colonies as well as to the United Kingdom of the retention of the unity of the empire."

2. *American.*—"I also desire to encourage and foster an appreciation of the advantages which I implicitly believe will result from the union of the English-speaking peoples throughout the world, and to encourage in the students from the United States of North America who will benefit from the American scholarships to be established for the reason above given at the university of Oxford to the end that they may entertain a sentiment to the country from which they have sprung, but without, I hope, withdrawing them or their sympathies from the land of their adoption or birth."

3. *German.*—"I note the German emperor has made instruction in English compulsory in German schools. I leave five yearly scholarships at Oxford of £250 per annum to students of German birth, the scholars to be nominated by the German emperor for the time being. Each scholarship to continue for three years, so that each year after the first three there will be fifteen scholars. The object is that an understanding between the three Great Powers will render war impossible and educational relations make the strongest tie."

He defines as follows the principles on which he wished his scholars to be selected:—

"My desire being that the students who shall be elected to the scholarships shall not be merely bookworms, I direct that in the election of a student to a scholarship regard shall be had to (1) his literary and scholastic attainments; (2) his fondness for and success in manly outdoor sports such as cricket, football and the like; (3) his qualities of manhood, truth, courage, devotion to duty, sympathy for and protection of the weak, kindliness, unselfishness and fellowship; and (4) his exhibition during school days of moral force of character and of instincts to lead and to take an interest in his schoolmates, for those latter attributes will be likely in after life to guide him to esteem the performance of public duties as his highest aim."

The trustees named in the will for the management of the trust were Lord Rosebery, Lord Grey, Lord Milner, Sir Lewis Michell, Dr L. S. Jameson, Mr Alfred Beit and Mr Bourchier F. Hawksley.

After consultation with the educational authorities of all the communities to which scholarships are assigned, the trustees arranged a system for the selection of scholars. This system, which is subject to such changes as experience suggests, may be summarized as follows. Every candidate, in order to become eligible, is required to pass the Responsions examination of the university of Oxford, or some examination accepted by the university as an equivalent. In the case of communities possessing universities or colleges in affiliation with Oxford, a certain standing at those universities is accepted in lieu of Responsions. Examinations are held in two successive years in each state of the American Union, and annually in colonies which do not have the affiliated universities or colleges referred to. German scholars are nominated by his majesty the emperor of Germany. Candidates must be unmarried—must be between the ages of 19 and 25 (in Jamaica and Queensland, 18–25; in Newfoundland, 18–21; in Western Australia, 17–25), and they must be, in the colonies, British subjects—in the United States and Germany, subjects of those countries. In each British colony elected scholars and in each state of the Union there is a committee of selection, composed commonly of leading educational authorities or high public officials. To these committees all candidates who have passed the qualifying tests submit their claims. The committees are entrusted with the power of selection, but are expected to exercise this power, as closely as circumstances permit, in accordance with the suggestions made by Rhodes. The trust arranges for the distribution of elected scholars among the colleges of Oxford, each of which has agreed to receive a limited number of approved candidates.

(G. R. P.)

RHODES, JAMES FORD (1848–), American historian, was born in Cleveland, Ohio, on the 1st of May 1848. He

entered the university of New York as a special student in 1865, studied at the university of Chicago in 1866–67, and at the Collège de France in 1867–68, and in 1868 served as occasional Paris correspondent to the Chicago *Times*. He then took a course in metallurgy in the School of Mines, at Berlin; subsequently inspected iron and steel works in western Germany and in Great Britain; and in 1870 joined his father in the iron, steel and coal business in Cleveland, becoming a member of the firm in 1874. He retired from business with an ample fortune in 1885, and after two years devoted to general reading and travel he began his *History of the United States from the Compromise of 1850*, which, closing the narrative with the year 1877, was published in seven volumes in 1893–1906. In recognition of the merit of his work he received honorary degrees from various American universities, was elected president of the American Historical Association in 1899, and received the Loubat prize of the Berlin Academy of Sciences in 1901. In 1909 he published a volume of *Historical Essays*.

RHODES, the most easterly of the islands of the Aegean Sea, about 10 m. S. of Cape Alypo in Asia Minor. It forms, with the islands of Syme, Casos, Carpathos, Castelorizo, Telos and Charki, one of the four sanjaks into which the Archipelago vilayet of Turkey is divided. The governor-general of the vilayet résides at the town of Rhodes. The length of the island is about 45 m. from N.E. to S.W., its greatest breadth 22 m., and its area nearly 424 sq. m. The population of the island comprises 7000 Moslems, 21,000 Christians, and 2000 Jews.

The island is diversified in its surface, and is traversed from north to south by an elevated mountain range, the highest point of which is called Atairo (anc. *Atabyris* or *Atabyrium*) (4560 ft.). It commands a view of the elevated coast of Asia Minor towards the north, and of the Archipelago, studded with its numerous islands, on the north-west; while on the south-west is seen Mount Ida in Crete, often veiled in clouds, and on the south and south-east the vast expanse of waters which wash the African shore. The rest of the island is occupied in great part by ranges of moderately elevated hills, on which are found extensive woods of ancient pines, planted by the hand of nature. These forests were formerly very thick, but they are now greatly thinned by the Turks, who cut them down and take no care to plant others in their place. Beneath these hills the surface of the island falls lower, and several hills in the form of amphitheatres extend their bases as far as the sea.

Rhodes was famed in ancient times for its delightful climate, and it still maintains its former reputation. The winds are liable to little variation; they blow from the west, often with great violence, for nine months in the year, and at other times from the north; and they moderate the summer heats, which are chiefly felt during the months of July and August, when the hot winds blow from the coast of Anatolia.

Rhodes, in addition to its fine climate, is blessed with a fertile soil, and produces a variety of the finest fruits and vegetables. Around the villages are extensive cultivated fields and orchards, containing fig, pomegranate and orange trees. On the sloping hills carob trees, and others both useful and agreeable, still grow abundantly; the vine also holds its place, and produces a species of wine which was highly valued by the ancients, though it seems to have degenerated greatly in modern times. The valleys afford rich pastures, and the plains produce every species of grain.

The commerce of the island has been of late years increasing at a rapid rate. Many British manufactures are imported by indirect routes, through Smyrna, Constantinople, Beyrout and other places. Cotton stuffs, calicoes and grey linen are among the goods most in demand; they are exported to the neighbouring coast of Anatolia, between Budrum and Adalia, and thence conveyed into the interior. The expansion of the trade has been very much owing to the establishment of steam navigation direct to the island, which is now visited regularly by French and Austrian steamers, as well as by some from England to Symrna.

The only town of any importance in the island is the capital, Rhodes, which stands at the north-east extremity. It rises in an imposing manner from the sea, on a gentle slope in the form of an amphitheatre. It is surrounded with walls and towers, and defended by a large moated castle of great strength. These fortifications are all the work of the Knights of St John. The interior of the city does not correspond to its outward appearance. No trace exists of the splendour of the ancient city, with its regular streets, well-ordered plan and numerous public buildings. The modern city of Rhodes is in general the work of the Knights of St John, and has altogether a medieval aspect. The picturesque fortifications also by which the city is surrounded remain almost unaltered as they were in the 15th century. The principal buildings which remain are the church of St John, which is become the principal mosque; the hospital, which has been transformed into public granaries; the palace of the grand master, now the residence of the pasha; and the senate-house, which still contains some marbles and ancient columns. Of the streets, the best and widest is a long street which is still called the Street of the Knights. It is perfectly straight, and formed of old houses, on which remain the armorial bearings of the members of the order. On some of these buildings are still seen the arms of the kings of some of the royal and noble houses of Europe.

The only relics of classical antiquity are the numerous inscribed altars and bases of statues, as well as architectural fragments, which are found scattered in the courtyards and gardens of the houses in the extensive suburbs which now surround the town, the whole of which were comprised within the limits of the ancient city. The foundations also of the moles that separate the harbours are of Hellenic work, though the existing moles were erected by the Knights of St John.

Rhodes has two harbours. The lesser of these lies towards the east, and its entrance is obstructed by a barrier of rocks, so as to admit the entrance of but one ship at a time. It is sufficiently sheltered, but by the negligence of the Turks the sand has been suffered to accumulate until it has been gradually almost choked up. The other harbour is larger, and also in a bad condition; here small ships may anchor, and are sheltered from the west winds, though they are exposed to the north and north-east winds. The two harbours are separated by a mole which runs obliquely into the sea. At the eastern entrance is the fort of St Elmo, with a lighthouse.

History.—It is as yet difficult to determine the part which Rhodes played in prehistoric days during the naval predominance of the neighbouring island of Crete; but archaeological remains dating from the later Minoan age prove that the early Aegean culture maintained itself there comparatively unimpaired until the historic period. A similar conclusion may be drawn from the legend which peopled primitive Rhodes with a population of skilful workers in metal, the "Telchines." Whatever the racial affinities of the early inhabitants may have been, it is certain that in historic times Rhodes was occupied by a Dorian population, reputed to have emigrated mainly from Argos subsequently to the "Dorian invasion" of Greece. The three cities founded by these settlers—Lindus, Ialysus and Camirus—belonged to the "League of Six Cities," by which the Dorian colonists in Asia Minor sought to protect themselves against the barbarians of the neighbouring mainland. The early history of these towns is a record of brisk commercial expansion and active colonization. The position of Rhodes as a distributing centre of Levantine and especially of Phoenician goods is well attested by archaeological finds. Its colonies extended not only eastward along the southern coast of Asia Minor, but also linked up the island with the westernmost parts of the Greek world. Among such settlements may be mentioned Phaselis in Lycia, perhaps also Soli in Cilicia, Salapia on the east Italian coast, Gela in Sicily, the Lipari islands, and Rhoda in north-east Spain. In home waters the Rhodians exercised political control over Carpathos and other islands.

The history of Rhodes during the Persian wars is quite obscure. In the 5th century the three cities were enrolled in the Delian League, and democracies became prevalent. In 412 the island revolted from Athens and became the headquarters of the Peloponnesian fleet. Four years later the inhabitants for the most part abandoned their former residences and concentrated in the newly founded city of Rhodes. This town, which was laid out on an exceptionally fine site according to a scientific plan by the architect Hippodamus of Miletus, soon rose to considerable importance, and attracted much of the Aegean and Levantine commerce which had hitherto been in Athenian hands. In the 4th century its political development was arrested by constant struggles between oligarchs and democrats, who in turn brought the city under the control of Sparta (412–395, 393–378), of Athens (395–393, 378–357), and of the Carian dynasty of Maussollus (357–340). It seems that about 340 the island was conquered for the Persian king by his Rhodian admiral Mentor; in 332 it submitted to Alexander the Great. Upon Alexander's death the people expelled their Macedonian garrison, and henceforth not only maintained their independence but acquired great political influence. The expansion of Levantine trade which ensued in the Hellenistic age brought especial profit to Rhodes, whose standard of coinage and maritime law became widely accepted in the Mediterranean. Under a modified type of democracy, in which the chief power would seem to have rested normally with the six *πρυτάνεις*, or heads of the executive, the city enjoyed a long period of remarkably good administration. The chief success of the government lay in the field of foreign politics, where it prudently avoided entanglement in the ambitious schemes of Hellenistic monarchs, but gained great prestige by energetic interference against aggressors who threatened the existing balance of power or the security of the seas. The chief incidents of Rhodian history during this period are a memorable siege by Demetrius Poliorcetes in 304, who sought in vain to force the city into active alliance with King Antigonus by means of his formidable fleet and artillery; a severe earthquake in 227, the damages of which all the other Hellenistic states contributed to repair, because they could not afford to see the island ruined; some vigorous campaigns against Byzantium, the Pergamene and the Pontic kings, who had threatened the Black Sea trade-route (220 sqq.), and against the pirates of Crete. In accordance with their settled policy the Rhodians eagerly supported the Romans when these made war upon Philip V. of Macedon and Antiochus III. of Syria on behalf of the minor Greek states. In return for their more equivocal attitude during the Third Macedonian War they were deprived by Rome of some possessions in Lycia, and damaged by the partial diversion of their trade to Delos (167). Nevertheless during the two Mithradatic wars they remained loyal to the republic, and in 88 successfully stood a siege by the Pontic king. The Rhodian navy, which had distinguished itself in most of these wars, did further good service on behalf of Pompey in his campaigns against the pirates and against Julius Caesar. A severe blow was struck against the city in 43 by C. Cassius, who besieged and ruthlessly plundered the people for refusing to submit to his exactions. Though Rhodes continued a free town for another century, its commercial prosperity was crippled and a series of extensive earthquakes after A.D. 155 completed the ruin of the city.

In the days of its greatest power Rhodes became famous as a centre of pictorial and plastic art; it gave rise to a school of eclectic oratory whose chief representative was Apollonius Molon, the teacher of Cicero; it was the birthplace of the Stoic philosopher Panaetius; the home of the poet Apollonius Rhodius and the historian Posidonius. Protogenes embellished the city with his paintings, and Chares of Lindus with the celebrated colossal statue of the sun-god, which was 105 ft. high. The colossus stood for fifty-six years, till an earthquake prostrated it in 224 B.C. Its enormous fragments continued to excite wonder in the time of Pliny, and were not removed till A.D. 656, when Rhodes was conquered by the Saracens, who sold the remains for old metal to a dealer, who employed nine hundred camels to carry them away. The notion that the colossus once stood astride over the entrance to the harbour is a medieval fiction. During the later Roman empire Rhodes was the capital of the province of the islands. Its history under the Byzantine rule is uneventful, but for some temporary occupations by the Saracens (653–658, 717–718), and the gradual encroachment of Venetian traders since 1082. In the 13th century the island stood as a rule under the control of Italian adventurers, who were, however, at times compelled to acknowledge the overlordship of the emperors of Nicaea, and failed to protect it against the depredations of Turkish corsairs. In 1309 it was conquered by the Knights Hospitallers of St John of Jerusalem at the instigation of the pope and the Genoese, and converted into a great fortress for the protection of the southern seas against the Turks. Under their mild and just rule both the native Greeks and the Italian residents were able to carry on a brisk trade. Commercial acts of these traders, in which the knights themselves sometimes joined, and the strategic position of the island between Constantinople and the Levant, necessitated its reduction by the Ottoman Turks. A siege in 1480 by Mahomet II. led to the capture of the Turks with severe losses; after a second investment, during which Sultan Suleiman I. is said to have lost 90,000 men out of a force of 200,000, the knights evacuated Rhodes under an honourable capitulation (1522). The population henceforth dwindled in consequence of pestilence and emigration, and although the island recovered somewhat in the 18th century under a comparatively lenient rule it was brought to a very low ebb owing to the severity of its governor during the Greek revolution. The sites of Lindus, Ialysus, and Camirus, which in the most ancient times were the principal towns of the island, are clearly marked, and the first of the three is still occupied by a small town with a medieval castle, both of them dating from the time of the knights. Within the castle occupies the site of the ancient acropolis, of the walls of which considerable remains are still visible. There are no ruins of any importance on the site of either Ialysus or Camirus, but excavations at the latter place have produced valuable and interesting results in the way of ancient vases and other antiquities, which are now in the British Museum. Rhodes was again famous for its pottery in medieval times; this was a lustre ware at first imitated from Persian, though it afterwards developed into an independent style of fine colouring and rich variety of design.

RHODESIA (so named after Cecil Rhodes), an inland country and British possession in South Central Africa, bounded S. and S.W. by the Transvaal, the Bechuanaland Protectorate and German South-West Africa; W. by Portuguese West Africa. N.W. by Belgian Congo; N.E. by German East Africa; E. by the British Nyasaland Protectorate and Portuguese East Africa. It covers an area of about 450,000 sq. m., being larger than France, Germany and the Low Countries combined. It is divided into two parts of unequal size by the middle course of the Zambezi.

Southern Rhodesia, with an area of 148,575 sq. m., consists of Matabeleland and Mashonaland, the western and eastern provinces, while the trans-Zambezi regions are divided into North-Western Rhodesia (or Barotseland) and North-Eastern Rhodesia.

Physical Features.—Rhodesia forms part of the high tableland which constitutes the interior of Africa south of the Congo basin. Hydrographically the greater part of the country belongs to the basin of the Zambezi (*q.v.*), but in the N.E. it includes the eastern headstreams of the Congo, and in the S. and S.E. it is drained by the tributaries of the Limpopo, the Sabi and the Pungwe. The Limpopo forms the boundary between Southern Rhodesia and the Transvaal. The north-western regions, drained by the upper Zambezi and its affluents, are described under Barotseland, and North-Eastern Rhodesia, together with the adjacent Nyasaland Protectorate, under British Central Africa. The highest portion of the tableland of Southern Rhodesia runs from the S.W. to the N.E. and forms a broad watershed between the tributaries of the Zambezi flowing north and the rivers flowing south and east. It is along this high plateau that the railway runs from Bulawayo to Salisbury and onwards to Portuguese East Africa. The elevation of the railway varies from 4500 ft. to 5500 ft. There is a gradual sloping away of the plateau to the N.W. and S.E., so

that only a small portion of Southern Rhodesia is under 3000 ft. The eastern boundary, along Portuguese East Africa, forms the edge of the tableland; the height of the edge is accentuated by a series of ridges, so that the country here assumes a mountainous appearance, the grass-clad heights being reminiscent of the Cheviot Hills of Scotland or the lower Alps of Switzerland.

Geology.—The geology of this region is very imperfectly known. Metamorphic rocks extend over immense areas, but these and the other formations are to a great extent hidden beneath superficial deposits. Conglomerates and banded ironstone rocks are found in the metamorphic areas around Bulawayo and the borders of Katanga; but to what extent these represent the different formations older than the Karroo and newer than the Swaziland schists (see TRANSVAAL) has not been satisfactorily determined. Certain gold-bearing conglomerates are regarded as the equivalents of the Witwatersrand series, but the main sources of gold are the veins of quartz and igneous rocks developed in the metamorphic series. The Karroo formation is well represented, and covers extensive areas in the Zambezi basin. The Dwyka conglomerate

breeding season, when they are on guard over their harems of from ten to fifteen wives,—the sunbirds, with their long curved beaks that search out the nectar of flowers, and the honey-guides, which, with their agitated "chuck, chuck," lead the wayfarer to bees' nests with expectation of joining in the plunder. The small birds of Rhodesia are usually very brilliantly coloured, the most distinguished being what is known as the blue jay, with its bright, iridescent, light blue plumage.

Flora.—The vegetation of the territory is luxurious and mainly subtropical, but in the lower valleys the flora assumes a tropical aspect. The country is well wooded and in this respect differs from the high tableland of Matabeleland. The trees as a rule attain to no greater height than about 20 ft., but in some districts, such as South Melsetter and Wankies, there are remains of forests of large timber. The small growth of the trees is said to be due to the annual veld fires, and it is noticeable that native trees that are protected attain a much greater height. As a rule the wood is either very hard or very soft, so that timber for building has still to be imported, although the existing timber is useful for mining purposes. One of the hardest woods is the so-called Rhodesian teak (native Ikusi), which is about 50% harder than real teak (*Tectona grandis*). The trees most commonly met with are mapane, used for poles; umkamba, resembling mahogany; m'lanji cedar, chiefly found along the eastern border; umasa, used for firewood; impachla, the native wisteria. Among other trees are the baobab with enormous very soft trunk, the fruit being a large nut containing citrate of magnesia, which natives use to make a cooling drink; the umvagaz—the bloodwood, which yields a blood-coloured gum when cut, and the umkuna, or hissing tree, which hisses when an incision is made. The barks of the umsasa, the umhondo, and the umgosa are much used by natives for binding fibres in making huts and are also used for tanning. The bark of the baobab yields a fine fibre which natives use in making excellent game nets and fishing nets. The native fruit-bearing trees are the fig (many varieties), the mahobobobo or umpanje, resembling the loquat, the Kaffir plum, very sour and totally different from the Kaffir plum of Cape Colony, and the Kaffir orange. Among the shrubs the proteas, or sugar bushes, with their nectar-stored flowers, are the most frequent. The mimosa thorn, although not quite the nature of a tree, grows in dense masses, chiefly in the western province.

The period of the year when flowers begin to bloom is rather remarkable. After the long spell of drought, lasting sometimes up to seven months, and before any rain has fallen, blooms appear all over the veld. Most of such flowers are those of bulbous plants or plants with large roots that have been stored with nourishment during the previous growing or season. The flowers are sustained by this stock of food until the rains appear again to replenish the roots. Even grass sprouts green over the earth before the rains appear, and the hard-baked veld is pierced by the shoots of the gladiolus, the orchid, the asparagus, the solanum, the convolulus and many other flowers. When the rains are far advanced, the annuals shoot rapidly and make a second show of bloom. A peculiarity of the early spring shoots on trees and shrubs is that they have not the green tints of the colder regions, but are all shades of brown and orange and red and yellow.

One of the chief features of Rhodesia is the vast stretches of grass-covered veld, the grasses varying from a few inches to 15 ft. in height and numbering about 100 different varieties. Along the rivers are to be found palms, tree ferns, bananas, dracaenas and other hot climate plants. Rubber, indigo and cotton are indigenous and there are groves of lemon trees, but these were most probably introduced by early settlers. Tobacco, which grows luxuriantly, may also have been introduced.

Inhabitants.—In Southern Rhodesia about half the European population, which in 1909 was approximately 16,500, is British born or born of British parents, and about one-third is South African born. There are about 11,500 males and 5000 females, and the population is equally divided between the urban and rural areas. In rural areas the chief occupations are mining and agriculture. Industrial pursuits, including mining, engage about 25% of the population, 8% are employed in agriculture, and 15% in commerce. Mashonaland has 7500 white inhabitants, and Matabeleland 9000. There are about 2000 Asiatics in Southern Rhodesia.

The *Natives* of Rhodesia belong to the Bantu-Negro stock and are roughly divisible into two groups; those long settled in the country, and the Amazulu, who during the 19th century left Zululand and, passing through the more southern regions, overran Rhodesia and settled in Matabeleland. The Barotse (q.v.) are mainly settled in North-West Rhodesia. In Southern Rhodesia, in spite of incursions from Portuguese territory and from the north, the natives can be still clearly divided into Mashona and Matabele, living in the eastern and western provinces respectively. The name Mashona is not used by the natives but is useful as distinguishing the allied tribes of the eastern division from the Matabele in the west. The languages of the Mashona tribes are allied and are distinct from that of the Matabele (or Zulu), but it is uncertain whether these Mashona tongues should be regarded merely as different dialects, or languages as different as those of the various nations of Europe (but see BANTU LANGUAGES). The tribes round Salisbury and extending as far as Marondella in the east and about 100 m. north are clearly branches of the Vasezuru people, that is, the people from "higher up," the "higher up" being a region in the south-east. Their history can be traced from about the beginning of the 18th century; but there is a great lack of tradition amongst this class of native, which is distinctly inferior in type to the Matabele in the west.

Farther north there are the Makorikori and the Mabudja or Mabushla. It would appear that the country in which these people now dwell was formerly in the possession of the Barotse, and some of the present chiefs obtained their positions by permission of the Barotse. Previously, according to Portuguese documents of the 16th and 17th centuries, the Makaranga or Makalanga now located in the south round about Victoria had possession of the country as far north as the Zambezi. Their language is allied to that of the present inhabitants, but in many respects is widely different and of late has become more so owing to intercourse with the Matabele. Along the eastern border two more tribes can be differentiated, namely, Umtasa's people in the north and those speaking the Chindawo language in the south. Their languages are merely variants of the language spoken in the Salisbury and Mazoe districts.

All the tribes in the eastern province have very similar habits and customs. Their huts are circular with a wall a foot or two high, made of poles and *daga* (mud) surmounted by a conical thatched roof. They thus differ from the beehive huts of the Zulus. They are built indiscriminately together and are not surrounded by stockades. The whole family dwells in the same hut along with dogs, goats and fowls, and sometimes even with cattle, though there are usually separate kraals for their cattle. The kraals are as a rule filthy, but the inside of the hut is kept clean. There is a special place for a bed, and a raised portion of the mud floor on which to sleep, but not furniture. Their mealie fields are usually some distance from the place of abode, but their tobacco gardens are near their huts. Their main object in life seems to be to grow sufficient grain for food and beer. The grain they store in granaries, resembling small huts, placed on rocks or on stakes, out of the reach of white ants and secure from the depredations of animals. They amuse themselves occasionally by making earthenware pots which are very soft and easily broken, or by engaging in iron-work or brass-wire work for ornamentation. In the south they are quite clever in making water-tight baskets from rushes grown by the Sabi river. In their religious beliefs spirits play a great part. Above all there is a vague idea of a Supreme Being whom they call *Mwari*. They have a fixed belief in the spirits of their ancestors, the spirits of the witch-doctors, the spirits of the Matabele, the spirits of old women, the spirits of the foolish, the spirits of baboons, &c. Every occurrence is attributed to the influence of a spirit, and if the occurrence is an evil one a feast and dance of propitiation are held. Feasts of thanksgiving are also held on such occasions as the gathering of the first-fruits, the harvest festival, or on the return from a long and dangerous journey. Of the tribes already mentioned the most advanced are Umtasa's people and the Makaranga. The probable connexion of the tribes now inhabiting Mashonaland with the architects of the ancient stone buildings which are scattered over the country is discussed in the section *Archaeology*. Of these ruins the most extensive are situated near Victoria and are known as Zimbabwe (q.v.).

In the western province the Matabele, or rather Amandabele, are the descendants of the Zulus who trekked under the

leadership of the famous Mosilikatze up through the Transvaal, whence they were driven by the Boers. Mosilikatze died in 1868, and his son Lobengula, after a fight with a brother, assumed sway in 1870. His people were divided into three main sections: the Abezansi (who were the aristocrats), the Abenhla and the Amaholi. The Amaholi or Holi were the inhabitants of the land at the time of the invasion and thereafter were practically in the position of bondsmen and rarely allowed to possess cattle. The great spirit of the Holis was the Mlimo, who was practically the spirit of the nation. Among the Holi tribes are the Abashangwe, the Abanyai, the Batonke (near the Zambezi), the Abananzwa of the Wankie district, the Ababiro of a city district, and the Abasili, a nomadic tribe in the Belingwe district called the Abalemba, which would appear to have been in touch with the Arabs in early times. Their customs include circumcision and the rejection of pork as food.

The natives in Southern Rhodesia number about 700,000, and of these 10,000 work on the mines and 20,000 are engaged in farm, railway and household work under Europeans.

Chief Towns.—Salisbury, which lies 4880 ft. above the sea, is the capital of Southern Rhodesia, being the seat of government, and is situated in the eastern province (Mashonaland). There are about 1700 white inhabitants and 3000 natives. It is the commercial centre for an extensive mining and farming district. The principal buildings include churches, public library, hospital, schools, banks, post office and administrative offices. There are considerable numbers of government offices, and the administrator and resident commissioner live here. The only industries are a brewery and a tobacco factory for grading and packing the tobaccos of the local growers.

Bulawayo (*q.v.*), situated 4469 ft. above the sea, is the largest town and is in the western province, Matabeleland. It is 301 m. by rail S.W. of Salisbury, and 1362 m. N.E. of Cape Town. The population is some 4000 Europeans and about the same number of natives. The town has the advantage of a good pipe water supply and a service of electric light. It was the ancient capital of the Matabele king, Lobengula. There is a Government house which is occasionally occupied, and was the residence of Cecil Rhodes. It is from Bulawayo that the World's View, the burial-place of Rhodes in the Matoppo Hills, is usually visited.

The other towns are Umtali, on the eastern border, pop. 800 whites, railway works, centre of numerous large and small gold mines; Gwelo, the central town, about midway between Salisbury and Bulawayo, 370 whites; Victoria and Melsetter in the south, centres of farming districts. Victoria, near which are the Victoria Zimbabwe ruins, is reached by mail car (80 m.) from Selukwe, and Melsetter by mail cart (95 m.) from Umtali. There are also small townships at Hartley, Selukwe, Enkeldoorn and Gwanda. Bulawayo and Salisbury are managed by town councils, the other towns have village boards.

Communications.—The Rhodesian railway system connects the chief towns and mining centres with one another and all the other South African countries. The main line is a continuation of the railway from Cape Town through Kimberley and Mafeking. It runs from Mafeking in a general N.E. direction to Bulawayo, whence it goes N.W. to the Zambezi, which is crossed a little below the Victoria Falls. The bridging of the river was completed in April 1905. Thence the railway is continued N.E. (92 m.) to Kalomo, Barotseland, and onward to the Katanga district of Belgian Congo. The section from Kalomo to Broken Hill (261 m.) was completed in 1907, and the extension to the Congo frontier (120 m.) in 1909. The main line forms the southern link in the Cape to Cairo railway and steamboat service. From Bulawayo a line goes N.E. by Gwelo to Salisbury and thence S.E. to the Portuguese port of Beira. From Bulawayo another line (200 m. long) in April to the West Nicholson Mine. From Gwelo a railway (40 m.) goes S.E. to Yankee Doodle, and from this there branches a line (50 m. long) in an easterly direction to Blinkwater. From Salisbury a line runs N.W. to Umtagumi (81 m.). The gauge named has a 2 ft. gauge. The other railways are of the standard gauge of South Africa—3 ft. 6 in. The distances from Bulawayo to the following places are:—Gwelo, 113 m.; Salisbury, 301 m.; Umtali, 471 m.; Beira, 675 m.; Mafeking, 490 m.; Kimberley, 713 m.; Cape Town, 1362 m.; Port Elizabeth, 1199 m.; East London, 1260 m.; Bloemfontein, 800 m.; Johannesburg, 931 m.; Pretoria, 977 m.; Lourenço Marques, 1307 m.; Durban, 1238 m. (the last four places all via Fourteen Streams, a junction 48 m. N. of Kimberley), and Victoria Falls, 282 m.

About 4000 m. of roads have been built and are maintained by government. The telegraph and telephone system is now complete, there being for the whole of Rhodesia about 8000 m. of wires. This total includes the police telephone wires and part of the African Transcontinental system, and is served by about ninety telegraph offices. In Southern Rhodesia there are about eighty post offices. A post office savings bank was brought into operation on the 1st of January 1905. Over 2,500,000 letters, post-cards and parcels are despatched annually.

Agriculture.—The country is well adapted for agriculture. Chief attention has been paid by farmers to the growing of maize, the annual produce being about half a million bushels. It is a very easily grown cereal, especially in such a fertile country as Rhodesia, and is extensively grown by natives, but the improved methods of the whites easily secure a yield of from twice to eight times that of the native. The average yield by European farmers is about eight bags of 200 lb per acre, but ten to fifteen bags is quite a common crop. Wheat, barley and oats are grown with success under irrigation in the winter time, but the moisture with attendant rust is too excessive for these crops in summer, and experience seems to be a great source of wealth to the territory. Both the Turkish and Virginian tobaccos have been raised and cured and put on the market, where they were easily disposed of. They are of better quality than those grown elsewhere in South Africa. In 1908 only about 500 acres were under cultivation, but there are large tracts of land suitable for this industry.

Fruits of very extensive variety thrive in Rhodesia; they include plums, bananas, grapes, guavas, papaus, figs, loquats, pine-apples, Cape gooseberries, mulberries, tree tomatoes, rosellas, granadillas, all kinds of citrus fruits. The most flourishing are the citrus fruits and the Japanese plums, but in the higher altitudes apples and pears are also very successful. Vegetables of nearly all kinds can be grown, especially potatoes, tomatoes, asparagus, sweet potatoes, yams, &c. Coffee produces as much as 4 lb of beans to the shrub in certain parts.

Cattle thrive well in Rhodesia, and stock-raising promises to be the chief agricultural industry of the future. During the early period of European occupation rinderpest and at a later date East Coast fever decimated the herds, but the prevention of these diseases is now thoroughly understood and, since the rinderpest of 1896 swept away large herds, cattle have been increasing rapidly in number. There is hardly any portion of the territory which is not suitable for cattle, and the rapid natural increase indicates a speedy prosperity in cattle ranching. Goats and woolless sheep number about 800,000 in the territory. Donkeys and mules thrive, but horses are very liable to horse-sickness towards the end of the rainy season.

Mining.—When Rhodesia was first opened up to European occupation, attention was immediately called to the large number of gold workings made by unknown former inhabitants of the country. These workings were principally on a limited scale, being stopped probably by the presence of water and the lack of suitable machinery. European enterprise has resulted in the discovery of a large number of mines situated in widely scattered areas. The chief mines are in the Gwelo district round the Selukwe and the Wanderer in the Gwelo district; the Giant in the Hartley district; the Jumbo in the Mazoe district; the Ayrshire in the Lomagundi district; the Penhalonga and the Rezende in the Umtali district, while there are numerous smaller mines in the Gwanda, Insiza, Gwelo, Hartley and Umtali districts. The output of gold increased in value from £308,000 in 1900 to £2,623,000 in 1909, about one-third of this being produced by small workers whose individual output is not over 20 oz. a month. As efforts have been restricted mainly to extracting the ore indicated by ancient workings, it is probable that many gold reefs still await discovery. The mineral wealth of Rhodesia is very varied and includes silver, of which 262,000 oz. were produced in 1909; coal, 170,000 tons (1909), and lead, 965 tons. Extensive discoveries of chrome iron have been made in the Selukwe district. There is a steady export of this metal, of which the output in 1909 was over 43,000 tons. Besides these, small quantities of copper, wolframite and diamonds have been exported, while scheelite and asbestos have been discovered in payable quantities.

Commerce.—Taking the average for a series of years ending 1908, the total imports amounted to about £1,500,000 per annum, 55% of which were manufactured articles, including £250,000 textile goods and wearing apparel, and £120,000 machinery. Imports of food and drink amounted to £330,000. In 1909 the imports amounted to £2,214,000, the chief items being food and drink (£422,000), machinery, animals and cotton goods. Exports consist almost entirely of minerals. In 1909 they were valued at £2,154,000. Included in the total is £342,000 goods imported and re-exported.

Administration.—The administration of Rhodesia is carried on by the British South Africa Company under an order in council of 1898, amended by orders in council of 1903 and 1905. The company is called upon to appoint for Southern Rhodesia an administrator or administrators. The company also appoints an executive council of not fewer than four members to advise the administrator upon all matters of importance in administration. An order in council of 1903 provided for a

legislative council consisting of the administrator, who presides, seven nominees of the company approved by the secretary of state, and seven members elected by registered voters (the number of registered voters in 1908 was 5291). In 1907 it was agreed to reduce the company's nominees by one, so that the elected members should form the majority of the council. The secretary of state appoints a resident commissioner, who sits on both executive and legislative councils without vote. The duty of the resident commissioner is to report to the high commissioner upon all matters of importance. Ordinances passed by the legislative council are submitted to the high commissioner for consent or otherwise, but may be disallowed by the secretary of state.

For the administration of justice there is a High Court with two judges having civil and criminal jurisdiction. There are seven magistrates' courts throughout the territory. For the administration of native affairs there are appointed a secretary for native affairs, two chief native commissioners, twenty-eight native commissioners and six assistant native commissioners. Natives suffer no disabilities or restrictions which do not equally apply to Europeans except in respect of the supply of arms, ammunition and liquor. Native commissioners may exercise jurisdiction in native affairs not exceeding that exercisable by magistrates. The company has to provide land, usually termed Native Reserves, sufficient and suitable for occupation by natives and for their agricultural and industrial requirements.

Revenue.—The administrative revenue of Southern Rhodesia was at first much less than the cost of administration. The figures for 1899–1900 were: revenue, £325,000; expenditure, £702,000. Since that date revenue has increased and expenditure decreased, and from 1905–6 (in which year the revenue exceeded £500,000) the cost of administration has been met out of revenue. For 1909–10 the revenue was approximately £600,000, the two main items being customs duty, £190,000, and native tax, £200,000. The native tax is £1 per head for every adult male and 10s. for every wife after the first.

Education.—Besides a few private schools, there were in 1909 34 schools for Europeans, 26 of which were wholly financed by government, the remainder being aided. The aided schools are as a rule connected with some religious body, and aid is given to the extent of half the salaries of teachers and half the cost of school requisites. Loans are also given to assist in school building. A system of boarding grants has been instituted to enable children in the outlying districts to attend school. Education is free except for poor children, but the fees in government schools do not exceed £6 a year. In 1910 several schools had reached the stage of preparing pupils for matriculation at the Cape University and similar examinations. The number of pupils in 1909 in European schools was 1212, being more than double what it had been four years previously. The education of natives is in the hands of various religious bodies, but financial aid is given by government to native schools which comply with certain easy conditions. In 1909, 80 native schools with an enrolment of 7622 pupils earned grants.

Military Forces.—The military force in Southern Rhodesia is styled the British South African Police, and numbers about 40 officers, 400 non-commissioned officers and men, and 550 native police. The force is under a commandant-general, who, with the subordinate officers, is appointed by the secretary of state, and is under the direct control and authority of the high commissioner. The commandant-general is paid by the British parliament. The offices of commandant-general and resident commissioner were combined in 1905.

The Southern Rhodesia Volunteers, in two divisions, eastern and western, under command of colonels, number altogether 86 officers and 1700 non-commissioned officers and men.

Medical.—There are, including cottage hospitals, ten hospitals in towns and townships, and thirteen district surgeries have been established. (G. Du.)

Archaeology.—Between the Zambezi and the Limpopo, and extending from the coast to at least 27° E., may be found the traces of a large population which inhabited Southern Rhodesia and Portuguese East Africa in bygone times. Apart from numerous mines, some of which are being successfully reworked at the present day, ruins of stone buildings have been found in several hundred distinct places. Few of these have been explored systematically, but investigations in 1905, though confined to a small number of sites, determined at least the main questions of date and origin. The fanciful theories of popular writers, who had ascribed these buildings to a remote antiquity, and had even been so audacious as to identify their founders with the subjects of King Solomon or of his contemporary the queen of Sheba, are now seen to be untenable. J. T. Bent's *Ruined Cities of Mashonaland* (1892) is now interesting only for its illustrations, and his theories are obsolete. Positive archaeological evidence demonstrates that the "Great Zimbabwe" itself, the most famous and the most imposing of the misnamed "Ruined Cities," was not built before medieval times, and that the earliest date which can be assigned to any of the sites explored is subsequent to the 11th century A.D. Moreover, the complete identity of custom, revealed no less by the details of the dwellings than by the type of the articles found within them, proves that the tribe that built these structures was one closely akin to if not actually identical with the present Bantu inhabitants of the country.

These ruins, even when stripped of their false romance, are of extreme interest; but their nature and appearance have been much misunderstood, and the skill and intelligence required for their erection have been grossly overestimated. It should be clearly stated, therefore, that the methods of the old Rhodesians evince their complete ignorance of all the devices employed in the architecture of civilized peoples. They have not attempted to solve the problems of supporting weight and pressure by the use of pillar, arch or beam; the ingenuity of the builders goes no further than the dexterous heaping up of stones. Indeed, their most finished and elaborate work must be compared with nothing more ambitious than the dry-built walls which serve to enclose the fields in certain parts of England. The material is the local granite or diorite obtainable in the immediate neighbourhood. Stone-hewing has not been practised; and was unnecessary, since the natural flaking of the boulders provides an abundance of ready-made slabs which need only be detached from the parent rock and broken to the required size. At most the blocks thus obtained have been very roughly trimmed with one or two blows, and any apparent regularity in the fitting has been obtained merely by judicious selection. Mortar has seldom been used; the courses are never laid with any approach to exactness; walls merely abut on one another without being bonded, and the same line often varies greatly in thickness at different parts.

The main principle of the ground plan is invariably circular or elliptical, though it is carried out with a conspicuous lack of symmetry or exactness. Straight lines are unknown, and even accidental approximations to an angle are rare. This is eminently characteristic of the Bantu, whose huts are commonly built in circular form. Indeed, it is the round Bantu hut which has been the original model for even the finest of these stone constructions. The connexion between the two, however, goes beyond mere resemblance. The stone walls are always accompanied by huts; they are mere partitions or ring-fences enclosing and structurally inseparable from platforms of clay or cement on which stand the remains of precisely the same dwellings that the Makalanga make at the present day. Buildings such as those at Dhlo Dhlo, Nanatali and Khami in Matabeleland, or at Zimbabwe in southern Mashonaland, are merely fortified *kraals*; remarkable indeed as the work of an African people, but essentially native African in every detail, not excepting the ornamentation.

The best-known and the most attractive of the Rhodesian ruins are those situated in the more central and southern region. In the north-east, however, the remains are even more numerous, though the single units are less remarkable. Over the whole of Inyanga and the Mazoe region are distributed hill-forts, pit-dwellings and intrenchments which are more primitive in character though of the same generic type as those found farther south. The inhabitants of these northern districts were occupied more in agriculture than in gold-mining, and one of the most striking features of their settlements is the

irrigation system. There are no aqueducts such as Europeans or Arabs might have built, but water furrows have been carried on admirably calculated gradients for miles along the hill-sides. The amount of labour which has been expended on the great villages between Inyanga and the Zambezi is astounding. On one site, the Niekerk Ruins, an area of fully 50 sq. m. is covered with uninterrupted lines of walls. It is an interesting question which may be solved by future explorations whether these settlements do not extend north of the Zambezi. Intrenchments like those of the Niekerk Ruins have been reported from the south-east of Victoria Nyanza, and Major Powell Cotton has published a photograph from the Nandi country which exhibits a structure precisely similar to the hill forts of Inyanga. (See also ZIMBABWE; MONOMOTAPA.)

See D. Randall-MacIver, *Mediaeval Rhodesia* (London, 1906); R. N. Hall and W. G. Neal, *The Ancient Ruins of Rhodesia* (London, 1902); *Zeitschrift für Ethnologie*, 1875 and 1876; *Journal of the R.G.S.*, 1890, 1893, 1899, 1906; *Journal of Anthropl. Inst.*, vols. xxxi., xxxv. (D. R.-M.)

History.—There is evidence that from the 10th or 11th centuries onward the lands now forming Rhodesia were inhabited by Bantu-negroes who had made some progress in civilization and who traded with the Arab settlements at Sofala and elsewhere on the east coast (see *Archaeology* above). From the 15th century, if not earlier, until about the close of the 18th century, a considerable part of this area was ruled by a hereditary monarch known as the Monomotapa, whose *simbabwe* (capital) was, in the earlier part of the period indicated, in what is now Mashonaland. Some of the Monomotapas during the 16th and 17th centuries entered into political and commercial relations with the Portuguese (see MONOMOTAPA and ZIMBABWE). The Monomotapa "empire" included many vassal states, and probably fell to pieces through intertribal fighting, which greatly reduced the number of inhabitants. In the early years of the 19th century the tribes appear to have lost all cohesion. The people were mainly agriculturists, but the working of the gold-mines, whence the Monomotapas had obtained much of their wealth, was not wholly abandoned.

The modern history of the country begins with its invasion by the Matabele, an offshoot of the Zulus. Mosilikatze, their first chief, was a warrior and leader who served under the great Zulu despot Chaka. Being condemned to death by Chaka, Mosilikatze fled, with a large division of the Zulu army. About 1817 he settled in territories north of the Vaal, not far from the site of Pretoria; and in 1836 a treaty of friendship was entered into with him by the governor of Cape Colony. In the same year a number of the "trek Boers" had crossed the Vaal river, and came in contact with the Matabele, who attacked and defeated them, capturing a large number of Boer cattle and sheep. In November 1837 the Boers felt themselves strong enough to assail Mosilikatze, and they drove him and his tribe north of the Limpopo, where they settled and occupied the country subsequently known as Matabeleland. In 1868 Mosilikatze died. Kuruman, son and recognized heir of the old chieftain, had disappeared years before, and though a Matabele who claimed to be the missing heir was brought from Natal he was not acknowledged by the leading indunas, who in January 1870 invested Lobengula, the next heir, with the chieftainship. Those Matabele who favoured the supposed Kuruman were defeated in one decisive battle, and thereafter Lobengula, whose kraal was at Bulawayo, reigned unchallenged. At this time the Matabele power extended north to the Zambezi, and eastward over the land occupied by the Mashona and other Makalanga tribes. North of the Zambezi the western districts were ruled by the Barotse (*q.v.*), while the eastern portion had been overrun by other tribes of Zulu-Xosa origin, among whom the Angoni were the most powerful. The explorations of David Livingstone, Thomas Baines (1822–1875), Karl Mauch, and other travellers, had made known to Europe the general character of the country and the existence of great mineral wealth. Lobengula was approached by several "prospectors" for the grant of concessions; among them two Englishmen, Baines in 1871 and Sir John Swinburne in 1872, obtained cessions of mineral rights, but little effort was made to put them in force. In 1882 President Kruger, who was then bent on extending the boundaries of the Transvaal in every direction, endeavoured to make a treaty with Lobengula, but without success. The Warren expedition of 1884 to Bechuanaland (*q.v.*), while it checked for a time the encroachments of the Transvaal Boers, and preserved to Great Britain the highway to the north through Bechuanaland, also served to encourage colonists to speculate as to the future of the interior. At this time, too, the struggle between the nations of western Europe for the unappropriated portions of Africa had begun, and while the Boers, foiled in Matabeleland, endeavoured to get a footing in Mashonaland, both Portuguese and Germans were anxious to secure for their countries as much of this region as they could. In 1887 a map was laid before the Portuguese cortes showing the territories in Africa claimed by Portugal. They stretched across the continent from sea to sea, and included almost the whole of what is now Rhodesia, as well as the British settlements on Lake Nyasa. To the claim of a transcontinental domain Portugal had succeeded in gaining the assent of Germany and France, though Germany, which had secured a footing in south-west Africa, still dreamed of extending her sway over Matabeleland. By the instructions of Lord Salisbury, then foreign secretary, the British representative at Lisbon informed the Portuguese government that except on the seacoast and on portions of the Zambezi river there was not a sign of Portuguese authority or jurisdiction in the districts claimed by them, and that the British government could not recognize Portuguese sovereignty in territory not effectively occupied by her.

This protest, so far as southern Rhodesia is concerned, might have been ineffective save for the foresight, energy and determination of Cecil Rhodes, who had been instrumental in saving Bechuanaland from the Boers, and who as early as 1878 had conceived the idea of extending British influence over central Africa.[1] At this time gold prospecting was being feverishly undertaken all over South Africa as a result of the discoveries at Barberton and on the Rand, and Lobengula was besieged for all sorts of concessions by both Portuguese and Boers, as well as by other adventurers from all parts of the world. If the country was to be saved for British influence action was necessary. Sir Sidney Shippard, who had succeeded Rhodes as commissioner in Bechuanaland and who shared his views, kept up a friendly correspondence with Lobengula, while at Bulawayo Mr J. S. Moffat was British resident. At the end of 1887 Sir Sidney urged the high commissioner, Lord Rosmead (then Sir Hercules Robinson), to allow him to conclude a treaty with Lobengula, but unavailingly, until Rhodes, by taking upon himself all pecuniary responsibility, succeeded in obtaining the required sanction. On the 11th of February 1888, Moffat and Lobengula signed an agreement, whereby the Matabele ruler agreed that he would refrain from entering into any correspondence or treaty with any foreign state or power without the previous knowledge and sanction of the British high commissioner for South Africa. Shortly after the conclusion of this treaty, representatives of influential syndicates directed by Rhodes, in which Alfred Beit and C. D. Rudd were large holders, were sent, with the knowledge of the British government and the high commissioner, to negotiate with Lobengula, and on the 30th of October of the same year he concluded an arrangement with Messrs Rudd, Rochfort Maguire and F.R. Thomson, by which, in return for the payment of £100 a month, together with 1000 Martini-Henry rifles and 100,000 rounds of ammunition, he gave the syndicate complete control over all the metals and minerals in his kingdom, with power to exclude from his dominions "all persons seeking land, metals, minerals or mining rights therein," in which action, if necessary, he promised to render them assistance. The position of the envoys was one of considerable danger, as Lobengula had around him many white advisers strongly antagonistic to

The country saved for Great Britain.

[1] See article "Bechuanaland" by Sir Henry Shippard in *British Africa* (London, 1899).

Rhodes's scheme. The arrival at Bulawayo of Dr L. S. Jameson, who had previously attended Lobengula professionally, and who strongly supported Rudd and his companions, appears to have been the factor which decided Lobengula to sign the concession. This concession once obtained, Rhodes proceeded with rapidity to prosecute his great enterprise. He extinguished the claims of earlier concessionaires by purchase (giving, for instance, £10,046 for the Baines and Swinburne grants), and united all interests in the British South Africa Company, with a share capital of £1,000,000.

Following the example of Sir George Goldie in West Africa and of Sir William Mackinnon in East Africa, Rhodes determined to apply to the British government for a charter for the newly formed company, whose original directors were, in addition to Rhodes and Beit, the duke of Abercorn, the duke of Fife, Lord Gifford, Albert (afterwards 4th earl) Grey and George Cawston. In applying for a charter (in April 1889) the founders of the company stated their objects to be the following: (1) To extend northwards the railway and telegraph systems in the direction of the Zambezi; (2) to encourage emigration and colonization; (3) to promote trade and commerce; (4) to develop and work minerals and other concessions under the management of one powerful organization, thereby obviating conflicts and complications between the various interests that had been acquired within these regions, and securing to the native chiefs and their subjects the rights reserved to them under the several concessions. In making this application the boundaries in which they proposed to work were purposely left somewhat vague. They were described to be the region of South Africa lying immediately north of British Bechuanaland, north and west of the South African Republic, and west of the Portuguese dominions on the east coast. The government, having ascertained the substantial nature of the company's resources and the composition of the proposed directorate, and also that they were prepared to begin immediately the development of the country, granted the charter, dated the 29th of October 1889. From this date onward the company was commonly known as "the Chartered Company."

The B.S.A. Co.'s charter.

A few points in the charter itself deserve to be noted. In the first place, it gave considerable extension to the terms of the original concessions by Lobengula. In short, it transformed the rights in working minerals and metals, and preventing others from doing so, into rights practically sovereign over the regions in which the company's activity was to be employed. These rights the crown granted directly itself, not merely confirming a previous grant from another source. By Article X. the company was empowered to make ordinances (to be approved by the secretary of state), and to establish and maintain a force of police. A strict supervision was provided for, to be exercised by the secretary of state over the relations between the company and the natives. The British government reserved to itself entire power to repeal the charter at any time that it did not consider the company was fulfilling its obligations or endeavouring duly to carry out the objects for which the charter was granted. The sphere of operations of the company was not stated with any greater precision than had been indicated in the application for the charter; but by agreements concluded with Germany in 1900, with Portugal in 1891 and with the Congo State in 1894, the international boundaries were at length defined (see AFRICA, § 5). The agreements, while they took the British sphere north to Lake Tanganyika, disappointed Rhodes in that they prevented the realization of the scheme he had formed by the time the charter was granted, namely, for securing a continuous strip of British territory from the Cape to Egypt—a scheme which was but an enlargement of his original conception as formulated in 1878.

Much, however, had happened before the boundaries of the British sphere were fixed. While the railway from Cape Town was being continued northward as rapidly as possible, the determination was taken to occupy immediately part of the sphere assigned to the company, and Mashonaland was selected as not being in actual occupation by the Matabele but the home of more peaceful tribes. A pioneer force was sent up in June 1890 under Colonel Pennefather, consisting of five hundred mounted police and a few hundred pioneers. Accompanying this force as guide was the well-known traveller, F. C. Selous. The work of transport was attended with considerable difficulty, and roads had to be cut as the expedition advanced. Nevertheless, in a few months the expedition, without firing a shot, had reached the site of what is now the town of Salisbury, and had also established on the line of march small forts at Tuli, Victoria and Charter. Archibald Ross Colquhoun was chosen as the first administrator. He had not long been in office when, in May 1891, difficulties arose with the Portuguese on their north-west frontier, both parties claiming a tract of territory in which a Portuguese trading station had been established. The result was a skirmish, in which a small company of British South Africa police were victorious. In 1891 Dr Jameson, who had joined the pioneer force, was appointed administrator in succession to Colquhoun. The Boers for several years had been planning a settlement north of the Limpopo, and they now determined, in spite of the Moffat treaty and the British occupation, to carry out their object. An expedition known as the Banyailand Trek was organized under the leadership of Colonel Ferreira, and two large parties of Boers proceeded to the banks of the Limpopo. Information of the intended trek had been conveyed to Cape Town, and Sir Henry (afterwards Lord) Loch (the high commissioner) at once sent a strong protest to President Kruger, informing him that any attempt to invade the Chartered Company's territories would be an act of hostility against the British Crown; and Kruger issued a proclamation forbidding the trekkers to proceed. Meanwhile, however, a party had already reached the Limpopo, where they were met by Jameson in command of the British South Africa Company's forces. He told them that they would not be allowed to proceed except as private individuals, who might obtain farms on application to the Chartered Company. Colonel Ferreira was arrested and detained for a few days, and the expedition then broke up and dispersed.

Mashonaland occupied —A Boer trek prevented.

The pioneers, who were granted farms and mining claims, having been settled in Mashonaland, Rhodes recognized the extreme importance of giving the country a port nearer than that provided by Cape Town. On his initiative proposals were made to Portugal, and the treaty concluded in 1891 between Great Britain and Portugal provided that a railway might be built from Beira in Portuguese territory to Salisbury, on condition that Portugal received a duty not exceeding 3% on the value of the goods imported. The treaty further stipulated for the free navigation of the Zambezi and the construction of telegraphs. Prospecting operations were at once started, and various gold mines were discovered containing traces of old workings. Fresh gold reefs were also opened up. The prospects of the country seemed promising, and although a good deal of fever occurred in the low-lying valleys under the conditions of pioneer life, the health of the community soon improved as more suitable habitations were erected. In two years a white population of 3000 people had settled in the newly opened country.

Though the company was now free from international rivalry it was soon faced by serious native trouble. The first pioneers had deliberately chosen Mashonaland as their place of settlement. Ever since the advent of Mosilikatze north of the Limpopo the unfortunate Mashonas had been the prey of the Matabele; they therefore readily accepted the British occupation. The Matabele, however, were loth to abandon their predatory excursions among the Mashonas, and in July 1893 a large *impi* (native force) was sent into Mashonaland, and entered not only native kraals, but also the streets of the new township of Victoria. An attempt was made to preserve the peace, but it was evident from the attitude taken by the Matabele that nothing short of the authority which only superior force could command would settle the question. The Matabele were

a proud and fearless race of warriors; the men of that generation had never come in conflict with Europeans, and had never been defeated in their conflicts with native foes. Jameson's forces were slender, and Rhodes, on being consulted, urged him by telegram to "Read Luke fourteen, thirty-one." On obtaining a Bible, Jameson read the words: "Or what king, going to make war against another king, sitteth not down first, and consulteth whether he be able with ten thousand to meet him that cometh against him with twenty thousand?" He telegraphed in reply: "All right. I have read Luke fourteen, thirty-one." The position, though dangerous, admitted of no delay, and Jameson determined to risk an expedition with the forces at his command. His success on this occasion doubtless weighed with him on another and less fortunate one. The force available consisted of about 700 volunteers and 225 British Bechuanaland police, with some 700 natives. Jameson determined to march to Bulawayo, the headquarters of Lobengula and the capital of Matabeleland. The force was divided into two columns, and was to be met by a further column of Bechuanas marching from the south under Khama, the most influential of the Bechuan chiefs and a loyal friend of the British. The first engagement took place on the Shangani river, where the two columns which had started from Fort Charter and Fort Victoria were both engaged. Majors Forbes and Allan Wilson commanded in these engagements; and after a hot contest with between 4000 and 5000 Matabele, the latter were repulsed, machine guns being used with terrible effect upon the enemy. On the 1st of November a second fight occurred on the high ground, in which it was estimated that 7000 of the Matabele attacked the laager of the two columns. The oldest and most tried regiments of Lobengula dashed right up to the muzzles of the guns, but were swept down before the modern rifles and machine guns with which the invaders were armed. Meanwhile the column of Khama's men from the south had reached the Tati, and won a victory on the Singuesi river on the 2nd of November. On the 3rd of November Bulawayo was reached, and the columns from Mashonaland, accompanied by Jameson and Sir John Willoughby, entered the town, Lobengula, and his followers being in full flight towards the Zambezi.

Matabeleland conquered. An endeavour was made to induce Lobengula to surrender; but as no replies were received to the messages, Major Forbes, on the 13th of November, organized a column and started in pursuit.[1] The pursuing party were delayed by difficult roads and heavy rains, and did not come up with Lobengula until the 3rd of December. Major Allan Wilson, in command of thirty-four troopers, crossed the Shangani river in advance, and bivouacked close to Lobengula's quarters. In the night the river rose, and reinforcements were unable to join him. During the early morning the Matabele surrounded the little band, and after fighting most gallantly to the last, Major Allan Wilson and all his followers, with the exception of three messengers, who had been sent back, were killed.

In January 1894 Lobengula died—from fever, or as the result of a wound, accounts differ—at a spot about forty miles south of the Zambezi. After his death his *indunas* submitted to the Chartered Company's forces, and the war, which cost the company over one hundred lives and £110,000, was thus ended. An order in council of the 18th of July following defined the administrative power of the company over Matabeleland. Charges were made against the company of having provoked the Matabele in order to bring on the war and thus secure their territory, but after inquiry the company was expressly exonerated from the charge by Lord Ripon, then colonial secretary. With the close of the war the Matabele appeared to be crushed, and for over two years there was no serious trouble with the natives. The country was at once thrown open to white settlers. Close to the site of Lobengula's kraal the new town of Bulawayo was founded, and rapidly grew in importance. Among the new settlers were many Dutch farmers. The Roman-Dutch law was chosen as that of the new colony, a land commission was established and commissioners appointed to look after the interests of the natives.

Considerable development in the part of the company's territory north of the Zambezi had meantime taken place. Between 1889 and 1891 a large number of tribes in the region between lakes Nyasa and Tanganyika and the Zambezi had entered into treaty relations with the company, and a settlement named Abercorn had been founded at the south end of Tanganyika. This work was undertaken in part to forestall German action, as before the signature of the agreement of July 1890 German agents entertained the design of penetrating west of Lake Nyasa to the Congo State frontier. The company further acquired the property of the African Lakes Company—which had done much to secure British predominance in the Nyasa region—and on the organization of Nyasaland as an imperial protectorate the South Africa Company contributed £10,000 a year for three years (1891–92–93) towards the cost of the administration, the imperial commissioner during this period acting as administrator for the adjacent territories belonging to the company (see BRITISH CENTRAL AFRICA). Farther west, Lewanika, the king of the Barotse, signed, on the 27th of June 1890, a treaty placing his country under the protectorate of the Chartered Company, which, while obtaining all mineral rights, undertook not to interfere in the internal administration of Barotseland. In securing a position thus early in Barotseland, Rhodes's aim was to prevent the farther extension eastward of the Portuguese province of Angola. The subsequent development of Barotseland had little direct connexion with the events in other parts of Rhodesia (see BAROTSE and LEWANIKA). The growth of territory and the outlay on Matabeleland led to a great increase of expenditure, and the capital of the company was raised to £2,000,000 in November 1893, and to £2,500,000 in July 1895.

In every step taken by the company the guiding hand was that of Cecil Rhodes, a fact which received recognition when, by a proclamation of the 3rd of May 1895, the company's territory received officially the name of "Rhodesia." During this year there was great activity in exploiting Matabeleland. "Stands" or plots were sold at extraordinary prices in Bulawayo; 539 fetched a total of £153,312, about £285 a stand. In within nine months Bulawayo had a population of 1900 whites, and in the various goldfields there were over 2000 prospectors. The construction of telegraphs proceeded with rapidity and by the end of 1895, 500 m. of new lines had been constructed, making about 1500 in all. A new company, the African Transcontinental Company, had been founded under the auspices of Rhodes, with the ultimate purpose of connecting the Cape with Cairo. By the end of 1895, 133 m. of these lines had been laid. At this time too, the railway from Cape Town had passed Mafeking and was approaching the Rhodesian frontier, while on the east coast the line to connect Salisbury with Beira was under construction.

In November 1895 the crown colony of British Bechuanaland was annexed to Cape Colony, and the Chartered Company desired to take over the administration of the Bechuanaland protectorate, which stretched between the newly annexed portion of Cape Colony and Matabeleland, and through which the railway to Bulawayo had to pass. The British government consented, and arrangements were made for the transfer. The company's police were moved down to a camp in the protectorate at Pitsani Potlogo. It was from this place that on the 29th of December Jameson crossed the Transvaal border and marched on Johannesburg, in his disastrous attempt to upset President Kruger's administration. The "Jameson Raid" put an end to the proposed transfer of the protectorate to the Chartered Company, and caused a serious crisis in its affairs. Rhodes resigned his position as managing director, and Alfred Beit

[1] Lobengula had in fact sent to the Forbes patrol gold dust worth about £1000, and intimated his desire to surrender: but two troopers to whom the gold and message were entrusted kept the gold and suppressed the message. Their crime was afterwards discovered and the troopers sentenced to fourteen years' penal servitude.

retired from the directorate in London. Jameson was, on the 9th of January 1896, officially removed from his office of administrator of the company's territories, and was succeeded by Earl Grey. Just at this time rinderpest made its appearance in southern Rhodesia, carrying off large herds of cattle, and this was followed in March 1896 by a revolt of the Matabele, while in June the Mashona also rebelled. The occasion, but not the cause, of the Matabele rising was the withdrawal of the greater part of the company's force to take part in the Jameson Raid. The Matabele had various grievances, chiefly that after the war of 1893 they were treated as a conquered people. All able-bodied young men were required to work for the white farmers and miners a certain number of months per annum at a fixed rate of pay—a most irksome regulation, enforced, on occasions, by the native police in a tyrannical fashion. Another grievance was the seizure by the company, after the death of Lobengula, of the cattle of the Matabele—their chief source of wealth. Not only was there a first confiscation after the war, but subsequently there was a periodical taking away of cattle in small numbers—the company acting under the belief that nearly all the cattle in Matabeleland belonged to the king and were therefore lawfully theirs. However, before the end of 1895 the company had settled the question in agreement with the indunas, two-fifths of the cattle to go to the company and the remainder to become the absolute property of the natives. But it was neither the action of the company in the confiscation of cattle nor the labour question, that induced the mass of the people to rebel; they were induced to act by chiefs who chafed under their loss of power and position and imagined themselves strong enough to throw off the yoke of the conquerors. In the manner customary among savages the Matabele began hostilities by the murder of defenceless white settlers—men, women and children. Bulawayo was threatened, and soon all the country south of the Zambezi was in a state of rebellion. Imperial troops under Sir Frederick Carrington were hurried up to the assistance of such police as the British South Africa Company still had at its command. Volunteers were enrolled, and much fierce fighting followed. Rhodes hastened to Bulawayo, and after conferences with military and other authorities he determined to go, with Dr Hans Sauer and Mr J. Colenbrander, a well-known hunter and pioneer intimately acquainted with the natives, and interview the chiefs. They went (September 1896) unarmed into the heart of the Matoppo Hills, and there arranged terms of peace with the indunas. The interview involved grave danger to the emissaries, and depended for its success entirely upon Rhodes's personality and influence over the native races, but it terminated what promised to be a long and disastrous native war. The Matabele, whose legitimate grievances were acknowledged and met, ceased the war after the indaba with Rhodes; the Mashona revolt continued, and was not finally crushed until October 1897, though all danger to settlers was over six months previously. At this time the rinderpest had carried off nearly all the cattle in the country—a disaster which, together with the destruction of grain during the war, had brought the natives almost to starvation—and steps had to be taken to supply their needs. Many of the white settlers too were reduced to sore straits and required assistance. The rebellions had cost the company fully £2,500,000, and to meet the debt incurred an additional capital of £1,500,000 was raised in 1898. At the meeting of the company in April 1898, at which this step was taken, Rhodes was re-elected a director.

The rebellions of 1896.

The events of 1896—the Jameson Raid and the rebellions—caused the imperial government to remodel the constitution of Rhodesia. The armed forces of the company had already been placed under the direct control of the crown, and on the 20th of October 1898 an order in council was passed providing for the future regulation of the country. An imperial resident commissioner was appointed, who was also to be *ex officio* a member of the executive and legislative councils; and there was to be a legislative council, consisting of five nominated and four elected members. The first meeting of the newly appointed council took place at Salisbury on the 15th of May 1899. Other changes, in the direction of giving more power to the non-official element, were made subsequently (see above, *Administration*).

While these political changes were being made the company and the settlers set to work to repair the losses by war and plague. In particular the policy of railway development was pushed forward, and in November 1897 the line from Cape Town reached Bulawayo. The Mashonaland railway connecting Salisbury with Beira was completed in May 1899. In the same year gold-mining on a considerable scale began, the output for the year being over 65,000 oz. In the early part of 1899 Rhodes visited London and Berlin in furtherance of his schemes for the transcontinental telegraph extension from Cape Town to Cairo, and the transcontinental railway. He endeavoured to obtain from the British Government the guarantee of a loan for extending the railway, to be raised at 3%, but was unsuccessful. He received, however, the support of various companies in Rhodesia, who amongst them subscribed £252,800 at 3% for the immediate extension of the railway for 150 miles; and in May he stated, at a meeting of the Chartered Company, that the Rhodesia Railways Limited would raise another £3,000,000 at 4%, to be guaranteed by the Chartered Company. In this way he hoped that the remaining 1050 miles of railway from Bulawayo to the frontier of German East Africa might be constructed. In Berlin, Rhodes had an interview with the German Emperor, when arrangements were arrived at for the passage of telegraph lines over German territory, and also in certain contingencies for the continuation of the transcontinental railway through German East Africa.

In many respects the country recovered rapidly from the disasters of 1896, one of the most important measures taken being the compulsory inoculation for rinderpest, which finally stamped out the disease in 1898–99. By the last balance-sheet issued by the company previous to the outbreak of the Boer War it would appear that the revenue of Rhodesia for the year ending the 31st of March 1898 amounted to £260,516 net, of which amount the sale of land plots accounts for £63,628, stamps and licences, £60,638; and posts and telegraphs, £46,745; so that the machinery of civilized life was already in full activity where eight years previously the only white inhabitants had been a few missionaries, hunters and traders. The government buildings were estimated in March 1898 to be worth £165,672, and the assessed value of the town property at Bulawayo was £2,045,000 and that at Salisbury £750,000. (Both those towns had been granted municipal government in 1897.) Education was arranged under the supervision of government inspectors, and various religious communities were also engaged in educational work. The country appeared indeed in 1899 to be starting on the road to industrial and agricultural prosperity, but an almost complete stop to progress resulted from the outbreak of the Boer War in October of that year. The company could point with satisfaction to the fact that Rhodesia contributed nearly 1500 men to the forces serving in the war, 12½% of the European population. Rhodesia itself was not subjected to invasion, but the withdrawal of so large a number of able-bodied men seriously interfered with the development of the country, the war not ending until June 1902. Throughout this period the natives, with few exceptions, remained peaceful and gave the administration no serious trouble.

Agitation for self-government.

Before the war ended, Cecil Rhodes, whose chief work during the period since the Raid had been the building up of the country which bore his name, was dead (26th of March 1902). Alfred Beit, who had in 1898 refused to rejoin the directorate, now consented (June 1902) to return to the board of the Chartered Company, on which he remained until his death in July 1906. The loss of Rhodes's guiding mind and inspiring personality was, however, manifest, and among the Rhodesians there arose

a feeling of discontent at the company's conduct of affairs. The company was willing on proper terms to hand over the administration to the colonists, and they secured the services of Sir George Goldie to examine the situation and report on what terms the transfer could be made. Sir George visited Rhodesia in 1903–4, and drew up a scheme which included the taking over by Rhodesia of the administrative liabilities incurred by the company, which would thus become a public debt. After consultation between leading Rhodesians and the directors of the company the scheme was abandoned, the Rhodesians considering the financial burden proposed too great for an infant colony. The company therefore continued the administration, devoting attention to the development of agriculture and mining. The two railway systems were linked together by a line from Bulawayo to Salisbury, and several short lines to mining properties were built. From Bulawayo the main line was continued to the Wankie coal-fields, thence to the Zambezi, bridged in 1905 just below the Victoria Falls. From the Zambezi the line went north-east, so as to render accessible the mineral wealth of Barotseland and that of Katanga on the Rhodesian-Congo frontier. Although Rhodesia was affected by the commercial depression which prevailed in South Africa for some years after the close of the war, its industries showed considerable vitality. In 1906 the gold output exceeded 500,000 oz., and in the financial year 1905–6 the revenue of Southern Rhodesia slightly exceeded the expenditure.

Only once (1895–96) in the first fifteen years following the settlement of the country had the company's annual revenue exceeded the amount expended in the same period. As a commercial undertaking, the company therefore was during this period of no pecuniary advantage to the shareholders. This was due in part to unforeseen and unavoidable causes, but it is also true that the founders of the company had other than commercial aims. Rhodes's chief ambition was to secure the country for Britain and to open it up to the energies of her peoples, and he succeeded in this aim. He acted more quickly, and in many ways more effectively, than the imperial government would have been able to act had it at the outset taken over the country. To the sturdy colonists Rhodes made available a land rich not only in gold, but in coal and other minerals, and with very great agricultural and pastoral resources, and all this was done without the cost of a penny to the imperial exchequer. Despite all drawbacks, an area (reckoning Southern Rhodesia only) considerably larger than that of the United Kingdom had in less than twenty years been endowed with all the adjuncts of civilization and made the home of thousands of settlers.

The progress made by the country in the five years 1906–10 demonstrated that the faith Rhodes and his colleagues had placed in it was not ill-founded. Although the white population increased but slowly, in all other respects healthy development took place, the element of speculation which had characterized many of the first attempts to exploit the land having largely eliminated. In 1906 Lord Selborne (the high commissioner) visited Rhodesia. He inquired into the various grievances of the settlers against the Chartered Company; held an indaba with Matabele indunas in the Matoppo Hills, and at Bulawayo had a conference with Lewanika, the paramount chief of the Barotse. In 1907 Dr Jameson and other directors of the Chartered Company travelled through Rhodesia, and the result was to clear up some of the matters in dispute between the settlers and the company. Southern Rhodesia had become self-supporting, and the essentially temporary nature of the existing system of government was recognized. But the company held that the time was not yet ripe for Southern Rhodesia to become a self-governing colony. The directors, however, adopted a more liberal land policy, the increased attention given to agriculture being a marked and satisfactory feature of the situation. Mining and railway development were also pushed on vigorously.

The movement for the closer union of the British South African colonies excited lively interest in Southern Rhodesia. The territory, not possessing self-government, could not take part in the national convention which met at Durban in October 1908 on equal terms with the delegates of the Cape, &c. It was, however, represented by three delegates on the understanding that Rhodesia would not, for the time being at least, be included in any agreement which might be reached. The convention resulted in the union (on the 31st of May 1910) under one government of the Cape, Transvaal, Natal and Orange River colonies. The position of Rhodesia with respect to the Union was set forth in the South Africa Act 1909. It provides that "the king, with the advice of the Privy Council, may on addresses from the Houses of Parliament of the Union admit into the Union the territory administered by the British South Africa Company on such terms and conditions as to representation and otherwise in each case as are expressed in the addresses and approved by the king."

In Rhodesia itself at this time there was a widespread feeling that there was no urgency as to the territory joining the Union, and the opinion was held by many that a separate existence as a self-governing community would be preferable. A section of the settlers were content for the present to remain under the government of the Chartered Company.

(A. P. H.; F. R. C.)

RHODIUM [symbol Rh; atomic weight 102·9 (O=16)], in chemistry, a metallic chemical element found, associated with the other elements of the platinum group, in crude platinum ore, wherein it was discovered in 1803 by W. H. Wollaston (*Phil. Trans.*, 1804, p. 419). It may be obtained from the residues of platinum ore after treatment with aqua regia and removal of the platinum as chlorplatinate. The mother liquors are decomposed by treatment with metallic iron, the precipitate obtained being warmed with concentrated nitric acid and heated in an iron crucible with concentrated caustic potash. The residue thus obtained is mixed with salt and

[1] Unless otherwise stated, the place of publication is London.

heated in a current of chlorine, any iridium present being converted into its chloride by treatment with nitric acid and precipitated by ammonium chloride, whilst rhodium ammonium chloride goes into solution with its characteristic rose-red colour (C. E. Claus, *Jour. prakt. Chem.*, 1843–1845). For other methods of extraction see Gibbs, ib., 1861, 84, p. 65; 1865, 94, p. 10; T. Wilm, *Bull. soc. chim.*, 1880 (2), 34, p. 679; E. Frémy, *Comptes rendus*, 1854, 38, p. 1008, &c.). The metal itself is best obtained by the reduction of chlorpurpureo rhodium chloride, $(Cl_2Rh_2{\cdot}10NH_3){\cdot}Cl_4$, in a current of hydrogen, the metal after reduction being cooled in a stream of carbon dioxide (S. M. Jorgensen, *Zeit. anorg. Chem.*, 1903, 34, p. 82). It somewhat resembles aluminium in colour; its specific gravity varies from 11·10 to 12; and its specific heat is 0·0527 (V. H. Regnault, *Ann. chim. phys.*, 1861, 63, p. 15). It is less fusible than platinum. It oxidizes superficially when heated, and may be distilled in the electric furnace. It is insoluble in acids, but forms a soluble sulphate when fused with potassium bisulphate (a reaction which distinguishes it from the other metals of the platinum group). It oxidizes when fused with potassium hydroxide and potassium nitrate, to the dioxide, RhO_2. It absorbs hydrogen readily. Rhodium black is obtained by reducing rhodium salts with formic acid; by alcohol in the presence of alkali; or by precipitation with zinc and iron. A colloidal rhodium may be prepared by reducing the sesquichloride with hydrazine hydrate. Rhodium salts may be recognized by the characteristic reaction with freshly prepared sodium hypochlorite solution. A yellow precipitate is obtained, which on shaking for some time with acetic acid gradually dissolves to an orange-coloured solution. This solution after a short time deposits a grey precipitate, and the supernatant liquid becomes azure blue in colour (E. Demarçay, *Comptes rendus*, 1885, 101, p. 951).

Several oxides of rhodium are known. The monoxide, RhO, formed when the hydrated sesquioxide is heated (Claus) or when finely divided rhodium is heated in a current of air (Wilm), is a grey powder which is insoluble in acids. The sesquioxide, Rh_2O_3, is a black insoluble powder, formed when the corresponding hydrate is heated. This hydrate, $Rh_2(OH)_6$, is obtained as a yellow powder, by decomposing rhodium salts (not the sulphate)with dilute solutions of the caustic alkalis. It is soluble in acids, and in the moist condition is also soluble in concentrated alkalis. A hydrated rhodium dioxide, $RhO_2{\cdot}2H_2O$, is formed when chlorine is passed into a solution of the sesquioxide in concentrated caustic potash, or by adding an alkaline hypochlorite to a concentrated alkaline solution of rhodium and sodium chlorides. It is a greenish-black powder which is soluble in hydrochloric acid. Rhodium chloride, Rh_2Cl_6, is obtained impure by heating the metal to dull redness in a current of chlorine, or, purer, by heating an alloy of rhodium and tin in chlorine or by heating the double ammonium rhodium chloride in chlorine at 440° C. (E. Leidié, *Ann. chim. phys.*, 1889, (6), 17, p. 265; *Comptes rendus*, 1899, 129, p. 1249). It is a red powder, which decomposes at a red heat, leaving a residue of the metal. It is insoluble in water and acids, but dissolves in concentrated solutions of potassium cyanide. The hydrated form $Rh_2Cl_6{\cdot}8H_2O$ is obtained impure by dissolving the hydrated sesquioxide in hydrochloric acid, by the action of hydrofluosilicic acid on potassium rhodium chloride, and by the action of chlorine on rhodium in the presence of sodium chloride. In the last method the product is dissolved in a dilute hydrochloric acid (1:1), and the solution saturated with hydrochloric acid gas at 0°, allowed to stand for some time, decanted, and finally evaporated in vacuo (Leidié, *loc. cit.*). It forms a very deliquescent, red, amorphous mass, which decomposes on exposure. It is very soluble in water, forming a yellow solution. It forms double salts with the alkalium chlorides.

Rhodium monosulphide, RhS, is formed when rhodium or rhodium ammonium chloride are heated with sulphur, and also by precipitating rhodium salts with sulphuretted hydrogen, the precipitate being dissolved in ammonium sulphide and thrown down again by dilute sulphuric acid (Lecoq de Boisbaudran, *Ber.*, 1883, 16, p. 579). It is a dark-coloured powder which is insoluble in acids and other solvents. It loses all its sulphur when heated in air. The sesquisulphide, Rh_2S_3, is prepared by heating anhydrous rhodium chloride, Rh_2Cl_6, in a current of sulphuretted hydrogen at 360° C., or by passing the gas into a boiling solution of the chloride. It is a black powder which is insoluble in acids and in alkaline sulphides. It decomposes when strongly heated. Rhodium sulphate, $Rh_2(SO_4)_3$, is prepared by oxidizing the sulphide, by fusing the metal with acid potassium sulphate, or by the action of concentrated sulphuric acid on an alloy of rhodium and lead, or on the hydrated sesquioxide. It is a red powder which decomposes when heated or when boiled with much water. It forms alums (Leidié, *Comptes rendus*, 1888, 107, p. 234). Rhodium potassium alum, $Rh_2(SO_4)_3{\cdot}K_2SO_4{\cdot}24H_2O$, is obtained by dissolving the sesquioxide in sulphuric acid and adding two-thirds of the calculated amount of potassium sulphate to the solution (A. Piccini and L. Marino, *Zeit. anorg. Chem.*, 1901, 27, p. 62). It crystallizes in cubes. Rhodium cyanide, $Rh_2(CN)_6$, is a carmine-red powder formed when rhodium potassium cyanide is boiled with acetic acid. Rhodium potassium cyanide, $K_6Rh_2(CN)_{12}$, is formed when the sesquioxide is dissolved in caustic potash and an excess of hydrocyanic acid added gradually, the solution being then evaporated in vacuo. It is a colourless crystalline solid soluble in water, and isomorphous with the corresponding iron, cobalt, chromium and manganese compounds.

The rhodium ammonia salts correspond almost with the similar cobalt compounds and may be divided into three series—namely, luteo-rhodium salts (luteo-salts), $[Rh(NH_3)_6]X_3$; aquopentammine salts (roseo-salts), $[Rh(NH_3)_5{\cdot}H_2O]X_3$; and pentammine salts (purpureo-salts), $[Rh(NH_3)_5X]X_2$. (See S. F. Jorgensen, C. W. Blomstrand, *Jour. prak. Chem.*, 1882, et seq.)

The atomic weight of rhodium has been determined by S. F. Jorgensen (*Jour. prakt. Chem.*, 1883, 27, p. 486), by the analysis of chlorpurpureo rhodium chloride, the mean value obtained being 103; whilst K. Seubert and K. Kobbé (*Ann.*, 1890, 260, p. 314), by analysis of the double chloride and sulphate, obtained as a mean value 102·86.

RHODOCHROSITE, a mineral species consisting of manganese carbonate, $MnCO_3$, crystallizing in the rhombohedral system and isomorphous with calcite. It usually occurs as cleavable, compact or botryoidal masses, distinct crystals being somewhat rare; these often have the form of the primitive rhombohedron, parallel to the faces of which there are perfect cleavages. When pure, the mineral contains 47·7% of manganese, but this is usually partly replaced by varying amounts of iron, and sometimes by calcium, magnesium, zinc, or rarely cobalt (cobalt-manganese-spar). With these variations in chemical composition the specific gravity varies from 3·45 to 3·60; the hardness is 4. The colour is usually rose-red, but may sometimes be grey to brown. The name rhodochrosite, from the Greek *ῥόδο-χροος* (rose-coloured), has reference to the characteristic colour of the mineral: manganese-spar and dialogite are synonyms. It is found in mineral veins with ores of silver, lead, copper, &c., or in deposits of manganese ore. Crystals have been met with in the mines at Kapnik-Bánya and Nagyág near Déva in Transylvania and at Diez in Nassau, but by far the best specimens are from Colorado. The mineral is used to a limited extent in the manufacture of spiegeleisen and ferromanganese.

RHODODENDRON. Classical writers, such as Dioscorides and Pliny, seem, from what can be ascertained, to have called the oleander (*Nerium Oleander*) by this name, but in modern usage it is applied to a large genus of shrubs and trees belonging to the order of heaths (Ericaceae). No adequate distinction can be drawn between this genus and *Azalea* (*q.v.*)—the proposed marks of distinction, however applicable in particular cases, breaking down when tested more generally. The rhododendrons are trees or shrubs, never herbs, with simple, evergreen or deciduous leaves, and flowers in terminal clusters surrounded in the bud by bud-scales but not as a rule by true leaves. The flowers are remarkable for the frequent absence or reduced condition of the calyx. The funnel- or bell-shaped corolla, on the other hand, with its five or more lobes, is usually conspicuous, and in some species so much so as to render these plants greatly prized in gardens. The free stamens are usually ten, with slender filaments and anthers opening by pores at the top. The ovary is five- or many-celled, ripening into a long woody pod which splits from top to bottom by a number of valves, which break away from the central placenta and liberate a large number of small branlike seeds provided with a membranous wing-like appendage at each end. The species are for the most part natives of the mountainous regions of the northern hemisphere, extending as far south as the Malay Archipelago and New Guinea, but not hitherto found in South America or Australia. None are natives of Britain. They vary greatly in stature, some of the alpine species being mere pygmies with minute leaves and tiny blossoms, while some of the Himalayan species are moderate-sizes trees with superb flowers. Some are

epiphytal, growing on the branches of other trees, but not deriving their sustenance from them. The varieties grown in gardens are mostly grafted on the Pontic species (*R. ponticum*) and the Virginian *R. catawbiense*. The common Pontic variety is excellent for game-covert, from its hardiness, the shelter it affords, and the fact that hares and rabbits rarely eat it. Variety of colour has been infused by crossing or hybridizing the species first named, or their derivatives, with some of the more gorgeously coloured Himalayan-American varieties. In many instances this has been done without sacrifice of hardihood.

Some of the finest hybrids for the open air, especially in favoured spots, are *dauderense* (scarlet); *Harrisi* (rosy crimson); *Keawne* (rose); *Luscombei* (rose-pink); *Manglesi* (white); *nobleanum* (crimson), one of the first to flower after Christmas; *praecox* (rose-purple); and *Shilsoni* (crimson). There are almost countless colour variations of these, but one of the most exquisite of late years is that known as *Pink Pearl*, with large clear rosy-pink blossoms of great purity. What are termed greenhouse rhododendrons are derivatives from certain Malayan and Javanese species, and are consequently much more tender. They are characterized by the possession of a cylindrical (not funnel-shaped) flower-tube and other marks of distinction. The foliage of rhododendrons contains much tannin, and has been used medicinally. Whether the honey mentioned by Xenophon as poisonous was really derived from plants of this genus as alleged is still an open question.

Cultivation.—The hardy evergreen kinds are readily propagated by seed, by layers, and by grafting. Grafting is resorted to only for the propagation of the rarer and more tender kinds. Loamy soil containing a large quantity of peat or vegetable humus is essential, the roots of all the species investigated being associated with a fungus partner in mycorrhiza. An excess of lime or chalk in the soil proves fatal to rhododendrons and these allies sooner or later—a fact overlooked by many amateurs. The hardy deciduous kinds are valuable for forcing, and withstand cold-storage treatment well. The tender Malayan and Javanese species thrive in warm greenhouse temperature, but are difficult to cultivate where the water is very alkaline.

RHODONITE, a member of the pyroxene group of minerals, consisting of manganese metasilicate, $MnSiO_3$, and crystallizing in the anorthic system. It commonly occurs as cleavable to compact masses with a rose-red colour; hence the name, from the Greek *ῥόδον* (a rose). Crystals often have a thick tabular habit; there are perfect cleavages parallel to the prism faces with an angle of 85° 31′. The hardness is 5½–6½, and the specific gravity 3·4–3·68. The manganese is often partly replaced by iron and calcium, which may sometimes be present in considerable amounts; a greyish-brown variety containing as much as 20% of calcium oxide is called "bustamite"; "fowlerite" is a zinciferous variety containing 7% of zinc oxide. Rhodonite is a mineral liable to alteration, with the formation of manganese carbonate, hydrous silicate or oxides. The compact material, which is cut and polished for ornamental purposes, is often marked in a striking manner by veins and patches of these black alteration products. At Syedelnikova, near Ekaterinburg in the Urals, compact material of a good colour occurs in a clay-slate and is extensively quarried: boulders of similar material found at Cummington in Massachusetts ("cummingtonite") have also been worked as an ornamental stone. In the iron and manganese mines at Pajsberg in Filipstadt and Långban in Vermland, Sweden, small brilliant and translucent crystals ("pajsbergite") and cleavage masses occur. Fowlerite occurs as large, rough crystals, somewhat resembling pink felspar, with franklinite and zinc ores in granular limestone at Franklin Furnace in New Jersey.

RHOECUS, a Samian sculptor of the 6th century B.C. He and his son Theodorus were especially noted for their work in bronze. Herodotus says that Rhoecus built the temple of Hera at Samos. In the temple of Artemis at Ephesus was a marble figure of night by Rhoecus. His name has been found on a fragment of a vase which he dedicated to Aphrodite at Naucratis. His sons Theodorus and Telecles made a statue of the Pythian Apollo for the Samians.

RHONDDA (formerly YSTRADFODWG), an urban district and parliamentary division of Glamorganshire, South Wales. It is 12 m. long by about 4¼ m. across at its widest part, and comprises two main valleys, named after their respective rivers, Rhondda Fawr (9¾ m.) and Rhondda Fach, or the lesser (6¼ m.), running S.E. and S.W. respectively till their junction at Porth, and thence the single valley for upwards of a mile farther down the boundary of the Pontypridd urban district at Trehafod. The valleys are narrow and tortuous, and their lateral boundaries are formed by steep hills varying in height from about 560 ft. on either side of Trehafod to 1340 ft. on the N.E. of Maerdy in the lesser Rhondda and 1742 ft. on the S.W. of Treherbert in the main valley, while the mountains at the upper end of the latter valley culminate in Carn Moesen (1950 ft.). The two valleys are separated by the steep ridge of Cefn-rhondda, which ranges from 600 ft. high above Porth to 1690 ft. near the upper end of the district. There are a few tributary valleys of which Cwmparc, Clydach Vale and Cymmer are the chief. Though the urban district measures 23,884 acres, the area built upon is generally a narrow strip on either side of each river except at Treorky and Ton, where the valley of the Rhondda Fawr opens out a little. In 1877 the ancient parish of Ystradyfodwg (with the omission of the township of Rhigos, which lies beyond the mountains to the north) was formed into an urban district bearing the parish name, the area having previously been part of a rural district under the Pontypridd rural sanitary authority. In October 1879, portions of the parishes of Llanwonno and Llantrisant, comprising over 5000 acres, were added to the urban area, the whole being consolidated in 1894 into one civil parish. In 1897, the name of the urban district was changed into Rhondda. The Taff Vale railway runs up each of the two valleys from a junction at Porth (16 m. N.W. of Cardiff), and has five stations in the main valley and four in the lesser one. From Porth it runs to Pontypridd, whence there is communication with Cardiff, Barry and Newport. The Rhondda and Swansea Bay railway (authorized in 1882, opened in 1890, and now worked by the Great Western) connects the upper end of the main valley, where it has a station, Blaen-rhondda, with Port Talbot, Neath and Swansea (31 m. distant) by means of a line which has a tunnel 3443 yds. long.

The district occupies almost the centre of the eastern division of the South Wales coal-field, and its coal, upon which the inhabitants are almost entirely dependent, is unsurpassed for its steam-raising properties. In common with other East Glamorgan coal it became commercially known as Cardiff coal from the fact that Cardiff was at first its only port of shipment. The development of the Rhondda coal-field was later in date than those of Aberdare and Merthyr, and it received its chief impetus from the American Civil War. Thus the population of the parish (excluding Rhigos), which was 576 in 1811, 951 in 1851 and 3035 in 1861, increased to 16,914 in 1871. When the boundaries of the district were extended in 1879 the population of the enlarged area was calculated by the registrar-general to be 23,950 in 1871, but it reached 55,632 in 1881, and 113,735 in 1901, showing an increase of 104% in the previous twenty years. In 1901, 35·4% of the population of three years of age and upwards spoke English only, 11·4% spoke Welsh only, the remainder being bilingual.

Ecclesiastically the parish of Ystradyfodwg was an ancient chapelry dependent on Llantrisant. The old parish church at Ton Pentre (in substitution for which a new church was built in 1893–94) served the whole parish till past the middle of the 19th century. Between 1879 and 1900 the ancient parish (excluding Rhigos) was divided into seven ecclesiastical parishes, the six new ones being Llwyn-y-pia (1879), Tylorstown (1887), Ynyshir (1887), Treherbert (1893), Cwmparc (1898) and Ferndale (1900). The additional area brought into the urban district in 1879 comprises two other ecclesiastical parishes, Cymmer and Porth (1894), and Dinas and Penygraig (1901). These nine parishes, comprised in the urban district, have twenty churches and eighteen mission-rooms, with accommodation for about 12,000 persons. This area, together with Pontypridd, Glyntaff and Llanwonno, form the rural deanery of Rhondda in the archdeaconry and diocese of Llandaff. There were at the end of 1905 over one hundred and fifty nonconformist chapels and mission rooms, with accommodation for over 85,000 persons, of which provision nearly two-thirds was in chapels with Welsh services. There is a Roman Catholic church at Tonypandy. The public buildings include the council house and offices of the district council, erected in 1883–84 for the local board at Pentre, libraries and workmen's institutes at Ystrad (1895), and Cymmer

(1893), Maerdy (1905), Dinas (1893), and Ferndale public halls, the property of a private company at Treherbert (1872), and Tonypandy (1891) and a county intermediate school at Porth. By means of a tunnel about 2100 yds. long water is obtained for the greater part of the main valley from the lake of Llyn Fawr on the Neath side of the mountain range which shuts in the valley on the north. This lake has been converted into a storage reservoir of about 167 million gallons capacity. The rest of the district is supplied from the Pontypridd Water Company's works above Maerdy in the lesser valley.

The ancient parish (excluding Rhigos) was formed into a parliamentary constituency with one member in 1885. The present urban district substantially corresponds to the ancient territorial division of Glyn-rhondda, one of the four commotes of the cantred of Penychen, and subsequently, in Norman times, one of the twelve "members" of the lordship of Glamorgan. Its Welsh lords enjoyed a large measure of independence and had their own courts, in which Welsh law was administered down to 1535, when the lordship was fully incorporated in the county of Glamorgan. On the ridge of Cefn-rhondda between the two valleys was the Franciscan monastery of Penrhys, famous for its image of the Virgin and for its holy well which attracted large pilgrimages. It was dissolved about 1415, probably owing to its having supported Glyndwr in his rebellion. Edward II. came here from Neath Abbey and was captured on the 16th of November 1326, either at Penrhys, or between it and Llantrisant. (D. Ll. T.)

RHONE (Fr. *Rhône*, Lat. *Rhodanus*), one of the most important rivers in Europe, and the chief of those which flow directly into the Mediterranean. It rises at the upper or eastern extremity of the Swiss canton of the Valais, flows between the Bernese Alps (N.) and the Lepontine and Pennine Alps (S.) till it expands into the Lake of Geneva, winds round the southernmost spurs of the Jura range, receives at Lyons its principal tributary, the Saône, and then turns southward through France till, by many mouths, it enters that part of the Mediterranean which is rightly called the Golfe du Lion (sometimes wrongly the Gulf of Lyons). Its total length from source to sea is 504½ m. (of which the Lake of Geneva claims 45 m.), while its total drainage area in 37,798 sq. m., of which 2772 sq. m. are in Switzerland (405 sq. m. of the Swiss portion being composed of glaciers), and its total fall 5808 ft. Its course (excluding the Lake of Geneva, *q.v.*) naturally falls into three divisions: (1) from its source to the Lake of Geneva, (2) from Geneva to Lyons, and (3) from Lyons to the Mediterranean.

1. From its source to the lake the Rhone is a purely Alpine river, flowing through the great trench which it has cut for itself between two of the loftiest Alpine ranges, and which (save a bit at its north-west end) forms the Canton of the Valais. Its length is 105¾ m., while its fall is 4679 ft. It issues as a torrent, at the height of 5909 ft., from the great Rhone glacier at the head of the Valais, the recent retreat of this glacier having proved that the river really flows from beneath it, and does not take its rise from the warm springs that are now at some distance from its shrunken snout. It is almost immediately joined on the left by the Mutt torrent, coming from a small glacier to the S.E., and then flows S.W. for a short distance past the well-known Gletsch Hotel (where the roads from the Grimsel and the Furka Passes unite). But about half a mile from the glacier the river turns S.E. and descends through a wild gorge to the more level valley, bending again S.W. before reaching the first village, Oberwald. It preserves this south-westerly direction till Martigny. The uppermost valley of the Rhone is named Goms (Fr. *Conches*), its chief village being Münster, while Fiesch, lower down, is well known to most Swiss travellers. As the river rolls on, it is swollen by mountain torrents, descending from the glaciers on either side of its bed—so by the Geren (left), near Oberwald, by the Eginen (left), near Ulrichen, by the Fiesch (right), at Fiesch, by the Binna (left), near Grengiols, by the Massa (right), flowing from the great Aletsch glaciers, above Brieg. At Brieg the Rhone has descended 3678 ft. from its source, has flowed 28 m. in the open, and is already a considerable stream when joined (left)by the Saltine, descending from the Simplon Pass. Its course below Brieg is less rapid than before and lies through the alluvial deposits which it has brought down in the course of ages. The valley is wide and marshy, the river frequently overflowing its banks. Further mountain torrents (of greater volume than those higher up) fall into the Rhone as it rolls along in a south-westerly direction towards Martigny: the Visp (left), coming from the Zermatt valley, falls in at Visp, at Gampel the Lonza (right), from the Lötschen valley, at Leuk the Dala (right), from the Gemmi Pass, at Sierre the Navizen (left), from the Einfisch or Anniviers valley, at Sion, the capital of the Valais, the Borgne (left) from the Val d'Hérens; soon the Rhone is joined by the Morge (right), flowing from the Sanetsch Pass, and the boundary in the middle ages between Episcopal Valais to the east and Savoyard Valais to the west, and at Martigny by the Dranse (left) its chief Alpine tributary, from the Great St Bernard and the Val de Bagnes. At Martigny, about 50 m. from Brieg, the river bends sharply to the N.W., and runs in that direction to the Lake of Geneva. It receives the Salanfe (left), which forms the celebrated waterfall of Pissevache, before reaching the ancient town and abbey of St Maurice (½m.). Henceforward the right bank is in the canton of Vaud (conquered from Savoy in 1475) and the left bank in that of the Valais (conquered similarly in 1536), for St Maurice marks the end of the historical Valais. Immediately below that town the Rhone rushes through a great natural gateway, a narrow and striking defile (now strongly fortified), which commands the entrance of the Valais. Beyond, the river enters the wide alluvial plain, formerly occupied by the south-eastern arm of the Lake of Geneva, but now marshy and requiring frequent "correction." It receives at Bex the Avançon (right), flowing from the glaciers of the Diablerets range, at Monthey the Vièze (left), from Champéry and the Val d'Illiez, and at Aigle the Grande Eau (right), from the valley of Ormonts-dessus. It passes by the hamlet of Port Valais, once on the shore of the lake, before expanding into the Lake of Geneva, between Villeneuve (right) and St Gingolph (left). During all this portion of its course the Rhone is not navigable, but a railway line runs along it from Brieg in about 72 m. to either Villeneuve or Le Bouveret.

2. On issuing at Geneva from the lake the waters of the Rhone are very limpid and blue, as it has left all its impurities in the great settling vat of the lake, so that Byron might well speak of the "blue rushing of the arrowy Rhone" (*Childe Harold*, canto iii. stanza 71). But about half a mile below Geneva this limpidity is disturbed by the pouring in of the turbid torrent of the Arve (left), descending from the glaciers of the Mont Blanc range, the two currents for some distance refusing to mix. The distance from Geneva to Lyons by the tortuous course of the Rhone is about 124 m., the fall being only about 689 ft. The characteristic feature of this portion of the course of the Rhone is the number of narrow gorges or *cluses* through which it rushes, while it is forced by the southern spur of the Jura to run in a southerly direction, till, after rounding the base of that spur, it can flow freely westwards to Lyons. About 12 m. S. of Geneva the Rhone enters French territory, and henceforth till near Lyons forms first the eastern, then the southern boundary of the French department of the Ain, dividing it from those of Haute Savoie and Savoie (E.) and that of the Isère (S.). Soon after it becomes French the river rushes furiously through a deep gorge, being imprisoned on the north by the Crédo and on the south by the Vuache, while the great fortress of l'Écluse guards this entrance into France. The railway pierces the Crédo by a tunnel. In the narrowest portion of this gorge, not far from Bellegarde at its lower end, there formerly existed the famous *Perte du Rhône* (described by Saussure in his *Voyages dans les Alpes*, chapter xvii.), where for a certain distance the river disappeared in a subterranean channel; but this natural phenomenon has been destroyed, partly by blasting, and partly by the diversion of the water for the use of the factories of Bellegarde. At Bellegarde the Valserine flows in (right), and then the river resumes its southerly direction, from which the great gorge had deflected it for a while. Some way below Bellegarde, between Le Parc and Pyrimont, the

Rhone becomes officially "navigable," though as far as Lyons the navigation now consists all but wholly of the floating of flat-bottomed boats, named *rigues*, laden chiefly with stone quarried from the banks of the river. Above Seyssel (11 m. from Bellegarde) the Usses (left) joins the Rhone, while just below that village the Fier (left) flows in from the Lake of Annecy. Below the junction of the Fier the hills sink on either side, the channel of the river widens, and one may say that it leaves the mountains for the plains. At Culoz (41¼ m. by rail from Geneva) the railway from Geneva to Lyons (105 m.) quits the Rhone in order to run west by a direct route past Ambérieu. The Rhone continues to roll on southwards, but no longer (as no doubt it did in ancient days) enters the Lac du Bourget, of which it receives the waters through a canal, and then leaves it on the east in order to run along the foot of the last spur of the Jura. It flows past Yenne (left) and beneath the picturesque fortress (formerly a Carthusian monastery) of Pierre Châtel (right) before it attains the foot of the extreme southern spur of the Jura, at a height of 696 ft., not far from the village of Cordon, and just where the Guiers flows in (left) from the mountains of the Grande Chartreuse. This is nearly the last of the *cluses* through which the river has to make its way. The very last is at the Pont du Saut or Sault, a little S. of Lagnieu. The river now widens, but the neighbouring country is much exposed to inundations. It receives (right) its most important tributary in this part of its course, the Ain, which descends from the French slope of the Jura and is navigable for about 60 m. above its junction with the Rhone. Farther south the Rhone meanders for a time with shifting channels in a bed about 2 m. broad, but it gathers into a single stream before its junction with the Saône, just below Lyons. The Saône (*q.v.*), which has received (left) the Doubs, is the real continuation of the Rhone, both from a geographical and a commercial point of view, and it is by means of canals branching off from the course of the Saône that the Rhone communicates with the basins of the Loire, the Seine, the Rhine and the Moselle. In fact, up to Lyons, the Rhone (save when it expands into the Lake of Geneva) is a huge and very unruly mountain torrent rather than a great European river.

3. Below Lyons, however, the Rhone becomes one of the great historical rivers of France. It was up its valley that first Greek, then Latin civilization penetrated from the Mediterranean to Lyons, as well as in the 10th century the Saracen bandits from their settlement at La Garde Freinet, near the coast of Provence. Then, too, from Lyons downwards, the Rhone serves as a great medium of commerce by which central France sends its products to the sea. Its length from Lyons to the sea is some 230 m., though its fall is but 530 ft. But during this half of its course it can boast of having on its left bank (the right bank is very poor in this respect) such historical cities as Vienne, Valence, Avignon, Tarascon and Arles, while it receives (left) the Isère, the Drôme and the Durance rivers, all formed by the union of many streams, and bringing down the waters that flow from the lofty snowy Dauphiné Alps. The Ardèche is the only considerable affluent from the right. Near Arles, about 25 m. from the sea, and by rail 175¼ m. from Lyons, the river breaks up into its two main branches, the Grand Rhone running S.E. and the Petit Rhone S.W.; they enclose between them the huge delta of the Camargue, which is cultivated on the banks of the river only, but elsewhere is simply a great alluvial plain, deposited in the course of ages by the river, and now composed of scanty pasturages and of great salt marshes. Between Lyons and the sea, the Rhone divides four departments on its right bank (Rhône, Loire, Ardèche and Gard) from as many on its left bank (Isère, Drôme, Vaucluse and Bouches du Rhône).

Consult in general Ch. Lenthéric, *Le Rhône—histoire d'un fleuve*, 2 vols. (Paris, 1892). (W. A. B. C.)

RHÔNE, a department of south-eastern France, formed in 1793 from the eastern portion of the department of Rhône-et-Loire, and comprising the old districts of Beaujolais, Lyonnais, Franc-Lyonnais, Forez and a small portion of Dauphiné. Pop. (1906) 858,907. Area, 1104 sq m. Rhône is bounded N. by the department of Saône-et-Loire, E. by Ain and Isère and S. and W. by Loire. The Saône and the Rhone form its natural boundary on the east. The department belongs almost entirely to the basin of the Rhone, to which it sends its waters by the Saône and its tributary the Azergues, and by the Gier. The mountains which cover the surface of the department constitute the watershed between the Rhone and the Loire, and from north to south form four successive groups—the Beaujolais Mountains, the highest peak of which is 3320 ft.; the Tarare group; the Lyonnais Mountains (nearly 3000 ft.); and Mont Pilat, the highest peak of which belongs to the department of Loire. The lowest point of the department (460 ft. above sea-level) is at the egress of the Rhone. The meteorological conditions vary greatly with the elevation and exposure. Snow sometimes lies in the mountains from November to April, while at Lyons and in the valleys the mean temperature in winter is 36° F. and in summer 70°, the annual mean being 53°. The average rainfall is somewhat higher than is general over France owing to the amount of the precipitation on the hilly region.

Good agricultural land is found in the valleys of the Saône and Rhone, but for the most part the soil is stony and only moderately fertile. Wheat, oats, rye and potatoes are extensively cultivated, but their importance is less than that of the vine, the hills of the Beaujolais on the right bank of the Saône producing excellent wines. Fruit trees, such as peaches, apricots, walnuts and chestnuts, grow well, but the wood in general is little more than copse and brushwood. Good pasture is found in the valleys of the Azergues and its affluents. Mines of iron-pyrites and coal and quarries of freestone are worked. The production of silk fabrics, the chief branch of manufacture, that of chemicals and machinery, together with most of the other industries of the department, are concentrated in Lyons (*q.v.*) and its vicinity. Tarare is a centre for the manufacture of muslin and embroidery. Oullins has large railway workshops belonging to the Paris-Lyon-Méditerranée railway, and there are important glass works at Givors. Cotton-spinning and weaving are carried on in several localities. The products of its manufactures, together with wine and brandy, form the bulk of the exports of the department; its imports comprise chiefly the raw material for its industries. It is served by the Paris-Lyon railway. The Rhone and the Saône and in the extreme south the canal of Givors are its navigable waterways. Lyons the capital is the seat of an archbishop and of a court of appeal and centre of an educational division (*académie*). The department is divided amongst the districts of the VII., VIII., XII., XIII. and XIV. army corps. There are two arrondissements (Lyons and Villefranche) subdivided into 29 cantons and 269 communes. The principal places besides Lyons are Givors, Tarare and Villefranche, which receive separate treatment.

RHÖNGEBIRGE, or DIE RHÖN, a mountain-chain of central Germany, running in a north-westerly direction from the Bavarian province of Lower Franconia to the Prussian province of Hesse-Nassau and the grand duchy of Saxe-Weimar, and divided by the Werra from the Thuringian Forest on the N. The other sides are bounded by the Fulda on the W. and the Sinn and Frankish Saab on the E. and S. Its length is 50 m., breadth 5–7 m., and its mean elevation 1900 ft. This district is divided into three groups—the southern, the high (Hohe) and the nearer (Vordere) Rhön. Of these the southern, a continuation of the Spessart, largely consists of flat conical masses and reaches its highest point in the Heiliger Kreuzberg (2900 ft.). The Hohe Rhön, beginning immediately to the north-west of the latter mountain, is a high plateau of red sandstone, covered with fens and basalt peaks. It is a wild, dreary, inclement tract of country, covered with snow for six months in the year and visited by frequent fogs and storms. It is said of it that whoever desires to experience a northern winter can spare himself a journey to the North Cape or Siberia, and find it in his native Rhön. There is little vegetation, and the inhabitants eke out a scanty sustenance from the cultivation of potatoes

and flax. The highest inhabited place is Frankenhausen, lying at a height of 2350 ft. with 6383 inhabitants (1900). The nearer (Vordere) Rhön, forming the northern side of the range, is more attractive, with forests and deep and fertile valleys.

See Lenk, *Zur geologischen Kenntnis der südlichen Rhön* (Würzburg, 1887); Scheidtweiler, *Die Rhön und ihre wirthschaftlichen Verhältnisse* (Frankfort, 1887); and Daniel, *Deutschland* (5th ed., Leipzig, 1878).

RHOXOLANI, a Sarmatian tribe defeated in the Crimea by Diophantus, general of Mithradates, *c.* 100 B.C., and by the Romans on the lower Danube *c.* A.D. 60, and also under M. Aurelius. They seem to have finally succumbed to the Goths.

RHUBARB. This name is applied both to a drug and to a vegetable.

1. The drug has been used in medicine from very early times, being described in the Chinese herbal *Pen-king*, which is believed to date from 2700 B.C. The name seems to be a corruption of *Rheum barbarum* or *Reu barbarum*, a designation applied to the drug as early as the middle of the 6th century, and apparently identical with the ῥῆον or ῥᾶ of Dioscorides, described by him as a root brought from beyond the Bosporus. In the 14th century rhubarb appears to have found its way to Europe by way of the Indus and Persian Gulf to the Red Sea and Alexandria, and was therefore described as "East Indian" rhubarb. Some also came by way of Persia and the Caspian to Syria and Asia Minor, and reached Europe from the ports of Aleppo and Smyrna, and became known as "Turkey" rhubarb. Subsequently to the year 1653, when China first permitted Russia to trade on her frontiers, Chinese rhubarb reached Europe chiefly by way of Moscow; and in 1704 the rhubarb trade became a monopoly of the Russian government, in consequence of which the term "Russian" or "crown" rhubarb came to be applied to it. Urga was the great depot for the rhubarb trade in 1719, but in 1728 the depot was transferred to Kiachta. All rhubarb brought to the depot passed through the hands of the government inspectors; hence Russian rhubarb was invariably good and obtained a remarkably high price. This severe supervision naturally led, as soon as the northern Chinese ports were thrown open to European trade, to a new outlet being sought; and the increased demand for the drug at these ports resulted in less care being exercised by the Chinese in the collection and curing of the root, so that the rhubarb of good quality offered at Kiachta rapidly dwindled in quantity, and after 1860 Russian rhubarb ceased to appear in European commerce. Owing to the expense of carrying the drug across the whole breadth of Asia, and the difficulty of preserving it from the attacks of insects, rhubarb was formerly one of the most costly of drugs. In 1542 it was sold in France for ten times the price of cinnamon and four times that of saffron, and in an English price list bearing date of 1657 it is quoted at 16s. per lb, opium being at that time only 6s. and scammony 12s. per lb.

The dose of rhubarb is anything from ½ up to 30 grains, according to the action which is desired. The British Pharmacopeia contains seven preparations, only one of which is of any special value. This is the Pulvis Rhei Compositus, or Gregory's powder, which is composed of 2 parts of rhubarb, 6 of heavy or light magnesia and 1 of ginger. The dose is 20 to 60 gr.

Rhubarb is used in small doses—½ to 2 gr.—as an astringent tonic since it stimulates all the functions of the upper part of the alimentary canal. In many cases of torpid dyspepsia it is very efficient when combined with the subnitrate of bismuth and the bicarbonate of sodium. The more characteristic action of rhubarb, however, is purgation, which it causes in doses of 15 gr. and upwards. The action occurs within seven or eight hours, a soft, pulpy motion of a yellow colour being produced. The colour is due to the chrysarobin, which is also the purgative constituent of the drug. Rhubarb is also a secretory cholagogue, increasing the amount of bile formed by the liver. The drug is apt to cause colic, and should therefore never be given alone. The ginger in Gregory's powder averts this unpleasant consequence of the aperient properties of rhubarb. The drug is peculiar in that the purgation is succeeded by definite constipation, said to be due to the rheotannic acid. This explanation is hardly satisfactory, however, since it is difficult to see how the rheotannic acid can be retained during the process of purgation. Rhubarb has, therefore, definite indications and contra-indications. It is obviously worse than useless in the treatment of chronic constipation, which it only aggravates. On the other hand, it is very valuable in children and others, when diarrhoea has been caused by an unsuitable dietary. The drug removes the indigestible residue of the food and then gives the bowel rest. Rhubarb is also useful in the weaning of infants, since it is partly excreted in the maternal milk, and gives it a bitter taste which baby dislikes.

Some chrysarobin is absorbed and is excreted in the urine, which it slightly increases and colours a reddish brown. The colour is discharged by the addition of a little dilute hydrochloric acid to the urine.

The botanical source of Chinese rhubarb cannot be said to have been as yet definitely cleared up by actual identification of plants observed to be used for the purpose. *Rheum palmatum*, *R. officinale*, *R. palmatum*, var. *tanguticum*, *R. colmianum* and *R. Franzenbachii* have been variously stated to be the source of it, but the roots produced by these species under cultivation in Europe do not present the characteristic network of white veins exhibited by the best specimens of the Chinese drug.

Chemistry.—The most important constituent of this drug, giving it its purgative properties and its yellow colour, is chrysarobin, $C_{28}H_{26}O_7$, formerly known as rhein or chrysophan. The rhubarb of commerce also contains chrysophanic acid, a dioxymethyl anthraquinone, $C_{14}H_5(CH_3)O_2(OH)_2$, of which chrysarobin is a reduction product. Nearly 40% of the drug consists of calcium oxalate, which gives it the characteristic grittiness. There is also present tannic acid, which is a glucoside of rheumic acid, yielding, on fusion with numerous other constituents, such as emodin, $C_{15}H_{10}O_5$, mucilage, resins, rheumic acid, $C_{28}H_{26}O_9$, asparhetin, &c.

Production and Commerce.—Rhubarb is produced in the four northern provinces of China, viz. Kansuh, Shen-se, Shen-se and Ho-nan), in the north-west provinces of Kan-suh, formerly included in Shen-se, but now extending across the desert of Gobi to the frontier of Tibet, in the Mongolian province of Tsing-hai, including the great lake Kokonor, and in the districts of Tangut, Sifan and Turfan, and in the mountains of the western provinces of Sze-chuen.[1] Two of the most important centres of the trade are Sining-fu in the province of Kan-suh, and Kwanhien in Sze-chuen. From Shen-se, Kan-suh and Sze-chuen the rhubarb is forwarded to Hankow, and thence carried to Shanghai, whence it is shipped to Europe. Lesser quantities are shipped from Tien-tsin, and occasionally the drug is exported from Canton, Amoy, Fuh-chow and Ning-po.

The drug is known according to the mode of preparing, Sifan and Turfan, and in the mountains of the western provinces of Sze-chuen.[1] Two of the most important centres of the trade are Sining-fu in the province of Kan-suh, and Kwanhien in Sze-chuen. From Shen-se, Kan-suh and Sze-chuen the rhubarb is forwarded to Hankow, and thence carried to Shanghai, whence it is shipped to Europe. Lesser quantities are shipped from Tien-tsin, and occasionally the drug is exported from Canton, Amoy, Fuh-chow and Ning-po.

The drug is known according to the mode of preparing for the market. According to Mr Bell, who on a journey from St Petersburg to Peking had the opportunity of observing the plant in a growing state, the root is not considered to be mature until it is six years old. It is then dug up, usually in the autumn, and deprived of its cortical portion and smaller branches, and the larger pieces are divided in half longitudinally; these pieces are bored with holes and strung up on cords to dry, in some cases being previously subjected to a preliminary drying, or have slabs heated by fire underneath. In Bhutan the root is said to be hung up in a kind of drying room, in which a moderate heat is regularly maintained. The effect produced by the above drying processes is very different: when dried by artificial heat, the exterior of the pieces becomes hardened before the interior has entirely lost its moisture, and consequently the pieces decay in the centre, although the surface may show no change. The two varieties of rhubarb are technically known as kiln-dried and sun-dried; and it was on account of this difference in quality that the Russian officer at Kiachta had every piece examined by boring a hole to its centre.

European Rhubarb.—As early as 1608 Prosper Alpinus of Padua cultivated as the true rhubarb a plant which is now known as *Rheum rhaponticum*, a native of southern Siberia and the basin of the Volga. This plant was introduced into England through Sir Matthew Lister, physician to Charles I., who gave seed obtained by him in Italy to the botanist Parkinson. The culture of this rhubarb for the sake of the root was commenced in 1777 at Banbury, in Oxfordshire, by an apothecary named Hayward, the plants being reared from seed sent by Dr Hope in 1762, and with such success that the Society of Arts awarded him a silver medal in 1789 and a gold one in 1794. The cultivation subsequently extended to Somersetshire, Yorkshire, and Middlesex, but is now chiefly carried on at Banbury. English rhubarb root is sold at a cheaper rate than the Chinese rhubarb, and forms a considerable article of export to America, and is said to be used in Britain in the form of powder, which is of a finer yellow colour than that of Chinese rhubarb. The Banbury rhubarb appears to be a hybrid between *R. rhaponticum* and *R. undulatum*—the root, according to E. Colin, not presenting the typical microscopic structure of the former. More recently very

[1] According to Mr F. Newcombe, *Med. Press and Circ.*, August 2, 1882, the Chinese esteem the Shen-se rhubarb as the best, that coming from Kanchow being the most prized of all; Sze-chuen rhubarb has a rougher surface and little flavour, and brings only about half the price; Chung-chi rhubarb also is greatly valued, while the Chi-chuang, Tai-huang and Shan-huang varieties are considered worthless.

good rhubarb has been grown at Banbury from *Rheum officinale*, but these two varieties are not equal in medicinal strength to the Chinese article, yielding less extract—Chinese rhubarb affording, according to H. Seier, 58%, English rhubarb 21%, and *R. officinale* 17%. In France the cultivation of rhubarb was commenced in the latter half of the 18th century—*R. compactum*, *R. palmatum*, *R. rhaponticum* and *R. undulatum* being the species grown. The cultivation has, however, now nearly ceased, small quantities only being prepared at Avignon and a few other localities.

The culture of *Rheum compactum* was begun in Moravia in the beginning of the present century by Fridyl, an apothecary in Austerlitz, and until about fifty years ago the root was largely exported to Lyons and Milan, where it was used for dyeing silk. As a medicine 5 parts are stated to be equal to 4 of Chinese rhubarb. Rhubarb root is also grown at Aujezd in Moravia and at Ilmitz, Kremnitz and Frauenkirchen in Hungary; *R. emodi* is said to be cultivated for the same purpose in Silesia.

Rhubarb is also prepared for use in medicine from wild species in the Himalayas and Java.

2. The rhubarb used as a vegetable consists of the leaf stalks of *R. rhaponticum* and its varieties, and *R. undulatum*. It is known in America as pie-plant. Plants are readily raised from seed, but strong plants can be obtained in a much shorter time by dividing the roots. Divisions or seedlings are planted about 3 ft. apart in ground which has been deeply trenched and manured, the crowns being kept slightly above the surface. Rhubarb grows freely under fruit-trees, but succeeds best in an open situation in rich, rather light soil. The stalks should not be pulled during the first season. If a top-dressing of manure be given each winter a plantation will last good for several years. Forced rhubarb is much esteemed in winter and early spring, and forms a remunerative crop. Forcing under glass or in a mushroom house is most satisfactory, but open-ground forcing may be effected by placing pots or boxes over the roots and burying in a good depth of stable litter and leaves. Several other species, such as *R. palmatum*, *R. officinale*, *R. nobile* and others, are cultivated for their fine foliage and handsome inflorescence, especially in wild gardens, margins of shrubberies and similar places. They succeed in most soils, but prefer a rich soil of good depth. They are propagated by seeds or by division.

RHYL, a watering-place and urban district of Flint, N. Wales, practically equidistant by rail from Bangor (29½ m.) and Chester (30 m.), and 209 m. from London on the London & North-Western railway. Pop. (1901) 8473. It is situated near the mouth of the Clwyd. Formerly, like Llandudno, a small fishing village, the town has now all the appointments of a popular resort. In winter the gales often fill the streets to the depth of several feet, with drifts of sand from the surrounding dunes, which, however, are noted in summer for the dry and bracing air. The neighbouring country is interesting from its scenery and antiquities. Among the institutions of the town may be mentioned the Queen Alexandra Hospital (1902), and several hydropathic establishments and convalescent homes. The estuary harbours coasting vessels, and some shipbuilding is carried on. On the beach towards Prestatyn can be seen the remains of a submerged forest.

RHYME, more correctly spelt RIME, from a Provençal word *rim* (its customary English spelling is due to a confusion with *rhythm*), a literary ornament or device consisting of an identity of sound in the terminal syllables of two or more words. In the art of versification it signifies the repetition of a sound at the end of two or more lines in a single composition. This artifice was practically unknown to the ancients, and, when it occurs, or seems to occur, in the works of classic Greek and Latin poets, it must be considered to be accidental. The natural tendency of the writer of verse unconsciously to repeat a sound, however, is shown by the fact that there have been discovered nearly one thousand lines in the writings of Virgil where the final syllable rhymes with a central one, thus—

Bella per Emathios plus quam civilia campos.

It is more than doubtful, however, whether the difference of stress would not prevent this from sounding as a rhyme in an antique ear, and the phenomenon results more from the contingencies of grammar than from intention on the part of the poet. Conscious rhyme belongs to the early medieval periods of monkish literature, and the name given to lines with an intentional rhyme in the middle is *Leonine verse*, the invention being attributed to a probably apocryphal monk Leoninus or Leonius, who is supposed to be the author of a history of the Old Testament preserved in the Bibliothèque Nationale of Paris. This "history" is composed in Latin verses, all of which rhyme in the centre. Another very famous poem in Leonine rhyme is the "De Contemptu Mundi" of Bernard of Cluny, which was printed at Bremen in 1595. Rhyme exists to satisfy the ear by the richness of repeated sound. In the beginnings of modern verse, alliteration, a repetition of a consonant, satisfied the listener. A further ornament was discovered when assonance, a repetition of the vowel-sounds, was invented. Finally, both of these were combined to procure a full identity of sound in the entire syllable, and rhyme took its place in prosody. When this identity of sound occurs in the last syllable of a verse it is the typical end-rhyme of modern European poetry. Recent criticism has been inclined to look upon the African church-Latin of the age of Tertullian as the starting-point of modern rhyme, and it is probable that the ingenuities of priests, invented to aid worshippers in hearing and singing long pieces of Latin verse in the ritual of the Catholic church produced the earliest conscious poems in rhyme. Moreover, not to give too great importance to the Leonine hexameters which have been mentioned above, it is certain that by the 12th century a school of artificial sacred poetry had come into existence, classical examples of which we still possess in the "Stabat Mater" and the "Dies Irae." In the course of the middle ages, alliteration, assonance and end-rhyme held the field without a rival in vernacular poetry. There is no such thing, it may broadly be said, as medieval verse in which one or other of these distinguishing ornaments is not employed. After the 14th century, in the north of Europe, and indeed everywhere except in Spain, where assonance held a powerful position, end-rhyme became universal and formed a distinctive indication of metrical construction. It was not until the invention of Blank Verse (*q.v.*) that rhyme found a modern rival, and in spite of the successes of this instrument rhyme has held its own, at all events for non-dramatic verse, in the principal literature of all Europe. Certain forms of poetry are almost inconceivable without rhyme. For instance, efforts have been made to compose rhymeless sonnets, but the result has been, either that the piece of blank verse produced is not in any sense a sonnet, or else that by some artifice the appearance of rhyme has been retained. In the heyday of Elizabethan literature a serious attempt was made in England to reject rhyme altogether, and to return to the quantitative measures of the ancients. The prime mover in this heresy was not a poet at all, but a pedantic grammarian of Cambridge, Gabriel Harvey (1545?–1630). He considered himself a great innovator, and for a short time he actually seduced no less melodious a poet than Edmund Spenser to abandon rhyme and adopt a system of rhymeless hexameters and trimeters. Spenser even wrote largely in those measures, but the greater portion of his experiments in this kind, of which *The Dying Pelican* is supposed to have been one, have disappeared. From 1576 to 1579 the genius of Spenser seems to have been obscured by this error of taste, but he shook it off completely when he composed *The Shepherd's Calendar*. Harvey considered Richard Stonyhurst (1547–1618) the most loyal of his disciples, and this author published in 1582 four books of the *Aeneid* translated into rhymeless hexameters on Harvey's plan. The result remains, a portent of ugliness and cacophony. A far greater poet, Thomas Campion (1575–1620), returned to the attack, and in a tract published in 1602 advocated the remission of rhyme from lyrical poetry. He, by dint of a prodigious effort, produced some unrhymed odes which were not without charm, but the best critics of the time, such as Daniel, repudiated the innovation, and rhyme continued to have no serious rival except blank verse.

There have, from time to time, been made experiments of a similar nature, notably by Tennyson, but rhyme has retained its sway as an essential ornament of all English poetry which is not in blank verse. There have been not a few poems composed, principally in the nineteenth century, in rhymeless hexameters, and even the elegiac couplet has been attempted. The experiments of Longfellow, Clough, Kingsley and others demand respectful notice, but it is more than doubtful whether any one of these, even the mellifluous *Andromeda* of the last-named writer, is really in harmony with the national prosody.

In Germany a very determined attack on rhyme was made early in the seventeenth century, particularly by a group of aesthetic critics in the Swiss universities. They attacked rhyme as an artless species of sing-song, which deadened and destroyed the true movement of melody in the rhythm. The argument of this group of critics had a deep influence in German practice, and led to the composition of a vast number of works in unrhymed measures, in few of which, however, is now found a music which justifies the experiment. Lessing recalled the German poets to a sense of the beauty and value of rhyme, but the popularity of Klopstock and his imitators continued to exercise a great influence. Goethe and Schiller, without abandoning rhyme altogether, permitted themselves a great liberty in the employment of unrhymed measures and in imitation of classic metres. This was carried to still greater lengths by Platen and Heine, the rhymeless rhythm of the last of whom was imitated in English verse by Matthew Arnold and others, not without an occasional measure of success. In France, on the other hand, the empire of rhyme has always been triumphant, and in French literature the idea of rhymeless verse can scarcely be said to exist. There is *rime pleine et riche*, in which not merely the sound but the emphasis is perfectly identical, is insisted upon, and a poet who rhymed as Mrs Browning did, or made "flying" an equivalent in sound to "Zion," would be deemed illiterate.

In French, two species of rhyme are accepted, the feminine and the masculine. Feminine rhymes are those which end in a mute *e*, masculine those which do not so end. The Alexandrine, which is the classical metre in French, is built up on what are known as *rimes croisées*, that is to say a couplet of masculine rhymes followed by a couplet of feminine, and that again by masculine. This rule is unknown to the medieval poetry of France.

In Italian literature the excessive abundance and facility of rhyme has led to a rebellion against its use, which is much more reasonable than that of the Germans, whose strenuous language seems to call for an emphatic uniformity of sound. But it was the influence of German aesthetics which forced upon the notice of Leopardi the possibility of introducing rhymeless lyrical measures into Italian verse, an innovation which he carried out with remarkable hardihood and success. The rhymeless odes of Carducci are also worthy of admiration, and may be compared by the student with those of Heine and of Matthew Arnold respectively. Nevertheless, in Italian also, the ear demands the pleasure of the full reiterated sound, and the experiments of the eminent poets who have rejected it have claimed respect rather than sympathy or imitation. At the close of the 19th century, particularly in France, where the rules of rhyme had been most rigid, an effort to modify and minimise these restraints was widely made. There is no doubt that the laws of rhyme, like other artificial regulations, may be too severe, but there is no evidence that the natural beauty which pure rhyme introduces into poetry is losing its hold on the human ear or is in any real danger of being superseded by accent or rhythm.

See Joseph B. Mayer, *A Handbook of Modern English Metre* (Cambridge, 1903); J. Minor, *Neuhochdeutsche Metrik* (Strassburg, 1893); J. B. Schuttze, *Versuch einer Theorie des Reimes nach Inhalt und Form* (Magdeburg, 1802). (E. G.)

RHYMNEY, an urban district in the western parliamentary division of Monmouthshire, England, on the borders of Glamorganshire, 22 m. N. by W. of Cardiff, on the Rhymney, the London & North-Western, and the Brecon & Merthyr railways. Pop. (1901), 7015. The Rhymney river, in the upper valley of which this town lies, forms almost throughout its course, to the estuary of the Severn near Cardiff, the boundary between England and Wales (Monmouthshire and Glamorganshire). In its upper part the valley, like others adjacent and parallel to it, is populous with mining townships, and the town of Rhymney owes its importance to the neighbouring coal-mines and to its iron and steel works, which employ nearly the whole population. The works of the Rhymney Iron Company, including blast furnaces and rolling mills, are among the largest of the kind in England.

RHYOLITE (Gr. *ῥεῖν*, to flow, because of the frequency with which they exhibit fluxion structures), the group name of a type of volcanic rock, occurring mostly as lava flows, and characterized by a highly acid composition. They are the most siliceous of all lavas, and, with the exception of the dacites, are the only lavas which contain free primary quartz. In chemical composition they very closely resemble the granites which are the corresponding rocks of plutonic or deep-seated origin; their minerals also present many points of similarity to those of granite though they are by no means entirely the same. Quartz, orthoclase and plagioclase felspars, and biotite are the commonest ingredients of both rocks, but the quartz of rhyolites is full of glass enclosures and the potash felspar is pellucid sanidine, while the quartz of granite contains dust-like fluid cavities of very minute size and its potash felspar is of the turbid variety which is properly called orthoclase. The granites also are holocrystalline, while in the rhyolites there are usually porphyritic crystals floating in a fine ground-mass. Rhyolites have also been called liparites because many of the lavas of the Lipari Islands are excellent examples of this group. Above all rocks they have a disposition to assume curious forms, as when fused they crystallize with great difficulty. Hence it has long baffled experimenters to produce rhyolite synthetically by fusion; it is stated that these difficulties have now been overcome, but geologists believe that the presence of steam and other gases in the natural state expedites crystallization. In crucibles these cannot be retained at the temperatures employed; when the rocks are melted the gases escape and on cooling a pure glass is formed. The vitreous forms of rhyolite are known as obsidian, perlite and pumice (*qq.v.*).

The minerals of the first generation, or phenocrysts, of rhyolite are generally orthoclase, oligoclase, quartz, biotite, augite or hornblende. The felspars are usually glassy clear, small but of well-developed crystalline form: the potash felspar is sanidine, usually Carlsbad twinned; the soda-lime felspar is almost always oligoclase, with characteristic polysynthetic structure. Both of these may be corroded and irregular in their outlines; their cleavage and twinning then distinguish them readily from quartz. Glass enclosures, sometimes rectangular with small immobile bubbles, are frequent. The quartz occurs as blebs or sub-rounded grains, which are corroded double hexagonal pyramids. Its glass enclosures are many and nearly always rounded or elliptical in section. No proper cleavage is seen in the quartz, though arcuate (conchoidal) fractures may often be noticed; they may have been produced by strain on cooling. Phenocrysts of micropegmatite are known in some rhyolites; they may have the shape of felspar or of quartz crystals; in the former case Carlsbad twinning is by no means uncommon, but in other cases hour-glass structure is very conspicuous. Biotite is always deep brown or greenish brown, in small hexagonal tables, generally blackened at their edges by magmatic corrosion. Muscovite is not known in rhyolites. Hornblende may be green or brownish, in the quartz-pantellarites it sometimes takes the form of strongly pleochroic brown cossyrite. Like biotite it is eumorphic but often corroded in a marked degree. Augite, which is equally common or more common than the other ferro-magnesian minerals, is always green; its crystals are small and perfectly shaped, and corrosion phenomena are very rarely seen in it. Zircon, apatite and magnetite are always present in rhyolites, their crystals being often beautifully perfect though never large. Olivine is never a normal ingredient, but occurs in the holocrystalline rhyolites or lithophysae of some rhyolites with garnet, tridymite, topaz and other minerals which indicate pneumatolytic action. Among the less common accessory minerals of the rhyolites are cordierite in crystals which resemble hexagonal prisms but break up under polarized light into six radiating sectors owing to complicated twinning; they weather to green aggregates of chlorite and muscovite (pinite); garnet, sphene and orthite may also be met with in rhyolites.

The ground-mass of rhyolitic rocks is of three distinct types which are stages in crystalline development, viz. the vitreous, the felsitic or cryptocrystalline, and the microcrystalline. Hence some authorities have proposed to subdivide the group

into the *vitrophyres*, the *felsophyres* and the *granophyres*, but this is not now in use, and the last of these terms has obtained a signification quite different from that originally assigned to it. Mixtures of the different kinds occur; thus a vitreous rhyolite has often felsitic areas in its ground-mass, and in the same lava flow some parts may be vitreous while others are felsitic. The vitreous rhyolites are identical in most respects with the obsidians, from which they can only be separated in an artificial classification; and in their glassy base the banded or eutaxitic, spherulitic and perlitic structures of pure obsidians are very frequently present (see OBSIDIAN; PERLITE). The felso-liparites or liparites with stony ground-mass are especially common among the pre-Tertiary igneous rocks (see QUARTZ-PORPHYRY), as liparite glass is unstable and experiences devitrification in course of time. Many of these felsites have fluxion banding, spherulites and even perlitic cracks, which are strong evidence that they were originally glassy. In other cases a hyaloliparite, obsidian, or pitchstone becomes felsitic along its borders and joint planes, or even along perlitic cracks, and we may assume that the once fibrous rock has changed into felsite under the action of percolating moisture or even by atmospheric decomposition. In many rhyolites the felsite is original and represents an incipient crystallization of the vitreous material which took place before the rock was yet cold. The felsite in turn is liable to change; it becomes a fine mosaic of quartz and alkali felspar; and in this way a matrix of the third type, the microcrystalline, may develop. This is proved by the occurrence of the remains of spherulitic and perlitic structures in rocks which are no longer felsitic or glassy. Many micro-crystalline rhyolites have a ground-mass in which much felsitic matter occurs; but as this tends to recrystallize in course of time, the older rocks of this group show least of it. Whilst no quartz-bearing rhyolites are known to have been erupted in recent years, Lacroix proved that portions of the "dome" which rose as a great tower or column out of the crater of Mont Pelée after the eruption in 1906 contained small crystals of quartz in the ground-mass. The rock was an acid andesite, and it was ascribed by Lacroix to the action of steam retained in the rock under considerable pressure. The microcrystalline ground-mass of rhyolites is never micrographic as in the porphyries (granophyres); on the other hand it is often micropoikilitic, consisting of small felspars, often sub-rectangular, embedded in little rounded or irregular plates of quartz.

The ground-mass of rhyolites is liable to other changes, of which the most important are silicification, kaolinization and sericitization. Among the older rocks of this group it is the exception to find that secondary quartz has not been deposited in some parts of them. Often indeed the matrix is completely replaced by silica in the form of finely crystalline quartz or chalcedony; and these rocks on analysis prove to contain over 90% of silica. In the recent rhyolites of Hungary, New Zealand, &c., the deposit of coarse opal in portions of the rock is a very common phenomenon.

Kaolinization may be due to weathering, and the stony dull appearance of the matrix of many microcrystalline rhyolites is a consequence of the decomposed state of the felspar grains in them; it is even more typically developed by fumarole action, which replaces the felspars with soft, cloudy white products which belong to a mineral of the kaolin group. Sericitization, or the development of fine white mica after felspar, is usually associated with shearing, and is commonest in the older rhyolites.

Vesicular structure is very common in rhyolites; in fact the pumiceous obsidians have this character in greater perfection than any other rocks (see PUMICE); but even the felso-rhyolites are very often vesicular. The cavities are usually lined with opal and tridymite; in the older rocks they may be filled with agate and chalcedony. The "mill-stone porphyries," extensively used in Germany for grinding corn, are porous rhyolites; the abundance of quartz makes them hard, and their rough surfaces render them peculiarly suitable for this purpose. In some of them the cavities are partly secondary. These rocks are obtained in the Odenwald, Thuringerwald and Fichtelgebirge.

In Britain a pale grey Tertiary rhyolite occurs at Tardree, Antrim (the only British rock containing tridymite), and in Skye. Felsitic rhyolites occur among the Old Red rocks of Scotland (Pentland Hills, Lorne, &c.), in Devonshire, and in large numbers in North Wales. The Carnarvonshire rhyolites are often much altered and silicified; many of them have a nodular structure which is very conspicuous on weathered surfaces. The spheroids may be two or three inches in diameter; some of them are built up of concentric shells. Rhyolites are also found from Fishguard, Malvern, Westmorland and Co. Waterford. One of the oldest volcanic rocks of Britain (pre-Cambrian, Uriconian) is the spherulitic rhyolite of the Lea Rock near Wellington in Shropshire. It shows bright red spherulites in great numbers and is probably an obsidian completely devitrified. Perlitic structure is also visible in it.

In other parts of Europe rhyolites have a fairly wide distribution though they are not very numerous. In Hungary (Hlinik, &c.) there are many well-known examples of this class. They extend along the margin of the Carpathians and are found also in Siebenburgen. In Italy they occur in the Euganean Hills and in the Lipari Islands; the latter being the principal source of pumice at the present day. Rhyolites of Recent age occur in Iceland (Myvatn, &c.), where they are characterized by the frequent absence of quartz, and the presence of much plagioclase and pyroxene. Some of these rocks have been called trachyte-obsidians, but they seem to be rhyolites which contain an exceptionally large amount of soda. The older rhyolites, which are generally called quartz-porphyries in Germany, are mostly of Permian or Carboniferous age and are numerous in the Vosges, Odenwald, Thuringerwald, &c. They are often accompanied by basic rocks (melaphyres). Permian rhyolites occur also at Lugano in Italy. Rhyolites are known also in Asia Minor and the Caucasus, in New Zealand, Colorado, Nevada and other parts of western North America. In the Yellowstone National Park there is a well-known cliff of obsidian which shows remarkably perfect columnar jointing. Some of the rhyolites of Nevada are exceedingly rich in porphyritic minerals, so that they appear at first sight to be holocrystalline rocks, since the ground-mass is scanty and inconspicuous. To this type the name nevadite has been given, but it is rare and local in its distribution.

In the island of Pantelleria, which lies to the south-west of Sicily, there are rocks of rhyolitic affinities which present so many unusual features that they have been designated pantellarites. They contain less silica and alumina and more alkalis and iron than do ordinary rhyolites. Their felspars are of the anorthoclase group, being rich in soda together with potash, and are very variable in crystalline development. Aegirine-augite and forms of soda-amphibole are also characteristic of these rocks: dark brown aenigmatite or cossyrite often occur in them. Quartz is not very plentiful; other ingredients are olivine, nepheline and tridymite. The ground-mass varies much, being sometimes quite vitreous, at other times a glass filled with swarms of microliths, while in certain pantellarites it is a true microcrystalline aggregate of quartz and alkali felspar. The absence of plagioclase and biotite are marked distinctions between these rocks and the rhyolites, together with the scarcity of quartz and the prevalence of soda-bearing pyroxenes and amphiboles.

Among the Palaeozoic volcanic rocks of Germany there is a group of lavas, the quartz-keratophyres, which are of acid composition and rich in alkali felspar. Their dominant alkali is soda: hence their felspars are albite and cryptoperthitic sanidine as in rhyolites. Quartz occurs sometimes as corroded phenocrysts, but is often scarce even in the ground-mass. Porphyritic biotite or augite are very rare, but occur in the matrix along with felspars and quartz. Micrographic intergrowths are not infrequent in these rocks, and they may be silicified like the rhyolites. As quartz-keratophyres mostly occur in districts where there has been a good deal of folding, they are often crushed and more or less sericitized. They are best known from the Devonian rocks of Westphalia, the Harz, but are also found in Queensland, and similar rocks have been described (as soda-felsites) from Ireland. The rocks which they accompany are usually diabases and spilites.

The other group of rhyolitic rocks rich in alkali felspars and soda pyroxenes and amphiboles are the comendites. They are often porphyritic, with crystals of quartz, sanidine, microperthite or albite: the ground-mass is microcrystalline or rarely micrographic, and often filled with spongy growths of aegirine and arfvedsonite. They are known from the recent eruptive districts of East Africa, from Sardinia and Texas, and very similar rocks occur as intrusive masses which may be grouped with the porphyries.

The following analyses show the composition of some of the principal types of rhyolites:—

	SiO_2	Al_2O_3	Fe_2O_3	FeO	CaO	MgO	K_2O	Na_2O	H_2O
I.	76·34	13·22	1·93		1·85	0·21	3·67	2·84	0·61
II.	72·15	13·50	3·12		0·93	0·16	4·54	4·20	0·85
III.	77·59	12·75	0·67	n.f.	0·04	0·16	3·99	2·56	1·54
IV.	67·48	9·70	7·42	2·21	1·45	0·77	2·94	7·21	0·96
V.	70·97	13·84	3·21	0·78	1·26	0·20	1·57	6·27	0·74
VI.	74·76	11·60	3·50	0·19	0·07	0·18	4·92	4·35	0·64

I. Rhyolite, Telki Banya, Hungary.
II. do. Mafahlid, Iceland.
III. do. Omahu, New Zealand.
IV. Pantellarite, Pantellaria.
V. Quartz-keratophyre, Muhlenthal, Harz.
VI. Comendite, Sardinia.

We note in the rhyolites I.–III. the very high silica, with alkalis and alumina also in considerable amount, while lime, magnesia and iron are very low. In the pantellarite, keratophyre and comendite the silica tends to be less abundant, while the alkalis, especially soda, increase; they have less alumina but are richer in iron and magnesia. It is easy to see why the latter types contain less quartz, felspars often very rich in soda, and femic minerals which contain iron and alkalis in notable amounts such as aegirine, riebeckite and arfvedsonite. (J. S. F.)

RHYTHM (Greek *ῥυθμός*, from *ῥεῖν*, to flow), the measured flow of movement, or beat, in verse, music or by analogy in other connexions, *e.g.* "rhythm of life." The early critic of prosody, Aristoxenus, distinguished as the three elements out of which rhythm is composed, the spoken word, *λέξις*, the tune of music and song, *μέλος*, and the bodily motion, *κίνησις σωματική*. The art of the early Greek poets was devoted to a harmonious combination of these three elements, language, instrument and gesture uniting to form perfect rhythm. Aristoxenus proceeds to define the rhythm so produced as an arrangement of time-periods, *τάξις χρόνων*, but other early theorists make not the time but the syllable the measurement of poetic speech. Both music and poetry depend, and have depended from the earliest times, on rhythm. But in music melody and harmony have to be taken into consideration, whereas in poetry the rhythmical value of the tone is modified by the imaginative value and importance of the words themselves. In earliest times the fundamental unity of the two arts was constantly manifest, but as the world has progressed, and they have ramified into countless forms, the difference between them has been emphasized more and more.

Rhythm in Verse.—Professor Jakob Minor has adduced a figure, valuable in helping us to realize what poetic rhythm is, when he remarks that to strike a bell twelve times, at exactly equal intervals, is to produce what may be called, indeed, a rhythmic effect, but not to awaken anything resembling the sensation of poetical rhythm. Into the idea of poetic rhythm enters an element of life, of pulse, of a certain inequality of time based upon an equality of tone. Rhythm ceases to be poetic rhythm if it is mechanical or lifeless. Aristotle, from whom a definition might be expected, is very vague in dealing with the subject, and most of the old rhetorical works darken counsel with statements that are obscure or irrational. The fact is that rhythm is an expression of the instinct for order in sound which naturally governs the human ear, and little practical knowledge is gained by following Suidas when he says that rhythm is the father of metre, or Quintilian in his epigram that rhythm is male and metre is female. These definitions arise from a rhetorical desire to measure a delicate instinct by rule of three, and, as a matter of fact, Greek criticism on this subject often lost itself in arithmetical absurdities. It is sufficient to say that rhythm is the law which governs the even and periodical progress of sounds, in harmony with the exigencies of human emotion. For the passions, as expressed in verse, various movements are appropriate. Joy demands that the voice should leap and sing; sorrow that it should move solemnly and slowly; and poetry, which is founded on rhythm, requires that the movement of words should respond to this instinctive gradation of sounds. The finer the genius of the metrist the more exquisitely does his rhythm convey, as upon an instrument, the nature of the passion which burdens his verses. Ecstasy takes a quick, eager, rising movement:—

> "Give him the nectar!
> Pour out for the poet,
> Hebe, pour free!
> Quicken his eyes with celestial dew,
> That Styx the detested no more he may view."

Mystery and suspense demand a faint, languid and throbbing movement:—

> "There is not wind enough in the air
> To move away the ringlet curl
> From the lovely lady's cheek—
> There is not wind enough to twirl
> The one red leaf, the last of its clan,
> That dances as often as dance it can."

An overpowering sadness interprets itself in rhythm that is full and slow and emphatic:—

> "My genial spirits fail,
> And what can these avail
> To lift the smothering weight from off my breast?
> It were a vain endeavour,
> Though I should gaze for ever
> On that green light that lingers in the west:
> I may not hope from outward forms to win
> The passion and the life, whose fountains are within."

The rhythm so produced, intimately linked, almost beyond the disintegrating power of analysis, with human feeling, may depend either on *accentuation* or *quantity*. The latter forms the principle upon which all classic metre was composed, while the former is dominant in nearly every description of modern verse. Greek and Latin verse depends entirely upon the relation of syllables, long or short. It was a question of time with the ancients, of stress or weight with us. It is an error to say, as is often done, that ancient verse did not recognize accent, and that in modern verse there is no place for quantity. These statements are generally true, but there are various exceptions to both rules. Schipper, in his *Englische Metrik*, specially points out that "long and short syllables have no constant length, no constant relation, but they depend on their place in the verse, and on the context; though they do not determine the rhythm of verse, they still act as regulators of our metre in a very important degree." *Pauses* take an essential importance in the construction of modern rhythm, of the variety and vitality of which they are the basis. They are introduced for the purpose of relieving the monotony of successive equal groups of syllables. The pause often takes the place of a light syllable, and there are instances in the verse of Shakespeare and Milton where it is even allowed to fill up the space of a heavy syllable. But still more often the pause does not supply the dropping of a syllable at all, but simply dictates a break in the sound, equivalent to a break in the sense. The following extract from a "Psalm" in Crashaw's *Steps to the Temple* (1646), in which the pauses are numerous and energetic, will exemplify the variety of this artifice:—

> "On the proud banks of great Euphrates' flood, |
> There we sate | and there we wept: |
> Our harps | (for | no use) | no music understood, |
> Nodding | on the willows slept |
> While | unhappy captiv'd | we |
> Lovely Sion | thought on thee."

In the blank verse of Milton the free use of pauses constitutes the principal element in the amazing metrical art of the poet, and is the source of the sublime originality of his music. In speaking of rhythm, it is customary to think of the formal rules which govern the fixed cadence of feet in poetry, but there is also a rhythm in prose, which imitates the measured movements of the body in stately speech. According to Renan, the rhythm of the ancient poetry of the Hebrews is solely founded on this prose movement, which differs, in fact, from that of modern European poetry merely in its undefined and indeterminate character.

Christ, *Die Metrik der Greichen* (Leipzig, 1874); Roderick Benadix, *Das Wesen des deutschen Rhythmus* (Leipzig, 1862); Jakob Schipper, *Englische Metrik* (Leipzig, 1895); Edwin Guest, *History of English Rhythms* (London, 1838; 2nd ed., 1882); Théodore de Banville, *Petit Traité de la poésie française* (Paris, 1881); F. B. Gummere, *Handbook of Poetics* (Boston, 1902). (E. G.)

Rhythm in Music.—The rhythm of modern music began to develop through the attempts of learned medieval musicians to adapt the rhythms of spoken language to the necessities of choral singing; but before the process had gone far, certain much more ancient and powerful principles, always manifest in folk-song and dance, gained ascendancy, so that even the

simplest classical music has a rhythm for which no criteria of poetic metre can be made adequate. From the musical point of view, the rhythm of speech, whether in prose or verse, is very subtle and almost uniformly fluent. The metrical feet which constitute the details of poetic rhythm are musically very minute; and the exaggerated forms in which music represents them are many and varied. On the other hand, the groups of metrical feet which constitute any one kind of verse are of a uniformity which for music on a large scale would be intolerable. Artistic music is soon compelled to draw upon infinite resources of its own, which preserve an appropriate accentuation of the sense and feeling, while obliterating or hugely exaggerating the poet's rhythmic effects. Musical rhythm cannot be studied on a sound basis unless its radical divergences from speech-rhythm are recognized from the outset.

In the earliest extant musical settings of poetry the treatment of accent and quantity was strictly arithmetical; and purely aesthetic requirements were satisfied by *ex post facto* inference from the arithmetical laws, rather than treated as the basis of the laws. Accent, when translated into music, is a rhythmic sensation resembling the stress we put on the left foot in marching; while quantity rarely suggests any bodily movement at all, since it can correspond only to variations in the length of steps. Now in modern music a sense akin to that of bodily movement is of overwhelming importance. Changes of *tempo*, and of the grouping of musical beats, are incidents as obvious in their effect as changes in the pace of a running horse. A consequence is that the laws of musical accent are simple and cogent, while the laws of musical quantity, if such exist, are far beyond analysis. Fluent speech and energetic physical exercise cannot be carried on simultaneously by the same person; and hence the laws of quantity belong to speech rather than to dance. Before we could form adequate notions of the musical rhythms of classical Greece, we should need to settle, firstly, how far the dancing in Greek drama included movements other than idealized dramatic gesticulation; secondly, how much bodily energy was involved in all dancing that may have gone beyond this; and lastly, how much dancing of any kind was executed by the singers while singing. What is certain is that ancient Greek musical rhythms were exact translations of verse rhythms, with the quantities interpreted arithmetically.

The extant fragments of Greek music are, whether we have read them correctly or not, undoubtedly very different in rhythm from the system of discant on which European music of the 12th and 13th centuries first developed; but they resemble discant in so far as the modern sense of rhythm is absent and its place is supplied by a sense of the rhythmic expression of unusually slow and emphatic speech. In ordinary speech there is an important difference between long syllables and short; but it is not naturally regulated by an exact rhythm, and the art by which it is organized in verse admits (or indeed demands) considerable freedom on the part of the reciter in varying his pace within such limits as do not destroy the structure of the lines. But when a chorus is made to sing words, it must, if the words are to reach the hearer, sing them slowly; and moreover, it must sing them exactly together, unless, as in much classical music, it can repeat them until they are either understood or dismissed from the mind as a mere pretext for the employment of voices in a merely musical design. In any case, if a chorus is to sing well together, the contrast between short and long syllables must be placed on an arithmetical basis, the simpler the better. Now the sole function of ancient Greek music was to enhance the emotional effect of poetic words by regulating their rise and fall in a musical scale and their length in a metrical scheme; and it was natural and right that its rhythms should, though accurate, have no stronger ictus than those of the words. To make them as rigid and forcible as the rhythms of a non-vocal music would produce an effect as intolerable to a Greek ear as a schoolboy's worst jog-trotting scansion of poetry. We need not, then, imagine that the human sense of rhythm has suffered any mysterious change, when our best attempts at deciphering the extant fragments of ancient Greek music yield us a rhythm which scholars can explain by the structure of Greek verse, but which gives us no musical sense. Neither here nor in such strange harmonic phenomena as our complete inversion of medieval harmonic ideas as to the treatment of "perfect concords" (see HARMONY) do we find any principle involved which is not as true at the present day as it ever was. Ancient musical rhythm shared in the general qualities of that "Flatland" which we know ancient music to have been; modern musical rhythm, like harmony, belongs, as it were, to a three-dimensioned musical space with the vast artistic resources of a consistent perspective.

Indeed, we need much the same kind of mental gymnastic in studying the origins of musical rhythm as we need for the much more abstruse subject of harmonic origins. The two subjects soon begin to show interaction. During the period of discant we find metrical conceptions already strongly modified by two purely musical factors. Firstly, the attempt to make voices produce a harmony from different simultaneous melodies (instead of from combinations conceived as disguised unison) brought with it the necessity for differences of length enormously larger than any possible metrical differences. The metrical influence, however, still so predominated, even in the 14th century, as to produce a rhythm based almost exclusively on what would now be called triple time. Secondly, that sense of bodily movement, for which the less clumsy term "dance-rhythm" is far too narrow, gained ground as the only means powerful enough to hold the various rhythms of the new and ever-growing polyphony together. In the later stages of discant the old metrical conceptions struggled against the grain of the polyphony for awhile, only to succumb in a tangle of inextricable technicality: and the new art, which became coherent in the 15th century, disregarded poetic metre, with little or no loss in capacity to interpret words if the composer had leisure or desire to do so; since, after all, poetic rhythm in its highest forms has a subtle freedom which renders mechanical musical translation worse than useless, while the rhythmic swing of the lighter forms of poetry was soon discovered by the composers of the "Golden Age" to be practically identical with the refined dance-rhythm which they in their lighter moments idealized from folk-music.[1]

By the middle of the 15th century polyphony attained such independence that the only rhythms which could hold the flow of independent melodious voices together were those in which a steadily duple or steadily triple rhythm (either of which might be subdivided by the other or by itself) could be felt as an absolutely regular musical tread. Such a rhythm is capable of expressing every poetic foot, either by the difference of stress between notes or by a difference in their length. Moreover, emphasis may be obtained by the pitch of the note, or, again, by its harmonic significance. All these forms of emphasis combine and counteract each other in an infinite variety, till the sense of musical movement becomes as remote from crude dance-rhythm as it is from poetic metre. But though the part thus played by accent was already of paramount importance in the "Golden Age" of music, it was not allowed to become evident to the ear except in the lighter and more coarse-grained art-forms. Its highest purpose was served as soon as the listener was able to lose all crude rhythmic impulses in a secure feeling that the mass of polyphonic harmony was held together by a general grouping of the rhythmic beats in fours or threes; and individual parts were at least as free to indulge in other rhythms across the main rhythm as they are in the most complex modern music, so long as the harmony was held together by the average grouping, or "time," as we now call it. Hence the rhythmic variety of 16th-century

[1] It would be interesting and fruitful to consider how far the growing preference, in modern European languages, of accent to quantity, may not only have modified the conception of musical rhythm, but may itself have been enhanced by the rhythmic tendencies of popular song, which had so great an influence on the learned music of the middle ages. And it can hardly be said that the subject of musical rhythm has yet been so clearly treated on these lines as to shed the light it seems capable of shedding upon many vexed questions in poetic rhythm.

music is exactly like the harmonic variety, and the limitations and waywardness of the one are no more archaic than those of the other.

When the resources of later music and the treatment of instruments necessitated the publishing of music in score as well as in separate parts, it became necessary to guide the eye by drawing vertical lines (" bars ") at convenient distances. Hence the term " score " (Ger. *Partitur*, Fr. *partition*). These divisions naturally coincided with the main rhythmic groups, and eventually became equidistant. This purely practical custom has co-operated with the great increase of rhythmic firmness necessary for the coherence of those large modern forms which decree the shape rather than the texture of the music, until our notions of rhythm may fairly be described as bar-ridden. And, since the vast majority of our musical rhythms absorb the utmost complexity of detail into the most square and symmetrical framework possible, we are taught to regard the " 4-bar period " as a normal (or even ultimate) rhythmic principle, instead of contenting ourselves with broader conceptions which treat symmetry and proportion in time as freely as they are treated in space. It cannot be too strongly emphasized that the bar indicates no universal musical principle. The havoc wrought by mechanical teaching on this point is incalculable, especially in the childish crudeness of current ideas as to the declamation of words in classical and modern music—ideas which influence some composers who might have been expected to know better.

As rhythm is contemplated in larger measures, it becomes increasingly difficult to say where the sense of rhythm ends and the sense of proportion begins. The same melody that may be felt as a square and symmetrical piece of proportion in four-bar rhythm if it is taken slowly, will be equally rational as a single bar of " common time " (see below) if it is taken very quickly; and between these two extremes there may be insensible gradations. All that can be laid down is that composers are apt to use short bars where they demand constant strong accent, while long bars will imply smoother rhythms. For example, if the scherzo of Beethoven's Ninth Symphony were written in $\frac{12}{4}$ instead of $\frac{6}{4}$ bars, then the passages now marked *Ritmo di tre battute* would have to appear in $\frac{4}{4}$ time, and so the changes of rhythm would be much more visible on paper. But the tendency to put a strong accent on the first beat of every bar would make this notation an undesirable substitute for Beethoven's, since it would lead to a neglect of the subordinate accents (all of them bar-accents, as Beethoven writes them). The trio of this scherzo shows the opposite case in the fact that Beethoven first intended to write it in $\frac{4}{4}$ time, but, in order to indicate a more tranquil flow at the same pace, doubled the quantity contained in a bar, substituting *alla breve* bars, each equal to two of the preceding $\frac{4}{4}$ bars. The alteration produced a discrepancy in the metronome marks, which has always caused controversy among conductors, but the facts admit of only one interpretation. It is clear, then, that the only sound theory of musical rhythm will be that in which accent, beat, bar, and even form and proportion are relative terms.

The kinds of *time* (*i.e.* rhythmic groups forming, as it were, invariable molecules in the structure of any continuous piece of music) that are used in all music from the 15th century onwards are nowadays classified as *duple* and *triple*, and each of these may be *simple* or *compound*. Simple time is that in which the normal subdivision of its beats is by two, whether the number of the beats themselves is duple or triple. Compound time is that in which the beats are regularly divided by three, which three subdivisions are reckoned as subordinate beats. The beats are in all kinds of time reckoned as halves, quarters, 8ths, 16ths or even 32nds of the standard note in modern music, the semibreve: and the time-signature placed at the beginning of a piece of music is really a fraction, of which the numerator expresses the number of beats in a bar, while the denominator expresses the size of a beat. Thus $\frac{3}{4}$ signifies three crotchets in a bar. Compound time is expressed, not by using normal fractions of a semibreve as main beats and dividing them into *triplets*,[1] but by using *dotted* beats. A dot after a note adds another half to its value, and so not only do we obtain the means of expressing a great variety of rhythmic effects (especially quantitative effects of iambic and trochaic character) in all kinds of time, but we are able to use normal fractions of a semibreve as the subordinate beats of compound time. Thus $\frac{6}{8}$ is the compound time obtained by dotting the two crotchets of $\frac{3}{4}$ time, and is thus totally different in accent and meaning from $\frac{6}{4}$ time though that also contains six quavers in a bar. The most highly compound times in classical music are to be found in the last movement of Beethoven's Sonata, Op. 111. He begins by dividing bars of $\frac{6}{4}$ into their usual compound time $\frac{12}{8}$. He then divides the six half-beats of $\frac{6}{4}$ time by three, producing $\frac{18}{16}$ (which he incorrectly calls $\frac{6}{16}$), and lastly he divides the 12 quarter-beats by 3, producing $\frac{36}{32}$ (which he calls $\frac{12}{32}$). The special signatures C for $\frac{4}{4}$ time, and C for $\frac{2}{2}$ time are the last survivals of the time system of the middle ages (see MUSICAL NOTATION). That complicated system of *mood*, *time* and *prolation* was capable of expressing even more highly compound rhythms than our usual time-signatures, though the complexity was in most cases unreal, since the small rhythmic ictus of ecclesiastical polyphony renders little but the general distinction between duple and triple rhythm audible: especially as the more complicated rhythms were not subdivisions but multiples, involving lengths better measurable by an eight-day clock than by human ears. The second Kyrie of Palestrina's *Missa L'Homme Armé* is one of the rare cases which remain both rhythmic and complex when transcribed in modern score. For genuine articulate complexity the ballroom scene in Mozart's *Don Giovanni* has never been surpassed. So real are its three simultaneous rhythms of minuet, contredanse and waltz that the person on the stage actually dances to whichever suits their character. Anomalous measures such as $\frac{5}{4}$ and $\frac{7}{4}$ time, whether divisible into alternations of $\frac{3}{4}$ and $\frac{2}{4}$ or not, are aesthetically best regarded not as rhythmic units, but as extreme cases of unsymmetrical phrase-rhythm erected into a system for special effect. They tend, however, to group themselves into musical sentences of reactionary squareness; and the $\frac{5}{4}$ movement in Tschaikovsky's *Pathetic Symphony* consists of twenty 8-bar periods (twenty-four, counting the repeats) before an unpaired 4-bar phrase is heard in the short coda. Even the last bar is not odd, though it is the 179th, for the rhythm ends with an unwritten bar of silence.

There is, no doubt, a germ of truth in current doctrine as to the fundamental character of 4-bar phrase-rhythms, inasmuch as the human anatomy has a bilateral symmetry with either limb on one side slightly stronger than that on the other. This is probably the basis of our natural tendency to group rhythmic units in pairs, with a stress on the first of each pair; and hence, if our attention is drawn to larger groups, we put more stress on the first of the first pair than on the first of the second; and so with still greater groups, until our immediate and unanalysed sense of rhythm merges into a sense of proportion distributed through time with a clear consciousness of past, present and future. The point at which this merging takes every ordinary purpose of musical rhythm, being capable of expressing clear distinctions far more minute than have ever been regulated in speech. It is impossible to pronounce a syllable in less than a tenth of a second; but it is easy to play 16 notes in a second on the pianoforte. (That is to say, musical rhythm continues to be measurable up to the point at which atmospheric vibrations coalesce in the ear as low musical notes!) In a series of such rapid notes a single break twice in a second would have a very obvious rhythmic effect directly *measured* by the ear. If the broken series were levelled into an even series of twenty-notes a second, the rhythmic effect would be entirely different, though the actual difference of pace would be only $\frac{1}{20}$ of a second. The special sign for triplets is readily adapted to other subdivisions where necessary; but such transformations generally indicate more of clockwork than of delicate rhythm than any abstruse arithmetical accuracy. Among the worst barbarisms in musical editing is the persistent reduction of Chopin's septoles, groups of 13, and other indeterminables, into common-outlet frills. A natural freedom in performance is as necessary for the minutiae of musical rhythm as it is in speech; but where all but the finest players fail is in basing this freedom on the superlative accuracy of the rhythmic notation of the great composers.

[1] Triplets are groups of three equal notes crowded into the time normally taken by two. Binary and ternary subdivision answer

[1] In the critical edition of Palestrina's complete works, vol. xii. p. 177 (Breitkopf and Härtel), the editor has violently simplified it. He is justified in using the ordinary ₵ bars to hold the piece together, and he is not called upon to reproduce the riddles of the original notation; but some secondary time signatures ought to have been added to indicate the strong swing of the tune in its conflicting shapes; and there is no justification, in a full score intended for scholars, in supplanting the true rhythm of the *quintus* by a rough practical compromise.

place depends on the extent to which these larger groups can dominate the details of the rhythm, and this again depends on the listener's capacity for grasping large and slow rhythms. In any case, the only "ultimate" rhythmic element is the tendency to mark off rhythmic beats into pairs, with a stress on the first of each pair. Where this tendency is resisted, the mind will follow the line of least resistance, which will vary according to the pace and detail of the music. Thus in rapid triple time it is easier to seek duple rhythm in the grouping of bars than in the details within the bars; but if the groups of bars are also triple, or irregular, the mind will fix on the first recurring salient feature for a secondary beat, regardless of inequality in length; rather than, so to speak, hop on one leg indefinitely. On this principle there is a distinct tendency in moderate and slow triple times to throw a secondary accent on the third beat; or sometimes on the second, as in the springing step of the mazurka, where the spring gives energy to the first beat and the descent from it gives poise to the second.

The tendency of small rhythmic groups to build themselves into large and square ones, such as 8-bar, 16-bar and even 32-bar periods, is doubtless important; but the converse tendency of large phrase-rhythms to break up in a tapering series is far more significant, since even in its most regular forms it not only produces more variety the further it goes, but always increases in obvious effect, until the subdivisions attain the minuteness (and therewith the expression) of speech rhythms. (A crude example of the device is Diabelli's waltz, on which Beethoven wrote his gigantic 33 variations. See VARIATIONS, where the point is illustrated by a diagram.) Regularly expanding rhythm, on the other hand, not only becomes imperceptible as it is carried further, but tends merely to make musical proportions resemble those of a chess-board. In great music the expanding principle is therefore always contrasted with or modified by the tapering principle, which can indeed exist simultaneously with it and with any other. For, to take only three categories, the harmonic changes of a passage may be designed in tapering rhythm while the melodic phrases expand, and the entries of instruments or parts occur on some third principle, regular or irregular. Such interplay need produce no feeling of complexity; indeed, it is an art most neglected by those composers who most rely on the effect of complex rhythm. It is the main discoverable source of that almost dramatic sense of movement that distinguishes the great musical styles from the academic methods which play for safety, and from the anti-academic novelties which end in monotony.

Square rhythms become desirable at climaxes where physical energy dominates thought. Strong final cadences accordingly require that the last chord should fall on an accent; and if the pace is rapid the final chord will probably be not only on an accented beat but on an accented bar. Thus it is quite obvious that there is by a mere oversight one bar too many in the four bars of tremolo quavers at the end of the first movement of Beethoven's Fourth Symphony; for they are followed by an important bar leading to the last three chords, which words can only mean (counting bars as beats)— "ONE, two, THREE" ("four" being silent and therefore unwritten). A fifth bar of tremolo would correct the rhythm in a more vigorous but more vulgar way by bringing the last chord onto "ONE" of the next imaginary group of four. The former correction is so obviously right that the imagination makes it in spite of the presence of the superfluous bar, which is instinctively ignored as an accidental prolongation of the tremolo. Where the composer writes in bars so short as to be permanently less than the phrases of the piece (as in Beethoven's scherzos), or in bars that are frequently longer than the phrases (as in most of Mozart's movements in slow or moderate common time), it sometimes becomes impossible to construe the music without carefully calculating where the accents come; and this calculation is most easily made on the assumption that the strongest cadences bring the tonic chord on an accent. Thus, in Beethoven's Sonata in E flat, Op. 27, No. 1, the first bar of the second movement must be preliminary and the first accent must come on the second bar, since the piece refuses to make sense in any other way. Indeed, Beethoven has written some notes twice over in order to bring his double-bars and repeat-marks where they will indicate the true rhythmic joints to the eye. (A double-bar is a mere graphic indication of some important sectional division, not necessarily rhythmic or even coincident with a normal bar-stroke.)

Theorists, however, have developed a tendency to assume that all cadences must be strong. More than one critic has told us that the scherzo of Beethoven's Sonata, Op. 28, is in the same predicament as that of Op. 27, No. 1; though it not only makes excellent sense with its cadences in the light and weak form in which they appear, but, when recontrued on the "strong cadence" theory, entirely fails in its middle portion to uphold that theory or to make any other rhythmic sense. And when Professor Prout tells us that the overture to *Figaro* begins with a silent bar, and that Schubert's *Impromptu* in B flat is positively ungrammatical in its cadences unless it is entirely rebarred, and when Dr Riemann turns half the ritornello of a Bach concerto from $\frac{4}{4}$ into $\frac{3}{4}$ time, simply in order to make the sequences coincide with the hardest possible accents; then we can only protest that this is regulating musical aesthetics by criteria too crude for the aesthetics of bricklaying. An edition of *Paradise Lost*, in which the lines were so rearranged as to bring all punctuation marks (except perhaps commas) at the end of the line, would be on precisely the same level of ingenious barbarity.

The technical terms exclusively peculiar to the subject of musical rhythm; but some obvious terms of syntax, such as *phrase*, *period* and *section* are used with varying degrees of system by all writers on music; and the whole terminology of prosody has been annexed—with such success that we are told in Grove's *Dictionary* (article "Metre") that "the theme of Weber's *Rondo brillante* in E flat (Op. 62) is in Anapaestic Tetrameter Brachycatalectic, very rigidly maintained."

One important term has acquired a special significance in music: viz. *Syncopation*. It means a cross-accent of such strength as to equal or even suppress the main accent; but the use of the term is generally restricted to cases in which the cross-accent is produced by shifting the notes of a melody or a formula so that they fall between the beats instead of upon them. From what we have said as to the almost physical energy of musical rhythm it is obvious that such a phenomenon is of far greater effect and importance in music than it could possibly be in verse; and, to whichever subject the term may belong by priority, extreme caution is needed in extending any musical notion of it to the structure of poetry. (D. F. T.)

RHYTINA, a name applied to the northern sea-cow (*Rhytina gigas*, or *stelleri*), a gigantic relative of the manati and dugong, which formerly inhabited Bering and Copper Islands, in the North Pacific, where it was discovered during Bering's voyage in 1741, and subsequently described by Steller, who accompanied that expedition as a naturalist. Bering's half-starved sailors soon reduced the numbers of these comparatively helpless creatures; and it was not long after—probably about the year 1768—that the species, which was the sole representative of its genus, became completely exterminated. The *Rhytina* was the largest member of the order Sirenia, attaining a length of nearly twenty feet; and had a very thick, rugged, bark-like skin. The jaws, which are bent downwards to a moderate extent, are unprovided with teeth, but in life carried ridged horny plates. The tail was very deeply forked; and the flippers were short and truncated, lacking apparently the terminal joints of the digits.

When first discovered, this Sirenian was extremely numerous in the bays of Bering Island, where it browsed upon the abundant sea-tangle. Its extirpation is due to the Russian sailors and traders who visited the island in pursuit of seals and sea-otters, and who subsisted on its flesh. Numbers of bones have been discovered in the soil of Bering and Copper Islands, from which more or less nearly perfect skeletons have been reconstructed, so that the osteology of this interesting animal is well represented in most of the larger museums. (R. L.*)

RIANSARES, AUGUSTIN FERNANDEZ MUÑOZ, DUKE OF (1808 or 1810–1873), morganatic husband of Maria Christina, queen and regent of Spain, was born at Tarancón, in the province of Cuenca, in New Castile. His father was the keeper of an "*estanco*" or office for the sale of the tobacco of the government monopoly. He enlisted in the bodyguard, and attracted the attention of the queen. According to one account, he distinguished himself by stopping the runaway horses of her carriage; according to another, he only picked up her handkerchief; a third and scandalous explanation of his fortune has been given. It is certain that the queen married him privately, very soon after the death of her husband on the 29th of September 1833. By publishing her marriage, Maria Christina would have forfeited the regency; but her relations with Muñoz were perfectly well known. When on the 13th of August 1836 the soldiers on duty at the summer palace, La Granja, mutinied and forced the regent to grant a constitution, it was generally, though wrongly, believed that they overcame her reluctance by seizing Muñoz, whom they called her "*guapo*," or fancy man, and threatening to shoot him. When in 1840 the queen found her position intolerable and fled the country, Muñoz went with her and the marriage was published, and on the overthrow of Espartero in 1843 the couple returned. In 1844 Queen Isabella II., who was now declared to be of age, gave her consent to her mother's marriage, which was publicly performed. Muñoz was created duke of Riansares and made a knight of the Golden Fleece. By Louis Philippe, king of the French, he was created Duke of Mont-Morol and Grand Cross of the Legion of Honour. Until his wife was finally driven from Spain by the revolutionary movement of 1854, the duke is credibly reported to have applied himself to making a large fortune out of railway concessions and by judicious stock exchange speculations. Political ambitions he had none, and it is said that he declined the offer of the crown of Ecuador. All authorities agree that he was not only good-looking, but kindly and well-bred. He died five years before his wife at L'Adresse, near Havre, on the 11th of September 1873. Several children were born of the marriage.

RIAZ PASHA (*c.* 1835–), Egyptian statesman, born about 1835, was of a Circassian family, but said to be of Hebrew extraction. Little is known of his early life save that until the accession of Ismail Pasha to the vice-royalty of Egypt in 1863 he occupied a humble position. Ismail, recognizing in this obscure individual a capacity for hard work and a strong will, made him one of his ministers, to find, to his chagrin, that Riaz was also an honest man possessed of a remarkable independence of character. When Ismail's financial straits compelled him to agree to a commission of inquiry Riaz was the only Egyptian of known honesty sufficiently intelligent and patriotic to be named as a vice-president of the commission. He filled this office with distinction, but not to the liking of Ismail. The khedive, however, felt compelled, when as a sop to his European creditors he assumed the position of a constitutional monarch, to nominate Riaz as a member of the first Egyptian cabinet. For the few months this government lasted (September 1878 to April 1879) Riaz was minister of the interior. When Ismail dismissed the cabinet and attempted to resume autocratic rule, Riaz had to flee the country. Upon the deposition of Ismail, June 1879, Riaz was sent for by the British and French controllers, and he formed the first ministry under the khedive Tewfik. His administration, marked by much ability, lasted only two years, and was overthrown by the agitation which had for figure-head Arabi Pasha (*q.v.*). The beginnings of this movement Riaz treated as of no consequence. In reply to a warning of what might happen he said, "But this is Egypt; such things do not happen; you say they have happened elsewhere, perhaps, but this is Egypt." On the evening of the 9th of September 1881, after the military demonstration in Abdin Square, Riaz was dismissed; broken in health he went to Europe, remaining at Geneva until the fall of Arabi. After that event Riaz, subordinating his vanity to his patriotism, accepted office as minister of the interior under Sherif Pasha (*q.v.*). Had Riaz had his way Arabi and his associates would have been executed forthwith, and when the British insisted that clemency should be extended to the leaders of the revolt Riaz refused to remain in office, resigning in December 1882. He took no further part in public affairs until 1888, when, on the dismissal of Nubar Pasha (*q.v.*), he was summoned to form a government. He now understood that the only policy possible for an Egyptian statesman was to work in harmony with the British agent (Sir Evelyn Baring—afterwards Lord Cromer). This he succeeded in doing to a large extent, witnessing if not initiating the practical abolition of the *corvée* and many other reforms. The appointment of an Anglo-Indian official as judicial adviser to the khedive was, however, opposed by Riaz, who resigned in May 1891. In the February following he again became prime minister under Abbas II., being selected as comparatively acceptable both to the khedivial and British parties. In April 1894 Riaz finally resigned office on account of ill-health. Superior, probably, both intellectually and morally to his great rival Nubar, he lacked the latter's broad statesmanship as well as his pliability. Riaz's standpoint was that of the benevolent autocrat; he believed that the Egyptians were not fitted for self-government and must be treated like children, protected from ill-treatment by others and prevented from injuring themselves. In 1889 he was made an honorary G.C.M.G. A worthy tribute to Riaz was paid by Lord Cromer in his final speech at Cairo on the 4th of May 1907. "Little or no courage is now required," said Lord Cromer, "on the part of a young Egyptian who poses as a reformer, but it was not always so. Ismail Pasha had some very drastic methods of dealing with those who did not bow before him. Nevertheless, some thirty years ago Riaz Pasha stood forth boldly to protest against the maladministration that then prevailed in Egypt. He was not afraid to bell the cat."

RIB (from O. Eng. *ribb*; the word appears in many Teutonic languages, cf. Ger. *Rippe*, Swed. *reb*), in anatomy, the primary meaning, one of the series of elastic arched bones (*costae*) which form the casing or framework of the thorax (see SKELETON: *Axial*). The word is in meaning transferred to many objects resembling a rib in shape or function, in architecture, it is thus used of the arches of stone which in medieval work constitute the skeleton of the vault, and carry the shell or web. Although in the Roman vault the rib played an important element in its construction, it was generally hidden in the thickness of the vault and was made subservient to its geometrical surfaces. The Gothic masons, on the other hand, reversed the process, and not only made the vaulting surface subservient to the rib, but by mouldings rendered the latter a highly decorative feature. The principal ribs are the transverse (*arc doubleau*), the diagonal (*arc ogive*) and the wall rib (*formeret*). Those of less importance are the intermediate, the ridge and lierne ribs. The ridge-rib was originally introduced into the vault to resist the thrust of the intermediate ribs between the wall and diagonal ribs; it also served to mark the junction of the filling-in or web of vaults in those cases where the courses dipped toward the diagonal rib. (See VAULT.) A lierne rib (the term is borrowed from the French) is a short rib, introduced into the vaulting in the Early Perpendicular period, which coupled together the transverse and intermediate ribs; in the later period the "lierne" rib becomes one of the chief features of the "stella" vault (see further VAULT).

RIBADENEIRA, PEDRO A. (1527–1611), hagiologist, was born at Toledo on the 1st of November 1527. As a lad he repaired to Rome for study, and there on the 18th of September 1540 was admitted by Ignatius Loyola, in his thirteenth year, as one of the Society of Jesus, which had not yet received papal sanction. He pursued his studies at Paris (1542) in philosophy and theology. Loyola, in 1555, sent him on a mission to Belgium; in pursuance of it he visited England in

1558. A later result of his visit was his *Historia Ecclesiastica del scisma del Reyno de Inglaterra* (1588–1594), often reprinted, and used in later editions of N. Sander's *De Origine et Progressu Schismatis Anglicani*. In 1560 he was made Provincial of the Society of Jesus in Tuscany, thence transferred as Provincial to Sicily in 1563, again employed in Flanders, and from 1571 in Spain. In 1574 he settled in Madrid, where he died on the 10th of September 1611. His most important work is the *Life of Loyola* (1572), which he was the first to write. In his first edition of the Life, as also in the second enlarged issue (1587), Ribadeneira affirmed that Loyola had wrought no miracle, except the foundation of his Society (thus making his claim parallel with that of Mahomet, whose only miracle, originally, was the Koran). In the process for the canonization of Loyola, a narrative published by Ribadeneira in 1609 exhibited miracles; and these are recorded in an abridgment of the Life by Ribadeneira (published posthumously in 1612) with a statement by Ribadeneira that he had known of them in 1572 but was not then satisfied of their proof. For this change of opinion he is taken to task by Bayle. That Ribadeneira was, though an able, a very credulous writer, is shown by his lives of the successors of Loyola in the generalship of the Society, Lainez and Borgia; and especially by his *Flos Sanctorum* (1590–1610), a collection of saints' lives, entirely superseded by the labours of the Bollandists. His other works are numerous but of little moment, including his *Tratado de la religion* (1595), intended as a refutation of Machiavelli's *Prince*.

See his autobiography in his *Bibliotheca Scriptorum Societatis Jesu* (1602 and 1608, supplemented by P. Alegambe and N. Sotwell in 1676); N. Antonio, *Biotheca Hispana Nova* (1788); *Biographie Universelle* (Michaud) (1842–1865). (A. Go.*)

RIBALD, a word now only used in the sense of jeering, irreverent, abusive, particularly applied to the uses of low, offensive or mocking jests. It has an interesting early history, of which Du Cange (Gloss. s.v. *Ribaldi*) gives a full account. It is one of those words, like the Greek *τύραννος*, an unconstitutional ruler, and the Latin *latro*, a hired soldier, mercenary, later robber, which have acquired a degraded and evil significance. The *ribaldi* were light-armed soldiers, on whom fell the duty of being first in attack, the *enfans perdus* or "forlorn hope" of the armies of the French kings; thus Rigordus, in his contemporary history of the reign of Philip Augustus, for the year 1189, speaks of the *Ribaldi . . . qui primos impetus in expugnandis munitionibus facere consueverunt*. Later we find the *ribaldi* among the rabble of camp-followers of an army, and Giovanni Villani, in his 16th-century *Chronicle* (11, 139), speaks of *ribaldi et i raguazzi del hoste*, and Froissart of the *ribaux* as the lowest ranks in an army. *Ribaldus* (*ribaut*) was thus a common name for everything ruffianly and abandoned, and Matthew Paris (*Ann.* 1251) says: *Fures, exules, fugitivi, excommunicati, quos omnes Ribaldos Francia vulgariter consuevit appellare.* The name (*ribaldae* or *ribaldi*) was particularly applied to prostitutes, brothel-keepers and all who frequent haunts of vice, and there was at the French court from the 12th century an official, known as *Rex Ribaldorum*, king of the ribalds, changed in the reign of Charles VI. to *Praepositus Hospitii Regis*, whose duty was to investigate and hold judicial inquiry into all crimes committed within the precincts of the court, and control vagrants, prostitutes, brothels and gambling-houses. The etymology of the word has been much discussed, and no certainty can be arrived at. The termination *—ald*—points to a Teutonic origin, and connexion has been suggested with O.H.Ger. *Hripa*, M.H.Ger. *Ribe*, prostitute, with Ger. *reiben*, rub, or with *rauben*, rob. Neither Skeat nor the *New English Dictionary* find any relation to the English "bawd," procuress, pander.

RIBAULT (or RIBAUT), **JEAN** (*c.* 1520–1565), French navigator, famous for his connexion with the early settlement of Florida, was born at Dieppe, probably about 1520. Appointed by Admiral Coligny to the command of an expedition to prepare an asylum for French Protestants in America, Ribault sailed on the 18th of February 1562, with two vessels, and on the 1st of May landed in Florida at St John's river, or, as he called it, Rivière de Mai. Having settled his colonists at Port Royal Harbour (now Paris Island, South Carolina), and built Fort Charles for their protection, he returned to France to find the country in the throes of the Civil War. In 1563 he appears to have been in England and to have issued *True and Last Discoverie of Florida* (Hakluyt Soc., vol. vii.). In April 1564 Coligny was in a position to despatch another expedition under René de Laudonnière, but meanwhile Ribault's colony had come to an untimely end—the unfortunate adventurers, destitute of supplies from home, having revolted against their governor and attempted to make their way back to Europe in a boat which was happily picked up, when they were in the last extremities, by an English vessel. In 1565 Ribault was again sent out to satisfy Coligny as to Laudonnière's management of his new settlement, Fort Caroline, on the Rivière de Mai. While he was still there the Spaniards, under Menendez de Aviles, though their country was at peace with France, attacked the French ships at the mouth of the river. Ribault set out to retaliate on the Spanish fleet, but his vessels were wrecked by a storm near Matanzas Inlet and he had to attempt to return to Fort Caroline by land. The fort had by this time fallen into the hands of the Spaniards, who had slaughtered all the colonists except a few who got off with two ships under Ribault's son. Induced to surrender by false assurances of safeguard, Ribault and his men were also put to the sword in October 1565. The massacre was avenged in kind by Dominique de Gourgues (d. 1583) two years later.

See E. and E. Haag, *La France protestante* (1846–1859); and F. Parkman, *Pioneers of France in the New World* (new ed., 1899).

RIBBECK, JOHANN CARL OTTO (1827–1898), German classical scholar, was born at Erfurt in Saxony on the 23rd of July 1827. Having held professorial appointments at Kiel and Heidelberg, he succeeded his tutor Ritschl in the chair of classical philology at Leipzig, where he died on the 18th of July 1898. Ribbeck was the author of several standard works on the poets and poetry of Rome, the most important of which are the following: *Geschichte der römischen Dichtung* (2nd ed., 1894–1900); *Die römische Tragödie im Zeitalter der Republik* (1875); *Scaenicae Romanorum Poesis Fragmenta*, including the tragic and comic fragments (3rd ed., 1897). As a textual critic he was distinguished by considerable rashness, and never hesitated to alter, rearrange or reject as spurious what failed to reach his standard of excellence. These tendencies are strikingly shown in his editions of the *Epistles* and *Ars Poetica* of Horace (1869), the *Satires* of Juvenal (1859) and in the supplementary essay *Der echte und unechte Juvenal* (1865). In later years, however, he became much more conservative. His edition of Virgil (2nd ed., 1894–1895), although only critical, is a work of great erudition, especially the Prolegomena. His biography of Ritschl (1879–1881) is one of the best works of its kind. The influence of his tutor may be seen in Ribbeck's critical edition of the *Miles Gloriosus* of Plautus, and *Beiträge zur Lehre von den lateinischen Partikeln*, a work of much promise, which causes regret that he did not publish further results of his studies in that direction. His miscellaneous *Reden und Vorträge* were published after his death (Leipzig, 1899). He took great interest in the monumental *Thesaurus Linguae Latinae*, and it was chiefly owing to his efforts that the government of Saxony was induced to assist its production by a considerable subsidy.

The chief authority for his life is *Otto Ribbeck; ein Bild seines Lebens aus seinen Briefen* (1901), ed. by Emma Ribbeck.

RIBBON-FISHES (Trachypteridae), a family of marine fishes readily recognized by their long, compressed, tape-like body, short head, narrow mouth and feeble dentition. A high dorsal fin occupies the whole length of the back; an anal is absent, and the caudal, if present, consists of two fascicles of rays of which the upper is prolonged and directed upwards. The pectoral fins are small, the ventrals composed of several rays, or of one long ray only. Ribbon-fishes possess all the characteristics of fishes living at very great depths. They are

extremely fragile when found floating on the surface or thrown ashore, and rarely in an uninjured condition; the rays of their

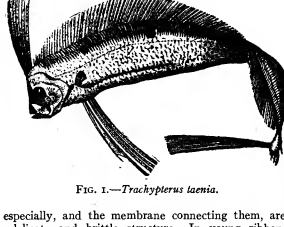

FIG. 1.—*Trachypterus taenia.*

fins especially, and the membrane connecting them, are of a very delicate and brittle structure. In young ribbon-fishes some of the fin-rays are prolonged in an extraordinary degree, and sometimes provided with appendages (see fig. 2). There

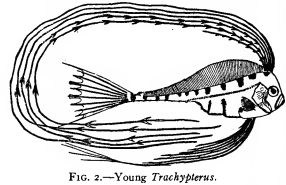

FIG. 2.—Young *Trachypterus.*

are only two genera in the family, *Regalecus*, the oar-fish, and *Trachypterus*. In the former the length of the body is about fifteen times its depth. The head likewise is compressed, short, resembling in its form that of a herring; the eye is large; the mouth is small, and provided with very feeble teeth. A long many-rayed dorsal fin, of which the very long anterior rays form a kind of high crest, extends from the top of the head to the end of the tail; the anal and perhaps the caudal fins are absent; but the ventrals (and by this the oar-fish is distinguished from the other ribbon-fishes) are developed into a pair of long filaments, which terminate in a paddle-shaped extremity, but are too flexible to assist in locomotion. The whole body is covered with a layer of silvery epidermoid substance, which easily comes off and adheres to other objects.

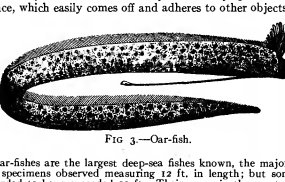

FIG 3.—Oar-fish.

Oar-fishes are the largest deep-sea fishes known, the majority of the specimens observed measuring 12 ft. in length; but some are recorded to have exceeded 20 ft. Their range in the great depths of the ocean seems to extend over all seas, but, however numerous they may be in the depths which are their home, it is only by rare accident that specimens reach the surface. Thus from the coasts of Great Britain only about twenty captures are known in the long space of a century and a half, and not more than thirteen from those of Norway. Oar-fishes have been considered by naturalists to have given rise to some of the tales of "sea-serpents," but their size as well as the facility with which they are secured when observed render this solution of the question of the existence of such a creature improbable. When they rise to the surface of the water they are either dead or in a helpless and dying condition. The ligaments and tissues by which the bones and muscles were held together whilst the fish lived under the immense pressure of great depths have then become loosened and torn by the expansion of the internal gases; and it is only with difficulty that the specimens can be taken entire out of the water, and preserved afterwards. Every specimen found has been more or less mutilated; and especially the terminal portion of the tail, which seems to end in a delicate waving filament, has never been perfect;—it is perhaps usually lost as a useless appendage at a much earlier period of the life of the fish. Of *Trachypterus*, specimens have been taken in the Atlantic, the Mediterranean, at Mauritius and in the Pacific. The species from the Atlantic has occurred chiefly on the northern coasts, Iceland, Scandinavia, Orkneys and Scotland. It is known as *T. arcticus*, in English the deal-fish; its Icelandic name is *Vagmaer*. Its length is 5 to 8 ft. Specimens seem usually to be driven to the shore by gales in winter, and are sometimes left by the tide. S. Nilsson, however, in Scandinavia observed a living specimen in two or three fathoms of water moving something like a flat-fish with one side turned obliquely upwards.

RIBBONISM, the name given to an Irish secret-society movement, which began at the end of the 18th century in opposition to the Orangemen (*q.v.*), and which was represented by various associations under different names, organized in lodges, and recruited all over Ireland from the lowest classes of the people. The actual name of Ribbonism (from a green badge worn by its members) became attached to the movement later, about 1826; and, after it had grown to its height about 1835, it declined in force, and was practically at an end in its old form when in 1871 the Westmeath Act declared Ribbonism illegal. See also under IRELAND: *History.*

RIBBONS. By this name are designated narrow webs, properly of silk, not exceeding nine inches in width, used primarily for binding and tying in connexion with dress, but also now applied for innumerable useful, ornamental and symbolical purposes. Along with that of tapes, fringes and other smallwares, the manufacture of ribbons forms a special department of the textile industries. The essential feature of a ribbon loom is the simultaneous weaving in one loom frame of two or more webs, going up to as many as forty narrow fabrics in modern looms. To effect the conjoined throwing of all the shuttles, and the various other movements of the loom, the automatic action of the power-loom is necessary; and it is a remarkable fact that the self-acting ribbon loom was known and extensively used more than a century before the famous invention of Cartwright. A loom in which several narrow webs could be woven at one time is mentioned as having been working in Dantzig towards the end of the 16th century. Similar looms were at work in Leiden in 1620, where their use gave rise to so much discontent and rioting on the part of the weavers that the states-general had to prohibit their use. The prohibition was renewed at various intervals throughout the century, and in the same interval the use of the ribbon loom was interdicted in most of the principal industrial centres of Europe. About 1676, under the name of the Dutch loom or engine loom, it was brought to London; and, although its introduction there caused some disturbance, it does not appear to have been prohibited. In 1745, John Kay, the inventor of the fly-shuttle, obtained, conjointly with Joseph Stell, a patent for improvements in the ribbon loom; and since that period it has benefited by the inventions applied to weaving machinery generally.

Ribbon-weaving is known to have been established near St Étienne (dep. Loire) so early as the 11th century, and that town has remained the headquarters of the industry. During the Huguenot troubles, ribbon-weavers from St Étienne settled at Basel and there established an industry which in modern times has rivalled that of the original seat of the trade. Crefeld is the centre of the German ribbon industry, the manufacture of black velvet ribbon being there a specialty. In England Coventry is the most important seat of ribbon-making, which is also prosecuted at Norwich and Leicester.

RIBEIRA, a town of north-western Spain, in the province of Corunna, on the extreme south-west of the peninsula formed between the river of Muros y Noya and Arosa Bay. Pop. (1900) 12,218. Ribeira is in a hilly country, abounding in wheat, wine, fruit, fish and game. Its port is Santa Eugenia de Ribeira, on Arosa Bay. The population is chiefly occupied in agriculture, cattle-breeding and fisheries.

RIBEIRO, BERNARDIM (1482–1552), the father of bucolic prose and verse in Portugal, was a native of Torrão in the Alemtejo. His father, Damião Ribeiro, was implicated in the conspiracy against King John II. in 1484, and had to flee to Castile, whereupon young Bernardim and his mother took refuge with their relations Antonio Zagalo and D. Ignez Zagalo at the Quinta dos Lobos, near Cintra. When King Manoel came to the throne in 1495, he rehabilitated the families persecuted by his predecessor, and Ribeiro was able to leave his retreat and return to Torrão. Meanwhile D. Ignez had married a rich landowner of Estremoz, and in 1503 she was summoned to court and appointed one of the attendants to the Infanta D. Beatriz. Ribeiro accompanied her, and through her influence the king took him under his protection and sent him to the university of Lisbon, where he studied from 1506 to 1512. When he obtained his degree in law, the king showed him further favour by appointing him to the post of *Escrivão da Camara*, or secretary, and later by bestowing on him the habit of the military order by São Thiago. Ribeiro's poetic career commenced with his coming to court, and his early verses are to be found in the *Cancioneiro Geral* of Garcia de Resende (*q.v.*). He took part in the historic *Serões do Paço*, or palace evening entertainments, which largely consisted of poetical improvisations; there he met and earned the friendship of the poets Sá de Miranda (*q.v.*) and Christovão Falcão (*q.v.*), who became his literary comrades and the confidants of his romance, in which hope deferred and bitter disappointment ended in tragedy. Ribeiro had early conceived a violent passion for his cousin, D. Joanna Zagalo, the daughter of his protectress, D. Ignez; but, though she seems to have returned it, her family opposed her marriage to a singer and dreamer with small means and prospects, and finally compelled her to wed a rich man, one Pero Gato. When the latter met a violent death shortly afterwards, D. Joanna retired to a house in the country, and it is alleged that Ribeiro visited her, and that their amour resulted in the birth of a child. All we know positively, however, is that in 1521 the lady went into seclusion in the convent of St Clare at Estremoz, where she fell a victim to a violent form of insanity, and that she died there some years later. It is further alleged that Ribeiro's conduct had caused a scandal which led the king to deprive him of his office and exile him. But the loss of position and income can have added very little to the poignant grief of such a true lover and profound idealist as Bernardim Ribeiro. He had poured out his heart in five beautiful eclogues, the earliest in Portuguese, written in the popular octosyllabic verse; and now, hopeless of the future and broken in spirit, he decided to go to Italy, for a poet the land of promise. He started early in 1522, and travelled widely in the peninsula, and during his stay he wrote his moving knightly and pastoral romance *Menina e Moça*, in which he related the story of his unfortunate passion, personifying himself under the anagram of "Bimnarder," and D. Ignez under that of "Aonia." When he returned home in 1524, the new king, John III., restored him to his former post, and it is said that he paid a last visit to his love at St Clare's convent and found her in a fit of raving madness. This no doubt preyed on a mind already unhinged by trouble, and hastened the decline of his mental powers, which had already commenced. About 1534 a long illness supervened, and the years that elapsed between that year and his death may be described as the night of his soul. He was quite unable to fulfil the duties of his office, and in 1549 the king bestowed upon him a pension for his support; but he did not live long to enjoy it, for in 1552 he died insane in All Saints Hospital in Lisbon.

The *Menina e Moça* was not printed until after Ribeiro's death, and then first in Ferrara in 1554. On its appearance the book made such a sensation that its reading was forbidden, because, though it contained nothing heterodox, it disclosed a family tragedy which the allegory could not hide. It is divided into two parts, the first of which is certainly the work of Ribeiro, while as to the second opinion is divided, though Dr Theophilo Braga considers it genuine and explains its progressive lack of lucidity and order by the mental illness of the author. The first part has been ably edited by Dr José Pessanha (**Oporto,** 1891). Ribeiro's verses, including his five ecogues, which for their sincerity of feeling, simple diction and chaste form are unsurpassed in Portuguese literature, were reprinted in a limited édition de luxe by Dr Xavier da Cunha (Lisbon, 1886).

AUTHORITIES.—Visconde Sanches de Baena, *Bernardim Ribeiro* (Lisbon, 1895); Dr Theophilo Braga, *Bernardim Ribeiro e o Bucolismo* (Oporto, 1897), containing a full analysis of Ribeiro's novel (sometimes called the *Saudades*, though it is more commonly described, as here, by the initial words of the story, *Menina e Moça*). (E. PR.)

RIBERA, GIUSEPPE (1588–1656), commonly called Lo SPAGNOLETTO, or the Little Spaniard, a leading painter of the Neapolitan or partly of the Spanish school, was born near Valencia in Spain, at Xativa, now named S. Felipe, on 12th January 1588. His parents intended him for a literary or learned career; but he neglected the regular studies, and entered the school of the Spanish painter Francisco Ribalta. Fired with a longing to study art in Italy, he somehow made his way to Rome. Early in the 17th century a cardinal noticed him in the streets of Rome drawing from the frescoes on a palace façade; he took up the ragged stripling and housed him in his mansion. Artists had then already bestowed upon the alien student, who was perpetually copying all sorts of objects in art and in nature, the nickname of Lo Spagnoletto. In the cardinal's household Ribera was comfortable but dissatisfied, and one day he decamped. He then betook himself to the famous painter Michelangelo da Caravaggio, the head of the naturalist school, called also the school of the Tenebrosi, or shadow-painters, owing to the excessive contrasts of light and shade which marked their style. The Italian master gave every encouragement to the Spaniard, but not for long, as he died in 1609. Ribera, who had in the first instance studied chiefly from Raphael and the Caracci, had by this time acquired so much mastery over the tenebroso style that his performances were barely distinguishable from Caravaggio's own. He now went to Parma, and worked after the frescoes of Correggio with great zeal and efficiency: in the museum of Madrid is his "Jacob's Ladder," which is regarded as his *chef-d'œuvre* in this manner. From Parma Spagnoletto returned to Rome, where he resumed the style of Caravaggio, and shortly afterwards he migrated to Naples, which became his permanent home.

Ribera was as yet still poor and inconspicuous, but a rich picture-dealer in Naples soon discerned in him all the stuff of a successful painter, and gave him his daughter in marriage. This was the turning-point in the Spaniard's fortunes. He painted a "Martyrdom of St Bartholomew," which the father-in-law exhibited from his balcony to a rapidly increasing and admiring crowd. The popular excitement grew to so noisy a height as to attract the attention of the Spanish viceroy, the Count de Monterey. From this nobleman and from the king of Spain, Philip IV., commissions now flowed in upon Ribera. With prosperity came grasping and jealous selfishness. Spagnoletto, chief in a triumvirate of greed, the "Cabal of Naples," his abettors being a Greek painter, Belisario Corenzio, and a Neapolitan, Giambattista Caracciolo, determined that Naples should be an artistic monopoly; by intrigue, terrorizing and personal violence on occasion they kept aloof all competitors. Annibale Caracci, the Cavalier d'Arpino, Guido, Domenichino, all of them successively invited to work in Naples, found the place too hot to hold them. The cabal ended at the time of Caracciolo's death in 1641.

The close of Ribera's triumphant career has been variously related. If we are to believe Dominici, the historian of Neapolitan art, he totally disappeared from Naples in 1648 and

was no more heard of—this being the sequel of the abduction by Don John of Austria, son of Philip IV., of the painter's beautiful only daughter Maria Rosa. But these assertions have not availed to displace the earlier and well-authenticated statement that Ribera died peaceably and wealthy in Naples in 1656. His own signature on his pictures is constantly "Jusepe de Ribera, Español." His daughter, so far from being disgraced by an abduction, married a Spanish nobleman who became a minister of viceroy.

The pictorial style of Spagnoletto is extremely powerful. In his earlier style, founded (as we have seen) sometimes on Caravaggio and sometimes on the wholly diverse method of Correggio, the study of Spanish and Venetian masters can likewise be traced. Along with his massive and predominating shadows, he retained from first to last great strength of local colouring. His forms, though ordinary and partly gross, are correct; the impression of his works gloomy and startling. He delighted in subjects of horror. Salvator Rosa and Luca Giordano were his most distinguished pupils; also Giovanni Do, Enrico Fiammingo, Michelangelo Fracanzani, and Aniello Falcone, who was the first considerable painter of battle-pieces. Among Ribera's principal works should be named "St Januarius Emerging from the Furnace," in the cathedral of Naples; the "Descent from the Cross," in the Neapolitan Certosa, generally regarded as his masterpiece; the "Adoration of the Shepherds" (a late work, 1650), now in the Louvre; the "Martyrdom of St Bartholomew," in the museum of Madrid; the "Pietà," in the sacristy of S. Martino, Naples. His mythologic subjects are generally unpleasant—such as the "Silenus," in the Studj Gallery of Naples, and "Venus Lamenting over Adonis," in the Corsini Gallery of Rome. The Louvre contains altogether twenty-five of his paintings; the National Gallery, London, two—one of them, a "Peità," being an excellent though not exactly a leading specimen. He executed several fine male portraits; among others his own likeness, now in the collection at Alton Towers. He also produced twenty-six etchings, ably treated. For the use of his pupils, he drew a number of elementary designs, which in 1650 were etched by Francisco Fernandez, and which continued much in vogue for a long while among Spanish and French painters and students.

Besides the work of Dominici already referred to (1840–46), the *Diccionario Historico* of Cean Bermudez is a principal authority regarding Ribera and his works; also E. de Laluing, "Iuberà." (In *Histoire de quatre grands peintres*), 1888. (W. M. R.)

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842–), French statesman, was born at St Omer on 7th February 1842. After a brilliant career at the university of Paris, where he was *lauréat* of the faculty of law, he rapidly made his mark at the bar. He was secretary of the conference of advocates and one of the founders of the *Société de législation comparée*. During 1875 and 1876 he was successively director of criminal affairs and secretary-general at the ministry of justice. In 1877 he made his entry into political life by the conspicuous part he played on the committee of legal resistance during the Broglie ministry, and in the following year he was returned to the chamber as a moderate republican member for Boulogne, in his native department of Pas-de-Calais. His impassioned yet reasoned eloquence gave him an influence which was increased by his articles in the *Parlement* in which he opposed violent measures against the unauthorized congregations. He devoted himself especially to financial questions, and in 1882 was reporter of the budget. He became one of the most prominent republican opponents of the Radical party, distinguishing himself by his attacks on the short-lived Gambetta ministry. He refused to vote the credits demanded by the Ferry cabinet for the Tongking expedition, and shared with M. Clémenceau in the overthrow of the ministry in 1885. At the general election of that year he was one of the victims of the Republican rout in the Pas-de-Calais, and did not re-enter the chamber till 1887. After 1889 he sat for St Omer. His fear of the Boulangist movement converted him to the policy of "Republican Concentration," and he entered office in 1890 as foreign minister in the Freycinet cabinet. He had an intimate acquaintance and sympathy with English institutions, and two of his published works—an address, *Biographie de Lord Erskine* (1866), and *Étude sur l'acte du 5 avril 1873 pour l'établissement d'une cour suprême de justice en Angleterre* (1874)—deal with English questions; he also gave a fresh and highly important direction to French policy by the understanding with Russia, which was declared to the world by the visit of the French fleet to Cronstadt in 1891, and which subsequently ripened into a formal treaty of alliance. He retained his post in the Loubet ministry (February–November 1892), and on its defeat became himself president of the council, retaining the direction of foreign affairs. The government resigned in March 1893 on the refusal of the chamber to accept the Senate's amendments to the budget. On the election of Félix Faure as president of the Republic in January 1895, M. Ribot again became premier and minister of finance. On the 10th of June he was able to make the first official announcement of a definite alliance with Russia. On the 30th of October the government was defeated on the question of the Chemin de fer du Sud, and resigned office. The real reason of its fall was the mismanagement of the Madagascar expedition, the cost of which in men and money exceeded all expectations, and the alarming social conditions at home, as indicated by the strike at Carmaux. After the fall of the Méline ministry in 1898 M. Ribot tried in vain to form a cabinet of "conciliation." He was elected, at the end of 1898, president of the important commission on education, in which he advocated the adoption of a modern system of education. The policy of the Waldeck-Rousseau ministry on the religious teaching congregations broke up the Republican party, and M. Ribot was among the seceders; but at the general election of 1902, though he himself secured re-election, his policy suffered a severe check. He actively opposed the policy of the Combes ministry and denounced the alliance with M. Jaurès, and on the 13th of January 1905 he was one of the leaders of the opposition which brought about the fall of the cabinet. Although he had been most violent in denouncing the anti-clerical policy of the Combes cabinet, he now announced his willingness to recognize a new régime to replace the Concordat, and gave the government his support in the establishment of the *Associations cultuelles*, while he secured some mitigation of the severities attending the separation. He was re-elected deputy for St Omer in 1906. In the same year he became a member of the French Academy in succession to the duc d'Audiffret-Pasquier; he was already a member of the Academy of Moral and Political Science. In justification of his policy in opposition he published in 1905 two volumes of his *Discours politiques*.

RIBOT, THÉODULE (1823–1891), French painter, was born at Breteuil, in Eure, in 1823, and died at Bois Colombes, near Paris, in September 1891. A pupil nominally of Glaize, but more really of Ribera, of the great Flemings and of Chardin, Théodule Ribot had yet conspicuously his own noble and personal vision, his own intensity of feeling and rich sobriety of performance. Beginning to work seriously at art when he was no longer extremely young, and dying before he was extremely old, Ribot crowded into some thirty or thirty-five years of active practice very varied achievements; and he worked in at least three mediums, oil paint, pencil or crayon draughtsmanship and the needle of the etcher. His drawings were sometimes "complete in themselves," and sometimes fragmentary but powerful preparations for painted canvases. The etchings, of which there are only about a couple of dozen, are of the middle period of his practice; they show a diversity of method as well as of theme; the work in the well-nigh Velazquez-like "Prière"—a group of girl children—contrasting strongly with that process almost of outline alone, which he employed in the brilliant little group of prints which record his vision of the character and humours of cooks and kitchen-boys. In etching, the method varied with the theme—not with the period. It is quite otherwise with the paintings. Here the earlier work, irrespective of its subject, is the drier

and the more austere; the later work, irrespective of its subject, the freer and broader. But even in that which is quite early there is a curious and impressive intensity of conception and presentation. His visions of elderly women and young girls remain upon the memory. His women, wrinkled and worn, have had the experience of a hard and grinding world; his children, his young girls, are the quintessence of innocence and happy hopefulness, and life is a jest to his boys. His religious pieces, in which Ribera affected him, have conviction and force. Into portraits and into character studies, but more especially into *genre* subjects, Ribot was apt to introduce Still-life, and to make much of it. Herein, as in his sense of homeliness, he resembled Chardin. But again, Chardin-like, he painted Still-life for its own sake, by itself, and always with an extraordinary sense of the solidity and form, the texture and the hue, and, it must be added also, the very charm of matter. (F. Ws.)

RIBOT, THÉODULE ARMAND (1839–), French psychologist, was born at Guingamp on the 18th of December 1839, and was educated at the Lycée de St Brieuc. In 1856 he began to teach, and was admitted to the École Normale Supérieure in 1862. In 1885 he gave a course of lectures on "Experimental Psychology" at the Sorbonne, and in 1888 was appointed professor of that subject at the College of France. His thesis for his doctor's degree, republished in 1882, *Hérédité: étude psychologique* (5th ed., 1889), is his most important and best known book. Following the experimental and synthetic methods, he has brought together a large number of instances of inherited peculiarities; he pays particular attention to the physical element of mental life, ignoring all spiritual or nonmaterial factors in man. In his work on *La Psychologie anglaise contemporaine* (1870), he shows his sympathy with the sensationalist school, and again in his translation of Herbert Spencer's *Principles of Psychology*. Besides numerous articles, he has written on Schopenhauer, *Philosophie de Schopenhauer* (1874; 7th ed., 1896), and on the contemporary psychology of Germany (*La Psychologie allemande contemporaine*, 1879; 13th ed., 1898), also four little monographs on *Les Maladies de la mémoire* (1881; 13th ed., 1898); *De la volonté* (1883; 14th ed., 1899); *De la personnalité* (1885; 8th ed., 1899); and *La Psychologie de l'attention* (1888), which supply useful data to the student of mental disease.

Other works by him are:—*La Psychologie des sentiments* (1896); *L'Évolution des idées générales* (1897); *Essai sur l'imagination créatrice* (1900). *La Logique des sentiments* (1904). *Essai sur les passions* (1906). Of the above the following have been translated into English:—*English Psychology* (1873); *Heredity: a Psychological Study of its Phenomena, Laws, Causes, and Consequences* (1875); *Diseases of Memory: An Essay in the Positive Psychology* (1882); *Diseases of the Will* (New York, 1884); *German Psychology of to-day*, tr. J. M. Baldwin (New York, 1886); *The Psychology of Attention* (Open Court Publishing Company, Chicago, 1890); *Diseases of Personality* (Chicago, 1895); *The Psychology of the Emotions* (1897); *The Evolution of General Ideas*, tr. F. A. Welby (Chicago, 1899); *Essay on the Creative Imagination*, tr. A. H. N. Baron (1906).

RICARD, LOUIS GUSTAVE (1823–1873), French painter, was born in Marseilles in 1823, and studied first under Auber in his native town, and subsequently under Coignet in Paris. The formation of his masterly, distinguished style in portraiture was, however, due rather to ten years' intelligent copying of the old masters at the Louvre and at the Italian galleries, than to any school training. He was a master of technique, and his portraits—about two hundred—reveal an extraordinary insight into the character of his sitters. Nevertheless, for some time after his death his name was almost forgotten by the public, and it is only of quite recent years that he has been corceded the position among the leading masters of the modern French school which is his due. A portrait of himself, and one of Alfred de Musset, are at the Luxembourg Gallery. Among his best known works are the portrait of his mother, and those of the painters Fromentin, Heilbuth and Chaplin.

See *Gustave Ricard*, by Camille Mauclair (Paris, *Librairie de l'art*).

RICARDO, DAVID (1772–1823), English economist, was born in London on the 19th of April 1772, of Jewish origin. His father, who was of Dutch birth, bore an honourable character and was a successful member of the Stock Exchange. At the age of fourteen Ricardo entered his father's office, where he showed much aptitude for business. About the time when he attained his majority he abandoned the Hebrew faith and conformed to the Anglican Church, a change which seems to have been connected with his marriage to Miss Wilkinson, which took place in 1793. In consequence of the step thus taken he was separated from his family and thrown on his own resources. His ability and uprightness were known, and he at once entered on such a successful career in the profession to which he had been brought up that at the age of twenty-five, we are told, he was already rich. He now began to occupy himself with scientific pursuits, and gave some attention to mathematics as well as to chemistry and mineralogy; but, having met with Adam Smith's great work, he threw himself with ardour into the study of political economy.

His first publication (1809) was *The High Price of Bullion a Proof of the Depreciation of Bank Notes*. This tract was an expansion of a series of articles which the author had contributed to the *Morning Chronicle*. It gave a fresh stimulus to the controversy, which had for some time been discontinued, respecting the resumption of cash payments, and indirectly led to the appointment of a committee of the House of Commons, commonly known as the Bullion Committee, to consider the whole question. The report of the committee asserted the same views which Ricardo had put forward, and recommended the repeal of the Bank Restriction Act. Notwithstanding this, the House of Commons declared in the teeth of the facts that paper had undergone no depreciation. Ricardo's first tract, as well as another on the same subject, attracted much attention.

In 1811 he made the acquaintance of James Mill, whose introduction to him arose out of the publication of Mill's tract entitled *Commerce Defended*. Whilst Mill doubtless largely affected his political ideas, he was, on his side, under obligations to Ricardo in the purely economic field; Mill said in 1823 that he himself and J. R. M'Culloch were Ricardo's disciples, and, he added, his only genuine ones.

In 1815, when the Corn Laws were under discussion, he published his *Essay on the Influence of a Low Price of Corn on the Profits of Stock*. This was directed against a recent tract by Malthus entitled *Grounds of an Opinion on the Policy of Restraining the Free Importation of Foreign Corn*. The reasonings of the essay are based on the theory of rent which has often been called by the name of Ricardo; but the author distinctly states that it was not due to him. "In all that I have said concerning the origin and progress of rent I have briefly repeated, and endeavoured to elucidate, the principles which Malthus has so ably laid down on the same subject in his *Inquiry into the Nature and Progress of Rent*." We now know that the theory had been fully stated, before the time of Malthus, by Anderson; it is in any case clear that it was no discovery of Ricardo. Ricardo states in this essay a set of propositions, most of them deductions from the theory of rent, which are in substance the same as those afterwards embodied in the *Principles*, and regarded as characteristic of his system, such as that increase of wages does not raise prices; that profits can be raised only by a fall in wages and diminished only by a rise in wages; and that profits, in the whole progress of society, are determined by the cost of the production of the food which is raised at the greatest expense. It does not appear that, excepting the theory of foreign trade, anything of the nature of fundamental doctrine, as distinct from the special subjects of banking and taxation, is laid down in the *Principles* which does not already appear in this tract. We find in it, too, the same exclusive regard to the interest of the capitalist class, and the same identification of their interest with that of the whole nation, which are generally characteristic of his writings.

In the *Proposals for an Economical and Secure Currency* (1816) he first disposes of the chimera of a currency without a specific standard, and pronounces in favour of a single metal, with a preference for silver, as the standard.

Ricardo's chief work, *Principles of Political Economy and Taxation*, appeared in 1817. The fundamental doctrine of this work is that, on the hypothesis of free competition, exchange value is determined by the labour expended in production,—a proposition not new, nor, except with considerable limitation and explanation, true, and of little practical use, as "amount of labour" is a vague expression, and the thing intended is incapable of exact estimation. Ricardo's theory of distribution has been briefly enunciated as follows: "(1) The demand for food determines the margin of cultivation; (2) this margin determines rent; (3) the amount necessary to maintain the labourer determines wages; (4) the difference between the amount produced by a given quantity of labour at the margin and the wages of that labour determines profit." These theorems are too absolutely stated, and require much modification to adapt them to real life. His theory of foreign trade has been embodied in the two propositions: "(1) International values are not determined in the same way as domestic values; (2) the medium of exchange is distributed so as to bring trade to the condition it would be in if it were conducted by barter."

A considerable portion of the work is devoted to a study of taxation, which requires to be considered as a part of the problem of distribution. A tax is not always paid by those on whom it is imposed; it is therefore necessary to determine the ultimate, as distinguished from the immediate, incidence of every form of taxation. Smith had already dealt with this question; Ricardo develops and criticizes his results. The conclusions at which he arrives are in the main as follows: a tax on raw produce falls on the consumer, but will also diminish profits; a tax on rents on the landlord; taxes on houses will be divided between the occupier and the ground landlord; taxes on profits will be paid by the consumer, and taxes on wages by the capitalist.

In 1819 Ricardo, having retired from business and become a landed proprietor, entered parliament as member for Portarlington. He was at first diffident and embarrassed in speaking, but gradually overcame these difficulties, and was heard with much attention and deference, especially when he addressed the House on economic questions. He probably contributed in a considerable degree to bringing about the change of opinion on the question of free trade which ultimately led to the legislation of Sir Robert Peel on that subject.

In 1820 he contributed to the supplement of the *Encyclopaedia Britannica* (6th ed.) an "Essay on the Funding System." In this besides giving an historical account (founded on Dr Robert Hamilton's valuable work *On the National Debt*, 1813, 3rd ed., 1818) of the several successive forms of the sinking fund, he urges that nations should defray their expenses, whether ordinary or extraordinary, at the time when they are incurred, instead of providing for them by loans.

In 1822 he published a tract *On Protection to Agriculture*, which is an able application to controversy of the general principles laid down in his systematic work. Its arguments and conclusions are therefore subject to the same limitations which those fundamental principles require.

In his *Plan for the Establishment of a National Bank*, published posthumously in 1824, he proposes that the issue of the paper currency should be taken out of the hands of the Bank of England and vested in commissioners appointed by the government. The tract describes in detail the measures to be adopted for the introduction and working of the system. A certain step towards realizing the objects of his scheme, though on different lines from Ricardo's, was taken in Sir Robert Peel's act of 1844, by which the discount business of the bank was separated from the issue department.

Ricardo died on the 11th of September 1823, at his seat (Gatcomb Park) in Gloucestershire, from a cerebral affection resulting from disease of the ear. James Mill, who was intimately acquainted with him, says (in a letter to Napier of November 1818) that he knew not a better man, and on the occasion of his death published a highly eulogistic notice of him in the *Morning Chronicle*. A lectureship on political economy, to exist for ten years, was founded in commemoration of him, M'Culloch being chosen to fill it.

In forming a general judgment respecting Ricardo, we must have in view not so much the minor writings as the *Principles*, in which his economic system is expounded as a whole. By a study of this work we are led to the conclusion that he was an economist only, not at all a social philosopher in the wider sense, like Adam Smith or John Mill. He had great acuteness, but little breadth. For any large treatment of moral and political questions he seems to have been alike by nature and preparation unfitted; and there is no evidence of his having had any but the most ordinary and narrow views of the great social problems. He shows no trace of that hearty sympathy with the working classes which breaks out in several passages of the *Wealth of Nations*; we ought, perhaps, with Held, to regard it as a merit in Ricardo that he does not cover with fine phrases his deficiency in warmth of social sentiment. The idea of the active capitalist having any duties towards his employés never seems to occur to him; the labourer is, in fact, merely an instrument in the hands of the capitalist, a pawn in the game he plays.

He first introduced into economics on a great scale the method of deduction from a priori assumptions. The conclusions so arrived at have often been treated as if they were directly applicable to real life, and indeed to the economic phenomena of all times and places. But the truth of Ricardo's theorems is now by his warmest admirers admitted to be hypothetical only. Bagehot seems right in believing that Ricardo himself had no consciousness of the limitations to which his doctrines are subject. Be this as it may, we now see that the only basis on which these doctrines could be allowed to stand as a permanent part of economic science is that on which they are placed by Roscher, namely, as a stage in the preparatory work of the economist, who, beginning with such abstractions, afterwards turns from them, not in practice merely, but in the completed theory, to real life and men as they actually are or have been.

The criticisms to which Ricardo's general economic scheme is open do not hold with respect to his treatment of the subjects of currency and banking. These form precisely that branch of economics into which moral ideas (beyond the plain prescriptions of honesty) can scarcely be said to enter, and where the operation of purely mercantile principles is most immediate and invariable. They were, besides, the departments of the study to which Ricardo's early training and practical habits led him to give special attention; and they have a lasting value independent of his systematic construction.

Ricardo's collected works were published, with a notice of his life and writings, by J. R. M'Culloch in 1846.

The *Principles* have been edited (with an introduction, bibliography and notes) by E. C. K. Gonner, 1891. See also *Letters to Malthus and Others*, ed. J. Bonar and J. H. Hollander, 1899; *Letters to J. R. M'Culloch*, ed. J. H. Hollander, 1895; *Letters to T. R. Malthus*, ed. J. Bonar, 1887. A French translation of the *Principles* by Constancio, with notes by Say, appeared in 1818; the whole works, translated by Constancio and Fonteyraud, form vol. xiii. (1847) of the *Collection des principaux économistes*, where they are accompanied by the notes of Say, Malthus, Sismondi, Rossi, &c. The *Principles* was first "naturalized" in Germany, says Roscher (though another version by Von Schmid had previously appeared), by Edward Baumstark in his *David Ricardo's Grundgesetze der Volkswirthschaft und der Besteuerung übersetzt und erläutert* (1837), which Roscher highly commends, not only for the excellence of the rendering, but for the value of the explanations and criticisms which are added.

RICASOLI, BETTINO, BARON (1809–1880), Italian statesman, was born at Broglio on the 19th of March 1809. Left an orphan at eighteen, with an estate heavily encumbered, he was by special decree of the grand duke of Tuscany declared of age, and

entrusted with the guardianship of his younger brothers. Interrupting his studies, he withdrew to Broglio, and by careful management disencumbered the family possessions. In 1847 he founded the journal *La Patria*, and addressed to the grand duke a memorial suggesting remedies for the difficulties of the state. In 1848 he was elected Gonfaloniere of Florence, but resigned on account of the anti-Liberal tendencies of the grand duke. As Tuscan minister of the interior in 1859 he promoted the union of Tuscany with Piedmont, which took place on the 12th of March 1860. Elected Italian deputy in 1861, he succeeded Cavour in the premiership. As premier he admitted the Garibaldian volunteers to the regular army, revoked the decree of exile against Mazzini, and attempted reconciliation with the Vatican; but his efforts were rendered ineffectual by the *non possumus* of the pope. Disdainful of the intrigues of his rival Rattazzi, he found himself obliged in 1862 to resign office, but returned to power in 1866. On this occasion he refused Napoleon III.'s offer to cede Venetia to Italy, on condition that Italy should abandon the Prussian alliance, and also refused the Prussian decoration of the Black Eagle because Lamarmora, author of the alliance, was not to receive it. Upon the departure of the French troops from Rome at the end of 1866 he again attempted to conciliate the Vatican with a convention, in virtue of which Italy would have restored to the Church the property of the suppressed religious orders in return for the gradual payment of £24,000,000. In order to mollify the Vatican he conceded the *exequatur* to forty-five bishops inimical to the Italian régime. The Vatican accepted his proposal, but the Italian Chamber proved refractory, and, though dissolved by Ricasoli, returned more hostile than before. Without waiting for a vote, Ricasoli resigned office and thenceforward practically disappeared from political life, speaking in the Chamber only upon rare occasions. He died at Broglio on the 23rd of October 1880. His private life and public career were marked by the utmost integrity, and by a rigid austerity which earned him the name of the "iron baron." In spite of the failure of his ecclesiastical scheme, he remains one of the most noteworthy figures of the Italian Risorgimento.

See Tabarrini and Gotti, *Lettere e documenti del barone Bettino Ricasoli*, 10 vols. (Florence, 1886–1894); Passerini, *Genealogia e storia della famiglia Ricasoli* (*ibid.* 1861); Gotti, *Vita del barone Bettino Ricasoli* (*ibid.* 1894). (H. W. S.)

RICCATI, JACOPO FRANCESCO, COUNT (1676–1754), Italian mathematician, was born at Venice on the 8th of May 1676, and died at Treviso on the 15th of April 1754.

He studied at the university of Padua, where he graduated in 1696. His favourite pursuits were scientific, and his authority on all questions of practical science was referred to by the senate of Venice. He corresponded with many of the European savants of his day, and contributed largely to the *Acta Eruditorum* of Leipzig. He was offered the presidency of the academy of science of St Petersburg; but he declined, preferring the leisure and independence of life in Italy. Riccati's name is best known in connexion with his problem called Riccati's equation, published in the *Acta Eruditorum*, September 1724. A very complete account of this equation and its various transformations was given by J. W. L. Glaisher in the *Phil. Trans.* (1881).

After Riccati's death his works were collected by his sons and published (1758) in four volumes. His sons, Vincenzo (1707–1775) and Giordano (1709–1790), inherited his talents. The former was professor of mathematics at Bologna, and published, among other works, a treatise on the infinitesimal calculus. Giordano was distinguished both as a mathematician and an architect.

RICCI, MATTEO (1552–1610), Italian missionary to China, was born of a noble family at Macerata in the March of Ancona on the 7th of October 1552. After some education at a Jesuit college in his native town he went to study law at Rome, where in 1571, in opposition to his father's wishes, he joined the Society of Jesus.

In 1577 Ricci and other students offered themselves for the East Indian missions. Ricci, without visiting his family to take leave, proceeded to Portugal. His comrades were Rudolfo Acquaviva, Nicolas Spinola, Francesco Pasio and Michele Ruggieri, all afterwards, like Ricci himself, famous in the Jesuit annals. They arrived at Goa in September 1578. After four years spent in India, Ricci was summoned to the task of opening China to evangelization.

Several fruitless attempts had been made by Xavier, and since his death, to introduce the Church into China,—as by Melchior Nunes of the Jesuit Society operating from Sanchian[1] in 1555; by Gaspar da Cruz, a Dominican, in that or the following year; by the Augustinians under Martin Herrada, 1575; and in 1579 by the Franciscans led by Pedro d'Alfaro. In 1571 a house of the Jesuits had been set up at Macao (where the Portuguese were established in 1557), but their attention was then occupied with Japan, and it was not till the arrival at Macao of Alessandro Valignani on a visitation in 1582 that work in China was really taken up. For this object he had obtained the services first of M. Ruggieri and then of Ricci. After various disappointments they found access to Chow-king-fu on the Si-Kiang or West River of Canton, where the viceroy of the two provinces of Kwang-tung and Kwang-si then had his residence, and by his favour were able to establish themselves there for some years. Their proceedings were very cautious and tentative; they excited the curiosity and interest of even the more intelligent Chinese by their clocks, their globes and maps, their books of European engravings, and by Ricci's knowledge of mathematics, including dialling and the projection of maps. They conciliated some influential friends, and their reputation spread widely in China. This was facilitated by the Chinese system of transfer of public officers from one province of the empire to another, and in the later movements of the missionaries they frequently met with one and another of their old acquaintances in office, who were more or less well disposed. Eventually troubles at Chow-king compelled them to seek a new home; and in 1589, with the viceroy's sanction, they migrated to Chang-chow in the northern part of Kwang-tung, not far from the well-known Meiling Pass.

During his stay here Ricci was convinced that a mistake had been made in adopting a dress resembling that of the bonzes, a class who were the objects either of superstition or of contempt. With the sanction of the visitor it was ordered that in future the missionaries should adopt the costumes of Chinese literates, and, in fact, they before long adopted Chinese manners altogether.

Chang-chow, as a station, did not prove a happy selection, but it was not till 1595 that an opportunity occurred of travelling northward. For some time Ricci's residence was at Nan-chang-fu, the capital of Kiang-si; but in 1598 he was able to proceed under favourable conditions to Nan-king, and thence for the first time to Peking, which had all along been the goal of his missionary ambition. But circumstances were not then propitious, and the party had to return to Nan-king. The fame of the presents which they carried had, however, reached the court, and the Jesuits were summoned north again, and on the 24th of January 1601 they entered the capital. Wan-li, the emperor of the Ming dynasty, in those days lived in seclusion, and saw no one but his women and the eunuchs. But the missionaries were summoned to the palace; their presents were immensely admired, and the emperor had the curiosity to send for portraits of the fathers themselves.

They obtained a settlement, with an allowance for subsistence, in Peking, and from this time to the end of his life Ricci's estimation among the Chinese was constantly increasing, as was at the same time the amount of his labours. Visitors thronged the mission house incessantly; and inquiries came to him from all parts of the empire respecting the doctrines which he taught, or the numerous Chinese publications which he issued. This in itself was a great burden, as Chinese composition, if wrong impressions are to be avoided, demands extreme care and accuracy. As head of the mission, which now had four stations

[1] The island (properly Chang-chuen) on which the Portuguese had a temporary settlement before they got Macao, and on which F. Xavier died in 1552.

in China, he also devoted much time to answering the letters of the priests under him, a matter on which he spared no pains or detail. New converts had to be attended to—always welcomed, and never hustled away. Besides these came the composition of his Chinese books, the teaching of his people and the maintenance of the record of the mission history which had been enjoined upon him by the general of the order, and which he kept well up to date. Thus his labours were wearing and incessant. In May 1610 he broke down, and after an illness of eight days died on the 11th of that month. His colleague Pantoja applied to the emperor for a burying-place outside the city. This was granted, with the most honourable official testimonies to the reputation and character of Ricci; and a large building in the neighbourhood of the city was at the same time bestowed upon the mission for their residence.

Ricci's work was the foundation of the subsequent success attained by the Roman Catholic Church in China. When the missionaries of other Roman Catholic orders made their way into China, twenty years later, they found great fault with the manner in which certain Chinese practices had been dealt with by the Jesuits, a matter in which Ricci's action and policy had given the tone to the mission in China—though in fact that tone was rather inherent in the Jesuit system than the outcome of individual character, for controversies of an exactly parallel nature arose two generations later in southern India, between the Jesuits and Capuchins, regarding what were called "Malabar rites." The controversy thus kindled in China burned for considerably more than a century with great fierceness.[1] The chief points were (1) the lawfulness and expediency of certain terms employed by the Jesuits in naming God Almighty, such as *Tien*, "Heaven," and *Shang-ti*, "Supreme Ruler" or "Emperor," instead of *Tien-Chu*, "Lord of Heaven," and in particular the erection of inscribed tablets in the churches, on which these terms were made use of;[2] (2) in respect to the ceremonial offerings made in honour of Confucius, and of personal ancestors, which Ricci had recognized as merely "civil" observances; (3) the erection of tablets in honour of ancestors in private houses; and (4), more generally, sanction and favour accorded to ancient Chinese sacred books and philosophical doctrine, as not really trespassing on Christian ground.

Probably no European name of past centuries is so well known in China as that of *Li-ma-teu*, the form in which the name of Ricci (*Ri-cci Mat-teo*) was adapted to Chinese usage, and by which he appears in Chinese records.[3] The works which he composed in Chinese are numerous; a list of them (apparently by no means complete, however) will be found in Kircher's *China Illustrata*, and also in Abel Rémusat's *Nouveaux Mélanges Asiatiques* (ii. 213–15). They are said to display an aptitude for clothing ideas in a Chinese dress very rare and remarkable in a foreigner. One of the first which attracted

[1] The list of the literature of this controversy occupies forty-one columns in M. Cordier's excellent *Bibliographie de la Chine*.

[2] Compare Browning, *The Ring and the Book*, x., The Pope, 1589–1603.

[3] The name comes forward prominently in the mouth of the emperor Kang-hi, in a dialogue which took place between him and Monsgr. Maigrot, the leader of the anti-Jesuit movement (mentioned in Browning's lines referred to above), at the summer residence in Tartary, August 1706—a dialogue which the Jesuits have reported with not a little malice:—

"*Emperor*, 'Tell me why do the people call me *Van-sui* (10,000 years).' *The Most Reverend* (*i.e.* Maigrot), 'To express their desire for your Majesty's long life.' *Emp.* 'Good. You see, then, Chinese words are not always to be taken literally. We pay cult to Confucius and to the dead to express our respect for them. How is that inconsistent with your religion? When did it begin to be so? Is it since Ly-Mattheu's time? Hast thou ever read Ly-Mattheu's?' *The Most Reverend*, turning to P. Parenin, whispers, 'Who's he?' and learning that it was P. Matteo Ricci, . . . answered the emperor: 'I have not read that book.' *Emp.* 'Ly-Mattheu and his fellows came hither some two centuries ago; and before their time Chinese never heard anything of the Incarnation, anything of *Tien-chu*, who had not become incarnate in this part of the world. Why then, if it was lawful to call God *Tien* before Ly-Mattheu's time, should it be improper now?'" —*Epistola de Eventu Apostolicae Legationis, scripta a P.P. Missionariis . . . ad Praepositum Generalem S. J.*, An. 1706, 1 Novembris.

attention and reputation among Chinese readers was a Treatise upon Friendship, in the form of a dialogue containing short and pithy paragraphs; this is stated in the *De Expeditione* to have been suggested during Ricci's stay at Nan-chang by a conversation with the prince of Kien-ngan, who asked questions regarding the laws of friendship in the West.

In the early part of his residence at Peking, when enjoying constant intercourse with scholars of high position, Ricci brought out the *T'ien-chu shih-i*, or "Veritable Doctrine of the Lord of Heaven," which deals with the divine character and attributes under eight heads. "This work," says A. Wylie, "contains some acute reasoning in support of the propositions laid down, but the doctrine of faith in Christ is very slightly touched upon. The teachings of Buddhism are vigorously attacked, whilst the author tries to draw a parallel between Christianity and the teachings of the Chinese literati."

In 1604 Ricci completed the *Erh-shih-wu yen*, a series of short articles of moral bearing, but exhibiting little of the essential doctrines of Christianity. *Chi-jên shih pien* is another of his productions, completed in 1608, and consisting of a record of ten conversations held with Chinese of high position. The subjects are: (1) Years past no longer ours; (2) Man a sojourner on earth; (3) Advantage of frequent contemplation of eternity; (4) Preparation for judgment by such contemplation; (5) The good man not desirous of talking; (6) Abstinence, and its distinction from the prohibition to take life; (7) Self-examination and self-reproof inconsistent with inaction; (8) Future reward and punishment; (9) Prying into futurity hastens calamity; (10) Wealth with covetousness more wretched than poverty with contentment. To this work is appended a translation of eight European hymns, with elucidations, written in 1609.

Some of the characteristics thus indicated may have suggested the bitterness of attacks afterwards made upon Ricci's theology. An example of these is found in the work called *Anecdotes sur l'état de religion dans la Chine* (Paris, 1733–35), the author of which (Abbé Villers) speaks of the *T'ien-chu shih-i* in this fashion: "The Jesuit was also so ill versed in the particulars of the faith that, as the holy bishop of Conon, Monsgr. Maigrot, says of him, one need merely read his book on the true religion to convince oneself that he had never imbibed the first elements of theology." . . .

Ricci's pointed attacks on Buddhism, and the wide circulation of his books, called forth the opposition of the Buddhist clergy. One of the ablest who took their part was Chu-hang, a priest of Hang-chow, who had abandoned the literary status for the Buddhist cloister. He wrote three articles against the doctrine of the missionaries. These were brought to Ricci's notice in an ostensible tone of candour by Yu-chun-he, a high mandarin at the capital. This letter, with Ricci's reply, the three Buddhist declamations and Ricci's confutation, were published in a collected form by the Christian Sen-Kwang-K'e.

Another work of Ricci's which attracted attention was the *Hsi-kuo fa*, or "Art of Memory as practised in the West." Ricci was himself a great expert in *memoria technica*, and astonished the Chinese by his performances in this line. He also wrote or edited various Chinese works on geography, the celestial and terrestrial spheres, geometry and arithmetic. And the detailed history of the mission was drawn out by him, which after his death was brought home by P. Nicolas Trigault, and published at Augsburg, and later in a complete form at Lyons under the name *De Expeditione Christiana apud Sinas Suscepta, ab Soc. Jesu*, Ex P. Mat. Ricci ejusdem Societatis *Commentariis*, Trigault himself adding many interesting notes on China and the Chinese.

Among the scientific works which Ricci took into China was a set of maps, which at first created great interest, but afterwards disgust when the Chinese came to perceive the insignificant place assigned to the "Middle Kingdom," thrust, as it seemed, into a corner, instead of being set in the centre of the world like the gem in a ring. Ricci, seeing their dissatisfaction, set about constructing a map of the hemisphere on a great scale, so adjusted that China, with its subject states, filled the central

area, and, without deviating from truth of projection, occupied a large space in proportion to the other kingdoms gathered round it. All the names were then entered in Chinese calligraphy. This map obtained immense favour, and was immediately engraved at the expense of the viceroy and widely circulated.

In the accompanying cut we have endeavoured to portray this map. The projection adopted is a perspective of the hemisphere as viewed from a point at the distance of one diameter from the surface, and situated on the production of the radius which passes through the intersection of 115° E. long. (Greenwich) with 30° N. lat. Something near this must have been Lima-teu's projection. With a vertex much more distant the desired effect would be impaired, and with one nearer neither the exaggeration of China

of the poles would be seen, whilst the compression of Europe would have been too gross for a professed representation of the hemisphere.

The chief facts of Ricci's career are derived from Trigault; some contemporary works on the rites controversy have also been consulted; in the notice of Ricci's Chinese writings valuable matter has been derived from *Notes on Chinese Literature* by A. Wylie (London and Shanghai, 1867). A number of Ricci's letters are extant in the possession of the family, and access to them was afforded to Giuseppe La Farina, author of the work called *La China, considerata nella sua Storia*, &c. (Florence, 1843), by the Marchese Amico Ricci of Macerata, living at Bologna. La Farina's quotations contain nothing of interest. There is a curious Chinese account of Ricci published by Dr Breitschneider in the *China Review*, iv. 301 sq.

(H. Y.)

RICCIARELLI, DANIELE (1509–1566), Italian artist, generally called, from the place of his birth, DANIELE DA VOLTERRA, studied painting under Sodoma and Peruzzi. Settling in Rome, he received abundant encouragement. His constant friend, Michelangelo, recommended him on all possible occasions, and he was commissioned to beautify with works of art a chapel in the church of the Trinità, to paint in the Farnese Palace, to execute certain decorations in the Palazzo de' Medici at Navona, and to begin the stucco work and the pictures in the Hall of the Kings. Towards the close of his life he turned his attention to statuary. His last work was a bronze horse intended for an equestrian statue of Henry II. of France. He died in 1566. The principal extant works of Ricciarelli are at Rome. These are a "St John the Baptist" in the picture gallery of the Capitol, a "Saviour bearing the Cross" in the Palazzo Rospigliosi, and a "Descent from the Cross," his masterpiece, in the church of Trinità de Monti. There is also an "Elijah" at Volterra.

RICCOBONI, MARIE JEANNE (1714–1792), whose maiden name was Laboras de Mézières, was born at Paris in 1714. She married in 1735 Antoine François Riccoboni, a comedian and dramatist, from whom she soon separated. She herself was an actress, but did not succeed on the stage. Her works are *Lettres de mistress Fanny Butler* (1757); the remarkable *Histoire du marquis de Cressy* (1758); *Milady Juliette Catesby* (1759–1760), like her other books, in letter form; *Ernestine* (1798), which La Harpe thought her masterpiece; and three series of *Lettres* in the names of *Adelaide de Dammartin* (*comtesse de Sancerre*) (2 vols., 1766), *Elizabeth Sophie de Vallière* (2 vols., 1772), and *Milord Rivers* (2 vols., 1776). She obtained a small pension from the crown, but the Revolution deprived her of it, and she died on the 6th of December 1792 in great indigence. Besides the works named, she wrote a novel (1762) on the subject of Fielding's *Amelia*, and supplied in 1765 a continuation (but not the conclusion sometimes erroneously ascribed to her) of Marivaux's unfinished *Marianne*.

All Madame Riccoboni's work is clever, and there is real pathos in it. But it is among the most eminent examples of the "sensibility" novel, of which no examples but Sterne's have kept their place in England, and that not in virtue of their sensibility. A still nearer parallel may be found in the work of Mackenzie. Madame Riccoboni is an especial offender in the use of mechanical aids to impressiveness—italics, dashes, rows of points and the like. The principal edition of her complete works is that of Paris (6 vols., 1818). The chief novels appear in a volume of Garnier's *Bibliothèque amusante* (Paris, 1865).

See Julia Kavanagh, *French Women of Letters* (2 vols., 1862), where an account of her novels is given; J. Pelluy, *Marivaux et le marivaudage* (Paris, 1881); J. M. Quérard, *La France littéraire* (vol. vii., 1835); and Lucy La Harpe, Grimm and Diderot prefixed to her *Œuvres* (9 vols., Paris, 1826).

RICE, EDMUND IGNATIUS (1762–1844), Irish philanthropist, founder of the "Irish Christian Brothers," was born at Westcourt, near Callen, Kilkenny, on the 1st of June 1762. He entered the business of his uncle, an export provision merchant in Waterford, in 1779 and succeeded him in 1790. In 1796 he established an organization for visiting and relieving the poor, and in 1802 began to educate the poor children of Waterford, renting a school and supporting two teachers. In 1803 he gave up his business and, joined by a number of friends, began to systematize his plans. Others, like-minded, opened schools at Dungarvan and Carrick-on-Suir. The latter society numbered nine in 1808, and meeting at Waterford took religious vows from their bishop, assumed a "habit" and adopted an additional Christian name, by which, as by the collective title "Christian Brothers," they were thenceforth known. Schools were established in Cork (1811), Dublin (1812), and Thurles and Limerick (1817). In 1820 Pope Pius VII. issued a brief sanctioning the order of "Religious Brothers of the Christian Schools (Ireland)," the members of which were to be bound by vows of obedience, chastity, poverty and perseverance, and to give themselves to the free instruction, religious and literary, of male children, especially the poor. The heads of houses were to elect a superior general, and Rice held this office from 1822 to 1838, during which time the institution extended to several English towns (especially in Lancashire), and the course of instruction grew out of the primary stage. Rice died on the 29th of August 1844. The Irish Christian Brothers have some hundred houses in Ireland with 300 attached schools and over 30,000 pupils. There are also industrial schools and orphanages, and the institute has branches in Australia, India, Gibraltar and Newfoundland.

RICE, JAMES (1843–1882), English novelist, was born at Northampton on the 26th of September 1843. Educated at Queens' College, Cambridge, where he graduated in law in 1867, he was called to the bar at Lincoln's Inn in 1871. In the meantime (1868) he had bought *Once a Week*, which proved a losing venture for him, but which brought him into touch with Walter Besant, a contributor [see Besant's preface to the Library Edition (1887) of *Ready-money Mortiboy*]. There ensued a close friendship and a literary partnership between the two men which lasted ten years until Rice's death, and resulted in a large number of successful novels. The first of them, published anonymously, Rice being responsible for the central figure and the leading situation, was *Ready-money Mortiboy* (1872), dramatized by them later and unsuccessfully produced at the Court Theatre in 1874. In rapid succession followed *My Little Girl* (1873); *With Harp and Crown* (1874); *This Son of Vulcan* (1876); *The Golden Butterfly* (1876), the most popular of their joint productions; *The Monks of Thelema* (1878); *By Celia's Arbour* (1878); *The Seamy Side* (1880); *The Chaplain of the Fleet* (1881); *Sir Richard Whittington* (1881), and a large number of short stories, some of them reprinted in *The Case of Mr Lucraft*, &c. (1876), *'Twas in Trafalgar's Bay*, &c. (1879), and *The Ten Years' Tenant*, &c. (1881).

James Rice died at Redhill on the 26th of April 1882.

RICE (Greek ὄρυζα, Latin *oryza*, French *riz*, Italian *riso*, Spanish *arroz*, derived from the Arabic), a well-known cereal, botanical name *Oryza sativa*. According to Roxburgh, the great Indian botanist, the cultivated rice with all its numerous varieties has originated from a wild plant, called in India Newaree or Nivara, which is indigenous on the borders of lakes in the Circars and elsewhere in India, and is also native in tropical Australia. The rice plant is an annual grass with long linear glabrous leaves, each provided with a long sharply pointed ligule. The spikelets are borne on a compound branched spike, erect at first but afterwards bent downwards. Each spikelet contains a solitary flower with two outer small barren glumes, above which is a large tough, compressed, often awned, flowering glume, which partly encloses the somewhat similar pale. Within these are six stamens, a hairy ovary surmounted by two feathery styles which ripens into the fruit (grain), and which is invested by the husk formed by the persistent glume and pale. The cultivated varieties are extremely numerous, some kinds being adapted for marshy land, others for growth on the hillsides. The cultivators make two principal divisions according as the sorts are early or late. Rice has been cultivated from time immemorial in tropical countries. According to Stanislas Julien a ceremonial ordinance was established in China by the emperor Chin-nung 2800 years B.C., in accordance with which the emperor sows the rice himself while the seeds of four other kinds may be sown by the princes of his family. This fact, joined to other considerations, induced Alphonse de Candolle to consider rice as a native of China. It was very early cultivated in India, in some parts of which country, as in tropical Australia, it is, as we have seen, indigenous. It is not mentioned in the Bible, but its culture is alluded to in the Talmud. There is proof of its culture in the Euphrates valley and in Syria four hundred years before Christ. Crawfurd, on philological grounds, considers that rice was introduced into Persia from southern India. The Arabs carried the plant into Spain. Rice was first cultivated in Italy near Pisa in 1468. It was not introduced into S. Carolina until 1700, and then, it is said, by accident, although at one time the southern United States furnished a large proportion of the rice introduced into commerce. Rice sports into far more varieties than any of the corns familiar to Europeans; for some varieties grow in the water and some on dry land; some come to maturity in three months, while others take four and six months to do so. A very full account of the cultivation of rice in India will be found in Sir George Watt's *Dictionary of the Economic Products of India*.

Rice (*Oryza sativa*).
A, spikelet (enlarged); B, bearded variety; C, spikelet of B (enlarged).

Rice constitutes one of the most important articles of food in all tropical and subtropical countries, and is one of the most prolific of all crops. The rice yields best on low lands subject to occasional inundations, and thus enriched by alluvial deposits. An abundant rainfall during the growing season is also a desideratum. Rice is sown broadcast, and in some districts is transplanted after a fortnight or three weeks. No special rotation is followed: indeed the soil best suited for rice is ill adapted for any other crop. In some cases little manure is employed, but in others abundance of manure is used. No special tillage is required, but weeding and irrigation are requisite. Rice in the husk is known as "paddy." On cutting across a grain of rice and examining it under the microscope, first the flattened and dried cells of the husk are seen, and then one or two layers of cells elongated in a direction parallel to the length of the seed, which contain the gluten or nitrogenous matter. Within these, and forming by far the largest part of the seed, are large polygonal cells filled with very numerous and very minute angular starch grains. Rice is not so valuable as a food as some other cereals, inasmuch as the proportion of nitrogenous matter (gluten) is less. Payen gives only 7% of gluten in rice as compared with 23% in the finest wheat, 14 in oats and 12 in maize. The percentage of potash in the ash is as 18 to 23 in wheat. The fatty matter is also less in proportion than in other cereals. Rice, therefore, is chiefly a farinaceous food, and requires to be combined with fatty and nitrogenous substances, such as milk or meat gravy, to satisfy the requirements of the system.

A large proportion of the rice brought to Europe is used for starch-making, and some is taken by distillers of alcohol. Rice is also the source of a drinking spirit in India, known as arrack, and the national beverage of Japan—saké—is prepared from the grain by means of an organic ferment.

RICE PAPER. The substance which has received this name in Europe, through the mistaken notion that it is made from rice, consists of the pith of a small tree, *Aralia papyrifera*, which grows in the swampy forests of Formosa. The cylindrical core of pith is rolled on a hard flat surface against a knife, by which it is cut into thin sheets of a fine ivory-like texture. Dyed in various colours, rice paper is extensively used for the preparation of artificial flowers, while the white sheets are employed by native artists for water-colour drawings.

RICH, BARNABE (*c.* 1540–1617), English author and soldier, was a distant relative of Lord Chancellor Rich. He fought in the Low Countries, rising to the rank of captain, and afterwards served in Ireland. He shared in the colonization of Ulster, and spent the latter part of his life near Dublin. In the intervals of his campaigns he produced many pamphlets on political questions and romances. In 1606 he was in receipt of a pension of half a crown a day, and in 1616 he was presented with a gift of £100 as being the oldest captain in the service. He died on the 10th of November 1617. His best-known work is *Riche his Farewell to Militarie Profession conteining verie pleasaunt discourses fit for a peaceable tyme* (1581). Of the eight stories contained in it, five, he says, "are forged only for delight, neither credible to be believed, nor hurtful to be perused." The three others are translations from the Italian. He claims as his own invention the story of *Apolonius and Silla*, the second in the collection, from which Shakespeare took the plot of *Twelfth Night*. It is, however, founded on the tale of Nicuola and Lattantio as told by Matteo Bandello. The eighth, *Phylotus and Emilia*, a complicated story arising from the likeness and disguise of a brother and sister, is identical in plot with the anonymous play, *Philotus*, printed in Edinburgh in 1603. Both play and story were edited for the Bannatyne Club in 1835. In the conclusion to his collection Rich tells a story of a devil named Balthaser, who possesses a king of Scots, prudently changed after the accession of James I. to the "Grand Turk." The *Strange and Wonderful Adventures of Don Simonides* (1581), with its sequel (1584), is written in imitation of Lyly. Among his other romances should be mentioned *The Adventures of Brusanus, prince of Hungaria* (1592). His authenticated works number twenty-four, and include works on Ireland, the troubles of which were, according to him, due to the religion of the people and to the lack of consistency and firmness on the part of the English government. Such are *Allarme to England* (1578); *A New Description of Ireland* (1610); *The Irish Hubbub, or the English Hue and Crie* (1617), in which he also inveighs against the use of tobacco.

See "Introduction" to the Shakespeare Society's reprint of *Riche his Farewell* (1846); P. Cunningham's "Introduction" to Rich's *Honestie of this Age* (reprinted for the Percy Society, 1844); and the life by S. Lee in the *Dictionary of National Biography*.

RICH, CLAUDIUS JAMES (1787–1821), English traveller and scholar, was born near Dijon on the 28th of March 1787. His youth was spent at Bristol. He early developed a gift for languages, becoming familiar not only with Latin and Greek but also with Hebrew, Syriac, Persian, Turkish and other Eastern tongues. In 1804 Rich went to Constantinople, where, and at Smyrna, he stayed some time, perfecting himself in Turkish. Proceeding to Alexandria as assistant to the British consul-general there, he devoted himself to Arabic and its various dialects, and made himself master of Eastern manners and usages. On leaving Egypt he travelled by land to the Persian Gulf, disguised as a Mameluke, visiting Damascus, and entering the great mosque undetected. At Bombay, which he reached in September 1807, he was the guest of Sir James Mackintosh, whose eldest daughter he married in January 1808, proceeding soon after to Bagdad as resident. There he began his investigations into the geography, history and antiquities of the district. He explored the remains of Babylon, and projected a geographical and statistical account of the pashalic of Bagdad. The results of his work at Babylon appeared first in the Vienna serial *Mines de l'orient*, and in 1815 in England, under the title *Narrative of a Journey to the Site of Babylon in 1811*. In 1813–14 Rich spent some time in Europe, and on his return to Bagdad devoted himself to the study of the geography of Asia Minor, and collected much information in Syrian and Chaldaean convents concerning the Yezidis. During this period he made a second excursion to Babylon, and in 1820 undertook an extensive tour to Kurdistan—from Bagdad north to Sulimania, eastward to Sinna, then west to Nineveh, and thence down the Tigris to Bagdad. The narrative of this journey, which contained the first accurate knowledge (from scientific observation) regarding the topography and geography of the region, was published by his widow under the title, *Narrative of a Residence in Koordistan and on the site of Ancient Nineveh, &c.* (London, 1836). In 1821 Rich went to Basora, whence he made an excursion to Shiraz, visiting the ruins of Persepolis and the other remains in the neighbourhood. At Shiraz he died of cholera on the 5th of October 1821. His fine collections of manuscripts and coins was purchased by the British Museum.

RICH, JOHN (1692–1761), English actor, the "father of English pantomime," was the son of Christopher Rich (d. 1714), the manager of Drury Lane, with whose quarrels and tyrannies Colley Cibber's *Apology* is much occupied. John Rich opened the new theatre in Lincoln's Inn Fields left unfinished by his father, and here, in 1716, under the stage name of Lun, he first appeared as Harlequin in an unnamed entertainment which developed into an annual pantomine (*q.v.*). By this departure he made successful headway in his competition with the stronger company at Drury Lane, including Cibber, Wilks and Booth. Rich was less happy in his management of Covent Garden, which he opened in 1733, until Garrick's arrival (1746), when a most prosperous season ensued, followed by a bad one when Garrick went to Drury Lane. During Rich's management occurred the rival performances of *Romeo and Juliet*—Barry and Mrs Cibber at Covent Garden, and Garrick and Miss Bellamy at Dury Lane—and the subsequent competition between the two rival actors in *King Lear*. Rich died on the 26th of November 1761. Garrick's lines show that his acting was pantomime pure and simple, without words:—

> "When Lun appeared, with matchless art and whim,
> He gave the power of speech to every limb:
> Tho' masked and mute, conveyed his quick intent,
> And told in frolic gesture what he meant."

RICH, PENELOPE, LADY (*c.* 1562–1607), the Stella of Sir Philip Sidney's *Astrophel and Stella*, was the daughter of Walter Devereux, 1st Earl of Essex. She was a child of fourteen when Sir Philip Sidney accompanied the queen on a visit to Lady Essex in 1576, on her way from Kenilworth, and must have been frequently thrown into the society of Sidney, in consequence of the many ties between the two families. Essex died at Dublin in September 1576. He had sent a message to Philip Sidney from his death-bed expressing his desire that he should marry his daughter, and later his secretary wrote to the young man's father, Sir Henry Sidney, in words which seem to point to the existence of a very definite understanding. Penelope's great-grandmother was a sister of Anne Boleyn, and she and her brother Robert were therefore distantly connected with Elizabeth. Perhaps the marriage of Lady Essex with the earl of Leicester, which destroyed Sidney's prospects as his uncle's heir, had something to do with the breaking off of the proposed match with Penelope. Her relative and guardian, Henry Hastings, earl of Huntingdon, secured Burghley's assent in March 1581 for her marriage with Robert Rich, 3rd Baron Rich. Penelope is said to have protested in vain against the alliance with Rich, who is represented as a rough and overbearing husband. The evidence against him is, however, chiefly derived from sources as interested as Sir Philip Sidney's violent denunciation in the twenty-fourth sonnet of *Astrophel and Stella*, "Rich fooles there be whose base and filthy hart." Sidney's serious love for Penelope appears to date from her marriage with Rich. The earlier sonnets are in praise of her beauty, or treat of the conventional topic of the struggle between reason and love, while the later ones are marked by unmistakable passion. The eighth song of *Astrophel and Stella* narrates Stella's refusal to accept Sidney as a lover. Lady Rich was the mother of six children by her husband when she contracted in 1595 an open liaison with Charles Blount, 8th Lord Mountjoy, a brilliant courtier and favourite of Elizabeth, to whom she had long been attached. Rich took no steps against his wife during her brother's lifetime, and she nursed him through an illness in 1600, but they obtained a legal separation in 1601, and Mountjoy acknowledged her five children born after 1595. Mountjoy was created earl of Devonshire on the accession of James I., and Lady Rich was in high favour at court. In 1605, however, they legitimized their connexion by a marriage celebrated by William Laud, the earl's chaplain. This proceeding, carried out in defiance of canon law, was followed by the disgrace of both parties, who were banished from court. Devonshire died on the 3rd of April 1606, and his wife within a year of that date. Her eldest son by Lord Rich, who became earl of Warwick in 1618, was Robert Rich, 2nd earl of Warwick (1587–1658). The second, Henry Rich, earl of Holland, was beheaded in 1649 for his share in the second Civil War. Her eldest son by Mountjoy, Mountjoy Blount, Baron Mountjoy and earl of Newport (*c.* 1597–1665) also figured in the Civil War.

See the editions of *Astrophel and Stella* by Dr A. B. Grosart, E. Arber and A. W. Pollard; also the various lives of Sir Philip Sidney, and Mrs Aubrey Richardson's *Famous Ladies of the English Court* (London, 1899). John Ford's *Broken Heart* has been alleged to have been founded on the story of Lady Rich, and Barnabe Barnfield dedicated his *Affectionate Shepherd* (1594) to her; Bartholomew Yonge his *Diana of George of Montemayor* (1598); and sonnets are addressed to her by John Davies of Hereford and by Henry Constable.

RICH, RICHARD (fl. 1610), English soldier and adventurer, the author of *Newes from Virginia*, sailed from England on the 2nd of June 1609 for Virginia, with Captain Christopher Newport and the three commissioners entrusted with the foundation of the new colony. In his verse pamphlet he relates the adventures undergone by the expedition, and describes the resources of the new country, with the advantages offered to colonists. The title runs: *Newes from Virginia. The lost Flocke Triumphant. With the happy Arrivall of that famous and worthy Knight Sr. Thomas Gates: and the well-reputed and valiant Captaine Mr Christopher Newport, and others, into England. With the maner of their distresse in the Iland of Devils (otherwise called Bermoothawes), where they remayned 42 weeks, and builded two Pynaces, in which they returned into Virginia.* By R. Rich, Gent., one of the Voyage (1610)." The only known copy of this tract is in the Huth Library. A reprint edited by J. O. Halliwell-Phillips appeared in 1865 (another ed., 1874). The adventures related by Rich are supposed to have been in Shakespeare's mind when he wrote *The Tempest*. Another tract by Rich mentioned in the Stationers' Register, *Good Speed to Virginia*, is unknown.

RICH, RICHARD, 1ST BARON RICH (1490?–1567), lord chancellor, was born of a Hampshire family about 1490, in the parish of St Laurence Jewry, London. His great-grandfather, Richard Rich, was a wealthy mercer and sheriff of the city of London in 1441. Probably Lord Rich's father was also a mercer, but he sent his son to the Middle Temple, where Sir Thomas More was among his acquaintances. More told him at the time of his trial that he was reputed light of his tongue, a great dicer and gamester, and not of any commendable fame; but he was a commissioner of the peace in Hertfordshire in 1528, and in the next autumn became reader at the Middle Temple. Other preferments followed, and in 1533 he was knighted and became solicitor-general, in which capacity he was to act under Thomas Cromwell as a "lesser hammer" for the demolition of the monasteries, and to secure the operation of Henry VIII.'s act of supremacy. He had an odious share in the trials of Sir Thomas More and Bishop Fisher. In both cases he made use in his evidence against the prisoner of admissions made in a professedly friendly conversation, and in More's case the words he had used were misreported and received a misconstruction that could hardly be other than wilful. More expressed his opinion of the witness in open court with a candour that might well have dismayed Rich. Rich became the first chancellor (April 19, 1536) of the Court of Augmentations established for the disposal of the monastic revenues. His own share of the spoil, acquired either by grant or purchase, included Leez (Leighs) Priory and about a hundred manors in Essex. He was Speaker of the House of Commons in the same year, and advocated the king's policy. In spite of the share he had taken in the suppression of the monasteries, and of the part he was to play under Edward VI., his religious convictions remained Roman Catholic. His testimony helped the conviction of Thomas Cromwell, and he was a willing agent in the Catholic reaction which followed. Anne Askew stated that the Chancellor Wriothesley and Rich screwed the rack at her torture with their own hands.

Rich was one of the executors of the will of Henry VIII., on which so much suspicion has been thrown, and on the 26th of February 1548 he became Baron Rich of Leez. In the next month he succeeded Wriothesley as chancellor, an office in which he found full scope for the business and legal ability he undoubtedly possessed. He supported Protector Somerset in his subversive reforms in church matters, in the prosecution of his brother Lord Seymour of Sudeley, and in the rest of his policy until the crisis of his fortunes in October 1549, when he deserted to Warwick (afterwards Northumberland), and presided over the trial of his former chief. His daughter had married Warwick's son, and both men were at heart no friends to the reformed religion. Nevertheless, Rich took part in the prosecution of bishops Gardiner and Bonner, and in the harsh treatment accorded to the Princess Mary. Possibly this harshness was exaggerated, for Mary on her accession showed no ill-will to Rich. He retired from the chancellorship on the ground of ill-health in the close of 1551, at the time of the final breach between Northumberland and Somerset. He was now sixty years old, and there is no reason to suspect the sincerity of his plea. There is an improbable story, however, to the effect that Rich warned Somerset of his danger in the Tower, and that the letter was delivered by mistake to the duke of Norfolk, who handed it to Northumberland.

Lord Rich took an active part in the restoration of the old religion in Essex under the new reign, and was one of the most active of persecutors. His reappearances in the privy council were rare during Mary's reign; but under Elizabeth he served on a commission to inquire into the grants of land made under Mary, and in 1566 was sent for to advise on the question of the queen's marriage. He died at Rochford, Essex, on the 12th of June 1567, and was buried in Felsted church. In Mary's reign he had founded a chaplaincy with provision for the singing of masses and dirges, and the ringing of bells in Felsted church. To this was added a Lenten allowance of herrings to the inhabitants of three parishes. These donations were transferred in 1564 to the foundation of a grammar-school at Felsted for instruction, primarily for children born on the founder's manors, in Latin, Greek and divinity. The patronage of the school remained in the family of the founder until 1851. By his wife Elizabeth Jenks, or Gynkes, he had fifteen children. The eldest son Robert (1537?–1581), second Baron Rich, supported the Reformation, and his grandson Robert, third lord, was created earl of Warwick in 1618.

The chief authorities are the official records of the period covered by his official life, calendared in the Rolls Series. See also A. F. Pollard, *England under Protector Somerset* (1900); P. Morant, *History of Essex* (2 vols., 1768); R. W. Dixon, *History of the Church of England* (6 vols., 1878–1902); and lives in J. Sargeaunt's *History of Felsted School* (1889), Lord Campbell's *Lives of the Lord Chancellors* (1845–69), and C. H. & T. Cooper's *Athenae Cantabrigienses* (2 vols., 1858–61).

RICHARD, ST, of Wyche (*c.* 1197–1253), English saint and bishop, was named after his birthplace, Droitwich in Worcestershire. Educated at Oxford, he soon began to teach in the university, of which he became chancellor, probably after he had studied in Paris and in Bologna. About 1235 he became chancellor of the diocese of Canterbury under Archbishop Edmund Rich, and he was with the archbishop during his exile in France. Having returned to England some time after Edmund's death in 1240 he became vicar of Deal and chancellor of Canterbury for the second time. In 1244 he was elected bishop of Chichester, being consecrated at Lyons by Pope Innocent IV. in March 1245, although Henry III. refused to give him the temporalities of the see, the king favouring the candidature of Robert Passelewe (d. 1252). In 1246, however, Richard obtained the temporalities. The new bishop showed much eagerness to reform the manners and morals of his clergy, and also to introduce greater order and reverence into the services of the church. His term of office was also marked by the favour which he showed to the Dominicans, a house of this order at Orleans having sheltered him during his stay in France, and by his earnestness in preaching a crusade. He died at Dover in April 1253. It was generally believed that miracles were wrought at his tomb in Chichester cathedral, which was long a popular place of pilgrimage, and in 1262 he was canonized at Viterbo by Pope Urban IV. Richard furnished the chronicler, Matthew Paris, with material for the life of Edmund Rich, and instituted the offerings for the cathedral at Chichester which were known later as "St Richard's pence."

His life by his confessor, Ralph Bocking, is published in the *Acta Sanctorum* of the Bollandists, where a later and shorter life by John Capgrave is also to be found.

RICHARD (d. 1184), archbishop of Canterbury, was a Norman, who became a monk at Canterbury, where he acted as chaplain to Archbishop Theobald and was a colleague of Thomas Becket. In 1173, more than two years after the murder of Becket, it was decided to fill the vacant archbishopric of Canterbury; there were two candidates, Richard, at that time prior of St Martin's, Dover, and Odo, prior of Canterbury, and in June Richard was chosen, although Odo was the nominee of the monks. Objections were raised against this election both in England and in Rome, but in April 1174 the new archbishop was consecrated at Anagui by Pope Alexander III., and he returned to England towards the close of the year. The ten years during which Richard was archbishop were disturbed by disputes with Roger, archbishop of York, over the respective rights of the two sees, and in 1175, at a council held in London, there was a free fight between their partisans. Henry II. arranged a truce for five years between the rival prelates, but Richard was soon involved in another quarrel, this being with Roger, abbot of St Augustine's, Canterbury, whose action also trenched upon the privileges of the archbishop. Richard was more acceptable to Henry II. than Becket had been; he attended the royal councils, and more than once he was with the king in Normandy. Henry probably preferred him because he insisted less on the rights of the clergy than his great predecessor had done; but the monastic writers and the followers of Becket regarded this attitude as a sign of weakness. Richard died at Rochester on the 16th of February 1184 and was

buried in his cathedral. See the article by W. Hunt in the *Dict. Nat. Biog.* vol. xlviii. (1896); and W. F. Hook, *Lives of the Archbishops of Canterbury.*

RICHARD, earl of Cornwall and king of the Romans (1209–1272), was the second son of the English king John by Isabella of Angoulême. Born in 1209, Richard was the junior of his brother, Henry III., by fifteen months; he was educated in England and received the earldom of Cornwall in 1225. From this date to his death he was a prominent figure on the political stage. In the years 1225–27 he acted as governor of Gascony; between 1227 and 1238, owing to quarrels with his brother and dislike of the foreign favourites, he attached himself to the baronial opposition and bade fair to become a popular hero. But in 1240 he took the command of a crusade in order to escape from the troubled atmosphere of English politics. He was formally reconciled with Henry before his departure; and their amity was cemented on his return by his marriage with Sancha of Provence, the sister of Henry's queen (1243). Henceforward Richard, though by no means blind to the faults of the government, was among the most constant supporters of Henry III. While affecting to remain neutral in the quarrels of the barons with the Poitevins and Savoyards he constantly assisted the king with loans, and thus enabled him to withstand the pressure of the Great Council for reform. In 1257 a bare majority of the German electors nominated Richard as king of the Romans, and he accepted their offer at Henry's desire. He was elected partly on account of his wealth, but also because his family connexion with the Hohenstaufen and his friendly relations with the papacy made it probable that he would unite all German parties. In the years 1257–68 Richard paid four visits to Germany. He obtained recognition in the Rhineland, which was closely connected with England by trade relations. Otherwise, however, he was unsuccessful in securing German support. In the English troubles of the same period he endeavoured to act as a mediator. On the outbreak of civil war in 1264 he took his brother's side, and his capture in a windmill outside Lewes, after the defeat of the royalist army, is commemorated in the earliest of English vernacular satires; he remained a prisoner till the fall of Montfort. But after Evesham he exerted himself, not without success, to obtain reasonable terms for those who had suffered from the vengeance of the royalist party. He died on the 2nd of April 1272. His end is said to have been hastened by grief for his eldest son, Henry of Almain, who had been murdered in the previous year by the sons of Simon de Montfort at Viterbo. The earldom of Cornwall passed to Richard's eldest surviving son Edmund, who was guardian of England from 1286 to 1289. On Edmund's death, in October 1300, it became extinct.

Authorities.—The original sources and general works of reference are the same as for the reign of Henry III. G. C. Gebauer's *Leben und Thaten Herrn Richards von Cornwall* (Leipzig, 1744). H. Koch's *Richard von Cornwall, 1209–1257* (Strassburg, 1888), and A. Busson's *Doppelwahl des Jahres, 1257* (Münster, 1866) are useful monographs.
(H. W. C. D.)

RICHARD I. (1157–1199), king of England, nicknamed "Cœur de Lion" and "Yea and Nay," was the third son of Henry II. by Eleanor of Aquitaine. Born in September 1157, he received at the age of eleven the duchy of Aquitaine, and was formally installed in 1172. In his new position he was allowed, probably from regard to Aquitanian susceptibilities, to govern with an independence which was studiously denied to his brothers in their shares of the Angevin inheritance. Yet in 1173 Richard joined with the young Henry and Geoffrey of Brittany in their rebellion; Aquitaine was twice invaded by the old king before the unruly youth would make submission. Richard was soon pardoned and reinstated in his duchy, where he distinguished himself by crushing a formidable revolt (1175) and exacting homage from the count of Toulouse. In a short time he was so powerful that his elder brother Henry became alarmed and demanded, as heir-apparent, that Richard should do him homage for Aquitaine. Richard having scornfully rejected the demand, a fratricidal war ensued; the young Henry invaded Aquitaine and attracted to his standard many of Richard's vassals, who were exasperated by the iron rule of the duke. Henry II. marched to Richard's aid; but the war terminated abruptly with the death of the elder prince (1183).

Richard, being now the heir to England and Normandy, was invited to renounce Aquitaine in favour of Prince John. The proposal led to a new civil war; and, although a temporary compromise was arranged, Richard soon sought the help of Philip Augustus, to whom he did homage for all the continental possessions in the actual presence of his father (Conference of Bonmoulins, 18th of November 1188) In the struggle which ensued the old king was overpowered, chased ignominiously from Le Mans to Angers, and forced to buy peace by conceding all that was demanded of him; in particular the immediate recognition of Richard as his successor.

But the death of Henry II. (1189) at once dissolved the friendship between Richard and Philip. Not only did Richard continue the continental policy of his father, but he also refused to fulfil his contract with Philip's sister, Alais, to whom he had been betrothed at the age of three. An open breach was only delayed by the desire of both kings to fulfil the crusading vows which they had recently taken. Richard, in particular, sacrificed all other interests to this scheme, and raised the necessary funds by the most reckless methods. He put up for auction the highest offices and honours; even remitting to William the Lion of Scotland, for a sum of 15,000 marks, the humiliating obligations which Henry II. had imposed in the treaty of Falaise. It is true that Richard indemnified himself on his return by resuming some of his most important grants and refusing to return the purchase money; but it is improbable that he had originally planned this repudiation of his ill-considered bargains. By such expedients he raised and equipped a force which may be estimated at 4000 men-at-arms and as many foot-soldiers, with a fleet of 100 transports (1191).

Richard did not return to his dominions until 1194. But his stay in Palestine was limited to sixteen months. On the outward journey he wintered in Sicily, where he employed himself in quarrelling with Philip and in exacting satisfaction from the usurper Tancred for the dower of his widowed sister, Queen Joanna, and for his own share in the inheritance of William the Good. Leaving Messina in March 1191, he interrupted his voyage to conquer Cyprus, and only joined the Christian besiegers of Acre in June. The reduction of that stronghold was largely due to his energy and skill. But his arrogance gave much offence. After the fall of Acre he inflicted a gross insult upon Leopold of Austria; and his relations with Philip were so strained that the latter seized the first pretext for returning to France, and entered into negotiations with Prince John (see JOHN, king of England) for the partition of Richard's realm. Richard also threw himself into the disputes respecting the crown of Jerusalem, and supported Guy of Lusignan against Conrad of Montferrat with so much heat that he incurred grave, though unfounded, suspicions of complicity when Conrad was assassinated by emissaries of the Old Man of the Mountain. None the less Richard, whom even the French crusaders accepted as their leader, upheld the failing cause of the Frankish Christians with valour and tenacity. He won a brilliant victory over the forces of Saladin at Arsuf (1191), and twice led the Christian host within a few miles of Jerusalem. But the dissensions of the native Franks and the crusaders made it hopeless to continue the struggle; and Richard was alarmed by the news which reached him of John's intrigues in England and Normandy. Hastily patching up a truce with Saladin, under which the Christians kept the coast-towns and received free access to the Holy Sepulchre, Richard started on his return (9th October 1192).

His voyage was delayed by storms, and he appears to have been perplexed as to the safest route. The natural route overland through Marseilles and Toulouse was held by his enemies; that through the empire from the head of the Adriatic was little safer, since Leopold of Austria was on the watch for him. Having adopted the second of these alternatives, he was cap-

tured at Vienna in a mean disguise (December 20th, 1192) and strictly confined in the duke's castle of Dürenstein on the Danube. His mishap was soon known to England, but the regents were for some weeks uncertain of his whereabouts. This is the foundation for the tale of his discovery by the faithful minstrel Blondel, which first occurs in a French romantic chronicle of the next century. Early in 1193 Leopold surrendered his prize, under compulsion, to the emperor Henry VI., who was aggrieved both by the support which the Plantagenets had given to the family of Henry the Lion and also by Richard's recognition of Tancred in Sicily. Although the detention of a crusader was contrary to public law, Richard was compelled to purchase his release by the payment of a heavy ransom and by doing homage to the emperor for England. The ransom demanded was 150,000 marks; though it was never discharged in full, the resources of England were taxed to the utmost for the first instalments; and to this occasion we may trace the beginning of secular taxation levied on movable property.

Richard reappeared in England in March 1194; but his stay lasted only a few weeks, and the remainder of his reign was entirely devoted to his continental interests. He left England to be governed by Hubert Walter (*q.v.*), and his personal authority was seldom asserted except by demands for new subsidies. The rule of the Plantagenets was still popular in Normandy and Aquitaine; but these provinces were unable or unwilling to pay for their own defence. Though Richard proved himself consistently the superior of Philip in the field, the difficulty of raising and paying forces to resist the French increased year by year. Richard could only stand on the defensive; the keynote of his later policy is given by the building of the famous Château Gaillard at Les Andelys (1196) to protect the lower courses of the Seine against invasion from the side of France. He did not live to see the futility of such bulwarks. In 1199 a claim to treasure-trove embroiled him with the viscount of Limoges. He harried the Limousin and laid siege to the castle of Châlus; while directing an assault he was wounded in the shoulder by a crossbow bolt, and, the wound mortifying from unskilful treatment or his own want of care, he died on the 6th of April 1199. He was buried by his own desire at his father's feet in the church of Fontevrault. Here his effigy may still be seen.[1] Though contemporary, it does not altogether agree with the portraits on his Great Seal, which give the impression of greater strength and even of cruelty. The Fontevrault bust is no doubt idealized.

The most accomplished and versatile representative of his gifted family, Richard was, in his lifetime and long afterwards, a favourite hero with troubadours and romancers. This was natural, as he belonged to their brotherhood and himself wrote lyrics of no mean quality. But his history shows that he by no means embodied the current ideal of chivalrous excellence. His memory is stained by one act of needless cruelty, the massacre of over two thousand Saracen prisoners at Acre; and his fury, when thwarted or humbled, was ungovernable. A brave soldier, an experienced and astute general, he was never happier than when engaged in war. As a ruler he was equally profuse and rapacious. Not one useful measure can be placed to his credit; and it was by a fortunate accident that he found, in Hubert Walter, an administrator who had the skill to mitigate the consequences of a reckless fiscal policy. Richard's wife was Berengaria, daughter of Sancho VI., king of Navarre, whom he married in Cyprus in May 1191. She was with the king at Acre later in the same year, and during his imprisonment passed her time in Sicily, in Rome and in France. Husband and wife met again in 1195, and the queen long survived the king, residing chiefly at Le Mans. She died soon after 1230. Berengaria founded a Cistercian monastery at Espau.

[1] The remains of Richard, together with those of Henry II. and his queen Eleanor, were removed in the 17th century from their tombs to another part of the church. They were rediscovered in 1910 during the restoration of the abbey undertaken by the French government.

AUTHORITIES.—The more important of the general chronicles are: the *Gesta Henrici Secundi*, ascribed to Benedict of Peterborough (Rolls Series, 2 vols., 1867); the *Chronica* of Roger of Hoveden (Rolls Series, 4 vols., 1868–71); the *Chronica* of Gervase of Canterbury (Rolls Series, 1879); the *Imagines Historiarum* of Ralph of Diceto (Rolls Series, 2 vols., 1876); the *Historia Rerum Anglicarum* of William of Newburgh (in *Chronicles of the Reigns of Stephen, &c.*, Rolls Series, 2 vols., 1884–85); the *De rebus gestis Ricardi Primi* of Richard of Devizes (in *Chronicles of the Reigns of Stephen, &c.*, vol. iii., Rolls Series, 1886); the *Chronicon Anglicanum* of Ralph of Coggeshall (Rolls Series, 1875); the *Flores Historiarum* of Roger of Wendover (Rolls Series, 3 vols., 1886–89); the *Gesta Philippi Augusti* of Rigord (*Société de l'histoire de France*, Paris, 1882) and of Guillaume le Breton (*op. cit.*). A detailed narrative of Richard's crusade is given in *L'Estoire de la guerre sainte*, a rhyming French chronicle by the minstrel Ambroise (ed. Gaston Paris, Paris, 1897), and in the Latin prose version known as the *Itinerarium O. Peregrinorum et gesta Regis Ricardi*; this last, with some valuable historical letters, is printed in W. Stubbs's *Chronicles and Memorials of the Reign of Richard I.* (Rolls Series, 2 vols., 1864–65). Of modern works the following are useful: W. Stubbs's preface to vols. iii. and iv. of Hoveden; the same author's *Constitutional History of England*, vol. i. (Oxford, 1897); Miss K. Norgate's *England under the Angevin Kings*, vol. ii. (London, 1887); Sir J. H. Ramsay's *Angevin Empire* (London, 1903); R. Röhricht's *Geschichte des Königreichs Jerusalem* (1898); W. B. Stevenson's *Crusaders in the East* (Cambridge, 1907); A. Cartellieri's *Philipp II. August* (Leipzig, 1899, &c.).

(H. W. C. D.)

RICHARD II. (1367–1400), king of England, younger son of Edward the Black Prince by Joan "the Fair Maid of Kent," was born at Bordeaux on the 6th of January 1367. He was brought to England in 1371, and after his father's death was, on the petition of the Commons in parliament, created prince of Wales on the 20th of November 1376. When Edward III. died, on the 21st of June 1377, Richard became king. Popular opinion had credited John of Gaunt with designs on the throne. This was not justified; nevertheless, the rivalry of the boy-king's uncles added another to the troubles due to the war, the Black Death and the prospect of a long minority. At first the government was conducted by a council appointed by parliament. The council was honest, but the difficulties in the situation were too great. The ill-considered poll-tax of 1381 was the occasion, though not the real cause, of the Peasants' Revolt in that year. The ministers were quite unequal to the crisis, and when Wat Tyler and his followers got possession of London, it was Richard who showed a precocious tact and confidence in handling it. It was the boy-king who met and temporized with the rebels on the 13th of June at Mile End, and again next day at Smithfield; and he who, with courageous presence of mind, saved the situation when Tyler was killed, by calling on them to take him for their leader. From this time Richard began to assert himself. His chief ministers, appointed by parliament in 1382, were the earl of Arundel and Michael de la Pole. Arundel Richard disliked, and dismissed next year, when he began his personal government. Pole, whom he retained as chancellor and made earl of Suffolk, was a well-chosen adviser. But others, and especially his youthful favourite Robert de Vere, promoted by unheard-of honour to be marquess of Dublin and duke of Ireland, were less worthy. Further, Richard made his own position difficult by lavish extravagance and unseemly outbursts of temper. He chafed under the restraint of his relatives, and therefore encouraged John of Gaunt in his Spanish enterprise. This gave the less scrupulous Thomas of Gloucester his opportunity. Gloucester, supported by Arundel, attacked his nephew's ministers in the parliament of 1386, and by open hints at deposition forced Richard to submit to a council of control. When Richard, with the aid of his friends and by the advice of subservient judges, planned a reversal of the parliament, Gloucester, at the head of the so-called lords appellant, anticipated him. Richard had been premature and ill-advised. Gloucester had the advantage of posing as the head of the constitutional party. The king's friends were driven into exile or executed, and he himself forced to submit to the loss of all real power (May 1388). Richard changed his

methods, and when the lords appellant had lost credit, asserted himself constitutionally by dismissing Gloucester's supporters from office, and appointing in their place well-approved men like William of Wykeham. In the next parliament of 1390 the king showed himself ready to meet and conciliate his subjects. The simultaneous return of John of Gaunt from Spain put a check on Gloucester's ambition. For seven years Richard ruled constitutionally and on the whole well. The opposition was quiescent except for two outbreaks by Arundel: the first was a violent attack on John of Gaunt, which rather strengthened Richard's position; the second was a wanton insult to the king at the funeral of his queen.

In January 1383 Richard had married Anne of Bohemia (1366–1394), daughter of the emperor Charles IV. The marriage, though childless, was happy; had Anne lived or borne a son the course of events might have been different. Her death on the 7th of June 1394 was a great shock to Richard, and incidentally had important consequences. Richard sought distraction by an expedition to Ireland, the first visit of an English king for more than two centuries. In his policy there he showed a wise statesmanship. At the same time he was negotiating for a permanent peace with France, which was finally arranged in October 1396 to include his own marriage with Isabella, daughter of Charles VI., a child of seven. Gloucester criticized the peace openly, and there was some show of opposition in the parliament of February 1397. But there was nothing to foreshadow the sudden stroke by which in July Richard arrested Gloucester and his chief supporters, the earls of Arundel and Warwick. The others of the five lords appellant, Henry of Bolingbroke afterwards King Henry IV., and the earl of Nottingham, now supported the king. Richard's action was apparently in deliberate revenge for the events of 1387–88. Gloucester, after a forced confession, died in prison at Calais, smothered by his nephew's orders. Arundel in a packed parliament was condemned and executed; his brother Thomas archbishop of Canterbury was exiled. The king's friends, including Nottingham and Bolingbroke, made dukes of Norfolk and Hereford, were all promoted in title and estate. Richard himself was rewarded for ten years' patience by the possession of absolute power. He might perhaps have established it if he could have exercised it with moderation. But he declared that the laws of England were in his mouth, and supported his court in wanton luxury by arbitrary methods of taxation. By the exile of Norfolk and Hereford in September 1398 he seemed to have removed the last persons he need fear. He was so confident that in May 1399 he paid a second visit to Ireland, taking with him all his most trusted adherents. Thus when Henry landed at Ravenspur in July he found only half-hearted opposition, and when Richard himself returned it was too late. Ultimately Richard surrendered to Henry at Flint on the 19th of August, promising to abdicate if his life was spared. He was taken to London riding behind his rival with indignity. On the 30th of September he signed in the Tower a deed of abdication, wherein he owned himself insufficient and useless, reading it first aloud with a cheerful mien and ending with a request that his cousin would be good lord to him. The parliament ordered that Richard should be kept close prisoner, and he was sent secretly to Pontefract. There in February 1400 he died: no doubt of the rigour of his winter imprisonment, rather than by actual murder as alleged in the story adopted by Shakespeare. The mystery of Richard's death led to rumours that he had escaped, and an impostor pretending to be Richard lived during many years under the protection of the Scottish government. But no doubt it was the real Richard who was buried without state in 1400 at King's Langley, and honourably reinterred by Henry V. at Westminster in 1413.

Richard II. is a character of strange contradictions. It is difficult to reconcile the precocious boy of 1381 with the wayward and passionate youth of the next few years. Even if it be supposed that he dissembled his real opinions during the period of his constitutional rule, it is impossible to believe that the apparent indifference which he showed in his fall was the mere acting of a part. His violent outbursts of passion perhaps give the best clue to a mercurial and impulsive nature, easily elated and depressed. He had real ability, and in his Irish policy, and in the preference which he gave to it over continental adventure, showed a statesmanship in advance of his time. But this, in spite of his lofty theory of kingship, makes it all the more difficult to explain his extravagant bearing in his prosperity. His fall was due to the triumph of national right over absolute government, but it was his personal conduct which made it inevitable. In appearance Richard was tall and handsome, if effeminate. He had some literary tastes, which were shown in fitful patronage of Chaucer, Gower and Froissart. His fancy for splendid dress may have been due to an artistic sense, which found better expression in his great buildings of Westminster Hall and Abbey. Richard's second queen, Isabella (1389–1409), was born in Paris on the 9th of November 1389, and was married to the English king at Calais in October, or November, 1396, but on account of the bride's youth the marriage was never consummated. When Richard lost his crown in 1399 Isabella was captured by Henry IV.'s partisans and sent to Sonning, near Reading, while her father, Charles VI., asked in vain for the restoration of his daughter and of her dowry. In 1401 she was allowed to return to France; in 1406 she became the wife of the poet, Charles, duke of Orleans, and she died on the 13th of September 1409.

BIBLIOGRAPHY.—The best contemporary authorities are the *Chronicon Angliae* down to 1388, Walsingham's *Historia Anglicana*, the *Annales Ricardi II.*, Knighton's *Chronicle* (all these in the Rolls Series), the *Vita Ricardi II.* by a Monk of Evesham (ed. T. Hearne), and the *Chronique de la traison et mort* (English Hist. Soc.). Froissart wrote from some personal knowledge. A metrical account of Richard's fall, probably written by a French knight called Creton, is printed in *Archaeologia*, xx. The chief collections of documents are the *Rolls of Parliament* and the *Calendar of Patent Rolls*. H. A. Wallon's *Richard II.* (Paris, 1864) is the fullest life, though now somewhat out of date. For other modern accounts see W. Stubbs, *Constitutional History*, and C. W. C. Oman, *The Political History of England*, vol. iv., and *The Great Revolt of 1381*. (C. L. K.)

RICHARD III. (1452–1485), king of England, youngest son of Richard, duke of York, by Cicely Neville, was born at Fotheringhay on the 2nd of October 1452. After the second battle of St Albans in February 1461, his mother sent him with his brother George for safety to Utrecht. They returned in April, and at the coronation of Edward IV. Richard was created duke of Gloucester. As a mere child he had no importance till 1469–1470, when he supported his brother against Warwick, shared his exile and took part in his triumphant return. He distinguished himself at Barnet and Tewkesbury; according to the Lancastrian story, after the latter battle he murdered the young Edward of Wales in cold blood; this is discredited by the authority of Warkworth (*Chronicle*, p. 18); but Richard may have had a share in Edward's death during the fighting. He cannot be so fully cleared of complicity in the murder of Henry VI., which probably took place at the Tower on the night of the 21–22 of May, when Richard was certainly present there. Richard shared in the full in his brother's prosperity. He had large grants of lands and office, and by marrying (July 1472–1485), the younger daughter of Warwick, secured a share in the Neville inheritance. This was distasteful to George, duke of Clarence, who was already married to the elder sister, Isabel. The rivalry of the two brothers caused a quarrel which was never appeased. Richard does not, however, seem to have been directly responsible for the death of Clarence in 1478; Sir Thomas More, who is a hostile witness, says that he resisted it openly "howbeit somewhat (as men deemed) more faintly than he that were heartily minded to his wealth." Richard's share of the Neville inheritance was chiefly in the north, and he resided usually at Middleham in Yorkshire. In May 1480 he was made the king's lieutenant-general in the north, and in 1482 commanded a successful invasion of Scotland. His administration was good, and brought him well-deserved popularity. On Edward's death he was kept informed of events in London by William, Lord Hastings, who shared his dislike of the Woodville influence.

On the 29th of April 1483, supported by the duke of Buckingham, he intercepted his nephew at Stony Stratford and arrested Lord Rivers and Richard Grey, the little king's half-brother. It was in Richard's charge that Edward was brought to London on the 4th of May. Richard was recognized as protector, the Woodville faction was overthrown, and the queen with her younger children took sanctuary at Westminster. For the time the government was carried on in Edward's name, and the 22nd of June was appointed for his coronation. Richard was nevertheless gathering forces and concerting with his friends. In the council there was a party, of whom Hastings and Bishop Morton were the chief, which was loyal to the boy-king. On the 13th of June came the famous scene when Richard appeared suddenly in the council baring his withered arm and accusing Jane Shore and the queen of sorcery: Hastings, Morton and Stanley were arrested and the first-named at once beheaded. A few days later, probably on the 25th of June, Rivers and Grey were executed at Pontefract. On the 22nd of June Dr Shaw was put up to preach at Paul's Cross against the legitimacy of the children of Edward IV. On the 25th a sort of parliament was convened at which Edward's marriage was declared invalid on the ground of his precontract with Eleanor Talbot, and Richard rightful king. Richard, who was not present, accepted the crown with feigned reluctance, and from the following day began his formal reign.

On the 6th of July Richard was crowned at Westminster, and immediately afterwards made a royal progress through the Midlands, on which he was well received. But in spite of its apparent success the usurpation was not popular. Richard's position could not be secure whilst his nephews lived. There seems to be no reasonable doubt that early in August Edward V. and his brother Richard (whom Elizabeth Woodville had been forced to surrender) were murdered by their uncle's orders in the Tower. Attempts have been made to clear Richard's memory. But the report of the princes' death was believed in England at the time, "for which cause king Richard lost the hearts of the people" (*Chronicles of London*, 191), and it was referred to as a definite fact before the French states-general in January 1484. The general, if vague, dissatisfaction found its expression in Buckingham's rebellion. Richard, however, was fortunate, and the movement collapsed. He met his only parliament in January 1484 with some show of triumph, and deserves credit for the wise intent of its legislation. He could not, however, stay the undercurrent of disaffection, and his ministers, Lovell and Catesby, were unpopular. His position was weakened by the death of his only legitimate son in April 1484. His queen died also a year later (March 16, 1485), and public opinion was scandalized by the rumour that Richard intended to marry his own niece, Elizabeth of York. Thus the feeling in favour of his rival Henry Tudor strengthened. Henry landed at Milford Haven on the 7th of August 1485, and it was with dark forebodings that Richard met him at Bosworth on the 22nd. The defection of the Stanleys decided the day. Richard was killed fighting, courageous at all events. After the battle his body was carried to Leicester, stripped across a horse's back, and buried without honour in the church of the Greyfriars.

Richard was not the villain that his enemies depicted. He had good qualities, both as a man and a ruler, and showed a sound judgment of political needs. Still it is impossible to acquit him of the crime, the popular belief in which was the chief cause of his ruin. He was not a monster; but a typical man in an age of strange contradictions of character, of culture combined with cruelty, and of an emotional temper that was capable of high ends, though unscrupulous of means. Tradition represents Richard as deformed. It seems clear that he had some physical defect, though not so great as has been alleged. John Stow told Buck that old men who remembered Richard described him as in bodily form comely enough. Extant portraits show an intellectual face characteristic of the early Renaissance, but do not indicate any deformity.

BIBLIOGRAPHY.—The chief original authorities are Sir Thomas More's *History of Richard III.*, based on information supplied by Archbishop Morton, and therefore to be accepted with caution; the more trustworthy *Continuation of the Croyland Chronicle* in Fulman's *Scriptores*, the *History* of Polydore Vergil, written in a Tudor spirit; the *Chronicle of London* (ed. C. L. Kingsford, 1905), and its biased expansion in Fabyan's *Chronicle*. See also *Letters and Papers Illustrative of the Reigns of Richard III. and Henry VII.*, ed. J. Gairdner, in Rolls Series. Of later accounts those in Stow's *Annales* (preserving some oral tradition) and George Buck's *Richard III.* ap. Kennet *History of England* deserve mention. Horace Walpole attempted a vindication in his *Historic Doubts* (1768). The best modern account is James Gairdner's *Life of Richard III.* (2nd ed., 1898). The latest and fullest defence is given in Sir Clements Markham's *Richard III., His Life and Character* (1906); G. B. Churchill's *Richard the Third up to Shakespeare* (*Palaestra* V., 1900) is a valuable digest of material. (C. L. K.)

RICHARD, FRANÇOIS MARIE BENJAMIN (1819–1908), archbishop of Paris, French prelate, was born at Nantes on the 1st of March 1819. Educated at the seminary of St Sulpice he became successively vicar-general of Nantes, bishop of Belley, and in 1875 coadjutor of Paris. In 1886 the death of Archbishop Guibert was followed by Mgr. Richard's appointment to the see of Paris, and in 1889 he received a cardinal's hat. In January 1900 the trial of the Assumptionist Fathers resulted in the dissolution of their society as an illegal association. Next day an official visit of the archbishop to the Fathers was noted by government as an act of a political character, and Mgr. Richard was officially censured. His attitude was in general exceedingly moderate, he had no share in the extremist policy of the Ultramontanes, and throughout the struggle over the law of Associations and the law of Separations he maintained his reasonable temper. He presided in September 1906 over an assembly of bishops and archbishops at his palace in the rue de Grenelle, a few days after the papal encyclical forbidding French Catholics to form associations for public worship, but it was then too late for conciliation. In December he gave up the archiepiscopal palace to the government authorities. He was then an old man of nearly ninety, and his "eviction" evoked great sympathy. Cardinal Richard died on the 29th of January 1908.

RICHARD, HENRY (1812–1888), Welsh politician, was the son of the Rev. Ebenezer Richard (1781–1837), a Calvinistic Methodist minister, and was born on the 3rd of April 1812. Educated at Llangeitho grammar school, he also studied at a college at Highbury, and in 1835 he became minister of a Congregational church in the Old Kent Road, London, a position which he retained for fifteen years. Richard is chiefly known as an advocate of peace and international arbitration. In 1848 he became secretary of the Peace Society, and in this capacity he helped to organize a series of congresses in the capitals of Europe, and was partly instrumental in securing the insertion of a declaration in favour of arbitration in the treaty of Paris in 1856. He resigned his post in 1885. In 1868 Richard was elected member of parliament for the Merthyr boroughs, and he remained in the House of Commons until his death at Treborth, near Bangor, on the 20th of August 1888. In parliament he was a leading member of the party which advocated the removal of Nonconformist grievances and the disestablishment of the church in Wales; in 1877 he was chairman of the Congregational Union of England and Wales. Among Richard's writings may be mentioned: *Defensive War* (1846, and again 1890); *Memoirs of Joseph Sturge* (1864); *Letters on the Social and Political Condition of the Principality of Wales* (1866, and again 1884); and *The Recent Progress of International Arbitration* (1884). He also prepared some of the material for the life of his friend and associate, Richard Cobden, which was written by Mr John, now Lord, Morley; and he did some journalistic work in the *Morning Star* and the *Evening Star*.

See C. S. Miall, *Henry Richard, M.P.* (1889); L. Appleton, *Memoirs of Henry Richard* (1889); and articles in *Cymru Fydd* for 1888.

RICHARD OF CIRENCESTER (*c.* 1335–*c.* 1401), historical writer, was a member of the Benedictine abbey at Westminster, and his name ("Circestre") first appears on the chamberlain's list of the monks of that foundation drawn up in the year 1355. In the year 1391 he obtained a licence from the abbot to go to Rome, and in this the abbot gives his testimony to Richard's

perfect and sincere observance of religion for upwards of thirty years. In 1400 Richard was in the infirmary of the abbey, where he died in the following year. His only known extant work is *Speculum Historiale de Gestis Regum Angliae, 447–1066*. The MS. of this is in the university library at Cambridge, and has been edited for the Rolls Series (No. 30) by Professor J. E. B. Mayor (2 vols., London, 1863–69). It is in four books, and at the conclusion of the fourth book Richard expresses his intention of continuing his narrative from the accession of William I., and incorporating a sketch of the Conqueror's career from his birth. This design he does not, however, appear to have carried into effect. The value of the *Speculum* as a contribution to our historical knowledge is but slight, for it is mainly a compilation from other writers; while even in transcribing these the compiler is guilty of great carelessness. He gives, however, numerous charters relating to Westminster Abbey, and also a very complete account of the saints whose tombs were in the abbey church, and especially of Edward the Confessor. The work was, however, largely used by historians and antiquaries, until, with the rise of a more critical spirit, its value became more accurately estimated. Besides the *Speculum* Richard also wrote, according to the statement of William of Woodford in his *Answer* to Wycliffe (Edward Brown, *Fasciculus Rerum expetendarum*, p. 193), a treatise *De Officiis*; and there was formerly in the cathedral library at Peterborough another tractate from his pen, entitled *Super Symbolum*. Of neither of these works, however, does any known copy now exist.

The *Speculum* affords the most conclusive proof of the spuriousness of another work attributed to Richard and long accepted by the learned world as his. This was the *De Situ Britanniae*, an elaborate forgery relating to the antiquities of Roman Britain, which first appeared at Copenhagen in the year 1747. It was printed with the works of Gildas and Nennius, under the editorship of Charles Julius Bertram, professor of English in the academy of Copenhagen in the middle of the 18th century, with the following special title: "Richardi Corinensis monachi Westmonasteriensis de situ Britanniae libri duo. E. Codici MS. descripsit, Notisque et Indice adornavit Carolus Bertram."

This forgery was accepted as genuine by a well-known antiquary of the 18th century, Dr William Stukeley, and under the sanction of his authority continued for a long time to be regarded in the same light by numerous scholars and antiquaries, including Gibbon and Lingard. On the other hand, critics of a later date gave expression, on various grounds, to a contrary conclusion. All doubt on the subject may, however, be held to have been effectually set at rest by the masterly exposure of the whole fraud drawn up by Professor Mayor in the preface to the edition above referred to of the *Speculum*. He has there not only demonstrated, from the external and internal evidence alike, the spuriousness of the whole treatise, but in a collation (extending to nearly a hundred pages) of numerous passages with corresponding passages in classical mediæval authorities, has also traced out the various sources whence Bertram derived the terminology and the facts which he reproduced in the *De Situ*. (J. B. M.)

RICHARD OF DEVIZES (fl. 1191), English chronicler, was a monk of St Swithin's house at Winchester. His birthplace is probably indicated by his surname, but of his life we know nothing. He is credited by Dale with the composition of the *Annales Wintonia*, which are edited by Luard in the second volume of the *Annales Monastici*. If this statement be correct, then the chronicler survived King Richard I. But the *Chronicon de rebus gestis Ricardi Primi*, by which Richard of Devizes is chiefly known, only covers the first three years of that king's reign; it is practically an account of events in England and the Holy Land during the Third Crusade. For the events of the crusade itself, Richard is a poor authority. But his account of the preparations for the crusade, and of English affairs in the king's absence, is valuable, in spite of some inaccuracies. The author is intensely conservative, steeped in the prejudices of his order, and particularly hostile to the Jews and to the chancellor, William Longchamp. He writes in a vivid and epigrammatic style; his Latin shows the effect of the 12th-century renaissance in its polish and in its reminiscences of classical poets.

See the editions of the *Chronicon de rebus gestis Ricardi Primi* by J. Stevenson (Eng. Historical Soc., 1838) and by R. Howlett in *Chronicles of the Reigns of Stephen, Henry II. and Richard I.*, vol. iii. (Rolls Series, 1886); the *Annales de Wintonia* in H. R. Luard's *Annales Monastici*, vol. ii. (Rolls Series, London, 1864–69). (H. W. C. D.)

RICHARD OF HEXHAM (fl. 1141), English chronicler, became prior of Hexham about 1141, and died between 1163 and 1178. He wrote *Brevis Annotatio*, a short history of the church of Hexham from 674 to 1138, for which he borrowed from Bede, Eddius and Simeon of Durham. This is published by J. Raine in *The Priory of Hexham, its Chroniclers, Endowments and Annals* (Durham, 1864–65). More important is his *Historia de gestis regis Stephani et de bello Standardii*, very valuable for the history of the north of England during the earlier part of the reign of Stephen, and especially for the battle of the Standard. This history, which is a contemporary one, covers the period from the death of Henry I. in 1135 to early in 1139. It has been edited for the Rolls Series by R. Howlett in the *Chroniclers of the Reigns of Stephen, Henry II. and Richard I.*, vol. iii. (1886); and has been translated by J. Stevenson in the *Church Historians of England*, vol. iv. (1856).

RICHARD OF ILCHESTER (d. 1188), English statesman and prelate, was born in the diocese of Bath, where he obtained preferment. Early in the reign of Henry II., however, he is found acting as a clerk in the king's court, probably under Thomas Becket, and he was one of the officials who assisted Henry in carrying out his great judicial and financial reforms. In 1170–1169, he was appointed archdeacon of Poitiers, but he passed most of his time in England, although in the next two or three years he visited Pope Alexander III. and the Emperor Frederick I. in the interests of the English king, who was then engaged in his struggle with Becket. For promising to support Frederick against Alexander he was excommunicated by Becket in 1166. Before this event, however, Richard had been appointed a baron of the exchequer, his great industry and exceptional abilities as an accountant being recognized by giving him a special seat at the exchequer table, and from 1168 until his death he frequently acted as one of the itinerant justices. Although totally immersed in secular business he received several rich ecclesiastical offices, and in May 1173 he was elected bishop of Winchester, being consecrated at Canterbury in October 1174. Richard still continued to serve Henry II. In 1176 he was appointed justiciar and seneschal of Normandy, and was given full control of all the royal business in the duchy. He died on the 21st or 22nd of December 1188, and was buried in Winchester cathedral. Richard owes his surname to the fact that Henry II. granted him a mill at Ilchester; he is also called Richard of Toclyve.

See the article by Miss K. Norgate in the *Dict. Nat. Biog.*, vol. xlviii. (1896); and W. R. W. Stephens and W. W. Capes, *The Bishops of Winchester* (1907).

RICHARD OF ST VICTOR (d. 1173), theologian and mystic of the 12th century. Very little is known of his life; he was born in Scotland or in England, and went to Paris, where he entered the abbey of St Victor and was a pupil of the great mystic, Hugh of St Victor. He succeeded as prior of this house in 1162, and was continually contesting the tyrannical authority of the abbot Ervisius. His writings, some of which are still in manuscript, are very numerous, the best known being his mystical treatises: *De statu hominis interioris*, *De praeparatione animi ad contemplationem*, *De gratia contemplationis*, *De gradibus caritatis*, *De arca nuptica*, and his two works on the Trinity: *De trinitate libri sex*, *De tribus appropriatis personis in Trinitate*. As is the case with all the Victorines, his mysticism was a reaction against the philosophy of the schools of his time, a perpetual justification of contemplation as opposed to logical reasoning. According to him, six steps lead the soul to contemplation: (1) contemplation of visible and tangible objects; (2) study of the productions of nature and of art; (3) study of character; (4) study of souls and of spirits; (5) entrance to the mystical region which ends in (6) ecstasy. His theory of the Trinity is chiefly based on the arguments of Anselm of Canterbury, although a certain deification of the social sense is evident.

His style is most affected, and the influence of the neo-Platonist terminology as well as of the works of the pseudo-Dionysius can be clearly detected. In the *Paradis* Dante has placed Richard de St Victor, whose books were much read by his contemporaries, among the greatest teachers of the Church. His writings seem to have come into favour again in the 16th and 17th centuries, six editions of his works having been printed between 1506 and 1650.

RICHARDIA, a small genus of the nat. ord. Araceae, native in South Africa, to which the "arum lily" belongs. They are all greenhouse herbaceous plants of handsome appearance, with thick underground stems and large, more or less fleshy, long-stalked, arrow-shaped leaves and white or yellow flower spathes. They are readily propagated by division of the shoot, also by seed. Water should be given abundantly at all times, and the soil for potting should be rich and retentive. Potting is best effected in spring, and from the end of June to the end of August they should be plunged in a sunny spot out of doors. They will not withstand frost, and should be wintered in a warm greenhouse. They flower throughout the year.

RICHARDS, ALFRED BATE (1820–1876), English journalist, was born in Worcestershire on the 17th of February 1820, and was educated at Westminster School and Exeter College, Oxford. After taking his degree in 1841 he published, anonymously, *Oxford Unmasked*, a denunciation of abuses in the university. Between 1845 and 1848 he wrote several dramas and some poetry, and in the latter year became editor of a weekly newspaper, the *British Army Despatch*. His temperament was strongly Imperialist; he opposed Cobden and the Manchester school of politicians, and in a volume entitled *Britain Redeemed and Canada Preserved* predicted, thirty years before the event, the construction of the Canadian Pacific railway. In 1855 he was appointed the first editor of the London *Daily Telegraph*, and through the medium of that journal strongly urged the formation of volunteer rifle corps. The National and Constitutional Defence Association was established in 1858 to carry out the idea. Richards himself raised a regiment of a thousand working men in London, becoming major and subsequently colonel of the corps. In 1870 he was appointed editor of the London *Morning Advertiser*, and retained this position till his death on the 12th of June 1876.

RICHARDS, HENRY BRINLEY (1819–1865), English pianist and composer, was born at Carmarthen, and educated at the Royal Academy of Music in London, where later he was a professor. He took much interest in Welsh music and in the Eisteddfod gatherings. He was a prolific composer, but is perhaps principally remembered for writing the song "God bless the Prince of Wales" (1862), which has been adopted as an English national anthem.

RICHARDS, WILLIAM TROST (1833–1905), American marine painter, was born at Philadelphia, Pennsylvania, on the 14th of November 1833. He was a pupil of Paul Weber in his native city, and lived much in France, Italy and London. He was a member of the Pennsylvania Academy of the Fine Arts, and of the American Water Colour Society. Examples of his work are in the collections of the Pennsylvania Academy of the Fine Arts, Philadelphia, Penn.; the Metropolitan Museum of Art, New York, the Corcoran Art Gallery, Washington, D.C., and the Schaube Gallery, Hamburg. He died at Newport, Rhode Island, on the 8th of November 1905. His daughter ANNA M. RICHARDS (b. 1870), figure and landscape painter, was a pupil of John La Farge and Benjamin Constant.

RICHARDSON, GEORGE, English 18th-century architect and designer. The dates of birth and death of this distinguished contemporary and rival of the brothers Adam are not ascertained, but he is conjectured to have been born about 1736 and to have died in 1817. Richardson spent three years—from 1760 to 1763—travelling in Dalmatia and Istria, in the south of France and in Italy. During that period he imbibed the inspiration of a lifetime, and acquired the material for its practical application. He soon began to show remarkable skill in adapting classical ideals to the uses of his time, and in 1765 he won a premium offered by the Society of Arts for a design of a street in the classical manner. Richardson's work is so closely allied to that of the brothers Adam that it is often difficult to distinguish between them, and if it possessed less freedom and variety, and bore to a smaller extent the impress of an original mind, it was in the main exceedingly admirable and satisfying. Richardson was an especially successful designer of ceilings and chimneypieces. He published in 1776 a *Book of Ceilings in the Style of the Antique Grotesque*. Many of its drawings are of exquisite taste. Nor is his fireplace work, as represented by his *Collection of Chimneypieces Ornamented in the Style of the Etruscan, Greek and Roman Architecture* (1781), less attractive. Richardson's chimneypieces are still to be found in considerable numbers in town and country houses. They are mostly of marble, but examples in wood are not uncommon. He made extensive use of coloured marbles, and the effect is constantly that of the sumptuous balancing the austere. Like the Adams, Richardson often worked with composition enrichments, and his *New Designs in Architecture* (1792) contains many drawings of interior friezes and columns to be executed either in this medium or in marble to suit the wall hangings. His versatility was considerable, as the titles of his works, a dozen in number, suggest. For many years he exhibited at the Royal Academy as well as in the Galleries of the Society of Arts. Why such a man should have fallen into penury in his old age we have no means of ascertaining, but we know that his necessities were relieved by Nollekens.

His principal works in addition to those already mentioned were, in chronological order: *Aedes Pembrochianae* (1774); *Iconology* (2 vols.), with plates by Bartolozzi and other engravers (1778–1779); *New Designs in Architecture* (1792); *Original Designs for Country Seats or Villas* (1795); *The New Vitruvius Britannicus*, a sequel to Colin Campbell's *Vitruvius Britannicus*, 2 vols. (1802); *Ornaments in the Grecian, Roman and Etruscan Tastes* (1816). He also published volumes dealing with vases and tripods, antique friezes and other architectural and decorative details.

RICHARDSON, HENRY HOBSON (1838–1886), American architect, was born in the parish of St James, Louisiana, on the 29th of September 1838, of a rich family, his mother being a granddaughter of the famous Dr Priestley, the English dissenting refugee and man of science. He was graduated from Harvard University in 1859, and going immediately to Paris to study architecture, entered the École des Beaux-Arts. The Civil War, which broke out in the United States while he was in the school, prevented his return to Louisiana, and stripped his family of their possessions, so that Richardson provided for his own support by working in the offices of practising architects in Paris, till the fall of 1865. Coming back, he established himself in New York, where he soon made his way into practice as an architect. In 1878 he moved to Boston, where he passed the remaining years of his life, designing there most of the work that made his reputation. He had married in 1867 Miss Julia Gorham Hayden of Boston; he died on the 27th of April 1886, not yet forty-eight years old.

Richardson's career was short, and the number of his works was small indeed compared with the attention they attracted and the influence he left behind him. The most important and characteristic are: Trinity church and the so-called Brattle Square church, in Boston; the alterations in the State Capitol at Albany; the county buildings at Pittsburg; town halls at Albany, Springfield and North Easton; town libraries at Woburn, North Easton, Quincy, Burlington and Malden; Sever Hall and Austin Hall at Harvard University; the Chamber of Commerce at Cincinnati. Trinity church, the Pittsburg buildings and the Capitol at Albany were works of great importance, which have had a strong influence on men

who followed him and brought him wide acknowledgment. It is notable that American architects who have studied in Europe, especially in Paris, are apt to drift either into a pathless eclecticism or into the English current. Richardson did neither. The Romanesque that he saw in Europe, especially in the middle and south of France, appealed so strongly to his sense for mass and broad picturesqueness that he soon followed its leading, away from the style he had learned in Paris. His earliest work was modern French in style; his first church, in Springfield, a startlingly independent version of English Gothic. Yet half a dozen buildings made the transition to that derivative of Romanesque to which afterwards in all his buildings he steadfastly adhered. In Trinity church, his first monumental work, perhaps his finest, he broke away absolutely from the prevailing English Gothic fashion. Instead of the long Latin cross with aisles and transepts, he made a wide cross almost Greek in plan, with short arms fifty feet broad and aisles that are only passages, a narthex flanked by two western towers, a nave of one double bay, an eastern arm prolonged into a great apse of the full width of the crossing, over which sits a massive square tower. The arms of the church are barrel-vaulted in wood; under the great tower is a flat coffered ceiling a hundred feet above the floor. The style, though mixed, shows his surrender to the attraction of the churches in Auvergne, which have furnished the material for the design of the apse. The central tower is a reminiscence of the noble lantern of the old cathedral of Salamanca, but the square outline is insisted on instead of the polygonal, and the forms are in other ways much changed. The alteration of the Capitol at Albany, half a dozen years later, shared with Leopold Eidlitz, was a compromise in style, and so lacks the sure handling of his best work, except in that part of the interior in which he was untrammelled, the Senate Chamber and the great staircase. In the buildings at Pittsburg, on the other hand, he was free from interference, and these satisfied him more than any other of his buildings. His great design for the new cathedral at Albany, an adaptation of the Romanesque forms of Auvergne to a large modern problem, would have displayed his mature manner, and been perhaps his greatest work; but the plan did not lend itself to the tradition or the ritual of the Anglican Church, and it was rejected, to his great disappointment.

At first the breadth of his compositions was offset by a richness of ornament which he afterwards called flamboyant, but there was a continual growth in simplicity. Some of his imitators have abused his example, running into mere baldness and brutality, but his own work never lost the fineness of quality with which he began, nor the adequacy of its detail.

Richardson's uncommon personality so embodied itself in his works that it cannot be overlooked. He had an inexhaustible energy of body and mind, an enthusiasm more genial than combative, but so abounding and at times vehement that few men and few bodies of men could resist him.

Abounding energy he had, but not health. A serious bodily injury, and later a chronic malady, made his last years a constant struggle with suffering and infirmity, borne with indomitable cheerfulness, but at last fatal.

It is likely that the small number of his designs enhanced their quality. He put twice the labour into his work that the average architect would have given to it, and often twice the time, but the result was apt to be twice as good. He found American architecture restless, incoherent and exuberant; his example did much to turn it back to simplicity and repose. He came as near to establishing a style as it is given to any one man to come; but the tendency of the time was too strong, and the classic styles, reasserting themselves, once more drove out the medieval.

The best known book about Richardson is Mrs Schuyler van Rensselaer's *H. H. Richardson and his Works* (Boston, 1888).

(W. P. P. L.)

RICHARDSON, SIR JOHN (1787–1865), British naturalist, was born at Dumfries on the 5th of November 1787. He studied medicine at Edinburgh, and became a surgeon in the navy in 1807. In 1819 he was appointed surgeon and naturalist to Franklin's first arctic expedition (1819–22), and he served in the same capacity to the second (1825–26). The scientific results of these expeditions he described in contributions to Franklin's *Narratives*, and especially in the four quarto volumes of his *Fauna Boreali-Americana* (1829–37). He was knighted in 1846, and in the following year was chosen commander of the Franklin search expedition (1848–49), the journal of which he published in 1851 under the title of *An Arctic Searching Expedition*. In 1855 he retired to Grasmere, where he died on the 5th of June 1865. He also wrote accounts dealing with the natural history, and especially the ichthyology, of several other arctic voyages, and was the author of *Icones Piscium* (1843), *Catalogue of Apodal Fish in the British Museum, translated from the German MS.* (1856), the second edition of Yarrell's *History of British Fishes* (1860), and *The Polar Regions* (1861), expanded from an article with the same title which he wrote for the *Encyclopaedia Britannica*.

A *Life* by John MacIlraith was published in 1868.

RICHARDSON, SAMUEL (1689–1761), English novelist, is a notable example of that "late-flowering" sometimes applied to Oliver Goldsmith. Born under William and Mary, the reign of the second George was well advanced before, at fifty years of age, he made his first serious literary effort—an effort which was not only a success, but the revelation of a new literary form. Samuel Richardson, a London joiner, who, for obscure reasons, probably connected with Monmouth's rebellion, had retired to an unidentified town in Derbyshire, where, in 1689, Samuel was born. At first intended for holy orders, and having little but the common learning of a private grammar school—for the tradition that upon the return of the family to the metropolis he went to Christ's Hospital cannot be sustained—he was eventually, as some compensation for a literary turn, apprenticed at seventeen to an Aldersgate printer named John Wilde. Here, like the typical "good apprentice" of his century, he prospered; became successively compositor, corrector of the press, and printer on his own account; married his master's daughter according to programme; set up newspapers and books; dabbled a little in literature by compiling indexes and "honest dedications," and ultimately proceeded Printer of the Journals of the House of Commons, Master of the Stationers' Company, and Law-Printer to the King. Like all well-to-do citizens, he had his city house of business and his "country box" in the suburbs; and, after a thoroughly "respectable" life, died on the 4th of July 1761, being buried in St Bride's Church, Fleet Street, close to his shop (now demolished), No. 11 Salisbury Court.

To this uneventful and conventional career one would scarcely look for the birth and growth of a fresh departure in fiction. And yet, although Richardson's manifestation of his literary gift was deferred for half a century, there is no life to which the Horatian "qualis ab incepto" can be more appropriately applied. From his youth this moralist had moralized; from his youth—nay, from his childhood—this letter-writer had written letters; from his youth this supreme delineator of the other sex had been the confidant and counsellor of women. In his boyhood he was secretary-general to all the love-sick girls of the neighbourhood; at eleven he addressed a hortatory epistle, stuffed with texts, to a scandal-loving widow; and whenever it was possible to correspond with any one he was as "corresponding" as even Horace Walpole could have desired. At last, when he was known to the world only as a steady business man, who was also a "dab at an index" and an invaluable compiler of the "puff prefatory," it occurred to Mr Rivington of St Paul's Churchyard and Mr Osborn of Paternoster Row, two booksellling friends who were aware of his epistolary gifts, to suggest that he should prepare a little model letter-writer for such "country readers" as "were unable to indite for themselves." Would it be any harm, he suggested in answer, if he should also "instruct them how they should think and act in common cases"? His friends were all the more anxious that he should

set to work. And thus originated his first novel of *Pamela; or, Virtue Rewarded.*

But not forthwith, as is sometimes supposed. Proceeding with the compilation of his model letter-writer, and seeking, in his own words, " to instruct handsome girls, who were obliged to go out on service . . . how to avoid the snares that might be laid against their virtue "—a danger which appears to have always abnormally preoccupied him—he came to recollect a story he had heard twenty years earlier, and had often proposed to other persons for fictitious treatment. It occurred to him that it would make a book of itself, and might moreover be told wholly in the fashion most congenial to himself, namely, by letters. Thereupon, with some domestic encouragement, he completed it in a couple of months, between the 10th of November 1739 and the 10th of January 1740. In November 1740 it was issued by Messrs Rivington & Osborn, who, a few weeks afterwards (January 1741), also published the model letter-writer under the title of *Letters written to and for Particular Friends, on the most Important Occasions.* Both books were anonymous. The letter-writer was noticed in the *Gentleman's Magazine* for January, which also contains a brief announcement as to *Pamela*, already rapidly making its way without waiting for the reviewers. A second edition, it was stated, was expected; and such was its popularity, that not to have read it was judged " as great a sign of want of curiosity as not to have seen the French and Italian dancers "—*i.e.* Mme Chateauneuf and the Fausans, who were then delighting the town. In February a second edition duly appeared, followed by a third in March and a fourth in May. At public gardens ladies held up the book to show they had got it; Dr Benjamin Slocock of Southwark openly commended it from the pulpit; Pope praised it; and at Slough, when the heroine triumphed, the enraptured villagers rang the church bells for joy. The other volume of " familiar letters" consequently fell into the background in the estimation of its author, who, though it went into several editions during his lifetime, never acknowledged it. Yet it scarcely deserves to be wholly neglected, as it contains many useful details and much shrewd criticism of lower middle-class life.

For the exceptional success of *Pamela* there was the obvious excuse of novelty. People were tired of the old " mouthy " romances about impossible people doing impossible things. Here was a real-life story, which might happen to any one—a story which aroused curiosity and arrested attention—which was not exclusively about " high life," and which had, in addition, a moral purpose, since it was avowedly " published in order to cultivate the principles of virtue and religion in the minds of the youth of both sexes." Whether it had exactly this effect, or owed its good fortune chiefly to this proclamation, may be doubted. The heroine in humble life who resists the licentious advances of her master until he is forced to marry her, does not entirely convince us that her watchful prudence and keen eye for the main chance have not, in the long run, quite as much to do with her successful defence as her boasted innocence and purity. Nor is the book without passages which more than smack of an unpleasant pruriency. Nevertheless, in its extraordinary gift of minute analysis; in its intimate knowledge of feminine character; in the cumulative power of its shuffling, loose-shod style, and, above all, in the unquestionable earnestness and sincerity of the writer, *Pamela* had qualities which—particularly in a dead season of letters—sufficiently account for its favourable reception by the contemporary public.

Such a popularity, of course, was not without its drawbacks. That it would lead to *Anti-Pamelas*, censures of *Pamela* and all the spawn of pamphlets which spring round the track of a sudden success, was to be anticipated. One of the results to which its rather sickly morality gave rise was the *Joseph Andrews* (1742) of Fielding (*q.v.*). But there are two other works prompted by *Pamela* which need brief notice here. One is the *Apology for the Life of Mrs Shamela Andrews*, a clever and very gross piece of raillery which appeared in April 1741, and by which Fielding is supposed to have preluded to *Joseph Andrews*. Fielding's own works contain no reference to *Shamela*. But Richardson in his *Correspondence*, both printed and unprinted, roundly attributes it to the writer who was to be his rival; and it is also assigned to Fielding by other contemporaries (*Hist. MSS. Commn.*, Rept. 12, App. Pt. IX. p. 204). All that can be said is, that Fielding's authorship cannot be proved. If it could, it would go far to justify the after animosity of Richardson to Fielding—much farther, indeed, than what Richardson described as the " lewd and ungenerous engraftment " of *Joseph Andrews*. The second noteworthy result of *Pamela* was *Pamela's Conduct in High Life* (September 1741), a spurious sequel by John Kelly of the *Universal Spectator*. Richardson tried to prevent its appearance, and, having failed, set about two volumes of his own, which followed in December, and professed to depict his heroine " in her exalted condition." But the public interest in Pamela had practically ceased with her marriage, and the author's continuation, like other continuations—particularly continuations prompted by extraneous circumstances—attracted no permanent attention.

About 1744 we begin to hear something of the progress of Richardson's second and greatest novel, *Clarissa; or, the History of a Young Lady*, usually miscalled *Clarissa Harlowe*. The first edition was in seven volumes, two of which came out in November 1747, two more in April 1748 and the last three in December. Upon the title-page of this, of which the mission was as edifying as that of *Pamela*, its object was defined as showing the distresses that may attend the misconduct both of parents and children in relation to marriage. Virtue, in *Clarissa*, is not " rewarded," but hunted down and outraged. The heroine, no longer an opportunist servant-girl, is a most pure, refined and beautiful young woman, invested with every attribute to attract and charm, while her pursuer, Lovelace, the libertine hero of the book—a personage of singular dash and vivacity, in spite of his worthlessness—is drawn with extraordinary tenacity of power. The wronged Clarissa eventually dies of grief, and her cold-blooded betrayer, whom strict justice would have hanged, is considerately killed in a duel by her soldier cousin. Of the genius of the story there can be no doubt. Nor is there any doubt as to the ability shown in the delineation of the two chief characters, to whom the rest are merely subordinate. The chief drawbacks of *Clarissa* are its merciless prolixity (seven volumes, which only cover eleven months); the fact that (like *Pamela*) it is told by letters; and a certain haunting and uneasy feeling that many of the heroine's obstacles are only molehills which should have been readily surmounted. As to its success, accentuated as this was by its piecemeal method of publication, there has never been any question. Clarissa's sorrows set all England sobbing, and her fame and her fate spread rapidly to the Continent.

Between *Clarissa* and Richardson's next work appeared the *Tom Jones* of Fielding—a rival by no means welcome to the elder writer, although a rival who generously (and perhaps penitently) acknowledged *Clarissa's* rare merits.

" Pectus inaniter angit
Irritat, mulcet, falsis terroribus implet
Ut Magus,"

Fielding had written in the *Jacobite's Journal*. But even this could not console Richardson for the popularity of the " spurious brat " whom Fielding had made his hero, and his next effort was the depicting of a genuine fine gentleman—a task to which he was incited by a chorus of feminine worshippers. In the *History of Sir Charles Grandison*, " by the Editor of *Pamela* and *Clarissa* " (for he still preserved the fiction of anonymity), he essayed to draw a perfect model of manly character and conduct. In the pattern presented there is, however, too much buckram, too much ceremonial—in plain words, too much priggishness—to make him the desired exemplar of propriety *in excelsis*. Yet he is not entirely a failure. still less is he to be regarded as no more than " the

condescending suit of clothes" by which Hazlitt unfairly defines Miss Burney's Lord Orville. When Richardson delineated Sir Charles Grandison he was at his best, and his experiences and opportunities for inventing such a character were infinitely greater than they had ever been before. And he lost nothing of his gift for portraying the other sex. Harriet Byron, Clementina della Porretta and even Charlotte Grandison, are no whit behind Clarissa and her friend Miss Howe. *Sir Charles Grandison*, in fine, is a far better book than *Pamela*, although M. Taine regarded the hero as only fit to be stuffed and put in a museum.

Grandison was published in 1753, and by this time Richardson was sixty-four. Although the book was welcomed as warmly as its predecessors, he wrote no other novel, contenting himself instead with indexing his works, and compiling an anthology of the "maxims," "cautions" and "instructive sentiments" they contained. To these things, as a professed moralist, he had always attached the greatest importance. He continued to correspond relentlessly with a large circle of worshippers, mostly women, whose counsels and fertilizing sympathy had not a little contributed to the success of his last two books. He was a nervous, highly strung little man, intensely preoccupied with his health and his feelings, hungry for praise when he had once tasted it, and afterwards unable to exist without it; but apart from these things, well meaning, benevolent, honest, industrious and religious. Seven vast folio volumes of his correspondence with his lady friends, and with a few men of the Young and Aaron Hill type, are preserved in the Forster Library at South Kensington. Parts of it only have been printed. There are several good portraits of him by Joseph Highmore, two of which are in the National Portrait Gallery.

Richardson is sometimes styled the "Father of the English Novel," a title which has also been claimed for Defoe. It would be more accurate to call him the father of the novel of sentimental analysis. As Sir Walter Scott has said, no one before had dived so deeply into the human heart. No one, moreover, had brought to the study of feminine character so much prolonged research, so much patience of observation, so much interested and indulgent apprehension, as this twitter, ing little printer of Salisbury Court. That he did not more materially control the course of fiction in his own country was probably owing to the new direction which was given to that fiction by Fielding and Smollett, whose method, roughly speaking, was synthetic rather than analytic. Still, his influence is to be traced in Sterne and Henry Mackenzie, as well as in Miss Burney and Miss Austen, both of whom, it may be noted, at first adopted the epistolary form. But it was in France, where the sentimental soil was ready for the dressing, that the analytic process was most warmly welcomed. Extravagantly eulogized by the great critic, Diderot, modified with splendid variation by Rousseau, copied (unwillingly) by Voltaire, the vogue of Richardson was so great as to tempt some modern French critics to seek his original in the *Marianne* of a contemporary analyst, Marivaux. As a matter of fact, though there is some unconscious consonance of manner, there is nothing whatever to show that the little-lettered author of *Pamela*, who was also ignorant of French, had the slightest knowledge of Marivaux or *Marianne*. In Germany Richardson was even more popular than in France. Gellert, the fabulist, translated him; Wieland, Lessing, Hermes, all imitated him, and Coleridge detects him even in the *Robbers* of Schiller. What was stranger still, he returned to England again under another form. Having given a fillip to the French *comédie larmoyante*, that comedy crossed the channel as the sentimental comedy of Cumberland and Kelly, which, after a brief career of prosperity, received its death-blow at the hands of Goldsmith and Sheridan.

A selection from Richardson's *Correspondence* was published by Mrs A. L. Barbauld in 1804, in six volumes, with a valuable Memoir. Recent lives are by Miss Clara L. Thomson, 1900, and by Austin Dobson ("Men of Letters"), 1902. A convenient reprint of the novels, with copies of the old illustrations by Stothard, Edward Burney and the rest, and an introducton by Mrs E. M. M. McKenna, was issued in 1901 in 20 volumes. (A. D.)

RICHELIEU, ARMAND EMMANUEL SOPHIE SEPTEMANIE DU PLESSIS, DUC DE (1766–1822), French statesman, was born in Paris on the 25th of September 1766, the son of Louis Antoine du Plessis, duc de Fronsac and grandson of the marshal de Richelieu (1696–1788). The comte de Chinon, as the heir to the Richelieu honours was called, was married at fifteen to Rosalie de Rochechouart, a deformed child of twelve, with whom his relations were never more than formal. After two years of foreign travel he entered the Queen's dragoons and next year received a place at court, where he had a reputation for Puritan austerity. He left Paris in 1790 for Vienna, and in company with his friend Prince Charles de Ligne joined the Russian army as a volunteer, reaching the Russian headquarters at Bender on the 21st of November. He was present at the capture of Ismailia and received from the empress Catherine the cross of St George and a golden sword. By the death of his father in February 1791, he succeeded to the title of duc de Richelieu. He returned to Paris shortly afterwards on the summons of Louis XVI., but he was not sufficiently in the confidence of the court to be informed of the projected flight to Varennes. In July he obtained a passport from the National Assembly for service in Russia. In the Russian army he obtained the grade of general-major, only to be forced by the intrigues of his enemies to resign. The accession of Alexander I. to the throne opened a prospect. His erasure from the list of *émigrés*, which he had failed to secure from Napoleon, was accorded on the request of the Russian government, and in 1803 he became governor of Odessa. Two years later he became governor general of the Chersonese, of Ekaterinoslav and the Crimea, then called New Russia. In the eleven years of his administration, Odessa rose from a miserable village to an important city. He commanded a division in the Turkish War of 1806–7, and was engaged in frequent expeditions to the Caucasus.

Richelieu returned to France in 1814; on the triumphant return of Napoleon from Elba he accompanied Louis XVIII. in his flight as far as Lille, whence he went to Vienna to join the Russian army, believing that he could best serve the interests of the monarchy and of France by attaching himself to the headquarters of the emperor Alexander. Richelieu on character and antecedents alike marked him out as valuable support of the monarchy after its second restoration. Though the bulk of his confiscated estates were lost beyond recall, he did not share the resentment of the mass of the returned *émigrés*, from whom and their intrigues he had held aloof during his exile, and was far from sharing their delusions as to the possibility of undoing the work of the Revolution. As the personal friend of the Russian emperor his influence in the councils of the Allies was likely to be of great service. He refused, indeed, Talleyrand's offer of a place in his ministry, pleading his long absence from France and ignorance of its conditions; but after Talleyrand's retirement he consented to follow him as prime minister, though—as he himself said—he did not know the face of one of his colleagues.

The events of Richelieu's tenure of office are noticed elsewhere (see FRANCE: *History*). Here it need only be said that it was mainly due to his efforts that France was so early relieved of the burden of the allied army of occupation. It was for this purpose mainly that he attended the congress of Aix-la-Chapelle in 1818. There he had been informed in confidence of the renewal by the Allies of their treaty binding them to interfere in case of a renewal of revolutionary trouble in France; and it was partly owing to this knowledge that he resigned office in December of the same year, on the refusal of his colleagues to support a reactionary modification of the electoral law. After the murder of the duc de Berry and the enforced retirement of Decazes, he again became president of the council (21st February 1821); but his position was untenable owing to the attacks of the "Ultras" on the one side and the Liberals on the other, and on the 12th of December he again resigned. He died of apoplexy on the 17th of May 1822.

Great part of Richelieu's correspondence with Pozzo di Borgo, Capo d'Istria and others, with his journal of his travels in Germany and the Turkish campaign, and a notice by the duchesse de Richelieu, is published by the Imperial Historical Society of Russia, vol. 54. There is an exhaustive study of his career by L. de Crousaz-Crétet, *Le Duc de Richelieu en Russie et en France* (1897), with which compare an article by L. Rioult de Neuville in the *Revue des questions historiques* (Oct. 1897). See also R. de Cisternes, *Le Duc de Richelieu, son action aux conférences d'Aix-la-Chapelle* (1898), containing copies of documents.

RICHELIEU, ARMAND JEAN DU PLESSIS DE, Cardinal (1585–1642), French statesman, was born of an ancient family of the lesser nobility of Poitou. The original name of the family was Du Plessis, but in the 15th century a younger branch obtained by marriage the estate of Richelieu with its strong castle surrounded by the waters of the Mable, and took the name of Du Plessis de Richelieu. The family produced not a few turbulent warriors during the Hundred Years' War, and the cardinal's father, François du Plessis, seigneur de Richelieu, began his career by killing the murderer of his elder brother and then fighting through the wars of religion, first as a favourite of Henry III., and after his death under Henry IV. He was a typical fighting gentleman of the period. The mother of the cardinal, Susanne de La Porte, belonged to a family of the magistrature, her father, François de La Porte, being one of the first advocates of the parlement of Paris. Armand was the third son and was born in Paris on the 9th of September 1585. When he was five years old his father died while assisting at the siege of Paris (on the 10th of July 1590); and his mother was left with five children and the estate heavily in debt. By care and economy, however, aided by generous royal grants, she was enabled to pay off mortgages and to bring up the children in a way befitting their rank. At the age of nine Armand was sent to Paris to the College of Navarre, where he passed with credit the regular courses in grammar and philosophy, and then entered a "finishing academy" which prepared the sons of nobles for the life of a courtier or a cavalier. But his training for a military career was suddenly cut short by the refusal of his elder brother, Alphonse, to accept the office of bishop of Luçon. The right of preferment to that see had been given to the Richelieu family by Henry III. as a reward for the services of Armand's father, and the family drained its revenues for private use. When the cathedral chapter found courage to oppose this and opened suit to recover the ecclesiastical revenues for ecclesiastical purposes, Richelieu's mother proposed to make her second son, Alphonse, bishop. He defeated this scheme, however, by becoming a monk of the Grande Chartreuse, and Armand, whose health was rather feeble in any case for a military career, was induced to propose himself for the priesthood.

In 1606, at the age of twenty-one, Richelieu was nominated bishop of Luçon by Henry IV. As he was almost five years under the canonical age, he was obliged to go to Rome to obtain a dispensation and was consecrated there in April 1607. In the winter of 1608 Richelieu went out to his poverty-stricken little bishopric, and for the next six years devoted himself seriously to his episcopal duties. He became favourably known among the zealous reformers of the church, and it was during this stage of his career that he made a friend of Father Joseph. Meanwhile he was impatiently waiting for an opening to a larger career. This came in 1614 when he was elected by the clergy of Poitou to the last States-general which met before the Revolution. In this he attracted the favourable attention of Marie de' Medici, the queen-mother, and was chosen at its close to present the address of the clergy embodying its petitions and resolutions. After the States-general was dissolved he remained in Paris, and the next year he became almoner to Anne of Austria, the child-queen of Louis XIII. Then, by adroit courtly intrigue and faithful service to Concini, he was appointed in 1616 a secretary of state to the king. But he owed all to Concini, and his taste of power ended with the murder of his patron on the 24th of August 1617.

The reign which Richelieu was to dominate so absolutely began with his exile from the court. He had, however, already shown his ability, his firmness, and his diplomatic skill, and conducted the negotiations on the part of the queen-mother with Luynes, the king's representative. Then, as he had incurred too much of the odium of a creature of Concini to hope for royal favour, he resigned himself to the post of chief adviser to Marie de' Medici in her exile at Blois. Here he sought to ingratiate himself with Luynes and the king by reporting minutely the actions of Marie and by protestations of loyalty. As this ungrateful work brought no reward, Richelieu, in spite of the earnest entreaties of the queen-mother, retired once more to his bishopric. But the king, while approving his conduct, was still suspicious of him, and he was exiled to Avignon, along with his brother and brother-in-law, on the 7th of April 1618. There he lived in discreet, if melancholy retirement, writing "A Defence of the Main Principles of the Catholic Faith," and had apparently little hope of a further political career when the escape of Marie de' Medici from Blois, on the 22nd of February 1619, again opened paths for his ambition. Luynes and the king recalled him to the post at Angoulême with the queen-mother, who received him ungraciously but who soon yielded to his judgment and allowed him to sign the treaty of Angoulême with the Cardinal de la Rochefoucauld, acting for the king. By this treaty Marie was given liberty to live wherever she wished, and the government of Anjou and of Normandy with several castles was entrusted to her. The bishop of Luçon was led to believe that the king would recommend him for a cardinalate, but, if we may trust the evidence, Luynes secretly opposed the request, and it was not until after his death that Richelieu was made a cardinal by Pope Gregory XV., on the 5th of September 1622. His rank in the church was due to his skill in intrigue with Marie de' Medici.

Luynes's death on the 15th of December 1621 made possible a reconciliation a month later between the king and his mother. Although Louis still distrusted her at heart, and disliked her dominating minister more, he allowed her to take up her residence in the Luxembourg palace in Paris, thus rendering intercourse possible. Richelieu seized his opportunity. He furnished Marie de' Medici with political ideas and acute criticisms of the king's ministry, especially of the Brularts. Marie zealously pushed her favourite towards office, and had gone so far as to absent herself from court for three months on account of the king's persistent refusal, when Charles, duc de La Vieuville, then head of the council, in need of her aid in his negotiations with reference to the marriage of her daughter Henriette Marie, finally agreed to force Richelieu's appointment to office upon the king, Louis XIII. La Vieuville thought to compromise by forcing the cardinal into a "council of despatches," with merely the privilege of advising the king's council but entrusted with no power. Richelieu raised many objections to such a partial realization of his ambition, but the king ended them in April 1624 by naming him as a member of his council. By August Vieuville's worst fears were realized; he was arrested on the 13th of the month for corrupt practices in office, and the intriguing cardinal who had caused his overthrow became chief minister of Louis XIII. His advent was hailed with joy by both the Catholic party and the patriotic party, eager for the overthrow of Habsburg supremacy in Europe.

For the next eighteen years the biography of Richelieu is the history of France, and to a large degree that of Europe. His work was directed toward a twofold aim: to make the royal power—his power—absolute and supreme at home, and to crush the rival European power of the Habsburgs. At home there were two opponents to be dealt with: the Huguenots and the feudal nobility. The former were crushed by the siege of La Rochelle and the vigorous campaign against the duc de Rohan. But the religious toleration of the edict of Nantes was reaffirmed while its political privileges were destroyed, and Huguenot officers fought loyally in the foreign enterprises of the cardinal. The suppression of the independence of the feudal aristocracy was inaugurated in 1626 by an edict calling for the destruction of all fortified castles not needed for defence against invasion.

The local authorities proceeded to carry this out with a zeal due to long suffering, and the ruined mediæval châteaux of France still bear witness to the action of Richelieu. Still there was no serious opposition to the new minister. The first serious conspiracy took place in 1626, the king's brother, Gaston of Orleans, being the centre of it. His governor, Marshal D'Ornano, was arrested by Richelieu's orders, and then his confidant, Henri de Talleyrand, marquis de Chalais and Vendôme, the natural sons of Henry IV. Chalais was executed and the marshal died in prison. The overthrow of the Huguenots in 1629 made Richelieu's position seemingly unassailable, but the next year it received its severest test. Marie de' Medici had turned against her "ungrateful" minister with a hatred intensified it is said, by unrequited passion. In September 1630, while Louis XIII. was very ill at Lyons, the two queens, Marie and Anne of Austria, reconciled for the time, won the king's promise to dismiss Richelieu. He postponed the date until peace should be made with Spain. When the news came of the truce of Regensburg Marie claimed the fulfilment of the promise. On the 10th of November 1630 the king went to his mother's apartments at the Luxembourg palace. Orders were given that no one should be allowed to disturb their interview, but Richelieu entered by the unguarded chapel door. When Marie had recovered breath from such audacity she proceeded to attack him in the strongest terms, declaring that the king must choose between him or her. Richelieu left the presence feeling that all was lost. The king gave a sign of yielding, appointing the brother of Mazilac, Marie's counsellor, to the command of the army in Italy. But before taking further steps he retired to Versailles, then a hunting lodge, and there, listening to two of Richelieu's friends, Claude de Saint-Simon, father of the memoir writer, and Cardinal La Valette, sent for Richelieu in the evening, and while the salons of the Luxembourg were full of expectant courtiers the king was reassuring the cardinal of his continued favour and support. The "Day of Dupes," as this famous day was called, was the only time that Louis took so much as a step toward the dismissal of a minister who was personally distasteful to him but who was indispensable. The queen-mother followed the king and cardinal to Compiègne, but as she refused to be reconciled with Richelieu she was left there alone and forbidden to return to Paris. The next summer she fled across the frontiers into the Netherlands, and Richelieu was made duke. Then Gaston of Orleans, who had fled to Lorraine, came back with a small troop to head a rebellion to free the king and country from "the tyrant." The only great noble who rose was Henri, duc de Montmorenci, governor of Languedoc, and his defeat at Castelnaudary on the 1st of September 1632 was followed by his speedy trial by the parlement of Toulouse, and by his execution. Richelieu had sent to the block the first noble of France, the last of a family illustrious for seven centuries, the feudal head of the nobility of Languedoc; then, unmoved by threats or entreaties, inexorable as fate itself, he cowed all opposition by his relentless vengeance. He knew no mercy. The only other conspiracy against him which amounted to more than intrigue was that of Cinq Mars in 1642, at the close of his life. This vain young favourite of the king was treated as though he were really a formidable traitor, and his friend, De Thou, son of the historian, whose sole guilt was not to have revealed the plot, was placed in a boat behind the stately barge of the cardinal and thus conveyed up the Rhone to his trial and death at Lyons. The voyage was symbolical of Richelieu's whole pitiless career.

Richelieu's foreign policy was as inflexible as his home policy. To humble the Habsburgs he aided the Protestant princes of Germany against the emperor, in spite of the strong opposition of the disappointed Catholic party in France, which had looked to the cardinal as a champion of the faith. The year of Richelieu's triumph over the Huguenots (1629) was also that of the Emperor Ferdinand's triumph in Germany, marked by the Edict of Restitution, and France was threatened by a united Germany. Richelieu, however, turned against the Habsburgs young Gustavus Adolphus of Sweden, paying him a subsidy of a million livres a year by the treaty of Bärwald of the 23rd of January 1631. The dismissal of Wallenstein, which is often attributed to the work of Father Joseph, Richelieu's envoy to the diet of Regensburg in July and August of 1630, was due rather to the fears of the electors themselves, but it was of double value to Richelieu when his Swedish ally marched south. After the treaty of Prague, in May 1635, by which the emperor was reconciled with most of the German princes, Richelieu was finally obliged to declare war, and, concluding a treaty of offensive alliance at Compiègne with Oxenstierna, and in October one at St Germain-en-Laye with Bernard of Saxe-Weimar, he proceeded himself against Spain, both in Italy and in the Netherlands. The war opened disastrously for the French, but by 1642, when Richelieu died, his armies—risen from 12,000 men in 1621 to 150,000 in 1638—had conquered Roussillon from Spain; they held Catalonia, which had revolted from Philip IV. of Spain, and had taken Turin and forced Savoy to allow French troops on the borders of the Milanese. In Germany Torstensson was sweeping the imperialist forces before him through Silesia and Moravia. The lines of the treaty of Westphalia, six years later, were already laid down by Richelieu; and its epochal importance in European history is a measure of the genius who threw the balance of power from Habsburg to Bourbon. The predominance of Louis XIV. in European politics was largely due to the statesman who prepared France for his absolutism at home.

The magnitude of Richelieu's achievement grows when one considers his relations with the king. Louis XIII. cordially disliked him, and would gladly have got rid of him if he had not been able to convince the king of the wisdom of everything he did. Thus obliged to assume the unpleasant rôle of tutor when delicate flattery was often most needful, the minister lectured and cajoled his master, always, until towards the last, giving credit to the king for his own successes, and overawing opposition by his imperious presence even when Louis was dabbling in plots against him (as in the case of Cinq Mars) behind his back. The king's consciousness of his weakness was combined with a sense of duty, and it was upon these two chords that Richelieu played. Besides, he was eternally on the alert. Spies in every salon in Paris and every court in Europe kept the grim courtier informed of every change in his master's mind and every intrigue against himself. The piquant comments of his platonic friend, Mademoiselle de Hautefort, upon Richelieu were relished by the king until he was informed of others said to have been made by her upon himself. Then it was easy to supplant her with another favourite, Mademoiselle de Lafayette. When this devout maiden began to denounce the ungodly cardinal who was allied with heretics, her confessor—in Richelieu's service—succeeded in inducing her to become a nun. Father Caussin, the king's confessor, ventured the same comments, and Louis plotted like a schoolboy to turn his devotions into secret criticisms of state policies. Caussin was sent into Brittany, and the judicious and learned Jesuit, Jacques Sirmond, who succeeded him, kept clear of politics. Such was the atmosphere of espionage in which Richelieu had to maintain his authority.

His own personality was his strongest ally. The king himself quailed before that stern, august presence. His pale, drawn face was set with his iron will. His frame was sickly and wasted with disease, yet when clad in his red cardinal's robes, his stately carriage and confident bearing gave him the air of a prince. His courage was mingled with a mean sort of cunning, and his ambition loved the outward trappings of power as well as its reality; yet he never swerved from his policy in order to win approbation, and the king knew that his one motive in public affairs was the welfare of the realm —that his religion, in short, was "reason of state." A clear conscience, not less than a sense of his own superiority to others at the court of Louis XIII., made the cardinal haughtily assert his ascendancy, and the king shared his belief in both.

No courtier was ever more assertive of his prerogatives. He claimed precedence over even princes of the blood, and one

like Condé was content to draw aside the curtains for him to pass, and to sue for the hand of Richelieu's niece for his son, the "Great Condé." His pride and ambition were gratified by the foundation of a sort of dynasty of his nephews and nieces, whose hands were sought by the noblest in the realm. Like all statesmen of his time, Richelieu made money out of politics. He came to court in 1617 with an income of 25,000 livres from his ecclesiastical benefices. In the later years of his life it exceeded 3,000,000 livres. He lived in imperial state, building himself the great Palais Cardinal, now the Palais Royal, in Paris, another at Rueil near Paris, and rebuilding his ancestral château in Poitou. His table cost him a thousand crowns a day, although he himself lived simply. He celebrated his triumphs to the full with gorgeous fêtes in his palace, especially with lavish theatrical representations. In January 1641 the tragedy of *Mirame*, said to have been his own, was produced with great magnificence. Richelieu was anxious for literary fame, and his writings are not unworthy of him. But more important than his own efforts as an author were his protection and patronage of literary men, especially of Corneille, and his creation of the French Academy in 1635. His influence upon French literature was considerable and lasting. Hardly less important was his rebuilding of the Sorbonne and his endowments there. When he died, on the 4th of December 1642, he was buried in the chapel of the Sorbonne, which still stands as he built it. His tomb, erected in 1694, though rifled at the Revolution, still exists.

Many writings are attributed to Richelieu, although owing to his habit of working with substitutes and assistants it is difficult to settle how much of what passes under his name is authentic. *Les Thuileries*, *La Grande Pastorale*, *Mirame*, and the other plays, over whose fate he trembled as over the result of an embassy or a campaign, have long been forgotten; but a permanent interest attaches to his *Mémoires* and correspondence: *Mémoire d'Armand du Plessis de Richelieu, évêque de Luçon, écrit de sa main, l'année 1607 ou 1610, alors qu'il était de garnison à la cour auprès de la reine mère* (1880); *Histoire de la mère et du fils* (i.e. of Marie de Medici and Louis XIII.), sometimes attributed to Mézeray, published at Amsterdam in 1730 and, under the title *Histoire de la régence de reine Marie de Médicis, femme de Henri le Grand*, at the Hague in 1743; *Mémoires sur la règne de Louis XIII.*, extending from 1610 to 1638, and of which the earlier portion is a reprint of the *Histoire de la mère et du fils*, published in Petitot's collection (Paris, 1823 seq.); *Testament politique et personnel du cardinal de Richelieu* (Amsterdam, 1687 seq.); *Journal de 1630–31* (Paris, 1645); "Lettres, instructions diplomatiques, et papiers d'état," published by G. d'Avenel in the *Coll. de doc. inéd.* (Paris, 1853–77); and "Maximes d'état et fragments politiques," published by V. Hanotaux in *Mélanges historiques: Choix de doc. iii.*, in the same collection.

See G. Hanotaux, *Cardinal Richelieu* (1893), one volume of the four then promised, an exhaustive history of the period down to 1624; and G. d'Avenel, *Richelieu et la monarchie absolue* (4 vols., 1895). The most important sources for Richelieu's statesmanship are the "Lettres, instructions diplomatiques, et papiers d'état," mentioned above, and Richelieu's *Mémoires* (1610–38) may be consulted in Petitot's and F. W. Michaud and J. Poujoulat's collections. Innumerable memoirs of the time also bear upon his life, *e.g.* those of Madame de Motteville, Mathieu Molé, De Brienne, and Bassompierre. In English there are short biographies by Richard Lodge (in the Foreign Statesmen series, 1896) and by J. B. Perkins (in Heroes of the Nations series, 1900).

(J. T. S.*)

RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, DUC DE (1696–1788), marshal of France, was a grandnephew of Cardinal Richelieu, and was born in Paris on the 13th of March 1696. Apart from his reputation as a man of exceptionally loose morals, he attained, in spite of a deplorably defective education, distinction as a diplomatist and general. As ambassador to Vienna (1725–29) he settled in 1727 the preliminaries of peace; in 1733–34 he served in the Rhine campaign. His real public career began ten years later. He fought with distinction at Dettingen and Fontenoy, where he directed the grapeshot upon the English columns, and three years afterwards he made a brilliant defence of Genoa; in 1756 he expelled the English from Minorca by the capture of the San Felipe fortress; and in 1757–58 he closed his military career by those pillaging campaigns in Hanover which procured him the sobriquet of *Petit Père de la Maraude*. After the wars he plunged again into court intrigue, favoured the comtesse du Barry and supported his nephew the duc d'Aiguillon. Louis XVI., however, was not favourably inclined to him. In his early days he was thrice imprisoned in the Bastille: in 1711 at the instance of his stepfather, in 1716 in consequence of a duel, and in 1719 for his share in Alberoni's conspiracy against the regent Orleans. He was thrice married: first, against his will, at the age of fourteen to Anne Catherine de Noailles; secondly, in 1734, by the intrigues (according to the witty Frenchman's own account) of Voltaire, to Marie Elisabeth Sophie, Mademoiselle de Guise; and thirdly, when he was eighty-four years old, to an Irish lady. He died in Paris on the 8th of August 1788. Marshal Richelieu's *Mémoires*, published by J. L. Soulavie in nine volumes (1790), are partially spurious.

See H. Noel Williams, *The Fascinating Duc de Richelieu* (1910).

RICHEPIN, JEAN (1849–), French poet, novelist and dramatist, the son of an army doctor, was born at Medea (Algeria) on the 4th of February 1849. At school and at the École normale he gave evidence of brilliant, if somewhat undisciplined, powers, for which he found physical vent in different directions—first as a *franc-tireur* in the Franco-German War, and afterwards as actor, sailor and stevedore—and an intellectual outlet in the writing of poems, plays and novels which vividly reflected his erratic but unmistakable talent. A play, *L'Étoile*, written by him in collaboration with André Gill (1840–1885), was produced in 1873; but Richepin was virtually unknown until the publication, in 1876, of a volume of poems entitled *Chanson des gueux*, when his outspokenness resulted in his being imprisoned and fined for *outrage aux mœurs*. The same quality has characterized his succeeding volumes of verse: *Les Caresses* (1877), *Les Blasphèmes* (1884), *La Mer* (1886), *Mes paradis* (1894), *La Bombarde* (1899). His novels have developed in style from the morbidity and brutality of *Les Morts bizarres* (1876), *La Glu* (1881) and *Le Pave* (1883) to the more thoughtful psychology of *Madame André* (1878), *Sophie Monnier* (1884), *Césarine* (1888), *L'Aimé* (1893), *Grandes amoureuses* (1896) and *Lagibasse* (1899), and the more simple portrayal of life in *Miarka* (1883), *Les Braves Gens* (1886), *Truandailles* (1890), *La Miseloque* (1892) and *Flamboche* (1895). His plays, though occasionally marred by his characteristic proneness to violence of thought and language, constitute in many respects his best work. The most notable are *Nana Sahib* (1883), *Monsieur Scapin* (1886), *Le Flibustier* (1888), *Par le glaive* (1892), *Vers la joie* (1894), *Le Chemineau* (1897), *Le Chien de garde* (1898), *Les Truands* (1899), *Don Quichotte* (1905), most of which were produced at the Comédie française. He also wrote *Miarka* (1905), adapted from his novel, for the music of Alexandre Georges, and *Le Mage* (1897) for the music of Jules Massenet.

His son, Jacques Richepin (b. 1880), the author of *La Reine de Tyr* (1899), *La Cavalière* (1901), *Cadet-Roussel* (1903) and *Falstaff* (1904), based on Shakespeare's *Henry IV.*, gave promise of making his mark as a dramatist.

RICHERUS, monk of St Remi at Reims, and a chronicler of the 10th century, son of Rodulf, a trusty councillor and captain of Louis IV. He studied at Reims under Gerbert, afterwards Pope Silvester II., who taught him mathematics, history, letters and eloquence. He was also well versed in the medical science of his time, and in 991 travelled to Chartres to consult the medical MSS. there. He was still living in 998, but there is no mention of him after that date. In spite of his violent partisanship,—for Richerus was an ardent upholder of the Carolings and French supremacy,—of great defects of style, and of an utter disregard of accuracy and truth, his *Historiae* has a unique value as giving us the only tolerably full account by a contemporary of the memorable revolution of 987, which placed the Capets on the throne of France. The *History*, in four books, begins with Charles the Fat and Eudes, and goes down to the year 995. From 969 onwards Richerus had no earlier history before him, and his work is the chief source for the period. It was first edited in Pertz's *Monumenta Germaniae*, vol. iii.

There are French translations by Guadet (Paris, 1843, Soc. de l'hist. de France); Poinsignon (Reims, 1855, pub. de l'Academie de Rheims); and a German version by K. Freiherr v. der Osten-Sacken (Berlin 1854). Cf. Molinier, *Sources de l'histoire de France*, i. 284 (ed. 1901).

RICHFIELD SPRINGS, a village of Richfield township, Otsego county, New York, U.S.A., about 22 m. S.S.E. of Utica and ¾ m. N. of Schuyler (or Candarago) lake. Pop. (1890) 1623; (1900) 1537; (1905) 1684; (1910) 1503. It is served by the Delaware, Lackawanna & Western railway, and by the Oneonta & Mohawk Valley electric line connecting with the New York Central railway at Herkimer. The village is situated in a farming country, about 1700 ft. above sea-level. Knit goods are manufactured, but the importance of the place is due to its sulphur springs, the waters of which are used for the treatment of skin diseases, gout, rheumatism, etc., and to the tonic air and fine scenery. In 1908 a Welsh eisteddfod was held here in Earlington Park. The first hotels were built between 1820 and 1830. A post office was established here in 1820, and the village was incorporated in 1861.

RICH HILL, a city of Bates county, Missouri, U.S.A., situated near the Osage (Marais des Cygnes) river, in the west central part of the state, about 75 m. S. by E. of Kansas City. Pop. (1900) 4053, of whom 255 were foreign-born; (1910) 2755. It is served by the Missouri Pacific and the St. Louis & San Francisco railway systems. The city has two public parks, and is a trading centre for the surrounding fertile farming country. Coal is mined in and near the city. There are lead and zinc smelters, and a large vitrified brick and tile factory. The municipality owns and operates its waterworks and gas and electric-lighting plants; the city is supplied with natural gas. The original Rich Hill was platted in 1867 somewhat north-west of the site of the present city, which was platted in 1880 by an association that bought out the old settlement. The new settlement was incorporated as a village in 1880, and chartered as a city in 1881.

RICHMOND, EARLS AND DUKES OF. The title earl of Richmond appears to have been in existence in England a considerable time before it was held in accordance with any strict legal principle. Alan, surnamed "Le Roux," and his brother Alan (*c.* 1040–1089), surnamed "Le Noir," relatives of Geoffrey, count of Brittany, and kinsman of William the Conqueror, took part in the latter's invasion of England; and Le Roux obtained grants of land in various parts of England, including manors formerly held by Earl Edwin in Yorkshire, on one of which he built the castle of Richmond, his possessions there being formed into the honour of Richmond, to which his brother Alan Le Noir, or Alan Niger (*c.* 1045–1093), succeeded in 1089. The latter was in turn succeeded as lord of the honour of Richmond by Stephen (d. 1137), count of Penthievre, who was either his son or another brother. These Breton counts, being territorial barons of great importance in England, and lords of the honour of Richmond where their castle was situated, are often reckoned as earls of Richmond, though they were not so in the strict and later sense. The same should perhaps be said of Stephen's son Alan Niger II. (*c.* 1116–1146), though he was styled earl of Richmond by John of Hexham. This Alan married Bertha, daughter and heiress of Conan, reigning count of Brittany; and his son Conan (*c.* 1138–1171), who married Margaret, sister of Malcolm IV. of Scotland, asserted his right to Brittany, and transferred it in his lifetime to his daughter Constance (*c.* 1162–1201). As he left no sons the honour of Richmond and his other English possessions passed to the king in 1171, though Constance is also loosely spoken of as countess of Richmond in her own right. Constance was three times married, and each of her husbands in turn assumed the title of earl of Richmond, in conjunction with that of count, or duke of Brittany. They were: Geoffrey Plantagenet (1158–1186), son of Henry II., king of England; Randolph de Blundeville, earl of Chester (*c.* 1172–1232), the marriage with whom Constance treated as null on the ground of consanguinity; and Guy de Thouars (d. 1213), who survived his wife for twelve years. The only son of the first marriage, Arthur of Brittany (1187–1203), was styled earl of Richmond in his mother's lifetime, and on his murder at the hands of his uncle, King John, the earldom was resumed by the crown.

By her third husband Constance had two daughters, the elder of whom, Alice, was given in marriage by Philip Augustus, king of France, to Peter de Braine in 1213, after which date Peter was styled duke of Brittany and earl of Richmond till about 1235, when he renounced his allegiance to the king of England and thereupon suffered forfeiture of his English earldom.

In 1241 Henry III. granted the honour of Richmond to Peter of Savoy (1203–1268), uncle of Queen Eleanor, who was thereafter described as earl of Richmond by contemporary chroniclers, though how far he was strictly entitled to the designation has been disputed. By his will he left the honour of Richmond to his niece, the queen consort, who transferred it to the crown. In the same year (1268) Henry III. granted the earldom specifically to John, duke of Brittany (1217–86), son of Peter de Braine, in whose family the title continued—though it frequently was forfeited or reverted to the crown and was re-granted to the next heir—till 1342, when it was apparently resumed by Edward III. and granted by that sovereign to his son John of Gaunt, who surrendered it in 1372. It was then given to John de Montfort, duke of Brittany, but on his death without heirs in 1399, or possibly at an earlier date through forfeiture, it reverted to the crown. The earldom now became finally separated from the duchy of Brittany, with which it had been loosely conjoined since the Conquest, although the dukes of Brittany continued to assume the title till a much later date. From 1414 to 1435 the earldom of Richmond was held by John Plantagenet, duke of Bedford, and in 1453 it was conferred on Edmund Tudor, uterine brother to King Henry VI., whose wife, Margaret Beaufort, was the foundress of St John's College, Cambridge, and of the "Lady Margaret" professorships of divinity at Oxford and Cambridge (see RICHMOND AND DERBY, MARGARET, COUNTESS OF). When Edmund Tudor's son Henry ascended the throne as Henry VII. in 1485, the earldom of Richmond merged in the crown, and for the next forty years there was no further grant of the title; but in 1525 Henry Fitzroy, natural son of Henry VIII. by Elizabeth Blound, was created duke of Richmond and Somerset and earl of Nottingham, all these titles becoming extinct at his death without children in 1536.

Ludovic Stuart, 2nd duke of Lennox (1574–1624), who also held other titles in the peerage of Scotland, was created earl of Richmond in 1613 and duke of Richmond in 1623. These became extinct at his death in 1624, but his Scottish honours devolved on his brother Esmé, who was already earl of March in the peerage of England (see MARCH, EARLS OF; and LENNOX). Esmé's son, James, 4th duke of Lennox (1612–1655), was created duke of Richmond in 1641, the two dukedoms as well as the lesser English and Scottish titles thus becoming again united. In 1672, on the death of his nephew Charles, 3rd duke of Richmond and 6th duke of Lennox, whose wife was the celebrated beauty called "La Belle Stuart" at the court of Charles II. (see RICHMOND AND LENNOX, FRANCES TERESA, DUCHESS OF), his titles became extinct.

In 1675 Charles II. created his illegitimate son Charles duke of Richmond, earl of March and baron Settrington, and a few weeks later duke of Lennox, earl of Darnley and baron Torboltoun. This Charles (1672–1723), on whom his father the king bestowed the surname of Lennox, was the son of the celebrated Louise de Keroualle, duchess of Portsmouth. His son Charles, 2nd duke (1701–1750), added to the titles he inherited from his father that of duke of Aubigny in France, to which he succeeded in 1734 on the death of his grandmother the duchess of Portsmouth; and all these honours are still held by his descendant the present duke of Richmond.

The seven dukes of Richmond of the Lennox line have all borne the Christian name of Charles. The 2nd duke, by his marriage with Sarah, daughter of the 1st Earl Cadogan, was father of Lady Caroline Lennox, who eloped with Henry Fox,

and was the mother of Charles James Fox, and of the beautiful Lady Sarah Lennox (1745–1826) with whom George III. fell in love and contemplated marriage, and who afterwards married, first, Sir Thomas Bunbury, from whom she was divorced, and secondly, George Napier, by whom she was the mother of Generals Sir Charles and Sir William Napier.

Charles, 3rd duke of Richmond (1735–1806), was one of the most remarkable men of the 18th century, being chiefly famous for his advanced views on the question of parliamentary reform. Having succeeded to the peerage in 1750, he was appointed British ambassador extraordinary in Paris in 1765, and in the following year he became a secretary of state in the Rockingham administration, resigning office on the accession to power of the earl of Chatham. In the debates on the policy that led to the War of American Independence Richmond was a firm supporter of the colonists; and he initiated the debate in 1778 calling for the removal of the troops from America, during which Chatham was seized by his fatal illness. He also advocated a policy of concession in Ireland, with reference to which he originated the phrase "a union of hearts" which long afterwards became famous when his use of it had been forgotten. In 1779 the duke brought forward a motion for retrenchment of the civil list; and in 1780 he embodied in a bill his proposals for parliamentary reform, which included manhood suffrage, annual parliaments and equal electoral areas. Richmond sat in Rockingham's second cabinet as master-general of ordnance; and in 1784 he joined the ministry of William Pitt. He now developed strongly such opinions, and his alleged desertion of the cause of reform led to a violent attack on him by Lauderdale in 1792, which nearly led to a duel between the two noblemen. Richmond died in December 1806, and, leaving no legitimate children, he was succeeded in the peerage by his nephew Charles, son of his brother, General Lord George Henry Lennox.

The 4th duke (1764–1819) and his wife Charlotte, daughter of the 4th duke of Gordon, were the givers of the famous ball at Brussels on the night before the battle of Quatre Bras, immortalized in Byron's *Childe Harold*. Their son, the 5th duke (1791–1860), while still known by the courtesy title of earl of March, served on Wellington's staff in the Peninstula, being at the same time member of parliament for Chichester. He was afterwards a vehement opponent in the House of Lords of Roman Catholic emancipation, and as a later date a leader of the opposition to Peel's free trade policy. In 1836, on inheriting the estates of his maternal uncle, the 5th and last duke of Gordon, he assumed the name of Gordon before that of Lennox. On his death in 1860 he was succeeded in his titles by his son Charles Henry, 6th duke of Richmond (1818–1903), a statesman who held various cabinet offices in the Conservative administrations of Lord Derby, Disraeli and the marquess of Salisbury; and who in 1876 was created earl of Kinrara and duke of Gordon. These honours in addition to the numerous family titles of more ancient creation passed on his death in 1903 to his son Charles Henry Gordon-Lennox (b. 1845), 7th duke of Richmond and Lennox and 2nd duke of Gordon.

RICHMOND, LEGH (1772–1827), English divine, was born on the 29th of January 1772, at Liverpool. He was educated at Trinity College, Cambridge, and in 1798 was appointed to the joint curacies of Brading and Yaverland in the Isle of Wight. He was powerfully influenced by William Wilberforce's *Practical View of Christianity*, and took a prominent interest in the British and Foreign Bible Society, the Church Missionary Society and similar institutions. In 1805 he became assistant-chaplain to the Lock Hospital, London, and rector of Turvey, Bedfordshire, where he remained till his death on the 8th of May 1827. The best known of his writings is *The Dairyman's Daughter*, of which as many as four millions in nineteen languages were circulated before 1849. A collected edition of his stories of village life was first published in 1814 under the title of *Annals of the Poor*. He also edited a series of Reformation biographies called *Fathers of the English Church* (1807–12).

See *Memoirs* by T. S. Grimshawe (1828); *Domestic Portraiture* by T. Fry (1833).

RICHMOND, SIR WILLIAM BLAKE (1842–), English painter and decorator, was born in London on the 29th of November 1842. His father, George Richmond, R.A. (1809–1896), himself the son of a successful miniature painter, was a distinguished artist, who painted the portraits of the most eminent people of his day, and played an important part in society. At the age of fourteen William Richmond entered the Royal Academy schools, where he worked for about three years. A visit to Italy in 1859 gave him special opportunity for studying the works of the old masters, and had an important effect upon his development. His first Academy picture was a portrait group (1861); and to this succeeded, during the next three years, several other pictures of the same class. In 1865 he returned to Italy, and spent four years there, living chiefly at Rome. To this period belongs the large canvas, "A Procession in Honour of Bacchus," which he exhibited at the Academy in 1869 when he came back to England. His picture, "An Audience at Athens," was exhibited at the Grosvenor Gallery in 1885. He became Slade professor at Oxford, succeeding Ruskin, in 1878, but resigned three years later. He was elected an Associate of the Royal Academy in 1888 and Royal Academician in 1895; he received the degree of D.C.L. in 1896, and a knighthood of the Bath in 1897, and became professor of painting to the Royal Academy. Apart from his pictures, he is notable for his work in decorative art, his most conspicuous achievement being the internal decoration and the glass mosaics of St Paul's Cathedral. Sir William Richmond also took a keen interest in social questions, particularly in smoke-prevention in London.

RICHMOND, a city of Bourke county, Victoria, Australia, 2 m. S.E. of and suburban to Melbourne. It is one of the pleasantest of the metropolitan suburbs, having numerous parks and public gardens. There are a number of prosperous industries in the city. Pop. (1901) 37,722.

RICHMOND, a city and the county-seat of Wayne county, Indiana, U.S.A., on the E. branch of the Whitewater river, about 68 m. E. of Indianapolis. Pop. (1890) 16,608; (1900) 18,226, of whom 1467 were foreign-born and 1009 negroes; (1910 census) 22,324. It is served by the Chicago, Cincinnati & Louisville, the Grand Rapids & Indiana and the Pittsburg, Cincinnati, Chicago & St Louis railways, and by the Terre Haute, Indianapolis & Eastern and the Ohio electric interurban railways. Richmond has broad well-shaded streets, several parks, including Glen Miller (130 acres), and handsome public buildings. Its public institutions include the Morrisson-Reeves (public) Library (1864), one of the largest (39,000 volumes in 1909) and oldest in the state, an art gallery, the Reid Memorial Hospital, a Home for Friendless Women, the Margaret Smith Home for Aged Women (1888), the Wernle Orphans' Home (1879; Evangelical Lutheran), and the Eastern Indiana Hospital for the Insane (1890). Just west of the city limits is **Earlham College** (co-educational), opened in 1847, chartered in 1859 and controlled by the Society of Orthodox Friends; in 1908–9 it had 30 instructors, 620 students and a library of 18,000 bound volumes. Richmond was for many years the centre, west of Philadelphia, of the activities of the Society of Friends. It is an important railway and commercial centre,

trade in hardware being especially large. Among its manufactures are agricultural machinery (especially seeding machines) and toots, automobiles, pianos, lawn-mowers, roller-skates, foundry and machine-shop products, furniture, burial caskets, and flour. In 1905 its factory product was valued at $6,731,740, an increase of 41·6% since 1900. Pipe lines supply the city with natural gas. The municipality owns and operates the electric-lighting plant. In 1806 Friends from North Carolina and Pennsylvania settled near here, and Richmond was platted in 1816. Its growth was slow until the opening of the National Road, which entered Indiana near the city, and the construction of railways. Richmond was incorporated as a village in 1818 and chartered as a borough in 1834 and as a city in 1840.

RICHMOND, a city and the county-seat of Madison county, Kentucky, U.S.A., about 95 m. S.E. of Louisville. Pop. (1890) 5073; (1900) 4653, of whom 2087 were negroes; (1910) 5340. It is served by the Louisville & Atlantic and the Louisville & Nashville railways. It is situated in the "Blue Grass Region," near the foothills of the Cumberland Mountains. It is the seat of Madison Institute for girls (1856) and of the Eastern Kentucky State Normal School (1906). From 1874 to 1901 it was the seat of Central University, which in the latter year was consolidated with Centre College at Danville, Ky. (*q.v.*). The surrounding country is devoted largely to the cultivation of tobacco, Indian corn and wheat, and the breeding of fine horses and cattle; and Richmond is an important live-stock market. Among the manufactures are bricks, flour, tobacco and cigars, and carriages. On the 30th of August 1862 a Confederate force of about 7000 men under General Edmund Kirby Smith won a decisive victory here over a Union force of a nearly equal number under Generals Mahlon D. Manson (1820–1895) and William Nelson.

RICHMOND, a municipal borough in the Kingston parliamentary division of Surrey, England, 9 m. W.S.W. of Charing Cross, London. Pop. (1891) 26,875; (1901) 31,672. It lies on the right bank of the Thames, which is here crossed by a bridge carrying the road to Twickenham. Through its pleasant situation Richmond has grown into a large residential suburb of the metropolis. The town was anciently called *Syenes* and afterwards *Schene* and *Sheen* (a name preserved in the village of East Sheen, adjacent on the London side) until the name was in 1500 changed to Richmond by command of Henry VII., who was earl of Richmond in Yorkshire. It grew up round the royal manor house, which became a frequent residence of sovereigns, but of which nothing more than a gateway remains. Edward I. received the Scotch commissioners at his manor of Sheen in 1300. The palace was rebuilt by Edward III., who died here in 1377. It was frequently used by Richard II., and here his wife Anne of Bohemia died, upon which he cursed the place and "caused it to be thrown down and defaced." By Henry V., however, it was rebuilt, and a great tournament was held here in 1492 by Henry VII., who after its destruction by fire in 1498 restored it. Henry VIII. gave it to Wolsey to reside in, after the latter presented him with the new palace of Hampton Court. James I. settled it on his son Henry, prince of Wales, who restored and embellished it at great expense. Charles I. added to it the new deer park generally known as Richmond Park, 2253 acres in extent, which is surrounded by a wall 11 m. in length. After the execution of the king, the parliament presented the park to the citizens of London, who again presented it to Charles II. at the Restoration. Though partly dismantled, the palace was the residence of the queen dowager till 1665, and by James II. it was used as a nursery for the young prince; but, gradually falling into decay, it was parcelled into tenements about 1720. In the old deer park extending northwards from the site of the palace, Kew Observatory was erected in 1769, occupying the site of a Carthusian convent founded by Henry V., and a dwelling-house in which Swift for some time resided. The White Lodge was built by George I., and has been a residence of various members of the royal family. To the south-east of the town, at the entrance to Richmond Park, is Richmond Hill, from which is seen a famous view of the Thames with the surrounding country to the west. This view was secured to the public by an agreement, sealed on the 7th of February 1896, between the corporation and the trustees of the earl of Dysart, by an act of Parliament of 1902, and by the acquisition in the same year, by the London County Council, with the assistance of the borough of Richmond and other interested local authorities, of the Marble Hill Estate and other property on the Middlesex shore. The church of St Mary Magdalen is of considerable antiquity, but almost entirely rebuilt; it contains a large number of monuments to celebrated persons. A theatre, first established in 1719, was during his later years leased by Edmund Kean. The town has a Wesleyan theological college, founded in 1834. Richmond, which was incorporated in 1890, is governed by a mayor, 10 aldermen and 30 councillors. The borough includes Kew (*q.v.*), Petersham and North Sheen. Area, 2491 acres.

RICHMOND, a market town and municipal borough in the Richmond parliamentary division of the North Riding of Yorkshire, England, 50 m. N.W. from York, the terminus of a branch of the North-Eastern railway. Pop. (1901) 3837. It is finely situated on the left bank of the Swale, the valley of which is narrow and the banks steep. The interest of the town centres in the castle founded about 1071 by Alan Rufus, a son of Odo, count of Penthièvre in Brittany, who is also said to have rebuilt the town on obtaining from William the Conqueror, among other possessions, the estates of the Saxon earl Edwin, embracing some two hundred manors of Richmondshire and extending over nearly a third of the North Riding. This tract, comprising five wapentakes, was called Richmondshire at this time, but the date of the creation of the shire is uncertain. When Henry VII. came to the throne these possessions reverted to the crown. Henry VIII. gave them to his son Henry, afterwards duke of Richmond, by a daughter of Sir John Blount, and Charles II. bestowed the title of duke of Richmond on his son by the duchess of Portsmouth. The castle is situated on a perpendicular rock rising about 100 ft. above the Swale, and from its great strength was considered impregnable. Originally it covered an area of 5 acres, but the only portions of it remaining are the Norman keep, with pinnacled tower and walls 100 ft. high by 11 ft. thick, and some other smaller towers. The view from the keep is very fine, extending westward up the bold valley and over the hills which wall it, and eastward over the rich plain of the centre of the county. The church of St Mary is transitional Norman, Decorated and Perpendicular, and is largely restored. The church of the Holy Trinity retains only the nave and the detached tower. The building is ancient but was restored to use from ruins. Close to the town are ruins of Easby Abbey, a Premonstratensian foundation by Roald, constable of Richmond Castle in 1152, beautifully situated by the river. The remains, which are considerable, include a Decorated gateway, an Early English chapel and fragments of the transepts and choir of the church, with sufficient portions of the domestic buildings to enable the complete plan to be traced. The free grammar-school founded by Elizabeth a Gothic building was erected in 1850, in memory of the Rev. James Tate, a former master. The tower of a Franciscan abbey founded in 1258 remains. The chief modern buildings are the town hall, market hall and the mechanics' institute. The principal trade is in agricultural produce, but there are a paper mill and an iron and brass foundry. An annual meeting is held on the racecourse in September. In 1889 Richmond became the seat of a suffragan bishop in the diocese of Ripon. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 2520 acres.

The name of Richmond (*Richemont, Richemund*) has not been traced further back than 1145. But it is probable that there was a settlement on the site of the present town before that date. Possibly it was the Hindrelagke of the Domesday Survey, a place which, although large enough to have a church in 1086, appears to have vanished before the close of the 12th century. As far as is known the earliest charter was granted in 1145. But a later charter (1146) shows that the burgesses had enjoyed some municipal

liberties at an earlier period. The charter of 1145 gave the burgesses the borough of Richmond to hold for ever in fee farm at an annual rent of £29. Other charters were granted by Earl Conan in 1150, by Earl John II. in 1268 and by Edward II. (the first royal charter) in 1328, and confirmed in subsequent reigns. A charter of incorporation was granted by Queen Elizabeth under the title of aldermen and burgesses in 1576, and another by Charles II. in 1668 under the name of mayor and aldermen. This last, though superseded, was resecured in the reign of James II. and, until the passing of the Municipal Reform Act of 1835, was regarded as the governing charter of the borough. Although Richmond received a summons as early as 1328, it was not represented in parliament until 1584, from which time it usually sent two members. In 1867 the number was reduced to one. Since 1885 the representation has been merged in the Richmond division of the North Riding. The charter of Earl John II. points to the existence of a market before 1268, but there is no grant of it extant. In 1478, Edward IV. granted the same earl a yearly fair to be held at Richmond from the 3rd to the 16th of September inclusive. Queen Elizabeth granted the burgesses a market every Saturday, a market every fortnight for animals and a fair each year on the vigil of Palm Sunday. At one time there appear to have been as many as four annual fairs. There is now only one, which takes place on the 2nd and 3rd of November. The weekly market is still held on Saturday, and there is a fortnightly market for cattle. In the middle ages Richmond had an important market for corn and wool. There is evidence later of traffic in lead, and also of a flourishing manufacture of hand-knitted stockings. As the town possesses the only railway station in Yorkshire, the market is of small consequence. But the stocking industry decayed with the introduction of machinery. William the Lion of Scotland was imprisoned in the castle in the reign of Henry II., but otherwise the town owes its importance chiefly to its castle. The honour was a valuable possession in the middle ages, and it was usually in royal or semi-royal hands.

See R. Gale, *Registrum Honoris de Richemund* (London, 1722); C. Clarkson, *The History and Antiquities of Richmond* (Richmond, 1821); D. Whitaker, *A History of Richmondshire* (London, 1823); *Victoria County History, Yorkshire*.

RICHMOND, the capital of Virginia, U.S.A., the county-seat of Henrico county, and a port of entry, on the James river (at the head of navigation), 100 m. S. by W. of Washington, D.C., and about 125 m. by water from the Atlantic Ocean. Pop. (1850) 27,570; (1860) 37,910; (1870) 51,038; (1880) 63,600; (1890) 81,388; (1900) 85,050, of whom 32,230 were negroes and 2865 were foreign-born; (1910 census) 127,628. Richmond is served by the Atlantic Coast Line, the Chesapeake & Ohio, the Seaboard Air Line, the Southern and the Richmond, Fredericksburg & Potomac railways, and by the Old Dominion, the Virginia Navigation and the Chesapeake steamship lines. The city has a beautiful situation on the hilly ground (maximum elevation, about 250 ft. above sea-level) along the north and east banks of the James, at a bend where the river changes its south-easterly course for one almost due south. It occupies seven hills, from which fact it has been called "the Modern Rome." The western stretch of the river, opposite the city, breaks into rapids which have a fall of about 116 ft. in 9 m. and provide abundant water power. Belle Isle (the site of a Confederate prison camp during the Civil War), about ½ m. long by about ¼ m. wide, is in this part of the river; a little farther down stream are a group of small islets, and opposite the south-eastern boundary of the city is Mayo's Island. Within the city's lines the river is crossed by two bridges (to Manchester) for vehicles and pedestrians, and three railway bridges. The river has been improved by Federal engineers since 1870; in June 1909 (up to which time $1,799,033 had been expended for improvements) there was a channel 100 ft. wide and 18 ft. deep, nearly continuously from Hampton Roads to the Richmond wharf, and the maximum draft at low water was 16½ ft.

About three-fourths of the city's total street mileage (120 m.) is paved, Belgian block or macadam being used on the principal thoroughfares. About 637·8 acres are devoted to city parks, among which are William Byrd Park (300 acres), in the western part of the city, Joseph Bryan Park (202·6 acres), Chimborazo Park (29 acres), near its eastern boundary, Gambles Hill Park (8·8 acres), Monroe Square (7½ acres), Jefferson Park (6·3 acres) and Marshall Square (7 acres). The State Capitol Square (10 acres) is not owned by the city. Half a mile N.W. of the city are the Fair Grounds, where a state fair is held annually.

Of Richmond's public buildings, several have great historic interest. St John's Episcopal church, built in 1740 (and subsequently much enlarged), is noted especially as the meeting-place of the Virginia Convention of March 1775, before which Patrick Henry made a famous speech, ending, "I know not what course others may take, but as for me, Give me liberty, or give me death!" The Capitol (begun in 1785 and completed in 1792—the wings were added in 1906) was designed from a model and plans of the Maison Carrée, at Nîmes, supplied by Thomas Jefferson, while he was minister to France. Aaron Burr was tried for treason and then for misdemeanour in this building in 1807, the Virginia secession convention met here in 1861, and during the Civil War the sessions of the Confederate Congress were held here. In its rotunda is Jean Antoine Houdon's full-length marble statue of Washington, provided for by the Virginia General Assembly in 1784, and erected in 1796; its base bears a fine inscription written by James Madison. In a niche is a Houdon bust of Lafayette, a replica of the original presented to the city of Paris by the state of Virginia. The Old Stone House (the oldest building in the city) was erected as a residence in 1737, and is now used for a museum. Masons' Hall, whose corner-stone was laid in 1785, is said to be the oldest exclusively Masonic building in the United States. The Executive Mansion of the Confederate States of America, built in 1819, purchased by the city in 1862, and leased to the Confederate government and occupied by President Jefferson Davis in 1862–65, was acquired in 1890 by the Confederate Memorial Literary Society, and is now a Confederate Museum, with a room for each state of the Confederacy and a general library in the "Solid South" room; it has valuable historical papers, collected by the Southern Historical Society, and the society has published a *Calendar of Confederate Papers* (1908). The former residence of Chief-Justice John Marshall, built in 1795, is still standing; and the Lee Mansion, which was the war-time residence of General Robert E. Lee's family, has been occupied, since 1893, by the Virginia Historical Society (organized 1831; reorganized 1847) as the repository of a valuable library and collection of portraits of historical interest. Libby Prison, which stood on the northern bank of a canal, near the river, in the eastern part of the city, was taken down in 1888–89, and its materials removed to Chicago, where it was reconstructed, in as nearly as possible its original form, and became the Libby Prison War Museum.[1] The Valentine Museum is in a house on Eleventh and Clay Streets, in which Aaron Burr was entertained while he was on trial, and which with $50,000 and his collections was devised to a board of trustees in 1892 by Mann S. Valentine. The museum includes 3300 books, many being of the 15th and 16th centuries, a department of engravings, a Virginia Room with portraits and relics, some tapestries, an excellent collection of casts and valuable American archaeological specimens.

The more modern buildings include the City Hall, a fine granite structure (completed in 1893), with a tower 180 ft. tall; the Library building which houses the state library (about 80,000 volumes, with many portraits and a valuable collection of old manuscripts), the State Law Library and also the offices of most of the state officials; the Post-Office and Customs House; the State Penitentiary; the Chamber of Commerce; and, among the religious edifices, the Sacred Heart Cathedral (Roman Catholic), presented to the city by Mr and Mrs Thomas F. Ryan; the Monumental Church, built on the site of the Richmond Theatre, in the burning of which, in 1811, Acting-Governor George W. Smith and fifty-nine others lost their lives; and St Paul's Church, where Jefferson Davis was attending services, on the 2nd of April 1865, when he received news from

[1] As built in Richmond in 1845 by Luther Libby, it was a brick structure, three storeys high in front and four in the rear. It had six rooms, each about 100×45 ft., was used as a tobacco warehouse and a ship-chandlery until 1861, and then until the capture of Richmond was used as a prison, chiefly for Federal officers. Frequently it was terribly overcrowded (by as many as 1200 prisoners at a time), the inmates often suffered great privations, and many died or were physically disabled for the remainder of their lives.

General Lee that General Grant had broken through the lines at Petersburg and that Richmond must be evacuated. Rosemary Library was given to the city by Thomas Nelson Page in memory of his wife, who died in 1888.

Richmond has many fine monuments and statues of historic interest and artistic merit, the most noteworthy of the former being the Washington Monument, in Capitol Square. In 1850 the commission accepted the model submitted by Thomas Crawford (1814–1857), an American sculptor, the corner-stone of the monument was laid in that year, and the equestrian statue of Washington, with sub-statues of Patrick Henry and Thomas Jefferson, was unveiled on the 22nd of February 1858. Thereafter were added sub-statues of Chief-Justice John Marshall and George Mason (1726–1792) by Crawford, and statues of Andrew Lewis (1730–1781) and Thomas Nelson (1738–1789), and six allegorical subjects, by Randolph Rogers (1825–1892), the monument being completed in 1869, at a cost of about $260,000, of which about $47,000 represented private gifts and the interest thereon. The greatest height of the monument is 60 ft., and the diameter of its base is 86 ft. In Capitol Square are also a marble statue of Henry Clay, by Joel T. Hart (1810–1877), a bronze statue of Stonewall Jackson, by John Henry Foley (1818–1874), an English sculptor, "presented to the city by English gentlemen" (Hon. A. J. Beresford-Hope and others) and unveiled in 1875; a statue of Hunter Holmes McGuire (1835–1900), a famous Virginia surgeon; and a statue of William Smith (1796–1887), governor of Virginia in 1841–42 and in 1864–65. In Monroe Park is a statue by E. V. Valentine of Brig.-General Williams Carter Wickham (1820–1888) of the Confederate army. Another noteworthy monument is the noble equestrian statue of General Robert E. Lee, surmounting a lofty granite pedestal at the head of Franklin Street. This statue, by Marius Jean Antonin Mercié (b. 1845), was unveiled in 1890. Adjacent is an equestrian statue of General J. E. B. Stuart, by Frederick Moynihan, and at the west end of Monument Avenue is the Jefferson Davis Monument, by W. C. Nowland, in front of which is a statue of Jefferson Davis, by E. V. Valentine. On Libby Hill, in the south-eastern part of the city, is a monument to the private soldiers and sailors of the Confederacy.

In Hollywood Cemetery (dedicated in 1849) are the graves of many famous men, including presidents James Monroe and John Tyler; Jefferson Davis, John Randolph of Roanoke, the Confederate generals, A. P. Hill, J. E. B. Stuart and George E. Pickett; Commodore Matthew F. Maury (1806–1873); James A. Seddon (1815–1880), Secretary of War of the Confederate States in 1862–64; and John R. Thompson (1823–1873), widely known in his day as a poet and as the editor of the *Southern Literary Messenger* in 1847–50. Here, too, are buried about 16,000 Confederate soldiers (to whose memory there is a massive pyramid of undressed granite, 40 ft. sq. at the base and 90 ft. high). In the north-eastern part of the city is Oakwood Cemetery, in which are the graves of about 18,000 Confederate soldiers. Two miles north-east of the city is the National Cemetery, with graves of 6571 Federal soldiers (5700 unknown) most of whom were killed in the actions near Richmond.

Richmond is the seat of Richmond College (opened in 1832; chartered in 1840; and co-educational since 1898), which in 1909–10 had 21 instructors and 341 students, of whom 55 were in the School of Law (established 1870; re-established 1890); the Woman's College (Baptist; opened in 1854), which in 1909–10 had 20 instructors and 275 students; the Virginia Mechanics' Institute (1856), including a Night School of Technology; the Union Theological Seminary in Virginia (Presbyterian; opened in 1824 and removed to Richmond in 1898 from Hampden-Sidney), which in 1909–10 had 7 instructors and 80 students; the Medical College of Virginia, (founded in 1838), which has medical, dental and pharmaceutical departments, and in 1909–10 had 50 teachers and 253 students; the University College of Medicine (1893), which has departments of medicine, dentistry and pharmacy, and in 1909–10 had 57 teachers and 220 students; the Hartshorn Memorial College (Baptist), for women; and, for negroes, Virginia Union University, founded in 1899.

Many periodicals (including several religious weeklies) are published in Richmond. The principal newspapers are the *Times-Dispatch* (Democratic; *Dispatch*, 1850; *Times*, 1886; consolidated in 1903) and the *News-Leader* (Democratic, 1899). Among the city's clubs are the Westmoreland and the Commonwealth.

The city's charitable institutions include the Memorial (1903), Virginia Sheltering Arms (1889) and St Luke's hospitals, the Retreat for the Sick (1877), the Eye, Nose, Ear and Throat Infirmary (1880), the Confederate Soldiers' Home (1884), supported wholly by the state and the city, a Home for Needy Confederate Women (1900), the City Almshouse and Hospital, and several orphanages and homes for the aged.

Richmond is the leading manufacturing city of Virginia, the value of its factory products in 1905 being $28,202,607, an increase of 22·4% since 1900 and nearly 19% of the value of the state's factory products in this year. The chief industry is the manufacture of tobacco for smoking and chewing, of cigars and cigarettes and of snuff. There are large iron and steel works here, notably the Tredegar Iron Works. Other important manufactures, with their product-values in 1905, are lumber and planing-mill products, $508,953; fancy and paper boxes and wooden packing boxes, $432,522; coffee and spices, $245,689; foundry and machine-shop products, $238,576; and saddlery and harness, $235,839. Richmond is the port of entry for the District of Richmond; in 1907 its imports were valued at $913,234 and its exports at $1,867,575; in 1909, its imports at $693,822 and its exports at $24,390. The city has a large jobbing and retail trade.

Richmond is governed under a charter of 1870 with amendments. The mayor is elected for two years and has the powers and authority in criminal cases of a justice of the peace. The council is composed of a common council (five members from each ward, elected for two years) and of a board of aldermen (three members from each ward to be elected for four years). Other elective officers are the treasurer, city treasurer, city sergeant, commonwealth attorney, city collector, city auditor, sheriff and high constable, elected for four years; and clerks of the various courts elected for eight years. The commissioner of the revenue is appointed for a term of four years by the judge of the corporation court. Three justices of the peace are elected from each ward for a term of two years. The city council appoints an attorney for the corporation, a city engineer, a city clerk, a police justice, a board of fire commissioners and a board of police commissioners, three from each ward, who have control of the fire and police departments, respectively, and a number of other officers. The city owns its gas works, water works and an electric-lighting plant (1910) for municipal lighting. The debt limit is fixed by the city charter at 15% of the assessed value of the taxable real estate of the city. In 1909 the taxable real estate and personal property was valued at $108,663,716, and the city had no floating debt; on the 1st of February 1910, there were $10,706,318 worth of bonds outstanding, and the sinking fund was $2,011,857.

An exploring party from Jamestown, under command of Captain Christopher Newport (*c.* 1565–1617), and including Captain John Smith, sailed up the James river in 1607, and on the 3rd of June erected a cross on one of the small islands opposite the site of the present city. The first permanent settlement within the present limits of the city was made in 1609 in the district long known as Rockett's. Later in the same year Captain Smith bought from the Indians a tract of land on the east bank of the river, about 3 m. below this settlement, and near the site of the present Powhatan. This was named "Nonesuch," and here he attempted to establish a small body of soldiers who had occupied a less favourable site in the vicinity; but they objected to the change and, being attacked by the Indians, sought the protection of Smith, who made prisoners of their leaders, with the result, apparently, that the settlement was abandoned. In 1645 Fort Charles was erected at the falls of the James as a frontier defence. In 1676, during "Bacon's Rebellion," a party of Virginians under Bacon's command killed about 150 Indians who were defending a fort on a hill a short distance east of the site of Richmond in the "Battle of Bloody Run," so called because the blood of the slain savages is said to have coloured the brook (or "run") at the base of the hill. Colonel William Byrd,[1] who owned much land along the

[1] The Byrds and their ancestors, the Steggs, were conspicuous in the political history of Virginia. The first family was Thomas Stegg (or Stegge) (d. 1651), born in England, who became an Indian trader on the James river as early as 1637, and had his home near what is now the village of Westover, Charles City county. He left his estate to his son Thomas (d. 1670), who settled at the falls of the James in 1661, and was auditor-general in 1664–1670. He was succeeded by his nephew, William Byrd (1652–1704), who was born in London, went to Virginia about 1670, became a successful Indian trader, was a member of the House of Burgesses in 1677–1682, was a supporter of Nathaniel Bacon at the beginning of

James river, at the falls, visited the tract in September 1733, and decided to found there the town of Richmond, at the same time selecting and naming the present site of Petersburg. The name Richmond was suggested probably by the similarity of the site to that of Richmond on the Thames. The settlement was laid out in April 1737 by Major William Mayo (*c.* 1685–1744), and was incorporated as a town in 1742. The public records of the state were removed thither in 1777 from Williamsburg, and in May 1779 Richmond was made the capital. On the 5th of January 1781 the town was partly burned by a force of about 800 British troops under Gen. Benedict Arnold, the 200 or 300 Virginians offering little resistance, and much of the damage being done by Lieutenant-Colonel John G. Simcoe's celebrated Rangers. Richmond was first chartered as a city in 1782, and in 1788 it was allowed a representative in the House of Delegates.

The importance of Richmond during the Civil War was principally due to its having been made the capital of the Confederate States (by act of the Provisional Government on the 8th of May 1861). Its nearness to Washington, the material and manufacturing resources concentrated in it, and the moral importance attached to its possession by both sides, caused it to be regarded as the centre of gravity of the military operations in the east to which the greatest leaders and the finest armies were devoted from 1861 to 1865. (See AMERICAN CIVIL WAR.) The city's system of defences, which began to take form in May 1861, included a line of 17 heavy batteries, completely encircling it at an average distance of about 2 m.; another line of smaller batteries and trenches, from about a mile (or less) to about 2 m. beyond the heavy batteries, and practically unbroken from the north bank of the James (west of the city) to about 1 m. west of that river (south of the city); and the outer works, approximately paralleling the inner line, at distances of from 2 to 3 m. from this line north and east of the city. There was much confusion and lawlessness in Richmond during the earlier stages of the war. The city's police force was unable to cope with the situation created by the influx of soldiers, gamblers and adventurers, and on the 1st of March 1862 President Davis (by authority of a secret Act of the Confederate Congress passed on the 2nd of February) declared martial law in the city and the country within a radius of 10 m., suspended the writ of *habeas corpus*, and appointed General John H. Winder (1800–1865) to enforce military rule. General Winder's arbitrary exercise of his powers, however, resented so vigorously by the citizens that on the 19th of April the Confederate Congress materially modified the law under which he received these powers from the president. The opening of M'Clellan's Peninsula Campaign (see YORKTOWN; SEVEN DAYS, &c.) in 1862 caused great apprehension in Richmond, and in May 1862 some of the government records were packed up and preparations made to ship them to a place of safety. The approach of the "Monitor" and the Union gunboats up the James river caused a partial and temporary panic; President Davis appointed a day for prayer, and the families of some of the cabinet secretaries and many citizens fled the city precipitately; but confidence, restored by the checking of the fleet at Drewry's Bluff (Fort Darling), about 8 m. below the city, on the 15th of May 1862, was increased by the battle of Fair Oaks and the Seven Days, after which the Army of the Potomac retreated. Unsuccessful attempts were made in February and March 1864 to free the Federal prisoners in Richmond by means of cavalry raids. The most important of these was that of General H. Judson Kilpatrick, a portion of whose force, under Col. Ulric Dahlgren (b. 1842), was annihilated, Dahlgren being killed (2nd March).

General U. S. Grant began the final campaign against Richmond in May 1864 (see WILDERNESS and PETERSBURG). Sheridan's cavalry, during the "Richmond Raid," carried the city's outer defences (May 12), but found the river line too strong to be taken by assault and moved away. In June Grant's army crossed the James and attacked Lee in Petersburg. Then followed many months of unintermittent pressure upon both Petersburg and Richmond. General Benjamin F. Butler captured the southern outer line of the Richmond defences on the 29th of September 1864. On the 2nd of April 1865 Petersburg fell. Richmond was evacuated that night, after the ironclads, the bridges and many of the military and tobacco store-houses had been set on fire by order of General R. S. Ewell, so that when the Federal troops, under General Godfrey Weitzel (1835–1884) entered the city on the following morning (3rd April) a serious conflagration was under way, which was not extinguished until about one-third of the city, including several of its historic buildings, had been destroyed. During the war the principal iron foundry of the Confederacy (Tredegar Iron Works) was in Richmond, and here most of the cannon used by the Confederate armies were cast. In 1910 the city of Manchester was annexed.

See William W. Henry, "Richmond on the James" in *Historic Towns of the Southern States* (New York, 1900), edited by Lyman P. Powell; and Samuel Mordecai, *Richmond in By-Gone Days* (Richmond, 1856; 2nd ed., 1860).

RICHMOND AND DERBY, MARGARET, COUNTESS OF (1443–1509), mother of the English king, Henry VII., and foundress of St John's and Christ's colleges at Cambridge, was the daughter and heiress of John Beaufort, duke of Somerset, and was born on the 31st of May 1443. In 1455 she married Edmund Tudor, earl of Richmond, who died in the following year; she then took for her husband Henry (d. 1482), son of Humphrey Stafford, duke of Buckingham, and later Thomas Stanley, afterwards earl of Derby. She was in constant communication with her son, the future king, during his exile in Brittany, and with her husband, Lord Stanley, aided him to gain the crown in 1485. The countess was very pious and charitable, and under the influence of her confessor, John Fisher, afterwards bishop of Rochester, she founded the Lady Margaret professorships of divinity at the universities of Oxford and Cambridge. She completed the foundation of Christ's college, Cambridge, and after her death, in accordance with her wishes, much of her wealth was devoted to building and endowing St John's College in the same university. She survived her son, whose title to the English throne was derived through her, and died on the 29th of June 1509. The countess translated some devotional books into English, and Fisher said of her, "All England for her death had cause of weeping."

See C. H. Cooper, *Memoir of Margaret, Countess of Richmond and Derby* (1874).

RICHMOND AND LENNOX, FRANCES TERESA STEWART, DUCHESS OF (1648–1702), daughter of Walter Stewart, or Stuart, a physician in the household of Queen Henrietta Maria when in exile after 1649, was born in 1648 and was brought up in France. Notwithstanding the desire of Louis XIV. to keep her at his court, she was sent to England by Henrietta Maria in 1663, when she was appointed maid of honour to Catherine of Braganza, Queen of Charles II. Pepys describes her at this time as the greatest beauty he had ever seen, and Henrietta Maria called her the prettiest girl in the world. Charles II., who is said to have first seen "La belle Stewart" in the apartments of his mistress Lady Castlemaine (afterwards duchess of Cleveland), quickly became enamoured of her; but for some

"Bacon's Rebellion," was auditor-general of the colony from 1687 until his death, and was a member of the committee which founded the College of William and Mary. His tombstone within the limits of the present city of Richmond, was preserved until about 1850. His son William (1674–1744), the founder of Richmond—and above referred to—was educated in England; returned to Virginia in 1696; succeeded his father as auditor-general of the colony, and was receiver-general in 1705–1716. In 1727 he was appointed one of the commission (of which William Fitzwilliams and William Dandridge were the other members) to mark the boundary between North Carolina and Virginia, concerning which undertaking he wrote (probably in 1737) *The History of the Dividing Line.* This with his other publications, *A Journey to the Land of Eden* and *A Progress to the Mines*, was published at Petersburg, Va., in 1841, and again (New York, 1901) as *The Writings of Colonel William Byrd of Westover in Virginia*, edited by John S. Bassett, and including an extended sketch of the Byrd family. Concerning Byrd's style as a writer, Professor Bassett says: "It would be hard to find before Franklin a better master of the art of writing clear, forceful and charming English."

time Miss Stewart resisted the king's importunities, though her behaviour was far from modest and "she had no aversion to scandal." She had numerous suitors, including the duke of Buckingham and Francis Digby, son of the earl of Bristol, whose unrequited love for her was celebrated by Dryden. Her beauty appeared to her contemporaries to be only equalled by her childish silliness; but her letters to her husband, preserved in the British Museum, are not devoid of good sense and feeling. The king's infatuation was so great that when the queen's life was despaired of in 1663, it was reported that he intended to marry Miss Stewart, and four years later he was considering the possibility of obtaining a divorce to enable him to make her his wife. This was at a time when Charles feared he was in danger of losing her as his mistress by Monmouth being sought in marriage by Charles Stuart, duke of Richmond and Lennox. The duchess of Cleveland, who was losing her hold on the king's affections, is reported by Hamilton to have led the king to Miss Stewart's apartment at midnight when Richmond was closeted with her, and the duke was immediately expelled from court. In March 1667 the lady eloped from Whitehall with Richmond and married him secretly in the country. The king, who was greatly enraged, suspected Clarendon of being privy to the marriage, and, according to Burnet, deprived him of office for this offence. The duchess of Richmond, however, soon returned to court, where she remained for many years; and although she was disfigured by small-pox in 1668, she retained her hold on the king's affections. Her husband was sent as ambassador to Denmark, where he died in 1672. The duchess was present at the birth of the prince of Wales, son of James II., in 1688, being one of those who signed the certificate before the council. She died in 1702, leaving a valuable property to her nephew the earl of Blantyre, whose seat was named Lennoxlove after her.

RICHTER, ADRIAN LUDWIG (1803–1884), German painter and etcher, was born at Dresden in 1803, the son of the engraver Karl August Richter, from whom he received his training; but he was strongly influenced by Erhard and Chodowiecki. He was the most popular, and in many ways the most typical German illustrator of the middle of the 19th century. His work is as typically German and homely as are the fairy-tales of Grimm. Richter visited Italy from 1823–26, and his "Thunderstorm in the Sabine Mountains" at the Staedel Institute in Frankfort is one of the rare Italian subjects from his brush. In 1828 he worked as designer for the Meissen factory, and in 1841 he became professor and head of the landscape atelier at the Dresden Academy. The Dresden Gallery owns one of his best and most characteristic paintings in the "Bridal Procession in a Spring Landscape." He died at Loschwitz near Dresden in 1884.

RICHTER, ERNST FRIEDRICH EDUARD (1808–1879), German musical theorist, was born at Grosschönau in Saxony, on the 24th of October 1808. He first studied music at Zittau, and afterwards at Leipzig, where he attained so high a reputation that in 1843 he was appointed professor of harmony and counterpoint at the conservatorium of music, then newly founded by Mendelssohn. On the death of Hauptmann on the 3rd of January 1868, he was elected cantor of the Thomasschule, which office he retained until his death on the 9th of April 1879. He is best known by three theoretical works—*Lehrbuch der Harmonie*, *Lehre vom Contrapunct* and *Lehre von der Fuge*—valuable textbooks known to English students through the excellent translation by Franklin Taylor.

RICHTER, EUGEN (1839–1906), German politician, was born on the 30th of July 1839 at Düsseldorf. After attending the universities of Bonn, Heidelberg and Berlin, he entered the government service, being stationed in his native town. In 1864 he was chosen burgomaster of Neuwied; but he was already known for his Liberal opinions, and the government refused to confirm the appointment. He was hereupon transferred to Bromberg, in East Prussia, which to an inhabitant of the Rhineland was the worst form of exile, and in consequence he resigned his place in the public service. He now went to Berlin, where he earned his living as a journalist. He was the most consistent advocate of those doctrines of *laissez faire* and individual liberty which the Germans call *Manchestertum*. He was also keenly interested in the attempts made at that period to create co-operative societies among the working men, and wrote a work on co-operative stores. It was not long before he came into conflict with the government; an electioneering pamphlet published in 1867 was confiscated; he was put on his trial but acquitted. In 1867 he was elected a member of the newly formed Reichstag, and in 1869 of the Prussian parliament. He soon became one of the most influential politicians in Germany. A member of the Progressive party, in 1880 one of the founders, and eventually the leader, of the Freisinnige, he was always in opposition. Next to Windthorst (*q.v.*) he was Bismarck's most dangerous opponent. After the great change of policy in 1878, for a time his influence was a great impediment to the government; as a consistent adherent to free trade, he was the leader of the opposition to the introduction of protection, to the new colonial policy, and to State Socialism. It was after 1880 that he raised the cry *Bismarck muss fort*. He always took a great part in attacks on the military and naval establishments, in vain opposing the constant increase of army and navy. It was his refusal to support the government proposals in 1893 for an increase of the army which led to the break up of his party: he was left with only eleven followers; and, except among the middle class of Berlin and some other Prussian cities, the old Radical party, of which he was the chief representative, from that time had little influence in the country. In 1885 he founded the *Freisinnige Zeitung*, which he edited himself; of his numerous brochures the most successful was his attack on Socialism, entitled *Sozialdemokratische Zukunftsbilder* (Berlin, 1891), a clever and successful satire on the Socialist state of the future. This has been translated into the English. He also wrote much on Prussian finance, and under the title *Das politische A, B, C Buch* compiled a very useful political handbook for Radical voters. He also published in 1892 reminiscences of his youth (*Jugenderinnerungen*), and two volumes of parliamentary reminiscences (*Im alten Reichstag*, 1894–1896).

He died at Jena on the 26th of January 1906.

RICHTER, HANS (1843–), Hungarian musical conductor, born at Raab on the 4th of April 1843, was the son of the kapellmeister at the cathedral, and of his wife, *née* Josephine Csazinsky, who was the first to perform Venus in *Tannhäuser* at Vienna. Young Hans sang either soprano or alto in the cathedral choir, according to requirement, and occasionally played the organ. But his public *début* was made as a drummer in Haydn's *Paukenmesse*. In 1853, at the age of ten, he appeared in a concert as pianist in Hummel's B flat quintet; and in 1854, after his father's death, went to the choristers' school, the Convikt (where Schubert was educated) in Vienna, and there became chorister in the Court Chapel. For five years from 1860 Richter studied under Heissler and Sechter in the Vienna Conservatorium, and he learnt the horn under Kleinecke. A year and a half after his first lesson he became hornist in the old Kärnthnerthor Theatre at £3 a month. Meanwhile he had devoted time to conducting. It was not till August 1868 that Richter made his first appearance as a conductor, at the Hof Theater, Munich (where he had just been appointed), in *William Tell*; but in the next year he resigned this post, went first to Paris, then to Brussels, and finally to Triebschen, where he copied *Der Ring des Nibelungen* for Wagner. In April 1871 Richter took up his new duties as conductor of the Hungarian National Opera at Budapest, where he remained four years, until he began in May 1875 his long connexion with the Vienna Opera, which terminated only with the century. In 1876 Richter

directed the rehearsals and performances of *Der Ring* at Bayreuth, and in 1877 paid his first visit to England to conduct the Wagner Festival at the Albert Hall. There in 1879 he founded the Richter Concerts, which were a revelation to London musical circles of the masterly personality of the conductor, and his influence upon the orchestra; in 1885 he became conductor of the Birmingham Triennial Festival, and was created Mus. Doc. Oxon. *honoris causa*. In 1882 Richter also conducted a famous series of performances of Wagner's works (including the first in England of *Die Meistersinger* and *Tristan*) at Drury Lane, and in 1900 became conductor of the Hallé Orchestra in Manchester. He had established his position as one of the most richly gifted and the most experienced of modern conductors, supreme in the interpretation of Beethoven, Wagner and Brahms.

RICHTER, JEREMIAS BENJAMIN (1762–1807), German chemist, was born at Hirschberg in Silesia on the 10th of March 1762, became a mining official at Breslau in 1794, and in 1800 was appointed assessor to the department of mines and chemist to the royal porcelain factory at Berlin, where he died on the 4th of April 1807. To him belongs the merit of carrying out some of the earliest determinations of the quantities by weight in which acids saturate bases and bases acids, and of arriving at the conception that those amounts of different bases which can saturate the same quantity of a particular acid are equivalent to each other. He was thus led to conclude that chemistry is a branch of applied mathematics and to endeavour to trace a law according to which the quantities of different bases required to saturate a given acid formed an arithmetical, and the quantities of acids saturating a given base a geometrical, progression. His results were published in his *Anfangsgründen der Stöchiometrie oder Messkunst chemischer Elemente* (1792–94), and *Über die neueren Gegenstände in der Chemie* (1792–1802), but it was long before they were properly appreciated, or he himself was accorded due credit for them. This was partly because some of his work was wrongly ascribed to C. F. Wenzel by Berzelius through a mistake which was only corrected in 1841 by Germain Henri Hess (1802–1850), professor of chemistry at St Petersburg, and author of "the laws of constant heat-sums and of thermoneutrality" (see THERMOCHEMISTRY).

RICHTER, JOHANN PAUL FRIEDRICH (1763–1825), usually called JEAN PAUL, famous German humorist, was born at Wunsiedel, in Bavaria, on the 21st of March 1763. His father was a schoolmaster and organist at Wunsiedel, but in 1765 he became a pastor at Joditz near Hof, and in 1776 at Schwarzenbach, where he died in 1779. After attending the gymnasium at Hof, Richter went in 1781 to the university of Leipzig. His original intention was to enter his father's profession, but theology did not interest him, and he soon devoted himself wholly to the study of literature. Unable to maintain himself at Leipzig he returned in 1784 to Hof, where he lived with his mother. From 1787 to 1789 he served as a tutor at Töpen, a village near Hof; and afterwards he taught the children of several families at Schwarzenbach.

Richter began his career as a man of letters with *Grönländische Prozesse* and *Auswahl aus des Teufels Papieren*, the former of which was issued in 1783–84, the latter in 1789. These works were not received with much favour, and in later life Richter himself had little sympathy with their satirical tone. His next book, *Die unsichtbare Loge*, a romance, published in 1793, had all the qualities which were soon to make him famous, and its power was immediately recognized by some of the best critics of the day. Encouraged by the reception of *Die unsichtbare Loge*, he sent forth in rapid succession *Hesperus* (1795), *Biographische Belustigungen unter der Gehirnschale einer Riesin* (1796), *Leben des Quintus Fixlein* (1796), *Blumen- Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Armenadvokaten Siebenkäs* (1796–97), *Der Jubelsenior* (1797), and *Das Kampaner Tal* (1797). This series of writings won for Richter an assured place in German literature, and during the rest of his life every work he produced was welcomed by a wide circle of admirers.

After his mother's death he went in 1797 to Leipzig, and in the following year to Weimar, where he had much pleasant intercourse with Herder, by whom he was warmly appreciated. He did not become intimate with Goethe and Schiller, to both of whom his literary methods were repugnant; but in Weimar, as elsewhere, his remarkable conversational powers and his genial manners made him a favourite in general society. In 1801 he married Caroline Meyer, whom he met in Berlin in 1800. They lived first at Meiningen, then at Coburg; and finally, in 1804, they settled at Bayreuth. Here Richter spent a quiet, simple and happy life, constantly occupied with his work as a writer. In 1808 he was fortunately delivered from anxiety as to outward necessities by the prince-primate, K. T. von Dalberg, who gave him a pension of a thousand florins. Before settling at Bayreuth, Richter had published his most ambitious novel, *Titan* (1800–3); and this was followed by *Flegeljahre* (1804–5), two works which he himself regarded as his masterpieces. His later imaginative works were *Dr Katzenbergers Badereise* (1809), *Des Feldpredigers Schmelzle Reise nach Flätz* (1809), *Leben Fibels* (1812), and *Der Komet, oder Nikolaus Marggraf* (1820–22). In *Vorschule der Aesthetik* (1804) he expounded his ideas on art; he discussed the principles of education in *Levana, oder Erziehungslehre* (1807); and the opinions suggested by current events he set forth in *Friedenspredigt* (1808), *Dämmerungen für Deutschland* (1809), *Mars und Phöbus Thronwechsel im Jahre 1814* (1814), and *Politische Fastenpredigten* (1817). In his last years he began *Wahrheit aus Jean Pauls Leben*, to which additions from his papers and other sources were made after his death by C. Otto and E. Förster. In 1821 Richter lost his only son, a youth of the highest promise; and he never quite recovered from this shock. He died of dropsy, at Bayreuth, on the 14th November 1825.

Schiller said of Richter that he would have been worthy of admiration "if he had made as good use of his riches as other men made of their poverty." And it is true that in the form of his writings he never did full justice to his great powers. In working out his conceptions he found it impossible to restrain the expression of any powerful feeling by which he might happen to be moved. He was equally unable to resist the temptation to bring in strange facts or reflections which occurred to him. Hence every one of his works is irregular in structure, and his style lacks directness, precision and grace. But his imagination was one of extraordinary fertility, and he had a surprising power of suggesting great thoughts by means of the simplest incidents and relations. The love of nature was one of Richter's deepest pleasures; his expressions of religious feelings are also marked by a truly poetic spirit, for to Richter visible things were but the symbols of the invisible, and in the unseen realities alone he found elements which seemed to him to give significance and dignity to human life. His humour, the most distinctive of his qualities, cannot be dissociated from the other characteristics of his writings. It mingled with all his thoughts, and to some extent determined the form in which his most serious and even his most solemn reflections appear. That it is sometimes extravagant and grotesque cannot be disputed, but it is never harsh nor vulgar, and generally it springs naturally from the perception of the incongruity between ordinary facts and ideal laws. Richter's personality was deep and many-sided; with all his wilfulness and eccentricity he was a man of a pure and sensitive spirit, with a passionate scorn for pretence and an ardent enthusiasm for truth and goodness.

Richter's *Sämtliche Werke* appeared in 1826–28 in 60 vols., to which were added 5 vols of *Literarischer Nachlass* in 1836–38; a second edition was published in 1840–42 (33 vols.); a third in 1860–62 (34 vols.). The last complete edition is that edited by R. Gottschall (60 parts, 1879). Editions of selected works appeared in 16 vols. (1865), in Kürschner's Deutsche Nationalliteratur (edited by P. Nerrlich, 6 vols., 1884–87), &c. The chief collections of Richter's correspondence are: *Jean Pauls Briefe an F. H. Jacobi* (1828); *Briefwechsel Jean Pauls mit seinem Freunde C. Otto* (1829–33); *Briefwechsel zwischen H. Voss und Jean Paul* (1833); *Briefe an eine Jugendfreundin* (1858); P. Nerrlich, *Jean Pauls Briefwechsel mit seiner Frau und seinem Freunde Otto* (1902). See further

the continuation of Richter's autobiography by C. Otto and E. Förster (1826–33); H. Döring, *J. P. F. Richters Leben und Charakteristik* (1830–32); R. O. Spazier, *J. P. F. Richter: ein biographischer Kommentar zu dessen Werken* (5 vols., 1833); E. Förster, *Denkwürdigkeiten aus dem Legen von J. P. F. Richter* (1863); P. Nerrlich, *Jean Paul und seine Zeitgenossen* (1876); J. Firmery, *Étude sur la vie et les œuvres de J. P. F. Richter* (1886); P. Nerrlich, *Jean Paul, sein Leben und seine Werke* (1880); F. J. Schneider, *Jean Pauls Altersdichtung* (1901); the same, *Jean Pauls Jugend und erstes Auftreten in der Literatur* (1906). All Richter's more important works have been translated into English, *Quintus Fixlein* and *Schmelzles Reise*, by Carlyle; see also Carlyle's two admirable essays on Richter.

RICHTHOFEN, FERDINAND, Baron von (1833–1905), German geographer and traveller, was born near Karlsruhe, Silesia, on the 5th of May 1833. He was educated at Breslau and Berlin, and in 1856 carried out geological investigations in the Tirol, subsequently extending them to Transylvania. In 1859 he accompanied as geologist the Prussian diplomatic mission to the Far East under Count von Eulenburg, and visited Ceylon, Japan, Formosa, the Philippines and Java, subsequently making an overland journey from Bangkok to Moulmein and reaching Calcutta in 1862. No important work resulted from these travels, for much of Richthofen's records and collections was lost. China was at the time inaccessible owing to the Taiping rebellion, but Richthofen was impressed with the desirability of exploring it, and after a visit to California, where he remained till 1868, he returned to the East. In a remarkable series of seven journeys he penetrated into almost every part of the Chinese Empire. He returned home in 1872, and a work comprising three large volumes and an atlas, which, however, did not cover the entire field or complete the author's plan, appeared at Berlin in 1877–85 under the title of *China; Ergebnisse eigner Reisen und darauf gegründeter Studien*. In this standard work the author deals not only with geology but with every subject necessary to a general geographical treatise. Notably he paid close attention to the economic resources of the country he traversed; he wrote a valuable series of letters to the Shanghai Chamber of Commerce, and first drew attention to the importance of the coalfields of Shantung, and of Kiaochow as a port. In 1875 Richthofen was elected professor of geology at Bonn, but being fully occupied with his work in China he did not take up professorial duties till 1879; in 1883 he became professor of geography at Leipzig, and in 1886 was chosen to the same office at Berlin, and held it till his death. His lectures attracted numerous students who subsequently became eminent in geographical work, and in order to keep in touch with them he established his weekly geographical "colloquium." Of his written works, besides that on China, there may be mentioned "Die Kalkalpen von Voralberg und Nordtirol" in *Jahrbuch der geologischen Reichsanstall* (1859–1861); "Die Metallproduktion Kaliforniens" in *Petermanns Mitteilungen* (1865); *Natural System of Volcanic Rocks* (San Francisco, 1867); *Aufgaben und Methoden der heutigen Geographie* (an address delivered at Leipzig, 1883); *Führer für Forschungsreisende* (Berlin, 1886); *Triebkräfte und Richtungen der Erdkunde in neunzehnten Jahrhunderi* (address on his election as rector, Berlin, 1903). He was for many years president of the German Geographical Society, and he founded the Berlin Hydrographical Institute. He died on the 16th of October 1905.

RICIMER (d. 472), master of the Roman Empire in the West during part of the 5th century, was the son of a prince of the Suebi and the daughter of Wallia, king of the Visigoths. His youth was spent at the court of Valentinian III., and he won distinction under Aetius. In 456 he defeated the Vandals in a sea-fight near Corsica, and on land near Agrigentum in Sicily, and backed by the popularity thus acquired, Ricimer then gained the consent of the Roman senate to an expedition against the emperor Avitus, whom he defeated in a bloody battle at Piacenza on the 16th of October 456. Avitus was taken prisoner and made bishop of Piacenza, and shortly afterwards sentenced to death. Ricimer then obtained from Leo I., emperor at Constantinople, the title patrician, but in 457 set up Majorianus as his own emperor in the West, and induced Leo to give his consent. When, however, Majorianus tried to rule by himself, Ricimer forced him to abdicate and caused his assassination on the 7th of August 461. The successor whom Ricimer placed upon the throne was Libius Severus, who proved to be more docile than Majorianus, but had to face the rivalry of Leo in the East and Aegidius in Gaul. Upon his death in 465—said to be due to the poison of Ricimer —this emperor-maker ruled the West for eighteen months without an emperor, and then accepted Leo's candidate Anthemius, diplomatically married his daughter, and for some time lived in peace with him. Before long, however, Ricimer moved to Milan, ready to declare war upon Anthemius. St Epiphanius, bishop of Milan, patched up a truce, but in 472 Ricimer was again before Rome with an army of Germans, proclaimed as emperor Olybrius, whom Leo had sent to pacify the two enemies, and after three months' siege took the city, on the 1st of July 472. Anthemius was massacred and Rome was a prey to Ricimer's soldiers. He himself, however, died on the 18th of August 472, of malignant fever.

RICINA, an ancient town of Picenum, Italy, 3 m. N.W. of the modern Macerata, on the banks of the river Potenza, in a fertile valley. It was probably a *municipium* until it was refounded by Pertinax and Septimius Severus, after which it bore the name Colonia Helvia Ricina Pertinax. The site is well preserved, but considerable ruins of a theatre and remains of baths and other buildings (all in brickwork of the imperial period) still exist; also the fragments of an ancient bridge over the Potenza.

RICKETS, a constitutional disease of childhood characterized chiefly by a softened condition of the bones and by other evidences of perverted nutrition. It was first described in 1649 by Arnold de Boot, a Frisian physician practising in Ireland. Its nature and causation are discussed under Metabolic Diseases. The name "rickets" is from the Old English *wrickken*, to twist; the more technical medical term, *rachitis*, which comes from Greek *ῥάχις*, the spine, was suggested by Francis Glisson in 1650, both from similarity of sound and from the part of the body which is one of the first to be affected. Rickets can seldom be recognized until several months after birth, and it most commonly attracts attention at about the end of the first year. The symptoms which precede the outward manifestation of the disease are marked disorders of the digestive and alimentary functions. The child's appetite is diminished, and there is frequent vomiting, together with diarrhoea or irregularity of the bowels, the evacuations being clay-coloured and unhealthy. Along with this there is a falling away in flesh. Importance is to be attached to certain other symptoms present in the early stages, namely, profuse sweating of the head and upper parts of the body, particularly during sleep, with at the same time dry heat of the lower parts and a tendency in the child to kick off all coverings and expose the limbs. At the same time there is great tenderness of the bones, as shown by the pain produced on moving or handling the child. Gradually the changes in the shape of the bones become visible, at first chiefly noticed at the ends of the long bones, as in those of the arm, causing enlargements at the wrists, or in the ribs, producing a knobbed appearance at the junction of their ends with the costal cartilages. The bones also from their softened condition tend to become distorted and misshapen, both by the action of the muscles and by the superincumbent weight of the body. Those of the limbs are bent outwards and forwards, and the child becomes "bow-legged" or "in-kneed" often to an extreme degree. The trunk of the body likewise shows various alterations and deformities owing to curvatures of the spine, the flattening of the lateral curves of the ribs, and the projection forwards of the sternum. The cavity of the chest may thus be contracted and the development of the thoracic organs interfered with as well as their functions more or less embarrassed. The pelvis undergoes distortion, which may reduce its capacity to a

degree that in the female may afterwards lead to serious difficulties in parturition. The head of the rickety child is large-looking in its upper part, the individual bones of the cranium sometimes remaining long ununited, while the face is small and ill-developed, and the teeth appear late and fall out or decay early. The constitutional conditions of ill-health continue, and the nutrition and development of the child are greatly retarded.

The disease may terminate in recovery, with more or less of deformity and dwarfing, the bones although altered in shape becoming firmly ossified, and this is the common result in the majority of instances. On the other hand, during the progress of the disease, various intercurrent ailments are apt to arise which may cause death, such as the infectious fevers, bronchitis and other pulmonary affections, chronic hydrocephalus, convulsions, laryngismus stridulus, &c.

An acute form of rickets of rare occurrence (really a form of *scurvy, q.v.*) has been described by writers on diseases of children, in which all the symptoms are of more rapid development and progress, the result in many instances being fatal.

The treatment of rickets is necessarily more hygienic than medicinal, and includes such preventive measures as may be exercised by strict attention to personal health and nutrition on the part of mothers, especially where there appears to be any tendency to a rickety development in any members of the family. Very important also is the avoidance of too prolonged nursing, which by its weakening effects upon the mother's health is calculated to engender the disease in any succeeding children. At the same time it must be admitted that, when the mother is healthy, her milk abundant, and nursing discontinued before the lapse of the first year, there is no better means of preventing the occurrence of rickets than this method of feeding an infant, the disease, as is well known, being far more frequently met with in children brought up by hand. The management of the child exhibiting any tendency to rickets is of great importance, but can only be alluded to in general terms. The digestive disorders characteristic of the setting in of the disease render necessary the greatest care and watchfulness as to diet. Thus, if the child be not nursed but fed artificially, fresh milk should be almost the only article of diet for at least the first year, and the chief element for the next. When not digested well, as may at times be shown by its appearance as a curd in the evacuations, it may be diluted with water or lime watcr, or else discontinued for a short time, carefully-made gruel or barley water being substituted. Many of the so-called "infants' foods" which are now so extensively used appear to be well adapted for their purpose, but when employed too abundantly and to the exclusion of the due amount of milk are often productive of digestive and intestinal disorders, probably from their containing a greater amount of starchy matter than can be utilized. From the end of the first year light animal soups may occasionally be given with advantage. The medicinal remedies most to be relied on are those which improve the digestive functions and minister to nutrition, and include such agents as the preparations of iron, quinine, and especially cod-liver oil and phosphorus, and the cautious use of extract of thyroid gland has been advocated by Henoch. Of no less importance, however, are abundance of fresh air, cleanliness, warm clothing, and attention to the general hygiene of the child and to regularity in all its functions.

When the disease is showing evidence of advancing, it is desirable to restrain the child from walking, as far as possible. But this precaution may be to some extent rendered unnecessary by the use of splints and other apparatus as supports for the limbs and body, enabling the child to move about without the risk of bending and deformity of the bones which otherwise would probably be the result.

The condition formerly known as foetal rickets (achondroplasia or chondrodystrophia foetalis) is now classed as a separate disease. Its chief characteristics are dwarfism with shortening of the limbs and enormous enlargment of the articulations.

RICKMAN, THOMAS (1776–1841), English architect, was born on the 8th of June 1776 at Maidenhead, Berkshire, where he assisted his father (a Quaker) in business as a grocer and druggist until 1797. He was then engaged in various businesses until 1818. All his spare time was spent in sketching and making careful measured drawings, till he gained a knowledge of architecture which was very remarkable at a time when little taste existed for the beauties of the Gothic styles. In 1811 alone he is said to have studied three thousand ecclesiastical buildings. When in 1818 a large grant of money was made by the government to build new churches, Rickman sent in a design of his own which was successful in an open competition; thus he was fairly launched upon the profession of an architect, for which his natural gifts strongly fitted him. Rickman then moved to Birmingham, and by 1830 became one of the most successful architects of his time. He built churches at Hampton Lucy, Ombersley, and Stretton-on-Dunsmore, St George's at Birmingham, St Philip's and St Matthew's in Bristol, two in Carlisle, St Peter's and St Paul's at Preston, St David's in Glasgow, Grey Friars at Coventry, and many others. He also designed the new court of St John's College, Cambridge, a palace for the bishop of Carlisle, and several large country houses. These are all in the Gothic style, but show more knowledge of the outward form of the medieval style than any real acquaintance with its spirit, and are little better than dull copies of old work, disfigured by much poverty of detail. Rickman nevertheless played an important part in the revival of taste for medievalism perhaps second only to Pugin. His *Attempt to discriminate the Styles of Architecture in England* shows painstaking research, and ran through many editions. Rickman died at Birmingham on the 4th of January 1841. He was married three times: first to his cousin, Lucy Rickman of Lewes; secondly to Christiana Hornor; thirdly to Elizabeth Miller of Edinburgh, by whom he had a son and a daughter.

RICKMANSWORTH, an urban district in the Watford parliamentary division of Hertfordshire, England; 17½ m. W.N.W. of London by the Metropolitan & Great Central joint railway; served also by a branch of the London & North Western railway from Watford. Pop. (1901) 5627. It lies in a pleasant valley at the junction of the Chess with the Colne, and on the Grand Junction canal. The church of St Mary, with the exception of the tower a modern reconstruction, contains some fine fourteenth stained glass of the 16th century. The chief industries are brewing and art-printing. The Colne here holds large trout, which are carefully preserved. The grounds of Moor Park to the south-east are finely wooded, and the mansion, belonging to Lord Ebury, is a good example of the period of George I. The estate counts among its former owners such famous names as the Botelers; George Neville, archbishop of York; John de Vere, earl of Oxford in Henry VII.'s time; Wolsey in the next reign; Robert Carey, earl of Monmouth, and the duke of Monmouth.

RICOCHET, a military term expressing the rebound of a projectile that strikes on a hard surface. The origin of the French word *ricochet* is unknown. Its earliest known use (14th and 15th centuries) was in the sense of "repetition," *e.g. chanson du ricochet*, "an oft-told tale." Hence it came to be applied to the rebound of a flat stone skimmed along the surface of water, known familiarly in English as "ducks and drakes," and so finally in the military sense defined above, which found its way into the English language.

The use of the now obsolete "ricochet fire" in war is well illustrated by "ducks and drakes." The shot, striking the ground at a small angle, described for the remainder of its course a succession of leaps and falls. The discovery of this species of fire, usually attributed to Vauban (siege of Ath in 1697), had the greatest influence both on sieges and on operations in the field. In siege warfare, ricochet, especially when combined with enfilade, *i.e.* when directed along the enemy's line of defence, soon became the principal weapon of the besieger, and with the system of parallels (*q.v.*) gave the attack a superiority so complete that a siege came to be considered as the most

certain operation of war. Enfilade fire by itself was neutralized by traverses (*q.v.*) in the defences, but by the new method a shot could be so aimed as to skip over each successive traverse and thus to search ground that was immune from direct fire. The application of ricochet fire to operations in the field came somewhat later. In the 18th century field artillery, which was not, before Napoleon's time, sufficiently mobile to close with the enemy, relied principally upon the ricochet of round shot, which, sweeping a considerable depth of ground, took effect upon several successive lines of hostile troops. But once artillery was able to gallop up to the enemy and to use its far more terrible close-range projectile, case-shot, ricochet fire came to be used less and less, until finally, with the general adoption of shell (which, of course, burst at the first contact with the ground), the round shot disappeared altogether from the battle-field. Similarly in siege warfare, as soon as high-angle fire with shells became sufficiently accurate, there was no further need of round shot and ricochet.

The term "ricochet" is now only applied, in modern rifle shooting, to the graze of a bullet that has struck short. A modern bullet that has ricochetted inflicts a very severe wound, as its nickel or other hard envelope is torn and jagged by its contact with the ground. With its high remaining velocity it is dangerous even after more than one ricochet, except at extreme ranges.

RICOLD OF MONTE CROCE (1242–1320), Italian Dominican missionary, was born at Monte Croce, near Florence. In 1267 he entered the Dominican house of Santa Maria Novella in Florence, and in 1272 that of St Catherine in Pisa. He started for Acre with a papal commission to preach in 1286 or 1287: in 1288 or 1289 he began to keep a record of his experiences in the Levant; this record he probably reduced to final book form in Bagdad. Entering Syria at Acre, he crossed Galilee to the Sea of Tiberias; thence returning to Acre he seems to have travelled down the coast to Jaffa, and so up to Jerusalem. After visiting the Jordan and the Dead Sea he quitted Palestine by the coast road, retracing his steps to Acre and passing on by Tripoli and Tortosa into Cilicia. From the Cilician port of Lajazzo he started on the great high road to Tabriz in north Persia. Crossing the Taurus he travelled on by Sivas of Cappadocia to Erzerum, the neighbourhood of Ararat and Tabriz. In and near Tabriz he preached for several months, after which he proceeded to Bagdad via Mosul and Tekrit. In Bagdad he stayed several years, studying the Koran and other works of Moslem theology, for controversial purposes, arguing with Nestorian Christians, and writing. In 1301 Ricold again appeared in Florence: some time after this he proposed to submit his *Confutatio Alcorani* to the pope, but did not. He died on the 31st of October 1320. As a traveller and observer his merits are conspicuous. His account of the Tatars and his sketch of Moslem religion and manners are especially noteworthy. In spite of strong prejudice, he shows remarkable breadth of view and appreciation of merit in systems the most hostile to his own.

Of Ricold's *Itinerary* (*Itinerarius* [*sic*]) fifteen MSS. exist, of which the chief are: (1) Florence, Laurentian Library, Fiesculi, 326; (2) Paris, National Library, Lat. 4955, fols. 46–55; (3) Wolfenbüttel, Cod. Weissenb. 40, fols. 73 B.–94 B. (all of 14th century). Of his *Epistles* there is one MS., viz. Rome, Vatican, 3717, fols. 249 A.–267 A. The best edition of the *Itinerary* is by J. C. M. Laurent, in *Peregrinatores Medii Aevi Quatuor*, pp. 105 (101)–41 (Leipzig, 1864 and 1873). The *Epistles* have been edited by R. Röhricht in *Archives de l'orient latin*, vol. ii. part ii. (Documents) pp. 258–96 (Paris, 1884). The *Confutatio Alcorani*, printed at Seville in 1500, at Venice in 1607, adds hardly anything to the sections of the *Itinerary* devoted to Moslem belief, &c. Ricold's *Libellus contra Nationes Orientales* and *Contra errores Judaeorum* have never been printed. See also C. Raymond Beazley, *Dawn of Modern Geography*, iii. 190–202, 218, 390–91, 547, 554, 564.

RICOTTI-MAGNANI, CESARE (1822–), Italian general and knight of the Annunziata, was born at Borgo Lavezzaro on the 30th of June 1822. As artillery lieutenant he distinguished himself and was wounded at the siege of Peschiera in 1848, and in 1852 gained further distinction by his efforts to prevent the explosion of a burning powder magazine. After serving from 1856 to 1859 as director of the Artillery School, he became general of division in 1864, commanding the 5th division at the battle of San Martino. In the war of 1866 he stormed Borgoforte, to open a passage for Cialdini's army. Upon the death of General Govone in 1872 he was appointed minister of war, and after the occupation of Rome bent all his efforts to army reform, in accordance with the lessons of the Franco-German War. He shortened the period of military service; extended conscription to all able-bodied men; created a permanent army, a mobile militia and a reserve; commenced the renewal of armaments; and placed Italy in a position to put 1,800,000 men on a war footing. Ricotti fell from power with the Right in 1876, but returned to office with Depretis in 1884, and amended his previous scheme of reform. Resigning in April 1887, he became a member of the senate in 1890, but took little part in public life until 1896, when, after the battle of Adowa, he was entrusted by King Humbert with the formation of a cabinet. Having constructed his ministry, he made over the premiership to the marquis di Rudini, retaining for himself the portfolio of war, and seeking to satisfy popular demands for the reduction of military expenditure by consolidating the tactical structure of the army without weakening its fighting power. Rudini, however, finding that Ricotti's ideas, which he himself shared, were not acceptable at court, obliged him to resign office. His prestige as creator of the modern Italian army remained unimpaired, and his views on army consolidation enjoyed a large measure of technical and public favour.

RIDDING, GEORGE (1828–1904), English headmaster and bishop, was born at Winchester College, of which his father, the Rev. Charles Ridding, vicar of Andover, was a fellow, on the 16th of March 1828. He was educated at Winchester and at Balliol College, Oxford. He became a fellow of Exeter College and was a tutor from 1853 to 1863. In 1853 he married Mary Louisa Moberly, who died within a year of her marriage. He was appointed second master of Winchester College in 1863, and on the retirement of his father-in-law, Dr Moberly, he succeeded to the headmastership. During the tenure of this office (1867–1884) he carried out successfully a series of radical reforms in the organization of the school, resulting in a great increase both in its reputation and numbers. In 1884 he became the first bishop of Southwell, and brought his powers of organization and conspicuous tact and moderation to bear on the management of the new diocese. He took an active share in its educational and social work, and was materially assisted in these respects by his second wife, Lady Laura Palmer, daughter of the 1st earl of Selborne. He resigned his see a short time before his death, which took place on the 30th of August 1904.

See *Church Quarterly Review* (July 1905).

RIDDLES (A.S. *raedan*, to interpret), probably the oldest extant form of humour. They spring from man's earliest perception that there are such things as analogies in nature. Max Müller observes an example of analogy, puts his observations in the form of a question, and there is the riddle ready made. Some Boeotian humorist, for example, detected the analogy between the life of humanity—the child on all fours, the man erect on two legs, old age with its staff—on one side, and on the other the conception of an animal with a varying number of limbs. Put this in a question and it is the riddle of the Sphinx. Another instance is the question, "What we caught we threw away, what we could not catch we kept." Homer is said to have died of vexation at not being able to discover the answer to this riddle, still current on the coast of Brittany, in Germany and in Gascony. After inventing the riddle, men began to use it in a kind of game; bets were staked on the answer and sides were made, each side backing its champion. These sports as in Mariner's time were common in Tonga; they are no less popular among the African Woloffs. Samson's riddle set to the Philistines is an instance of the sport in a Semitic country. In märchen and ballads, the hero's chance of

winning his beloved, or of escaping threatened punishment, is often made to turn on his power of answering riddles. It follows from the artless and primitive character of the riddle that regular popular riddles (*Devinettes*) are widely distributed, like popular tales, popular songs and popular customs. The Wolofs ask, "What flies for ever and rests never?" Answer, The wind. The Basutos put this riddle, "What is wingless and legless, yet flies fast and cannot be imprisoned?" Answer, The voice. The German riddle runs, "What can go in face of the sun yet leave no shadow?" Answer, The wind. In riddles may perhaps be noticed the animistic or personalizing tendency of early human thought, just beginning to be conscious of itself. The person who asked these riddles had the old sense of wind, for example, as a person, yet probably, unlike the bushmen, he would never expect to see the personal wind. He knew the distinction between the personal and impersonal well enough to be sure that his enigma would present some difficulty. The riddle, to be brief, is an interrogatory form of the fable, and like the fable originates among rude people, and is perpetuated in the folklore of peasantry.

Probably the best book on the riddle (a subject less frequently studied than the märchen or the myth) is Eugène Rolland, *Devinettes ou énigmes populaires*, with a preface by M. Gaston Paris. The power of answering riddles among the people who invented the legend of Solomon and the queen of Sheba seems to have been regarded as a proof of great sagacity. The riddle proper is all but extinct outside folklore and savage life, and has been replaced by the conundrum, which is a pun in the interrogative form.

OLD ENGLISH RIDDLES.—A number of interesting poetical riddles in old English are contained in the *Exeter Book*, written about A.D. 1000. According to the numbering in the only complete edition (in Grein-Wülker, *Bibliothek der Angelsächsischen Poesie*, vol. iii. pp. 184–238), there would appear to be 95 of them; but No. 1 is the monodramatic lyric *Wulf and Eadwacer*, which was included among the riddles by a mistake of the first editor of the *Exeter Book*, B. Thorpe; No. 90 is not in Old English, but in Latin; and several others are mere unintelligible fragments. There remain about 85 that have been preserved either entire or with sufficient approach to completeness for their general drift to be perceived.

The riddles Nos. 2–60 occupy 15 folios in the middle of the MS.; Nos. 62–95 occupy the last 7 folios. No. 61 and a mutilated and divergent copy of No. 31 are placed by themselves among poems of a different kind. Attempts have been made to show that the two main groups are distinguished from each other by special characteristics that may indicate difference of authorship or date; but there seems to be no good reason for attaching any significance to the arrangement of the MS. Some of the riddles almost certainly were written in Northumbria in the early part of the 8th century; a copy of one of them (No. 36), in Anglian dialect, has been preserved in a MS. at Leiden. Whether all the riddles are the work of one author, or whether they belong to different periods and districts, remains at present uncertain. For the reasons stated in the article CYNEWULF the attribution of the whole collection to that poet, once almost universally accepted, is now no longer tenable; and there is no overwhelming probability that he is the author of any portion of it.[1]

The investigations of F. Dietrich and A. Ebert have established the fact that a few of the riddles are imitated from the Latin enigmas of Symphosius and Aldhelm. No. 36 is a translation of Aldhelm's riddle *De Lorica*, and No. 41 is founded on the same writer's riddle *De Creatura*. The dependence of the Old English riddles on Latin originals has, however, been greatly exaggerated, especially by A. Prehn (*Komposition und Quellen der Rätsel des Exeterbuches*, 1883), who goes so far as to maintain that every one of them contains reminiscences of one or more of the compositions of Symphosius, Aldhelm, Tatwine and Eusebius. The correspondences alleged are in most cases slight, if not purely fanciful, and it is even doubtful whether the two writers last named were known at all to the authors of the vernacular riddles. All the Englishmen who wrote Latin in the 8th and following centuries, whether they wrote in their native tongue or in Latin, may be said to belong to one school, and their work has many features in common. But except in a few instances the riddles written in Old English are probably not less but more original than those written in Latin. In poetical merit they are generally superior. A good notion of their character and style may be gained from Mr Stopford Brooke's spirited (though not minutely accurate) translations of many of them in his *History of Early English Literature*, vol. i. (1892). Mr Brooke's interpretation of No. 11 (the Barnacle Goose) is original, and no doubt correct: in some other instances the solutions he has adopted are somewhat more questionable than they would appear to be from his translations.

Unlike the Latin riddles of Aldhelm, the riddles of the Exeter Book are unaccompanied with solutions. In some of them, however, the answer is indicated by an anagram, usually expressed in runic characters. Thus No. 24 begins with the words "Æcor is my name reversed," where the West Saxon scribe, in accordance with the phonetic laws of his own dialect, has substituted F for the þ of his Anglian original; the word is an anagram of *boga*, "bow." In No. 25 the mimic skill of the magpie is described, and at the conclusion the name of the bird (*higora*) is indicated by the six letters G, A, R, O, H, I.

The attention of nearly all the riddles was attempted by F. Dietrich, in the 11th and 12th volumes of Haupt's *Zeitschrift für deutsches Alterthum*. In many cases Dietrich was certainly right, but in many others his conjectures are strangely perverse, owing to misleading comparisons with supposed Latin originals. Subsequent scholars have been much more successful in refuting Dietrich's explanations than in replacing them by others more satisfactory. The most copious contributor of new interpretations has been Prof. M. Trautmann, in several articles in *Anglia*, and also in Kölbing, *Beiträge zur Anglistik*, No. 19 (1905); but very few of his interpretations can be considered even plausible, and he sometimes rejects the solutions of his predecessors when they are probably right. The riddle (No. 51, Fire) was independently solved by Prof. Trautmann and G. Herzfeld (*Die Rätsel des Exeterbuches und ihr Verfasser*, 1890). The articles on the subject by F. Tupper, Jr., in *Modern Philology*, vol. ii. (1903), and in *Modern Language Notes* for 1903 and 1904, are extremely valuable, though the author's original explanations do not appear convincing. After all that has been done, the meaning of a considerable number of the riddles is still uncertain. In some instances this may be due to the corrupt state of the text; in others the nature of the subject is described in terms so vague that several solutions are equally plausible. (H. BR.)

RIDGE, WILLIAM PETT (1864–), English author, was born at Chartham, near Canterbury, and was educated at Marden, Kent, and at the Birkbeck Institute, London. He was for some time a clerk in the Railway Clearing House, and began about 1891 to write humorous sketches for the *St James's Gazette* and other papers. He secured his first striking success, in volume form, with *Mord Em'ly* (1898), an excellent example of his ability to draw humorous portraits of lower class life. His later books include *A Son of the State* (1899), *A Breaker of Laws* (1900), *Lost Property* (1902), *Erb* (1903), *Mrs Caler's Business* (1905), *The Wykhamsee* (1906), &c.

RIDGE (a word common to many Teutonic languages, meaning "back," whether of a man or an animal, cf. German *Rücke*), the word applied to many objects resembling the projecting line of an animal's back, such as the strip of soil thrown up by a plough between furrows, the elevations or protuberances on bones which serve for the attachment of muscles or ligaments, &c. In architecture the ridge (Fr. *faite, crête*; Ger. *First*; Ital. *asinello*) is the highest portion of a roof, which is covered with lead, slate, or tiles, and sometimes decorated with a cresting in terra-cotta or metal-work. The term is also applied to the meeting of the common rafters on each side of a roof, which are sometimes butted against an upright board known as the ridge-piece. For the ridge-rib see VAULT.

RIDING, the art or practice of locomotion on the back of an animal or in a vehicle (the verb *to ride* originally meant "to travel," or "go," as the derived noun *road* means "a way"). Where no vehicle is specified (*e.g.* "riding a bicycle"), the word is associated with horseback riding, for exercise or pleasure.

The origin of the use of the horse as a means of transport goes back to prehistoric times. The fable of the centaurs, if the derivation from *κεντέω*, to goad, *ταῦρος*, bull, be accepted (but see CENTAUR), would indicate the early existence of pastoral peoples living on horseback, like the modern cowboys (cp. "cow-punchers") or *gauchos* of North and South America. Archaeological discoveries in India, Persia, Assyria and Egypt show that in the polished stone age quaternary man had domesticated the horse, while a Chinese treatise, the *Goei-leaotse*, the fifth book of the Wenking, a sort of military code dating from the reign of the emperor Hoang-Ti (2637 years B.C.), places the cavalry on the wings of the army. The Hebrews understood

[1] For the linguistic arguments against Cynewulf's authorship of the Riddles see especially A. Madert, *Die Sprache der altenglischen Rätsel des Exeterbuches und die Cynewulffrage* (1900).

the use of the horse in war (Job xxxix. 18–25), as did the Persians (Cyrus at the battle of Thymbra), Greeks and Romans. The Greeks and Romans, especially the former, were skilled horsemen, and feats on horseback were a feature of their games. They used no stirrup, but had both bridle and bit. They rode bareback, or on a cloth or skin strapped to the horse.

When roads were poor and vehicles cumbersome horseback was almost the only method of travel for both sexes. With the introduction of steam-locomotion and the improvement of roads, however, riding has become to a large extent a sport, rather than a necessity. There are different styles of riding adapted to the different purposes for which horses are ridden—on the road, in the school, hunting, racing, steeple-chasing and in the cavalry service—just as there are different horses more suitable by conformation, breeding and training for each.

In western civilization there is a traditional difference between the riding of men and women, in this particular, that men ride astride and women on a side-saddle. But in the following observations we deal generally with the more important features of riding as practised astride.

After securing an animal of the right height, weight and disposition, with a saddle of a length of tree and a breadth of seat that fits the rider and that is lined to fit the back of the horse, with a bridle bitted to his mouth, the first step is to mount. Having taken up the reins, the rider should stand at his horse's near (left) shoulder, facing towards the tail, and in that position hold the stirrup with his right hand for the reception of his left foot. By standing at the shoulder the rider is out of harm's way in the event of the horse kicking while he mounts. Ladies generally have the aid of a block or a groom's or escort's hand beneath the left foot. But a woman should be able to mount without aid, by lowering her stirrup, so that she can reach it from the ground, and then raising it again when she is seated in the saddle. Riding astride is sometimes recommended for women. The chief argument in its favour — symmetrical development of the figure—is, however, lost if the growing girl be taught to ride on a side-saddle of which the pommels can be shifted to the off side on alternate days.

Having gained the saddle, the necessity arises for *seat* and *hands*. Here good instruction is imperative at the outset. The great desideratum in a seat on horseback is that it should be firm. A rider with an insecure seat is apt to be thrown by any unexpected movement the horse may make; and, without a firm seat, the acquirement of good hands is well-nigh hopeless, because, when the balance is once disturbed the insecure rider will have to depend on something else for the maintenance of his seat, and this generally takes the shape of "riding on the horse's mouth," a practice as cruel as it is ugly.

Having gained the saddle, the rider should adjust the stirrups to the proper length, depending on the kind of riding, the length of his leg and the roughness of the horse's trot. Sitting well in the middle of the saddle, the thighs turned in, and the heels drawn somewhat back, the stirrup leathers may be let out or taken up until the tread of the stirrup is on a level with the inner ankle bone, and at this length, when the rider stands up, his fork will easily clear the pommel of the saddle. For maintaining his seat the horseman should depend upon his thighs and knees only, and not upon the knee and calf; a proper seat should be a mixture of balance and grip; a man riding by balance only is sure to be thrown, while to grip with all one's might during an hour's ride is to undertake as much exertion as should last for a whole day. The position of the foot exercises much influence on the security of the seat; it should be opposite the girth, parallel with the barrel of the horse, with the heels depressed. A good seat on a horse should not be strong merely; it should be graceful; above the loins the body should be loose, so as readily to adapt itself to every motion of the horse, but it should be upright.

Beginners are advised to practise riding with and without stirrups; thus, let the pupil who has ridden half an hour in a saddle with stirrups have a cloth substituted for the saddle for about ten minutes, care being taken to observe the rules already laid down for the position of the legs; in this way the proper seat will be strengthened.

The proper adjustment of the reins is the next thing to be attended to, and as the management of these depends so much upon the seat being firm and independent of the bridle the acquisition of a firm seat is certainly half-way towards the acquirement of good hands. An excellent way to start a pupil is on a sure-footed horse without bridle, the master governing him by a leading rein until the pupil has acquired a firm seat and can be trusted with reins. Assuming that a double-reined bridle is used, the third finger of the left hand should be first inserted between the snaffle reins; then the little, third and second fingers should be between the curb reins, the two outside reins being the curb, and the two inside ones the snaffle. In this manner of holding the reins the snaffle is not so likely to slip, while the curb can be easily slackened or drawn tighter. As military riders use the curb only the position of snaffle and curb as just explained is reversed in the cavalry service. The snaffle reins should be drawn up gently until the rider feels that he has an equal and light hold of his horse's mouth on both sides, with just so much pressure that the slightest movement of the left or right rein would cause him to turn to the left or right respectively. The arms from the shoulder to the elbow should hang naturally, close to the sides, and the arms from elbow to wrist should be about parallel to the ground, the wrist being kept loose, so as to yield gently with every motion of the horse. The rider sitting in the position described, square to the front, with his shoulders well back, will be riding with fairly long reins, one of the secrets of good hands.

When the horse is in motion the hands should not be held rigid, as the horse's mouth would thereby become dead, and the horse would lean unpleasantly on the hand; but the rider should give and take, without, however, entirely relaxing the hold.

In order to encourage the horse to walk the head must not be confined, but a light feeling of the horse's mouth must be kept up. Should the horse, unasked, break into a trot, never snatch at his mouth, but restrain him gently. To trot, press the legs to the saddle, and raise the bridle hand a little, and, after a moment's sitting close, begin to rise ("pose") in cadence with the action of the horse. The rising to the trot should be performed easily; the legs must not swing backwards and forwards, nor should the hands be jerked up and down. To start the canter, which should always be done from the walk and not the trot, take up the curb rein a little and turn the horse's head slightly to the right, at the same time pressing the left leg behind the girth; the horse will then lead with the off (right) fore leg, which is generally preferred; but a well-broken hack should lead with either leg at command, and if he be cantered in a circle to the left he must lead with the near leg, as otherwise an ugly fall is likely to result from the leg being crossed. Galloping is a pace not to be generally indulged in by road or park riders; when it is, the hands should be kept low, the body thrown back, and an extra grip taken with the knees, as nearly all horses pull more or less when extended.

Hitherto only road or park riding has been considered. When a person has become a fair road rider he has made some progress towards being a hunting man. But if first principles are disregarded, and a follower of hounds believes in the system "it doesn't matter how you ride so long as you stick on," he will not only always be a "sight" but a menace in the hunting field. Few self-taught riders attain to excellence; they may keep a good place in hunting, if possessed of plenty of courage, and mounted on a bold and not too tender-mouthed horse, but they never will be riders in the proper sense of the word.

Hunting and Riding to Hounds.—For practical purposes the chief difference between a park seat and a hunting seat consists in the shortening of the stirrups some two or three holes. The seat of the hunting man is the most important of any connected with amusement; he must sit firm, so as not to be thrown off when his horse leaps, or makes a mistake, and he must be able to save his horse under all circumstances, and to make as much of him as possible. As with road riding, so with hunting, the actual

length of the stirrups will depend a good deal upon the shape and action of the horse, but the nature of the animal and the peculiarities of the country ridden over will also have something to do with their adjustment. A puller will compel the rider to shorten his leathers one or perhaps two holes—a course that may also be rendered necessary in a hilly country, for, in going down hill, the stirrups, if kept at the ordinary length, will generally feel a great deal too long. The rider's body must be always close to the saddle in leaping, for if he were perked up, the weight of say only a 10-stone man coming down on the horse a couple of seconds after he has negotiated a large fence is sufficient to throw the animal down. Nothing but actual practice with hounds can teach a man how to ride where all kinds of going and obstacles of various sorts, natural and artificial, have to be encountered in a day's hunting. For example, the country gone over is seldom level springy turf; it is up hill and down dale, across ridge and furrow, over grass mixed with ant-hills which, when made-hills, are often very hard), over ploughed or boggy land. Each of these varieties requires a different method of riding over, and nearly every horse will require different handling under similar circumstances. It will therefore be seen that much depends on the rider having good hands. This qualification, though generally understood, is difficult to define. A rider with good hands never depends upon his reins for retaining his seat; nor does he pull at the horse's mouth or make him afraid to go up to his bit; nor again does he ever use more force than is necessary for the accomplishment of what he desires to perform. But besides all this, there is an unaccountable sympathetic something about the man who possesses the art that cannot be described. Pullers appear to renounce pulling, refusers take to jumping and clumsy horses become nearly as handy as a trick horse in a circus. Though hands can to a great extent be acquired by care and practice, yet in the highest form this is a gift and cannot be learned.

There are different kinds of "fences," as all obstacles are generically called. First, there is timber, such as gates, stiles and rails; the first two are, nine times out of ten, awkward jumps, as the take off is either pounded by cattle, or else is on the ascent or descent. Hedges vary according to the construction of the county in which they are found: they either grow in the soil of the field, and are protected by a ditch on one side, or are planted on a bank with a ditch on one side or sometimes on both. These obstacles are also called large banks as are found in Wales, Devon and Cornwall. Lastly come water jumps, which are met with in two forms: the water is either within an inch or two of the top of the bank, so as to be about on a level with the field through which it runs, or there may be a space of some 6 or 7 ft. from the bank to the water. For the successful negotiation of brooks a bold horse is required, ridden by a bold man. No fence that is ever encountered stops such a large proportion of the field as water; even a clever hunter will prove to be unequal to some, while anything over 10 or 12 ft. will in general be crossed only by a very few. Some horses, good performers over any description of fence, will not jump water under any circumstances; while the chance of a ducking does not always deter a rider at it, and, however bold the horse may be, he will soon refuse water if his rider be perpetually in two minds when approaching it.

The pace at which a hunter should be ridden at his fences depends upon the nature of the fence, and the capacities of each individual horse. With some very good jumpers—they can hardly be called good hunters—to steady them is to bid for a fall, while with some very clever hunters to hurry them is to bring them to grief. With ordinary horses, however, it is a good general rule to ride at fences of all descriptions as slowly as the nature of the obstacle admits. In grass countries, where "flying fences" are found, the rate of speed must of necessity be quicker than when about to take a Devonshire bank of some 7 ft. high, but even at a flying fence the rider should steady his horse so as to contract the length of his stride, in order that he may measure the distance for taking off with greater accuracy. Flying fences consist of a hedge with or without a post and rail, and with or without a ditch on one or both sides; consequently a horse has to jump both high and wide to clear them. But in jumping a gate, or a flight of rails, as ordinarily situated, there is no width to be covered, and to make a horse go through the trouble of jumping both high and wide when no need only do one is to waste his power, added to which to ride fast at timber, unless very low with a ditch on the landing side, is highly dangerous.

All hedges on banks, banks and doubles must be ridden at slowly; they are usually of such a size as to make flying them impossible, or at least undesirable. Horses jump them on and off, and in taking them at a moderate pace there is a chance of stopping on the top and choosing a better place to jump from, or, if needs be, of returning and taking the fence at another place. Cramped places will have to be jumped from a walk or even at a stand; for instance, a tree may be in a line with and close to the only practicable place in a fence; it then becomes necessary to go round the tree before a run at the place can be managed. So, too, with places that have to be crawled over between trees, or with dykes to be crawled down.

In jumping an ordinary hedge or ditch at moderate speed, there is of course a moment of time during which the horse is on his hind legs, and in theory the rider should then lean forward, but, in practice, this position is so momentary, and the lash out of the hind legs in the spring is so powerful, that it is best not to lean forward at all, because of the difficulty, if not impossibility, of getting back in time for the reverse movement, when the rider should be preparing to render the horse some assistance with the bridle as his feet touch the ground.

When a line of willows indicates the whereabouts of a brook, the horse should be well collected, a clear place selected, so far as circumstances allow, and the pace increased, though in short strides, up to the very brink. If the hounds jump at the brook, even though they fail to clear it, the rider may take it for granted that at that place the leap is within the capacity of any ordinary hunter in his stride; hence if, when going at three parts speed, a horse's feet come just right to take off, the mere momentum of his body would take him over a place 15 ft. wide.

The experience of a single day's hunting will teach the novice that gates are far oftener opened than jumped; it is therefore necessary that a hunter should be handy at opening them. Many accidents have arisen from horses rushing through a gateway directly the latch is released, or from their jumping a gate at which they have been pulled up to enable the rider to open it. The horse should be taught to obey the leg as well as the hand, and, by a slight pressure of the leg, should throw his haunches round to the left or right as occasion may require.

Racing (see also HORSE-RACING).—The qualities possessed by a good jockey, either on the flat or across country, show the value of good instruction in riding. After having been some time in a training stable, a lad is put on horses for exercise; his stirrups are adjusted, and the reins knotted for him at a proper length. He subsequently rides other horses, each with some peculiarity perhaps, and, to keep his place in the string, a sluggard must be kept going, and an impetuous one restrained; they cannot both be ridden alike, but they must both be ridden as a jockey should ride them. In this way the lad learns the principle of holding a puller, getting hack into a lazy one, and leaving well alone with a nice free but temperate mover; he learns to do everything in a horsemanlike manner, and when he has raised himself to the pitch of a "fashionable" jockey, he will frequently be called upon to ride several times in a day at race meetings. A jockey must therefore, more than any other civilian rider, have a hand for all sorts of horses, and in the case of two and three year olds a very good hand it must be. The same ability to adapt himself to circumstances must be possessed by a steeple-chase jockey, who should possess fine hands to enable him to handle his horse while going at his fences at three-quarter speed. In most details the nearer a hunting man approaches to a steeple-chase jockey the better; but in the matter of the seat it must be remembered that a few generations last but a few minutes, while none can tell when the hunting man will finish his day's work; the jockey can therefore ride with more absolute grip during his race than the rider to hounds.

See also HORSEMANSHIP; HUNTING; CAVALRY; RACING AND STEEPLE-CHASE; and POLO.

RIDINGS are the three districts into which from ancient times Yorkshire has been divided for administrative purposes. Formerly there were similar districts in Lindsey in Lincolnshire. The word riding was originally written as *thrithing* or *thriding*, but the initial *th* has been absorbed in the final *th* or *t* of the words north, south, east and west, by which it was normally preceded. Ridings are Scandinavian institutions. In Iceland the third part of a *thing* corresponds roughly to an English county was called *thrithjungr*; in Norway, however, the *thrithjungr* seems to have been an ecclesiastical division. According to the 12th-century compilation known as the "laws of Edward the Confessor," the riding was the third part of a county (*provincia*); to it causes were brought which could not be determined in the wapentake, and a matter which could not be determined in the riding was brought into the court of the shire. There is abundant evidence that riding courts were held after the Norman Conquest. A charter which Henry I. granted to the Church of St Peter's at York mentions wapentacmot, tridingmot and shiresmot, and exemptions from suit to the thriding or riding may be noticed frequently in the charters of the Norman kings. As yet, however, the jurisdiction and functions of these courts have not been ascertained. It seems probable from the silence of the records that they had already fallen into disuse early in the 13th century.

Each of the ridings of Yorkshire has its own lord lieutenant and commission of the peace, and under the Local Government Act of 1888 forms a separate administrative county. They are distinguished as the north, east and west ridings, but the ancient

divisions of Lindsey were known as the north, south and west ridings respectively.

See Felix Liebermann, *Die Gesetze der Angelsachsen* (Halle, 1888–89); William Stubbs, *Constitutional History of England*; Richard Cleasby, *Icelandic Dictionary*; *New English Dictionary*; and William Dugdale, *Monasticon Anglicanum*, vol. vi., edited by John Caley and others (1846). (G. J. T.)

RIDLEY, NICHOLAS (*c.* 1500–1555), English bishop and martyr, was descended from an old Northumberland family. The second son of Christopher Ridley of Unthank Hall, near Willemoteswick, in that county, he was born in the beginning of the 16th century. From a school at Newcastle-on-Tyne he was sent about 1518 to Pembroke Hall, Cambridge, being supported there by his uncle, Dr Robert Ridley (d. 1536), and specially distinguishing himself in Greek. Having graduated M.A. in 1526, he went to study at the Sorbonne in Paris and at Louvain, and on his return to Cambridge he was appointed junior treasurer of his college. In 1534 he was one of the university proctors, and he signed the decree of the university against the jurisdiction of the pope in England. About this time Ridley, who was now chaplain to the university, began to distinguish himself as an orator and a disputant, and to show leanings to the reformed faith. Having proceeded B.D. in 1537, he was appointed by Thomas Cranmer, archbishop of Canterbury, one of his chaplains, and in April 1538 the same prelate instituted him to the vicarage of Herne in Kent. In 1540 he was chosen master of Pembroke Hall; in 1541 he became chaplain to Henry VIII. and canon of Canterbury. In 1543 he was accused of heretical teaching and practices, but he managed to allay the suspicions of the royal commissioners, although just after his exculpation he finally abandoned the doctrine of transubstantiation.

In 1547 Ridley was presented by his college to the Cambridgeshire living of Soham, and in September of the same year he was nominated bishop of Rochester. Edward VI. was now on the throne and the new bishop was in high favour. He was one of the visitors who were appointed to establish protestantism in the university of Cambridge; in 1548 he helped to compile the English prayer book; and in 1549 he was one of the commissioners who examined Bishops Gardiner and Bonner. He concurred in their deprivation and succeeded Bonner in the see of London. Having signed the letters patent settling the English crown on Lady Jane Grey, Ridley, in a sermon preached at St Paul's cross on the 9th of July 1553, affirmed that the princesses Mary and Elizabeth were illegitimate and that the succession of the former would be disastrous to the religious interests of England. When Lady Jane's cause was lost, however, he went to Framlingham to ask Queen Mary's pardon, but at once he was arrested and sent to the Tower of London. From his prison he wrote in defence of his religious opinions, and early in 1554 he, with Cranmer and Latimer, was sent to Oxford to be examined. He defended himself against a number of divines, but was declared a heretic, and this was followed by his excommunication. He refused to recant, and in October 1555 he was tried for heresy under the new penal laws, being degraded and sentenced to death. With Cranmer and Latimer he met his end at the stake in Oxford on the 16th of October 1555.

Ridley was a voluminous writer, but many of his writings have been lost. The *Works of Nicholas Ridley D.D.* were edited for the Parker Society by the Rev. Henry Christmas in 1841. His *Life* was written by Dr Gloucester Ridley in 1763, and there is a memoir of him in H. C. G. Moule's edition of the bishops' *Declaration of the Lord's Supper* (1895). See also John Foxe's *Acts and Monuments* (new ed., 1877); J. Strype's *Memorials of Cranmer* (new ed., Oxford, 1840); T. Burnet's *History of the Reformation* (new ed., Oxford, 1865); J. A. Froude's *History of England* (1881 fol.); and J. Lingard's *History of England* (1854–55).

RIDOLFI, or RIDOLFO, **ROBERTO DI** (1531–1612), Italian conspirator, belonged to a famous family of Florence, where he was born on the 18th of November 1531. As a banker he had business connexions with England, and about 1555 he settled in London, where he soon became a person of some importance, and consorted with William Cecil and other prominent men. During the early years of Elizabeth's reign he began to take a more active part in politics, associating with the discontented Roman Catholics in England and communicating with their friends abroad. In 1570 he set to work on the plot against the queen which is usually associated with his name. His intention was to marry Mary, queen of Scots, to the duke of Norfolk and to place her on the English throne. With the aid of John Lesley, bishop of Ross, he gained the consent of these high personages to the conspiracy, and then in 1571 he visited the duke of Alva at Brussels, Pius V. at Rome, and Philip II. at Madrid to explain to them his scheme and to gain their active assistance thereto. His messenger, by name Charles Baillie (1542–1625), was, however, seized at Dover, and in other ways the English government heard of the intended rising. Consequently, Norfolk and Lesley were arrested, the former being condemned to death in January 1572. Ridolfi, who was then in Paris, could do nothing when he heard this news, and his scheme collapsed. Afterwards he served the pope, but much of his later life was spent in Florence, where he became a senator and where he died on the 18th of February 1612.

RIEGER, PHILIPP FRIEDRICK VON (1818–1903), Bohemian politician and publicist, was born on the 18th of December 1818 at Semil in the circle of Jičin, Bohemia. He first came into prominence as one of the Czech leaders in the revolution of 1848. He was returned by seven constituencies to the *Reichstag* at Vienna, where he was the leader of the Czech party. In 1853 he married a daughter of the historian Palacky. In 1858 he started the *Slovník naučny*, the Czech national encyclopaedia, the first volume of which was published in 1859, the 11th and last in 1874. He was also instrumental in founding the first Czech political daily newspaper published in Prague, which appeared on the 1st of January 1861, and of which he was for awhile the editor. After the issue of the "October diploma" of 1860, Rieger, with his father-in-law, Palacky, undertook the leadership of the reconstituted Czech party, and after the decision of this party in 1863 no longer to attend the Austrian *Reichsrath*, he led the agitation in favour of the restoration of the Bohemian kingdom. In 1871 he conducted the negotiations with the Hohenenwarth ministry for a federal constitution of the empire, which broke down owing to his extreme attitude in the matter of Bohemian independence. On the reappearance of the Czechs in the Bohemian diet (1878) and the Austrian *Reichsrath* (1879) Rieger was one of the leaders of the federalist majority supporting Count Taaffe's government and the chief of the so-called "Old Czechs." On his seventieth birthday (December 10, 1888) he received a national gift of 100,000 gulden; but, in spite of this evidence of his popularity, his conservatism, his close connexion with the Bohemian nobility and his clerical tendencies brought him into conflict with the growing influence of the radical "Young Czech" party, and in 1891, together with the other "Old Czechs," he was defeated at the poll. In March 1897 he was created a baron (*Freiherr*) and given a seat in the Upper House. He continued occasionally to interfere in politics; but his influence was now at an end, though when he died, on the 3rd of March 1903, his funeral at Prague was made the occasion of a magnificent demonstration of respect.

RIEGO NUÑEZ, RAFAEL DEL (1784–1823), Spanish army officer, who has the melancholy distinction of having begun the long series of political military mutinies—*pronunciamientos*—in Spain, was born at Santa María de Tuna in Asturias on the 2nd of April 1784. He was educated for the legal profession at Oviedo, and passed the necessary examinations. But in 1807 he enlisted in the guard. When the French invasion took place in 1808 he was employed by the junta of Asturias and placed in command of a newly raised battalion. He was taken prisoner at the battle of Espinosa de los Monteros, on the 10th and 11th of November 1808, and was sent to France. During his years of imprisonment he, like many others of his countrymen, was converted to liberalism on the French model. Riego had the good fortune to escape and to reach England after various wanderings in Switzerland and Germany. In England

he was incorporated with other rescued or escaped Spaniards, in a corps equipped by the British government, and was sent to Spain in 1812. He continued in service as a military officer, and was commandant of the second battalion of the regiment "Asturias," which formed part of the army collected at Cadiz to be sent to South America in 1819. Service in America was unpopular with the soldiers, and there was much discontent in the country with the government of King Ferdinand VII. A conspiracy was formed among the officers to use the army for the purpose of forcing the king to grant a constitution. They were betrayed by a general who at first professed to sympathize with them, and many were arrested. Riego was apparently not suspected, and he decided to act on his own account. On New Year's Day 1820 he made his *pronunciamiento* with his regiment at the village of Cabezas de San Juan. He proclaimed for the constitution drawn up by the Cortes in 1812, which was unworkable, and which the chiefs of the conspiracy did not propose to restore. He hoped to seize Cadiz, but it was held by a loyal officer, and for a time no popular movement took place. Riego now started on a revolutionary propaganda through Andalusia at the head of his regiment. The country proved hostile or at the best indifferent. His following gradually melted away, and he was about to flee to Portugal when Galicia revolted. The rebellion extended rapidly, and the king was compelled to yield. When the liberals were in possession of power they would gladly have kept Riego in a subordinate place. But he came to the capital, where he was soon the most popular spokesman of the extreme parties. There he discredited himself by his vanity, and shocked even the populace of Madrid by appearing drunk at the theatre. He was at last persuaded to accept the military command in Aragon, which he thought below his merits. He began intrigues and agitations. The government was strong enough to put him under arrest at Lérida. When the new Cortes was elected in 1822, he was chosen deputy for his native city Oviedo, and the radicals selected him as president of the chamber on the 17th of February 1823. The unceasing intrigues of the king, the incapacity of the moderate parties and the hysterical excitement of the mob combined to make anarchy worse daily. Riego was the noisiest shouter of all. When the French intervention took place, he helped to carry the king to Cadiz, and he fought as a few unsuccessful skirmishes with the invaders. He was at last captured at Arcos near Algullos in the province of Jaen. Unfortunately for him, he fell into the hands of the royalist volunteers, by whom he was carried to the capital. On his way he was repeatedly mobbed and had many narrow escapes from being torn to pieces. He was hanged at Madrid in the Plaza de la Cebada on the 7th of November 1823. At the end he professed abject repentance for his impiety and disloyalty. The popular revolutionary tune of Spain, the "himno de Riego," is named after him, and his picture is hung in the Cortes, but he was a poor creature, and a bad example of the light-headed military agitators who have caused Spain much misery.

H. Baumgarten, *Geschichte Spaniens* (Berlin, 1865–1871).

RIEHM, EDUARD KARL AUGUST (1830–1888), German Protestant theologian, was born at Diersburg in Baden on the 20th of December 1830. He studied theology and philology at Heidelberg and later at Halle under Hermann Hupfeld, who persuaded him to include Arabic, Syriac and Egyptian. Entering the ministry in 1853, he was made vicar at Durlach soon afterwards, and became a licentiate in the theological faculty at Heidelberg. In 1854 he was appointed garrison-preacher at Mannheim; and in 1858 he was licensed to lecture at Heidelberg, where in 1861 he was made professor extraordinarius. In 1862 he obtained a similar post at Halle, and in 1866 was promoted to the rank of professor ordinarius. Throughout his life he followed Hupfeld's plan in his scientific treatment of the Old Testament—that of reconciling the results of a free criticism with a belief in divine revelations. His practical experience of pastoral work also proved of service to him when he became a professor of theology, for "if there is one quality more striking than another in the writings of Riehm, it is that of sympathy with orthodox believers" (T. K. Cheyne). In 1865 Riehm was made a member of the commission for the revision of Luther's translation of the Bible, and became one of the editors of the quarterly review, *Theologische Studien und Kritiken*. He died on the 5th of April 1888.

His works include: *Die Gesetzgebung Mosis im Lande Moab* (1854), in which the Deuteronomic law book is assigned to the second half of the reign of Manasseh; *Der Lehrbegriff des Hebräerbriefs* (1858–59, 2nd ed. 1867); Hermann Hupfeld, *Lebens-und Charakterbild eines deutschen Professors* (1867); *Die Messianische Weissagung* (1875, 2nd ed. 1883; Eng. trans. 1890); *Religion und Wissenschaft* (1881); and the well-known *Handwörterbuch des biblischen Altertums* (2 vols., 1884; 2nd. ed. revised by F. Baethgen, 1892–94). After his death were published the *Einleitung in das Alte Testament* (1889, ed. by A. Brandt), in which the date of the Deuteronomic law book is placed earlier than in his book on the legislation of Moses—shortly before or at the beginning of the reign of Hezekiah; and his *Alttestamentliche Theologie* (1889, ed. by Fahncke). See Herzog-Hauck, *Realencyklopädie*, and T. K. Cheyne, *Founders of Old Testament Criticism*.

RIEL, LOUIS (1844–1885), Canadian agitator, son of Louis Riel and Julie de Lagemaundière, was born at St Boniface, on the 23rd of October 1844, according to his own account, though others place his birth in 1847. Though known as a half-breed, or Métis, and though with both Indian and Irish ancestors, his blood was mainly French. From July 1866 he worked for two years at various occupations in Minnesota, returning in July 1868 to St Vital, near St Boniface. In 1869 the transfer of the territorial rights of the Hudson's Bay Company to the dominion of Canada gave great uneasiness to the Métis, and in October 1869 a party led by Riel turned back at the American frontier the newly appointed Canadian governor; in November they ensconced Fort Garry (Winnipeg), the headquarters of the company, and called a convention which passed a bill of rights. In December a provisional government was set up, of which on the 29th of December Riel was made president, and which defeated two attacks made on it by the English-speaking settlers of the vicinity. So far the Métis had been within their rights, but Riel was flighty, vain and mystical, and his judicial murder on the 4th of March 1870 of Thomas Scott, an Orangeman from Ontario, roused against him the whole of English-speaking Canada. An expedition was equipped and sent out under Colonel Garnet, later Lord, Wolseley, which captured Fort Garry on the 24th of August 1870, Riel decamping. (See STRATHCONA, LORD.) He was not arrested, and on the 4th of August 1871 urged his countrymen to combine with the Canadians against a threatened attack from American Fenians, for which good service he was publicly thanked by the lieutenant-governor. In 1872 for religious reasons he changed his name to Louis David Riel. In October 1873 he became member of the Dominion parliament for Provencher, came to Ottawa and took the oath, but did not sit. On the 16th of April 1874 he was expelled the House, but in September was again elected for Provencher; on the 10th of February 1875 he was outlawed, and the seat thereby again vacated. In 1877–78 he was for over a year a patient in the Beauport asylum for the insane, but from 1879 to 1884 he lived quietly in Montana, where in 1881 he married Marguerite Bellimeure. In 1884 in response to a deputation from the Métis, who had moved west to the forks of the Saskatchewan river, he returned to Canada to win redress for their wrongs. His own rashness and the ineptitude of Canadian politicians and officials brought on a rising, which was crushed after some hard fighting, and on the 15th of May 1885 Riel surrendered. He was imprisoned at Regina, was tried and on the 1st of August found guilty of treason, and on the 16th of November was hanged at Regina, meeting his fate with courage. His death was the signal for a fierce outburst of racialism in Quebec and Ontario, which nearly overthrew the Conservative government of the Dominion.

See J. S. Willison, *Sir Wilfrid Laurier*, vol. i.; George Bryce, *History of the Hudson's Bay Company* (1900); and the Canadian daily press of 1885.

RIEMANN, GEORG FRIEDRICH BERNHARD (1826–1866), German mathematician, was born on the 17th of September

1826, at Breselenz, near Dannenberg in Hanover. His father, Friedrich Bernhard Riemann, came from Mecklenburg, had served in the war of freedom, and had finally settled as pastor in Quickborn. Here with his five brothers and sisters Riemann spent his boyhood and received, chiefly from his father, the elements of his education. He showed at an early age well-marked mathematical powers, and his progress was so rapid in arithmetic and geometry that he was soon beyond the guidance not only of his father but of schoolmaster Schulz, who assisted in the mathematical department of his training.

In 1840 he went to Hanover, where he attended the lyceum, and two years later he entered the Johanneum at Lüneburg. The director, Schmalfuss, encouraged him in his mathematical studies by lending him books (among them Leonhard Euler's works and Adrien Marie Legendre's *Theory of Numbers*), which Riemann read, mastered and returned within a few days. In 1846 Riemann entered himself as a student of philology and theology in the university of Göttingen. This choice of a university career was dictated more by the natural desire of his father to see his son enter his own profession, and by the poverty of his family, than by his own preference. He attended lectures on the numerical solution of equations and on definite integrals by M. A. Stern, on terrestrial magnetism by Goldschmidt, and on the method of least squares by K. F. Gauss. It soon became evident that his mathematical studies, undertaken at first probably as a relaxation, were destined to be the chief business of his life. He proceeded in the beginning of 1847 to Berlin, attracted thither by that brilliant constellation of mathematical genius whose principal stars were P. G. L. Dirichlet, C. G. J. Jacobi, J. Steiner and F. G. M. Eisenstein. He appears to have attended Dirichlet's lectures on theory of numbers, theory of definite integrals, and partial differential equations, and Jacobi's on analytical mechanics and higher algebra. It was during this period that he first formed those ideas on the theory of functions of a complex variable which led to most of his great discoveries. One stirring social incident at least marked this part of his life, for, during the revolutionary insurrection in March 1848, the young mathematician, as a member of a company of student volunteers, kept guard in the royal palace from 9 o'clock on the morning of the 24th of March till 1 o'clock on the afternoon of the following day.

In 1849 he returned to Göttingen and began to prepare his doctor's dissertation, busying himself meanwhile with "Naturphilosophie" and experimental physics. This double cultivation of his scientific powers had the happiest effect on his subsequent work; for the greatest achievements of Riemann were effected by the application in pure mathematics generally of a method (theory of potential) which had up to this time been used solely in the solution of certain problems that arise in mathematical physics.

In November 1851 he obtained his doctorate, the thesis being "Grundlagen für eine allgemeine Theorie der Functionen einer veränderlichen complexen Grösse." This memoir excited the admiration of Gauss, and at once marked its author's rank as a mathematician. The fundamental method of research which Riemann employed has just been alluded to; the results will be best indicated in his own words:—

"The methods in use hitherto for treating functions of a complex variable always started from an expression for the function as its definition, whereby its value was given for every value of the argument; by our investigation it has been shown that, in consequence of the general character of a function of a complex variable, its definition of this sort one part of the determining conditions is a consequence of the rest, and the extent of the determining conditions has been reduced to what is necessary to effect the determination. This essentially simplifies the treatment of such functions. Hitherto, in order to prove the equality of two expressions for the same function, it was necessary to transform the one into the other, *i.e.* to show that both expressions agreed for every value of the variable; now it is sufficient to prove their agreement to a far less extent" [merely in certain critical points and at certain boundaries].

The time between his promotion to the doctorate and his habilitation as *Privatdozent* was occupied by researches undertaken for his Habilitationsschrift, by "Naturphilosophie," and by experimental work. The subject he had chosen for his Habilitationsschrift was the "Representation of a Function by Means of a Trigonometrical Series," a subject which Dirichlet had made his own by a now well-known series of researches. It was fortunate, no doubt, for Riemann that he had the kind advice and encouragement of Dirichlet himself, who was then on a visit at Göttingen during the preparation of his essay; but the result was a memoir of such originality and refinement as showed that the pupil was fully the equal of the master. Of the customary three themes which he suggested for his trial lecture, that "On the Hypotheses which form the Foundation of Geometry" was chosen at the instance of Gauss, who was curious to hear what so young a man had to say on this difficult subject, on which he himself had in private speculated so profoundly (see GEOMETRY, NON-EUCLIDIAN).

In 1855 Gauss died and was succeeded by Dirichlet, who along with others made an effort to obtain Riemann's nomination as extraordinary professor. In this they were not successful; but a government stipend of 200 thalers was given him, and even this miserable pittance was of great importance, so straitened were his circumstances. But this small beginning of good fortune was embittered by the deaths of his father and his eldest sister, and by the breaking up of the home at Quickborn. Meantime he was lecturing and writing the great memoir (*Borchardt's Journal*, vol. liv., 1857) in which he applied the theory developed in his doctor's dissertation to the Abelian functions. It is amusing to find him speaking jubilantly of the unexpectedly large audience of eight which assembled to hear his first lecture (in 1854) on partial differential equations and their application to physical problems.

Riemann's health had never been strong. Even in his boyhood he had shown symptoms of consumption, the disease that was working such havoc in his family; and now under the strain of work he broke down altogether, and had to retire to the Harz with his friends Ritter and R. Dedekind, where he gave himself up to excursions and "Naturphilosophie." After his return to Göttingen (November 1857) he was made extraordinary professor, and his salary raised to 300 thalers. As usual with him, misfortune followed close behind; for he lost in quick succession his brother Wilhelm and another sister. In 1859 he lost his friend Dirichlet; but his reputation was now so well established that he was at once appointed to succeed him. Well-merited honours began to reach him; and in 1860 he visited Paris, and met with a warm reception there. He married Elise Koch in June 1862, but the following month he had an attack of pleurisy which proved the beginning of a long illness that ended only with his death. His physician recommended a sojourn in Italy, for the benefit of his health, and Weber and Sartorius von Waltershausen obtained from the government leave of absence and means to defray the cost of the journey. At first it seemed that he would recover; but on his return in June 1863 he caught cold on the Splügen Pass, and in August of the same year had to go back to Italy. In November 1865 he returned again to Göttingen, but, although he was able to live through the winter, and even to work a few hours every day, it became clear to his friends, and clearest of all to himself, that he was dying. In order to husband his few remaining days he resolved in June 1866 to return once more to Italy. Thither he journeyed through the confusion of the first days of the Austro-Prussian War, and settled in a villa at Selasca near Intra on Lago Maggiore. Here his strength rapidly ebbed away, but his mental faculties remained brilliant to the last. On the 19th of July 1866 he was working at his last unfinished investigation on the mechanism of the ear. The day following he died. Few as were the years of work allotted to him, and few as are the printed pages covered by the record of his researches, his name is, and will remain, a household word among mathematicians. Most of his memoirs are masterpieces—full of original methods, profound ideas and far-reaching imagination.

The collected works of Riemann were published by H. Weber, assisted by R. Dedekind (8vo, Leipzig, 1876; 2nd ed., 1892).

At the end of this volume there is a touching account of his life by the latter. (G. Ch.)

RIENZI, COLA DI (*c.* 1313–1354), tribune of the Roman people, was born in Rome, being the son of a tavern-keeper named Lorenzo Gabrini. His father's Christian name was shortened to Renzo, and his own, Nicholas, to Cola; hence the Cola di Rienzi, or Renzo, by which he is generally known. His early years were passed at Anagni. Having devoted much time to the study of the Latin writers, historians, orators and poets, and filled his mind with stories of the glories and the power of ancient Rome, he turned his thoughts to the task of restoring his native city to its pristine greatness, his zeal for this work being quickened by the desire to avenge his brother, who had been killed by a noble, a member of the ruling class. He became a notary and a person of some importance in the city, and was sent in 1343 on a public errand to Pope Clement VI. at Avignon. He discharged his duties with ability and success, and although the boldness with which he denounced the aristocratic rulers of Rome drew down upon him the enmity of powerful men, he won the favour and esteem of the pope, who gave him an official position at his court. Returning to Rome about April 1344 he worked for three years at the great object of his life, the restoration of the city to its former position of power. He gathered together a band of supporters, plans were drawn up, and at length all was ready for the rising. On the 19th of May 1347 heralds invited the people to a parliament on the Capitol, and on the 20th, the day being Whit-Sunday, the meeting took place. Dressed in full armour and attended by the papal vicar, Cola headed a procession to the Capitol; here he addressed the assembled crowd, speaking "with fascinating eloquence of the servitude and redemption of Rome." A new series of laws was published and accepted with acclaim, and unlimited authority was given to the author of the revolution. Without striking a blow the nobles left the city or went into hiding, and a few days later Rienzi took the title of tribune (*Nicholaus, severus et clemens, libertatis, pacis justiciaeque tribunus, et sacre Romane Reipublice liberator*).

His authority quickly and quietly accepted by all classes, the new ruler governed the city with a stern justice which was in marked contrast to the recent reign of licence and disorder. In great state the tribune moved through the streets of Rome, being received at St Peter's with the hymn *Veni Creator Spiritus*, while in a letter the poet Petrarch urged him to continue his great and noble work, and congratulated him on his past achievements, calling him the new Camillus, Brutus and Romulus. In July in a sonorous decree he proclaimed the sovereignty of the Roman people over the empire, but before this he had set to work upon his task of restoring the authority of Rome over the cities and provinces of Italy, of making the city again *caput mundi*. He wrote letters to the cities of Italy, asking them to send representatives to an assembly which would meet on the 1st of August, when the formation of a great federation under the headship of Rome would be considered. On the appointed day a number of representatives appeared, and after some elaborate and fantastic ceremonials Rienzi, as dictator, issued an edict citing the emperor Louis the Bavarian and his rival Charles, afterwards the emperor Charles IV., and also the imperial electors and all others concerned in the dispute, to appear before him in order that he might pronounce judgment in the case. On the following day the festival of the unity of Italy was celebrated, but neither this nor the previous meeting had any practical result. Rienzi's power, however, was recognized in Naples, whence both Queen Joanna and her bitter foe, King Louis of Hungary, appealed to him for protection and aid, and on the 15th of August he was crowned tribune with great pomp, wreaths of flowers being placed on his head. Gregorovius says this ceremony "was the fantastic caricature in which ended the imperium of Charles the Great. A world where political action was represented in such guise was ripe for overthrow, or could only be saved by a great mental reformation." He then seized, but soon released, Stephen Colonna and some other barons who had spoken disparagingly of him. But his power was already beginning to wane. His extravagant pretensions only served to excite ridicule. His government was costly, and to meet its many expenses he was obliged to lay heavy taxes upon the people. He offended the pope by his arrogance and pride, and both pope and emperor by his proposal to set up a new Roman empire, the sovereignty of which would rest directly upon the will of the people. In October Clement gave power to a legate to depose him and bring him to trial, and the end was obviously in sight. Taking heart, the exiled barons gathered together some troops, and war began in the neighbourhood of Rome. Rienzi obtained aid from Louis of Hungary and others, and on the 20th of November his forces defeated the nobles in a battle just outside the gates of Rome, a battle in which the tribune himself took no part, but in which his most distinguished foe, Stephen Colonna, was killed. But this victory did not save him. He passed his time in feasts and pageants, while in a bull the pope denounced him as a criminal, a pagan and a heretic, until, terrified by a slight disturbance on the 15th of December, he abdicated and fled from Rome. He sought refuge in Naples, but soon he left that city and spent over two years in an Italian mountain monastery.

Emerging from his solitude Rienzi journeyed to Prague, which he reached in July 1350, and threw himself upon the protection of the emperor Charles IV. Denouncing the temporal power of the pope he implored the emperor to deliver Italy, and especially Rome, from their oppressors; but, heedless of the entreaties of Rienzi, Charles kept him in prison for more than a year in the fortress of Raudnitz, and then handed him over to Clement, who had been clamouring for his surrender. At Avignon, where he appeared in August 1352, Rienzi was tried by three cardinals, and was sentenced to death, but this judgment was not carried out, and he remained in prison in spite of appeals from Petrarch for his release. Freedom, however, was at hand. In December 1352 Clement died, and his successor, Innocent VI., anxious to strike a blow at the baronial rulers of Rome, and seeing in the former tribune an excellent tool for this purpose, pardoned and released his prisoner. Giving him the title of senator, he sent him to Italy with the legate, Cardinal Albornoz, and having collected a few mercenary troops on the way, Rienzi entered Rome in August 1354. He was received with rejoicings and was restored to his former position of power. But this latter term of office was destined to be even shorter than his former one had been. Having vainly besieged the fortress of Palestrina, he returned to Rome, where he treacherously seized the soldier of fortune, Fra Monreale, who was put to death, and where, by other cruel and arbitrary deeds, he soon lost the favour of the people. Their passions were quickly aroused and a tumult broke out on the 8th of October. Rienzi attempted to address them, but the building in which he stood was fired, and while trying to escape in disguise he was murdered by the mob. Rienzi was the hero of one of the finest of Petrarch's odes, *Spirito gentil*, and also of some beautiful verses by Lord Byron. He was a man of vivid, but disordered, imagination, without possessing any conception of statesmanship. In 1887 a statue of the tribune was erected at the foot of the Capitoline Hill in Rome.

Rienzi's life and fate have formed the subject of a famous novel by Bulwer Lytton, of an opera by Wagner and of a tragedy by Julius Mosen. His letters, edited by A. Gabrielli, are published in vol. vi. of the *Fonti per la storia d'Italia* (Rome, 1890). See also Papencordt, *Cola di Rienzo und seine Zeit* (Hamburg, 1841); Auriac, *Etude historique sur N. Rienzi* (Amiens, 1885); E. Rodocanachi, *Cola di Rienzi* (Paris, 1888); Kühn, *Die Entwickelung der Bundesplane Cola di Rienzos im Jahre 1347* (Berlin, 1905); A. von Reumont, *Geschichte der Stadt Rom* (1867–70); and F. Gregorovius, *Geschichte der Stadt Rom im Mittelalter*, vol. vi. (Eng. trans., by A. Hamilton, 1898). (A. W. H.*)

RIESA, a town of Germany, in the kingdom of Saxony, pleasantly situated on the left bank of the Elbe, 30 m. N.W. of Dresden, on the main line of railway to Leipzig, and at the junction of lines to Chemnitz, Elsterwerda and Nossen. Pop. (1905) 14,073. The river is here crossed by a fine bridge, a

sandstone and iron structure, carrying both railway and road, and replacing the one carried away by floods in 1875. The town contains two Evangelical churches, a castle, formerly a convent and now used as a town hall, and several schools. There is a harbour with quays and a dockyard, also rolling-mills and saw-mills, ironworks and sandstone quarries. Other industries are the manufacture of furniture, beer, soap, carriages and bricks. The most important shipping station on the Elbe in Saxony, Riesa is the lading-place for goods to and from Bavaria, and a mart for herrings, petroleum, wood, coal and grain. A constant passenger steamboat communication is maintained with Meissen and Dresden; and, owing to the artillery practice ranges at Zeithain, on the right bank of the Elbe, Riesa has become of recent years one of the chief depôts of the Saxon army. Riesa received municipal rights in 1633, and after a period of decay was again raised to the rank of a town in 1859.

RIESENER, JEAN HENRI (1734–1806), French cabinet-maker of the Louis XVI. period, was born at Gladbach near Cologne. At an early age he went to Paris, where he entered the workshop in the Arsenal of Jean François Oeben (*q.v.*). When that great master died, Riesener became foreman of the works; two years later he married Mme. Oeben, and in 1768 was admitted "maître-menuisier-ébéniste." His wife died in 1776, and in 1782 he espoused, as his second wife, Anne Grezel, daughter of a *bourgeois* of Paris. The union was unhappy, and when, under the first Republic, divorce was legalized, the marriage was dissolved. When Riesener contracted his first marriage he possessed little or nothing; his second contract of marriage recited that in cash and in the money due to him by Louis XVI. he was worth more than £20,000, without counting the finished work in hand, bronze models, jewels and personal effects and invested funds. Thus in fifteen years he had accumulated a fortune amounting in all to about £40,000. By that time there had been conferred upon him the title, formerly enjoyed by Oeben, of "Ébéniste du Roi." He died on the 6th of January 1806, in the Enclos des Jacobins, leaving an only son, Henri François (1767–1828), a distinguished portrait-painter of the First Empire. Riesener was unquestionably the greatest of the Louis Seize cabinet-makers. His name is stamped upon the Bureau du Roi in the Louvre, and although the original conception of that master-work was due to Oeben, it cannot be doubted that its consummate and perfect achievement he must in great measure be attributed to the man who completed it. Occasionally there may, perhaps, be some lack of spontaneity in his forms, but his work is generally at once bold and graceful. His marquetry presents an extraordinary finish; his chiselled bronzes are of the first excellence. He was especially distinguished for his cabinets, in which he employed many European as well as exotic woods. Wreaths and bunches of flowers form the centres of the panels; on the sides are often diaper patterns in quiet colours. Yet despite his distinction as a maker of cabinets his high-water mark was reached in the Bureau du Roi, finished in 1769 and consequently belonging rather to the Louis Quinze than the Louis Seize period, and a not altogether dissimilar cylinder bureau believed to have been made for Stanislas Leszczynski, king of Poland, now in the Wallace Collection. Stanislas died in 1766, but the desk was not completed until February 20, 1769, as appears by the inscription accompanying the maker's signature. Upon its completion it passed into the possession of the French crown and was included in a sale of the royal furniture which took place in Holland. It was purchased by Sir William Hamilton, then British Minister at the Hague, and appears to have passed out of his hands when he left Naples, where it was purchased by Sir Richard Wallace. At Buckingham Palace there is a third bureau on the same lines. These pieces are triumphs of marquetry. They are inlaid with trophies of musical instruments, doves, bouquets and garlands of flowers; the bronze vases and "galleries" are exquisite—they may possibly be the work of Gouthière, but are more probably from the hands of Duplessis. For several years this great artist appears to have used the models of his master Oeben, but there was a gradual transition to a style more individual, more delicately conceived, with finer but hardly less vigorous lines. By the time he had been working alone for ten years he had completely embraced the Louis Seize manner—he had, perhaps, some responsibility for it. One of the most distinguished of his achievements for the court was the famous flat writing-table now at the Petit Trianon, for which he received only £200. The extent of these royal orders may be gauged from the fact that between 1775 and 1785 Riesener received 500,000 livres from the Garde Meubles, notwithstanding that during the whole of this period Gondouin the architect was the official designer of furniture for the royal palaces. Like so many other artists he was condemned in the end to sacrifice to the false taste of his day, and a certain number of his creations, otherwise delightful, were vitiated by being mounted with panels of Sèvres, Wedgwood and other china. The beautiful little secretaire in the Jones collection in the Victoria and Albert Museum suffers seriously by this lapse.

RIESENGEBIRGE (Bohemian *Krkonose*), or Giant Mountains, a lofty and rugged group on the boundary of Silesia and Bohemia, between the upper courses of the Elbe and the Oder. They form the highest portion of the Sudetic system which separates south-east Prussia from the Austrian empire, and finds its natural continuation towards the N.W. in the Erzgebirge, the Thuringian Forest and the Harz Mountains. Adjoining the Isergebirge and the Lausitzergebirge on the W., and the Eulengebirge and the Adlergebirge on the E. and S.E., the Riesengebirge proper run S.E. and N.W. between the sources of the Zacken and the Bober, for a distance of 23 m., with a breadth of 14 m. They cover an area of about 425 sq. m., three-fourths of which is in Austrian, and the remainder in Prussian territory. The boundary line follows the crest of the principal chain or ridge (Riesenkamm), which stretches along the northern side of the group, with an average height of over 4000 ft. The principal peaks are the Reifträger (4430 ft.), the Hohe Rad (4968 ft.), the Great Sturmhaube (4862 ft.), the Little Sturmhaube (4646 ft.), and, near the east extremity, the Schneekoppe or Riesenkoppe (5266 ft.), the loftiest mountain in northern or central Germany. Roughly parallel to this northern ridge, and separated from it by a long narrow valley known as the Siebengründe, there extends on the S. a second and lower chain, of broad massive "saddles," with comparatively few peaks. The chief heights here are Kesselkoppe (4708 ft.), the Krkonose (4849 ft.), the Ziegenrücken and the Brunnenberg (5072 ft.). From both ridges spurs of greater or less length are sent off at various angles, whence a magnificent view is obtained from Breslau to Prague; the lowlands of Silesia, watered by the Oder, and those of Bohemia, intersected by the Elbe and the Moldau, appearing to lie mapped in relief. The summit is crowned by a chapel dedicated to St Lawrence, which once also served as a traveller's shelter. Since 1850 the chapel has been restored to its religious use, and a hotel for the accommodation of tourists is built close by. A remarkable group of isolated columnar rocks are those known as the *Adersbacher Felsen* in a valley on the Bohemian side of the Riesengebirge, about 20 m. N.W. of Braunau.

On its northern side this mountain group rises ruggedly and precipitously from the Hirschberg valley; but on its southern side its slope towards Bohemia is very much more gradual. The scenery is in general bold and wild. The Bohemian ridge is cleft about the middle by a deep gorge through which pour the headwaters of the river Elbe, which finds its source in the Siebengründe. The Iser, Bober, Aupa, Zacken, Queiss, and a great number of smaller streams also rise among these mountains or on their skirts; and small lakes and tarns are not unfrequent in the valleys. The Great and Little Schneegruben—two deep rocky gorge-like valleys in which snow remains all the year round—lie to the north of the Hohe Rad.

Nearly the whole of the Riesenkamm and the western portion of the southern chain are granite; the eastern extremity of the main ridge and several mountains to the south-east are formed of a species of gneiss; and the greater part of the Bohemian chain, especially its summits, consists of mica-slate. Blocks of these minerals lie scattered on the sides and ridges of the mountains and

in the beds of the streams; and extensive turf moors occupy many of the mountain slopes and valleys. The lower parts of the Riesengebirge are clad with forests of oak, beech, pine and fir; above 1600 ft. only the last two kinds of trees are found, and beyond about 3950 ft. only the dwarf pine (*Pinus Pumilio*). Various alpine plants are found on the Riesengebirge, some of them having been artificially introduced on the Schneekoppe. Wheat is grown at an elevation of 1800 ft. above the sea-level, and oats as high as 2700 ft. The inhabitants of this mountain region, who are tolerably numerous, especially on the Bohemian side, live for the most part, not in villages, but in scattered huts called "Bauden." They support themselves by the rearing of cattle, tillage, gardening and linen-weaving. Mining is carried on only to a small extent for arsenic, although there are traces of former more extensive workings for other metals.

The Riesengebirge has of late years been made easily accessible by railway, several branches from the main lines, both on the Silesian and Bohemian side, penetrating the valleys, and thus many spots in the Riesengebirge are a good deal frequented in the summer. The Schneekoppe and other summits are annually visited by a considerable number of travellers, notably the spas of Warmbrunn (near Hirschberg) and Flinsberg on the Gneis, and Görbersdorf, known as a climate health resort for consumptives. The Riesengebirge is the legendary home of Rübezahl, a half-human, half-friendly goblin of German folklore, and various localities in the group are more or less directly associated with his name.

RIETI (anc. *Reate*), a city and episcopal see of Italy, in the province of Perugia, 25½ m. by rail and 15 m. direct S.S.E. of Terni, which is 70 m. by rail from Rome. Pop. (1901) 14,145 (town), 17,716 (commune). It occupies a fine position 1318 ft. above sea-level on the right bank of the Velino (a torrent subtributary to the Tiber), which at this point issues from the limestone plateau; the old town occupies the declivity and the new town spreads out on the level. While with its quaint red-roofed houses, its old town walls (restored about 1250), its castle, its cathedral (13th and 15th centuries), its episcopal palace (1283), and its various churches and convents Rieti has no small amount of medieval picturesqueness; it also displays a good deal of modern activity in vine and olive growing and cattle-breeding. The fertility of the neighbourhood is celebrated both by Virgil and by Cicero. A Roman bridge over the Turano, and the Palazzo Vincentini by Vignola deserve to be mentioned.

Reate was reached from Rome by the Via Salaria (*q.v.*), which may originally have ended there, and a branch road ran from it to Interamna. While hardly mentioned in connexion with the Punic or Civil Wars, Reate is described by Strabo as exhausted by these long contests. Its inhabitants received the Roman franchise at the same time with the rest of the Sabines (290 B.C.), but it appears as a praefecture and not as a municipium down to the beginning of the empire. It was never made a colonia, though veterans of the Praetorian guard and of the eighth (Augusta) and ninth legions were settled there by Vespasian, who belonged to a Reatine family and was born in the neighbourhood. For the contests of the Reatines with the people of Interamna see TERNI. In 1148 the town was besieged and captured by Roger I. of Sicily. In the struggle between church and empire it always held with the former; and it defied the forces of Frederick II. and Otho IV. Pope Nicholas IV. long resided at Rieti, and it was there he crowned Charles II. of Anjou king of the Two Sicilies. In the 14th century Robert, and afterwards Joanna, of Naples managed to keep possession of Rieti for many years, but it returned to the States of the Church under Gregory IX. About the year 1500, the liberties of the town, long defended against the encroachments of the popes, were entirely abolished. An earthquake in 1785 was in 1799 followed by the much more disastrous pillage of Rieti by the papal troops for a space of fourteen days.

RIETSCHEL, ERNST FRIEDRICH AUGUST (1804–1861), German sculptor, was born at Pulsnitz in Saxony. At an early age he became an art student at Dresden, and subsequently a pupil of Rauch in Berlin. He there gained an art studentship, and studied in Rome in 1827–28. After returning to Saxony he soon brought himself into notice by a colossal statue of Frederick Augustus, king of Saxony; was elected a member of the academy of Dresden, and thenceforth became one of the chief sculptors of his country. In 1832 he was elected to the Dresden professorship of sculpture, and had many foreign orders of merit conferred on him by the governments of different countries. He died at Dresden in 1861.

Rietschel's style was very varied; he produced works imbued with much religious feeling, and to some extent he occupied the same place as a sculptor that Overbeck did in painting. Other important works by him were purely classical in style. He was specially famed for his portrait figures of eminent men, treated with much idealism and dramatic vigour; among the latter class his chief works were colossal statues of Goethe and Schiller for the town of Weimar, of Weber for Dresden and of Lessing for Brunswick. He also designed the memorial statue of Luther for Worms, but died before he could carry it out. The principal among Rietschel's religious pieces of sculpture are the well-known Christ-Angel, and a life-sized Pietà, executed for the king of Prussia. He also worked a great deal in rilievo, and produced many graceful pieces, especially a fine series of bas-reliefs representing Night and Morning, Noon and Twilight, designed with much poetical feeling and imagination.

For a good biography of Rietschel and account of his works see Appermann, *Ernst Rietschel* (Leipzig, 1863). (J. H. M.)

RIEU, CHARLES PIERRE HENRI (1820–1902), Swiss Orientalist, was born at Geneva in 1820. He studied at Bonn University, where he received his doctor's degree in 1843. He entered the British Museum in 1847, and after twenty years of service, a new post, that of keeper of Oriental manuscripts, was created for him. He completed in 1871 the second part, dealing with Arabian MSS., of the *Catalogus codicum manuscriptorum orientalium*, which had been begun by William Cureton, and he issued a supplementary volume in 1894. He also drew up a *Catalogue of the Turkish Manuscripts* (1888) and a *Catalogue of the Persian Manuscripts* (4 vols., 1879–95), the latter being a storehouse of information on the books and their authors. In 1895 he was made professor of Arabic in the university of Cambridge in succession to Robertson Smith. He died in London on the 19th of March 1902.

RIEVAULX, a village in the North Riding of Yorkshire, England, 3 m. W. by N. of the small town of Helmsley, which is served by a branch of the North-Eastern railway. Here, exquisitely situated in a deep wooded valley, are the ruins of Rievaulx Abbey, a foundation by Walter l'Espec in 1131 for Cistercians. The principal remains are those of the cruciform church, mainly Early English in date, and of the finest workmanship. There are considerable fragments of the refectory, and all the important domestic buildings may be traced. A beautiful prospect over the ruins and the valley is seen from the terrace on the eastern flanking hill.

RIFFIANS, the name given to the Berbers of the Rif district of Morocco, the mountain region bordering the north coast from Ceuta eastward nearly to the borders of Algeria and forming part of the Atlas range. The name, it has been suggested, is identical with Libyan or Libi. A peculiarity of the Rif dialect is the change of the Arabic "l" to "r," and this would seem to support this derivation, "b" and "f" being interchangeable through "v." The Riffians are only nominally subject to the sultan of Morocco, against whose authority they are in constant revolt. They are typical Berbers in physique, tall, well made and muscular, with European features and fair skins bronzed by the sun. In morality they are singularly superior to their neighbours. In order to prevent youthful unchastity, marriages are contracted between children of eight years old, the girl being brought home to live with the lad at his parents' home till a child is born, when a separate dwelling is provided for the youthful couple. The women are noted for their beauty. The Riffians understand and speak Arabic very little. They were among the fiercest and most cruel of the pirates of the north coast of Africa. Even now they are entirely untrustworthy in this respect. See further BERBERS, MOROCCO, MOORS, KABYLES, MZABITES.

RIFLE, a firearm which may be shortly defined as a musket in which, by grooves (cf. Ger. *riffeln*, to groove) in the bore or otherwise, the projectile is forced to rotate before leaving the barrel. This rotatory motion, maintained during flight, equalizes any irregularities in the form or weight of the bullet, and so lessens the tendency to depart from a straight line, and also in a measure overcomes atmospheric resistance. Rifling was invented about 1520, by Gaspard Koller or Kollner, a gunmaker of Vienna, according to some authorities; by August Kotter of Nuremberg, according to others. It has been said

that at first the grooves were made straight, with the object of admitting a tight-fitting bullet and relieving the effects of fouling, and that the virtue of spiral grooving was subsequently discovered by accident. But this theory is unsupported. The earliest known rifle barrels have spiral grooving. The amount of turn varied in old rifles from a half or three-quarters turn to one turn in two to three feet. The form and depth of the grooving and the number of grooves also greatly varied.

Historical Development of Military Rifles.—For the chief infantry firearms that preceded the modern military rifle, see GUN, ARMS AND ARMOUR (firearms), ARQUEBUS, &c. Rifles were at first used for amusement. There are, however, instances of their occasional employment in war in the 17th and 18th centuries. In 1631 the landgrave of Hesse had a troop of riflemen. Ten years later Maximilian of Bavaria had several troops armed with rifled arquebuses. Louis XIII. armed his bodyguard with rifles. Napoleon withdrew the rifle from those of his troops to whom it had been issued during the wars of the Republic, nor did the French make any considerable use of it again until 1830, when the Chasseurs d'Orléans were armed with it for the invasion of Algeria. The British learnt the value of rifles during the American War of Independence, when the government subsidized continental *Jägers* armed with rifles to oppose the American riflemen. After the war these corps disappeared, and though they are now represented by the 60th (King's Royal) Rifles, the senior rifle corps in the British Army is the Rifle Brigade, raised in 1800 as the 95th Regiment and armed with a flint-lock weapon known as "Baker's Rifle," which weighed 9½ lb. The barrel was 2½ ft. long, its calibre 20-bore, with seven grooves making a quarter-turn in its length. A small wooden mallet was at first supplied with this rifle to make the ball enter the barrel, and it was loaded with great difficulty. In 1826 Delvigne, a French infantry officer, invented a breech with abrupt shoulders on which the spherical bullet was rammed down until it expanded and filled the grooves. The objection was that the deformed bullet had an erratic flight. Delvigne's system was subsequently improved upon by Thouvenin, who introduced into the breech an iron stem, upon which the bullet, now of conical form, rested, and was expanded by a sharp blow with the iron ramrod when loading. In William IV.'s reign the Brunswick percussion rifle[1] was introduced into the British rifle regiments. Its weight with bayonet was 11 lb 5½ oz.; length of barrel, 2 ft. 6 in., with two grooves making one turn in the length of the barrel; weight of spherical belted bullet, 557 grs.; diameter, ·704 in.; charge of powder, 2½ drs. This rifle was not easily loaded, soon fouled, and shot wild beyond 400 yds.

In 1835 W. Greener produced a new expansive bullet, an oval ball, a diameter and a half in length, with a flat end, perforated, in which a cast metallic taper plug was inserted. The explosion of the charge drove the plug home, expanded the bullet, filled the grooves and prevented windage. A trial of the Greener bullet in August 1835 proved successful. The range and accuracy of the rifle were retained, while the loading was made as easy as with a smooth-bore musket. The invention was, however, rejected by the military authorities on the ground that the bullet was a compound one. In 1852 the Government awarded Minié, a Frenchman, £20,000 for a bullet of the same principle adopted into the British service. In 1857 Greener received a belated reward of £1000 for "the first public suggestion of the principle of expansion." The Minié bullet contained an iron cup in a cavity at the base of the bullet. In 1851 a rifled musket of the Minié pattern was introduced into the British army, and, though not generally issued, was used in the Kaffir War of 1851, and in the Crimea. Its weight with bayonet was 10 lb 8¼ oz., length of barrel 3 ft. 3 in., with four grooves making one turn in 72 in.; diameter of bore ·702 inch; charge of powder 2½ drs., and sighted from 100 to 1000 yds. The form of its bullet was at first conoidal, afterwards changed to cylindro-conoidal, with a hemispherical iron cup. In 1855 the Enfield rifle, having in a series of trials competed favourably with the Minié and Lancaster rifles, was introduced into the British army; it was used during the latter part of the Crimean war, having there replaced the Minié rifle and the percussion musket, and remained the general weapon of the entire infantry until the introduction of the breech-loader in the year 1867. This rifle weighed, with bayonet, 9 lb 3 oz., barrel 39 in.; diameter of bore ·577 in.; three-grooved, with one turn in 78 in. It fired a bullet of cylindro-conoidal form with hollow base, weighing 530 grains, made up into cartridges and lubricated as for the Minié rifle, adapted to this rifle by Pritchett, who was awarded £1000 by the Government. This bullet was wrapped in greased paper round the cylindrical part half-way up its length. Short rifles of the same pattern, with five-grooved barrels 2 ft. 9 in. long and a sword bayonet, were supplied to the 60th Rifles and to the Rifle Brigade. Two small carbines of the same principle were at this time introduced for the cavalry and artillery, also a rifled pistol.

In 1854, on the suggestion of General Lord Hardinge, Sir Joseph Whitworth, the first mechanician of the day, began to consider the subject of rifling, and after a long series of experiments the Whitworth rifle was produced with hexagonal bore, ·45-in. calibre, and with one turn in 20 in. It was tried at Hythe in 1857, and completely defeated the Enfield rifle up to 1800 yds. upon a fixed rest. This trial and Whitworth's experiments proved the advantages of a sharp twist, a smaller bore, and elongated projectile; but Whitworth's rifle was never adopted into the Government service, probably because the hexagonal rifling wore badly, and owing to the difficulty of equal mechanical perfection in all similar rifles and ammunition. Several improvements were subsequently made in the sighting, grooving and some other details of the Enfield rifle. In 1855 a boxwood plug to the bullet was used.

Between 1857 and 1861 four breech-loading carbines were experimentally introduced in the cavalry—viz. Sharp's, Terry's, Green's, and Westley-Richards'. Sharp's and other breech-loading carbines and also Spencer repeating carbines were used by the Federal cavalry in the American Civil War. The general adoption of the breech-loading principle may be said to date from 1867. The Prussians were the first to see its great advantages, and about 1841 had adopted the celebrated needle-gun (*q.v.*), a bolt-action weapon. In 1864 and 1866 committees were appointed by the British War Office to report on breech-loading arms, and after protracted experiments, Jacob Snider's method of conversion of the muzzle-loading Enfield to a breech-loader (fig. 1) was adopted, with the metallic cartridge-case improved in 1867 by Colonel Boxer, R.A. All available Enfield rifles were thus converted, and new arms made with steel barrels instead of iron. Great Britain was the first to adopt for her army a breech-loading

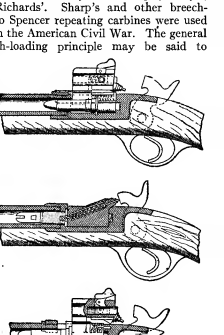

FIG. 1.—Snider Rifle. (*Text Book of Small Arms*, by permission of the Controller, H.M. Stationery Office.)

[1] The percussion principle, invented by the Rev. Alexander John Forsyth (1768–1843) in 1805, was not accepted for military arms until the introduction of this rifle. A small and belated money grant was made to Forsyth in 1843. See Major-General A. J. F. Reid's memoir of Forsyth (1910).

rifle with metallic cartridge-case, which secured the perfect obturation of the breech. The Snider breech was a hinged block, a type much in favour at the time. The French similarly converted their muzzle-loaders, the converted weapon being known as the Tabatière or snuff-box. Other breech actions on the same principle were the Austrian Werndl and the Bavarian Podewils and Werder rifles. But these were only transitional arms. In 1866 France adopted the bolt-action Chassepôt (*q.v.*); in 1867 Sweden the Hagström, and Russia the Carte; in 1868 Italy the Carcano. All these were breech-loaders firing paper cartridges containing their own means of ignition. After further experiments by a fresh committee the Martini-Henry rifle (fig. 2) was definitely adopted by the British

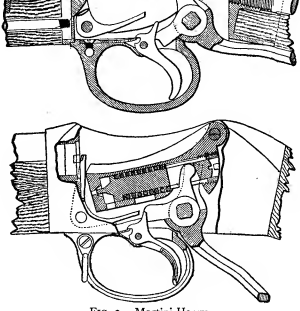

FIG. 2.—Martini-Henry.

Government in 1871, with the short chamber Boxer-Henry ammunition. This rifle was a combination of Martini's block-action breech mechanism with Henry's barrel of ·45-in. calibre, firing a *papered* bullet of 480 grains from Boxer cases with a wad of wax lubrication at base of bullet, as proposed by Henry. The Henry rifling had seven grooves with one turn in 22 in.; the lands and the centres of the grooves were contained in the same circle. About the same time or a little later the various powers re-armed their infantry with breech-loaders of different patterns and names, all of which were of about 11 mm. (·433 in.) calibre, and nearly all of the bolt-action type.

The next stage in the history of military firearms was the introduction of the repeating or magazine system. The Winchester rifle, an American invention which appeared in 1865, was one of the earliest magazine rifles. This weapon was used by Turkey to some extent in the Russo-Turkish War of 1877–78, but Germany was the first great power to provide its army with a magazine rifle. In 1884 it converted the 1871 pattern Mauser of ·443-in. bore into a magazine rifle, holding eight cartridges in a tube magazine in the fore end. In 1885 France followed with the Lebel, which had an enormous advantage in its smokeless powder. In 1886 the question of the best calibre for small arms was reopened in England. In this year, 1886, Austria had adopted a Mannlicher rifle, ·433 bore, with a straight-pull bolt. This rifle was the first adopted by any European nation embodying Lee's box magazine, an invention patented in 1879 and 1882, and consisting of a box, in rear of and below the entrance to the chamber, containing the cartridges. Another important improvement, the steel clip loader containing five cartridges, was also introduced with this rifle. In 1888 these rifles were converted to ·315 bore, firing black powder cartridges; and in 1890, on the introduction of smokeless powder, the sights were re-graduated. In 1887 the British Small Arms Committee, after experiments with the small-calibre rifle invented in 1883 by the Swiss Major Rubin, director of the Federal laboratory at Thun, recommended the small calibre for adoption into the British service. The essential features of Rubin's system were the employment of a compound bullet with a leaden core in a copper envelope, and the use of a compressed charge of black powder. In 1888 a pattern of ·303-in. calibre rifle, rifled on the Metford system and with the improved Lee bolt and magazine, was approved for trial by British troops. The Metford rifling is as follows:—diameter of bore, ·303 in.; depth of rifling, ·004 in.; width of lands, ·023 in.; twist of rifling, one turn in 10 in. (left-hand); radial grooves, seven in number. About 1892, and later, W. E. Metford had carried out an exhaustive series of experiments on bullets and rifling. He invented the important system of light rifling, with increasing spiral with a hardened bullet. The Metford match rifle was prominent in all N.R.A. competitions from 1871 to 1894. In 1887 he laid down for the Small Arms Committee the proper proportions for the grooving, spiral and cartridge chamber of the ·303 military rifle. This weapon proved satisfactory and was adopted by the War Office as the Lee-Metford rifle, Mark I., in December 1888. It had a magazine of eight cartridges. In 1891 the Mark II. pattern was approved, with a ten-cartridge magazine, a simplified bolt, and many minor improvements. A magazine carbine with barrel 21 in. long and a six-cartridge magazine, otherwise identical with the Lee-Metford Mark II., was also approved. The Lee-Metford Mark II. rifle was subsequently further improved in its rifling to resist the wear of smokeless powder, and also in its bolt action, and became known as the Lee-Enfield rifle, and under that name was officially adopted as the rifle of the British army. The number of grooves were reduced from seven to five. Neither the Lee-Metford nor the Lee-Enfield has increasing spiral grooves, which are found inconvenient for military arms from a manufacturing point of view.[1] The L.M. and L.E. carbines are similar to the shorter models of the rifles, but are covered for the whole length of the barrel by a wooden handguard and take only six cartridges; the fore-sights are protected by wings on the nose-cap, and the long-range sights are omitted. These, as also the Martini-Metford and Martini-Enfield carbines (falling-block action small-bores), have practically been replaced by the "short" rifle described below.

The efficiency of the modern small-bore magazine rifle is largely due to the production of smokeless nitro-compound powder. France was the first country to adopt, about 1885, a smokeless powder with the Lebel magazine rifle. It was known as "Vieille" powder, or "Poudre B" (after General Boulanger). Since then smokeless explosives have been universally adopted in all small-bore magazine military rifles. The smokeless explosive known as "Cordite" or "Cordite M.D." (see CORDITE) is well for the cartridges of the Lee-Metford and Lee-Enfield rifles and rifle-calibre machine guns. (H. S.-K.)

Military Rifles of To-day.—About 1900, the various armies were equipped with weapons of nearly equal efficiency. The weights varied between 8¼ and 9¼ lb, the lengths between 49 and 52 in.; the calibres were ·315, ·311, ·303, with one or two ·256. None of the rifles were sighted to less than 2000 yds., and nearly all had a "fixed" or "battle" sight. All were bolt-action rifles, and had a muzzle velocity of about 2000 f.s. (the ·256 Mannlichers, about 2300 f.s.). Except France, with the tube-magazine Lebel, Denmark and the U.S.A. with the horizontal-box Krag-Jörgensen, and Great Britain, all nations used multiple-loading by clip or charger. With Lebel and Krag-Jörgensen weapons, multiple-loading is a practical impossibility, but in Great Britain the charger was deliberately rejected. It was desired to use the rifle normally as a

[1] Of all modern military rifles, the Italian 1891 weapon alone has an increasing twist.

single-loader, and to reserve the magazine (which held ten cartridges, or twice as many as the multiple-loading Mausers, Mannlichers, &c.) for emergencies. But from about 1903 this equivalence of infantry weapons began to be disturbed by two new influences: the tendency towards a "short" rifle, and the introduction of the pointed bullet.

In the first, Switzerland took the lead with the short Schmidt-Rubin in 1900. But amongst the greater powers, England and the United States alone have followed her example. At the close of the South African War Great Britain issued 1000 short Lee-Enfield rifles experimentally, and in 1903 the "short rifle" was actually approved and issued generally. Since then it has been improved in details. The barrel was shortened by 5 in., multiple-loading by charger was introduced, and by the *Musketry Regulations* of 1909 magazine fire was laid down as the normal, single-loading being forbidden. The change met with very considerable opposition, especially from target-shooting experts, who maintained that a long rifle, so perfected in details as to be equal to the short in every point except in length, must be more accurate. The view of the military authorities, which was maintained in spite of criticism, was that for service purposes, and especially for prolonged snap-shooting, the handier weapon was preferable. One important factor in the decision was the desire to give the cavalry a weapon with which, when dismounted, it could fight the infantry rifle on equal terms. A more serious objection than that of want of superfine accuracy in bull's-eye shooting was the loss of 4 in. of reach in bayonet fighting. This objection was met in 1907 by the introduction of a new pattern bayonet with a blade 5 in. longer. In 1908 the long Lee-Enfield and Lee-Metford rifles in store were converted for charger-loading (fig. 3), fitted with safety catches and

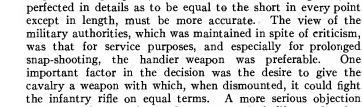

FIG. 3.—Charger-loading L.E. (*Text Book of Small Arms*, by permission.)

new sights, and issued to the infantry of the Territorial Force in 1909 and 1910. For target purposes many rifle shots prefer this converted weapon to the short rifle (fig. 4).

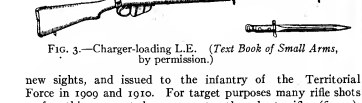

FIG. 4.—L.E. Short Rifle. (*Text Book of Small Arms*, by permission.)

The United States in 1904 replaced the Krag-Jörgensen (hand-loading horizontal magazine) by the short Springfield. A sort of spring bayonet was at first fitted to this rifle, but it was soon replaced by an ordinary sword bayonet.

The pointed bullet ("Spitz-geschoss" or "S") was introduced by Germany in 1905, and her example was quickly followed by France (balle D) and other powers. Its advantage is a considerable flattening of the trajectory, chiefly on account of the lessened resistance of the air. This latter allows of a reduction in the sectional density and consequently in the weight of the bullet. Thus velocities up to 2900 foot-seconds are realized, which enables the "dangerous space" to be very greatly augmented (see fig. 20). The "fixed sight" range with the "S" bullet is 700 yds., as against the Lee-Enfield's 500. It was announced in the House of Commons in 1910 that a modified bullet was being experimented with, and that some increase in the fixed-sight range was expected to be obtained, but the relatively weak breech action of the Lee-Enfield—which is due chiefly to the rearward position of the locking lugs—does not allow designers much freedom in the matter of increasing velocities, as the chamber pressure has to be kept low. It will be seen from the table that other rifles are constructed to stand a much higher pressure.

But both these improvements are destined to be eclipsed in importance by the adoption of the automatic rifle. The application of the automatic principle to the modern high-velocity small-arm of precision has been occupying the attention of the small-arms experts of all armies and of numerous private inventors for some years past. These numerous attempts have, in the case of the rifle, been largely doomed to failure because of the necessary limitations of space and weight; although the automatic principle has been successfully applied both to machine guns (*q.v.*) and to pistols (*q.v.*). In these weapons the work of extracting the empty cartridge-case, re-loading and re-cocking, is accomplished either by the motive power of the recoil or of the gas generated by the explosion of the powder, thus enabling a rapid and continuous fire to be maintained to the full capacity of the weapon's magazine. In the case of machine guns the firing also is automatic, but self-firing rifles are not very desirable as infantry weapons and in addition are so heavy as to approximate to machine guns.

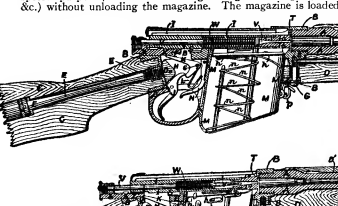
Of the recoil-operated class of automatic rifles there are two subdivisions, "short-recoil" and "long-recoil." In the former, which is most favoured by inventors, the barrel, body and bolt recoil together for a short distance, about $\frac{1}{2}$ in., in which space the bolt is unlocked, and the bolt then recoils freely in the body. The bolt is run forward in reloading by a spring. In the long-recoil type the barrel, body and bolt recoil together a whole distance, and the barrel body are run up by one spring, the bolt by another. Several such rifles have been shown at the N.R.A. meetings at Bisley; the Rexer, Mauser and Woodgate rifles being on the long-recoil, the Hallé on the short-recoil principle. Gas-operated rifles, like the Hotchkiss and Colt machine guns, have fixed barrels and are worked by a portion of the powder-gases which is allowed to escape from the barrel through a small hole near the muzzle, thence entering a cylinder and working a piston in connexion with the breech mechanism. No automatic rifle has as yet (August 1910) been issued as a service weapon by any power, the problem of ensuring certainty in action under service conditions—*i.e.* with grit and dirt in the working parts—being the principal difficulty.

Great Britain.—There are two principal types of Lee-Metford and Lee-Enfield rifles in the service, the "short" and the "charger-loading." The former is carried by all units (cavalry included) of the regular army, by the yeomanry cavalry of the Territorial Force, and by units of the Officers' Training Corps. The latter is used by the infantry of the Territorial Force. There exist, further, the older, non-charger-loading Lee-Metford and Lee-Enfield rifles, a few carbines of the same type, and some Martini-Metford and Martini-Enfield carbines which have the ·303 barrel and cartridge with the falling-block Martini action. ·45 Martini-Henry rifles and carbines, and even Sniders, are still used by local police forces in some of the smaller colonies.

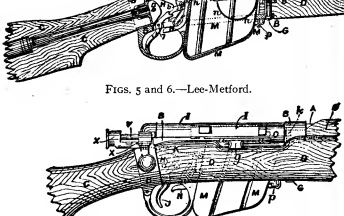
The "long" charger-loading Lee-Enfield is converted from earlier patterns by the addition of a charger guide, the stripping of the bolt-cover, and improvements in the sighting. The action of the breech mechanism[1] is as follows (the breech mechanism of the "short" rifle being practically the same): The breech is closed by a bolt (I) which slides in a bolt-way cut in the body; the bolt-head (Io) abuts against the base of the cartridge when the rifle is loaded, and when the knob is turned down the whole is locked. On the right side of the bolt is a solid rib, and on the left side a lug; these support the bolt on firing by contact with the "resisting shoulder" on the right, and the rear face of the "lug seating" on the left of the body. Underneath the bolt there are two recesses and two studs. The bolt-head is screwed to the bolt and is fitted with an extractor claw. The bolt-head, instead of being rigidly connected to the bolt, is so far independent that it remains stationary while the bolt is revolved. Inside the bolt is the arrangement of striker (V) and spring (W), and at its rear end, forming the working connexion between trigger and striker, is the "cocking-piece" (X) which is fitted with a safety-catch (not in the old pattern rifle illustrated). This cocking-piece (which cannot turn) has a long tongue projecting to the front, lying along the under side of the bolt, and the front end of this tongue (Y), called the "full-bent,"

[1] The annexed figures show the old pattern weapon. In both the existing patterns a safety catch is fitted, the magazine spring is of a different shape and there is no bolt-cover. But the essential parts of the action remain the same.

engages the nose of the trigger sear when the weapon is loaded (a groove in the tongue, called the "half-bent" (Z), serves as a half-cock arrangement, and could be used as a safety-catch if the proper safety-catch were damaged). The trigger sear (K) is a bell-crank lever, the upper long arm of which is put in and out of contact with the "full-bent," and the lower or short arm is connected to the trigger. The magazine holds ten cartridges, which rest on a platform, underneath which is the magazine spring that pushes the platform and cartridges up. A "cut-off" is fitted in the "long" and in some marks of the "short" rifle. This is a sort of lid to the magazine, enabling the magazine to be kept full while the rifle is being used as a single loader. But the present musketry regulations forbid single-loading, and the cut-off is now only closed for special purposes, such as unloading a single cartridge (miss-fire, &c.) without unloading the magazine. The magazine is loaded by



FIGS. 5 and 6.—Lee-Metford.



FIGS. 7 and 8.—Lee-Metford.

inserting a charger in the "charger guides" (these, attached to the body, form a sort of bridge over the bolt) and forcing down the strip of cartridges into the magazine (charger guides not shown in diagrams). The action of the mechanism is as follows: Suppose that the rifle has been fired and the magazine is full. On beginning to turn up the knob of the bolt, the latter is revolved, but the cocking-piece (the tongue being held by a groove in the body) and the bolt-head remain stationary. Soon, however, a cam on the bolt comes in contact with a stud on the cocking-piece and the latter is brought slightly to the rear, pulling in the point of the striker and partly compressing the spring. At the same time the lug on the left of the bolt, in contact with the front face of a recess in the body (both being cut slantwise to a screw pitch), forces the bolt and with it the claw of the extractor, which grips the base of the cartridge-case, to slide backwards a little. As the bolt continues to turn the rib on the right of it comes up clear of the body and the whole bolt, with the bolt-head, can thus be drawn back until the bolt-head comes against the resisting shoulder on the right of the body and the extractor attached to it flings out the fired cartridge-case. Another cartridge then comés up from the magazine and lies in front of the bolt-head ready to be pushed home. At this moment (the beginning of loading) the stud on the cocking-piece has fallen into one of the grooves on the bolt, and as the bolt is pushed forward the tongue or full-bent comes against the nose of the trigger sear and is held there, while the rest of the bolt mechanism goes on. Thus between the moving bolt and the fixed cocking-piece the striker spring is further compressed, and when the sloping faces of the bolt lugs and ribs engage the resisting portions of the body a last forward push is given to the bolt and the spring compressed, more compressed, even than when drawn backward when the full-bent is released from the nose of the sear. Figs. 5–8 of the older pattern rifle show the working of the breech mechanism. Instead of the older single pull-off of the trigger the "short" rifle, like many Continental weapons, has a double pull-off. This is provided for by suitably shaping the portion of the trigger which is in contact with the short arm of the sear. The "short" rifle has also a somewhat different pattern of safety-catch.

The sights of British service rifles up to 1903 were of a very simple type, the fore-sight a "barleycorn" of triangular shape, and the back-sight a plain leaf with sliding bar into which a V was cut, the tip of the fore-sight seen in the middle of the V being brought on to the mark. In the long charger-loader this form of back-sight has been greatly modified, and in the "short" rifle it has been altogether abolished. The barleycorn fore-sight has been replaced in both cases by an upright blade, protected from injury by two ears or wings, and the V by a U aperture. For elevation the long rifle has still a slide on a vertical leaf, but the movement of this slide is controlled no longer merely by its tight fit but by a clamping screw. The sight of the short rifle is larger and also quite different in appearance and principle. There is a leaf and on it a slide, but the slide (controlled by clamping studs) works on a cam-shaped bed; its position on the leaf, affecting the point of contact with the cam-shaped bed, elevates the leaf to the required amount, the actual sighting U being on the extremity of the leaf. The short rifle has also a "fine adjustment" which admits of minor changes of elevation within the usual 50 yds. graduation. Both the long and the short rifles have "wind-gauges," or mechanisms for fine lateral adjustment of the central U sighting aperture, so as to point the axis of the barrel a little to the left or the right of the line of sight to compensate for wind, error of the individual rifle, &c. In both rifles, on the left side of the stock, is a long-distance sight (graduated to 2800 yds.), which consists of an aperture sight near the bolt and a dial and movable pointer near the hand-guard. The short rifle is cased from breech to muzzle in a wooden hand-guard; all patterns of long rifle have only a short wooden hand-guard just behind the back-sight bed. The bayonet in the long rifle is secured to the fore-end by a spring catch and to the barrel by a ring passing over the muzzle. This traditional, and still usual, arrangement has been abandoned in the short rifle, as the vibration of the barrel on discharge is more or less checked by the extra weight of the bayonet, and therefore the shooting of the rifle differs according as it is fired with or without the bayonet fixed. With the short rifle the bayonet is fixed to two metal fastenings, a plug for the ring and a catch for the handle.

Continental European Rifles.—These are for the most part of the Mauser and the Mannlicher types. The Mauser is a bolt weapon with box magazine. The bolt is simple, without separate bolt-head, and is held by two bolt-lugs at its front end engaging with recesses in the body (the German Mauser has an extra lug near the rear end). Near the rear end there is a cam-shaped recess, which, engaging with a stud on the cocking-piece, partially forces back the cocking-piece and spring when the bolt is revolved. When the bolt lever is turned up and the bolt begins to revolve, the cocking-piece and bolt plug, which together form the connexion between the bolt and the trigger, do not revolve, but are forced back slightly, so as to begin the compression of the striker spring. Then, the bolt lever being so shaped as to bear against an inclined-plane edge on the body, the bolt comes back a little, and with it the extractor jaw and the empty cartridge-case. Lastly, when the bolt has turned through a right angle, all studs are opposite their slots and ways in the body, and the bolt can be drawn back. At the farthest rearward position of the bolt the cocking-stud on the cocking-piece is well behind the nose of the trigger sear, and is thus held when the bolt is pushed forward again, the spring being thereby compressed. All Mauser rifles have a safety-catch and a double pull-off. None have cut-offs except the Turkish pattern. All are constructed for clip or charger loading, but the box magazine contains only five cartridges as against the Lee-Enfield's ten. Mauser rifles, which are perhaps the strongest and least complicated of magazine arms, are used in the German, Belgian, Spanish, Portuguese and Turkish armies, and were also used by the Boers in the South African War. The type adopted by each of these nations differs from the rest in details only. The German rifle has a long sword bayonet, fixed to the fore-end only and not connected with the barrel, and a peculiar form of back-sight, which bears some resemblance to the

slide and bed arrangement of the British "short" rifle. The special feature of the Belgian Mauser is a thin steel casing for the barrel,

FIG. 9.—Belgian Mauser. (*Text Book of Small Arms*, by permission.)

FIG. 9a.—Spanish Mauser. (*Text Book of Small Arms*, by permission.)

which is supposed to act as a hand-guard or cooler and to free the barrel from disturbing influences due to its connexion with the fore-end; but it is expensive, and if strong adds unduly to the weight

FIG. 10.—German Mauser, 1898. (*Text Book of Small Arms*, by permission.)

of the weapon. The older German magazine rifle, pattern 1888, had a barrel casing, but this was given up when the new 1898 pattern was introduced. The bayonets of the Belgian and Spanish patterns are very short knives.

The Mannlicher rifle, which is extensively used for sporting and target work, has been adopted for military purposes by various states, notably Austria-Hungary. Both the 1890 and

FIG. 11.—Austrian Mannlicher, 1895. (*Text Book of Small Arms*, by permission.)

1895 patterns of Austrian . Mannlicher have "straight-pull" bolts; that is, bolts which are not turned for locking. The

FIG. 12.—Mannlicher, 1890.

bolts are in two parts, which "telescope" into each other. In the 1890 pattern (see fig. 12), when the bolt I is home against the cartridge and the "lever cylinder" I', which carries the bolt knob, is further pushed forward, the hinged block R is caused to drop in front of the resistance-piece Q, and so locks the bolt I against the cartridge. In the 1893 pattern (see fig. 13), the final pushing forward of the lever cylinder causes the head of the bolt I to turn and projections on its head to lock into recesses SS just in rear of the breech. The turning is due to helical feathers (20) on the inside of the lever cylinder I' working in grooves in the rear of the bolt I. The 1890 pattern has a double pull-off. It will be seen from the figure that as the trigger is pulled the bearing is taken first at (8) and then at (9). This gives, owing to the change of leverage, power at the commencement and rapidity at the end of the pull. The weapon is a clip loader. The Dutch,

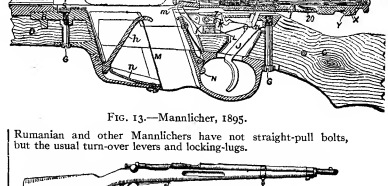


FIG. 13.—Mannlicher, 1895.

Rumanian and other Mannlichers have not straight-pull bolts, but the usual turn-over levers and locking-lugs.

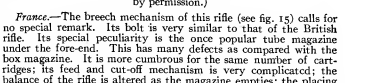

FIG. 14.—Austrian Mannlicher Carbine. (*Text Book of Small Arms*, by permission.)

France.—The breech mechanism of this rifle (see fig. 15) calls for no special remark. Its bolt is very similar to that of the British rifle. Its special peculiarity is the once popular tube magazine under the fore-end. This has many defects as compared with the box magazine. It is more cumbrous for the same number of cartridges; its feed and cut-off mechanism is very complicated; the balance of the rifle is altered as the magazine empties; the placing of the cartridges base to point, even when the bullet has a flat point, is not unattended with danger, especially when the magazine is full and the spiral spring strongly compressed; lastly, loading by any form of charger is practically impossible.

FIG. 15.—Lebel Rifle.

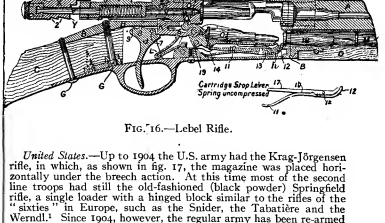

FIG. 16.—Lebel Rifle.

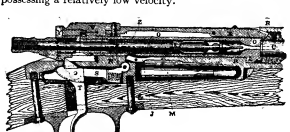
United States.—Up to 1904 the U.S. army had the Krag-Jörgensen rifle, in which, as shown in fig. 17, the magazine was placed horizontally under the breech action. At this time most of the second line troops had still the old-fashioned (black powder) Springfield rifle, a single loader with a hinged block similar to the rifles of the "sixties" in Europe, such as the Snider, the Tabatière and the Werndl.[1] Since 1904, however, the regular army has been re-armed with a short rifle (fig. 18) which in its action has a general resemblance to a Mauser. As at first issued, the new Springfield had a rod bayonet which, when not in use, lay within the fore-end of the stock, and when required was run forward and fastened by a catch. This novelty was, however, soon discarded in favour of a sword bayonet 16 in long. The United States navy had until about 1900 the Lee "straight-pull" rifle. The *Russian* "3-line" and the *Japanese*

[1] The Springfield was, however, a much improved model of this kind of weapon, dating from 1884 only.

"30th year" (1900) and "38th year" (1907) rifles are bolt-action weapons, with no special peculiarities. The *Swiss* rifle (Schmidt-Rubin) is a remarkable weapon of the straight-pull type, short, and possessing a relatively low velocity. (X.)



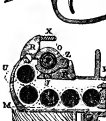


FIG. 17.—Krag-Jörgensen.

The Use of the Rifle in War.—The study of "musketry" as distinct from target shooting may be said to date from the Franco-German War. Previously military students and practical soldiers concerned themselves rather with the tactical question of fire-power—fire *versus* shock, bullet *versus* bayonet and so on—

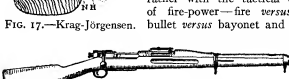

FIG. 18.—U.S. Short Rifle. (*Text Book of Small Arms*, by permission.)

than with the technical question of its application. This was natural enough in the days of short-range fighting. But when bullets began to cause losses at 1000 yds. and more from the firing point, formations that presented the least vulnerable target had to be discovered and tested, aiming grew more difficult as the range increased, and firing by word of command in large units became practically impossible. The very accuracy and range of modern weapons involved new problems. The necessity, in the larger area of effective fire, of setting the sights to the distance of the mark made further demands on fire-discipline and brought up the difficult problem of judging distance. The possibilities of varying the rate of fire conferred by the magazine rifle also demanded close study. Each war, as it came, produced fresh evidence as to what was possible and what was not in matters of fire-control, the best rate of fire for effect, the range at which fire should be opened, and other half-tactical, half-technical problems. Thus, although many points still remain in the region of controversy, certain ideas and principles are almost universally accepted as the basis of service musketry.

The leading idea is that of the "cone of dispersion." A modern rifle, even fired from a fixed rest under good conditions, will not place shot after shot in the same spot, but the shot-marks on the target form a more or less close "group." When to this error of the rifle and the ammunition there is added the personal error of the marksman, the group is larger, and in the collective fire of a squad it is larger still. Now the trajectories of bullets that do not strike in the same place naturally do not coincide, and the group on the target is represented in the air by a cone or sheaf of trajectories. The bullets of this sheaf striking the ground on either side of the target form on the ground a much elongated ellipse. The ellipse containing 90 % of the bullets fired is called the *beaten zone*. It is usual, however, to calculate from the "effective" zone, or that which contains 75% of bullets. Within the "effective" zone, and at its centre, is found the closely grouped "nucleus" of 50% of bullets. With the British ·303 rifle in collective fire, the depths of these zones are:—

	Nucleus.	Effective.	Beaten.
500 yds.	120 yds.	220 yds.	320 yds.
1000 ,,	70 ,,	120 ,,	170 ,,
1500 ,,	60 ,,	100 ,,	140 ,,

The target aimed at and sighted for is at the centre of the zone (see fig. 19). The height of the grouping on a vertical target compared to the depth of the grouping on the ground is of course proportionate to the tangent of the angle of descent; hence, small as is the group on a vertical target at 500 yds., the beaten zone is no less than 320 yds. deep. For the same reason, as the range, and consequently the angle of descent, increases, the beaten zone diminishes in depth. Another factor is the "dangerous space." This is the space between "first catch," *i.e.* the point at which the bullet (in a sheaf, the lowest bullet) comes low enough to catch a man's head, and "first graze," that at which it strikes the ground. The extent of this dangerous space varies of course with the height of the man's head. In the case of a mounted man, at 1000 yds., it is 105 yds., while in that of a sharpshooter lying down, it is only 13 yds. (in addition of course to the beaten zone). As nowadays nearly all targets, on service, are lying or three-quarters concealed figures, the dangerous space as compared with the beaten zone is at such a range too small to count as a factor. It is, however, important at shorter ranges, 500 yds. and under (700 and under with the new pointed bullets). Here the advantages of flat trajectory make themselves felt. Within this distance the bullet is at no point in its career too high to be dangerous to a standing man or a horseman. A lying figure is in danger at any distance beyond 350 yds. if the sights are set to 500 yds. (front half of effective zone 100 yds., dangerous space 52 yds.). This is the theory underlying the 500 yds. "fixed sight" or "battle-sight," a setting which holds good for all less ranges, and can be put on the rifle instantly and without looking at the back-sight graduations.

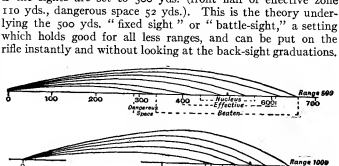

FIG. 19.—Beaten Zone.

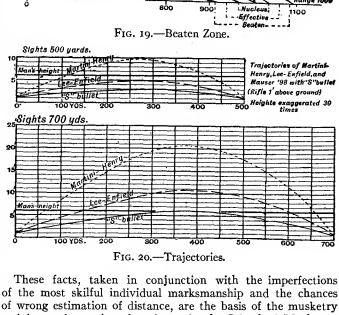

FIG. 20.—Trajectories.

These facts, taken in conjunction with the imperfections of the most skilful individual marksmanship and the chances of wrong estimation of distance, are the basis of the musketry training and practice of to-day. At the School of Musketry, Hythe, the standard of judging distance is "not more than

100 yds. wrong at any range." Now at 1000 yds. an error in judging distance of 13 yds. above or below the true range will cause all the shots of a particular rifle to fall away from the target, and the better the marksman—*i.e.* the closer his group—the more necessary is perfection in judging distance, a perfection which in reality seems unattainable. The British musketry regulations therefore lay it down that the individual marksman's fire at service targets is unprofitable at ranges of more than 600 yds. Beyond that distance collective fire, controlled and directed by an officer or non-commissioned officer, is the rule. The question as to whether fire is to be opened in any given set of circumstances is decided by the fire-director, who considers first whether the probable error in judging distance is greater than half of the effective zone for the estimated range. If it is so, he must order "combined sights," *i.e.* half of the units under his command use one elevation, the rest another, which method artificially increases the dispersion of the bullets and thereby the probability of the target being included in the zone. This, however, makes the fire less effective, and in practice cannot profitably be used by any body of rifles of less than 80 or 100. The commander of only a single section, therefore, however tempting the target, must refrain from opening fire at all. At medium ranges, however, controlled and directed fire is effective, and at such ranges troops should still be sufficiently in hand to execute the fire-director's orders. Within decisive ranges fire-direction has to give place to fire-control. All that the strongest commander can enforce is the opening and ceasing of fire when he gives the order, and success is sought through making the individual soldier skilful at rapid and snap shooting. Black bull's-eyes on white targets are now used only to teach men to make uniformly good shooting, which is shown by the closeness of the shot-grouping. The rest of the musketry course is fired against grey-green "head and shoulders" targets or brown silhouettes, and consists of slow, rapid and snap shooting, from behind cover, at disappearing or running targets, &c. In 1909 special attention began to be paid to visual training, both as an aid to judging distance and as an actual ingredient of fire-discipline. A method of indicating targets which originated in the French army was adopted and improved upon, consisting essentially of giving two or three conspicuous "auxiliary marks," in artillery language, and naming the target with reference to them. Judging distance is generally associated with fire-discipline practices, and men are frequently exercised in locating and ranging upon a hidden skirmisher, 300–800 yds. away. Perhaps the most important modification of musketry training, within recent years, has been the adoption of rapid fire in "bursts," as the normal procedure for infantry, instead of slow continuous fire. The complete cessation of fire at intervals enables the leaders to observe the

progress of the engagement, to change their target, to economize ammunition, to select the ground for the next rush and the next burst of fire, and to regain control of the men, whom a prolonged fire-fight hypnotizes and rivets to the ground. The chief use of "slow" fire, which is generally employed by skirmishers working in pairs, is to keep the enemy under; the storm of well-directed "rapid fire" the fire-director should hold in his own hands, ready to release it at the right moment. Slow fire averages 3 rounds a minute, rapid (aimed) 8–12. The configuration of the ground has often a great influence on fire effect. If the target is on a sharp forward slope, the beaten zone is greatly diminished in depth, ranging errors are no longer neutralized by the flatness of trajectory and (the bullets meeting the ground at a steeper angle) the dangerous space is reduced; if, on the other hand, the slope descends gently in rear of the target so that the falling bullets instead of making a pattern upon the ground, skim along parallel to the surface, the zone is increased. For instance, at 1500 yds., if there is a reverse slope of about 5° in rear of the target the depth of the beaten zone is tenfold that of the zone for the same range on level ground. Similarly if the target is on the crest of a hill and the firers below, the "over" half of the cone of fire may graze the reverse slope or pass far above, according as the reverse slope is gentle or sharp with respect to the line of sight.

The normal position for the firing infantryman in action is lying; the kneeling position is used for firing from behind cover, the sitting for firing down hill. Standing, formerly the usual position, is now employed chiefly for firing behind cover with the rifle rested, and for snap-shooting during an advance when it is undesirable to halt and lie down. As regards cover, it may be mentioned that well-covered or intrenched troops generally shoot less accurately than troops in the open, the soldier in security being loth to expose himself long enough to take careful aim. This was particularly noticeable in the Russo-Turkish War, and its effect is to create a zone of unaimed fire behind the assailants' fighting line, which sometimes causes serious losses to his supports and reserves. The relation between the cone of dispersion of peace-time experiments, even when these are specially designed to establish that relation (for example, series fired in France by third-class shots, after a long march without food), has never been satisfactorily established. An arbitrary figure of one-tenth or one-twentieth of peace-time effect has generally been assumed as representing war results, but some think that however the normal cone may be multiplied or divided, no relation can be found between peace and war effect, and that in battle the brave men aim and fire as if on the practice range, and the rest fire absolutely at hazard. From a musketry point of view, this brings again into the foreground the question of distance-judging, as, if the sights be wrongly set, the more accurate the fire the less its effect, and a

mistake would nullify even the small amount of aimed fire that can be reckoned upon. Peace-time experiments have their value—and it is very great—in establishing data as to the effect of fire on troops in different formations, the limits of permissible error in ranging, &c., on the principle that of two methods, that which is proved to be better in peace would in much the same proportion be found better in war. (C. F. A.)

Match or Target Rifle.—The sport or pastime of target shooting has many times changed its character, owing to the steady improvement in the rifle and the different ranges or distances at which shooting is practised. Range usually governs the construction of the target rifle, long-range rifles not being necessarily the best weapons for a short range of, say, 200 yds. Limitations—such as the amount of powder charge, weight of bullet and rifle—are also usually imposed in order to place all competitors on equal terms. The long-range match rifle is not the superior of the military rifle as a weapon, but as a scientific shooting instrument is the best small-arm produced. The ordinary target rifle is a hybrid arm, combining the points of the long-range match, modern military and best sporting rifles. The miniature match rifle is used for short-range practice.

Shooting at fixed marks has been practised continuously in Switzerland from mediaeval times. A club ("Société de l'harquebuse et de la Navigation") has existed in Geneva since 1474; and the Zürich "Schützen-Gesellschaft" since about the same date. It is not clear at what period rifles were introduced in these clubs. From the beginning of the 19th century up to 1844 the rifle generally used in Great Britain had a polygrooved barrel ·630 in. in diameter, with spherical ball, and the arm weighed from 11 to 15 lb. It was not fired in military fashion, but had a handle extending downwards fixed in front of the trigger-guard, which was grasped by the left hand, the left arm being steadied against the body. This method of shooting is still sometimes followed by Swiss and German riflemen. Target shooting as a sport or business was rarely practised in Great Britain until after the formation of the Volunteer Force in 1859. The inauguration of the "National Rifle Association" in 1860 opened a new and most important era in the history and development of the rifle. This institution was established "for the encouragement of rifle corps and the promotion of rifle shooting throughout Great Britain. . . . As a national pastime to make the rifle what the bow was in the days of the Plantagenets, the familiar weapon of those who stand forth in the defence of their country." The first meeting of the N.R.A. was held at Wimbledon in 1860. The first shot was fired by Queen Victoria[1] from a Whitworth rifle on a machine rest, at 400 yds., and struck the bull's-eye. The Whitworth muzzle-loading rifle won many of the important prizes at this and subsequent meetings prior to 1871. Its most important features, arrived at after exhaustive experiments, were a smaller bore of ·450 in., with a twist of rifling of one turn in 20 in., and an elongated mechanically fitting projectile. Long-range rifle construction is also largely indebted to Whitworth for the highly accurate and superior tools and processes introduced by him in this branch of manufacture.

In 1866 and after, Metford's system of hardened expanding bullets and shallow rifling gradually superseded the mechanically fitting system of Whitworth, and the Whitworth rifle gradually lost its position. In 1861, the Henry grooving for a cylindrical bullet, a modification of the Whitworth, first appeared. In 1864, Rigby, with a five-grooved rifle and a mechanically fitting bullet, tied with the Whitworth rifle in the preliminary rifle trial of the N.R.A. at 1000 yds., and in a subsequent trial took the first place. By 1871 the Whitworth rifle had given place to the Metford system with hardened cylindrical bullets, shallow rifling and increasing spiral. In 1867 the modern breech-loading rifle with a metallic cartridge was first introduced. The Metford system of rifling greatly assisted its development. In this year Rigby also produced a new model long-range rifle designed on the lines followed by Metford. In 1869 the Henry barrel came to the front. In 1870 the Martini-Henry, the new service arm, won the duke of Cambridge's prize, the extreme range in this competition being 800 yds. In 1871 the Snider breech-loader replaced the Enfield muzzle-loader, and the Martini-Henry replaced the Whitworth in the later stages—800, 900 and 1000 yds.—of the Queen's prize. The Metford barrel was also used in breech-loaders, and the duke of Cambridge's prize—for the first time fired at 1000 yds.—fell to it. During the twenty-three years from 1871 to 1894 the Metford military match rifle only four times failed to win this prize, while it took a preponderating share of other prizes. The years 1872 and 1873 marked a decided advance in the military breech-loader, though for fine shooting the muzzle-loader still seemed hard to equal. In 1875 a team of American riflemen first visited Wimbledon with "army-pattern" breech-loading rifles, which were cleaned out after every shot, and met with considerable success. A feature of their shooting was the "back position," then a novelty. In 1877 the superiority of the cleansable and cleansed breech-loader over the increased fouling of the muzzle-loader was clearly demonstrated, though the muzzle-loader did not at once disappear. In 1878 the highest scores ever made with the muzzle-loader in Great Britain were recorded, greater care in cleaning the rifle after every shot being observed.

In 1883 the N.R.A. Council altered the conditions, wiping out after every shot was forbidden, but muzzle-loaders were not disqualified. The result was that the American type of rifle disappeared. The poor shooting of the Martini at 1000 yds. induced the Council to take the retrograde step of reducing the maximum range for the Queen's prize to 900 yds. In 1890 the N.R.A. first met at the new ranges at Bisley. This year was noticeable for the excellent shooting made in the "any" rifle competitions by the Gibbs-Metford match rifle, particularly at 1000 yds. range. The accepted type was ·461 calibre; 7 grooves ·0045 in. in depth; 80 grains of special black gunpowder, and a bullet of 570 grains. In 1892 and 1893 the Lee-Metford ·303 rifle with cordite ammunition was first used by the army teams. In 1890 and later the Hon. T. F. Fremantle, Captain Gibbs and some others used Metford's copper-coated bullets in the Gibbs-Metford rifle with success. In 1895 many match rifle shots followed their example. In 1895 and 1896 the ·303 was equalled, and in some instances beaten, by the smaller-calibre Mannlicher rifle. This was partly due to faulty Lee-Metford ammunition. The ·303 now proved its superiority to the ·450 Martini, especially at the longer ranges. The Bisley meeting of 1896 practically closed the series of contests with both the Martini and the military match rifles. The Volunteers were thenceforth armed with the ·303.

The results of the Bisley meetings since 1895 have proved that rifles of the ·303 class, the British ·303 rifle particularly, are not so good for match rifles pure and simple as the larger bores using black powder. The light bullets are more subject to deflection by the wind at long ranges than the heavier speed-retaining bullets of the larger bores. No nitro-powder used appears to have equalled the black powder in regularity of shooting. At the same time the object of the N.R.A. competitions is to encourage the use of the military service rifle in the first place, and in the case of the "any" rifle competitions to encourage the production of weapons of the highest efficiency for military purposes. Acting on these principles the rifles allowed by the N.R.A. regulations (1907) are classed as follows:—*Class I.*—Service rifle (S.R.): government pattern ·303 magazine rifles;

[1] The "Queen's" or "King's" prize is the highest distinction to which a rifle shot can attain. The competition is one of three stages, the first and second eliminating all but the best 100 competitors. The bronze medal of the N.R.A. is awarded to the highest scorer in the first stage, the silver medal to the leader in the second, and the King's prize and N.R.A. gold medal to the winner in the last stage: 71 shots in all are fired at distances up to 1000 yds., and the winners' scores of late years have been 320 to 325 out of a possible 355. Only the service rifle is allowed.

sights strictly in accordance with service pattern.[1] *Class II.*—Match rifles (M.R.): any breech-loading rifle complying with the following conditions: maximum weight of barrel, 3¼ lb; maximum calibre, ·325; stock sufficiently strong for service purposes, and without pad or shoe on the heelplate; minimum pull of trigger, 4 lb; sights, of any description. *Class III.*—Military breech-loading rifles (M.B.L.); any rifle, that is either (*a*) the regulation military rifle of any country; or (*b*) a breech-loading rifle complying with the following conditions: maximum weight, exclusive of bayonet, 8½ lb; maximum calibre, ·315; minimum pull of trigger, 4 lb. Sights may be of any description except telescopic or magnifying, but must be fixed to the barrel and must be strong enough for military purposes. *Class IV.*—Sporting rifles: calibre, any; minimum pull of trigger, 3 lb; sights, open or such as are sanctioned by the council or committee. The Lyman back-sight and the Beech combination fore-sight have been sanctioned. No lateral adjustment of fore- or back-sight is permitted. The miniature rifles allowed fall into two classes, "military," with open sights, only, and "any," with no restrictions as to sights except that magnifying and telescopic sights are forbidden.

Modern American Target Rifles.—In America, according to some authorities, there are three recognized departments of target shooting—namely off-hand shooting; shooting from a simple rest; and shooting from a machine rest, with telescopic or any other sight. For the first two classes small-bore rifles of ·380 calibre or under only are used. The usual weight is from 8 to 10 lb, with 28- or 30-in. barrel. Light charges for the shorter ranges are used. In the ·380 bore only 15 grains of powder with a 330-grain bullet is employed. In the second-class contests, from a simple rest, the barrel is longer and the weight increased to just under 12 lb. The bore is generally ·380. The usual range is 200 yds. The third-class shooting from a machine rest, generally with telescopic sights, is not much practised. Every kind of rifle is employed, usually of large bore and weighing from 20 to 60 lb. The long-range breech-loading match rifle, with which so much fine shooting was done when wiping out after each shot was allowed, weighed about 10 lb; the breech mechanism, any falling block, as the Sharp, Farquharson, Deeley, and Edge or Wiley, that admitted the insertion of the cleaning rod at the breech; length of barrel, 32 to 34 in.; seven or more grooves ·003 to ·005 in depth with a complete turn in 100 in. A sharp continual spiral and very shallow grooves constituted the feature of the American plan. Rigby's plan was similar, with one turn in 18 in. and eight grooves, the lands being about half the width of the grooves. In the Wiley the grooves were fewer and wider. The Metford is an increasing twist, starting with one turn in 60 in. and finishing with one in 20, or sharper. The usual bore of the American long-range rifle was ·458 or ·461; powder, 76 grains of special "fouling" rifle powder; elongated cylindrical bullet of 540 grains. The pull-off was under 3 lb. During recent years smaller-bore smokeless-powder rifles have also been used.

Continental Match Rifles.—The target rifle used by continental marksmen for medium ranges is a modification of the old pattern Swiss rifle, with scroll guard, hollowed butt plate and hair trigger. This latter, a mechanical device to free the tumbler from the sear without sufficient pull on the trigger to influence the aim, is disallowed in military arms.

Sporting Rifles.—Prior to 1845 smooth-bore guns with double charge of powder and an ounce spherical ball were generally preferred to rifles for sporting purposes and for large game; 16-bore muzzle-loading rifles were occasionally used by British sportsmen in the East Indies before that date, firing 1½ drs. of powder with a spherical ounce ball. These rifles were sighted to 200 yds., but the trajectory was high and the penetration weak; they were also difficult to load when foul. The twist of the rifling was also too rapid, causing the bullet to strip with heavy charges of powder. According to Captain Forsyth and others, up to 1860 there was no known rifle suitable for sporting purposes in India. Rifles of 12-bore gauge, firing a spherical ball, were subsequently made, with broad and shallow grooves making one turn in 10 ft. The bullet, of the same diameter as the bore, was loaded with a thin patch that took the grooving. These rifles proved very successful, possessing velocity equal to a smooth-bore of the same calibre, accuracy for sporting distances, flat trajectory and great striking power. In 1855 W. Greener produced the "Cape rifle" for South African sport, calibre ·450 or ·500; rifling, two deep grooves with one turn in 26 in., with a flanged bullet to fit the grooves; weight, 12 lb; sighted up to 1200 yds. This rifle was successful, and others were built by Purdey, who in 1856 named the pattern "Express Train." Since that date the word "express" has been generally used to denote a rifle possessing high velocity, flat trajectory and long fixed-sight range.[2] In America small-bore rifles were used earlier in the 19th century. The celebrated Kentucky rifles were of various sizes, firing spherical balls of 90, 60 and 40 to the lb, and were renowned for their accuracy and fixed-sight range up to 100 yds. Some maintain that the express rifle was developed from the Kentucky model. The modern express rifle may be defined as a breech-loading rifle with a height of trajectory not exceeding 4½ in. at 150 yds., with a muzzle velocity of at least 1750 f.s. These rifles are usually 5- to 7-grooved, double-barrelled, with 26- to 28-in. barrels of ·360, ·400, ·450, ·500 and ·577 bores, weighing respectively from 6½ to 7 lb, 7 to 8 lb, 7½ to 9 lb, 8½ to 10 lb and 10½ to 12 lb. The respective average charges are: bullet, 150 grains; powder, 50 grains; 209 and 823; 270 and 110; 340 and 130; 500 and 160; the fixed-sight ranges, 130, 160, 150, 130 and 120 yds. Double and single express rifles of ·303 bore with 26-in. barrels are also made.

Since the invention of cordite powder and the advent of the small-bore high-velocity rifle for military purposes, the variety of sporting rifles with different-sized bores has increased. Sporting cordite express rifles are now made, both single- and double-barrelled, of the following calibres: ·256, ·265, ·276, ·303, ·310, ·360, ·370, ·375, ·400, ·450, ·500, ·577 and ·600. Some of these calibres, such as ·500, ·577 and ·600, are seldom used with cordite. The ·450 cordite express is the largest bore high-velocity rifle recommended.

The modern small-bore military rifle already described possesses all the best qualities of an express sporting rifle—namely accuracy, flat trajectory, high muzzle velocity and long point-blank or fixed-sight range up to 200 yds. The muzzle velocity of the ·303 bore with black powder is 1850 f.s.; with cordite, 2100 f.s. The hollow-pointed or slit expanding bullet is generally used in these high-velocity rifles, as in the black-powder express, for ordinary sporting purposes, with the solid metal cartridge-case. The pointed bullet is also sometimes used, generally with the ·375 and ·475 calibre rifles, and gives an increased muzzle velocity of 2500 f.s. The trajectory of the cordite rifle is stated to be 10 in. flatter at 200 yds. than that of a black-powder rifle of similar calibre and corresponding charge. The vexatious bores in sporting rifles is due largely to restrictions on the importation of arms of the military calibres (especially ·303) into India and South Africa.

The sights of sporting express rifles are of some variety, and are usually designed and made with special care. The open V

[1] The N.R.A. have recently sanctioned the use of the aperture sight in service rifles, provided it be attached to the weapon by the hinge-pin which fastens the ordinary folding leaf.

[2] The term "point-blank range" is often used in this connexion. Strictly speaking, there is no such thing as "point-blank range," the bullet commencing to drop immediately it leaves the muzzle of the rifle. The path or trajectory of the bullet if fired horizontally is therefore always a downward curve. The higher the muzzle velocity the flatter is this curve. The "fixed-sight," or so-called "point-blank" range, is usually taken at such range, generally 100 yds. with black powder, and with such elevation as render the amount of drop of the bullet or curve of its path practically immaterial for sporting purposes, say a maximum of 4½ in. At shorter range this curve would therefore take the bullet so much above the line of fixed-sight aim, and must where necessary be allowed for. With the high-velocity small-bore rifle the fixed-sight range can be increased to 200 yds. for the sporting rifle; and for military purposes in the field to 500 yds. and (with pointed bullets) even more.

back-sight on an ivory pyramid with two or three leaves up to 300 yds., and the enamelled bead fore-sight, are the most usual form. The more elaborate Lyman and Beech peep-sights are also popular. One or two varieties of telescope sight, attachable to the barrel, are also made by some leading gunmakers, and have been used with success in the field. Solid-drawn brass cartridge-cases are now always used for sporting rifles, except occasionally for some of the larger bores, in which paper cartridges may be used. The peculiarity of the express bullet is its hollow point, which is intended to ensure the expansion of the projectile on impact. This diminishes its penetration, but translates its velocity or energy into "shock." If greater penetration is needed, the leaden bullet is hardened with mercury or tin, or the military nickel-coated bullet is used. Explosive bullets filled with detonating powder were at one time used in express and large-bore rifles for large game. These are now practically abandoned, owing to their uncertainty of action and the danger in handling them. The use of the large 4- and 8-bore black-powder rifles is restricted to the hunting of large and dangerous game. These are usually double-barrelled. The 4-bore weighs from 14 to 18 lb with 20-in. barrels, and fires a charge of 12 to 14 drs. of powder, with a spherical bullet of 1510 grs. The great weight of this rifle is against its general use. The 8-bore rifle weighs from 11½ to 15 lb with 20- to 24-in. barrels, with a charge of 8 to 12 drs. of powder with a spherical ball. These rifles are accurate and effective up to 120 yds. Rook and rabbit rifles are usually single-barrel breech-loading rifles of from ·220 to ·380 bore, hammerless, ejectors. The range is ordinarily restricted to 200 yds.

Combined rifles and shot-guns are generally used in countries where the kind of game to be met with is not known beforehand, and by emigrants who can only afford one gun. These weapons are double-barrelled (·450 rifle barrel and 16-bore shot barrel; or ·500 rifle and 12-bore shot). Such a gun has many drawbacks, being too heavy for a shot-gun and too light for a rifle, with a bad balance. More modern combinations of the rifle and shot-gun are Holland's "Paradox," a smooth bore with the last three inches of the barrel ratchet-rifled, Lancaster's "Colindian" twisted oval bore, and Bland's "Euoplia" with "invisible" undulating rifling. All these weapons fire heavy bullets more or less accurately up to 100 yds., are also used as shot-guns, and are made double- or single-barrelled and of various calibres, 12-bore being the most common. There is also Greener's "under and over," the rifle barrel being topmost (usually 16-bore shot-gun barrel and ·450 rifle barrel). The Morris tube also enables a shot-gun to be utilized as a small-bore rifle or a large rifle as a saloon rifle for gallery practice. The automatic principle has not yet been applied to sporting rifles.

Miniature Rifles.—In 1905 a War Office miniature or cadet rifle for instruction purposes was officially adopted by the British military authorities. The details of this rifle were determined by a committee, upon which the National Rifle Association and the Society of Miniature Rifle Clubs were represented. It is a single-loading bolt-action rifle of ·22 calibre with military sights (the aperture sight being barred), shooting a rim-fire cartridge having a 40-gr. bullet propelled by 5 grs. of black gunpowder or its equivalent in some smokeless explosive. It is used at ranges from 25 yds. up to a maximum of 200 yds. The official adoption of such a rifle was largely due to the civilian rifle club movement, which was the outcome of the South African War, and in which the Society of Miniature Rifle Clubs has played an important part. Until the recent official adoption of the miniature rifle, the council of the N.R.A. regarded marksmanship with the service rifle as its main object of encouragement, and the service rifle itself as the orthodox weapon. The Society of Miniature Rifle Clubs, on the other hand, makes the encouragement of the use of low-power rifles its special object, with few restrictions as to type of sights, rifle or ammunition. Numerous civilian rifle clubs have adopted the ·22 calibre rifle, in many cases with aperture sights, with marked success, and British rifle-makers were encouraged to cater for this new demand for low-power rifles. Such weapons can be far more widely and generally used than the ordinary service weapon, owing to their smaller cost, cheaper ammunition, absence of recoil, and their convenience for use at short covered ranges in crowded centres of population. In many parts of Great Britain there is practically no alternative between low-power short-range practice and no shooting at all. The N.R.A. has now admitted the miniature ·22 calibre rifle upon equal terms with the service rifle. The miniature rifle has, to some extent, taken the place of the Morris tube and "adaptors" previously used for rifle practice at short ranges.[1] The Morris tube consists of a small-rifled barrel, usually chambered for the 297/230-bore cartridge, and capable of being fitted inside the barrel of the ordinary service weapon, which thus becomes available as a miniature rifle for short-range practice. The Morris tube has been adopted by the British War Office, and affords an excellent means of training the recruit. "Adaptors" are dummy cartridge-cases fitted into the breech of the ordinary rifle, by means of which a shorter cartridge firing a lighter charge of powder, but with a bullet of the same calibre as the rifle, can be used for short-range practice. One of the first English miniature target rifles was the "Sharpshooters' Club" rifle, on the Martini principle, of ·310 calibre, manufactured and introduced by W. W. Greener, and suitable for ranges from 50 to 300 yds. This rifle was adopted by many rifle clubs, and in 1901 established a record in the miniature rifle competition at Bisley. Miniature rifle shooting has been much encouraged throughout the United Kingdom by the establishment of the Light Rifle Championship competition under the auspices of the Society of Miniature Rifle Clubs. In 1907 Queen Alexandra presented a cup for this event. (H. S-K.)

RIFLEMAN-BIRD, or RIFLE-BIRD, names given by the English in Australia to a very beautiful inhabitant of that country,[2] probably because in coloration it resembled the well-known uniform of the rifle-regiments of the British army, while in its long and projecting hypochondriac plumes and short tail a further likeness might be traced to the hanging pelisse and the jacket formerly worn by the members of those corps. The cock bird is clothed in velvety-black generally glossed with rich purple, but having each feather of the abdomen broadly tipped with a chevron of green bronze, while the crown of the head is covered with scale-like feathers of glittering green, on the throat gleams a triangular patch of brilliant bluish emerald, a colour that reappears on the whole upper surface of the middle pair of tail-quills. The hen is greyish-brown above, the crown striated with dull white; the chin, throat and a streak behind the eye are pale ochreous, and the lower parts deep buff, each feather bearing a black chevron. According to James Wilson (*Ill. Zoology*, pl. xi.), specimens of both sexes were obtained by Sir T. Brisbane at Port Maçquarie, whence, in August 1823, they were sent to the Edinburgh Museum, where they arrived the following year; but the species was first described by W. Swainson in January 1825 (*Zool. Journal*, i. 81) as the type of a new genus *Ptiloris*, more properly written *Ptilorrhis*,[3] and is generally known in ornithology as *P. paradisea*. It inhabits the northern part of New South Wales and southern part of Queensland as far as Wide Bay, beyond which its place is taken by a kindred species, the *P. victoriae* of J. Gould, which was found by John Macgillivray on the shores and islets of Rockingham Bay. Farther to the north, in York Peninsula, occurs what is considered a third species, *P. alberti*,

[1] In the military forces short-range practice now takes two forms —practice with Morris tube or miniature rifle, and practice with the full-sized rifle and ammunition on specially protected 30-yd. ranges.

[2] Curiously enough, its English name seems to be first mentioned in ornithological literature by Frenchmen—R. P. Lesson and Garnot —in 1828, who say (*Voy. "Coquille," Zoologie*, p. 669) that it was applied "pour rappeler que ce fut un soldat de la garnison [of New South Wales] qui le tua le premier"—which seems to be an insufficient reason, though the statement as to how the first specimen was obtained may be true.

[3] Some writers have amended Swainson's faulty name in the form *Ptilorris*, but that is a mistake.

very closely allied to and by some authorities thought to be identical with the *P. magnifica* (Vieillot) of New Guinea—the "Promerops" of many writers. From that country a fifth species, *P. wilsoni*, has also been described by Mr Ogden (*Proc. Acad. Philadelphia*, 1875, p. 451, pl. 25). Little is known of the habits of any of them, but the rifleman-bird proper is said to get its food by thrusting its somewhat long bill under the loose bark on the boles or boughs of trees, along the latter of which it runs swiftly, or by searching for it on the ground beneath. During the pairing-season the males mount to the higher branches and there display and trim their brilliant plumage in the morning sun, or fly from tree to tree uttering a note which is syllabled "yass" greatly prolonged, but at the same time making, apparently with their wings, an extraordinary noise like that caused by the shaking of a piece of stiff silk stuff. Verreaux informed D. G. Elliot that he believed they breed in the holes of trees and lay white eggs; but on that score nothing is really known. The genus *Ptilorrhis*, thought by Gould to be allied to *Climacteris*, has been generally placed near *Epimachus*, which is now considered, with *Drepanornis* and *Seleucides*, to belong to the Passerine Paradiseidae, or birds-of-paradise, and in his *Monograph* of that family all the species then known are beautifully figured by D. G. Elliot. (A. N.)

RIGA (Esth. *Ria-Lin*), a seaport of Russia, 366 m. by rail S.W. of St Petersburg, the capital of the government of Livonia. The Gulf of Riga, 100 m. long and 60 m. in width, with shallow waters of inconsiderable salinity (greatest depth, 22 fathoms), freezes to some extent every year. The town is situated at the southern extremity of the gulf, 8 m. above the mouth of the Dvina, which brings Riga, by means of inland canals, into water communication with the basins of the Dnieper and the Volga. Below the town the river divides into several branches, among islands and sandbanks, receiving before it enters the sea the Bolderaa river, and expanding towards the east into wider lacustrine basins. Having direct railway communication with the fertile parts of southern and south-eastern Russia, Riga has become the second port for foreign trade on the Baltic, ranking next after St Petersburg. The port freezes on an average 127 days every year. The larger ships cannot reach Riga, and are unloaded at Ust-Dvinsk (formerly Dunamünde). By no means all the trade with the interior is transported by the railways; no inconsiderable portion of the goods is carried by water.

Riga consists of four parts—the old town and the St Petersburg and Moscow suburbs on the right bank of the Dvina, and the Mitau suburb on the left bank, the two sides being connected by a floating bridge, which is removed in winter, and by a viaduct, 820 ft. long. The old town still preserves its Hanseatic features—high storehouses, with spacious granaries and cellars, flanking the narrow, winding streets. The only open spaces are the market-place and two other squares, one of which, facing the citadel, is adorned with a granite column erected (1818) in commemoration of the defeat of Napoleon I. in 1812. The suburbs, with their broad and quiet boulevards on the site of the former fortifications, are steadily growing. The St Petersburg suburb is the seat of the German aristocracy and merchant community.

Few antiquities of the medieval town remain. The oldest church, the Dom (St Mary's), founded in 1215, was burned in 1547, and the present building dates from the second half of the 16th century, but has been thoroughly restored since 1883. Its organ, dating from 1883, is one of the largest in the world. St Peter's church, with a beautiful tower 412 ft. high, was erected in 1406–9. The castle, built in 1494–1515 by the master of the Knights of the Sword, Walter von Plettenberg—a spacious building often rebuilt—is the seat of the Russian authorities. The "House of the Black Heads," a corporation or club of foreign merchants, was founded in 1330, and subsequently became the meeting-place of the wealthier youth of the place. Of the recent erections, the polytechnic, the exchange, the monument of the German writer, Johann Gottfried von Herder, who lived at Riga towards the end of the 18th century, the gymnasiums (schools) of Lomonosov and Alexander I. and the large bonded warehouse are worthy of notice. The esplanade (where a Greek cathedral built in 1877–84 now stands), the Wöhrmann Park and the Imperial Park are much visited. Riga gives name to an archiepiscopal see of the Orthodox Greek Church and to an episcopal see of the Roman Catholic Church, and is the headquarters of the XX. army corps. In the environs, Dubbeln and the sea-bathing resorts of Bilderlingshof and Majorenhof have numerous visitors in summer.

The population, which was 102,590 in 1867, increased to 168,728 in 1881 and to 282,943 in 1897, so that Riga now ranks seventh in the empire in order of population; 47% of the inhabitants are Germans, 25% Russians and 23% Letts, with a small admixture of Esthonians, Jews, &c. The city has a commercial school (1903), a municipal library, the Dom museum, an art museum with picture gallery (1904–8), technical and theological middle schools and a pilot and navigation school. Industrial activity has developed and includes railway-carriage works, works for the manufacture of machinery, oil mills and breweries. Owing to its communication by water and rail with the forests of White Russia and Volhynia, Riga is a great mart for timber. Flax and linseed also occupy a prominent place, Riga being the chief Russian port for the extensive flax-producing region of north-west Russia. Owing to the great railway which crosses the country from Riga to Smolensk, afterwards dividing into two branches, to Orenburg and Tsaritsyn on the lower Volga respectively, Riga is the storehouse and place of export for hemp coming by rail from west central Russia, and for corn, Riga merchants securing their buyers as far east as Tambov. Oats, in particular, are extensively exported to England from the central provinces. Wheat, barley, eggs, butter, oilcake, hides, tallow, leather, tobacco, bristles, feathers and other items add considerably to the total value of the exports, which increased from 1½ million sterling in 1851–60 to 8–14 millions sterling in 1901–5. The imports, consisting chiefly of salt, fish, wine, cotton, metals, machinery, coal, oils, fruits and colonials, are also rapidly increasing: whereas in 1851–60 they were valued at about ½ million sterling, in 1901–5 they reached 6–11½ millions sterling.

History.—Riga was founded in 1158, as a storehouse at the mouth of the Düna (Dvina), by a few Bremen merchants. About 1190 the Augustinian monk Meinhard erected a monastery there, and in 1199–1201 Bishop Albert I. of Livonia obtained from Pope Innocent III. permission for German merchants to settle at the new settlement, and chose it for his seat, exercising his power over the neighbouring district in connexion with the Teutonic Knights. As early as the first half of the 13th century the young city obtained the right of electing its own magistracy, and enlarged the walls erected during Albert I.'s time. It joined the Hanseatic League, and from 1253 refused to recognize the rights of the bishop and the knights. In 1420 it fell once more under the rule of the bishop, who maintained his authority until 1566, when it was abolished in consequence of the Reformation. Sigismund II., king of Poland, took Riga in 1547, and in 1558 the Russians burned its suburbs and many ships in the river. In 1561 Gotthard Ketteler publicly abdicated his mastership of the order of the Teutonic Knights, and Riga, together with southern Livonia, became a Polish possession; after some unsuccessful attempts to reintroduce Roman Catholicism, Stephen Bathory, king of Poland, granted the religious freedom of the Protestant population. Throughout the 17th century Riga was a bone of contention between Sweden, Poland and Russia. In 1621 Gustavus Adolphus, king of Sweden, took it from Poland, and held it against the Poles and the Russians, who besieged it in 1656. During the Northern War between Sweden and Russia, it was courageously defended (1700), but after the battle of Poltava it succumbed, and was taken in July 1710 by the Russians. In 1781 it was made by Russia the capital of the Riga viceroyalty, but fifteen years later, the viceroyalty having been abolished, it was made the capital of Livonia. In 1812, the approach of the French being apprehended, the suburbs were burned. (P. A. K.; J. T. Bs.)

RIGAUD, HYACINTHE (1659–1743), French painter, born at Perpignan on the 20th of July 1659, was the descendant of a line of artists. Having early lost his father, he was sent by his mother to Montpellier, where he studied under Pezet and was helped by Ranc, then to Lyons, and in 1681 to Paris. There, whilst following the regular course of academical instruction,

Rigaud produced a great number of portraits so good that Le Brun advised him to give up going to Rome and to devote himself wholly to this class of work. Rigaud, although he had obtained the Grand Prix, followed this advice, and for sixty-two years painted at the rate of thirty to forty portraits a year, all carried through with infinite care by his own hand. His portraits of himself, of the sculptor Desjardins (Louvre), of Mignard and of Le Brun (Louvre) may be cited as triumphs of a still more attractive, if less imposing, character than that displayed in his grand representations of Bossuet (Louvre) and Louis XIV. (Louvre), while his beautiful portraits of his mother, Marie Serre (Louvre), must for ever remain amongst the masterpieces of French art. Rigaud, although the great successes to which he owed his fame were won without exception in portrait-painting, persisted in pressing the Academy to admit him as an historical painter. This delayed his reception, and it was not until January 1700 that he succeeded in obtaining his desire. He presented as his diploma works a St Andrew (Louvre) and the portrait of Desjardins already mentioned, exhibited at the salon of 1704, and filled in turn all the various posts of academical distinction. He died on the 27th of December 1743, having never recovered from the shock of losing his wife in the previous year. He had many pupils, and his numerous works had the good fortune to be reproduced by the greatest of French engravers—Edelinck, Drevet, Wille, Audran and others.

RIGBY, RICHARD (1722–1788), English politician, was the only son of Richard Rigby (d. 1730) of Mistley Hall, Essex, a merchant who made a fortune through his connexion with the South Sea Company. Young Rigby became an associate of Frederick, prince of Wales, and entered parliament in 1745. He is chiefly known to fame through his connexion with John Russell, 4th duke of Bedford, and the "Bloomsbury gang," his audacity earning for him the title of the "brazen boatswain" of the "crew." In 1758 he became secretary to Bedford, who was lord lieutenant of Ireland, and in the following year he was given the sinecure office of master of the rolls for Ireland. Following the political fortunes of the duke he became vice-treasurer of Ireland in 1765, and in 1768 he obtained the lucrative position of paymaster-general of the forces. Rigby often spoke in parliament, and in 1769 he shared in the opposition to Wilkes. In 1782 he was obliged to resign his position as paymaster-general, and he was somewhat surprised and embarrassed when he was requested to pay over the large sum of public money which was in his possession. He left a great fortune when he died at Bath on the 8th of April 1788. A rapacious and unscrupulous politician, Wraxall says Rigby "possessed talents for addressing a popular assembly which were sustained by a confidence that nothing could abash."

RIGG, JAMES HARRISON (1821–1909), English Nonconformist divine, was born at Newcastle-on-Tyne on the 16th of January 1821. His father was a Wesleyan minister and sent his son to the Old Kingswood School, Bristol, where he subsequently became an assistant teacher. In 1845 he entered the Wesleyan ministry, and during the agitation of 1849–52 wrote successfully in exposition and defence of the polity of Methodism. In 1857 he published *Modern Anglican Theology*, an acute criticism of the writings of Coleridge, Hare, Maurice, Kingsley and Jowett. The book was timely and well received, and though Kingsley at first resented the criticism he afterwards became a cordial friend of the writer. Rigg had now become a leading figure in his own church, and in 1868 was appointed Principal of the Westminster Wesleyan Training College for day-school teachers, a post which he held with growing distinction for 35 years. In 1870 he was elected on the first School Board for London, one of the most remarkable assemblies of modern times, and took an important part in providing the syllabus of religious instruction and framing the religious settlement for teachers.

In 1873 he wrote *National Education in its Social Conditions and Aspects*. A resolute opponent of secular education, he maintained that the state ought not to compete with the churches, but welcome their aid in the work of national education. He was also strongly against the adoption of a rigid universal code. In 1886 he sat on the Royal Commission of Education, and was brought into close contact with Matthew Arnold, and with Dean Stanley, Bishop Temple and other Anglican prelates, who held him in high esteem. In 1877 he became chairman of the second London district of Methodism, and for fourteen years helped to make the history of his church in the home counties. In 1878 he was elected president of conference—and again in 1892. From 1881 he was ministerial treasurer of the Wesleyan Missionary Society, taking an active part in its work. He resigned his principalship in 1903 and died at Brixton on the 17th of April 1909. Dr Rigg was universally honoured as the Nestor of Wesleyan Methodism, in the development of which he had taken a foremost part for over 60 years. His *Connexional Economy* is a standard work, and his *Living Wesley* a most discriminating study of the character and work of its subject. His *Oxford High Anglicanism* (1895) showed how keenly he followed modern developments in the Church of England. His lifelong principle was that Methodism is "a church friendly to all, but owing allegiance to none."

See *Life* by John Telford (London, 1909).

RIGGING (A.S. *wrigan* or *wrihan*, to clothe), the general term, in connexion with ships, for the whole apparatus of spars (including both masts and yards), sails and cordage, by which the force of the wind is utilized to move the hull against the resistance, and with the support, of the water. (See also Navigation and Shipbuilding). The word is often used as meaning the cordage only, but this is a too limited, and even an irrational, use of the term. A ship is not rigged until she is provided with all the spars, sails and cordage required to move and control the hull. The straight or curved pieces of wood or metal, called davits, from which the boats carried along the bulwarks are hung, belong to the rigging. All are fastened directly or indirectly to the hull, and all are required to complete her "clothing." Vessels of all classes, from the smallest sailing-boat up to the largest ship, are classed according to the particular combination of their spars, sails and cordage. "Cutter," "brig," or "ship," are only convenient abbreviations for "cutter-rigged," "brig-rigged," or "ship-rigged." They are of such or such a "rig." It is strictly correct to speak of the rigging of a mast or a yard, or of a boom, when all that is meant is the special set of ropes, of whatever size or material, required to keep them in their place, or withdraw them from it, when they have to be moved in the ship. In such cases the part is looked upon as a whole, and is mentally abstracted from the total of the vessel's rigging.

The basis of all rigging is the mast (*q.v.*), whether it be composed of one or of many pieces of wood or metal. The mast is held up and controlled by ropes, which are classed together as the "standing rigging," because they are "that part (of the whole rigging) which is made fast, and not hauled upon" (Admiral Smyth, *Sailor's Word-Book*). This must be understood subject to the restriction that in the case of a mast composed of several parts, including topmast and topgallant mast, these subdivisions may be, often are, lowered. The backstays and other ropes which keep the top and topgallant masts in place, are therefore only "comparative fixtures." The bowsprit, though it does not rise from the deck but projects from the bow, is in fact a mast. The masts, including the bowsprit, support all the sails, whether they hang from the "yards," which are spars slung to the mast, or from "gaffs," which are spars projecting from the mast, or, as in the case of the "jibs," are triangular sails, travelling on ropes called "stays," which go from the foremast to the bowsprit and suspended by halliards. The bowsprit is subdivided like other masts. The bowsprit proper corresponds to the lower fore-, main- or mizzen-mast. The jib-boom, which is movable and projects beyond the bowsprit, corresponds to a topmast; the flying jib-boom, which also is movable and projects beyond the jib-boom, answers to a topgallant mast. The whole body of ropes by which the yards, booms and sails are manipulated

constitute the "running rigging," since they are "in constant use, to trim yards, and make or shorten sail" (Admiral Smyth, *op. cit.*). The rigging must also provide the crew with the means of going aloft, and with standing ground to do their work when aloft. Therefore the shrouds (see below) are utilized to form ladders of rope, of which the steps are called ratlines, by which the crew can mount. Near the heads of the lower masts are the tops—platforms on which men can stand—and in the same place on the topmasts are the "cross-trees," of which the main function is to extend the topgallant shrouds. The yards are provided with ropes, extending from the middle to the extremities or arms, called horses, or foot-ropes, which hang about 2 or 3 ft. down, and on which men can stand. The material of which the cordage is made has differed, and still differs greatly. Leather has been used.

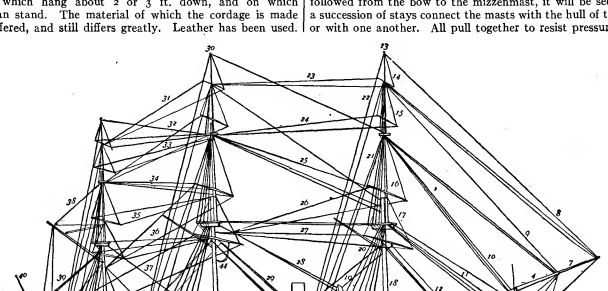

FIG. 1.—The Spars and Rigging of a Frigate. References are not repeated for each mast where the names and functions are identical. 1, bowsprit; 2, bobstays, three pairs; 3, spritsail-gaffs, projecting on each side of the bowsprit—the ropes at the extremities are jib-guys and flying jib-guys; 4, jib-boom; 5, martingale-stay, and below it the flying-jib martingale; 6, back-ropes; 7, flying jib-boom; 8, fore-royal stay, flying jib-stay and halliards; 9, fore-topgallant-stay, jib-stay and halliards; 10, two fore-topmast-stays and fore-topmast staysail halliards; 11, the foretop-bowlines, stopped into the top and two fore-stays; 12, two fore-tacks; 13, fore-truck; 14, fore-royal mast, yard and lift; 15, topgallant mast, yard and lift; 16, fore-top mast, topsail-yard, lift and reef-tackle; 17, foretop, fore-lift, and topsail-sheet; 18, foremast and fore-shrouds, nine pairs; 19, fore-sheets; 20, fore-gaff; 21, fore-topmast backstays and topsail tye; 22, royal and topgallant backstays; 23, fore-royal-braces and main-royal-stay; 24, fore-topgallant braces and main-topgallant-stay; 25, standing parts or fore-topsail-braces and main-topmast-stays; 26, hauling parts of fore-topsail-braces and main-top-bowlines; 27, fore parts of fore-braces; 28, mainstays; 29, main-tacks; 30, main-truck; 31, main-royal-braces; 32, mizzen-royal-stay and mizzen-royal-braces; 33, main-topgallant-braces and mizzen-topgallant-braces; 34, standing parts of main-topsail-braces and mizzen-topmast-stay; 35, mizzen-topsail-braces; 36, hauling parts of main-topsail-braces, mizzen-top-bowlines and cross-jack-braces; 37, main-braces and mizzen-stay; 38, standing part of peak halliards; 39, vangs, similar on each gaff; 40, ensign staff; 41, spanker-boom; 42, quarter-boat's davits; 43, one of the davit topping-lifts and wind-sail; 44, main-yard-tackle; 45, a bull-rope.

During historic times, however, the prevailing materials have been hemp or esparto grass (*Machrocloa*, or *Stipa tenacissima*), and in recent days chain and wire. As the whole of the rigging is divided into standing and running, so a rope forming part of the rigging is divided into the "standing part" and the "fall." The standing part is that which is made fast to the mast, deck or block. The fall is the loose end or part on which the crew haul. The block is the pulley through which the rope runs. "Standing" in sea language means "fixed"—thus the standing part of a hook is that which "is attached to block, chain or anything which is to heave the hook up, with a weight hanging to it; the part opposite the point" (Smyth, *sub voce*). "Tackle" is the combination of ropes and blocks; the combination of cables and anchors constitutes the "ground tackle."

The function of all cordage may be said to be to pull, for the purpose either of keeping the masts in their places, or of moving spars and sails. The standing rigging which supports the masts must be adapted to resist two kinds of pressure, the longitudinal, whether applied by the wind or by the motion of the vessel when pitching (*i.e.* plunging head and stern alternately into the hollow of the sea), and the lateral, when the wind is blowing on the side and she is rolling. The longitudinal pressure is counteracted by the bobstays, stays and backstays. A reference to fig. 1 will show that the bobstays hold down the bowsprit, which is liable to be lifted by the tug of the jibs, and of the stays connecting it with the fore-topmast. If the bowsprit is lifted the fore-topmast loses part of its support. In the case of a small vessel, the lifting of a bowsprit would wreck her whole system of rigging in an instant. If fig. 1 is followed from the bow to the mizzenmast, it will be seen that a succession of stays connect the masts with the hull of the ship or with one another. All pull together to resist pressure from in front. Pressure from behind is met by the backstays, which connect the topmasts and topgallant masts with the sides of the vessel. Lateral pressure is met by the shrouds and breast-backstays. A temporary or "preventer" backstay is used when great pressure is to be met. Seamen have at all times had recourse to special devices to meet particular dangers. When Dundonald, then captain of the "Pallas" frigate, was chased by a French squadron in stormy weather, he fortified his masts by ordering "all the hawsers" (large ropes a little less strong than the cables which hold the anchor) "in the ship to be got up to the mast heads, and hove taut," *i.e.* made fast to the side. Thus she was able to carry more sail than would have been possible with her normal rigging. The running rigging by which all spars and sails are hoisted, or lowered and spread or taken in, may be divided into those which lift and lower—the lifts, jeers, halliards (haulyards)—and those which hold down the lower corners of the sails—the tacks and sheets. A

long technical treatise would be required to name the many combinations of cordage and spars which make up the total rigging. All that is attempted here is to give the main lines and general principles or divisions.

The vessel dealt with here is the fully rigged ship of three or more masts. But she includes all the others and the principles are the same. The simplest of all forms of rigging is the dipping lug, a quadrangular sail hanging from a yard, and always hoisted on the side of the mast opposite to that on which the wind is blowing (the lee side). When the boat is to be tacked so as to bring the wind on the other side, the sail is lowered and rehoisted. One rope can serve as halliard to hoist the sail and as a stay when it is made fast on the weather side on which the wind is blowing. The difference between such a craft and the fully rigged ship is that between a simple organism and a very complex one; but it is one of degree, not of kind. The steps in the scale are innumerable. Every sea has its own type. Some in eastern waters are of extreme antiquity, and even in Europe vessels are still to be met with which differ very little if at all from the ships of the Norsemen of the 9th and 10th centuries. For a full account of these varieties of rigging the reader may be referred to *Mast and Sail in Europe and Asia* (London, 1906), by H. Warington Smyth.

When the finer degrees of variation are neglected the types of rigging may be reduced to comparatively few, which can be classed by the shape of their sail and the number of their masts. At the bottom of the scale is such a craft as the Norse herring boat (fig. 2).

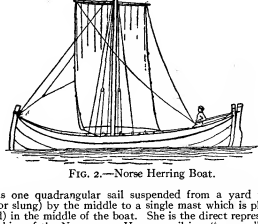

FIG. 2.—Norse Herring Boat.

She has one quadrangular sail suspended from a yard which is hung (or slung) by the middle to a single mast which is placed (or stepped) in the middle of the boat. She is the direct representative of the ships of the Norsemen. Her one sail is a "course" such as is still used on the fore and mainmasts of a fully developed ship; a topsail may be added (as in fig. 3) and then we have the beginning

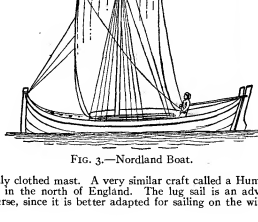

FIG. 3.—Nordland Boat.

of a fully clothed mast. A very similar craft called a Humber keel is used in the north of England. The lug sail is an advance on the course, since it is better adapted for sailing on the wind, with the wind on the side. When the lug is not meant to be lowered, and rehoisted on the lee side, as in the dipping lug mentioned above, it is slung at a third from the end of the yard, and is called a standing lug. A good example of the lug is the Chinese junk (fig. 4). The

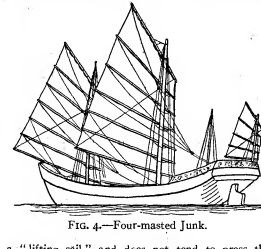

FIG. 4.—Four-masted Junk.

lug is a "lifting sail," and does not tend to press the vessel down as the fore and aft sail does. Therefore it is much used by fishing vessels in the North Sea. The type of the fore and aft rig is the schooner (fig. 5). The sails on the masts have a gaff above and a boom below. These spars have a prong called "the jaws," which fit to the mast, and are held in place by a "jaw rope" on which are threaded beads called trucks. Sails of this shape are carried by fully rigged ships on the mizzen-mast, and can be spread on the fore and main. They are then called try-sails and are used only in bad weather when little sail can be carried, and are hoisted on the trysail mast, a small mast attached to the great one. The Lateen (Latin) sail (fig. 6) is a triangular sail akin to the lug, and is the prevailing type of the Mediterranean. These original types,

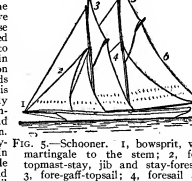

FIG. 5.—Schooner. 1, bowsprit, with martingale to the stem; 2, fore-topmast-stay, jib and stay-foresail; 3, fore-gaff-topsail; 4, foresail and mainstays; 5, main-gaff-topsail; 6, mainsail; 7, end of boom.

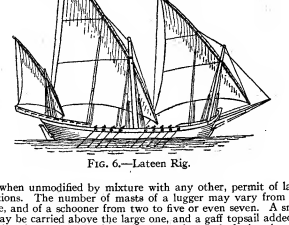

FIG. 6.—Lateen Rig.

even when unmodified by mixture with any other, permit of large variations. The number of masts of a lugger may vary from one to five, and of a schooner from two to five or even seven. A small lug may be carried above the large one, and a gaff topsail added to the sails of a schooner. A small-masted fore-and-aft-rigged vessel may be a cutter (fig. 7) or sloop. But the pure types may be combined, in topsail schooner, brigantines, barquentines and barques, when the topsail, a quadrangular sail hanging from and fastened to a yard, slung by the middle, is combined with fore and aft sails. The lateen rig has been combined with the square rig to make such a rigging as the xebec—a three-masted vessel square rigged on the main, and lateen on the fore and mizzen. Triangular sails of the

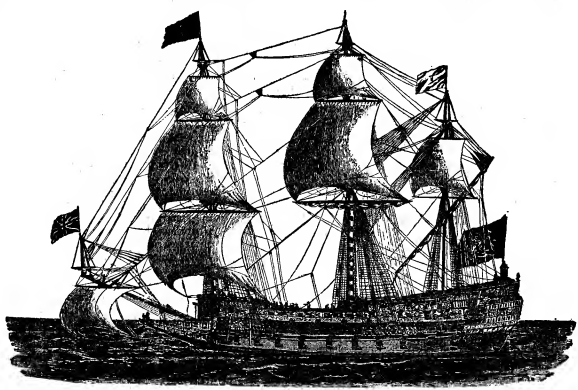
FIG. 8.—Sail Plan of the "Santa Maria."

same type as the jibs can be set on the stays between the masts of a fully rigged ship, and are then known as staysails. But it can only be repeated that the variations are innumerable. Studding-sails are pieces added to increase the breadth (spread) of sails, and require the support of special yards, booms and tackle.

The development of the rigging of ships is a very obscure subject. It was the work of centuries, and of practical men who wrote no treatises. It has never been universal. A comparison of the four-masted junk given above with the figures of ships on medieval seals shows at least much similarity. Yet by selecting a few leading types of successive periods it is possible to follow the growth of the fully rigged ship, at least in its main lines, in modern times.

Fig. 8 gives the sail plan of the "Santa Maria," the flagship of Columbus. It is a modern reconstruction, made in 1893 in Spain at the Carraca arsenal, but is based on good authority. She has only the fixed bowsprit, with a yard and a sail hanging from it, the spritsail yard and spritsail. The foremast has one course, the mainmast a course and topsail, the mizzen a lateen sail. Fig. 9 is the "Sovereign of the Seas," a British warship of 1637. She still has only the fixed bowsprit, but a small upright mast has been erected at the end, which serves to spread a sprit topsail. In some cases at least a sprit topgallant sail was used. The mizzenmast still carries a lateen sail, but topsails have been added, and the whole rigging has multiplied and developed. Between the "Sovereign of the Seas" and the fully developed ship given in fig. 1 the most apparent differences are in the rigging of the bowsprit and the mizzenmast. The sprit topmast has disappeared, and is replaced



From Sir George V. C. Holmes's *Ancient and Modern Ships*, Part I., by permission of the Controller of H.M. Stationery Office.

FIG. 9.—The "Sovereign of the Seas."

by the jib-boom. The square spritsail, which could not be trained fore and aft, and was of feeble effect in keeping the ship's head from turning to windward, has been replaced by the jib. The spritsail yard (which continued in use till after 1850) has disappeared and has been replaced by the spritsail gaff; two fixed spars which slope downwards and help to support the " jib-guys," the lateral supports of the booms. For a time, and after the use of spritsails had been given up, the spritsail yard continued to be used to discharge the function now given to the gaffs (see **W. Scott's *Watch-Book, sub voce***). The changes in the mizzen have an obscure history. About the middle of the 18th century it ceased to be a pure lateen. The yard was retained, but no sail was set on the forearm. Then the yard was given up and replaced by a gaff and a boom. The new sail was called the spanker. It was, however, comparatively narrow, and when a greater spread of sail was required, a studding-sail (at first called a " driver ") was added. At a later date a " spanker " and " driver " were used as synonymous terms, and the studding-sail was called a " ringtail." The studding-sails are the representatives of a class of sail once more generally used. In modern times a sail is cut of the extreme size which is capable of being carried in fine weather, and when the wind increases in strength it is reefed—*i.e.* part is gathered up and fastened by reef points, small cords attached to the sail. Till the 17th century at least the method was often to cut the courses small, so that they could be carried in rough weather. When a greater spread of sail was required, a piece called a bonnet was added to the foot of the sail, and a further piece called a drabbler could be added to that. It is an example of the tenacious conservatism of the sea that this practice is still retained by the Swedish small craft called " lodjor " in the Baltic and White Sea. It will be easily understood that no innovation was universally accepted at once. Jib and sprit topsail, lateen, mizzen and spanker, and so forth, would be found for long on the sea together.

The history of the development of rigging is one of adjustment. The size of the masts had to be adapted to the ship, and it was necessary to find the due proportions between yards and masts. As the size of the medieval ship increased, the natural course was to increase the height of the mast and of the sail it carried. Even when the mast was subdivided into lower, top and topgallant, the lower mast was too long, and the strain of the sail racked the hull. Hence the constant tendency of the ships to leak. Sir Henry Manwarying, when giving the proper proportions of the masts, says that the Flemings (*i.e.* the Dutch) made them taller (" taller " and " taunt " were for long used to mean the same thing) than the English, which again forced them to make the sails less wide. A tall sail could not be cut so wide as a lower one without putting an excessive strain on the mast. He says that the Flemings found an advantage in working to small sails, and they " wronged " (*i.e.* racked) their ships. The English preferred a less lofty mast and a wider spread of sail.

It is very difficult to say what changes in the proportions of masts and sails took place in English ships between the early 17th and the 19th centuries. The difficulty arises largely not only from insufficient knowledge of the earlier period, but from the fact that a scale was fixed only after trials, and by degrees. Manwarying, for instance, when giving rules for finding the lengths of lower masts, says: " The topmasts are ever half so long as the masts into which they belong; but there is no absolute proportion in these, and the like things, for if a man will have his mast short, he may the bolder make his topmast long." In some respects the change was certainly slight. In the early 17th century, in England at least, the length of the mainmast was fixed by taking four-fifths of the breadth of the ship and multiplying by three. Two centuries later the method was to take the length of the lower deck and the extreme breadth, add them together, and divide by two. If we take a 74-gun ship of about the year 1820, which was 176 ft. long on the lower deck and 48 ft. 8 in. wide, she would have, by the system then used, a mainmast of 112 ft. Manwarying's system would have given her one of 117 ft. But in the proportions of the masts to one another there was a change. In the 17th century the foremast was four-fifths of the main, and the bowsprit was of the same length as the foremast. But in both the lengths were eight-ninths of the mainmast, while the bowsprit was seven-elevenths of the mainmast in the largest ships, and three-fifths in the others. When we come to the relative proportions of masts and yards the difficulty increases, for the standard was not the same. The seamen of the 17th century calculated the length of the mainyard not by the size of the mast but by the length of the keel. The mainyard, which was the standard for the others, ought according to " the best and most absolute " estimate to be five-sixths of the length of the keel. But Manwarying again explains that " the proportion is not absolute." If it was followed, the yards of a 17th-century ship must have been rather longer than in a vessel of a hundred and fifty and two hundred years later, when the mainyard was eight-ninths of the mainmast, and a regular scale was fixed through-out. Even so Manwarying's warning that " the proportion was not absolute " must be borne in mind. Changes were constant. The development of the famous American clippers made a considerable one. So has the growth of the vast four- and five-masted iron sailing ships of recent days. Individual captains have fitted ships according to their own ideas. It has always happened that extra sails have been invented and set by ingenious devices for particular purposes. One large sail requires more men to handle it than several small ones. For this reason it is that in recent times the topsail merchant ships have been divided into upper and lower, with a great loss of beauty, but an increase of convenience. To the same cause, the wish to economize in the size of the crew, is to be attributed the introduction of machinery for reefing sail from the deck. There is also an easier and safer power than going aloft to reef them by hand. In a general way it may be said that the development of the rigging has been towards establishing a fair balance between the fore and after spread of canvas. Until the jib was invented in the 18th century, a ship which was sailing on the wind was subject to a disproportionate pressure aft. If she was at all given to " griping "—that is to say, inclined to turn head to wind (and all ships are liable to have ways and manners which are mysterious in origin and not seldom incurable), the mizzen-sail could not be used, for if it had been she would never have been " out of the wind." Therefore when close-hauled (sailing with the wind on the side and somewhat from before her centre) she lost the use of part of her sail. The spritsail which could not be trained fore and aft was no use " on the wind."

A few words may be added concerning the tops. In the earlier form of ships the top was a species of crow's nest placed at the head of the mast to hold a look-out, or in military operations to give a place of advantage to archers and slingers. They appear occasionally as mere bags attached to one side of the mast. As a general rule they are round. In the 16th century there were frequently two tops on the fore- and main-masts, one at the head of the lower, another at the head of the topmast, where in later times there have only been the two traverse beams which make the crosstrees. The upper top dropped out by the 17th century. The form was round, and so continued to be till the 18th century when the quadrangular form was introduced. In quite recent times the military tops of warships have resumed the circular form.

AUTHORITIES.—The present writer is indebted to Admiral Sir Cyprian A. G. Bridge, G.C.B., whose practical acquaintance with the older type of sailing ship as well as with the modern steamship makes his authority specially valuable, for the correction or confirmation of the technical details in the above article. Among the literature of the subject, reference may be made to the following works: Sir Henry Manwaring, *The Seaman's Dictionary* (London, 1644); Darcy Lever, *The Young Sea Officer's Sheet Anchor* (London, 1808); Sir George Nares, *Seamanship* (Portsmouth, 1882); Vice-Admiral Edmond Paris, *La Musée de marine du Louvre* (Paris, 1883). (D. H.)

RIGHT ASCENSION, in astronomy, that co-ordinate of a heavenly body defined by the angle which the meridian passing through it makes with the prime meridian through the vertical equinox (see ASTRONOMY).

RIGHTS OF MAN AND OF THE CITIZEN, DECLARATION OF, a sort of manifesto issued in 1789 by the Constituent Assembly in the French Revolution, to be inscribed at the head of the constitution when it should be completed. It stated the fundamental principles which inspired the revolution. Historians have traced a connexion with the declarations of rights which preceded the constitution of some of the states of the American Union, especially of Virginia, but the situation in France at the time, and the influence of the writings of the *philosophes* made the proposal for such a statement very natural. The declaration overturned the political and social principles upon which the existent régime stood. It has served as a base for modern civil legislation and is still a force in European history. The final text voted by the Assembly was accepted by the king on the 5th of October 1789, at first conditionally, then with modifications. It contains a preamble and 17 articles. They proclaim and define political equality and liberty in its various manifestations, determine the character of the law and the conditions of its application, and state at the same time the restrictions upon the individual will which are necessary

for the benefit of society. Similar declarations were attached to the constitution of 1793 and to that of the year III.

See E. Blum, *La Déclaration des droits de l'homme et du citoyen*, text with commentary (Paris, 1902); L. Bourgeois and A. Metin, *Déclaration des droits de l'homme et du citoyen, 1789* (Paris, 1901); G. Jellinck, *Die Erklärung der Menschen und Bürgerrechte* (Leipzig, 1895). This study has been translated into English by Rudolf Tombo (New York), and has aroused considerable controversy; see E. Boutmy, "La Déclaration des droits de l'homme et du citoyen et M. Jellinck," in *Annales des sciences politiques* for the 15th of July 1902; also E. Walsh, *La Déclaration des droits de l'homme et du citoyen et l'assemblée constituant, Travaux préparatoires* (Paris, 1903).

RIGORD (*c.* 1150–*c.* 1209), French chronicler, was probably born near Alais in Languedoc, and became a physician. Afterwards becoming a monk he entered the monastery of Argenteuil, and then that of St Denis, and described himself as *regis Francorum chronographus*. Rigor wrote the *Gesta Philippi Augusti*, dealing with the life of the French king, Philip Augustus, from his coronation in 1179 until 1206. The work, which is very valuable, was abridged and continued by William the Breton (*q.v.*). The earlier part of the *Gesta* speaks of the king in very laudatory terms, but in the latter part it is much less flattering in its tone. It is published in tome xvii. of Dom Bouquet's *Recueil des historiens des Gaules et de la France* (Paris, 1738–1876); and with introduction by H. F. Delaborde (Paris, 1882–85). A French translation of the *Gesta* is in tome xi. of Guizot's *Collection des mémoires relatifs à l'histoire de France* (Paris, 1825). Rigord also wrote a short chronicle of the kings of France.

See A. Potthast, *Bibliotheca historica* (Berlin, 1896); and A. Molinier, *Les Sources de l'histoire de France*, tome iii. (Paris, 1903).

RIGORISM (Lat. *rigor*, stiffness, firmness), a philosophical term applied by Kant specially to those moralists who take up an anti-hedonist or ascetic standpoint. In general the term is opposed to "latitudinarianism" or "indifferentism," respectively a morality of compromise and a morality of pure indifference,—and signifies insistence upon the strictest interpretation of a principle, rule or criterion. Thus, in Roman Catholic theology, a rigorist holds that in cases of conscience the proper course is to adhere to the strict wording of the law in question.

RILEY, JAMES WHITCOMB (1853–), American poet, was born in Greenfield, Indiana, in 1853. He spent several years as an itinerant sign-painter, actor and musician. During this vagabond experience he had opportunities to revise plays and compose songs, and was brought into close touch with the rural folk of Indiana, becoming familiar with their life and speech. About 1875 he first contributed verses, especially in the Hoosier dialect, to the papers, and he soon became local editor of the Anderson (Ind.) *Democrat*. In August 1877, over the initials "E.A.P.," he printed in the Kokomo (Indiana) *Dispatch* a poem, *Leonainie*, in the manner of Poe.[1] The press throughout the country copied the poem, and many critics of acknowledged authority believed it to have been actually written by Poe, until the hoax was explained by the paper in which it first appeared. To the Indianapolis *Daily Journal* Riley contributed many poems, the best known being a series in dialect which purported to have been written by one "Benjamin F. Johnson, of Boone," a farmer. These he published in book form, under the same pen-name, as *The Old Swimmin' Hole and 'Leven More Poems* (1883). He wrote short stories and sketches, some of unusual merit, but is known almost exclusively as a poet. Of his poems some are in conventional English, many others in the Hoosier dialect of the Middle-West. His materials are the homely incidents and aspects of village and country life, especially of Indiana, and his manner is marked by delicate imagination and naïve humour and tenderness.

The bulk of his work appeared in *The Boss Girl and Other Sketches* (1886), republished in 1891 as *Sketches in Prose; Afterwhiles* (1887); *Pipes o' Pan at Zekesbury* (1888); *Rhymes of Childhood* (1890); *Neighborly Poems* (1891); *The Flying Islands of the Night* (1891), a fantastic blank verse drama; *Green Fields and Running Brooks* (1892); *Poems Here at Home* (1893); *Armazindy* (1894), which contains the poem "Leonainie"; *A Child-World* (1896), reminiscent of his own boyhood; *The Rubáiyát of Doc Sifers* (1897); *Home Folks* (1900); *The Book of Joyous Children* (1902); *His Pa's Romance* (1903); *A Defective Santa Claus* (1904); and in several books of selections, such as *Old Fashioned Roses* (1889), published in England; *Child Rhymes* (1898); *Love Lyrics* (1899); *The Golden Year* (1899), published in England; *Farm Rhymes* (1901); *An Old Sweetheart of Mine* (1902); *Out to Old Aunt Mary's* (1904); *Songs o' Cheer* (1905); *Morning* (1907); and *Songs of Summer* (1908).

RIMBAUD, JEAN ARTHUR (1854–1891), French poet and adventurer, was born at Charleville, in the Ardennes, on the 20th of October 1854. He was the second son of a captain in the French army, who in 1860 abandoned his wife and family. From early childhood Arthur Rimbaud, who was severely brought up by his mother, displayed rich intellectual gifts and a sullen, violent temperament. He began to write when he was ten, and some of the poems which now appear in his works belong to his fifteenth year. Before he was sixteen, in consequence of a violent quarrel with his mother, the boy ran away from Charleville with a packet of his verse, was arrested as a vagabond, and for a fortnight was locked up in the Mazas prison, Paris. A few days after being taken home Rimbaud escaped again, into Belgium, where he lived for some time as a tramp, almost starved, but writing verses with feverish assiduity. In February 1871 he left his mother for a third time, and made his way to Paris, where he knew no one, and whence, after very nearly dying of hunger and exposure, he begged his way back to Charleville. There he wrote in the same year the extraordinary poem of *Le Bateau ivre*, which is now hailed as the pioneer of the entire "symbolist" or "decadent" movement in French literature in all its forms. He sent it to Verlaine, who encouraged the boy of seventeen (whom he supposed to be a man of thirty) to come again to Paris. Rimbaud spent from October 1871 to July 1872 in the capital, partly with Verlaine, partly as the guest of Théodore de Banville, and served in the army of the Commune. With Verlaine he travelled for thirteen months, after the fall of the Commune, through England and Belgium, where in 1873 he published the only work which he ever printed, *Une Saison en Enfer*, in prose; in this he gives an allegorical account of his extravagant relations with Verlaine, which ended at Brussels by a double attempt of the latter to murder his young companion. On the second occasion Rimbaud was dangerously wounded by Verlaine's revolver, and the elder poet was imprisoned at Mons for two years. Meanwhile Rimbaud, deeply disillusioned, determined to abandon Europe and literature, and he ceased at the age of nineteen to write poetry. He settled for a while at Stuttgart, studying German, and in 1875 he disappeared. He set out on foot for Italy, and after extraordinary adventures found employment as a day-labourer in the docks at Lcghorn. Returning to Paris, he obtained a little money from his mother, and then definitely vanished. For sixteen years nothing whatever was heard of him, but it is now known that he embarked as a Dutch soldier for the Sunda Isles, and, presently deserting, fled to Sumatra and then to Java, where he lived for some time in the forest. Returning to Europe, after a vagabond life in every capital, he obtained in 1880 some menial employment in the quarries of Cyprus, and then worked his way to Aden and up into Abyssinia, where he was one of the pioneers of European commercial adventure. Here he settled, at Harrar, as a trader in coffee and perfumes, to which he afterwards added gold and ivory; for the next eleven years, during which he led many commercial expeditions into unknown parts of northern Africa, Shoa and Harrar were his headquarters, and he lived almost entirely with the natives, and as one of themselves. From 1888 to 1891, having prospered greatly as a merchant, he became a sort of semi-independent chieftain, intriguing for France, just

[1] The poem was accompanied by a statement from the editor of the paper that it was "from the gifted pen of the erratic poet, Edgar Allan Poe," and by a circumstantial story to the effect that the poem had been found written on the fly-leaf of an old Latin-English dictionary then owned by "an uneducated and illiterate man" in Kokomo, who had received it from his grandfather, in whose tavern, near Richmond, Va., it had been left by "a young man who showed plainly the marks of dissipation."

outside the borders of civilization. From documents which were first produced in 1902 it appears that from 1883 to 1889 Rimbaud was in close relations with the Ras Makonnen and with Menelek, then only king of Shoa. At the death of the Negus John, in 1888, he was concerned in the formation of the empire of Ethiopia. From this time Rimbaud had a palace in the town of Harrar, and intrigued with the French government in favour of Menelek and against Italy. Meanwhile, in 1886, believing Rimbaud to be dead, Verlaine had published his poems, under the title of *Les Illuminations*, and they had created a great sensation in Paris. In this collection appeared the sonnet on the vowels, attributing a different colour to each: "*A noir, E blanc, I rouge, U vert, O bleu voyelles.*" But the author, in his Abyssinian hut of palm-leaves, was, and unmanned, quite unconscious of the fact. In March 1891 a tumour in his knee obliged Rimbaud to leave Harrar and go to Europe for surgical advice. He reached Marseilles, but the case was hopeless; the leg had to be amputated, and Rimbaud died there in hospital on the 10th of November 1891. The poems of Rimbaud all belong to his earliest youth. Their violent originality, the influence which they have exercised upon younger writers, the tumultuous existence of their author, and the strange veil of mystery which still hangs over his character and adventures, have given to Rimbaud a remarkable fascination. His life has been written by M. Paterne Berrichon (1897), and valuable reminiscences by his sister, Mlle Isabella Rimbaud. His *Œuvres* were collected in 1898 by MM. Berrichon and Delahaye, and in 1901 his statue was unveiled at Charleville.

RIME ROYAL, the name given to a strophe or stanza-form, which is of Italian extraction, but is almost exclusively identified with English poetry from the fourteenth to the early seventeenth centuries. It appears to be formed out of the stanza called Ottava rima (*q.v.*), by the omission of the fifth line, which reduces it to seven lines of three rhymes, arranged ababbcc. It was earliest employed with skill, if not, as seems probable, invented, by Chaucer, who composed his long romantic poem of *Troilus and Cressida* in rime royal, of which the following is an example:—

> "And as the new-abashéd nightingale,
> Thet stinteth first when she begineth sing,
> When that she heareth any herdë tale,
> Or in the hedges any wight stirring,
> And, after, siker doth her voice out-ring,—
> Right so Cresseyda, when her dredë stint,
> Opened her heart, and told all her intent."

The "Prioress' Tale," in the *Canterbury Tales*, offers another particularly beautiful proof of Chaucer's skill in the use of the rime royal. In the fifteenth century this stanza was habitually used, in preference to heroic verse, by Hoccleve and Lydgate, and, with more melody and grace, by the unknown writer of *The Flower and the Leaf*. In the sixteenth century, rime royal was chosen by Hawes as the vehicle of his *Pastime of Pleasure* (1506) and by Barclay in his *Ship of Fools* (1509); it was now regarded as the almost exclusive classical form for heroic poetry in England, and it had long been so accepted in Scotland, where *The King's Quair* of King James I., the *Fables* of Henryson and *The Thistle and the Rose* of Dunbar had closely followed Chaucer's pattern. The greater part of that huge poetic miscellany, *The Mirror for Magistrates* (1559–1610), was written in rime royal, Sackville's momentous *Induction* among the rest. The seven-line stanza began to go out of fashion with the revival of Elizabethan poetry, but we find it still used in Spenser's *Hymn of Heavenly Beauty*, Shakespeare's *Lucrece* and the *Orchestra* of Sir John Davys. After the first decade of the seventeenth century rime royal went out of fashion. Since then it has been occasionally revived, but not in poems of great length or particular importance. Rime royal should always be written in iambic metre, and be formed of seven lines of equal length, each containing ten syllables.

RIMINI, a town and bishop's see of Italy, in the province of Forlì, Emilia, on the Adriatic coast, 69 m. S.E. of Bologna by rail. Pop. (1901) town, 18,022; commune, 46,801. The city is bounded on three sides by water. It faces the Adriatic to the north, has the torrent Aprusa, now called Ausa, on the east, and the river Marecchia on the west. It stands in a fertile plain, which on the southern side soon swells into pleasant slopes backed by the jagged peaks of the Umbrian Apennines. The foremost foothill of the range is the steep crag of Mons Titanus, crowned by the towers of the republic of San Marino. Rimini attracts numerous visitors for the sea-bathing at Porta Marina. It has mineral springs, and the industries comprise fisheries, ironworks and foundries, sulphur furnaces, silk-mills, rope walks, match factories, brickworks, flourmills and furniture. Its main interest, however, is historical. Apart from the ancient buildings, &c., referred to below, Rimini can boast of a good public library, founded by the jurist Gambalunza in 1617, a municipal picture gallery, an archaeological museum, a technical school (1882) and a bronze statue of Pope Paul V. The ancient castle of Sigismondo Malatesta, now dilapidated, has in recent years been used as a prison.

History.—Rimini is the ancient Ariminum (*q.v.* for its early history and remains). During the middle ages the history of Rimini has no importance. Alternately captured by Byzantines and Goths, it was rigorously besieged by the latter in A.D. 538. They were, however, compelled to retreat before the reinforcements sent by Belisarius and Narses; thus the Byzantines, after various vicissitudes, became masters of the town, appointed a duke as its governor, and included it in the exarchate of Ravenna. It afterwards fell into the power of the Longobards, and then of the Franks, who yielded it to the pope, for whom it was governed by counts to the end of the 10th century. Soon after this period the imperial power became dominant in Rimini. In 1157 Frederick I. gave it, by imperial patent, the privilege of coining money and the right of self-government; and in the 13th century we find Rimini an independent commune waging war on the neighbouring cities.

In the year 1216, Rimini, being worsted by Cesena, adopted the desperate plan of granting citizenship to two members of the powerful Malatesta tribe, Giovanni and Malatesta, for the benefit of their aid and that of their vassals in the defence of the state and the conduct of the war. This family quickly struck root in the town and gave birth to future tyrants; for in 1237 Giovanni was named podestà, and this office was the first step towards the sovereign power afterwards assumed by his descendants. Meanwhile, Rimini was torn by the feuds of Guelf and Ghibelline. The latter were the dominant party in the days of Frederick II., although very unpopular on account of the grievous taxes imposed by the empire. Accordingly, the majority of the urban nobles joined the Guelfs and were driven into exile. But before long, as the Swabian power declined in Italy, the Guelf party was again predominant.

Then followed a long period of confusion, in which, by means of conspiracies and crimes of every kind, the Malatesta succeeded in becoming masters and tyrants of Rimini. Giovanni Malatesta had died in 1247 and been succeeded by his son Malatesta, born in 1212, and surnamed Malatesta da Verrucchio. This chieftain, who lived to be a hundred years old, had ample time to mature his ambitious designs, and was the real founder of his house. Seizing the first suitable moment, he placed himself at the head of the exiled Guelfs, and restored them to Rimini. Then, as the empire acquired fresh strength in Italy, he quietly bided his time and, on the descent of the Angevins, again assumed the leadership of the Guelfs who now had the upper hand for a long time. Being repeatedly elected podestà for lengthy terms of office, he at last became the virtual master of Rimini. Nor was he checked by Rome. Pope Boniface VIII. was fully aware of the rights and traditional pretensions of the Holy See, but preferred to keep on good terms with one who had so largely contributed to the triumph of the Guelfs in Romagna. Accordingly he not only left Malatesta unmolested, but in 1299 conferred on him fresh honours and estates, so that

his power went on increasing to the day of his death in 1312.

Four sons had been born to Malatesta—Malatestino, Giovanni the Lame, Paolo the Handsome, and Pandolfo; but only the oldest and youngest survived him. Giovanni the Lame (*Sciancato*), a man of a daring impetuosity only equalled by his ugliness, had proved so useful a general to Giovanni da Polenta of Ravenna as to win in reward the hand of that potentate's beautiful daughter, known to history as Francesca da Rimini. But her heart had been won by the handsome Paolo, her brother-in-law; and the two lovers, being surprised by Giovanni, were murdered by him on the spot (1285). This episode of the story of the Malatesta has been immortalized in Dante's *Inferno*. Giovanni died in 1304. Thus in 1312 Malatestino became lord of Rimini, and on his decease in 1317 bequeathed the power to his brother Pandolfo.

Pandolfo died in 1326, leaving two heirs, Malatesta and Galeotto. The former was nicknamed Guastafamiglia, because, although at first willing to let his brother share his power, he rid himself by violence and treachery of other kinsmen who claimed their just rights to a portion of the state. His intent was to become sole lord and to aggrandize his tiny principality. But the reigning pope, Innocent VI., despatched the terrible Cardinal Albornoz to Romagna, and it was speedily reduced by fire and sword. In 1355 the Malatesta shared the fate of the other potentates of the land. Nevertheless, it was the cardinal's policy to let existing governments stand, provided they promised to act in subordination to the papal see. Thus he granted the Malatesta brothers the investiture of Rimini, Pesaro, Fano and Fossombrone, and they arranged a division of the state. Guastafamiglia took Pesaro, which was held by his descendants down to the brothers Carlo and Galeazzo. The former of these, who died in 1430, was father to the Parisina beheaded in Ferrara, whose tragic love story has been sung by Byron. The latter won the title of "l'Inetto" (the Incapable) by the foolish sale of his rights over Pesaro to the Sforza in 1447.

Galeotto, on the other hand, retained the lordship of Rimini ruling tranquilly and on good terms with the popes, who allowed him to add Cervia, Cesena and Bertinoro to his states. Dying in 1385 at the age of eighty, he left two sons—Carlo, who became lord of Rimini, and Pandolfo, who had Fano for his share. Carlo (1364–1420) was energetic, valiant and a friend of the popes, who named him vicar of the church in Romagna. He was a patron of letters and the arts, and during his reign his court began to be renowned for its splendour. As he left no issue, his inheritance was added to that of his brother Pandolfo, and Fano was once more united to Rimini. Pandolfo (1370–1427) had led the life of a condottiere, taking a prominent part in the Lombard wars following on the death of Galeazzo Maria Visconti, and held rule for some time in Brescia and Bergamo. He left three natural sons who were declared legitimate by Pope Martin V. The eldest, Galeotto (1411–1432), was an ascetic, gave little or no attention to public business, and, dying early, bequeathed the state to his brother Sigismondo Pandolfo. The third son, Novello Malatesta (1418–1465) ruled over Cesena.

Sigismondo (1417–1468) is the personage to whom Rimini owes its renown during the Renaissance, of which indeed he was one of the strangest and most original representatives. He was born in Brescia, and when called to the succession, at the age of fifteen, had already given proofs of valour in the field. His knowledge of antiquity was so profound as to excite the admiration of all the learned men with whom he discoursed, even when, as in the case of Pius II., they chanced to be his personal enemies. To him is due the erection of the church of St Francis, or temple of the Malatesta, one of the rarest gems of the Renaissance and the greatest of Rimini's treasures (see below for description).

Of so dissolute a life that, although married, he had children by several mistresses at the same time, he gave vent to all his passions with a ferocity that was bestial rather than human. And—as the crowning contradiction of his strange nature—from his youth to the day of his death he remained the devoted lover of the woman for whose sake he became a poet, whom he finally made his wife, and whom he exalted in every way, even to the point of rendering her almost divine honours. Yet this love never availed to check his excesses. On assuming power in 1432, Sigismondo was already affianced to the daughter of Count Carmagnola; but when that famous leader was arraigned as a traitor by the Venetians, and ignominiously put to death, he promptly withdrew from his engagement, under the pretext that it was impossible to marry the child of a criminal. In fact, he aimed at a higher alliance, for he espoused Ginevra d'Este, daughter of the duke of Ferrara, and his entry into Rimini with his bride in 1434 was celebrated by splendid festivities. In 1437 a son was born to him, but died within the year, and in 1440 the young mother followed it to the grave. Every one declared that she died by poison administered by her husband. This, however, was never proved. The duke of Ferrara remained his friend, nor is it known what motive Sigismondo could have for wishing to get rid of his wife. Two years afterwards he married Polissena, daughter of the famous condottiere Francesco Sforza, who in 1443 bore him a son named Galeotto Roberto. But by this time he was already madly in love with Isotta degli Atti, and this was the passion that endured to his death. The lady succeeded in gaining an absolute ascendancy over him, which increased with time. She bore him several children, but this did not prevent his having others by different concubines. Such being the nature of the man, it is not astonishing that, as his ardour for Isotta increased, he should have little scruple in ridding himself of his second wife. On the 1st June 1450 Polissena died by strangling, and on the 30th of the same month Isotta's offspring were legitimated by Nicholas V.

It is only just to record that, although Malatesta's intrigue with Isotta had long been notorious to all, and he had never sought to conceal it, no one ever accused her of either direct or indirect complicity in her lover's crimes. Isotta's history, however, is a strange one, and opens up many curious questions. She was of noble birth and seems to have attracted Sigismondo's notice as early as 1438, for at the age of twenty he produced verses of some merit in praise of her charms. She was indeed widely celebrated for her beauty and intellect, culture, firmness and prudence; and even Pope Pius II. proclaimed her worthy to be greatly loved. When Sigismondo was absent she governed Rimini wisely and well, and proved herself a match for the statesmen with whom she had to deal. The leading poets of the court dedicated to her a collection of verses entitled *Isottaei*, styled her their mistress and the chosen of Apollo. Artists of renown perpetuated her features on canvas, on marble and on many exquisite medals, one of which has a closed book graven on the reverse, with the inscription "Elegiae" in allusion to poems she was said to have written. Nevertheless, Yriarte, in his book on the Malatesta and Rimini, asserted that there was documentary evidence to prove that Isotta was unable to sign her own name. But it is not at all surprising that Isotta should have her letters written and signed by another hand, when such was by no means an uncommon practice among the princes and nobilities of her day. Lucrezia Borgia, for instance, frequently did the same. It is besides simply incredible that a woman of the Italian Renaissance of Isotta's birth, standing and reputation should have been unable to write.

Her marriage with Malatesta did not take place until 1456; but of the ardent affection that had long bound them together there are stronger proofs than the lover's juvenile verses, or than even the children Isotta had borne to him. For, more than all else, the temple of St Francis has served to transmit to posterity the history of their loves. Malatesta decided on building this remarkable church as a thankoffering for his safety during a dangerous campaign undertaken for Pope Eugenius IV. about the year 1445.

The first stone was laid in 1446, and the work was carried on

with so much alacrity that mass was performed in it by the close of 1450. Sigismondo entrusted the execution of his plans to Leo Battista Alberti, who had to encase in a shell of classic architecture a 13th-century Franciscan church. The original edifice being left intact, it was a difficult question how to deal with the windows and the Gothic arches of the interior. Alberti solved the problem with marvellous skill, blending the old architecture with the new style of the Renaissance, and giving it variety without destroying its unity of effect.

Being eager to adorn his temple with the most precious marbles, Sigismondo's veneration for antiquity did not prevent him from pillaging many valuable classical remains in Rimini, Ravenna and even in Greece. Such was the zeal with which Alberti pursued his task that the exterior of the little Rimini church is one of the finest and purest achievements of the Renaissance, and surpasses in beauty and elegance all the rest of his works. But it is much to be deplored that he should have left the upper part of the façade unfinished. Alberti came to Rimini, made his design, saw the work begun and then left it to be carried out by very skilful artists, on whom he impressed the necessity of faithfully preserving its general character so as "not to spoil that music."

The internal decorations, especially the enormous quantity of wall ornaments, consisting chiefly of scrolls and bas-reliefs, were executed by different sculptors under the personal direction of Malatesta, who, even when engaged in war, sent continual instructions about their work. It is difficult to give an exact idea of this extraordinary church to those who have no personal acquaintance with it. The vault was never finished, and still shows its rough beams and rafters. The eight side chapels alone are complete, and their pointed arches spring from Renaissance pilasters planted on black marble elephants, the Malatesta emblems, or on baskets of fruit held by children. The surface of the pilasters is divided into compartments encrusted with bas-reliefs of various subjects and styles. Everywhere—on the balustrades closing the chapels, round the base of the pilasters, along the walls, beneath the cornice of both the exterior and the interior of the church—there is one ornament that is perpetually repeated, the interwoven initials of Sigismondo and Isotta. This monogram is alternated with the portrait and arms of Malatesta; and these designs are enwreathed by festoons linked together by the tyrant's second emblem, the rose. The most singular and characteristic feature of this edifice is the almost total absence of every sacred emblem. Rather than to St Francis and the God of the Christians it was dedicated—and that while Sigismondo's second wife still lived—to the glorification of an unhallowed attachment. Nature, science and antiquity were summoned to celebrate the tyrant's love for Isotta. The bas-reliefs of one of the chapels represent Jupiter, Venus, Saturn, Mars and Diana, together with the signs of the zodiac. And these subjects are derived, it appears, from a poem in which Sigismondo had invoked the gods and the signs of the zodiac to soften Isotta's heart and win her to his arms. The pageants of Mars and Diana seem to have been suggested by the *Trionfi* of Petrarch. Elsewhere we see prophets and sibyls, personifications of the theological virtues and of the sciences. The delicate bas-reliefs of botany and medicine, history and astronomy, have been judged by some writers to be Grecian, on account of the ancient appearance of their marble, their inscriptions in Greek and Latin, and others that have never been deciphered. But a moment's examination of the sculptures is enough to destroy this hypothesis. Besides, some of the inscriptions are very easily read and record "Apollo Arminaeus" and "Jupiter Arminaeus."

In the first chapel on the left is the family tomb of the Malatesta, with sculptured records of their triumphs and of their alleged descent from Scipio Africanus. Better worthy of notice is the third chapel to the right, known as that of the Angels, on account of the angels and children carved on its pillars. It is nominally dedicated to the archangel Michael, whose statue is enshrined in it; but the figure has the face of Isotta, the ruling deity of this portion of the church. For here is the splendid and fantastic tomb erected to this lady, during her life and previous to the death of Sigismondo's second wife. No monument, be it remarked, is raised over the burial-place of Ginevra and Polissena. The urn of Isotta's sarcophagus is supported by two elephants, and bears the inscription, "D. Isottae Ariminensi B. M. Sacrum, MCCCCL." The "D." has been generally interpreted as "Divae" and the "B. M." as "Beatae Memoriae." But some, unwilling to credit such profanity, allege that the letters stand for "Bonae Memoriae." Nevertheless, all who have seen the church must admit the improbability of similar scruples.

The numerous artists employed on the interior of the church were under the direction of the *proto-maestro* Matteo de Pasti the celebrated medallist. And indeed the peculiar and fantastic character of the sculptures in this chapel frequently recalls the designs of his famous works. All this decoration is in strange contrast with the grandly austere simplicity of the façade and outer walls of the church. There no ornament disturbs the harmony of the lines. The frieze beneath the cornice, reproducing the lovers' initials and the Malatestian ensigns, is in such very low relief that it only enhances the perfection of "that music" produced by the marvellous skill of Alberti. Also the colour of the stone, a soft creamy white, adds to the general beauty of effect. And everything both within and without contributes to the profane and pagan character which it was Sigismondo's purpose to impress on the Christian church. On each of its outer walls are seven arched recesses, intended to contain the ashes of the first literati and scientists of his court. In the first, to the right, is the urn of the poet Basinio, one of his pensioners, in the second that of Giusto de' Conti, author of some rhymes on the *Bella Mano*, while the third bore the more famous name of Gemisthus Pletho. This well-known Byzantine philosopher was the diffuser of Platonism in Florence during the time of Cosimo de' Medici, and had faith in the revival of paganism. Returning to his own people, he had died in the Morea. Sigismondo, having gone there in command of the Venetian expedition against the Turks, exhumed the philosopher's bones as holy relics, and brought them to Rimini for worthy sepulture in his Christian pantheon. All this is solemnly recorded in the inscription, which is dated 1465. The fourth sarcophagus was that of Roberto Valturio (d. 1489), the engineer, author of *De Re Militari*, who had been Sigismondo's minister and had aided him in the construction of the castle of Rimini. The other urns on this side were placed by Malatesta's successors, and the arches on the left wall remained untenanted.

Sigismondo understood the science of fortification. He was also the first to discard the use of wooden bomb-shells, and substitute others cast in bronze. As a soldier his numerous campaigns had shown him to be possessed of all the best qualities and worst defects of the free captains of his time. He began his military career in 1432 in the service of Eugenius IV.; but, when this pope doubted his good faith and transferred the command to another, he sided with the Venetians against him, though at a later date he again served under him. On the decease of Filippo Maria Visconti in 1447 he joined the Aragonese against Venice and Florence; but, presently changing his flag, fought valiantly against Alphonso of Aragon and forced him to raise the siege of Piombino. In 1454 he accepted a command from the Sienese; but suddenly, after his usual fashion, he made peace with the enemies of the republic, and had to save himself by flight from arrest for his perfidy. It was then that the letters from Isotta were confiscated. After this he began scheming to hasten the coming of the Angevins, and took part in new and more hazardous campaigns against adversaries such as the duke of Urbino, Sforza of Milan, Piccinino, and, worst of all, the Sienese pope, Pius II., his declared and mortal foe. This time Sigismondo had blundered; for the cause of Anjou was hopelessly ruined in Italy. He was therefore driven to make his submission to the pope, but, again rebelling, was summoned to trial in Rome (1460) before a tribunal of hostile cardinals. All the old charges against him were now revived

and eagerly confirmed. He was pronounced guilty of rapine, incendiarism, incest, assassination and heresy. Consequently he was sentenced to the deprivation of his state (which was probably the main object of the trial), and to be burnt alive as a heretic.

This sentence, however, could not easily be executed, and Sigismondo was only burnt in effigy. But the pope marked the intensity of his hatred by causing the dummy to be carved and dressed with such lifelike resemblance that he was almost able to persuade himself that his hated enemy was really consumed in the flames. Malatesta could afford to laugh at this farce, but he nevertheless prepared in haste for a desperate defence (1462). He knew that the bishop Vitelleschi, together with the duke of Urbino and his own brother Novello Malatesta, lord of Cesena, were advancing against him in force; and, being defeated by them at Pian di Marotta, he was driven to Rome in 1463 to again make submission to the pope. This time he was stripped of all his possessions excepting the city of Rimini and a neighbouring castle, but the sentence of excommunication was withdrawn. The once mighty tyrant of Rimini found himself reduced to penury with a state chiefly composed of a single town. He therefore took service with the Venetians, and in 1464 had the command of an expedition to the Morea. Here his movements were so hampered by the interference of the commissioners of the republic that, with all his valour, he could achieve no decisive success. In 1466 he was able to return to Rimini, for Pius II. was dead, and the new pope, Paul II., was less hostile to him. Indeed, the latter offered to give him Spoleto and Foligno, taking Rimini in exchange; but Malatesta was so enraged by the proposal that he went to Rome with a dagger concealed on his person, on purpose to kill the pope. But, being forewarned, Paul received him with great ceremony, and surrounded by cardinals prepared for defence; whereupon Sigismondo changed his mind, fell on his knees and implored forgiveness. His star had now set for ever. For sheer subsistence he had to hire his sword to the pope and quell petty rebellions with a handful of men. At last, his health failing, he returned to his family, and died in Rimini on the 7th of October 1468, aged fifty-one years.

He was succeeded, according to his desire, by Isotta and his son Sallustio. But there was an illegitimate elder son by another mother, named Roberto Malatesta, a valiant and unscrupulous soldier. Befriended by the pope, this man nndertook to conquer Rimini for the Holy See, but came there to further his own ends instead (20th October 1469), and, while feigning a desire to share the government with Isotta and her son, resolved, sooner or later, to seize it for himself. This aroused the pope's wrath, and Roberto instantly prepared for defence. Finding an ally in the duke of Urbino, whose eyes were now opened to the aggressive policy of the church, he was able to repulse its forces. Paul II. died soon after, and was succeeded by Sixtus IV. Roberto's position was now more secure, and in order to strengthen his recent alliance he betrothed himself to the daughter of the duke of Urbino. The next step was to dispose of his rival kindred. On the 8th of August 1470 Isotta's son was found murdered in a well belonging to the Marcheselli family; and a bloodstained sword, placed in their courtyard by Roberto, made it appear as though they had been guilty of the crime. Towards the end of the same year Isotta died also, apparently of a slow fever, but really, it was believed, by poison. Another of her sons, Valerio, born in 1453, still lived, but he was openly put to death by Roberto on a trumped-up charge of treason. In 1475 the new tyrant celebrated his nuptials with the duke of Urbino's daughter, and, being again taken into favour by the pope, valiantly defended him in Rome against the attacks of the duke of Calabria, and died there in 1482 of the hardships endured in the war. His widow was left regent during the minority of his son Pandolfo, who was nicknamed Pandolfaccio on account of his evil nature. Directly he was of age, he seized the reins of government by killing some relations who had plotted against him, and crushed another conspiracy in the same way. A daring soldier, he distinguished himself at the battle of the Taro against the French; but his tyranny made him hated by his subjects. In 1500, when Cesare Borgia fell on Romagna with violence and fraud, this Malatesta shared the fate of other petty tyrants and had to fly for his life. After the fall of the Borgia he returned, but, being bitterly detested by his people, decided to sell his rights to the Venetians, who had long desired to possess Rimini, and who gave him in exchange the town of Cittadella, some ready money, and a pension for life.

This arrangement was naturally disapproved by Rome, and especially by Julius II.; he therefore contrived the league of Cambray on purpose to ruin the Venetians, who were crushingly defeated in 1509. Thereupon the pope, having accomplished his own ends, made alliance with the Venetians, who were now prostrate at his feet, and, with them, the Spaniards and the Swiss, fought against the French at Ravenna in 1512. Here the French were victors, but owing to their heavy losses and the death of their renowned leader, Gaston de Foix, were compelled to retreat. Thus Julius became master of Rimini and the other coveted lands. Malatesta made more than one attempt to win back his city, but always in vain, for his subjects preferred the papal rule, and in 1528 Pope Clement VII. became definite master of the town. Thus, after two hundred and fifty years, the sway of the Malatesta came to an end, and Pandolfo was reduced to beggary. He died in 1534, leaving a daughter and two sons in great poverty. The elder, Sigismondo, after various military adventures, died at Reggio d'Emilia in 1543; and Malatesta, the younger, went to fight in the Scotch and English wars, and was never heard of again. Sigismondo had left male heirs who made another attempt to regain Rimini in 1555, but Pope Paul IV. declared them deposed in perpetuity in punishment of Pandolfaccio's misdeeds.

From that time the Malatesta became citizens of Venice; their names were inscribed in the Golden Book, and they were admitted to the grand council. With the death, in 1716, of Christina Malatesta, the wife of Niccolo Boldu, the Rimini branch of the family became extinct. The descendants of Giovanni, brother of Malatesta da Verrucchio, who married one of the Sogliano, were known as the Sogliano-Malatesta. The representatives of this branch settled in Rome.

The history of Rimini practically ends with its independence. It fell into obscurity under the rule of the popes, and was not again mentioned in history until, in 1831 and 1845, it began taking a prominent part in the revolutionary movements against papal despotism and in favour of Italian independence.

RIMMER, WILLIAM (1816–1879), an American artist, was born in Liverpool, England, on the 20th of February 1816. He was the son of a French refugee, who emigrated to Nova Scotia, where he was joined by his wife and child in 1818, and who in 1826 removed to Boston, where he earned a living as a shoe-maker. The son learned the father's trade; at fifteen became a draughtsman and sign-painter; then worked for a lithographer; opened a studio and painted some ecclesiastical pictures; in 1840 made a tour of New England painting portraits; lived in Randolph, Mass., in 1845–55 as a shoemaker, for the last years of the decade practising medicine; practised in East Chelsea and received a diploma from the Suffolk County Medical Society; and in 1855 removed to East Milton, where he supplemented his income by carving busts from blocks of granite. In 1860 he made his head of St Stephen (now in the Boston Athenaeum) and in 1861 his "Falling Gladiator" (since 1880 in the Boston Museum of Fine Arts), which Truman H. Bartlett calls "the most remarkable

work of sculpture that has yet [1882] been produced in this country . . . powerful, wonderful, but not alluring." Rimmer's sculptures, except those mentioned and "The Fighting Lions" (now in the Boston Art Club), "A Dying Centaur" (in the Boston Museum of Fine Arts), and a statue of Alexander Hamilton (made in 1865 for the city of Boston), were soon destroyed. He worked in clay, not modelling but building up and chiselling; almost always without models or preliminary sketches; and always under technical disadvantages and in great haste; but his sculpture is anatomically remarkable and has an "early-Greek" simplicity and strength. He published *Elements of Design* (1864) and *Art Anatomy* (1877), but his great work was in the class-room, where his lectures were illustrated with blackboard sketches. His studies in line suggest William Blake in their imaginative power. He died on the 20th of August 1879.

See Truman H. Bartlett, *The Art Life of William Rimmer* (Boston, 1882).

RIMSKY-KORSAKOV, NICOLAS ANDREIEVICH (1844–1908), Russian composer, was born at Tikhvin, Novgorod, on the 18th (N.S.) of March 1844. He was one of the musical amateurs who, with Borodin, Cui and Moussorsky, gathered round Balakirev in St Petersburg in the days when Wagner was still unknown. By 1865 he had written a symphony (in E minor) which in that year was performed—the first by a Russian composer—under Balakirev's direction, and in 1873 he definitely retired from the navy, having been appointed a professor in the St Petersburg Conservatoire. The same year witnessed his marriage to a talented pianist, Nadejda Fourgold, and the production of his first opera, Pskovitianka. This was followed by *May Night* (1878), *The Snow Maiden* (1880), *Mlada* (1892), *Christmas Eve* (1894), *Sadko* (1895), *Mozart and Salieri* (1898), *The Tsar's Bride* (1899), *Tsar Saltana* (1900), *Servilia* (1902), *Kostchei the Immortal* (1902), *Kites* (1905). But his operas attracted less attention abroad than his symphonic compositions, which show a mastery of orchestral effect combined with a fine utilization of Russian folk-melody and a happy feeling for "programme music," his writing being peculiarly individual and distinctive in its restraint and avoidance of violent methods. Notable among these works are his first symphony, his second (Op. 9) *Antar*, his third (Op. 32), and his orchestral suites and overtures, his Spanish *Capriccio* (1887) being particularly appreciated. He also wrote a number of beautiful songs, pianoforte pieces, &c., and he eventually took Balakirev's place as the leading conductor in St Petersburg, never sparing himself in assisting in the musical development of the Russian school. He died there on the 20th of June 1908.

RINDERPEST (German for "cattle-plague," which is the English synonym), one of the most infectious and fatal diseases of oxen, sheep, goats, camels, buffaloes, yaks, deer, &c.; a virulent eruptive fever which runs its course so rapidly and attacks such a large percentage of ruminants when it is introduced into a country, that from the earliest times it has excited terror and dismay. It is an Asiatic malady, and has prevailed extensively in south Russia, central Asia, China, Indo-China, Burma, India, Persia, Ceylon and the Malay Archipelago. Thence it has at times been carried into Europe, and towards the end of the 19th century into South Africa. It appeared in Egypt in 1844 and 1865, Abyssinia in 1890, Japan in 1892, and the Philippines in 1898.

It has been noted that its irruptions into Europe in the earlier centuries of our era always coincided with invasions of barbarous tribes in the east of Europe; and even at a later period the disease accompanied the events of war, when troops with their commissariat moved from the east towards the west, or cattle, when they were carried in the same direction. One of the earliest recorded irruptions of cattle-plague into western Europe occurred in the 5th century after the sanguinary invasion of the Huns under Attila, the expulsion of the Goths from Hungary, and the fierce internecine wars of the whole Germanic population. The disease appears then to have been carried from Hungary through Austria to Dalmatia, while by Brabant it obtained access to the Low Countries, Picardy, and so on to the other provinces of France. In the curious poem *De Mortibus Boum* written by St Severus, who lived at that period, the course and destructiveness of the disease are specially alluded to. Many invasions of Europe are described, and in several of these Britain was visited by it—as in 809–10, 986–87, 1223–25, 1513–14, and notably in 1713, 1745, 1774, 1799. In 1865 and 1872 it was imported direct from Russia. In 1870–71 it destroyed 70,000 cattle in France, 30,000 in Alsace-Lorraine, and 10,000 in Germany. In England an outbreak occurred in 1877, when it was imported from Germany, where the disease continued until 1879.

The infective agent has not been positively identified, but it is known to exist in all the various secretions and excretions, in the flesh, blood and various organs of the body. Contagion may be direct or indirect, and the disease may be conveyed to healthy cattle by contaminated fodder, litter, water, clothing, pasture, sheds, railway wagons, hides, horns and hoofs. Attendants, cats, dogs, birds, vermin and flies may spread the infection. Definite symptoms of the disease may not be recognized until the expiration of three to six days after exposure, the period of incubation.

Symptoms.—Like some other general diseases, this does not offer any exclusive or pathognomonic symptoms, but is rather characterized by a group of functional and anatomical alterations. An exact knowledge of its symptoms and necroscopical appearances is of the utmost importance, as its extension and consequent ravages can only be arrested through its timely recognition and the immediate adoption of the necessary sanitary measures. Intense fever, diarrhœa or dysentery, croupous inflammation of the mucous membranes in general, sometimes a cutaneous papular eruption, and great prostration mark the course of the affection, which is frequently most difficult to diagnose during life, especially if its presence is not suspected. Its introduction and mode of propagation can, in many instances, be ascertained only at a late period, and when great loss may already have been sustained. In the majority of cases the examination of the carcase of an animal which has died or been purposely killed is the best way to arrive at a correct diagnosis. Indeed, this is practically the only certain means of concluding as to the presence of the malady, as there are considerable variations in the chief symptoms with regard to their intensity as well as in the secondary symptoms or epiphenomena.

Among cattle indigenous to the regions in which this malady may be said to be enzootic the symptoms are often comparatively slight, and the mortality not great. So much is this the case that veterinary surgeons who can readily distinguish the disease when it affects the cattle of western Europe, can only with difficulty diagnose it in animals from Hungary, Bessarabia, Moldavia, or other countries where it is always more or less prevalent. In these the indications of fever are usually of brief duration, and signs of lassitude and debility are, in some instances, the only marks of the presence of this virulent disorder in animals which may, nevertheless, communicate the disease in its most deadly form to the cattle of other countries. Slight diarrhœa may also be present, and a cutaneous eruption, accompanied by gastric disturbance, running at the eyes, and occasional cough. In the more malignant form the fever runs high, 106° to 107° Fahr., and all the characteristic symptoms are well marked: dulness, sunken eyes, eruption on the skin, discharges from eyes, nose and mouth, shivering fits, difficult breathing, dry, harsh cough, miliary eruptions on the gums, accumulation of bran-like exudate within the lips, fetid breath, with certain nervous phenomena, and dysenteric dejections. Death generally occurs in four or five days, the course of the disorder being more rapid with animals kept in sheds than with those living in the open, and in summer than in winter. The post-mortem appearances are most marked in the digestive canal, and comprise red spots and erosions on the palate, lips, tongue and pharynx; intense congestion of the lining of the fourth stomach, which in places is covered with a grey or reddish pultaceous deposit, under which the membrane is deeply

ulcerated. Similar lesions are seen in the small intestine, caecum and rectum. The membrane lining the air passages is congested throughout, and the lungs are emphysematous.

In recent years much has been done in Russia and India towards the prevention of rinderpest by inoculation and the use of immunizing sera. In South Africa the bile method (or the injection of bile obtained from cattle dead of rinderpest), discovered by Koch, in 1896; bile with admixture of glycerine, recommended by Edington; the simultaneous injection of serum and rinderpest blood, introduced by Turner and Kolle in 1897, and repeated injection of fortified serum alone, have been employed, more or less successfully, in conferring immunity. But elsewhere the main line of action has been in the direction of preventing the introduction of the disease by prohibiting the importation of cattle from infected countries.

RING (O.E. *hring*; a word common to Teutonic languages,[1] and probably cognate with the Lat. *circus*, Gr. κίρκος or κρίκος, Skt. *chakra*, wheel, circle, cf. also "harangue"), in art, a band of circular shape of varying sizes, made of any material and used for various purposes, but, particularly, a circular band of gold, silver or other precious or decorative material used as an ornament, not only for the finger, but also for the ear (see EARRING), or even for the nose, where it is still worn by certain races in India and Africa. The word is also used of many objects which in structure take the shape of a circle or hoop, such as the tracheal rings, the circular-shaped bands of cartilage in the walls of the windpipe, the "annual rings," or concentric layers of wood produced each year in the trunks of trees, &c. In transferred senses "ring" is also applied to an enclosed space, whether circular, oval or otherwise: hence to the arena of a circus or hippodrome, the enclosure for a boxing contest, or to the place on a racecourse reserved for the bookmakers for the purpose of betting. A particular application in a transferred sense is that to a combination of persons in trade for the purpose of controlling markets, prices, etc.

In the art sense (see also GEMS), the English and German "ring" corresponds to the Gr. δακτύλιος, Lat. *annulus*, Fr. *anneau*. The enlarged part of a ring on which the device is engraved is called the "bezel," the rest of it being the "hoop." To decorate the human finger with a ring, if possible with one combining beauty, value and a distinctive character, was a widely spread natural impulse. At an early period, when the art of writing was known to but very few, it was commonly the custom for men to wear rings on which some distinguishing sign or badge was engraved (ἔκδημον), so that by using it as a seal the owner could give a proof of authenticity to letters or other documents. Thus, when some royal personage wished to delegate his power to one of his officials, it was not unusual for him to hand over his signet ring, by means of which the full royal authority could be given to the written commands of the subordinate (cf. Gen. xli. 42; Esth. viii. 2). Among the Battas of Sumatra rings of a certain form are used to this day as passports.

Egyptian rings.

The earliest existing rings are naturally those found in the tombs of ancient Egypt. The finest examples date from about the XVIIIth to the XXth Dynasty; they are of pure gold, simple in design, very heavy and massive, and have usually the name and titles of the owner deeply sunk in hieroglyphic characters on an oblong gold bezel. Rings worn in Egypt by the poorer classes were made of less costly materials, such as silver, bronze, glass or pottery covered with a siliceous glaze and coloured brilliant blue or green with various copper oxides. Some of these had hieroglyphic inscriptions impressed while the clay was moist. Other examples have been found made of ivory, amber and hard stones, such as carnelian. Another form of ring used in the XIIth and subsequent dynasties of Egypt had a scarab in place of the bezel, and was mounted on a gold hoop which passed through the hole in the scarab and allowed it to revolve.

[1] "To ring," in the sense of to make a bell sound, is a different word. It also appears in various Teutonic languages and is probably of onomatopoeic origin, and may be akin to Lat. *clangor*.

In ancient Babylonia and Assyria finger rings do not appear to have been used. In those countries the signet took a different form, namely, that of a cylinder cut in crystal or other hard stone, and perforated from end to end. A cord was passed through it, and it was worn on the wrist like a bracelet. This way of wearing the signet is more than once alluded to in the Old Testament (Gen. xxxviii. 18, R.V., and Cant. viii. 6).

Cylinders.

Within the limits necessarily imposed by its purpose the finger-ring assumed a considerable variety of form, according to its date and place of origin.

In the Cretan and Mycenaean periods a characteristic form of ring had a broad flat bezel, not organically connected with the hoop, and having an incised design in the gold. The use of inset stones hardly occurs, but rings from Enkomi and Aegina of the late Mycenaean period have inset paste decorations.

The Phoenician type of ring was primarily intended to carry a scarab or scarabaeoid, usually in a box setting on a swivel, called for by the fact that the flat base of the scarab would be wanted for sealing purposes, but in wear would be most conveniently turned inwards. Strength being necessary, the hoop became massive. A similar arrangement of the signet-scarab is found attached to a twisted ring, which, from its shape, must have been meant to be suspended, and which is shown thus worn on some of the Cypriote terra-cottas.

The Greek ring of an early period has a characteristic flattened bezel, for an intaglio design in the gold. Such engravings attained great freedom and beauty in the 5th and 4th centuries B.C. An alternative form was a swivel ring for a scarab or scarabaeoid, imitating the Phoenician shape. When the stone was flat and inset the bezel became a mass of metal to hold it securely.

Greek rings.

Among the Greeks signet rings were very largely worn. In Sparta a sumptuary law was passed at an early time to forbid any substance more valuable than iron to be used for signet rings; but in other parts of the Hellenic world there appears to have been no restriction of this sort. In some of the numerous tombs of Etruria and Kertch (Panticapaeum) in the Cimmerian Bosphorus gold rings of great magnificence have been discovered, apparently of the finest Greek workmanship.

FIG. 2.

Fig. 1 shows a ring from the Crimea with a finely engraved scarabaeus in gold, with an intaglio engraving on the base.

Fig. 2, also from the Crimea, has a cornelian carved in lion form in place of the scarab, and has an intaglio figure on the base of a running lion.

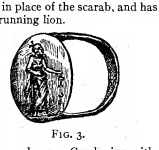

FIG. 3.

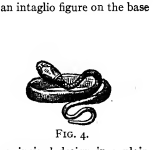

FIG. 4.

Fig. 3 shows a Greek ring with an incised design in a plain bezel.

Fig. 4 is a ring from which the idea of a signet is entirely wanting.

[2] Figs. 1–6, 8 and 9 are from Dr Robert Forrer's *Reallexikon*, by permission of W. Spemann, Berlin and Stuttgart.

The Etruscans used very largely the gold swivel ring mounted with a scarab, a form of signet probably introduced from Egypt. Some found in Etruscan tombs have real Egyptian scarabs with legible hieroglyphs; others, probably the work of Phoenician or native engravers, have rude copies of hieroglyphs, either quite or partially illegible. A third and more numerous class of Etruscan signet rings have scarabs, cut usually in sard or carnelian, which are a link between the art of Egypt and that of Greece, the design cut on the flat side being Hellenic in style, while the back is shaped like the ordinary Egyptian scarabaeus beetle. One from Etruria, now in the British Museum, is formed by two minutely modelled lions whose bodies form the hoop, while their paws hold the bezel, a scarab engraved with a lion of heraldic character. An alternative type of Etruscan ring (as in fig. 5) has an incised design on the gold bezel, or a flat stone set in the rigid bezel. In either case the Etruscan rings tend to extravagance in size and elaboration.

Etruscan rings.

FIG. 5.

The Romans appear to have imitated the simplicity of Lacedaemonia. Throughout the republic none but iron rings were worn by the bulk of the citizens, and even these were forbidden to slaves. Ambassadors were the first who were privileged to wear gold rings, and then only while performing some public duty. Next senators, consuls, equites and all the chief officers of state received the *jus annuli aurei*. In the Augustan age many valuable collections of antique rings were made, and were frequently offered as gifts in the temples of Rome. One of the largest and most valuable of the *dactyliothecae* was dedicated in the temple of Apollo Palatinus by Augustus's nephew Marcellus (Pliny, *H.N.* xxxvii. 5). The temple of Concord in the Forum contained another; in this collection was the celebrated ring of Polycrates, king of Samos, the story of which is told by Herodotus; Pliny, however, doubts the authenticity of this relic (*H.N.* xxxvii. 2).

Roman rings.

Different laws as to the wearing of rings existed during the empire: Tiberius made a large property qualification necessary for the wearing of gold rings in the case of those who were not of free descent (Pliny, *H.N.* xxxiii. 8); Severus conceded the right to all Roman soldiers; and later still all free citizens possessed the *jus annuli aurei*, silver rings being worn by freedmen and iron by slaves. Under Justinian even these restrictions passed away.

In the rings of the Roman period the decoration is no longer an accessory of the bezel alone. It modifies the form of the hoop, which may be polygonal or angular (see fig. 6). The ring here figured is set with an eye, as an amulet, capable of turning on a swivel.

In the 3rd and 4th centuries Roman rings were made engraved with Christian symbols. Fig. 7 shows two silver rings of the latter part of the 4th century which were found in 1881 concealed in a hole in the pavement of a Roman villa at Fifehead Neville, Dorset, together with some coins of the same period. Both have the monogram of Christ, and one has a dove within an olive wreath rudely cut on the silver bezel. These rings are of special interest, as Roman objects with any Christian device have very rarely been found in Britain.

Part of FIG. 9.

Fig. 9 is a gold ring from Smyrna (Brit. Mus.) with seven incised intaglio medallions, with a figure of Christ on the bezel. Assigned to the 5th century.

Large numbers of gold rings have been found in many parts of Europe in the tombs of early Celtic races. They are usually of very pure gold, often penannular in form—with a slight break, that is, in the hoop so as to form a spring. They are often of gold wire formed into a sort of rope, or else a simple bar twisted in an ornamental way. Some of the quite plain penannular rings were used in the place of coined money.

Celtic rings.

Throughout the Middle Ages the signet ring was a thing of great importance in religious, legal, commercial and private matters.

The episcopal ring[1] was solemnly conferred upon the newly made bishop together with his crozier, a special formula for this being inserted in the Pontifical. In the earliest references to rings worn by bishops, there is nothing to distinguish them from other signet rings. In A.D. 610 the first mention has been found of the episcopal ring as a well-understood symbol of dignity. It is clear that it was derived from the signet. It was only in the 12th century and onwards that it was brought into mystical connexion with the marriage ring. In the time of Innocent III. (1194) the ring was ordered to be of pure gold mounted with a stone that was not engraved; but this rule appears not to have been strictly kept. Owing to the custom of burying the episcopal ring in its owner's coffin, a great many fine examples still exist. Among the splendid collection of rings formed by the distinguished naturalist Edmund Waterton, and now in the South Kensington Museum, is a fine gold episcopal ring decorated with niello, and inscribed with the name of Alhstan, bishop of Sherborne from 824 to 867 (see fig. 10). In many cases an antique gem was mounted in the bishop's ring, and often an inscription was added in the gold setting of the gem to give a Christian name to the pagan figure. The monks of Durham, for example, made an intaglio of Jupiter Serapis into a portrait of St Oswald by adding the legend CAPVT S. OSWALDI. In other cases the engraved gem appears to have been merely regarded as an ornament without meaning—as, for example, a magnificent gold ring found in the coffin of Seffrid, bishop of Chichester (1125–1151), in which is mounted a Gnostic intaglio. Another in the Waterton collection bears a Roman cameo in plasma of a female head in high relief; the gold ring itself is of the 12th century. More commonly the episcopal ring was set with a large sapphire, ruby or other stone cut *en cabochon*, that is, without facets, and very magnificent in effect (see fig. 11). It was

worn over the bishop's gloves, usually on the forefinger of the right hand; and this accounts for the large size of the hoop of these rings. In the 15th and 16th centuries bishops often wore three or four rings on the right hand in addition to a large jewel which was fixed to the back of each glove.

"Ring of the Fisherman."

The papal "Ring of the Fisherman" (*annulus piscatoris*) bears the device of St Peter in a boat, drawing a net from the water. The first mention of it, as the well-understood personal signet ring of the pope, that has been found, occurs in a letter of Clement IV. in 1265. After the middle of the 15th century it was no longer used as the private seal of the popes, but was always attached to briefs. After the death of a pope the ring is broken. A new ring with the space for the name left blank is taken into the conclave, and placed on the finger of the newly elected pontiff, who thereupon declares what name he will assume, and gives back the ring to be engraved (see Waterton, *Archaeologia*, 40, p. 138).

Papal rings.

The so-called papal rings, of which many exist dating from the 15th to the 17th centuries, appear to have been given by the popes to new-made cardinals. They are very large thumb rings, usually of gilt bronze coarsely worked, and set with a foiled piece of glass or crystal. On the hoop is usually engraved the name and arms of the reigning pope, the bezel being without a device. They are of little intrinsic value, but magnificent in appearance.

Betrothal and wedding rings.

The giving of a ring to mark a betrothal was an old Roman custom. The ring was probably a mere pledge, *pignus*, that the contract would be fulfilled. In Pliny's time conservative custom still required a plain ring of iron, but the gold ring was introduced in the course of the 2nd century. This use of the ring, which was thus of purely secular origin, received ecclesiastical sanction, and formulae of benediction of the ring exist from the 11th century. The exact stages by which the wedding ring developed from the betrothal ring can no longer be traced.

Gemel rings.

Gemel or gimmel rings, from the Latin *gemellus*, a twin, were made with two hoops fitted together, and could be worn either together or singly; they were common in the 16th and 17th centuries, and were much used as betrothal rings.

Posy rings.

Posy rings, so called from the "posey" or rhyme engraved on them, were specially common in the same centuries. The name "posy ring" does not occur earlier than the 16th century. A posy ring inscribed with "Love me and leave me not" is mentioned by Shakespeare (*Mer. of Ven.*, act v. sc. 1). The custom of inscribing rings with mottoes or words of good omen dates from a very early time. Greek and Roman rings exist with words such as ΖΗCΑΙC, ΧΑΙΡΕ, ΚΑΑΗ, or *votis meis Claudia vivas*. In the Middle Ages many rings were inscribed with words of cabalistic power, such as *anam zapta*, or Caspar, Melchior and Balthasar, the supposed names of the Magi. In the 17th century they were largely used as wedding rings, with such phrases as "Love and obayre," "Fear God and love me," "No gift can show the love I owe," "God above increase our love" or "Mulier viro subjecta esto."

Memorial rings.

In the same century memorial rings with a name and date of death were frequently made of very elaborate form, enamelled in black and white; a not unusual design was two skeletons bent along the hoop, and holding a coffin which formed the bezel.

Cramp rings.

Cramp rings were much worn during the Middle Ages as a preservative against cramp. They derived their virtue from being blessed by the king; a special form of service was used for this, and a large number of rings were consecrated at one time, usually when the sovereign touched patients for the king's evil.

Decade rings.

Decade rings were not uncommon, especially in the 15th century; these were so called from their having ten knobs along the hoop of the ring, and were used, after the manner of rosaries, to say nine aves and a paternoster. In some cases there are only nine knobs, the bezel of the ring being counted in, and taking the place of the *gaude* in a rosary. The bezel of these rings is usually engraved with a sacred monogram or word.

Merchants' rings.

In the 15th and 16th centuries signet rings engraved with a badge or trademark were much used by merchants and others; these were not only used to form seals, but the ring itself was often sent by a trusty bearer as the proof of the genuineness of a bill of demand.[1] At the same time private gentlemen used massive rings wholly of gold with their initials cut on the bezel, and a graceful knot of flowers twining round the letters. Other fine gold rings of this period have coats of arms or crests with graceful lambrequins.

Poison rings.

Poison rings with a hollow bezel were used in classical times; as, for example, that by which Hannibal killed himself, and the poison ring of Demosthenes. Pliny records that, after Crassus had stolen the gold treasure from under the throne of Capitoline Jupiter, the guardian of the shrine, to escape torture, "broke the gem of his ring in his mouth and died immediately." The medieval *anello della morte*, supposed to be a Venetian invention, was actually used as an easy method of murder. Among the elaborate ornaments of the bezel a hollow point made to work with a spring was concealed; it communicated with a receptacle for poison in a cavity behind, in such a way that the murderer could give the fatal scratch while shaking hands with his enemy. This device was probably suggested by the poison fang of a snake.

Hebrew rings.

A very large and elaborate form of ring is that used during the Jewish marriage service. Fine examples of the 16th and 17th centuries exist. In the place of the bezel is a model, minutely worked in gold or base metal, of a building with high gabled roofs, and frequently movable weathercocks on the apex. This is a conventional representation of the temple at Jerusalem.

Thumb rings.

Perhaps the most magnificent rings from the beauty of the workmanship of the hoop are those of which Benvenuto Cellini produced the finest examples. They are of gold, richly chased and modelled with caryatides or grotesque figures, and are decorated with coloured enamels in a very skilful and elaborate way. Very fine jewels are sometimes set in these magnificent pieces of 16th-century jewellery.

Thumb rings were commonly worn from the 14th to the 17th century. Falstaff boasts that in his youth he was slender enough to "creep into any alderman's thumb ring" (Shakes., *Hen. IV., Pt. I.*, act ii. sc. 4).

The finest collections of rings formed in Britain have been those of Lord Londesborough, Edmund Waterton (now in the Victoria and Albert Museum) and the collection in the British Museum, which was greatly augmented in 1897 by the bequest of the late Sir A. W. Franks.

RING-GOAL, a game for two persons played on a ground, or indoor rink, 78 ft. long by 10 ft. wide, with a ring of split cane about $7\frac{1}{2}$ in. in diameter and weighing about $3\frac{1}{2}$ oz., which is propelled in the air by means of two sticks, resembling miniature billiard-cues, which are held inside the ring. The goals consist of two uprights 8 ft. high and 10 ft. apart, from which a net is stretched on an incline, so that its base will be a few feet behind the goal-line, and the object of the game is to drive the ring into these goals, each goal made scoring one point. The ring must be propelled by the server and caught by his opponent, on one or both of his sticks, if he can, and so returned alternately, and a point is scored for either player if it be stopped by his opponent in any other manner. A point is also scored for the receiver if the server, who begins the game, throw the ring so that it falls to the ground before

[1] The celebrated ring given to Essex by Queen Elizabeth was meant to be used for a similar purpose. It is set with a fine cameo portrait of Elizabeth cut in sardonyx, of Italian workmanship.

the receiver can catch it between the creases, which are lines drawn across the court 6 ft. from the goal-lines, or the ring be driven out of court. Eleven points constitute a game. Ring-goal was invented by an under-graduate of Keble College, Oxford, about 1885, and was played at Oxford, but without attracting any wide popularity.

RINGWOOD, a market town in the New Forest parliamentary division of Hampshire, England, 103¾ m. S.W. by W. from London by the London & South-Western railway. Pop. (1901) 4629. It lies pleasantly on the river Avon, which here divides into numerous branches, flowing through flat meadow land. The church of SS. Peter and Paul, which was almost entirely reconstructed in 1834, the town hall and corn exchange are the chief buildings. A large agricultural trade and manufactures of agricultural implements, linen goods and woollen gloves are carried on.

RINGWORM (or TINEA TONSURANS), a disease of the scalp (especially common within the tropics); it consists of bald patches, usually round, and varying in diameter from half an inch up to several inches, the surface showing the broken stumps of hairs and a fine whitish powdering of desquamated epidermic scales. In scrofulous subjects matter is sometimes produced, which forms crusts, or glues the hair together, or otherwise obscures the characteristic appearance. The disease is due to a parasite, *Trichophyton tonsurans*, which exists mostly in the form of innumerable spores (with hardly any mycelium), and is most abundant within the substance of the hairs, especially at their roots. If a piece of the hair near the root be soaked for a time in dilute liquor potassae and pressed flat under a cover-glass, the microscope will show it to be occupied by long rows of minute oval spores, very uniform in size, and each bearing a nucleus.

The same fungus sometimes attacks the hairs of the beard, producing a disease called "sycosis." Sometimes it invades the hairless regions of skin, forming "tinea circinata"; circular patches of skin disease, if they be sharply defined by a margin of papules or vesicles, may be suspected of depending on the tinea-fungus. Interesting varieties of tinea are found in some of the Pacific and East Indian islands. Among the best remedial agents are various mercurial preparations. But in modern practice much success has been found in X-raying the patch in order to remove the dead and diseased hairs, thus leaving a free channel for the passage of antiseptic applications to the follicles. The exposures are followed by inunction of a mercurial preparation or of a lotion of tincture of iodine with methylated spirit.

See also FAVUS.

RINTOUL, ROBERT STEPHEN (1787–1858), British journalist, was born at Tibbermore, Perthshire, in 1787, and educated at the Aberdalgie parish school. After serving his apprenticeship to the printing trade he became the printer and subsequently the editor of the *Dundee Advertiser*. In 1826 he came to London, and in July 1828, with the assistance of friends, founded *The Spectator*. In it Rintoul strongly supported the Reform Bill, and to him was due the catch-phrase "The bill, the whole bill, and nothing but the bill." After conducting *The Spectator* for more than thirty years, he sold it shortly before his death, which occurred on the 22nd of April 1858.

RINUCCINI, GIOVANNI BATTISTA (1592–1653), archbishop of Fermo, was born in Rome on the 15th of September 1592, being the son of a senator. He studied at several Italian universities, became chamberlain to Pope Gregory XV., and in 1625 was made archbishop of Fermo. His participation in Irish politics, which is his chief title to fame, began during the later stages of the Civil War when Ireland was the scene of universal disorder. In 1645 Pope Innocent X. despatched him to that country as papal nuncio; he landed at Kenmare with arms and money in October 1645, and took up his residence at Kilkenny. Before this time the Roman Catholics had banded themselves together for defence. Called the Confederate Catholics, they had set up a provisional government, and when the nuncio reached Kilkenny they were engaged in negotiating for peace with the lord lieutenant, the marquess, afterwards duke, of Ormonde. Rinuccini took part in the proceedings, but as his demands were ignored he refused to recognize the peace which was concluded in March 1646, and gaining the support of the Irish general, Owen Roe O'Neill, he used all his influence, both ecclesiastical and political, to prevent its acceptance by others. To a large extent he succeeded. Meeting at Waterford, the clergy condemned the treaty and several towns took up the same attitude. The nuncio's most pliant helper was now Edward Somerset, earl of Glamorgan, afterwards marquess of Worcester, who had been sent to Ireland by Charles I., and who had entered into communication with Rinuccini when the latter first arrived in that country. Glamorgan bound himself to carry out all the wishes of the nuncio, who intended that he should supplant Ormonde. In September 1646 Rinuccini took over the conduct of affairs. He imprisoned his opponents on the council and tried to arrange for an attack on Dublin. But there was no harmony among his subordinates, his military plans failed and soon all parties were tacitly ignoring him. Leaving Kilkenny he stayed for some time in Galway, and in February 1649 he left Ireland. After visiting Rome he returned to Ferno in 1650 and died on the 3th of December 1653.

See G. Aiazzi, *La Nunziatura in Irlanda* (Florence 1844), English translation as *The Embassy in Ireland*, by A. Hutton (Dublin, 1873); S. R. Gardiner, *History of the Great Civil War*, vols. iii. and iv. (1905).

RIOBAMBA or ROYABAMBA, a town of Ecuador, capital of the province of Chimborazo, on the railway between Guayaquil and Quito, about 85 m. E.N.E. of the former. Pop. (1900, estimate) 12,000. It stands in a barren, sandy basin of the great central plateau, drained by the Chambo, a tributary of the Pastaza, on the old road running southward from Quito into Peru, 9030 ft. above sea-level, and in full view of the imposing heights of Chimborazo, Carahuairazo (Carguairazo), Tunguragua and Altar. Though 300 ft. lower than Quito, its climate is considerably colder, owing, perhaps, to its more exposed situation and the vicinity of so many snow-clad peaks. It is a town of unusually wide streets and one-storeyed adobe houses, being so laid out and built because of earthquakes. It has very little importance as a commercial or industrial centre, having only a small trade and a few unimportant industries. The present town dates from 1797, when the great earthquake of that year destroyed the old town then situated 12 m. W., near the existing village of Cajabamba. The ruins of the old town indicate that it was much larger and finer than its successor.

RIO CUARTO, a town of Argentina in the province of Cordoba, 119 m. S. of the city of that name, and about 500 m. N.W. of Buenos Aires. Pop. (1904, estimate) 12,000. It stands 1440 ft. above sea-level and about half-way across the great Argentine pampas, on the banks of a river of the same name which finds an outlet through the Carcarañal into the Parana near Rosario. The town is built on the open plain and is surrounded with attractive suburbs. It is the commercial centre of a large district and has a large and lucrative trade. Its geographical position gives it great strategical importance, and the government maintains here a large arsenal and a garrison of the regular army. The surrounding country belongs to the partially arid pampa region and is devoted to stock-raising—cattle, horses, sheep and goats. Irrigation is employed in its immediate vicinity. Previous to 1872 this region was overrun by the Ranqueles, a warlike tribe of Indians, but the vigorous reprisals of General Ivanovski in that year, supplemented by the tactful intervention of the Franciscan missionaries, who have a convent in this town, put an end to these hostile forays and gave full opportunity for the industrial development of the country. There are some manufacturing industries in the town. The National Andine railway passes through Rio Cuarto, and branch lines connect with the Buenos Aires and Pacific line—all of which give railway communication

with Buenos Aires, Rosario, Tucuman, Cordoba, San Luis and Mendoza.

RIO DE CONTAS, or VILLA DE CONTAS, a town of Brazil in the state of Bahia, 230 m. S.W. from the city of Bahia, on the Brumado (Contas-Pequeno), a head stream of the Rio de Contas (Jussiape), which rises on the eastern slope of the neighbouring Serra das Almas, and flows S.E. and E. to the Atlantic coast at Barra do Rio de Contas. Pop. (1890), including rural districts, 17,318. The surrounding country is fertile and produces sugar, cotton, mandioca and tobacco, but has lost much of its prosperity through the droughts that have devastated the interior of the state, and because of the costs of transporting produce to market. Stock-raising was at one time an important industry here. The town was founded in 1715 by some "Paulistas" who discovered gold there in the sands of the river. It became a "villa" in 1724, but was soon afterward moved down the river 5 m. to a more convenient site on the high road between Bahia and Goyaz.

RIO DE JANEIRO, a maritime state of Brazil, bounded N. by Minas Geraes, E. by Espirito Santo and the Atlantic, S. by the Atlantic, and W. by São Paulo. It is one of the smaller states of the republic and has an area of 26,635 sq.m.; pop. (1900) 926,585. The state is traversed longitudinally by the Serra do Mar, which divides it into a low, narrow, irregular coastal zone, and a broad elevated river valley through which the Parahyba flows eastward to the Atlantic. The eastern part of this valley widens out into a great alluvial plain on which are to be found some of the richest sugar estates of Brazil. The central mountainous region is heavily wooded, the coast region is hot and in places malarial, but the valleys are fertile and well watered. The Parahyba valley has long been celebrated for its fertility, and was for many years the centre of the coffee-producing industry. The exhaustion of the soil and antiquated methods of cultivation have caused a great decline in this industry, and many of its coffee plantations are now either abandoned or are producing but a fraction of earlier crops. Stock-raising has been slowly developing since the abolition of slavery (1888) and the decline in coffee production, and the state now possesses large herds of cattle and droves of swine.

The state's agricultural and pastoral products are coffee, sugar, rum, Indian corn, mandioca (both bitter and sweet), cotton, tropical fruits, cattle, hogs, butter, cheese, milk and lard. The state is well watered by the Parahyba (*q.v.*) and its tributaries and by numerous short streams flowing from the Serra do Mar to the coast. Manufacturing has been developed largely because of the fine water power supplied by the mountain streams, and among the manufactures are cotton, woollen, silk and jute fabrics, brick, tile and rough pottery, sugar, rum, vehicles, furniture, beer and fruit conserves. The state is well provided with railways, which include the Central do Brazil, Leopoldina, Melhoramentos and Rio do Ouro. The Central line runs from the city of Rio de Janeiro N.N.W. across the Serra do Mar to the Parahyba valley, where it divides into two branches at the station of Barra do Pirahy, one running westward to São Paulo, and the other eastward and northward into Minas Geraes. Besides these there are a number of short railways called the Theresopolis, União Valenciana, Rio das Flores, Bananal, and Vassourense lines. The total extension of these railways in the state in 1907 was 1445 m. Other than Nictheroy, the ports of the state are São João da Barra, Macahé or Imbetiba, Cabo Frio and Paraty, but they are visited only by the smaller coasting vessels.

The capital of the state is Nictheroy on the E. side of the Bay of Rio de Janeiro, and other cities and towns, with their populations in 1890 except where otherwise stated, are: Campos (estimate, in 1907, 35,000), on the lower Parahyba in the midst of a rich sugar-producing region; Rio Bonito (19,321); Itaborahy (17,817); Barra Mansa (14,449), on the upper Parahyba; Rezende (14,370), in a fertile district of the upper Parahyba; Petropolis (*q.v.*); Cantagallo (about 9000), in a rich coffee district of the Serra do Mar; Paraty (10,765), a small port on the W. side of the bay of Angra dos Reis; Valença (11,965); Vassouras (9666); São Fidelis (11,770), a river port on the lower Parahyba having steamboat communication with Campos; Macahé (about 7000 in 1900), an old port on the eastern coast of the state at the mouth of the Macahé river whose original anchorage has been filled with silt, and that of Imbetiba, in the vicinity, with which it is connected by tramway, is now used by vessels both for the town and the Macahé and Campos railway; Barra do Pirahy (7750), an important station and junction of the Central do Brazil railway on the N. side of the Serra do Mar, with large manufacturing and commercial interests; Parahyba do Sul (7343), in a fertile, long-settled district in the N.E. part of the state; Maricá (10,373); Cabo Frio (10,382); Pirahy (10,420); Saquarema (12,480); Nova Friburgo (9857); and Araruama (9087).

RIO DE JANEIRO (in full, SÃO SEBASTIÃO DO RIO DE JANEIRO, colloquially shortened to RIO), a city and port of Brazil, capital of the republic, and seat of an archbishopric, on the western side of the Bay of Rio de Janeiro, or Guanabara, in lat. 25°54′23″S., long. 43°8′34″W. (the position of the Observatory). The city is situated in the S.E. angle of the Federal District (*Districto Federal*) formerly known as the Neutral Municipality (*Municipio Neutro*), an independent district or commune with an area of 538 sq. m., which was detached from the province of Rio de Janeiro in 1834. The city stands in great part on an alluvial plain formed by the filling in of the western shore of the bay, which extends inland from the shore-line in a north-westerly direction between a detached group of mountains on the S. known as the Serra da Carioca, and the imposing wooded heights of the Serra do Mar on the N. The spurs of the Carioca range project into this plain, in some places, closely up to the margin of the bay, forming picturesque valleys within the limits of the city. Some of the residential quarters follow these valleys up into the mountains and extend up their slopes and over the lower spurs, which, with the hills covered with buildings rising in the midst of the city, give a picturesque appearance. At the entrance to the bay is the Sugar Loaf (*Pão de Assucar*), a conical rock rising 1212 ft. above the water-level and forming the terminal point of a short range between the city and the Atlantic coast. The culminating point of that part of the Carioca range which projects into and partly divides the city is the Corcovado (Hunchback), a sharp rocky peak 2320 ft. high overlooking the Botafogo suburb and approachable only on the wooded N.W. side. These spurs are covered with luxuriant vegetation, excepting their perpendicular cliffs and the slopes occupied by the suburbs. Considerably beyond the limits of the city on its S.W. side, but within the municipality, is the huge isolated flat-topped rock known as the Gavea, 2575 ft. high, which received its name from its resemblance to the square sail used on certain Portuguese craft. The sky-line of this range of mountains, as seen by the approaching traveller some miles outside the entrance to the bay, forms the rough outline of a huge reclining figure called "the sleeping giant," the facial profile of which is also known as "Lord Hood's nose."

The entrance to the bay, between the Sugar Loaf on the W. and the Pico on the E., with fortress of Santa Cruz on one side and the fort of São João on the other, is about a mile wide and free from obstructions. Almost midway in the channel lies the little island and fort of Lage, so near the level of the sea that the spray is sometimes whirled completely over it. On the W. is the semicircular bay of Botafogo, round which are grouped the residences of one of the richest suburbs; on the E., the almost land-locked bay of Jurujuba (see NICTHEROY). The bay extends northward nearly 16½ nautical miles, with a maximum breadth of 11 m. and a minimum, between the arsenal of war (*Ponta do Calabouço*) and the opposite Ponta da Gravatá, of about 3500 yds. The shore-line is irregular, and has been modified by the construction of sea-walls and the filling in of shallow bays. Close to the shore are the islands of Villegaignon (occupied by a fort), Cobras (occupied by fortifications, naval storehouses, hospital and dry docks), Santa Barbara and Enxadas, the site of the Brazilian naval school. A small island just above the lower anchorage, which is occupied by port officials, was once known as Rat island, and is now called Ilha Fiscal. There is one lake

within the urban limits, the Lagôa de Rodrigo de Freitas, near the Botanical Garden, separated from the sea by a narrow sand beach, which is being gradually filled in. Several small streams from the hills are conspicuous only in times of heavy rains.

The oldest part of the city, which includes the commercial section, lies between Castle and Santo Antonio hills on the S. and São Bento, Conceição and Livramento hills on the N., and extends inland to the Praça da Republica, though the defensive works in colonial times followed a line much nearer the bay. This section during the past century has extended southward along the bay shore in a string of suburbs known as the Cattete and Botafogo, with that of Larangeiras behind the Cattete, a pretty valley of the same name, and others on or near the Atlantic coast as Largo dos Leoes, Copacabana and Gavea, the last including the Botanical Garden. The greatest development has been northward and westward, where are to be found the suburbs of Cidade Nova, São Christovão, Engenho Novo, Prça Formoso, Pedregulho, Villa Isabel, Tijuca, and a number of smaller places extending far out on the line of the Central railway. The extreme length of the city along lines of communication is little less than 20 m.

Streets.—Some of the most modern streets on the plain have been laid out with Spanish-American regularity, but much the greater part seems to have sprung into existence without any plan. Most of the streets of the old city are parallel and cross at right angles, but they are narrow and enclose blocks of unequal size. Each suburb is laid out independently, with straight streets where the ground permits, and crooked ones where the steepness of mountain contour compels. Since the beginning of the 20th century large sums have been borrowed and expended on new avenues, the widening and straightening of old streets, and the improvement of the water-front between the Passeio Publico and the southern extremity of the Praia de Botafogo by the construction of a grand boulevard, partly on reclaimed land. One of these improvements consists of a central avenue cut across the old city from a point on the water-front near the Passeio Publico northward to the Saúde water-front. The shore-line boulevard, called the Avenida Beira-Mar, is about 4½ m. long, the wider parts being filled in with gardens. It was undertaken in 1903, during the administration of President Rodrigues Alves, as part of a vast scheme to improve the sanitary and traffic conditions of the city, including the construction of a new shore-line and filling in the shallow parts of the shore, which had long been considered one of the prime causes of the unhealthy state of the city. Another improvement was the completion and embellishment of the Mangue canal, originally designed as an entrance to a central market for the banana product on the bay, but now designed for drainage purposes and as a public pleasure ground. This canal, as completed, is nearly 2 m. long, enclosed with stone walls, crossed by a number of iron bridges and bordered by lines of royal palms. The most famous street of the old city is the Rua do Ouvidor, running westward from the market-place to the Largo de São Francisco de Paula, and lined with retail shops, cafés and newspaper offices. It has long been a favourite promenade, and fills an important part in the social and political life of the city. The principal business street is the Rua Primeiro de Março, formerly called Rua Direita, which extends from the Praça 15 de Novembro northward to São Bento Hill. All these old streets, excepting the last, are narrow and paved with squared granite blocks, and have their vehicle traffic regulated to go in one direction only. The side walks are very narrow, and the gas lamps are attached to the walls of the buildings. The streets and suburbs are served by five groups of tramway lines—Jardim Botanico, Tijuca, São Christovão, Villa Isabel, and Carris Urbanos—all using electric traction but the last. The streets are lighted with electricity and gas, the Ouvidor and some other narrow streets having a great number of gas-pipe arches across them for decorative illumination on festal occasions.

Parks.—The public parks and gardens are numerous and include the Botanical Garden with its famous avenue of royal palms (*Oreodoxa regia*); the Passeio Publico dating from 1779, a small garden on the water-front facing the harbour entrance; the Jardim d'Acclamação, forming part of the Praça da Republica (once known as the Campo de Sant' Anna) with its artistic walks and masses of shrubbery; the Praça Tiradentes (the old Largo do Rocio, afterwards rechristened Praça da Constituição) with its magnificent equestrian statue of Dom Pedro I. executed by the French sculptor Luiz Rochet; the Praça 15 de Novembro on the water-front facing the old city palace; and a number of smaller squares with and without gardens.

Water Supply and Sewerage Drainage.—The water supply is derived from three sources: the small streams flowing down the mountain sides which serve small localities; the old Carioca aqueduct, dating from colonial times, which collects a considerable supply from the small streams of the Serra da Carioca and brings it into the city through a covered conduit which once crossed the gap between Santa Thereza and Santo Antonio hills on two ranges of stone arches (now used as a viaduct by the Santa Thereza Tramway Company); and the modern Rio do Ouro waterworks, which brings in an abundant supply from the Serra do Tinquá, N.W. of the city—the length of the iron mains being 33 m. between the principal collecting reservoir and the main distributing reservoir at Pedregulho, near the Ponta do Cajú. There are three other distributing reservoirs in different parts of the city, and the supply, which has been augmented since the works were inaugurated in 1885, is good and ample. An extensive system of sewers was constructed by the City Improvements Co., an English corporation, which initiated the work in 1853; and a separate system of rain-water drains. The Leicester system is used because the greater part of the sewers are below sea-level, and it is necessary to use powerful pumps.

Climate.—The climate of Rio de Janeiro is hot, humid and debilitating, the temperature ranging from 50° to 99·5° F. in the shade, with an average for the year of 74°, and the rainfall being about 44 in. The greater part of the city is only 2 or 3 ft. above sea-level, is surrounded by mountains, and has large areas of water, swamp and wet soil in its vicinity. But the unhealthiness of Rio de Janeiro in past years may be charged to insanitary conditions and not to the climate. Yellow fever, whose first recorded appearance was in December 1849, was for many years almost a regular yearly visitant, and the mortality from it has been terrible. Smallpox also is practically endemic, owing in great part to negligent sanitary supervision. Since 1900 there have been several mild outbreaks of bubonic plague. These dangerous diseases are slowly disappearing as sanitary conditions are improved. The death-rate from tuberculosis, however, is high, and apparently shows no abatement. This is undoubtedly due to constitutional weakness arising from bad nutrition and the habit of sleeping in closed or badly ventilated apartments. Malarial fevers are also common, and diseases of the digestive organs, in great part easily preventible, figure among the principal causes of death. According to official returns for the five years 1900–1905, the average number of deaths was 15,926, or 20·4 per 1000. Among the deaths 2789 were from tuberculosis, 1200 from smallpox, 778 from malarial diseases, 331 from *la grippe*, and 106 from beri-beri. There were no unusual epidemics during those years, and the rate given may be considered normal.

Buildings.—There remain many public edifices and dwellings of the colonial period, severely plain in appearance, with heavy stone walls and tile roofs. The old city palace facing upon Praça 15 de Novembro, once the residence of the fugitive Portuguese sovereign Dom João VI., is a good example. The 19th century brought into important modifications until near its close, when French and Italian styles began to appear, both in exterior decoration and in architectural design. The new Praça do Commercio (Merchants' Exchange) and Post Office on Rua 1° de Março, and the national printing office near the Largo da Carioca, are notable examples. Since then exterior ornamentation and architectural eccentricities have run riot, and the city is now a mixture of the plain masonry and two-storey buildings of the Portuguese type, and fanciful modern creations, embellished with stucco and overtopping the others by many storeys. Although a metropolitan see, Rio has no cathedral, the old imperial chapel facing the Praça 15 de Novembro being used for that purpose. The foundations were once laid for a great cathedral on the Largo de São Francisco de Paula, but the building stone was taken for a neighbouring theatre, and the foundations were afterwards used for the Polytechnic School. The most noteworthy church is the Candelaria church, in the commercial district, whose twin towers and graceful dome form one of the most conspicuous landmarks of the city. It was begun in 1775, but was not finished until near the end of the 19th century. Its fine proportions, however, are obscured by commercial buildings and by the narrow streets. Among many other churches, usually plain and bare of interior decoration, are the popular São Francisco de Paula church, on the square of that name; the Carmo church in Rua 1° de Março; the Cruz dos Militares church in the same street; the Rosario church in the

street of that name, belonging to a fraternity of negroes and once occupied by the episcopal chapter; and the prettily situated octagonal Gloria church on a hill of that name overlooking the lower bay. Another church of the same name faces on the Largo do Machado and shows the peculiar combination of a Greek temple surmounted by a modern spire. The British residents have an unpretentious chapel in Rua Evaristo da Veiga, the Methodists a more modern structure on the Largo do Catete and the Presbyterians a chapel near Praça Tiradentes. There is religious toleration in Brazil, but down to the organization of the republic no non-Catholic church or chapel was permitted to have a spire or other outward symbol of a place of worship.

Among public buildings of an official character the following are noteworthy. The old city palace facing on Praça 15 de Novembro dates from 1743 and was the residence of the royal governors and Dom João VI., but is now used for the principal telegraph offices. The São Christovão palace, in the suburb of that name, was the residence of the Emperor Dom Pedro II. It is a rambling structure now occupied by the National Museum. The Cattete palace, on the street of that name, originally a private residence, is now the official residence of the President, richly decorated within and partly surrounded by a handsome park. The Itamaráty palace near the Praça da Republica, a typical private residence of the better class, was purchased for and occupied by the first presidents and is now occupied by the ministry of foreign affairs. The palace of justice, on Rua Primeiro de Março, is one of the finest edifices in the city; and the ministry of industry and public works, on the south side of the Praça 15 de Novembro, may be mentioned. The ministry of war has its offices in the immense military *quartel* (barracks) on the north side of the Praça da Republica, and the ministry of marine in the naval arsenal at the foot of São Bento Hill. The ministry of finance is in the Treasury building on Rua do Sacramento—an immense structure of no special architectural merit. The Senate occupies a plain unattractive building on the west side of the Praça da Republica, and the Chamber of Deputies an ugly colonial building in Rua da Misericordia, originally used as a city hall and jail. A new legislative palace is designed to occupy the block on the west side of the Praça Tiradentes. There are a number of theatres, but the city had no large theatre of architectural merit previous to the construction of the Municipal Theatre at the intersection of the Avenida Central with Rua 13 de Maio, with an elegant marble façade in the French Renaissance style. Bull-fights have never been popular in Rio de Janeiro, but horse-racing is a favourite sport, and the Jockey Club maintains a fine course in the São Francisco Xavier suburb. Other notable buildings are the ornate Monroe palace at the intersection of the Central and Beira-Mar avenues, the Praça do Commercio (Commercial Exchange) on Rua 1° de Março, the Caixa da Amortização on the Avenida Central, the custom-house with its extensive warehouses, the terminal station of the Central railway at the N.W. angle of the Praça da Republica, and the library building of the Gabinete Portuguez da Leitura with its exquisite "Manueline" façade of white marble.

Education.—Although much money is given to hospitals and asylums, Rio de Janeiro has no great educational institutions either public or private. The Medical School may be considered the only distinctively professional school in the city. The Polytechnic School, occupying an interesting old building on the Largo de São Francisco de Paula, is chiefly devoted to civil engineering. The Gymnasio Nacional, formerly the Collegio D. Pedro II., is a boys' college of a high school grade, located on Rua Floriano Peixoto, with an *internato* or boarding-school in Rua de S. Francisco Xavier. The college dates from 1735, when it was founded as an asylum for orphan boys destined for the Church. In 1837 it became a state institution and took the name of the Emperor Dom Pedro II. One of the most noteworthy schools of the city is the Lyceo de Artes e Officios, located on Rua 13 de Maio, opposite the opera-house; it dates from 1858 and has been the means of giving instruction to a multitude of clerks, artisans and others, through its night classes. Another important school, partly of this class, is the Instituto Benjamin Constant, located in a fine new edifice on the Praia da Saudade, Botafogo. The public schools of Rio de Janeiro are defective both in organization and administration; the non-attendance of children from the higher classes, and the antagonism of the Church to schools under purely secular administration, must be held responsible for the backwardness of these schools. The episcopal seminary on Castle Hill, called the "Seminario Episcopal de São José," founded in 1739 and devoted exclusively to the education of priests, is the best classical school in the city. There are a number of charitable institutions devoted to the education of orphans, the blind and the deaf and dumb, which are admirably equipped and administered. Among other educational institutions are a conservatory of music, school of fine arts, normal school, a national library with upwards of 260,000 volumes and a large number of manuscripts, maps, medals and coins, the national observatory on Castle Hill, the national museum now domiciled in the São Christovão palace in the midst of a pretty park, a zoological garden in the suburb of Villa Isabel, and the famous Botanical Garden founded by Dom João VI. in 1808 and now a horticultural experiment station.

Hospitals, &c.—Rio de Janeiro is well provided with hospitals, asylums and benevolent institutions. Chief of these is the Misericordia Hospital, popularly known as the "Santa Casa," belonging to a religious brotherhood dating from 1591. In addition to a large income from rentals, the Santa Casa receives the product of certain port taxes in return for opening its wards to the crews of all vessels in port. Other public hospitals are a lepers' hospital in São Christovão, the military and naval hospitals, the São Sebastião hospital and the isolation and contagious diseases hospitals in Jurujuba. There are also a number of private hospitals maintained by church brotherhoods and charitable associations; among them are the Portuguese hospital in Rua de Santo Amaro and the Strangers' Hospital (American and British) in Botafogo. Most prominent among the asylums is the Hospicio Nacional for the Insane, on the Praia da Saudade, Botafogo, which was erected 1842–52, and is one of the most completely equipped institutions of its class in the world. There are two public cemeteries: São Francisco de Xavier in São Christovão, and São João Baptista, in Botafogo, the former having an unconsecrated section for Protestants. Besides these there are five private cemeteries, the one belonging to the British colony being on a hill overlooking the Gambôa shoreline.

Harbour, Communications and Commerce.—The port and harbour of Rio de Janeiro are the largest and most important in the republic. The entrance is open to vessels of the largest draught, and there is sufficient deep-water anchorage inside for the navies of the world. The lower anchorage, where the officers of health visit vessels, is below Ilha Fiscal, and the upper, or commercial anchorage, is in the broad part of the bay above Ilha das Cobras, the national coasting vessels occupying the shallower waters near the Saúde and Gambôa districts. The custom-house occupies a considerable part of the shore-line in front of the old city, and has a protected basin for the discharge of lighters. The new port works, under construction since 1903, consist of a new water-front for the Saúde, Gambôa and Sacco de Alferes districts, in which the shipping interests are centred, and a continuation of the sea-wall across the shallow São Christovão bay to the Ponta do Cajú, the large reclaimed area to be filled in by the removal of some small hills. The commercial quays are built in deep water and permit the mooring alongside of the largest vessels. The total length of the commercial quays is about 3800 yds. Railway and tramway connexions are provided and both electric and hydraulic power are available. Special surtaxes are levied on imports to meet the interest and redemption charges on the loans raised for the execution of these important works. Another improvement is the extension of the sea-wall southward from the ferry-slips (Praça 15 de Novembro) to the Ponta do Calabouço (war arsenal), providing protected basins for the arsenal and enclosing small reclaimed areas. With the completion of these improvements the water-front of the city will consist entirely of deep-water walls from Botafogo to the Ponta do Cajú, with the exception of a short section between the Ponta do Calabouço and the Avenida Central. The port is in regular communication with the principal ports of Europe and America. The coastwise service is good, though rates are high. Railway communication with the interior is maintained by the Central do Brazil (formerly the Dom Pedro II.), Leopoldina and Melhoramentos lines, besides which there is a short passenger line up to the Corcovado about 2½ m. long, an electric line to Tijuca, and a narrow-gauge line running out to the Rio do Ouro waterworks. There is daily communication with Petropolis by a branch line of the Leopoldina system, and also by a steamer to the head of the bay and thence by rail up the serra. Ferry-boats cross the bay to Nictheroy at intervals of 20 minutes, and smaller craft provide communication with the islands of Governador and Paqueta.

Rio de Janeiro is the seaport for a large area of the richest, most productive and most thickly settled parts of Brazil, including the states of Rio de Janeiro and Minas Geraes and a small part of eastern São Paulo. Its exports include coffee, sugar, hides, cabinet woods, tobacco and cigars, tapioca, gold, diamonds, manganese and sundry small products. Rio is also a distributing centre in the coasting trade, and many imported products, such as jerked beef (*carne secca*), hay, flour, wines, &c., appear among the coasting exports, as well as domestic manufactures. The total exports for 1905 were officially valued at 62,572,033 *milreis* gold, or a little over one-sixth the exportation of the whole country. Formerly Rio led all other ports in the value of coffee, but the enormous increase in production in the state of São Paulo has given Santos the lead. The exports of coffee from Rio in 1908 amounted to 3,062,268 bags of 60 kilogrammes each, officially valued at about $27,846,600. The coffee-producing area tributary to Rio de Janeiro is slowly decreasing, owing to the exhaustion of the soil and the greater productiveness of São Paulo. The imports include wheat, flour, Indian corn, jerked beef (*carne secca*), lard, bacon, wines and liquors, butter, cheese, conserves of all kinds, coal, cotton, woollen, linen and silk textiles, boots and shoes, earthen- and glasswares, railway material, machinery, furniture, building material, including pine lumber, drugs and chemicals, and hardware. The imports for 1905 aggregated 103,872,724 *milreis* gold, or about twice that the importation of the whole republic. The shipping arrived in 1908 were as follows: from foreign ports, 1,195 steamers of 3,479,357 tons and 75 sailing vessels of 84,474 tons; from national ports, 243 foreign steamers of 363,886 tons and 33 national steamers of 18,000 tons and 294 national sailing vessels of 20,250 tons—in all 2580 vessels of 4,642,301 tons.

Manufactures.—The industrial activities of Rio Janeiro have been largely increased since the organization of the republic through increased import duties on foreign products. There were a number of protected industries before this, but they made slight impression on imports. Rio de Janeiro has manufactures of flour from imported wheat, cotton, woollen and silk textiles, boots and shoes, ready-made clothing, furniture, vehicles, cigars and cigarettes, chocolate, fruit conserves, refined sugar, biscuits, macaroni, ice, beer, artificial liquors, mineral waters, soap, stearine candles, perfumery, feather flowers, printing type, &c. There are numerous machine and repair shops, the most important of which are the shops of the Central railway. One of the most important industrial enterprises in the city is the electric plant belonging to the Rio de Janeiro Light and Power Company, which supplies electric currents for public and private lighting, and power for the tramways and many industries. The hydro-electric works are situated about 50 m. N.W. of the city, in a valley of the Serra do Mar, where a large reservoir has been created by building a dam across the Rio das Lages.

Government.—Rio de Janeiro is governed by a prefect, who represents the national government, and a municipal council which represents the people. The prefect is appointed by the President of the republic for a term of four years, and the appointment must be confirmed by the Senate. There are seven *directorias*, or boards, under the prefect, each with a special field of work, the chief among which are education, health and public assistance, public works and transportation, and finance. The municipal council is elected by direct suffrage for a term of two years, and is composed of 18 members. The funded debt of the city, on the 30th of June 1907 was £7,000,677, a part of which is guaranteed by the national government. There is some confusion in administration and accounts, however, and it is sometimes difficult to determine the exact situation. The Federal District is represented in Congress by 2 senators and 10 deputies, and is credited with the rights and privileges of citizenship. On the other hand, the city is a garrison town and a district under the direct administration of the national executive, who appoints its chief executive, controls its police force, and exercises part control over its streets, squares and water front. In the work of improving the city, the national government assumed the expense of the commercial quays, the filling of the São Christovão bay, the opening of the Mangue canal and its embellishment, the opening of the Avenida Central, the extension of the sewage system and the addition of new sources to the water supply, while the city was responsible for the Avenida Beira-Mar, the opening of a new avenue from the Largo do Machado westward, the Rua Frei Caneca, the removal of the Morro do Senado, the widening of some streets crossing the Avenida Central and the opening and straightening of other streets.

History.—The discovery of the Bay of Rio de Janeiro is attributed by many Portuguese writers to André Gonçalves, who entered its waters on the 1st of January 1502, and believed that it was the mouth of a great river, hence the name Rio de Janeiro (River of January). Another Portuguese navigator, Martim Affonso de Souza, visited it in 1531, but passed on to São Vicente, near Santos, where he established a colony. The first settlement in the bay was made by an expedition of French Huguenots under the command of Nicholas Durand Villegaignon, who established his colony on the small island that bears his name. In 1560 their fort was captured and destroyed by a Portuguese expedition from Bahia under Mem de Sá, and in 1567 another expedition under the same commander again destroyed the French settlements, which had spread to the mainland. The victory was won on the 20th of January, the feast-day of St Sebastian the Martyr, who became the patron saint of the new settlement and gave it his name—São Sebastião do Rio de Janeiro. The French had named their colony La France Antarctique, and their island fort had been called Fort Coligny. In 1710 a French expedition of five vessels and about 1000 men under Duclerc attempted to regain possession, but was defeated; its commander was captured and later assassinated. This led to a second French expedition, under Duguay Trouin, who entered the bay on the 12th of September 1711, and captured the town on the 22nd. Trouin released Duclerc's imprisoned followers, exacted a heavy ransom and then withdrew. The discovery of gold in Minas Geraes at the end of the 17th century greatly increased the importance of the town. It had been made the capital of the southern captaincies in 1680, and in 1762 it became the capital of all Brazil. In 1808 the fugitive Portuguese court, under the regent Dom João VI., took refuge in Rio de Janeiro, and gave a new impulse to its growth. It was thrown open to foreign commerce, foreign mercantile houses were permitted to settle there, printing was introduced, industrial restrictions were removed, and a college of medicine, a military academy and a public library were founded. Dom João VI. returned to Portugal in 1821, and on the 7th of September 1822 Brazil was declared independent and Dom Pedro I. became its first emperor. There was no resistance to this declaration in Rio de Janeiro. There were some political disorders during the reign of Dom Pedro I., who was finally harassed into an abdication in favour of his son, Dom Pedro II., on the 7th of April 1831. The regency that followed was one of many changes, and led in July 1840 to a declaration of the young prince's majority at the age of fifteen. A long and peaceful reign followed, disturbed only by the struggles of rival political factions. In 1839 a steamship service along the coast was opened, but direct communication with Europe was delayed until 1850, and with the United States until 1865. These services added largely to the prosperity of the port. The first section of the Dom Pedro II. railway was opened in 1858, and the second or mountain section in 1864, which brought the city into closer relations with the interior. In 1874 submarine communication with Europe was opened, which was soon afterwards extended southward to the Platine republics. The first coffee tree planted in Brazil was in a convent garden of Rio de Janeiro. On the 15th of November 1889 a military revolt in the city under the leadership of General Deodoro da Fonseca led to the declaration of a republic and the expulsion of the imperial family, which was accomplished without resistance or loss of life. Disorders followed, a naval revolt in 1891 causing the resignation of President Deodoro da Fonseca, and another in 1893–94 causing a blockade of the port for about six months and the loss of many lives and much property from desultory bombardments. There have been since that time some trifling outbreaks on the part of agitators allied with the extreme republican element, but at no time was the security of the government in danger.

BIBLIOGRAPHY.—Nearly all books relating to Brazil devote some attention to its capital city. The history of its settlement and colonial development will be found in Robert Southey, *History of Brazil* (3 vols., London, 1810–19). For descriptions of the city, the customs and manners of its people and some of the larger political events during the first three-quarters of the 19th century, see R. Walsh, *Notices of Brazil in 1828 and 1829* (2 vols., London, 1830); Thomas Ewbank, *Life in Brazil* (New York, 1856); M. J. Moreira de Azevedo, *O Rio de Janeiro* (2 vols., Rio de Janeiro, 1877); and J. C. Fletcher and D. P. Kidder, *Brazil and the Brazilians* (9th ed., Boston, 1879), especially chapters iv. to xiv. For later descriptions, see A. J. Lamoureux, *Hand-Book of Rio de Janeiro* (Rio de Janeiro, 1887); Frank Vincent, *Around and About South America* (New York, 1890), chapters xxv. to xxix.; Marguerite Dickins, *Along Shore with a Man-of-War* (Boston, 1893); Arthur Reas, *Il Brasile attuale* (Nivelle, Belgium, 1907); also in French and Portuguese, pp. 367–449.

RIO DE ORO, a Spanish possession on the N.W. coast of Africa. It is bounded W. by the Atlantic, E. and S. by Saharan territory under French protection. The northern frontier, where the protectorate adjoins the territory of the semi-independent tribes south of Morocco, is undefined. The most northerly point claimed by Spain on the coast is Cape Bojador. The southern and eastern boundaries were defined by a Franco-Spanish convention in 1900. The frontier traverses the middle of the Cape Blanco promontory, then runs eastward along the parallel of 21° 20′ N. till it meets the meridian of 13° W., whence it turns first N.W. and afterwards N.E., meeting the tropic of Cancer at 12° W. and thereafter runs due N. Forming part of the Sahara, Rio de Oro is nearly waterless. Oases are few and the sparse population consists almost entirely of nomad Arabs and Berbers. They are Mahommedans. In the south is the hilly country called Adrar Suttuf, not to be confounded with Adrar Temur (see ADRAR and SAHARA). The estimated area of the protectorate is 70,000 sq. m.

The peninsula of Rio de Oro, where is the principal Spanish settlement, occupies the central part of the coast-line in 23° 50′ N., 16° W., and is united to the mainland by a sandy isthmus. Its length is 23 m., its breadth 1½ to 2 m. and it is on an average about 20 ft. above sea-level. The bay between peninsula and mainland—the so-called Rio de Oro—is 22 m. long, 5 broad, navigable over two-thirds of its extent, with good anchorage in most of the channel, but the bar at its mouth is not always easy to pass in rough weather. The peninsula has very sparse vegetation, except in its southernmost part near Cape Durnford. At the head of the bay is a small island—Isla Herne.

The climate is generally temperate, and not unhealthy except in the autumn. Esparto grass and manzanilla are grown in many places, but European plants are not easily acclimatized. On the peninsula and in the neighbouring country there are many wolves, foxes, hyenas, gazelles, lizards, hares, pelicans and large crows. The natives rear cattle, sheep, camels, and have but few horses. In contrast with the sterility of the land the sea throughout the coast of Rio de Oro abounds in fish, especially cod. The fishing industry is in the hands of the Canary Islanders and of the French.

The estuary between the mainland and the peninsula was taken by its Portuguese discoverers in the middle of the 15th century for a river, and, obtaining there a quantity of gold dust from the natives, they named it Rio d'Ouro (Gold River). Rio de Oro being the Spanish form. At a point about 50 m. inland from the head of the estuary a Portuguese trading station was established, of which ruins exist, but the activity of the Portuguese was before long transferred to the true auriferous regions of the Gulf of Guinea.

Spain's interest in the Saharan coast dates from the 13th century, but was particularly directed to that part nearest the Canary Islands, a strip of coast over which she now exercises no sovereignty. The site of the fort of Santa Cruz de Mar Pequeña, established in 1476, though not identified, was north of Cape Bojador. The protection of the Canary Islanders engaged in the fisheries south of that point occasioned, however, the presence of Spanish warships in these waters, and small trading stations were formed at Rio de Oro, Cape Blanco and elsewhere. To preserve the interests thus acquired, Spain in January 1883 took the territories on the coast between capes Blanco and Bojador under her protection. The year before the Hispano-American Company had built a trading station on Rio de Oro peninsula, but in 1885 it was destroyed by the natives. The company renewed its operations, but subsequently ceded its rights to the Transatlantic Company of Barcelona. The extension inland of Spanish influence was opposed by France, which claimed a protectorate over the Sahara. The conflicting claims of the two powers were finally settled by the convention of 1900, which fixed the frontier in the manner stated. The administration is carried on under the control of the captain-general of the Canary Islands.

RIO GRANDE, a North American river, which rises in the San Juan Mountains of southern Colorado, flows S.E. and S. in Colorado, S. by W. and S.E. through New Mexico, and S.E. between Texas and Mexico to the Gulf of Mexico. Its length is approximately 2200 m., and for about 1300 m. it forms the international boundary between the United States and Mexico. It presents many features of a complex physiographic type, being first a river of the Rocky Mountains, then of the interior deserts and then of the Atlantic Coastal Plain. It also presents a complicated geological history, as it includes what were originally several distinct streams. The Mexicans call it the Rio del Norte in its upper course, the Rio Bravo in the "Big Bend," from the mouth of the Conchas river to the mouth of the Devils river, and the Rio Grande only in its course through the Coastal Plain. From its headwaters, 12,000 ft. above the sea, it rushes rapidly down a mountain canyon to San Luis Valley, in Colorado. It flows with moderate speed through this broad valley, enters a long canyon with a maximum depth of 400 ft., about 4 m. above the boundary between Colorado and New Mexico, and is hemmed in between canyon walls rising as high as 1000 ft. or between the sides of narrow mountain valleys throughout its course through New Mexico. It passes through a series of picturesque canyons, some of them 1750 ft. in depth, in the "Big Bend," and becomes a silt-laden stream with a shifting channel in its passage through the Coastal Plain. Except in the flood season of May and June, the quantity of water which, for irrigation and by evaporation, is taken from the Rio Grande between its entrance to the San Luis Valley and the mouth of the Conchas, is greater than that received, and as a consequence it is an intermittent stream in this region. The flow of the Conchas is constant, and in the "Big Bend" the volume of the Rio Grande is enhanced by springs which break out in the bed. The total flow of the Rio Grande is ten times greater in some years than in others, and when its waters have been highest there have been great floods in its lower course and so much shifting of its banks as to cause international complications. Even in its course through the Coastal Plain its channel is so much obstructed by sand bars that it is of little importance for navigation. As the increasing diversion of the water of the Upper Rio Grande for irrigation in Colorado and New Mexico resulted in a scarcity of water for this purpose in Mexico, that country complained, and to remedy the evil the Reclamation Service of the United States proposed the construction by the United States of a storage dam across the river near Engle, New Mexico, which would form a storage reservoir having a capacity of 2,000,000 acre-feet and from which Mexico should be furnished with 60,000 acre-feet of water annually. Mexico agreed to this proposal and a treaty covering the matter was proclaimed in January 1907. The principal towns and cities on the river are: Brownsville, Texas; Matamoros, Mexico; Laredo, Texas; El Paso, Texas; and Ciudad Juarez, Mexico.

RIO GRANDE DO SUL, a southern frontier state of Brazil, bounded N. by the state of Santa Catharina, E. by the Atlantic, S. by Uruguay and W. by Uruguay and Argentina—the Uruguay river forming the boundary line with the latter. Area, 91,333 sq. m. Pop. (1900) 1,149,070, an increase of 251,615 since 1890. The northern part of the state lies on the southern slopes of the elevated plateau extending southward from São Paulo across the states of Paraná and Santa Catharina, and is much broken by low mountain ranges whose general direction across the trend of the slope gives them the appearance of escarpments. A range of low mountains extends southward from the Serra do Mar of Santa Catharina and crosses the state into Uruguay. West of this range is a vast grassy plain devoted principally to stock-raising—the northern and most elevated part being suitable in pasturage and climate for sheep, and the southern for cattle. East of it is a wide coastal zone only slightly elevated above the sea; within it are two great tide-water lakes—Lagôa dos Patos and Lagôa Mirim—which are separated from the ocean by two sandy, partially barren peninsulas. The coast is one great sand beach, broken only at one point—that of the outlet of the two lakes, called the Rio Grande, which affords an entrance to navigable inland waters and several ports. There are two

distinct river systems in Rio Grande do Sul—that of the eastern slope draining to the tide-water lakes, and that of the La Plata basin draining westward to the Uruguay. Fully one-third of the state belongs to the La Plata drainage basin. The larger rivers of the eastern group are the Jacuhy, Sinos, Cahy, Gravatahy and Camaquam, which flow into the Lagôa dos Patos, and the Jaguarão which flows into the Lagôa Mirim. All of the first named, except the Camaquam, discharge into one of the two arms or estuaries opening into the northern end of Lagôa dos Patos, which is called the Rio Guahyba, though in reality it is not a river. It is broad, comparatively deep and about 35 m. long, and with the rivers discharging into it affords upwards of 200 m. of fluvial navigation. The Jacuhy is one of the most important rivers of the state, rising in the ranges of the Cocilha (Cuchilla) Grande of the North and flowing S. and S.E. to the Guahyba estuary, with a course of nearly 300 m. It has two large tributaries—the Vaccacahy from the S. and the Taquary from the N.—besides many small streams. The Jaguarão, which forms part of the boundary line with Uruguay, is navigable 26 m., up to and beyond the town of Jaguarão. Of the many streams flowing northward and westward to the Uruguay, the largest are the Ijuhy-guassú, of the plateau region, the Ibicuhy, which has its source in the central part of the state, near Santa Maria, and flows westward to the Uruguay a short distance above Uruguayana and the Quarahim, or Quarahy, which forms part of the boundary line with Uruguay. The Uruguay river itself is formed by the confluence of the Rio das Canôas and Rio Pelotas in about long. 51° 30' W. With its southern confluent, the Rio Pelotas, which has its source in the Serra do Mar, on the Atlantic coast, it forms the northern and western boundary line of the state down to the mouth of the Quarahim, on the Uruguayan frontier. In addition to the Lagôa dos Patos and Lagôa Mirim there are a number of small lakes on the sandy, swampy peninsulas that lie between the coast and these two, and there are others of a similar character along the northern coast. The largest lake is the Lagôa dos Patos (Lake of the Patos—an Indian tribe inhabiting its shores at the time of the discovery), which lies parallel with the coast-line, N.E. and S.W., and is about 133 m. long exclusive of the two arms at its northern end, 25 and 35 m. long respectively, and of its outlet, the Rio Grande, about 24 m. long. Its width varies from 22 to 36 m. The lake is generally shallow and filled with sand banks, making its navigable channels tortuous and difficult. The Lagôa Mirim occupies a similar position farther S., on the Uruguayan frontier, and is about 108 m. long by 6 to 22 m. wide. It is more irregular in outline and discharges into Lagôa dos Patos through a navigable channel known as the Rio São Gonçalo. A part of the lake lies in Uruguayan territory, but its navigation, as determined by treaty, belongs exclusively to Brazil. Both of these lakes are evidently the remains of an ancient depression in the coast-line shut in by sand beaches built up by the combined action of wind and current. They are of the same level as the ocean, but their waters are affected by the tides and are brackish only a short distance above the Rio Grande outlet.

Rio Grande lies within the South Temperate zone and has a mild, temperate climate, except in the coastal zone where it is semi-tropical. There are only two well-marked seasons, though the transition periods between them (about two months each) are sometimes described as spring and autumn. The winter months, June to September, are characterized by heavy rains and by cold westerly winds, called *minuanos*, which sometimes lower the temperature to the freezing point, especially in the mountainous districts. Snow is unknown, but ice frequently forms on inland waters during cold winter nights, only to disappear with the first rays of the sun. In summer, which is nominally a dry season, light rains are common, northerly and easterly winds prevail, and the temperature rises to 95° in the shade. Cases of insolation are not rare. Malaria is unusual and the state has a high reputation for healthiness, though insanitary conditions are responsible for various diseases in large communities.

The principal industry of the state is stock-raising, especially on the southern plains, where large *estancias* (ranches) are to be found. This industry originated with the Jesuit missions on the Uruguay early in the 17th century, and its development here has been much the same as in Argentina and Uruguay. No general effort was made before the 20th century to improve the herds by the importation of better breeds, and the industry was practically in a state of decay until higher tariff rates were imposed on imported *carne secca* (jerked beef) toward the end of the 19th century. The export of live-stock is insignificant, the practice being to sell the cattle to the *xarqueadas* or *saladeros* where they are slaughtered for *xarque, charqui* or *carne secca*, which is usually prepared by salting and drying in the sun. The jerked beef is largely exported to other Brazilian states for consumption, while the hides and other by-products are exported to Europe and the United States. The importance of the industry is shown in the exports of 1905, in kilogrammes, viz.: jerked beef, 37,555,951; dry hides, 4,735,987; salted hides, 12,141,779; beef extract, 16,712; ox-tongues, 498,577; tallow, 6,174,189; and large quantities of leather, horns, hoofs, bone-ash and preserved meats. Horses, mules, sheep, goats and swine are also raised; the raising of sheep being fostered by the building of woollen factories, and that of swine by the higher duties on imported pork and lard. In some parts of the state agriculture claims much attention, especially in the forested districts of the north where colonies of foreign immigrants have been established. The principal products are wheat, Indian corn, rice, beans, pease, onions, garlic, *farinha de mandioca* (cassava flour), potatoes, tomatoes, cabbage, fruit, tobacco and peanuts—all of which find a ready market on the coast. Grapes are grown in several localities (São Leopoldo, Alegrete, Bagé, &c.) for wine-making, and the industry has become important—the export in 1905 being 2,092,417 litres. The forest products are *Araucaria brasiliana* (*Ilex paraguayensis*), timbers and lumber, and vegetable fibre (*crina vegetal*). Coal of an inferior quality is mined at São Jeronymo, on a small tributary (Arroio dos Ratos) of the Jacuhy river, and has been discovered in other localities. Lime is found in Uruguayana, and at some other places. Gold, copper and iron are said to exist, but are not mined. Considerable progress has been made in manufacturing industries, among whose products are: woollen, cotton and jute textiles, leather goods, boots, shoes, hats, sandals (*tamnacos*), wines and liquors, beer, macaroni, biscuits and other prepared foods, cigars and cigarettes, hats, matches, soap, candles and wrapping paper. Much of the diversity in production is due to the foreign element in the population.

The railway lines in the state are: the Porto Alegre to Novo Hamburgo (27 m.), with an extension to Taquary (28 m.); Porto Alegre to Uruguayana (through from Porto Alegre, on the Bank of the Taquary) to Cacequy (232 m.); Santa Maria to Passo Fundo (221 m.); Rio Grande to Bagé (175 m.), with 14 m. in branches at Rio Grande; an extension from Cacequy to Bagé (129 m.); and the Quarahim to Itaquy (109 m.). All these railways, but 18 have been taken over by the national government and leased to the Belgian "Compagnie auxiliare de Chemin de Fer au Brésil," which has undertaken to complete the line from Cacequy to Uruguayana (168 m.). From Marco, on Quarahim to Itaquy, and on the Novo Hamburgo line (60 m.), and some other branches. The Quaralim to Itaquy line belongs to an English company and runs from the Uruguayan frontier, where it connects with the North-Western of Uruguay, northward to Uruguayana and the naval station of Itaquy.

The population in 1900 was 1,149,070. There is a large foreign element: in 1905 the total number of foreigners residing in the state was estimated at 400,000 (not including children born in the country), and of Germans at 250,000. The first German colony was founded in 1824 and settled in 1825 in the rich forested country N. of Porto Alegre, and many large and prosperous communities have been established since then in spite of the wars and political agitations in the state. Several of these colonies, such as São Leopoldo, Novo Hamburgo and Conde d'Eu (now Garibaldi), have become important towns and are no longer under colonial administration. Italian colonies were subsequently established, also with good results, but an Irish colony founded at Monte Bonito, near Pelotas, about 1851, failed completely. The capital of Rio Grande do Sul is Porto Alegre at the northern extremity of Lagôa dos Patos, and its two next most important cities are Rio Grande and Pelotas, both at the southern extremity of the same lake. Among other important cities and towns, with population returns for 1900, are Alegrete (11,438), prettily situated in the W. part of the state on the Porto Alegre to Uruguayana railway; Bagé (13,463), about 173 m. by rail N.W. of Rio Grande in a picturesque mountainous region, 702 ft. above sea-level; Jaguarão (9000), on a river of the same name and opposite the Uruguayan town of Artigas, with steamboat communication with Rio Grande; Caçapava (8781 in 1890) in a fine grazing district in the central part of the state, 1732 ft. above sea-level; Quarahim, or Quaraby (about 6500), a town of much commercial

importance on the Quarahim river opposite the Uruguayan town of Santo Eugenio, and surrounded by a rich grazing country which supports one of the largest *saladeros* in the state; São Leopoldo; Santa Maria da Bocca do Monte; and Uruguayana.

The territory was first settled along the Uruguay river by the Jesuits when they were compelled to abandon their missions on the upper Paraná. Between 1632 and 1707, they founded on the E. side of the Uruguay seven missions—all under Spanish jurisdiction—which became highly prosperous, and at the time of their transfer from Spanish to Portuguese rule by a treaty of 1750 had an aggregate population of about 14,000, living in villages and possessing large herds of cattle and many horses. A joint effort of the two powers in 1753 to enforce the treaty, remove the Indians to Spanish territory, and mark the boundary line, led to resistance and a three years' war, which ended in the capture and partial destruction of the missions. On the coast the first recognized settlement—a military post at Estreito, near the present city of Rio Grande—was made in 1737. Before this, and as early as 1680, according to some chroniclers, the region S. of Santa Catharina was occupied by settlements, or penal colonies, of *degradados* (banished men) and immoral women from Santos, São Vicente and São Paulo, and was known as the "Continente de São Pedro." In 1738 the territory (which included the present state of Santa Catharina) became the Capitania d'El Rei and was made a dependency of Rio de Janeiro. Territorial disputes between Spain and Portugal led to the occupation by the Spanish of the town of Rio Grande (then the capital of the *capitania*) and neighbouring districts from 1763 to 1776, when they reverted to the Portuguese. The capture of Rio Grande in 1763 caused the removal of the seat of government to Viamão at the head of Lagôa dos Patos; in 1773 Porto dos Cazaes, renamed Porto Alegre, became the capital. In 1801 news of war between Spain and Portugal led the inhabitants of Rio Grande to attack and capture the seven missions and some frontier posts held by the Spaniards since 1763; since 1801 the boundary lines established by treaty in 1777 have remained unchanged. The districts of Santa Catharina and Rio Grande had been separated in 1756 for military convenience, and in 1807 the latter was elevated to the category of a *capitania-geral*, with the designation of "São Pedro do Rio Grande," independent of Rio de Janeiro, and with Santa Catharina as a dependency. In 1812 Rio Grande and Santa Catharina were organized into two distinct *comarcas*, the latter becoming an independent province in 1822 when the empire was organized. In 1835 a separatist revolution broke out in the province and lasted ten years. It was reduced more through the use of money and favours than by force of arms; but the province had suffered terribly in the struggle and did not recover its losses for many years. An incident in this contest was the enlistment of Garibaldi for a short time with the forces of the separatists. In 1865 a Paraguayan army invaded the state and on the 5th of August occupied the town of Uruguayana. On the 18th of September following, the Paraguayan general (Estigarribia) surrendered without a fight—an unusual occurrence in the remarkable war that followed. Political agitations have been frequent in Rio Grande do Sul, whose people have something of the temperament of their Spanish neighbours, but no important revolution occurred after the "ten years' war" (1835–45) until the presidency at Rio de Janeiro of General Floriano Peixoto, whose ill-considered interference with the state governments led to the revolt of 1892–94, under Gumersindo Saraiva. In this struggle the revolutionists occupied Santa Catharina and Paraná, capturing Curityba, but were eventually overthrown through their inability to obtain munitions of war. An incident in this struggle was the death of Admiral Saldanha da Gama, one of the most brilliant officers of the Brazilian navy and one of the chiefs of the naval revolt of 1893–94, who was killed in a skirmish on the Uruguayan frontier at the close of the war.

RIO GRANDE DO SUL, or São Pedro do Rio Grande do Sul (sometimes São Pedro and commonly Rio Grande), a city and port of the state of Rio Grande do Sul, Brazil, on the western side of the Rio Grande (as the outlet of the Lagôa dos Patos is called), about 6 m. from its mouth and nearly 780 m. S.W. of Rio de Janeiro, in lat. 32° 7′ S., long. 52° 8′ W. Pop. (1890) of the municipio (area, about 656 sq. m.) 24,653; of the city, including its suburbs, 20,193; (1900, estimate) of the city, 22,000, and of the city and its suburbs, 30,000. Rio Grande is the coast terminus of the Rio Grande to Bagé railway, which now forms part of the railway system of the state leased to the Belgian Compagnie Auxiliare de Chemin de Fer au Brésil. Some of the principal streets are served by tramways, and the Rio Grande to Bagé railway has an extension to its shipping wharf called "Estação Marítima" (1½ m.), a branch to some points on the river (1½ m.), and a branch to Costa do Mar, on the ocean coast (11 m.). The city is a port of call for several steamship lines, and has direct communication with European ports. The bar at the mouth of the river, however, restricts traffic to vessels of light draught, not exceeding 12 to 15 ft. Extensive improvements, at an estimated cost of about 13½ millions of dollars, were undertaken in 1908 for deepening the bar to admit vessels of 30 ft. draught.

The city is built on a low sandy peninsula, barely 5 ft. above sea-level, formed by two arms of the Rio Grande projecting westward from the main channel, the peninsula being part of a large sandy plain extending southward along the coast to Lagôa Mirim. The level of the plain is broken by ranges of sand dunes, some of which rise not far from the city on the south and south-east. The openness of the surrounding country and the proximity of the sea give to Rio Grande unusually healthy conditions, which, however, are largely counteracted by defective sanitary arrangements. Not infrequently the deaths exceed the births, and epidemics of contagious diseases make deadly inroads upon the population. The city has been developed irregularly, but the streets are for the most part broad, and the principal ones are well paved. Gas lighting was introduced about 1871, and in 1908 acetylene was used for public lighting. In one of the public squares is a shaft commemorating the abolition of slavery, and said to be the only monument of the kind in Brazil of that character. There is a notable scarcity of shade trees in the streets and squares, though flowers, shrubbery and some kinds of fruit trees are grown. In pleasing contrast to the drifting sands which surround the city is the fertile Ilha dos Marinheiros (Sailor's Island) lying directly in front of the port; it is highly cultivated and supplies the market with fruit and vegetables. The water-front has been improved by substantial stone walls, which permit the mooring of light-draught vessels alongside.

Among noteworthy public buildings and institutions are the municipal palace, the parochial church of São Pedro, dating from the 18th century, the modern church of N.S. de Bomfim, the beautiful Protestant Episcopal church (Gothic), the public hospital (Hospital de Caridade), the hospital of the Beneficencia Portugueza, the public library (Bibliotheca Riograndense), created and maintained by private effort and containing about 30,000 volumes, the old custom-house and the *quartel-geral* (military barracks). Rio Grande is wholly a commercial and industrial city. Its exports include salted jerked beef (*carne seca*, or *xarque*), preserved meats, tongues, hides, horns, hoofs, woollen fabrics, Paraguay tea, beans, onions, fruit, flour, *farinha de mandioca* (cassava flour), lard, soap, candles and leather. Its manufactures include cotton, woollen and jute fabrics, wheat flour, biscuits, cigars and cut tobacco, beer, artificial drinks, boots, shoes and sandals (*alpergatas*), soap and candles, fireworks, ice, earthenware, hats, cast-iron and leather. The pioneer woollen factory in Brazil, and one of the largest in the country, is in Rio Grande.

Rio Grande was founded in 1737 by José da Silva Paes, who built a fort on the river near the site of the present city and called it Estreito. In 1745 the garrison and settlement was removed by Gomes Freire d'Andrade to its present site, which became a "villa," in 1751, with the name of São Pedro do Rio Grande, and a "cidade" (city) in 1807. It was the capital of the captaincy down to 1763, when it was captured by a Spanish force from Buenos Aires under the command of its governor, Don Pedro Zeballos, the seat of government being then removed to Viamão at the northern end of Lagôa dos

Patos. The city was occupied by the national forces in the ten years' war which began in 1835, and in 1894 it was unsuccessfully besieged by a small insurgent force that had attempted to overthrow the government at Rio de Janeiro.

RIOJA, LA, an Andine province of Argentina, bounded N. by Catamarca, E. by Catamarca and Cordoba, S. by San Luis and San Juan and W. by San Juan and Chile. Area, 34,546 sq. m. Pop. (1895) 69,502; (1902, estimate) 82,099. The province is traversed from N. to S. by eastern ranges of the Andes and is separated from Chile by the Cordillera itself. The western part of the province is drained by the Bermejo, which flows southward into the closed lacustrine basin of Mendoza. The eastern side of the province is arid, but in the extreme N. some small streams flow northward into Catamarca. The scanty waters of these streams are used for irrigation purposes. The principal industry of the province is that of mining, its mineral resources including gold, silver, copper, nickel, tin, cobalt, coal, alum and salt. Its best known mines are those of the Sierra de Famatina, 16,400 ft. above sea-level, where an aerial wire line is used for transportation to Chilecito in the valley below. The development of mining industries is seriously hindered by lack of water. For the same reason, agriculture is in a very backward condition. The climate is hot and dry, and there is no cultivation of the soil except in the valleys of the Cordillera and a few other places where irrigation is possible. Under these conditions, there are grown wheat (a limited extent), grapes, oranges, olives and tobacco. Alfalfa is grown to a considerable extent and is used for feeding the herds of cattle driven across country to Chile. The capital of the province is La Rioja (pop., 1904, about 6000), on the eastern flank of the Sierra de Velasco, about 1770 ft. above sea-level and near the gorge of Sanagasta, through which a small stream, also called Rioja, flows northward and affords water for the gardens, vineyards and orchards that surround it. The wines of Rioja are highly esteemed and are an important source of income for the district. The town is connected by rail with Cordoba and Catamarca. It was founded in 1591 by Velasco and in 1894 was destroyed by an earthquake from which it has only partially recovered. The most important town in the province is the mining centre of Chilecito, or Villa Argentina (pop., 1904, about 4000), about 2950 ft. above sea-level near the Famatina mines.

RIOM, a town of central France, capital of an arrondissement in the department of Puy-de-Dôme, 8 m. N. by E. of Clermont-Ferrand by rail. Pop., town, 7839; commune, 10,627. Riom is situated on the left bank of the Ambène, on an eminence rising above the fertile plain of Limagne. It is surrounded with boulevards and has wide streets, but the houses, being built of black lava, have a sombre appearance. Some belong to the 15th and 16th centuries, and have turrets and carved stonework. The church of St Amable, of Romanesque and early Gothic architecture, dates from the 12th century, but has been restored in modern times. It has fine carved woodwork of the 17th century. The church of Notre-Dame du Marthuret (15th century) has a well-known statue of the Virgin at its western entrance. The Sainte-Chapelle of the 14th and 15th centuries is a relic of the palace of Jean de Berry, duke of Auvergne, and contains fine stained glass. Near it stands a statue of the chancellor Michel de l'Hôpital, who was born near Riom. The rest of the site of the palace is occupied by the law courts. Other interesting buildings are the belfry of the 16th century and a mansion of the same period known as the Maison des Consuls. The town possesses numerous fountains, some of which are of the Renaissance period.

Riom is the seat of a court of appeal, a court of assizes and a sub-prefect, and has tribunals of first instance and commerce and a communal college. It has a state manufactory of tobacco, and carries on the preparation of fruit preserves. Trade is in grain, wine, vegetables, fruit, nut-oil and Volvic stone.

Riom (*Ricomagus* or *Ricomum* of the Romans) was long the rival of Clermont. Along with Auvergne it was seized for the crown by Philip Augustus, and it was the capital of this province under the dukes of Berry and Bourbon.

RIO NEGRO, a territory of Argentina lying between the Colorado river and the 42nd parallel S. lat., within the geographical area formerly known as Patagonia, bounded N. by the territories of Neuquen and La Pampa, E. by the province of Buenos Aires and the Atlantic, S. by the territory of Chubut and W. by Chile and Neuquen. Area, about 75,924 sq. m.; pop. (1895) 9241; (1904, estimate) 18,648. That part of it lying between the Colorado and Negro rivers has much of the formation and characteristics of the "sterile pampas," but with irrigation the greater part of it can be utilized for agriculture and grazing. South of the Negro the country is arid, barren and lies in great shingle-covered terraces sloping eastward to the Atlantic; its larger part is practically uninhabitable, only the river valleys and the foot-hills of the Andes having a regular water supply. The rivers of the territory are the Colorado, which forms a part of its northern boundary, and the Negro, formed by the confluence of the Limay (which forms part of the western boundary) and Neuquen on the boundary between Rio Negro territory and the territory of Neuquen. These rivers have no tributaries of importance within the territory, but the Limay receives some small streams from the Andean slopes. Lake Nahuel-Huapi lies partly in this territory (see NEUQUEN), and there are several small lakes scattered over the shingly steppes. The Atlantic coast-line of the territory has one deep indentation—the Gulf of San Matias—but, owing to the arid surroundings, there are no ports or towns upon it. The only industry of importance is grazing, cattle being raised for export to Chile, and a few sheep for their wool. The capital is Viedma (pop. in 1895, estimate, 1500), on the right bank of the Rio Negro, 22 m. from its mouth and opposite Carmen de Patagones, a town and port of Buenos Aires. There are other small settlements on the Rio Negro, which is navigable up to the Neuquen frontier (about 450 m.), but the only place of importance is General Roca (about 2300), a military and supply station situated a few miles below the confluence of the Limay and Neuquen rivers and connected with Bahia Blanca and Buenos Aires by a branch of the Great Southern railway.

RIO PARDO (formerly Villa do Rio Pardo), a town of Brazil in the state of Rio Grande do Sul, on the left bank of the Jacuhy at its confluence with the Pardo. Area (of the municipality) 1737 sq. m. Pop. (1890) of the municipality, 19,346; (1908, estimated) of the town, 3500. The town is about 80 m. due west of Porto Alegre, with which it is connected by rail and steamer. The Jacuhy is navigable by small steamers to this place, which was once an important military station and commercial centre. Its military importance has considerably declined through railway extension. The surrounding districts are fertile but only slightly cultivated, and stock-raising is its chief industry. The town had its origin in a frontier fort built at this point by the Portuguese in 1751, but did not reach the dignity of a "villa" until 1809.

RIOT (O. Fr. *riote*, of uncertain etymology), the gravest kind of breach of the peace, short of treason, known to the English law. It consists in a tumultuous disturbance of the peace by an assemblage of three or more persons who, with intent to help one another against any one who opposes them in the execution of some enterprise, actually execute that enterprise in a violent and turbulent manner, to the terror of the people. It is not necessary that violence should be used to any person or damage done to any property. Whether the enterprise itself is lawful or unlawful is not material, the gist of the offence lying in the mode in which the enterprise is carried out (*The Trafalgar Square Riots*, 1888, 16 Cox. Cr. Cas. 420, 427; Stephen, *Dig. Crim. Law*, 6th ed., art. 77). Nor is it material whether the enterprise is of a private or a public nature, though in the latter case the rioters may also be guilty of sedition or treason. An assembly in its inception perfectly lawful may become a riot if the persons assembled proceed to form and execute a common purpose in the manner above stated, although they had no such purpose when they first assembled. Riot differs from "Affray" in the number of persons necessary to constitute the offence, from an "Unlawful Assembly" in that actual tumult or violence is an

essential element, and from "Rout," which may be described as a beginning or endeavour to create a riot. It was considered as early as the 14th century that the English common law gave an insufficient remedy against riot. In 1360 the statute of 34 Edward III. gave jurisdiction to justices to restrain, arrest and imprison rioters. In 1393 the statute of 17 Richard II. conferred similar powers on the sheriff and *posse comitatus*. Numerous other acts extending the common law were passed, especially in the Tudor reigns (see Stephen, *History of the Criminal Law*, vol. i. p. 202). Both these acts above mentioned are still on the statute book, but the earliest act now in force of real importance as to this offence is the Riot Act (1716), which creates certain statutory offences for riot attended by circumstances of aggravation. That act makes it the duty of a justice, sheriff, mayor or other authority, wherever twelve persons or more are unlawfully, riotously and tumultuously assembled together, to the disturbance of the public peace, to resort to the place of such assembly and read the following proclamation: "Our Sovereign Lord the King chargeth and commandeth all persons being assembled immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the act made in the first year of King George for preventing tumultuous and riotous assemblies. God save the King." It is a felony to obstruct the reading of the proclamation or to remain or continue together unlawfully, riotously and tumultuously for one hour after the proclamation was made or for one hour after it would have been made but for being hindered. The act requires the justices to seize and apprehend all persons continuing after the hour, and indemnifies them and those who act under their authority from liability for injuries caused thereby. The punishment for the felony is penal servitude for life or for a term of not less than three years, or imprisonment with or without hard labour for not more than two years. Prosecutions for an offence against the act must be commenced within twelve months after the offence.

By s. 11 of the Malicious Damage Act 1861 (which is a re-enactment of a similar provision made in 1827 in consequence of the frame-breaking riots), it is a felony for persons riotously and tumultuously assembled together to the disturbance of the public peace to unlawfully and with force demolish or begin to demolish or pull down or destroy any building, public building, machinery or mining plant. The punishment is the same as for a felony under the Riot Act. By s. 12 it is a misdemeanour to injure or damage such building, &c. The punishment is penal servitude from three to seven years, or imprisonment as in the case of the two felonies above described. Under the Shipping Offences Act (1793) a riotous assemblage of three or more seamen, ship's carpenters and other persons, unlawfully and with force preventing and hindering or obstructing the loading or unloading or the sailing or navigation of any vessel, or unlawfully and with force boarding any vessel with intent to prevent, &c., is punishable on a first conviction as a misdemeanour by imprisonment from six to twelve months, and on a second conviction as a felony by penal servitude from three to fourteen years. And under the Offences against the Person Act 1861 (s. 40) summary penalties are provided for forcible interference with seamen in the exercise of their lawful occupation.

Besides these enactments there are others aimed at similar offences, such as smuggling, forcible entry and detainer, tumultuous petitioning (1661, 13 Charles II.), holding large political meetings within a certain distance of Westminster Hall during the sitting of parliament (Seditious Meetings Act 1817). For these offences see Stephen, *Dig. Cr. Law*, 6th ed., arts. 81–87.

It is the duty of a magistrate at the time of a riot to assemble subjects of the realm, whether civil or military, for the purpose of quelling the riot. In this duty he is aided by the common law, and a statute of 1414 (Henry V.), under which all subjects of the realm are bound to assist on reasonable warning, and by various enactments enabling the authorities to call out the militia, yeomanry and reserve forces for the suppression of riot, and to close public-houses where a riot is apprehended (Licensing Act 1872). It is his duty to keep the peace; if the peace be broken, honesty of intention will not avail him if he has been guilty of neglect of duty. The question is whether he did all that he knew was in his power and which could be expected from a man of ordinary prudence, firmness and activity. The law as thus stated is gathered from the opinions of the judges on the trials of the lord mayor of London and the mayor of Bristol on indictments for neglect of duty at the time of the Gordon riots of 1780 and the Bristol riots in 1831.[1] In addition to his liability to an indictment at common law, a defaulting magistrate is subject under the provisions of acts of 1411 (Henry IV.) and 1414 (Henry V.) to a penalty of £100 for every default, the default to be inquired of by commission under the great seal. A matter of interest is the extent of the protection afforded by the Riot Act to soldiers acting under the commands of their officers. The question was dealt with by Lord Bowen and his fellow-commissioners in the report on the Featherstone riots (Parl. Paper, 1893–1894, c. 7234). The substance of their views is as follows:—

By the law of England every one is bound to aid in the suppression of riotous assemblages. The degree of force, however, which may be lawfully employed in their suppression depends on the nature of each riot, for the force used must always be moderated and proportioned to the circumstances of the case and to the end to be attained. The taking of life cannot be justified by the necessity for protecting persons or property against various forms of violent crime, or by the necessity of dispersing a riotous crowd which is dangerous unless dispersed, or in the case of persons whose conduct has become felonious through disobedience to the provisions of the Riot Act, and who resist the attempt to disperse or apprehend them. The necessary prevention of such outrage on person or property justifies the guardians of the peace in the employment against a crowd of even deadly weapons. Officers and soldiers are under no special privileges and subject to no special responsibilities as regards the principle of the law. A soldier for the purpose of establishing civil order is only a citizen armed in a particular manner. He cannot because he is a soldier be exonerated if without necessity he takes human life. The duty of magistrates and peace officers to summon or abstain from summoning the assistance of the military depends in like manner on the necessities of the case. A soldier can act only by using his arms. The weapons he carries are deadly. They cannot be employed at all without danger to life or limb, and in these days of improved rifles and perfected ammunition without some risk of danger to distant and possibly innocent bystanders. To call for assistance against rioters from those who can interfere only under such grave conditions ought, of course, to be the last expedient of the civil authorities. But when the call for help is made and a necessity for assistance from the military has arisen, to refuse such assistance is in law a misdemeanour. The whole action of the military when once called in ought from first to last to be based on the principle of doing, and doing without fear, that which is absolutely necessary to prevent serious crime, and of exercising care and skill with regard to what is done. No set of rules exists which governs every instance or defines beforehand any contingency that may arise. The presence of a magistrate is not essential, but is usual, and of the highest value to aid the commander of the troops by local knowledge. But his presence or absence has no legal effect on the duties or responsibilities of the military to use their arms when it becomes necessary to do so, and without recklessness or negligence and with reasonable care and caution; and where they have so acted the killing of a rioter is justifiable homicide, and the killing of an innocent bystander is homicide by misadventure. It is not usual to resort to extremities with rioters until after reading the proclamation under the Riot Act (1716),

[1] Reports of these trials will be found in the State Trials, New Series, vol. iii. pp. 1, 11. Most of the important cases of riot are collected or referred to in that series.

but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.

The crown cannot charge upon the local rates the expense of maintaining soldiers called into a district by the magistrates to suppress a riot (*re* Glamorgan County Council, L.R. 1899, 2 Q.B. 536); but the cost of extra police drafted in for the like purpose falls on the rates of the district into which they are drafted (see Police Act 1890, s. 25). Until 1886 persons whose property was damaged by riot had a civil remedy of an exceptional character by action against the hundred in which the riot took place. This remedy was a survival of the pre-Conquest liability of the hundred to guarantee the orderly conduct of its inhabitants. The hundred was made liable in case of robbery by the Statute of Winchester (1285).[1] That and subsequent acts were repealed in the reign of George IV., and their provisions were consolidated by an act of 1827 which gave a remedy against the hundred in the case of felonious demolition of churches, chapels, houses, machinery, &c., being feloniously demolished by rioters. The last instance of the use of this exceptional remedy was in the case of a riot at Worthing, and the remedy was abolished in 1886. When the Piccadilly riots occurred in that year no one knew that the injured shops were in the hundred of Ossulston, and difficulties arose in applying the old procedure. So an *ex post facto* statute was passed (the Metropolitan Police Compensation Act 1886) for a special settlement of the claims, and the old statutes were repealed and replaced by the Riot Damage Act 1886. Under this act compensation is payable where rioters have injured or destroyed houses, shops, buildings, fixed or movable machinery and appliances prepared or used for or in connexion with manufactures or agriculture, or for mines or quarries, or vessels stranded or in distress (see WRECK), or have injured, stolen, or destroyed property in houses, shops or buildings. The compensation is payable out of the police rate for the district in which the damage is done; or if it was done afloat, for the district nearest to the scene of action. The claim is made on the police authority for the district. The time and form for making claims and the mode of fixing the amount of compensation is regulated by rules made by the Home Secretary on the 30th of June 1894 (Stat. R. and O. 1894, No. 636). In adjusting the amount regard is had to the conduct of the claimant, viz. as to precautions taken by him, his share if any, in the riot, or provocation offered to the rioters. Failure to carry out a programme for athletic sports has been held to debar a claimant from compensation for damage done by a riot among the disappointed spectators who had paid to see the sports. The claimant must give credit for insurance money, or any other compensation received in respect of the damage; but the insurers or persons who paid such compensation may file a claim against the police rate for the amount paid by them. Persons dissatisfied with the award of the police authority may sue for the recovery of their claim subject to a liability to pay all the costs if they do not get judgment for more than the amount awarded. The action, if it is not for more than £100, is to be brought in the county court. The remedy is available in the case of stranded ships plundered by rioters (s. 515 of the Merchant Shipping Act 1894).

The Riot Act does not extend to Ireland, but similar provisions are contained in an act of the Irish Parliament passed in 1787 as amended by acts of 1831 and 1842. These acts create a special offence punishable by penal servitude for life, viz. sending notices, letters or messages inciting or tending to riot. Under the Criminal Procedure Ireland Act 1887 (a temporary act) summary proceedings may be taken against rioters. The civil remedy against the county or borough for malicious injury to property, real or personal, including ships in distress and their cargo, is wider than in England or Scotland, but it includes malicious injury by rioters where the injury is a crime within the Malicious Damage Act of 1861. Claims are now dealt with in the county court, and not as formerly by the grand jury and judge of assize (Local Government Ireland Act 1898, s. 5).

In Scotland a riot may be either "rioting and mobbing" or "rioting and breach of the peace." The first is much the same as riot in English law. Mobbing consists in the assembling of a number of people and then combining against order or peace to the alarm of the lieges (Alison, *Cr. Law of Scotland*, vol. i. p. 509; Macdonald, *Criminal Law*, 180). The second offence occurs when concourse or a common purpose are wanting. Numerous acts against rioting and unlawful convocation were passed by the Scottish parliament, beginning in 1487. The Riot Act (1716) applies to Scotland. There is a civil remedy against the county or burgh in which a riot takes place in respect of damage done by the rioters to houses, churches, buildings and ships, and buildings or engines used in trade or manufacture. The remedy is given by a series of statutes of 1716, 1812, 1816, 1817 and 1894. The procedure for its enforcement is now regulated by the Riotous Assemblies (Scotland) Act 1822, and amending statutes. The county or burgh authorities may adjust claims without litigation, and pay them out of the general assessments.

British Dominions.—In India the offence of riot, as defined by s. 146 of the Penal Code, consists in the use of force or violence by an unlawful assembly (which must consist of at least five persons, s. 141), or by any member thereof in the prosecution of the common object of such assembly (see Mayne, *Ind. Criminal Law*, ed. 1896, p. 480). In Ceylon and the Straits Settlements provisions based on the Indian Code are in force. In most of the settled Colonies the English law as to riot applies subject to local legislation. The Criminal Codes of Canada (1892, ss. 79–86), New Zealand (1893, ss. 83–89) and Queensland (1899, ss. 61–67) adopt the substance of the English law as to riot, in terms borrowed from the English draft Code of 1880. In those of the West Indies whose common law is based on that of France, Holland or Spain, the English law as to riot has been applied by ordinance, *e.g.* in British Guiana (Criminal Code 1893, tit. xix), and St Lucia (Criminal Code 1888, tit. xxv). In the South African colonies the English law of riot does not apply, but under the Dutch Roman law there was a similar offence, known as "public violence" (*vis publica*), *i.e.* the use of violence or force by which the public rest and order is endangered and the authority of the lawful authorities and officials is set at naught. The offence was capital (see Van Leeuwen, *Roman-Dutch Law*, tr. by Kotze, 1886, vol. ii. p. 294; Morice, *English and Roman-Dutch Law*, 1903, p. 334). Similar provisions based on the French Penal Code are in force in Mauritius (Penal Code of 1838).

United States.—In the United States the law is based upon that of England (see Bishop, *Amer. Cr. L.*, 8th ed., 1892, vol. i. s. 534, vol. ii. ss. 1143 et seq.). In some states there is a statutory proclamation for the dispersion of rioters in terms almost identical with those of the British Riot Act. The city, town, or county is by the statutes of many states compellable for damage caused by rioters, with or without a remedy over against the persons who did the damage (see revised Laws of Massachusetts, ed. 1902, chap. 211, sects. 2, 8).

RIO TINTO (MINAS DE RIO TINTO), a mining town of south-western Spain, in the province of Huelva; near the source of the river Tinto, and at the terminus of a light railway from the port of Huelva. Pop. (1900) 11,603. Rio Tinto is one of the greatest copper-mining centres in the world; and it is from the discoloration of its waters by copper ore that the river derives its name. Besides the town of Minas, several villages are peopled by the native miners, whose numbers exceed 10,000; and one is occupied solely by British mine officials. The surrounding country is covered for miles with heaps of slag, and has been reduced to a desert. In 1903 the output of the mines included 840,000 tons of copper ore, worth more than £500,000, besides a relatively small quantity of iron and manganese. Almost the entire product is despatched to Huelva for shipment to Great

[1] There is a curious exception still on the Statute-book depriving persons robbed while travelling on the Lord's Day of any right to compensation from the hundred (Lord's Day Act 1677, s. 5).

Britain. Rio Tinto was probably first exploited by the Carthaginians; vestiges of later Roman workings may still be seen. After the Moorish conquest, in 711, it was neglected until 1725, when the mines were leased to a Swede named Wolters. Their modern importance dates from 1872, when a syndicate of London and Bremen capitalists purchased them from the Spanish government for nearly £4,000,000.

RIOU, EDWARD (1758?–1801), British sailor, entered the navy at an early age. In 1780 he was promoted lieutenant, and nine years later he was in command of the "Guardian" when that vessel, crowded with convicts, struck a hidden rock off the African coast. Riou, after parting with as many of his men as the boats would hold, not only successfully navigated his half-sinking ship 400 leagues to the Cape of Good Hope, but kept order amongst the panic-stricken convicts, an achievement which had few parallels in naval annals, and won Lieutenant Riou's immediate promotion. He did not long remain a commander and in 1791 he was posted. Under Sir John Jervis he was present at the operations about Martinique and Guadeloupe in 1794, and in the "Amazon" he accompanied the expedition under Sir Hyde Parker to the Baltic in 1801. His frigate led the way through the Channel at Copenhagen, and in the battle he was attached as commodore of a light squadron to Nelson's division. Through the grounding of three ships of the line, Riou and his frigates found themselves opposed to the full force of the great Trekroner battery. Early in the fight he was wounded, but refused to leave the deck, and, as he was sitting on a gun-carriage and directing his men's fire, he was cut in two by a cannon ball. Nelson, who had not known him before this expedition, had conceived a great affection for Riou, and spoke of his loss as "irreparable." Brenton, the naval historian, declared that he had all the qualities of a perfect officer. Parliament commemorated the memory of the "gallant good Riou" by a memorial in St Paul's Cathedral.

RIOUW, RHIOUW or BINTANG, an archipelago of the Dutch East Indies, E. of Sumatra, and separated from the Malay Peninsula by the Straits of Singapore. With the Lingga, Karimon, Tambelan, Anambas and Natuna Islands, to the N.E., E. and S., and the territory of Indragiri in Sumatra, it forms the Dutch residency of Riouw and dependencies. The seat of government is at Tanjong Pinang, a small port of 4000 inhabitants (including 160 Europeans and about 2000 Chinese), on the S.W. coast of the chief island, Bintang or Riouw. The total area of the residency is about 17,550 sq. m., and its population (1905) 112,216, of whom considerably over a quarter are Chinese. These cultivate gambier and pepper successfully in Bintang, and there is a considerable trade in wood. Bintang has an area of about 440 sq m., and is surrounded by many rocks and small islands, making navigation dangerous. The soil is not fertile, and much of it is swampy. There is an assistant residency of Lingga, to which belongs the island of Singkep, where extensive tin-deposits are worked. Geologically the Riouw and Lingga Islands are appendages of the Malay Peninsula, not of Sumatra. Bintang is mentioned by Marco Polo under the name of *Pentam*, which is not far from the genuine Malay name *Bentān*, said to mean a half-moon. After the Portuguese conquest of Malacca (1511), the expelled Mahommedan dynasty took up its residence on Bintang, where it long fostered piracy.

RIPLEY, GEORGE (1802–1880), American critic and man of letters, was born at Greenfield, Massachusetts, on the 3rd of October 1802. He graduated first in his class at Harvard in 1823. From 1826 to 1840 he was pastor of a Unitarian church in Boston, subsequently retiring from the active ministry altogether. It was during those years that there grew up in New England that form of thought or philosophy known as Transcendentalism. Ripley was prominent, if not the leader, in all practical manifestations of the movement; and it was largely by his earnestness and practical energy that certain of its more tangible results were brought about. The first meeting of the Transcendental Club was held at his house in September 1836. He was a founder and a chief supporter of the magazine, the *Dial*, which was the organ of the school from 1841 to 1844. Most important of all, however, he was the originator of "The Brook Farm Institute of Education and Agriculture." Until the abandonment of this experiment in 1847, Ripley was its leader, cheerfully taking upon himself all kinds of tasks, teaching mathematics and philosophy in the school, milking cows and attending to other bucolic duties, and after June 1845 editing the weekly *Harbinger*, an organ of "association," which he continued to edit in New York from 1847 until it was discontinued in 1849. The failure of Brook Farm (*q.v.*) left Ripley poor and feeling keenly the defeat of his project; but the event forced him at last to devote himself to that career of literary labour in which the real success of his life was achieved. In 1849 he joined the staff of the *New York Tribune*, and in a short time became its literary editor. This position, which, through his steadiness, scholarly conservatism and freedom from caprice as a critic, soon became one of great influence, he held until his death in New York City on the 4th of July 1880.

During the greater part of the time of his connexion with the *Tribune*, Ripley was also an adviser of a prominent publishing house, an occasional contributor to the magazines, and a co-operator in several literary undertakings. The chief of these was the *American Cyclopaedia*, which as the *New American Cyclopaedia*—so named to distinguish it from Francis Lieber's *Encyclopaedia Americana*—was issued, under the editorship of Ripley and Charles A. Dana, in 1857–63, a revised edition, with the word "new" dropped from the title, being issued under the same editorship in 1873–76. He also issued, in translation, a series of *Specimens of Foreign Standard Literature* (14 vols., 1838–42). Ripley was twice married, first in 1827 to Miss Sophia Willard Dana (d. 1861), a daughter of Francis Dana and a conspicuous figure at Brook Farm; and second, in 1865, to a young German widow, Mrs Augusta Schlossberger, who survived him and subsequently married Alphonse Pinede.

A biography of Ripley (Boston, 1882), written by the Rev. O. B. Frothingham, forms one of the volumes of the "American Men of Letters" series. (E. L. B.)

RIPLEY, a market town in the Ilkeston parliamentary division of Derbyshire, England, 10 m. N. by E. of Derby, on a branch of the Midland railway. Pop. of urban district (1901) 10,111. It lies on high ground between the valleys of the Derwent and the Erewash. In the neighbourhood there are extensive collieries, and coke is largely manufactured. Besides iron foundries, blast furnaces and boiler works, the town possesses silk and cotton mills. The charter for the market was granted by Henry III. The district has a large industrial population. To the west of Ripley lies the township of HEAGE (pop. 2889).

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, 1ST MARQUESS OF (1827–1900), British statesman, only son of the 1st earl of Ripon and his wife Lady Sarah, daughter of Robert Hobart, 4th earl of Buckinghamshire, was born in London on the 24th of October 1827. The Robinson family was descended from an eminent Hamburg merchant, William Robinson (1522–1616), who represented York in parliament in Elizabeth's reign. His great-grandson was in 1666 created a baronet. Thomas Robinson, 1st Baron Grantham (1695–1770), son of a later holder of the baronetcy, was created a peer in 1761, having been an indefatigable diplomatist plenipotentiary at the peace of Aix-la-Chapelle, and secretary of state. The 2nd Baron Grantham (1738–1786), ambassador at Madrid, and foreign secretary under Lord Shelburne, had two sons. The elder of these, succeeding as 3rd Baron Grantham (1781–1859), became in 1833 2nd Earl de Grey, in right of his maternal aunt, and assumed the surname of de Grey; he was lord-lieutenant of Ireland (1841–44). The younger, Frederick John (1782–1859), created Viscount Goderich in 1827 and earl of Ripon in 1833, was the well-known "Prosperity Robinson" who was chancellor of the exchequer from 1823 to 1827; as Lord Goderich he became prime minister (and a peculiarly weak one) from August 1827 to January 1828, colonial secretary in 1831 and 1832, lord privy

seal (1833–34), president of the Board of Trade (1841–43), and president of the India board (1843–46).

His son, the future marquess, began his political life as *attaché* to a special mission to Brussels in 1849. In 1851 he married Henrietta Vyner (d. 1907), and their eldest son, afterwards known as Earl de Grey, was born in 1852. Under his courtesy title of Viscount Goderich he was returned to the House of Commons for Hull in 1852 as an advanced Liberal. In 1853 he was elected for Huddersfield, and in 1857 for the West Riding of Yorkshire. In January 1859 he succeeded to his father's title, and in November of the same year to that of his uncle, Earl de Grey. A few months after entering the Upper House he was appointed under-secretary for war, and in February 1861 under-secretary for India. Upon the death of Sir George Cornewall Lewis in April 1863 he became secretary for war, with a seat in the cabinet. In 1866 he was appointed secretary of state for India. On the formation of the Gladstone administration in December 1868, Lord Ripon was appointed lord president of the council, and held that office until within a few months of the fall of the government in 1873, when he resigned on purely private grounds. In 1869 he was created a Knight of the Garter. In 1871 Lord Ripon was appointed chairman of the High Joint-Commission on the Alabama claims, which arranged the treaty of Washington. In recognition of his services he was elevated to a marquessate (1871). In 1874 he became a convert to Roman Catholicism, and this involved his resignation of the office of grand master of the English Freemasons. On the return of Gladstone to power in 1880 Lord Ripon was appointed viceroy of India, the appointment exciting a storm of controversy, the marquess being the first Roman Catholic to hold the viceregal office. He went out to reverse the Afghan policy of Lord Lytton, and Kandahar was given up, the whole of Afghanistan being secured to Abdur Rahman. The new viceroy was also called upon to decide grave questions between the native population and the resident British, and he resolved upon a liberal policy towards the former, among his measures being the repeal of the Vernacular Press Act, the extension of local government and the appointment of an Education Commission. He extended the rights of the natives, and in certain directions curtailed the privileges of Europeans. Several of the viceroy's measures, notably the Ilbert Bill of 1883—so named after its author Sir Courtenay Ilbert—irritated the Anglo-Indian population, and it was fiercely assailed. The purpose of this bill was disclosed in the statement that "the government of India had decided to settle the question of jurisdiction over European British subjects in such a way as to remove from the code, at once and completely, every judicial disqualification which is based merely on race distinctions," in fact to subject Europeans in certain cases to trial by native magistrates. This announcement raised a storm of indignation among the European community in India, and the government were obliged virtually, though not avowedly, to abandon their measure. Act III. of 1884 was a compromise, which, while subjecting Europeans to the jurisdiction of native district magistrates or sessions judges, reserved to them the right to demand trial by a jury of which at least half should be Europeans. There probably never was a viceroy so unpopular among Anglo-Indians or so popular with the natives. On Lord Ripon's departure from India in November 1884 there were extraordinary manifestations in his favour on the part of the Hindu population of Bengal and Bombay, and more than a thousand addresses were presented to him. On his arrival in England the marquess delivered a number of vigorous speeches in defence of his administration. In 1886 he became first lord of the admiralty in the third Gladstone ministry; and on the return of the Liberals to power in 1892 he was appointed colonial secretary, which post he continued to hold until the resignation of the government in 1895. He was included in Sir Henry Campbell-Bannerman's cabinet at the close of 1905 as lord privy seal, an office which he retained in 1908 when Mr Asquith formed his new ministry, but which he resigned later in the same year. He died at his seat, Studley Royal, near Ripon, on the 9th of July 1909, when his only son, Earl de Grey, who has been treasurer of the queen's household since 1901, became the 2nd marquess. For many years Lord Ripon was president of the Yorkshire College of Science at Leeds, and chairman of the West Riding County Council.

RIPON, a cathedral city and municipal borough in the Ripon parliamentary division of the West Riding of Yorkshire, England, 214 m. N.N.W. from London, on the North-Eastern railway. Pop. (1901) 8230. It is pleasantly situated at the confluence of the streams Laver and Skell with the river Ure, which is crossed by a fine bridge of nine arches. The streets are for the most part narrow and irregular, and, although most of the houses are comparatively modern, some of them retain the picturesque gables characteristic of earlier times. The cathedral, although not ranking among those of the first class, is celebrated for its fine proportions, and is of great interest from the various styles of architecture which it includes. Its entire length from E. to W. is 266 ft., the length of the transepts 130 ft., and the width of the nave and aisles 87 ft. Besides a large square central tower, there are two western towers. The cathedral was founded on the ruins of St Wilfrid's abbey about 680, but of this Saxon building nothing now remains except the crypt, called St Wilfrid's Needle. The present building was begun by Archbishop Roger (1154–81), and to this Transition period belong the transepts and portions of the choir. The western front and towers, fine specimens of Early English, were probably the work of Walter de Grey, archbishop of York (d. 1255), and about the close of the century the eastern portion of the choir was rebuilt in the Decorated style. The nave, portions of the central tower, and two bays of the choir are Perpendicular, having been rebuilt towards the close of the 15th century. Earlier than the rest of the fabric (except the crypt) is part of the chapter-house and the vestry, adjoining the south side of the choir, and terminating eastward in an apse. This is pure Norman work, and there is a crypt of that period beneath, which was formerly filled with unburied bones. There are a number of monuments of historical and antiquarian interest. The diocese includes rather less than one-third of the parishes of Yorkshire, and also a small part of Lancashire. The bishop's palace, a modern building in Tudor style, is situated in extensive grounds about a mile from the town. In the vicinity is the domain of Studley Royal, the seat of the marquess of Ripon, which contains the celebrated ruins of Fountains Abbey (*q.v.*). The principal secular buildings are the town hall, the public rooms, and the mechanics' institution (1804) where technical and other classes are held. There are several old charities, including the hospital of St John the Baptist, founded in 1109 but modernized; the hospital of St Anne, founded probably in the reign of Henry VI. by an unknown benefactor; and the hospital of St Mary Magdalene for women. This last was founded by Thurstan, archbishop of York (1114–41), as a secular community, one of the special duties of which was to minister to lepers. In the 13th century a master and chaplain took the place of the lay brethren, and in 1334 a chantry was founded. The chapel remains, with its intermixture of Norman work, its low side-windows, said to have allowed the lepers to follow the services, and its pre-Reformation altar of stone, a rare example. There is a considerable trade in varnish, and the saddle-trees and other leather goods produced here are in high repute. The borough is under a mayor, 4 aldermen, and 12 councillors. Area, 1809 acres.

Ripon (*In Rhypum, Ad Ripam*) owed its origin to the monastery founded in the 7th century. A certain king, Alchfrith, is said to have given the site of the town to Eata, abbot of Melrose, to found a monastery, but before it was completed Eata was deposed for refusing to celebrate Easter according to the Roman usage, and St Wilfrid was appointed the first abbot. Another version of the story, however, says that the land was given to St Wilfrid, who himself built the monastery. Ripon is said to have been made a royal borough by Alfred the Great, and King Æthelstan, after his victory at Brunanburh

in 937, is stated to have granted to the monastery sanctuary, freedom from toll and taxes, and the privilege of holding a court, although both charters attributed to him are known to be spurious. At the same time he is said to have given the manor to Wulfstan, archbishop of York. About 950 the monastery and town were destroyed by King Edred during his expedition against the Danes, but the monastery was rebuilt by the archbishops of York, and about the time of the Conquest was changed to a collegiate church. In 1318, when the Scots invaded England, Ripon only escaped being burnt a second time by the payment of 1000 marks. The custom of blowing the wakeman's horn every night at nine o'clock is said to have originated about A.D. 700. It was probably at first a means of calling the people together in case of a sudden invasion, but was afterwards a signal for setting the watch. A horn with a baldric and the motto "Except the Lord keep the city the watchman waketh but in vain" forms the mayor's badge. The archbishops of York as lords of the manor had various privileges in the town, among which were the right of holding a market and fair, and Archbishop John, being summoned in the reign of Henry I. to answer by what right he claimed these privileges, said that he held them by prescription and by the charter of King Æthelstan. Henry I. afterwards granted or confirmed to Archbishop Thomas a fair on the feast of St Wilfrid and four following days. The fairs and markets belonged to the archbishops of York until they were transferred to the bishop of Ripon in 1857. In 1857 they were transferred to the ecclesiastical commissioners, from whom they were purchased by the corporation of Ripon in 1880. From before the Conquest until the incorporation charter of 1604 Ripon was governed by a wakeman and 12 elders, or aldermen, but in 1604 the title of wakeman was changed to mayor, and 12 aldermen and 24 common councilmen were appointed. The manufacture of cloth was at one time carried on in Ripon, but was almost lost in the 16th century when the town was visited by Leland. The making of spurs succeeded the cloth manufacture and became so noted that the saying "as true as Ripon rowells" was a well-known proverb. This manufacture died out in the 18th century. Ripon was summoned to send two members to parliament in 1295, and occasionally from to time until 1328–29. The privilege was revived in 1553, after which the burgesses continued to send two members until 1867, when they were allowed only one. This latter privilege was taken away by the Redistribution Bill of 1885, and it now gives its name to one of the divisions of the county.

See *Victoria County History, Yorkshire*; and W. Harrison, *Ripon Millenary: a Record of the Festival and a History of the City, arranged under its Wakemen and Mayors from the year 1400* (1892).

RIPON, a city of Fond du Lac county, Wisconsin, U.S.A., on Silver Creek, about 22 m. W. of Fond du Lac, and about 75 m. N.W. of Milwaukee. Pop. (1890), 3358; (1900), 3818, of whom 885 were foreign-born; (1905), 3811; (1910), 3739. Ripon is served by the Chicago & North-Western, and the Chicago, Milwaukee & St Paul railways. The city has a Carnegie library, which also houses the library of the Ripon Historical Society, and is the seat of Ripon College (non-sectarian, co-educational), which was founded in 1850 as the Lyceum of Ripon, and was named Ripon College in 1864; in 1908 it had 23 instructors and 279 students. There are grain elevators and various manufactories, among the products of which are cheese and other creamery products, flour, knit goods, pickles and canned goods, woodenware, washing machines and gloves.

The site of Ripon was purchased in 1838 by John Scott Horner (1802–1883), of Virginia, secretary and acting-governor of Michigan Territory in 1835, and the first secretary of Wisconsin Territory in 1836–37, who named the village when it was established in 1849 from the seat of his ancestors in Yorkshire. In May 1844 a settlement, named Ceresco or "the Wisconsin Phalanx," a Fourierist community,[1] organized in Southport (now Kenosha), had been established in the vicinity. A "Long House," 400 ft. in length, was erected, which contained tenements, an amusement or lecture hall, and a dining-room where all ate at a common table, and where board was provided at cost, sometimes as low as sixty-three cents per week. The "class of usefulness" was divided into three groups, agricultural, mechanical and educational, with such subdivisions as necessity dictated, and an exact account of labour was kept. The community prospered materially from the start. In the second season it consisted of thirty families with property valued at $27,725; in 1846 there were 180 resident members, and the net profit for the year was $9039. Eventually differences of opinion arose as to the division of labour, and the common dining-hall did not prove popular. Rivalry developed with the village of Ripon, and the community gave up its charter at the close of 1850, dividing property valued at $40,000 among the shareholders. On the whole it was one of the most successful experiments in communism ever tried in America. In 1858 Ripon absorbed the village of Ceresco and was chartered as a city. At Ripon started one of the disconnected movements that resulted in the founding of the Republican party.

See D. P. Mapes, *History of Ripon* (Milwaukee, Wis., 1873); Consul W. Butterfield, *History of Fond du Lac County* (1880); W. A. Hinds, *American Communities and Co-operative Colonies* (3rd ed., Chicago, 1908), and F. A. Flower, *History of the Republican Party* (1884).

RIPPERDA, JOHN WILLIAM, Baron, and afterwards duke of (1680–1737), political adventurer and Spanish minister, was a native of Groningen in the Netherlands. According to a story which he himself set going during his adventures in Spain, his family was of Spanish origin. But there does not appear to be any foundation for this assertion. The name was not uncommon in Groningen, and was borne by several persons of some note in the 16th and 17th centuries, one of whom was a follower of William the Silent. They were people of some position, possessing "lordships" at Jansinia, Poëlgast, and other places, and some at least of them were Roman Catholics. John William, if he was, as he asserted, born a Roman Catholic, conformed to Dutch Calvinism in order to obtain his election as delegate to the states-general from Groningen. In 1715 he was sent by the Dutch government as ambassador to Madrid. Saint-Simon says that his character for probity was even then considered doubtful. The fortune of Orry, Alberoni and other foreigners in Spain, showed that the court of Philip V. offered a career to adventurers. Ripperda—whose name is commonly spelt Riperda by the Spaniards—devoted himself to the Spanish government, and professed himself a Roman Catholic. He first attached himself to Alberoni, and after the fall of that minister he became the agent of Elizabeth Farnese, the restless and intriguing wife of Philip V. Though perfectly unscrupulous in money matters, and of a singularly vain and blustering disposition, he did understand commercial questions, and he has the merit of having pointed out that the poverty of Spain was mainly due to the neglect of its agriculture. But his fortune was not due to any service of a useful kind he rendered his masters. He rose by undertaking to aid the queen, whose influence over her husband was boundless, in her schemes for securing the succession to Parma, Plasencia and Tuscany for her sons. Ripperda was sent as special envoy to Vienna in 1725. He behaved with ridiculous violence, but the Austrian government, which was under the influence of its own fixed idea, treated him seriously. The result of ten months of very strange diplomacy was a treaty by which the emperor promised very little, but and shares to be sold at $25; (2) land to be limited to 40 acres for each member of the corporation; (3) a unanimous vote of the managers necessary for admission; (4) an annual settlement of profits on the basis of one-quarter credit to dividend on stock, and three-quarters credit to labour; (5) free public schools, capital paying three-quarters and labour one-quarter of cost; and (6) complete religious toleration and no involuntary taxation for church support.

[1] The charter, granted by the legislature in 1845, contained the following features: (1) property to be held in common;

Spain was bound to pay heavy subsidies, which its exhausted treasury was quite unable to afford. The emperor hoped to obtain money. Elizabeth Farnese hoped to secure the Italian duchies for her sons, and some vague stipulations were made that Charles VI. should give his aid for the recovery by Spain of Gibraltar and Minorca. When Ripperda returned to Madrid at the close of 1725 he asserted that the emperor expected him to be made prime minister. The Spanish sovereigns, who were overawed by this quite unfounded assertion, allowed him to grasp the most important posts under the crown. He excited the violent hostility of the Spaniards, and entered into a complication of intrigues with the French and English governments. His career was short. In 1726 the Austrian envoy, who had vainly pressed for the payment of the promised subsidies, came to an explanation with the Spanish sovereigns. It was discovered that Ripperda had not only made promises that he was not authorized to make, but had misappropriated large sums of money. The sovereigns who had made him duke and grandee shrank from covering themselves with ridicule by revealing the way in which they had been deceived. Ripperda was dismissed with the promise of a pension. Being in terror of the hatred of the Spaniards, he took refuge in the English embassy. To secure the favour of the English envoy, Colonel William Stanhope, afterwards Lord Harrington, he betrayed the secrets of his government. Stanhope could not protect him, and he was sent as a prisoner to the castle of Segovia. In 1728 he escaped, probably with the connivance of the government, and made his way to Holland. His last years are obscure. It is said that he reverted to Protestantism, and then went to Morocco, where he became a Mahommedan and commanded the Moors in an unsuccessful attack on Ceuta. But this story is founded on his so-called *Memoirs*, which are in fact a Grub-street tale of adventure published at Amsterdam in 1740. All that is really known is that he did go to Morocco, and that he died at Tetuan in 1737.

See Arnold Ritter von Arneth, *Prinz Eugen von Savoyen* (Vienna, 1864), for the negotiations of 1725, and Gabriel Syveton, *Une Cour et un aventurier au XVIII^e siècle* (Paris, 1896). His *Memoirs* were translated into English by J. Campbell, London, 1750.

RISHANGER, WILLIAM (*c.* 1250–*c.* 1312), English chronicler, made his profession as a Benedictine at St Alban's abbey in 1271, of which he perhaps became the official chronicler. The most important of his writings is the *Narratio de bellis apud Lewes et Evesham*. Though written many years afterwards and drawn from other sources, it is a spirited account of the barons' war. He is so great an admirer of Simon de Montfort that this work has been called a hagiography. He is credited with the authorship of a chronicle covering the period 1259–1306; this has been disputed, but the work is printed under his name by Riley. Another work of his, of not much importance, is a chronicle entitled *Recapitulatis brevis de gestis domini Edwardi, &c.* He is probably not the author of other works commonly attributed to him.

AUTHORITIES.—*Wilhelmi Rishanger chronica et annales*, Rolls Series, Introduction ed. H. T. Riley; the *Narratio de bellis apud Lewes et Evesham*, ed. J. O. Halliwell, Camden Society, 1840.

RISK, hazard, chance of danger or loss, especially the chance of loss to property or goods which an insurance company undertakes to make good to the insurer in return for the recurrent payment of a sum called the premium (see INSURANCE). The word appears late in English, and in the 17th century in the Fr. form *risque* or It. *risco* or *risgo*, for *risico*, *risigo*; cf. Sp. *riesgo*. The Med. Lat. *riscus*, *rischium*, and *risicum* are found, according to Du Cange (*Gloss.*, *qq.v.*), as early as the 13th century. Skeat (*Etym. Dict.*, 1910) accepts Diez's suggestion that the word is originally a sailor's term, and is to be referred to Sp. *risco*, a steep rock, from Lat. *resecare*, to cut back, shut off; thus Sp. *arriesgar*, to run into danger, means literally "to go against a rock."

RIST, JOHANN VON (1607–1667), German poet, was born at Ottensen in Holstein on the 8th of March 1607; the son of the Lutheran pastor of that place. He received his early training in Hamburg and Bremen; after studying theology at Rinteln and Rostock, he became in 1633 private tutor in a family of Heide, and two years later (1635) was appointed pastor of the village of Wedel on the Elbe, where he laboured until his death on the 31st of August 1667. Rist first made his name known to the literary world by a drama, *Perseus* (1634), which he wrote while at Heide, and in the next succeeding years he produced a number of dramatic works of which the allegory *Das friedewünschende Teutschland* (1647) and *Das friedejauchzende Teutschland* (1653) (new ed. of both by H. M. Schletterer, 1864) are the most interesting. Rist soon became the central figure in a school of minor poets, and honours were showered upon him from every side. The emperor Ferdinand III. crowned him laureate in 1644, ennobled him in 1653, and invested him with the dignity of a Count Palatine, an honour which enabled him to crown, and to gain numerous poets for the Elbschwanen order, a literary and poetical society which he founded in 1656. He had already, in 1645, been admitted, under the name "Daphnis aus Cimbrien," to the literary order of Pegnitz, and in 1647 he became, as "Der Rüstige," a member of the Fruchtbringende Gesellschaft. It is, however, as a writer of church hymns (see HYMNS) that Rist is best known to fame. Among these several are still retained in the evangelical hymn book: *e.g. O Ewigkeit, du Donnerwort* and *Ermuntre dich, mein schwacher Geist.* Collections of his poems appeared under the titles *Musa Teutonica* (1634) and *Himmlische Lieder* (1643).

Selections of Rist's writings have been published by W. Müller in vol. viii. of his *Bibliothek deutscher Dichter des 17. Jahrh.* (1822–1838), and by K. Goedeke and E. Goeze (1885). See T. Hansen, *Johann Rist und seine Zeit* (1872); K. T. Gaedertz, *J. Rist als niederdeutscher Dramatiker* (*Jahrb. f. niederdeutsche Sprache*, vol. vii., 1881); and M. von Waldberg's article in the *Allg. deutsche Biographie.*

RISTITCH (or RISTICH), **JOVAN** (1831–1899), Servian statesman, was born at Kragugevats in 1831. He was educated at Belgrade, Heidelberg, Berlin and Paris. After failing to obtain a professorship in the high school of Belgrade, he was appointed in 1861 Servian diplomatic agent at Constantinople. His reputation was enhanced by the series of negotiations which ended in the withdrawal of the Turkish troops from the Servian fortresses in 1867. On his return from Constantinople he was offered a ministerial post by Prince Michael, who described him as "his right arm," but declined office, being opposed to the reactionary methods adopted by the prince's government. He had already become the recognized leader of the Liberal party. After the assassination of Prince Michael in 1868, he was nominated member of the council of regency, and on the 2nd January 1869 the first Servian constitution, which was mainly his creation, was promulgated. When Prince Milan attained his majority in 1872, Ristitch became foreign minister; a few months later he was appointed prime minister, but resigned in the following autumn (1873). He again became prime minister in April 1876, and conducted the two wars against Turkey (July 1876–March 1877 and December 1877–March 1878). At the congress of Berlin he laboured with some success to obtain greater advantages for Servia than had been accorded to her by the treaty of San Stefano. The provisions of the treaty of Berlin, however, disappointed the Servians, owing to the obstacles now raised to the realization of the national programme; the Ristitch government became unpopular, and resigned in 1880. In 1887 King Milan (who had assumed the royal title in 1882), alarmed at the threatening attitude of the Radical party, recalled Ristitch to power at the head of a coalition cabinet; a new constitution was granted in 1888, and in the following year the king abdicated in favour of his son, Prince Alexander. Ristitch now became head of a council of regency, entrusted with power during the minority of the young king, and a Radical ministry was formed. In 1892, however, Ristitch transferred the government to the Liberal party, with which he had always been connected. This step and the subsequent

conduct of the Liberal politicians caused serious discontent in the country. On the 1st (13th) of April 1893 King Alexander, by a successful stratagem, imprisoned the regents and ministers in the palace, and, declaring himself of age, recalled the Radicals to office. Ristitch now retired into private life. He died at Belgrade on 4th September 1899. Though cautious and deliberate by temperament, he was a man of strong will and firm character. He was the author of two published works: *The External Relations of Servia from 1848 to 1867* (Belgrade, 1887) and *A Diplomatic History of Servia* (Belgrade, 1896).

(J. D. B.)

RISTORI, ADELAIDE (1822–1906), Italian actress, was born at Cividale del Friuli on the 30th of January 1822, the daughter of strolling players. As a child she appeared upon the stage, and at fourteen made her first success as Francesca da Rimini in Silvio Pellico's tragedy. She was eighteen when for the first time she played Mary Stuart in an Italian version of Schiller's play. She had been a member of the Sardinian company and also of the Ducal company at Parma for some years before her marriage (1846) to the marchese Giuliano Capranica del Grillo (d. 1861); and after a short retirement she returned to the stage and played regularly in Turin and the provinces. It was not until 1855 that she paid her first professional visit to Paris, where the part of Francesca was chosen for her *début*. In this she was rather coldly received, but she took Paris by storm in the title rôle of Alfieri's *Myrrha*. Furious partisanship was aroused by the appearance of a rival to the great Rachel. Paris was divided into two camps of opinion. Humble playgoers fought at gallery doors over the merits of their respective favourites. The two famous women never actually met, but the French actress seems to have been convinced that Ristori had no feelings towards her but those of admiration and respect. A tour in other countries was followed (1856) by a fresh visit to Paris, when Ristori appeared in Montanelli's Italian translation of Legouvé's *Medea*. She repeated her success in this in London. In 1857 she visited Madrid, playing in Spanish to enthusiastic audiences, and in 1866 she paid the first of four visits to the United States, where she won much applause, particularly in Giacometti's *Elizabeth*, an Italian study of the English sovereign. She finally retired from professional life in 1885, and died on the 9th of October 1906 in Rome. She left a son, the marchese Georgio Capranica del Grillo. Her *Studies and Memoirs* (1888) provide a lively account of an interesting career, and are particularly valuable for the chapters devoted to the psychological explanation of the characters of Mary Stuart, Elizabeth, Myrrha, Phaedra and Lady Macbeth, in her interpretation of which Ristori combined high dramatic instinct with the keenest and most critical intellectual study.

See also Kate Field, *Adelaide Ristori: A Biography* (New York, 1867); E. Peron Kingston, *Adelaide Ristori: A Sketch of her Life* (1856); *Daily Telegraph* (London, Oct. 10, 1906).

RITCHIE, CHARLES THOMSON RITCHIE, 1ST BARON (1838–1906), English politician, was born at Dundee, and educated at the City of London school. He went into business, and in 1874 was returned to parliament as Conservative member for the Tower Hamlets. In 1885 he was made secretary to the Admiralty, and from 1886 to 1892 president of the Local Government Board, in Lord Salisbury's administration, sitting as member for St George's in the East. He was responsible for the Local Government Act of 1888, instituting the county councils; and a large section of the Conservative party always owed him a grudge for having originated the London County Council. In Lord Salisbury's later ministries, as member for Croydon, he was president of the Board of Trade (1895–1900), and home secretary (1895–1900); and when Sir Michael Hicks-Beach retired in 1902, he became chancellor of the exchequer in Mr Balfour's cabinet. Though in his earlier years he had been a "fair-trader," he was strongly opposed to Mr Chamberlain's movement for a preferential tariff (see the articles on BALFOUR, A. J., and CHAMBERLAIN, J.), and he resigned office in September 1903. In December 1905 he was created a peer, but he was in ill-health, and he died at Biarritz on the 9th of January 1906.

RITCHIE, DAVID GEORGE (1853–1903), Scottish philosopher, was born at Jedburgh, son of the Rev. George Ritchie, D.D. He had a distinguished university career at Edinburgh, and Balliol College, Oxford, and after being fellow of Jesus and tutor of Balliol was elected professor of logic and metaphysics at St Andrews. He was president of the Aristotelian Society in 1898. Among his works are: *Darwinism and Politics* (1889); *Principles of State Interference* (1891); *Darwin and Hegel* (1893); *Natural Rights* (1895); a translation with R. Lodge and P. E. Matheson of Bluntschli's *Theory of the State* (1885); many articles in *Mind*, *Philosophical Review*, &c. His *Philosophical Studies* was edited with a memoir by L. Latta (1905).

RITSCHL, ALBRECHT (1822–1889), German theologian, was born at Berlin on the 25th of March 1822. His father, Georg Karl Benjamin Ritschl (1783–1858), became in 1810 pastor at the church of St Mary in Berlin, and from 1827 to 1854 was general superintendent and evangelical bishop of Pomerania. Albrecht Ritschl studied at Bonn, Halle, Heidelberg and Tübingen. At Halle he came under Hegelian influences through the teaching of Julius Schaller (1810–1868) and J. H. Erdmann (b. 1805). In 1845 he was entirely captivated by the Tübingen school, and in his work *Das Evangelium Marcions und das kanonische Evangelium des Lukas*, published in 1846, he appears as a disciple of F. C. Baur. This did not last long with him, however, for the second edition (1857) of his most important work, on the origin of the old Catholic church (*Die Entstehung der alt-kathol. Kirche*), shows considerable divergence from the first edition (1850), and reveals an entire emancipation from F. C. Baur's method. Ritschl was professor of theology at Bonn (extraordinarius 1852; ordinarius 1859) and Göttingen (1864; *Consistorialrath* also in 1874), his addresses on religion delivered at the latter university showing the impression made upon his mind by his enthusiastic studies of Kant and Schleiermacher. Finally, in 1864, came the influence of Rudolf Lotze. He wrote a large work on the Christian doctrine of justification and atonement, *Die Christliche Lehre von der Rechtfertigung und Versöhnung*, published during the years 1870–74, and in 1880–86 a history of pietism (*Die Geschichte des Pietismus*). His system of theology is contained in the former. He died at Göttingen on the 20th of March 1889.

His son, OTTO RITSCHL (b. 1860), after studying at Göttingen, Bonn and Giessen, became professor at Kiel (extraordinarius) in 1889 and afterwards at Bonn (extraordinarius 1894; ordinarius 1897). He has published, amongst other works, *Schleiermachers Stellung zum Christentum in seinen Reden über die Religion* (1888), and a *Life* of his father (2 vols., 1892–96).

Ritschl claims to carry on the work of Luther and Schleiermacher, especially in ridding faith of the tyranny of scholastic philosophy. His system shows the influence of Kant's destructive criticism of the claims of Pure Reason, recognition of the value of morally conditioned knowledge, and doctrine of the kingdom of ends; of Schleiermacher's historical treatment of Christianity, regulative use of the idea of religious fellowship, emphasis on the importance of religious feeling; and of Lotze's theory of knowledge and treatment of personality. Ritschl's work made a profound impression on German thought and gave a new confidence to German theology, while at the same time it provoked a storm of hostile criticism: his school has grown with remarkable rapidity. This is perhaps mainly due to the bold religious positivism with which he assumes that spiritual experience is real and that faith has not only a legitimate but even a paramount claim to provide the highest interpretation of the world. The life of trust in God is a fact, not so much to be explained as to explain everything else. Ritschl's standpoint is not that of the individual subject. The objective ground on which he bases his system is the religious experience of the Christian community. The "immediate object of theological knowledge is the faith of the community," and from this positive religious datum theology constructs a "total view of the world and human life." Thus the essence of Ritschl's work is systematic theology. Nor does he painfully work up to his master-category, for it is given in the knowledge

of Jesus Christ revealed to the community. That God is love and that the purpose of His love is the moral organization of humanity in the "Kingdom of God"—this idea, with its immense range of application—is applied in Ritschl's initial datum.

From this vantage-ground Ritschl criticizes the use of Aristotelianism and speculative philosophy in scholastic and Protestant theology. He holds that such philosophy is too shallow for theology. Hegelianism attempts to squeeze all life into the categories of logic: Aristotelianism deals with "things in general" and ignores the radical distinction between nature and spirit. Neither Hegelianism nor Aristotelianism is "vital" enough to sound the depths of religious life. Neither conceives "God" as correlative to human "trust" (cf. *Theologie und Metaphysik*, esp. p. 8 seq.). And Ritschl's recoil carries him so far that he is left alone with merely "practical" experience. "Faith" knows God in His active relation to the "kingdom," but not at all as "self-existent."

His limitation of theological knowledge to the bounds of human need might, if logically pressed, run perilously near phenomenalism; and his epistemology ("we only know things *in* their activities") does not cover this weakness. In seeking ultimate reality in the circle of "active conscious sensation" he rules out all "metaphysic." Indeed, much that is part of normal Christian faith—*e.g.* the Eternity of the Son—is passed over as beyond the range of his method. Ritschl's theory of "value-judgments" (*Werturtheile*) illustrates this from its inconsistency. Religious judgments of value determine objects according to their bearing on our moral and spiritual welfare. They imply a lively sense of radical human need. This sort of knowledge stands quite apart from that produced by "theoretic" and "disinterested" judgments. The former moves in a world of "values," and judges things as they are related to our "fundamental self-feeling." The latter moves in a world of cause and effect. (*N.B.* Ritschl appears to confine Metaphysic to the category of Causality.) The theory as formulated has such grave ambiguities, that his theology, which, as we have seen, is wholly based on uncompromising religious realism, has actually been charged with individualistic subjectivism. If Ritschl had clearly shown that judgments of value ended and transform her types of knowledge, just as the "spiritual man" includes and transfigures but does not annihilate the "natural man," then within the compass of this spiritually conditioned knowledge all other knowledge would be seen to have a function and a home. The theory of value-judgments is part too of his ultra-practical tendency: both "metaphysic" and "mysticism" are ruthlessly condemned. Faith-knowledge appears to be wrested from its bearings and suspended in mid-ocean. Perhaps if he had lived to see the progress of will-psychology he might have welcomed the hope of a more spiritual philosophy.

A few instances will illustrate Ritschl's positive systematic theology. The conception of God as Father is given to the community in Revelation. He must be regarded in His active relationship to the "kingdom," as spiritual personality revealed in spiritual purposiveness. His "Love" is His will as directed towards the realization of His purpose in the kingdom. His "Righteousness" is His fidelity to this purpose. With God as "First Cause" or "Moral Legislator" theology has no concern; nor is it interested in the "speculative" problems indicated by the traditional doctrine of the Trinity. "Natural theology" has no value save where it leans on faith. Again, Christ has for the religious life of the community the unique value of Founder and Redeemer. He is the perfect Revelation of God and the Exemplar of true religion. His work in founding the kingdom was a personal vocation, the spirit of which He communicates to believers, "thus, as exalted king," sustaining the life of His Kingdom. His Resurrection is a necessary part of Christian belief (G. Locke, pp. 198–199). His "Divinity" is a predicate applied by faith to Jesus in His founding and redeeming activity. We note here that though Ritschl gives Jesus a unique and unapproachable position in His active relation to the kingdom, he declines to rise above His relative consciousness. The "Person" problem and the eternal relation of the Son to the Father have no bearing on experience, and therefore stand outside the range of theology.

Once more, in the doctrine of sin and redemption, the governing idea is God's fatherly purpose for His family. Sin is the contradiction of that purpose, and guilt is alienation from the family. Redemption, justification, regeneration, adoption, forgiveness, reconciliation all mean the same thing—the restoration of the broken family relationship. All depends on the Mediation of Christ, who maintained the filial relationship even to His death, and communicates it to the brotherhood of believers. Everything is defined by the idea of the family. The whole apparatus of "forensic" ideas (law, punishment, satisfaction, &c.) is summarily rejected as foreign to God's purpose of love. Ritschl is so faithful to the standard of the religious community, that he has nothing definite to say on many inevitable questions, such as the relation of God to pagan races. His school, in which J. G. W. Herrmann, Julius Kaftan and Adolf Harnack are the chief names, diverges from his teaching in many directions; *e.g.* Kaftan appreciates the mystical side of religion, Harnack's criticism is very different from Ritschl's arbitrary exegesis. They are united on the value of faith-knowledge as opposed to "metaphysic."

Ritschl, *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (3rd ed., 1889); *Unterricht in der Christlichen Lehre* (very many editions); and *Theologie und Metaphysik* (2nd ed., 1887), give his main position. Many historical and other works besides.—E. Bertrand, *Une nouvelle conception de la rédemption. La Doctrine de la justification et de la réconciliation dans le système de Ritschl* (1891); H. Schoen, *Les Origines historiques de la théologie de Ritschl* (1893); G. Ecke, *Die theologische Schule, A. Ritschl's und die evangelische Lehre der Gegenwart* (1897); James Orr, *The Ritschlian Theology and the Evangelical Faith* (London 1898); and A. E. Garvie, *The Ritschlian Theology* (Edinburgh 1899), in both of which the bibliography of the movement is given in full.—G. Wobbermin, *Development of Theology in Germany since Kant* (1890). The German literature on the subject is very large; see article in *Herzog-Hauck*, vol. xvii.

RITSCHL, FRIEDRICH WILHELM (1806–1876), German scholar, was born in 1806 in Thuringia. His family, in which culture and poverty were hereditary, were Protestants who had migrated several generations earlier from Bohemia. Ritschl was fortunate in his school training, at a time when the great reform in the higher schools of Prussia had not yet been thoroughly carried out. His chief teacher, Spitzner, a pupil of Gottfried Hermann, divined the boy's genius and allowed it free growth, applying only so much either of stimulus or of restraint as was absolutely needful. After a wasted year at the university of Leipzig, where Hermann stood at the zenith of his fame, Ritschl passed in 1826 to Halle. Here he came under the powerful influence of Reisig, a young "Hermannianer" with exceptional talent, a fascinating personality and a rare gift for instilling into his pupils his own ardour for classical study. The great controversy between the "Realists" and the "Verbalists" was then at its height, and Ritschl naturally sided with Hermann against Boeckh. The early death of Reisig in 1828 did not sever Ritschl from Halle, where he began his professorial career with a great reputation and brilliant success, but soon hearers fell away, and the pinch of poverty compelled his removal to Breslau, where he reached the rank of "ordinary" professor in 1834, and held other offices. The great event of Ritschl's life was a sojourn of nearly a year in Italy (1836–37), spent in libraries and museums, and more particularly in the laborious examination of the Ambrosian palimpsest of Plautus at Milan. The remainder of his life was largely occupied in working out the material then gathered and the ideas then conceived. Bonn, whither he removed on his marriage in 1839, and where he remained for twenty-six years, was the great scene of his activity both as scholar and as teacher. The philological seminary which he controlled, although nominally only joint-director with Welcker, became a veritable *officina litterarum*, a kind of Isocratean school of classical study; in it were trained many of the foremost scholars of the last forty years. The names of Georg Curtius, Ihne, Schleicher, Bernays, Ribbeck, Lorenz, Vahlen, Hübner, Bücheler, Helbig, Benndorf, Riese, Windisch, who were his pupils either at Bonn or at Leipzig, attest his fame and power as a teacher. In 1854 Otto Jahn took the place of his colleague Welcker at Bonn, and after a time succeeded in dividing with Ritschl the empire over the philological school there. The two had been friends, but after gradual estrangement a violent dispute arose between them in 1865, which for many months divided into two hostile forces the universities and the press of Germany. Both sides were steeped in fault, but Ritschl undoubtedly received harsh treatment from the Prussian government, and pressed his resignation. He accepted a call to Leipzig, where he died in harness in 1876.

Ritschl's character was strongly marked. The spirited element in him was powerful, and to some at times he seemed overbearing, but his nature was noble at the core; and, though intolerant of inefficiency and stupidity, he never asserted his personal claims in any mean or petty way. He was warmly attached to family and friends, and yearned continually after sympathy, yet he established real intimacy with only a few. He had a great faculty for organization, as is shown by his

administration of the university library at Bonn, and by the right years of labour which carried to success a work of infinite complexity, the famous *Priscae Latinitatis Monumenta Epigraphica* (Bonn, 1862). This volume presents in admirable facsimile, with prefatory notices and indexes, the Latin inscriptions from the earliest times to the end of the republic. It forms an introductory volume to the Berlin *Corpus Inscriptionum Latinarum*, the excellence of which is largely due to the precept and example of Ritschl, though he had no hand in the later volumes. The results of Ritschl's life are mainly gathered up in a long series of monographs, for the most part of the highest finish, and rich in ideas which have leavened the scholarship of the time.

As a scholar, Ritschl was of the lineage of Bentley, to whom he looked up, like Hermann, with fervent admiration. His best efforts were spent in studying the languages and literatures of Greece and Rome, rather than the life of the Greeks and Romans. He was sometimes, but most unjustly, charged with taking a narrow view of "Philologie." That he keenly appreciated the importance of ancient institutions and ancient art both his published papers and the records of his lectures amply testify. He devoted himself for the most part to the study of ancient poetry, and in particular of the early Latin drama. This formed the centre from which his investigations radiated. Starting from this he ranged over the whole remains of pre-Ciceronian Latin, and not only analysed but augmented the sources from which our knowledge of it must come. Before Ritschl the acquaintance of scholars with early Latin was so dim and restricted that it would perhaps be hardly an exaggeration to call him its real discoverer.

To the world in general Ritschl was best known as a student of Plautus. He cleared away the accretions of ages, and by efforts of that real genius which goes hand in hand with labour, brought to light many of the true features of the original. It is infinitely to be regretted that Ritschl's results were never combined to form that monumental edition of Plautus of which he dreamed in his earlier life. Ritschl's examination of the Plautine MSS. was both laborious and brilliant, and greatly extended the knowledge of Plautus and of the ancient Latin drama. Of this, two striking examples may be cited. By the aid of the Ambrosian palimpsest he recovered the name T. Maccius Plautus, for the vulgate M. Accius, and proved it correct by strong extraneous arguments. On the margin of the Palatine MSS. the marks C and DV continually recur, and had been variously explained. Ritschl proved that they meant "Canticum" and "Diverbium," and hence showed that in the Roman comedy only the conversations in iambic senarii were not intended for the singing voice. Thus was brought into strong relief a fact without which there can be no true appreciation of Plautus, viz. that his plays were comic operas rather than comic dramas.

In conjectural criticism Ritschl was inferior not only to his great predecessors but to some of his contemporaries. His imagination was in this field (but in this field only) hampered by erudition, and his judgment was unconsciously warped by the desire to find in his text illustrations of his discoveries. But still a fair proportion of his textual labours has stood the test of time, and he rendered immense service by his study of Plautine metres, a field in which little advance had been made since the time of Bentley. In this matter Ritschl was aided by an accomplishment rare (as he himself lamented) in Germany the art of writing Latin verse.

In spite of the incompleteness, on many sides, of his work Ritschl must be assigned a place in the history of learning among a very select few. His studies are presented principally in his *Opuscula* collected partly before and partly since his death. The *Trinummus* (twice edited) was the only specimen of his contemplated edition of Plautus which he completed. The edition has been continued by some of his pupils—Goetz, Loewe and others.

The facts of Ritschl's life may be best learned from the elaborate biography by Otto Ribbeck (Leipzig, 1879). An interesting and discriminating estimate of Ritschl's work is that by Lucian Mueller (Berlin, 1877). (J. S. R.)

RITSON, JOSEPH (1752–1803), English antiquary, was born at Stockton-on-Tees, of a Westmorland yeoman family, on the 2nd of October 1752. He was educated for the law, and settled in London as a conveyancer when twenty-two. He devoted his spare time to literature, and in 1782 published an attack on Warton's *History of English Poetry*. The fierce and insulting tone of his *Observations*, in which Warton was treated as a showy pretender, and charged with cheating and lying to cover his ignorance, made a great sensation in literary circles. In nearly all the small points with which he dealt Ritson was in the right, and his corrections have since been adopted, but the unjustly bitter language of his criticisms roused great anger at the time, much, it would appear, to Ritson's delight. In 1783 Johnson and Steevens were assailed in the same bitter fashion as Warton for their text of Shakespeare. Bishop Percy was next subjected to a furious onslaught in the preface to a collection of *Ancient Songs* (printed 1787, dated 1790, published 1792). The only thing that can be said in extenuation of Ritson's unmatchable acrimony is that he spared no pains himself to ensure accuracy in the texts of old songs, ballads and metrical romances which he edited. His collection of the Robin Hood ballads is perhaps his greatest single achievement. Scott, who admired his industry and accuracy in spite of his temper, was almost the only man who could get on with him. On one occasion, when he called in Scott's absence, he spoke so rudely to Mrs Scott that Leyden, who was present, threatened to "thraw his neck," and threw him out of the window. Spelling was one of his eccentricities, his own name being an example: Ritson is short pronunciation for Richardson. As early as 1796 Ritson showed signs of mental collapse, and on the 10th of September 1803 he became completely insane, barricaded himself in his chambers at Gray's Inn, made a bonfire of manuscripts, and was finally forcibly removed to Hoxton, where he died on the 23rd of the month.

RITTENHOUSE, DAVID (1732–1796), American astronomer, was born at Germantown, Pennsylvania, on the 8th of April 1732. First a watchmaker and mechanician he afterwards became treasurer of Pennsylvania (1777–89), and from 1792 to 1795 director of the U.S. mint (Philadelphia). He was largely occupied in 1763 and in 1770–86 in settling the boundaries of several of the states. He was a fellow of the Royal Society of London, and a member of the American Philosophical Society; and was elected president of the latter society in 1791. As an astronomer, Rittenhouse's principal merit is that he introduced in 1786 the use of spider lines in the focus of a transit instrument. His priority with regard to this useful invention was acknowledged by E. Troughton, who brought spider lines into universal use in astronomical instruments (see von Zach's *Monatliche Correspondenz*, vol. ii. p. 213), but Felice Fontana (1730–1805), professor of physics at the university of Pisa, and afterwards director of the museum at Florence, had already anticipated the invention in 1775, though no doubt this fact was unknown to Rittenhouse. His researches were published in the *Transactions of the American Philosophical Society* (1785–1799). He died at Philadelphia on the 26th of June 1796.

See *Memoir* (1813) by William Barton.

RITTER, HEINRICH (1791–1869), German philosopher, was born at Zerbst on the 21st of November 1791, and died at Göttingen on the 3rd of February 1869. He studied philosophy and theology at Göttingen and Berlin until 1815. In 1824 he became extraordinary professor of philosophy at Berlin, whence he was transferred to Kiel, where he occupied the chair of philosophy from 1833 to 1837. He then accepted a similar position at the university of Göttingen, where he remained till his death. His chief work was a history of philosophy (*Geschichte der Philosophie*) published in twelve volumes at Hamburg from 1829 to 1853. This book is the product of a wide and thorough knowledge of the subject aided by an impartial critical faculty, and its value is demonstrated by the

fact that it has been translated into almost all the languages of Europe. He wrote also accounts of ancient schools of philosophy, the Ionians, the Pythagoreans and the Megarians. Beside these important historical works, he published a large number of treatises of which the following may be mentioned: *Versuch zur Verständigung über die neueste deutsche Philosophie seit Kant* (1853); *Die christliche Philosophie bis auf die neuesten Zeiten* (2 vols., 1858–59), a work which supplemented the *Geschichte*; *Abriss der philosophischen Logik* (1824); *Ueber das Verhältnis der Philosophie zum Leben* (1835); *Historia philosophiae Graeco-Romanae* (in collaboration with Preller, 1838; 7th ed., 1888); *Kleine philosophische Schriften* (1839–40); *System der Logik und Metaphysik* (1856); *Encyclopädie der philosophischen Wissenschaften* (1862–64); *Ernst Renan, über die Naturwissenschaften und die Geschichte* (1865); *Ueber das Böse und seine Folgen* (1869). Of these latter, the one best known in England is the History of Greek and Roman Philosophy, which, by reason of the excellence of its arrangement and its judicious quotations and notes, is almost indispensable to the student of ancient philosophy.

RITTER, KARL (1779–1859), German geographer, was born at Quedlinburg on the 7th of August 1779, and died in Berlin on the 28th of September 1859. His father, a physician, left his family in straitened circumstances, and Karl was received into the Schnepfenthal institution then just founded by Christian Gotthilf Salzmann (1744–1811) for the purpose of testing his educational theories. The Salzmann system was practically that of Rousseau—conformity to natural law and enlightenment were its watchwords; great attention was given to practical life; and the modern languages were carefully taught, to the complete exclusion of Latin and Greek. Ritter already showed geographical aptitude, and when his schooldays were drawing to a close his future course was determined by an introduction to Bethmann Hollweg, a banker in Frankfort. It was arranged that Ritter should become tutor to Hollweg's children, but that in the meantime he should attend the university at his patron's expense. His duties as tutor in the Hollweg family began at Frankfort in 1798 and continued for fifteen years. The years 1814–19, which he spent at Göttingen in order still to watch over the welfare of his pupils, were those in which he began to devote himself exclusively to geographical inquiries. He had already travelled extensively in Europe when in 1817–18 he brought out his first masterpiece, *Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen* (Berlin, 2 vols., 1817–1818). In 1819 he became professor of history at Frankfort, and in 1820 professor extraordinarius of history at Berlin, where shortly afterwards he began also to lecture at the military college. He remained in this position till his death. The second edition of his *Erdkunde* (1822–58) was conceived on a much larger scale than the first, but he completed only the sections on Africa and the various countries of Asia. The service rendered to geography by Ritter was especially notable because he brought to his work a new conception of the subject. Geography was, to use his own expression, a kind of physiology and comparative anatomy of the earth: rivers, mountains, glaciers, &c., were so many distinct organs, each with its own appropriate functions; and, as his physical frame is the basis of the man, determinative to a large extent of his life, so the structure of each country is a leading element in the historic progress of the nation. Moreover, Ritter was a scientific compiler of the first rank. Among his minor works may be mentioned *Vorhalle europäischer Völkergeschichten vor Herodot* (Berlin, 1820); *Die Stupas . . . an der indobaktrischen Königsstrasse und die Kolosse von Bamiyan* (1838); *Einleitung zur allgemeinen vergleichenden Geographie* (Berlin, 1852); "Bemerkungen über Veranschaulichungsmittel räumlicher Verhältnisse bei graphischen Darstellungen durch Form u. Zahl," in the *Trans.* of the Berlin Academy, 1828. After his death selections from his lectures were published under the titles *Geschichte der Erdkunde* (1861), *Allgemeine Erdkunde* (1862), and *Europa* (1863). Several of his works (*e.g.* the "Palestine" volumes of his Erdkunde) were translated into English. "Karl Ritter" foundations were established in his memory at Berlin and Leipzig, for the furtherance of geographical study.

See G. Kramer, *Karl Ritter, ein Lebensbild* (Halle, 1864 and 1870; 2nd ed., 1875); W. L. Gage, *The Life of Karl Ritter* (London, 1867); F. Marthe, "Was bedeutet Karl Ritter für die Geographie," in *Zeitsch. der Ges. f. Erdk.* (Berlin, 1879). All Ritter's works mentioned above were published at Berlin.

RITUAL (from Lat. *ritus*, a custom, especially a religious rite or custom), a term of religion, which may be defined as the routine of worship. This is a "minimum definition"; "ritual" at least means so much, but may stand for more. Without some sort of ritual there could be no organized method in religious worship. Indeed, viewed in this aspect, ritual is to religion what habit is to life, and its *rationale* is similar, namely, that by bringing subordinate functions under an effortless rule it permits undivided attention in regard to vital issues. This analogy—for it is safer to regard such applications of individual psychology to social phenomena as only analogies—may be carried a step further. Just as the main business of habit is to secure bodily equilibrium in order to allow free play to the mental life, so the chief task of routine in religion is to organize the activities necessary to its stability and continuance as a social institution, in order that all available spontaneity and initiative may be directed into spiritual channels. Such organization will naturally affect far more than the forms of worship; but these at least, to judge from the past history of religion, cannot but submit extensively to its influence. The nature of religion, as the sociologist understands it, is bound up with its congregational character. In order that inter-subjective relations should be maintained between fellow-worshippers, the use of one or another set of conventional symbols is absolutely required; for example, an intelligible vocabulary of meet expressions, or (since this is, perhaps, not indispensable) at any rate sounds, sights, actions and so on, that have come by prescription to signify the common purpose of the religious society, and the means taken in common for the realization of that purpose. In this sense, the term "ritual," as meaning the prescribed ceremonial routine, is also extended to observances not strictly religious in character.

But, whilst ritual at least represents routine, it tends, historically speaking, to have a far deeper significance for the religious consciousness. A recurrent feature of religion, which many students of its phenomena would even consider constant and typical, is the attribution of a more or less self-contained and automatic efficacy to the ritual procedure as such. Before proceeding to considerations of genesis, it will be convenient briefly to analyse the notion as it appears in the higher religions. Two constituent lines of thought may be distinguished. Firstly, there is the tendency to pass beyond the purely petitionary attitude which as such can imply no more than the desire, hope or expectation of divine favour, and to take for granted the consummation sought, a deity that answers, a grace and blessedness that are communicated. Only when such accomplishment of its end is assumed can efficacy be held to attach to the act of worship. Secondly, there is the tendency to identify such a self-accomplishing act of worship with its objective expression in the ritual that for purposes of mutual understanding makes the body of worshippers one.

The Magical Element in Ritual.—Exactly similar tendencies—to impute efficacy, and to treat the ritual procedure as the source of that efficacy—are typically characteristic of magic, and their reappearance in religion can hardly be treated as a coincidence, seeing that magic and religion would appear to have much in common, at any rate during the earlier stages of their development. In magic a suggestion is made orally, or by dramatic action, or most often in both ways together, that is held *ipso facto* to bring about its own accomplishment. A certain conditionality attaches to the magical operation, inasmuch as each magician is subject to interference on the part of other magicians who may neutralize his spell **by a**

counter spell of equal or greater power; nevertheless, the intrinsic tone is that of a categorical assertion of binding force and efficacy. Again, in magic the self-realizing force is apt to seem to reside in the suggestional machinery rather than in the spiritual qualifications of the magician, though this is by no means invariably the case. On the whole, however, spells and ceremonies are wont to be regarded as an inheritable and transferable property containing efficacy in themselves. And what is true of magic is equally true of much of primitive, and even of relatively advanced, religion. Dr J. G. Frazer has pronounced the following to be marks of a primitive ritual: negatively, that there are no priests, no temples and no gods (though he holds that departmental, non-individual "spirits" are recognized); positively, that the rites are magical rather than propitiatory (*The Golden Bough*, 2nd ed. ii. 191). If we leave it an open question whether, instead of "spirits," it would not be safer to speak of "powers" (to which not a soul-like nature, but simply a capacity for exercising magic, is attributed), this characterization may be accepted as applying to many, if not to all, the rites of primitive religion. Thus the well-known totemic ceremonies of Central Australia afford a striking example of rites of a deeply religious import—in the sense that the purpose they embody is that of consecrating certain functions of the common life (see RELIGION)—yet almost wholly magical in form. They resolve themselves on analysis into (1) direct acts of magical suggestion, and (2) acts commemorative of the magical doings of mythical ancestors, the purport of which may be regarded as indirectly and constructively magical, on the principle that in magic to mention a thing's origin is to control it, to recount another's wonder-working is to reproduce his power, and so on. It is to be noted, however, that other Australian rites are found, notably those that accompany initiation in the south-eastern region, over which anthropomorphic beings having enough individuality to rank as "gods" undoubtedly preside; but even here, though traces of propitiatory worship may be discernible (the evidence being scanty and conflicting), acts of pure magic are decidedly to the fore. And what is true of the most primitive and unreflective forms of cult remains true of more advanced types which have become relatively self-conscious. There is little or no felt opposition between processes implying control and processes of a propitiatory character in the religion of the Pueblo Indians, which American ethnologists have been so successful in expounding, or, to mount to a still higher level, in the Vedic, Assyrian or Egyptian cults. The leading idea, we may even say, is that expressed so happily by a character in Renan's *Le Prêtre de Némi*: "L'ordre du monde dépend de l'ordre des rites qu'on observe" (cf. A. Lang, *Myth, Ritual and Religion*, 2nd ed. i. 251). As regards the most developed forms of religion, whilst the old procedure largely survives unchanged, its original intention is disowned by theologians, though it may be doubted if the popular mind is always strong enough to withstand the appeal of prima facie appearance.

This proneness to impute efficacy to ritual is immensely reinforced by another social proclivity, more or less distinct in its ultimate nature, which causes the rite to rank as a divine ordinance or command. Naturally if the god manifests himself by means of certain forms, if he is reputed to have founded or revealed them, or if he has been known to evince displeasure at departures from them, there is strong reason to think that such forms are efficacious, and that in a sense of themselves, namely, by being what they are. At the sociological level of thought this divine sanction has to be treated as the echo of a social sanction which ratifies and protects religious custom. In early society the influence of what Walter Bagehot (in *Physics and Politics*, 9th ed. p. 102) calls the "persecuting tendency" in enforcing custom is on the whole not markedly in evidence. The fact is that imitation in a homogeneous group produces such unanimity that, with the help of some education, notably the instruction given at the time of initiation, all nonconformity is nipped in the bud. Of the Central Australian ceremonies we read that they "had to be performed in precisely the same way in which they had been in the Alcheringa (lit. 'dream-time'=age of mythical tribal ancestors). Everything was ruled by precedent; to change even the decoration of a performer would have been an unheard-of thing; the reply, 'It was so in the Alcheringa,' was considered as perfectly satisfactory by way of explanation" (B. Spencer and F. Gillen, *The Native Tribes of Central Australia*, 324). Here we perceive the social sanction of public opinion insensibly merging in a supernatural sanction. The tribe is a religious partnership with a divine past with which it would not willingly break. As Mr Lang well puts it, "Ritual is preserved because it preserves luck" (*loc. cit.*). Given an intrinsic sacredness, it is but a step to associate definite gods with the origin or purpose of a rite, whose interest it thereupon becomes to punish omissions or innovations by the removal of their blessing (which is little more than to say that the rite loses its efficacy), or by the active infliction of disaster on the community. In the primitive society it is hard to point to any custom to which sacredness does not in some degree attach, but, naturally, the more important and solemn the usage, the more rigid the religious conservatism. Thus there are indications that in Australia, at the highly sacred ceremony of circumcision, the fire-stick was employed after stone implements were known; and we have an exact parallel at a higher level of culture, the stone implement serving for the same operation when iron is already in common use (Spencer and Gillen, ib. 401; cf. E. B. Tylor, *Early History of Mankind*, 3rd ed. p. 217).

The Interpretation of Ritual.—A valuable truth insisted on by the late W. Robertson Smith (*Religion of the Semites*, 17 sqq.) is that in primitive religion it is ritual that generates and sustains myth, and not the other way about. Sacred lore of course cannot be dispensed with; even Australian society, which has hardly reached the stage of having priests, needs its *Oknirabata* or "great instructor" (Spencer and Gillen, ib. 303). The function of such an expert, however, is chiefly to hand on mere rules for the performance of religious acts. If his lore include sacred histories, it is largely, we may suspect, because the description and dramatization of the doings of divine persons enter into ritual as a means of magical control. Similarly, the sacred books of the religions of middle grade been with minute prescriptions as to ritual, but are almost destitute of doctrine. Even in the highest religions, where orthodoxy is the main requirement, and ritual is held merely to symbolize dogma, there is a remarkable rigidity about the dogma that is doubtless in large part due to its association with ritual forms many of them bearing the most primeval stamp. As regards the symbolic interpretation of ritual, this is usually held not to be primitive; and it is doubtless true that an unreflective age is hardly aware of the difference between "outward sign" and "inward meaning," and thinks as it were by means of its eyes. Nevertheless, it is easier to define fetishism (a fetish "differing from an idol in that it is worshipped in its own character, not as the symbol, image or occasional residence of a deity," *New English Dictionary*, Oxford, 1901) than it is to bring such a term home to any savage people, the West African negroes not excluded (cf. A. B. Ellis, *The Tshi-speaking Peoples of the Gold Coast of W. Africa*, 192). It is the magic power, virtue or grace residing in, and proceeding from, the material object—a power the communicability of which constitutes the whole working hypothesis of the magico-religious performance—that is valued in those cases where native opinion can be tested. Moreover, it must be remembered that in the act of magic a symbolic method is consciously pursued, as witness the very formulas employed: "As I burn this image, so may the man be consumed," or the even more explicit, "It is not wax I am scorching; it is the liver, heart and spleen of So-and-so that I scorch" (W. W. Skeat, *Malay Magic*, 570), where appearance and reality are distinguished in order to be mystically reunited. Now it is important to observe that from the symbol as embodying an imperative to the symbol as expressing an optative is a transition of meaning that involves no change of form whatever; and, much as theorists love to contrast the suggestional and the petitionary attitudes,

it is doubtful if the savage does not move quite indifferently to and fro across the supposed frontier-line between magic and religion, interspersing "bluff" with blandishment, spell with genuine prayer. Meanwhile the particular meanings of the detailed acts composing a complicated piece of ritual soon tend to lose themselves in a general sense of the efficacy of the rite as a whole to bring blessing and avert evil. Nay, unintelligibility is so far from invalidating a sacred practice that it positively supports it by deepening the characteristic atmosphere of mystery. Even the higher religions show a lingering predilection for cabalistic formulas.

Changes in Ritual.—Whilst ritual displays an extraordinary stability, its nature is of course not absolutely rigid; it grows, alters and decays. As regards its growth, there is hardly a known tribe without its elaborate body of magico-religious rites. In the exceptional instances where this feature is relatively absent (the Masai of E. Africa offer a case in point), we may suspect a disturbance of tradition due to migration or some similar cause. Thus there is always a pre-existing pattern in accordance with which such evolution or invention as occurs proceeds. Unconscious evolution is perhaps the more active factor in primitive times; imitation is never exact, and small variations amount in time to considerable changes. On the other hand, there is also deliberate innovation. In Australia councils of the older men are held day by day during the performance of their ceremonies, at which traditions are repeated and procedure determined, the effect being mainly to preserve custom but undoubtedly in part also to alter it. Moreover, the individual religious genius exercises no small influence. A man of a more original turn of mind than his fellows will claim to have had a new ceremony imparted to him in a vision, and such a ceremony will even be adopted by another tribe which has no notion of its meaning (Spencer and Gillen, ib. 272, 278, 281 n.). Meanwhile, since little is dropped whilst so much is being added, the result is an endless complication and elaboration of ritual. Side by side with elaboration goes systematization, more especially when local cults come to be merged in a wider unity. Thereupon assimilation is likely to take place to one or another leading type of rite—for instance, sacrifice or prayer. At these higher stages there is more need than ever for the expert in the shape of the priest, in whose hands ritual procedure becomes more and more of a conscious and studied discipline, the naïve popular elements being steadily eliminated, or rather transformed. Not but what the transference of ritualistic duties to a professional class is often the signal for slack and mechanical performance, with consequent decay of ceremonial. The trouble and worry of having to comply with the endless rules of a too complex system is apt to operate more widely—namely, in the religious society at large—and to produce an endless crop of evasions. Good examples of these on the part alike of priests and people are afforded by Toda religion, the degenerate condition of which is expressly attributed by Dr W. H. R. Rivers to "the over-development of the ritual aspect of religion" (*The Todas*, 454–55). It is interesting to observe that a religion thus atrophied tends to revert to purely magical practices, the use of the word of power, and so on (ib. ch. x.). It is to be noted, however, that what are known as ritual substitutions, though they lend themselves to purposes of evasion (as in the well-known case of the Chinese use of paper money at funerals), rest ultimately on a principle that is absolutely fundamental in magico-religious theory—namely, that what suggests a thing because it is like it or a part of it becomes that thing when the mystic power is there to carry the suggestion through.

The Classification of Rites.—More than one basis of division has suggested itself. From the sociological point of view perhaps the most important distinction in use is that between public and private rites. Whilst the former essentially belong to religion as existing to further the common weal, the latter have from the earliest times an ambiguous character, and tend to split into those which are licit—"sacraments," as they may be termed—and those which are considered anti-social in tendency, and are consequently put beyond the pale of religion and assigned to the "black art" of magic. Or the sociologist may prefer to correlate rites with the forms of social organization—the tribe, the phratry, the clan, the family and so on. Another interesting contrast (seeing how primary a function of religion it is to establish a calendar of sacred seasons) is that between periodic and occasional rites—one that to a certain extent falls into line with the previous dichotomy. A less fruitful method of classing rites is that which arranges them according to their inner meaning. As we have seen, such meaning is usually acquired *ex post facto*, and typical forms of rite are used for many different purposes; so that attempts to differentiate are likely to beget more equivocations than they clear up. The fact is that comparative religion must be content to regard all its classifications alike as pieces of mere scaffolding serving temporary purposes of construction.

Negative Rites.—A word must be added on a subject dealt with elsewhere (see TABOO, GENNA), but strictly germane to the matter in hand. What have the best, if not the sole, right to rank as taboos are ritual interdictions (see M. Mauss in *L'Année sociologique*, ix. 249). Taboo, as understood in Polynesia, the home of the word, is as wide as, and no wider than, religion, representing one side or aspect of the sacred (see RELIGION). The very power that can help can also blast if approached improperly and without due precautions. Taboos are such precautions, abstinences prompted, not by simple dread or dislike, but always by some sort of respect as finding that which in other circumstances or in other form has healing virtue. Thus the negative attitude of the observer of taboo involves a positive attitude of reverence from which it becomes in practice scarcely distinguishable. To keep a fast, for instance, is looked upon as a direct act of worship. It must be noted, too, that, whereas taboo as at first conceived belongs to the magico-religious circle of ideas, implying a quasi-physical transference of sacredness from what has it to one not fit to receive it, it is very easily reinterpreted as an obligation imposed by the deity on his worshippers. The law observed by a primitive religious community abounds in negative precepts, and if early religion tends to be a religion of fear it is because the taboo-breaker provides the most palpable objective for human and divine sanctions. In the higher religions, to be pure remains amongst the most laudable of aspirations, and, even though the ceremonial aversion of a former age has become moralized, and a purity of heart set up as the ideal, it is on "virtues of omission" that stress is apt to be laid, so that a timorous propriety is too often preferred to a forceful grappling with the problems of life. There are signs, however, that the religious consciousness has at length come to appreciate the fact that the function of routine in religion as elsewhere is to clear the way for action.

BIBLIOGRAPHY.—A comprehensive study of ritual as such from the comparative standpoint remains yet to be written. Some leading ideas on the subject are struck out by E. B. Tylor, *Primitive Culture*[3] (1903), ch. 18; and A. Lang, *Myth, Ritual and Religion*[2] (1899); whilst the whole of J. G. Frazer's vast collection of facts in *The Golden Bough*[2] (1900) illustrates ritual, more especially on its magical side; see also W. Robertson Smith, *Lectures on the Religion of the Semites* (1889). A very valuable work of restricted range but embodying a method that might fruitfully be applied to the whole subject of ritual is H. Hubert and M. Mauss, "Essai sur la nature et sur la fonction du sacrifice" in *L'Année sociologique*, ii.; for close connexion with the above should be studied S. Lévi, *La Doctrine du sacrifice dans les Brâhmanas* (1899); W. Caland and V. Henry, *L'Agnistoma, description complète de la forme normale du sacrifice del Soma dans le culte védique* (1906); see also Oldenberg, *Die Religion des Veda* (1894); A. Hillebrant, *Ritual Litteratur: Vedische Opfer und Zauber* (1896). Admirable descriptions of Australian ritual are to be found in B. Spencer and F. J. Gillen, *The Native Tribes of Central Australia* (1899) and *The Northern Tribes of Central Australia* (1904). On North American rituals very excellent studies exist in A. C. Fletcher, "The Hako: A Pawnee Ceremony," in *22nd Report of Bureau of American Ethnology*; see also various papers by the same authoress in *Peabody Reports*; likewise in J. W. Fewkes, "Tusayan Katchinas," in *15th Rep. of B. of A. Eth.*; and *id.*, "Hopi Katchinas," in *21st Rep.*; M. C. Stevenson, "The Zuñi Indians," in *23rd Rep.*; cf. F. H. Cushing, "Zuñi Fetiches," in *2nd Rep.* The following works pay special attention to ritual

features: L. R. Farnell, *The Cults of the Greek States* (1896–1907); A. Moret, *Le Rituel du culte divin journalier en Égypte* (1902); A. de Marchi *Il culto privato di Roma antica* (1902). (R. R. M.)

RITUAL MURDER, a general term for human sacrifice in connexion with religious ceremonies. False accusations as to the practice of ritual murder by Jews and Christians have often been made. "The Christians of the second and third centuries suffered severely under them" (Strack). Justin Martyr (150–160) in his Second Apology (ch. 12) vigorously defends the Christian community against this charge; Octavius, Minucius Felix, Tertullian, Origen and other Church Fathers all refer to the subject and indignantly repudiate the atrocious libel that the Eucharist involved human sacrifice. The myth was revived against the Montanists, and in the later middle ages against various sects of heretical Christians. In recent years the accusation has been again levelled against "foreigners" during the disturbances in China. The chief sufferers, however, from the charge were the Jews. • The charge was never coherently defined, but a notion prevailed that at the Passover Christian blood was used in Jewish rites. For this belief there is no foundation whatever, as is proved in the classical treatise[1] on the subject by Hermann L. Strack, Regius Professor of Theology at Berlin University. The first occasion on which the medieval Jews were accused of the murder of a Christian child was at Norwich in 1144. In the following century other instances of the charge occurred on the Continent, and by this time (middle of the 13th century) the legend had grown into a belief that "the Jews of every province annually decide by lot" which congregation or town is to be the scene of the mythical murder. It is easy to understand how in ages when the Jews were everywhere regarded with superstitious awe, such stories to their detriment would find ready credence, but the revival of the myth in recent times by the anti-Semite is a deplorable instance of degeneration. It is only necessary here to refer to the Lincoln case (1255), the Trent case (1475) and more recently the Damascus case (1840), the Tisza-Eszlar affair (1882), the Xanten charge (1891) and the Polna case (1899). All of these charges—sometimes invented by malicious seceders from the Jewish fold—were followed by spoliation and tragic persecution of the Jews. On the other hand many Jewish proselytes to Christianity have strenuously defended the Jews from the charge, among them may be particularly named Prof. D. Chwolson (*Blutanklage*, 1901). In 1840 a protest against the charge was signed by 58 Jewish-Christians, the list being headed by M. S. Alexander, Anglican bishop at Jerusalem. Further testimonies of a similar kind are collected in Strack (*op. cit.* p. 239). Many of the popes have issued bulls exonerating the Jews (cf. Strack, p. 250); similarly temporal princes have often taken a similar step (ibid. p. 260). Many Christian scholars and ecclesiastics have felt it their duty to utter protests in favour of the Jews. Among them have been the most eminent Christian students of Rabbinism of recent times, *e.g.* Professors Alexander McCaul, P. Lagarde, Franz Delitzsch, A. Merx, T. Nöldeke, C. Siegfried, A. Wünsche, G. H. Dalman and J. von Döllinger. A careful examination of the evidence (with a complete acquittal of the Jews) is contained in a notable work by a Catholic priest, F. Frank, *Der Ritualmord vor den Gerichtshöfen der Wahrheit und der Gerechtigkeit* (1901, 1902). The literature on the other side is entirely antisemitic and in no instance has it survived the ordeal of criticism. The most notorious exponent of the charge was A. Rohling, the worthlessness of whose writings on the subject is exposed by (among many others) Strack (*op. cit.* pp. 155 seq.).

A list of some of the most important of the cases is given by J. Jacob in the *Jewish Encyclopedia*, iii. 266–67. (I. A.)

RIVA, a fortified district town of Tirol, Austria, near the Italian frontier. Pop. (1900) 7530. It is a lake port and steamship station at the northern extremity of the Lago di Garda. There are two forts on the Monte Brione a little over a mile north-east of the town, and the old castle of La Rocca was reconstructed and extended in accordance with modern requirements in 1850. The Minorite Church (1603), with altar pictures by Guido Reni and other Italian painters, is much frequented as a place of pilgrimage. In addition to its transit trade and the entertainment of visitors, the principal resources of the town are the manufacture of paper, iron wares and pottery, the cultivation of the silk-worm and the olive tree, and a considerable commerce in timber, planks and coal. Riva is connected with the Ledro valley by a picturesque road which passes in a series of tunnels and galleries along the rocky and precipitous west shore of the lake.

RIVAL, one who competes with another, one who strives to out-do or excel another or to gain an object or end before or in preference to another. The Latin *rivalis*, which was in classical Latin used of a competitor in love, meant by derivation one who used the same brook or stream (*rivus*) as another, hence a neighbour; thus in the *Digest*, xliii. 20, i. 26, "si inter *rivales*, id est qui per eundem rivum aquam ducunt, sit contentio de aquae usu." The term naturally applied more particularly to those who lived on opposite sides of a stream which would be a frequent subject of dispute as to rights.

RIVAROL, ANTOINE DE (1753–1801), French writer and epigrammatist, was born at Bagnols in Languedoc on the 26th of June 1753, and died at Berlin on the 11th of April 1801. It seems that his father was an innkeeper but a man of cultivated tastes. The son assumed the title of comte de Rivarol, and asserted his connexion with a noble Italian family, but his enemies said that the name was really Riverot, and that the family was not noble. After various vicissitudes he appeared in Paris in 1777. After winning some academic prizes, Rivarol distinguished himself in the year 1784 by a treatise *Sur l'universalité de la langue française*, and by a translation of the *Inferno*. The year before the Revolution broke out he, with some assistance from a man of similar but lesser talent, Champcenetz,[2] compiled a lampoon, entitled *Petit Almanach de nos grands hommes pour 1788*, in which the names of several future talent and a great many nobodies were ridiculed in the most pitiless manner. When the Revolution developed the importance of the press, Rivarol at once took up arms on the Royalist side, and wrote in the *Journal politique* of Antoine Sabatier de Castres (1742–1817) and the *Actes des Apôtres* of Jean Gabriel Peltier (1770–1825). But he emigrated in 1792, and established himself at Brussels, whence he removed successively to London, Hamburg and Berlin. Rivarol has had no rival in France except Piron in sharp conversational sayings. These were mostly ill-natured, and mostly have a merely local application. Their brilliancy, however, can escape no one. His brother, Claude François (1762–1848), was also an author. His works include *Isman, ou le fatalisme* (1793), a novel; *Le Véridique* (1827), comedy; *Essai sur les causes de la révolution française* (1827).

The works of Antoine de Rivarol were published in five volumes (Paris, 1808); selections (1808, 1858), with introductory matter by Sainte-Beuve and others, and that edited in 1862 (2nd ed., 1880) by M. de Lescure, may be specified. See also M. de Lescure's *Rivarolet la société française pendant la révolution et l'émigration* (1882), and Le Breton's *Rivarol, sa vie, ses idées* (1895).

RIVE-DE-GIER, a town of east-central France, in the department of Loire, 14 m. E.N.E. of St Étienne, on the railway to Lyons. Pop. (1906) 15,338.

Situated on the Gier and the Canal de Givors, it is principally dependent on the coal industry, giving its name to a coal-basin which is a continuation of that of St Étienne. It has glass works, the products of which are celebrated on account of the fineness and purity of the sand found on the banks of

[1] *Das Blut im Glauben und Aberglauben* (Eng. trans., *The Jew and Human Sacrifice*, London, 1909).

[2] Louis René Quantin de Richebourg, Chevalier de Champcenetz (1760–1794), died on the scaffold. He is not to be confounded with Louis Pierre, marquis de Champcenetz, governor of the Tuileries in 1789, who escaped in 1792 through the protection of Mme. Elliott, mistress of the duc d'Orléans.

the Rhone and the Saône. There are also iron and steel works where iron goods and ironmongery of all kinds are manufactured.

Rive-de-Gier is a place of some antiquity, as appears from remains of Gallo-Roman buildings, and mosaics and coins found at various times. In the time of Henry IV. the working of the mines had already given to the locality a measure of importance.

RIVER, any considerable stream of water flowing in a defined channel. The origin and subsequent formation of rivers and the valleys along which they flow are considered under GEOGRAPHY, § *Principles of Geography,* and GEOLOGY, § viii. The word "river" is an adaptation of the O. Fr. *rivere* (mod. *rivière*), which descends through Med. Lat. *rivera*, Low. Lat. *riparia*, in the sense of river-bank and river, from *ripa*, bank. The Latin for a stream or river is *rivus*, whence *rivulus*, a small stream, Eng. "rivulet," which is, therefore, distinct in origin from "river," though probably the sense of *rivus* influenced the Med. Lat. *rivera*. The etymology of *rivus* and *ripa* is disputed; some scholars refer both to the root *ri-*, to drop, flow; others take *ripa* to be from the root seen in Gr. ἐρείκειν, to tear, English "rive," the sense being a broken cliff or steep bank.

RIVER BRETHREN, the name of a group of three Christian communities in the United States of America, descended from Swiss settlers near the Susquehanna river in Pennsylvania in 1750. The first pastor was Jacob Engle, who became head of the community in 1770. Their system is based on literal obedience to the commands of the New Testament, and they have points of similarity both with the Mennonites and with the Dunkards. They practise foot-washing and baptism by trine immersion; are strict sabbatarians and simple in their manner of life. The three branches are: (1) *The Brethren in Christ*, who are the most elaborately organized and are numerous in Ohio, Pennsylvania and Kansas; they have also formed churches in New York and in Canada, and missions in South Africa, India and Texas. In 1909 they had 174 ministers, and 65 churches with 3675 communicants. (2) *The Old Order*, or *Yorker Brethren*, consists of a small body which separated from the main body in 1843 and maintained more strictly the original practice. They are found specially in York county, Pennsylvania (whence the name "Yorkers"). In 1909 they had 21 ministers, 2 churches, and 423 communicants. (3) *The United Zion's Children* date from 1853, when a small body left the parent communion on minor questions of administration. They had in 1909 22 ministers and 28 churches with 740 communicants, all in Pennsylvania.

RIVER ENGINEERING. Before undertaking works for the improvement of rivers, either with the object of mitigating the effects of their inundations, or for increasing and extending their capabilities for navigation, it is most important that their physical characteristics should be investigated in each case, for these vary greatly in different rivers, being dependent upon the general configuration of the land, the nature of the surface strata and the climate of the country which the rivers traverse.

Physical Characteristics of Rivers

The size of rivers above any tidal limit and their average freshwater discharge are proportionate to the extent of their basins, and the amount of rain which, falling over these basins, reaches the river channels in the bottom of the valleys, by which it is conveyed to the sea.

River Basins.—The basin of a river is the expanse of country, bounded by a winding ridge of high ground, over which the rainfall flows down towards the river traversing the lowest part of the valley; whereas the rain falling on the outer slope of the encircling ridge flows away to another river draining an adjacent basin. River basins vary in extent according to the configuration of the country, ranging from the insignificant drainage-areas of streams rising on high ground very near the coast and flowing straight down into the sea, up to immense tracts of great continents, when rivers, rising on the slopes of mountain ranges far inland, have to traverse vast stretches of valleys and plains before reaching the ocean. The size of the largest river basin of any country depends on the extent of the continent in which it is situated, its position in relation to the hilly regions in which rivers generally rise and the sea into which they flow, and the distance between the source and the outlet of the river draining it.

Great Britain, with its very limited area, cannot possess large river basins, its largest being that of the Thames with an area of 5244 sq. m. Even on the mainland of Europe, river basins augment in extent on proceeding eastwards with the increasing width of the continent; in France the largest basin is that of the Loire with an area of 45,000 sq. m., while the Rhine has a basin of 86,000 sq. m. with a length of 800 m., the Danube a basin of 312,000 sq. m. with a length of 1700 m., and the Volga a basin of 563,000 sq. m. with a length of 2000 m. The more extensive continents of Asia, Africa and North and South America possess still larger river basins, the Obi in Siberia having a basin of about 1,300,000 sq. m. and a length of 3200 m., the Nile a basin of 1,500,000 sq. m. with a length of over 4000 m., and the Mississippi, flowing from north to south, having a basin of 1,244,000 sq. m. with a length of 4200 m. The vast basin of the Amazon of 2,250,000 sq. m. is due to the chain of the Andes almost bordering the Pacific coast-line, so that the river rising on its eastern slopes has to traverse nearly the whole width of South America at its broadest part before reaching the Atlantic Ocean.

Available Rainfall.—The rainfall varies considerably in different localities, both in its total yearly amount and in its distribution throughout the year; also its volume fluctuates from year to year. Even in small river basins the variations in rainfall may be considerable according to differences in elevation or distance from the sea, ranging, for instance, in the Severn basin, with an area of only 4350 sq. m., from an average of under 30 in. in the year to over 80 in. The proportion, moreover, of the rain falling on a river basin which actually reaches the river, or the available rainfall in respect to its flow, depends very largely on the nature of the surface strata, the slope of the ground and the extent to which it is covered with vegetation, and varies greatly with the season of the year. The available rainfall has, indeed, been found to vary from 75% of the actual rainfall on impermeable, bare, sloping, rocky strata, down to about 15% on flat, very permeable soils.

Fall of Rivers.—The rate of flow of rivers depends mainly upon their fall, though where two rivers of different sizes have the same fall, the larger river has the quicker flow, as its retardation by friction against its bed and banks is less in proportion to its volume than that of the smaller river. The fall of a river corresponds approximately to the slope of the country it traverses; and as rivers rise close to the highest part of their basins, generally in hilly regions, their fall is rapid near their source and gradually diminishes, with occasional irregularities, till, in traversing plains along the latter part of their course, their fall usually becomes quite gentle. Accordingly, in large basins, rivers in most cases begin as torrents with a very variable flow, and end as gently flowing rivers with a comparatively regular discharge.

Variations in the Discharge of Rivers.—The irregular flow of rivers throughout their course forms one of the main difficulties in devising works, either for mitigating inundations or for increasing the navigable capabilities of rivers. In tropical countries, subject to periodical rains, the rivers are in flood during the rainy season and have hardly any flow during the rest of the year; whilst in temperate regions, where the rainfall is more evenly distributed throughout the year, evaporation causes the available rainfall to be much less in hot summer weather than in the winter months, so that the rivers fall to their low stage in the summer and are very liable to be in flood in the winter. In fact, with a temperate climate, the year may be divided into a warm and a cold season, extending from May to October and from November to April respectively; the rivers are low and moderate floods are of rare occurrence during the first period, and the rivers are high and subject to occasional heavy floods after a

considerable rainfall during the second period in most years. The only exceptions are rivers which have their sources amongst mountains clad with perpetual snow, and are fed by glaciers; their floods occur in the summer from the melting of the snows and ice, as exemplified by the Rhone above the Lake of Geneva, and the Arve which joins it below. But even these rivers are liable to have their flow modified by the influx of tributaries subject to different conditions, so that the Rhone below Lyons has a more uniform discharge than most rivers, as the summer floods of the Arve are counteracted to a great extent by the low stage of the Saône flowing into the Rhone at Lyons, which has its floods in the winter when the Arve on the contrary is low.

Transportation of Materials by Rivers.—Another serious obstacle encountered in the improvement of rivers consists in the large quantity of detritus brought down by them in flood-time, derived mainly from the disintegration of the surface-layers of the hills and slopes in the upper parts of the valleys by glaciers, frost and rain. The power of a current to transport materials varies with its velocity, so that torrents with a rapid fall near the sources of rivers can carry down rocks, boulders and large stones, which are by degrees ground by attrition in their onward course into shingle, gravel, sand and silt, simultaneously with the gradual reduction in fall, and, consequently, in the transporting force of the current. Accordingly, under ordinary conditions, most of the materials brought down from the high lands by the torrential water-courses are carried forward by the main river to the sea, or partially strewn over flat alluvial plains during floods; and the size of the materials forming the bed of the river or borne along by the stream is gradually reduced on proceeding seawards, so that in the Po, for instance, pebbles and gravel are found for about 140 m. below Turin, sand along the next 100 m., and silt and mud in the last 110 m. When, however, the fall is largely and abruptly reduced, as in the case of rivers emerging straight from mountainous slopes upon flat plains, deposit necessarily occurs, from the materials being either too large or too great in volume to be borne along by the enfeebled current; and if the impeded river is unable to spread this detritus over the plains, its bed becomes raised by deposit, causing the river in flood-time to rise to a higher level. The materials, moreover, which are carried in suspension or rolled along the bed of the river to the sea, tend to deposit when the flow of the river slackens and is finally brought to rest on encountering the great inert mass of the sea, especially in the absence of a tide and any littoral current, and this is the cause of the formation of deltas with their shallow outlets, barring the approach to many large rivers.

Influence of Lakes on Rivers.—Sometimes a peculiar depression along part of a valley, with a rocky barrier at its lower end, causes the formation of a lake in the course of the river flowing down the valley. The intervention of a lake makes the river, on entering at the upper end, deposit all the materials with which it is charged in the still waters of the lake; and it issues at the lower end as a perfectly clear stream, which has also a very regular discharge, as its floods, in flowing into the lake, are spread over a large surface, and so produce only a very slight raising of the level. This effect is illustrated by the river Rhone, which enters the Lake of Geneva as a very turbid, torrential, glacier stream, and emerges at Geneva as a sparkling, limpid river with a very uniform flow, though in this particular case the improvement is not long maintained, owing to the confluence a short distance below Geneva of the large, rapid, glacial river, the Arve.

The influence of lakes on rivers is, indeed, wholly beneficial, in consequence of the removal of their burden of detritus and the regulation of their flow. Thus the Neva, conveying the outflow from Lake Ladoga to the Baltic, is relieved by the lake from the detritus brought down by the rivers flowing into the lake; and the Swine outlet channel of the Oder into the Baltic is freed from sediment by the river having to pass through the Stettiner Haff before reaching its mouth. The St Lawrence, again, deriving most of its supply from the chain of Great Lakes of North America, possesses a very uniform flow.

River Channels.—The discharge of the rainfall erodes the beds of rivers along the lowest parts of the valleys; but floods occur too intermittently to form and maintain a channel large enough to contain the flow. A river channel, indeed, generally suffices approximately to carry off the average flow of the river, which, whilst comprising considerable fluctuations in volume, furnishes a sufficiently constant erosive action to maintain a fairly regular channel; though rivers having soft beds and carrying down sediment erode their beds during floods and deposit alluvium in dry weather. As the velocity of a stream increases with its fall, the size of a channel conveying a definite average flow varies inversely with the fall, and the depth inversely with the width. A river channel, accordingly, often presents considerable irregularities in section, forming shallow rapids when the river flows over a rocky barrier with a considerable fall, and consisting of a succession of pools and shoals when the bed varies in compactness and there are differences in width, or when the river flows round a succession of bends along opposite banks alternately.

A river flowing through a flat alluvial plain has its current very readily deflected by any chance obstruction or by any difference in hardness of the banks, and generally follows a winding course, which tends to be intensified by the erosion of the concave banks in the bends from the current impinging against them in altering its direction round the curves. Sometimes also a large river, bringing down a considerable amount of detritus, shifts its course from time to time, owing to the obstruction produced by banks of deposit, as exemplified by the Po in traversing the portion of the Lombardy plains between Casale and the confluence of the Ticino.

Floods of Rivers.—The rise of rivers in flood-time depends not merely on the amount of the rainfall, but also on its distribution and the nature of the strata on which it falls. The upper hilly part of a river basin consists generally of impermeable strata, sometimes almost bare of vegetation; and the rain flowing quickly down the impervious, sloping ground into the water-courses and tributaries feeding the main river produces rapidly rising and high floods in these streams, which soon pass down on the cessation of the rain. The river Marne, draining an impermeable part of the Upper Seine basin, is subject to these sudden torrential floods in the cold season, as illustrated by a diagram of the variations in height of the river at St Dizier from November to March 1903–4 (fig. 2). On the contrary, rain falling on permeable strata takes longer in reaching the rivers; and the floods of these rivers rise more gradually, are less high, continue longer and subside more slowly than in rivers draining impervious strata, as indicated by the diagram of the Little Seine at Nogent during the same period, which has a permeable basin (fig. 1). A main river fed by several tributaries, some from impermeable and others from permeable strata, experiences floods of a mixed character, as shown by the diagram of the same floods in 1903–4 of the Seine at Paris, below the confluence of the torrential Marne and Yonne, where the floods of the gently flowing Upper Seine and other tributaries with permeable basins also contribute to the rise of the river (fig. 3).

High floods are caused by a heavy rainfall on land already sodden by recent rains at a period of the year when evaporation is inactive, and especially by rain falling on melting snow. A fairly simultaneous rainfall over the greater part of a moderate-sized river basin is a tolerably common occurrence; and under such conditions, the floods coming from the torrential tributaries reach their maximum height and begin to subside before the floods from the gently flowing tributaries attain their greatest rise. Exceptional floods, accordingly, only occur in a main river when a heavy rainfall takes place at such periods over different parts of the basin that the floods of the various tributaries coincide approximately in attaining their maximum at certain points in the main river.

Mitigation of Floods and Protection from Inundations.—As the size of the channel of a river is generally quite inadequate to carry down the discharge of floods, the river overflows its

volume and height of the flood. An enlargement of the bed of the river, principally by deepening it, in order to increase its discharging capacity sufficiently to prevent inundations, is precluded by the cost, and also, in rivers bringing down sediment, by the large deposit that would take place in the enlarged channel from the reduction in the velocity of the current when the flood begins to subside. Where, however, the depth of a tidal river has been considerably increased by dredging for the extension of its sea-going trade, the enlargement of its channel and the lowering of its low-water line have greatly facilitated the passage of land floods from the river above for some distance up, and consequently reduced their height; for instance, the Glasgow quays along the deepened Clyde are no longer subject to inundation, and the lands and quays bordering the Tyne have been relieved from flooding for nearly 10 m. above Newcastle by the deepening of the river from Elswick to the sea (fig. 18).

Sometimes works are carried out in a river valley for diminishing the height of floods by delaying the discharge of part of the rainfall into the main river; whilst others are designed to increase the discharging efficiency of the river channels. In certain cases, moreover, it is more important to restrict or to prevent the inundation of some riparian districts by embankments; and occasionally low-lying lands are so unfavourably situated that pumping has to be resorted to for the removal of their drainage waters.

Works in River Valleys for diminishing Floods.—Rain falling on bare, impervious, hilly slopes rapidly flows into the nearest water-course, carrying with it any loose soil or disintegrated materials met with in its rush down the ravines, thereby intensifying the torrential character of the river, increasing the height of its floods and adding to the sediment obstructing its course to the sea. By encouraging the growth of vegetation and restricting its use for pasturage, and by planting trees on the mountain slopes, which have often been denuded of their natural covering by the reckless clearing of forests, the flow of the rain off the slopes is retarded; the soil, moreover, is bound together by the roots of the plants, and the surface strata are protected from disintegration by the covering of grass and leaves, so that the amount of detritus carried down into the river is greatly reduced.

Proposals have sometimes been made to reduce the height of floods in rivers and restrict the resulting inundations by impounding some of the flood discharge by the construction of one or more dams across the upper valley of a river, and letting it out when the flood has passed down. This arrangement, however, is open to the objection that in the event of a second flood following rapidly on the first, there might not be time to empty the reservoir for its reception. The cost, moreover, of the formation of such reservoirs could rarely be justified merely for the purpose of reducing the flood-level along an ordinary river valley. Nevertheless, when this provision against floods can be combined with the storage of water-supply for a town, it becomes financially practicable. Thus two masonry dams erected across the narrow valley of the river Furens, a torrential tributary of the Loire, form two reservoirs for the supply of the town of St Étienne, in which the water is kept down several feet below the full level in order to provide for the reception of the surplus flood-waters, and thereby protect St Étienne from inundation. Storage reservoirs also, formed solely for water-supply or irrigation, provided adequate compensation water is discharged from them during dry weather, are advantageous, like lakes, in regulating the flow of the river below.

When a river flowing through flat plains has a very small fall, it requires a proportionately large channel to carry away the drainage waters of the valley; and, accordingly, the low-lying lands bordering the river are very subject to inundations if the rainfall over the higher ground is allowed to flow straight down into the bottom of the valley. By intercepting, however, the flow off the high parts of the valley in small channels excavated along the slopes, termed "catch-water drains," the ample fall available from this higher elevation can be utilized for conveying the flow farther down the valley; and the congested river is thereby relieved for a certain part of its length from the rainfall over the higher ground.

Methods of increasing the Discharging Efficiency of River Channels.—The discharging efficiency of a river within the limits of its bed depends on the fall and the cross-section of the channel. The only way of increasing the fall is to reduce the length of the channel by substituting straight cuts for a winding course. This involves some loss of capacity in the channel as a whole, and in the case of a large river with a considerable flow it is very difficult to maintain a straight cut, owing to the tendency of the current to erode the banks and form again a sinuous channel. Even if the cut is preserved by protecting the banks, it is liable to produce changes, shoals and a raising of the flood-level in the channel just below its termination. Nevertheless, where the available fall is exceptionally small, as in lands originally reclaimed from the sea, such as the English fen districts, and where, in consequence, the drainage is in a great measure artificial, straight channels have been formed for the rivers; and on account of the importance of preserving these fertile, low-lying lands from inundation, additional straight channels have been provided for the discharge of the rainfall, known as drains in the fens. Except where a town is exposed to inundations, a considerable modification of the course of a river and an enlargement of its channel do not produce a reduction in the damage from its floods commensurate with the expenditure involved.

The removal of obstructions, whether natural or artificial, from the bed of a river furnishes a simple and efficient means of increasing the discharging capacity of its channel, and, consequently, of lowering the height of floods; for every impediment to the flow, in proportion to its extent, raises the level of the river above it so as to produce the additional artificial fall necessary to convey the flow through the restricted channel, thereby reducing the total available fall. Accidental obstructions, brought down by floods, such as trunks of trees, boulders and accumulations of gravel, require to be periodically removed. In the absence of legal enactments for the

conservancy of rivers, numerous obstructions have in many cases been placed in their channel, such as mining refuse, sluice-gates for mills, fish-traps, unduly wide piers for bridges and solid weirs, which impede the flow and raise the flood-level. Stringent probibitions with regard to refuse, the enlargement of sluice-ways and the compulsory raising of their gates for the passage of floods, the removal of fish-traps which are frequently blocked up by leaves and floating rubbish, a reduction in the number and width of the piers of bridges when rebuilt, and the substitution of movable weirs for solid weirs, greatly facilitate the discharge of a river, and consequently lower its flood-level.

Prediction of Floods in Rivers.—By erecting gauges in a fairly large river and its tributaries at suitable points, and keeping continuous records for some time of the heights of the water at the various stations, the rise of the floods in the different tributaries, the periods they take in passing down to definite stations on the main river, and the influence they severally exercise on the height of the floods at these places, are ascertained. With the help of these records, by observing the times and heights of the maximum rise of a particular flood at the stations on the various tributaries, the time of arrival and height of the top of the flood at any station on the main river can be predicted with remarkable accuracy two or more days beforehand. By telegraphing these particulars about a high flood to places on the lower river, the weir-keepers are enabled to open fully beforehand the movable weirs for the passage of the flood, and the riparian inhabitants receive timely warning of the impending inundation.

Embankments along Rivers to prevent Inundations.—Where portions of a riverside town are situated below the maximum flood-level, or when it is important to protect land adjoining a river from inundations, the overflow of the river must be confined within continuous embankments on both sides. By placing these embankments somewhat back from the margin of the river-bed, a wide flood-channel is provided for the discharge of the river directly it overflows its banks, whilst leaving the natural channel unaltered for the ordinary flow. Low embankments may be sufficient where only exceptional summer floods have to be excluded from meadows. Occasionally the embankments are raised high enough to retain the floods during most years, whilst provision is made for the escape of the rare exceptionally high floods at special places in the embankments, where the scour of the issuing current is guarded against, and the inundation of the neighbouring land is least injurious. In this manner, the increased cost of embankments raised above the highest flood-level of rare occurrence is saved, and the danger of breaches in the banks from an unusually high flood-rise and rapid flow, with their disastrous effects, is avoided. Both the above methods afford the advantage of relieving the embanked channel of some of the sediment deposited in it by the confined flood-waters, when the surplus flow passes over the embankments.

When complete protection from inundations is required, the embankments have to be raised well above the highest flood-level, after allowing for the additional rise resulting from the confinement of the flood within the embankments, instead of spreading over the low-lying land; and they have to be made perfectly watertight and strong enough to resist the water-pressure and current of the highest floods. The system has been very extensively adopted where large tracts of fertile alluvial land below flood-level stretch for long distances away from the river. Thus the fens of Lincolnshire, Cambridgeshire and Norfolk are protected from inundations by embankments along their rivers and drains; a great portion of Holland is similarly protected; and the plains of Lombardy are shut off from the floods of the Po by embankments along each side of the river for a distance of about 265 m., extending from Cornale, 89 m. below Turin, to its outlet.

The system has been developed on a very extensive scale along the alluvial valley of the Mississippi, which is below the high flood-level of the river from Cape Girardeau, 45 m. above Cairo, to the Gulf of Mexico, and has a length of 600 m. in a straight line with a width ranging between 20 and 80 m., and an area of 29,790 sq. m. These embankments, having been begun by the French settlers in Louisiana, are called levees, and have a total length of 1490 m. They, however, do not afford complete protection from inundations, as they are not quite continuous and are not always strong enough to withstand the water-pressure of high floods, which have at Vicksburg a maximum rise of 50 ft. above the lowest stage of the river, and tend to increase in height owing to the improved drainage following on the extension of cultivation. Breaches, or crevasses as they are termed in the United States, resulting from a deficiency in the strength or consistency of the banks, or from their being overtopped or eroded by the current, produce a sudden rush of the flood-waters through the opening, which is much more damaging to the land in the neighbourhood of the breach than a gradual inundation. Moreover, the violence of the outflowing flow is intensified by the sloping down of the land on these alluvial plains for some distance away from the river, owing to the raising of the ground nearest the river by the gradual deposit of layers of sediment from the flood-waters when they begin to overflow the river banks. The levees on the Mississippi are breached in weak places every year during the spring floods, and are liable to be destroyed along considerable lengths by the rapid erosion resulting from their being overtopped by exceptional floods at intervals of about ten years; and in places they are undermined and overthrown by changes in the course of the river from the caving-in of concave banks at bends, necessitating reconstruction some distance back from the river at points likely to be threatened. When towns have established below the flood-level of an adjoining river, like New Orleans on the Mississippi and Szegedin on the Theiss in Hungary, the channel of the river should be improved to facilitate the passage of floods past the town. The town also must be enclosed within solid embankments, raised above the highest possible flood-level, to obviate the contingency of an exceptional flood, or a gradually raised flood-level, overtopping the protecting bank at a low part, leading to an inevitable breach and a catastrophe such as overwhelmed the greater part of Szegedin in March 1879.

Effect of Embankments in raising the River Bed.—A most serious objection to the formation of continuous, high embankments along rivers bringing down considerable quantities of detritus, especially near a part where their fall has been abruptly reduced by descending from mountain slopes on to alluvial plains, is the danger of their bed being raised by deposit, producing a rise in the flood-level, and necessitating a raising of the embankments if inundations are to be prevented. Longitudinal sections of the Po taken in 1874 and 1901 show that its bed was materially raised in this period from the confluence of the Ticino to below Caranella, in spite of the clearance of sediment effected by the rush through breaches; and therefore the completion of the embankments, together with their raising, would only eventually aggravate the injuries of inundations they have been designed to prevent, as the escape of floods from the raised river must sooner or later occur.

The periodical devastating floods of the Hwang Ho or Yellow River in China are due to the raising of the bed of its embanked channel by detritus brought down from the hills, followed by the raising of the banks, whereby the river is forced to flow above the level of the plains. When the river was first embanked, a considerable space was left between it and its banks on each side, which allowed for deviations in the channel, and also afforded a fair area for the deposit of detritus away from its bed, and a good width for the discharge of floods. Later, however, in order to appropriate and bring under regular cultivation the riparian land thus prudently left within the embankments and exposed to every flood, lines of inferior embankments were formed close to the river, thereby greatly confining the flood-waters, and, consequently, raising the flood-level and the river-bed, besides exposing these embankments to undermining by merely a moderate change in position of the river channel. This reckless policy of securing additional land regardless of consequences has greatly contributed to the more frequent occurrence of the very widespread inundations resulting from the bursting of the huge volume of periodical flood-waters through breaches in the banks, which descend with torrential violence upon the plains below, causing great destruction of life and property.

The restriction of the floods on the lower Mississippi by the levees, placed about double the width apart of the ordinary channel, has caused the river to enlarge its very soft alluvial bed, resulting in a lowering of the water-line at the low stage; and it is, therefore, anticipated that the further scour by floods when the levees have been made continuous will, in this instance, prevent any material raising of the flood-level by the levees.

Protection of Vessels during Floods.—On large open rivers, where vessels during high floods are exposed to injury from

large floating *débris* and ice floes, shelter can be provided for them in refuge ports, formed in a recess at the side under the protection of a solid jetty or embankment constructed in the river parallel to the bank, these ports being closed against floods at their upper end and having their entrance at the lower end facing down-stream. Many such ports have been provided on several German and North American rivers; where the port, being near a town, is lined with quay walls, it can also be used for river traffic, a plan adopted at the refuge port on the Main just below Frankfort (fig. 8).

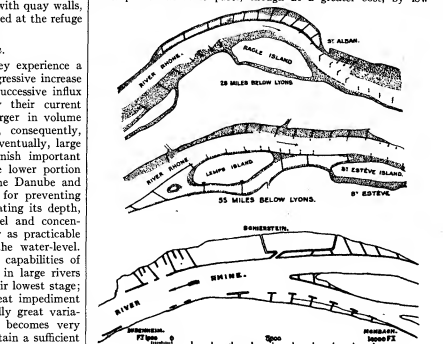
Regulation of Rivers for Navigation.

As rivers flow onward towards the sea, they experience a considerable diminution in their fall, and a progressive increase in the basin which they drain, owing to the successive influx of their various tributaries. Thus gradually their current becomes more gentle and their discharge larger in volume and less subject to abrupt variations; and, consequently, they become more suitable for navigation. Eventually, large rivers, under favourable conditions, often furnish important natural highways for inland navigation in the lower portion of their course, as, for instance, the Rhine, the Danube and the Mississippi; and works are only required for preventing changes in the course of the stream, for regulating its depth, and especially for fixing the low-water channel and concentrating the flow in it, so as to increase as far as practicable the navigable depth at the lowest stage of the water-level. Regulation works for increasing the navigable capabilities of rivers can only be advantageously undertaken in large rivers with a moderate fall and a fair discharge at their lowest stage; for with a large fall the current presents a great impediment to up-stream navigation, and there are generally great variations in water-level, and when the discharge becomes very small in the dry season it is impossible to maintain a sufficient depth of water in the low-water channel.

Removal of Shoals.—The possibility of securing uniformity of depth in a river by the lowering of the shoals obstructing the channel depends upon the nature of the shoals. A soft shoal in the bed of a river is due to deposit from a diminution in velocity of flow, produced by a reduction in fall and by a widening of the channel, or to a loss in concentration of the scour of the main current in passing over from one concave bank to the next on the opposite side. The lowering of such a shoal by dredging merely effects a temporary deepening, for it soon forms again from the cause which produced it. The removal, moreover, of the rocky obstructions at rapids, though increasing the depth and equalizing the flow at these places, produces a lowering of the river above the rapids by facilitating the efflux, which may result in the appearance of fresh shoals at the low stage of the river. Where, however, narrow rocky reefs or other hard shoals stretch across the bottom of a river and present obstacles to the erosion by the current of the soft materials forming the bed of the river above and below, their removal may prove a permanent improvement by enabling the river to deepen its bed by natural scour.

The deepening of the bed of a non-tidal river along a considerable length by dredging merely lowers the water-level of the river during the low stage; and though this deepening facilitates the passage of floods in the first instance, it does not constitute a permanent improvement even in this respect, for the deposit of the detritus brought down by the river as the floods abate soon restores the river to its original condition. Nevertheless, where sand-banks obstruct and divert the low-state channel of a river at its low stage, as in parts of the Mississippi below Cairo, it has been found possible before the river has fallen to its lowest level to form a channel through these sand-banks, with a depth of 9 or 10 ft. and 250 ft. wide, by suction dredgers, aided by revolving cutters or water-jets (see DREDGING), which discharge the sand through floating tubes into a part of the river away from the channel; and the navigation can thus be maintained throughout the low stage at a reasonable cost. Though, however, these channels across the shoals, connecting the deeper parts of the river, can be easily kept open on the Mississippi till the return of the floods, they are obliterated by the currents in flood-time, and have to be dredged out again afresh every year on the abatement of the floods.

Regulation of the Low-Water Channel.—The capability of a river to provide a waterway for navigation during the summer or throughout the dry season depends upon the depth that can be secured in the channel at the lowest stage. Owing to the small discharge and deficiency in scour during this period, it is important to restrict the width of the low-water channel, so as to concentrate the flow in it, and also to fix its position so that, forming the deepest part of the bed along the line of the strongest current, it may be scoured out every year by the floods, instead of remaining an undefined and shifting channel. This is effected by closing subsidiary low-water channels with dikes across them, and narrowing the channel at the low stage by low-dipping cross dikes extended from the river banks down the slope, and pointing slightly up-stream so as to direct the water flowing over them into a central channel (figs. 4 and 5). The contraction also of the channel is often still more effectually accomplished at some parts, though at a greater cost, by low



Regulation Works.

FIGS. 4 and 5.—River Rhone.
FIG. 6.—River Rhine.

longitudinal dikes placed along either side of the low-water channel, some distance forward from the banks but connected with them generally at intervals by cross dikes at the back to prevent the current from scouring out a channel behind them during floods (figs. 4 and 6). By raising these dikes only slightly above the surface of the bed of the river, except where it is expedient to produce accretion for closing an old disused channel or rectifying the course of the river, the capacity of the channel for discharging floods is not affected; for the slight obstruction to the flow produced by the dikes at the sides is fully compensated for by the deepening of the low-water channel in the central course of the river.

This system of obtaining a moderate increase in depth during the low stage of a river, whilst leaving the river quite open for navigation, has been adopted with satisfactory results on several large rivers, of which the Rhone, the Rhine and the Mississippi furnish notable examples. Regulation works were preferred on the Rhone to canalization from Lyons nearly to its outlet, in spite of its large fall, which reaches in some places 1 in 250, on account of the considerable quantities of shingle and gravel carried down by the river; the comparative regularity of the discharge, owing to the flow being derived from tributaries having their floods at different times of the year, has aided the effects of the works, which have produced an increase of about 3¾ ft. in the available navigable depth below Lyons at the lowest water-level. Owing, however, to the unfavourable natural condition of the river, the depth does not exceed 5 ft. at this stage; and the rapid current forms a serious impediment to up-stream navigation. The Rhine is much better adapted for improvement by regulation works than the Rhone, for it has a basin more than double the area of the Rhone basin, and its fall does not exceed 3·1 ft. per mile up at Strassburg and 2·5 ft. per mile through the rocky defile from Bingen to Kaub, and is much less along most of the length below Strassburg. These works systematically carried out in wide shallow reaches between the Dutch frontier and Mainz, aided by dredging where necessary, have secured a navigable depth at the low stage of the river of 10 ft. from the frontier to Cologne, 8½ ft. from Cologne to Kaub, and 6½ ft. through the rocky defile up to Bingen, beyond which the same depth is maintained up to Philippsburg, 22½ m. above Mannheim. Works, moreover, are in progress by which it is anticipated that the minimum depth of 6½ ft. will be extended up to Strassburg by 1916. The Mississippi also, with its excessive basin and its moderate fall in most parts, is well suited for having its navigable depth increased

by regulation works, which have been carried out below St Paul in shallow and shifting reaches, with the object of obtaining a minimum navigable depth during the low stage of 6 ft. along the upper river from St Paul to St Louis just below the confluence of the Missouri, and 8 ft. thence to Cairo at the mouth of the Ohio.

Various materials are used for the regulation works according to the respective conditions and the materials available in the locality. On the Rhone below Lyons with its rapid current, the dikes have been constructed of rubble-stone, consolidated above low water with concrete. The dikes on the Rhine consist for the most part of earthwork mounds protected by a layer of rubble-stone or pitching on the face, with a rubble mound forming the toe exposed to the current; but occasionally fascines are employed in conjunction with stone or simple rubble mounds. The dams closing subsidiary channels on the Mississippi are almost always constructed of fascine mattresses weighted with stone; but whereas the regulating dikes on the upper river are built similar in construction, a common form for dikes in the United States consists of two parallel rows of piles filled in between with brushwood or other materials not affected by water, and protected at the sides from scour by an apron of fascines and stone. Other forms of dikes sometimes used are timber cribs filled with stone, single rows of sheet piling, permeable dikes composed of piles supporting thin curtains of brushwood for promoting silting at the sides, and occasionally rubble-stone in places needing special protection.

Protecting and Easing Bends.—Unless the concave banks of a river winding through wide, alluvial plains are protected from the scour of the current, the increasing curvature presents serious impediments to navigation, sometimes eventually becoming so intensified that the river at last makes a short cut for itself across the narrow strip of land at the base of the loop it has formed. This, however, produces considerable changes in the channel below, and disturbances in the navigable depth. Protection, accordingly, of concave banks is necessary to prevent excessive curvature of the channel and changes in the course of a river. On the Mississippi the very easily

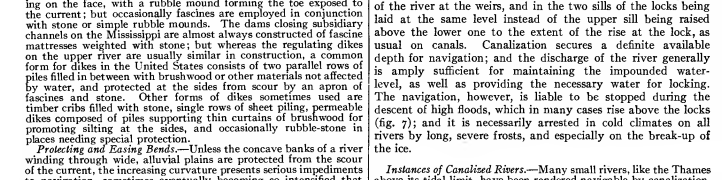


FIG. 7.—Canalized River Main.

eroded banks are protected along their upper, steeper part by stone pitching or a layer of concrete, and below low-water level by fascine mattresses weighted with stone, extended a short distance out on the bed to prevent erosion at the toe. Dikes, also, projecting into the channel from the banks reduce the curvature of the navigable channel by pushing the main current into a more central course; whilst curved longitudinal dikes placed in the channel in front of concave banks (figs. 4 and 6) are still more effective in keeping the current away from the banks, which is sometimes still further promoted by dipping cross dikes in front (fig. 5).

Regulation of Depth.—The regulation works at bends, besides arresting erosion, also reduce the differences in depth at the bends and the crossings, since they diminish the excessive depth round the concave banks and deepen the channel along the crossings, by giving a straighter course to the current and concentrating it by a reduction in width of the channel between the bends (figs. 4 and 5). Where there are deep pools at intervals in a river, shoals are always found above them, owing to the increased fall which occurs in the water line on approaching the pool, to compensate for the very slight inclination of the water-line in crossing the pool, which serves for the discharge of the river through the ample cross-section of this part of the river-bed. These navigable depths can be regulated to some extent by rubble dikes or fascine mattress sills deposited across the bed of the pool, so as to reduce its excessive depth, but not raised high enough to interfere at all with the navigable depth. These obstructions in the pool cause the water-line towards its upper end, in order to provide the additional fall needed to effect the discharge through the pool with its diminished cross section; and this raising of the water-line increases the depth over the shoal above the pool, so that the general depth in these irregular parts of a river is rendered more uniform, with benefit to navigation.

Canalization of Rivers.

Rivers whose discharge is liable to become quite small at their low stage, or which have a somewhat large fall, as is usual in the upper part of rivers, cannot be given an adequate depth for navigation by regulation works alone; and their ordinary summer level has to be raised by impounding the flow with weirs at intervals across the channel (see WEIR), while a lock (see CANAL and DOCK) has to be provided alongside the weir, or in a side channel, to provide for the passage of vessels (fig. 8). A river is thereby converted into a succession of fairly level reaches rising in steps up-stream, providing a comparatively still-water navigation like a canal; but it differs from a canal in the introduction of weirs for keeping up the water-level, in the provision for the regular discharge of the river at the weirs, and in the two sills of the locks being laid at the same level instead of the upper sill being raised above the lower one to the extent of the rise at the lock, as usual on canals. Canalization secures a definite available depth for navigation; and the discharge of the river generally is amply sufficient for maintaining the impounded water-level, as well as providing the necessary water for locking. The navigation, however, is liable to be stopped during the descent of high floods, which in many cases rise above the locks (fig. 7); and it is necessarily arrested in cold climates on all rivers by long, severe frosts, and especially on the break-up of the ice.

Instances of Canalised Rivers.—Many small rivers, like the Thames above its tidal limit, have been rendered navigable by canalization, and several fairly large rivers have thereby provided a good depth for vessels for considerable distances inland. Thus the canalized Seine has secured a navigable depth of 10½ ft. from its tidal limit up to Paris, a distance of 135 m., and a depth of 6½ ft. up to Montereau, 62 m. higher up. Regulation works for improving the river Main, from its confluence with the Rhine opposite Mainz up to Frankfort, having failed to secure a minimum depth of 3 ft. at the low stage of the river, canalization works were carried out in 1883–86 by means of five weirs in the 22 m. between the Rhine and Frankfort, and provided a minimum depth of 6½ ft. (figs. 7 and 8).

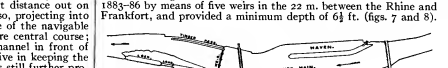

FIG. 8.—Locks, Weir and Haven near Frankfort.

This depth was subsequently increased by dredging the shoaler portion towards the upper end of each reach, due to the rise of the river-bed up-stream, so as to attain a minimum depth of 7½ ft. just below the lowest lock, and 7½ to 8½ ft. in the other reaches; whilst a sixth weir was erected at Offenbach above Frankfort (fig. 7). The Great Kanawha, Ohio, and other rivers, furnish instances of canalization works in the United States.

Limits to Canalization.—On ascending a river it becomes increasingly difficult to obtain a good depth by canalization in the upper part, owing to the progressive inclination of the river-bed; thus, even on the Seine, with its moderate fall, whereas a depth of 10½ ft. has been obtained on the Lower Seine by weirs placed on the average 13½ m. apart, on the Upper Seine weirs are required at intervals of only about 4½ m. to attain a depth of 6½ ft. Accordingly, the higher parts of rivers are only suitable for floating down trunks of trees felled on the hills, or rough rafts of timber, conveying small loads of produce, which are broken up on reaching their destination. Moreover, sometimes an abrupt fall or rocky shoals make it necessary to abandon a section of the river and to continue the navigation by lateral canal.

Small River Outlets exposed to Littoral Drift.

Rivers with a small discharge flowing straight into the sea on an exposed coast are more or less obstructed at their outlet

by drift of shingle or sand carried along the coast by the waves in the direction of the prevailing winds. When the flow falls very low in dry weather, the outlet of a river is sometimes completely closed by a continuous line of beach, any inland or tidal waters merely trickling through the obstruction; and it is only on the descent of floods that the outlet is opened out. In rivers which always have a fair fresh-water discharge, or a small fresh-water flow combined with a tidal flow and ebb, the channel sometimes has its direct outlet closed, and is deflected parallel to the shore till it reaches a weak place in the line of beach, through which a new outlet is formed; or, where the current is strong enough to keep the outlet open, a bar is formed across the entrance by the littoral drift, reducing the navigable depth.

Jetties at River Outlets.—The bar formed by littoral drift across the outlet of a river not charged with sediment and flowing into a tideless sea can be lowered by carrying out solid jetties on each side of the outlet across the foreshore, so as to scour the bar by concentrating the issuing current over it. Thus by means of jetties, aided by dredging, the depth at the entrance to the Swine mouth of the Oder has been increased from 7 ft. to 22½ ft.; the approach channels to the river Pernau (fig. 9) and other Russian rivers flowing into the Baltic have been deepened by jetties, and the outlet channels of some of the rivers flowing into the Great Lakes of North America have been improved by crib-work jetties and dredging.

FIG. 9.—Jetty Outlet into Baltic: River Pernau.

Where the littoral drift is powerful enough to divert the outlet of a river, as in the case of the river Yare, which at one time was driven to an outlet 4 m. south of its direct course into the sea at Yarmouth, and the river Adour in France, whose outlet, owing to the violent storms of the Bay of Biscay, was liable to be shifted 18 m. from its proper position, it has proved practicable to fix as well as to deepen the outlet by means of jetties (fig. 10). In such cases,

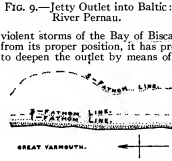

FIG. 10.—Shifting Outlet, fixed by Jetties: River Yare.

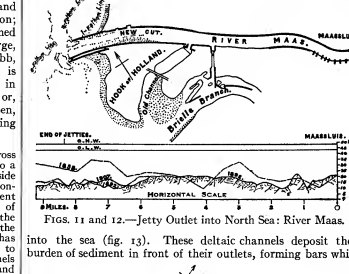
however, where the rivers flow into tidal seas, it is important to place the jetties sufficiently apart to avoid any loss of tidal influx, since the tidal flow assists the fresh-water discharge in keeping the outlet open; whereas, with rivers flowing into tideless seas, a moderate restriction of the width between the jetties increases the scour. The tortuous and somewhat shifting outlet channel of the Scheur branch of the river Maas, emerging on to a sandy coast where the rise of tide is small, and obstructed at its mouth by a bar, has been replaced by a straight cut across the Hook of Holland, and by an outlet guided across the foreshore and fixed in position by fascine mattress jetties (see JETTY), the maintenance of the depth at the mouth by the tidal and fresh waters being aided by frequent dredging (figs. 11 and 12).

Deltaic Outlets of Tideless Rivers.

Large rivers heavily charged with sand and silt, when their current is gradually arrested on entering a tideless sea, deposit these materials as a constantly advancing fan-shaped shoal in front of their mouths, through which comparatively shallow diverging channels, almost devoid of fall, have to force their way in order to convey the fresh-water discharge



FIGS. 11 and 12.—Jetty Outlet into North Sea: River Maas.

into the sea (fig. 13). These deltaic channels deposit their burden of sediment in front of their outlets, forming bars which

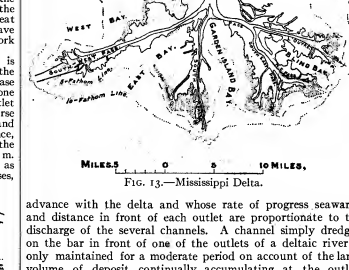


FIG. 13.—Mississippi Delta.

advance with the delta and whose rate of progress seawards and distance in front of each outlet are proportionate to the discharge of the several channels. A channel simply dredged on the bar in front of one of the outlets of a deltaic river is only maintained for a moderate period on account of the large volume of deposit continually accumulating at the outlet. Thus the channel in front of the outlet of the south-west pass of the Mississippi delta, when deepened from 13 ft. to 18 ft. over its bar by dredging many years ago, was soon silted up again on the discontinuance of the dredging; whilst the depth of the outlet channel of one of the branches of the Volga delta, which was increased from 4 ft. to 8 ft., could only be maintained by regular yearly dredging.

Parallel Jetties at Delta Outlets.—In order to procure and maintain for some time an adequate deepening across the bar in front of the outlets of delta channels, recourse has been had to the scour of the issuing current concentrated and extended out to the bar by parallel jetties, forming prolongations seawards of the banks of the channel. The requisite conditions for the success of this system of improvement are a good depth in the sea beyond the bar, allowing of a considerable deposit of alluvium before the increased depth is interfered with, and a littoral current carrying a portion of the alluvium away from the outlet, both of which retard the progression of the delta in front of the outlet and the inevitable eventual formation of a new bar farther out. The rate of advance of a delta depends also on the proportion of solid matter contained in the river water and on the specific gravity and size of the particles of alluvium discharged into the sea: for the heavier and coarser materials, and especially those which are rolled along the bed of the channels, come first to rest. Moreover, as the larger channels of a delta bring down a larger volume of alluvium on account of their larger discharge, and as their bars form farther seawards from their outlets owing to the issuing current being less rapidly arrested in proportion to the volume discharged, the rate of advance of the

delta in front of an outlet is proportionate to the size of the channel, and the length of the jetties required for lowering the bar by scour in front of any channel is proportionate to the discharge of the channel. Consequently, the conditions are more unfavourable for the improvement of the outlets of the larger delta channels than of the smaller ones; though, on the other hand, the larger channels crossing the delta are generally more suitable for navigation on account of their size, and the natural depth over their bars is greater owing to the larger discharge.

The discharge of the main branch of the Rhone, which formerly flowed into the Mediterranean and the Gulf of Foz through six mouths, was in 1852–57 concentrated in the direct or Rhone. channel by embankments along sides, which closed all the lateral channels. The entire flow of the river, being thus discharged through the eastern outlets, increased for a time the depth over its bar from 4½ ft. to 9½ ft.; but as the great volume of alluvium brought down, including an unusually large proportion of sand rolled along the bed of the river, was also all discharged through the one outlet, the bar soon formed again farther out, and naturally advanced with the delta in front of the outlet more rapidly than formerly when the deposit was distributed through six divergent mouths. Accordingly, the very moderate deepening produced by the embankments was not long maintained, and the average depth over the bar has not exceeded 6½ ft. for many years past; the St Louis Canal was constructed to provide a deeper outlet for the navigation.[1] This want of success was due to the selection of an outlet opening on a sheltered, somewhat shallow bay, instead of a southern outlet discharging into deep water in the Mediterranean and having a deep littoral current flowing across it, and also resulted from the closing of all the other outlets, whereby the whole of the deposit, as well as all the discharge, was concentrated in front of the badly situated eastern outlet. The southern Roustan branch was reopened in 1893 to prevent the silting-up of the outlet of the St Louis Canal.

The Danube traverses its delta in three branches, the northern one of which, though conveying nearly two-thirds of the discharge of the river, is unsuitable for improvement owing to its Danube. splitting up along portions of its course into several channels, and eventually flowing into the sea through twelve mouths of a small independent delta advancing about 250 ft. annually across a shallow foreshore. The central Sulina branch was selected for improvement in 1858 in preference to the southern St George's branch, which had a more favourably situated outlet and a better channel through the delta, on account of the much smaller expenditure required for carrying out jetties to the bar in front of the Sulina outlet, which was only half the distance from the shore of the bar of the St George's outlet, owing to the much smaller discharge of the Sulina branch.[2] The jetties, begun provisionally in 1858 and subsequently consolidated and greatly extended, were finally completed in 1877. They increased the depth over the bar from an average of about 9 ft. previously to 1858 up to 20½ ft. in 1873, which was maintained for many years. In 1893, however, the increasing draught of vessels rendered a greater depth necessary; the wide inshore portion of the jetty channel was therefore narrowed by inner parallel jetties, and a powerful dredger was set to work in the jetty channel and outside, whereby the depth was increased to 24 ft. in 1897, and was fairly maintained up to 1907, when a second dredger became necessary to cope with the shoaling. The somewhat small ratio of sediment to discharge in the Danube, the fineness of the greater portion of this sediment, its comparatively moderate amount owing to the small proportion of the discharge flowing through the Sulina branch, and its partial dispersion by the southerly littoral current and wave action, have prevented the rapid formation of a shoal in front of the Sulina outlet. Nevertheless, the lines of soundings are gradually advancing seawards in the line of the outlet channel, and there are signs of the formation of a new bar farther out, whilst the deposit to the south by the current and waves has deflected the deepest channel northwards. Accordingly, a prolongation of the jetties will eventually be necessary, notwithstanding the removal of a portion of the deposit from the outlet channel by dredging.

The selection of the outlet of the south pass of the Mississippi delta for improvement by parallel jetties in 1876–79, in spite of the south-west pass possessing a larger channel and a better Mississippi. depth over its bar, was due, as at the Danube, to motives of economy, as the bar of the south-west pass was found to be far off from the shore as that of the south pass (fig. 13). There fascine mattress jetties, weighted with limestone, and with large concrete blocks at their exposed ends (see JETTY), 2¼ and 1¼ m. long, and curved slightly southwards at their outer ends to direct the sediment-bearing current more directly at right angles to the westerly littoral current, increased the depth of 8 ft. over the bar in 1875 up to 31 ft. between the jetties and out to deep water (fig. 14). The prolonged current of the river produced by the jetties has, as at the Sulina outlet, carried the main portion of the heavier sediment into fairly deep water, so that the greatest advance of the foreshore in front of the south pass has occurred in the 70-ft. line of soundings, though the shallower soundings have also advanced.

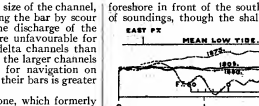

FIG. 14.—Deltaic Jetty Outlet, South Pass, Mississippi.

The shoaling, however, in the jetty channel necessitated its reduction in width by mattresses and spurs from 1000 ft. to 600 ft., and also dredging to maintain the stipulated central depth of 30 ft., and 26 ft. depth for a width of 200 ft., out to deep water; whilst the outer channel was deflected to the east and narrowed by the alluvium carried westwards by the littoral current and also deposited in front of the jetty outlet. Accordingly, dredging has been increasingly needed to straighten the channel outside and maintain its depth and width; and since the United States engineers took in hand its maintenance in 1901, the available depth of the outlet channel has been increased from 26 ft. up to 28 ft. by extensive suction dredging.

In order to provide for the increasing requirements of sea-going vessels, the dredging of a channel 35 ft. deep and 1000 ft. wide, cut from the large south-west pass outlet to deep water in the gulf, was begun at the end of 1903; and jetties of fascine mattresses weighted with stone and concrete blocks have been carried out about 4 and 3 m. respectively from the shore on each side of the outlet for maintaining the dredged channel[3] (fig. 15). These works differ

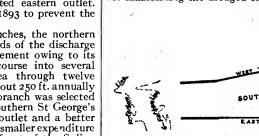

FIG. 15.—Deltaic Jetty Outlet, South-West Pass, Mississippi.

from the prior improvement of the south pass in the adoption mainly of suction dredging for the formation of the channel in place of scour alone, so that it will be unnecessary to restrict the width of the jetty channel to secure the desired depth; whilst as the discharge through the south-west pass is rather more than three times the discharge through the south pass, and the bar is double the distance seawards of the outlet, the slightly converging jetties, in continuation of the south-west pass, are placed about 3400 ft. apart at their outer ends, and have been given about twice the length of the south pass jetties. As soon as the dredging of the channel has been completed (which depends on the appropriations granted by Congress) the south pass will be abandoned, and the south-west pass will form the navigable approach. Dredging will be required for preserving the depth of the outlet of the south-west pass; and when the large volume of sand and other alluvium discharged by the pass accumulates in front sufficiently to begin forming a bar farther out, an extension of the jetties will be necessary to maintain the elongated channel free from drift, and extend the scour, especially in flood-time.

Improvement of Tidal Rivers for Navigation.

Whereas the size of tideless rivers depends wholly on their fresh-water discharge, the condition of tidal rivers is due to the configuration of their outlet, the rise of tide at their mouth, the distance the tide can penetrate inland, and the space available for its reception. Accordingly, tidal rivers sometimes, even when possessing a comparatively small fresh-water discharge, develop under favourable conditions into large rivers in their lower tidal portion, having a much better natural navigable channel at high tide than the largest deltaic rivers, as shown by a comparison of the Thames, the Humber and the Elbe with the Danube, the Nile and the Mississippi. Tidal water is, indeed, unlimited in volume; but, unlike the drainage waters which must be discharged into the sea, it only flows up rivers where there is a channel and space available for its

[1] L. F. Vernon-Harcourt, *Rivers and Canals*, 2nd ed. pp. 187–90, plate. 5, figs. 1 and 9.

[3] *Report of the Chief of Engineers for 1906*, pp. 382 and 1296 and charts.

reception. Consequently, it is possible to exclude the tide by injudicious works, such as the sluices which were erected long ago across the fen rivers to secure the low-lying lands from the inroads of the sea; the tidal influx is also liable to be reduced by accretion in an estuary resulting from training works. The great aim, on the contrary, of all tidal river improvement should be to facilitate to the utmost the flow of the flood-tide up a river, to remove all obstructions from the channel so as to render the scouring efficiency of the flood and ebb tides as great as possible, and by making the tidal flow extend as far up the river as possible to reduce to a minimum the period of slack tide when deposit takes place.

Tidal Flow in a River.—The progress of the flood-tide up a river and the corresponding ebb are very clearly shown by a diagram giving a series of simultaneous tidal lines obtained from simultaneous observations of the height of the river Hugli during a high spring-tide in the dry season, taken at intervals at several stations along the river, and exhibiting on a very distorted scale the actual water-level of the river at these periods (fig. 16). The steep form assumed

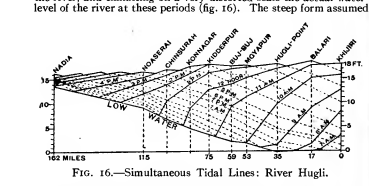

FIG. 16.—Simultaneous Tidal Lines: River Hugli.

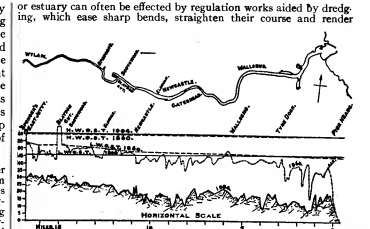
by the foremost part of the flood-tide lines from the entrance to beyond Chinsura, attaining a maximum in the neighbourhood of Konnagar and Chinsura, indicates the existence of a *bore*, caused by the sand-banks in the channel obstructing the advance of the flood-tide, till it has risen sufficiently in height to rush up the river as a steep, breaking wave, overcoming all obstacles and producing a sudden reversal of the flow and abrupt rise of the water-level, as observed on the Severn, the Seine, the Amazon and other rivers. A bore indicates defects in the tidal condition and the navigable channel, which can only be reduced by lowering the obstructions and by the regulation of the river. No tidal river of even moderate length is ever completely filled by tidal water; for the tide begins to fall at its mouth before the flood-tide has produced high water at the tidal limit, as most clearly shown in the case of a long tidal river by the Hugli tidal diagram. Every improvement of the channel, however, expedites and increases the filling of the river, whilst the volume of water admitted at each tide is further augmented by the additional capacity provided by the greater efflux of the ebb, as indicated by the lowering of the low-water line.

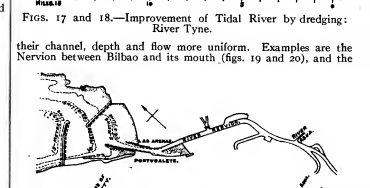
Deepening Tidal Rivers by Dredging.—The improvement of tidal rivers mainly by dredging is specially applicable to small rivers which possess a sufficient navigable width, like the Clyde and the Tyne; for such rivers can be considerably deepened by an amount of dredging which would be quite inadequate for producing a similar increase in depth in a large, wide river, with shifting channels. Both the Clyde below Glasgow and the Tyne below Newcastle were originally insignificant rivers, almost dry in places at low water of spring-tides; and the earliest works on both rivers consisted mainly in regulating their flow and increasing their scour by jetties and training works. They have, however, been brought to their present excellent navigable condition almost wholly, since 1840 on the Clyde and 1861 on the Tyne, by continuous systematic dredging, rendered financially practicable by the growing importance of their sea-going traffic. The Clyde has been given a minimum depth of about 22 ft. at low water of spring-tides up to Glasgow, and can admit vessels of 27 to 28 ft. draught. In the Tyne (figs. 17 and 18), it was decided in 1902 to provide a minimum dredging depth in the river channel at low water of 25 ft. from the sea to the docks, of 20 ft. thence to Newcastle and of 18 ft. up to Scotswood, the rise of spring-tides increasing these depths by 15 ft. In 1906 it was determined to make the channel 30 ft. deep at low water of spring-tides from the sea to the docks, and in 1908 to deepen it between the docks and Newcastle swing bridge from 20 to 25 ft., and also between the swing bridge and Derwenthaugh from 18 to 25 ft. The natural scour of these rivers has been so much reduced by such an extensive enlargement of the channel that a considerable amount of dredging will always be required to preserve the depth attained.

Regulation and Dredging of Tidal Rivers.—Considerable improvements in the navigable condition of tidal rivers above their outlet or estuary can often be effected by regulation works aided by dredging, which ease sharp bends, straighten their course and render



FIGS. 17 and 18.—Improvement of Tidal River by dredging: River Tyne.

their channel, depth and flow more uniform. Examples are the Nervion between Bilbao and its mouth (figs. 19 and 20), and the

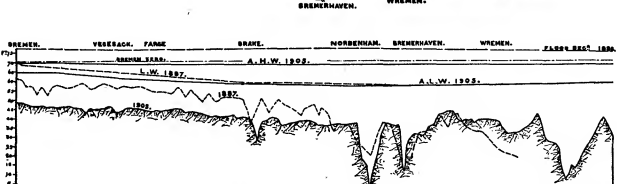


FIGS. 19 and 20.—Training Tidal River and protection of Outlet: River Nervion.

Weser from Bremen to Bremerhaven at the head of its estuary (figs. 21 and 22). These works resemble in principle the regulation works on large rivers with only a fresh-water discharge, previously described; but on tidal rivers the main low-water channel should alone be trained with an enlarging width seawards to facilitate the tidal influx, and the tidal capacity of the river above low water should be maintained unimpaired.

To secure a good and fairly uniform depth on a tidal river, it is essential that the flood and ebb tides should follow the same course, in order to combine their scouring efficiency, and form a single, continuous deep channel. In wide, winding reaches, however, the flood tide in ascending a river follows as direct a course as practicable; and on reaching a bend, the main flood-tide current, in being deflected from its straight course, hugs the concave bank, and, keeping close alongside the same bank beyond the bend, cuts into the shoal projecting from the convex bend of the bank higher up, forming a blind shoaling channel, as clearly indicated near the Moyapur Magazine in fig. 23, and a little below Shipgunj Point in fig. 24. This effect is due to the flood-tide losing its guidance, and consequently its concentration, at the change of curvature beyond the termination of the concave bank, where it spreads out and passes gradually over, in its direct course, to the next concave bend above along the opposite bank. The ebb tide, on the contrary, descending the river, follows the general course of the fresh-water discharge in all rivers, its main current in the Moyapur reach keeping close along the concave bank between Ulabaria and Hiraganj Point, and crossing over opposite the point to the next concave bank below (fig. 23); whilst in the James and Mary reach the main ebb-tide current runs alongside the concave bank in front of Ninan and Nurpur, and crosses over near Hugli Point to the opposite concave bank below Gewankhali (fig. 24). The main currents, accordingly, of the flood and ebb tides in such reaches act quite independently between the bends, forming channels on opposite sides of the river and leaving a central intervening shoal. The surveys of the two reaches of the Hugli, represented in figs. 23 and 24, having been taken in the dry season, exhibit the flood-tide channels at their deepest phase, and the ebb-tide channels in their worst or least continuous condition.

In tidal rivers the main ebb-tide current, being reinforced by



FIGS. 21 and 22.—Training Tidal River at Estuary: River Weser.

the fresh-water discharge, generally forms the navigable channel, which is scoured out during floods. Narrowing the river between the bends to bring the two channels together would unduly restrict the tidal flow; and in a river like the Hugli dependent on the tidal influx for the maintenance of its depth for two-thirds of the year, and with channels changing with the wet and dry seasons, so that deepening by dredging in the turbid river could not be permanent, training works below low water to bring the ebb-tide current into the flood-tide channel, which latter must not be obstructed at all, offer, aided by dredging, the best prospects of improvement.

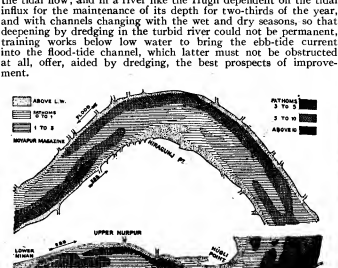


FIG. 23.—Moyapur Reach, River Hugli, Jan. 1896.
FIG. 24.—James and Mary Reach, River Hugli, April 1890.

The average rate of enlargement adopted for the trained channel of the Nervion, in proportion to its length, is 1 in 75 between Bilbao and its mouth, and 1 in 71 for the Weser from Bremen to Bremerhaven; and these ratios correspond very nearly to the enlargement of the regulated channel of the Clyde from Glasgow to Dumbarton of 1 in 83, and of the Tyne from Newcastle to its mouth of 1 in 75. Accordingly, a rate of enlargement comprised between 1 in 70 and 1 in 80 for the regulated or trained channel of the lower portion of a tidal river with a fairly level bed may be expected to give satisfactory results.

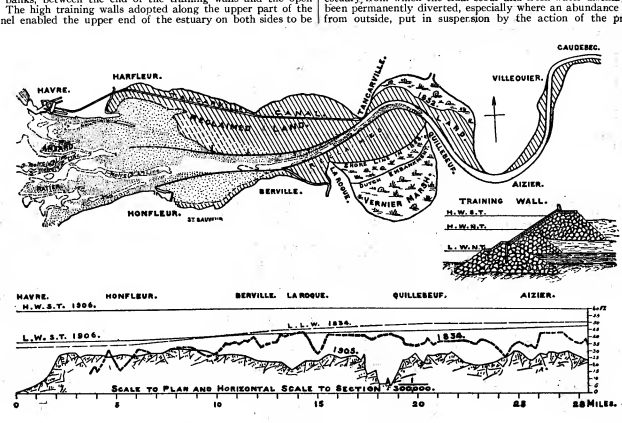
Works at the Outlet of Tidal Rivers.—Tidal rivers flowing straight into the sea, without expanding into an estuary, are subject to the obstruction of a bar formed by the heaping-up action of the waves and drift along the coast, especially when the fresh-water discharge is small; and the scour of the currents is generally concentrated and extended across the beach by parallel jetties for lowering the bar, as at the outlets of the Maas (figs. 11 and 12) and of the Nervion (figs. 19 and 20). In the latter case, however, the trained outlet was still liable to be obstructed by drift during north-westerly storms in the Bay of Biscay; and, except in the case of large rivers, the jetties have to be placed too close together, if the scour is to be adequate, to form an easily accessible entrance on an exposed coast. Accordingly, a harbour has been formed in the small bay into which the Nervion flows by two converging breakwaters, which provides a sheltered approach to the river and protects the outlet from drift (fig. 19), and a similar provision has been made at Sunderland for the mouth of the Wear; whilst the Tynemouth piers formed part of the original design for the improvement of the Tyne, under shelter of which the bar has been removed by dredging (fig. 17).

Training Works through Sandy Estuaries.—Many tidal rivers flow through bays, estuaries or arms of the sea before reaching the open sea, as, for instance, the Mersey through Liverpool Bay, the Tees through its enclosed bay, the Liffey through Dublin Bay, the Thames, the Ribble, the Dee, the Shannon, the Seine, the Scheldt, the Weser and the Elbe through their respective estuaries, the Yorkshire Ouse and Trent through the Humber estuary, the Garonne and Dordogne through the Gironde estuary, and the Clyde, the Tay, the Severn and the St Lawrence through friths or arms of the sea. These estuaries vary greatly in their tidal range, the distance inland of the ports to which they give access, and the facilities they offer for navigation. Some possess a very ample depth in their outer portion, though they generally become shallow towards their upper end; but dredging often suffices to remedy their deficiencies and to extend their deep-water channel. Thus the St Lawrence, which posseses an ample depth from the Atlantic up to Quebec, has been rendered accessible for seagoing vessels up to Montreal by a moderate amount of dredging; while dredging has been resorted to in parts of the Thames and Humber estuaries, and on the Elbe a little below Hamburg, to provide for the increasing draught of vessels; and the Mersey bar in Liverpool Bay, about 11 m. seawards of the actual mouth of the river, has been lowered by suction dredging from a depth of about 9 ft. down to about 27 ft. below low water of equinoctial spring tides, to admit Atlantic liners at any state of the tide.

Some estuaries, however, are so encumbered by sand banks that their rivers can only form shallow, shifting channels through them to the sea; and these channels require to be guided or fixed by longitudinal training walls, consisting of mounds of rubble stone, chalk, slag or fascines, in order to form sufficiently deep stable channels to be available for navigation. The difficulty in such works is to fix the wandering channel adequately, and to deepen it

sufficiently by the scour produced between the training walls, without placing these walls so close together and raising them so high as to check the tidal influx and produce accretion behind them, thereby materially reducing the volume of tidal water entering and flowing out of the estuary at each ebb. The high training works in the Dee estuary, carried out in the 18th century with the object of land reclamation, unduly narrowed the channel, and led it towards one side of the estuary; and though they effectually fixed the navigation channel, they produced very little increase in its depth, but caused a very large amount of sand to accumulate in the estuary beyond, owing to the great reduction in tidal volume by the reclamations, and diminished considerably the channel through the lower estuary in width and depth without checking its wanderings.[1] The training of the channel of the Ribble through its estuary below Preston, for improving its depth and rendering it stable, was begun in 1839, and has been gradually extended at intervals; but the works have not yet been carried out to deep water, and a shifting, shallow channel still exists through the sand banks, between the end of the training walls and the open sea. The high training walls adopted along the upper part of the channel enabled the upper end of the estuary on both sides to be reclaimed for a length of 4 m.; whilst the half-tide training walls below, placed unduly close together, have led to considerable accretion at the sides of the estuary and some extension of the sand banks seawards. Moreover, by fixing the channel near the northern shore they have enabled the landowners to carry out large reclamations on the southern foreshore. These works, however, besides fixing the navigable channel, have increased its depth, especially in the upper part, and augmented the tidal scour along it by lowering the low-water line; and the trained channel is further deepened by dredging. The training works in the Weser estuary have been confined to constructing a single low training wall at the upper end, which forms a trumpet-shaped outlet for the river below Bremerhaven, and to guiding the navigable channel by occasional low dikes at the side and closing minor channels, so as to concentrate the tidal scour and fresh-water discharge in it, whilst additional depth is obtained by dredging (fig. 21). A remarkable improvement has been effected in the navigable condition of the upper portion of the Seine estuary by training works, begun in 1848; for in place of a shallow, intricate channel through shifting sand banks, whose dangers were at times intensified by a *bore*, a stable deep channel has been provided down to about half-way between Berville and St Sauveur, rendering access easy to the river above at high tide (figs. 25 and 26). The channel, however, was made too narrow between Aizier and Berville and was subsequently enlarged, and large tracts of land were reclaimed in the upper estuary. The reduction in tidal capacity by the reclamations, together with the fixing and undue restriction in width of the channel, occasioned very large accretions at the back of the lower portions of the training walls and at the sides of the estuary beyond them, and an extension of the sand banks seawards. Moreover, the channel has always remained shallow and unstable beyond the ends of the training walls down to deep water near the mouth of the estuary.[2]

Conclusions about Training Works in Estuaries.—Experience has proved that training works through sandy estuaries, by stopping the wanderings of the navigable channel, produce an increase in its depth, and, consequently, in the tidal scour for maintaining it. This scour, however, being concentrated in the trained channel, is withdrawn from the sides of the estuary, which in its natural condition is stirred up periodically by the wandering channel; and, therefore, accretion takes place in the parts of the estuary, from which the tidal scour and fresh-water discharge have been permanently diverted, especially where an abundance of sand from outside, put in suspension by the action of the prevalent winds blowing into the estuary, is brought in by the flood-tide, as in the cases of the estuaries of the Dee, the Ribble and the Seine. This accretion reduces the tidal capacity of the estuary, and, producing a diminution in the tidal volume passing through the outlet, promotes the extension of the sand banks seawards, as indicated by the difference in the outer portions of the longitudinal sections of different dates of the Weser and Seine estuaries (figs. 22 and 26). To prevent as far as possible the reduction in tidal capacity, the training walls should not be raised more above low-water level than absolutely necessary to fix the channel; and the rate of enlargement of their width apart should not be less than 1 in 80 at the upper end, and should increase considerably towards the mouth of the estuary so as to form a trumpet-shaped outlet. The loss of scour in the channel resulting from this enlargement must be compensated for by dredging to attain the requisite depth. Training works partially carried out through an estuary have the advantage of reducing the length of shallow channel to be traversed between deep water and the entrance to the deepened river; but as these works produce no influence on the channel for any distance beyond their termination, a shallow, shifting channel is always found between the end of the trained channel and deep water. Accordingly, when training works are started at the head of a sandy estuary, provision should always be made in their design for their eventual



FIGS. 25 and 26.—Training Works in Sandy Estuary: River Seine.

prolongation to deep water at the mouth of the estuary, to ensure the formation of a stable, continuous, navigable channel. Experiments with a model, moulded to the configuration of the estuary under consideration and reproducing in miniature the tidal ebb and flow and fresh-water discharge over a bed of very fine sand, in which various lines of training walls can be successively inserted,[1] are capable in some cases of furnishing valuable indications of the respective effects and comparative merits of the different schemes proposed for works which have often evoked very conflicting opinions and have sometimes produced most unexpected results. (L. F. V.-H.)

RIVER-HOG, a sportsman's name for the African wild pigs of which the southern representative is known to the Boers as the bosch-vark (" bush-pig "). They constitute a genus, *Potamochoerus*, nearly allied to the typical pigs of the genus *Sus* (see SWINE), from which they are distinguishable by the presence in the nape of a long horny ridge below the eye; while they are further characterized by their thick coat of bristly and often brightly coloured hair, and by tufts of long bristles at the tips of the elongated and pointed ears. The southern *P. choeropotamus*, of southern and east Africa, is typically a greyish-brown animal, but one of its eastern representatives is orange-red. In north-east Africa occurs the allied *P. johnstoni*, while in Kordofan and Abyssinia this is in turn replaced by *P. hassama*. The most remarkable member of the group is, however, the red river-hog, *P. porcus*, which is a heavy, short-legged species remarkable for its bright red colour, the great length of the ear-tufts and the white rings round the eyes. It is a native of the great forest-tracts, extending from Senegambia, Liberia and Angola on the W., to Mombuttu in the E. Very nearly akin is the ordinary form of a small yellow-haired representative of the group (*P. larvatus*) in Madagascar, which evidently must have reached its present habitat from the mainland. (R. L.*)

RIVERINA, a large tract of pastoral country between the rivers Murray and Darling in New South Wales, Australia. It gives name to the see of an Anglican bishop who has his seat at Hay. The chief towns are Deniliquin, Hay, Moulamein, Oxley and Booligal.

RIVERS, EARL, an English title held in succession by the families of Woodville or Wydeville, Darcy and Savage. In 1299 John Rivers, or de Riparîis, was summoned to parliament as a baron, and his son John was similarly summoned by Edward II. The earldom was created for Sir Richard Woodville in 1466 and remained in this family until 1491. (For the three earls of his line see below.) As borne by the Woodvilles the title was not derived from the name of a place, but from an ancient family name, Redvers, or Reviers, members of this family, whose arms are quartered on the Rivers shield, having been sometime earls of Devon.

From 1626 to his death in 1640 the earldom was held by Thomas Darcy, Viscount Colchester, from whom it descended by special remainder to his grandson John (*c.* 1610–1654), the son of his daughter Elizabeth (d. 1651) by her marriage with Sir Thomas Savage (d. 1635), who was created Viscount Savage in 1626. John's son Thomas (*c.* 1626–1694) was the 3rd earl, and his grandson Richard the 4th earl (see below). The title became extinct when John, the 5th earl, died about 1735.

A new barony of Rivers, held by the family of Pitt and its later representative, that of Pitt-Rivers, was in existence from 1776 to 1880.

RIVERS, ANTHONY WOODVILLE, or WYDEVILLE, 2ND EARL (*c.* 1442–1483), statesman and patron of literature, and author of the first book printed on English soil, was born probably in 1442. He was the son of Richard de Wydeville and his wife, Jacquetta de Luxemburg, duchess of Bedford. His father was raised to the peerage in his son's infancy, and was made earl of Rivers in 1466. Anthony, who was knighted before he became of age, and fought at Towton in 1461, married the daughter of Lord Scales, and became a peer *jure uxoris* in 1462, two years after the death of that nobleman. Being lord of the Isle of Wight at the time, he was in 1467 appointed one of the ambassadors to treat with the duke of Burgundy, and he exalted his office by challenging Anthony, comte de la Roche, the bastard of Burgundy, to single fight in what was one of the most famous tournaments of the age (see the elaborate narrative in Bentley's *Excerpta Historica*, 176–182). In 1469 Anthony was promoted to be lieutenant of Calais and captain of the king's armada, while holding other honorary posts. His father and brother were beheaded after the battle of Edgecot, and he succeeded in August of that year to the earldom. He accompanied Edward in his temporary flight to the Continent, and on his return to England had a share in the victory of Barnet and Tewkesbury and defended London from the Lancastrians. In 1473 he became guardian and governor to the young prince of Wales, and for the next few years there was no man in England of greater responsibility or enjoying more considerable honours in the royal service. It is now that for the first time we become aware of Lord Rivers's literary occupations. His mother, the duchess, died in 1472, and his first wife in 1473; in 1475 and the following year he went on pilgrimage to the holy places of Italy; from this time forth there was a strong tincture of serious reflection thrown over his character; he was now, as we learn from Caxton, nominated " Defender and Director of the Siege Apostolic for the Pope in England." Caxton had in 1476 rented a shop in the Sanctuary at Westminster, and here had set up a printing-press. The first MS. which he undertook in London was one sent to him by " the noble and puissant lord, Lord Antone, Erle of Ryvyers," consisting of a translation " into right good and fayr Englysh " of Jean de Teonville's French version of a Latin work, " a gloryous litil mirror and book for good Christian people." In 1477 Caxton brought out this book, as *Dictes and Sayengis of the Philosophers*, and it is illustrious as the first production of an English printing-press. To this succeeded the *Moral Proverbs* of Christine de Pisan, in verse, in 1478, and a *Cordial*, in prose, in 1479. The original productions of Lord Rivers, and, in particular, his *Balades against the Seven Deadly Sins*, are lost. In 1478 a marriage was arranged between him and Margaret, sister of King James III. of Scotland, but it was mysteriously broken off. Rivers began to perceive that it was possible to rise too high for the safety of a subject, and he is now described to us as one who " conceiveth well the mutability and the unstableness of this life." After the death of Edward IV., he became the object of Richard III.'s peculiar animus, and was beheaded by his orders at Pontefract on the 25th of June 1483. He was succeeded by his brother Richard, the 3rd and last earl of the Wydeville family, who died in 1491. Lord Rivers is spoken of by Commines as " un très-gentil chevalier," and by Sir Thomas More as " a right honourable man, as valiant of hand as politic in counsel." His protection and encouragement of Caxton were of inestimable value to English literature, and in the preface to the *Dictes* the printer gives an account of his own relations with the statesman which illustrates the dignity and modesty of Lord Rivers in a very agreeable way. Rivers was one of the purest writers of English prose of his time.

" Memoirs of Anthony, Earl Rivers " are comprised in the *Historical Illustrations of the Reign of Edward the Fourth* (ed. W. H. B[lack]). (E. G.)

RIVERS, RICHARD SAVAGE, 4TH EARL (*c.* 1660–1712), was the second son of Thomas, 3rd earl; and after the death about 1680 of his elder brother Thomas, styled Viscount Colchester, he was designated by that title until he succeeded to the peerage. Early in life Richard Savage acquired notoriety by his dare-devilry and dissipation, and he was, too, one of the most conspicuous rakes in the society of the period. After becoming Lord Colchester on his brother's death he entered parliament as member for Wigan in 1681 and procured a commission in the Horseguards under Sarsfield in 1686. He was " the first nobleman and one of the first persons " who joined the prince of Orange on his landing in England, and he accompanied William to London. Obtaining promotion in the army, he served with distinction in Ireland and in the Netherlands, and was made major-general in 1693 and

[1] *Rivers and Canals*, 2nd ed. pp. 327–342, and plate 10.

lieutenant-general in 1702. In 1694 he succeeded his father as 4th Earl Rivers. He served abroad in 1702 under Marlborough, who formed a high opinion of his military capacity and who recommended him for the command of a force for an invasion of France in 1706. The expedition was eventually diverted to Portugal, and Rivers, finding himself superseded before anything was accomplished, returned to England, where Marlborough procured for him a command in the cavalry. The favour shown him by Marlborough did not deter Rivers from paying court to the Tories when it became evident that the Whig ascendancy was waning, and his appointment as constable of the Tower in 1710 on the recommendation of Harley and without Marlborough's knowledge was the first unmistakable intimation to the Whigs of their impending fall. Rivers now met with marked favour at court, being entrusted with a delicate mission to the elector of Hanover in 1710, which was followed by his appointment in 1711 as master-general of the ordnance, a post hitherto held by Marlborough himself. Swift, who was intimate with him, speaks of him as "an arrant knave"; but the dean may have been disappointed at being unmentioned in Rivers's will, for he made a fierce comment on the earl's bequests to his mistresses and his neglect of his friends. In June 1712 Rivers was promoted to the rank of general, and became commander-in-chief in England; he died a few weeks later, on the 18th of August 1712. He married in 1679 Penelope, daughter of Roger Downes, by whom he had a daughter Elizabeth, who married the 4th earl of Barrymore. He also left several illegitimate children, two of whom were by Anne, countess of Macclesfield. Rivers's intrigue with Lady Macclesfield was the cause of that lady's divorce from her husband in 1701. Richard Savage, the poet, claimed identity with Lady Macclesfield's son by Lord Rivers, but though his story was accepted by Dr Johnson and was very generally believed, the evidence in its support is faulty in several respects. As Rivers left no legitimate son the earldom passed on his death to his cousin, John Savage, grandson of the 2nd earl, and a priest in the Roman Catholic Church, on whose death, about 1735, all the family titles became extinct.

See William Coxe, *Memoirs of Marlborough* (3 vols., London, 1818); *Letters and Despatches of Marlborough, 1702–1712*, vol. v., edited by Sir G. Murray (5 vols., London, 1845); Gilbert Burnet, *History of his own Time* (6 vols., Oxford, 1833); F. W. Wyon, *History of Great Britain during the Reign of Queen Anne* (2 vols., London, 1876); G. E. C., *Complete Peerage*, vol. vi. (London, 1895).

RIVERS, RICHARD WOODVILLE, or WYDEVILLE, EARL (d. 1469), was a member of a family of small importance long settled at Grafton in Northamptonshire. His father, Richard Woodville, was a squire to Henry V., and afterwards the trusted servant of John of Bedford, in whose interest he was constable of the Tower during the troubles with Humphrey of Gloucester in 1425. The younger Richard Woodville was knighted by Henry VI. at Leicester in 1426. He served under Bedford in France, and after his master's death married his widow Jacquetta of Luxemburg. The mésalliance caused some scandal, but Woodville enjoyed the king's favour and continued to serve with honour in subordinate positions in France. He also distinguished himself at jousts in London (*Chronicles of London*, 146, 148). On the 9th of May 1448 Henry VI. created him Baron Rivers. His associations made him a strong Lancastrian. For some years he was lieutenant of Calais in Henry's interests. In 1459, when stationed at Sandwich to prevent a Yorkist landing, he was surprised by Sir John Dinham, and taken prisoner with his son Anthony to the earl of Warwick at Calais. He was, however, released in time to fight for Henry VI. at Towton. Early in the reign of Edward IV. Rivers recognized that the Lancastrian cause was lost and made his peace with the new king. The marriage of his eldest daughter, Elizabeth, widow of Sir John Grey of Groby, to Edward on the 1st of May 1464, secured the fortunes of his family. Rivers was appointed treasurer on the 4th of March 1466, and a little later created earl. Elizabeth found great alliances for her younger brothers and sisters, and the Woodville influence became all-powerful at court. The power of this new family was very distasteful to the old baronial party, and especially so to Warwick. Early in 1468 Rivers's estates were plundered by Warwick's partisans, and the open war of the following year was aimed to destroy the Woodvilles. After the king's defeat at Edgecot, Rivers and his second son, John, were taken prisoners at Chepstow and executed at Kenilworth on the 12th of August 1469. Rivers had a large family. His third son, Lionel (d. 1484), was bishop of Salisbury. All his daughters made great marriages: Catherine, the sixth, was wife of Henry Stafford, 2nd duke of Buckingham (*q.v.*).

See also some notices in *Calendars of State Papers, Venetian*, ed. Rawdon Browne. For modern accounts see Sir James Ramsay's *Lancaster and York* (1892), *The Political History of England*, vol. iv., by Professor C. Oman, and *The Complete Peerage*, by G. E. C[okayne]. For Earl Anthony's connexion with Caxton consult William Blades's *Life of Caxton* (1861–63). (C. L. K.)

RIVERSIDE, a city of southern California, U.S.A., and the county-seat of Riverside county, situated on the Santa Ana river, in the San Bernardino valley. Pop. (1890) 4683; (1900) 7973 (1525 foreign-born); (1910) 15,212. It is served by the Atchison, Topeka & Santa Fé, the Southern Pacific and the San Pedro, Los Angeles & Salt Lake railways. The city occupies a slope (about 800–1000 ft. above sea-level), rising toward the east from beautifully built and in a winter and health resort. In the Albert S. White Park there is a notable collection of cacti; and Huntington Park is high and rocky, is well planted with trees and has a finely shaded automobile drive. Magnolia Avenue, bordered with pepper-trees, is 10 m. long and 130 ft. wide; and Victoria Avenue is similarly parked and lined with semi-tropical trees. Riverside is the seat of an important (non-reservation) boarding-school for Indians, Sherman Institute (1903), which in 1908 had 699 students. Riverside is devoted to the cultivation of oranges, lemons and other subtropical fruits, and has a large trade in these products. It is in the centre of the finest orange district of the state; near Huntington Park is the state citrus experiment station (1906), with an experimental orchard of 20 acres. The cultivation of navel oranges was first introduced from Brazil into the United States at Riverside in 1873; the two original trees, protected by an iron railing, were still standing in 1909. The domestic water supply is obtained from artesian wells. In 1870 the site of the present city, then called Jurupa Rancho, the name of the old Spanish grant, was purchased by the Southern California Colony Association. The settlement was chartered in 1883 as a city, with limits including about 56 sq. m. Riverside county was not organized until ten years later. From 1895 there were no saloons in the city.

RIVES, WILLIAM CABELL (1793–1868), American political leader and diplomat, was born in Nelson county, Virginia, on the 4th of May 1793. He attended Hampden-Sidney and William and Mary colleges, was admitted to the bar, and practised in Nelson county (till 1821) and afterwards in Albemarle county. In politics a Democrat, he served in the state constitutional convention in 1816, in the Virginia House of Delegates in 1817–19 and in 1822, and in the Federal House of Representatives in 1823–29. From 1829 to 1832 he was minister to France; in 1833 he entered the United States Senate, but in the following year resigned. From 1836 to 1845 he again served in the Senate, and in 1849–53 he was again minister to France. In February 1861 he was a delegate to the Peace Conference in Washington; he opposed secession, but was loyal to his state when it seceded, and was one of its representatives in the Confederate Congress during the Civil War. He died at the country estate of Castle Hill, Albemarle county, Virginia, on the 25th of April 1868. Rives was the author of several books, the most important being his *Life and Times of James Madison* (3 vols., Boston, 1859–68), the completion of which was prevented by his death. He was the father of Alfred Landon Rives (1830–1903), an engineer of some prominence, whose daughter, Amélie Rives (1863–), became well known as a novelist, her best known book being *The*

Quick or the Dead? (1888); she married John A. Chanler in 1888, and after their divorce married in 1896 Prince Pierre Troubetzkoy of Russia.

RIVET (O. Fr. *rivet*, from *river*, to fix, fasten together, of unknown origin; Skeat compares Icel. *rifa*, to stitch together), a metal pin or bolt used to fasten metal plates together. A rivet, made of wrought iron, copper or other malleable substance, is usually made with a head at one end, the other end being hammered out after passing through the plates so as to keep them closely fastened together. A "bolt" differs from a rivet in that one or both ends have screw-threads to hold a nut (see SHIPBUILDING).

RIVIERA, the narrow belt of coast which lies between the mountains and the sea all round the Gulf of Genoa in the north of Italy, extending from Nice on the W. to Spezia on the E. It is usually spoken of as Riviera di Ponente ("the coast of the setting sun"), the portion between Nice and the city of Genoa; and as Riviera di Levante ("the coast of the rising sun"), the portion from Genoa to Spezia. All this district, being open to the S. and sheltered from the N. and E. winds, enjoys a remarkably mild climate (winter mean, about 49° Fahr.); so much so that the vegetation in many places partakes of a subtropical character (*e.g.* the pomegranate, agave, prickly pear, date, palm and banana). Large numbers of flowers, especially roses, violets, hyacinths, &c., are grown near Nice, Mentone, Bordighera and other towns, and sent to the London and Paris markets. Bordighera is particularly noted for its noble groves of date-palms, one of the few places in Europe where these trees grow. The uncommon mildness of the climate, conjoined with the natural beauty of the coast scenery,—the steep sea-crags, the ruined towers and the range of the Maritime Alps,—attracts thousands of invalids and convalescents to spend the winter in the chain of towns and villages which stretch from the one end of the Riviera to the other, while these resorts are frequented for sea-bathing in summer by the Italians. Proceeding from W. to E. the following are the places to which visitors principally resort: Nice, Monaco (an independent principality), Monte Carlo, Mentone (the last town on the French Riviera), Ventimiglia, Bordighera, Ospedaletti, San Remo, Porto Maurizio, Oneglia, Diano Marina, Alassio, Arenzano, Pegli (in the Riviera di Ponente), and Nervi, Santa Margherita, Rapallo, Chiavari, Sestri Levante, Levanto, Spezia, and San Terenzo (Lerici) in the Riviera di Levante. The Riviera labours, however, under the grave drawback of being liable to earthquakes. In the 19th century there were four such visitations, in 1818, 1831, 1854 and 1887, which especially affected the western Riviera. A railway runs close along the shore all through the Riviera, the distance from Nice to Genoa being 116 m., and the distance from Genoa to Spezia 56 m. In the latter stretch the line burrows through the many projecting headlands by means of more than eighty tunnels. The pearl of the eastern Riviera is the stretch (6 to 7 m.) between Rapallo and Chiavari. Lord Byron and Shelley both lived and wrote on the shores of the Gulf of Spezia, and Dickens wrote *The Chimes* at Genoa.

RIVIERE, BRITON (1840–), English artist, was born in London on the 14th of August 1840. His father, William Riviere, was for some years drawing-master at Cheltenham College, and afterwards an art teacher at Oxford. He was educated at Cheltenham College and at Oxford, where he took his degree in 1867. For his art training he was indebted almost entirely to his father, and early in life made for himself a place of importance among the artists of his time. His first pictures appeared at the British Institution, and in 1857 he exhibited three works at the Royal Academy, but it was not until 1863 that he became a regular contributor to the Academy exhibitions. In that year he was represented by "The Eve of the Spanish Armada," and in 1864 by a "Romeo and Juliet." Subjects of this kind did not, however, attract him long, for in 1865 he began, with a picture of a "Sleeping Deerhound," that series of paintings of animal-subjects which has since occupied him almost exclusively. Among the most memorable of his productions are: "The Poacher's Nurse" (1866), "Circe" (1871), "Daniel" (1872), "The Last of the Garrison" (1875), "Lazarus" (1877), "Persepolis" (1878), "In Manus Tuas, Domine" (1879), "The Magician's Doorway" (1832), "Vae Victis" (1885), "Rizpah" (1886), "An Old-World Wanderer" (1887), "Of a Fool and his Folly there is no End" (1889), "A Mighty Hunter before the Lord" (1891), "The King's Libation" (1893), "Beyond Man's Footsteps" (1894), now in the National Gallery of British Art; "Phoebus Apollo" (1895); "Aggravation" (1896), "St George" (1900), and "To the Hills" (1901). He has also painted portraits; and at the outset of his career made some mark as an illustrator, beginning with *Punch*. He was elected an Associate of the Royal Academy in 1878, and R.A. in 1881, and received the degree of D.C.L. at Oxford in 1891.

See Sir Walter Armstrong, "Briton Riviere, R.A.; His Life and Work," *Art Annual* (1891).

RIVINGTON, CHARLES (1688–1742), British publisher, was born at Chesterfield, Derbyshire, in 1688. Coming to London as apprentice to a bookseller, he took over in 1711 the publishing business of Richard Chiswell (1639–1711), and, at the sign of the Bible and the Crown in Paternoster Row, he carried on a business almost entirely connected with theological and educational literature. He also published one of Whitefield's earliest works, and brought out an edition of the *Imitation of Christ*. In 1730 Rivington founded the company of booksellers who called themselves the "New Conger," in rivalry with the older association, the "Conger," dating from about 1700. In 1741 he published the first volume of Richardson's *Pamela*. Charles Rivington died on the 22nd of February 1742, and was succeeded by his two sons, John (1720–1792) and James (1724–1802). James emigrated to America, and pursued his trade in New York (see NEWSPAPERS, *U.S.A.*); John carried on the business on the lines marked out by his father, and was the great Church of England publisher of the day. In 1760 he was appointed publisher to the Society for Promoting Christian Knowledge, and the firm retained the agency for over seventy years. Having admitted his sons Francis (1745–1822) and Charles (1754–1831) into partnership he undertook for the "New Conger" Association the issue of a standard edition of the works of Shakespeare, Milton, Locke and other British classics; also Cruden's *Concordance*. John Rivington died on the 16th of January 1792. In 1810 John (1779–1841), the eldest son of Francis, was admitted a partner. In 1827 George (1801–1858) and Francis (1805–1885), sons of Charles Rivington, joined the firm. Rivington contracted further ties with the High Church party by the publication (1833, &c.) of *Tracts for the Times*. John Rivington died on the 21st of November 1841, his son, John Rivington (1812–1886) having been admitted a partner in 1836. George Rivington died in 1858; and in 1859 Francis Rivington retired, leaving the conduct of affairs in the hands of John Rivington and his own sons, Francis Bransard (b. 1834) and Septimus (b. 1846). In 1890 the business was sold to Messrs Longmans (*q.v.*). A business of the same character was, however, carried on from 1889 to 1893 by Mr Septimus Rivington and Mr John Guthrie Percival, as Percival & Co. This was changed in 1893 to Rivington, Percival & Co.; and in 1897 the firm revived its earlier title of Rivington & Co., maintaining its reputation for educational works and its connexion with the Moderate and High Church party.

See *The House of Rivington*, by Septimus Rivington (1894); also the *Publishers' Circular* (15th January 1885, 2nd June 1890).

RIVOLI VERONESE, a village of Venetia, Italy, in the province of Verona, on a hill on the right bank of the Adige, 13 m. N.W. of Verona, 617 ft. above sea-level. Pop. (1901) 1340. It is celebrated as the scene of the battle in which, on the 15th of January 1797, Napoleon inflicted a decisive defeat upon the Austrians commanded by Josef Alvintzi, Baron von Barberek (1735–1810) (see FRENCH REVOLUTIONARY WARS). A famous street in Paris (Rue de Rivoli) commemorates

the victory, and under the empire Marshal Masséna received the title of duke of Rivoli. The strong positions around Rivoli, which command the approaches from Tirol and the upper Adige into the Italian plain, have always been celebrated in military history as a formidable obstacle, and Charles V. and Prince Eugene of Savoy preferred to turn them by difficult mountain paths instead of attacking them directly. Minor engagements, such as rearguard actions and holding attacks, have consequently often taken place about them, notably in the campaign of 1796–97. An engagement of this character was fought here in 1848 between the Austrian and the Piedmontese troops.

RIXDORF, a town of Germany, lying immediately south of Berlin, of which it practically forms a suburb, though retaining its own civil administration. Pop. (1880) 18,720; (1895) 59,495; (1905) 153,659. It is connected with the metropolis by a railway (Ring-bahn) and by an electric tramway. It contains no public buildings of any interest, and is almost entirely occupied by a large industrial and artisan population, engaged in the manufacture of linoleum, furniture, cloth, pianos, beer, soap, &c.

Rixdorf is chiefly interesting as a foundation of Moravian Brethren from Bohemia, who settled here in 1737 under the protection of King Frederick William I. German Rixdorf, which is now united with Bohemian Rixdorf, was a much more ancient place, and appears as Richardsdorf in 1630 and as Riegenstorp in 1435. Before 1435 it belonged to the order of the Knights of St John.

RIZZIO, or **RICCIO, DAVID** (*c.* 1533–1566), secretary of Mary (*q.v.*), queen of Scots, was a native of Turin, and came to Scotland in 1561 in the train of the Piedmontese ambassador. The queen wanted a bass singer, and he entered her service as a musician, becoming also her *valet de chambre*, and in 1564 private foreign secretary. After her marriage to Darnley in 1565 his influence with Mary became paramount, and he gave himself great airs and affected considerable state, practically superseding Maitland of Lethington as secretary of state. His elevation aroused the active hostility of Darnley and the other nobles, and he was suspected of being the queen's lover. On the evening of the 9th of March 1566, the earls of Morton and Lindsay, with armed followers, entered Mary's supper chamber at Holyrood, seized Rizzio, hacked him to death with daggers, and threw his body into the courtyard.

See Ruthven's *Narrative of Riccio's Murder* (1836); and the articles on MARY, QUEEN OF SCOTS, and allied biographies.

ROACH (*Leuciscus rutilus*), a small fish belonging to the Cyprinid family, the genus *Leuciscus* having many representatives in Europe, in which the rudd, the chub and the dace are included. It may attain a length of over 12 in., but a roach of 2 lb is an unusually large one. It is good sport for anglers, but is not esteemed for the table. The general colour is silvery, with reddish fins. It does not occur in Ireland. In America, the "golden shiner" minnow (*Abramis chrysoleucus*) is sometimes called a roach.

See Greville Fennell's *Book of the Roach*, 1870.

ROADS AND STREETS. These words embrace the two divisions into which the lines of communication made by man for vehicular and pedestrian traffic between different places may be roughly classified. In current usage "road" is applied as a general term for all broad made ways from place to place, whether with separate side-paths for foot-passengers or not, while "street" is confined to the roads through towns, villages and other inhabited places, more or less lined by houses and other buildings on either side. The present article is confined to the methods adopted in making roads, from the first great road-makers, the Romans, down to modern times. The roadways of times anterior to the Romans, at least in Europe, were merely the tracks worn by the feet of pedestrians and animals, and the wheels of vehicular traffic.

Etymologically considered, "road" in its current usage is late in its appearance. The first quotation in the *New English Dictionary* is from Shakespeare (*1 Henry IV.* 2, i. 16). The true O.E. word was *weg*, way, common to Teut. languages, and probably allied to Lat. *via*. The O.E. *rād* meant the act of riding, and is formed from *ridan*, to ride, and is thus used of a journey on horseback, and in compounds of a track or course, cf. *swanrād*, the swan's track, a poetic word for the sea- or *streām-rād*, course of a stream, *hwēolrad*, wheel-track, &c. A special use of the word, occurring as early as the Anglo-Saxon *Chron.* c. 900, was for a hostile foray, an "inroad," a "raid," which is the N. Eng. doublet of "road," and has superseded it in general use. Another use, which still survives, and shows the origin, is that of a space of water where ships may "ride at anchor in security from stress of weather, a roadstead." "Street" (O.E. *strēt*) represents the Lat. *strata via*, paved way (from *sternere*, to strew, pave). It is one of the few words adopted in O.E. from the Romans.

The earliest roads about which anything definite is known, so far as construction is concerned, are those of ancient Rome, one of the oldest of which and the most celebrated for the grandeur of its works—the Appian Way—was commenced in 312 B.C. Roman roads are remarkable for preserving a straight course from point to point regardless of obstacles which might have been easily avoided. They appear to have been often laid out in a line with some prominent landmark, and their general straightness is perhaps due to convenience in setting them out. In solidity of construction they have never been excelled, and many of them still remain, often forming the foundation of a more modern road, and in some instances constituting the road surface now used. It is consequently possible, with the help of allusions of ancient writers, to follow the ideal mode of construction, though this was not always adopted. Two parallel trenches were first cut to mark the breadth of the road; loose earth was removed until a solid foundation was reached; and it was replaced by proper material consolidated by ramming, or other means were taken to form a solid foundation for the body of the road. This appears often to have been composed of four layers, generally of local materials, though sometimes they were brought from considerable distances. The lowest layer consisted of two or three courses of flat stones, or, when these were not obtainable, of other stones, generally laid in mortar; the second layer was composed of rubble masonry of smaller stones, or a coarse concrete; the third of a finer concrete, on which was laid a pavement of polygonal blocks of hard stone jointed with the greatest nicety. The four layers are found to be often 3 ft. or more in thickness, but the lower ones were dispensed with on rock, on which the paving stones were sometimes laid almost directly. The paved part of a great road appears to have been about 14 ft. wide, and on either side, and separated from it by raised stone edgings, were unpaved sideways, each of half the width of the paved road. Where, as on many roads, the surface was not paved, it was made of hard concrete, or pebbles or flints set in mortar. Sometimes clay and marl were used instead of mortar, and it would seem that where inferior materials were used the road was made higher above the ground and rounder in cross section. Streets were paved with large polygonal blocks laid as above described, and footways of rectangular slabs. Specimens are still to be seen in Rome and Pompeii, while in Britain many of the roads were of hard gravel or had a cobbled surface. There are no traces of Roman influence in the later roads in England, but in France the Roman method appears to have been followed to some extent when new roads were constructed about the beginning of the 18th century. A foundation of stones on the flat was laid, and over that two layers of considerable thickness, of larger and smaller stones, bordered by large stones on edge, which appeared on the surface of the road. In 1764 Trésaguet set the foundation-stones on edge and reduced the thickness of the upper layers, and his method was generally followed until the influence of John Loudon McAdam (1756–1836) began to be felt. A French chaussée with accotements still retains some resemblance to the old Roman roads.

Roman roads.

The almost incredibly bad state of the roads in England towards the latter part of the 17th century appears from the accounts cited by Macaulay (*Hist.* c. iii.). It was due chiefly to the state of the law, which compelled each parish to maintain its own roads by statute labour, but the establishment of turnpike trusts and the maintenance of roads by tolls do not appear to have effected any great improvement. At the time of Arthur Young's six months' tour in 1770 the roads would seem to have been almost as bad as ever, and it is doubtful if there was much improvement up to the beginning of the 19th century. The turnpike roads were generally managed by ignorant and incompetent men until Telford and McAdam brought scientific principles and regular system to their construction and repair. The name of Telford is associated with a pitched foundation, which he did not always use, but which closely resembled that which had been long in use in France, and the name of McAdam often characterizes roads on which all his precepts are disregarded. Both insisted on thorough drainage and on the use of carefully prepared materials, and adopted a uniform cross section of moderate curvature instead of the exaggerated roundness given before; but, while Telford paid particular attention to a foundation for the broken stone, McAdam disregarded it, contending that the subsoil, however bad, would carry any weight if made dry by drainage and kept dry by an impervious covering. McAdam was engaged more with the repair of old roads than with the construction of new ones, and, though it is not possible to agree with all his doctrines, the improvement which he introduced in road management and maintenance was great and lasting.

English roads, 18th century.

Construction of Roads.—A road should be as short as possible between two points to be connected, but straightness must often be sacrificed to avoid difficulties and expense and to secure good gradients. The latter should be as easy as practicable, having regard to the country to be traversed, and it is desirable that there should be a ruling gradient than which none should be steeper. On the level macadamized road in ordinary repair the force which the horse has to put forth to draw a load may be taken as one-thirtieth of the load. But in going uphill the horse has also to lift the load, and the additional force to be put forth on this account is very nearly equal to the load drawn, divided by the rate of gradient. Thus on a gradient of 1 in 30 the force spent in lifting is one-thirtieth of the load, and in ascending a horse has to exert twice the force required to draw the load on a level. In descending, on the other hand, on such a gradient, the vehicle, when once started, would just move of itself without pressing on the horse. A horse can without difficulty exert twice his usual force for a time, and can therefore ascend gradients of 1 in 30 on a macadamized surface without sensible diminution of speed, and can trot freely down them. These considerations have led to 1 in 30 being generally considered as the ruling gradient to be aimed at on first-class roads, though 1 in 40 has been advocated. Telford adopted 1 in 30 as the ruling gradient on the Holyhead road through North Wales, and there are only two gradients steeper, in places where they were unavoidable. All unnecessary rises and falls should be avoided, but a dead level is unfavourable for drainage, and on this account 1 in 100 to 1 in 150 is the flattest gradient that is desirable. Such slight rises and falls are probably rather favourable than otherwise to ease of draught by horses.

Gradient.

In transverse section, roads in the United Kingdom generally consist of a carriage-way, with spaces on each side, on one or both of which there may be a footpath, and fences and ditches. The width of the carriage-way may be from 15 ft., which allows of the easy passage of two vehicles, to 30 or 50 ft. for roads of importance near towns. The side spaces may be from 4 or 5 to 8 or 10 ft. wide; wide sides give the sun and air access to the road, and tend to keep it dry, and also afford space for the deposit of road materials and scrapings. In cuttings or on embankments the transverse section has of course to be modified. The road surface should have just enough convexity to throw the wet off freely, and a very moderate amount is sufficient when a good surface is maintained. On a too convex road the traffic keeps to the middle, and wears ruts which retain the water, so that the surface is not so dry as with a flatter section which allows the traffic to distribute itself over the whole width. Telford used a cross section differing slightly from an arc of a circle in being more convex in the middle than at the sides. J. Walker recommended two straight lines joined in the middle of the road by a curve, and inclined about 1 in 24 towards the sides, the objection to which is that the flat sides are liable to wear hollow. On the whole a curve of the form of a flat ellipse is the best; the rise in the curve from the sides to the centre need not exceed one-fortieth of the width, and one-sixtieth is generally enough on well-kept roads. It is generally best to obtain the requisite convexity by rounding the formation surface or seat of the road and giving a uniform thickness to the coating of stone, but often, especially in country roads where the traffic is not very heavy and keeps mainly to the centre, the formation is made level and the convexity is obtained by using more road material at the centre than the sides. When there is not a kerb there should be a "shouldering" of sods and earth on each side to keep the road materials in place, and to form with the finished surface the water tables or side channels in which the surface drainage is collected, to be conveyed by outlets at frequent intervals to the side ditches. The outlets are open cuts through the sides or drains beneath the footpaths. The side ditches should be deep enough thoroughly to drain the foundation of the road, and cross or mitre drains under the road communicating with the side ditches may be required in wet soil. A thorough drainage of the subsoil is of the greatest importance, and it is economical in the end to go to considerable expense to secure it. In a cutting, or where there are no side ditches, the surface water may be taken off by gratings and under drains beneath the side channels.

Cross section.

Macadam Roads.—The thickness to be given to a road made altogether of broken stone will depend on the traffic it is intended for. On a good well-drained soil a thickness of 6 in. will make an excellent road for ordinary traffic, and McAdam's opinion that 10 in. of well-consolidated material was sufficient to carry the heaviest traffic on any substratum if properly drained has proved to be generally correct. In a new road the loss of thickness during consolidation must be allowed for, and the materials should be laid about one-half thicker than the coating is intended to be. When the materials are not rolled, a thickness of 3 to 6 in. should be laid first, and when that has partly consolidated under the traffic other coats may be added to make up the full thickness. There is great wear and waste of the materials in consolidating if they are laid too thickly at once. Inferior material is sometimes used in the lower part of the road coating, especially when the surface is to be of granite or other hard expensive stone. Thus flints or gravel may be used for the lower 5 or 6 in. of a road to be coated with 3 or 4 in. of granite. Telford covered the broken stone of new roads with $1\frac{1}{2}$ in. of gravel to act as a binding material. McAdam absolutely interdicted the use of any binding material, leaving the broken stone to work in and unite by its own angles under the traffic.

If the ideas of the inventor are strictly followed, macadam, when the fine network of joints is thinly masked with hardened mud worn from the stone, comes near to a perfect surface. But stones that will pass through a ring of a given size may be twice as much in length, and unless their form is about that of a cube not exceeding $1\frac{1}{2}$ in. on its longest side, they cannot be rammed or rolled into the regular mosaic characteristic of the true macadam. The best modern roads are of hand-broken stone dressed slightly on the surface with stone chips, while the mass of the road-metal is kept free from any kind of binding. Some roadmakers, however, have found the large irregularly shaped stones from the machine so difficult to consolidate that they have had to reconsider the question of binding. The engineer of Central Park, New York, found that, with the greatest care and attention to rolling, such stones would not

consolidate properly without admixture; indeed they became more intractable the more they were abraded by rolling. G. F. Deacon of Liverpool advocated a binding composed of large chips of trap rock or else of siliceous gravel from the size of three-quarters of an inch down to that of a pin's head, together with about one-fourth part of macadam sweepings obtained in wet weather. This will enable the roller to consolidate the road-metal in a third of the time required for broken stone alone. The harder materials here suggested differ essentially from the sand and dirt formerly used for binding, since they fill up all the vacant spaces and cannot be washed down.

A new road is preferably finished by rolling, since in that way the materials are consolidated with less waste, and wear and tear of vehicles is saved. A 15-ton steam-roller, 7 ft. wide, giving upwards of 2 tons weight per foot can thoroughly consolidate 1000 to 2000 sq. yds. of newly laid materials per day.

A pitched foundation, as used by Telford, consists of flat stones set on edge in courses across the road with the broader edges downwards. All inequalities must be knocked off, and small stones and chips must be firmly pinned into the interstices with a hammer, so as to form a regular convex surface with every stone fixed firmly in place. A foundation of cement concrete 6 in. thick was used by Sir J. Macneill on the Highgate Archway (London) road on a bad clay bottom, and common lime concrete was subsequently used elsewhere. A bed of lias lime concrete 12 in. thick was laid as a foundation in Southwark Street and on the Thames Embankment, but it is too expensive for a macadamized road under ordinary circumstances. Foundations of large and rough hard-core should be rolled down to a surface close enough to keep the finer pieces of road-metal from dropping down, so as to create hollows which, though they may escape the roller, will be detected by the laden wheel and by the pounding of the heavy hoof. But there is no foundation equal to sand, which has the property of spreading pressure over an enlarged area. A 12-in. bed of sand rolled down to 8 in. has been recommended, but military engineers have found that a layer of so little as 3 or 4 in. is sufficient as a foundation for macadam in very bad ground that has been rolled, or on an embankment that has had time to settle.

Tar Macadam.—Broken stone mixed with some bituminous composition has been found very suitable for suburban roads, and for towns where the nature of the traffic requires smooth roadways reasonably free from noise and dust. In its simplest form, tar macadam is made from a good hard limestone broken into the usual sizes, the fine chips being used for top-dressing. In a shed a large hearth is formed of stone flagging, under which the flues of a furnace are constructed, and upon the hearth the broken stone is spread in a layer just as thick as the heat may be able to penetrate, to dry off the moisture and make the stones distinctly hot. The load of an ordinary barrow is tipped on an iron plate and gas tar is poured over it (from 8 to 12 gals. per cubic yard), while a couple of men with shovels turn it over carefully as they would turn concrete. No more tar should be used than is required completely to blacken the whole surface of every stone; and when this has been done, the stone can be thrown upon the heap, where it may be kept for one or two months, under cover, to allow the volatile oils to evaporate. Fine siftings are treated in the same way. When it has been properly seasoned, the mass should assume a greenish lustre; and when cut into by a shovel, the particles will cling together and creep down slowly so that the heap is said to be "alive." In that state it may be used. The tar ought to be boiled, and if too thin, a little pitch may be added to it, though not enough to make the heap consolidate. A mixture of tar with pitch and creosote oil is used by more precise makers, one formula being 12 gals. tar, ½ cwt. pitch and 2 gals. creosote oil to a ton of stone. But these ingredients differ considerably in their chemical composition, and the proportions have to be varied according to experience. Moreover, as regards the tar and pitch used in the manufacture of pavements, the varieties that come directly from a vegetable source are liable to melt in hot and to become brittle in cold weather; coal tar is only moderately proof against these extremes.

Tar macadam must be put down in dry weather. If the material seems too dry, hot tar may be applied as before, but only as an expedient, and with great economy, so that the pavement may not soften in the sun. Upon a well-rolled foundation of hard material a layer of the coarser macadam should be put and rolled, then a layer of the smaller grade. For a road of light traffic a coat of the fine siftings may be put down and heavily rolled to a finished surface. For a road of heavier traffic the second coat should be dressed before rolling with tarred stone of a gauge of three-quarters of an inch to an inch and a quarter, and rolled first with a roller of not more than 10 or 12 cwt., then with one of 30 cwt. After the traffic has been turned on the road for a few days it should again be rolled as heavily as may be necessary to restore any parts that have been disturbed. But such roads are often consolidated by steam-rollers of 10 or 15 tons. For refacing an old road the prongs attached to a steam-roller will easily lift the old layer. Small depressions may be well tarred and levelled up with fine stuff, and the whole surface may be dressed every three years with tar and a fresh coat of fine chips. If the surface of the road is irregular, water will hang upon it, and frost may cause it to become slippery. The lack of affinity between granite and bitumen prevents the use of tar macadam upon roads of heavy traffic.

Concrete Macadam.—Rocks like granite and syenite may be used in combination with Portland cement. The ingredients are mixed in about the proportion of four parts of broken stone that has first been well wetted, one and a quarter or two parts of clean sharp sand, and one of cement put on in two layers, the second being rolled by hand to the required shape and to a good surface. It should remain for two or three weeks to dry and set. Want of elasticity may be urged against concrete macadam, and it is productive of dust, but in some cases it has proved satisfactory.

Gravel Roads.—Smooth rounded gravel is unsuitable for roads unless a large proportion of it is broken, and about an eighth part of ferruginous clay added for binding. Rough pit gravel that will consolidate under the roller may be applied in two or more layers, but each must be of similar composition, or the smaller stuff will work downwards. A gravel road should be always under inspection, and repairs should be done without delay. A track for equestrian exercise should be made of hoggin or fine gravel, that will remain soft when raked or harrowed and watered. It should be well drained. A foundation of rough hard core will let the hoggin pass down into it, so that the hard core will appear at the surface. The best material is rough chalk sufficiently rolled to stop the gravel while draining off the surface water.

Stone Pavements.—Early pitched roadways consisted of pebbles or rounded boulders ("cobblestones") bedded in the natural surface or in sand or gravel. The next step in advance was to employ roughly squared blocks; but the wide and irregular joints admitted the water to the subsoil, and the mud worked up and the stones sank irregularly under the traffic. Telford, who was called upon to report on the street pavements of the parish of Hanover Square in 1824, saw the necessity of cutting off all connexion between the subsoil and the paving stones. He recommended a bed of about 6 in. of clean river ballast, rendered compact by being travelled upon for some time before the paving was laid, but he subsequently considered that nothing short of 12 in. of broken stone, put on in layers 4 in. thick and completely consolidated by carriages passing over them, would answer the purpose. He recommended paving stones of considerable depth and of from 4½ to 6 or 7½ in. in breadth for the greatest thoroughfares, and he pointed out the importance of working the stones flat on the face and square on all sides, so as to joint close and preserve the bed or base as nearly as possible of the same size as the face, and of carefully placing together in the same course stones of equal

breadth. Many pavements thus laid with stones of considerable breadth still remain, but experience proved that it was a mistake to suppose that broad stones having a larger base would support better the weight and shocks of heavy traffic; on the contrary, a wide stone has a tendency to rock on its bed, and also to wear round on the top and become slippery. To obtain an evener surface and a better foothold for the horses the stones were reduced in width, and in 1840 a granite pavement was laid by Walker on Blackfriars Bridge, which may be considered the first of modern set pavements. The stones were 3 in. broad and 9 deep; they were laid on a bed of concrete 1 ft. thick and were jointed with mortar. The reduction of breadth to about 3 in. was generally followed, but it was some time before a concrete foundation was employed to any great extent, the frequent breaking up to which streets are subject having prevented it. In London a foundation of broken stone has been continued in some thoroughfares, the sets being evenly bedded in gravel upon it and rammed with a heavy wooden rammer. Hard core—a mixture of broken stone, clinker, brick rubbish and old building materials—has also been largely used to form a foundation. In the northern towns of England cinders have been employed, and where the traffic is exceptionally heavy a pitched foundation of stones on edge has been laid when the sets were not paved upon an old macadamized surface. The concrete for a foundation to a paved street should be made with the best Portland cement, thoroughly mixed in proper proportions with the sand and gravel or other materials used, water being added as sparingly as possible. A thickness of 6 in. of well-made cement concrete is sufficient for the heaviest traffic, and it can be cut out in slabs for pipe-laying or repairs and can be relaid and cemented in its place. To obtain the best result a new foundation should not be paved upon for a week. A foundation of bituminous concrete is sometimes used where only a thin bed can be laid, in consequence of there being an old foundation which it is undesirable to disturb. It is made by pouring a composition of coal-tar, pitch and creasote oil while hot over broken stone levelled and rolled to the proper form, and then spreading a thin layer of smaller broken stone over the surface and rolling it in. It has the advantage that it can be paved upon a few hours after it has been laid.

The best materials for pavement sets are the hard igneous and metamorphic rocks, though millstone grit and other hard sedimentary rocks of the same nature are used when the traffic is comparatively light. Excessively hard stone which wears smooth and slippery is objectionable in spite of its durability.

Joints simply filled in with gravel are of course pervious to water, and a grout of lime or cement does not make a permanently watertight joint, as it becomes disintegrated under the vibration of the traffic. Grouted joints, however, make a good pavement when there is a foundation of concrete or broken stone or hard core. Where there is not a regular foundation imperviousness in the joints is of great importance. In some of the Lancashire towns the joints have for many years past been made by first filling them with clean gravel, well shaken in by ramming, and then pouring in a composition of coal-tar, pitch and creasote oil, which is allowed to percolate and fill up the interstices, the pavement being finished by covering it with small gravel. Joints so formed are impervious to wet and have a certain amount of elasticity; the foundation is kept dry; and the pavement with bituminous grout of this kind keeps its form well for many years. The objection is made that in hot weather the composition runs from the joints and makes the streets unpleasant for foot-passengers.

A pavement consisting of broad, smooth, well-jointed blocks of granite for the wheel tracks, and pitching between for the horse track, was laid by Walker in Commercial Road (London) for the heavy traffic to the West India Docks in 1825, and similar pavements have been successfully used elsewhere, principally for heavy traffic, in streets only wide enough for one vehicle. In Milan, Turin and other towns of northern Italy tramways of the same sort are extensively used for the ordinary street traffic. The tractive force required is small, while the foothold on the horse track is good; but the tramstones are slippery for horses to pass over. The rigidity of the roadway renders it more suitable for slow heavy traffic than for light quick vehicles, and the improvement in other pavements has limited the application of this one in ordinary streets.

Brick Paving.—Since about 1885 brick as a paving for carriage-ways has been adopted to a considerable extent, chiefly in the form of shale bricks, in American cities. The clay is a hydrated silicate of alumina, containing about 24% of alumina with 15% of iron, lime, soda, potash and magnesia. Lime is injurious, but alkalis to the extent of 3% are needed to ensure a slight degree of vitrification. Various tests are used to determine their liability to absorb moisture and to be abraded. That for abrasion is made by rolling half-bricks in an iron barrel or rattler in company with pieces of cast-iron for a given time, and noting the effect on the surfaces, but particularly on the angles, which should be tough enough to resist chipping. Comparisons are also made with test pieces of granite that are mixed with the bricks. To guard against chipping, the best-made bricks are pressed over again, and the upper angles rounded to a radius of three-eighths of an inch. Upon a foundation of concrete or well-rolled ballast a cushion or bed of coarse sand from half an inch to 3 in. thick is laid, and on this the bricks are set. They are then rolled till level, or are heavily rammed, a plank being interposed between the bricks and the rammer. No channel-courses are used. Pitch is poured in at the joints, but by no means on the surface, as that would make them slippery. Brick roadways have stood well under hard wear for fourteen years. Although in the United Kingdom bricks are produced unequalled for hardness and finish, no serious attempt has been made to introduce a tough brick for roadways that will neither chip nor wear smoothly. In various experiments with bricks that seemed most suitable they stood hard traffic for about a year. Clay of absolutely uniform character, and kilns that will ensure perfect equality in firing, are requisite. Slag bricks, made to interlock in the form of a double hexagon, the surface being grooved to a small pattern, have stood good tests for wear and foothold on a perfectly level surface. Many attempts have been made to use compositions, into which asphalt or cement usually enters, for making blocks or slabs, square or hexagonal, that can be laid down on a concrete foundation. A mosaic of macadam set in an iron frame is fixed by running molten slag into the back of the block. Small square pieces of oak are formed into blocks, end-grain upwards. Staffordshire blue bricks, made with holes to hold wooden plugs, have been used with some success. Broad blocks not firmly fixed down usually become loose and tilt when subjected to traffic.

Asphalt Paving.—Asphalt was first used for street paving in Paris in 1854. It was introduced in London in 1869, when Threadneedle Street was paved by the Val de Travers Asphalt Company, and since then it has been extensively used for paving both streets and footways. The material is a hard limestone impregnated with bitumen in the proportion of from 6 to 8% in the Seyssel rock, and from 10 to 12 in that from Val de Travers. Asphalts containing less than the former proportion have not sufficient coherence for street pavements, and those containing more than the latter proportion soften from heat in the summer. Asphalt is employed either as a mastic or compressed. The mastic is previously prepared in cakes and is melted for use in caldrons with a small quantity of bitumen, and for a street pavement is thoroughly mixed with sand or grit. It is spread in one thickness on a concrete foundation, covered with sand, and beaten to an even surface. This material has not proved so successful for street surfaces as compressed asphalt. To produce this, the rock asphalt, previously reduced to a fine powder by mechanical means, is heated in revolving ovens to from about 220° to 250° F., spread while still hot, and compressed into a solid mass by hot

disk-shaped rammers, and afterwards smoothed with irons heated to a dull redness. The original rock is thus, as it were, reconstructed by taking advantage of the power of coherence of the molecules under pressure when hot. In heating the powder the moisture combined in the limestone must be driven off without reducing the proportion of the bitumen more than is unavoidable. The powder cools very slowly, and may be conveyed long distances from the ovens; it may even be kept till the next day before use. When laid it should still retain a temperature of from 150° to 200°. It is spread evenly with a rake by skilled workmen for the whole width of the street to a thickness about two-fifths greater than the finished coating is intended to be. Ramming is commenced with light blows to ensure equality of compression throughout, and is continued with increased force until the whole is solidified. The ramming follows up the spreading, so that a joint is required only when the work is interrupted at the end of a day, or from some other cause. In a few hours after it has been laid an asphalt pavement may be used for traffic. When finished, its thickness may be from 1½ to 2½ in., according to the traffic; a greater thickness than the latter cannot be evenly compressed with certainty. The asphalt loses thickness by compression under the traffic for a long time and to the extent, it is said, of one-fifth or one-fourth, but the wear appears to be very small. The wear-resisting power of the asphalt is due to its elasticity; tracks are made by the wheels at first, but when thoroughly compressed by the traffic the mass retains little or no trace of the heaviest loads. Repairs are easily and quickly made by cutting out defective places and ramming in fresh heated powder, which can be done in the early morning without stopping the traffic. An unyielding foundation is indispensable; it should be of the best Portland cement concrete, 6 in. in thickness, which must be well set and perfectly dry throughout before the asphalt is laid, or the steam generated on the application of the hot powder will prevent coherence and lead to cracks and holes in the asphalt, which quickly enlarge under the traffic. For the same reason the asphalt should be laid in dry weather. The concrete foundation must be carefully formed to the proper profile, with an inclination towards the sides of not more than 1 in 50, which is sufficient to shed smooth a surface. About 1 in 50 is the steepest gradient on which an asphalt pavement can be safely laid. When either dry or wet it affords good foothold for horses, but when beginning to get wet, or drying, it is often extremely slippery. This is said to be due to dirt on the surface, and not to the nature of the material. Sand is strewed over the surface to remedy the slipperiness; it tends, however, to wear out the asphalt, and great cleanliness is the best preventive. An asphalt pavement can be kept cleaner than any other, is impervious to moisture, and dries quickly. While the road is kept clean, a very slight depression is made by the horse-shoe, which for foothold is a great advantage. The noise made on asphalt by horse-traffic is about the same as that made on hard wood, and is not much more than is necessary for the safety of foot-passengers. In American cities asphalt has been adopted in a totally different form. All asphalt pavements are composed of a very large proportion, perhaps five parts in six, of a hard non-bituminous material. In America it is found cheaper to get the purer bitumen of the island of Trinidad, and to procure in the localities the bulky material required for admixture—a coarse angular sand with a little pure carbonate of lime. An asphaltic cement is made from refined asphaltum. Of this, from 12 to 15% is used with 70 to 80% of sand and 5 to 15% of limestone dust. These materials are heated and stirred together into a stiff mastic paste to form the wearing surface of the road. Upon the concrete foundation is first spread a layer of fine bituminous concrete called "binder," 1½ in. thick, to unite the wearing surface to the concrete foundation. Upon the binder the asphalt is laid to a thickness of 2 in., being spread with iron rakes and brought to its finished surface by the steam roller. Obviously this is a process requiring great judgment and experience; but the system has become established in America, to the exclusion of European methods. Its great recommendation is the freedom from slipperiness that is said to result from the admixture of sharp sand, and this freedom is really the one quality in which asphalt pavement is seriously deficient. This system has been introduced into England.

Wood-Paving.—Wood pavements were introduced in England in 1839. Hexagonal blocks of fir, 6 to 8 in. across and 4 to 6 deep, were bedded in gravel laid on a foundation previously levelled and beaten. The blocks were either bevelled off at the edges or grooved across the face to afford foothold. Other wood pavements were tried in London about the same time, but they soon got out of order from unequal settlement of the blocks, and most of them lasted but a few years. The "improved wood pavement" was first used in London in 1871. After the foundation was formed to the proper cross-section a bed of sand 4 in. deep was laid, upon which came two layers of inch deal boards saturated with boiling tar, one layer across the other. The wooden blocks were 3 in. wide, 5 deep, and 9 long; they were dipped in tar and laid on the boards with the ends close together, but transversely the courses were spaced by fillets of wood three-fourths of an inch wide nailed to the floor and to the blocks. The joints were filled up with clean pebbles rammed in, and were run with a composition of pitch and tar, the surface being dressed with boiling tar and strewed with small sharp gravel and sand. In this pavement a somewhat elastic foundation was provided in the boards, which were also intended to prevent unequal settlement of the blocks; but the solidity of the pavement depended upon its water-tightness, for, when the surface water reached the sand, as it did sooner or later, settlement and dislocation of the blocks under the traffic arose. Pavements on this system were laid between 1872 and 1876, and were kept in repair and relaid from time to time, but about 1877 the plank foundation was abandoned for a foundation of cement concrete, which is now generally employed. Australian hard woods have to a large extent supplanted the fir and pine which were at one time used as the materials for wood-paving. The softer woods, which afford reasonably good foothold and are comparatively noiseless, wear rapidly under heavy traffic, and are very liable to decay. Most of the wood actually used has been of mixed qualities, and when a block fails, those near it suffer; thus holes are formed, so that the pavement has to be renewed before its time. English oak and beech, which are perhaps too hard, have been used with varying results; but the Australian woods of the genus *Eucalyptus* have been most extensively tried, and with the most satisfactory results. Those which are best known are jarrah and kauri, but tallow wood, black-butt, blue-gum, red-gum, and spotted-gum, with others, have been tried. Of these, one or two are too dense and hard to afford foothold, others are not easily procured, but jarrah and kauri are used extensively. When cut from the matured heart-wood they are uniform in quality, hard enough for durability, and rough enough to afford fairly good foothold. A very large quantity of wood has been used in London under the name of American red-gum. In substance it comes between the soft and hard woods above mentioned. Wood blocks for paving must be cut with the utmost precision as to the depth of 5 or 6 in. and the breadth of 3 in. The usual length of 8 or 9 in. should also be kept well enough for bond. A long block is liable to tilt. As to depth, although a slight depression may be of little account, the least projection in a block will be immediately noted as a jolt by the swift-moving wheel. The laying and jointing of wood blocks on concrete is still a matter of experiment. They may be set on a half-inch bed of sand, which is supposed to, though it is doubtful whether it actually does, make the pavement elastic to the tread. If the blocks are not accurately gauged, the sand enables the paviour to adjust them to a uniform surface. But the practice most approved is to pave directly upon the smoothly finished concrete, trusting for elasticity to the wood. On the revival of wood-paving it was thought necessary, for foothold, to leave

wide joints filled with small gravel grouted with cement; but this is mischievous. The cement breaks up, and when the blocks shrink, the filling-in is driven downwards, and when they again get wet, they have less room to expand, the side kerbs are driven back, and the foot-pavements are displaced, so as to require relaying. To guard against this, a space of about 2 in. has been left between the pavement and the kerb, to be temporarily filled with clay or sand, which can be cleared out as the pavement expands. But cement has no affinity for wood, and its use, together with the wide joints that were thought necessary to give foothold, has been abandoned. They permitted the edge of the block to be beaten down below the centre, so as to produce a succession of ridges, having much of the character of a "corduroy" road. Asphalted felt placed in the joints has not succeeded. A method very successfully adopted is to leave the end joints slightly open, and to place strips or laths one-tenth of an inch thick between the courses, so that hot pitch can be poured down to fill the joint and cover the surface. The roadway is then strewn with fine sharp gravel. Hard-wood blocks so laid expand very slightly, so that a space of an inch and a quarter is sufficient between the kerb and the two courses of blocks that are usually laid parallel to it; this, when filled with pitch, is more than enough to allow for expansion. Paving has been laid with close joints, small vessels of hot pitch being provided, into which each paviour dips the blocks more or less completely before laying them; but wood blocks are more commonly laid dry, a little pitch being brushed over the surface. The gradual abandonment of the wide joints once considered necessary for foothold will be noticed. Soft wood seems to wear under very heavy traffic about five times as fast as hard wood.

Plank Roads.—In opening up a new country, roads, temporary or permanent, must be made with such materials as may happen to be at hand. The plank road often used in American forests makes an excellent track for all kinds of traffic. Upon that side of the space devoted to the road, which the heavy traffic leading to a town will use, two parallel rows of sills 15 to 20 ft. long, 12 in. wide and 4 deep are laid longitudinally flatwise 4 ft. from centre to centre, the earth being well packed and rammed to the level of their faces. The joints are not opposite; a short piece of sill is put either under or by the side of each joint. Cross-sleepers, about 8 ft. 3 in. long and 3 in. thick are laid down loosely, so that groups of four boards together will project on alternate sides of the road 3 or 4 in., forming a shoulder to enable vehicles to get on to the track at any point. The remainder of the road space is formed as an earthen track, 12 ft. wide, for light vehicles. Its slope outwards may be 1 in 16, that of the plank road 1 in 32. If the soil is too bad for the earthen track, short lengths of plank road of double width are made at intervals to form passing places. The cross boards are spiked down on five sills, and are sprung so as to give a fall both ways.

Log Roads.—The log road is formed across swamps by laying young trees of similar length close together. This is ridiculed as a "corduroy" road, but it is better than the swamp. Good temporary roads are made by laying down half logs roughly squared upon the ground, close together or with spaces between of a couple of inches, into which earth is well rammed. They may be 8 or 9 ft. long, alternate logs being made to project a foot on each side for convenience of driving on and off the track.

Charcoal Roads.—When fuel is available, good roads can be formed of burned materials. Clay is burned into ballast for foundations, or for a temporary track. In American forests charcoal roads have been largely used. Logs from 6 in. to 2 ft. in diameter are piled along the whole route, the stack being 9 ft. broad at the base, 6 ft. high and 2 ft. broad at the top. Dry materials for lighting are intermixed, and the stack is covered up with sods and earth from the side ditches. When burned, the charcoal is simply raked down so as to form a 15-ft. road of a well-rounded section. These roads are dry and hard, and otherwise satisfactory.

The mode of carrying a road across a bog upon a foundation of faggots or brushwood is well known. In India the native roads have been made equal to heavy traffic by laying branches of the mimosa across the track. And in the great plains, where the soil, when dry, would otherwise be made deep in dust, this is entirely prevented by laying across the track a coarse reed or grass like the pampas-grass, and covering it with 3 or 4 in. of loam.

Sand Dressing.—In carrying traffic over a clay soil a covering of 3 or 4 in. of coarse sand will entirely prevent the formation of the ruts which would otherwise be cut by the wheels; and if the ground has already been deeply cut up, a dressing of sand will so alter the condition of the clay that the ridges will be reduced by the traffic, and the ruts filled in.

Noiseless Roads.—A comparatively noiseless pavement may be formed with bricks made of cork granulated and mixed with fibre and asphalt; they are set in pitch, and seem to be suitable for rather steep gradients. For a perfectly noiseless pavement, such as is specially required where a carriage entrance under bedrooms is used by night, no substance is equal to indiarubber. For this purpose it is made in inch sheets about 3 ft. wide and as long as the width of the roadway; it is fixed over concrete and secured by iron clips. This arrangement carries the whole of the passenger traffic to St Pancras Station, London, and also a considerable amount of traffic passing under the Euston Square Station Hotel.

Dustless Roads.—The necessity for making roads dustless has been rendered urgent by the advent of the motor-car. The oldest and least efficacious method is to convert the dust into mud by the aid of the watering cart; at the best, however, the improvement is temporary, though attempts have been made to obtain more lasting results by using a solution of some hygroscopic salt such as calcium chloride. Various special preparations of petroleum and other oils have been introduced as palliatives, but the most promising treatment for existing macadam roads consists in distributing tar by hand or machine over the surface, care being taken to make the application in fine weather when the roads are dry. The radical solution of the problem, however, is to be sought in the adoption of improved methods and materials for construction, probably with a bituminous binding or matrix.

This same problem of the motor-car, which, by its rapidity of movement, rendered many of the old country roads in England (suitable, or at least tolerable, as they were for slow-moving traffic) positively dangerous for the new traffic by reason of their narrowness, sharp corners, &c., has been responsible for the passing by the legislature of a very important measure, the Development and Road Improvement Funds Act 1909. This act, in its second part, deals with the question of road improvement, and establishes a Road Board, making it a body corporate. The Board is given powers to make advances to county councils or other highway authorities for the construction of new roads or the improvement of existing roads, as well as itself to construct and maintain new roads. The expression "improvement of roads" is defined by the act as including the widening of a road, the cutting off corners, levelling, treating a road for mitigating dust nuisance, &c. Power is given to the Board to acquire land for the purposes of road improvements. The expenses of the Board are met out of a road improvement grant each year, the greater part of which it was proposed should be provided by diverting the tax on motor spirit and on motor vehicles levied under the Finance Act of 1909–10.

Watering.—On macadamized roads in Great Britain watering is only good for the road itself when the materials are of a very siliceous nature and in dry weather. With other materials the effect is to soften the road and increase wear. In and near towns watering is required for the comfort of the inhabitants, but it should not be more than enough to lay the dust without softening the road, and the amount required for this may be greatly reduced by keeping the surface free from mud, and by sweeping off the dust when slightly wetted. Pavements are watered to cleanse them as well as to lay the dust, but it must be remembered that both wood

and asphalt are more slippery when wet, and that therefore watering should be obviated as far as possible by thorough cleansing. Hydrostatic vans, by improvements in the distributing pipes and regulating valves, water a wide track uniformly with an amount of water which can be regulated at pleasure. Where hydrants exist in connexion with a water supply at high pressure, street watering can be effected by a movable hose and jet, a method much more effective in cleansing the surface, but using a much larger quantity of water. Another method which has been used, but not much in use, is to lay perforated pipes at the back of the kerb on each side of the road, from which jets are thrown upon the surface. The first cost is considerable, and the openings for the jets are liable to choke and get out of order. Deliquescent salts have been used for street watering, by which the surface is kept moist, but at the expense of the moisture in the air. Sea water has the same effect in a less degree.

Cleansing.—The principal streets of a town are generally cleansed daily, either by hand-sweeping and hand-scraping or by machines. Sir Joseph Whitworth's machine consists of a series of revolving brooms on an endless chain, whereby the mud or dust is swept up an inclined into the cart. A less costly and cumbersome machine consists of a revolving brush mounted obliquely, which sweeps a track 6 ft. wide and leaves the dust or mud on one side to be gathered up by hand. A horse scraping-machine which delivers the mud at the side is also used, the blades of the scrapers being mounted obliquely and covering a width of 6 ft. For general use, more especially in the country, scraping-machines, worked by a man from side to side of the road, and scraping a width of about 4 ft., are more convenient.

All street surfaces suffer from the constant breaking up and disturbance to which they are subjected for the purpose of laying and repairing gas and water pipes. Subways, either under the middle of the road or near the kerb, in which the pipes may be laid and be always accessible, have often been advocated, and in a few instances have been constructed; but they have not hitherto found general favour.

Footways.—Gravel is the most suitable material for country or suburban footways; it should be bottomed with a coarser material, well drained and should be laid with a roller. An inclination towards the kerb of about half an inch in a foot may be made, or the surface may be rounded, to throw off the wet. Where greater cleanliness is desirable and the traffic is not too great a coal-tar concrete similar to that already described, but of smaller materials, makes a good and economical footway. Concrete slabs, especially when silicated and constituting artificial stone, make an excellent footway. The material is composed of crushed granite, gravel or other suitable material, mixed with Portland cement and cast in moulds, and when set saturated with silicate of soda. This process has proved more durable than York stone flagging, but it is more slippery, especially when made with granite. York stone makes a good and pleasant foot pavement, but is somewhat expensive considering its durability; it is apt to wear unevenly and to scale off when the stone is not of the best quality. It should not be laid of a less thickness than 2 in.; 2½ or 3 in. are more usual. The flags should be square jointed, not under-cut at the edges, and should be well bedded and jointed with mortar. Caithness flag is much more durable than York stone and wears more evenly; it is impervious to wet and dries quickly by evaporation. The edges are sawn, and the hardness of the stone renders it difficult to cut it to irregular shapes so to fit openings. Staffordshire blue bricks and bricks made of scoria from iron furnaces are both very durable, though somewhat brittle. Asphalt either laid as mastic or compressed is extensively used for footways; the former is considered inferior in durability to York stone and the latter superior to it. Asphalt should not be laid less than three-fourths of an inch thick on 4 in. of cement concrete, and 1 in. of asphalt is desirable where there is great traffic.

Footways in a street must be retained by a kerbing of granite, York stone, Pitcock or other stone sufficiently strong to stand the blows from wheels to which it is subjected. It should be at least 4 in. wide and 9 deep and in lengths of not less than 3 ft. A granite kerb is usually about 12 by 6 in., either placed on edge or laid on the flat. When set on edge, Caithness flag is generally bedded on gravel with a mall; when laid on the flat a concrete bed is desirable.

In a macadamized street pitched or paved water channels are required to prevent the wash of the surface water from undermining the kerb. The pitching consists of cubical blocks of hard stone about 4 in. deep, bedded on sand or mortar, or preferably on a bed of concrete. A paved channel consists of flat stones about 1 ft. wide inclining slightly towards the kerb. Moulded bricks and artificial stone are also used both for side channelling and for kerbing. Such an inclination must be given to the channel as will bring the surface water to gullies placed at proper intervals, and the level of the kerbing and consequently of the footway will depend to some extent on the surface drainage as well as on the levels of adjacent houses. To lay out a street satisfactorily the longitudinal and transverse sections must be considered in relation to these matters as well as to the levels of intersecting streets.

ROAN (O. Fr. *rouan, rouen*; Ital. *roano, rovano*; perhaps connected with *rufus*, red), a word applied to a variety of colour in an animal's coat, especially that of a horse, where there is a mixture of grey or white hair with the prevailing tint of bay, chestnut or sorrel. A sorrel when thus modified is either a strawberry-roan or a cream-roan. The term is also used of a soft, flexible kind of leather made of sheepskin, used in bookbinding as a substitute for or in imitation of morocco; but in this sense the origin is doubtful.

ROANNE, a town of east-central France, capital of an arrondissement in the department of Loire, on the left bank of the Loire, 54 m. N.W. of Lyons on the Paris-Lyons railway to Moulins. Pop. (1906) 33,981. The chief buildings are a modern town hall and the church of St Étienne (1835–1843), built in the Flamboyant Gothic style. The lycée occupies the buildings of the old college dating from the early 17th century. A fine bridge of fourteen arches connects Roanne with the industrial suburb of Le Côteau on the right bank of the river. The town is the seat of a sub-prefect, of tribunals of first instance and of commerce, of a chamber of commerce and a board of trade-arbitration, and has lycées for both sexes. Cotton goods form the staple manufacture, and cotton-spinning is also important. The making of knitted woollen articles gives employment to large numbers of women in the town and district. There are besides extensive engineering works, foundries, dye-works, tanneries, pottery and tile-works and other industrial establishments. As the centre of the Roannais coalfield, Roanne has trade in coal and coke. It is also the terminus of the Roanne-Digoin Canal and the real starting-point of the Loire navigation.

Roanne (*Rodomna*, or *Rodomna*) was an ancient city of the Segusiani and a station on the great Roman road from Lyons to the ocean. In 1447 the lordship of Roannais became the property of the celebrated banker Jacques Cœur, from whom it passed as the result of a law-suit to the family of Gouffier. In their favour the title was raised to the rank of marquisate and in 1566 to the rank of duchy; it became extinct in the first half of the 18th century.

ROANOKE, a river of the South Atlantic Slope, U.S.A. With the Staunton, which rises in the Appalachian Valley in southwestern Virginia, it constitutes one river, and, flowing in a general south-easterly direction, crosses the boundary between Virginia and North Carolina just above the Fall Line and discharges into Albemarle Sound. It is nearly 400 m. long, with a drainage area of 9237 sq. m. The United States government adopted a project in 1871 for clearing a channel with a minimum depth of 5 ft. at low water from its mouth to Weldon, a distance of 129 m., and in 1909, when the project was 80% completed, vessels drawing 4 ft. of water could ascend at low stages nearly to Weldon. The main river and its principal tributary, the Dan, are also navigable, for many miles above the Fall Line, by pole boats. In 1829 the Weldon Canal, 12 m. long, was opened to afford a passage around the falls, but it was abandoned in 1850.

ROANOKE, a city in (but administratively independent of) Roanoke county, Virginia, on the Roanoke river, about 55 m. W.S.W. of Lynchburg. Pop. (1890) 16,159; (1900) 21,495, of whom 5834 were negroes; (1910 census) 34,874. Roanoke is served by the Virginian railway, by the main line and the Shenandoah and the Winston-Salem divisions of the Norfolk & Western railway, and by electric railway to Vinton and to Salem. The city is about 900 ft. above sea-level and is surrounded by high hills; its picturesque situation and its nearness to famous mineral springs make it a health resort. On a mountain slope, about ½ m. from the city limits, is the Virginia College for Young Ladies; 7 m. north of the city, at what was

formerly called Botetourt Springs (there is a sulphur spring), is Hollins Institute (1842) for girls; and in the city are the National Business College, the City Hospital (1890), private hospitals, and St Vincent's Orphan Asylum (1893) for boys, under the Sisters of Charity. Stock-raising, tobacco-growing, and coal and iron-mining are the industries of the district. Roanoke's factory product in 1905 was valued at $5,544,907 (2·7% more than in 1900). Its railway car repair and construction shops, belonging to the Norfolk & Western railway, employed in that year 66.9% of the total number of factory wage-earners; pig-iron, structural iron, canned goods, bottles, tobacco, planing-mill products and cotton are among the manufactures. The municipal water supply comes from a reservoir at Crystal Springs at the foot of Mill Mountain near the city limits. Roanoke was the town of Big Lick (founded about 1852; incorporated in 1874; pop. in 1880, 669) until 1882, when it received its present name; in 1884 it was chartered as a city.

ROARING FORTIES, the name given to the zone in the southern hemisphere, near the 40th parallel of latitude, in which the north-westerly "anti-trade" winds attain their greatest development. Since the belt lies in the Great Southern Ocean (*q.v.*), and is little interrupted by land, the "planetary circulation" undergoes little modification and barometric gradients are steep. The "brave west winds" are accordingly of great strength, and, as in the corresponding belt of the northern hemisphere, the movement is largely broken up into the low and high pressure vortices known as cyclones and anticyclones.

ROBBEN ISLAND, an island at the entrance of Table Bay, 7 m. N.N.W. of Cape Town. It is some 4 m. long by 2 broad. At its southern end is a lighthouse with a fixed light visible for 20 m. It got its name (*robben*, Dutch for seal) from the seals which formerly frequented it, now only occasional visitants. The island when discovered was uninhabited. It is first mentioned by an English seaman named Raymond, who states that in 1591 seals and penguins were there in large numbers. In 1614 ten criminals from London were landed on the island to form a settlement and supply fresh provisions to passing ships. The attempt, which ended in failure, is interesting as the first recorded settlement of English in South Africa. In the 18th century the slate quarries of Robben Island were extensively worked by the Dutch of Cape Town. The island is now noted for its leper asylum and its convict establishment. For many years an asylum for lunatics was also maintained, but in 1904 the lunatics were removed to the mainland. The common rabbit, brought from England, abounds, but its introduction to the mainland is prohibited. As early as 1657 criminals were banished to the island by the Dutch authorities at Cape Town; it has also served as the place of detention of several noted Kaffir chiefs.

See G. F. Gresley, "The Early History of Robben Island," in *The Cape Illustrated Magazine* (Oct. 1895).

ROBBER SYNOD, the name given to an irregular ecclesiastical council held at Ephesus in A.D. 449. See EPHESUS, COUNCIL OF.

ROBBERY (from O. Fr. *rober*, to steal), the unlawful and forcible taking of goods or money from the person of another by violence or threatened violence. Robbery is larceny (*q.v.*) with violence. It is a specific offence under the Larceny Act 1861, and is punishable by penal servitude for any term not exceeding fourteen years and not less than three years, or imprisonment for any term not exceeding two years, with or without hard labour. Under the Garrotters Act 1863, whipping may be added as part of the sentence for robbery. In Scots law robbery is termed *stouthrief*.

United States.—The nature of the offence is practically the same in America as in England, but what constitutes robbery is provided by statute in each state, as is also the punishment. The chief difference between English and American law is that the latter often divides the offences into grades and takes a liberal view of what constitutes force or fear. Train robbery is specially dealt with in some states owing to the prevalence of that species of crime.

Federal Statute.—Congress has made it piracy punishable with death to commit robbery on the high seas or on shore or in any harbour out of the jurisdiction of any state by landing from a piratical vessel (U.S. Rev. St. § 1047).

In *Alabama* it is train robbery to "enter upon or go near to any locomotive, engine, or car, on any railroad and by threats or exhibition of a deadly weapon or discharging a pistol or gun on or near such engine or car induce or compel any one to deliver up anything of value. It is punishable at the discretion of the jury by *death* or imprisonment for not less than ten years. Any one who stops, impedes or detains any locomotive or car with intent to commit train robbery must be punished by imprisonment for not less than ten nor more than thirty years. Conspiring to commit train robbery is punishable to the same extent (Crim. Code, §§ 5480–5482).

In *Arizona*, *California* and *Missouri* the "fear" may be that of the person robbed or of any relative of his or member of his family or of any one in his company. The punishment is imprisonment for not less than five years.

In *Arkansas* and *Missouri* extorting money or property by blackmail is an "attempt to rob"; it is punishable by not less than one nor more than five years' imprisonment. In *Georgia* larceny from the person is statutory robbery (*Hickey* v. *State* (1906), 125, Ga. 145).

Louisiana.—Train robbery is punishable by imprisonment for not less than five nor more than ten years.

Missouri.—Train robbery is punishable by *death* or imprisonment for not less than ten years. It may consist in placing an obstruction on the line with intent to rob.

Massachusetts.—Robbery, committed when armed with a dangerous weapon, is punishable by imprisonment for *life* (*Rev. L.*, 1902, ch. 207, § 17).

Minnesota.—The extreme penalty for robbery is forty years' imprisonment (L. 1905, ch. 114).

New Jersey.—The extreme penalty is $3000 fine or twelve years' imprisonment.

Texas.—Falsely personating an officer and by means of arrest extorting money is robbery (*Burnside* v. *State* (1907), 102, S.W. Rep. 178).

ROBERT I., "THE BRUCE" (1274–1329), king of Scotland, was the son of the 7th Robert de Bruce, earl of Carrick by right of his wife Marjorie, daughter of Niel, or Nigel, earl of Carrick, and was the eighth in direct male descent from a Norman baron who came to England with William the Conqueror. After the death of Margaret, the "maid of Norway," in 1290, Bruce's grandfather, the 6th Robert de Bruce, lord of Annandale, claimed the crown of Scotland as the son of Isabella, the second daughter of David, earl of Huntingdon, and great-granddaughter of King David I.; but John de Baliol, grandson of Margaret, the eldest daughter of Earl David, was preferred by the commissioners of Edward I.

The birthplace of Bruce is not certainly known, but was probably Turnberry, his mother's castle on the coast of Ayr. The date is the 11th of July 1274. His youth is said by an English chronicler to have been passed at the court of Edward I. At an age when the mind is quick to receive the impressions which give the bent to life he must have watched the progress of the great suit for the crown of Scotland. Its issue in 1292 in favour of Baliol led his grandfather to resign Annandale to his son, the 7th Robert de Bruce, who either then or after the death of his father in 1295 assumed the title of lord of Annandale. Already on his wife's death in 1292 he had resigned the earldom of Carrick to his son, the future king, who presented the deed of resignation to Baliol at Stirling in August 1293, and offered the homage which his father, like his grandfather, was unwilling to render. Feudal law required that the king should take seisin of the earldom before regranting it and receiving the homage, and the sheriff of Ayr was directed to take it on Baliol's behalf. As the disputes between Edward I. of England and Baliol, which ended in Baliol losing his kingdom, commenced in this year, it is doubtful whether Bruce ever rendered homage; but he is henceforth known as earl of Carrick, though in a few instances this title is still given to his father. Both father and son sided with Edward against Baliol. In April 1294 the younger Bruce had permission to visit Ireland for a year and a half, and as a further mark of Edward's favour a respite of all debts owing by him to the exchequer.

In August 1296 Bruce and his father swore fealty to Edward I. at Berwick, but in breach of this oath, which had been renewed

at Carlisle, the younger Robert joined Sir William Wallace, who raised the standard of Scottish independence in the name of Baliol after that king had surrendered his kingdom to Edward in 1296. Urgent letters were sent ordering Bruce to support John de Warenne, earl of Surrey, Edward's general, in the summer of 1297; but, instead of complying, he assisted to lay waste the lands of those who adhered to Edward. On the 7th of July Bruce and his friends were forced to make terms by a treaty called the capitulation of Irvine. The Scottish lords were not to serve beyond the sea against their will, and were pardoned for their recent violence, in return owning allegiance to Edward. The bishop of Glasgow, James the steward, and Sir Alexander Lindesay became sureties for Bruce until he delivered his daughter Marjorie as a hostage. Wallace almost alone maintained the struggle for freedom which the nobles, as well as Baliol, had given up, and Bruce had no part in the honour of Stirling Bridge in September 1297, or the reverse of Falkirk, where in July 1298 Edward in person recovered what his generals had lost, and drove Wallace into exile. Shortly afterwards Bruce appears again to have sided with his countrymen; Annandale was wasted, while he, as Walter of Hemingford says, "when he heard of the king's coming, fled from his face and burnt the castle of Ayr which he held." Yet, when Edward was forced by home affairs to quit Scotland, Annandale and certain earldoms, including Carrick, were excepted from the districts he assigned to his followers, Bruce and other earls being treated as waverers whose allegiance might still be retained. About 1299 Bruce was appointed in Scotland in the name of Baliol, and a letter of Baliol mentions Robert Bruce, lord of Carrick, as regent, along with William of Lamberton, bishop of St Andrews, and John Comyn the younger, a strange combination—Lamberton the friend of Wallace, Comyn the enemy of Bruce, and Bruce a regent in name of Baliol. Comyn in his own interest as Baliol's nephew and heir was the active regent; the insertion of the name of Bruce was an attempt to secure his co-operation. For the next four years he kept studiously in the background, waiting his time. A statement of Peter Langtoft that he was at the parliament of Lincoln in 1301, when the English barons repudiated the claim of Pope Boniface VIII. to the suzerainty of Scotland, is not to be credited, though his father may have been there. In the campaign of 1304, when Edward renewed his attempt on Scotland and reduced Stirling, Bruce supported the English king, who in one of his letters to him says, "If you complete that which you have begun, we shall hold the war ended by your deed and all the land of Scotland gained." But, while apparently aiding Edward, Bruce had taken a step which bound him to the patriotic cause. On the 11th of June, five weeks before the fall of Stirling, he met Lamberton at Cambuskenneth and entered into a secret bond by which they were to support each other against all adversaries and undertake nothing without consulting together. The death of his father in 1304 may have determined his course, and led him to prefer the chance of the Scottish crown to his English estates and the friendship of Edward.

This determination closes the first chapter of his life; the second, from 1304 to 1314, is occupied by his contest for the kingdom, which was really won at Bannockburn, though disputed until the treaty of Northampton in 1328; the last, from 1314 to his death in 1329, was the period of the establishment of his government and dynasty by an administration as skilful as his generalship. It is to the second of these that historians, attracted by its brilliancy even amongst the many romances of history and its importance to Scottish history, have directed most of their attention, and it is during it that his personal character, tried by adversity and prosperity, gradually unfolds itself. But all three periods require to be kept in view to form a just estimate of Bruce. That which terminated in 1304, though unfortunately few characteristics, personal or individual, have been preserved, shows him by his conduct to have been the normal Scottish noble of the time. A conflict of interest and of bias led to contradictory action, and this conflict was increased in his case by his father's residence in England, his own upbringing at the English court, his family feud with Baliol and the Comyns, and the jealousy common to his class of Wallace, the mere knight, who had rallied the commons against the invader and taught the nobles what was required in a leader of the people. The merit of Bruce is that he did not despise the lesson. Prompted alike by patriotism and ambition, at the prime of manhood he chose the cause of national independence with all its perils, and stood by it with an unwavering constancy until he secured its triumph. Though it is crowded with incident, the main facts in the central decade of Bruce's life may be rapidly told. The fall of Stirling was followed by the capture and execution of Wallace in London in August 1305. Edward hoped still to conciliate the nobles and gain Scotland by a policy of clemency to all who did not dispute his authority. A parliament in London in September 1305 to which Scottish representatives were summoned, agreed to an ordinance for the government of Scotland, which, though on the model of those for Wales and Ireland, treating Scotland as a third subject province under an English lieutenant, was in other respects not severe. Bruce is reputed to have been one of the advisers who assisted in framing it; but a provision that his castle of Kildrummy was to be placed in charge of a person for whom he should answer shows that Edward, not without reason, suspected his fidelity. The details of his final breach with the English king are somewhat obscure. According to one account, the bond between Bruce and Lamberton was revealed to Edward by Comyn when Bruce was at the English court. Alarmed by a hint dropped by Edward, he left England secretly, and in the church of the Friars Minorite at Dumfries on the 10th of February 1306 met Comyn, whom he slew before the high altar for refusing to join in his plans. So much is certain, though the precise incidents of the interview are variously told. It was not their first encounter, for a letter of 1299 to Edward from Scotland describes Comyn as having seized Bruce by the throat at a meeting at Peebles, where they were with difficulty reconciled by the regents.

The bond with Lamberton was now sealed by blood, and the confederates lost no time in putting it into execution. Within little more than six weeks Bruce, collecting his adherents in the south-west, passed from Lochmaben to Glasgow and thence to Scone, where he was crowned king of Scotland on the 27th of March 1306. Two days later Isabella, countess of Buchan, claimed the right of her family, the Macduffs, earls of Fife, to place the Scottish king on his throne, and the ceremony was repeated with an addition flattering to the Celtic race. Though a king, Bruce had not yet a kingdom, and his efforts to obtain it were disastrous failures until after the death of Edward I. In June 1306 he was defeated at Methven, and on the 11th of August he was surprised in Strathfillan, where he had taken refuge. The ladies of his family were sent to Kildrummy in January 1307, and Bruce, almost without a follower, fled to the island of Rathlin. Edward came to the north in the following spring On his way he granted the forfeited estates of Bruce and his adherents to his own followers, Annandale falling to Humphrey de Bohun, 4th earl of Hereford. At Carlisle there was published a bull excommunicating Bruce; and Elizabeth his wife, Marjorie his daughter, and Christina his sister, were captured in a sanctuary at Tain, while three of his brothers were executed. In a moment all was changed by the death of Edward I. on the 7th of July 1307. Instead of being opposed to the greatest, Bruce had now as his antagonist the feeblest of the Plantagenets. Quitting Rathlin, he had made a short stay in Arran, and before Edward's death had failed to take Ayr and Turnberry, although he defeated Aymer de Valence, earl of Pembroke, at Loudoun Hill in May 1306. After wasting the critical moment of the war in the diversions of court life, the new English king, Edward II., made an inglorious march to Cumnock and back without striking a blow; and then returned south, leaving the war to a succession of generals. Bruce, with the insight of military

genius, seized his opportunity. Leaving Edward, now his only brother in blood and almost his equal in arms, in Galloway, he suddenly transferred his own operations to Aberdeenshire. He overran Buchan either once or twice, and after a serious illness defeated the earl of Buchan, one of his chief Scottish opponents, near Inverurie on the 22nd of May 1308. Then crossing to Argyllshire he surprised another body of his enemies in the pass of Brander early in 1309, took Dunstaffnage, and in March of this year held his first parliament at St Andrews. In 1309 a truce scarcely kept was effected by Pope Clement V. and Philip IV. of France, and in 1310, in a general council at Dundee, the clergy of Scotland, all the bishops being present, recognized Bruce as king. The support given to him by the national church in spite of his excommunication must have been of great importance in that age, and was probably due to the example of Lamberton. The next three years was signalized by the reduction one by one of the strong places still held by the English: Linlithgow towards the end of 1310, Dumbarton in October 1311, Perth, by Bruce himself, in January 1312. Previous to these two latter successes the king had made two raids into the north of England; after which Buittle, Dalswinton and Dumfries were reduced, and Berwick was threatened. In March 1313 his lieutenant Sir James Douglas surprised Roxburgh, and Thomas Randolph surprised Edinburgh. In May Bruce was again in England, and though he failed to take Carlisle, he subdued the Isle of Man. About the same time Edward Bruce took Rutherglen and laid siege to Stirling, whose governor, Sir Philip de Mowbray, agreed to capitulate if not relieved before the 24th of June 1314.

Bruce's rapidity of movement was one cause of his success. His sieges, the most difficult part of medieval warfare, though won sometimes by stratagem, prove that he and his followers had benefited from their early training in the wars of Edward I. We know that he had been employed by that king to prepare the siege-train for his attack on Stirling in 1304. By the close of 1313 Berwick, Stirling and Bothwell alone remained English. Edward II. felt that if Scotland was not to be lost a great effort must be made. With the whole available feudal levy of England, and a contingent from Ireland, he advanced from Berwick to Falkirk, which he reached on the 22nd of June 1314. After a preliminary skirmish on Sunday the 23rd, in which Bruce distinguished himself by a personal combat with Sir Henry de Bohun, whom he felled by a single blow of his axe, the battle of Bannockburn was fought on Monday the 24th; and the complete rout of the English determined the independence of Scotland and confirmed the title of Bruce. The details of the day, memorable in the history of war as well as of Scotland, have been singularly well preserved, and redound to the credit of Bruce, who had studied in the school of Wallace as well as in that of Edward I. He had chosen and knew his ground, lying between St Ninians and the Bannock, a petty burn, yet sufficient to produce marshes dangerous to heavily armed horsemen, while from the rising ground on his right the enemy's advance was seen. His troops were in four divisions: his brother Edward commanded the right, Randolph the centre, Douglas the left. Bruce with the reserve planted his standard at the Bore Stone, whence there is the best view of the field. His camp-followers on the Gillies' Hill appeared over its crest at the critical moment which comes in all battles. The plain on the right of the marshes was prepared with pits and spikes. But what more than any other point of strategy made the fight famous was that the Scots fought on foot in battalions with their spears outwards, in a circular formation serving the same purpose as the modern square. A momentary success of the English archers was quickly reversed by a flank movement on the part of Sir Robert Keith. The Scottish bowmen followed up this advantage, and the fight became general; the English horse, crowded into too narrow a space, were met by the steady resistance of the Scottish pikemen, who knew, as Bruce had told them truly, that they fought for their country, their wives, their children, and all that freemen hold dear. The English rear was either unable to come up in the narrow space, or got entangled in the broken ranks of the van. The first repulse soon passed into a rout, and from a rout into a headlong flight, in which the English king himself barely escaped. In the career of Bruce, Bannockburn was the turning-point. The enthusiasm of the nation he had saved forgot his tardy adhesion to the popular cause, and at the parliament of Ayr on the 25th of April 1315 the succession was settled by a unanimous voice on him, and, failing males of his body, on his brother Edward and his heirs male, or failing them on his daughter Marjorie and her heirs, if she married with his consent. Soon afterwards she married Walter the steward (d. 1326). As a result of Bannockburn, Bruce's queen was restored to her husband; Stirling was delivered up to the Scots; the north of England was ravaged, and Carlisle and Berwick were besieged.

The last part of Bruce's life, from 1315 to 1329, began with an attempt which was the most striking testimony that could have been given to the effect of Bannockburn, and which, had it succeeded, might have altered the future of the British Isles. This was no less than the rising of the whole Celtic race, who had felt the galling yoke of Edward I. and envied the freedom the Scots had won. In 1315 Edward Bruce crossed to Ireland on the invitation of the natives, and in the following year the Welsh became his allies. In the autumn of 1316 Robert came to his brother, and together they traversed Ireland to Limerick. Dublin was saved by its inhabitants committing it to the flames, and, though nineteen victories were won, of which that at Slane in Louth by Robert was counted the chief, the success was too rapid to be permanent. The brothers retreated to Ulster, and, Robert having left Ireland in May 1317 to protect his own borders, Edward, who had been crowned king of Ireland, was defeated and killed at Dundalk in October 1318. On his return Bruce addressed himself to the siege of Berwick, a standing menace to Scotland. While he was preparing for it two cardinals arrived in England with a mission from Pope John XXII. to effect a truce, or, failing that, to renew the excommunication of Bruce. The cardinals did not trust themselves across the border; their messengers, however, were courteously received by Bruce, but with a firm refusal to admit the papal bulls into his kingdom because not addressed to him as king. Another attempt by Adam Newton, guardian of the Friars Minorite at Berwick, had a more ignominious result. Bruce admitted Newton to his presence at Aldcamus or Old Cambus, and informed him that he would not receive the bulls until his title was acknowledged and he had taken Berwick. On his return Newton was waylaid and his papers seized, not without suspicion of Bruce's connivance. In March 1318 the town and soon afterwards the castle of Berwick capitulated, and Bruce wasted the English border as far as Ripon. In December he held a parliament at Scone, where he displayed the same wisdom as a legislator which he had shown as a general. The death of his brother and his daughter rendered a resettlement of the crown advisable, and it was settled on his grandson, Robert, son of Marjorie and Walter the steward, in case Bruce died without sons, with a provision as to the regency in case of a minor heir in favour of Randolph. The defence of the country was next cared for by regulations for the arming of the whole nation, down to every one who owned the value of a cow, a measure far in advance of the old feudal levy. Exports during war, and of arms at any time, were prohibited. Internal justice was regulated, and it was declared that it was to be done to poor and rich alike. Leasing-making—a Scottish term for seditious language—was to be sternly punished. The nobles were exhorted not to oppress the commons. Reforms were also made in the tedious technicalities of the feudal law. In September 1319 an attempt to recover Berwick was repelled by Walter the steward, and Bruce took occasion of a visit to compliment his son-in-law and raise the walls to ft.

The king's position was now so strong that foreign states began to testify their respect. Bruges and Ypres rejected a request of Edward II. to cut off the Scottish trade with Flanders. Pope John, who had excommunicated Bruce, was addressed

by the parliament of Arbroath in April 1320 in a letter which compared Bruce to a Joshua or Judas Maccabaeus, who had wrought the salvation of his people, and declared they fought "not for glory, truth or honour, but for that liberty which no virtuous man will survive." Moved by this language and conscious of the weakness of Edward, the pope exhorted him to make peace with Scotland, and three years later Randolph, now earl of Moray, procured the recognition of Bruce as king from the papal see by promising aid for a crusade. In 1326 the French king, Charles IV., made a similar acknowledgment by the treaty of Corbeil. Meantime hostilities more or less constant continued with England, but, though in 1322 Edward made an incursion as far as Edinburgh, the internal weakness of his government prevented his gaining any real success, while in October of this year Bruce again ravaged Yorkshire, defeated the English near Byland, and almost captured their king. Some of his chief nobles—Thomas, earl of Lancaster, in 1321, and Sir Andrew Harclay, earl of Carlisle, in 1322—entered into correspondence with the Scots, and, though Harclay's treason was detected and punished by his death, Edward was forced to make a truce of thirteen years at Newcastle on the 30th of May 1323, which Bruce ratified at Berwick. In 1327 Edward III. became king of England, and one of the first acts of the new reign, after a narrow escape of the young king from capture by Moray, was the treaty of York, ratified at Northampton in April 1328, by which it was agreed that "Scotland, according to its ancient bounds in the days of Alexander III., should remain to Robert, king of Scots, and his heirs free and divided from England, without any subjection, servitude, claim or demand whatsoever." Joanna, Edward's sister, was to be given in marriage to David, the infant son of Bruce, born subsequent to the settlement of 1318 and now recognized as heir to the crown, and the ceremony was celebrated at Berwick on the 12th of July 1328.

The chief author of Scottish independence barely survived his work. He appears to have conducted an expedition to Ireland in 1327, and on his return led a foray into England. His last years were chiefly spent at the castle of Cardross on the Clyde, which he acquired in 1326, and the conduct of war, as well as the negotiations for peace, had been left to the young leaders, Moray and Sir James Douglas, whose training was one of Bruce's services to his country. Ever active, he employed himself in the narrower sphere of repairing the castle and improving its domains and gardens, in shipbuilding on the Clyde, and in the exercise of the virtues of hospitality and charity. The religious feeling, which had not been absent even during the struggles of manhood, deepened in old age, and took the form the piety of the times prescribed. He made careful provision for his funeral, his tomb, and masses for his soul. He procured from the pope a bull authorizing his confessor to absolve him even at the moment of death. He died at Cardross from leprosy, contracted in the hardships of earlier life, on the 7th of June 1329, and was buried at Dunfermline beside his second wife, Elizabeth (d. 1327), daughter of Richard de Burgh, earl of Ulster, whom he had married about 1304, and who bore him late his only son, David, who succeeded him. Of two surviving daughters, Matilda married Thomas Ysaak, a simple esquire, and Margaret became the wife of William, earl of Sutherland. Marjorie, an only child by his first wife, Isabella, daughter of Donald, earl of Mar, had predeceased him. Several children not born in wedlock have been traced in the records, but none of them became in any way famous.

In fulfilment of a vow to visit the Holy Sepulchre, which he could not accomplish in person, Bruce requested Douglas to carry his heart there, but his faithful follower perished on the way, fighting in Spain against the Moors, and the heart of Bruce, recovered by Sir William Keith, found its resting-place at Melrose. When his corpse was disinterred in 1821 the breast-bone was found severed to admit of the removal of the heart, thus confirming the story preserved in the verses of Barbour. That national poet collected in the earliest Scottish poem, written in the reign of Bruce's grandson, the copious traditions which clustered round his memory. It is a panegyric; but history has not refused to accept it as a genuine representation of the character of the great king, in spirit, if not in every detail. Its dominant note is freedom—the liberty of the nation from foreign bondage, and of the individual from oppression. It is the same note which Tacitus embodied in the speech of Galgacus at the dawn of Scottish history. Often as it has been heard before and since in the course of history, seldom has it had a more illustrious champion than Robert the Bruce.

BIBLIOGRAPHY.—The chief contemporary authorities for the life of Bruce are coloured to some extent by the nationality of the writers. On the Scottish side *The Brus*, a poem by John Barbour, edited by W. W. Skeat (Edinburgh, 1894) and the *Chronica gentis Scotorum* of John of Fordun, edited by W. F. Skene (Edinburgh, 1871–72), are perhaps the most valuable. The *Chronicon de Lanercost*, edited by J. Stevenson (Edinburgh, 1839), is also very important. The English chronicles which may be consulted with advantage are those of Walter of Hemingford, edited by H. C. Hamilton (London, 1848–49); and of Peter Langtoft, edited by T. Wright (London, 1866–68), and the *Scalacronica* of Thomas Gray, edited by J. Stevenson (Edinburgh, 1836). For the documents of the time reference should be made to the *Calendar of Documents relating to Scotland*, edited by J. Bain (Edinburgh, 1881–88), *Documents and Records illustrating the History of Scotland*, vol. i., edited by F. Palgrave (London, 1837); the *Rotuli Scotiae* (London, 1814–19), and the *Foedera* of T. Rymer, vol. i. (London, 1704). The chief general histories are: Sir D. Dalrymple, Lord Hailes, *Annals of Scotland* (Edinburgh, 1819); P. F. Tytler, *History of Scotland* (Edinburgh, 1841–43); J. H. Burton, *History of Scotland*, vol. ii. (Edinburgh, 1853); A. Lang, *History of Scotland*, vol. i. (Edinburgh, 1904); R. Pauli, *Geschichte von England* (Hamburg, 1834–58). See also Sir H. Maxwell, *Robert the Bruce* (London, 1897).

ROBERT II. (1316–1390), called "the Steward," king of Scotland, was a son of Walter, the steward of Scotland (d. 1326), and of Marjorie (d. 1316), daughter of King Robert the Bruce, and was born on the 2nd of March 1316. In 1318 the Scottish parliament decreed that if King Robert died without sons the crown should pass to his grandson; but the birth of a son, afterwards King David II., to Bruce in 1324 postponed the accession of Robert for nearly forty-two years. Soon after the infant David became king in 1329, the Steward began to take a prominent part in the affairs of Scotland. He was one of the leaders of the Scottish army at the battle of Halidon Hill in July 1333; and after gaining some successes over the adherents of Edward Baliol in the west of Scotland, he and John Randolph, 3rd earl of Moray (d. 1346), were chosen as regents of the kingdom, while David sought safety in France. The colleagues soon quarrelled; then Randolph fell into the hands of the English and Robert became sole regent, meeting with such success in his efforts to restore the royal authority that the king was able to return to Scotland in 1341. Having handed over the duties of government to David, the Steward escaped from the battle of Neville's Cross in 1346, and was again chosen regent while the king was a captive in England. Soon after this event some friction arose between Robert and his royal uncle. Accused, probably without truth, of desertion at Neville's Cross, the Steward as heir-apparent was greatly chagrined by the king's proposal to make Edward III. of England, or one of his sons, the heir to the Scottish throne, and by David's marriage with Margaret Logie. In 1363 he rose in rebellion, and after having made his submission was again imprisoned together with four of his sons, being only released a short time before David's death in February 1371. By the terms of the decree of 1318 Robert now succeeded to the throne, and was crowned at Scone in March 1371. His reign in unimportant. Some steps were taken by the nobles to control the royal authority. In 1378 a war broke out with England; but the king took no part in the fighting, which included the burning of Edinburgh and the Scottish victory at Otterbourne in 1388. As age and infirmity were telling upon him, the estates in 1389 appointed his second surviving son Robert, earl of Fife, afterwards duke of Albany, guardian of the kingdom. The king died at Dundonald on the 13th of May 1390, and was buried at Scone. His first wife was Elizabeth, daughter of Sir Robert Mure of Rowallan, a lady who had formerly been his mistress. By her he had at least four sons, the eldest of whom was his successor, King Robert III. and six daughters. By his second wife, Euphemia, daughter of Hugh, earl of Ross, and widow of Moray, formerly his

colleague as regent, he had two sons and several daughters; and he had also many illegitimate children.

See Andrew of Wyntoun, *The Orygynale Cronykil of Scotland*, edited by D. Laing (Edinburgh, 1872–1879); John of Fordun, *Scotichronicon*, continued by Walter Bower, edited by T. Hearne (Oxford, 1722); John Major, *Historia majoris Britanniae*, translated by A. Constable (Edinburgh, 1892); and P. F. Tytler, *History of Scotland* (Edinburgh, 1841–1843).

ROBERT III. (*c.* 1340–1406), king of Scotland, was the eldest son of King Robert II. by his mistress, Elizabeth Mure, and was legitimatized when his parents were married about 1349. In 1368 he was created earl of Carrick, and he took some part in the government of the kingdom until about 1387, when he was disabled by the kick of a horse. He was probably in consequence of this accident that his brother Robert, earl of Fife, and not the crown prince himself, was made guardian of the kingdom in 1389; but the latter succeeded to the throne on his father's death in May 1390. At this time he changed his baptismal name of John, which was unpopular owing to its connexion with John de Baliol, for that of Robert, being crowned at Scone in August 1390 as King Robert III. Although he probably attended several parliaments the new king was only the nominal ruler of Scotland, the real power being in the hands of his brother, the earl of Fife. In 1399, however, owing to the king's "sickness of the body," his elder son, David, duke of Rothesay, was appointed lieutenant of the kingdom; but this event was followed by an English invasion of Scotland, by serious differences between Rothesay and his uncle, Robert, now duke of Albany, and finally in March 1402 by Rothesay's mysterious death at Falkland. Early in 1406 the king's only surviving son, afterwards King James I., was captured by the English; and on the 4th of April 1406 Robert died, probably at Rothesay, and was buried at Paisley. He married Annabella Drummond (*c.* 1350–1402), daughter of Sir John Drummond of Stobhall, and, in addition to the two sons already mentioned, had four daughters.

ROBERT I. (*c* 865–923), king of France, or king of the Franks, was the younger son of Robert the Strong, count of Anjou, and the brother of Odo, or Eudes, who became king of the western Franks in 888. Appointed by Odo ruler of several counties, including the county of Paris, and abbot *in commendam* of many abbeys, Robert also secured the office of duke of the Franks, a military dignity of high importance. He did not claim the crown of France when his brother died in 898; but recognizing the supremacy of the Carolingian king, Charles III., the Simple, he was confirmed in his offices and possessions, after which he continued to defend northern France from the attacks of the Normans. The peace between the king and his powerful vassal was not seriously disturbed until about 921. The rule of Charles, and especially his partiality for a certain Hagano, had aroused some irritation; and, supported by many of the clergy and by some of the most powerful of the Frankish nobles, Robert took up arms, drove Charles into Lorraine, and was himself crowned king of the Franks at Reims on the 29th of June 922. Collecting an army, Charles marched against the usurper, and on the 15th of June 923, in a stubborn and sanguinary battle near Soissons, Robert was killed, according to one tradition in single combat with his rival. Robert left a son, Hugh the Great, duke of the Franks, and his grandson was Hugh Capet, king of France.

See F. Lot, *Les Derniers Carolingiens* (Paris, 1891); and E. Lavisse, *Histoire de France*, tome ii. (Paris, 1903).

ROBERT II. (*c.* 970–1031), king of France, was a son of Hugh Capet, and was born at Orleans. He was educated at Reims under Gerbert, afterwards Pope Silvester II. As the ideal of medieval Christianity he won his surname of "Pious" by his humility and charity, but he also possessed some of the qualities of a soldier and a statesman. His father associated him with himself in the government of France, and he was crowned in December 987, becoming sole king on Hugh's death in October 996. Robert's reign is chiefly remembered for its dramatic side. In 988 he had married Rosala, or Susanna, widow of Arnold II., coun of Flanders. This lady, however, was much older than Robert, who repudiated her in 989, fixing his affections upon Bertha, daughter of Conrad the Peaceful, king of Burgundy, or Arles, and wife of Eudes I., count of Blois; and although the pair were related, and the king had been godfather to one of Bertha's children, they were married in 996, a year after the death of Eudes. Pope Gregory V., whose favour Robert vainly sought to win by allowing Arnulf, the imprisoned archbishop, to return to his see of Reims and forcing Gerbert to flee to the court of the emperor Otto III., excommunicated the king, and a council at Rome imposed a seven years' penance upon him. For five years the king braved all anathemas, but about 1002 he gave up Bertha and married Constance, daughter of a certain Count William, an intriguing and ambitious woman, who made life miserable for her husband, while the court was disturbed by quarrels between the partisans of the two queens. Still attached to Bertha, Robert took this lady with him to Rome in 1010, but the pope refused to recognize their marriage, and the king was forced to return to Constance. By this wife Robert had four sons, and in 1017, the eldest of these, Hugh, (1007–1025), was crowned as his father's colleague and successor. After Hugh's death the king procured the coronation of his second son, Henry, duke of Burgundy, afterwards king of France, a proceeding which displeased Constance, who wished her third son, Robert (d. 1075), afterwards duke of Burgundy, to receive the crown. Robert's concluding days were troubled by a rising on the part of these two sons, and after a short war, which he was worsted, the king died at Melun on the 20th of July 1031. The notable gain to France during this reign was the duchy of Burgundy, which Robert claimed on the death of his uncle, Duke Henry, in 1001. The other claimant, however, Otto William, count of upper Burgundy, or Franche Comté, offered so stubborn a resistance that it was not until 1015 that the king secured the duchy, which he gave as an apanage to his son Henry. Nevertheless, Robert himself kept a close oversight over its government, and this was one reason which led to the revolt of his sons in 1030. Owing to family quarrels, he could not prevent the kingdom of Burgundy, or Arles, from passing into the hands of the emperor Conrad II., and no serious results followed his interference in Flanders or in Lorraine. Robert added to the royal domains, and was greatly aided by the support of Richard II. and Richard III., dukes of Normandy, the latter of whom was his son-in-law.

His life was written by his chaplain, Helgaud, and this panegyric, *Epitoma vitae Roberti regis*, is published by J. P. Migne in the *Patrologia Latina*, tome cxli. (Paris, 1844). See also C. Pfister, *Études sur le règne de Robert le Pieux* (Paris, 1885); and E. Lavisse, *Histoire de France*, tome ii. (Paris, 1901).

ROBERT (1275–1343), king of Naples, was the son of Charles II., duke of Anjou and king of Naples, and in his youth took part in several expeditions to Sicily with the object of wresting the island from Frederick III. of Aragon. But his efforts, like those of his father and grandfather, proved fruitless, and the Angevins were compelled at last to agree to the peace of Caltabellotta (1302). On the death of Charles in 1309 Robert succeeded to the throne, although his nephew Caroberto (Carlo Roberto), son of his elder brother Charles Martel, who had died before his father, had a prior claim. He was crowned by Pope Clement V. at Avignon, and on the descent into Italy of the emperor Henry VII. was appointed papal vicar in Romagna to resist the imperialists; thenceforth he became the recognized leader of the Guelphs or papal faction in Italy and took part in all the wars against the Ghibellines. On various occasions he obtained for himself or his sons the suzerainty over Rome, Florence, and other cities, and was regarded as the most powerful Italian prince of his day. Pope John XXII. created him papal vicar in Italy against the emperor Louis the Bavarian. In 1320 Robert summoned his kinsman Philip V. of France to Italy, and he waged war against Sicily once more from 1325 to 1341, but failed to drive out the Aragonese. He died in 1343, just as he was about to lead another expedition to the island. Robert was a man of learning, devoted to

literature, and a generous patron of literary men: he befriended the poet Petrarch, who admired the king so greatly as to express the wish to see him lord of all Italy; while Boccaccio celebrated the virtues and charms of Robert's natural daughter Maria, under the name of Fiammetta. Dante was perhaps too severe on Robert, whom he described as a *re da sermone* (word king), and contemporary critics accused him of covetousness, a fault partly excused by his pressing need of money to pay the expenses of his perpetual wars. In spite of his power and influence, his position as a leader of the Guelphs was greatly shaken during the latter years of his reign, while at home he was never able completely to subjugate his rebellious barons.

See G. Villani, *Cronache*; M. Murena, *Vita di Roberto d'Angiò, re di Napoli* (Naples, 1770); and *Archivio storico Siciliano* (1884, viii. 511 seq.).

ROBERT, the name of two dukes of Normandy.

ROBERT I. (d. 1035), called Robert the Devil, was the younger son of Richard II., duke of Normandy (d. 1026), who bequeathed to him the county of Exmes. In 1028 he succeeded his brother, Richard III., whom he was accused of poisoning, as duke of Normandy. His time was mainly spent in fighting against his rebellious vassals. At his court Robert sheltered the exiled English princes, Edward, afterwards King Edward the Confessor, and his brother Alfred, and fitted out a fleet for the purpose of restoring them to their inheritance, but this was scattered by a storm. When returning from a pilgrimage to Jerusalem, he died at Nicaea on the 22nd of July 1035. His successor as duke was his natural son, William the Conqueror, afterwards king of England. In addition to winning for him his surname, Robert's strength and ferocity afforded material for many stories and legends, and he is the subject of several poems and romances (see ROBERT THE DEVIL below).

ROBERT II. (*c.* 1054–1134) was the eldest son of William the Conqueror. Although recognized in boyhood as his father's successor in Normandy, he was soon dissatisfied with his position, and about 1078, following a quarrel between his brothers and himself, he revolted. He was obliged to fly from his own country, but after a period of exile he returned, raised some troops, and began to harry the duchy, wounding his father during a skirmish at Gerberoi early in 1079. He was, however, quickly forgiven, and passed two or three years in England and in Normandy until 1083, when he entered upon a second term of exile. When the Conqueror died in September 1087 Robert became duke of Normandy, but not king of England; although he received offers of help, he took no serious steps to displace his younger brother, King William II. In Normandy his rule was weak and irresolute. He lost the county of Maine, which for some years had been united with Normandy, and he was soon at variance with his brothers, the younger of whom, Henry, he seized and put into prison. In 1089 his duchy was invaded by William II., who soon made peace with Robert, the two agreeing to dispossess their brother Henry of his lands in Normandy. This peace lasted until 1094, when occasions of difference again arose and another struggle began, Robert being aided by King Philip I. of France.

This warfare ended in 1096, when Robert set out on the first crusade, having raised money for this purpose by pledging his duchy to William for 10,000 marks. With his followers he journeyed to Constantinople; then he took part in the siege of Nicaea, the battle of Dorylaeum, and the famous battle under the walls of Antioch in June 1098. He shared in the siege of Jerusalem and other exploits of the crusade, while one account says that he was offered and refused the crown of the new Latin kingdom. Having won a great reputation both for valour and for generosity, the duke left Palestine and arrived in Normandy in September 1100.

William Rufus died while Robert was on his homeward way, and in Italy the Norman duke was greeted as king of England; but when he reached Normandy he learned that the English throne was already in the possession of Henry I. In July 1101 he crossed over to England, intending to contest his brother's title, but Henry met him near Alton, in Hampshire, and an amicable arrangement was made between them. Having received presents and the promise of a pension, Robert went quietly home. But the fraternal strife was not allayed. Henry had interests in Normandy in addition to the county of Evreux, which Robert ceded to him about 1102. Visits were exchanged, but no lasting peace was made, and in 1106 the English king crossed over to Normandy, where Robert was in great extremities. At the battle of Tinchebrai, fought on the 28th of September 1106, Henry took his brother prisoner and carried him to England. For twenty-eight years the unfortunate duke was a captive, first in the Tower of London, and later in the castles of Devizes and Cardiff, but the evidence goes to show that he was not treated with cruelty. He died probably at Cardiff on the 10th of February 1134. Robert had a son, William, called the Clito, and several natural children. He was called Curthose, and also Gambaron, his figure being short and stout. Although wanting in decision of character, he was a skilled and able warrior, and the chroniclers tell many stories, some of them obviously legendary, of his exploits in the Holy Land.

The chief sources for the life of Robert II. are Ordericus Vitalis, William of Malmesbury and other chroniclers of the time. See E. A. Freeman, *History of the Norman Conquest* (1870–76), and *The Reign of Rufus* (1882).

ROBERT GUISCARD [*i.e.* "the resourceful"] (*c.* 1015–1085), the most remarkable of the Norman adventurers who conquered southern Italy. From 1016 to 1030 the Normans were pure mercenaries, serving either Greeks or Lombards, and then Sergius of Naples, by installing the leader Rainulf in the fortress of Aversa in 1030, gave them their first pied-à-terre and they began an organized conquest of the land. In 1030 there arrived William and Drogo, the two eldest sons of Tancred of Hauteville, a petty noble of Coutances in Normandy. The two joined in the organized attempt to wrest Apulia from the Greeks, who by 1040 had lost most of that province. In 1042 Melfi was chosen as the Norman capital, and in September of that year the Normans elected as their count William "Iron Arm," who was succeeded in turn by his brothers Drogo, "comes Normannorum totius Apuliae et Calabriae," and Humfrey, who arrived about 1044. In 1046 arrived Robert, the sixth son of Tancred of Hauteville. His tall stature, blonde colouring and powerful voice are strikingly described by Anna Comnena.

Guiscard soon rose to distinction. The Lombards turned against their allies and Leo IX. determined to expel the Norman freebooters. The army which he led towards Apulia in 1053 was, however, overthrown at Civitate on the Fortore by the Normans united under Humfrey, Guiscard and Richard of Aversa. In 1057 Robert succeeded Humfrey as count of Apulia and, in company with Roger his youngest brother, carried on the conquest of Apulia and Calabria, while Richard conquered the principality of Capua. The Papacy, foreseeing the breach with the emperor over investitures, now resolved to recognize the Normans and secure them as allies. Therefore at Melfi, on the 23rd of August 1059, Nicholas II. invested Robert with Apulia, Calabria, and Sicily, and Richard with Capua. Guiscard "by Grace of God and St Peter duke of Apulia and Calabria and future lord of Sicily" agreed to hold by annual rent of the Holy See and to maintain its cause. In the next twenty years he made an amazing series of conquests. Invading Sicily with Roger, the brothers captured Messina (1061) and Palermo (1072). Bari was reduced (April 1071) and the Greeks finally ousted from southern Italy. The territory of Salerno was already Robert's; in December 1076 he took the city, expelling its Lombard prince Gisulf, whose sister Sikelgaita he had married. The Norman attacks on Benevento, a papal fief, alarmed and angered Gregory VII., but pressed hard by the emperor, Henry IV., he turned again to the Normans, and at Ceprano (June 1080) reinvested Robert, securing him also in the southern Abruzzi, but reserving Salerno. Guiscard's last enterprise was his attack on the Greek Empire, a rallying ground for his rebel vassals. He

contemplated seizing the throne of the Basileus and took up the cause of Michael VII., who had been deposed in 1078 and to whose son his daughter had been betrothed. He sailed with 16,000 men against the empire in May 1081, and by February 1082 had occupied Corfu and Durazzo, defeating the emperor Alexis before the latter (October 1081). He was, however, recalled to the aid of Gregory VII., besieged in San Angelo by Henry IV. (June 1083). Marching north with 36,000 men he entered Rome and forced Henry to retire, but an émeute of the citizens led to a three days' sack of the city (May 1084), after which Guiscard escorted the pope to Rome. His son Bohemund, for a time master of Thessaly, had now lost the Greek conquests. Robert, returning to restore them, occupied Corfu and Kephalonia, but died of fever in the latter on 17th of July 1085, in his 70th year. He was buried in S. Trinità at Venosa. Guiscard was succeeded by Roger "Borsa," his son by Sikelgaita; Bohemund, his son by an earlier Norman wife Alberada, being set aside. At his death Robert was duke of Apulia and Calabria, prince of Salerno and suzerain of Sicily. His successes had been due not only to his great qualities but to the "entente" with the Papal See. He created and enforced a strong ducal power which, however, was met by many baronial revolts, one being in 1078, when he demanded from the Apulian vassals an "aid" on the betrothal of his daughter. In conquering such wide territories he had little time to organize them internally. In the history of the Norman kingdom of Italy Guiscard remains essentially the hero and founder, as his nephew Roger II. is the statesman and organizer.

The best modern authorities are F. Chalandon, *Histoire de la domination normande en Italie et en Sicile* (Paris, 1907); and L. von Heinemann, *Geschichte der Normannen in Unteritalien* (Leipzig, 1894). Contemporary authors: Amatus, *Ystoire de li Normant*, ed. Delarc (Rouen, 1892); Geoffrey Malaterra and William of Apulia, both in Muratori Rer. Ital. SS., vol. v., and Anna Comnena in *Corpus script. hist. Byz.* (Bonn, 1839). (E. Cu.)

ROBERT OF AUXERRE (*c.* 1156–1212), French chronicler, was an inmate of the monastery of St Marien at Auxerre. At the request of Milo de Trainel (1155–1202), abbot of this house, he wrote a *Chronicon*, or universal history, which covers the period between the creation of the world and 1211. For the years previous to 1181 this is merely a compilation from Prosper of Aquitaine, Sigebert of Gembloux and others, but it is an original authority for the period from 1181 to 1211. It is one of the most valuable sources for the history of France during the reign of Philip Augustus, and it also contains information about other European countries, the Crusades and affairs in the East. Molinier, in fact, describes the author as one of the best historians of the middle ages. Robert was evidently a man of great diligence and of sound judgment. Two continuators took the work down to 1228 and it was extensively used by later chroniclers. The original manuscript is now at Auxerre.

The *Chronicon* was first published by N. Camuzat at Troyes in 1608; the best edition is in Band xxvi. of the *Monumenta Germaniae historica. Scriptores*, with introduction by A. Holder-Egger. Robert has been identified, but on very questionable grounds, with a certain Robert Abolant, an official of the monastery of St Marien, who died in 1214. See A. Molinier, *Les Sources de l'histoire de France*, tomes iii. and iv. (1903–1904).

ROBERT OF COURTENAY (d. 1228), emperor of Romania, or Constantinople, was a younger son of the emperor Peter of Courtenay, and was descended from the French king, Louis VI., while his mother Yolande was a sister of Baldwin and Henry of Flanders, the first and second emperors of Constantinople. When it became known in France that Peter of Courtenay was dead, his eldest son, Philip, marquess of Namur, renounced the succession to the Latin empire of Constantinople in favour of his brother Robert, who set out to take possession of his distracted inheritance, which was then ruled by Conon of Béthune as regent. Crowned emperor on the 25th of March 1221, Robert, who was surrounded by enemies, appealed for help to the pope and to the king of France; but meanwhile his lands were falling into the hands of the Greeks. Some little aid was sent from western Europe, but soon Robert was compelled to make peace with his chief foe, John Ducas Vataces, emperor of Nicaea, who was confirmed in all his conquests. Robert promised to marry Eudoxia, daughter of the late emperor of Nicaea, Theodore Lascaris I., a lady to whom he had been betrothed on a former occasion; however, he soon repudiated this engagement, and married a French lady, already the fiancée of a Burgundian gentleman. Heading a conspiracy, the Burgundian drove Robert from Constantinople, and early in 1228 the emperor died in Achaia.

ROBERT OF GLOUCESTER, English chronicler, is known only through his connexion with the work which bears his name. This is a vernacular history of England, from the days of the legendary Brut to the year 1270, and is written in rhymed couplets. The lines are of fourteen syllables, with a break after the eighth syllable. The author gives his name as Robert; the dialect which he uses, and his acquaintance with local traditions, justify the supposition that he was a monk of Gloucester. He describes, from his own recollections, the bad weather which prevailed in the neighbourhood of Evesham on the day of the battle between the Montfortians and Prince Edward (1265). He also alluded to the canonization of Louis IX. of France, which took place in 1297. He probably wrote about the year 1300. The earlier part of his chronicle (up to 1135) may be from another hand, since it occurs in some manuscripts in a shorter form, and with an exceedingly brief continuation by an anonymous versifier. There is no good reason for the theory that this part was translated from a French original; nor does it contain any undoubted borrowings from French sources. The authorities employed for the earlier part were Geoffrey of Monmouth, Henry of Huntingdon, William of Malmesbury, the English Chronicles, and some minor sources; Robert, in making his recension of it, also used the *Brut* of Layamon. From 1135 to 1256 Robert is still a compiler, although references to oral tradition become more frequent as he approaches his own time. From 1256 to 1270 he has the value of a contemporary authority. But he is more important to the philologist than to the historian. His chronicle is one of the last works written in Old English.

Robert's chronicle was first edited by T. Hearne (2 vols., Oxford, 1724); but this text is now superseded by that of W. Aldis Wright (Rolls Series, 1887). Minor works attributed to the author are: a *Life of St Alban* in verse (MS. Ashmole 43); a *Life of St Patrick*, also in verse (MS. Tanner 17); a *Life of St Bridget* (MS. C.C.C. Cambridge, 145); and a *Life of St Alphege* (MS. Cott., Julius D. ix). A *Martyrdom of St Thomas Becket* and a *Life of St Brendan*, both attributed to Robert, were printed by the Percy Society in 1843.

See T. D. Hardy's *Descriptive Catalogue of MSS.* i. 25, 68, iii. 181–189; J. K. Brossman, *Über die Quellen der Chronik des R. von Gloucester* (Striegau, 1887); W. Ellmer in *Anglia* (1888), x. 1–37, 291–322; H. Strohmeyer, *Der Stil der Reimchronik R. von Gloucester* (Berlin, 1891). (H. W. C. D.)

ROBERT OF JUMIÈGES (d. *c.* 1070), archbishop of Canterbury, was a Norman who became prior of St Ouen at Rouen and then abbot of Jumièges. A close friend of the future king of England, Edward the Confessor, he crossed over to England with Edward in 1042, and in 1044 became bishop of London. In English history Robert appears as the most trusted and the most prominent of the king's foreign friends, and as the leader of the party hostile to the influence of Earl Godwine. In 1051, although the chapter had already made an election, Edward appointed him archbishop of Canterbury. He seems to have been sent by the king on an errand to Duke William of Normandy, and on the return of Godwine from exile in 1052 he fled in great haste from England. He was outlawed and deposed, and he died at Jumièges about 1070. The treatment of Robert by the English was put forward by William the Conqueror as a pretext for invading England.

See *Two Saxon Chronicles*, edited by J. Earle and C. Plummer (Oxford, 1892); and E. A. Freeman, *History of the Norman Conquest* (Oxford, 1870–76).

ROBERT OF TORIGNI (*c.* 1110–1186), medieval chronicler, was prior of Bec in 1149, and in 1154 became abbot of Mont

St Michel, whence he is also sometimes called Robertus de Monte. He died, according to Potthast, on the 29th of May 1186. He wrote additions and appendices to the chronicle of Sigebert of Genblours, covering the period A.D. 385–1100, and a chronicle in continuation of Sigebert, extending from 1100 to 1186, of great value for Anglo-Norman history. Robert was in a good position to obtain information, for the Mont St Michel was one of the four great centres of pilgrimage in Europe. But he was excessively timid and cautious, and hardly mentions events, like the murder of Becket, which were subjects of controversy. Besides, his style is that of the driest annalist. It is for continental affairs between 1154 and 1170 that his information is especially valuable. His notices of English affairs are slight and sometimes misleading.

The best modern editions are the *Chronique de Robert de Torigni, &c.*, edited by Léopold Delisle for the *Soc. de l'histoire de Normandie* (Rouen, 1872–1873), and *Chronicle of Robert of Torigni*, edited, with an introduction, by Richard Howlett (Rolls Series, No. 82, iv. 1889).

ROBERT THE DEVIL, hero of romance. He was the son of a duke and duchess of Normandy, and by the time he was twenty was a prodigy of strength, which he used, however, only for outrage and crime. At last he learnt from his mother, in explanation of his wicked impulses, that he was born in answer to prayers addressed to the devil. He was directed by the pope to a hermit, who imposed on him by way of penance that he should maintain absolute silence, feign madness, take his food from the mouth of a dog, and provoke ill-treatment from the common people without retaliating. He became court fool to the emperor at Rome, and delivered the city from Saracen invasions in three successive years in the guise of an unknown knight, having each time been bidden to fight by a celestial messenger. The emperor's dumb daughter recovered speech to declare the identity of the court fool with the deliverer of the city, but Robert refused the hand of the princess and the imperial inheritance, and ended his days in the hermitage of his old confessor.

The French romance of *Robert le Diable* is one of the oldest versions of the legend, and differs in detail from the popular tales printed in the 15th and 16th centuries. It was apparently founded on folk-lore, not on the wickedness of Robert Guiscard or any historical personage; but probably the name of Robert and the localization of the legend may be put down to the terror inspired by the Normans. In the English version the hero is called Sir Gowther, and the scene is laid in Germany. This metrical romance dates from the beginning of the 15th century, and is based, according to its author, on a Breton lay. The legend had undergone much change before it was used by E. Scribe and C. Delavigne in the libretto of Meyerbeer's opera of *Robert le Diable*.

See *Robert le Diable*, ed. E. Löseth (Paris, 1903, for the Soc. des anc. textes fr.); *Sir Gowther*, ed. K. Breul (Oppeln, 1886); M. Tardel, *Die Sage v. Robert d. Teufel in neueren deutschen Dichtungen* (Berlin, 1900). Breul's edition of the English poem contains an examination of the legend, and a bibliography of the literature dealing with the subject. The English prose romance of *Robert the Devyll* was printed (*c.* 1510) by Wynkyn de Worde.

ROBERT THE STRONG (le Fort) (d. 866), count of Anjou and of Blois, is said by Richerus to have been the son of a certain Witichin, but nothing definite is known about his parentage or early life. Quickly attaining a prominent position among the Frankish nobles, he appears as rector of the abbey of Marmoutier in 852, and as one of Charles the Bald's *missi dominici*, in 853; but soon afterwards he was among those who rebelled against Charles, and invited the king's half-brother, Louis the German, to invade West Francia. However, after the peace between Charles and Louis in 860 Robert came to terms with his sovereign, who made him count of Anjou and of Blois, and entrusted him with the defence of that part of his kingdom which lay between the Seine and the Loire, a district which had suffered greatly from the ravages of the Normans and the Bretons. By his conduct in many stubborn fights with these foes, Robert thoroughly earned his surname and gained the confidence of the king, who gave him the counties of Nevers and Auxerre. He was killed in battle at Brissarthe in October 866, leaving two sons, Odo, or Eudes, and Robert, both of whom became kings of the Franks. Robert has been compared to the Maccabees, and the fact that he was the ancestor of the Capetian kings of France has invested him with historical importance.

See K. von Kalckstein, *Robert der Tapfere* (Berlin, 1871); and E. Favre, *Eudes, comte de Paris et roi de France* (Paris, 1893).

ROBERT, HUBERT (1753–1808), French artist, born at Paris in 1753, deserves to be remembered not so much for his skill as a painter as for the liveliness and point with which he treated the subjects he painted. The contrast between the ruins of ancient Rome and the life of his time excited his keenest interest; and, although he had started for Italy on his own responsibility, the credit he there acquired procured him the protection of the minister Marigny and an official allowance. His incessant activity as an artist, his daring character, his many adventures, attracted general sympathy and admiration. In the fourth canto of his *L'Imagination* Delille celebrated Robert's miraculous escape when lost in the catacombs; later in life, when imprisoned during the Terror and marked for the guillotine, by a fatal accident another died in his place and Robert lived. The quantity of his work is immense; the Louvre alone contains nine paintings by his hand and specimens are frequently to be met with in provincial museums and private collections. Robert's work has more or less of that scenic character which justified his selection by Voltaire to paint the decorations of his theatre at Ferney. Robert died of apoplexy on the 15th of April 1808. His work was much engraved by the abbé Le Non, with whom he had visited Naples in the company of Fragonard during his early days; in Italy his work has also been frequently reproduced by Chatelain, Liénard, Le Veau, and others.

See C. Blanc, *Hist. des peintres*; Villot, *Notice des tableaux du Louvre*; Julius Meyer, *Gesch. mod. fr. Malerei*.

ROBERT, LOUIS LÉOPOLD (1794–1835), French painter, was born at Chaux de Fonds (Neuchâtel) in Switzerland on the 13th of May 1794, but left his native place with the engraver Girardet at the age of sixteen for Paris. He was on the eve of obtaining the *grand prix* for engraving when the events of 1815 blasted his hopes, for Neuchâtel was restored to Prussia, and Robert was struck off the list of competitors as a foreigner. Whilst continuing his studies under Girardet he had never ceased to frequent the studio of David, and he now determined to become a painter, and only returned to his native country when his master himself was exiled. At Neuchâtel he attracted the notice of Roullet de Mezerac, who enabled him by a timely loan to proceed to Rome. In depicting the customs and life of the people, of southern Italy especially, he showed peculiar feeling for the historical characteristics of their race. After executing many detached studies of Italian life Robert conceived the idea of painting four great works which should represent at one and the same time the four seasons in Italy and the four leading races of its people. In the "Return from the Fête of the Madonna dell' Arco" (Louvre) he depicted the Neapolitans and the spring. This picture, exhibited at the Salon of 1827, achieved undoubted success and was bought for the Luxembourg by Charles X.; but the work which appeared in 1831—the "Summer Reapers arriving in the Pontine Marshes" (Louvre), which became the property of Louis Philippe—established the artist's reputation. Florence and her autumn vineyards should now have furnished him with his third subject. He attempted to begin it, but, unable to conquer his passion for Princess Charlotte Napoleon (then mourning the violent death of her husband, Robert's devoted friend), he threw up his work and went to Venice, where he began and carried through the fourth of the series, the "Fishers of the Adriatic." This work was not equal to the "Reapers." Worn by the vicissitudes of painful feeling, and bitterly discouraged, Robert committed suicide before his easel on the 20th of March 1835, on the tenth anniversary of the melancholy suicide of a brother to whom he had been much attached.

See Villot, *Notice des tableaux du Louvre*; C. Blanc, *Hist. des peintres*; Feuillet de Conches, *Correspondance de L. L. Robert*; Julius Meyer, *Gesch. mod. fr. Malerei*.

ROBERT-FLEURY, JOSEPH NICOLAS (1797–1890), French painter, was born at Cologne. He was sent by his family to Paris, and after travelling in Italy returned to France and made his first appearance at the Salon in 1824; his reputation, however, was not established until three years later, when he exhibited "Tasso at the Convent of St Onophrius." Endowed with a vigorous original talent, and with a vivid imagination, especially for the tragic incidents of history, he soon rose to fame, and in 1850 succeeded Granet as member of the Académie des Beaux-Arts. In 1855 he was appointed professor and in 1863 director of the École des Beaux-Arts, and in the following year he went to Rome as director of the French Academy in that city. Among his chief works are: "A Reading at Mme. de Sévigné's," "Scene of St Bartholomew," "Henry IV. taken to the Louvre after his Assassination" (1836); "Triumphal Entry of Clovis at Tours" (1838), at the Versailles Museum; "Le Colloque de Poissy" (1840), at the Luxembourg Museum in Paris; "The Children of Louis XVI. in the Temple" (1840); "Marino Faliero"; "An Auto-da-fé," "Galileo before the Holy Office," at the Luxembourg Museum; "Christopher Columbus received by the Spanish Court" (1847), at the same gallery; "The Last Moments of Montaigne" (1853); and "Charles V. in the Monastery of Yuste" (1857). He died in Paris in 1890.

His son, TONY ROBERT-FLEURY (1837–), French painter, was born in Paris, and studied under his father and under Delaroche and Léon Coignet. His first picture at the Salon, in 1866, was a large historical composition of the "Warsaw Massacres on April 8, 1861." In the following year his "Old Women in the Place Navone, Rome" was bought for the Luxembourg Museum, as was also the "Last Day of Corinth" in 1870. In 1880 he painted a ceiling for the Luxembourg, representing "The Glorification of French Sculpture." Tony Robert-Fleury became president of the Société des Artistes français in succession to Bouguereau. He acquired a great reputation for his historical compositions and portraits; and from his atelier have issued a great number of the best-known painters of our day.

ROBERTS, DAVID (1796–1864), Scottish painter, was born at Stockbridge, Edinburgh, on the 24th of October 1796. He was apprenticed by his father, a shoemaker, for seven years to a painter and house-decorator; and during this time he employed his evenings in the study of art. In 1820 he formed the acquaintance of Clarkson Stanfield, then painting at the Pantheon, Edinburgh, at whose suggestion he sent three pictures in 1822 to the Exhibition of Works by Living Artists, held in Edinburgh. In the same year he removed to London, where he worked for the Coburg Theatre, and was afterwards employed, along with Stanfield, at Drury Lane. In 1824 he exhibited at the British Institution a view of Dryburgh Abbey, and sent two works to the first exhibition of the Society of British Artists, of which he was elected president in 1832. In the same autumn he visited Normandy, and the works which were the results of this excursion began to lay the foundation of the artist's reputation—one of them, a view of Rouen Cathedral, being sold for eighty guineas. His scenes for an opera, *The Seraglio*, executed two years later, and the scenery for a pantomime dealing with the naval victory of Navarino, and two panoramas executed jointly by him and Stanfield, were among his last work for the theatres. In 1829 he exhibited the "Departure of the Israelites from Egypt," in which his style first becomes apparent; three years afterwards he travelled in Spain and Tangiers, returning in the end of 1833 with a supply of effective sketches, elaborated into attractive and popular paintings. His "Interior of Seville Cathedral" was exhibited in the British Institution in 1834, and sold for £400; and he executed a fine series of Spanish illustrations for the *Landscape Annual* of 1836, while in 1837 a selection of his *Picturesque Sketches in Spain* was reproduced by lithography.

In 1838 Roberts made a long tour in the East, and accumulated a vast collection of sketches of a class of scenery which had hitherto been hardly touched by British artists, and which appealed to the public with all the charm of novelty. The next ten years of his life were mainly spent in elaborating these materials. An extensive series of drawings was lithographed by Louis Haghe in *Sketches in the Holy Land and Syria*, 1842–1849. In 1851, and again in 1853, Roberts visited Italy, painting the "Ducal Palace, Venice," bought by Lord Londesborough, the "Interior of the Basilica of St Peter's, Rome," "Christmas Day, 1853," and "Rome from the Convent of St Onofrio," presented to the Royal Scottish Academy. His last volume of illustrations, *Italy, Classical, Historical and Picturesque*, was published in 1859. He also executed, by command of Queen Victoria, a picture of the opening of the Great Exhibition of 1851. In 1839 he was elected an associate and in 1841 a full member of the Royal Academy; and in 1858 he was presented with the freedom of the city of Edinburgh. The last years of his life were occupied with a series of views of London from the Thames. He had executed six of these, and was at work upon a picture of St Paul's Cathedral, when, on the 25th November 1864, he died suddenly of apoplexy.

A *Life* of Roberts, compiled from his journals and other sources by James Ballantine, with etchings and pen-and-ink sketches by the artist, appeared in Edinburgh in 1866.

ROBERTS, FREDERICK SLEIGH ROBERTS, EARL (1832–), British soldier, second son of General Sir Abraham Roberts, K.C.B., was born at Cawnpore, India, on the 30th of September 1832. Educated at Eton, Sandhurst and Addiscombe, he obtained a commission in the Bengal Artillery on 12th December 1851. In the following year he was posted to a field battery at Peshawar, where he also acted as aide-de-camp to his father, who commanded the Peshawar division. In 1856 Roberts was appointed to the quartermaster-general's department of the staff, in which he remained for twenty-two years, passing from one grade to another until he became quartermaster-general in India. On the outbreak of the Mutiny in 1857, Roberts, at first, was staff officer to the movable column operating against the mutineers in the Punjab, successively commanded by Colonels Neville Chamberlain and John Nicholson, but, towards the end of June, he joined the Delhi Field Force, as assistant and deputy assistant quartermaster-general with the artillery during the operations against Delhi. He was wounded in the fight of the 14th of July, but was sufficiently recovered in September to take command as a regimental officer of the left half of No. 2 Siege Battery during the siege. He rejoined the headquarters staff for the assault, and took part in the storm and subsequent seven days' fighting in the city. He then accompanied Colonel Greathed's column to Cawnpore, and during September and October was present at the actions of Bulandshahr, Aligarh, Agra, Bithur and Kanauj. He served under Sir Colin Campbell at the second relief of Lucknow in November, at the battle of Cawnpore on the 6th of December, and the subsequent pursuit and defeat of the Gwalior contingent under Scindiyapur. Roberts distinguished himself at the engagement of Khudaganj, on the 2nd of January 1858, by capturing, in single-handed combat, a standard from two sepoys, and also by cutting down a sepoy about to kill a sowar. For these acts of gallantry he was recommended for the Victoria Cross. He was present at the reoccupation of Fatehgarh on the 6th of January, the storm of Mianganj in February, the siege and capture of Lucknow in March, and the action at Kursi on the 22nd of that month, after which he went home on sick leave. For his services in the Mutiny he was seven times mentioned in despatches, received the medal with three clasps, the Victoria Cross, and on his promotion to captain, in October 1860, a brevet majority. On the 17th of May 1859 he married, at Waterford, Miss Nora Bews, and on his return to India was entrusted with the organization of the viceroy's camps during the progresses through Oudh, the North-West Provinces, the Punjab and Central India in 1860 and 1861. In December 1863 he took part, under

Major-General Garvock, in the Umbeyla campaign among the mountains to the north of Peshawar, and was present at the storm of Lalu, the capture of Umbeyla, and the destruction of Mulka, receiving for his services the medal and clasp.

In 1867 Roberts was appointed assistant quartermaster-general to Sir Donald Stewart's Bengal Brigade for Abyssinia. He showed judgment in embarking each unit complete in every detail, instead of despatching camp equipage in one ship, transport in another, and so on, as was customary. He arrived at Zula, Annesley Bay, in the Red Sea, the base of the expedition, on the 3rd of February 1868, and remained there as senior base staff officer during the four months' campaign. At its close he superintended the re-embarkation of the whole army. His duties were so well performed that Sir Robert Napier sent him home with his final despatches. He was three times "mentioned," and received a brevet lieutenant-colonelcy and the war medal. He returned to India the following year as first assistant quartermaster-general. In the autumn of 1871 he made the arrangements for the expedition into Lushai, between south-east Bengal and Burma, fitted out two columns under Brigadiers-General Bourchier and Brownlow, and himself accompanied the first. A road, over 100 m. long, was cut through dense gloomy forests in stifling heat, and the column was attacked by cholera; but the object of the expedition was successfully accomplished, and Roberts, who was present at the capture of the Khoki villages and the action in the Northlang range, and commanded the column at the burning of Taikum, was mentioned in despatches and made a Companion of the Bath. On his return in March 1872, he became deputy quartermaster-general in Bengal, and in 1875 quartermaster-general and colonel. He settled the details of the great camp of exercise at Delhi on the occasion of the visit of the prince of Wales in January 1876, and attended H.R.H. at the manœuvres. He also superintended the arrangements for the great durbar at Delhi on the 1st of January 1877, when Queen Victoria was proclaimed empress of India.

In 1878 Roberts was appointed to the command of the Frontier Field Force at Abbottabad, in Hazara; but in the autumn, on the repulse of the Chamberlain Mission by the Afghans, and the insertion of three columns to advance into Afghanistan by the Khyber, the Bolan and the Kurram passes, he was given the command of the Kurram Field Force, with the rank of major-general. Concentrating his column at Thal, he advanced to Kurram towards the end of November, and having formed an advanced base there, moved on to Habib Kila. Under cover of preparations for a front attack on the Peiwar Kotal, he reconnoitred that formidable position, and on the night of the 1st of December moved part of his force to attack the Spingawi Kotal, in order to turn the Afghan left flank, leaving the remainder of the force to feign a front attack on the Peiwar, and to guard the camp. After a very difficult night march the Spingawi Kotal was carried at daybreak on the 2nd, and, later, the Afghans on the Peiwar Kotal, threatened in rear, abandoned the position. The next morning Roberts occupied the Peiwar, and on the 6th advanced to Ali Khel. He reconnoitred the Shutargardan and the Sapari passes, and made a strong reconnaissance through Khost, in which some fighting took place, and at the end of January returned to Hagir Pir, in Kurram, where his force remained in occupation. In July Major Cavagnari, the British envoy to the new amir, Yakub Khan, passed through Kurram on his way to Kabul, and, shortly afterwards, Roberts left his Kurram command and went to Simla to take his seat on the army commission, where he strongly advocated the abolition of the three Presidency armies, and the substitution for them of four army corps, a measure which was carried out sixteen years later. While he was at Simla, news arrived on the 5th of September of the murder of Cavagnari and his companions at Kabul. The Peshawar Valley Force had been broken up; Sir Donald Stewart was still at Kandahar, but most of his troops had started for India; Roberts, therefore, had the only force ready to strike rapidly at Kabul. It was hastily reinforced, and he hurried back to Kurram to take command, as a lieutenant-general, of the Kabul Field Force (7500 men and 22 guns). By the 19th of September a brigade was entrenched on the Shutargardan, and as Roberts advanced, the Amir Yakub Khan came into his camp. An Afghan force of 8000 men blocked the way in a strong position on the heights beyond Charasia, and on the 6th of October Roberts repeated the tactics that had done him such good service at the Peiwar in the previous year, and sending Brigadier-General T. D. Baker with the greater part of his force to turn the Afghan right flank, threatened the pass in front with the remainder. By the afternoon Baker had seized the position, and the enemy, severely defeated, were in full retreat. Kabul was occupied without further opposition.

The city was spared, but punishment was meted out to those convicted of complicity in the murder of the British Mission. Yakub Khan abdicated on the 12th of October, and was eventually deported to India. The troops occupied the Sherpur cantonments; but in November a religious war was proclaimed by the Mullahs, and early in December, in order to prevent a threatening combination of Afghan tribes against him, Roberts moved out two columns to attack them in detail. After considerable fighting around Kabul, the numbers of the enemy were so great that he was forced to concentrate his troops again at Sherpur, the defences of which had been greatly improved and strengthened. Sherpur was invested by the Afghans, and early on the 23rd of December was attacked by over 100,000 Afghans. They were driven off with great loss; and on making a second attempt to storm the place, were met by Roberts, who moved out, attacked them in flank, and defeated them, when they broke and dispersed. Roberts now recommended the political dismemberment of Afghanistan, and negotiations were carried on with the northern tribes for the appointment of an amir for the Kabul district only. On the 5th of May Sir Donald Stewart arrived with his column from Kandahar and assumed the supreme command in Afghanistan, Roberts retaining, under Stewart, the command of the two Kabul divisions, and organizing an efficient transport corps under Colonel R. Low, which was soon to be of inestimable value. On the 22nd of July Abdur Rahman was proclaimed Amir of Kabul; and Roberts was preparing to withdraw his troops to India by the Kurram route, when news arrived that a British brigade had been totally defeated at Maiwand on the 27th of July, and that Lieutenant-General Primrose was besieged in Kandahar. Roberts was ordered to proceed thither at once with a specially selected column of 10,000 troops and his new transport corps. He started on his famous march on the 9th of August and arrived at Kandahar on the morning of the 31st, having covered 313 miles in twenty-two days. On the following day he fought the battle of Kandahar and gained a complete victory. His services in the Afghan campaigns of 1878 to 1880 are recorded in eight *Gazettes*, and were recognized by the thanks of both Houses of Parliament, of the Government of India, and of the Governor-General in Council. He was created K.C.B., G.C.B. and a baronet, received the medal with four clasps and the bronze star, and was given the command of the Madras army.

Before proceeding to Madras, Roberts went home on furlough, and when the news of the disaster at Majuba Hill in South Africa arrived in London at the end of February 1881, he was appointed governor of Natal and commander-in-chief in South Africa. He arrived at Cape Town to find that peace had been made with the Boers, and that instructions were awaiting him to return home. The same year he attended the autumn manœuvres in Hanover as the guest of the German emperor. He declined the post of quartermaster-general to the forces in succession to Sir Garnet Wolseley, and returned to India, arriving at Madras in November. The following year he visited Burma with the viceroy, and in 1885 attended the meeting between Abdur Rahman and Lord Dufferin at Rawalpindi at the time of the Panjdeh incident, in connexion with which he had been nominated to the command of an army corps in

case of hostilities. In July he succeeded Sir Donald Stewart as commander-in-chief in India, and during his seven years' tenure of this high position instituted many measures for the benefit of the army, and greatly assisted the development of frontier communications and defence. At the end of 1886, at the request of the viceroy, he took personal command for a time of the forces in Burma, and organized measures for the suppression of dacoity. For his services he received the medal, was created G.C.I.E., and promoted supernumerary general. In 1890 he did the honours of the army to Prince Albert Victor at a standing camp at Muridki, and in 1891 his attention was occupied with the Zhob and Hunza Nagar frontier campaigns. On the 1st of January 1892 he was raised to the peerage as Baron Roberts of Kandahar and Waterford. In 1893 he left India for good, and the G.C.S.I. was bestowed upon him. He was promoted to be field-marshal in 1895, and in the autumn of that year succeeded Lord Wolseley in the Irish command and was sworn a privy councillor. At Queen Victoria's diamond jubilee in 1897 he was created K.P.

After the disastrous actions in the Boer war in South Africa in December 1899 at Magersfontein, Stormberg and Colenso, where his only son was killed, Lord Roberts was sent out as commander-in-chief. He arrived at Cape Town on the 10th of January 1900, and after organizing his force, advanced with sound strategy on Bloemfontein, the capital of the Orange Free State, and soon changed the aspect of affairs. The sieges of Kimberley and Ladysmith were raised, and the Boer general, Cronje, flying towards the capital, was overtaken at Paardeberg and, after a fine defence, compelled to surrender, with 5000 men, on the anniversary of Majuba Day, the 27th of February 1900. Roberts entered Bloemfontein on the 13th of March, and after six weeks' preparation, advanced on Pretoria, the capital of the Transvaal. Mafeking was relieved on the 17th of May, and Pretoria occupied on the 5th of June. The two Boer states were annexed, and the war gradually assuming a guerilla character, Roberts handed over the command to Lord Kitchener and returned to England to fill the office of commander-in-chief of the army in succession to Lord Wolseley.

He arrived in the Solent on the 2nd of January 1901, and the same day, at Osborne, had an audience of Queen Victoria, who handed him the insignia of the Order of the Garter. The next day he was received at Paddington by the prince and princess of Wales, and drove in procession to Buckingham Palace, where he was entertained as the guest of the queen. He again had an audience of the queen at Osborne on the 14th of January on his elevation to an earldom, the last audience given by her majesty before her death, which took place eight days later. When the German emperor came to London for the queen's funeral, he decorated Lord Roberts with the Order of the Black Eagle. Earl Roberts received the thanks of both Houses of Parliament and a grant of £100,000 for his services in South Africa. In 1905 he resigned his post on the Committee of National Defence, and devoted himself to attempting to rouse his countrymen to the necessity of cultivating rifle-shooting and of adopting systematic general military training and service. As an author he is known by his *Rise of Wellington* (1893), and his *Forty-One Years in India* (1897), an autobiography which has passed through numerous editions.

ROBERTSON, FREDERICK WILLIAM (1816–1853), English divine, known as Robertson of Brighton, was born in London on the 3rd of February 1816. The first five years of his life were passed at Leith Fort, where his father, a captain in the Royal Artillery, was then resident. The military spirit entered into his blood, and throughout life he was characterized by the qualities of the ideal soldier. In 1821 Captain Robertson retired to Beverley, where the boy was educated. At the age of fourteen he spent a year at Tours, from which he returned to Scotland and continued his education at the Edinburgh Academy and university. In 1834 he was articled to a solicitor in Bury St Edmunds, but the uncongenial and sedentary employment soon broke down his health. He was anxious for a military career, and his name was placed upon the list of the 3rd Dragoons, then serving in India. For two years he worked hard in preparing for the army, but, by a singular conjunction of circumstances and at the sacrifice of his own natural bent to his father's wish, he matriculated at Brasenose College, Oxford, just two weeks before his commission was put into his hands. Oxford he did not find wholly congenial to his intensely earnest spirit, but he read hard, and, as he afterwards said, "Plato, Aristotle, Butler, Thucydides, Sterne, Jonathan Edwards, passed like the iron atoms of the blood into my mental constitution." At the same time he made a careful study of the Bible, committing to memory the entire New Testament both in English and in Greek. The Tractarian movement had no attraction for him, although he admired some of its leaders. He was at this time a moderate Calvinist in doctrine, and enthusiastically evangelical. Ordained in July 1840 by the bishop of Winchester, he at once entered on ministerial work in that city, and during his ministry there and under the influence of the missionaries Henry Martyn and David Brainerd, whose lives he studied, he carried devotional asceticism to an injurious length. In less than a year he was compelled to seek relaxation; and going to Switzerland he there met and married Helen, third daughter of Sir George William Denys, Bart. Early in 1842, after a few months' rest, he accepted a curacy in Cheltenham, which he retained for upwards of four years. The questioning spirit was first aroused in him by the disappointing fruit of evangelical doctrine which he found in Cheltenham, as also by intercourse with men of varied reading. And we are to judge from his own statement in a letter from Heidelberg in 1846, the doubts which now actively assailed him had long been latent in his mind. The crisis of his mental conflict had just been passed in Tirol, and he was now beginning to let his creed grow again from the one fixed point which nothing had availed to shift: "The one great certainty to which, in the midst of the darkest doubt, I never ceased to cling—the entire symmetry and loveliness and the unequalled nobleness of the humanity of the Son of Man." After this mental revolution he felt unable to return to Cheltenham, but after doing duty for two months at St Ebbe's, Oxford, he entered in August 1847 on his famous ministry at Trinity Chapel, Brighton. Here he stepped at once into the foremost rank as a preacher, and his church was thronged with thoughtful men of all classes in society and of all shades of religious belief. His fine appearance, his flexible and sympathetic voice, his manifest sincerity, the perfect lucidity and artistic symmetry of his address, and the brilliance with which he illustrated his points would have attracted hearers even had he had little to say. But he had much to say. He was not, indeed, a scientific theologian; but his insight into the principles of the spiritual life was unrivalled. As his biographer says, thousands found in his sermons "a living source of impulse, a practical direction of thought, a key to many of the problems of theology, and above all a path to spiritual freedom." His closing years were full of sadness. His sensitive nature was subjected to extreme suffering, arising mainly from the opposition aroused by his sympathy with the revolutionary ideas of the 1848 epoch. Moreover, he was crippled by incipient disease of the brain, which at first inflicted unconquerable lassitude and depression, and latterly agonizing pain. On the 5th of June 1853 he preached for the last time, and on the 15th of August he died.

Robertson's published works include five volumes of sermons, two volumes of expository lectures, on Genesis and on the epistles to the Corinthians, a volume of miscellaneous addresses, and an *Analysis of "In Memoriam."* See *Life and Letters* by Stopford A. Brooke (1865).

ROBERTSON, GEORGE CROOM (1842–1892), Scottish philosopher, was born at Aberdeen on the 10th of March 1842. In 1857 he gained a bursary at Marischal College, and graduated M.A. in 1861, with the highest honours in classics and philosophy. In the same year he won a Fergusson scholarship of £100 a year for two years, which enabled him to pursue his studies outside Scotland. He went first to University

College, London; at Heidelberg he worked at German; at Berlin he studied psychology, metaphysics and also physiology under du Bois-Reymond, and heard lectures on Hegel, Kant and the history of philosophy, ancient and modern. After two months at Göttingen, he went to Paris in June 1863. In the same year he returned to Aberdeen and helped Alexander Bain with the revision of some of his books. In 1864 he was appointed to help Professor Geddes with his Greek classes, but he gave up the vacations to philosophical work. In 1866 he was appointed professor of philosophy of mind and logic at University College, London. This post he retained until ill-health compelled him to resign a few months before his death in 1892. He lectured on logic, deductive and inductive, systematic psychology and ethical theory. He left little published work. A comprehensive work on Hobbes was never completed, though part of the materials were used for an article in the *Encyclopaedia Britannica*, and another portion was published as one of Blackwood's "Philosophical Classics." Together with Bain, he edited Grote's *Aristotle*, and was the editor of *Mind* from its foundation in 1876 till 1891. He was keenly interested in German philosophy, and took every opportunity of making German works on English writers known in the United Kingdom. In philosophy he followed mainly Mill and Bain, but he was acquainted with all philosophical literature. He was associated with his wife (a daughter of Mr Justice Crompton) in many kinds of social work; he sat on the Committee of the National Society for Women's Suffrage, and was actively associated with its president, John Stuart Mill. He warmly supported the admission of women students to University College.

ROBERTSON, JOSEPH (1810–1866), Scottish antiquary, was born at Aberdeen on the 17th of May 1810, the son of a small shopkeeper. He was educated in Marischal College in Aberdeen and was for some years engaged in literary and newspaper work there and in Glasgow and Edinburgh. In 1839 he helped to found the Spalding Club, organized to publish the historical, genealogical, topographical and literary remains of the north-eastern counties of Scotland, and he edited eight of its thirty-eight volumes. In 1853 he was appointed curator of the historical and antiquarian department of the General Register House, Edinburgh, hitherto a subordinate and unimportant office, but which, in his hands, became of the first consequence to the interests of antiquarian literature in Scotland. His inventory of the personal property and jewels of Mary Queen of Scots, prefaced by a paper of great learning and research, and his essays on Scottish architecture, preceded his greatest work, published by the Bannatyne Club (1866), *Concilia Scotiae, Ecclesiae Scoticanae Statuta*. In 1864 the University of Edinburgh conferred upon him the honorary degree of LL.D. He died on the 13th of December 1866.

ROBERTSON, THOMAS WILLIAM (1829–1871), English actor and dramatist, was born at Newark on the 9th of January 1829. As a dramatist he had a brief but very brilliant career. The son of a provincial actor and manager, chief of a "circuit" that ranged from Bristol to Cambridge, Robertson was familiar with the stage from his childhood. He was the eldest of a large family, the actress Margaret (Madge) Robertson (Mrs Kendal) being the youngest. His success came late. A farcical comedy by him, *A Night's Adventure*, was produced at the Olympic under Farren's management as early as 1851, but this did not make good his footing, and he remained for some years longer in the provinces, varying his work as an actor with miscellaneous contributions to newspapers. In 1860 he went to London, and edited a mining journal to which he contributed a novel afterwards dramatized with the title *Shadow Tree Shaft*. He was at one time prompter at the Olympic under the management of Charles Mathews. He wrote a farce entitled *A Cantab*, which was played at the Strand Theatre in 1861. This brought him a reputation in a Bohemian clique, but so little practical assistance that he thought of abandoning the profession to become a tobacconist. Then, in 1864, came his first marked success, *David Garrick*, produced at the Haymarket with Edward Sothern in the principal character. It was not, however, till the production of *Society* at the Prince of Wales Theatre in 1865, under the management of Miss Marie Wilton, afterwards Mrs Bancroft, that the originality and cleverness of the dramatist were fully recognized. Play-writer and company were exactly suited one to another; the plays and the acting together—the small size of the playhouse being also in their favour—were at once recognized as a new thing. Although some critics sneered at the "cup-and-saucer comedy," voted it absurdly realistic, said there was nothing in it but commonplace life represented without a trace of Sheridanian wit and sparkle, all London flocked to the little house in Tottenham Street, and the stage was at once inundated with imitations of the new style of acting and the new kind of play. Robertson, although his health was already undermined, rapidly followed up *Society* with a series of characteristic plays which made the reputation of himself, the company and the theatre. All his best known plays (except *David Garrick*) were written for the old Prince of Wales's under the Bancrofts, and that régime is now an historical incident in the progress of the English stage. *Ours* was produced in 1866, *Caste* in 1867, *Play* in 1868, *School* in 1869, *M.P.* in 1870. Unhappily, Robertson enjoyed his success for but a short time. He died in London on the 3rd of February 1871. His work is notable for its masterly stagecraft, wholesome and generous humour, bright and unstrained dialogue, and high dramatic sense of human character in its theatrical aspects.

See *Principal Dramatic Works of Robertson; with Memoir by his son* (1889); and T. E. Pemberton, *Life and Writings of Robertson* (1893).

ROBERTSON, WILLIAM (1721–1793), Scottish historian, born at Borthwick, Mid Lothian, on the 19th of September 1721, was the eldest son of the Rev. William Robertson. He was educated at the school of Dalkeith and the university of Edinburgh. He was from the first intended for the ministry; in 1743 he was presented to the living of Gladsmuir in East Lothian, and two years later he lost both his father and his mother, who died within a few hours of each other. The support and education of a younger brother and six sisters then devolved upon him, though at that time his income was less than £100 a year. Robertson's inclination for study was never allowed to interfere with his duties as a parish minister, and his power as a preacher had made him a local celebrity while still a young man.

His energy and decision of character were brought out vividly by the rebellion of 1745. When Edinburgh seemed in danger of falling into the hands of the rebels he joined the volunteers in the capital. When the city was surrendered he was one of the small band who repaired to Haddington and offered their services to the commander of the royal forces. Such a man could not remain in obscurity, and in 1746 he was elected a member of the General Assembly, where his influence as leader of the "moderate" party was for many years nearly supreme (see PRESBYTERIANISM).

During all this period of prominent activity in the public life of Edinburgh, Robertson was busy with his historical labours. His *History of Scotland*, begun in 1753, was published in 1759. Till he had finished his book Robertson had never left his native country; but the publication of his history necessitated a journey to London, and he passed the early months of the year 1758 partly in the capital and partly in leisurely rambles in the counties of England. The success of the *History of Scotland* was immediate, and within a month a second edition was called for. Before the end of the author's life the book had reached its fourteenth edition; and it soon brought him other rewards than literary fame. In 1759 he was appointed chaplain of Stirling Castle, in 1761 one of His Majesty's chaplains in ordinary, and in 1762 he was chosen principal of the university of Edinburgh. In May 1763 he was elected Moderator of the General Assembly, and in August of the same year the office of king's historiographer was revived in his favour with a salary of £200 a year.

The rest of Robertson's life was uneventful. His *History of*

the Reign of the Emperor Charles the Fifth occupied ten consecutive years of labour. It appeared in three volumes quarto in 1769. In 1777 he published his *History of America* and in 1791 his *Disquisition concerning the Knowledge which the Ancients had of India*, which concluded his historical labours and appeared only two years before his death, which occurred near Edinburgh on the 11th of June 1793. His fame had long been European, and he left no rival in the field of historical composition save Gibbon alone.

For an adequate appreciation of Robertson's position in British literature, and more especially of his rank as an historian, we have to consider the country and the age in which he was born and his own personal qualities and limits. Considering the small size and poverty of the country, Scotland had made a more than creditable figure in literature in the great age of the Reformation and the Renaissance, and Scottish contributions to British literature in the last half of the 18th century were distinctly superior to those produced in the southern portion of the island.

Of the three great British historians of the 18th century two were Scotsmen. The exact place of Robertson with regard to his two friends Hume and Gibbon, and to such historians as the rest of Europe had to offer, presents a question of some nicety, because it is complicated by extraneous considerations, so to speak, which should not weigh in an abstract estimate, but cannot be excluded in a concrete and practical one. If we regard only Robertson's potential historic power, the question is not so much whether he was equal to either of his two friends as whether he was not superior to both. The man who wrote the review of the state of Europe prefixed to the *History of Charles V.*, or even the first book of the *History of Scotland*, showed that he had a wider and more synthetic conception of history than either the author of the *Decline and Fall* or the author of the *History of England*. These two portions of Robertson's work, with all their shortcomings in the eye of modern criticism, have a distinctive value which time cannot take away. He was one of the first to see the importance of *general ideas* in history. He saw that the immediate narrative of events with which he was occupied needed a background of broad and connected generalizations, referring to the social life of which the detailed history formed a part. But he did more than this. In the appendix to the view of Europe called "Proofs and Illustrations" he enters into the difficult and obscure question of land tenure in Frankish times, and of the origin of the feudal system, with a sagacity and knowledge which distinctly advanced the comprehension of this period beyond the point at which it had been left by Du Bos, Montesquieu and Mably. He was well acquainted with the original documents,—many of them, we may conjecture, not easy to procure in Scotland. It must have been a genuine aptitude for historical research of a scientific kind which led Robertson to undertake the labour of those austere disquisitions of which there were not many in his day who saw the importance. Gibbon, so superior to him for wide reading and scholarship, has pointedly avoided them. Robertson's views are now out of date. But he deserves the honour of a pioneer in one of the most obscure if also important lines of inquiry connected with European history. On the other hand, it must be admitted that he showed himself only too tame a follower of Voltaire in his general appreciation of the middle ages, which he regarded with the mingled ignorance and prejudice common in the 18th century. In this particular he was not at all in advance of his age.

The neglect and gradual oblivion which have overtaken the greater part of Robertson's historical work are owing to no fault of his. He had not and could not have the requisite materials: they were not published or accessible. Justice requires that we should estimate his performance in view of the means at his command, and few critics would hesitate to subscribe to the verdict of Buckle, "that what he effected with his materials was wonderful." His style is singularly clear, harmonious and persuasive. The most serious reproach made against it is that it is correct to a fault and lacks idiomatic vigour, and the charge is not without foundation. But there can be no doubt that, if Robertson's writings are less read than they formerly were, the fact is to be attributed to no defects of style but to the growth of knowledge and to the immense extension of historical research which has inevitably superseded his initiatory and meritorious labours.

By his wife, Mary Nisbet, whom he married in 1751, Robertson left three sons: William (1753–1835), who in 1805 was raised to the Scottish bench as Lord Robertson; James, who became a general in the British army; and David, who in 1799 married Margaret, sister of Colonel Donald Macdonald and heiress of Kinloch-Moidart, whose surname he assumed.

There are lives of Robertson by Dugald Stewart (Edinburgh, 1801 and 1802), prefixed to most of the collective editions of his works; by George Gleig, bishop of Brechin (Edinburgh, 1812); and by Lord Brougham in *Lives of Men of Letters*, &c. (1845–1846).

ROBERTSON, WILLIAM BRUCE (1820–1886), Scottish divine, was born at Greenhill, St Ninians, Stirlingshire, on the 24th of May 1820, and was educated at Glasgow University and at the Secession Theological Hall, Edinburgh, where he made the acquaintance of Thomas de Quincey, and on his recommendation went to Halle and studied under Tholuck. After travelling in Italy and Switzerland he was licensed to preach by the presbytery of Stirling and Falkirk in 1843, and was soon after ordained at the Secession (after 1847, the United Presbyterian) Church in Irvine, Ayrshire. In this charge he remained for 35 years, exercising from his pulpit a truly magnetic influence, not so discernible in his published sermons. From 1871 his health failed, in spite of several visits to Florence and the Riviera. He resigned his charge in 1878 and died at Bridge of Allan on the 27th of June 1886.

He wrote many hymns, among them a version of "Dies Irae"; several of them, together with letters, &c., are to be found in the *Life* by James Brown. A volume containing Robertson's lectures on Martin Luther and other subjects was published in 1892.

ROBERVAL, GILLES PERSONNE (or PERSONIER) **DE** (1602–1675), French mathematician, was born at Roberval, near Beauvais, on the 8th of August 1602. His name was originally Gilles Personne, that of Roberval, by which he is known, being taken from the place of his birth. Like René Descartes, he was present at the siege of La Rochelle in 1627. In the same year he went to Paris, where he was appointed to the chair of philosophy in the Gervais College in 1631, and two years later to the chair of mathematics in the Royal College of France. A condition of tenure attached to this chair was that the holder should propose mathematical questions for solution, and should resign in favour of any person who solved them better than himself; but, notwithstanding this, Roberval was able to keep the chair till his death, which occurred at Paris on the 27th of October 1675.

Roberval was one of those mathematicians who, just before the invention of the infinitesimal calculus, occupied their attention with problems which are only soluble, or can be most easily solved, by some method involving limits or infinitesimals, and in the solution of which accordingly the calculus is always now employed. Thus he devoted some attention to the quadrature of surfaces and the cubature of solids, which he accomplished, in some of the simpler cases, by an original method which he called the "Method of Indivisibles"; but he lost much of the credit of the discovery as he kept his method for his own use, while Bonaventura Cavalieri published a similar method which he himself had invented. Another of Roberval's discoveries was a very general method of drawing tangents, by considering a curve as described by a moving point whose motion is the resultant of several simpler motions. (See INFINITESIMAL CALCULUS.) He also discovered a method of deriving one curve from another, by means of which finite areas can be obtained equal to the areas between certain curves and their asymptotes. To these curves, which were also applied to effect some quadratures, Evangelista Torricelli gave the name of "Robervallian lines." Between Roberval and Descartes there existed a feeling of ill-will, owing to the jealousy aroused in the mind of the former by the criticism which Descartes offered to some of the methods employed by him and by Pierre de Fermat; and this led them to criticize and oppose the analytical methods which Descartes introduced into geometry about this time. As results of Roberval's labours outside the department of pure mathematics may be noted a work on the system of the universe, in which he supports the Copernican system and attributes a mutual attraction to all particles of matter;

and also the invention of a special kind of balance which goes by his name.

His works were published in 1693 by the Abbé Gallois, in the *Recueil of the Mémoires de l'Académie des Sciences*.

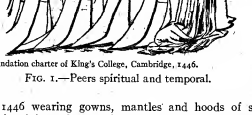
See J. A. N. de C. Condorcet, *Éloge de Roberval* (Paris, 1773): J. E. Montucla, *Histoire des mathématiques* (1802).

ROBES (Fr. *robe*, Late Lat. *roba*, *roupa*, meaning (1) spoils, (2) robe, stuff, cf. Mod. Ital. *roba*, connected with a Teutonic root *raub*, *raub*, German *rauben* and English *rob*), the name generally given to a class of official costume, especially as worn by certain persons or classes on occasions of particular solemnity. According to Du Cange, the word robe was earliest used, in the sense of a garment, of those given by popes and princes to the members of their household or their great officers. Thus Matthew Paris (*Chron. Majora*, Rolls Series, V. 38) tells how, in 1248, the pope gave to some Tatar envoys "vestes pretiosissimas quas Robas vulgariter appellamus, de escarleto praeelecto, cum pellibus et furruris," with which Du Cange compares the "festiva indumenta" given, *e.g.*, by King John *magnatum suorum multitudini* at Christmas time (1214, Matt. Paris, Rolls Series, II. 520) and the *raubae papales scutiferorum*, and the like, given by the popes to members of their households, after the fashion of a livery. It would, however, be perhaps going too far to assume that, *e.g.*, peers' robes were originally the king's livery, for there seems to be no proof that this was the case; but it is curious that in most early cases where robes are mentioned, if not of cloth of gold, &c., they are of scarlet, furred. A robe is properly a long garment, and the term "robes" is now applied only in those cases where a long garment forms part of the official costume, though in ordinary usage it is taken to include all the other articles of dress proper to the costume in question. The term "robes," moreover, connotes a certain degree of dignity or honour in the wearer. We speak of the king's robes of state, of peers' robes, of the robes of the clergy, of academic robes, judicial robes, municipal or civic robes; we should not speak of the robes of a cathedral verger, though he too wears a long gown of ceremony, and it is even only by somewhat stretching the term "robes" that we can include under it the ordinary academical dress of the universities. In the case of the official costume of the clergy, too, a distinction must be drawn. The *vestimenta sacra* are not spoken of as "robes"; a priest is not "robed" but "vested" for Mass; yet the rochet and chimere of an English bishop, even in church, are more properly referred to as robes than as vestments, and while the cope he wears in church is a vestment rather than a robe, the scarlet cope which is part of his parliamentary full dress is a robe, not a vestment. For the sake of convenience the official, non-liturgical costume of the clergy is dealt with under the general heading VESTMENTS and the subsidiary articles (*e.g.* COPE).

The coronation robes of emperors and kings, representing as they do the sacerdotal significance of Christian kingship, are essentially vestments rather than robes (see CORONATION). Apart from these, however, are the royal robes of state; in the case of the king of England a crimson velvet surcoat and long mantle, fastened in front of the neck, ermine lined, with a deep cape or tippet of ermine.[1]

The subject of official robes is too vast for any attempt to be made to deal with it comprehensively here. All countries, East and West, which boast an ancient civilization have retained them in greater or less degree, and the tendency in modern times has been to multiply rather than to diminish their number. Even in republican France they survived the Revolution, at least in the universities and the law courts. But nowhere has custom been so conservative in this matter as in the United Kingdom, where in this as in other matters the wise Machiavellian principle has been followed of changing the substance of institutions without altering their outward semblance. The present article, then, does not attempt to deal with any but British robes,[2] under the headings of (1) peers' robes, (2) robes in the House of Commons, (3) robes of the Orders of Knighthood, (4) judicial and forensic robes, (5) municipal and civic robes, (6) academic costume.

Peers' Robes.—As early as the end of the 14th century peers seem to have worn at their creation some kind of robe of honour; this we may conclude from the description of the investiture of the earl of Somerset in 1397 (*Rot. Parl.* iii. 343), which says: "le dit Monsieur John fut amesnée devant le Roy en Parlement entre deux Contes, c'est assavoir Huntyngdon et Mareschall, vestuz en un pane (Du Cange; *pannus* = 3. *habitus vestimentum*) come vesture de honor"; while in accounts of various creations of about the same time (*Rot. Parl.* iii. 205, 206) are used the words "advenienteque . . . prefato Duce honorifice . . . togato et ornato." An early illustration of their use is to be found in an illumination on the foundation charter of King's College, Cambridge (see fig. 1), which represents the peers as



From the foundation charter of King's College, Cambridge, 1446.

FIG. 1.—Peers spiritual and temporal.

early as 1446 wearing gowns, mantles and hoods of scarlet, furred with miniver, the mantle opening on the right shoulder and guarded with two, three or four bars of miniver, in the form of short stripes high up on the shoulder. The origin of these is as yet unknown, and it is not certain precisely when the peers' velvet robe of estate was first used. At the coronation of Henry VI. the king's own parliament robe was of scarlet and miniver (Gregory's *Chronicle*, ed. Gairdner, Camden Soc. pp. 165–70), so the peers' robes were certainly not yet of velvet; at that of Henry VII. (see *Rulland Papers*, 1842; "Device for the Coronation of Henry VII.") the king had a robe of crimson velvet and ermine, but the "lords temporall" are only said to have been "in their robes"; at that of Henry VIII. (see Hall's *Chronicle*) the king in his progress through the city wore a crimson velvet robe furred with ermine, "his knights and esquires for his body" wore crimson velvet, and "all the gentlemen," &c., scarlet, while we hear of the "lords spiritual and temporal, and of their costly and rich apparel, of several devises and fashions," and notably of the duke of Buckingham's robe of gold and needlework (Stow's *Annals*, p. 813), which would show that the velvet robe of estate was not yet worn at the king's coronation. The duke of Richmond at his creation in 1525 (17 Henry VIII., see Brewer, *State Papers*, iv. 659) is described as clad in robes of estate, and the description of the investiture says that "the patent was read, the *robe*, sword, cap and circlet put on," and about this time references are found to the "parliament robes" of peers, implying that there were others.

An account of the coronation of Anne Boleyn in 1533, in J. Nichols, *Progresses of Queen Elizabeth*, vol. i. p. 1, says that in her progress through the city "all the lordes for the most part were clothed in crimson velvet," while at

[1] For the sovereign's coronation robes, see "The King's Coronation Ornaments," by W. St John Hope, in *The Ancestor*, vols. i. and ii., also L. Wickham Legg, *English Coronation Records*, 1901. The "parliamentary robes" used to be of crimson or purple velvet, furred with ermine. See the above, also the inventories of the wardrobes of sovereigns, &c.

[2] In the United States few save Federal judges wear robes. The scarlet judicial robes were discarded at the Revolution. Those of black silk now worn are slightly modified academic gowns. John Jay, first Chief Justice of the Supreme Court (1787), set the fashion by sitting in the LL.D. gown granted him by Columbia University.

Westminster the barons and viscounts wore their parliament robes,[1] the earls, marquesses and dukes wearing their robes of estate of crimson velvet "furred with ermins, poudred according to their degrees." This was also the case at the coronation of James I., and in Selden's *Titles of Honour* (3rd ed., 1672) the illustrations show the baron and viscount in parliamentary robes, the higher ranks in robes of estate. By the time of James II.'s coronation, however, the baron and viscount had the velvet robes of estate (see illustration on p. 188 of Perkins's *The Coronation Book*, 1902, where the surcoat also appears to have a pointed collar edged with white and to be sleeveless). The colour of these seems to have been crimson at first, sometimes varying to purple. They consisted of a long gown or surcoat with girdle, a mantle lined with ermine, a hood and a tippet of ermine, the rows being as follows: for a duke 4, a marquess $3\frac{1}{2}$, an earl 3, a viscount $2\frac{1}{2}$, and a baron 2.

Till late in the 18th century peers continued to attend the House of Lords in parliamentary robes, with the stars and ribbons of their orders, but robes are now only worn in the House of Lords, *e.g.* at the opening of parliament, on occasions when the sovereign gives his assent to bills by "royal commission" (when five or six peers on the government side appear in robes, and the lord chancellor also wears his peer's robe of scarlet ermine), and at the introduction of a newly created peer, when the new peer and his two introducers wear their parliamentary robes (over morning dress) during the ceremony of introduction only. The mover and seconder of the address no longer wear robes, but uniform. On all the above occasions, and when the peers as a body attend church or some other ceremony, the parliamentary robe of scarlet cloth is worn; in the present day it takes the form of a mantle opening on the right shoulder, with a collar of "ermine," and guarded with rows of ermine and gold lace round the right shoulder, varying in number according to the rank of the wearer. The modern coronation robes consist of a crimson velvet surcoat and a mantle with a tippet of ermine and with rows of ermine as in the parliamentary robes. The surcoat is no longer a gown, but a short sleeveless garment.

For Scotland, an order of James II. (1455) prescribed for earls "mantles of brown granick colour," open before, lined and faced in front, as far as the girdle, with white fur, and with hoods to match; for the other lords of parliament a red mantle lined with silk or fur, with a furred hood, while James I. (and VI.) in 1606 had to issue an order restraining the Scotch peers from wearing velvet robes in parliament, and confining them to those of scarlet cloth (*Miscellany of the Maitland Club*, vol. i. p. 147). The robes of the Scottish peers are now, of course, similar to those of the others.

The peeresses' robes at the coronation of Anne Boleyn are also described in the account mentioned above. The duchess of Norfolk, the train-bearer, was followed by "ladies being lords' wives" in scarlet robes furred with "lettice," while Wriothesley (*loc. cit.*) adds that the duchess was also in scarlet.[2] The order of the earl-marshal for the regulation of the peeresses' robes at the coronation of James II. (given in J. H. T. Perkins's *The Coronation Book*, 1902, pp. 202-5) shows that by then all peeresses wore the robes of state of crimson velvet, and minutely regulates all details, such as shape, powderings, length of train and width of the fur edging of the mantle. They have changed very little up to the present day.

Robes of the Orders of Knighthood.—The history of the robes of the two oldest orders is given in great detail in Ashmole's *Order of the Garter* (London, 1672) and Anstis's *Order of the Bath* (London, 1725); see also G. F. Beltz, *Memorials of the Order of the Garter* (London, 1841), p. l-lii. In each case the robes consisted of a mantle, surcoat and hood. The robes of the Garter were originally of blue woollen stuff, the surcoat and hood being powdered with garters embroidered in silk and gold. In the time of Henry VI. the mantle was first made of velvet, and between the time of Elizabeth and of Charles I. it seems to have been sometimes purple in colour. The surcoat varied in colour from year to year; in the reign of the founder alone, *e.g.*, it was first blue, then black (possibly as a sign of mourning for the plague), then "sanguine in grain." The hood was made of the same material as the surcoat, and when hats began to be worn, was carried hanging over the shoulder. The number of garters embroidered on the surcoat and hood came to be fixed by rank, but after Henry VI. the surcoat seems to have been made of plain velvet. Robes were sometimes granted to ladies in the early days (see Beltz, p. ccxxi., for a list of those ladies), in which case the robe and hood were of the colour of the surcoat worn by the knights that year, and powdered with garters. The last lady to receive the robes was Margaret, countess of Richmond, in 1488. At the present day the mantle is of dark blue velvet, of the same colour as the ribbon, lined with this taffeta, and with the star embroidered on the left shoulder, the hood and surcoat of crimson velvet lined with white taffeta, and with these are worn a doublet and trunk-hose of white satin and a plumed hat (see Lawrence-Archer, *The Orders of Chivalry*, p. 106).

The robes worn by the knights of the Bath created at the coronation of Henry IV. were green with furred hoods, and a white silk cord hanging from the left shoulder.[3] In the various accounts of later creations of knights of the Bath quoted by Anstis, the costume worn before the ceremonial bath seems to have been a priest-like garment of russet or grey, with a girdle and hood; after the bath, was put on a red surcoat and mantle, the latter with a lace of white silk, from which hung a pair of white gloves; and the final costume was a blue (later a purple) velvet or satin gown, with hood furred with miniver (later lined with sarcenet), and the white cord hanging from the shoulder, until it should be removed by the sovereign or a lady for some deed of valour. The mantle in the present day is of crimson velvet lined with white over a white satin under-coat and trunk-hose, and a plumed hat and white boots with red tops are worn. The mantle of the Thistle is of dark green velvet, over surcoat, &c., of cloth of silver; that of St Patrick azure, with doublet and trunk-hose of white satin; that of St Michael and St George of Saxon blue satin lined with scarlet; and that of the Star of India of light blue satin lined with white.

House of Commons.—The speaker of the House of Commons wears on state occasions a black damask robe with gold lace and a full-bottomed wig; in the House itself he wears a black silk robe with train and a full-bottomed wig. The clerks at the table wear barristers' gowns and wigs.

Judicial and Forensic Robes.—It is frequently stated that judicial robes had their origin in the dress of ecclesiastics. But though ecclesiastics in early days frequently acted as judges, and though, as Fortescue says, the serjeants' long robe was "ad instar sacerdotis," judicial robes more probably arose from the ordinary civilian dress of the early 14th century. The chief argument for the ecclesiastical origin has been found in the coif (*tena*, *birretum album*), a cap of white linen or silk, tied under the chin, and described by Fortescue as "the principal or chief insignment and habit wherewith serjeants-at-law at their creation are decked," which is said to have been used by ecclesiastics to hide the tonsure when in court. This view is disposed of by Pulling (*The Order of the Coif*, London, 1884). More probably the coif was a head-dress in common use in the 13th century, which survived as the distinguishing mark of men of law.[4] As such it is found in a wardrobe-roll of

[1] "Longues cottes vertes a estroictes manches fourres de menever, et chapperons pareil fourres de menever, en guise de prelats; et avoient les dits chevaliers sur la senestre espaule ung double cordeau de soye blanche a blanche houppettes pendans" (Froissart).

[2] "And after her followed ladies being lordes' wives, which had circotes of scarlet, with narrow sleeves, the breast all lettice, with barres of pouders according to their degrees, and over that they had mantles of scarlet furred, and every mantle had lettice about the necke like a neckerchief, likewise poudered, so that by the poudrings their degrees might be known. Then followed ladies being knights' wives in gownes of scarlet."

[3] Mr Oswald Barron, in *The Ancestor*, vols. v. (p. 105) and vii. (p. 108 seq., plate xii.), has given reproductions of figures from MSS.

Richard II. (1391, see Fairholt, ii. 341) in an entry for "twenty-one linen coifs for counterfeiting men of the law in the king's play at Christmas." The serjeant-at-law's "houve of silk" is also mentioned in *Piers the Plowman* (latter half of the 14th century)[1] together with his furred cloak. Chaucer, at the same period, describes his serjeant-at-law as wearing a party-coloured gown and girdle with bars.[2]

The earliest document quoted by Planché and others with reference to judges' costume is a Close-roll of 20 Edw. III. (1347). See also a wardrobe-roll of 21 Edw. III., and wardrobe accounts of 11 Richard II. and 22 Henry VI., all quoted in Dugdale's *Origines Juridiciales*, from which we gather that the robes of the judges varied in colour, in the 14th and 15th centuries, from scarlet to green or "violet in grain," and that their winter gowns were furred with budge or miniver.

From a brass in Deerhurst church, Gloucestershire.

FIG. 2.—Sir John Cassy, chief baron of the Exchequer (*c.* 1400).

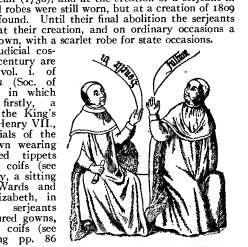
For the early 15th century there are more data. Firstly, there is the illumination of the serjeant-at-law in the Ellesmere MS. of *The Canterbury Tales* (reproduced in Furnivall's 6-text edition for the Chaucer Society), in which he is shown wearing a short, party-coloured mayed gown of red and blue, lined with white fur, a hood and tippet edged with white fur, and a white coif with two little bands showing below the hood. Secondly, there are a certain number of effigies or brasses of judges and serjeants belonging to the first half of the 15th century.[3] Of judges, an early brass is that of Sir John Cassy (*c.* 1400) (see fig. 2).[4]

For the second half of the 15th century the authority is Chief-Justice Fortescue, who, writing in the reign of Henry VI., describes the dress of the serjeant-at-law as follows:—

> "Roba longa ad instar sacerdotis cum capicio penulato circa humeros ejus, et desuper collobium, cum duobus labellulis, qualiter sui socii doctores legum in universitatibus quibuslibet, cum supra descripto birreto vestiebatur." "He was clothed in a long robe, after the fashion of a priest, with a furred cape about his shoulders, and above it a hood, with two bands, such as are used by doctors of laws in some universities, with the coif as described above" (*De Laudibus Legum Angliæ*, cap. lx.). Fortescue continues: "But being once made a justice, instead of his hood, he shall wear a cloak closed upon his right shoulder, all the other ornaments of a serjeant still remaining; saving that a justice shall wear no party-coloured vesture, as a serjeant may, and his cape is furred with miniver, whereas the serjeant's cape is furred with budge."[5]

This description of Fortescue's is borne out by some illuminations from a 15th-century MS. representing sittings of the four superior courts in the time of Henry VI. (reproduced in *Archaeologia*, vol. xxix. p. 358, &c., with an article by G. R. Corner; see plate). In them we see the scarlet robes of the judges furred with miniver, and the party-coloured mayed gowns, tippets and blackt furred with white, and scarlet; but the robe which they usually wear at their creation only is of two colours, viz. murrey and mouse colour; whereunto they have a hood suitable, as also a coif of white silk or linen." (See also Pulling, p. 218, and Druitt, p. 221.) Sir E. Ashbrook (*Proceedings of the Soc. of Antiquaries*, 2nd series, vol. iii. p. 414) quotes descriptions of calls of serjeants showing that as late as 1700 the serjeants wore party-coloured gowns at their creation and during the year following, and stating on what occasions they wore their black, scarlet or purple gowns (the last with scarlet or purple hoods). At the last general call (1736), and at the creation of a serjeant in 1762, party-coloured robes were still worn, but at a creation of 1809 they are no longer found. Until their final abolition the serjeants wore purple robes at their creation, and on ordinary occasions a black cloth or silk gown, with a scarlet robe for state occasions.

Illustrations of judicial costumes in the 16th century are to be found in vol. i. of *Vetusta Monumenta* (Soc. of Antiquaries, 1747), in which are reproduced, firstly, a "painted table in the King's Exchequer," *temp.* Henry VII., on which the officials of the Exchequer are shown wearing long gowns, furred tippets and mantles, with coifs (see fig. 3); and secondly, a sitting of the Court of Wards and Liveries, *temp.* Elizabeth, in which are shown serjeants wearing party-coloured gowns, tippets, hoods and coifs (see also Pulling, facing pp. 86 and 214).



From the Standard of Weights and Measures (*temp.* Henry VIII.), in *Vetusta Monumenta* (Soc. of Antiquaries), vol. i.

FIG. 3.—Figures wearing coif.

About this time the square cap, otherwise known as the cornered, black or sentence cap (the last from the fact of its being put on by the judge when pronouncing sentence of death), begins to be seen in monuments (cf. that of Sir Richard Harpur, *temp.* Mary; Fairhold, p. 223). Sometimes this cap is worn over the coif only, sometimes over the coif and skull-cap (cf. the portrait of Sir Edward Coke, in Pulling, facing p. 180). The form also varies; sometimes, as in the portrait of Coke, it has no ear-flaps, some times, as in its present form, it has. The form with ear-flaps is held by some to be a combination of the square cap and skull-cap. The square cap was a mark of dignity, worn or carried on solemn occasions, hence its use when pronouncing sentence of death, to mark the solemnity of the moment.

Among the State Papers of 1625 is a "Discourse on what robes and apparell the judges are to wear, and how the serjeants-at-law are to wear their robes, and when," and on the 4th of July 1635 there was a "solemn decree and rule made by all the judges of the courts at Westminster," which is quoted in Dugdale (*loc. cit.*) and Pulling (p. 215, footnote).

This costume is illustrated in Hollar's engraving of the coronation procession of Charles II. Towards the end of the 17th century the judges took to wearing wigs, and have continued to wear them ever since. The wearing of wigs naturally concealed the coif and velvet skull-cap, so a device had to be invented by which they could still be displayed. The expedient was hit upon of putting a round patch of white stuff, with a black spot in the middle of it, on the crown of the wig of certain of the judges, to represent the coif and skull-cap. The rank of serjeant no longer existing, this round patch has now disappeared, the only trace of it left being the circular depression on the crown of the wig.

The costume of judges of the High Court at the present day differs very little from that given in the order of 1635; but the cap is carried in the hand as a part of the full dress, and only worn when a judge is passing sentence of death.[6] The

[1] *Prol.* line 210 (ed. Skeat, Clarendon Press): "Jit houed there an hondreth in houues of silke, serianne it semed that serueden atte barre"; and iii. 293: "Shal no seriaunt for here seruyse were a silk howue, Ne no pelure in his cloke, for pleding atte barre."

[2] *Prol.* line 382 (ed. Morris, Clarendon Press): "He rood but homely in a medlee cote-armyr, A ceint of silk, with barres smale; of his array telle I no longer tale."

[3] The effigy "supposed to represent Sir Richard de Willoughby, chief justice of the king's bench" *temp.* Edward III., illustrated by Fairholt, p. 201, wears a long gown with full skull-cap, no distinctively judicial dress. The figure of Robert Grymbald (*temp.* Henry II.), engraved from his seal by Dugdale, wears the ordinary dress of the time.

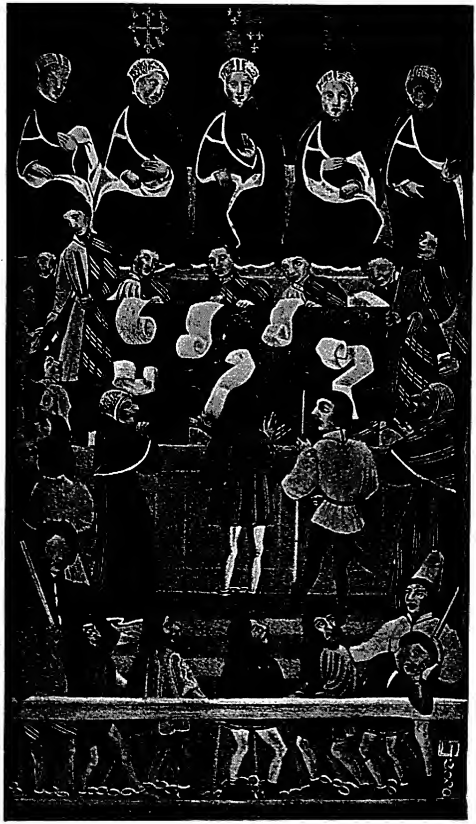
[4] See also that of Sir Hugh de Holes (1415; see Haines, *Brasses*, i. xc), and a stone effigy of Sir William Gascoigne in Harwood Church, Yorks (d. 1419, see Planché, *Cyclopaedia*, i. 427). Of serjeants-at-law, an early example is the brass of Nichol Rolond at Cople, Beds, (*c.* 1414), see Druitt, *Costume in Brasses*, p. 221); also the brass of Thomas Rolf at Gosfield, Essex (*c.* 1440, see Haines, p. 85), who wears a gown, tabard, tippet, hood and coif, with two bands showing below the hood, like the Ellesmere MS. figure. The inscription calls Rolf "legi professus," which Haines takes to mean "professor of law," Boutell and Clark (*Archaeological Journal*, vol. i. pp. 203–4) consider that he is a serjeant-at-law. Druitt (p. 224) remarks on the likeness of his tabard to that of a Master of Arts, but compares a figure on a 15th-century cope, who also appears to be a serjeant-at-law and wears a tabard. That a tabard sometimes formed part of the dress of a serjeant, can be seen in the extract from the *Liber famelicus* of Sir James Whitelocke, quoted by Druitt, p. 225, footnote.

[5] They were probably originally liveries; see G. R. Corner in *Archaeologia*, also Pulling, *op. cit.* pp. 211–12.

[6] See an essay by Sir Herbert Stephen in *Unwritten Laws and Ideals*, ed. E. H. Pitcairn (Smith, Elder, 1899), from which the following paragraph is largely condensed.

One of four illuminations belonging to a law treatise, *temp. Henry VI*, found at Whaddon Hall, Bucks, depicting five presiding judges of the Court of King's Bench, wearing coifs and scarlet robes; below the King's Coroner, Attorney and Masters of the Court; two ushers at table swearing the jury; a tipstaff in charge of a fettered prisoner, two sergeants at law in coif on either side; in foreground six prisoners.

From *Archæologia* XXXIX.



One of four illuminations belonging to a law treatise, *temp. Henry VI*, found at Whaddon Hall, Bucks, depicting five presiding judges of the Court of King's Bench, wearing coifs and scarlet robes; below the King's Coroner, Attorney and Masters of the Court; two ushers at table swearing the jury; a tipstaff in charge of a fettered prisoner, two sergeants at law in coif on either side; in foreground six prisoners.

From *Archæologia* XXXIX.

dress worn when trying criminal cases, attending church officially, and on "red letter days" in the courts, consists of a scarlet gown, with a broad black belt, a tippet trimmed with white fur, known by courtesy as "ermine" (this is worn only on state occasions), and a scarlet casting-hood, always worn with the scarlet gown, the end of which is passed under the belt. For summer the robes are of thinner stuff, faced with slate-coloured silk instead of ermine. The full-bottomed wig is worn on state occasions; at other times a wig is worn similar to that of barristers, except that it has one vertical curl just above the tail of the wig instead of the three rows of horizontal curls going all the way round.

The judges of the King's Bench Division have also a black gown, trimmed with ermine, which may be worn with the scarlet casting-hood when they sit two or more together. The summer equivalent of the black robes is in thin blue stuff, faced with silk. A costume like that of King's Counsel, namely, a black silk gown, with black cloth court suit, is the dress of judges when sitting alone to try civil actions, and of vice-chancellors and judges of the Chancery Division, but Sir Herbert Stephen remarks that of late years certain of the judges have preferred on grounds of comfort the black or blue gown with scarlet casting-hood. The court dress of the judges of the High Court and of Indian and colonial judges consists of a black damask tufted gown, without train, worn over a black velvet court suit, with full-bottomed wig, lace bands and three-cornered silk hat.[1]

The Lord Chancellor, when in the House of Lords, and sitting on Appeals, wears a black silk trained gown, over a black cloth court suit, with full-bottomed wig; he has also his peer's robe (see above), and his state robe of black damask with gold lace, worn over a velvet court suit, with full-bottomed wig, lace bands, &c.; the purse is carried on state occasions when in the royal presence. The state robe of the Master of the Rolls, the Lords Justices of the Court of Appeal, and the President of the Probate, Divorce and Admiralty Divisions is the same, except that they have not the purse, and similar to it is the full-dress gown of the Speaker of the House of Commons, the Chancellor of the Exchequer, &c. The Lords Justices of the Court of Appeal sit in court in a costume similar to that of King's Counsel.

The Lords of Appeal have no official robes, but sit in ordinary civilian dress. On state occasions they wear their peers' robes. The robes of state of the Lord Chief Justice of England are the same as those of the judges of the High Court, except that his are trained, and he wears the gold chain of office, the "collar of SS."

The Scottish judges have two sets of robes, one for Justiciary (*i.e.* the criminal court), which is also their full dress, and one for civil causes (Court of Session). The dress for the President and Ordinary Lords of Session was fixed in 1610 by an order of James I., and was of purple cloth, faced with crimson satin, with hood to match, the President's gown having crimson velvet instead of satin. The four "extraordinary Sessionaries" were to wear black velvet, satin, or silk gowns, lined with black. The Lord Justice General wore a scarlet gown lined with ermine and an ermine hood, the Lord Justice Deputy and Lord Justice Clerk black gowns with crimson satin facings and hoods (see *Register of the Privy Council of Scotland*, vol. viii. p. 612). At the foundation of the High Court of Justiciary (1672) it was enacted "that for the splendour of that court, all the judges sit in red robes, faced with white, that of the Justice Generalls being lined with ermine for distinction from the rest" (see *Acts of Parliament of Scotland*, vol. viii. p. 88). The present full dress of the Lord Justice General is a scarlet silk robe with tippet and hood, the hood falling down the back; the collar is of ermine, with which the tippet, sleeves and gown are edged and the hood lined. The Lord Justice Clerk wears a scarlet cloth robe and hood, and a white silk tippet lined with scarlet, the silk being perforated with small holes to imitate ermine, as also on the sleeves and edges of the gown. In front of the tippet on each side are two crosses in scarlet silk, and on each side of the gown six crosses. The ordinary Lords Commissioners of Justiciary have robes the same as those of the Lord Justice Clerk, except that the satin is not perforated. Instead of the bands worn by English judges, the Scottish judges wear a long fall in front.

The Bar.—There appears to have been no official costume for the bar until the end of the 17th century. Druitt (*Costume in Brasses*, pp. 232–33) gives a list of several brasses of *in lege periti*, or *apprenticii ad legem*, most of whom wear ordinary civilian costume, occasionally with the addition of a high cap. In the 16th and 17th centuries they wear the false-sleeved gown worn by civilians. Before the 17th century the costume worn by students at the Inns of Court and by "Utter Barristers" consisted of a stuff gown, and sometimes, in term-time, a round cap, which was worn in hall and in church (see Herbert, *History of the Inns of Court* (1804), p. 230). In Westminster Hall (see Pulling, p. 223) the same costume was worn, Benchers and Readers having a more elaborate gown with facings of black velvet and tufts of silk. Frequent laws were passed in the 16th century and later, forbidding the wearing of swords, cloaks, boots and spurs, &c., in hall, and insisting on the wearing of gowns by students of the Inns of Court when walking in the city. In the 17th century, barristers, like the judges, adopted wigs, the full-bottomed wigs being confined to judges, "King's Counsellors," &c., and ordinary counsellors wearing small wigs. In Hollar's engraving of the coronation of Charles II. the King's Counsel, the King's Attorney and Solicitor, and the Master of the Rolls wear a laced gown with hanging sleeves. The silk gown, full-bottomed wig and black court dress now worn by King's Counsel is generally held to date from the funeral of Queen Mary II., being the mourning dress worn by the wish of King William for a considerable period after the queen's death, and adopted as a convenient costume ever since. There is a well-known jest of Chief Baron Pollock to the effect that "the Bar went into mourning at the death of Queen Anne, and never came out again," which bears out this theory as to the origin of the costume. At the present time barristers wear black stuff gowns, with small wigs having three rows of curls round the head. King's Counsel wear black silk gowns over a cloth court suit (cp. the expression "to take silk," *i.e.* to become a K.C.); on full-dress occasions they wear a full-bottomed wig, and at court a black damask tufted gown over a velvet court suit. This is also the dress for state occasions of the Attorney-General, Solicitor-General, &c.

Municipal and Civic Robes.—The word "livery," the use of which is now practically confined to the costume of the "livery companies," the dress of men-servants, &c., originally meant an allowance of food or clothing granted to certain persons (Lat. *liberata*, Fr. *livrée*). It is still used of the allowances of food made to the fellows of certain colleges. As early as the 13th century, according to Matt. Paris (*Chron. Maj.*; Rolls Series, III. 337), we find the citizens of London assuming a uniform dress to do honour to some great occasion, as, *e.g.*, when in 1236 a body of them rode out to meet Henry III. and Queen Eleanor, "sericis vestimentis ornati, cicladibus auro textis circumdati, excogitatis mutatoriis amicti," or when 600 citizens rode out to meet Queen Margaret, wife of Edward I., "in one livery of red and white, with the cognizances of their misteries embroidered upon their sleeves" (see Stow's *Survey*, ed. Morley, p. 444). By the 14th century there is evidence of the adoption of liveries by the trades and fraternities. At the celebrations of the birth of Edward III. (see Riley's *Memorials*, p. 105) the mayor and aldermen were "richly arrayed in suits of robes," while the drapers, mercers and vintners were also "in costume." This need not, however, refer to liveries. G. Unwin (*The Gilds of London*, 1908) quotes a chronicler who records that by the year 1319 "many of the people

[1] Minute details of court and levée dress, judicial and legal, will be found in *Dress worn at Court* (pp. 60–61), issued with the authority of the Lord Chamberlain, and ed. H. A. P. Trendell, of the Lord Chamberlain's department (London, 1908),—also details of mourning costume.

of the trades of London were arrayed in livery," and an ordinance of 1347 of the fraternity of the Mercers commanding that "all those of the said mistery shall be clothed of one suit once a year at the feast of Easter," and Riley (*op. cit.* p. 516) quotes an order of 1389 allowing the sheriffs, on grounds of expense, to proceed to Westminster by boat instead of on horseback, "without there being any arraying of men of the trades in like suit for that purpose; except that such men of the trades as should wish to accompany them should walk in such suit of vestments of the livery of their respective trade as they might then have." As to the liveries of the religious fraternities, Chaucer (*Prol.* 361) describes:—

> "An Haberdasher and a Carpenter
> A Webbe, a Dyere, and a Tapicer,"
> As, "clothed alle in a liveree
> Of a solempne and greet fraternitee."

In 1389 there was a petition against the giving of liveries by the fraternities, on the ground that these gatherings were centres of political agitation, but in the statutes of Edward III. and Richard II. against liveries members of guilds were expressly excepted from these prohibitions. However, it was doubtless deemed prudent to make sure of the privilege, and so, when the livery companies were incorporated, they took care to have their liveries authorized by their charters.

These liveries consisted of a gown and hood, though the hood only was sometimes given; thus the Grocers' Company had in 1430 55 members in the full livery, 17 in hoods and 42 not in livery. It was also customary for such of the companies as wished it to present liveries to outsiders, for instance, to the mayor, should he belong to another company. Thus in 1390 the Tailors gave liveries to the king, the prince and the mayor, and hoods to the sheriffs. But in 1415 and 1423 the mayor and aldermen were forbidden to receive any livery except that of their own company. A similar custom was that by which a member of any company might send to the mayor a certain sum, receiving in return a suit of the livery of the mayor's company. The colours of the various liveries varied very much from time to time. Thus in 1414 the Grocers wore liveries of scarlet and green, which were changed in 1418 to scarlet and black, in 1428 to scarlet and blue and in 1450 to "violet in grain," with party-coloured hoods of violet and crimson. At first both gowns and hoods were party-coloured, but later a party-coloured hood was worn with a gown of one colour. The gowns were also lined and edged with fur. An early illustration of the liveries is to be found on the first charter of the Leathersellers' Company, granted them in 1444 by Henry VI., where the members of the company are depicted kneeling before the king in short party-coloured gowns of red and blue, edged at the neck, wrists and round the bottom with fur and with white girdles (see fig. 4, from a coloured reproduction in W. H. Black's *History and Antiquities of the Leathersellers' Co.*).

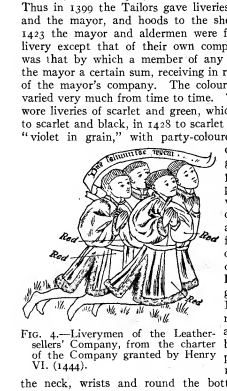


FIG. 4.—Liverymen of the Leathersellers' Company, from the charter of the Company granted by Henry VI. (1444).

In the reign of Henry VIII., Holbein's picture of the king giving a charter to the Barber-Surgeons' Company shows the members of the latter wearing gowns of rich stuff, with red and black party-coloured hoods, three of the figures also in coifs. The form of gown which has survived, practically unchanged, till the present day; may be seen on the second charter of the Leathersellers' Company, granted them by James I. in 1604 (see fig. 5, and for coloured plate see W. H. Black, *op. cit.*). Here we see them in flat caps, long black furred gowns, with false sleeves, and having on the right shoulder party-coloured hoods of scarlet and black, the end of which is cast over the left shoulder and hangs down nearly to the edge of the gown.

Besides the liveries of the city companies, and those of the mayor and sheriffs, there was often a special livery adopted by all the citizens on some great occasion, such as a visit of the sovereign to the City. W. St John Hope (*Corporation Plate and Insignia*, ii. 141) quotes a number of such cases, showing that the city livery was sometimes green, sometimes blue, sometimes violet, sometimes red and white, the city colours *par excellence*.

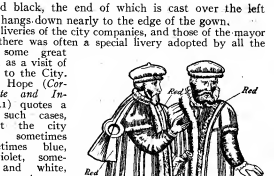

FIG. 5.—Liverymen of Leathersellers' Company, from a charter of James I. (1604).

As to the costume of the mayor, aldermen, sheriffs, &c., we have seen above the mayor "richly costumed," and the aldermen in like fashion, at the birth of Edward III., and Riley (*op. cit.*) gives an order of 1378, that the aldermen are to ride to Westminster in the mayor's procession, "arrayed in a cloak and hood at least, that are party-coloured with red, scarlet and white, the red on the right side"; while he quotes (from Letter-book H. fol. cxlvi) the amusing sentence passed by his fellow-aldermen in 1382 on one John Seley, for disregarding the order to have his green cloak for the Whitsuntide procession lined with green tafteta. Thus before the 15th century the aldermen apparently had not yet their scarlet robes, but on state occasions wore the ordinary city livery. For the early 15th century we have the *Liber Albus* (written *c.* 1419; Rolls Series, ed. Riley), where we are told (p. 35) that "The Mayor, Sheriff and Aldermen were wont to array themselves in like suits of cloth twice in the year, viz. when the mayor rode to Westminster to take the oath, and on the day following the feast of SS. Simon and Jude; and this raiment was trimmed with fur as befitting their honourable rank; and they would also dress themselves in suits of robes against the feast of Pentecost, these robes having a lining of silk." The scarlet, violet and black robes, still worn by the Lord Mayor, aldermen, &c., were early in use. There is an order of 1421 (8 Henry V.) that the aldermen should use "togis et armillausis de scarlet," and in numerous accounts of royal receptions and other solemn occasions in the City we are told that the mayor and aldermen were in scarlet (W. St John Hope, in *Corporation Plate and Insignia*, i., Introd. lxxiv seq., and ii. 138–147, quotes a number of these and treats the whole subject of mayors' &c., robes very fully). The *Liber Albus* (i. i, ch. vi.) also shows us the mayor and aldermen assembled at the Guildhall on the day of the election of the new mayor *induti togis de violet*. As to the form of the dress in the 14th and 15th century, we can see from brasses of lord mayors and aldermen (see Haines, *Manual*, pp. cc–cci; and Cotman, *Norfolk Brasses*. There is a fine series of brasses of mayors, &c., at Norwich) that it consisted of a long gown, a mantle fastened on the right shoulder and a hood. As to the provincial mayors and aldermen there is evidence that at quite an early date many of them followed the fashion of London; *e.g.* the Royal Charter of Nottingham, of 1448, contains the words: "that the Aldermen of the same town forever . . . may use gowns, hoods and cloaks of one suit and one livery together with furs and linings suitable to these cloaks, in the same manner and form as the Mayor and Aldermen of our city of London do use, the Statute of Liveries . . . notwithstanding." (see *Nottingham Records*, ii. 208), while the charter granted by Henry VI. to Kingston-upon-Hull in 1440 contains practically the same words (see St J. Hope, i. lxxxvi). The costume of provincial mayors, &c., is shown by St John Hope (*loc. cit.*) to have generally consisted of a scarlet furred gown and cloak, with tippet or scarf of black velvet. The civic robe not, however, invariably scarlet, but varied to violet, blue and black, sometimes even for the mayor. An account of the robes of modern provincial mayors will be found in St J. Hope, p. lxxxix seq. and under the accounts of the various boroughs, *passim*.

There is some doubt as to when the Lord Mayor first began to wear his robe of estate of crimson velvet. Stow (*Survey*, ed. Strype, 1720, ii. 165) says that at the reception of Henry VI. at Eltham the mayor was in crimson velvet, the aldermen in scarlet with "sanguine" hoods, but at the coronation of Edward V. (see St J. Hope) he wore scarlet. At the coronation of Anne Boleyn (see Wriothesley's *Chronicle*, *loc. cit. supr.*, and Hall's *Chronicle*) the mayor wore his crimson velvet robe of state, the aldermen and sheriffs scarlet; and at the entry of Anne of Cleves into London the mayor was again in his crimson velvet robe with his collar of gold, the aldermen and councilmen in robes of black velvet with chains of gold (but see

The Lord High Chancellor of England, in robes of State.

Judge of the Supreme Court of the United States of America.

Judge of the High Court, England, in black robes.

Lord Mayor of London, in full robes.

Alderman of the City of London, in bench robes.

Robes lent by Ede, Son & Ravenscroft, Chancery Lane, London.

St J. Hope, ii. 144, who quotes the order for these same robes, from which it would appear that the mayor also wore black velvet).

About this period begin to occur notices of the wearing of official robes by the wives of mayors and aldermen, *e.g.* for Lincoln there is an entry in the corporation records in 1544: "Every alderman that hath not been mayor to prepare for himself and his wife gowns of crimson, and every one that hath been mayor to prepare for himself and his wife gowns of scarlet and tippets of velvet to be worn at all principal feasts" (see 14th report, *Hist. MSS. Commiss.* App. VIII). St John Hope (p. lxxxix) quotes numerous instances in the 16th century, in some of which the husband was liable to a heavy fine in the event of his wife's non-compliance with the rule.

In 1568 (see Stow, and J. G. Nichols, *Account of 55 Royal Processions and Entertainments*, pt. ii. p. 94) first appeared an "Order observed by my Lord Mayor, Aldermen and Sheriffs, for their meetings and wearing the apparel thereof, which is uniform and according as formerly it hath been used," which has been altered and revised from time to time by order of the Corporation, and is still issued under the name of the *Handbook of Ceremonials* to the officers of the City Corporation. In 1568 we find the aldermen and sheriffs going to Westminster in the Lord Mayor's procession in scarlet-furred gowns "and their cloaks borne with them," and in 1575 Nichols quotes a London citizen's description of the same processions: "they of the livery in their long gowns, with hood on the left shoulder, half black and half red. . . . The Mayor in a long gown of scarlet, and on his left shoulder a hood of black velvet, and a collar of SS. . . . The Aldermen in scarlet gowns, those having been mayors with chains of gold, the others with black velvet tippets." The Order of 1629 gives particulars of the various gowns; the cloaks are violet from Michaelmas to Whitsuntide, furred, for mayors and ex-mayors, with "amys," for aldermen with "caddice" and scarlet in summer, lined with "changeable taffety" and "green taffety" respectively.

After the 16th century the costume of the Lord Mayor can be studied in successive "Orders" or Ceremonial Books, accounts of coronations, &c., and in portraits and sculptured monuments of the various city companies. Early in the 19th century (1806) the Lord Mayor began to wear on some state occasions a black robe with gold lace, similar to that of the Lord Chancellor. The Ceremonial Book was thoroughly revised in 1864, and the latest edition is that issued in 1906 (*Handbook of Ceremonials*, &c., "issued under the direction and with the approval of the Privileges Committee of the Court of Aldermen").

At the present day the Lord Mayor has several sets of robes; a special coronation robe (see illustration in Naylor, *Book of the Coronation of George IV.*, 1837), a crimson velvet robe of state like that of an earl, worn with the chain and jewel, *e.g.* in the presence of the sovereign when in the city;[1] a black robe of state trimmed with gold, which is worn with the chain and jewel, *e.g.* at the Guildhall on Lord Mayor's Day; the scarlet robes, which are worn, with or without the chain, on most public occasions, such as the service at St Paul's on the first day of the Easter Law Term, audiences of the sovereign, the election of the Lord Mayor, the opening of the Central Criminal Court, &c.; a violet gown, which is worn, *e.g.*, when the Lord Mayor elect is presented to the king, when he is sworn in, at the election of sheriffs, &c., and a black gown worn in church on Good Friday, &c. The aldermen wear scarlet on most occasions of ceremony, ex-mayors "having the Cap of Dignity attached to their gown, and being entitled to introduce a sword and mace into their badges." Violet robes are also worn on certain occasions marked in the almanac of the *Alderman's Pocket-Book*; and black gowns when the Lord Mayor wears his. The sheriffs and recorders[2] have scarlet, violet and black gowns, and the members of the common council have deep mazarine blue gowns, which seem to have been first prescribed in 1761.

For Scotland an order of James I. and VI. of 1610 (see *Register of Privy Council, loc. cit.*) ordered that the provosts, aldermen, &c., of every borough should wear, for ordinary occasions, black furred gowns, the officers of the chief boroughs having also scarlet furred gowns for Sundays and other solemn occasions, when the provost of Edinburgh was to wear a gold chain.

Academic Costume.—No thorough study has so far been made of early English academic costume as compared with that of the continental universities—a study which ought to throw much light on the subject.[3] A vexed question is that of how far academic dress is derived from the ecclesiastical. Anthony Wood's view, that it was derived from the *tunica talaris* and *cuculus* of the Benedictines, would not now meet with much support; but many writers seem to be unnecessarily anxious to trace each item of the academic robes to some definite ecclesiastical garment. The medieval scholar was of course a clerk, and had to wear the clerkly gown and the tonsure. But the fact that this was the case makes it more difficult to distinguish between academical and ecclesiastical robes, notably in the case of brasses and other monuments of university graduates and dignitaries who were also priests. Another source of difficulty is the variety of names by which the different parts of the academic costume are called in the university statutes and elsewhere, resulting sometimes in inextricable confusion.

The earliest information as to English academic dress is found in the second half of the 14th century. Certain early statutes show that "excess in apparel" had already to be rebuked in scholars (cf. the Constitution of Archbishop Stratford, 1342), while the statutes of certain colleges require of the scholars the tonsure and a "decent habit" suitable to a clerk (cf. Statutes of Peterhouse, 1344, and of Merton Coll., Oxford), *i.e.* a long gown (*toga* or *tunica talaris*), which it is stipulated in some cases must be closed in front. Some colleges had liveries, prescribed perhaps by the founder of the college and laid down by the statutes. The differences of colour and shape in the undergraduate gowns of most of the Cambridge colleges are supposed to be a survival of this. There was also an ordinance of Edward II. for King's Hall, Cambridge (1309), which fixed the dress of a scholar as the *roba talaris*, except which, if a bachelor, he should wear a tabard suited to his degree. The undergraduates seem in the early days to have worn a hood, the ordinary head-covering worn by all, but they gradually ceased to do so, until nobody below the rank of a bachelor might wear one.

It is proposed to give here (1) a list of the various parts of the academic dress, with a few remarks on each; (2) a short account of the early costume of the various degrees; (3) a sketch of any changes which have taken place since the Reformation.

The Gowns (*toga*, *roba*, or *tunica talaris*) was worn by all degrees, as befitting clerks. It is hard to determine whether there was at first any difference between the gown of the higher degrees, which some maintain was the *roba*, and that of the lower degrees, the *toga* or *tunica talaris*, but it seems improbable. It was frequently fur-lined, but the use of the more costly furs was forbidden to all below the degree of Master, except sons of noblemen, or those possessing a certain income, bachelors using budge (see in Anstey's *Munimenta Academica*, p. 301, the Hope i. lxxvi–lxxix. For mayor's and sheriff's chains see ibid. pp. lxxix–lxxxiv.

[1] Sir G. G. Young in a pamphlet called *The Place of the Lord Mayor in proceeding through or within the City of London* (1852), quotes various royal visits to the city which seem to show that the Lord Mayor did not always wear his crimson velvet robe on these occasions. Thus in 1638 Charles I., on going to meet Marie de Médicis, was met by the Lord Mayor in scarlet, which was also worn at the entry of Charles II. in 1660. In 1702, when Queen Anne went in state to a thanksgiving service at St Paul's, the Lord Mayor wore crimson velvet, with the collar and jewel; but in 1705, at the thanksgiving after Blenheim, he met the queen on horseback, dressed in scarlet. In 1714, at the reception of George I., the Lord Mayor wore crimson velvet robes.

[2] The recorders had from an early date annual suits of robes like the mayor, aldermen, &c. See *Liber Albus*, p. 43: "Habet itaque Recordator pro feodo de Camera totiens et talem vesturam lineatam sive penulatum, quotiens et qualem Major et Aldermanni capiunt annuatim." The chamberlain, common serjeant, &c., had also gowns (see an order of 1523 in St J. Hope, ii. 146). For the sword-bearer's cap of maintenance see article CAP and St John

[3] Practically the only detailed study of early English academic costume is a paper on "English Academic Costume (Medieval)," by Dr E. C. Clark, in *Archaeolog. Journal*, vol. l. pp. 74 seq., 137 seq. and 183 seq., which contains a mass of information, and upon which the present article is to a great extent based. Rashdall (*Universities of Europe in the Middle Ages*, vol. ii. pt. ii.) and Druitt (*Costume on Brasses*, ch. ii.) each devote a chapter to the subject; Rashdall treats of both the English and continental universities, not very thoroughly, Druitt of English academic dress only, but thoroughly. Clark gives many facts about foreign, as well as the English, costume.

statute of 1432 *de admissione ad pelluram*). Students, and even doctors in theology (*Mun. Acad.* ii. 393), were also restricted to budge, and to sad-coloured habits. The robes of masters were to be flowing and reach to the ankles (see *Mun. Acad.* p. 212, an order of 1358 to the tailors not to stint the robes, which should be "*largae et talares*," because clerks should be distinguished from the laity).

The COPE, worn as part of academic dress over the gown, probably originated in the ordinary *cappa clericalis*, or every-day mantle of the clergy, which had been introduced into general use in England by synods of 1222, 1237 and 1268.[1] This kind of cope, closed in front, and originally black in colour, is generally known as the *cappa clausa*, and sometimes, for convenience' sake, had a slit in front to allow of the passage of the hands. It was worn by Regent Masters when lecturing

FIG. 6.—Members of New College, Oxford, from Chandler MS. (15th century).

(*Mun. Acad.* p. 421) and as a full dress by certain doctors. By the second half of the 14th century differences of colour occur; *e.g.* the Chancellor represented in a 14th-century miniature in the Oxford *Chancellor's Book* (reproduced by J. W. Wells, *The Oxford Degree Ceremony* (1906), facing p. 19) wears a scarlet cope closed in front, lined with miniver and with tippet and hood of miniver, and there is also a mention in an ancient statute of Cambridge of a red cope worn by Inceptors in Canon Law (Clark, p. 102). The Rev. N. F. Robinson (*loc. cit.* p. 195) quotes the will of R. Browne, archdeacon of Rochester (d. 1452), to prove that the habit of a doctor of civil law was violet; he also thinks that that of a doctor of theology was green, and of a doctor of canon law scarlet. By the 16th century all copes were scarlet. Clark (p. 138) gives as evidence "Stokys' picture" in the Cambridge Registrary. The scarlet *cappa clausa* has survived to the present day at Cambridge as the dress worn by the Vice-Chancellor and by Regius Professors of Divinity, Law and Medicine when presenting for degrees. It is now open down the front, but the fur edging only reaches half-way down, marking the place where the slit used to be. At Oxford the so-called "cope" which is the Convocation robe of certain doctors is not a real cope, but is probably derived from the medieval tabard, the out-of-door dress worn by the clergy and others, it having become customary by the beginning of the 16th century for Regent Masters to wear the tabard at lectures as more convenient than the cope (Rashdall, II. ii. 639, and *Mun. Acad.* p. 421, where the *pallium* is spoken of as an alternative to the *cappa clausa*. The *pallium* is most probably to be identified with the tabard).[2] The *cappa manicata* mentioned in Anstey (*Mun. Acad.* p. 421, &c.) seems to have been a shorter gown with bell-shaped sleeves reaching to the elbow, and lined with fur, worn by masters and bachelors of arts (see Druitt, p. 124), and a shorter tabard is also occasionally found (Robinson's *Taberdum ad medias tibias*). These are illustrated in fig. 6 from a MS. of the 15th century at New College, Oxford.[3] The D.D.'s wear the *cappa clausa*, the other doctors tabards (see also pl. iii., xvi. in *Archaeologia*, where William of Wykeham and all the doctors wear long sweeping tabards, as ample as copes), the Warden a shorter tabard, reaching just below the knees, and the M.A.'s gowns or tabards with false sleeves.

The HOOD was originally worn by all scholars, as by everybody, and had evidently no academic significance. Sometimes a cape was also worn, the hood being thrown back (Chaucer's "clerk of Oxenford" in the Ellesmere MS. illumination wears a red skull-cap, and a furred tippet and hood, with the hood falling rather back, though not on his shoulders). The lirippe[4] became somewhat elongated, as is seen in the hoods of the so-called M.A. group in the Chandler MS. An early mention of the undergraduate hood is the much-discussed Oxford Statute of 1489 (*Mun. Acad.* p. 360), which reads: "ut nullus de cetero scholaris non-graduatus (nobili sanguine insignitis &c. exceptis) capitio quovis utatur publice . . . nisi liripipium consutum habeat et non contextum, prout antiqua Universitatis laudabilis consuetudo exposcit . . ."[5] but the undergraduate

[1] Clark (pp. 138–39) treats of the *pallium* and tabard as two separate garments, deciding that the *pallium* was a kind of tippet. Robinson considers the *pallium* to correspond to the tabard, his *taberdum talare*, which the Rev. T. A. Lacey (p. 128) also compares with the chimere of Anglican bishops. (See article CHIMERE, where the chimere is likewise traced to the tabard.) Moroni, *Dizionario dell' erudizione storico-ecclesiastica*, s.v. *zimarra*, says that professors of the university of Rome wear black *zimarre* while teaching. This recalls the *pallium* of Regent Masters (*Mun. Acad.* p. 421) and Inceptors in arts and medicine (*id.* p. 459).

[2] The Chandler MS. The drawings from which the illustration is taken are reproduced in the *Transactions of the St Paul's Ecclesiological Society*, p. 208, with an explanatory article by the Rev. N. F. Robinson, and in *Archaeologia*, vol. liii. pl. i., with notes by T. F. Kirby. Robinson identifies the various groups of the Society of New College on his plate i. (xv. in *Archaeol.*) by the aid of a statute of the College settling the order of standing in choir and at processions, and thus claims to settle the question of the dress of the various kinds of Doctor and Bachelor, M.A.'s, &c., at the period.

[3] In the present article "liripipe" will be used of the tail of the hood, "tippet" of the shoulder-cape, sometimes forming part of the same garment as the hood, sometimes not, and "scarf" of the "tippet" or scarf, *e.g.* of D.D.'s, Anglican clergy.

[4] "that no non-graduate scholar (with the usual exceptions of noblemen, &c.) shall wear any kind of hood in public, unless it have the liripipe sewn on, and not woven in one piece, as the ancient and venerable custom of the university demands." The meaning of this is not clear; Anstey (marginal note *ad loc.*) takes it to mean that the tail of the hood should be sewn to the hood; others that the tail of the hood should be sewn down to the gown (footnote, *Prol. to Canon's, Yeoman's Tale*: "Till that I understood How that his cloke was sowed to his hood. For which, when I hadde long avysed me, I demed him some Chanoun for to be," which shows that this method of sewing the hood, whatever it were, was used to define rank; others again hold that "*liripipium*" here means a tippet or shoulder-cape, and that for some reason the hood was to be sewn to the tippet and not made all in one piece with it. Rashdall reads "*consutum*" instead of "*consutum*" (footnote ii. p. 641). The Constitution of Archbishop Bourchier (1463) forbids undergraduates to use liripipes or "tippets" round the neck in public (Clark, p. 85), so the sewing down of the liripipe at the back may

hood had gone out of use by the end of the 16th century.[1] Bachelors' hoods were to be lined throughout with fur (*Mun. Acad.* p. 361), which we learn from the statute *de admissione ad pelluram* (1432) to have been budge. Masters and noblemen might use miniver, or silk in summer (*Mun. Acad.* pp. 283, 301). There were evidently hoods of at least two kinds for masters, sometimes called respectively *caputium* and *epomis*, whether corresponding to the distinction between regents and non-regents we do not know. (See *Mun. Acad.* p. 638, will of Thomas Bray, M.A., and Robinson, *loc. cit.* In the Oxford *Corpus Statutorum* of 1768 the *epomis* is worn with the ordinary gown, the *caputium* with the scarlet habit.) At a later date, at Cambridge, a distinction was made between the hoods of non-regents, which were lined with silk, and those of regents, which were lined with miniver.[2] Later again the regents wore their hoods in such a way as to show the white lining, while the non-regents wore theirs "squared," so that the white did not show. Hence the name "White Hoods" and "Black Hoods" given to the upper and lower houses of the old Senate respectively. It is not settled when the modern colourings of hoods arose; they probably followed those of the gowns of the faculties, but about these we are equally uncertain. The Oxford Proctor still wears a miniver hood. The modern Cambridge hood has preserved the original shape more closely than the Oxford one, being a hood and tippet combined, the hood having square corners. The tippet, which appears as part of the early costume of certain doctors, was probably, like the judges' tippet, originally the shoulder-cape forming part of the same garment as the hood. Clark and others would derive it from the almuce (*q.v.*), but do not seem to show any definite grounds for so doing. Its place seems to have been taken by the scarf worn by D.D.'s, &c., probably developed from the hood with long liripipe as worn turban-wise on the head or as a scarf round the shoulders. It seems rather far-fetched to derive the scarf from the two pendants of the almuce.[3] (See article VESTMENTS and cp. the mayor's scarf mentioned above.)

There seem to have been at least three varieties of academic head-dress:[4] firstly, the doctor's skull-cap with "apex" as illustrated in the *Chandler MS.* drawings; secondly, the square cap of cloth as prescribed by Laud's statutes of 1636 for graduates and possession scholars (similarly for Cambridge by Burleigh's letter to the vice-chancellor in 1588), with its counterpart of velvet worn by doctors; thirdly, a round cloth cap prescribed by the Laudian statutes and Burleigh's letter for undergraduates who were not foundation scholars, with the round cap of velvet for doctors which survives as part of their full dress to the present day. The square cap was adopted at the universities, according to Robinson, after 1520, by statutes of the university of Paris. For the development of the modern "college cap," see BIRETTA. In this connexion should be mentioned the term "tuft-hunting," *i.e.* attempting to thrust oneself into the society of one's social superiors, derived from the gold tufts or tassel worn by noblemen and fellow-commoners on their college caps.

As to the dresses of the different degrees, the drawings from the *Chandler MS.* give a good idea of the early costume. It is also well illustrated by brasses.[5] Doctors of theology seem to have worn a tippet but no hood. Masters of Arts seem to have worn a gown, over which was a garment with bell-shaped sleeves reaching to the elbow, a tippet and a hood (see Druitt, plate facing p. 136, and p. 135). The same dress was sometimes worn by B.A.'s (see brass of John Palmer, B.A., d. 1479, New College, Oxford, in Druitt, p. 141), and bachelors of law and divinity, the latter being generally already LL.A.'s (Druitt, p. 139). Haines's theory is that after the middle of the 15th century the dress of the M.A.'s was changed, and they wore a sleeveless tabard reaching to midway between ankle and knee. This costume certainly occurs on brasses, chiefly of the 16th and 17th centuries, but the change is hard to explain.[6]

Academic dress underwent much inquiry and some revision at the time of the Reformation, chiefly in the direction of sobriety and uniformity, "excess of apparel" being repressed as severely as ever, but not with much more effect.[7] Burleigh's letter to the Vice-Chancellor of Cambridge University (1585), and the statutes of Queen Elizabeth, strictly enforce the wearing of cap and gown by all, and hoods and habits by those entitled to wear them, and similar regulations were made for Oxford by Laud's statutes of 1633, further details being dealt with by a decree of 1770. Academic dress during the 17th century may be further studied in Bedel Buck's book (1665, see Appendix B. to Peacock, *Observations on the Statutes of the University of Cambridge*), and Loggan's plates of academic costume in *Oxonia Illustrata* (1675) and *Cantabrigia Illustrata* (1690, ed. J. W. Clark, 1905).

There have been few far-reaching changes since Loggan's day. Cambridge has of late been inquired into and revised her regulations as to dress, and in the *Ordinances* (latest ed. 1908, Statute A, cap. VII. p. 303) clear rules are laid down; the Oxford regulations (see *Statuta et Decreta Univ. Oxon.*

[1] See for doctors' costume, J. G. and L. A. B. Waller's *Series of Monumental Brasses* (London, 1864), plate of "Four Ecclesiastics," from New College, Oxford, who are also illustrated in Druitt, pp. 131, 139, and for M.A.'s and B.A.'s, Druitt, p. 135 seq. and plate facing p. 136. On the brass of John Lord, LL.D., C.L., should be noticed the two curious long streamers or lirippes hanging from the back of his tabard or hood. It is hard to say what they can be; but the closest parallel is the two streamers on the back of the old Oxford commoners' gown, which were probably survivals of sleeves. They are said to have given rise to the term "plucking," *i.e.* failing in examination, the story being that a man's creditors might grabble at the coming of degrees, and by "plucking" at his gown prevent him from going up for his degree.

[2] It is just possible that this sleeved garment may be the *capa manicata* mentioned in *Mun. Acad.* p. 421: "nullus regens in artibus capa manicata lectoriata legat ordinarie sed in capa vel capa clausa." Clark (pp. 188, 189, &c.) identifies the *cappa manicata* with the tabard, but if, as suggested above, the *pallium* is the tabard, the *cappa manicata* cannot be the same. Braun, *Liturgische Gewandung*, p. 508, shows that a sleeved cope, called *cappa manicata*, did develop from the *cappa clericalis* or everyday cope of the clergy, at the end of the 12th century, its use being forbidden by various synods. It is possible, then, that the *capa manicata* may have been worn by non-regents, the tabard (which Haines alleges to have been adopted generally by M.A.'s in the late 15th century), or *pallium*, by regents.

[3] The essential parts of Laud's statutes, Burleigh's letter, &c., with much other matter bearing on academic costume from the 16th century onwards, will be found in C. Wordsworth's *University Life in the 18th Century* (London and Cambridge, 1874. p. 485 seq.). To the passages quoted by him may be added the following from *John Bereblock's Commencement*, an eye-witness account of Queen Elizabeth's visit to Oxford in 1566 (published in *Elizabethan Oxford*, ed. C. Plummer, Oxford Hist. Soc., 1887); at one of the disputations Mr. Campion, M.A., was dressed as follows: "Toga illi tum Dalmatica talaris fuit, manicis remissis ac largitate sua diffluentibus. Huic pallium inductum est undique consutum, praeter quam qua dextro patebant aditus. Postremo erant humeri superius pellibus albis, candoreque lucentibus, redimiti. Atque hic tum habitus fuit omnium magistrorum, quicunque apud universitatem Dalmamenti illius pellicei, serico utebantur, omni colore variegato." This points to the wide-sleeved gown, tabard and hood as the dress of masters, but the colour of the hood was evidently not fixed. See also Doctor White, D.C.L., "ei vestis Dalmatica lucrat talaris, ex electiori et clarissima purpura; lato clavo coccineo superius induebatur, additum postremo humeris paludamentum est ejusdem coloris, cum serico subtegmine, similique tum vestiti habitu omnes Doctores sedebant." Here *vestis Dalmatica* would be the ordinary gown, *clavus latus* the scarlet gown, and *paludamentum* the hood, as before. For costume up to the middle of the 19th century see Wall-Gunning, *Ceremonies observed in the Senate House at Cambridge* (1828).

[1] An interesting survival, which only disappeared about the middle of the 19th century, was the little black hood placed round the neck of candidates going in for *viva voce* in all examinations subsequent to responsions at Oxford. This was a survival of the custom of conferring on *sophistae generales*, *i.e.* those who had passed the first stage of the examinations for the B.A. degree, a hood of plain black cloth. See A. Clark's *Introduction to the Registers of Oxford University*, vol. ii. pt. 1, p. 22 (Oxford Hist. Soc., 1887).

[2] See *Caius' Statutes* (1557), also an account of the entertainments at Cambridge on the visit of Queen Elizabeth, 1564, given in Nichols, *Progresses*, vol. iii., "Theologiae Baccalaureos ac non-Regentes primum, seriesque capuitiis induti, tum Regentes Magistri suis pelliceis albescentibus decorati; tandem Juris Artiumque Baccalaureos suis agninis bracceis conspicui."

[3] See Rev. E. Wickham Legg in *Trans. of St Paul's Eccles. Soc.* vol. iii. Also Lacey and Robinson (*loc. cit.*).

[4] The subject is discussed in detail by Clark, "College Caps and Doctors' Hats," in *Archaeol. Journal*, vol. lxi., and N. F. Robinson, "Pileus Quadratus," in *Transact. of St Paul's Ecclesiological Socy.*, vol. v. pt. 1. (1901). There is also much miscellaneous information in C. Wordsworth, *University Life in the 18th Century*, p. 499 seq.

for 1909, Tit. xiv., *de vestitu et habitu*, pp. 327–328) have not been revised lately, and some of them are a dead letter.

Doctors of both universities have three sets of robes: firstly, the full-dress gown of scarlet cloth; secondly, the congregation habit and hood of scarlet (now at Cambridge a cope, at Oxford the so-called "cope"); thirdly, the black gown. The first is worn by all doctors except the doctor of music, and is accompanied by the round cap of velvet. The Oxford D.D. also wears a cassock, sash and scarf. The scarlet gown is of a different and older shape than the M.A. and B.A. gowns. As now worn, it is faced with silk of the same colour as the hood of the faculty. The second, or cope, has now gone almost out of use, but is still worn when presenting for degrees, &c. It is sometime worn over the black gown. There are several types of black gown, but the tufted gown of Loggan's day has now gone out of use. The M.D. and Mus.D. black gowns at Cambridge are now made after the pattern of the LL.D. gown, with wing-like sleeve and flap collar, trimmed with black lace, but the D.D., D.Sc. and Litt.D. wear the M.A. gown, the former with the scarf, the two latter with lace on the sleeve, placed horizontally for D.Sc. and vertically for Litt.D. Some doctors of divinity wear the full-sleeved gown with scarf. The head-dress of a D.D. is the square cap, that of the lay doctors the velvet bonnet with gold cord. At Oxford, too, some doctors wear the M.A. gown, others the doctor's laced gown. The M.A. and B.A. gowns are two varieties of the civilian gown of the 15th and 16th century. The B.A. loose-sleeved gown is no longer worn with the sleeve tucked up round the elbow.

The Oxford sleeveless commoner's gown, though still by statute *talaris*, now reaches little below the waist, the full-sleeved scholar's gown to the knees. The tufted silk gown of the gentleman-commoner and the nobleman's gold-laced gown are not yet abolished by statute, but have fallen into disuse. Vice-Chancellors have no official costume, but wear the habit of their degree. The Chancellors of the older universities wear a black damask robe with gold lace, and a black velvet square cap with gold tassel or a doctor's velvet bonnet with gold cord; those of the newer universities have robes "created" by the robe-makers, who are nowadays to a large extent the arbiters of academic dress.

For the colours of the hoods of the various university degrees see UNIVERSITIES *ad fin.* (C. B. P.)

ROBESPIERRE, MAXIMILIEN FRANÇOIS MARIE ISIDORE DE (1758–1794), French revolutionist, was born at Arras on the 6th of May 1758. His family, according to tradition, was of Irish descent, having emigrated from Ireland at the time of the Reformation on account of religion, and his direct ancestors in the male line had been notaries at the little village of Carvin near Arras from the beginning of the 17th century. His grandfather, being more ambitious, established himself at Arras as an advocate; and his father followed the same profession, marrying Jacqueline Marguerite Carraut, daughter of a brewer in the same city, in 1757. Of this marriage four children were born, two sons and two daughters, of whom Maximilien was the eldest; but in 1767 Madame Derobespierre, as the name was then spelt, died, and the disconsolate widower at once left Arras and wandered about Europe until his death at Munich in 1769. The children were taken charge of by their maternal grandfather and aunts, and Maximilien was sent to the college of Arras, whence he was nominated in 1770 through the bishop of his native town to a bursarship at the college of Louis-le-Grand at Paris. Here he had for fellow-pupils Camille Desmoulins and Stanislas Fréron.

Completing his law studies with distinction, and having been admitted an advocate in 1781, Robespierre returned to his native city to seek for practice, and to struggle against poverty. His reputation had already preceded him, and the bishop of Arras, M. de Conzié, appointed him criminal judge in the diocese of Arras in March 1782. This appointment, which he soon resigned, to avoid pronouncing a sentence of death, did not prevent his practising at the bar, and he speedily became a successful advocate. He now turned to literature and society, and came to be esteemed as one of the best writers and most popular dandies of Arras. In December 1783 he was elected a member of the academy of Arras, the meetings of which he attended regularly; and, like all other young Frenchmen with literary proclivities, he began to compete for the prizes offered by various provincial academies. In 1784 he obtained a medal from the academy of Metz for his essay on the question whether the relatives of a condemned criminal should share his disgrace, the prize being divided between him and Pierre Louis Lacretelle, an advocate and journalist in Paris. An *éloge* on J. B. L. Gresset (1709–1777), the author of *Vert-Vert* and *Le Méchant*, written for the academy of Amiens in 1785, was not more successful; but Robespierre was compensated for these failures by his great popularity in the little literary and musical society at Arras known as the "Rosati," of which Carnot was also a member. There the sympathetic quality of Robespierre's voice, which afterwards did him such good service in the Jacobin Club, always caused his indifferent verses to be loudly applauded by his friends.

In 1788 he took part in the discussion as to the way in which the states-general should be elected, showing clearly and forcibly in his *Adresse à la nation artésienne* that, if the former mode of election by the members of the provincial estates were again adopted, the new states-general would not represent the people of France. Necker also perceived this, and therefore determined to make the old royal *bailliages* and *sénéchaussées* the units of election, which then took place on the basis of almost universal suffrage. Under this plan the city of Arras was to return twenty-four members to the assembly of the *bailliage* of Artois, which was to elect the deputies. The corporation claimed the right to a preponderating influence in these city elections, and Robespierre headed the opposition, making himself very conspicuous and drawing up the *cahier*, or table of complaints and grievances, for the gild of the cobblers. Although the leading members of the corporation were elected, their chief opponent succeeded in getting elected with them. In the assembly of the *bailliage* rivalry ran still higher, but Robespierre had already made his mark in politics; by the *Avis aux habitants de Campagne* (Arras, 1789), which is almost certainly by him, he secured the support of the country electors, and, though but thirty years of age, poor and without influence, he was elected fifth deputy of the *tiers état* of Artois to the states-general.

When the states-general met at Versailles on 5th May 1789, the young deputy of Artois already possessed the one faculty which was to lead him to supremacy: he was a fanatic. As Mirabeau is reported to have said: "That young man believes what he says: he will go far." Without the courage and wide tolerance which make a statesman, without the greatest qualities of an orator, without the belief in himself which marks a great man, nervous, timid and suspicious, Robespierre yet believed in the doctrines of Rousseau with all his heart, and would have gone to death for them; and in the belief that they would eventually succeed and regenerate France and mankind, he was ready to work with unwearied patience. While the Constituent Assembly occupied itself in drawing up a constitution, Robespierre turned from the assembly of provincial lawyers and wealthy *bourgeois* to the people of Paris. However, he spoke frequently in the Constituent Assembly, and often with great success, and was eventually recognized as second only to Pétion de Villeneuve—if second to him—as a leader of the small body of the extreme left,—the thirty voices, as Mirabeau contemptuously called them. It is hardly necessary to examine minutely Robespierre's speeches and behaviour before 1791, when the death of Mirabeau left the way clear for the influence of his party; but what is noteworthy, as proving the religious cast of his mind and his belief in the necessity of a religion, is that he spoke several times in favour of the lower clergy and laboured to get their pensions increased. When he instinctively felt that his doctrines would have no success in the Assembly, he turned to the Society of the Friends of the Constitution, known

later as the Jacobin Club, which had consisted originally of the Breton deputies only, but which, after the Assembly moved to Paris, began to admit among its members various leaders of the Parisian *bourgeoisie*. As time went on, many of the more intelligent artisans and small shopkeepers became members of the club, and among such men Robespierre found the hearers he sought. They did more than listen to him: they idolized him; the fanatical leader had found followers. As the wealthier *bourgeois* of Paris and deputies of a more moderate type seceded to the club of '89, the influence of the old leaders of the Jacobins (Barnave, Duport, Alexandre de Lameth) diminished; and when they themselves, alarmed at the progress of the Revolution, founded the club of the Feuillants in 1791, the followers of Robespierre dominated the Jacobin Club. The death of Mirabeau strengthened Robespierre's influence in the Assembly; but on the 15th of May 1791 he proved his lack of statesmanlike insight and his jealous suspicion of his colleagues by proposing and carrying the motion that no deputies who sat in the Constituent could sit in the succeeding Assembly. The flight of the king on the 20th of June and his arrest at Varennes made Robespierre declare himself at the Jacobin Club to be *ni monarchiste ni républicain*. After the "massacre" of the Champ de Mars (on the 17th of July 1791) he established himself, in order to be nearer to the Assembly and the Jacobins, in the house of Duplay, a cabinetmaker in the Rue St Honoré, and an ardent admirer of his, where he lived (with but two short intervals) till his death. At last came his day of triumph, when on the 30th of September, on the dissolution of the Constituent Assembly, the people of Paris crowned Pétion and himself as the two incorruptible patriots.

On the dissolution of the Assembly he returned for a short visit to Arras, where he met with a triumphant reception. In November he returned to Paris, and on the 18th of December made a speech which marks a new epoch in his life. Brissot de Warville, the *âme politique* of the Girondin party which had been formed in the Legislative Assembly, urged vehemently that war should be declared against Austria, and the queen was equally urgent, in the hope that a victorious army might restore the old absolutism of the Bourbons. Two men opposed the projects of the queen and the Girondins—Marat and Robespierre. Robespierre feared a development of militarism, which might be turned to the advantage of the reactionaries. This opposition from those whom they had expected to aid them irritated the Girondins greatly, and from that moment began the struggle which ended in the *coups d'état* of the 31st of May and the 2nd of June 1793. Robespierre persisted in his opposition to the war; the Girondins, especially Brissot, attacked him violently; and in April 1792, he resigned the post of public prosecutor at the tribunal of Paris, which he had held since February, and started a journal, *Le Défenseur de la Constitution*, in his own defence. It is noteworthy that during the summer months of 1792 in which the fate of the Bourbon dynasty was being sealed, neither the Girondins in the Legislative Assembly nor Robespierre took any active part in overthrowing it. Stronger men with practical instincts of statesmanship, like Danton and Billaud Varenne, who dared to look facts in the face and take the responsibility of doing while others were talking, were the men who made the 10th of August and took the Tuileries. The Girondins, however, were quite ready to take advantage of the accomplished fact; and Robespierre, likewise, though shocked at the shedding of blood, was willing to take his seat on the Commune of Paris, which had overthrown Louis XVI., and might check the Girondins. The strong men of the Commune were glad to have Robespierre's assistance, not because they cared for him or believed in him, but because of the help got from his popularity, his reputation for virtue, which had won for him the surname of "The Incorruptible," and his influence over the Jacobin Club and its branches, which spread all over France. He it was who presented the petition of the Commune of Paris on 16th August to the Legislative Assembly, demanding the establishment of a revolutionary tribunal and the summoning of a Convention. The massacres of September in the prisons, which Robespierre in vain attempted to stop, showed that the Commune had more confidence in Billaud than in him. Yet, as a proof of his personal popularity, he was a few days later elected first deputy for Paris to the National Convention.

On the meeting of the Convention the Girondins immediately attacked Robespierre; they were jealous of his influence in Paris, and knew that his single-hearted fanaticism would never forgive their intrigues with the king at the end of July. As early as the 26th of September the Girondin M. D. A. Lasource accused him of aiming at the dictatorship; afterwards he was informed that Marat, Danton and himself were plotting to become triumvirs; and eventually on the 29th of October Louvet de Couvrai attacked him in a studied and declamatory harangue, abounding in ridiculous falsehoods and obviously concocted in Madame Roland's boudoir. But Robespierre had no difficulty in rebutting this attack (5th of November), while he denounced the federalist plans of the Girondins. All personal disputes, however, gave way by the month of December 1792 before the great question of the king's trial, and here Robespierre took up a position which is at least easily understood. These are his words spoken on the 3rd of December: "This is no trial; Louis is not a prisoner at the bar; you are not judges; you are—you cannot but be—statesmen, and the representatives of the nation. You have not to pass sentence for or against a single man, but you have to take a resolution on a question of the public safety, and to decide a question of national foresight. It is with regret that I pronounce the fatal truth: Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live." This great question settled by the king's execution, the struggle between Robespierre and the Girondins entered upon a more acute stage, and the want of statesmanship among the latter threw upon the side of the fanatical Robespierre Danton and all those strong practical men who cared little for personal questions, and whose only desire was the victory of France in her great struggle with Europe. Had it been at all possible to act with that group of men of genius whom history calls the Girondins, Danton, Lazare Carnot, Robert Lindet, and even Billaud-Varenne, would have sooner thrown in their lot with them than with Robespierre, whom they thoroughly understood, but the Girondins, spurred on by Madame Roland, refused to have anything to do with Danton. Government became impossible; the federalist idea, which would have broken France to pieces in the very face of the enemy, grew and flourished, and the men of action had to take a decided part. In the month of May 1793 Camille Desmoulins, acting under the inspiration of Robespierre and Danton, published his *Histoire des Brissotins* and *Brissot démasqué*; Maximin Isnard declared that Paris must be destroyed if it pronounced itself against the provincial deputies; Robespierre preached insurrection at the Jacobin Club; and on the 31st of May and the 2nd of June the Commune of Paris destroyed the Girondin party. For a moment it seemed as if France would avenge them; but patriotism was stronger than federalism. The defence of Lyons cooperated the more with those working for France, and the armies who were fighting for her, and on the 27th of July 1793, when the struggle was practically decided, the Convention elected Robespierre to the new Committee of Public Safety. He had not solicited, so it seems, nor even desired this election, yet it marks an important epoch, not only in the life of Robespierre, but in the history of the Revolution. Danton and the men of action had throughout the last two years of the crisis, as Mirabeau had in the first two years, seen that the one great need of France, if she was to see the end of her troubles without the interference of foreign armies, was the existence of a strong executive government. The means for establishing the much-needed strong executive were found in the Committee of Public Safety. The success of this Committee in suppressing the Norman insurrection had confirmed the majority of the Convention in the expediency of strengthening its powers, and the Committee of General

Security which sat beside it was also strengthened and given the entire management of the internal police of the country. It was not until Robespierre was elected to the Committee that he became one of the actual rulers of France. Indeed, the Committee was not finally constituted until the 13th of September, when the last two of the "great" twelve who held office until July 1794 were elected. Of these twelve at least seven —Lazare Carnot, Billaud-Varenne, Collot d'Herbois, Prieur Duvernois (of the Marne), Prieur (of the Côte d'Or), Jean Bon Saint-André and Robert Lindet—were essentially men of action, and were entirely free from the influence of Robespierre. Of the other four, Hérault de Séchelles was a professed adherent of Danton, Barère de Vieuzac was an eloquent Provençal who was ready to be the spokesman to the Convention of any view which the majority of the Committee might adopt; and only Georges Couthon and Saint-Just, devoted to Robespierre, adroitly sustained his policy. It is necessary to dwell upon the fact that Robespierre was always in a minority in the great Committee in order to absolve him from the blame of being the inventor of the Terror, as well as to deprive him of the glory of the gallant stand made against Europe in arms.

After this examination of Robespierre's position it is not necessary to investigate closely every act of the great Committee during the year which was pre-eminently the year of the Terror; the biographer is rather called upon to examine his personal position with regard to the establishment of the Terror and the fall of the Hébertists and Dantonists, and then to dwell upon the last three months in which he stood almost alone trying to work up an effective counterbalance to the power of the majority of the great Committee. The Terror was the embodiment of the idea of Danton, that it was necessary to have resort to extreme measures to keep France united and strong at home in order to meet successfully her enemies upon the frontier. This idea was systematized by the Committee of Public Safety. With the actual organization of the Terror Robespierre had little or nothing to do; its two great engines, the revolutionary tribunal and the almost absolute power in the provinces of the representatives on mission, were in existence before he joined the Committee of Public Safety, and the laws of the maximum and of the suspects were by no means of his creation. The reason why he is almost universally regarded as its creator and the dominant spirit in the Committee is not hard to discover. Men like Lazare Carnot and Billaud-Varenne were not conspicuous speakers in the Convention, nor were they the idols of any section of the populace; but Robespierre had a fanatical following among the Jacobins and was one of the most popular orators in the Convention, on which his carefully prepared addresses often made a deep impression. His panegyrics on the system of revolutionary government and his praise of virtue led his hearers to believe that the system of the Terror, instead of being monstrous, was absolutely laudable; his pure life and admitted incorruptibility threw a lustre on the Committee of which he was a member; and his colleagues offered no opposition to his posing as their representative and reflecting some of his popularity upon them so long as he did not interfere with their work. Moreover, he alone never left Paris, whilst all the others, except Barère, were constantly engaged on missions to the armies, the navy and the provinces. It has been asserted that Robespierre, Couthon and Saint-Just took upon themselves the direction of "la haute politique," while the other members acted only in subordinate capacities; undoubtedly it would have suited Robespierre to have had this believed, but as a matter of fact he was in no way especially trusted in matters of supreme importance.

After this explanation it may be said at once that Robespierre was not the sole author of the overthrow of the Dantonists and the Hébertists, though he thoroughly agreed with the majority and had no desire to save them, the principles of both parties being obnoxious to him. The Hébertists were communists in the true meaning of the word. They held that each commune should be self-governing, and, while admitting the right of a central authority to levy men and money for the purposes of the state, they believed that in purely internal matters, as well as in determining the mode in which men and money were to be raised, the local government ought to be supreme. This position of the Hébertists was of course obnoxious to the Committee, who believed that success could only be won by their retention of absolute power; and in the winter of 1794–1795 it became obvious that the Hébertist party must perish, or its opposition to the Committee would grow too formidable owing to its paramount influence in the Commune of Paris. Robespierre shared his colleagues' fear of the Hébertist opinions, and he had a personal reason for disliking that party of atheists and *sansculottes*, since he believed in the necessity of religious faith, and detested their imitation of the grossness that belongs to the lowest class of the populace. In 1792 he had indignantly thrown from him the cap of liberty which an ardent admirer had placed upon his head; he had never pandered to the depraved tastes of the mob by using their language; and to the last day of his life he wore knee-breeches and silk stockings and wore his hair powdered. His position towards the Dantonist party was of a different character. After having seen established the strong executive he had laboured for, and having moved the resolutions which finally consolidated the power of the Committee of Public Safety in September 1793, Danton retired to his country house. But to his retreat came the news of the means the Committee used to maintain their supremacy. Danton did not believe that this continuous series of sacrifices under the guillotine was necessary, especially since the danger to the country had passed away with the victories of the revolutionary army; hence he inspired Camille Desmoulins to protest against the Terror in the *Vieux Cordelier*. Where is this system of terror to end? What is the good of a tyranny comparable only to that of the Roman emperors as described by Tacitus? Such were the questions which Camille Desmoulins asked under Danton's inspiration. This "modernatism," as it was called, was as objectionable to the members of the Committee as the doctrines of the Hébertists. Both parties must be crushed. Before the blows at the leaders of those two parties were struck, Robespierre retired for a month (from 13th February to 13th March 1794) from active business in the Convention and the Committee, apparently to consider his position; but he came to the conclusion that the cessation of the Reign of Terror would mean the loss of that supremacy by which he hoped to establish the ideal of Rousseau; for Danton, he knew, was essentially a practical statesman and laughed at his ideas and especially his politico-religious projects. He must have considered too that the result of his siding with Danton would probably have been fatal to himself. The result of his deliberations was that he abandoned Danton and co-operated in the attacks of the Committee on the two parties. On the 15th of March he reappeared in the Convention; on the 19th Hébert and his friends were arrested; and on the 24th they were guillotined. On the 30th of March Danton, Camille Desmoulins and their friends were arrested, and on the 5th of April they too were guillotined.

It was not until after the execution of Danton that Robespierre began to develop a policy distinct from that of his colleagues in the Committee, an opposition which ended in his downfall. He began by using his influence over the Jacobin Club to dominate the Commune of Paris through his devoted adherents, two of whom, Fleuriot-Lescot and C. F. de Payan, were elected respectively mayor and *procureur* of the Commune. He also attempted to usurp the influence of the other members of the Committee over the armies by getting his young adherent, Saint-Just, sent on a mission to the frontier. In Paris Robespierre determined to increase the pressure of the Terror: no one should accuse him of moderantism; through the increased efficiency of the revolutionary tribunal Paris should tremble before him as the chief member of the Committee; and the Convention should pass whatever measures he might dictate. To secure his aims, Couthon, his other ally in the Committee,

proposed and carried on the 10th of June the outrageous law of 22nd Prairial, by which even the appearance of justice was taken from the tribunal, which, as no witnesses were allowed, became a simple court of condemnation. The result of this law was that between the 12th of June and the 28th of July, the day of Robespierre's death, no less than 1285 victims perished by the guillotine in Paris. It was the bloodiest and the least justifiable period of the Terror. But before this there had taken place in Robespierre's life an episode of supreme importance, as illustrating his character and his political aims: on the 7th of May he secured a decree from the Convention recognizing the existence of the Supreme Being. This worship of the Supreme Being was based upon the ideas of Rousseau in the *Social Contract*, and was opposed by Robespierre to Catholicism on the one hand and the Hébertist atheism on the other. In honour of the Supreme Being a great fête was held on the 8th of June; Robespierre, as president of the Convention, walked first and delivered his harangue, and as he looked around him he may well have believed that his position was secured and that he was at last within reach of a supreme power which should enable him to impose his belief on all France, and so ensure its happiness. The majority of the Committee found his popularity—or rather his ascendancy, for as that increased his personal popularity diminished—useful to them, since by increasing the stringency of the Terror he strengthened the position of the Committee, whilst attracting to himself, as occupying the most prominent position in it, any latent feeling of dissatisfaction at such stringency. Of the issue of a struggle between themselves and Robespierre they had little fear: they controlled the Committee of General Security through their alliance with its leaders, André Amar and Marc Guillaume Alexis Vadier; they were hopeful of obtaining a majority in the Convention; for they knew that the chief deputies on the left, or "the Mountain," were Dantonists, who burned to avenge Danton's death; while they felt sure also that the mass of the deputies of the centre, or "the Marsh," could be hounded on against Robespierre if they were to accuse him of aiming at the dictatorship and pour on him the obloquy of having increased the Terror when neither on the frontier rendered it less necessary; and they knew finally that his actual adherents, though devoted to him, were few in number. The devotion of these admirers had been further excited by the news that a half-witted girl, named Cécile Renault, had been found wandering near his house, with a knife in her possession, intending to play the part of Charlotte Corday. She was executed on the 17th of June, on the very day that Vadier raised a laugh at Robespierre's expense in the Convention by his report on the conspiracy of Catherine Théot (*q.v.*), a mad woman, who had asserted that Robespierre was a divinity.

Robespierre felt that he must strike his blow now or never. Yet he was not sufficiently audacious to strike at once, as Payan and Jean Baptiste Coffinhal, the ablest of his adherents, would have had him do, but retired from the Convention for some weeks, as he had done before the overthrow of the Hébertists and the Dantonists, to prepare his plan of action. This retirement seemed ominous to the majority of the Committee, and they too prepared for the struggle by communicating with the deputies of the Mountain, who were either friends of Danton or men of prôved energy like Barras, Fréron and Tallien. These weeks, the last of his life, Robespierre passed very peacefully, according to his wont all through the Revolution. He continued to live with the Duplays, with whose daughter Éléonore he had fallen in love, and used to wander with her and his favourite dog, a great Danish hound, named Bruant, in the Champs Élysées during the long summer evenings. At last, on the 26th of July, Robespierre appeared, for the first time for more than four weeks, in the Convention and delivered a carefully studied harangue, which lasted for more than four hours, in which he declared that the Terror ought to be ended, that certain deputies who had acted unjustly and exceeded their powers ought to be punished, and that the Committees of Public Safety and General Security ought to be renewed. Great was the excitement in the Convention: all wondered who were the deputies destined to be punished; all were surprised that the Terror should be imputed as a fault to the very Committee of which Robespierre had been a member. The majority of the Committee of Public Safety determined to act promptly. The Convention, moved by Robespierre's eloquence, at first passed his motions; but he was replied to by Joseph Cambon the financier, Billaud-Varenne, Amar and Vadier, and the Convention rescinded their decrees and referred Robespierre's question to their committees. On the following day, the 27th of July, or in the revolutionary calendar the 9th Thermidor, Saint-Just began to speak on behalf of the motions of Robespierre, when violent interruptions showed the temper of the Convention. Jean Lambert, Tallien, Billaud-Varenne and Vadier again attacked Robespierre; cries of "Down with the tyrant!" were raised; and, when Robespierre hesitated in his speech in answer to these attacks, the words "C'est le sang de Danton qui t'étouffe" showed what was uppermost in the minds of the Mountain. Robespierre tried in vain to gain a hearing, the excitement increased and at five in the afternoon Robespierre, Couthon and Saint-Just, with two young deputies, Augustin Robespierre (younger brother of Maximilien) and Philippe François Joseph Lebas, the only men in all the Convention who supported them, were ordered to be arrested. Yet all hope for Robespierre was not gone; he was speedily rescued from his prison with the other deputies, by the troops of the Commune and brought to the Hôtel de Ville. There he was surrounded by his faithful adherents, led by Payan and Coffinhal. But the day was past when the Commune could overawe the Convention; for now the men of action were hostile to the Commune, and its chief was not a master of *coups d'état*. On the news of the release of Robespierre, the Convention had again met, and declared the members of the Commune and the released deputies outlawed. The national guards under the command of Barras had little difficulty in making their way to the Hôtel de Ville; Robespierre was shot in the lower jaw by a young gendarme named Meda while signing an appeal to one of the sections of Paris to take up arms for him, though the wound was afterwards believed to have been inflicted by himself; and all the releasd deputies were again arrested. After a night of agony, Robespierre was the next day taken before the tribunal, where his identity as an outlaw was proved, and without further trial he was executed with Couthon and Saint-Just and nineteen others of his adherents on the Place de la Révolution on the 10th Thermidor (28th July) 1794.

The character of Robespierre, when looked upon simply in the light of his actions and his authenticated speeches, and apart from the innumerable legends which have grown up about it, is not a difficult one to understand. A well-educated and accomplished young lawyer, he might have acquired a good provincial practice and lived a happy provincial life had it not been for the Revolution. Like thousands of other young Frenchmen, he had read the works of Rousseau and taken them as gospel. Just at the very time in life when this illusion had not been destroyed by the realities of life, and without the experience which might have taught the futility of idle dreams and theories, he was elected to the states-general. At Paris he was not understood till he met with his audience of fellow-disciples of Rousseau at the Jacobin Club. His fanaticism won him supporters; his singularly sweet and sympathetic voice gained him hearers; and his upright life attracted the admiration of all. As matters approached nearer and nearer to the terrible crisis, he failed, except in the two instances of the question of war and of the king's trial, to show himself a statesman, for he had not the liberal views and practical instincts which made Mirabeau and Danton great men. His admission to the Committee of Public Safety gave him power, which he hoped to use for the establishment of his favourite theories, and for the same purpose he acquiesced in and even heightened the horrors of the Reign of Terror. It is here that the fatal mistake of allowing a theorist to have power appeared:

Billaud-Varenne systematized the Terror because he believed it necessary for the safety of the country; Robespierre intensified it in order to carry out his own ideas and theories. Robespierre's private life was always respectable: he was always emphatically a gentleman and man of culture, and even a little bit of a dandy, scrupulously honest, truthful and charitable. In his habits and manner of life he was simple and laborious; he was not a man gifted with flashes of genius, but one who had to think much before he could come to a decision, and he worked hard all his life.

On the family of Robespierre see A. J. Paris in the *Mémoires* (2nd series, vol. iii.) of the Academy of Arras; the *Œuvres de Maximilien Robespierre* (3 vols., 1840), published by Laponneraye with prefaces by Armand Carrel, contain some of his speeches and the memoirs of Charlotte Robespierre on her brothers. The standard work on Robespierre's career is Ernest Hamel, *Histoire de Robespierre d'après des papiers de famille, les sources originales et des documents entièrement inédits* (3 vols., 1865–67). After the appearance of the first volume, the publisher refused to proceed for fear of prosecution until compelled to do so by the author. Another edition with a different title appeared in 1878. See also Ch. d'Hericault, *La Révolution de Thermidor* (2nd ed., 1878); Karl Brunnemann, *Maximilian Robespierre* (Leipzig, 1880); F. A. Aulard, *Les Orateurs de l'Assemblée Constituante* (1882); M. de Lescure, "Le Roman de Robespierre," in *La Société française pendant la Terreur* (1882); E. Hamel, *La Maison de Robespierre* (1890); Hilaire Belloc, *Robespierre* (1901); and C. F. Warwick, *Robespierre and the French Revolution* (1909). Many of the books which have been written about Robespierre are most untrustworthy, and the picture of him given by Thomas Carlyle in his *French Revolution* is unjust.

ROBILANT, CARLO FELICE NICOLIS, CONTE DI (1826–1888), Italian statesman and diplomat, was a native of Turin. He entered the army, and lost his left hand at Novara, where he was aide-de-camp to Charles Albert, king of Piedmont. He fought in 1859, and reached the grade of general in the Austrian campaign of 1866, after which he served on the delimitation commission. He was chief of the Military Academy, and in 1867 was made prefect of Ravenna to suppress political disorder. He was defeated at Turin in the elections for the Chamber in 1870, and was sent in 1871 as minister plenipotentiary to Vienna, where he subsequently became ambassador. He was connected with the Prussian nobility by his mother, and he married an Austrian, a daughter of Prince Edmund Clary-Aldringen. In spite of the active share he had taken in driving Austria from Italy, he was a *persona grata* at Vienna, and his policy was steadily directed to an alliance between the two powers. This was accomplished by the secret terms of the Triple Alliance in 1882. He was recalled to Rome in 1885 to become minister for foreign affairs in the Depretis cabinet. Robilant's independent attitude as foreign minister secured greater consideration for Italy from her allies, but he did not adapt himself to the exigencies of domestic politics, and his excessive unpopularity contributed to the downfall of the ministry on the 7th of February 1887, consequent on an adverse vote on the Massawa question. Before leaving office, he completed the negotiations for the renewal of the Triple Alliance, and for its extension to cover Anglo-Italian co-operation in the Mediterranean. In the new Depretis-Crispi administration Robilant was not included. He was sent to London as ambassador in the next year, but died two months after his arrival, on the 17th of October 1888.

ROBIN HOOD, English legendary hero. The oldest mention of Robin Hood at present known occurs in the second edition—what is called the B text—of *Piers the Plowman*, the date of which is about 1377. In passus v. of that poem the figure of Sloth is represented as saying—

> "I can nought perfitly my pater-noster, as the prest it syngeth:
> But I can rymes of Robyn Hood and Randolf Erle of Chestre."

He is next mentioned by Andrew of Wyntoun in his *Original Chronicle of Scotland*, written about 1420—

> "Lytel Jhon and Robyne Hude
> Waythmen ware commendyd gude;
> In Yngilwode and Barnysdale
> Thai oysyd all this time [c. 1283] thare trawale";

next by Walter Bower in his additions of Fordun's *Scotichronicon* about 1450—

"Hoc in tempore [1266] de exheredatis et bannitis surrexit et caput erexit ille famosissimus sicarius Robertus Hode et Littill Johanne cum eorum complicibus, de quibus stolidum vulgus hianter in comoediis et tragoediis prurienter restrum faciunt et super ceteras romancias, mimos, et bardanos cantitare delectantur."

Of his popularity in the latter half of the 15th and in the 16th centuries there are many signs. Just one passage must be quoted as of special importance because closely followed by R. Grafton, J. Stow and W. Camden. It is from John Mair's *Historia Majoris Britanniae tam Angliae quam Scotiae*, which appeared in 1521—

"Circa haec tempora [Ricardi Primi], ut auguror, Robertus Hudus Anglus et Parvus Joannes latrones famatissimi in nemoribus latuerunt, solum opulentorum virorum bona deripientes. Nullum nisi eos invadentem vel resistentem pro suarum rerum tuitione occiderunt. Centum sagittarios ad pugnam aptissimos Robertus latrociniis aluit, quos 400 viri fortissimi invadere non audebant. *Rebus hujus Roberti gestis tota Britannia in cantibus utitur.* Faeminam nullam opprimi permisit nec pauperum bona surripuit, verum eos ex abbatum bonis sublatis opipare pavit. Viri rapinam improbo, sed latronum omnium humanissimus et princeps erat."

In the Elizabethan era and afterwards mentions abound; see the works of Shakespeare, Sidney, Ben Jonson, Drayton, Warner, A. Munday, Camden, Stow, Braithwaite, Fuller, &c.

Of the ballads themselves, *Robin Hood and the Monk* is possibly as old as the reign of Edward II. (see Thomas Wright's *Essays on England in the Middle Ages*, ii. 174); *Robin Hood and the Potter* and *Robyn and Gandelyn* are certainly not later than the 15th century. Most important of all is *A Lytell Geste of Robyn Hode*, which was first printed about 1510 (see A. W. Pollard's *Fifteenth Century Prose and Verse*, Westminster, 1903). This is evidently founded on older ballads; we read in *The Seconde Fytte*, ll. 176 and 177—

> "He wente hym forthe full mery syngynge,
> As men have told in tale."

In fact, it does for the Robin Hood cycle what a few years before Sir Thomas Malory had done for the Arthurian romances —what in the 6th century B.C. Peisistratus is said to have done for the Homeric poems.

These are the facts about him and his balladry. Of conjectures there is no end. He has been represented as the last of the Saxons—as a Saxon holding out against the Norman conquerors so late as the end of the 12th century (see Augustin Thierry's *Norman Conquest*, and compare Sir Walter Scott's *Ivanhoe*). J. M. Gutch maintains that he was a follower of Simon de Montfort. The Rev. Joseph Hunter associated him with the rebel earl of Lancaster of Edward II.'s time. This scholar in a brochure published in 1852 produced evidence from the exchequer accounts and the court rolls of the manor of Wakefield showing that a "Robyn Hod" and a "Robertus Hood" were living in this reign. The series of coincidences to which he points is undoubtedly striking, but had failed to convince most critics. Professor F. J. Child dismisses his inferences as "ludicrous."

For our part, we are not disinclined to believe that the Robin Hood story has some historical basis, however fanciful and romantic the superstructure. We parallel it with the Arthurian story, and hold that, just as there was probably a real Arthur, however different from the hero of the trouvères, so there was a real Hood, however now enlarged and disguised by the accretions of legend. That Charlemagne and Richard I. of England became the subjects of romances does not prevent our believing in their existence; nor need Hood's mythical life deprive him of his natural one. Sloth in Langland's poem couples him, as we have seen, with Randle, earl of Chester; and no one doubts this nobleman's existence because he had "rymes" made about him. We believe him to have been the third Randle (see Bishop Percy's Folio MS., ed. Hales and Furnivall, i. 260). And possibly enough Hood was contemporary with that earl, who "flourished" in the reigns of Richard I., John and Henry III. Wyntoun and Mair, as we have seen, assign him to that period. It is impossible to believe with Hunter that he lived so late as Edward II.'s reign. This would leave no time for the growth

of his myth; and his myth was, as is evident from what we have already said and quoted, full-grown in the first half of the 14th century. Whatever may have been the immediate genesis of the myth —and it may well be sought in the heartless forest laws—its vitality was assured by the English love of archery and historical repetition. In the rolls of parliament of 1437 mention is made of Piers Venables, a robber who took to the woods "like as it had been Robin Hood and his meyné." There are indications that Robin was identified or confused with Robert Locksley, a manslayer of Bradfield in Hallamshire. The former is said to have been born in "Merry sweet *Locksley* town."

But whether he lived or not, and whenever he lived, it is certain that many mythical elements are contained in his story. Both his name and his exploits remind us of the woodland spirit Robin Goodfellow and his merry pranks. He is fond of disguising himself, and devoted to fun and practical jokes. These frolics suggest the wind. "The whole story," says Mr H. Bradley, "is ultimately derived from the great Aryan sunmyth. Robin Hood is Hod, the god of the wind, a form of Woden; Maid Marian is Morgen, the dawn-maiden; Friar Tuck is Toki, the spirit of frost and snow."

The name Robin (a French form from Rob, which is of course a short form for Robert) would serve both for "the shrewd and knavish sprite"—the German Knecht Ruprecht (see Grimm's *Teut. Myth.* p. 504, trans. Stallybrass)—and for the bandit (see "Roberdes Knaues" in the Prologue of *Piers the Plowman*, l. 44, and the note in Wanton's *Hist. of Eng. Poet.* ii. 95, ed. 1840). *Hood* is a very usual dialectal form of *wood*; and in his play *Edward the First*, George Peele actually alludes to the bandit as "Robin of the Wood." Mr Gutch thus explains the origin of the name. It is still a common enough surname, of which the earlier shape is Odo (see "Houdart," &c., in Larchey's *Dict. des Noms*); notice, too, the name Hudson. But it also reminds one of the German familiar spirit Hudekin, or possibly of the German Witikind (see Wright's *Essays on the Middle Ages*, ii. 207). Mr Sidney Lee suggests that Robin was a forest elf so called because elves wore hoods (see *Dict. of National Biography*, sub. "Robin Hood"). How certain it is that the Robin Hood story attracted to it and appropriated other elements is illustrated by its subsequent history—its history after the 14th century. Thus later on we find it connected with the Morris dance; but the Morris dance was not known in England before the 16th century or late in the 15th. The Friar Tuck and Maid Marian elements have been thought to have been introduced for the purpose of these performances, which were held on May-day and were immensely popular (see Latimer's *Frutefull Sermons* (London, 1571), p. 75; also *Paston Letters*, ed. J. Gairdner, iii. 89). After 1615, the date of the pageant prepared for the mayoralty of Sir John Jolles, draper, by Anthony Munday and entitled *Metropolis Coronata*, a peer was imported into it, and the yeoman of the older version was metamorphosed into the earl of Huntingdon, for whom in the following century William Stukeley discovered a satisfactory pedigree! The earl of Huntingdon was probably a nickname for a hunter. At last, with the change of times, the myth ceased growing. Its rise and development and decay deserve a more thorough study than they have yet received.

What perhaps is its greatest interest as we first see it is its expression of the popular mind about the close of the middle ages. Robin Hood is at that time the people's ideal as Arthur is that of the upper classes. He is the ideal yeoman as Arthur is the ideal knight. He readjusts the distribution of property: he robs the rich and endows the poor. He is an earnest worshipper of the Virgin, but a bold and vigorous hater of monks and abbots. He is the great sportsman, the incomparable archer, the lover of the greenwood and of a free life, brave, adventurous, jocular, open-handed, a protector of women. Observe his instructions to Little John—

> "Loke ye do no housbonde harme
> That tylleth with his plough;
> No more ye shall no good yeman
> That walketh by grene wode shawe;
> Ne no knyght ne no squyer
> That wolde be a good felawe:
> These bysshoppes and thyse archebysshoppes
> Ye shall them bete and bynde;
> The hye sheryfe of Notynghame
> Hym holde in your mynde."

And we are told—

> "Robin loved our dere lady;
> For doute of dedely synne
> Wolde he never do company harme
> That ony woman was ynne."

See also Drayton's *Polyolbion*, Song xxvi. The story is localized in Barnsdale and Sherwood, *i.e.* between Doncaster and Nottingham. In Yorkshire, Nottinghamshire and Lincolnshire a host of place-names testify to the popularity of the Robin Hood legend—Robin Hood's Bay, Robin Hood's Cave, Robin Hood's Chase, Robin Hood's Cup (a well), Robin Hood's Chair, Robin Hood's Pricks, and many more.

The best collections of Robin Hood poems are those of Ritson (8vo, 1795) and Gutch (2nd ed., 1847), and of Professor Child in the 5th volume of his invaluable *English and Scotch Popular Ballads* (Boston, 1888). See also Professor F. B. Gummere's *Old English Ballads* (Boston, 1894). The versions in the Percy Folio (edited by Hales and Furnivall, 1867, vol. i.) are unhappily mutilated; but they should be consulted, for they are all more or less unique, and that on "Robin Hood his death" is of singular interest. The literary and artistic value of many of the Robin Hood ballads cannot be pronounced considerable, but eight of them attain the high-water mark of their class. *Robin Hood and the Monk* and *Guy of Gisborne* are perhaps the best. There is, however, real vigour and force in this fragment on the hero's death. The earliest "Garland" was printed in 1670, and in 1678 appeared a prose version which was reprinted by W. J. Thoms in his *Early English Prose Romances* (vol. ii., 1858). Mr Lee's memoir in the *Dictionary of National Biography* is extremely erudite, and two valuable articles, contributed by Sir Edward Brabrook to the *Antiquary* for June and July 1906, might be consulted. See also Stukeley, *Palaeographia Britannica*, No. i. 115; Thierry, *Conquête de l'Angleterre* (1830); and J. Hunter's *Great Hero of the Ancient Minstrelsy of England, Robin Hood* (1852). (J. W. H.; F. J. S.)

ROBIN HOOD'S BAY, a seaside resort in the Whitby parliamentary division of the North Riding of Yorkshire, England, 6¾ m. S.E. of Whitby by a branch of the North-Eastern railway. The bay itself is a shallow indentation of the coast, and is fringed with high picturesque cliffs, breached in places by steep-sided narrow gullies. The small fishing village overhangs the cliffs, while the more modern watering-place is mostly built a little inland. A fine stretch of sandy shore is exposed at low tide.

ROBINIA, or LOCUST-TREE, a genus of about six species native of the United States and Mexico, belonging to the sub-order Papilionaceae of the great family Leguminosae. It was named by Linnaeus in honour of Jean Robin (1550–1629), herbalist to the king of France and his son and successor, Vespasien Robin (1579–1660) by whom the best-known species, *Robinia Pseudacacia*, was introduced into Europe, in the Jardin du Roi at Paris in 1636. This tree, the bastard acacia, or false acacia, and often called erroneously acacia, is now widely cultivated as an ornamental tree in this country and on the European continent. It grows from 30 to 60 ft. high, and bears long, graceful, compound leaves with 9 to 17 bright green oblong leaflets, and white fragrant flowers in loose pendulous racemes, recalling the laburnum in habit. There are many varieties in English gardens varying in the method of growth, the presence or absence of thorns (persistent spinose stipules) on the branches and the colour of the flower.

In the eastern United States, where it is native, it grows from 70 to 80 ft. high with a trunk 3 or 4 ft. in diameter. It is one of the most valuable timber trees of the American forest. The wood is heavy, very hard, strong, close-grained and durable, and is extensively used in shipbuilding, also for posts and other purposes where durability in contact with the ground is essential.

Like many plants of the same family, the leaves show sleep movement, folding together at night and in dull or wet weather; for this reason it is less injurious than many trees to plants growing in its shade, as the rain is able more quickly to reach the ground beneath.

ROBINS, BENJAMIN (1707–1751), English man of science and engineer, was born at Bath in 1707. His parents were Quakers in poor circumstances, and gave him very little education. Having come to London by the advice of Dr Henry Pemberton (1694–1771), who had recognized his talents, he for a time maintained himself by teaching mathematics, but soon devoted himself to engineering and the study of fortification. In particular he carried out an extensive series of experiments in gunnery, embodying his results in his famous treatise on *New Principles in Gunnery* (1742), which contains a description of his ballistic pendulum (see CHRONOGRAPH). Robins also made a number of important experiments on the resistance of the air to the motion of projectiles, and on the force of gunpowder, with computation of the velocities thereby communicated to projectiles. He compared the results of his theory with experimental determinations of the ranges of mortars and cannon, and gave practical maxims for the management of artillery. He also made observations on the flight of rockets, and wrote on the advantages of rifled barrels. His work on gunnery was translated into German by L. Euler, who added to it a critical commentary of his own. Of less interest nowadays are Robins's more purely mathematical writings, such as his *Discourse concerning the Nature and Certainty of Sir Isaac Newton's Methods of Fluxions and of Prime and Ultimate Ratios* (1735), "A Demonstration of the Eleventh Proposition of Sir Isaac Newton's Treatise of Quadratures" (*Phil. Trans.*, 1727), and similar works. Besides his scientific labours Robins took an active part in politics. He wrote pamphlets in support of the opposition to Sir Robert Walpole, and was secretary of a committee appointed by the House of Commons to inquire into the conduct of that minister. He also wrote a preface to the *Report on the Proceedings of the Board of General Officers on their Examination into the Conduct of Lieutenant-General Sir John Cope*, in which he gave an apology for the battle of Prestonpans. In 1749 he was appointed engineer-general to the East India Company, and went out to superintend the reconstruction of their forts; but his health soon failed, and he died at Fort St David on the 29th of July 1751.

His works were published in two volumes in 1761.

ROBINSON, EDWARD (1794–1863), American Biblical scholar, was born in Southington, Connecticut, on the 10th of April 1794, the son of William Robinson (1754–1825), minister of the Congregational Church of Southington. He graduated in 1816 at Hamilton College. In 1821 he came under the influence and teaching of Moses Stuart, the second edition of whose *Hebrew Grammar* he helped to prepare for the press in 1823, and through whom he was appointed in the same year instructor in Hebrew in Andover Seminary. With Stuart he translated in 1825 the first edition of Winer's *Grammar of New Testament Greek*; and alone he translated Wahl's *Clavis Philologica Novi Testamenti* (1825). In 1826–30 he studied in Germany, especially at Halle, under Gesenius, Tholuck, and Rödiger, and at Berlin, under Neander. He was professor (extraordinary) of sacred literature and librarian at Andover in 1830–33, resigning because of dangerous epileptic attacks; and in 1831–35 he edited the *Biblical Repository*, which he founded and carried on very largely by his own contributions, assisted somewhat by his young German wife, Theresa Albertina Luise (1797–1869), the daughter of Professor Ludwig Heinrich von Jakob of Halle, a linguist of considerable ability, and a writer (in her early years under the pseudonym "Talvi") of essays and stories. In 1837 he accepted the professorship of Biblical literature in Union Theological Seminary, and left America for three years of study in Palestine and Germany, the fruit of which, his *Biblical Researches*, published in 1841, brought him the gold medal of the Royal Geographical Society in 1842. A second volume of *Researches* appeared in 1856. His plans to sum up his important topographical studies in a work on Biblical geography were cut short by cataract in 1861 and by his death in New York City on the 27th of January 1863. A great Biblical scholar and exegete, Robinson must be considered the pioneer and father of Biblical geography—his *Biblical Researches*, supplemented by the *Physical Geography of the Holy Land* (1865), were based on careful personal exploration and tempered by a thoroughly critical spirit, which was possibly at times too sceptical of local tradition. Of scarcely less value in their day were his *Greek Harmony of the Gospels* (1845 and often) and his *Greek and English Lexicon of the New Testament* (1836; revised 1847 and 1850). He established in 1843 and edited for some years the *Bibliotheca Sacra* (in which the *Biblical Repository* was merged in 1852), for which he wrote until 1855.

See Henry B. Smith and Roswell D. Hitchcock, *The Life, Writings and Character of Edward Robinson* (New York, 1863); a biography of Mrs Robinson was published, with a collection of her stories, in Leipzig, in 1874.

ROBINSON, HENRY CRABB (1777–1867), English journalist and diarist, the son of a tanner, was born at Bury St Edmunds on the 13th of March 1775. In 1796 he entered the office of a solicitor in London, but two years later, having inherited a sum of money sufficient to give him a small yearly income, he started in 1800 upon a tour on the Continent, travelling chiefly in Germany and Bohemia. In 1802 he became a student at the university of Jena, where he remained until his return to England in 1805. After vain endeavours to obtain a post in the diplomatic service, he was appointed foreign correspondent for *The Times* at Altona. His letters, "From the Banks of the Elbe," were published in this newspaper during 1807, and on his return he became its foreign editor. In 1808 at the outbreak of the Peninsular War he was sent out as special war correspondent—an innovation in English journalism—for *The Times* to Spain. There he witnessed Sir John Moore's retreat at Corunna. After his return to England he read for the bar at the Middle Temple, and from 1813 to 1828 he practised as a barrister, retiring as soon as he had acquired a modest competence. He is remembered chiefly as the friend of Lamb, Coleridge, Wordsworth and Southey. He was a great conversationalist, and his breakfast parties rivalled those of Samuel Rogers. He died in London on the 5th of February 1867.

His *Diary* of 35 volumes, his *Journals* of 30 volumes, and his *Letters and Reminiscences* in 36 volumes, contain vivid pictures drawn by an acute and sympathetic observer who had exceptional opportunities of studying contemporary celebrities. They are preserved at Dr Williams's Library in Gordon Square, London. Crabb Robinson seems to have intended to edit these for publication, but except for a meagre selection edited by Thomas Sadler and entitled *The Diary, Reminiscences and Correspondence of H. Crabb Robinson* (1869), they have never been reprinted. Crabb Robinson was one of the founders of the Athenaeum Club and of University College, London.

ROBINSON, JOHN (1650–1723), English diplomatist and prelate, a son of John Robinson (d. 1651), was born at Cleasby, near Darlington, on the 7th of November 1650. Educated at Brasenose College, Oxford, he became a fellow of Oriel College, and about 1680 chaplain to the British embassy to Stockholm, and remained in Sweden for nearly thirty years. During the absence of the minister, Philip Warwick, Robinson acted as resident and as envoy extraordinary, and he was thus in Sweden during a very interesting and important period, and was performing diplomatic duties at a time when the affairs of northern Europe were attracting an unusual amount of attention. Among his adventures not the least noteworthy was his journey to Narva with Charles XII. in 1700. In 1709 Robinson returned to England, and was appointed dean of Windsor and of Wolverhampton; in 1710 he was elected bishop of Bristol, and among other ecclesiastical positions he held that of dean of the Chapel Royal. In August 1711 he became lord privy seal, this being, says Lord Stanhope, "the last time that a bishop has been called upon to fill a political office." In 1712 the bishop represented England at the important congress of Utrecht, and at first plenipotentiary he signed the treaty of Utrecht in April 1713. Just after his return to England he was chosen bishop of London in succession to Henry Compton. He died at Hampstead on the 11th of April 1723, having been a great benefactor to Oriel College. Robinson wrote an *Account of Sweden:*

together with an Extract of the History of that Kingdom. By a person of note who resided many years there (London, 1695). This was translated into French (Amsterdam, 1712), and in 1738 was published with Viscount Molesworth's *Account of Denmark in 1692*. Some of his letters are among the Strafford papers in the British Museum.

A member of the same family was Sir Frederick Philipse Robinson (1763–1852), a Virginian soldier, who fought for England during the American War of Independence. On the conclusion of peace he went to England, and in 1813 and 1814 he commanded a brigade under Wellington in Spain. Afterwards he was governor of Tobago, and he became a general in 1841. He died at Brighton on the 1st of January 1852.

ROBINSON, JOHN (1575?–1625), English Nonconformist divine, was born probably in Lincolnshire or Nottinghamshire about 1575. He seems to have studied at Cambridge, and to have been influenced by William Perkins. He took orders and held a curacy in Norwich, but was attracted by Puritan doctrines, and finally associated himself with a Congregation meeting at Gainsborough (where the "John Robinson Memorial Church" bears witness to his work). In 1606 the members divided into two societies, Robinson becoming minister of the one which made its headquarters at Scrooby, a neighbouring village. The increasing hostility of the authorities towards nonconformity soon forced him and his people to think of flight, and, not without difficulty, they succeeded in making their escape by detachments to Holland. Robinson settled in Amsterdam in 1608, but in the following year removed, with a large contingent, to Leiden, where he ministered to a community whose numbers gradually grew from one hundred to three hundred. In 1620 a considerable minority of these sailed for England in the "Speedwell," and ultimately crossed the Atlantic in the "Mayflower"; it was Robinson's intention to follow as soon as practicable, along with the rest of his flock, but he died before the plan could be carried out, on the 1st of March 1625.

In the early stages of the Arminian controversy he took the Calvinistic side, and even engaged in a public disputation with the famous Episcopius. He bore a high reputation even among his ecclesiastical opponents, and one of them (Robert Baillie) calls him "the most learned, polished and modest spirit that ever that sect enjoyed." He was large-minded and eminently reasonable in spirit, recognizing parish assemblies where "the pure word and discipline" prevailed as true churches of God. His sound judgment is seen in the way in which he adjusted the relations of elders and church—the most delicate practical problem of Congregationalism.

Amongst his publications may be mentioned *Justification of Separation from the Church* (1610), *Apologia Brownistarum* (1619), *A Defence of the Doctrine propounded by the Synod of Dort* (1624), and a volume of *Essays, or Observations Divine and Moral*, printed in 1625. His Works (with one exception, *A Manumission to a Manduction*, since published by the Massachusetts Historical Society, ser. iv., vol. i.), including a memoir, were reprinted by R. Ashton in three vols. in 1851. A summary of their contents is given in G. Punchard, *History of Congregationalism* (New York, 1867), iii. 300–344. See further CONGREGATIONALISM, and the literature there cited; also O. S. Davis, *John Robinson* (Hartford, Connecticut, 1897).

ROBINSON, SIR JOHN BEVERLEY, BART. (1791–1863), Canadian statesman and jurist, was the son of Christopher Robinson (1764–1708), one of the band known as United Empire Loyalists, who came to Canada at the conclusion of the American Revolution. He was born at Berthier, Quebec, on the 26th of July 1791, and studied under Dr John Strachan, by whom his religious and political ideas were much influenced. He served with distinction at the beginning of the war of 1812, and later in the war was appointed acting attorney-general of Upper Canada. In 1815 he visited England and read law at Lincoln's Inn.

From 1818 till 1829 he was the head of the Tory party in Upper Canada (the so-called "Family Compact"). In 1829 he became chief justice of Upper Canada, which position he held till shortly before his death on the 31st of January 1863. Not one of his decisions was ever reversed on appeal. In 1824 and again in 1839 he strongly advocated a federal union of British North America, and in 1839 opposed in *Canada and the Canada Bill* the legislative union of the two Canadas proposed by Lord Durham. In 1854 he was created a baronet of the United Kingdom and in 1855 a D.C.L. of Oxford University. His unbending Toryism rendered him a reactionary in politics, but his bitterest opponents admitted his sincerity and patriotism.

Several of his sons rose to eminence, John Beverley Robinson (1820–1896) becoming a member of the Dominion parliament and lieutenant-governor of Ontario (1880–1887). Christopher Robinson (1828–1905) was for many years the acknowledged leader of the Canadian Bar.

His *Life*, by his son, Major-General C. W. Robinson, C.B. (Toronto and London, 1904), gives a very favourable picture of the fine old colonial gentleman and loyalist. For a less favourable view see J. C. Dent, *Canadian Portrait Gallery*, vol. iv. (Toronto, 1881).

ROBINSON, JOHN THOMAS ROMNEY (1792–1882), Irish astronomer and physicist, was born in Dublin on the 23rd of April 1792. He studied at Trinity College, Dublin, and obtained a fellowship in 1814; for some years he was deputy professor of natural philosophy, until in 1821 he obtained the college living of Enniskillen. In 1823 he was appointed astronomer of the Armagh observatory, with which he (from 1824) combined the living of Carrickmacross, but he always resided at the observatory, engaged in researches connected with astronomy and physics, until his death on the 28th of February 1882.

Robinson published a number of papers in scientific journals, and the Armagh catalogue of stars (*Places of 5345 Stars observed from 1828 to 1854 at the Armagh Observatory*, Dublin, 1859), but he is best known as the inventor (1846) of the cup-anemometer for registering the velocity of the wind.

ROBINSON, SIR JOSEPH BENJAMIN (1845–), South African mine-owner, was born at Cradock, Cape Colony, in 1845. At the age of sixteen he started business as a general trader, wool-buyer and stock-breeder, but on the discovery of diamonds in South Africa in 1867 he hastened to the Vaal river district, where, by purchasing the stones from the natives and afterwards by buying diamond-bearing land, notably at Kimberley, he soon acquired a considerable fortune. He was mayor of Kimberley in 1880, and for four years was a representative of Griqualand West in the Cape parliament. On the discovery of gold in the Witwatersrand district in 1886, Robinson purchased the Langlaagte and Randfontein estates. His views as to the westerly trend of the main gold-bearing reef were entirely contrary to the bulk of South African opinion at the time, but events proved him to be correct, and the enormous appreciation in value of his various properties made him one of the richest men in South Africa. As a Rand capitalist he stood aloof from combinations with other gold-mining interests, and took no part in the Johannesburg reform movement, maintaining friendly relations with President Kruger. He claimed that it was as the result of his representations after the Jameson Raid that Kruger appointed the Industrial Commission of 1897, whose recommendations—had they been carried out—would have remedied some of the Uitlander grievances. In 1908 he was created a baronet.

ROBINSON, MARY ["Perdita"] (1758–1800), English actress and author, was born in Bristol on the 27th of November 1758, the daughter of a captain of a whaler named Darby. In 1774 she was married to Thomas Robinson, a clerk in London, where her remarkable beauty brought her many attentions; and when, after two years of fashionable life, her husband was arrested for debt, she shared his imprisonment. She had been a precocious child, encouraged to write verses, and while in King's Bench prison she completed the collection published in two volumes in 1775. On her release, thanks to Garrick, she secured an engagement at Drury Lane, making a successful first appearance as Juliet in 1776. On the 3rd of December 1779 she was Perdita in Garrick's version of *The Winter's Tale*, and her beauty so captivated George, prince of Wales (afterwards

George IV.), then in his eighteenth year, that he began a correspondence with her, signing himself "Florizel." She was for about two years his mistress, but he then deserted her, even dishonouring his bond for £20,000, payable when he came of age, and left her to obtain a pension of £500 in exchange for it from Charles James Fox. Owing to the hostility of public opinion, she feared to return to the stage, but she published some more volumes of her writings. There are numerous charming portraits of "Perdita"; two in the Wallace Collection, by Reynolds and by Gainsborough, reveal "her grave, refined beauty." Hoppner, Cosway and Romney also painted her.

See *Memoirs of Mary Robinson, "Perdita,"* with introduction and notes by J. F. Molloy (1894).

ROBINSON, THEODORE (1852–1896), American artist, was born at Irasburg, Vermont, in 1852. He was a pupil of J. L. Gérôme and Carolus-Duran in Paris, and worked with Claude Monet. He received the Webb Prize in 1890 for his "Winter Landscape," and the Shaw Fund in 1892 for his "In the Sun," a study of a peasant girl. He became a member (1881) of the Society of American Artists. He died in New York City on the 2nd of April 1896.

ROB ROY (1671–1734), the popular designation of a famous Highland outlaw whose prowess is the theme of one of Sir Walter Scott's novels, was by descent a Macgregor, being the younger son of Donald Macgregor of Glengyle, lieutenant-colonel in the army of James II., by his wife, a daughter of William Campbell of Gleneaves. He received the name Roy from his red hair, and later adopted Campbell as his surname on account of the acts proscribing the name of his clan. Though in stature not much above the middle height, he was so muscular and thickly set that few were his equals in feats of strength, while the unusual length of his arms gave him an extraordinary advantage in the use of the sword. His eyes were remarkably keen and piercing, and with his whole expression formed an appropriate complement to his powerful physical frame. He inherited a small property on the Braes of Balquhidder, and at first devoted himself to the rearing of cattle. Having formed a band of armed clansmen, he obtained, after the accession of William III., a commission from James II. to levy war on all who refused to acknowledge him as king, and in the autumn of 1691 made a descent on Stirlingshire to carry off the cattle of Lord Livingstone, when, being opposed by the villagers of Kippen, he also seized the cattle from all the byres of the village. Shortly afterwards he married Helen Mary, daughter of Macgregor of Comar. On the death of Gregor Macgregor, the chief of the clan, in 1693 he managed, though not the nearest heir, to get himself acknowledged chief, obtaining control of the lands stretching from the Braes of Balquhidder to the shores of Loch Lomond, and situated between the possessions of Argyll and those of Montrose. To assist in carrying on his trade as cattle-dealer he borrowed money from the 1st duke of Montrose, and, being unable to repay it, he was in 1712 evicted from his property and declared an outlaw. Taking refuge in the more inaccessible Highlands, Rob Roy from this time forward supported himself chiefly by depredations committed in the most daring manner on the duke and his tenants, all attempts to capture him being unsuccessful. During the rebellion of 1715, though nominally siding with the Pretender, he did not take an active part in the battle of Sheriffmuir except in plundering the dead on both sides. He was included in the Act of Attainder; but, having for some time enjoyed the friendship of the duke of Argyll, he obtained, on making his submission at Inveraray, a promise of protection. He now established his residence at Craigroyston, near Loch Lomond, whence for some time he levied blackmail as formerly upon Montrose, escaping by his wonderful address and activity every effort of the English garrison stationed at Inversnaid to bring him to justice. Ultimately, through the mediation of Argyll, he was reconciled to Montrose, and in 1722 he made submission to General Wade; he was carried off, and imprisoned in Newgate, and in 1727 was pardoned just as he was to be transported to Barbados. He then returned to Scotland. According to a notice in the *Caledonian Mercury* he died at Balquhidder on the 28th of December 1734. He was buried in Balquhidder churchyard.

The best lives are K. Macleay, *Historical Memoirs of Rob Roy* (1818; new ed., 1881); A. H. Millar, *Story of Rob Roy* (1883). See also Sir W. Scott's introduction to the novel *Rob Roy*. An early account, *The Highland Rogue*, &c. (1723), is ascribed to Defoe.

ROBSART, the maiden name of LADY AMY DUDLEY (1532–1560), wife of Lord Robert Dudley, afterwards earl of Leicester. She was the daughter of Sir John Robsart of Norfolk, and was married to Lord Robert on the 4th of June 1550. The marriage was apparently arranged by the family for business reasons, and there is no ground for supposing that it was a love match, or that she was beautiful. Her attraction lay in her estate, which was a provision for a younger son. During the early years of the marriage her husband was entangled in the rebellion of his family against Queen Mary, and was imprisoned in the Tower. She visited him there, and acted for his interests. After his release she saw little of him. When Elizabeth became queen in 1559 Lord Robert was soon known to be her favourite, and it was believed that she would marry him if he were free. His wife never came to court and was never in his company. Stories were set about to the effect that she was suffering from cancer and would soon die. Quadra, the Spanish ambassador, reported to the king of Spain that the queen had repeated this rumour to him in 1560 that she went by her husband's directions to Cumnor Place, a house near Oxford, rented by his agent Anthony Forster or Forrester, member of parliament for Abingdon. Here she was found lying dead on the floor of the hall on the 8th of September 1560 by her servants, whom she had allowed to go to Abingdon Fair. The circumstances of her death never have been, and now cannot be cleared up. A coroner's jury, which her husband did his best to pack and influence, attributed her end to accident. There is no evidence against Dudley, unless it be evidence that he was a most unscrupulous man, and that he was generally believed to have murdered several other persons who stood in his way.

See G. Adlard, *Amy Robsart and Leycester* (London, 1870), and W. Bruce, *The Murder of Amy Robsart* (London, 1885).

ROBSON, STUART (1836–1903), American actor, whose real name was Robson Stuart, was born in Annapolis, Maryland, on the 4th of March 1836. An unintentionally humorous appearance in a serious part in 1852 showed him that his forte was comedy; and in partnership with W. H. Crane from 1877 to 1889 he was very successful as a comedian, *The Henrietta* being one of their best productions. He died on the 29th of April 1903. His wife, May Robson, also became well known as an actress.

ROBY, HENRY JOHN (1830–), English classical scholar and writer on Roman law, was born at Tamworth on the 12th of August 1830. He was educated at St John's College, Cambridge (senior classic, 1853; fellow, 1854). From 1866 to 1868 he was professor of jurisprudence at University College, London, and from 1872 to 1874 commissioner of endowed schools. From 1890 to 1895 he was member of parliament in the Liberal interest for the Eccles division of Lancashire. The book by which he is perhaps best known is his *Grammar of the Latin Language from Plautus to Suetonius*, a storehouse of illustrative quotations from Latin literature, but his most important works deal with Roman law—*Introduction to Justinian's Digest* (1884) and *Roman Private Law* (1902).

ROC, or more correctly RUKH, a fabulous bird of enormous size which carries off elephants to feed its young. The legend of the roc, familiar to every one from the *Arabian Nights*, was widely spread in the East; and in later times the home of the monster was sought in the direction of Madagascar, whence gigantic fronds of the *Raphia* palm very like a quill in form appear to have been brought under the name of roc's feathers (see Yule's *Marco Polo*, bk. iii. ch. 33, and *Academy*, 1884, No. 620). Such a feather was brought to the Great Khan, and we read also of a gigantic stump of a roc's quill being

brought to Spain by a merchant from the China seas (Abu Ḥāmid of Spain, in Damīrī, *s.v.*). The roc is hardly different from the Arabian *'ankā* (see PHOENIX); it is also identified with the Persian *sīmurgh*, the bird which figures in Firdausi's epic as the foster-father of the hero Zal, father of Rustam. When we go farther back into Persian antiquity we find an immortal bird, *amru*, or (in the *Mīnō-khiradh*) *sīnamrū*, which shakes the ripe fruit from the mythical tree that bears the seed of all useful things. Sīnamrū and sīmurgh seem to be the same word. In Indian legend the *garuḍa* on which Vishnu rides is the king of birds (Benfey, *Pantschatantra*, iii. 98). In the Pahlavi translation of the Indian story as represented by the Syrian *Kalīlag and Damnag* (ed. Bickell, 1876), the simurgh takes the place of the garuḍa, while Ibn al-Mokaffa' (*Calila et Dimna*, ed. De Sacy, p. 126) speaks instead of the 'ankā. The later Syriac, curiously enough, has *behmoth*,—apparently the behemoth of Job transformed into a bird.

For a collection of legends about the roc, see Lane's *Arabian Nights*, chap. xx. notes 22, 62, and Yule, *ut supra*. Also see Bochart, *Hieroz*, bk. vi. ch. xiv.; Damīrī, i. 414, ii. 177 seq.; Kazwīnī, i. 419 seq.; Ibn Baṭūṭa, iv. 305 seq.; Spiegel, *Eran. Altertumsk.* ii. 118.

ROCAMADOUR, a village of south-western France, in the department of Lot, 36 m. N.N.E. of Cahors by road. Pop. (1906) 296. Rocamadour, a famous place of pilgrimage, is most strikingly situated. Its buildings rise in stages up the side of a cliff on the right bank of the Alzou, which here runs between rocky heights 400 ft. in height. Flights of steps ascend from the lower town to the churches—a group of massive buildings half-way up the cliff. The chief of them is the church of Notre-Dame (1479), containing the wooden figure of the Madonna reputed to have been carved by St Amadour. The church opens on to a terrace called the Plateau of St Michel, where there is a broken sword said to be a fragment of "Durandal," once wielded by the hero Roland. The interior walls of the church of St Sauveur are covered with paintings and inscriptions recalling the pilgrimages of celebrated persons. The subterranean church of St Amadour (1166) extends beneath St Sauveur and contains relics of the saint. On the summit of the cliff stands the château built in the middle ages to defend the sanctuaries.

Rocamadour owes its origin to St Amadour or Amateur, who, according to tradition, chose the place as a hermitage for his devotions to the Virgin Mary. The saint is identified with Zacchaeus the publican and disciple of Jesus, who is said to have journeyed to Gaul to preach the gospel. The renown of Rocamadour as a place of pilgrimage dates from the early middle ages.

ROCAMBOLE, *Allium Scorodoprasum*, a hardy bulbous perennial occurring in a wild state in sandy pastures and waste places throughout Europe, but not common in the south; in Britain it is rare, and found in the north of England and the south of Scotland. Its cultivation does not appear to be of ancient date; it is not mentioned by Greek and Roman authors, and there are only a small number of original common names among ancient peoples (A. de Candolle, *Origin of Cultivated Plants*, p. 72). The plant is grown for its bulbs, which are smaller and milder than those of garlic, and consist of several cloves chiefly produced at the roots. The cloves are planted about the end of February or in March, and treated like garlic or shallot. When mature, the bulbs are taken up, dried and stored for use.

ROCH, ST (Lat. Rochus; Ital. Rocco; Span. Roque; Fr. Roch) (d. 1327), a confessor whose death is commemorated on the 16th of August; he is specially invoked against the plague. According to his *Acta*, he was born at Montpellier, France, about 1295. He early began to manifest strict asceticism and great devoutness, and on the death of his parents in his twentieth year he gave all his substance to the poor. Coming to Italy during an epidemic of plague, he was very diligent in tending the sick in the public hospitals at Aquapendente, Cesena and Rome, and effected many miraculous cures by prayer and simple contact. After similar ministries at Piacenza he himself fell ill. He was expelled from the town, and withdrew into the forest, where he would have perished had not a dog belonging to a nobleman named Gothardus supplied him with bread. On his return to Montpellier he was arrested as a spy and thrown into prison, where he died on the 16th of August 1327, having previously obtained from God this favour —that all plague-stricken persons invoking him should be healed. His cult spread through Spain, France, Germany, Belgium and Italy. A magnificent temple was raised to him at Venice, where his body is believed to lie, and numerous brotherhoods have been instituted in his honour. He is usually represented in the garb of a pilgrim, with a wound in his thigh, and with a dog near him carrying a loaf in its mouth.

See *Acta sanctorum*, August, iii. 380-415; Charles Cahier *Les Caractéristiques des saints* (Paris, 1867) pp. 215-217. (H. DE)

ROCHAMBEAU, JEAN BAPTISTE DONATIEN DE VIMEUR, COMTE DE (1725–1807), French soldier, was born at Vendôme (Loir-et-Cher) on the 1st of July 1725. He was originally destined for the church and was brought up at the Jesuit college at Blois, but after the death of his elder brother he entered a cavalry regiment, served in Bohemia and Bavaria and on the Rhine, and in 1747 had attained the rank of colonel. He took part in the siege of Maestricht in 1748, became governor of Vendôme in 1749, and after distinguishing himself in 1756 in the Minorca expedition was promoted brigadier of infantry. In 1757 and 1758 he fought in Germany, notably at Crefeld, received several wounds in the battle of Closterkamp (1760), was appointed *maréchal de camp* in 1761 and inspector of cavalry and was frequently consulted by the ministers on technical points. In 1780 he was sent, with the rank of lieutenant-general, in command of 6000 French troops to help the American colonists under Washington against the English. He landed at Newport, Rhode Island, on the 10th of July, but was held here inactive for a year, owing to his reluctance to abandon the French fleet, which was blockaded by the British in Narragansett Bay. At last, in July 1781, Rochambeau's force was able to leave Rhode Island and, marching across Connecticut, joined Washington on the Hudson. Then followed the celebrated march of the combined forces to Yorktown, where on the 22nd of September they formed a junction with the troops of Lafayette; as the result Cornwallis was forced to surrender on the 19th of October. Throughout, Rochambeau had displayed an admirable spirit, placing himself entirely under Washington's command and handling his troops as part of the American army. In recognition of his services, Congress voted him and his troops the thanks of the nation and presented him with two cannon taken from the English. These guns, which Rochambeau took back to Vendôme, were requisitioned in 1792. On his return to France he was loaded with favours by Louis XVI. and was made governor of Picardy. During the Revolution he commanded the Army of the North in 1790, but resigned in 1792. He was arrested during the Terror, and narrowly escaped the guillotine. He was subsequently pensioned by Bonaparte, and died at Thoré (Loir-et-Cher) on the 10th of May 1807.

A statue of Rochambeau by Ferdinand Hamar, the gift of France to the United States, was unveiled in Lafayette Square, Washington, by President Roosevelt on the 24th of May 1902. The ceremony was made the occasion of a great demonstration of friendship between the two nations. France was represented by her ambassador, M. Cambon, Admiral Fournier and General Brugère, a detachment of sailors and marines from the warship "Gaulois" being present. Representatives of the Lafayette and Rochambeau families also attended. Of the many speeches perhaps the most striking was that of Senator Henry C. Lodge, who, curiously enough in the circumstances, prefaced his eloquent appreciation of the services rendered to the American cause by France by a brilliant sketch of the way in which the French had been driven out of North America by England and her colonists combined. General Brugère, in his speech, quoted Rochambeau's words, uttered in 1781: "*Entre vous*,

entre nous, à la vie, à la mort." A "Rochambeau fête" was held simultaneously in Paris.

The *Mémoires militaires, historiques et politiques, de Rochambeau* were published by Luce de Lancival in 1809. Of the first volume a part, translated into English by M. W. E. Wright, was published in 1838 under the title of *Memoirs of the Marshal Count de R. relative to the War of Independence in the United States*. Rochambeau's correspondence during the American campaign is published in H. Doniol, *Hist. de la participation de la France à l'établissement des Etats Unis d'Amérique*, vol. v. (Paris, 1892). See Duchesne, "Autour de Rochambeau" in the *Revue des facultés catholiques de l'ouest* (1898–1900); E. Gachot, "Rochambeau" in the *Nouvelle Revue* (1902); H. de Ganniers, "La Dernière Campagne du maréchal de Rochambeau" in the *Revue des questions historiques* (1901).

ROCHDALE, a municipal, county and parliamentary borough of Lancashire, England, on the river Roch, 10½ m. N.N.E. from Manchester and 196 m. N.W. by N. from London, on the Lancashire & Yorkshire railway. Pop. (1891) 76,161; (1901) 83,114. By means of the Rochdale canal and connexions it has water communications in every direction. The site rises sharply from the Roch, near its confluence with the Spodden, and from the high-lying public park of Rochdale fine views of the picturesque neighbourhood are obtained. Several interesting old houses remain in the vicinity of the town. The parish church of St Chad is built on the site of a church erected in the 12th century, but itself retains no portion earlier than the Perpendicular period. In the churchyard is buried John Collier (1708–1786), a local author, artist and caricaturist, who was among the first to recognize and utilize in writing the humour of the Lancashire dialect, and attained considerable fame under the pseudonym of Tim Bobbin. The town hall is an extensive and elaborate structure in the Decorated style, with a tower. Of educational charities the principal is the Archbishop Parker free grammar school, founded in 1565. There are also technical and art schools; and a large Roman Catholic orphanage. Among other public institutions are the public library, the infirmary, the literary and scientific society and the art society. Rochdale was the birthplace of the co-operative movement. The Equitable Pioneers Society (1844) numbers over 11,000 members, with a capital of over £350,000. A handsome co-operative store, belonging to the Rochdale Provident Co-operative Society, was opened in 1900. A statue of John Bright (1891) recalls the connexion of the statesman and his family with Rochdale. The staple manufactures are those of woollens and cottons. There are, besides, foundries, iron-works and machine-factories. Coal and stone are obtained extensively in the neighbourhood. Frequent cattle and horse fairs are held. Rochdale was incorporated in 1856, and includes several townships. The corporation consists of a mayor, 10 aldermen and 30 councillors. The county borough was created in 1888. The parliamentary borough, which has returned one member since 1832, falls between the Middleton and Heywood divisions of the county. Area of municipal borough, 6446 acres.

Rochdale (Recedham, Rachedam, Rachedal) takes its name from the river on which it stands. A Roman road passed the site, and a Saxon castle stood in Castleton, one of the component parts of the town. In Edward the Confessor's reign most of the land was held by Gamel the Thane, but after the Conquest the manor probably came into the hands of Roger de Poictou, from whom it passed to the Lacys and like their other lands became merged in the duchy of Lancaster. From 1462 to 1625 the crown seems to have leased it to the Byron family. In 1625 Charles I. conveyed the manor in trust for the earl of Holdernesse, and in 1638 it was sold to Sir John Byron, afterwards Baron Byron of Rochdale, whose descendants held it till 1823 when it was sold to the Deardens. Manor courts are still held periodically. Henry III. in 1240–41 granted by charter to Edmund de Lacy the right to hold a weekly market on Wednesday and an annual fair on the feast of SS Simon and Jude (28th October). Early in George III.'s reign the market day was changed to Monday. Two of the early industries, cutlery and hat-making, date from about the middle of the 16th century. The woollen industry is generally, but erroneously, said to have been introduced by Flemish immigrants in Edward III.'s reign; but, with the cognate trades of dyeing and fulling, its importance only dates from the early part of the 17th century. It was not till 1795 that a cotton mill was built here, and in the latter half of the 18th century the town was famed for its woollen, not its cotton manufactures.

See H. Fishwick, *History of the Parish of Rochdale* (1889).

ROCHE, SIR BOYLE, BART. (1743–1807), Irish soldier and politician, famous for his "bulls," came of a branch of the family of the Viscounts Fermoy. He served in the American War, and sat in the Irish parliament from 1777 onwards, being created a baronet in 1782 for his loyalty to the government. He supported the Union, and one of his recorded "bulls"—many, however, being only fastened on him—was his declaration that he would have "the two sisters" (England and Ireland) "embrace like one brother." Sir Boyle Roche was a characteristically witty and genial Irishman, and was master of the ceremonies at Dublin Castle.

ROCHEFORT, HENRI, MARQUIS DE ROCHEFORT-LUÇAY (1830–), French politician, was born in Paris on the 30th of January 1830. His father was a Legitimist noble who as "Edmond Rochefort" was well known as a writer of vaudevilles; his mother's views were republican. After experience as a medical student, a clerk at the Hôtel de Ville, a playwright and a journalist, he joined the staff of the *Figaro* in 1863; but a series of his articles, afterwards published as *Les Français de la Décadence* (3 vols., 1866–68), brought the paper into collision with the authorities and caused the termination of his engagement. In collaboration with different dramatists he had meanwhile written a long series of successful vaudevilles, which began with the *Monsieur bien mis* at the Folies Dramatiques in 1856. On leaving the *Figaro* Rochefort determined to start a paper of his own, *La Lanterne*. The paper was seized on its eleventh appearance, and in August 1868 Rochefort was fined 10,000 francs, with a year's imprisonment. He then published his paper in Brussels, whence it was smuggled into France. Printed in French, English, Spanish, Italian and German, it went the round of Europe. After a second prosecution he fled to Belgium. A series of duels, of which the most famous was one fought with Paul de Cassagnac a propos of an article on Joan of Arc, kept Rochefort in the public eye. In 1869, after two unsuccessful candidatures, he was returned to the Chamber of Deputies as the first Opposition-scription of Paris. He was arrested on the frontier, only to be almost immediately released, and forthwith took his seat. He renewed his onslaught on the empire, starting a new paper, the *Marseillaise*, as the organ of political meetings arranged by himself at La Villette. The staff was appointed on the votes of the members, and included Victor Noir and Pascal Grousset. The violent articles in this paper led to the duel which resulted in Victor Noir's death at the hands of Prince Pierre Bonaparte. The paper was seized, and Rochefort and Grousset were sent to prison for six months. The revolution of September was the signal for his release. He became a member of the government of National Defence, but this close association with the forces of law and order was soon broken on account of his openly expressed sympathy with the Communards. On the 11th of May 1871 he fled in disguise from Paris. A week earlier he had resigned with a handful of other deputies from the National Assembly rather than countenance the dismemberment of France. Arrested at Meaux by the Versailles government, he was detained for some time in prison with a nervous illness before he was condemned under military law to imprisonment for life. In spite of Victor Hugo's efforts on his behalf he was transported to New Caledonia. In 1874 he escaped on board an American vessel to San Francisco. He lived in London and Geneva until the general amnesty permitted his return to France in 1880. In Geneva he resumed the publication of *La Lanterne*, and in the Parisian papers articles constantly appeared from his pen. When at length in 1880 the general amnesty

permitted his return to Paris he founded *L'Intransigeant* in the Radical and Socialist interest. For a short time in 1885–86 he sat in the Chamber of Deputies, but found a great opportunity next year for his talent for inflaming public opinion in the Boulangist agitation. He was condemned to detention in a fortress in August 1889 at the same time as General Boulanger, whom he had followed into exile. He continued his polemic from London, and after the suicide of General Boulanger he attacked M. Constans, minister of the interior in the Freycinet cabinet, with the utmost violence, in a series of articles which led to an interpellation in the chamber in circumstances of wild excitement and disorder. The Panama scandals furnished him with another occasion, and he created something of a sensation by a statement in the *Figaro* that he had met M. Clemenceau at the table of the financier Cornélius Herz. In 1895 he returned to Paris, two years before the Dreyfus affair supplied him with another *point d'appui*. He became a leader of the anti-Dreyfusards, and had a principal share in the organization of the press campaign. Subsequently he was editor of *La Patrie*.

Besides his plays and articles in the journals he published several separate works, among them being: *Les Petits Mystères de l'Hôtel des Ventes* (1862), a collection of his art criticisms; *Les Dépravés* (Geneva, 1882); *Les Naufrageurs* (1876); *L'Evadé* (1883), *Napoléon dernier* (3 vols., 1884); and *Les Aventures de ma vie* (5 vols., 1896).

ROCHEFORT, a small town of Belgium, situated on the Lomme, a tributary of the Lesse, in the S.E. of the province of Namur close to the Ardennes. Resident pop. (1904) 3068, which in July and August is doubled. It is of ancient origin, its position at the point where the route to St Hubert crossed that from Liége to Bouillon having made it at all times a place of some importance. The ruins of the old castle, which gave the place its name and a title to a long line of counts who had the right of coining their own money, still exist. This castle underwent many sieges and suffered much in the earlier wars, especially at the hands of Marshal de Chatillon in 1636. Rochefort is noted for its healthiness, and is a favourite place of residence. It also attracts every summer a large number of visitors and tourists, who visit it on account of the remarkable grottoes in its neighbourhood. One of these is situated in the town itself and is known by its name. This grotto contains six halls or chambers, the largest of which is called the Sabbat, and is remarkable for its great height. But the most famous are the grottoes of Han, situated three miles from Rochefort at Han sur Lesse. Here the river Lesse passes by a subterranean and undiscovered passage under the hill called Boème or Boine. The endeavour to trace the course of the river led to the discovery of the grottoes, which consist of fifteen separate halls, connected by passages more or less short and emerging on the river in a dark and extensive cavern forming a sort of side creek or bay. Except in flood-time, when the exit has to be used, the entrance is near the point where the river disappears at what is called the gap or hole of Belvaux, and the exit is made by boat from the cavern last described, which leads out to the open river. A beautiful effect is afforded by the passage from the complete darkness of this cavern into the light. The finest stalactites are in the three halls called the Mysterieuses, the Vigneron and the Draperies. In the last-named is "the tomb," which looks as if chiselled out of white marble. The central hall—called the Salle d'Armes—is immense, and one of the river channels flows through it. Electric light has been introduced. Near Rochefort are the famous red marble quarries of St Remy, and the old Cistercian abbey of that name is now a Trappist seminary.

ROCHEFORT, a town of western France, capital of an arrondissement in the department of Charente-Inférieure, 20 m. S.S.E. of La Rochelle on the State railway from Nantes to Bordeaux. Pop. (1906) town, 31,433; commune, 36,694. It is situated on the right bank of the Charente, 9 m. from the Atlantic, and is built partly on the side of a rocky hill and partly on an old marshland. The town is laid out with great regularity, the streets being wide and straight and centring round the Place Colbert, in the middle of which is a monumental fountain of the 18th century. The public institutions of Rochefort comprise the sub-prefecture, tribunals of first instance and of commerce, a board of trade arbitration, a chamber of commerce, a lycée for boys, a college for girls and schools of drawing and architecture. The fortifications are slight. Below Rochefort the Charente is crossed by a *pont transbordeur*, the carrier of which is suspended at a height which admits of the tallest ships passing underneath at any time. There are both a naval and a commercial harbour. The former has the advantage of deep anchorage well protected by batteries at the mouth of the river, and the roadstead is perfectly safe. The windings of the channel, however, between Rochefort and the sea, and the bar at the entrance render navigation dangerous. Rochefort is capital of the fourth maritime arrondissement, which stretches from the bay of Bourgneuf to the coast of Spain. The naval harbour and arsenal, separated from the town by a line of fortifications with three gates, contain large covered building yards, repairing docks and extensive timber basins on both banks of the river. The arsenal has also a ropewalk dating from 1668, a school of navigation and pilotage, the offices of the maritime prefecture, the navy commissariat, a park of artillery and various boards of direction connected with the navy. Other government establishments at Rochefort are barracks for infantry, artillery and marines, and the naval hospital and school of medicine. In the grounds of this last institution is an artesian well, sunk in 1862–1866 to a depth of 2800 ft., and yielding water with a temperature of 100° F. The commercial harbour, higher up the river than the naval harbour, has two small basins, a third basin with an area of 15 acres and a depth at neap-tide of 25 ft., at spring-tide of 29½ ft., and a dry dock 110 yds. long. Besides shipbuilding, which forms the staple industry, flour- and saw-milling, sail-cloth, &c., are among the local manufactures. At the ports of Rochefort and Tonnay-Charente (4 m. higher up) there entered, in 1905, 265 vessels (166 British), with a tonnage of 192,537.

The lordship of Rochefort, held by powerful nobles as early as the 11th century, was united to the French Crown by Philip the Fair early in the 14th century; but it was alternately seized in the course of the Hundred Years' War by the English and the French, and in the Wars of Religion by the Catholics and Protestants. Colbert having in 1665 chosen Rochefort as the seat of a repairing port between Brest and the Gironde, the town rapidly increased in importance; by 1674 it had 20,000 inhabitants; and when the Dutch admiral Cornelius Tromp appeared at the mouth of the river with seventy-two vessels for the purpose of destroying the new arsenal, he found the approaches so well defended that he gave up his enterprise. It was at Rochefort that the naval school, afterwards transferred to Brest, was originally founded. The town continued to flourish in the later part of the 17th century. In 1690 and in 1703 the English made unsuccessful attempts to destroy it. Its fleet, under the command of Admiral la Gallissonnière, a native of the place, defeated Admiral Byng in 1755 and did good service in the wars of the republic. But the destruction of the French fleet by the English in 1809 in the roadstead of Île d'Aix, the preference accorded to the harbours of Brest and Toulon and the unhealthiness of its climate seriously interfered with the prosperity of the place. The convict establishment, founded at Rochefort in 1777, was suppressed in 1852.

ROCHESTER, JOHN WILMOT, 2ND EARL OF (1647–1680), English poet and wit, was the son of Henry Wilmot, 1st earl. The family was descended from Edward Wilmot of Witney, Oxfordshire, whose son Charles (*c.* 1570–*c.* 1644), having served with distinction in Ireland during the rebellion at the beginning of the 17th century, was president of Connaught from 1616 until his death. In 1621 he had been created an Irish peer as Viscount Wilmot of Athlone, and he was succeeded by his only surviving son, Henry (*c.* 1612–1658). Having fought against the Scots at Newburn and been imprisoned and expelled from

the House of Commons for plotting in the interests of the king in 1641, Henry Wilmot served Charles I. well during the Civil War, being responsible for the defeats of Sir William Waller at Roundway Down in July 1643 and at Cropredy Bridge in June 1644. In 1643 he was created Baron Wilmot of Adderbury. Wilmot was on bad terms with some of the king's friends and advisers, including Prince Rupert, and in 1644 he is reported to have said that Charles was afraid of peace and to have advised his supercession by his son, the prince of Wales. Consequently he was deprived of his command, and after a short imprisonment was allowed to cross over to France. He was greatly trusted by Charles II., whose defeat at Worcester and subsequent wanderings he shared, and during this king's exile he was one of his principal advisers, being created by him earl of Rochester in 1652. In the interests of Charles he visited the emperor Ferdinand III., the duke of Lorraine, and the elector of Brandenburg, and in March 1655 he was in England, where he led a feeble attempt at a rising on Marston Moor, near York; on its failure he fled the country.

Born at Ditchley in Oxfordshire on the 10th of April 1647, John Wilmot, who succeeded his father as 2nd earl in 1658, was educated at Wadham College, Oxford, and in 1661, although he was only fourteen years of age, received the degree of M.A. On leaving Oxford he travelled in France and Italy with a tutor who encouraged his love of literature, and moreover advocated principles of temperance which, however, bore little fruit. He returned in 1664, and at once made his way to Charles II.'s court, where his youth, good looks and wit assured him of a welcome In 1665 he joined the fleet serving against the Dutch as a volunteer, and in the following year distinguished himself by carrying a message in an open boat under fire. This reputation for courage was afterwards lost in private quarrels in which he seems to have shirked danger. He became gentleman of the bedchamber to Charles II., and was the confidant of his various exploits. According to Anthony Hamilton, banishment from court for lampooning the king or his mistresses was with Rochester an almost annual occurrence, but his disgrace was never of long duration. Charles seems to have found his company too congenial to be long dispensed with, and Pepys says that all serious men were disgusted by the unbalance with which he passed over Rochester's insolence (*Diary*, 17th Feb. 1669). In order to restore his rapidly vanishing fortune he became a suitor to Elizabeth Malet. In spite of the king's support of Rochester's suit, Miss Malet refused to marry the earl, who thereupon had her seized (1665) from her uncle's coach. Rochester was pursued, and Charles, who was very angry, sent him to the Tower. Miss Malet, however, married him in 1667.

Not content with making or unmaking the reputation of the maids of honour and the courtiers by his squibs and songs, Rochester aspired to be a patron of poetry and an arbiter of taste, but he was vain and capricious, tolerating no rivals in his capacity of patron. Dryden dedicated to him his *Marriage-à-la-Mode* (1672) in a preface full of effusive flattery, at the close of which, however, occurs a passage that may be taken to indicate that he already had misgivings. "Your lordship has but another step to make," he says, "and from the patron of wit, you may become its tyrant; and oppress our little reputations with more ease than you now protect them." Dryden had another patron in Lord Mulgrave (afterwards duke of Buckingham and Normanby), to whom he dedicated (1675) *Aurengzebe*. Mulgrave had engaged in a duel with Rochester, who had refused to fight at the last minute on the ground of ill-health. Mulgrave allowed this story to spread, and Rochester, who apparently thought him too dangerous an opponent, revenged himself on Dryden as Mulgrave's protégé by setting up as his rivals, first Elkanah Settle, and then John Crowne. By his influence Settle's *Emperor of Morocco* was played at Whitehall, and Crowne was employed, in direct infringement of Dryden's province as laureate, to write a masque for the court. Both these poets were discarded in turn for Nathaniel Lee and Thomas Otway. In 1679 Mulgrave began to circulate his *Essay on Satire* in which Rochester was singled out for severe criticism. Rochester chose to pretend that this was Dryden's work, not Mulgrave's, and by his orders a band of roughs set on the poet in Rose Alley, Covent Garden, and beat him. He obviously felt no shame for this infamous attack, for in his "Imitation of the First Satire of Juvenal" he says, "Who'd be a wit in Dryden's cudgelled skin?" His health was already undermined, and in the spring of 1680 he retired to High Lodge, Woodstock Park. He began to show signs of a more serious temper, and at his own request was visited (July 20th to July 24th) by Bishop Burnet, who attested the sincerity of his repentance. He died, however, two days after the bishop left him. When his son Charles, the 3rd earl, died on the 12th of November 1681, his titles became extinct.

As a poet Rochester was a follower of Abraham Cowley and of Boileau, to both of whom he was considerably indebted. His love lyrics are often happy, but his real vigour and ability is best shown in his critical poems and satires. The political satires are notable for their fierce exposure of Charles II.'s weakness, his ingratitude, and the slavery in which he was held by his mistresses. They show that Rochester had it in him to be a very different man from the criticizing courtier and the "very profane wit" who figures in contemporary memoirs.

BIBLIOGRAPHY.—*Poems on Several Occasions by the Right Honourable the Earl of Rochest Works of the Earl of Rochester* (1680) was really printed in London. Other issues, slightly varying in title and contents, appeared in 1685, 1691 and 1696. *Valentinian, A Tragedy*, adapted from Beaumont and Fletcher, was printed in 1685; a scandalous attack on Charles II. in the shape of a play in heroic couplets, *Sodom*, was printed in 1684, and is supposed, in spite of Rochester's denial, to have been chiefly his work. No copy of this is known, but there are two MSS. extant. The completest edition of his works is *The Poetical Works of the Earl of Rochester* (1731–32). Expurgated collections are to be found in Johnson's, Anderson's and Chalmers's editions of the *British Poets*. His *Familiar Letters* were printed in 1686, 1697 and 1699. His Political Satires are available, with those of Sir John Denham and Andrew Marvell, in the *Bibliotheca Curiosa* (*Some Political Satires of the Seventeenth Century*, vol. i., Edinburgh, 1885). Contemporary accounts of Rochester are to be found in the memoir by Saint-Evremond prefixed to an edition of 1705, in Hamilton's *Mémoires du Comte de Gramont*, in the funeral sermon preached by Robert Parsons (1680), and in Bishop Burnet's *Some Passages in the Life and Death of John, Earl of Rochester* (1680), reprinted in Bishop Wordsworth's *Ecclesiastical Biography* (vol. vi.).

ROCHESTER, LAWRENCE HYDE, EARL OF (1641–1711), English statesman, second son of Edward Hyde, earl of Clarendon, was born in March 1641. After the restoration of Charles II. he sat as member of parliament, first for Newport in Cornwall and afterwards for the university of Oxford, from 1660 to 1679. In 1661 he was sent on a complimentary embassy to Louis XIV. of France, while he held the court post of master of the robes from 1662 to 1675. In 1665 he married Henrietta (d. 1687), daughter of Richard Boyle, earl of Burlington and Cork. When his father was impeached in 1667, Lawrence joined with his elder brother, Henry, in defending him in parliament, but the fall of Clarendon did not injuriously affect the fortunes of his sons. They were united with the royal family through the marriage of their sister, Anne, with the duke of York, afterwards James II., and were both able and zealous royalists. In 1676 Lawrence Hyde was sent as ambassador to Poland; he then travelled to Vienna, whence he proceeded to Nijmwegen to take part in the peace congress as one of the English representatives. Having returned to England, he entered the new parliament, which met early in 1679, as member for Wootton Bassett; in November 1679 he was appointed first lord of the treasury, and for a few years he was the principal adviser of Charles II. In April 1681 he was created Viscount Hyde of Kenilworth, and in November following earl of Rochester. He was compelled to join in arranging the treaty of 1681, by which Louis XIV. agreed to pay a subsidy to Charles, at the very moment when he was imploring William, prince of Orange, to save Europe from the ambitions of the French monarch. The conflict between his wishes and his interests may have tended to sour a temper never very equable; at all events the earl made himself so unpleasant to his colleagues that in August 1684 he was removed from the treasury to the

more dignified, but less influential, post of president of the council, a process which his enemy Halifax described as being "kicked upstairs." Although appointed lord lieutenant of Ireland, Rochester did not take up this position; he was still president of the council when James II. became king in February 1685, and he was at once appointed to the important office of lord treasurer. But in spite of their family relationship and their long friendship, James and his treasurer did not agree. The king wished to surround himself with Roman Catholic advisers; the earl, on the other hand, looked with alarm on his master's leanings to that form of faith. In January 1687 he was removed from his office of treasurer, being solaced with a pension of £5000 a year and a gift of Irish lands.

After the revolution of 1688 Rochester appeared as a leader of the Tories, and he opposed the election of William and Mary as king and queen, raising his voice for the establishment of a regency on behalf of the exiled James. But he soon reconciled himself to the new order, perhaps because he could not retain his pension unless he took the oaths of allegiance. After this he was quickly in the royal favour and again a member of the privy council. He advised the queen in ecclesiastical matters, and returned to his former position as the leader of the High Church party. From December 1700 until February 1703 he was lord lieutenant of Ireland, although he did not spend much time in that country, and the concluding years of his public life were mainly passed in championing the interests of the Church. In 1710 he was again made lord president of the council. He died on the 2nd of May 1711, and was succeeded by his only son, Henry (1672–1758), who in 1724 inherited the earldom of Clarendon. When Henry died without issue on the 10th of December 1758 all his titles became extinct.

Lawrence Hyde had some learning and a share of his father's literary genius. The main employment of his old age was the preparation for the press of his father's *History of the Rebellion*, to which he wrote a preface. Like most of the men of his time, he drank deeply, and he was of an arrogant disposition and had a violent temper. In Dryden's satire of *Absalom and Achitophel* he is "Hushai," the friend of David in distress.

The correspondence of Rochester with his brother the earl of Clarendon, together with other letters written by him, was published with notes by S. W. Singer (1828). Other authorities are G. Burnet, *History of his Own Time*, edited by O. Airy (Oxford, 1897–1900); John Evelyn, *Diary*, edited by H. B. Wheatley (1879); and Macaulay, *History of England*.

ROCHESTER, a city, municipal and parliamentary borough of Kent, England, on the river Medway, 33 m. E.S.E. of London by the South-Eastern & Chatham railway, contiguous to Chatham and Strood. Pop. (1901) 30,590. Chatham lies east of the city on the same bank of the river, while Strood is opposite, on the left bank, being connected with Rochester by a railway bridge and by an iron swing bridge, the latter occupying the site of a bridge which spanned the Medway before the Conquest. The cathedral church of St Andrew was originally founded by Augustine in 604, for when Æthelberi built the church, it was partially destroyed by the Danes, but was rebuilt, with a long choir and square east end, by Bishop Gundulph, the second Norman bishop (1077–1108). Gundulph at the same time (1089) established an order of Benedictine monks here. Bishop Ernulf (1115–24), who as prior of Canterbury and abbot of Peterborough had already distinguished himself as a builder, completed and also renovated the church, lengthening it by two bays eastward; the old chapter-house remains. The beautiful Norman west front was built about 1125–30, and in 1130 the new cathedral was consecrated. About 1201 a baker, William of Perth, while on a pilgrimage was murdered near Rochester by robbers. He was buried in the cathedral and was canonized, his shrine becoming a famous resort of pilgrims, who brought much wealth to the monastery. The edifice suffered from fire in 1137 and in 1171. During the whole of the 13th and a part of the 14th century a gradual rebuilding, or sometimes mere recasing, of the church was effected from east to west. The work included an extended choir by William de Hoo (1227), enlargement of the main transepts, the building of piers for a central tower, and treatment of the nave to the third bay. About 1352 a low central tower was built, to which a spire was added in the next century. Towards the end of the 15th century St Mary's chapel was added, the Norman clerestory was rebuilt, and a great west window inserted. Though a comparatively small building, being only 306 ft. in length and 65 ft. in breadth at the nave, the cathedral is of much architectural interest, and exhibits a variety of styles from Norman to Perpendicular. The rich and varied decoration of the Norman nave (especially the triforium) is very noteworthy, as is also the chapter-house doorway, a fine example of Decorated work. The Early English portion of the building is less successful. The ruins of Gundulph's Tower stand detached from and are earlier than the church; this tower was built by Bishop Gundulph probably as a defensive work for the eastern boundary of the city. The crypt beneath the choir is of special interest, showing early Norman work in the western part. The remainder is Early English, and there are traces of mural painting. The cathedral contains many interesting monuments, including a plain slab assigned to Gundulph, and several tombs of bishops of the 13th century, among them that of Bishop Walter de Merton, founder of Merton College, Oxford (d. 1277). The library attached to the modern chapter-house contains, among various valuable relics, the *Textus Roffensis*, being records of the cathedral compiled in the time of Bishop Ernulf. The old episcopal palace is partly converted into dwelling-houses. Portions of the wall of the priory dormitory and the refectory doorway may also still be seen. Among various restorations of the cathedral in the 19th century the earliest was that of Lewis Cottingham (1825–27), who erected a Decorated central tower unsuited to the general character of the building. Bishop Hamo de Hythe (1319–52) had erected a tower with short spire of timber and lead, and of this the general design is reproduced in the present tower and spire from designs of Mr C. H. Fowler, begun in 1904 under Dean Hole, who, however, did not survive to see its dedication on St Andrew's day at the close of the same year.

The parish church of St Nicholas was built in 1421, and restored after a fire in 1892. In Saxon times the cathedral was the parish church, but after the establishment of a monastery here, monks and parishioners quarrelled as to their rights, and a new parish church was built.

On the eminence overlooking the right bank of the river and commanding a wide view of the surrounding country are the extensive remains of the Norman castle, part of which was built by Bishop Gundulph at the order of William Rufus towards the close of the 11th century. The castle was besieged by King John, by Simon de Montfort in the reign of Henry III., and in the reign of Richard II. by a party of rebels during the insurrection of Wat Tyler. It was repaired by Edward IV., but soon afterwards fell into decay, although the massive keep is still in good preservation. This, one of the finest relics of its kind in England, is considered to be the work of William de Corbeil, archbishop of Canterbury, to whom the castle was granted in 1126. It is a quadrangular four-storeyed structure, flanked by turrets, with an extreme height of 120 ft. Remains of the 13th-century walls which once surrounded the city also exist. Gad's Hill, above Strood, to the north-west, is famous as the residence of Charles Dickens. At Borstal, south-west of Rochester, is a large convict prison. Among the principal public buildings of secular character in the city are the town hall (1687), the corn exchange with free library and a museum, the county court offices, and the Richard Watt's almshouses (1579). Besides these almshouses there are a number of other charities, among which the almshouse of St Catherine originated in 1316 as a leper's hospital. A picturesque Elizabethan mansion was acquired by the corporation for a museum as a memorial of Queen Victoria's Diamond Jubilee. The principal schools are the cathedral grammar-school or King's School, founded in 1544, and the Williamson mathematical school (1704), formerly

for the sons of freemen, but now open to all. Rochester has an oyster fishery of some importance, and there is a considerable shipping trade, a quay and landing-place having been erected by the corporation. There is a large steam-engine manufactory. In Strood, which is a ward of the borough of Rochester, there are oil-mills, and brick and cement works. The dockyards and government works of Chatham employ many inhabitants of Rochester. The parliamentary borough returns one member. The city is governed by a mayor, six aldermen, and eighteen councillors. Area, 2933 acres.

History.—Its situation on the Roman way from the Kentish ports to London, as well as its strategical position on the bend of the river Medway, gave Rochester (Durobrivae, Hrofescester or Hrobicester, Roffa) an early importance. It was a walled Romano-British town (though of no great size), and the original bridge across the Medway probably dated from that period. The church of St Andrew was founded by King Æthelbert, who also made Rochester a bishop's see. Rochester was a royal borough in the time of William I., who raised a castle here, probably on Boley Hill. Richard I. granted the citizens quittance of *passagium* from crusaders in the town of Rochester. In 1227 Henry III. granted them the city at a fee farm rent of £25; he also granted them a gild merchant, the right to be impleaded only within the city walls, and other liberties. These charters were confirmed by subsequent sovereigns down to Henry VI., who in 1446 incorporated the city by the title of the bailiff and citizens, and granted them the power of admiralty and many privileges. Edward IV. by his charter of 1461 altered the style of incorporation to the mayor and citizens. Charters were granted in successive reigns down to Charles I., whose charter of 1629 remained the governing charter until 1835. A fair on the 18th, 19th and 20th of May was granted to the citizens by Henry VI., and another fair was formerly held in December by prescription. At the present time fairs are held on the 18th of May and the 26th, 27th and 28th of August. A "formarket" was granted in the second charter of Henry III.; the market days were formerly Tuesday and Friday. Corn and cattle markets are now held on Tuesday.

ROCHESTER, a city and the county seat of Olmsted county, Minnesota, U.S.A., on the Zumbro river, about 70 m. S.E. of St Paul. Pop. (1890) 5321; (1900) 6843; (1905, state census) 7233 (1905 foreign-born); (1910 census) 7844. It is served by the Chicago & North-Western and the Chicago Great Western railways. The city has a public library (1865), and is the seat of St John's School and the Academy of Our Lady of Lourdes (both Roman Catholic), of a state hospital for the insane (1878), originally planned (1877) as an inebriate asylum, liquor dealers being taxed for its erection, and of St Mary's Hospital (1889), a famous institution founded and maintained by the Sisters of St Francis. There is valuable water-power, and the city has grain elevators and various manufactures. Rochester was first settled in 1854, and was chartered as a city in 1858.

ROCHESTER, a city of Strafford county, New Hampshire, U.S.A., on the Cochecho and Salmon Falls rivers, about 30 m. E. by N. of Concord. Pop. (1890) 7396; (1900) 8466, of whom 1651 were foreign-born; (1910 U.S. census) 8868. Area, about 34 sq. m. Rochester is served by four lines of the Boston & Maine railroad. The rivers furnish excellent water-power for various manufactures. Rochester, named in honour of Lawrence Hyde, earl of Rochester, was incorporated as a town by a royal charter in 1722, but no settlement was made here until 1728. From parts of the original town Farmington and Milton were erected in 1798 and 1802 respectively, and in 1846 part of Rochester was annexed to Barrington. It was the birthplace of John Parker Hale. Rochester was chartered as a city in 1891.

See F. McDuffee, *History of the Town of Rochester, New Hampshire* (Rochester, 1892).

ROCHESTER, a city and the county-seat of Monroe county, New York, U.S.A., about 70 m. E.N.E. of Buffalo and about 230 m. W. of Albany, on the Genesee river, 7 m. above where it empties into Lake Ontario. Pop. (1880), 89,366; (1890), 133,896; (1900), 162,608, of whom 40,748 were foreign-born (including 15,685 Germans; 7746 English-Canadians; 5590 Irish; 3909 English; 1777 Russians; and 1278 Italians) and 601 were negroes; (1910, census) 218,149. Rochester is served by the Erie, the Pennsylvania (two divisions), the Lehigh Valley, the West Shore, the Buffalo, Rochester & Pittsburg (two divisions), and the New York Central & Hudson River (five divisions) railways. The Genesee river, which cuts through the centre of the city in a deep gorge whose banks vary in height from 50 to 200 ft., is navigable for lake craft only for 2½ m. from the mouth, to a point 4¾ m. below the city; the Erie Canal runs through the heart of the city and is carried across the river on a stone viaduct of seven arches, 850 ft. long, and having a channel 45 ft. wide. Several lines of freight and passenger steamboats connect with Buffalo, Oswego and other lake ports, and there are daily passenger steamboats to Toronto, Canada, 70 m. distant across the lake. Electric railways connect with neighbouring cities and lake-side resorts on Lake Ontario (Ontario Beach) and Irondequoit Bay, an irregular arm of the lake, 5 m. long 2 m. E. of the city limits. Rochester is on high plateaus on either side of the Genesee river at a general altitude of about 500 ft. above sea-level. It occupies an area of 20·3 sq. m. Within the city limits are the famous Falls of the Genesee,[1] three cataracts of 96, 26 and 83 ft. respectively, the banks above the first fall, which is in the heart of the city, rising to a height of fully 200 ft. above the river. From the city limits the river falls 263 ft. in its 7 m. course to the lake. Ten bridges, road and railway, connect the two sides of the river.

Rochester is an attractive city, with many fine avenues. East Avenue is perhaps the most beautiful street in the city, and Plymouth, West and Lake Avenues are other prominent residential streets. The park system of Rochester, planned by Frederick Law Olmsted, was 1264 acres in extent in 1908. The largest park is Eastman-Durand (512 acres), on the shore of Lake Ontario; Genesee Valley Park (443 acres) is on both sides of the river; Seneca Park (212 acres) includes a zoological garden; Highland Park (75 acres) and eleven other smaller parks. In Washington Park there is a soldiers' monument surmounted by a statue of Lincoln, and a statue (1898) by S. W. Edwards of Frederick Douglass, the negro orator and editor, who lived in Rochester in 1847–70, stands at the approach to the New York Central & Hudson River railway station. The principal cemeteries are the Mount Hope, the Holy Sepulchre, and Riverside. The Powers Building, a 7-storey stone and iron structure surmounted by a tower 204 ft. high, was one of the first office buildings in the United States to be equipped with elevator service. The Monroe County Court House (of New Hampshire granite) on East Main Street is in the Renaissance style, and contains a law library of about 25,000 volumes. The City Hall (of grey sandstone) has a tower 175 ft. high. Among the other prominent buildings are the Post Office, the Chamber of Commerce, the Lyceum Theatre, the Temple Theatre, the Masonic Building, the Buffalo, Rochester & Pittsburg office building, the Sibley building, the Duffy-McInnerney building, and the Young Men's Christian Association building. The following churches are architecturally noteworthy: the Central, the First and the Third Presbyterian, the Brick Presbyterian, St Patrick's Cathedral (Roman Catholic), the Cornhill and the Asbury (Methodist Episcopal), the First Baptist, St Paul's (Protestant Episcopal), and the First Unitarian. Rochester is the see of a Roman Catholic bishop. In Rochester are the Western New York Institution for Deaf Mutes, the Monroe County Penitentiary, a State Arsenal, a State Hospital for the Insane, the Protestant Episcopal Church Home, Rochester City Hospital (1864), and others, including the Rochester Municipal Hospital (1903) for contagious diseases and consumption.

Rochester is an important educational centre. Its best-known institution is the University of Rochester (Baptist, 1850; co-educational since 1900), having in 1908–9 28 instructors, 352 students (231 men and 121 women), and a library of 49,000 volumes. It occupies a tract of 24 acres

[1] From the top of the upper falls (96 ft. high), in the centre of the city, Sam Patch (1807–1829) jumped (he was killed in November 1829; he had formerly made the same leap, had jumped half the depth of Niagara, and was planning to go to London and jump from London Bridge—he was to go by sailing packet to Liverpool and jump from the yard-arm every fair day.

on University Avenue in the eastern part of the city. With it is connected the Ward Museum, containing the valuable geological and zoological collections of Henry Augustus Ward (1834–1906), an American naturalist, professor of natural sciences here in 1860–75, who had in Rochester a laboratory for the manufacture of plaster-casts of fossils, and who prepared natural-history cabinets for many museums. Much of the success of the university was due to Martin Brewer Anderson (1815–1890), president from 1853 to 1888, and David Jayne Hill (b. 1850), who was president from 1888 to 1896, and subsequently was assistant secretary of state in 1898–1903, and minister to Switzerland in 1903–5 and to the Netherlands from 1905 to 1907, when he became ambassador to Germany. Rochester Theological Seminary (1850) is also under the control of the Baptist Church, but has no organic connexion with the university of Rochester. Its library of 36,500 volumes includes the valuable collection (6500 vols.) of the German church historian, Johann August Wilhelm Neander. Other educational institutions include St Bernard's Theological Seminary (Roman Catholic; 1893); Wagner Memorial Lutheran College (German); Academy of the Sacred Heart (Roman Catholic), &c. One of Rochester's most noteworthy institutions is the Athenaeum and Mechanics' Institute (an outgrowth of the Rochester Athenaeum, established in 1829); it was founded in 1885 by Henry Lomb, of the Bausch & Lomb Optical Co., and has a large building, the gift of George Eastman (b. 1854), of the Eastman Kodak Co. It has an endowment of $650,000, and more than 60 instructors, and in 1907–8 more than 5000 students were enrolled. Since 1907 public school buildings have been used as club-houses for community civic clubs with libraries and gymnasiums; and in 1909 a League of Civic Clubs was organized. Besides the law library and the libraries of the educational institutions mentioned above, Rochester has the Reynolds (Public) Library, containing more than 65,000 volumes in 1910.

The Falls of the Genesee provide a valuable water-power, early utilized by the flour-milling industry, of which, owing largely to the nearness of the fertile wheat-fields of the Genesee Valley and the transportation facilities furnished by the Erie Canal and Lake Ontario, as well as to the water-power, Rochester was for many years the most important centre in the country. Flour-milling is no longer so important an industry here, but Rochester ranks high among the great manufacturing cities of the country, holding third rank in this as in population in New York state, and is remarkable for the great size and output of several of its manufacturing plants, which are the largest of their sort in the United States or the world. In 1905 the value of the city's factory products was $82,747,370, an increase of 38·7% since 1900. In value of product and in number of wage-earners employed the manufacture of men's clothing stood first; the value of the product was $14,948,703, or more than 18% of the total value of all the city's manufactures; and 20% of the factory wage-earners in the city were employed in this industry. The second industry in 1905 was the making of boots and shoes, of which the value was $8,620,011, an increase of 24·3% since 1900. In the value of clothing and in the value of boots and shoes manufactured Rochester ranked seventh among the cities of the United States in 1905. In the manufacture of photographic apparatus and materials and optical goods Rochester easily holds first place in the world, and it has the largest establishment for the manufacture of cameras (the Eastman Kodak Co. at Kodak Park) and the largest manufactory of lenses, telescopes, opera and field glasses (Bausch & Lomb Optical Co.). The total value of the photographic apparatus in 1905 was $3,886,629, which represented 82·9% of the product value of photographic apparatus manufactured in the entire United States, and was 176·1% more than in 1900. Photographic materials amounted in value to $4,528,582, 47·4% of the total value of the product of the country. The value of the output of this industry was 2100% more in 1905 than in 1900. Another remarkable increase was shown in the value of electrical machinery and apparatus, which was only $15,000 in 1900, but in 1905 was $2,078,360. Flour and grist mill products in 1905 were valued at $3,222,257. In Rochester is an immense refinery of lubricating oil, and the oil product more than doubled in value between 1900 and 1905. Other important manufactures, with the value of their product in 1905, are as follows: foundry and machine-shop products, $2,874,142; furniture, $2,364,859; tobacco, cigars, snuff, &c., $2,234,531; malt liquors, $2,173,067; confectionery, $1,812,611; lumber and planing mill products, $1,495,229; carriages and wagons, $1,229,570; and stationery goods, $1,130,873. Rochester is also the nursery-gardening centre of the United States. The first nursery, that of Ellwanger & Barry, now one of the largest in the world, was established here in 1840. There are now more than a score of large nurseries, representing an investment of several millions of dollars, and annually shipping seeds, bulbs and plants having an approximate value of $2,000,000. Rochester is the port of entry for the Genesee customs-district, importing Canadian lumber and wheat and exporting dairy, garden, farm and orchard products. In 1909 its imports were valued at $1,809,746 and its exports at $1,360,367.

The government of Rochester is that of cities of the first class (the state census of 1905 showed that it had more than the 175,000 inhabitants necessary for a city of the first class under the New York state law). The city owns its water supply system, the supply being obtained largely from Hemlock Lake, 30 m. S. of the city limits. The value of the plant is approximately $8,000,000. Rochester is famous for the purity of its milk supply, which is regulated under a strict system of supervision and inspection.

The region about Rochester, when first visited by Europeans, was the home of the Seneca Indians. The Jesuits, Peter Joseph Marie Chaumonot (1611–1693) and Jacques Frémin (d. 1691), worked among the Indians in the neighbourhood. In 1687 the marquis de Denonville fought a battle with the Iroquois near the falls. In 1710 there was a French post on Irondequoit Bay. The district was included in the Phelps-Gorham Purchase in 1788. It was not until Ebenezer Allan (called "Indian Allan") built a saw and grist mill at the falls in 1790 that a small settlement began to grow up. In 1802 a large tract of land, which included the site of the present city, passed into the hands of three Maryland proprietors, Charles Carroll, William Fitzhugh, and Nathaniel Rochester (1752–1831). Rochester, from whom the city took its name, was a native of Virginia, had been a manufacturer at Hagerstown, Maryland, and after settling in Rochester in 1818 was a member in 1822 of the New York Assembly. He established a settlement, largely of New Englanders, at the falls in 1810–12, but its growth was slow as it was not on the direct road between Albany and Buffalo, and the region was malarial. It was known at first as "The Falls" or "Falls Town." In 1817 it was incorporated as the village of Rochesterville, the name being shortened to its present form two years later. In 1820 it had 1502 inhabitants. In 1821 Monroe county was erected with Rochester as the county-seat. The real growth of the place began with the completion of the Rochester and Lockport section of the Erie Canal in 1823, and in two years the population had about doubled. Rochester was first chartered as a city in 1834, with 12,000 inhabitants. Rochester's first newspaper, the *Gazette*, was established in 1816, the *Telegraph* following in 1818. The first daily newspaper was the *Daily Advertiser* (1826). Between 1828 and 1830 Rochester was the centre of the anti-Masonic political movement, and here Thurlow Weed published his *Anti-Masonic Enquirer*. Subsequently it was a centre of the abolitionist movement in New York state; Myron Holley (1779–1841) began here the publication of his *Freeman* in 1830, and in 1847 Frederick Douglass established the *North Star*. For many years before the Civil War it was a busy station of the "Underground Railroad," by which fugitive slaves were assisted in escaping to Canada. In 1846 Miss Susan B. Anthony settled in Rochester, and the city has been a gathering-place for advocates of women's rights. Here lived the Fox sisters, Margaret (1836–1893) and Katharine (b. 1839), whose spiritualistic demonstrations became notorious about 1850 as the "Rochester Rappings," and the city has been a gathering-place for American spiritualists also. The narrowness of the gorge through which the Genesee river runs has always rendered the city liable to disastrous floods. Several of these in its early history practically destroyed the manufacturing industries along the river, but the loss of property in the more recent ones has been relatively less; that of 1865 entailed a loss of more than $1,000,000, and in that of 1902 the damage exceeded $1,500,000.

See William F. Peck, *History of Rochester and Monroe County* (2 vols., Chicago, 1908).

ROCHET (Lat. *rochettum*, from the late Lat. *roccus*, connected with the O.H.Ger. *roch*, roc and the A.S. *rocc*; Fr. *rochet*, Ital. *rocchetto*, Sp. *roquete*, Ger. *Rochett*, *Chorkleid*), an ecclesiastical

vestment. In the Roman Catholic Church the rochet is a tunic of white, and usually fine linen or muslin (battiste, mull) reaching about to the knee, and distinguished from the surplice by the fact that its arms are narrow and tight-fitting. The lower edge and the sleeves are usually garnished with lace, lined with violet or red silk in the case of prelates, or—more rarely—with embroidered borders.

The rochet is proper to, and distinctive of, prelates and bishops: but the right to wear it is sometimes granted by the pope to others, especially the canons of cathedral churches. It is not a *vestis sacra*, and cannot therefore be used as a substitute for the surplice, *e.g.* in the administering of the Sacraments (Decree of the Congregation of Rites of Jan. 10, 1852). None the less, since it is used at choir services and is ordered to be worn over the everyday dress at Mass (*Missa rom. Rit. celebr.* i. 2), it may be included among liturgical vestments in the widest sense.

The earliest notice of the use of the rochet is found in an inventory of the vestments of the Roman clergy, dating from the 9th century. In this it is called *camisia*, a name which it retained at Rome until the 14th century, and it seems to have been already at that time proper to particular members of the clergy. Other Roman names for the vestment were *succa*, *sucta*; it was not till the 14th century that the name *rochetum* appeared at Rome, but it was not long before it had superseded all the native designations. Outside Rome, too, the vestment is early met with, *e.g.* in the Frankish empire (9th century) as *alba cotealis*, in contradistinction to the liturgical alb, and in England (10th century) under the name of *oferslip* in the 46th canon of the ecclesiastical laws of Edgar. At the beginning of the 12th century the rochet is mentioned, under the name of *camisia*, by Gilbert of Limerick and by Honorius, and, somewhat later, by Gerloh of Reichersperg as *tunica talaris*. From the 13th century onward it is frequently mentioned. The name *rochettum* is first traceable in England; in Germany and northern France the rochet was also called *saroht* (*sarrotus*) or *sarcos* (*sarcotium*).

Outside Rome the rochet was, until well into the 14th century, a vestment common to all the clergy, and especially to those of the lower orders; and so it remained, in general, until the 16th century, and even here and there, so late as the 19th. Moreover, in further contradistinction to the Roman use, it had—especially in the German dioceses—a liturgical character, being used instead of the surplice.

The rochet was originally a robe-like tunic, and was therefore girdled, like the liturgical alb. So late as 1260 the provincial synod of Cologne decreed that the *vestis camisialis* must be long enough entirely to cover the everyday dress. A good example of the *camisia* of the 12th century is the rochet of Thomas Becket, preserved at Dammartin in the Pas de Calais, the only surviving medieval example remarkable for the pleating which, as was the case with albs also, gave greater breadth and more elaborate folds. In the 15th century the rochet only reached half-way down the shin; in the 16th and 17th to the knee; in the 18th and 19th often only to the middle of the thigh. In the middle ages it was always plain. The rochet is unknown in the Eastern Churches. (J. Bra.)

Church of England.—In the English Church the rochet is a vestment peculiar to bishops, and is worn by them, with the chimere (*q.v.*) both "at all times of their ministration" in church and also on ceremonial occasions outside, *e.g.* in the House of Lords or at a royal levee. In general it has retained the medieval form more closely than the Roman rochet, in so far as it is of plain, very fine linen (lawn), and reaches almost to the feet. The main modifications have been in the sleeves. At the time of the Reformation these were still narrow, though already showing a tendency to expand. The portrait of Archbishop Warham at Lambeth, for instance, shows a rochet with fairly wide sleeves narrowing towards the wrists, where they are confined by fur cuffs. This fashion continued until, in the 17th century, the sleeves became much fuller; but it was not till the 18th century that they developed into the familiar exaggerated balloon shape, confined at the wrists by a ribbon, beyond which a ruffle projected. About the same period, too, arose the custom of making the rochet sleeveless and attaching the "lawn sleeves" to the chimere. This fashion survived throughout most of the 19th century, but there has since been a tendency to revert to the earlier less exaggerated form, and the sleeves have been reattached to the rochet. The ribbon by which the wrist is confined is black, except when convocation robes are worn, when it is scarlet. The rochet is worn without the chimere under the cope by those bishops who use this vestment. At his consecration the bishop-elect is, according to the rubric, presented to the consecrating bishops vested in a rochet only; after the "laying on of hands" he retires and puts on "the rest of the episcopal habit," *i.e.* the chimere. (W. A. P.)

ROCHFORD, EARL OF, an English title borne by the family of Nassau de Zulestein from 1695 to 1830. William Henry Nassau de Zulestein (1645–1709) was born at Zuylestein, near Utrecht, his father being Frederick Nassau de Zulestein (1608–1672), a natural son of Henry Frederick, prince of Orange, and his mother an English lady, Mary Killegrew. One of the most trusted companions of his kinsman, William of Orange, Zulestein was sent to England in 1687 and again in 1688 to report on the condition of affairs, and later in 1688 he sailed with the prince on his famous expedition. After the Revolution he was naturalized and served the king in the field, being created Viscount Tunbridge and earl of Rochford in 1695. He was succeeded by his son William (1681–1710), who was killed at the battle of Almenara, and then by another son Frederick (1682–1738). Frederick's son, William Henry, the 4th earl (1717–1781), was a diplomatist and a statesman. Having gained experience as envoy at Turin from 1749 to 1753, he was ambassador at Madrid from 1763 to 1766 and at Paris from 1766 to 1768. From 1768 to 1775 he was one of the secretaries of state. This earl left no children when he died on the 28th of September 1781, and his nephew, William Henry, the 5th earl (1754–1830), dying in September 1830 the earldom became extinct. The estates of the earls of Rochford were in Suffolk and Essex, their principal residence being St Osyth Priory in the latter county.

ROCHFORD, a town in the south-eastern parliamentary division of Essex, England, 39 m. E. by N. from London by the Southend branch of the Great Eastern railway. Pop. (1901) 1820. It lies on the small river Roach, near the head of a long estuary. The town has a Perpendicular church (St Andrew), a corn exchange and some agricultural trade. Rochford Hall, a picturesque gabled mansion of various dates, belonged once to the Boleyns, and it has been stated that Anne Boleyn, the unfortunate queen of Henry VIII., was born here, but this is in no way proved. Near Rochford the Lawless or Whispering Court, a remarkable survival of unknown origin, is held by a manorial tenure on the Wednesday following Michaelmas Day, beginning at midnight. No light is permitted, nor may voices be raised above a whisper. Nearly 3 m. N.W. from Rochford is Ashingdon. This is generally accepted as the scene of the fight of Assandun in 1016 between Canute and Edmund Ironside, in which the English were defeated through treachery in their ranks. Earthworks, of this or an earlier date, remain.

ROCK, DANIEL (1799–1871), English Roman Catholic priest and ecclesiologist, was born at Liverpool on the 31st of August 1799, and educated at St Edmund's College, Ware, Herts, and at the English College, Rome. He was ordained priest in 1824 and successively appointed chaplain to the 16th earl of Shrewsbury at Alton Towers, Staffordshire, and priest in charge of the Roman Catholic congregation at Buckland, near Faringdon in Berkshire. After the re-establishment of the Roman Catholic hierarchy in England, in which he had taken an active part, Rock was elected a canon of St George's Cathedral, Southwark. He was greatly interested in medieval art, and, having gone to live at South Kensington in 1864, in order to be near the museum, was of great assistance to the authorities there. He died on the 28th of November 1871.

Rock's principal works are: *Hierurgia, or the Holy Sacrifice of the Mass expounded* (London, 1833; revised edition by W. H. J. Weale, 1893), an exhaustive account of the Eucharistic rites in the Latin, Greek and Oriental Churches, and illustrated from early paintings, sculptures and inscripcions; *The Church of Our Fathers, as seen in St Osmund's Rite for the Cathedral of Salisbury, with Dissertations on the Belief and Ritual in England before the Coming of the Normans* (3 vols., 1849–54; new edition by G. W. Hart and W. H. Frere, London, 1903).

See the Memoir prefixed to Hart & Frere's edition of *The Church of Our Fathers* by the Rev. B. W. Kelly; a full list of his writings is given in J. Gillow's *Bibl. Dict. of the Engl. Catholics*, vol. v. p. 436.

ROCK (O.Fr. *roke*, Sp. *roca*, Ital. *rocca*; possibly from a Lat. form *rupica*, from *rupes*, rock), in geology a mass of the mineral matter of which the crust of the earth is composed (see PETROLOGY and GEOLOGY). In more general usage a "rock" is a large mass of this mineral matter, as distinguished from smaller pieces which are termed "stones."

From this word must be distinguished the verb "to rock," to swing an object to and fro, particularly of a cradle in which a child is rocked to sleep, the original meaning. The O.Eng. word is *roccian*, and is cognate with many words in Teutonic languages, *e.g.* Du. *rukkea*, Dan. *rykke*, Ger. *rücken*, to pull, tug, push.

ROCK-CRYSTAL, a colourless and transparent variety of quartz (*q.v.*), used as an ornamental stone. It usually occurs as crystals lining cavities in quartz-veins, which often run through granite, gneiss and crystalline schists. The limpidity of the crystal, its coldness to the touch and its common occurrence in rocks among Alpine glaciers, led to the ancient belief that it was a kind of congealed water, whence the name crystal, from Gr. κρύσταλλος (ice). In the Swiss Alps the "*Strahler*," or crystal-gatherer, searches the rocks at much personal risk, and is often led to a druzy cavity by tracing narrow veins, or strings, of quartz on the mountain-side. A remarkable druse, or *Krystallkeller*, discovered at Zinkenstock in the Bernese Oberland, in 1719, yielded about 20 tons of crystal; a single specimen weighing 8 cwt. The famous discovery of the Galenstock, in 1867, furnished magnificent crystals, but they were dark brown or smoky quartz. La Gardette, near Le Bourg d'Oisans, in the Alps of Dauphiné, is a notable locality for fine specimens of rock-crystal. The Alps and India probably furnished the ancients with their supplies.

Rock-crystal has been used for ornamental purposes since the Mycenean period. By the Romans under the Empire it was highly valued, and carved into vases and goblets, in some cases elaborately engraved. Lenses or globes were used for kindling the sacred vestal fire and for cauterizing the flesh, while the engraved balls of crystal in order to cool their hands during the heat of summer. The artists of the Early Renaissance greatly favoured the use of rock-crystal, and executed beautiful carvings in this material. In modern times the use of rock-crystal has been largely superseded by that of glass, and it is notable that flint-glass is known in France as "*cristal*," probably from its resemblance to limpid quartz, or perhaps from the fact that powdered rock-crystal has been used as a source of silica in the manufacture of the finest glass. Rock-crystal is still cut as a faceted stone for personal decoration, but though not without brilliancy it lacks the "fire" of many gemstones. It is often known locally by such names as Bristol diamond, Cornish diamond, Isle of Wight diamond, Briançon diamond, Marmaros diamond, Lake George diamond, &c. Rock-crystal is also carved into seals, paper-weights and other trivial objects, and into spheres for divination by crystal-gazing, Japanese balls being specially noteworthy. In Japan the crystal has been obtained for centuries from the granitic districts around Kimpū-san, in the province of Kai. Probably the most valuable application of rock-crystal is for spectacle lenses, which in consequence of their hardness are not readily abraded by use. They should be cut at right angles to the optic axis, or axis of the prism.

The "pebble" for lenses is found loose in the soil in many parts of the provinces of Goyaz, São Paulo and Minas Geraes in Brazil. Much of the material for spectacles comes also from Madagascar, where large crystals of clear quartz are found in the beds of certain streams, especially in the N.E. part of the island, having probably been derived from quartz-veins in the gneiss and pegmatite. In India rock-crystal has been worked at many localities, and the loot of the palace of Delhi yielded marvellous ornaments carved in this material. At the present day it is cut and polished at Vellum in the Tanjore district in Madras, and is known as Vellum stone. Among the numerous localities in the United States which yield rock-crystal mention may be made of those in Herkimer Co., New York State, whence the Lake George crystals are obtained; and it is notable that some of the Herkimer quartz encloses bituminous matter. Mokelumne Hill, Calaveras Co., California, has furnished some remarkable rock-crystal. In Europe the localities are very numerous, the most important being those in the Alps. Very fine crystals remarkable for pellucidity though not of large size occur in cavities in the statuary marble of Carrara; and remarkably hollowed crystals are known from Porretta near Bologna in Italy. The finest rock-crystal in Great Britain occurs at Tintagel and the Delabole slate quarry in N. Cornwall; and at Snowdon in N. Wales. (F. W. R.*)

ROCKEFELLER, JOHN DAVISON (1839–), American capitalist, was born in Richford, Tioga county, New York, on the 8th of July 1839. In 1853 his family removed to Ohio, living after 1857 in Cleveland, where Rockefeller had begun to work as a bookkeeper in 1855 and where in 1858 he went into the produce commission business. His firm, Clark & Rockefeller, in 1862 invested in an oil refinery, planned by Samuel Andrews, and in 1865 Rockefeller sold out his share to his partner Clark, bought for $72,500 a larger share in another refinery, and formed the partnership of Rockefeller & Andrews. At about the same time another refinery was started by Rockefeller's brother William (b. 1841), but in 1867 Rockefeller & Andrews absorbed this business, and Henry M. Flagler was added to the partnership. In 1870 the two Rockefellers, Flagler, Andrews and a refiner named Stephen V. Harkness formed the Standard Oil Company, with a capital of $1,000,000 (increased in 1872 to $2,500,000 and in 1874 to $3,500,000), of which John D. Rockefeller was president. This great corporation gradually established itself in practical control of the oil production in America, by means of business methods and financial operations which have been severely criticized, but which brought immense wealth to those concerned. Its capital was further increased in 1882, when separate companies were organized in each state; and in later years, as the first great American "trust," the Standard Oil Company was hotly attacked during the anti-trust movement (see INTER-STATE COMMERCE). Into the merits of this question it is impossible to enter here. Rockefeller himself retired from active business in 1895; he had for a time large iron interests (mines and ore-carrying vessels) on Lake Superior, which he sold to the United States Steel Corporation, and his personal wealth was probably greater than that of any other man in the country. In private life he was a devoted member of the Baptist church, and his benefactions were numerous. To "the University of Chicago founded by John D. Rockefeller" (in 1892) he had given, up to 1910, $24,809,666, while to the General Education Board he had given $43,000,000; he founded (1901) and supported the Rockefeller Institute for Medical Research in New York City; he gave large sums to Rush Medical College in Chicago, to Johns Hopkins Hospital in Baltimore, to Barnard College in New York City and to the Baptist Missionary Society; and in 1909 he gave $1,000,000 to endow a medical commission to investigate the nature of the hook-worm and to suppress the hook-worm disease.

See Ida M. Tarbell's *History of the Standard Oil Company* (New York, 1903), a severe attack on the Trust; also his own *Random Reminiscences* (1909).

ROCKET. (1) The name (Fr. *roquette*, Lat. *eruca*, a kind of cabbage) of two species of plants. The one, *Eruca sativa*, is a cruciferous annual with white flowers veined with purple; the leaves have a sharp flavour and are used in southern Europe for salads. The other is a hardy perennial herbaceous plant, of the genus *Hesperis*, of which *Hesperis matronalis* is the most familiar species (see HORTICULTURE).

(2) A cylinder of paper, pastcboard or metal, filled with an explosive mixture. This word, which appears in many forms in various languages, is from the It. *rochetta*, diminutive of *rocca*, a distaff, the obsolete English "rock"; the application

is due to a resemblance in shape. Rockets are used in pyrotechny for purpose of display, scattering showers of stars, coloured balls, &c., on bursting (see FIREWORKS). They are also used in signalling, and especially as a part of life-saving apparatus for wrecks (see LIFEBOAT and LIFE-SAVING SERVICE).

Large and heavy rockets, of which the head formed a projectile, had too a considerable vogue in the early part of the 19th century for war purposes. They were invented by Sir William Congreve (*q.v.*) and employed by him both afloat in coast operations and in field operations. Brought to the notice of all armies by the fact that a rocket battery of the Royal Artillery served in the allied army in the Leipzig campaign, war rockets were introduced in many armies, being sometimes issued as an additional portion of the equipment of ordinary field batteries, sometimes reserved for special rocket batteries. The Congreve rocket was in use in the British army as late as 1860. There were four natures—3-pounder, 6-pounder, 12-pounder and 24-pounder. The case was of sheet-iron, on to which was screwed a cylindro-conoidal head forming the projectile. The head was made hollow and could be filled with a bursting charge if a shell effect was desired, a base fuze being provided. The iron case contained the rocket composition, and was closed at the rear end by a metal plate with five holes or vents, and on the centre a bush into which the stick was screwed. These rockets were fired from rocket tubes on tripods, the tubes being provided with a tangent sight. Against masses of troops within easy range, the war rocket was considered an efficient engine; it was used also to set fire to buildings, but was always deficient in accuracy. Eventually the Congreve rocket was superseded by the Hale, of which two patterns were in use, the 9-pounder and the 24-pounder, for field and fortress warfare respectively. These had no sticks, and were centred by the arrangement of the vent, the gases, as they emerged from the vent, impinging upon a screw-formed tail, to which they imparted the necessary rotation. These rockets were fired from a trough. The maximum effective range of the 9-pounder Hale rocket was about 1200 yards. The use of these engines was discontinued in the British service about 1885. On the continent of Europe they had disappeared more than twenty years before. Austria, the last power to use them, broke up her rocket batteries in 1867.

ROCKFORD, a city and the county seat of Winnebago county, Illinois, U.S.A., on the Rock river, in the northern part of the state, about 85 m. N.W. of Chicago. Pop. (1890) 23,584; (1900) 31,051, of whom 9337 were foreign-born (6690 Swedes); (1910 census) 45,401. Area, 8·91 sq. m. It is served by the Chicago, Burlington & Quincy, the Chicago & North-Western, the Chicago, Milwaukee & St Paul, the Chicago, Milwaukee & Gary ("Rockford Route") and the Illinois Central railways, and is connected by interurban electric railway with Chicago and Freeport, Illinois, and Janesville, Wisconsin. The city has a Memorial Hall, erected in honour of the soldiers and sailors of Winnebago county, and in charge of the Grand Army of the Republic; a soldiers' memorial fountain; a Carnegie library, containing 51,340 volumes in 1909; and the Veile Museum of natural history. Rockford College (non-sectarian), for the higher education of women, is ranked by the United States Commissioner of Education as one of fifteen women's colleges of the highest grade in the country; it was opened in 1849 as Rockford Seminary, and was named Rockford College in 1892. In 1908–9 it had 196 students. Rockford is the see of a Roman Catholic bishop. In and near the city there are two hospitals and three sanatoriums. Manufacturing is facilitated by good water-power, supplied by a dam across the Rock river about 800 ft. long, constructed in 1844. Among the manufactures are furniture, hosiery and knit goods, agricultural implements, foundry and machine-shop products, saddlery and harness, &c. The total value of all factory products in 1905 was $15,276,129 (38·6% more than in 1900). The municipality owns and operates its waterworks; the water supply is obtained from artesian wells. Rockford was first settled in 1834, and was chartered as a city in 1852. More than one-fourth of its area has been annexed to the city since 1889.

ROCKHAMPTON, a town of Livingstone county, Queensland, Australia, on the Fitzroy river 43 m. from its mouth, 335 m. in a direct line N.W. of Brisbane. It has a beautiful situation, and its climate, in spite of heat, is healthy. It is the port of a wide agricultural district, which also produces gold, copper and silver. Much of the trade is carried on through the ports of Alma and Broadmount, near the mouth of the river, both available for ocean steamers. Rockhampton has a large trade in frozen meat, and there are factories for extract and meat preserving. Rockhampton is the terminus of the Queensland Central railway and the seat of an Anglican and a Roman Catholic bishopric. Population of the municipality (1901), 15,461; within the 5 m. radius, 19,691; of the separate municipality of North Rockhampton, 2865.

ROCK HILL, a city of York county, South Carolina, U.S.A., 84 m. by rail N. of Columbia. Pop. (1890) 2744; (1900) 5485 (1706 negroes); (1910) 7216. Rock Hill is served by two lines of the Southern railway. It lies at an elevation of about 670 ft. above the sea. Among its buildings and institutions are the Federal Government Building, the City Hall, the Carnegie Library and the Winthrop Normal and Industrial College (chartered in 1891 and opened in 1894), a state institution for white girls. Cotton is the most important product of the surrounding country. The Catawba river, 5 m. distant, furnishes good water-power, and in a large power-plant electricity is generated for the city's manufactories. Among the manufactures are cotton goods, cotton-seed oil, yarn, wagons and carriages, foundry and machine-shop products; and there are cotton gins, marble and stone works. The growth of the city has been almost entirely since the Civil War. Rock Hill was incorporated as a village in 1870, and was chartered as a city in 1892.

ROCKINGHAM, CHARLES WATSON WENTWORTH, 2ND MARQUESS OF (1730–1782), twice prime minister of England, was the son of Thomas Watson Wentworth (*c.* 1690–1750), who was created earl of Melton in 1733 and marquess of Rockingham in 1746. The family of Watson was descended from Sir Lewis Watson (1584–1653), son and heir of Sir Edward Watson (d. 1616) of Rockingham Castle in Northamptonshire. For his services to the king during the Civil War Sir Lewis was created Baron Rockingham in 1645. His grandson Lewis, the 3rd baron (1655–1724), was created earl of Rockingham in 1714, and was succeeded by his grandson Lewis (*c.* 1709–1745), whose brother Thomas, the 3rd earl, died unmarried in February 1746, when the earldom became extinct. The barony of Rockingham, however, descended to a cousin, Thomas, father of the prime minister, a grandson of Edward, the 2nd baron (1630–1689), who had married Anne, daughter and heiress of Thomas Wentworth, 1st earl of Strafford. The vast estates of the Wentworths had passed to Edward's son, Thomas, who took the additional name of Wentworth, and then to his son, the 1st marquess of Rockingham.

Charles Watson Wentworth was born in 1730 on the 19th of March (according to some, the 13th of May), and was educated at Westminster school and St John's College, Cambridge. He showed his spirit as a boy by riding across from Wentworth to Carlisle in 1746 to join the duke of Cumberland in his pursuit of the Young Pretender. He was created earl of Malton in the peerage of Ireland in September 1750, and succeeded his father as 2nd marquess of Rockingham in December of the same year. In 1751 he became lord-lieutenant of the North and East Ridings of Yorkshire and a lord of the bedchamber, and in 1760 was made a knight of the Garter. After George III. had begun his policy of dividing the great Whig families, those Whig noblemen and gentlemen who did not choose to join the sections headed by the Grenvilles, the duke of Bedford, or any other great noblemen, selected as their chief the young marquess of Rockingham. In May 1762 the king's favourite,

the earl of Bute, became first lord of the treasury, and the marquess of Rockingham was amongst those who in the following year were dismissed from their lord-lieutenancies. The opposition now grew so strong that Lord Bute resigned in April 1763, and the king, true to his policy, appointed George Grenville to be his successor. But Grenville's section of the Whig party was not strong enough to maintain him in power long, and in July 1765 Lord Rockingham formed his first administration with General Conway and the duke of Grafton as secretaries of state. The cabinet seemed stronger than it really was, for it was divided by intestine quarrels, and the earl of Chatham refused to have anything to do with it. Nevertheless, Rockingham recovered his lord-lieutenancies and won reputation as a good administrator. In May 1766 the duke of Grafton, a far abler man than Rockingham, though neither so conciliatory in his manners nor so generally popular, seceded from the government, and in August 1766 he succeeded his former chief as first lord of the treasury and prime minister. Then followed many years of fruitless opposition to the king's personal authority as exhibited through his ministers, but at last, on the 27th of March 1782, Lord Rockingham again became prime minister with Fox and Shelburne (afterwards marquess of Lansdowne) as secretaries of state. This time he enjoyed office for but a few weeks, for he died on the 1st of July 1782. He left no issue, and his property went to his nephew, the 2nd Earl Fitzwilliam, his titles becoming extinct. A few words from his epitaph by Burke deserve quotation as giving the reason of the predominance of such an ordinary man as Lord Rockingham over a party abounding in men of great abilities: "A man worthy to be held in esteem, because he did not live for himself. . . . He far exceeded all other statesmen in the art of drawing together, without the seduction of self-interest, the concurrence and co-operation of various dispositions and abilities of men, whom he assimilated to his character and associated in his labours."

See *Memoirs of the Marquis of Rockingham and his Contemporaries*, by George Thomas, earl of Albemarle (2 vols., 1852); Horace Walpole's *Memoirs* of the reign of George III., edited by G. F. R. Barker (1894); and the other letters, papers and diaries of the time.

ROCK ISLAND, a city and the county-seat of Rock Island county, Illinois, U.S.A., in the N.W. part of the state, on the E. bank of the Mississippi river, adjoining Moline, and opposite Davenport, Iowa (with which it is connected by two bridges) about 3 m. above the mouth of the Rock river, and at the foot of Rock Island rapids, which extend for nearly 16 m. Pop. (1890) 13,634; (1900) 19,493, of whom 4412 were foreign-born; (1910) 24,335. It is served by the Chicago, Burlington & Quincy, the Chicago, Milwaukee & St Paul, the Chicago, Rock Island & Pacific, and the Davenport, Rock Island & North-Western railways. Near the city, at the mouth of Rock river, the "Hennepin" (or Illinois & Mississippi) canal joins the Mississippi river. The city occupies a plain lying between the river and a series of bluffs. The island of Rock Island, a ridge of limestone rock about 3 m. long and 1½ m. wide, is connected with the mainland by bridges to Rock Island and Moline; on it there are a Federal arsenal, the most important in the country for the manufacture of small-arms, gun carriages and artillery equipment, a Federal armoury and a national cemetery; the island is connected with the Illinois shore at Moline by a dam, whence good water-power is derived. In the city are: a public library (1872), the Augustana College and Theological Seminary (controlled by the Evangelical Lutheran Augustana Synod of North America; co-educational), which was founded as Augustana Seminary in Chicago in 1860 chiefly for the education of Swedish Lutheran clergymen, was removed to Paxton, Illinois, in 1863 and to Rock Island in 1875, and received its present name in 1869; and the principal offices of the Modern Woodmen of the World, a fraternal society, founded in 1884 and having 219,729 members in 1909. The city has a large trade by water and rail; commercially it forms a unit with Davenport and Moline. Among the city's manufactures are lumber, agricultural implements, flour, glass, stoves, carriages, soap, &c. In 1905 the value of the factory product was $5,332,967. Some coal is mined in the county.

On the north bank of the Rock river, 3 m. from its mouth, there was a large summer village (sometimes called Saukenuk) of the Sauk Indians, built about 1730 and destroyed in 1831; and near the mouth of the Rock river is a bluff called "Black Hawk's watch-tower." A settlement on the island was made in 1816, when the fort was built; the first settlement on the mainland was made in 1826. In 1841 the town of Rock Island was formed by the consolidation of two small settlements named Stephenson and Farnhamsburg and was incorporated; it received a city charter in 1849. Upon the west end of the island the United States government in 1816 built Fort Armstrong, where on the 21st of September 1832, at the close of the Black Hawk War, a treaty of peace was signed by General Winfield Scott and Governor John Reynolds of Illinois and by the chiefs of the Sauk and Foxes, and where, six days before, General Scott and Governor Reynolds had made a treaty with the Winnebagoes. The fort was abandoned in 1836 and was burned in 1855; a monument now marks its site. The Rock Island armoury and arsenal, under an act of 1862, were built in 1863, when a number of captured Confederate soldiers were confined on the island.

ROCKLAND, a city and the county-seat of Knox county, Maine, U.S.A., on Rockland Harbor, Penobscot Bay, 86 m. by rail E.N.E. of Portland. Pop. (1900) 8150; (1910) 8174. It is the eastern terminus of a branch of the Maine Central railway, and is served by a steamboat and electric line and by steamboat lines to Portland, Boston, Bangor, Bar Harbor and other coast ports. The harbour is protected by a breakwater nearly 5000 ft. long. The principal buildings are the United States Government Building and the County Court House. Granite and limestone are quarried in the vicinity. The granite (biotite, biotite-muscovite and quartz-monzonite) is of fine quality, and has been used extensively in the United States for building and monumental purposes; and the burning of lime is by far the most important industry of the city. The shipbuilding industry is also important. The total value of the city's factory products in 1905 was $1,822,591 (46·5% more than in 1900). Lobsters and fish in considerable quantities are shipped from the city. Rockland was settled in 1769, but its growth began only with the establishment of the lime industry in 1795. It was a part of the township of Thomaston (pop. 2205 in 1910), from 1777 to 1848, when it was incorporated as a separate township under the name of East Thomaston. Two years later the present name was adopted, and in 1854 Rockland was chartered as a city.

ROCKLAND, a township of Plymouth county, Massachusetts, U.S.A., about 20 m. S. of Boston. Pop. (1890) 5213; (1900) 5327; (1910 U.S. census) 6928. Area, about 10 sq. m. It is served by the New York, New Haven & Hartford railway, and by interurban electric railway. Among its manufactures are boots and shoes and tacks. There is a public library (1878). Rockland was erected into a township in 1874, having been previously a part of Abington.

ROCKPORT, a township of Essex county, Massachusetts, U.S.A., on the N.E. end of Cape Ann, on the Atlantic Ocean, north-east of Gloucester, and about 35 m. north-east of Boston. Pop. (1890) 4087; (1900) 4592; (1910, U.S. census) 4211. Rockport is the southern terminus of the Gloucester branch of the Boston & Maine railway, and is served by an electric railway extending from Gloucester through Rockport and around the cape. Off Sandy Bay, a rendezvous of the Atlantic squadron of the U.S. navy, the Federal government began in 1884 a harbour of refuge, with an area of 1664 acres, to be protected from north and north-east winds by a breakwater, 117 ft. wide at a depth of 12 ft. below mean low water, rising 22 ft. above mean low water, and 9000 ft. long. In the township are the North Village or Pigeon Cove and the South Village or Rockport. Rockport is a summer resort, and there are many summer residences at Andrews Point and at the South

End and Headlands. There are large granite quarries along the coast, especially in Pigeon Cove, and there are two varieties of granite, called commercially "grey" and "green," both very hard, the former the more abundant. It has been used in building the great breakwater off Sandy Bay and various large bridges. Granite for paving-stones is quarried. Like many of the Maine quarries those of Rockport owe much of their development to their nearness to deep water transportation. Isinglass, glue, tools, parts for automobile engines, and copper paint are among the manufactures. Fishing was formerly of importance, but quarrying has displaced it. Sandy Bay, the fifth parish of Gloucester, first settled about 1697, and Pigeon Cove, part of the third parish, were set off from Gloucester and were incorporated as the township of Rockport in 1840. The Bennett & Mackay transatlantic commercial cable was landed in Rockport in May 1884.

ROCKVILLE, a city of Tolland county, Connecticut, U.S.A., in the N.E. part of the state, on the Hockanum river, about 15 m. N.E. of Hartford. Pop. (1890) 7772; (1900) 7287, of whom 2548 were foreign-born, many being Germans and Poles; (1910) 7977. It is served by the New York, New Haven & Hartford railway and by electric lines. It is in the township of Vernon (pop. in 1890, 8808; in 1910, 9087; area, 19 sq. m.), which was separated from Bolton township in 1808, and contains the villages of Vernon, Vernon Centre, Dobsonville and Talcottville. In the city are the George Maxwell Memorial Library and the Sykes Manual Training School. The river, by a series of falls, makes a descent of 280 ft. here, and furnishes power for large manufacturing establishments. The principal manufactures are woollen, silk and cotton goods, envelopes, and silk fish-lines. In 1841 fancy cassimeres, probably the first manufactured in the United States, were made here. At the Hockanum Mills (established 1809) worsted for men's clothing was first made (about 1870) in the United States. The first settlement here was made about 1726. Rockville was chartered as a city in 1889.

ROCKY MOUNTAIN GOAT, or WHITE GOAT (*Oreamnus montanus*), a North American hollow-horned ruminant of the family BOVIDAE, distinguished by its white colour. It is, in fact, the only ruminant, with the exception of the white Alaskan wild sheep, which is entirely white at all seasons of the year; and cannot, therefore, be mistaken for any other animal, and its description may consequently be brief. In the winter coat the hair is long and pendent, elongated into a short beard on the sides of the lower jaw behind the chin, and it is also longer than elsewhere on the neck and the chest; at the base of the long hair is a thick growth of short and woolly under-fur. In summer the coat becomes comparatively short. The muzzle is hairy, the ears are of moderate size, and the tail is short, and partially buried among the long hair of the rump. There are no glands on the face; but there is a large globular one at the base of each horn of the size of half a small orange. The black horns, which are ringed in their basal portion, are comparatively short and not unlike those of the Asiatic serows in general characters, being subcylindrical, and curving slightly backwards. They taper, however, much more rapidly than those of the serows, and diverge much more widely from the middle line. The lateral hoofs are well developed. Although commonly described as white, the hair has a more or less decided tinge of yellow, which appears to be more marked in the summer than in the winter coat. The cannon-bones are remarkably short and wide, and in this respect differ from those of all allied ruminants, except the Tibetan takin. The general shape of the animal is ungainly, owing to a huge hump on the withers, at which point the height is about 3 ft.

The head of a white goat obtained in 1900 from the mountains at the mouth of Copper river, opposite Kyak Island, has been described as a species apart. In addition to certain details in the conformation of the skull, the horns are much more slender than in the ordinary white goat, and instead of bending regularly backwards till near their tips, curve widely outwards from their bases. Their length is nearly equal to that of the longest pair of the ordinary form hitherto recorded, while the tip-to-tip interval is nearly double that of any other known specimen. This animal can scarcely be regarded as more than a local race, and should be styled *Oreamnus montanus kennedyi*.

The affinities of the white goat (which is really a member of a group intermediate between goats and antelopes) are probably with the Asiatic serows and takin, and hence perhaps with the musk-ox.

See a paper by Madison Grant, entitled "The Rocky Mountain Goat," published in the ninth annual report of the New York Zoological Society (1905). (R. L.*)

ROCOCO, or ROCAILLE, literally "rock-work," a style of architectural and mobiliary decoration popular throughout the greater part of Europe during the first half of the 18th century. In France it was especially characteristic of the regency and the reign of Louis XV. A debased style at the best, essentially fantastic and bizarre, it ended in extravagance and decadence. A meaningless mixture of imitation rock-work, shells, scrolls and foliage, the word came eventually to be applied to anything extravagant, flamboyant or tasteless in art or literature. The very exuberance of the rococo forms is, indeed, the negation of art, which is based upon restraint. There is something fundamentally Italian in the *bravura* upon which the style depends; yet Italy has produced some of the worst examples of what in that country is called the "Jesuit style," in allusion to the supposed lack of directness in Jesuit policy. Everything, indeed, in the rococo manner is involved and tortured, though before a superb example of Jacques Caffieri, such as the famous commode in the Wallace Collection, it is impossible not to admire the art with which genius can treat even the defects and weaknesses of a peculiarly mannered fashion. The best French work possesses a balance and symmetry which are usually entirely absent from its imitations. Spain and Italy produced many monstrous travesties—it is impossible to imagine anything more grotesque than the flamboyant convolutions of the monumental Roman style of the third quarter of the 18th century. In Germany, weak and lifeless imitations were as popular as might be imagined in a land which was content to take its art, especially its bad art, from France. England did not escape the infection, and Chippendale and his school produced examples of rocaille work and *coquillage* which were quite foreign to their own sentiment, and rarely rose above respectable mediocrity.

ROCROI, a town of northern France, capital of an arrondissement in the department of Ardennes, 22 m. N.N.W. of Charleville by rail, and within 2 m. of the Belgian frontier. Pop. (1906) town, 796; commune, 2116. As a fortified place it commands the Ardennes plateau between the valley of the Meuse and the head-waters of the Oise. The present fortifications, constructed by Vauban, form a pentagon and entirely close in the town, which has regularly built streets converging on a central square. Overlooking the latter is the church, a florid building of the 18th century. Rocroi is the seat of a sub-prefect and has a tribunal of first instance.

The place, originally called Croix-de-Rau or Rau Croix, was fortified in the 16th century and besieged by the imperialists in 1555. Invested by the Spaniards in 1643, it was relieved by Louis II., the duke of Enghien (afterwards the Great Condé), after a brilliant victory. Captured in 1658 by the same duke, then in the Spanish service, it was restored to France till the treaty of the Pyrenees in 1659. In 1815 Rocroi was besieged for a month by the allies.

ROD, ÉDOUARD (1857–1910), French-Swiss novelist, was born at Nyon, in Switzerland, on the 31st of March 1857. He studied at Lausanne and Berlin, and in 1878 found his way to Paris. In 1881 he dedicated his novel, *Palmyre Veulard*, to Zola, of whom he was at this period of his career a faithful disciple. A series of novels of similar tendency followed. In 1884 he became editor of the *Revue contemporaine*, and in 1887 succeeded Marc Monnier as professor of comparative literature at Geneva, where he remained till 1893. *La Course à la mort* (1885) marks a turning-point in his career; in it he

forsook the so-called naturalistic novel for the analysis of moral motives. He is at his best in presenting cases of conscience, the struggle between passion and duty, and the virtues of renunciation. *Le Sens de la vie* (1889), one of his most famous books, is in the nature of a complement to *La Course à la mort*. It was followed by *Les Trois cœurs* (1890), *La Sacrifiée* (1892), *La Vie privée de Michel Teissier* (1893), translated as *The Private Life of an Eminent Politician* (1893); *La Seconde Vie de Michel Teissier* (1894), *Le Silence* (1894), *Les Roches blanches* (1895), *Le Dernier Refuge* (1896), *Le Ménage du pasteur Naudié* (1898), a study of Protestant France; *L'Eau courante* (1902), *L'Inutile Effort* (1903), *Un Vainqueur* (1904), *L'Indocile* (1905), and *L'Incendie* (1906). M. Rod's books of literary criticism include *Les Idées morales du temps présent* (1897), an admirable *Essai sur Goethe* (1898), *Stendhal* (1892), and some columns of collected essays. He published *L'Affaire J. J. Rousseau* in 1906, and in the same year he drew from an episode in the life of the philosopher a play in three acts, *Le Réformateur*, which was produced at the Nouveau Théâtre. He died in January 1910.

ROD (O.E. *rodd*, probably related to Norw. *rudda*, stick, *rodda*, stake), a twig or shoot of a tree or bush, especially a straight slender stick or wand used as an instrument of punishment, as a symbol of office, or as an implement, usually composed of several joints, for angling or fishing. The term is thus applied to a metal bar, slender in proportion to its length, used as a tie, brace or connecting shaft between different parts of a machine. It is familiar in the titles, showing the colour of their wands of office, of the gentlemen ushers of the three principal British orders of knighthood, the ushers of the Garter and St Patrick being "Ushers of the Black Rod," and of the Thistle "Green Rod." The use of a rod as a measuring implement has given rise to the use of the word for a measure of length = 5½ yds. or 16½ ft.; this length is also named a pole or perch, the origin of the application being the same as in "rod"; as a measure of area, a rod = a square pole or perch, 30¼ square yds. = 272¼ square ft., 160 rods = 1 acre.

RODBERTUS, KARL JOHANN (1805–1875), German socialist, was born at Greifswald on the 12th of August 1805, his father being a professor at the university there. He studied law at Göttingen and Berlin, thereafter engaging in various legal occupations; and, after travelling for some time, he bought the estate of Jagetzow in Pomerania, hence his name of Rodbertus-Jagetzow. In 1836 he settled on this estate, and henceforward devoted his life chiefly to economic and other studies, taking also some interest in local and provincial affairs. After the revolution of March 1848 Rodbertus was elected member of the Prussian national assembly, in which body he belonged to the left centre; and for fourteen days he filled the post of minister of public worship and education. He sat for Berlin in the second chamber of 1849, and moved the adoption of the Frankfort imperial constitution, which was carried. When the system of dividing the Prussian electorate into three classes was adopted, Rodbertus recommended abstention from voting. His only subsequent appearance in public life was his candidature for the first North German diet, in which he was defeated. His correspondence with Lassalle was an interesting feature of his life. At one time Rodbertus had some intention of forming a "social party" with the help of the conservative socialist Rudolf Meyer and of W. Hasenclever, a prominent follower of Lassalle; but no progress was made in this. Rodbertus was neither disposed nor qualified to be an agitator, being a man of a quiet and critical temperament, who believed that society could not be improved by violent changes, but by a long and gradual course of development. He warned the working men of Germany against connecting themselves with any political party, enjoining them to be a "social party" pure and simple. He died on the 8th of December 1875.

The general position of Rodbertus was "social, monarchical and national." He held the purely economic part of the creed of the German social-democratic party, but he did not agree with their methods, and had no liking for the productive associations with state help of Lassalle. He regarded a socialistic republic as a possible thing, but he cordially accepted the monarchic institution in his own country and hoped that a German emperor might undertake the rôle of a social emperor. The basis of the economic teaching of Rodbertus is the principle laid down by Adam Smith and Ricardo, and insisted on by all the later socialists, that labour is the source and measure of value. In connexion with this he developed the theory that rent, profit and wages are all parts of a national income produced by the united organic labour of the workers of the community. Consequently there can be no talk of the wages of labour being paid out of capital; wages is only that part of the national income which is received by the workmen, of a national income which they have themselves entirely produced. The wages fund theory is thus summarily disposed of. But the most important result of the theory is his position that the possession of land and capital enables the landholders and capitalists to compel the workmen to divide the product of their labour with those non-working classes, and in such a proportion that the workers only obtain as much as can support them in life. Thus the iron law of wages is established. Hence also Rodbertus deduces his theory of commercial crises and of pauperism.

A fundamental part of the teaching of Rodbertus is his theory of social development. He recognized three stages in the economic progress of mankind: (1) the ancient heathen period in which property in human beings was the rule; (2) the period of private property in land and capital; (3) the period, still remote, of property in capital entirely in service of society. The goal of the future is to be one society organized on a communistic basis; only in that way can the principle that every man be rewarded according to his work be realized. In this communistic or socialistic state of the future land and capital will be nationalized property, and the entire national production will be under national control; and means will be taken so to estimate the labour of each citizen that he shall be rewarded according to its precise amount. An immense staff of government officials will be required for this function. Rodbertus believed that this stage of social development is yet far distant; he thought that five centuries will need to pass away before the ethical force of the people can be equal to it.

From temperament, culture and social position Rodbertus was averse to agitation as a means of hastening the new era; and, in the measures which he recommends for making the transition towards it, he showed a scrupulous regard for the existing interests of the capitalists and landholders. He proposed that these two classes should be left in full possession of their present share of the national income, but that the workers should reap the benefit of the increasing production. To secure them this increment of production, he proposed that the state should fix a "normal working day" for the various trades, a normal day's work, and a legal wage, the amount of which should be revised periodically, and raised according to the increase of production, the better workman receiving a higher wage. By means of these measures, carried out by the state in order to correct the evils of competition, would Rodbertus seek to make the transition into the socialistic era.

The economic work of Rodbertus is an attempt made in a temperate and scientific spirit to obviate the evil tendencies inherent in the competitive system, especially as exemplified in the operation of the iron law of wages. The remedy he proposes is a state management of production and distribution, which shall secure more and more, that the share of the workers in the national income shall approximate to the whole product of their labour. He also regards the existence of the capitalist class as a necessary evil, and would only gradually abolish it. Rodbertus's principal writings are: *Zur Erkenntniss unserer staatswirtschaftlichen Zustände* (1842); *Sociale Briefe an von Kirchmann* (1850); *Creditnot und Grundbesitzes* (2nd ed., 1876); "Der Normal-Arbeitstag," in *Tüb. Zeitschrift* (1878); *Letters* to A. Wagner, &c., *Tüb. Zeitschrift* (1878–79); *Letters* to Rudolf Meyer (1882). Rodbertus has received great attention in Germany, especially from Adolf Wagner ("*Tüb. Zeitschrift*, 1878); see also Kosak's *Rodbertus socialökonomische Ansichten* (Jena, 1882); an excellent monograph by G. Adler, *Rodbertus, der Begründer des wissenschaftlichen Sozialismus* (Leipzig, 1884); Dietzel, *Karl Rodbertus, Darstellung seines Lebens und seiner Lehre* (Jena, 1886); Jentsch, *Rodbertus* (Stuttgart, 1899); and E. C. K. Gonner, *Social Philosophy of Rodbertus* (London, 1899).

RODENTIA, or GLIRES, an order of placental mammals characterized by the peculiar form and structure of their front or incisor teeth, which are reduced to a single functional chisel-like pair in each jaw, specially adapted for gnawing, and growing throughout the entire life of their owners. Rodents may be characterized as terrestrial, or in some cases arboreal or aquatic, placental mammals of small or medium size, with a milk and a permanent series of teeth, plantigrade or partially plantigrade, and generally five-toed, clawed (rarely nailed or semi-

hoofed) feet, clavicles or collar-bones (occasionally imperfect or rudimentary), no canine teeth, and a single pair of lower incisors, opposed by only one similar and functional pair in the upper jaw.

In all rodents the upper incisors resemble the lower ones in growing uninterruptedly from persistent pulps, and (except in the hare group, Duplicidentata) agree with them in number. The premolars and molars may be rooted or rootless, with tuberculated or laminated crowns, and are arranged in an unbroken series. The orbits are always open behind, never being surrounded by bone. The condyle of the lower jaw is antero-posteriorly elongated. The intestine (except in the dormice or Gliridae) has a large caecum. The testes are inguinal or abdominal. The uterus is two-horned, with the cornua opening separately into the vagina or uniting to form a *corpus uteri*. The placenta is discoidal and deciduate. And the smooth hemispheres of the brain do not extend backwards so as to cover any part of the cerebellum.

Rodents include by far the greater number of species, and have the widest distribution, of any of the orders of terrestrial mammals, being in fact cosmopolitan, although more abundant in some parts, as in South America, which may be considered their headquarters, than in others, as in Australasia and Madagascar, where they are represented only by members of the mouse-group, or Myoidea.

All rodents are vegetable-feeders, and this uniformity in their food and in the mode of obtaining it, namely by gnawing, has led to that general uniformity in structure observable throughout the group; a feature which renders their classification difficult. Indeed, despite the fact that they present much diversity of habit—some being arboreal, as the squirrels, many of which are provided with expansions of skin or parachutes on which they glide from tree to tree; some cursorial, as the hares; others jumpers, as the jerboas; others fossorial, as the mole-rats; and others aquatic, as the beavers and water-rats—no important structural modifications are correlated with such diversity of habit.

Anatomy.—The rodent skull is characterized by the great size of the premaxillae, which completely separate the nasals from the maxillae; by the presence of zygomatic arches; and by the wide unoccupied space existing between the incisors and the cheek-teeth; and (except in the Duplicidentata) by the antero-posteriorly elongated glenoid cavity for the articulation of the lower jaw. Post-orbital processes of the frontals exist in squirrels, marmots and hares; but in all other genera they are rudimentary or altogether absent; and the zygoma seldom sends upwards a corresponding process, so that the orbit is more or less completely continuous with the temporal fossa. The lachrymal foramen is always within the orbital margin; and in many species the infra-orbital foramen is very large (in some as large as the orbit) and transmits part of the masseter muscle. The zygomatic arch is variously developed, and the position of the jugal is a character for grouping the families. The nasals are, with few exceptions, large, and extend far forwards, the parietals are moderate, and there is generally a distinct interparietal. The palate is narrow from before backwards, this being especially the case in the hares, where it is reduced to a mere bridge between the premolars; in others, as in the rodent-moles (Bathyerginae), it is extremely narrow transversely, its width being less than that of one of the molar teeth. Tympanic bullae are always present and generally large; in some genera, as in the gerbils (Gerbillinae) and jerboas (Jaculidae), there are supplemental mastoid bullae which form great hemispherical bony swellings at the back of the skull (fig. 1, *Per*), in these genera and the hares the meatus auditorius being tubular and directed upwards and backwards. The lower jaw is characterized by its abruptly narrowed and rounded front part supporting the pair of large incisors, as well as by the small size of the coronoid process, and the great development of the lower hind, or angular, portion.

The dental formula varies from *i.* $\frac{1}{1}$, *c.* $\frac{0}{0}$, *p.* $\frac{2}{1}$, *m.* $\frac{3}{3}$ (total 28) in the hares and rabbits to *i.* $\frac{1}{1}$, *c.* $\frac{0}{0}$, *p.* $\frac{3}{3}$, *m.* $\frac{3}{3}$ (total 12) in the Australian water-rats; but in the great majority of species it presents striking uniformity, and may be set down typically as *i.* $\frac{1}{1}$, *c.* $\frac{0}{0}$, *p.* $\frac{1}{1}$ or $\frac{0}{0}$, *m.* $\frac{3}{3}$. In the Duplicidentata only is there more than a single pair of incisors, and in these the additional pair is small and placed behind the middle pair. In this group the enamel extends partially to the back of the incisors, but in all the rest it is restricted to the front surface, so that, by the more rapid wearing-away of the softer structures behind, a chisel-shaped edge is maintained. Both upper and lower incisors are regularly curved, the upper ones slightly more so than the lower; and, their growth being continuous, should anything prevent the normal wear by which their length is regulated—as by the loss of one of them, or by displacement owing to a broken jaw or other cause—the unopposed incisor may gradually curve upon itself until a complete circle or more has been formed, the tooth sometimes passing through some part of the animal's head. The cheek-teeth may be either rooted or

FIG. 2.—Skull of Porcupine (*Hystrix cristata*), with muscle attached. *t*, temporal muscle; *m*, masseter; *m'*, portion of masseter transmitted through the infra-orbital foramen, the superior maxillary nerve passing outwards between it and the maxilla.

FIG. 3.—Vertical and Longitudinal Section through the Skull of the Beaver (*Castor fiber*), showing the brain-cavity, the greatly developed plates of bone in the nasal cavity, the mode of implantation of the ever-growing chisel-edged incisor, and the curved rootless cheek-teeth.

rootless, and either cusped or formed of parallel plates, this diversity of structure often occurring in the same family. When there are more than three cheek-teeth, those which precede the last three have succeeded milk-teeth, and are premolars. In some species, as in the agoutis (Dasyproctidae), the milk-teeth are long retained, while in the allied cavies (Caviidae) they are shed before birth.

The tongue presents little variability in length, being short and compressed, with a blunt tip, which is never protruded beyond the incisors. In most species there are three circumvallate papillae at the base, and the apical portion is generally covered with small thread-like papillae, some of which in the porcupines become greatly enlarged, forming toothed spines. The stomach varies in form from the simple oval bag of the squirrels to the complex ruminant-like organ of the lemmings. In the water-rat and agoutis it is constricted between the oesophagus and pylorus; while in the dormouse the oesophagus immediately before entering the stomach is much dilated, forming a large egg-shaped bag with thickened glandular walls; and in certain other species, as in *Lophiomys* and the beaver, glandular masses are attached to and open into the cardiac or pyloric pouches. All rodents, with the sole exception of the dormice, have a caecum, often of great length and sacculated, as in hares, the water-rat and porcupines; and the long colon in some, as the hamster and water-rat, is spirally twisted upon itself near the commencement. The liver is divided in the typical manner in all, but the lobes are variously subdivided in different species (in *Capromys* they are divided into minute lobules); and the gall-bladder, though present in most, is absent in a few. In most species the penis (which is generally provided with a bone) may be more or less completely retracted within the fold of integument surrounding the vent, and lie curved backwards upon itself under cover of the integument, or it may be carried forward some distance in front of the anal orifice, from which, as in voles and **marmots**,

in the breeding-season, it is separated by the prominent testicular mass. The testes in the pairing-season form projections in the groins, but (except in the Duplicidentata) do not completely leave the cavity of the abdomen. Prostate glands and, except in the Duplicidentata, vesiculae seminales are present in all. The uterus may be double, each division opening by a separate *os uteri* into a common vagina, as in *Leporidae*, *Sciuridae*, and *Hydrochoerus*, or two-horned, as in most species. The teats vary in number from a single abdominal pair in the guinea-pig to seven thoracic-and-abdominal pairs in the rats; while in the *Octodontidae* and *Capromyidae* they are placed high up on the sides of the body.

There are generally nineteen dorso-lumbar vertebrae (thirteen thoracic and six lumbar), the form of which varies in different genera; in the cursorial and leaping species the lumbar transverse processes are generally very long, and in the hares there are large compressed inferior spines, or hypapophyses. The caudal vertebrae vary from a rudimentary condition in the guinea-pig to a great size in the jumping-hare and prehensile-tailed porcupines. The scapula is usually narrow, with a long acromion; the clavicles may be altogether absent or imperfect, as in porcupines, cavies and hares, but in most species are well developed. The humerus has no supra-condylar foramen, and the forearm bones are distinct; and in most species the fore foot has five digits with the phalanges normally developed, the first toe being but rarely rudimentary or absent. The pelvis has large ischia and pubes, with a long and usually bony symphysis. The femur varies considerably in form, but generally has a well-defined third trochanter. In the squirrels and porcupines the tibia and fibula are distinct, but in rats and hares they are usually more or less united up. The hind foot is more variable than the front one, the digits varying in number from five, as in squirrels and rats, to four, as in hares, or even three, as in the capybara, viscacha and agouti. In the *Ascalabotae* the metatarsals are greatly elongated, and in some of the species, as jerboas, they are welded together.

The mouth is divided into two cavities communicating by a narrow orifice, the anterior one containing the incisors and the posterior the molars, the bony skin of the face being continued inwards behind the incisors. This evidently prevents substances not intended for food getting into the mouth, as when the animal is engaged in gnawing through an obstacle. In hares and pacas the inside of the cheeks is hairy, and in most rodents, especially rats and hamsters, there are large internal cheek-pouches lined with hair, which open near the angles of the mouth and extend backwards behind the ears. In the New World pouched rats (*Geomyidae*) the pouches open on the cheeks.

The peculiar odour evolved by many rodents is due to the secretions of special glands, which may open into the prepuce, as in *Mus*, *Microtus* and *Cricetus*, or into the rectum, as in *Arctomys* and *Pteromys*, or into the passage common to both, as in the beaver, or into pouches opening near the vent, as in hares, agoutis and jerboas.

The skin is generally thin, and the panniculus carnosus muscle rarely much developed. The fur varies exceedingly in character,—in some, like the chinchillas and hares, being fine and soft, while in others it is more or less replaced by spines on the upper surface, as in spiny rats and porcupines; these spines in several genera, as *Xerus*, *Cercomys*, *Myocastor*, *Erethizon*, *Lonchoeres* and *Echinomys*, being flattened. In muscular structure the chief peculiarities are noticeable in the comparatively small size of the temporal muscles, and in the great double masseters (fig. 2), which are the principal agents in gnawing. The digastric muscles also are remarkable for their well-defined central tendon, and in many species their anterior bellies are united between the two halves of the lower jaw. The cleido-mastoid generally arises from the basi-occiput, and the sterno-mastoid is connected with the latissimus dorsi. In porcupines and hares the tendons of the flexor digitorum longus and flexor hallucis longus are connected in the foot, while in the rats and squirrels they are separate, and the flexor digitorum longus is generally inserted into the metatarsal of the first toe.

Classification.—Some diversity of view obtains among naturalists with regard to the classification of the order; the scheme here followed being the one adopted (with some modifications of nomenclature) by Professor Max Weber in his *Säugethiere*. The number of genera is so great that only the more important can be noticed. All authorities are agreed in dividing rodents into two great sections or sub-orders, the one, *Duplicidentata*, comprising only the hares, rabbits and picas, and the other, *Simplicidentata*, all the rest. In the latter there is only one pair of incisor teeth in the upper jaw, in which the enamel is confined to the front surface. The incisive foramina of the palate are moderate and distinct; the fibula does not articulate with the calcaneum, and the testes are abdominal, and descend periodically only into the inguinal canal.

Sewellels.—The first family is represented by certain peculiar North American rodents known as sewellels, constituting the genus *Haplodon* (or *Aplodon*) and the family Haplodontidae and section Haplodontoidea. In common with the next three sections these rodents have the angular process of the lower jaw (fig. 4) arising from the inferior surface of the socket of the incisor. The masseter

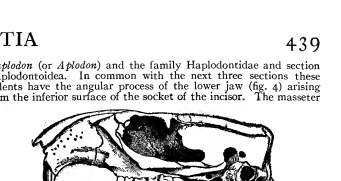

FIG. 4.—Skull of the American Marmot (*Arctomys monax*). The projection at the right-hand lower corner of the figure is the angular process of the lower jaw.

muscle does not pass through the narrow infra-orbital canal. An alisphenoid canal may be present in the palatal fossae of the skull; but there is always a transverse canal. The malleus and incus of the inner ear are separate. The humerus often has a foramen (entepicondylar) on the inner side of its lower end; the tibia and fibula may be separate or united; but the scaphoid and lunar of the carpus are also united, while the centrale is free. The stomach is simple.

Sewellels are medium-sized terrestrial rodents, with no post-orbital processes to the skull, which is depressed in front, and roots-less cheek-teeth, among which the premolars number $\frac{3}{3}$, the first in the upper jaw being very small. The build is stout and heavy, the limbs and tail are short, the ears moderate, the eyes minute and the feet five-toed and plantigrade. *Haplodon* is represented by a small number of species in America west of the Rocky Mountains, of which *H. rufus* is the longest known. They are burrowing, and, in some cases at any rate, partially aquatic rodents.

Squirrel Group.—The Sciuroidea, which include the great group of squirrels, sousliks, marmots, &c., all comprised in the single family Sciuridae, differ from the sewellels in having large post-orbital processes to the skull (figs. 4, 5, 6); and, with one exception, have rooted cheek-teeth, the premolar-formula being $\frac{2\text{or}1}{2}$. The infra-orbital foramen is also narrower, and the tympanic bulla is cellular. In both groups the tibia and fibula are separate.

The family is divided into three sub-families, the first of which is the Sciurinae. In this the crowns of the molars are more or less shortened, with their cusps either arranged in longitudinal lines, or forming four upper and three lower more or less distinct oblique ridges. The post-orbital processes of the frontal and jugal are widely sundered, and the former may even be small (*Xerus*). The expanded anterior root of the zygomatic process has its front border oblique. According to modern views the sub-family is broken up into a large number of genera.

The first of these is *Rhithrosciurus*, represented by one large species (*R. notatus*) from Borneo, characterized by its finely grooved incisors (see GROOVE-TOOTHED SQUIRREL). The second genus, *Heliosciurus*, includes arboreal African squirrels, typified by *H. stangeri*, allied in the characters of their skulls to the under-mentioned *Xerus*, and with a very large pre-orbital foramen in the more typical forms. The third, *Funisciurus*, of which *F. pyrrhopus* is a well-known example, is also African and allied to *Xerus*, but has a still longer skull and soft fur. In *Xerus* itself, which is represented by the ground African spiny squirrels, the ears are short, there are only two teats, and flat spines are mingled with the fur; while the skull, and more especially the frontals, is elongated, with a very short post-orbital process, and the crowns of the molars are taller than usual (see SPINY SQUIRREL). The well-known Indian palm-squirrel, *Funambulus palmarum*, typifies an Indo-Malay genus allied to *Xerus* in skull-characters but with molars more like those of *Sciurus*. In contrast to these small striped species are the giant squirrels of the same region, such as *Ratufa indica* and *R. bicolor*, which are very brightly coloured rodents, with *Sciurus*-like skulls (fig. 5) but extremely short-crowned molars, and only one pair of upper premolars. Next comes the typical *Sciurus*, including the great bulk of the entire group, and ranging over Europe, Asia, North Africa and America. The skull is short and broad, especially as regards the frontals, with large post-orbital processes (fig. 5), and very generally two upper premolars, making a total of five pairs of upper cheek-teeth, which have crowns of medium height. The teats are either four or six. Squirrels of this and the other arboreal groups have the bodily form slender and agile, the tail long and bushy, the ears well developed, pointed and often tufted; the feet adapted for

climbing, the anterior pair with four toes and a rudimentary thumb, and the posterior pair with five toes, all the toes having long, curved and short-pointed claws (see SQUIRREL). The names *Glyphotes* and

FIG. 5.—Under Side of Skull of the Malay Giant Squirrel (*Ratufa bicolor*).

FIG. 6.—Under Side of Skull of Prairie-Marmot (*Cynomys ludovicianus*).

Sciurotamias have been proposed respectively for one Bornean and some four Chinese squirrels. With *Tamias* (sometimes split into *Tamias* and *Eutamias*) we reach the North American striped ground-squirrels, or chipmunks, well characterized by the large internal cheek-pouches, with one outlying species in Northern Asia and Europe (see GROUND-SQUIRREL). These lead on to the souslics, *Spermophilus* (or *Citellus*), in which the incisors (as in the following genera) differ from those of all the squirrels in not being compressed. The genus which is common to the northern parts of both hemispheres is distinguished by the large cheek-pouches and by the absence or rudimentary condition of the claw of the first hind-toe, resembles *Tamias* in the slender form of the body, but displays great variation in the length of the tail, which may be a mere stump, or comparatively long. As in the following genera, there are two pairs of premolars, of which the first in this case is small and rounded, while the two series of cheek-teeth are nearly parallel (see SOUSLIK). The prairie-dogs, or prairie-marmots, *Cynomys*, are a North American group, in which the five-toed forefeet have the claw of the first as large as that of the fifth toe. The skull is heavily built, with the post-orbital processes directed outwards. Dentition (fig. 6) remarkably heavy, the molar teeth differing from those of *Spermophilus* and *Arctomys* by having three instead of two transverse grooves on their crowns. First premolar nearly as large as the second. Molar series strongly convergent behind (see PRAIRIE-MARMOT). Finally, we have the marmots (*Arctomys*), which are larger and more heavily built rodents, with short ears, more or less short tails and rudimentary or no cheek-pouches. Fore-feet with the first toe rudimentary and bearing a flat nail. Skull (fig. 4) large and heavy, with the post-orbital process stouter and at right angles to the axis. Incisors broad and powerful. First upper premolar nearly as large as the second. Molar series nearly parallel, scarcely converging behind at all.

The genus is common to the northern half of both hemispheres; and its members, like those of the two preceding groups, burrow and hibernate (see MARMOT).

The Nannosciurinae, or second sub-family of Sciuridae, are represented only by the pigmy squirrels (*Nannosciurus*), characterized by their very short-crowned molars (approximate in size to those of dormice in structure) and small premolars, of which the first upper pair is often deciduous, while the upper molars have only three oblique ridges. The front root of the zygomatic arch is nearly vertical, and placed so far back that it is above the second molar, while the orbit—a unique feature among rodents—is almost completely surrounded by bone. The few representatives of this group are all very small rodents, confined to tropical Africa, the Philippines and the Malay islands.

The third and last sub-family, the Pteromyinae, is distinguished from the other two by the presence of a parachute-like fold of skin along the sides of the body, the supporting cartilage of which arises from the carpus or wrist. It includes *Sciuropterus*, represented by small species from the northern parts of both hemispheres; *Pteromys*, comprising large flying-squirrels, ranging from India and the Malay countries to Japan, characterized by the long cylindrical tail and large inter-femoral membrane; and *Eupetaurus*, represented by one very large dark grey, long-tailed and long-haired species from Astor and Gilgit, which differs from all other members of the family by its tail-crowned cheek-teeth (see FLYING-SQUIRREL).

Beavers.—The second section, Castoroidea, of the present group includes only the family Castoridae, represented by the beavers, which are large aquatic rodents characterized by their massive skulls, devoid of post-orbital processes, with the angle of the lower jaw rounded, the molars rootless or semi-rooted, with re-entering enamel-folds, and one pair of premolars above and below. The tibia and fibula are united inferiorly, the tympanic bulla is hollow and the infra-orbital foramen narrow. The single existing genus comprises the European beaver, *Castor fiber*, of Europe and Northern Asia, and the North American *C. canadensis*. The upper molars are subequal, each with one internal and two external enamel-folds; the stomach has a large glandular mass situated to the right of the oesophageal orifice; the anal and urino-genital orifices open within a common cloaca; the tail is broad, horizontally flattened and naked; and the hind-feet are webbed (see BEAVER).

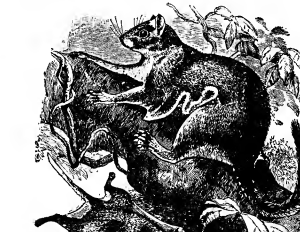
Pouched Rats.—The American pouched rats, or pocket-gophers, constitute the third section, Geomyoidea, with the single family Geomyidae. The dentition includes one pair of premolars above and below, and rooted or rootless molars with but few enamel-folds. In the skull the infra-orbital foramen is narrow, and post-orbital processes and an alisphenoid canal are absent. The tibia are fibula are united. The cheeks are provided with large pouches opening externally. Two sub-families are recognized. The first of these, or Geomyinae, is characterized as follows: Incisors broad; mastoid not appearing on the top of the skull; eyes small; ears rudimentary; limbs short, subequal. Habits fossorial. *Geomys bursarius*, the "red pocket-gopher" of North America, with deeply grooved incisors, inhabits the plains of the Mississippi, living in burrows like the mole. Several other species from the Southern States, Mexico and Central America are recognized. *Thomomys talpoides*, with plain incisors, extending from Canada to the United States west of the Rocky Mountains, typifies the second genus, which has also many species. The following are the characters of the second sub-family, Heteromyinae: Incisors narrow; mastoid appearing largely on the top of the skull; eyes and ears moderate or large; hind-limbs and tail elongated. Habits terrestrial. *Dipodomys*, which has the molars rootless, is typified by *D. phillipi*, the kangaroo-rat of the desert regions east of the Rocky Mountains. *Perognathus* and *Microdipodops*, being allied genera. *Liomys* and *Heteromys* have rooted molars; the latter genus is distinguished by the presence of flattened spines among the fur, and has species extending into South America. (See POCKET-GOPHER, POCKET-MOUSE and KANGAROO-RAT.)

Scaly-tailed Squirrels.—The next section, according to Prof. Max Weber's arrangement, is that of the Anomaluroidea, typified by the rodents commonly called African flying-squirrels (Anomaluridae), but better distinguished as scaly-tailed squirrels, or simply "scaly-tails," since one member of the family has no parachute. To this group Prof. H. Winge affiliates the African jumping-hares (Pedetidae), a view which is adopted by Prof. Weber, although Mr A. Thomas places these rodents in the neighbourhood of the porcupines. In the more extended sense, the Anomaluroidae are diagnosed as follows: In the skull the infra-orbital foramen (or canal) is large, the lachrymal foramen placed high up, and no transverse canal below the malleus and incus of the internal ear are fused. In the carpus the scaphoid and lunar bones are united. There is a single pair of premolars in each jaw.

The Anomaluridae are characterized by having rooted cheek-teeth with but few transverse enamel-folds, the two halves of the lower jaw movably articulated in front, very small post-orbital processes to the skull, and the presence of two rows of scales on the under surface of the base of the tail (figs. 7 and 8), which is cylindrical and thickly haired. The family is confined to the equatorial forest-tract of Africa, where it is most numerously represented on the west side. The majority of the species belong to the typical genus *Anomalurus* (fig. 7), which is provided with a parachute supported by a cartilaginous process arising from the extremities of the ulna, and has well-developed ears and a moderately long tail. Several of the species are considerably larger than an ordinary squirrel. *Idiurus*, as represented by the West African *I. sentheri* figured in the article FLYING-SQUIRREL), is a mouse-like form, with very small ears and an extremely long tail. The third genus, *Zenkerella* (*Aethurus*), which is also West African, has no parachute (fig. 8).

Jumping-Hares.—The grounds for referring the African jumping-hares (Pedetidae) to the Anomaluroidea rest largely on the evidence of certain Tertiary rodents from Europe, such as *Issiodoromys*. The family is represented by the South African *Pedetes caffer*, which is as large as a hare, and the smaller East African *P. surdaster*. In general habits and appearance these animals recall large jerboas, from which group they are, however, distinguished by the four pairs of rooted cheek-teeth, the premolars being as large as the molars, and the latter having one outer and one inner enamel-fold. The hind-limbs are elongated, with four toes, of which the metatarsals are separate; the tibia and fibula are welded in old age; the calcaneum and astragalus of the tarsus are elongated; and there is a perforation in the inner side of the lower end of the humerus (see JUMPING-HARE).

Dormice.—The next three sections of the order, namely, the Myoxoidea, or dormice, Dipodoidea, or jerboas, and Myoidea, or the mouse group, have the following characteristics in common. The



From Alston.

FIG. 7.—Red Scaly-tailed Squirrel (*Anomalurus fulgens*).

angular process of the lower jaw has the same relations as in the sewellels and the allied groups. The lachrymal foramen in the skull is low down and forms an elongated slit. In the carpus the scaphoid and lunar are welded, but the centrale remains distinct. The tibia and fibula are fused at their upper and lower ends. The malleus and incus of the inner ear are separate. Except in *Lophiomys*, the clavicles are complete. The infra-orbital foramen of the skull (fig. 9) is more or less broad; and there is generally a transverse canal. The stomach is generally complex.

From de Winton.

FIG. 8.—Zenker's Scaly-tailed Squirrel (*Zenkerella insignis*).

In the dormice, forming the section Myoxidea, with the single family Gliridae (or Myoxidae), a single pair of premolars may or may not be present; the molars are short-crowned and rooted, with transverse enamel-folds. The angle of the lower jaw is turned in, and its coronoid process is slender. Dormice are small arboreal rodents, with long hairy tails, large eyes and ears, and short fore-limbs, ranging over Europe, Asia and Africa. Of the four genera in the typical sub-family Glirinae, the first is *Glis*, represented by *Glis vulgaris* (or *G. glis*) of Europe, with a doubly vaned, bushy tail, simple stomach, and large molars with well-marked enamel-folds; the second, *Muscardinus*, with *M. avellanarius*, the common dormouse, distinguished by the cylindrical bushy tail, and thickened glandular walls of the cardiac extremity of the œsophagus; thirdly, *Eliomys*, containing several species, with tufted and doubly vaned tails, simple stomachs and smaller molar teeth, having concave crowns and faintly marked enamel-folds; and lastly, the African *Graphiurus*, represented by several species, with short cylindrical tails ending in a pencil of hairs, and very small molars almost without trace of enamel-folds. None of the members of the typical sub-family extend into India, where the group is represented by *Platacanthomys*, typifying the sub-family Platacanthomyinae, characterized by the absence of premolars; the other being the Chinese *Typhlomys*. These are small rodents with somewhat the appearance of the pigmy squirrels (*Nannosciurus*), which in some degree connect the family with the Muridae. (See DORMOUSE.)

Jerboa Group.—The Dipodoidea, or jerboa-group, which likewise includes only a single family, Jaculidae (or Dipodidae), is characterized by the presence of not more than one pair of premolars in the upper jaw, which, however, may be wanting; by the rooted cheek-teeth, which have transverse enamel-folds, and the absence of a transverse canal in the skull, and of a horny layer in the stomach. The family is divisible into two sub-families, of which the first, or Sminthinae, is represented only by the genus *Sminthus*, containing a few species which range from Denmark into Western Asia, Kashmir and China. They are small rat-like rodents, with one pair of upper premolars, which are mere pins, as is the last molar, and the two pairs of limbs of normal length, with the metatarsals separate; the infra-orbital opening in the skull being triangular and widest below, while the incisive foramina in the palate are elongated. The European *S. subtilis* has a black dorsal stripe bordered with yellow.

The Dipodinae, on the other hand, are leaping rodents, with the metatarsals elongated, a small upper premolar present or absent, and the crowns of the molars tall. Various degrees of specialization occur in the adaptation for leaping. The least specialized genus is *Zapus*, containing the jumping-mice of North America, with one outlying Siberian species, in which the five metatarsals are free, as are also the cervical vertebrae, the small upper premolar being retained. (See JUMPING-MOUSE.)

In the other genera, so far as known, the three central metatarsals of the hind foot are fused into a cannon-bone, of a type unique among mammals and comparable to that of birds. Some of the cervical vertebrae are also united in at least the better-known genera. The tail and ears are generally very long; while, in correlation with the size of the latter, the auditory bullae of the skull are also large. In the typical jerboas, *Jaculus* (or *Dipus*), ranging from North Africa to Persia, Russia and Central Asia, there are only three hind toes, the incisors are grooved, and the premolars are generally wanting. The other genera have five toes, of which only the middle three are functional, and smooth incisors. *Euchoreutes*, with one Yarkand species, has premolars, enormous ears and a long nose. *Alactaga*, ranging over Russia and Western and Central Asia, inclusive of Persia and Baluchistan, has smaller ears and a shorter nose; by some naturalists it is taken to include the North African *A. tetradactylus*, which is separated by others as *Scartaurus*. The Turkestan *Platycercomys* (or *Pygeretmus*) has a lancet-shaped tail and no premolars; while *Cardiocranus* of the Nan-shan district of Central Asia has a similar type of tail, but short ears and a peculiarly triangular skull. (See JERBOA.)

Mole-Rats.—The mole-rats (Spalacidae) bring us to the mouse-like section, or Myoidea, in which there are no premolars and the molars may be occasionally reduced to 5; these teeth being either rooted or rootless, with either cusps or enamel-folds, and the first generally larger than the second. In the skull the zygomatic arch is slender and the jugal bone small and not extending far forwards, being supported by the long zygomatic process of the maxilla, while the infra-orbital foramen is mostly large, and there are no post-orbital processes. Although sometimes short, the tail is generally long, sparsely haired and scaly. The cardiac portion of the complex stomach has a horny layer, and there is a cæcum.

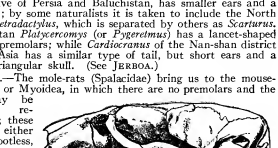


FIG. 9.—Skull of the Muskrat (*Fiber zibethicus*). Natural size.

The Spalacidae are burrowing types, allied apparently to the ancestral Jaculidae, and characterized by the second and third molars being equal in size, the presence of enamel-folds in all these teeth, and the superiority in size of the claws of the second, third and fourth front toes over the other two. All these "rodent-moles" are thoroughly adapted to a subterranean life, the eyes and ears being small and rudimentary, as is also the tail; while the bodily form is cylindrical, and the front claws are very large and powerful. The incisors are very large; and the palate of the skull is narrow. The typical representative of the group is the great mole-rat (*Spalax typhlus*) of Eastern Europe and North-East Africa, which, together with a few closely allied species, has the eyes completely buried in the skin, and the head much flattened.

In the bamboo-rats, *Rhizomys*, from the Indo-Malay countries, China and Tibet, as well as in the closely allied East African *Tachyoryctes*, the eyes are, however, functional, and the head is rounded. (See MOLE-RAT.)

According to the arrangement here followed, the burrowing zokors may be placed in this family, although they have teeth like those of the vole group in the Muridae. The first representative of this sub-group is the genus *Siphneus* (or *Myotalpa*), of which some five Central and North Asiatic species are known. They are characterized by the mole-like form and long, powerful, front claws (fig. 10). In the true zokors (*Ellobius*), on the other hand,

From Milne-Edwards.

FIG. 10.—The Tibetan Zokor (*Siphneus armandi*).

the claws are short and the general form more vole-like. Of three named species, one extends from South Russia to Siberia, while two others are respectively from Kurdistan and Afghanistan. A third type, *Prometheomys*, from the Caucasus, is represented by a species of the size of a small water-rat, chestnut-brown in colour, with lighter feet, and the minute eyes covered with skin. The teeth are nearest to those of the true zokors (*Ellobius*). The single example was taken under flowering anemones.

Malagasy Rats.—On account of certain structural peculiarities, the rats of Madagascar, which have a dentition like that of the cricetine Muridae, are separated as a distinct family, Nesomyidae. They are the only rodents in that island. Of these, *Hypogeomys* is a large, long-tailed, fawn-coloured rat, with large ears and feet; *Nesomys* is a red species, with long hair; *Brachytarsomys* is short-footed and long-tailed, with velvety fawn fur; *Hallomys* has elongated hind feet, as has also *Macrotarsomys*; *Gymnuromys* is naked-tailed; and the several species of *Eliurus* are dormouse-like.

Mouse Tribe.—The characteristics of the Muridae are those of the Myoidea generally, as given above under the heading of the Spalacidae. With the exception of Madagascar, the family, which may be divided into six sub-families, has a cosmopolitan distribution, and the genera are so numerous that only some of the most important can be even mentioned.

The first group is that of the hamsters, or cricetines (Cricetinae), in which the molars are rooted and tuberculated, with the cusps of the upper ones arranged in two longitudinal rows (fig. 13, B); in the upper teeth the outer cusps and in the lower the inner ones are the higher, and when worn the crown surfaces show oblique enamel-areas; in shape the third molar is like the second, but it is smaller. The infra-orbital foramen is generally narrow, and the tympanic bulla hollow. The humerus has a foramen at the lower end. The tail is short. The group is typified by the European hamster (*Cricetus vulgaris* or *C. cricetus*), to which a separate article is devoted (see HAMSTER); the genus includes a number of species ranged under several sub-genera, such as *Mesocricetus*, *Cricetulus*, and *Urocricetus*, widely spread in Western and Central Asia, the last-mentioned, which is from Tibet, being distinguished by its relatively long tail. The hamsters all possess cheek-pouches, which are, however, absent in many of the following genera. Africa claims only a single representative of the group, *Mystromys*, with one southern and one eastern species. Persia is the home of *Calomyscus* (with one species), a near relative of the American *Peromyscus*. In America, where the more typical kinds are known as white-footed, or deer, mice, the cricetines absolutely swarm, and include a host of genera, the majority of which are North American, although others are peculiar to Central and South America. Among these may be named *Onychomys*, *Peromyscus*, *Rhipidomys*, *Holochilus* (which is South American and includes the largest species), *Sigmodon* (typified by the North American rice-rat, *S. hispidus*), *Oryzomys*, *Rhithrodontomys* (with grooved incisors), *Ichthyomys* and *Anotomys* (fish-eating, aquatic forms, from the mountains of South America), *Acodon*, and the North American wood-rats, or *Neotoma*, in which the molars have a structure simulating that of the under-mentioned Microtinae. A distinct sub-family, Lophiomyinae, is represented by the Central African arboreal spiny rats, *Lophiomys*, of which there are two or three species. Although agreeing with the Cricetinae in

From Milne-Edwards.

FIG. 11.—African Spiny Rat (*Lophiomys imhausi*).

the hollow tympanic bullae, they have the clavicles imperfect, the first front toe opposable to the rest, the temporal region of the skull roofed with bone, and the crowns of the molars with cusps arranged in rows but eventually covered by a layer of enamel.

The third sub-family is that of the Microtinae, or voles, which are distributed all over Europe, Northern Asia and North America, and are characterized by the tympanic bulla of the skull being filled with honey-combed bony tissue, the small size of the infra-orbital foramen, and the deep pterygoid fossa on the palatal aspect. The humerus lacks a foramen at the lower end; and the molar teeth, as explained and illustrated in the article VOLE (*q.v.*), consist of two longitudinal rows of triangular alternating vertical prisms, and may be either rootless or rooted. Voles, as typified by the water-rat and the tailed field-mouse, are stouter built and shorter-nosed rodents than the typical rats and mice, with smaller ears and eyes and shorter tails; all being good burrowers. In the circumpolar *Evotomys* (represented in England by the red-backed field-mouse) and the nearly allied North American *Phenacomys*, the molars develop roots in old age; but in *Microtus* (which includes the water-rat, and is circumpolar) they are rootless throughout life, the genus being one of the largest in the mammalian class (see VOLE). *Fiber*—the muskrats—is a North American aquatic type (see MUSKRAT), characterized by the compression of the tail. *Synaptomys* is also North American, and characterized by the grooved

After Gould.

FIG. 12.—The Australian Brown-footed Rat (*Mus fuscipes*).

upper incisors and the presence of distinct enamel-loops on the outer side of the lower molars. The circumpolar lemmings of the genera *Lemmus* and *Dicrostonyx* are noticed in the article LEMMING. *Ellobius*, which many naturalists place in this group, has been mentioned among the Spalacidae.

The typical rats and mice, together with their nearest relatives, constitute the sub-family Murinae, which is represented by more than three hundred species, distributed over the whole of the Old World except Madagascar. The molars (fig. 13, A) are rooted and have a plate-like structure, with the cusps or tubercles forming three longitudinal rows in those of the upper jaw, but only two distinct ones in the lower. By this structure the Murinae are broadly distinguished both from the Cricetinae (fig. 13, B) and the Microtinae. In the skull the tympanic bulla is hollow, the pterygoid fossa shallow and the zygomatic arch slender, with a rudimentary jugal bone. The tail is long and scaly (fig. 12). The genus *Mus*, with about a couple of hundred species, includes the true mice and rats (see MOUSE and RAT), and has the typical characters of the group, the incisors being narrow and smooth, the molars small, the eyes and ears large and the tip of the muzzle naked. In some cases there may be spines among the fur. None are much larger than the brown rat (*M. norvegicus*) or smaller than the harvest mouse; and they all have habits generally similar to those of one or other of the English species, although some live in trees like squirrels, or in the water; among the latter being the brown-footed rat (*M. fuscipes*) of western and southern Australia (fig. 12). The genus *Nesocia* is like *Mus*, but with the incisors and molars broader, and the transverse laminae of the latter more clearly defined. This genus contains a few clumsily built rats spread over Southern Asia from Palestine to Formosa, and from Kashmir to Ceylon (see BANDICOOT-RAT). Among other important genera *Cricetomys* and *Eosaccomys* (both African) stand apart by the possession of cheek-pouches: *C. gambianus* being a very large species. The Javan *Pithechirus* has the thumb opposable, while the Papuan *Chiruromys* has the tip of the tail naked above and prehensile. The spiny mice, *Acomys* (or *Acanthomys*), of Western Asia, Cyprus and Africa, take their name from the fur being almost entirely replaced by flattened spines, and are further distinguished by the rudimentary coronoid process of the lower jaw. *Dasymys* is an allied African genus; while *Arvicanthis* includes the African striped mice. *Golunda*, from India and Africa, is like *Mus*, but with grooved upper incisors. *Vandeleuria*, ranging from India to Yunnan, has flat nails on the first and fifth toes of both feet, and a very long tail; while the Indo-Malay *Chiropodomys* has a flat nail on the first toe of both feet and a tufted tail. In the Philippines occur the peculiar genera *Batomys*, *Carpomys* and *Crateromys*, confined to the mountains of Luzon, the third remarkable for its huge size and long hair. *Mastacomys* is like *Mus*, but with the molars remarkably broadened, and with only four teats. The single species is from Tasmania, though it has been found fossil in New South Wales; it is somewhat similar in size and appearance to the English water-rat, but has longer and softer fur. *Uromys* differs from *Mus* in having the scales of the tail not overlapping, but set edge to edge, so as to form a sort of mosaic work. There are several species, spread over the northern part of the Australian region from the Aru Islands to Queensland. *Echinothrix* is a rat with an extremely elongated muzzle, all the bones of the face being much produced, and the incisors faintly grooved, the only species, *E. leucura*, being about the size of the common rat, with its fur thickly mixed with spines, a native of Celebes. Australia is the home of the group of jumping species, known as jerboa-rats, characterized by the elongation of the hind limbs, arranged under the genera *Notomys*, *Dipodillus*, *Ammomys* and *Conilurus*, distinguished from one another by the structure of the molars and the number of teats and foot-pads, the second being further characterized by its long ears.

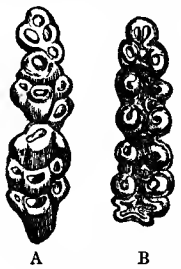

FIG. 13.—Upper Molars of *Mus* (A) and *Cricetus* (B).

The large-eared African *Otomys* and the allied *Oreomys* (*Oreinomys*), often made the type of a distinct sub-family, may be included in this section; as well as the small African tree-mice, *Dendromys*, allied to which is *Deomys*, peculiar in the circumstance that only the first molar has three rows of cusps, the other two having only a couple of such rows, as in cricetines. Other allied African genera are *Steatomys* and *Lophuromys*, which include several species of small mouse-like rodents, with the habits of dormice generally, though some burrow in cornfields. Here also may be noticed the huge Philippine long-haired rats of the genus *Phlaeomys*, characterized by their broad incisors, transversely laminated molars and large claws. They are often regarded as forming a sub-family by themselves. The gerbils, which are widely distributed over the more or less desert-like regions of the Old World exclusive of the Malay countries and Australia, form the sub-family Gerbillinae. They have long hind limbs, large eyes and ears; and in correlation with the latter an enlarged auditory bulla to the skull, which is hollow and divided into a tympanic and a mastoid portion. The tail is generally long and hairy. There are three pairs of rooted molars, whose crowns carry transverse plates, decreasing in number from three in the first to one in the last tooth. *Gerbillus* (or *Tatera*), with a large number of species, has a range coextensive with that of the sub-family; *Pachyuromys*, with two African species, has a short club-shaped tail and enormous auditory bullae; while the remaining members of the group, which are confined to North Africa, Eastern Europe and Asia, are arranged in the genera *Meriones*, *Psammomys* and *Rhombomys*, the latter represented only by *R. opimus* from Russia and Central Asia (see GERBIL).

The last representatives of the Muridae are confined to Australasia and the Philippines, and constitute the sub-family Hydromyinae, characterized by the very general presence of only two pairs of molars in each jaw. In the typical Australian and Papuan *Hydromys*, locally known as water-rats, the molars originally have transverse ridges, the enamel folds between which form cutting edges whose sharpness depends upon the degree to which the teeth have been worn, while the large hind feet are webbed. The typical *H. chrysogaster* is a large brown rat with an orange belly, which feeds on small fishes and insects. *Limnomys*, from New Guinea, is a type less specialized for swimming, the hind-feet being much less twisted than in *Hydromys*, and not so fully webbed. Still less specialized are *Chrotomys* and *Xeromys*, which include Philippine land-rats, while *Crunomys*, from the same area, retains the third molars, and thus connects the group with the Murinae.

Finally, the Philippine *Rhynchomys* is represented by a rat with two pairs of molars and a long shrew-like nose, the zygomatic arch of the skull being also placed unusually far backward.

Strand-Moles.—With the so-called strand-moles of South Africa, forming the section Bathyergoidea, and the family Bathyergidae, which were formerly placed with the Spalacidae, we come to the first of two sections in which the lower jaw has a totally different form to that obtaining in all the preceding groups. In the rodents now to be considered, the angular process of the lower jaw arises from the outer side of the sheath of the incisor. The malleus and incus of the internal ear are united, and there is no transverse canal in the skull. At least one pair of premolars is present in each jaw; and these teeth and the molars typically have one outer and one inner enamel fold. There is no foramen at the lower end of the humerus, and no horny layer in the stomach.

In the Bathyergoidea the scaphoid and lunar of the carpus are separate, the tibia and fibula united and the clavicles normal. The masseter muscle does not pass through the narrow infra-orbital canal, and the temporal muscle is large. All the Bathyergidae are African, and adapted to a burrowing life, having minute ears and eyes, a short tail and the thumb armed with a large claw. The largest species represents the genus *Bathyergus*, while several smaller kinds are included in *Georychus*. The former constructs its tunnels in the sandy flats near the shore at the Cape, but the latter generally frequent higher ground. In both genera there is only a single pair of premolars in each jaw, but in the smaller *Myoscalops* there are usually three pairs of these teeth. The most remarkable members of the family are the sand-rats of Somaliland and Shoa, forming the genera *Heterocephalus* and *Fornarina*, in which the premolars may be reduced to two pairs. They have large heads, projecting incisors, no ears, almost functionless eyes and moderately long tails; the skin, with the exception of a few hairs on the body and fringes on the feet, being naked. They spend their whole time buried in the hot desert sand, in which they construct burrows, throwing up at intervals small hillocks.

Porcupines.—In the second section, or Hystricoidea, including several families, the skull (fig. 14) is characterized by the heavy

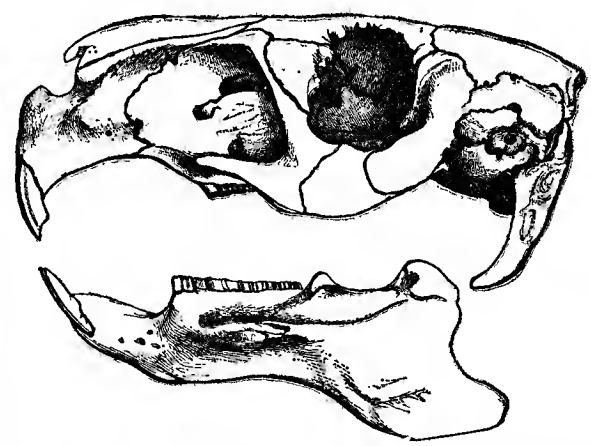

FIG. 14.—Skull of the Capybara (*Hydrochaerus capybara*), reduced.

zygomatic arch, the middle portion of which is formed by the more or less straight and horizontal jugal, and the large infra-orbital canal, traversed by a portion of the masseter muscle. The tibia and fibula are separate, but the scaphoid and lunar are united, and the clavicles are generally incomplete. There is never more

than one pair of premolars, and the original ridges of all the cheek-teeth have become obscured and complicated by the development of secondary enamel-folds. The majority of these rodents, many of which are of large size, are terrestrial, but a few are burrowing, others arboreal and two or three aquatic.

The Old World porcupines, constituting the family Hystricidae, are terrestrial, stoutly built rodents, with limbs of subequal length in front and behind, and the skin covered with strong spines. The upper lip is cleft, the jugal lacks an inferior angle, the fore part of the skull is short and broad; the cheek-teeth are partially rooted, with external and internal enamel-folds, the soles of the feet are smooth, there are six pairs of teats, the clavicle is imperfect and the tail is not prehensile. In the typical genus *Hystrix*, which

FIG. 15.—The Brazilian Tree-Porcupine (*Synetheres* (or *Cœndu*) *prehensilis*).

is represented in all the three great continents of the Old World, and extends as far east as Flores and Celebes, the skull is swollen and convex, the spines are cylindrical, and the tail is short and covered with spines and slender-stalked open quills. In *Atherura fasciculata* of the Malay Peninsula the spines are flattened, and the tails long and scaly, with a tuft of compressed bristles. A closely allied species, *A. africana*, inhabits Western Africa. The third genus is *Trichys* (see PORCUPINE).

American Porcupines.—All the New World porcupines, representing the family Erethizontidae (or Cœndidae) are arboreal in their habits, and have the upper lip undivided, the cheek-teeth rooted, the clavicles complete, the soles of the feet tuberculated and three pairs of teats. *Erethizon dorsatus*, the urson, is distributed all over the forest regions of North America; *Synetheres* (or *Cœndu*) *prehensilis*, the prehensile-tailed porcupine of South America (fig. 15), represents a genus in which the whole upper surface of the body is protected by long white-tipped spines; *Chaetomys subspinosus* is clothed with strong wavy bristles. In the last two genera the feet have four toes, in place of the five of *Erethizon* (see PORCUPINE).

Cavy Group.—In the family Caviidae, typified by the cavies (or guinea-pigs), may be included a large number of South and Central American rodents, among which the agoutis and pacas are often ranked as a family (Dasyproctidae) by themselves. The Caviidae, in the present more comprehensive sense, include the giants of the rodent order. Many of them, like ungulates, are specialized for swift running, and have unusually long limbs, with ridges developed on the articular surfaces of the lower bones; the clavicles are more or less reduced; the thorax is more compressed than usual, with a narrower breast-bone; and there is a marked tendency to the reduction or loss of the lateral toes, more especially in the hind limbs. Since these rodents walk more or less entirely on their toes, in such a manner that the edges of the claws or nails come in contact with the ground, these tend to assume somewhat of a hoof-like character; while the foot-pads are more or less horny. The tail is generally very short, and its basal vertebrae are often fused with the sacrum. In the skull the lachrymal bone is large, the par-occipital process is directed vertically downwards and the tympanic bulla is hollow. In the soft parts the caecum is very large, the penis is armed with a pair of barbed horny claspers and the scrotum is spiny.

Special interest attaches to the most aberrant member of the family, the Peruvian Dinomys, known for more than thirty years only by a single specimen taken in a house in Lima, and only lately rediscovered. It is a large rodent known to the Tupi Indians as the paca-rana, or false paca, in allusion to the bomblander of its coloration to that of the true paca, from which it differs by its well-developed tail, the absence of cheek-pouches, the full development of all five toes and the wider thorax. The Tupi name may be adopted as the popular title of the species. Dr E. Goeldi states that the paca-rana is a rodent of phlegmatic and gentle disposition, which may account, perhaps, for its rarity, if, indeed, it be really scarce in its native home, which is probably the eastern slopes and valleys of the Bolivian and Peruvian Andes, the bomblander of Brazil, inclusive of the headwaters of the Purus, Acre and Jurua rivers. In the true pacas, *Coelogenys* (or *Agouti*), the first front toe is small, and both the first and fifth digits of the hind-foot are much inferior in size to the other three. The most remarkable feature of the genus is, however, the extraordinary development of the zygomatic arches of the skull, which are enormously expanded vertically, forming great convex bony capsules on the sides of the face, enclosing on each side a large cavity lined with mucous membrane internally, and communicating by a small opening with the mouth. *C. paca* is a white-spotted rodent, about 2 ft. long, and lives generally in the forests or along the banks of rivers (see PACA). The Agoutis, *Dasyprocta*, include several species of slender-limbed rodents, with three hind-toes, inhabiting Central and South America, one (*D. cristata*) extending into the West Indian islands. The members of both *Coelogenys* and *Dasyprocta* are terrestrial in their habits, and have the fore- and hind-limbs subequal, hoof-like claws, short or obsolete tail and rudimentary clavicles. The masseteric ridge of the lower jaw is obsolete, the palate broad, the incisors long and the molars semi-rooted, with external and internal enamel-folds (see AGOUTI). The remaining and more typical members of the family, one of which is aquatic, are characterized by their short incisors, the strong masseteric ridges on the sides of the lower jaw, the long and curved par-occipitals and the palate contracted in front. Fore-feet with four digits, hind-feet with three; clavicles imperfect; molars divided by enamel-folds into transverse lobes; milk-teeth shed before birth. In the true cavies, or couies, *Cavia*, the fore- and hind-limbs are short and of subequal length, the ears are short and there is no tail. They include several species widely distributed throughout South America, extending even to the straits of Magellan, from one of which (*C. antheri* of Peru) the guinea-pig is derived. The mares (*Dolichotis*) have the limbs and ears long and the tail very short. *D. patagonica* is a large species, nearly 3 ft. long, inhabiting the gravelly plains of Patagonia, while *D. salinicola* is a much smaller rodent from the salt-lagunas of Argentina. The head of a much contracted in front that the premolars of opposite sides touch by their antero-internal edges. *Hydrochaerus*, in which all the feet are fully webbed, includes a single species, the capybara, or carpincho, the largest of living rodents. The skull (fig. 16) is remarkable not only by its great size, but by the enormous development of the par-occipital processes and the complex structure and large size of the last molars (see CAVY and CAPYBARA).

Chinchilla Group.—The family, Chinchillidae, typified by the well-known chinchilla, includes a small number of South American rodents with large ears and proportionately great auditory bullae in the skull, elongated hind-limbs, bushy tails, very soft fur and perfect clavicles. The jugal is without an inferior angle, and extends forwards to the lachrymal; the palate is contracted in front and deeply emarginate behind; the incisors are short, and the molars divided by continuous folds into transverse plates; and the two halves of the lower jaw are united in front. It includes three existing genera, represented by some five species. Of these the true chinchilla, *Chinchilla lanigera*, *C. brevicaudata*, *Lagidium peruanum* and *L. pallipes*, are restricted to the alpine zones of the Andes, while the north-eastern part of Chile and the western parts of Chili; while *Lagostomus trichodactylus* (or *Viscaccia viscaccia*), the viscacha, is confined to the pampas from the Uruguay river to the Rio Negro. In *Chinchilla* the fore-feet have five and the hind four digits, the tail is long and bushy, and the auditory bullae are enormous, appearing on the top of the skull; *Lagidium* has four digits in both fore- and hind-feet, and *Lagostomus* three only in the hind-feet, while the auditory bullae are much smaller (see CHINCHILLA and VISCACHA).

Hutia Group.—The three remaining families of the Hystricoidea, of which one is African while the other two are chiefly South American, are very closely allied and often brigaded in a single family group. In the Capromyidae, which includes only the South American and West Indian hutias, the South American coypu and the African cane-rats, the tympanic bulla of the skull is hollow, the par-occipital process straight, the lachrymal small, and the cheek-teeth rooted, with deep enamel-folds; the first front toe being occasionally absent. Of the five living representatives of the group, the genus *Myocastor* (or *Myopotamus*) is represented only by the South American coypu, *M. coypus*, which is aquatic in its habits, and measures about 2 ft. in length, being the largest member of the group. It has a long tail, brown fur and red incisors, and lives in burrows near water, feeding on aquatic plants.

The hutia (*Capromys pilorides*) is nearly as large, arboreal in habits, and a native of Cuba, where it is a large tasted indigenous mammal. Other species occur in Cuba, Jamaica and the Bahamas, while a Venezuelan species, *Procapromys geayi*, represents a separate genus. In one kind the tail is prehensile. All these rodents are remarkable for the manner in which the liver is divided into minute lobules. *Plagiodontia aedium*, another member of the group, is peculiar to Hayti. The African cane-rats, *Thryonomys* (or *Aulacodus*), have large terrestrial rodents, ranging from the centre of the continent to the Cape, easily recognized by their deeply fluted incisors (see COVPU). The Octodontidae, which are exclusively South American, differ from the preceding family by the presence of bullae being filled with cellular bony tissue, and by the par-occipital process curving beneath it, while the cheek-teeth are almost or completely rootless and composed of parallel plates. The first front toe may be absent. The diverse typical members of the family are rat-like burrowing rodents, living in communities. The typical genus is represented by the degu (*Octodon degus*) and several nearly related species; other genera being *Ctenomys*, *Octodontomys* (*Neoctodon*), *Acaenamys*, *Spalacopus* and *Abrocoma*; the latter taking its name from its unusually soft fur. Among these, the tuco-tucos (*Ctenomys*) are characterized by their burrowing habits, almost rudimentary ears, small eyes, short tails and the kidney-shaped grinding-surfaces of their cheek-teeth. They take their name of tuco-tuco from their cry, which resembles the blows of a hammer on an anvil, and may be heard all day as the little rodents move in their burrows, generally formed in sandy soil. In some districts the ground is undermined by these burrows, in which stores of food are accumulated. The species of *Octodon* have larger ears, longer, tufted tails and the sides of the cheek-teeth indented by plates of enamel; they are chiefly found in hedgerows and bushes, where they burrow under the tall grass. They have no tuft, the ears are still larger and the lower cheek-teeth more complex than the upper ones. *Acoaenmys* is an allied Chilean genus in which the enamel-folds meet across the molars. Several of these rodents live in the Andes, where the ground is covered for months with snow. The second group of the family is formed by the genera *Loncheres*, *Dactylomys*, *Echi[no]mys*, *Proechimys* and a few others, the members of which are rat-like rodents, with long, scaly or bristly tails, and very flattened spines mingled with the fur of the back. Most species are brown above and whitish beneath, but in some the lighter tints extend on to the sides, shoulders and head, communicating a coloration like that of a piebald rat or guinea-pig (see COYPOU). The North African gundis (*Ctenodactylus gundi* and *Ct. vali*) are the types of an African family, which also includes the genera *Massoutiera*, *Pectinator* and *Petromys*. In the gundi the two inner toes of the hind-foot are furnished with a horny comb and bristles for the purpose of cleaning the fur, and the tail is very short; but in *Pectinator* the tail is longer. *Petromys* has a still longer and more bushy tail, and no comb to the hind-feet. The gundi is a diurnal species, inhabiting rocky districts, and having habits very similar to those of a jerboa. Of these *Ctenodactylus* and *Pectinator* are characterized by the union of the incus and malleus of the internal ear, the free fibula and the almost rootless cheek-teeth. The granular is very small, in showing an approximation to that of the Myoidea, although in other respects *Petromys* appears to approximate to the Hystricidae.

Picas and Hares.—The remaining rodents, which include two families, the Picas (Ochotonidae) and the hares and rabbits (Leporidae)—constitute a second sub-order, the Duplicidentata, differing from all the foregoing groups in possessing two pairs of incisors in the upper jaw (of which the second is small, and placed directly behind the large first pair), the enamel of which extends round to their posterior surfaces. At birth there are three pairs of incisors, but the outer one is soon lost. The incisive foramina are large and usually confluent; the bony palate is very narrow from before backwards; there is no lachrymal canal; the fibula is welded to the tibia, and articulates with the calcaneum; and the testes are permanently external. All are terrestrial, and in many cases burrowing, in their habits, and some of them are of extreme fleetness. The Ochotonidae are represented at the present day only by the single genus *Ochotona* (*Lagomys*), which includes all the picas, or mouse-hares. They are small rodents with complete clavicles, fore- and hind-limbs of nearly equal length, no external tails and short ears. Skull depressed, frontals contracted and without post-orbital processes; *p.* $\frac{1}{1}$ or $\frac{2}{1}$; molars rootless, with transverse enamel-folds. In some cases the molar-formula is $\frac{2}{3}$. The species include about a score of species of quiet, timid animals, inhabiting chiefly the mountainous parts of Northern Asia (from 11,000 to 14,000 ft.), one species only being known from South-east Europe and several from the Rocky Mountains and Alaska.

From the picas the hares and rabbits (Leporidae) are distinguished by the imperfect clavicles, the more or less elongated hind-limbs, short recurved tail (absent in one case) and generally long ears. The skull is compressed, with large wing-shaped post-orbital processes (fig. 16); *p.* $\frac{2}{1}$. With the exception of Australasia, the family has a cosmopolitan distribution; and its numerous species resemble one another more or less closely in general external characters. In all the fore-limbs have five and the hind four digits; and the soles of the feet are densely clothed with hairs similar to those covering the legs; the inner surface of the cheeks being naked. Although the family has such a wide distribution, the typical number of the species are restricted to Europe, northern and central Asia and North America; South America having very few. Till within the last few years the majority of naturalists followed the practice of including

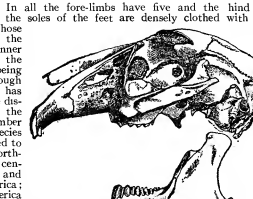

FIG. 16.—Skull of the Common Hare (*Lepus europaeus*).

all the members of the family in the genus *Lepus*. It is true that Mr E. Blyth long ago proposed the name *Caprolagus* for the remarkable spiny rabbit of the western Himalayas, while the generic name *Oryctolagus* was suggested later for the rabbit, and *Sylvilagus* for the American "cotton-tails"; but neither of these was accorded general acceptation. Of late years, however, zoologists have come to the conclusion that generic subdivisions of the Leporidae are advisable. In 1899 Dr Forsyth Major proposed a classification of the family in which a number of species were grouped with the spiny rabbit in the genus *Caprolagus*, whilst *Oryctolagus* was taken to include not only the common rabbit, but likewise the Cape hare. A more recent classification is that of Mr M. W. Lyon, in which by far the largest number of species of the family are retained in the original genus *Lepus*, which has also the widest geographical distribution of all the genera. It is typified by the blue hare (*Lepus timidus*), next to which comes the common hare (*L. europaeus*) and certain other allied forms. The jackass-hares of Mexico, &c., such as *L. californicus*, form a second sub-group; while these are in turn followed by the American hare (*L. americanus*) and its immediate relatives. The cotton-tails or Mr M. W. Lyon, in which by far the largest number of species of the family are retained in the original genus *Lepus*, which has also the widest geographical distribution of all the genera. It is typified by the blue hare (*Lepus timidus*), next to which comes the common hare (*L. europaeus*) and certain other allied forms. The jackass-hares of Mexico, &c., such as *L. californicus*, form a second sub-group; while these are in turn followed by the American hare (*L. americanus*) and its immediate relatives. The cotton-tails or Mr M. W. Lyon, in which by far the largest number of species of the family are retained in the original genus *Lepus*, which has also the widest geographical distribution of all the genera. It is typified by the blue hare (*Lepus timidus*), next to which comes the common hare (*L. europaeus*) and certain other allied forms. The jackass-hares of Mexico, &c., such as *L. californicus*, ferm

If the latter course be followed, Mr Lyon's genera must be reduced to the rank of sub-genera, and his sub-generic divisions of *Lepus* and *Sylvilagus* ignored. (See HARE and RABBIT.)

EXTINCT RODENTS

Among extinct rodents, only a few of the more important types may be noticed. As to the origin of the order, we are still to a great extent in the dark; and even the relations of the Duplicidentata to the Simplicidentata are not yet fully understood. With regard to the latter point, it is, however, considered probable that both are branches of a common stock, which diverged from each other before all the typical rodent characters were acquired. As to the ancestral stock of the order, it has been suggested that this is represented by certain Lower Eocene European and North American mammals at one time regarded as primitive Lemurs or Insectivores; these include *Plesiadapis* and *Pelaeadapis*, and in North America *Mixodectes*, *Microsyops* and *Cynodontomys*; the last three constituting the family Mixodectidae. Possibly the European forms, in which the dental formula has been given as $\frac{3}{3}, \frac{1}{1}, \frac{4}{4}, \frac{3}{3}$, and there is a gap between the incisors and the cheek-teeth, are more nearly related to modern rodents than the American types, and may indeed belong to the same order. On the other hand, the American forms, which have one pair of large chisel-like incisors in the lower jaw, also possess a lower canine, and show no marked gap in front of the cheek-teeth, nor any indication of the characteristic rodent backwards movement of the lower jaw. On these grounds, while admitting that they are allied to the rodents, it has been pointed out that they can scarcely be included in the Rodentia, and the order Proglires has in consequence been proposed for their reception.

Whatever may be the true affinity of these problematical mammals, undoubted rodents are known from the Lower Eocene of both Europe and North America. In Europe these form the genus *Ischyromys* and the family Ischyromyidae, and have premolars $\frac{4}{4}$, and all the cheek-teeth low-crowned, with simple cusps or ridges. Possibly we are akin to the Sciuridae in America, and Europe, with transversely ridged molars, is allied; and the European *Sciuromys* should perhaps find a place in the same neighbourhood. A more advanced phase is represented in the European Lower Oligocene by the Pseudosciuridae, with the genera *Pseudosciurus*, *Sciuroides*, *Trechomys*, *Theridomys*, &c., in which part of the masseter passes through the broad infra-orbital canal, and the premolars are $\frac{3}{3}$; the molars being low-crowned, many-rooted and either cusped or ridged. These rodents are probably allied to the Anomaluridae; and it is partly on their evidence that the family Pedetidae is placed next the latter. Here it may be mentioned that *Leithia*, from the Pleistocene of Malta, originally regarded as a giant dormouse, seems near akin to *Anomalurus*. In the highly specialized mastoid region of the skull, the North American Oligocene *Prototypchus* approaches to *Dipodomys*, while the contemporary *Gymnoptychus* and *Entoptychus* likewise appear to be connected with Anomaluridae. Upper Oligocene *Cricetodon* in Europe and *Eumys* in America are the earliest known forerunners of the cricetine Muridae; while at the same time primitive beavers appear in the form of *Steneofiber*, to be succeeded in the Upper Pliocene by the gigantic *Trogontherium*.

The still larger North American Pleistocene *Castoroides*, known by one species of the size of a bear, and the allied West Indian *Amblyrhiza*, appear to be specialized beavers, although they have been referred to a family by themselves. Near akin to the North American Miocene family Mylagaulidae, typified by *Mylagaulus*, but including *Mesogaulus* and *Protogaulus*. Although showing some dental characters approximating to the porcupines, these rodents are regarded as allied to the Geomyidae, although forming an isolated type. The prominent feature, writes Mr E. S. Riggs, is the unusual development of the premolar to the exclusion of the posterior teeth. Associated with this is the strength and sharpness of the lower jaw, the deepening of the anterior part of the massetric ridge, and the depth of the ramus from the alveolar line to the angle. These indicate unusual capacity for crushing or grinding; while the last premolar is a crushing implement, which has reached the highest degree of specialization known in rodents. It is suggested that these teeth may have been employed for cracking nuts or hard seeds, although also used for grinding. The remarkable North American *Ceratogaulus*, with a large bony nasal horn, belongs to the same family. To discuss the remaining Miocene and later fossil Simplicidentata would be doing little more than adding to the generic names referable to the various existing families. It may be mentioned, however, that the distribution of Miocene and later Tertiary types accords very closely with that of their existing relatives; the families of South American hystricoids being represented by a number of extinct genera in the formations of Argentina and Brazil. Special mention may be made of *Megamys*, found in the caves of Brazil, which, while apparently allied to the living viscacha, attained dimensions approximating to those of a hippopotamus.

As regards the Duplicidentata, it appears that the families Ochotonidae and Lagomyidae had become differentiated as early as the Lower Miocene. *Titanomys* is the earliest form, from the Middle Miocene, succeeded by *Lagopsis*, and then by the modern *Ochotona*. In this line there is a tendency to lose the last upper molar, but in *Prolagus*, which ranges in the Miocene of Sardinia and Corsica, to Spain, and forms a side-branch, the corresponding lower tooth has likewise disappeared. In contradistinction to *Titanomys*, in which the cheek-teeth are rooted, is the North American Upper Oligocene *Palaeolagus*, where they are rootless. In general dental characters, especially the retention of three pairs of molars, this genus approximates to the Leporidae, although in the absence of post-orbital processes and the pattern of the molars it departs less widely from the modern Ochotonidae than does *Prolagus*.

RODERICK, or RUADRI (d. 1198), king of Connaught and high king of Ireland, was the son of Turlough (Tordelbach) O'Connor, king of Connaught, who had obtained the overkingship in 1151, but had been driven in 1154 through the rise of Muirchertach O'Lochlainn in Ulster. Roderick succeeded to Connaught in 1156, and after ten years' fighting won back the title of high king. His ill-advised persecution of Dermot (Diarmait MacMurchada), king of Leinster, furnished the pretext for the Anglo-Norman invasion of Ireland. Roderick endeavoured to expel the invaders, but was driven behind the Shannon. He delayed his submission to Henry II. until 1175, when a treaty was concluded at Windsor. Roderick, under this agreement, held Connaught as the vassal of England, and exercised lordship over all the native kings and chiefs of Ireland; in return he undertook to pay an annual tribute. The treaty did not put an end to the wars of the Norman adventurers against Connaught and Roderick's descendants. He held out till 1191; but then, weary of strife, retired to the cloister. He died in 1198, the last of the high kings of Ireland.

RODEZ, a town of southern France, capital of the department of Aveyron, 51 m. N.N.E. of Albi by rail. Pop. (1906) town, 11,076; commune, 15,502. Rodez is situated on the southern border of the Causse of Rodez, on an isolated plateau bordered on the E. and S. by the river Aveyron. The cathedral was built between 1277 and 1535. A great Flamboyant rose-window and a gallery in the same style are the chief features of the principal façade, which is flanked by two square towers and has no portal. Each transept has a fine Gothic doorway. On the north side of the building rises a tower (1510–1526) of imposing height (253 ft.). The three upper stages are richly decorated, and the whole is surmounted by a colossal statue of the Virgin. In the cathedral are a fine rood-loft, some good wood-carving and the tombs of several bishops. Other interesting buildings are the episcopal palace (17th and 19th centuries), flanked by a massive tower, relic of an older palace; the church of St Amans, of Romanesque architecture, restored in the 18th century; and, among other old houses, the hôtel d'Armagnac built in the Renaissance period on the site of the old palace of the counts. The ruins of a Roman amphitheatre still exist in Rodez, which is supplied with water by a Roman aqueduct. About 6 m. to the north of Rodez is the chasm of Tindoul de la Vayssière, leading to a subterranean river issuing in the springs of the picturesque village of Salles-la-Source.

The town is the seat of a bishop, a prefect and a court of assizes, and has tribunals of first instance and commerce, a chamber of commerce, a branch of the Bank of France, a lycée training college for both sexes and an ecclesiastical seminary. The industries include wool-spinning and the weaving of woollen goods.

Rodez, called *Segodunum* under the Gauls, and *Ruthena* under the Romans, was the capital of the *Ruteni*, a tribe allied to the Arverni, and was afterwards the principal town in the district of Rouergue. In the 4th century it adopted the Christian faith, and St Amans, its first bishop, was elected in 401. During the middle ages contests were rife between the bishops, who held the temporal power in the "cité," and the counts in the "bourg." The Albigenses were defeated near Rodez in 1211. The countship of Rodez, detached from that of Rouergue at the end of the 11th century, belonged first to the viscounts of Carlat, and from the beginning of the 14th century to the counts of Armagnac. From 1360 to 1368 the English held the town. After the confiscation of the estates of the Armagnacs in 1475 the countship passed to the dukes of Alençon and then to the D'Albrets. Henry IV. finally annexed it to the crown of France.

RODGERS, JOHN (1771–1838), American sailor, was born in Harford county, Maryland, on the 11th of July 1771. He entered the United States navy when it was organized in 1798. He was second in command to Commodore James Barron (1769–1851) in the expedition against the Barbary pirates, and succeeded him in the command in 1805. In this year he brought both Tunis and Tripoli to terms, and then returned to America. In 1811 he was in command as commodore of the U.S. frigate "President" (44) off Annapolis when he heard that an American seaman had been "pressed" by a British frigate off Sandy Hook. Commodore Rodgers was ordered to see "to protect American commerce," but he may have had verbal instructions to retaliate for the impressment of real or supposed British subjects out of American vessels, which was causing much ill-feeling and was a main cause of the War of 1812. On the 16th of May 1811 he sighted and followed the British sloop "Little Belt" (22), and after some hailing and counter-hailing, of which very different versions are given on either side, a gun was fired, each side accusing the other of the aggression, and an action ensued in which the "Little Belt" was cut to pieces. The incident, which was represented as an accident by the Americans, and believed to be a deliberate aggression by the British navy, had a share in bringing on war. When hostilities broke out Rodgers commanded a squadron on the coast of America, and was wounded by the bursting of one of his guns while pursuing the British frigate "Belvedere." He was subsequently President of the Board of Navy Commissioners in 1815–1824 and in 1827–1837, and acting secretary of the navy in 1823 for two weeks. He died in Philadelphia on the 1st of August 1838.

His brother, George Washington Rodgers (1787–1832), a brother-in-law of Commodore Perry, served in the War of 1812 and in the war with Algiers (1815). Rear-Admiral John Rodgers (1812–1882), a son of Commodore John Rodgers, served in the Union navy and in 1877–1882 was superintendent of the Naval Observatory at Washington. G. W. Rodgers had two sons who were naval officers, Christopher Raymond Perry Rodgers (1819–1892) and George Washington Rodgers (1822–1863).

RODIN, AUGUSTE (1840–), French sculptor, was born in 1840, in Paris, and at an early age displayed a taste for his art. He began by attending Barye's classes, but did not yield too completely to his influence. From 1864 to 1870, under pressure of necessity, he was employed in the studio of Carrier-Belleuse, where he learnt to deal with the mechanical difficulties of a sculptor. Even so early as 1864 his individuality was manifested in his "Man with a Broken Nose." After the war, finding nothing to do in Paris, Rodin went to Brussels, where from 1871 to 1877 he worked, as the colleague of the Belgian artist Van Rasbourg, on the sculpture for the outside and the caryatides for the interior of the Bourse, besides exhibiting in 1875 a "Portrait of Garnier." In 1877 he contributed to the Salon "The Bronze Age," which was seen again, cast in bronze, at the Salon of 1880, when it took a third-class medal, was purchased by the State, and is now in the museum of the Luxembourg. Between 1882 and 1885 he sent to the Salons busts of "Jean-Paul Laurens" and "Carrier-Belleuse" (1882), "Victor Hugo" and "Dalou" (1884), and "Antonin Proust" (1885). From about this time he chiefly devoted himself to a great decorative composition six metres high, which was not finished for twenty years. This is the "Portal of Hell," the most elaborate perhaps of all Rodin's works, executed to order for the Musée des arts décoratifs. It is inspired mainly by Dante's *Inferno*, the poet himself being seated at the top, while at his feet, in under-cut relief, we see the writhing crowd of the damned, torn by the frenzy of passion and the anguish of despair. The lower part consists of two bas-reliefs, in their midst two masks of tormented faces. Round these run figures of women and centaurs. Above the door three men cling to each other in an attitude of despair. After beginning this titanic undertaking, and while continuing to work on it, Rodin executed for the town of Damvillers a statue of "Bastien-Lepage"; for Nancy a "Monument to Claude le Lorrain," representing the Chariot of the Sun drawn by horses; and for Calais "The Burgesses of Calais" surrendering the keys of the town and imploring mercy. In this, Rodin, throwing over all school tradition, represents the citizens not as grouped on a square or circular plinth, but walking in file. This work was exhibited at the Petit Gallery in 1889. At the time of the secession of the National Society of Fine Arts, or New Salon, in 1890, Rodin withdrew from the old Society of French Artists, and exhibited in the New Salon the bust of his friend "Puvis de Chavannes" (1892), "Contemplation" and a "Caryatid," both in marble, and the "Monument to Victor Hugo" (1897), intended for the gardens of the Luxembourg. In this the poet is represented nude, as a powerful old man extending his right arm with a sovereign gesture, the Muses standing behind him. In 1898 Rodin exhibited two very dissimilar works, "The Kiss," exhibited again in 1900, a marble group representing Paolo Malatesta and Francesca da Rimini, and the sketch in plaster for a "Statue of Balzac." This statue, a commission from the Society of Men of Letters, had long been expected, and was received with vehement dissensions. Some critics regarded this work in which Balzac was represented in his voluminous dressing-gown, as the first-fruits of a new phase of sculpture; others, on the contrary, declared that it was incomprehensible, if not ridiculous. This was the view taken by the society who had ordered it, and who "refused to recognize Rodin's rough sketch as a statue of Balzac," and withdrew the commission, giving it to the sculptor Falguière. Falguière exhibited his model in 1899. In the same Salon, Rodin, to prove that the conduct of the society had made no change in his friendship with Falguière, exhibited a bust in bronze of his rival, as well as one of "Henri Rochefort." In 1900, the city of Paris, to do honour to Rodin, erected at its own expense a building close to one of the entrances to the Great Exhibition, in which almost all of the works of the artist were to be seen, more especially the great "Portal of Hell," still quite incomplete, the "Balzac," and a host of other works, many of them unfinished or mere rough sketches. Here, too, were to be seen some of Rodin's designs, studies and water-colour drawings. He has also executed a great many etchings and *sgraffiti* on porcelain for the manufactory at Sèvres. His best-known etching is the portrait of Victor Hugo. Many of Rodin's works are in private collections, and at the Luxembourg he is represented by a "Danaïd" (in marble), a "Saint John" (in bronze, 1880), "She who made the Helmet" (bronze statuette), the busts of "J. P. Laurens" and of "A Lady" and other works. In the Musée Galliera is a very fine bust of Victor Hugo. Rodin's "Hand of God" was exhibited in the New Gallery, London, in 1905. In 1904 Mr Ernest Beckett (Lord Grimthorpe) presented the British nation with the sculptor's "Le Penseur." In the same year Rodin became president of the International Society of Sculptors, Painters and Engravers, in succession to James McNeill Whistler.

RODNEY, GEORGE BRYDGES RODNEY, BARON (1718–1792), English admiral, second son of Henry Rodney of

Walton-on-Thames, was born in February 1718. His father had served in Spain under the earl of Peterborough, and on quitting the army served as captain in a marine corps which was disbanded in 1713. George was sent to Harrow, being appointed, on leaving, by warrant dated the 21st of June 1732, a volunteer on board the "Sunderland." While serving on the Mediterranean station he was made lieutenant in the "Dolphin," his promotion dating the 15th of February 1739. In 1742 he attained the rank of post-captain, having been appointed to the "Plymouth" on the 9th of November. After serving in home waters, he obtained command of the "Eagle" (60), and in this ship took part in Hawke's victory off Ushant (14th October 1747) over the French fleet. On that day Rodney gained his first laurels for gallantry, under a chief to whom he was in a measure indebted for subsequent success. On the 9th of May 1749 he was appointed governor and commander-in-chief of Newfoundland, with the rank of commodore, it being usual at that time to appoint a naval officer, chiefly on account of the fishery interests. He was elected M.P. for Saltash in 1751, and married his first wife, Jane Compton (1730–1757), sister of the 7th earl of Northampton, in 1753. During the Seven Years' War Rodney rendered important services. In 1757 he had a share in the expedition against Rochefort, commanding the "Dublin" (74). Next year, in the same ship, he served under Boscawen at the taking of Louisburg (Cape Breton). On the 19th of May 1759 he became a rear-admiral, and was shortly after given command of a small squadron destined to secure a large number of flat-bottomed boats and stores which were being collected at Havre for an invasion of the English coasts. He bombarded the town for two days and nights, and inflicted great loss of war-material on the enemy. In July 1760, with another small squadron, he succeeded in taking many more of the enemy's flat-bottomed boats and in blockading the coast as far as Dieppe. Elected M.P. for Penryn in 1761, he was in October of that year appointed commander-in-chief of the Leeward Islands station, and within the first three months of 1762 had reduced the important island of Martinique, while both St Lucia and Grenada had surrendered to his squadron. During the siege of Fort Royal (now Fort de France) his seamen and marines rendered splendid service on shore. At the peace of 1763 Admiral Rodney returned home, having been during his absence made vice-admiral of the Blue and having received the thanks of both houses of parliament.

In 1764 Rodney was created a baronet, and the same year he married Henrietta, daughter of John Clies of Lisbon. From 1765 to 1770 he was governor of Greenwich Hospital, and on the dissolution of parliament in 1768 he successfully contested Northampton at a ruinous cost. When appointed commander-in-chief of the Jamaica station in 1771 he lost his Greenwich post, but a few months later received the office of rear-admiral of Great Britain. Till 1774 he held the Jamaica command, and during a period of quiet was active in improving the naval yards on his station. Sir George struck his flag with a feeling of disappointment at not obtaining the governorship of Jamaica, and was shortly after forced to settle in Paris. Election expenses and losses at play in fashionable circles had shattered his fortune, and he could not secure payment of the salary as rear-admiral of Great Britain. In February 1778, having just been promoted admiral of the White, he used every possible exertion to obtain a command, to free himself from his money difficulties. By May he had, through the splendid generosity of his Parisian friend Marshal Biron, effected the latter task, and accordingly he returned to London with his children. The debt was repaid out of the arrears due to him on his return. The story that he was offered a French command is fiction.

Sir George was appointed once more commander-in-chief of the Leeward Islands late in 1779. His orders were to relieve Gibraltar on his way to the West Indies. He captured a Spanish convoy off Cape Finisterre on the 8th of January 1780, and eight days later defeated the Spanish admiral Don Juan de Langara off Cape St Vincent, taking or destroying seven ships. On the 17th of April an action, which, owing to the carelessness of some of Rodney's captains, was indecisive, was fought off Martinique with the French admiral Guichen. Rodney, acting under orders, captured the valuable Dutch island of St Eustatius on the 3rd of February 1781. It had been a great *entrepôt* of neutral trade, and was full of booty, which Rodney confiscated. As large quantities belonged to English merchants, he was entangled in a series of costly lawsuits.

After a few months in England, recruiting his health and defending himself in Parliament, Sir George returned to his command in February 1782, and a running engagement with the French fleet on the 9th of April led up to his crowning victory off Dominica, when on the 12th of April with thirty-five sail of the line he defeated the comte de Grasse, who had thirty-three sail. The French inferiority in numbers was more than counterbalanced by the greater size and superior sailing qualities of their ships, yet five were taken and one sunk, after eleven hours' fighting. This important battle saved Jamaica and ruined French naval prestige, while it enabled Rodney to write: "Within two little years I have taken two Spanish, one French and one Dutch admirals." A long and wearisome controversy exists as to the originator of the manœuvre of "breaking the line" in this battle, but the merits of the victory have never seriously been affected by any difference of opinion on the question. A shift of wind broke the line of battle, and advantage was taken of this by the English ships in two places.

Rodney arrived home in August to receive unbounded honour from his country. He had already been created Baron Rodney of Rodney Stoke, Somerset, by patent of the 19th of June 1782, and the House of Commons had voted him a pension of £2000 a year. From this time he led a quiet country life till his death, which occurred on the 24th of May 1792, in London. He was succeeded as 2nd baron by his son, George (1753–1802), from whom the present baron is descended.

Rodney was unquestionably a most able officer, but he was also vain, selfish and unscrupulous, both in seeking prize money, and in using his position to push the fortunes of his family. He made his son a post-captain at fifteen. He was accused by his second-in-command, Hood, of sacrificing the interest of the service to his own profit, and of showing want of energy in pursuit of the French on the 12th of April 1782. It must be remembered that he was then prematurely old and racked by disease.

See General Mundy, *Life and Correspondence of Admiral Lord Rodney* (2 vols., 1830); David Hannay, *Life of Rodney*; Rodney letters in 9th *Report* of Hist. MSS. Com., pt. iii.; "Memoirs," in *Naval Chronicle*, i. 353–93; and Charnock, *Biographia Navalis*, v. 204–28. Lord Rodney published in his lifetime (probably 1789) *Letters to His Majesty's Ministers, &c., relative to St Eustatius, &c.*, of which there is a copy in the British Museum. Most of these letters are printed in Mundy's *Life*, vol. ii., though with many variant readings.

RODOMONTADE, or RHODOMONTADE, a term for boastful, extravagant language or any inflated bragging speech. The word refers to the brave but boastful Saracen leader Rodomonte in Ariosto's *Orlando Furioso*. The name (in the form Rodamante) appears earlier in Boiardo's *Orlando Innamorato*. It is supposed to represent a compound of *rodare*, to roll, and *monte*, mountain.

RODOSTO (Turkish, *Tekir Dagh*), a town of European Turkey, in the vilayet of Adrianople, on the coast of the Sea of Marmora, 78 m. W. of Constantinople. Pop. (1905) about 35,000, of whom half are Greeks. The picturesque Bay of Rodosto is enclosed by the great promontory of Combos, a spur about 2000 ft. in height from the hilly plateau to the north. The church of Panagia Rheumatocratissa contains the graves, with long Latin inscriptions, of the Hungarians who were banished from their country in 1686 by the imperialist captors of Buda. Rodosto was long a great depot for the produce of the Adrianople district, but its trade suffered when Dédéagatch became the terminus of the railway up the Maritza, and the town is now

dependent on its maritime trade, especially its exports to Constantinople. It is the administrative centre of a district (*sanjak*) producing and exporting barley, oats, spelt and canary seed, and largely planted with mulberry trees, on which silk-worms are fed. White cocoons are exported to western Europe (394 cwt. in 1901), silkworms' eggs to Russia and Persia.

Rodosto is the ancient *Rhaedestus* or *Bisanthe*, said to have been founded by Samians. In Xenophon's *Anabasis* it is mentioned as in the kingdom of the Thracian prince Seuthes. Its walls restored by Justinian in the 6th century A.D. is chronicled by Procopius. In 813 and again in 1206 it was sacked by the Bulgarians, but it continues to appear as a place of considerable note in later Byzantine history.

RODRIGUEZ (officially RODRIGUES), an island in the Indian Ocean in 19° 41′ S., 63° 23′ E.; the most important dependency of the British colony of Mauritius, from which it is distant 344 nautical miles. It is a station on the "all-British" cable route between South Africa and Australia, telegraphic communication with Mauritius being established in 1902. With a length of 13 m. E. and W., and a breadth of 3 to 6 m. N. and S., it has an area estimated at 42½ sq. m. On all sides it is surrounded by a fringing reef of coral, studded with islets. This reef, only 100 yds. wide at the eastern end of the island, extends westward 3 m., and both N. and S. forms a flat area partly dry at low water. Two passages through the reef are available for large vessels—these leading respectively to Port Mathurin on the N. coast and to Port South-East.

The island was at one period believed to consist of granite over-laid with limestone and other modern formations, and its supposed formation caused it to be regarded as a remnant of the hypothetical continent of Lemuria. The investigations made by an expedition sent by the British government in 1874 showed, however, that the island is a mass of volcanic rock, mainly a doleritic lava, rich in olivine. The land consists largely of a series of hills. The main ridge, which runs parallel to the longest diameter, rises abruptly on the east, more gradually on the west, where there is a wide plain of coralline limestone, studded with caves, some stalactitic. Of several peaks on the main ridge the highest is Mt. Limon, 1300 ft. above the sea. The ridge is deeply cut by ravines, the upper parts of which show successive belts of lava separated by thin beds of cinders, agglomerate and coloured clays. In places the cliffs rise 300 ft. and exhibit twelve distinct lava flows. The climate is like that of Mauritius, but Rodriguez is more subject than Mauritius to hurricanes during the north-west monsoon (November to April).

Flora and Fauna.—When discovered, and down into the 17th century, Rodriguez was clothed with fine timber trees; but goats, cattle and bush-fires have combined to destroy the great bulk of the old vegetation, and the indigenous plants have in most cases been ousted by intrusive foreigners. Parts are, however, still well wooded, and elsewhere there is excellent pasturage. The sweet potato, manioc, maize, millet, the sugar-cane, cotton, coffee and rice grow well, and the soil is also cultivated. Wheat is seldom seen, mainly because of the parakeets and the Java sparrows. Beans (*Phaseolus lunatus*), lentils, gram (*Cicer arietinum*), dholl (*Cajanus indicus*) and ground-nuts are all grown to a certain extent in spite of ravages by rats. Mangoes, bananas, guavas, custard-apples, custard-apples, and especially oranges, citrons and limes flourish. Of the timber trees the most common are *Elaeodendron orientale*, much used in carpentry and for pirogues, and *Latania Verschaffelti* (Lequat's plantane). At least two species of screw-pine (*Pandanus heterocarpus*, Balf. fil., and *P. tenuifolius*) occur freely throughout the island. The total number of known species, according to Professor I. B. Balfour, is 470, belonging to 85 families and 293 genera. The families represented by the greatest number of species are Gramineae, Leguminosae, Convolvulaceae, Malvaceae, Rubiaceae, Cyperaceae, Euphorbiaceae, Liliaceae, Compositae. *Mathurina pendulifiora* (Turneraceae) is interesting as the nearest congener is in Central America. Of 33 species of mosses 17 are peculiar. Variability of species and heterophylly are characteristic of the flora to quite an unusual degree.

At present the only indigenous mammal is a species of fruit-eating bat (*Pteropus rodericensis*), and the introduced species are familiar creatures as deer, pig, rabbit, rat, mouse, &c.; but down to a recent period the island was the home of a very large land-tortoise (*T. vosmaeri*) or elephant-tortoise, as a limestone cave has yielded a large number of skeletons of the dodo-like solitaire (*Pezophaps solitarius*), which still built its mound-like nest in the island in the close of the 17th century, but is now extinct (see DODO). Deer, once plentiful, had become very scarce by the beginning of the 20th century, having been indiscriminately hunted by the inhabitants. Of indigenous birds 13 species have been registered. The guinea-fowl (introduced) has become exceedingly abundant, partly owing to a protective game-law, and a flamingo (*P. ponticerianus*), popularly a "partridge," is also common. The marine fish-fauna does not differ from that of Mauritius, and the freshwater species, with the exception of *Mugil rodericensis* and *Myxus caeculicus*, are common to all the Mascarenes. Thirty-five species of crustaceans are known. The insects (probably very imperfectly registered) comprise 60 species of Coleoptera, 15 Hymenoptera, 21 Lepidoptera, 15 Orthoptera, and 20 Hemiptera. Forty-nine species of coral have been collected, showing a close affinity to those of Mauritius, Madagascar and the Seychelles.

History.—Rodriguez or Diego Ruy's Island was discovered by the Portuguese in 1645. In 1690 Duquesne prevailed on the Dutch Government to send a body of French Huguenots to the Island of Bourbon, at that time, he believed, abandoned by the French authorities. As the refugees, however, found the French in possession, they proceeded to Rodriguez, and there eight of their number were landed on the 30th of April 1691 with a promise that they should be visited by their compatriots within two years. The two years were spent without misadventure, but, instead of waiting for the arrival of their friends, the seven colonists (for one had meanwhile died) left the island on the 8th of May 1693 and made their way to Mauritius, where they were treated with great cruelty by the governor. The account of the enterprise by Francis Leguat—*Voyages et aventures* (London, 1708), or, as it is called in the English translation, *A New Voyage to the East Indies* (London, 1708)—is a garrulous and amusing narrative, and was for a long time almost the only source of information about Rodriguez. His description of the solitaire is unique.

From the Dutch the island passed to the French, who colonized it from Mauritius. Large estates were cultivated, and the islanders enjoyed considerable prosperity. In 1809–10 Rodriguez was seized by the British, in whose possession it has since remained. The abolition of slavery proved disastrous to the prosperity of the island, and in 1843 the population had sunk to about 250. Since that time there has been a gradual recovery in the economic condition and a steady increase in population. In 1881 the inhabitants numbered 1436; in 1904 the total had risen to 3681. In 1907 the total population was 4231. The inhabitants are mainly of African origin, being descendants of slaves introduced by the French and negro immigrants chiefly from Africa. There are a few families of European descent (besides the comparatively large staff maintained by the Eastern Telegraph Company) and a small colony of Indians and Chinese. The bulk of the people are French-speaking and Roman Catholics. There are two small settlements, Port Mathurin, the capital, and Gabriel, in the centre of the island. The chief industries are fisheries and cattle-rearing. Salt fish is the principal export, next in importance coming goats, pigs and horned cattle and tobacco. The value of the exports for the four years 1903–06 was £30,894; of the imports for the same period, £54,710. The island is administered by a magistrate appointed by the governor of Mauritius, and the laws are regulations issued by the governor in executive council. The revenue, some £1000 a year, is about half the expenditure incurred, the balance being furnished from the Mauritian treasury. The government maintains a hospital and schools, and pays the salary of a Roman Catholic priest.

Leguat's *Voyage*, edited by Capt. P. Oliver, forms vols. 82 and 83 of the Hakluyt Soc. publications (1891). See also C. Grant, *Hist. of Mauritius and the Neighbouring Islands* (1801); Higgin, in *Jour. R. Asi. Soc.* (1849); the *Reports* of the Transit of Venus Expedition 1874–75, published as an extra volume of the *Philosophical Transactions* (clxviii., London, 1879) (Botany, by I. B. Balfour; Petrology, by N. S. Maskelyne, &c.); Behm, in *Petermann's Mittheilungen* (1880); and the annual reports on Mauritius.

ROE, EDWARD PAYSON (1838–1888), American novelist, was born in Moodna, Orange county, N.Y., on the 7th of March 1838. He graduated at Williams College and at Auburn Theological Seminary; in 1862 became chaplain of the Second New York Cavalry, U.S.V., and in 1864 chaplain of Hampton Hospital, at Hampton, Virginia. In 1866–74 he was pastor of the Presbyterian Church at Highland Falls, N.Y. In 1874 he removed to Cornwall-on-the-Hudson, where he devoted himself to the writing of fiction and to horticulture. He died on the 19th of July 1888. During the Civil War he wrote weekly

letters to the *New York Evangelist*, and subsequently lectured on the war and wrote for periodicals. Among his novels were *Barriers Burned Away* (1872), which first appeared as a serial in the *Evangelist* and made him widely known; *What Can she Do?* (1873), *Opening of a Chestnut Burr* (1874), *From Jest to Earnest* (1875), *Near to Nature's Heart* (1876), *A Knight of the Nineteenth Century* (1877), *A Face Illumined* (1878), *A Day of Fate* (1880), *Without a Home* (1881), *Nature's Serial Story* (1884), *A Young Girl's Wooing* (1884), *An Original Belle* (1885), *He Fell in Love with his Wife* (1886), *The Earth Trembled* (1887) and *Miss Lou* (left unfinished, 1888). He wrote also *Play and Profit in My Garden* (1873), *Success with Small Fruits* (1881) and *The Home Acre* (1887). His novels were very popular in their day, especially with middle-class readers in England and America, and were translated into several European languages. Their strong moral and religious purpose, and their being written by a clergyman, did much to break down a Puritan prejudice in America against works of fiction.

See *E. P. Roe: Reminiscences of his Life* (New York, 1899), by his sister, Mary A. Roe.

ROE (or Row), **SIR THOMAS** (*c.* 1581–1644), English diplomatist, son of Robert Rowe, and of Elinor, daughter of Robert Jermy of Worstead in Norfolk, was born at Low Leyton near Wanstead in Essex, and at the age of twelve (1593) matriculated at Magdalen College, Oxford. Shortly afterwards he joined one of the inns of court, and was made esquire of the body to Queen Elizabeth. He was knighted by James I. in 1605, and became intimate with Henry, prince of Wales, and also with his sister Elizabeth, afterwards queen of Bohemia, with whom he maintained a correspondence and whose cause he championed. In 1610 he was sent by Prince Henry on a mission to the West Indies, during which he visited Guiana and the river Amazon, but failed then, and in two subsequent expeditions, to discover the gold which was the object of his travels. In 1614 he was elected M.P. for Tamworth, and in 1621 for Cirencester. His permanent reputation was mainly secured by the success which attended his embassy in 1615–18 to the court at Agra of the Great Mogul, Jahāngīr, the principal object of the mission being to obtain protection for an English factory at Surat. Appointed ambassador to the Porte in 1621, which he even then describes as being "irrevocably sick," he distinguished himself by further successes. He obtained an extension of the privileges of the English merchants, concluded a treaty with Algiers in 1624, by which he secured the liberation of several hundred English captives, and gained the support, by an English subsidy, of the Transylvanian Prince Bethlen Gabor for the European Protestant alliance and the cause of the Palatinate. Through his friendship with the patriarch of the Greek Church, Cyril Lucaris, the famous Codex Alexandrinus was presented to James I., and Roe himself collected several valuable MSS. which he subsequently presented to the Bodleian library. In 1629 he was again successful in another mission undertaken to arrange a peace between Sweden and Poland. Subsequently Roe negotiated treaties with Danzig and Denmark, returning home in 1630, when a gold medal was struck in his honour. In January 1637 he was appointed chancellor of the Order of the Garter, with a pension of £1200 a year. Subsequently he took part in the peace conferences at Hamburg, Regensburg and Vienna, and used his influence to obtain the restoration of the Palatinate, the emperor declaring that he had "scarce ever met with an ambassador till now." In June 1640 he was made a privy councillor, and in October was returned to parliament as member for the university of Oxford, where his unrivalled knowledge of foreign affairs, commerce and finance, together with his learning and eloquence, gained for him in another sphere considerable reputation. He died on the 6th of November 1644. He had married Eleanor, daughter of Sir Thomas Carr of Stamford, Northamptonshire. Roe was a distinguished and most successful diplomatist, an accomplished scholar and a patron of learning, while his personal character was unblemished.

His *Journal* of the mission to the Mogul, several times printed, has been re-edited, with an introduction by W. Foster, for the Hakluyt Society (1899). This is a valuable contribution to the history of India in the early 17th century. Of his correspondence, *Negotiations in his Embassy to the Ottoman Porte, 1621–28*, vol. i. was published in 1740, but the work was not continued. Other correspondence, consisting of letters relating to his mission to Gustavus Adolphus, was edited by S. R. Gardiner for the Camden Society Miscellany (1875), vol. vii., and his correspondence with Lord Carew in 1615 and 1617 by Sir F. Maclean for the same society in 1860. Several of his MSS. are in the British Museum collections. Roe published a *True and Faithful Relation . . . concerning the Death of Sultan Osman . . . 1622*; a translation from Sarpi, *Discourse upon the Resolution taken in the Valteline* (1628); and in 1613 Dr T. Wright published *Quatuor Colloquia*, consisting of theological disputations between himself and Roe; a poem by Roe is printed in *Notes and Queries*, iv. Ser. v. 9. The *Swedish Intelligencer* (1632–33), including an account of the career of Gustavus Adolphus and of the Diet of Ratisbon (Regensburg), is attributed to Roe in the catalogue of the British Museum. Several of his speeches, chiefly on currency and financial questions, were also published. Two other works in MS. are mentioned by Wood: *Compendious Relation of the Proceedings . . . of the Imperial Diet at Ratisbon* and *Journal of Several Proceedings of the Order of the Garter*.

ROEBLING, JOHN AUGUSTUS (1806–1869), American civil engineer, was born at Mühlhausen, Prussia, on the 6th of June 1806. Soon after his graduation from the polytechnic school at Berlin he removed to the United States, and in 1831 entered on the practice of his profession in western Pennsylvania. He established at Pittsburg a manufactory of wire-rope, and in May 1845 completed his first important structure, a suspended aqueduct across the Allegheny river. This was followed by the Monongahela suspension bridge at Pittsburg and several suspended aqueducts on the Delaware & Hudson Canal. Removing his wire manufactory to Trenton, New Jersey, he began, in 1851, the erection at Niagara Falls of a long span wire suspension bridge with double roadway, for railway and carriage use (see BRIDGE), which was completed in 1855. Owing to the novelty of its design, the most eminent engineers regarded this bridge as foredoomed to failure; but, with its complete success, demonstrated by long use, the number of suspension bridges rapidly multiplied, the use of wire-ropes instead of chain-cables becoming all but universal. The completion, in 1867, of the still more remarkable suspension bridge over the Ohio river at Cincinnati, with a clear span of 1057 ft., added to Roebling's reputation, and his design for the great bridge spanning the East river between New York and Brooklyn was accepted. While personally engaged in laying out the towers for the bridge, Roebling received an accidental injury, which resulted in his death, at Brooklyn, from tetanus, on the 22nd of July 1869. The bridge was completed under the direction of his son, Washington Augustus Roebling (b. 1837), who introduced several modifications in the original plans.

ROEBOURNE, a settlement of De Witt county, Western Australia, 8 m. from the N.W. coast, on the Harding river, 920 m. direct N. of Perth. It is the centre of one of the richest and most varied mineral districts in the colony; gold, silver, tin, lead, copper, diamonds and other precious stones are found here, there are extensive pearl fisheries off its port at Cossack Bay.

ROEBUCK, JOHN (1718–1794), English inventor, was born in 1718 at Sheffield, where his father had a prosperous manufacturing business. After attending the grammar school at Sheffield and Dr Philip Doddridge's academy at Northampton, he studied medicine at Edinburgh, where he was imbued with a taste for chemistry by the lectures of William Cullen and Joseph Black, and he finally graduated M.D. at Leiden in 1742. He started practice at Birmingham, but devoted much of his time to chemistry, especially in its practical applications. Among the most important of his early achievements in this field was the introduction, in 1746, of leaden condensing chambers for use in the manufacture of sulphuric acid. Together with Samuel Garbett he erected a factory at Prestonpans, near Edinburgh, for the production of the acid in 1749, and for some years enjoyed a monopoly; but ultimately his methods became known, and, having omitted to take out patents for

them at the proper time, he was unable to restrain others from making use of them. Engaging next in the manufacture of iron, he in 1760 established the ironworks which still exist at Carron, in Stirlingshire. There he introduced various improvements in the methods of production, including the conversion (patented in 1762) of cast iron into malleable iron " by the action of a hollow pit-coal fire " urged by a powerful artificial blast. His next enterprise was less successful. He leased a colliery at Bo'ness to supply coal to the Carron works, but in sinking for new seams encountered such quantities of water that the Newcomen engine which he used was unable to keep the pit clear. In this difficulty he heard of James Watt's engine and entered into communication with its inventor. This engine, then at an early stage of its development, also proved inadequate, but Roebuck became a strong believer in its future and in return for a two-thirds share in the invention assisted Watt in perfecting its details. His troubles at the colliery, however, aggravated by the failure of an attempt to manufacture alkali, brought him into pecuniary straits, and he parted with his share in Watt's engine to Matthew Boulton in return for the cancellation of a debt of £1200 which he owed the latter. Subsequently, though he had to give up his interest in the Bo'ness works, he continued to manage them and to reside at the neighbouring Kinneil House, where he occupied himself with farming on a considerable scale. He died on the 17th of July 1794.

ROEBUCK, JOHN ARTHUR (1801–1879), British politician, was born at Madras on the 28th of December 1801. After the death of his father, a civil servant, his mother's second marriage transferred him to Canada, where he was chiefly brought up. He came to England in 1824, was called to the bar (Q.C. 1843), became intimate with the leading radical and utilitarian reformers, was elected M.P. for Bath in 1832, and took up that general attitude of hostility to the government of the day, be it what it might, which he retained throughout his life. At all times conspicuous for his eloquence, honesty and recalcitrancy, he twice came with especial prominence before the public—in 1838, when, although at the time without a seat in parliament, he appeared at the bar of the Commons to protest, in the name of the Canadian Assembly, against the suspension of the Canadian constitution; and in 1855, when, having overthrown Lord Aberdeen's ministry by carrying a resolution for the appointment of a committee of inquiry into the mismanagement in the Crimean War, he presided over its proceedings. In his latter years his political opinions became greatly modified, but with one interruption he retained his seat for Sheffield, which he had won in 1849, until his death in London on the 30th of November 1879.

ROE-BUCK, the smallest of the British deer (a full-grown buck standing not more than 27 in. high at the shoulder), the typical representative of a genus (*Capreolus*) in which the antlers lack a brow-tine and belong to what is characterized as the forked type, while the tail is rudimentary (see DEER). The antlers are short, upright and compressed, the brow-tine forking at about two-thirds of its length, and the upper prong again dividing, thus making three points. The coat in summer is foxy red above and white below; in winter this changes to a greyish fawn, with a white rump-patch. The roe-buck or roe-deer (*Capreolus caprea*, or *C. capreolus*) inhabits southern and temperate Europe as far east as the Caucasus, where, as in Syria, it is probably represented by another race or species. It frequents woods, preferring such as have a large growth of underwood and are in the neighbourhood of cultivated ground. The latter it visits in the evening in search of food; and where roe are numerous the damage done to growing crops is considerable. Pairing takes place in August, but the fawns are not born till the following May. According to one theory, the germ lies dormant until December, when it begins to develop; but it is now believed that this long gestation is due to slow rather than arrested development. Roe were formerly abundant in all the wooded parts of Great Britain, but were gradually exterminated, till a century and a half ago they were unknown south of Perthshire. Since then the increase of plantations has led to the partial restoration of the species in the south of Scotland and the north of England; and it was reintroduced into Dorset early in the 19th century. These deer take readily to the water, and they have been known to swim across lochs more than half a mile in breadth. The Siberian roe (*C. pygargus*), which is common in the Altai, is larger and paler than the type species, with shorter and more hairy ears, a larger white rump-patch, and small irregular snags on the inner border of the antlers. The Manchurian roe (*Capreolus manchuricus*) is about the size of the European species, with antlers of the type of those of the Siberian roe, but more slender, and the coat shorter. Although described in 1889 as a local variety of the Siberian species, the Manchurian roe really appears, both as regards stature, hairiness and the black and white markings on the muzzle, much more nearly related to the European animal. This is the more remarkable seeing that the habitats of the two are separated by such an enormous tract of country.

(R. L.*)

ROEDERER, PIERRE LOUIS, COMTE (1754–1835), French politician and economist, was born at Metz on the 15th of February 1754, the son of a magistrate. At the age of twenty-five he became councillor at the parlement of Metz, and was commissioned in 1787 to draw up a list of remonstrances. His work advocating the suppression of internal customs houses (*Suppression des douanes intérieures*), published the same year, is an elaborate treatise on the laws of commerce and on the theory of customs imposts. In 1788 he published *Députation aux États généraux*, a pamphlet remarkable for its bold exposition of liberal principles, and partly on the strength of this he was elected deputy to the states-general by the Third Estate of the *bailliage* of Metz. In the Constituent Assembly he was a member of the committee of taxes (*comité des contributions*), prepared a scheme for a new system of taxation, drew up a law on patents, occupied himself with the laws relating to stamps and *assignats*, and was successful in opposing the introduction of an income tax. After the close of the Constituent Assembly he was elected, on the 11th of November 1791, *procureur général syndic* of the department of Paris. The directory of the department, of which the duc de la Rochefoucauld was president, was at this time in pronounced opposition to the advanced views that dominated the Legislative Assembly and the Jacobin Club, and Roederer was not altogether in touch with his colleagues. Thus he took no share in signing their protest against the law against the non-juring clergy, as a violation of religious liberty. But the directory did not long survive. With the growing anarchy of the capital many of its members resigned and fled, and their places could not be filled up. Roederer himself has left in his *Chronique des cinquante jours* (1832) an account of the pitiable part played by the directory of the department in the critical period between the 20th of June and the 10th of August 1792. Seeing the perilous drift of things, he had tried to get into touch with the king; and it was on his advice that Louis, on the fatal 10th, took refuge in the Assembly. His conduct arousing suspicion, he went into hiding, and did not emerge again until after the fall of Robespierre. In 1796 he was made a member of the Institute, was appointed to a professorship of political economy, and founded the *Journal d'économie publique, de morale et de législation*. Having escaped deportation at the time of the *coup d'état* of 18 Fructidor, he took part in the revolution of 18 Brumaire, and was appointed by Napoleon member of the council of state and senator. Under the Empire, Roederer, whose public influence was very considerable, was Joseph Bonaparte's minister of finance at Naples (1806), administrator of the grand duchy of Berg (1810), and imperial commissary in the south of France. During the Hundred Days he was created a peer of France. The Restoration government stripped him of his offices and dignities, but he recovered the title of peer of France in 1832. He died on the 17th of December 1835. His son, Baron Antoine Marie Roederer

(1782–1865), was also a politician of some note in his day.

Among P. L. Roederer's writings may be mentioned *Louis XII.* (1820); *François I.* (1825); *Comédies historiques* (1827–30); *L'Esprit de la révolution de 1789* (1831); *La Première et la deuxième année du consulat de Bonaparte* (1802); *Chronique des cinquante jours*, an account of the events of the 10th of August 1792; and *Mémoire pour servir à l'histoire de la société polie en France* (1835).

See his *Œuvres*, edited by his son (Paris, 1853 seq.); Sainte-Beuve, *Causeries du lundi*, vol. viii.; M. Mignet, *Notices historiques* (Paris, 1853).

ROEMER, FRIEDRICH ADOLPH (1809–1869), German geologist, was born at Hildesheim, in Prussia, on the 14th of April 1809. His father was a lawyer and councillor of the high court of justice. In 1845 he became professor of mineralogy and geology at Clausthal, and in 1862 director of the School of Mines. He first described the Cretaceous and Jurassic strata of Germany in elaborate works entitled *Die Versteinerungen des Norddeutschen Oolithen-gebirges* (1836–39), *Die Versteinerungen des Norddeutschen Kreidegebirges* (1840–1841) and *Die Versteinerungen des Harzgebirges* (1843). He died at Clausthal on the 25th of November 1869.

His brother, CARL FERDINAND VON ROEMER (1818–1891), who had been educated for the legal profession at Göttingen, also became interested in geology, and abandoning law in 1840, studied science at the university of Berlin, where he graduated Ph.D. in 1842. Two years later he published his first work, *Das Rheinische bergangsgebirge* (1844), in which he dealt with the older rocks in the Rhine valley. In 1845 he paid a visit to America, and devoted a year and a half to a careful study of the geology of Texas and other Southern states. He published at Bonn in 1849 a general work entitled *Texas*, while the results of his investigations of the Cretaceous rocks and fossils were published three years later in a treatise, *Die Kreidebildungen von Texas und ihre organischen Einschlüsse* (1852), which included also a general account of the geology, and gained for him the title "Father of the geology of Texas." Subsequently he published at Breslau *Die Silurische Fauna des westlichen Tennessee* (1860). During the preparation of these works he was from 1847 to 1855 "privat-docent" at Bonn, and was then appointed professor of geology, palaeontology and mineralogy in the university of Breslau, a post which he held with signal success as a teacher until his death. As a palaeontologist he made important contributions to our knowledge especially of the invertebrata of the Devonian and older rocks. He assisted H. G. Bronn with the third edition of the *Lethaea geognostica* (1851–56), and subsequently he laboured on an enlarged and revised edition, of which he published one section, *Lethaea palaeozoica* (1876–1883). In 1862 he was called on to superintend the preparation of a geological map of Upper Silesia, and the results of his researches were embodied in his *Geologie von Oberschlesien* (3 vols., 1870). As a mineralogist he was likewise well known, more particularly by his practical teachings and by the collection he formed in the Museum at Breslau. He died at Breslau on the 14th of December 1891.

ROEMER, OLE (Latinized OLAUS) (1644–1710), Danish astronomer, was born at Aarhuus in Jutland on the 25th of September 1644. He became in 1662 the pupil and amanuensis of Erasmus Bartholinus at Copenhagen, and assisted J. Picard in 1671 to determine the geographical position of Tycho Brahe's observatory (Uraniborg on the island of Hveen). In 1672 he accompanied Picard to Paris, where he remained nine years, occupied with observations at the new royal observatory and hydraulic works at Versailles and Marly. On the 22nd of November 1675 he read a paper before the Academy on the successive propagation of light as revealed by a certain inequality in the motion of the first of Jupiter's satellites. A scientific mission to England in 1679 made him acquainted with Newton, Halley and Flamsteed. In 1681, on the summons of Christian V., king of Denmark, he returned to Copenhagen as royal mathematician and professor of astronomy in the university; and from 1688 he discharged, besides, many important administrative functions, including those of mayor (1705), chief of police and privy councillor. He died at Copenhagen on the 23rd of September 1710.

Roemer will always be remembered as the discoverer of the finite velocity of light. He showed besides wonderful ingenuity in the improvement of astronomical apparatus. The first transit instrument worthy the name was in 1690 erected in his house. In the same year he set up in the university observatory an instrument with altitude and azimuth circles (for observing equal altitudes on both sides of the meridian) and an equatorial telescope. In 1704 he built, at his own cost, the so-called "Tusculan" observatory at Vridlösemagle, a few miles west of Copenhagen, and equipped it with a meridian circle (the transit instrument and vertical circle combined) and a transit moving in the prime vertical. Roemer thus effectively realized nearly all our modern instruments of precision, and accumulated with them a large mass of observations, all of which unfortunately perished in the great conflagration of the 21st of October 1728, except the three nights' work discussed by J. G. Galle (*O. Roemeri triduum observationum astronomicarum a. 1706 institutarum*, Berlin, 1845).

ROERMOND, a town in the province of Limburg, Holland, on the right bank of the Maas at the confluence of the Roer, and a junction station 28 m. by rail N.N.E. of Maastricht. Pop. (1900) 12,348. The old fortifications have been dismantled and partly converted into fine promenades. At this point the Maas is crossed by a bridge erected in 1866–67, and the Roer by one dating from 1771, replacing an older structure, and connecting Roermond with the suburb of St Jacob. Roermond is the seat of a Roman Catholic episcopal see. The finest building in the town is the Romanesque minster church of the first quarter of the 13th century. In the middle of the nave is the tomb of Gerhard III., count of Gelderland, and his wife Margaret of Brabant. It was formerly the church of a Cistercian nunnery, and in modern times has been elaborately restored. The cathedral of St Christopher is also of note; on the top of the tower (246 ft.) is a copper statue of the saint, and the interior is adorned with paintings by Rubens, Jacob de Wit (1695–1754) and others. The Reformed church was once the chapel of the monastery of the Minorites. There is also a Redemptorist chapel. The old bishop's palace is now the courthouse, and the old Jesuits' monastery with its fine gardens a higher-burgher school. Woollen, cotton, silk and mixed stuffs, paper, flour and beer are manufactured at Roermond.

Close to Roermond on the west is the village of Horn, once the seat of a lordship of the same name, which is first mentioned in a document of 1106. The lordship of Horn was a fief of the counts of Loon, and after 1361 of the bishop of **Liége**; but in 1450 it was raised to a countship by the Emperor Frederick II. On the extinction of the house of Horn in 1540, the countship passed to the famous Philip of Montmorency, who, with the count of Egmont, was executed in Brussels in 1568 by order of the duke of Alva. In the beginning of the next century the countship was forcibly retained by the see of Liége, and was incorporated in the French department of the Lower Maas at the end of the 18th century. The ancient castle is in an excellent state of preservation and is sometimes used for the assembly of the states.

ROGATION DAYS (Lat. *rogatio*, from *rogare*, to beseech; the equivalent of Gr. λιτανεία, litany), in the Calendar of the Christian Church, the Monday, Tuesday and Wednesday before Ascension Day, so called because long associated with the chanting of litanies in procession (*rogationes*). The week in which they occur is sometimes called Rogation Week. In 511

the first Council of Orleans ordered that the three days preceding Ascension Day should be celebrated as rogation days with fasting and *rogationes*. All work was to be suspended that all might join in the processions. Leo III. (pope 795–816) introduced rogation days, but without the fasting, at Rome. St Augustine had earlier introduced the custom into the English Church, learning it on his way through Gaul. The Council of Clovesho in 747 confirmed Augustine's injunction, and ordered that the rogation days be kept up "according to the way of our fathers." The place-name "Gospel Oak," which occurs in London and elsewhere, is a relic of these rogation processions, the gospel of the day being read at the foot of the finest oak the parish boasted. After the Reformation the processions gradually ceased to be ecclesiastical in England, and are now practically secularized into the perambulation of the parish boundaries on or about Ascension Day.

See also PROCESSION and LITANY.

ROGER I. (1031–1101), ruler of Sicily, was the youngest son of Tancred of Hauteville. He arrived in Southern Italy soon after 1057. Malaterra, who compares Robert Guiscard (see GUISCARD, ROBERT) and his brother to "Joseph and Benjamin of old," says of Roger: "He was a youth of the greatest beauty, of lofty stature, of graceful shape, most eloquent in speech and cool in counsel. He was far-seeing in arranging all his actions, pleasant and merry all with men; strong and brave, and furious in battle." He shared with Robert Guiscard the conquest of Calabria, and in a treaty of 1062 the brothers in dividing the conquests apparently made it "condominium," the terms of which either was to have half of every castle and town in Calabria.[1] Robert now resolved to employ Roger's genius in reducing Sicily, which contained, besides the Moslems, numerous Greek Christians subject to Arab princes who had become all but independent of the sultan of Tunis. In May 1061 the brothers crossed from Reggio and captured Messina. After Palermo had been taken in January 1072 Robert Guiscard, as suzerain, invested Roger as count of Sicily, but retained Palermo, half of Messina and the north-east portion (the Val Demone). Not till 1085, however, was Roger able to undertake a systematic crusade. In March 1086 Syracuse surrendered, and when in February 1091 Noto yielded the conquest was complete. Much of Robert's success had been due to Roger's support. Similarly the latter supported Duke Roger, his nephew, against Bohemund, Capua and his rebels, and the real leadership of the Hautevilles passed to the Sicilian count. In return for his aid against Bohemund and his rebels the duke surrendered to his uncle in 1085 his share in the castles of Calabria, and in 1091 the half of Palermo. Roger's rule in Sicily was more real than Robert Guiscard's in Italy. At the enfeoffments of 1072 and 1092 no great undivided fiefs were created, and the mixed Norman, French and Italian vassals owed their benefices to the count. No feudal revolt of importance therefore troubled Roger. Politically supreme, the count became master of the insular Church. While he gave full toleration to the Greek Churches, he created new Latin bishoprics at Syracuse and Girgenti and elsewhere, nominating the bishops personally, while he turned the bishopric of Palermo into a Catholic see. The Papacy, favouring a prince who had recovered Sicily from Greeks and Moslems, granted to him and his heirs in 1098 the Apostolic Legateship in the island. Roger practised general toleration to Arabs and Greeks, allowing to each race the expansion of its own civilization. In the cities the Moslems, who had generally secured such terms of surrender, retained their mosques, their kadis, and freedom of trade; in the country, however, they became serfs. He drew from the Moslems the mass of his infantry, and St Anselm visiting him at the siege of Capua, 1098, found "the brown tents of the Arabs innumerable." Nevertheless the Latin element began to prevail with the Lombards and other Italians who flocked into the island in the wake of the conquest, and the conquest of Sicily was decisive in the steady decline from this time of Mahommedan power in the western Mediterranean.

[1] See Chalandon, *La Domination normande*, vol. i. p. 205.

Roger, the "Great Count of Sicily," died on the 22nd of June 1101 in his seventieth year and was buried in S. Trinità di Mileto. His third wife, Adelaide, niece of Boniface, lord of Savona, gave him two sons, Simon and Roger, of whom the latter succeeded him.

See E. Caspar, *Roger II. und die Gründung der normannisch-sicilischen Monarchie* (Innsbruck, 1904). (E. CU.)

ROGER II. (1093–1154), king of Sicily, son of the preceding, began personally to rule in 1112, and from the first aimed at uniting the whole of the Norman conquests in Italy. In June 1127, William, duke of Apulia, grandson of Robert Guiscard, died childless, having apparently made some vague promise of the succession to Roger. In any case Roger claimed not only all the Hauteville possessions, but also the overlordship of Capua, for which Richard II. in 1098 had sworn homage to Duke Roger. The union of Sicily and Apulia, however, was resisted by Honorius II. and by the subjects of the duchy itself, averse from any strong ducal power, and the pope at Capua (Dec. 1127) preached a crusade against the claimant, setting against him Robert II. of Capua and Ranulf of Alife, or Avellino, brother-in-law of Roger, who proved himself the real leader of the revolt. The coalition, however, failed, and in August 1128 Honorius invested Roger at Benevento as duke of Apulia. The baronial resistance, which was backed by Naples, Bari, Salerno and other cities, whose aim was civic freedom, also gave way, and at Melfi (Sept. 1129) Roger was generally recognized as duke by Naples, Capua and the rest. He began at once to enforce order in the Hauteville possessions, where the ducal power had long been falling to pieces. For the binding together of all his states the royal name seemed essential, and the death of Honorius in February 1130, followed by a double election, seemed the decisive moment. While Innocent II. fled to France, Roger, with deep design, supported Anacletus II. The price was a crown, and on the 27th of September 1130 a bull of Anacletus made Roger king of Sicily. He was crowned in Palermo on the 25th of December 1130.

This plunged Roger into a ten years' war. Bernard of Clairvaux, Innocent's champion, built up against Anacletus and his "half heathen king" a coalition joined by Louis VI. of France, Henry I. of England and the emperor Lothar. Meanwhile the forces of revolt in South Italy drew to a head again. The rebels under Ranulf shamefully defeated the king at Nocera on the 24th of July 1132. Nevertheless, by July 1134 his terrific energy and the savagery of his Saracen troops forced Ranulf, Sergius, duke of Naples, and the rebels to submit, while Robert was expelled from Capua. Meanwhile Lothar's contemplated attack upon Roger had gained the backing of Pisa, Genoa and the Greek emperor, all of whom feared the growth of a powerful Norman kingdom. In February 1137 Lothar began to move south and was joined by Ranulf and the rebels; in June he besieged and took Bari. At San Severino, after a victorious campaign, he and the pope jointly invested Ranulf as duke of Apulia (Aug. 1137), and the emperor then retired to Germany. Roger, freed from the utmost danger, recovered his ground, sacked Capua and forced Sergius to acknowledge him as overlord of Naples. At Rignano the indomitable Ranulf again utterly defeated the king, but in April 1139 Ranulf died, leaving none to oppose Roger, who subdued pitilessly the last of the rebels.

The death of Anacletus (25 Jan. 1138) determined Roger to seek the confirmation of his title from Innocent. The latter, invading the kingdom with a large army, was skilfully ambushed at Galuccio on the Garigliano (22 July 1139). This secured the king's object; on the 25th July the pope invested him as "Rex Siciliae ducatus Apuliae et principatus Capuae." The boundaries of the "regno" were finally fixed, by a truce with the pope in October 1144, at a line south of the Tronto and east of Terracina and Ceprano.

Roger, now become one of the greatest kings in Europe, made Sicily the leading maritime power in the Mediterranean. A powerful fleet was built up under several "admirals," or

"emirs," of whom the greatest was George of Antioch, formerly in the service of the Moslem prince of El Mehdia. Mainly by him a series of conquests were made on the African coast (1135–53) which reached from Tripoli to Cape Bona. The second crusade (1147–48) gave Roger an opportunity to revive Robert Guiscard's designs on the Greek Empire. George was sent to Corinth at the end of 1147 and despatched an army inland which plundered Thebes. In June 1149 the admiral appeared before Constantinople and defied the Basileus by firing arrows against the palace windows. The attack on the empire had, however, no abiding results. The king died at Palermo on the 26th of February 1154, and was succeeded by his fourth son William.

Personally Roger was of tall and powerful body, with long fair hair and full beard. "He had," says Romnald of Salerno, "a lion face, and spoke with a harsh voice." With little or none of Robert Guiscard's personal valour, and living at intervals the life of an eastern Sultan, he yet showed to the full his uncle's audacity, diplomatic skill and determination. It is Roger II.'s distinction to have united all the Norman conquests into one kingdom and to have subjected them to a government scientific, personal and centralized. The principles of this are found in the Assizes of the kingdom of Sicily, promulgated at Ariano in 1140, which enforced an almost absolute royal power. At Palermo Roger drew round him distinguished men of various races, such as the famous Arab geographer Idrisi and the historian Nilus Doxopatrius. The king's active and curious mind welcomed the learned; he maintained a complete toleration for the several creeds, races and languages of his realm; he was served by men of nationality so dissimilar as the Englishman Thomas Brun, a kaid of the Curia, and, in the fleet, by the renegade Moslem Christodoulos, and the Antiochene George, whom he made in 1132 "amiratus amiratorum," in effect prime vizier. The Capella Palatina, at Palermo, the most wonderful of Roger's churches, with Norman doors, Saracenic arches, Byzantine dome, and roof adorned with Arabic scripts, is perhaps the most striking product of the brilliant and mixed civilization over which the grandson of the Norman Trancred ruled.

Contemporary authors are: Falco of Benevento, Alexander of Telese, Romuald of Salerno and Hugo Falcandus, all in the *Scriptori e cronisti napoletani*, ed. Del Re, vol. i. See also E. Caspar, *Roger II. und die Gründung der normannisch-sicilischen Monarchie* (Innsbruck, 1904). (E. Cu.)

ROGER (d. 1139), bishop of Salisbury, was originally priest of a small chapel near Caen. The future King Henry I., who happened to hear mass there one day, was impressed by the speed with which Roger read the service, and enrolled him in his own service. Roger, though uneducated, showed great talent for business, and Henry, on coming to the throne, almost immediately made him chancellor (1101). Soon after Roger received the bishopric of Salisbury. In the Investitures controversy he skilfully managed to keep the favour of both the king and Anselm. Roger devoted himself to administrative business, and remodelled it completely. He created the exchequer system, which was managed by him and his family for more than a century, and he raised his position to heap up power and riches. He became the first man in England after the king, and was in office, if not in title, justiciar. He ruled England while Henry was in Normandy, and succeeded in obtaining the see of Canterbury for his nominee, William of Corbeil. Duke Robert seems to have been put into his custody after Tinchebrai. Though Roger had sworn allegiance to Matilda, he disliked the Angevin connexion, and went over to Stephen, carrying with him the royal treasure and administrative system (1135). Stephen placed great reliance on him, on his nephews, the bishops of Ely and Lincoln, and on his son Roger, who was treasurer. The king declared that if Roger demanded half of the kingdom he should have it, but chafed against the overwhelming influence of the official clique whom Roger represented. Roger himself had built at Devizes the most splendid castle in Christendom. He and his nephews seem to have secured a number of castles outside their own dioceses, and the old bishop behaved as if he were an equal of the king. At a council held in June 1139, Stephen found a pretext for demanding a surrender of their castles, and on their refusal they were arrested. After a short struggle all Roger's great castles were sequestrated. But Henry of Winchester demanded the restoration of the bishop. The king was considered to have committed an almost unpardonable crime in offering violence to members of the church, in defiance of the scriptural command, "Touch not mine anointed." Stephen took up a defiant attitude, and the question remained unsettled. This quarrel with the church, which immediately preceded the landing of the empress, had a serious effect on Stephen's fortunes. The moment that the fortune of war declared against him, the clergy acknowledged Matilda. Bishop Roger, however, did not live to see himself avenged. He died at Salisbury in December 1139. He was a great bureaucrat, and a builder whose taste was in advance of his age. But his contemporaries were probably justified in regarding him as the type of the bishop immersed in worldly affairs, ambitious, avaricious, unfettered by any high standard of personal morality.

Roger's nephew Alexander (d. 1148), who became bishop of Lincoln in 1123, was a typical secular ecclesiastic of the middle ages, wealthy, proud, ambitious and ostentatious. He founded monasteries, built castles at Newark, Sleaford and Banbury, and restored his cathedral at Lincoln after the fire of 1145. He followed the policy of Roger, whose imprisonment he shared, and died after a visit to Pope Eugenius III. at Auxerre, early in 1148.

See Sir J. Ramsay's *Foundations of England*, vol. ii., and J. H. Round's *Geoffrey de Mandeville*.

ROGER (d. 1181), archbishop of York, known as Roger of Pont l'Evêque, was a member of the household of Theobald, archbishop of Canterbury, where he quarrelled violently with another future archbishop, Thomas Becket. In 1148 he was appointed archdeacon of Canterbury, and soon afterwards chaplain to King Stephen, who sent him on an errand to Rome in 1152; then in October 1154 he was consecrated archbishop of York in Westminster Abbey. When Henry II. entered upon his great struggle with Becket over the immunity of clerks from secular jurisdiction, he managed to secure the support of Roger, and having been appointed papal legate in England, the archbishop visited Pope Alexander III. and the French king, Louis VII., in his master's interests. In June 1170 he crowned the king's son Henry, in spite of prohibitions from the pope and from Becket, and for this act he was suspended. One authority declares that Roger, who was then with Henry II. in Normandy, instigated the murder of the rival archbishop, but he swore he was innocent of this crime. He quarrelled with Richard, the new archbishop of Canterbury, about the respective rights of the two archiepiscopal sees, until 1176, when the king arranged a truce between them; and he was constantly endeavouring to assert his supremacy over the Scottish church. The archbishop died at York on the 21st of February 1181. He was always loyal to Henry II., to whom he was very useful during the great rising of 1174; but he has been accused of avarice, and he was certainly not lacking in ambition.

Another English prelate of this name was ROGER, bishop of Worcester, a younger son of Robert, earl of Gloucester, and thus a grandson of the English king Henry I. In 1163 his cousin Henry II. appointed him bishop of Worcester, but almost alone of the English bishops he supported Thomas Becket and not the king during the quarrel between them in 1166. In 1167 he left England to share Becket's exile, but he soon returned to court, although he appears to have remained on friendly terms with the archbishop. He died at Tours in 1179.

ROGER OF HOVEDEN, or HOWDEN (fl. 1174–1201), English chronicler, was, to judge from his name and the internal evidence of his work, a native of Howden in the East Riding of Yorkshire. But nothing is known of him before the year 1174. He was then in attendance upon Henry II., by whom

he was sent from France on a secret mission to the lords of Galloway. In 1175 he again appears as a negotiator between the king and a number of English religious houses. The interest which Hoveden shows in ecclesiastical affairs and miracles may justify the supposition that he was a clerk in orders. This, however, did not prevent him from acting, in 1180, as a justice of the forests in the shires of Yorkshire, Cumberland and Northumberland. After the death of Henry II., it would seem that Hoveden retired from the public service, though not so completely as to prevent him from drawing on the royal archives for the history of contemporary events. About the year 1192 he began to compile his *Chronica*, a general history of England from 732 to his own time. Up to the year 1192 his narrative adds little to our knowledge. For the period 732–1148 he chiefly drew upon an extant, but unpublished chronicle, the *Historia Saxonum sive Anglorum post obitum Bedae* (British Museum MS. Reg. 13 A. 6), which was composed about 1150. From 1148 to 1170 he used the Melrose Chronicle (edited for the Bannatyne Club in 1835 by Joseph Stevenson) and a collection of letters bearing upon the Becket controversy. From 1170 to 1192 his authority is the chronicle ascribed to Benedictus Abbas (*q.v.*), the author of which must have been in the royal household at about the same time as Hoveden. Although this period was one in which Hoveden had many opportunities of making independent observations, he adds little to the text which he uses; except that he inserts some additional documents. Either his predecessor had exhausted the royal archives, or the supplementary searches of Hoveden were languidly pursued. From 1192, however, Hoveden is an independent and copious authority. Like "Benedictus," he is sedulously impersonal, and makes no pretence to literary style, quotes documents in full and adheres to the annalistic method. His chronology is tolerably exact, but there are mistakes enough to prove that he recorded events at a certain distance of time. Both on foreign affairs and on questions of domestic policy he is unusually well informed. His practical experience as an administrator and his official connexions stood him in good stead. He is particularly useful on points of constitutional history. His work breaks off abruptly in 1201, though he certainly intended to carry it further. Probably his death should be placed in that year.

See W. Stubbs's edition of the *Chronica* (Rolls Series) and the introductions to vols. ii. and iv. This edition supersedes that of Sir H. Savile in his *Scriptores post Bedam* (1596). (H. W. C. D.)

ROGER OF WENDOVER (d. 1236), English chronicler, was probably a native of Wendover in Buckinghamshire. At some uncertain date he became a monk of St Albans; afterwards he was appointed prior of the cell of Belvoir, but he forfeited this dignity in the early years of Henry III., having been found guilty of wasting the endowments. His latter years were passed at St Albans, where he died on the 6th of May 1236. He is the first of the important chroniclers who worked in the scriptorium of this house. His great work, the *Flores Historiarum*, begins at the creation and extends to 1235. It is of original value from 1202. Some critics have supposed, but on inconclusive evidence, that Wendover copied, up to 1189, an earlier compilation, the work of John de Cella, the twenty-first abbot of St Albans (1195–1214). Wendover's work is known to us through one 13th-century manuscript in the Bodleian library (Douce MS. 207), a mutilated 14th-century copy in the British Museum (Cotton MS. Otho B. v.), and the edition prepared by Matthew Paris which forms the first part of that writer's *Chronica Majora* (ed. H. R. Luard, Rolls Series, 7 vols.). The best edition of Wendover is that of H. O. Coxe (4 vols., London, 1841–42); there is another (from 1154) in the Rolls Series by H. G. Hewlett (3 vols., 1886–89). Wendover is a copious but inaccurate writer, less prejudiced but also less graphic than Matthew Paris. Where he is the sole authority for an event, he is to be used with caution.

See Luard's prefaces to vols. i., ii., iii. and vii. of the *Chronica Majora*; and the *Monumenta Germaniae Historica. Scriptores*, Band xxviii. pp. 3–20. (H. W. C. D.)

ROGERS, HENRY (1806–1877), English Nonconformist divine, was born at St Albans on the 18th of October 1806, and was educated privately and by his father, a surgeon of considerable culture. Rogers was meant to follow his father's profession, but the reading of John Howe turned him to theology, and after qualifying at Highbury College he accepted a call to the Congregational Church at Poole in 1829. In 1832 he was appointed lecturer in logic at Highbury, in 1836 professor of English at University College, London, and in 1839 professor of English, mathematics and mental philosophy at Spring Hill College, Birmingham. In 1836 appeared his *Life and Character of John Howe*, and in 1837 *The Christian Correspondent*, a collection of some 400 religious letters "by eminent persons of both sexes." His contributions to the *Edinburgh Review* began in 1839 and were collected in volume form in 1850, 1853 and 1874. His most famous book, *The Eclipse of Faith, or a Visit to a Religious Sceptic*, was published anonymously in 1852 and went through six editions in three years. It drew a *Reply* from F. W. Newman, which Rogers answered in a *Defence* (1854). Two volumes of imaginary letters, *Selections from the Correspondence of R. E. H. Greyson* (an anagram for his own name), appeared in 1857 and show his style at its best. In 1858 he became principal and professor of theology at the Lancashire Independent College, where he edited the works of John Howe (6 vols., 1862–63) and wrote for the *British Quarterly*. He retired in 1871, and died at Machynlleth on the 21st of August 1877. Rogers was widely read, and as a Christian apologist carried on the traditions of the 18th century as illustrated by Butler.

See Memoir by Dr R. W. Dale, prefixed to the 8th edition of *The Supernatural Origin of the Bible Inferred from Itself* (the Congregational Lecture for 1873, delivered by Rogers).

ROGERS, HENRY DARWIN (1808–1866), American geologist, was born at Philadelphia on the 1st of August 1808. At the age of twenty-one he was chosen professor of chemistry and natural philosophy at Dickinson College, Pennsylvania. After holding this post for three years, he went to Europe and took up the study of geology. Subsequently he was engaged for twenty-two years in the State surveys of Pennsylvania and New Jersey, his Reports on which were published during the years 1836–41. In 1842 he and his brother WILLIAM BARTON ROGERS (1805–1882), who had been similarly occupied in Virginia (his Reports were published in 1838–41, and he wrote also on the connexion between thermal springs and anticlinal axes and faults), brought before the Association of American Geologists and Naturalists their conclusions on the physical structure of the Appalachian chain, and on the elevation of great mountain chains. The researches of H. D. Rogers were elaborated in his final *Report on Pennsylvania* (1858), in which he included a general account of the geology of the United States and of the coal-fields of North America and Great Britain. In this important work he dealt also with the structure of the great coal-fields, the method of formation of the strata, and the changes in the character of the coal from the bituminous type to anthracite. In 1857 he was appointed professor of natural history and geology at Glasgow. One of his later essays (1861) was on the parallel roads of Lochaber (Glen Roy), the origin of which he attributed to a vast inundation. He died at Glasgow on the 29th of May 1866.

ROGERS, JAMES EDWIN THOROLD (1823–1890), English economist, was born at West Meon, Hampshire, in 1823. He was educated at King's College, London, and Magdalen Hall, Oxford. After taking a first-class degree in 1846, he was ordained, and was for a few years a curate in Oxford. Subsequently, however, he resigned his orders. For some time the classics were the chief field of his activity. He devoted himself a good deal to classical and philosophical tuition in Oxford with success, and his publications included an edition of Aristotle's *Ethics* (in 1865). Simultaneously with these occupations he had been diligently studying economics, with

the result that in 1859 he was appointed professor of statistics and economic science at King's College, London, a post which he filled till his death. From 1862 to 1867 he also held the position of Drummond professor of political economy at Oxford. During that period he published (in 1866) the first two volumes of his *History of Agriculture and Prices in England*, dealing with the period 1259–1400, a minute and masterly record of the subject, and the work upon which his reputation mainly rests. Two more volumes (1401–1582) were published in 1882, a fifth and sixth (1583–1702) in 1887, and he left behind him at his death copious materials for a seventh and eighth. In 1868 he published a *Manual of Political Economy*, and in 1869 an edition of Adam Smith's *Wealth of Nations*. In 1875 he collected and edited the *Protests of the Lords*. An intimate acquaintance with Cobden and John Bright led Rogers to take an active part in politics: he represented Southwark in parliament from 1880 to 1885, and Bermondsey from 1885–86, as an advanced Liberal. In 1888, on the death of Professor Bonamy Price, who had succeeded him at Oxford as professor of political economy, he was re-elected to the post, and held it till his death. Previously (in 1883) he had been appointed lecturer in political economy at Worcester College, Oxford. His latter years were mainly spent at Oxford, where he died on the 12th of October 1890. He was celebrated as a caustic wit and humorist. Of his miscellaneous economic and historical writings, which were numerous, the most noteworthy is his *Six Centuries of Work and Wages*, published in 1884. As an economist, Thorold Rogers did much to promote the historical study of his subject. He was, however, apt to be guided too frequently by political prejudice, and the value of his work suffered from his aggressively contentious spirit.

ROGERS, JOHN (1627–*c.* 1665), English preacher, second son of Nehemiah Rogers, a royalist and Anglican clergyman, was born at Messing in Essex, and became a servitor and student of medicine at King's College, Cambridge. When still a youth the violence of his religious despair led him to attempt suicide and ended in his joining the extreme sect of the Puritans. Deprived of his home in 1642, he walked to Cambridge, and found the college establishment broken up; he nearly starved, but obtained in 1643 a scholastic post in Lord Rich's household in Huntingdonshire, and subsequently at St Neot's free school. He became known as a preacher, received Presbyterian ordination in 1647, married a daughter of Sir Robert Payne of Midloe in Huntingdonshire, and obtained the living of Purleigh in Essex. Subsequently he came to London, joined the Independents, became lecturer at St Thomas Apostle's, and attracted attention by the violence of his political sermons. He was appointed preacher to Christ Church Cathedral in Dublin by the parliament in 1651, and while there served in the field, returning in 1652 to St Thomas Apostle's on account of religious dissensions. In 1653 his parishioners at Purleigh, where he had hitherto managed to retain the living, successfully proceeded against him for non-residence. In the quarrel between the army and the parliament Rogers had naturally sided with the former, and he was one of the first to join the Fifth Monarchy movement. He approved of the expulsion of the Long Parliament, and addressed two letters to Cromwell on the subject of the new government to be inaugurated, but the establishment of the Protectorate at once threw the Fifth Monarchy men into antagonism. Rogers addressed a warning letter to Cromwell, and boldly attacked him from the pulpit on the 9th of January 1654. Thereupon his house was searched and his papers seized, and Rogers then issued another denunciation against Cromwell, *Meme, Tekel, Peres: a Letter lamenting over Oliver Lord Cromwell*. On the 28th of March, on which day he had proclaimed a fast for the sins of the rulers, he preached a violent sermon against the protector, which occasioned his arrest in July. He confronted Cromwell with great courage when brought before him on the 5th of February 1655, and was imprisoned successively at Windsor and in the Isle of Wight, being released in January 1657. He returned to London, and, being suspected of a conspiracy, was again imprisoned by Cromwell in the Tower from the 3rd of February 1658 till the 16th of April. On the protector's death and the downfall of Richard Cromwell, the ideals of the Fifth Monarchy men seemed nearer realization, but Rogers was engaged in political controversy with Prynne and became a source of embarrassment to his own faction, which endeavoured to get rid of him by appointing him "to preach the gospel" in Ireland. On the outbreak of Sir George Booth's royalist insurrection, however, he became chaplain in Charles Fairfax's regiment, and served throughout the campaign. He obtained a lectureship at Shrewsbury in October and was in Dublin in January 1660, being imprisoned there by order of the army faction and released subsequently by the parliament. At the Restoration he withdrew to Holland, studied medicine at Leiden and Utrecht, and obtained from the latter university the degree of M.D. in 1662. He returned to England the same year and resided at Bermondsey, was admitted to the degree of M.D. at Oxford in 1664, and is supposed, in the absence of further record, to have died soon afterwards.

Besides the pamphlet already cited, Rogers wrote in 1653 *Ohel or Bethshemesh, a Tabernacle for the Sun*, in which he attacked the Presbyterians, and *Sagrir, or Doomesday drawing nigh*, from his new standpoint as a Fifth Monarchy man, and was the author of *Challah, the Heavenly Nymph* (1653); *Dod, or Chatham; the Beloved or the Bridegroom going forth for his Bride* . . . (1653); *Prison-born Morning Beams* (1654); *Jegar Sahadutha* . . . (1657); *Mr Prynne's Good Old Cause stated and stunted 10 Year ago* . . . (1660); Διαπολιτεία, *a Discourse Concertation* (1659); *Mr Harrington's Parallel Unparalleled* (1659); *A Vindication of Sir H. Vane* (1659); *Disputatio Medica Inauguralis* (1662).

AUTHORITIES.—*Life and Opinions of a Fifth Monarchy Man*, by Ed. Rogers (1867), compiled from Rogers's own works; Wood, *Athenae Oxonienses and Fasti; Calendars of State Papers (Domestic)*. ROGERS, JOHN (*c.* 1500–1555), English Protestant martyr, was born in the parish of Aston, near Birmingham, and was educated at Pembroke Hall, Cambridge, where he graduated B.A. in 1526. Six years later he was rector of Holy Trinity, Queenhithe, London, and in 1534 went to Antwerp as chaplain to the English merchants. Here he met William Tyndale, under whose influence he abandoned the Roman Catholic faith, and married an Antwerp lady. After Tyndale's death Rogers pushed on with his predecessor's English version of the Old Testament, which he used as far as 2 Chronicles, employing Coverdale's translation (1535) for the remainder and for the Apocrypha. Tyndale's New Testament had been published in 1526. The complete Bible was put out under the pseudonym of Thomas Matthew in 1537; it was printed in Antwerp, and Richard Grafton published the sheets and got leave to sell the edition (1500 copies) in England. Rogers had little to do with the translation, but he contributed some valuable prefaces and marginal notes. His work was largely used by those who prepared the Great Bible (1539–40), out of which in turn came the Bishop's Bible (1568) and the Authorized Version of 1611. After being in charge of a Protestant congregation in Wittenberg for some years, Rogers returned to England in 1548, where he published a translation of Melanchthon's *Considerations of the Augsburg Interim*. In 1550 he was presented to the crown livings of St Margaret Moyses and St Sepulchre in London, and in 1551 was made a prebendary of St Paul's, where the dean and chapter soon appointed him divinity lecturer. He courageously denounced the greed shown by certain courtiers with reference to the property of the suppressed monasteries, and defended himself before the privy council. He also declined to wear the prescribed vestments, donning instead a simple round cap. On the accession of Mary he preached at Paul's Cross commending the "true doctrine taught in King Edward's days," and warning his hearers against "pestilent Popery, idolatry and superstition." Ten days after (16th August 1553), he was summoned before the council and bidden to keep within his own house. His emoluments were taken away and his prebend was filled in October. In January 1554 Bonner, the new bishop of London, sent him to Newgate, where he lay with

John Hooper, Laurence Saunders, John Bradford and others for a year, their petitions, whether for less rigorous treatment or for opportunity of stating their case, being alike disregarded. In December 1554 parliament re-enacted the penal statutes against Lollards, and on January 22nd, 1555, two days after they took effect, Rogers with ten others came before the council at Gardiner's house in Southwark, and held his own in the examination that took place. On the 28th and 29th he came before the commission appointed by Cardinal Pole, and was sentenced to death by Gardiner for heretically denying the Christian character of the Church of Rome and the real presence in the sacrament. He awaited and met death (on the 4th of February 1555 at Smithfield) cheerfully, though denied even an interview with his wife. Noailles, the French ambassador, speaks of the support given to Rogers by the greatest part of the people: "even his children assisted at it, comforting him in such a manner that it seemed as if he had been led to a wedding." He was the first Protestant martyr of Mary's reign, and his friend Bradford wrote that "he broke the ice valiantly."

The following divines of the same name may be distinguished:—JOHN ROGERS (1572?–1603), Puritan vicar of Dedham, Essex, "one of the most awakening preachers of the age."—JOHN ROGERS (1610–1680), ejected vicar of Croglin, Cumberland, and the founder of Congregational churches in Teesdale and Weardale, where he evangelized the lead miners.—JOHN ROGERS (1679–1729), one of George II.'s chaplains, famous for his share in the Bangorian controversy (1719), his *Vindication of the Civil Establishment of Religion* (1728), and his *Persuasives to Conformity*, addressed to Dissenters (1736) and to Quakers (1747).—JOHN ROGERS (1740?–1814), leader of the Irish seceding divines, minister of Cahans, Co. Monaghan.—JOHN ROGERS (1778–1856), rector of Mawnan, Cornwall, and the owner of the Penrose and Helston estates; a good botanist and mineralogist, and a distinguished Hebrew and Syriac scholar.

ROGERS, JOHN (1829–1904), American sculptor, was born at Salem, Massachusetts, on the 30th of October 1829. In 1848 he became an apprentice in a machine shop at Manchester, New Hampshire, and remained there for about ten years. During the latter part of this time he had done some modelling in clay in his leisure hours, and, having decided to become a sculptor, he spent eight months in Rome and Paris in 1858–59. Becoming discouraged, he returned to America and obtained employment as a draughtsman in the office of the city surveyor of Chicago; but soon afterwards, owing to the favourable reception of his group of small figures, "The Checker Players," he resumed sculptural work, confining himself to these small figures, known as "Rogers Groups," which had an enormous popular success and were extensively reproduced. The Civil War in America gave him patriotic themes that increased his vogue and prosperity, and in 1863 he became a National Academician. His subjects were familiar scenes and incidents of home life known to the masses, and the reproductions of his groups were sold in the most remote districts as well as in the larger cities. He executed several life-sized statues, including "General John F. Reynolds" and a seated figure of Lincoln, both in Philadelphia; but it is by his statuettes that he is best remembered, and these were characterized by sentiment and human interest rather than any genuine artistic feeling. He died at New Haven, Connecticut, on the 27th of July 1904.

ROGERS, ROBERT (1727–1784?), American frontier soldier, was born of Irish parentage in 1727, probably at Methuen, Massachusetts, whence his father, James Rogers (often confused with James Rogers, an early settler of Londonderry, N.H.), removed in 1739 to Starktown (now Dunbarton), New Hampshire. During the Seven Years' War he raised and commanded a force of militia, known as Rogers' Rangers, which won a wide reputation for its courage and endurance in the campaigns about Lake George. He took part in Wolfe's expedition against Quebec, and on the 4th of October 1759 he destroyed an Abnaki Indian village on the St Francis river near its mouth and killed about 200 of its inhabitants. After the Montreal campaign of 1760, in which he served, he was sent by General Amherst to take possession of the north-western posts, occupied Detroit on the 29th of November, and later returned to the east. In 1763, during the Pontiac uprising, he accompanied the relief expedition under James Dalyell to Detroit and took part in the battle of Bloody Bridge on the 31st of July (see PONTIAC). Soon after this he went to England, and in 1765 published in London a *Concise Account of North America, containing a Description of the Several British Colonies . . . also an Account of the Several Nations and Tribes of Indians* (new edition, Albany, 1883). In 1766–68 he was commandant of Michilimackinac. He spent the next few years in England, and after 1772 was in the service of the dey of Algiers. At the beginning of the War of Independence he returned to America, and in spite of his protestations of patriotism was considered by Washington and others a Loyalist spy. He was arrested by agents of Congress, but was paroled. His request that he be considered a release from his parole. He then openly joined the British, and under a commission from General Howe organized a regiment of Loyalists which was known as the Queen's Rangers, and which after his return to England in 1776 was commanded by Capt. John G. Simcoe. In 1779 he was commissioned to raise a regiment to be called the King's Rangers, and he returned for a short time to America; but the command of the Rangers, which soon became a part of the garrison of St John's, Quebec, was taken by his brother James (d. 1792), who had formerly served under Robert. Rogers died in London probably in 1784.

In addition to the *Concise Account of North America*, he published his *Journals* (London, 1765), and is supposed to have written, at least in part, *Ponteach, or the Savages of America, a Tragedy* (London, 1766). See also his "Journal" in the *Diary of the Siege of Detroit in the War with Pontiac* (Albany, 1860; new edition, 1883), edited by F. B. Hough; and Francis Parkman, *Montcalm and Wolfe* (2 vols., Boston, 1884).

ROGERS, SAMUEL (1763–1855), English poet, was born at Newington Green, London, on the 30th of July 1763. His father, Thomas Rogers, was the son of a Stourbridge glass manufacturer, who was also a merchant in Cheapside. Thomas Rogers had a place in the London business, and married Mary, the only daughter of his father's partner, Daniel Radford, becoming himself a partner shortly afterwards. On his mother's side Samuel Rogers was connected with the two well-known Nonconformist divines Philip and Matthew Henry, and it was in Nonconformist circles at Stoke Newington that he was brought up. He was educated at private schools at Hackney and Stoke Newington. He wished to enter the Presbyterian ministry, but at his father's desire he joined the banking business in Cornhill. In long holidays, necessitated by delicate health, Rogers became a diligent student of English literature, particularly in Johnson, Gray and Goldsmith. Gray's poems, he said, he had by heart. He had already made some contributions to the *Gentleman's Magazine*, when in 1786 he published a volume containing some imitations of Goldsmith and an "Ode to Superstition" in the manner of Gray. In 1788 his elder brother Thomas died, and Samuel's business responsibilities were increased. In the next year he paid a visit to Scotland, where he met Adam Smith, Henry Mackenzie, the Piozzis and others. In 1791 he was in Paris, and enjoyed a hurried inspection of the art collection of Philippe Égalité at the Palais Royal, many of the treasures of which were later on to pass into his possession. With Gray as his model, Rogers took great pains in polishing his verses, and six years elapsed after the publication of his first volume before he printed his elaborate poem on *The Pleasures of Memory* (1792). This poem may be regarded as the last embodiment of the poetic diction of the 18th century. Here is carried to the extremest pitch the theory of elevating and refining familiar themes by abstract treatment and lofty imagery. In this art of "raising a subject," as the 18th-century phrase was, the *Pleasures of Memory* is much more perfect than Thomas Campbell's *Pleasures of Hope*, published a few years later in imitation. The acme of positive praise for the fashionable serious poetry of the time was given by Byron when he said, "There is not a vulgar line in the poem."
