Canute was obliged at firſt to make great conceſſions to the nobility: but he afterwards put to death many of thoſe in whom he could not put confidence; and, among the reſt, the traitor Edric himſelf, who was publicly executed, and his body thrown into the Thames. In order to prevent any danger from the Normans, who had threatened him with an invaſion, he married Emma the widow of Ethelred, and who now came over from Normandy; promiſing that he would leave the children he ſhould have by that marriage heirs to the crown after his deceaſe. The Engliſh were at firſt diſpleaſed with Emma for marrying the mortal enemy of her former huſband; but at the ſame time were glad to find at court a ſovereign to whom they were accuſtomed, and who had already formed connections with them: and thus Canute, beſides ſecuring by his marriage the alliance with Normandy, gradually acquired by the ſame means the confidence of his own people.

The moſt remarkable tranſaction in this prince's reign, beſides thoſe mentioned under the article Canute, is his expedition to Scotland againſt Malcolm king of that country, whom he forced to do homage for the county of Cumberland, which the Scots at that time poſſeſſed. After this enterpriſe, Canute paſſed four years in peace, and died at Shaftſbury; leaving three ſons, Sweyn, Harold, and Hardicanute. Sweyn, whom he had by his firſt marriage with Alfwen, daughter of the earl of Hampſhire, was crowned in Norway; Hardicanute, whom Emma had born, was in poſſeſſion of Denmark; and Harold, who was of the ſame marriage with Sweyn, was at that time in England.

77 Harold.

78 His treachery and cruelty.

Harold ſucceeded to the crown of England; though it had been ſtipulated that Emma's ſon, Hardicanute, ſhould be heir to that kingdom. This advantage Harold obtained by being on the ſpot, and getting poſſeſſion of his father's treaſures, while Hardicanute was at a diſtance. As Hardicanute, however, was ſupported by earl Godwin, a civil war was likely to enſue, when a compromiſe was made; by which it was agreed, that Harold ſhould enjoy London, and all the provinces north of the Thames, while the poſſeſſion of the ſouth ſhould remain to Hardicanute: and till that prince ſhould appear and take poſſeſſion of his dominions, Emma fixed her reſidence at Wincheſter, and ruled her ſon's part. Harold reigned four years; during which time, the only memorable action he performed was a moſt infamous piece of treachery.—Alfred and Edward, the two ſons of Emma by Ethelred, paid a viſit to their mother in England. But, in the mean time, earl Godwin being gained over by Harold, a plan was laid for the deſtruction of the two princes. Alfred was accordingly invited to London by Harold, with many profeſſions of friendſhip; but when he had reached Guildford, he was ſet upon by Godwin's vaſſals. about 600 of his train were murdered in the moſt cruel manner; he himſelf was taken priſoner, his eyes were put out, and he was conducted to the monaſtery of Ely, where he died ſoon after. Edward and Emma, appriſed of the fate which awaited them, fled beyond ſea, the former into Normandy, the latter into Flanders; while Harold took poſſeſſion of all his brother's dominions without oppoſition.—He died in April 1039.

7 Edwar Confe

Hardicanute ſucceeded his brother Harold without oppoſition. His government was extremely violent and tyrannical. However, it was but of ſhort duration. He died, in 1041, of a debauch at the marriage of a Daniſh lord. After his death, a favourable opportunity was offered to the Engliſh for ſhaking off the Daniſh yoke. Sweyn, king of Norway, the eldeſt ſon of Canute, was abſent; and as the two laſt kings had died without iſſue, there appeared none of that race whom the Danes could ſupport as ſucceſſor to the throne. For this reaſon, the eyes of the nation were naturally drawn towards prince Edward, who happened to be at court when the king died. There were ſome reaſons, however, to fear, that Edward's ſucceſſion would be oppoſed by earl Godwin, who was by far the moſt powerful nobleman in the kingdom. A declared animoſity ſubſiſted between Edward and Godwin, on account of the hand which the latter had in the murder of his brother Alfred; and this was thought to be an offence of ſo grievous a nature, that Edward could never forgive it. But here their common friends interpoſed; and repreſenting the neceſſity of their good correſpondence, obliged them to lay aſide their animoſities, and to concur in reſtoring liberty to their native country. Godwin only ſtipulated that Edward, as a pledge of his ſincere reconciliation, ſhould promiſe to marry his daughter Editha. This propoſal was agreed to; Edward was crowned king of England, and married Editha as he had promiſed. The marriage, however, proved rather a ſource of diſcord than otherwiſe between the king and Godwin. Editha, though a very amiable woman, could never obtain the confidence and affection of her huſband. It is even ſaid, that, during the whole courſe of her life, he abſtained from all matrimonial converſe with her; and this ridiculous behaviour was highly celebrated by the monkiſh writers of the age, and contributed to the king's acquiring the title of Saint and Confeſſor.

8 Varian the kin and ea Godwi

Though the neglect of his daughter could not fail to awaken Godwin's former enmity againſt king Edward, it was neceſſary to chooſe a more popular ground before he could vent his complaints againſt the king in a public manner. He therefore choſe for his theme the influence which the Normans had on the affairs of government; and a declared oppoſition took place between him and theſe favourites. In a ſhort time, this animoſity openly broke out with great violence. Euſtace count of Bologne having paid a viſit to the king, paſſed by Dover on his return. One of his train being refuſed acceſs to a lodging which had been appointed for him, attempted to make his way by force, and wounded the maſter of the houſe in the conteſt. The townſmen revenged this inſult by the death of the ſtranger; the count and his train took arms, and mur-

murdered the townſman in his own houſe. A tumult enſued; near 20 perſons were killed on each ſide; and Euſtace being overpowered with numbers, was at laſt obliged to fly. He complained to the king; who gave orders to earl Godwin, in whoſe government Dover lay, to puniſh the inhabitants. But this nobleman refuſed to obey the command, and endeavoured to throw the whole blame on count Euſtace and his followers. The king was diſpleaſed; and threatened to make him feel the utmoſt effects of his reſentment, in caſe he finally refuſed to comply. Upon this, Godwin aſſembled a powerful army, on pretence of repreſſing ſome diſorders on the frontiers of Wales; but, inſtead of this, marched directly to Gloceſter, where the king at that time was without any military force, as ſuſpecting no danger.

81
win
:o Flan-

Edward perceiving his danger, applied to Siward duke of Northumberland, and Leofric duke of Mercia, two very powerful noblemen. They haſtened to him with ſuch followers as they could aſſemble, iſſuing orders at the ſame time for all the forces under their reſpective governments to march without delay to the defence of the king. Godwin, in the mean time, ſuffered himſelf to be deceived by negociations, till the king's army became ſo powerful, that he was not able to cope with it. He was therefore obliged to fly with his family to Flanders. Here he was protected by Baldwin earl of that country, together with his three ſons Gurth, Sweyn, and Toſti; the laſt of whom had married Baldwin's daughter. Harold and Leofwin, two other ſons of Godwin, took ſhelter in Ireland.

82

iled
the

After the flight of earl Godwin, he was proceeded againſt as a traitor by king Edward. His eſtates, and thoſe of his ſons, were confiſcated; his governments given to others; queen Editha was confined in a monaſtery; and the great power of this family, which had become formidable to the crown itſelf, ſeemed to be totally overthrown. Godwin, however, ſoon found means to retrieve his affairs. Having hired ſome ſhips, and manned them with his followers, he attempted to make a deſcent at Sandwich. The king, informed of his preparations, equipped a fleet which Godwin could not reſiſt, and he therefore retreated into the Flemiſh harbours. On his departure, the Engliſh diſmiſſed their armament. This Godwin had expected, and therefore kept himſelf in readineſs for the favourable opportunity. He immediately put to ſea, and ſailed to the Iſle of Wight, where he was joined by Harold with a ſquadron which he had collected in Ireland. Being thus maſter of the ſea, Godwin entered the harbours on the ſouthern coaſt; ſeized all the ſhips; and being joined by great numbers of his former vaſſals, he ſailed up the Thames, and appeared before London.

The approach of ſuch a formidable enemy threw every thing into confuſion. The king alone ſeemed reſolute to defend himſelf to the laſt extremity; but the interpoſition of many of the nobility, together with the ſubmiſſions of Godwin himſelf, at laſt produced an accommodation. It was ſtipulated, that Godwin ſhould give hoſtages for his good behaviour, and that all the foreigners ſhould be baniſhed the kingdom; after which, Edward, ſenſible that he had not power ſufficient to detain the earl's hoſtages in England, ſent them over to his kinſman the young duke of Normandy.

83
His ſon Harold aſpires to the crown.

Soon after this reconciliation, Godwin died as he was ſitting at table with the king. He was ſucceeded in the government of Weſſex, Suſſex, Kent, and Eſſex, and in the office of ſteward of the houſehold, a place of great power, by his ſon Harold. The ſon was no leſs ambitious than his father had been; and as he was a man of much greater abilities, he became a more dangerous enemy to Edward than even Godwin had been. Edward knew no better expedient to prevent the increaſe of Harold's power, than by giving him a rival. This was Algar ſon of Leofric duke of Mercia, whom he inveſted with the government of Eaſt Anglia, which had formerly belonged to Harold. The latter, however, after ſome broils, finally got the better of his rival, and baniſhed him the kingdom. Algar returned ſoon after with an army of Norwegians, with whom he invaded Eaſt Anglia; but his death in a ſhort time freed Harold from all further apprehenſions from that quarter. His power was ſtill further increaſed in a ſhort time after by the acceſſion of his brother Toſti to the government of Northumberland; and Edward now declining in years, and apprehenſive that Harold would attempt to uſurp the crown after his death, reſolved to appoint a ſucceſſor. He therefore ſent a deputation into Hungary, to invite over his nephew, Edward, ſon to his elder brother, who was the only remaining heir of the Saxon line. That prince accordingly came over with his children, Edgar Atheling, Margaret, and Chriſtina; but died a few days after his arrival. His death threw the king into greater perplexity than ever. Being reſolved to exclude Harold if poſſible, he ſecretly caſt his eye on his kinſman William duke of Normandy; a perſon of whoſe power, character, and capacity, he had juſtly a very high opinion. This advice had formerly been given him by Robert archbiſhop of Canterbury, who was himſelf a Norman, and had been baniſhed along with the reſt upon the return of earl Godwin. But Edward finding that the Engliſh would more eaſily acquieſce in the reſtoration of the Saxon line, had in the mean time invited his brother's deſcendants from Hungary as already mentioned. The death of his nephew, and the inexperience and unpromiſing qualities of young Edgar, made him reſume his former intentions in favour of the duke of Normandy, though his averſion to hazardous enterpriſes engaged him to poſtpone the execution, and even to keep his purpoſe concealed from all his miniſters.

Harold in the mean time increaſed his popularity by all poſſible means, in order to prepare his way for being advanced to the throne after the death of Edward, which now ſeemed to be faſt approaching. He had no ſuſpicion of the duke of Normandy as a rival; but as he knew that a ſon and grandſon of the earl Godwin were in the hands of that prince as hoſtages, he feared that they might be made uſe of as checks upon his ambition, in caſe he attempted afterwards to aſcend the throne. He therefore prevailed upon Edward to releaſe theſe hoſtages unconditionally; and having obtained his conſent, he ſet out for Normandy himſelf, attended by a numerous retinue. He was driven by a tempeſt on the territory of Guy count of

England.

Ponthieu, who detained him priſoner, and demanded an exorbitant ſum for his ranſom. Harold found means to acquaint William with his ſituation. The duke of Normandy, deſirous of gaining Harold over to his party, commanded Guy to reſtore his priſoner to his liberty. Upon this Harold was immediately put into the hands of the Norman ambaſſador, who conducted him to Rouen. William received him with great demonſtrations of reſpect and friendſhip; but ſoon took an opportunity of acquainting him with his pretenſions to the crown of England, and aſked his aſſiſtance in the execution of his ſcheme. Harold was ſurpriſed with this declaration of the duke; but being entirely in his power, he feigned a compliance with his deſires, and promiſed to ſecond to the utmoſt of his ability the will of king Edward. William, to ſecure him as much as poſſible to his intereſt, promiſed him his daughter in marriage, and required him to take an oath that he would fulfil his promiſes. Harold readily complied; but to make the oath more binding, William privately conveyed under the altar where the oath was taken, reliques of ſome of the moſt revered martyrs; and when Harold had taken the oath, he ſhowed him the relics, and admoniſhed him to obſerve religiouſly ſuch a ſolemn engagement.

Harold was no ſooner at liberty, than he found himſelf maſter of caſuiſtry ſufficient to excuſe the breaking of his oath, which had been extorted from him, and which, if kept, might be attended with the ſubjection of his country to a foreign power. He continued to practiſe every art to increaſe his popularity; and about this time, two accidents enabled him to add much to that character which he had already ſo well eſtabliſhed. The Welſh had for ſome time made incurſions into the Engliſh territories, and had lately become ſo troubleſome, that Harold thought he could not do a more acceptable piece of ſervice to the public, than undertake an expedition againſt theſe invaders. Having therefore prepared ſome light-armed foot to purſue the natives into their fortreſſes, ſome cavalry to ſecure the open country, and a ſquadron of ſhips to attack the ſea-coaſts, he employed all theſe forces againſt the enemy at once; and thus reduced them to ſuch diſtreſs, that they were obliged to purchaſe peace by ſending their prince's head to Harold, and ſubmitting to the government of two Welſh noblemen appointed by Edward.

The other incident was no leſs honourable to Harold. Toſti his brother had been created duke of Northumberland; but being of a violent tyrannical temper, had treated the inhabitants with ſuch cruelty, that they roſe in rebellion againſt him, and drove him from his government. Morcar and Edwin, two brothers, grandſons of the great duke Leofric, joined in the inſurrection; and the former being elected duke, advanced with an army to oppoſe Harold, who had been commiſſioned by the king to reduce and puniſh the Northumbrians. Before the armies engaged, Morcar endeavoured to juſtify his conduct, and repreſented to Harold, that Toſti had behaved in ſuch a manner, that no one, not even a brother, could defend him without participating of the infamy of his conduct: that the Northumbrians were willing to ſubmit to the king, but required a governor that would pay ſome attention to their privileges; and they truſted that Harold would not defend in another that violent conduct from which his own government had always kept at ſo great a diſtance. This ſpeech was accompanied by ſuch a detail of well ſupported facts, that Harold abandoned his brother's cauſe; and returning to Edward, perſuaded him to pardon the Northumbrians, and confirm Morcar in his government. He even married the ſiſter of that nobleman; and by his intereſt procured Edwin the younger brother to be choſen governor of Mercia. Toſti, in a rage, departed the kingdom, and took ſhelter in Flanders with Baldwin his father-in-law; while William of Normandy ſaw that now he had nothing to expect from Harold, who plainly intended to ſecure the crown for himſelf.

Confeſſ

Edward died in 1067, and was ſucceeded by Harold with as little oppoſition as though he had been the lawful heir. The very day after Edward's death, he was anointed and crowned by the archbiſhop of York. The whole nation ſeemed joyfully to ſwear allegiance to him. But he did not long enjoy the crown, to obtain which he had taken ſo much pains, and which he ſeemed to have ſuch capacity for wearing. His brother Toſti, provoked at his ſucceſs, ſtirred up againſt him every enemy he could have any influence with. The duke of Normandy alſo was enraged to the laſt degree at the perfidy of Harold; but before he commenced hoſtilities, he ſent an embaſſy to England, upbraiding the king with his breach of faith, and ſummoning him to reſign the kingdom immediately. Harold replied, that the oath, with which he was reproached, had been extorted by the well-grounded fear of violence, and for that reaſon could never be regarded as obligatory: that he never had any commiſſion either from the late king or the ſtates of England, who alone could diſpoſe of the crown, to make any tender of the ſucceſſion to the duke of Normandy; and if he, a private perſon, had aſſumed ſo much authority, and had even voluntarily ſworn to ſupport the Duke's pretenſions, the oath was unlawful, and it was his duty to take the firſt opportunity of breaking it: that he had obtained the crown by the unanimous ſuffrages of the people; and ſhould ſhow himſelf totally unworthy of their favour, did he not ſtrenuouſly maintain thoſe liberties with which they had entruſted him; and that the Duke, if he made any attempt by force of arms, ſhould experience the power of an united nation, conducted by a prince, who, ſenſible of the obligations impoſed on him by his royal dignity, was determined, that the ſame moment ſhould put a period to his life and to his government.

This anſwer was according to William's expectations; and therefore he had already made preparations for invading England. He was encouraged and aſſiſted in this enterpriſe by Howel count of Brittany, Baldwin earl of Flanders, the emperor Henry IV. and pope Alexander II. The latter declared Harold a perjured uſurper; denounced excommunication againſt him and his adherents; and the more to encourage William in his enterpriſes, ſent him a conſecrated banner, and a ring with one of St Peter's hairs in it. Thus he was enabled to aſſemble a fleet of 3000 veſſels, on board of which were embarked 60,000 men, choſen from among thoſe numerous ſupplies which were ſent him from all quarters. Many eminent perſonages were enliſted under

der his banners. The moſt celebrated were Euſtace count of Boulogne, Aimeri de Thouars, Hugh d'Eſtaples, William d'Evreux, Geoffroy de Rotrou, Roger de Beaumont, William de Warenne, Roger de Montgomeri, Hugh de Grantmeſnil, Charles Martel, and Geoffroy Giffard.

In order to embarraſs the affairs of Harold the more effectually, William alſo excited Toſti, in concert with Halfager king of Norway, to infeſt the Engliſh coaſts. Theſe two having collected a fleet of 350 ſhips, ſailed up the Humber, and diſembarked their troops, who began to commit great depredations. They were oppoſed by Morcar earl or duke (B) of Northumberland, and Edwin earl of Mercia, who were defeated. Harold, on the news of this invaſion, aſſembled a conſiderable army, engaged the enemy at Standford, and after a bloody battle entirely defeated them. Toſti and Halfager were killed in the action, and all the fleet fell into the hands of the victors; but Harold generouſly allowed Olave the ſon of Halfager to depart with 20 veſſels.

The king of England had ſcarce time to rejoice on account of his victory, when news were brought him that the Normans were landed in Suſſex. Harold's victory had conſiderably weakened his army. He loſt many of his braveſt officers and ſoldiers in the action; and he diſguſted the reſt, by refuſing to diſtribute the Daniſh ſpoils among them. He haſtened, however, by quick marches, to repel this new invader; but though he was reinforced at London and other places with freſh troops, he found himſelf weakened by the deſertion of his old ſoldiers, who, from fatigue and diſcontent, ſecretly withdrew from their colours. Gurth, the brother of Harold, a man of great conduct as well as bravery, became apprehenſive of the event; and entreated the king to avoid a general engagement for ſome time, or at leaſt not to hazard his perſon But though this advice was in itſelf evidently proper, and enforced by all the arguments which Gurth could ſuggeſt, Harold continued deaf to every thing that could be ſaid. Accordingly, on the 14th of October 1066, the two armies engaged near Haſtings, a town of Suſſex. After a moſt obſtinate and bloody battle *, the Engliſh were entirely defeated, Harold and his two brothers killed, and William left maſter of the kingdom of England.

Nothing could exceed the terror of the Engliſh upon the news of the defeat and death of Harold. As ſoon as William paſſed the Thames at Wallingford, Stigand, the primate, made ſubmiſſions to him in the name of the clergy; and before he came within ſight of London, all the chief nobility, and even Edgar Atheling himſelf, who, being the rightful heir to the throne, had juſt before been declared king, came and ſubmitted to the conqueror. William very readily accepted of the crown upon the terms that were offered him; which were, that he ſhould govern according to the eſtabliſhed cuſtoms of the country. He could indeed have made what terms he pleaſed; but, though really a conqueror, he choſe rather to be thought an elected king. For this reaſon he was crowned at Weſtminſter by the archbiſhop of York, and took the oath adminiſtered to the former kings of England; namely, that he would protect and defend the church, obſerve the laws of the realm, and govern the kingdom with impartiality.

88
The Engliſh grievouſly oppreſſed.

The Engliſh hiſtorians complain of the moſt grievous oppreſſion by William and his Normans. Whether by his conduct the conqueror willingly gave the Engliſh opportunities of rebelling againſt him, in order to have a pretence for oppreſſing them afterwards, is not eaſy to ſay; but it is certain that the beginning of his reign cannot juſtly be blamed. The firſt diſguſt againſt his government was excited among the clergy. William could not avoid the rewarding of thoſe numerous adventurers who had accompanied him in his expedition. He firſt divided the lands of the Engliſh barons who had oppoſed him among his Norman barons; but as theſe were found inſufficient, he quartered the reſt on the rich abbeys, of which there were many in the kingdom, until ſome other opportunity of providing for them offered itſelf.

Though this laſt ſtep was highly reſented by the clergy, it gave very little offence to the laity. The whole nation, however, was ſoon after diſguſted, by ſeeing all the real power of the kingdom placed in the hands of the Normans. He diſarmed the city of London, and other places which appeared moſt warlike and populous, and quartered Norman ſoldiers wherever he dreaded an inſurrection. This was indeed acting as a conqueror, and not as an elected king; but the event ſhowed the neceſſity of ſuch precautions. The king having thus ſecured, as he imagined, England from any danger of a revolt, determined to pay a viſit to his Norman dominions. He appointed his brother Odo, biſhop of Bayeaux, and William Fitz-Oſborne, regents in his abſence; and to ſecure himſelf yet farther, he reſolved to carry along with him ſuch of the Engliſh nobility as he put the leaſt confidence in.

Having taken all theſe methods to enſure the tranquillity of his new kingdom, William ſet ſail for Normandy in March 1067; but his abſence produced the moſt fatal conſequences. Diſcontents and murmurings were multiplied everywhere; ſecret conſpiracies were entered into againſt the government; hoſtilities were commenced in many places; and every thing ſeemed to threaten a ſpeedy revolution. William of Poictiers, a Norman hiſtorian, throws the blame entirely on the Engliſh. He calls them a fickle and mutinous race, while he celebrates with the higheſt encomiums the juſtice and lenity of Odo's and Fitz-Oſborne's adminiſtration. On the other hand, the Engliſh hiſtorians tell us, that theſe governors took all opportunities of oppreſſing the people, either with a view to provoke them to rebellion, or in caſe they tamely ſubmitted to their impoſitions, to grow rich by plundering them. Be this as it will, however, a ſecret conſpiracy was formed among the Engliſh for a general maſſacre of the Normans, like what had formerly been made of the Danes. This was proſecuted with ſo much animoſity, that the vaſſals of the earl of Coxo put him to death becauſe he refuſed to head them in the enterpriſe. The conſpirators had already taken the reſolution, and fixed the day for their intended maſſacre, which was to be on Aſh-Wedneſday, during the time of divine ſervice,

---

(B) Anciently theſe two titles were ſynonymous.

vice, when all the Normans would be unarmed as penitents, according to the diſcipline of the times. But the preſence of William diſconcerted all their ſchemes. Having got intelligence of their bloody purpoſe, he haſtened over to England. Such of the conſpirators as had been more open in their rebellion, conſulted their ſafety by flight; and this ſerved to confirm the proofs of an accuſation againſt thoſe who remained. From this time the king not only loſt all confidence in his Engliſh ſubjects, but regarded them as inveterate and irreconcileable enemies. He had already raiſed ſuch a number of fortreſſes in the country, that he no longer dreaded the tumultuous or tranſient efforts of a diſcontented multitude. He determined therefore to treat them as a conquered nation. The firſt inſtance of this treatment was his revival of the tax of Danegelt, which had been impoſed by the Daniſh conquerors, and was very odious to the people. This produced great diſcontents, and even inſurrections. The inhabitants of Exeter and Cornwal revolted; but were ſoon reduced, and obliged to implore the mercy of the conqueror. A more dangerous rebellion happened in the north; but this was alſo ſoon quaſhed, and the Engliſh became ſenſible that their deſtruction was intended. Their eaſy ſubmiſſion after the battle of Haſtings had inſpired the Normans with contempt; their commotions afterwards had rendered them objects of hatred; and they were now deprived of every expedient which could make them either regarded or beloved by their ſovereign. Many fled into foreign countries; and among the reſt Edgar Atheling himſelf, who made his eſcape to Scotland, and carried thither his two ſiſters Margaret and Chriſtina. They were well received by Malcolm, who ſoon after married Margaret the elder ſiſter, and alſo received great numbers of other exiles with the utmoſt kindneſs.

The Engliſh, though unable to make any reſiſtance openly, did not fail to gratify their reſentment againſt the Normans in a private manner. Seldom a day paſſed, but the bodies of aſſaſſinated Normans were found in the woods and high-ways, without any poſſibility of bringing the perpetrators to juſtice. Thus, at length, the conquerors themſelves began again to wiſh for tranquillity and ſecurity; and ſeveral of them, though entruſted with great commands, deſired to be diſmiſſed the ſervice. In order to prevent theſe deſertions, which William highly reſented, he was obliged to allure others to ſtay by the largeneſs of his bounties. The conſequences were, freſh exactions from the Engliſh, and new inſurrections on their part againſt their cruel maſters. The Norman power, however, was too well founded to be now removed, and every attempt of the Engliſh to regain their liberty ſerved only to rivet their chains the more firmly. The county of Northumberland, which had been moſt active in theſe inſurrections, now ſuffered moſt ſeverely. The whole of it was laid waſte, the houſes were burned, the inſtruments of agriculture deſtroyed, and the inhabitants forced to ſeek new places of abode. On this occaſion it is ſaid that above 100,000 perſons periſhed either by the ſword or famine; and the country is ſuppoſed, even to this day, to retain the marks of its ancient depopulation. The eſtates of all the Engliſh gentry were next confiſcated, and beſtowed on the Normans. By this means all the ancient and honourable families were reduced to beggary; and the Engliſh found themſelves totally excluded from every road that led either to honour or preferment.

8
Diſſ-n
in Wil
famil

By proceeding in this manner, William at laſt broke the ſpirit of the Engliſh nation, and received no farther trouble from them. In 1076, however, he found that the latter part of his life was likely to be unhappy through diſſenſions in his own family. He had four ſons, Robert, Richard, William, and Henry, beſides ſeveral daughters. Robert, his eldeſt ſon, ſurnamed *Curthoſe*, from the ſhortneſs of his legs, was a prince who inherited all the bravery and ambition of his family. He had formerly been promiſed by his father the government of the province of Maine in France, and was alſo declared ſucceſſor to the dukedom of Normandy. He demanded from his father the fulfilment of theſe promiſes; but William gave him a flat denial, obſerving, that "it was not his cuſtom to throw off his clothes till he went to bed." Robert declared his reſentment; and openly expreſſed his jealouſy of his two brothers William and Henry, (for Richard was killed, in hunting, by a ſtag). An open rupture was ſoon commenced. The two young princes one day took it into their heads to throw water on their elder brother as he paſſed through the court after leaving their apartment. Robert conſtrued this frolic into a ſtudied indignity; and having theſe jealouſies ſtill farther inflamed by one of his favourites, he drew his ſword, and ran up ſtairs with an intent to take revenge. The whole caſtle was quickly filled with tumult, and it was not without ſome difficulty that the king himſelf was able to appeaſe it. But he could not allay the animoſity which from that moment prevailed in his family. Robert, attended by ſeveral of his confederates, withdrew to Rouen that very night, hoping to ſurpriſe the caſtle; but his deſign was defeated by the governor. The popular character of the prince, however, engaged all the young nobility of Normandy, as well as of Anjou and Brittany, to eſpouſe his quarrel; even his mother is ſuppoſed to have ſupported him in his rebellion by ſecret remittances. The unnatural conteſt continued for ſeveral years; and William was at laſt obliged to have recourſe to England for ſupport againſt his own ſon. Accordingly, he drew an army of Engliſhmen together; he led them over to Normandy, where he ſoon compelled Robert and his adherents to quit the field, and was quickly reinſtated in all his dominions. Robert then took ſhelter in the caſtle of Gerberoy, which the king of France had provided for him, where he was ſhortly after beſieged by his father. As the garriſon was ſtrong, and conſcious of their treaſon, they made a gallant defence; and many ſkirmiſhes and duels were fought under its walls. In one of theſe the king and his ſon happened to meet; but being both concealed by their helmets, they attacked each other with mutual fury. The young prince wounded his father in the arm, and threw him from his horſe. The next blow would probably have put an end to his life, had he not called for aſſiſtance. Robert inſtantly recollected his father's voice, leaped from his horſe, and raiſed him from the ground. He proſtrated himſelf in his preſence, aſked pardon for his offences, and promiſed for the future a ſtrict adherence to his duty. The king was not ſo eaſily appeaſed; and perhaps his reſentment was heightened

and

by the diſgrace of being overcome. He therefore gave his malediction to his ſon; and returned to his own camp on Robert's horſe, which he had aſſiſted him to mount. After ſome recollection, however, he was reconciled to Robert, and carried him with him into England.

William returned in 1081; and being now freed from his enemies both at home and abroad, began to have more leiſure to attend to his own domeſtic affairs. For this purpoſe the *Doomsday-Book* was compoſed by his order, of which an account is given under that article. He reſerved a very ample revenue for the crown; and in the general diſtribution of land among his followers, kept poſſeſſion of no fewer than 1400 manors in different parts of the country. No king of England was ever ſo opulent; none was able to ſupport the ſplendor and magnificence of a court to ſuch a degree; none had ſo many places of truſt and profit to beſtow; and conſequently none ever had ſuch implicit obedience paid to his commands. He delighted greatly in hunting; and to indulge himſelf in this with the greater freedom, he depopulated the county of Hampſhire for 30 miles, turning out the inhabitants, deſtroying all the villages, and making the wretched outcaſts no compenſation for ſuch an injury. In the time of the Saxon kings, all noblemen without diſtinction had a right to hunt in the royal foreſts; but William appropriated all theſe to himſelf, and publiſhed very ſevere laws to prohibit his ſubjects from encroaching on this part of his prerogative. The killing of a boar, a deer, or even an hare, was puniſhed with the loſs of the delinquent's eyes; at the time when the killing of a man might be atoned for by paying a moderate fine or compoſition.

As the king's wealth and power were ſo great, it may reaſonably be ſuppoſed, that the riches of his miniſters were in proportion. Odo, biſhop of Bayeux, William's brother, was become ſo rich, that he reſolved to purchaſe the papacy. For this purpoſe, taking the opportunity of the king's abſence, he equipped a veſſel in the Iſle of Wight, on board of which he ſent immenſe treaſures, and prepared for his embarkation. He was detained, however, by contrary winds; and, in the mean time, William, being informed of his deſigns, reſolved to prevent the exportation of ſo much wealth from his dominions. Returning therefore from Normandy, where he was at that time, he came to England the very inſtant his brother was ſtepping on board. He immediately ordered him to be made priſoner: but his attendants, reſpecting the biſhop's eccleſiaſtical character, ſcrupled to execute his commands; ſo that the king was obliged to ſeize him with his own hand. Odo appealed to the Pope: but the king replied, that he did not ſeize him as biſhop of Bayeux, but as earl of Kent; and, in that capacity, he expected, and would have, an account of his adminiſtration. He was therefore ſent priſoner to Normandy; and, notwithſtanding all the remonſtrances and threats of pope Gregory, was detained in cuſtody during the remainder of William's reign.

f
en;

Soon after this, William felt a ſevere blow in the death of Matilda his queen; and, almoſt at the ſame time, received information of a general inſurrection in Maine, the nobility of which had always been averſe to his government. Upon his arrival on the continent, he found that the inſurgents had been ſecretly aſſiſted and excited by the king of France, who took all opportunities of leſſening the Norman power, by creating diſſenſions among the nobles. His diſpleaſure on this account was very much increaſed, by notice he received of ſome railleries thrown out againſt him by the French monarch. It ſeems that William, who was become corpulent, had been detained in bed ſome time by ſickneſs; and Philip was heard to ſay, that he only lay in of a big belly. This ſo provoked the Engliſh monarch, that he ſent him word, he would ſoon be up, and would, at his churching, preſent ſuch a number of tapers as would ſet the kingdom of France in a flame.

91
And of the king.

To perform this promiſe, he levied a powerful army; and, entering the Iſle of France, deſtroyed every thing with fire and ſword. He took the town of Mante, and reduced it to aſhes. But a period was ſoon put to the conqueſts and to the life of this great warrior by an accident. His horſe happening to put his fore feet on ſome hot aſhes, plunged ſo violently, that the rider was thrown forward, and bruiſed his belly on the pommel of the ſaddle. Being now in a bad habit of body, as well as ſomewhat advanced in years, he began to be apprehenſive of the conſequences, and ordered himſelf to be carried in a litter to the monaſtery of St Gervaiſe. Finding his illneſs increaſe, and being ſenſible of the approach of death, he diſcovered at laſt the vanity of all human grandeur; and was ſtruck with remorſe for thoſe many cruelties and violences of which he had been guilty. He endeavoured to make compenſation by preſents to churches and monaſteries, and gave orders for the liberation of ſeveral Engliſh noblemen. He was even prevailed upon, though not without reluctance, to releaſe his brother Odo, againſt whom he was very much incenſed. He left Normandy and Maine to his eldeſt ſon Robert. He wrote to Lanfranc the primate of England, deſiring him to crown William king of England. To Henry he bequeathed nothing but the poſſeſſions of his mother Matilda; but foretold, that one day he would ſurpaſs both his brothers in power and opulence. He expired on the 9th September 1087, in the 63d year of his age, in the 21ſt of his reign over England, and 54th of that over Normandy.

93
William Rufus.

William, ſurnamed *Rufus*, from his red hair, was in Normandy at the time of his father's illneſs. He no ſooner received the letter for Lanfranc, than, leaving his father in the agonies of death, he ſet out for England; where he arrived before intelligence of the deceaſe of the Conqueror had reached that kingdom. Being ſenſible that his brother Robert, as being the eldeſt ſon, had a preferable title to himſelf, he uſed the utmoſt diſpatch in getting himſelf firmly eſtabliſhed on the throne. The Engliſh were ſo effectually ſubdued, that they made no oppoſition; but the Norman barons were attached to Robert. This prince was brave, open, ſincere, and generous; and even his predominant fault of indolence was not diſagreeable to thoſe haughty barons, who affected an almoſt total independence of their ſovereign. The king, on the other hand, was violent, haughty, and tyrannical. A powerful conſpiracy was therefore carried on againſt William; and Odo, biſhop of Bayeux, undertook to conduct it. Many of the moſt powerful nobility were concerned; and as the conſpirators expected to be in a ſhort time ſupported by powerful ſuccours from Normandy, they retired to their caſtles, and put themſelves in an offenſive poſture.

William, ſenſible of his danger, engaged the Engliſh on his ſide, by promiſing ſome mitigation of their hardſhips, and liberty to hunt in the royal foreſts. Robert, in the mean time, through his natural indolence, neglected to give his allies proper aſſiſtance. The conſpirators were obliged to ſubmit. Some of them were pardoned; but moſt of them confiſcated, and their eſtates beſtowed on the barons who had continued faithful to the king.

93
Proves a tyrant.

William, freed from this danger, thought no more of his promiſes to the Engliſh. He proved a greater tyrant than his father; and, after the death of Lanfranc, who had been his preceptor, and kept him within ſome bounds, he gave full ſcope to his violent and rapacious diſpoſition. Not content with oppreſſing the laity, he invaded the privileges of the church; which, in thoſe days, were held moſt ſacred. He ſeized the temporalities of all the vacant biſhoprics and abbeys, and openly put to ſale thoſe ſees and abbeys which he thought proper to diſpoſe of.

94
Attempts the conqueſt of Normandy.

Theſe proceedings occaſioned great murmurs among the eccleſiaſtics, which were quickly ſpread through the nation, but the terror of William's authority preſerved the public tranquillity. In 1090, the king thought himſelf ſtrong enough to attempt the conqueſt of Normandy, which at that time was in the greateſt confuſion through the indolent and negligent adminiſtration of Robert. Several of the barons had revolted, and theſe revolts were encouraged by the king of France. Robert alſo imagined he had reaſon to fear the intrigues of his other brother Henry, whom for 3000 merks he had put in poſſeſſion of *Cottentin*, near a third part of the duchy of Normandy. He therefore threw him into priſon; but finding himſelf threatened with an invaſion from the king of England, he gave Henry his liberty, and even made uſe of his aſſiſtance in ſuppreſſing the inſurrections of his rebellious ſubjects. William, however, was no ſooner landed in Normandy, than the nobility on both ſides interpoſed, and a treaty of peace was concluded. In this treaty Henry finding his intereſts entirely neglected, retired to St Michael's Mount, a ſtrong fortreſs on the coaſt of Normandy, and infeſted the neighbourhood with his incurſions. He was beſieged by his two brothers, and obliged to capitulate in a ſhort time; after which, being deprived of all his dominions, he wandered about for ſome time with very few attendants, and often in great poverty.

The peace with Robert was of no long duration. In the interval ſome hoſtilities with Scotland ſucceeded, and theſe terminated in the death of Malcolm king of that country; after which new broils enſued with Normandy. The rapacious temper of William prompted him to encroach upon his brother's territories, and the ſame rapacity prompted him to uſe a very extraordinary expedient in order to accompliſh his deſigns. Having gone over to Normandy to ſupport his partiſans, he ordered an army of 20,000 men to be raiſed in England, and conducted to the ſea-coaſt as if they were to be immediately embarked: but when they came there, inſtead of embarking, they were forced to pay the king ten ſhillings a man; after which they were diſmiſſed to their ſeveral counties. With this money William engaged the king of France to depart from the protection of Robert; and alſo bribed many of the Norman barons to revolt. He was called from Normandy, however, by an irruption of the Welſh; and having repulſed them, he was prevented from attempting other enterpriſes by a conſpiracy of his barons.

merk

In 1096, however, the ſuperſtition of Robert put the king of England in poſſeſſion of thoſe dominions which he had not been able to conquer by force of arms. The cruſades were now commenced, and Robert was deſirous of undertaking an expedition into the Holy Land. As money for this purpoſe was wanting, he mortgaged his dominions to his brother for 10,000 merks. The king raiſed the money by violent extortions on his ſubjects; forcing even the convents to melt their plate, in order to furniſh the quota demanded of them. He was then put in poſſeſſion of Normandy and Maine; and Robert with a magnificent train ſet out for the Holy Land.

His q
with
prima

After the death of Lanfranc, the king had retained in his own hands the revenues of Canterbury, as he had done thoſe of many other biſhoprics; but falling into a dangerous illneſs, he was ſeized with remorſe; and the clergy repreſented to him that he was in danger of eternal perdition if he did not make atonement for thoſe impieties and ſacrileges of which he had been guilty. He therefore inſtantly reſolved to ſupply the vacancy of Canterbury: he ſent for Anſelm, a Piedmonteſe by birth, abbot of Bec in Normandy, who was much celebrated for his piety and devotion. The abbot refuſed the dignity with great earneſtneſs; fell on his knees, wept, and intreated the king to change his purpoſe; and when he found him obſtinate in forcing the paſtoral ſtaff upon him, he kept his fiſt ſo hard clenched, that it required the utmoſt violence of the byſtanders to open it, and force him to receive that enſign of his ſpiritual dignity. William ſoon after recovered his health, and with it his violence and rapacity. As he now ſpared the church no more than before, a quarrel with Anſelm ſoon enſued; and this was the more dangerous to the king, on account of the great character for piety which the primate had acquired by his zeal againſt abuſes of all kinds, particularly thoſe of dreſs and ornament.

At this time there was a mode which prevailed not only in England, but throughout Europe, both among men and women, of giving an enormous length to their ſhoes, drawing the toe to a ſharp point, and affixing to it the figure of a bird's bill, or ſome ſuch ornament, which was turned upwards, and which was often ſuſtained by gold or ſilver chains tied to the knee. The eccleſiaſtics took exception at this ornament, which they ſaid was an attempt to bely the ſcripture, where it is affirmed, that no man can add a cubit to his ſtature; and they not only declaimed againſt it with vehemence, but aſſembled ſome ſynods, in which the faſhion was abſolutely condemned. Such, however, are the contradictions in human nature, that all the influence of the clergy, which at that time was ſufficient to ſend vaſt multitudes of people into Aſia to butcher one another, was not able to prevail againſt thoſe long-pointed ſhoes. The faſhion, contrary to what hath happened to almoſt all others, maintained its ground for ſeveral centuries; and even Anſelm found his endeavours againſt it ineffectual. He was more ſucceſsful in decrying the long hair and curled locks then worn by the courtiers. He refuſed the aſhes on Aſh-Wedneſday to ſuch as were ſo accoutred; and his authority and eloquence had ſuch influence, that the young men univerſally abandoned that ornament, and appeared in the cropt hair recommended to them by the ſermons of the primate. For this reformation Anſelm is highly celebrated by his hiſtorian Eadmer, who was alſo his companion and ſecretary.

When William's profaneneſs returned with his health, he was engaged in almoſt perpetual conteſts with this auſtere prelate *. Theſe were pretty well ſettled, when the king, who had undertaken an expedition into Wales, required Anſelm to furniſh him with a certain number of ſoldiers. The primate regarded this as an invaſion of the rights of the church; and therefore, tho' he durſt not refuſe compliance, ſent the men ſo miſerably accoutred, that the king was exceedingly diſpleaſed, and threatened him with a proſecution. Anſelm demanded reſtitution of all his revenues which the king had ſeized, and appealed to the Pope. The quarrel, however, ran ſo high that the primate found it dangerous to remain in England. He deſired and obtained the king's permiſſion to retire beyond ſea. His temporalities were confiſcated immediately on his departure; but pope Urban received him as a martyr in the cauſe of religion, and even threatened the king with ſentence of excommunication. William, however, proceeded in his projects of ambition and violence, without regarding the threats of the Pope; who he knew was at that time too much engaged with the cruſades to mind any other buſineſs. Though his acquiſition of Maine and Normandy had brought him into perpetual conteſts with the haughty and turbulent barons who inhabited thoſe countries, and raiſed endleſs tumults and inſurrections; yet William ſeemed ſtill intent on extending his dominions either by purchaſe or conqueſt. William Earl of Poictiers and Duke of Guienne had reſolved upon an expedition to the Holy Land; and, for this purpoſe, had put himſelf at the head of a vaſt multitude, conſiſting, according to ſome hiſtorians, of 60,000 horſe, and a much greater number of foot. Like Robert of Normandy, he offered to mortgage his dominions for money ſufficient to conduct this multitude into Aſia. The king accepted his offer; and had prepared a fleet and army to take poſſeſſion of theſe dominions, when an unfortunate accident put an end to his projects and his life. He was engaged in hunting, the ſole amuſement, and indeed the principal occupation, of princes in thoſe rude times. Walter Tyrrel, a French gentleman remarkable for his ſkill in archery, attended him in this recreation, of which the new foreſt was the ſcene. William had diſmounted after a chaſe; and Tyrrel, impatient to ſhow his dexterity, let fly an arrow at a ſtag which ſuddenly ſtarted before him. The arrow glanced from a tree, and ſtruck the king to the heart. He inſtantly fell down dead; and Tyrrel, terrified at the accident, clapt ſpurs to his horſe, haſtened to the ſea-ſhore, and embarked for France, where he joined the cruſade that was ſetting out from that country. This happened on the 2d of Auguſt 1100, after the king had reigned 13 years, and lived about 40. His body was found in the woods by the country-people, and buried without ceremony at Wincheſter.

99
Prince Henry uſurps the crown.

After the death of William, the crown of right devolved to Robert his eldeſt brother; for William had no legitimate children. But what Robert had formerly loſt by his indolence, he was again deprived of by his abſence at the holy war. Prince Henry was in the foreſt with William Rufus at the time the latter was killed. He no ſooner heard the important news, than he hurried to Wincheſter, and ſecured the royal treaſure. William de Breteuil, keeper of the treaſure, arrived almoſt the ſame inſtant, and oppoſed his pretenſions; telling him, that the treaſure belonged to his elder brother, who was now his ſovereign, and for whom he was determined to keep it. But Henry, drawing his ſword, threatened him with inſtant death if he dared to diſobey him; and others of the late king's retinue, who came every moment to Wincheſter, joining the prince's party, he was obliged to deſiſt. Henry loſt no time in fully accompliſhing his purpoſe. In leſs than three days he got himſelf crowned king of England by Maurice biſhop of London. Preſent poſſeſſion ſupplied every deficiency of title; and no one dared to appear in defence of the abſent prince.

100
His charter in favour of the people.

The beginning of king Henry's reign promiſed to be favourable to the Engliſh liberty; owing chiefly to his fear of his brother. To conciliate the affections of his ſubjects, he paſſed a charter calculated to remove many of the grievous oppreſſions which had been complained of during the reigns of his father and brother. He promiſed, that at the death of any abbot or biſhop, he never would ſeize the revenues of the ſee or abbey during the vacancy, but would leave the whole to be reaped by the ſucceſſor; and that he would never let to farm any eccleſiaſtical benefice, or diſpoſe of it for money. To the laity he promiſed, that, upon the death of any earl, baron, or military tenant, his heir ſhould be admitted to the poſſeſſion of his eſtate, on paying a juſt and lawful relief; without being expoſed to thoſe enormous exactions which had been formerly required. He remitted the wardſhip of minors; and allowed guardians to be appointed, who ſhould be anſwerable for the truſt. He promiſed not to diſpoſe of any heireſs in marriage but by advice of all the barons; and if any baron intended to give his daughter, ſiſter, niece, or kinſwoman, in marriage, it ſhould only be neceſſary for him to conſult the king, who promiſed to take no money for his conſent, nor ever to refuſe permiſſion, unleſs the perſon to whom it was propoſed to marry her ſhould happen to be his enemy. He granted his barons and military tenants the power of bequeathing by will their money or perſonal eſtates; and if they neglected to make a will, he promiſed that their heirs ſhould ſucceed to them. He renounced the right of impoſing moneyage, and of levying taxes at pleaſure, on the farms which the barons kept in their own hands. He made ſome general profeſſions of moderating fines; he offered a pardon for all offences; and remitted all debts due to the crown. He alſo required, that the vaſſals of the barons ſhould enjoy the ſame privileges which he granted to his own barons; and he promiſed a general confirmation and obſervance of the *laws of king Edward* *. To give greater authenticity to theſe conceſſions, a

copy of the charter was lodged in ſome abbey of each county.

101
Quarrels with the primate.

King Henry, farther to increaſe his popularity, degraded and committed to priſon Ralph Flambard biſhop of Durham, who had been the chief inſtrument of oppreſſion under his brother. He ſent for Anſelm, who was then at Lyons, inviting him to return and take poſſeſſion of his dignities. Anſelm returned; but when Henry propoſed to him to do the ſame homage to him which he had done to his brother, the king met with an abſolute refuſal. During his exile, Anſelm had aſſiſted at the council of Bari; where, beſides fixing the controverſy between the Greek and Latin churches concerning the proceſſion of the Holy Ghoſt, the right of election to church-preferments was declared to belong to the clergy alone, and ſpiritual cenſures were denounced againſt all eccleſiaſtics who did homage to laymen for their fees and benefices, and on all laymen who exacted it. The rite of homage † by the feudal cuſtoms was, that the vaſſal ſhould throw himſelf on his knees, put his joined hands between thoſe of his ſuperior, and ſhould in that poſture ſwear fealty to him. But the council declared it execrable, that pure hands, which could create God, and offer him up for the ſalvation of mankind, ſhould be put, after this humiliating manner, between profane hands, which, beſides being inured to rapine and bloodſhed, were employed day and night in impure purpoſes and obſcene contacts. To this decree therefore Anſelm appealed; and declared, that ſo far from doing homage for his ſpiritual dignity, he would not even communicate with any eccleſiaſtic who paid that ſubmiſſion, or who accepted of inveſtitures from laymen. Henry durſt not inſiſt; and therefore deſired that the controverſy might be ſuſpended, and that meſſengers might be ſent to Rome to accommodate matters with the Pope, and to obtain his confirmation of the laws and cuſtoms of England.

† See Feudal *Tenure*.

102
He marries Matilda.

Henry now took another ſtep which ſeemed capable of confirming his claims to the crown without any danger of a rival. The Engliſh remembered with regret their Saxon monarchs, when they compared the liberty they enjoyed under them with the tyranny of the Normans. Some deſcendants of that favourite line ſtill remained; and among the reſt, Matilda, the niece of Edgar Atheling. Upon her the king fixed his eyes as a proper conſort, by whoſe means the breach between the Saxons and Normans might be cemented. A difficulty, however, occurred, becauſe ſhe had been educated in a nunnery. The affair was examined by Anſelm in a council of prelates and nobles ſummoned at Lambeth. Matilda there proved, that ſhe had put on the veil, not with a deſign of entering into a religious life, but merely in imitation of a cuſtom familiar to the Engliſh ladies, who protected their chaſtity from the brutal violence of the Normans by taking ſhelter under that habit, which amid the horrid licentiouſneſs of the times was yet generally revered. The council, ſenſible that even a princeſs had otherwiſe no ſecurity for her honour, admitted this reaſon as valid. They pronounced that Matilda was ſtill free to marry; and her nuptials with Henry were celebrated by Anſelm with great ſolemnity and pomp.

10
Crow
Engla
claim
Rober

While Henry was thus rendering himſelf popular at home, his brother Robert, who had loitered away a twelvemonth in Italy, where he married Sibylla daughter of the count of Converſana, arrived in England, in 1101, in order to put in his late and ineffectual claim to the crown. His fame, however, on account of the exploits he had performed in Paleſtine, was ſo great, that even yet he was joined by many noblemen of the firſt rank, and the whole nation ſeemed prepoſſeſſed in his favour. But Henry, having paid his court to Anſelm, by his means retained the army in his intereſts, and marched with them to Portſmouth, where Robert had landed his forces a few days before. The armies lay for ſome time in ſight of each other; when an accommodation was effected through the mediation of Anſelm and other great men. By this treaty it was agreed, that Robert ſhould reſign his pretenſions to England, and receive in lieu of them an annual penſion of 3000 marks; that if either of the princes died without iſſue, the other ſhould ſucceed to his dominions; that the adherents of each ſhould be pardoned, and reſtored to all their poſſeſſions either in Normandy or England; and that neither Robert nor Henry ſhould thenceforth encourage, receive, or protect, the enemies of each other.

The two princes ſeparated with mutual marks of friendſhip; but next year, Henry, under various pretences confiſcated the eſtates of almoſt all the noblemen who had favoured his brother's pretenſions. Robert, enraged at the fate of his friends, ventured to come to England in order to remonſtrate with his brother in perſon. But he met with ſuch a bad reception, that, apprehending his liberty to be in danger, he was glad to make his eſcape by reſigning his penſion.

1
Norn
invad
Henr

This infringement of the treaty was followed the enſuing year by an invaſion of Normandy, at the deſire of Robert's own ſubjects, whom he was totally incapable of governing *. The event of this war was the defeat and captivity of Robert, who was henceforth deprived not only of all his dominions, but of his perſonal liberty. He lived 28 years a priſoner, and died in the caſtle of Cardiff in Glamorganſhire. It is even ſaid by ſome, that he was deprived of his ſight by a red-hot copper-baſon applied to his eyes, and that king Henry appeaſed his conſcience by founding the monaſtery of Reading.

1
Quar
with
prim

The conqueſt of Normandy was completed in 1006; and next year the controverſy between the king and primate, concerning the inveſtitures of clergymen and their doing homage to princes, was reſumed. The king was very ſenſible that it was not his intereſt to quarrel with ſuch a powerful body as the clergy were at that time; and on the other hand he fully underſtood the neceſſity of guarding the prerogatives of the crown from their encroachments. While, therefore, he avoided an open rupture with Anſelm, he obſtinately refuſed to give up the privileges which had been enjoyed by his predeceſſors. On the firſt arrival of Anſelm, the king had avoided the diſpute in the manner already mentioned. A meſſenger was diſpatched to Rome, in order to compromiſe matters with the Pope. The meſſenger returned with an abſolute refuſal of the king's demands. One of the reaſons given by the Pope on this occaſion, was expreſſed in the following words: "It is monſtrous that a ſon ſhould pretend to beget his father, or a man to create his God: prieſts are called

called *gods* in ſcripture, as being the vicars of God: and will you, by your abominable pretenſions to grant them their inveſtiture, aſſume the right of creating them?" Henry was not yet convinced; but as he was determined to avoid, or at leaſt to delay, the coming to any dangerous extremity with the church, he perſuaded Anſelm, that by farther negociation he ſhould be able to compound matters with the Pope. Meſſengers were therefore diſpatched to Rome a ſecond time from the king; and alſo from Anſelm, who wanted to be fully aſſured of the Pope's intentions. They returned with letters wrote in the moſt arrogant and poſitive manner, both to the king and primate. The king ſuppreſſed the letter ſent to himſelf; and perſuaded the three biſhops, by whom it was ſent, to aſſert, upon their epiſcopal faith, that the Pope had aſſured them of his private good intentions towards king Henry, and of his reſolution not to reſent any future exertion of his prerogative in granting inveſtitures; though he himſelf ſcrupled to give this aſſurance under his hand, leſt other princes ſhould copy the example and aſſume a like privilege. Anſelm's two meſſengers, who were monks, affirmed that it was impoſſible this ſtory could have any foundation; but their word was not deemed equivalent to that of three biſhops; and the king, as if he had finally gained his cauſe, proceeded to fill the ſees of Hereford and Saliſbury, and to inveſt the new biſhops in the uſual manner. Anſelm, however, gave no credit to the aſſertions of the king's meſſengers; and therefore refuſed not only to conſecrate them, but even to communicate with them; and the biſhops themſelves, finding they were become univerſally odious, returned the enſigns of their ſpiritual dignity.

The quarrel continued between the king and primate, till the latter, ſenſible of his dangerous ſituation, deſired leave to make a journey to Rome, in order to lay the caſe before the Pope. This permiſſion was eaſily obtained; but no ſooner was the primate gone, than Henry confiſcated all his revenues, and ſent another meſſenger to negociate with the Pope. The new meſſenger told his holineſs, that his maſter would ſooner part with his crown than the right of granting inveſtitures. "And I (replied the Pope) would rather loſe my head than allow him to retain it." This quarrel now became very dangerous to the king; as he was threatened by the Pope with excommunication, which would have been attended with terrible conſequences. At laſt, however, a compromiſe was made in the following manner. Before biſhops took poſſeſſion of their dignities, they had formerly been accuſtomed to paſs through two ceremonials: They received, from the hands of the ſovereign, a ring and croſier as the ſymbols of their office, and this was called their *inveſtiture*: they alſo made thoſe ſubmiſſions to the prince, which were required of the vaſſals by the rites of the feudal law, and which received the name of *homage*. The Pope, therefore, was for the preſent contented with Henry's reſigning his right of granting inveſtitures, by which the ſpiritual dignity was ſuppoſed to be conferred; and he allowed the biſhops to do homage for their temporal properties and privileges. After this, the Pope allowed Anſelm to communicate with the prelates who had already received inveſtitures from the crown; and he only required of them ſome ſubmiſſions for their paſt conduct. He alſo granted to Anſelm a plenary power of remedying every diſorder, which he ſaid might ariſe from the barbarouſneſs of the country. About the ſame time the marriage of prieſts was prohibited; and even laymen were not allowed to marry within the ſeventh degree of affinity. By this contrivance the Pope augmented the profits which he reaped from granting diſpenſations, and likewiſe thoſe from divorces. For as the art of writing was then rare, and pariſh-regiſters were not regularly kept, it was not eaſy to aſcertain the degrees of affinity even among people of rank; and any man who had money to pay for it, might obtain a divorce, on pretence that his wife was more nearly related to him than was permitted by the canons. A decree was alſo publiſhed, prohibiting the clergy to wear long hair; and the king, tho' he would not reſign his prerogatives to the church, very willingly cut his hair in the form which was required of him, obliging all the courtiers at the ſame time to follow his example.

From the time of this compromiſe, which happened in 1107, to the year 1120, nothing remarkable happened except ſome ſlight commotions in Normandy: but this year, prince William, the king's only ſon, was unfortunately drowned off the coaſt of Normandy; and Henry was ſo much affected, that he is ſaid never afterwards to have ſmiled or recovered his wonted cheerfulneſs. It is very doubtful, however, whether the death of this prince was not an advantage to the Britiſh nation, ſince he was often heard to expreſs the utmoſt hatred to the natives; inſomuch that he had threatened, that when he came to the throne, he would make them draw the plough, and would turn them into beaſts of burden. Theſe prepoſſeſſions he inherited from his father; who, though he was wont, when it might ſerve his purpoſes, to value himſelf on his birth as a native of England, ſhowed, in the courſe of his government, an extreme prejudice againſt that people. All hopes of preferment to eccleſiaſtical as well as civil dignities are denied to the Engliſh during this whole reign; and any foreigner, however ignorant or worthleſs, was ſure to have the preference in every competition. The charter formerly mentioned, which the king granted at the beginning of his reign, was no more thought of; and the whole fell ſo much into neglect and oblivion, that in the following century, when the barons, who had heard an obſcure tradition of it, deſired to make it the model of the great charter which they exacted from king John, they could only find one copy of it in the whole kingdom; while the grievances, propoſed to be redreſſed by it, continued ſtill in their full extent.

106
Prince William drowned.

As Henry had now no legitimate children except Matilda, whom in 1110 he had betrothed, though only eight years of age, to the emperor of Germany, he was induced to marry a ſecond time in hopes of having ſons. He made his addreſſes accordingly to Adelais the daughter of Godfrey Duke of Lovaine, and niece to Pope Calixtus; a young princeſs of an amiable perſon. But Adelais brought him no children: and in 1135, the king died in Normandy, from eating too plentifully of lampreys; having lived 67 years, and reigned 35.

107
Death of King Henry.

By the will of king Henry, his daughter Matilda became heireſs of all his dominions. She had been

England. married, after her firſt huſband's death, to Geoffrey Plantagenet eldeſt ſon of the count of Anjou, by whom ſhe had a ſon named *Henry;* but as Geoffrey had given umbrage to the king of England in ſeveral inſtances, no notice was taken of him in the will. The nobility had already ſworn fealty to her; and the foremoſt to ſhow this mark of ſubmiſſion to the king's will had been Stephen, ſon of the count of Blois (who had married Adela the daughter of William the Conqueror). He had been married to Matilda daughter and heireſs of Euſtace Count of Boulogne; who brought him, beſides that feudal ſovereignty of France, a vaſt property in England, which in the diſtribution of lands had been conferred by the Conqueror on the family of Boulogne. By this marriage Stephen acquired a new connection with the royal family of England: for Mary, his wife's mother, was ſiſter to David the preſent king of Scotland, and to Matilda the firſt wife of Henry and mother of the empreſs. The king alſo, imagining that by the aggrandizement of Stephen he ſtrengthened the intereſt of his own family, had enriched him with many poſſeſſions; but inſtead of this, it appeared by the event that he had only put it more and more in his power to uſurp the throne.

108 Stephen uſurps the throne.

No ſooner was Henry dead, than Stephen haſtened from Normandy into England. The citizens of Dover and Canterbury, apprized of his purpoſe, ſhut their gates againſt him; but when he arrived at London, ſome of the lower claſs of people, inſtigated by his emiſſaries, immediately proclaimed him king. The archbiſhop of Canterbury refuſed to give him the royal unction; but this difficulty was got over by Stephen's brother the biſhop of Wincheſter. Hugh Bigod, ſteward of the houſehold, made oath before the primate, that the late king, on his death-bed, had diſcovered a diſſatisfaction with his daughter Matilda, and had expreſſed his intention of leaving the Count of Boulogne heir to all his dominions; and the biſhop, either believing, or pretending to believe, this teſtimony, gave Stephen the royal unction. Very few of the nobility attended his coronation; but none oppoſed his uſurpation, however unjuſt or flagrant.

Stephen, in order to eſtabliſh himſelf on the throne as firmly as poſſible, paſſed a charter, in which he made liberal promiſes to all ranks of men. To the clergy he promiſed, that he would ſpeedily fill all the vacant benefices, and never would levy any of their rents during the vacancy. To the nobility he gave liberty to hunt in their own foreſts; and to the people he promiſed to remit the tax of danegelt, and to reſtore the laws of Edward the Confeſſor. He ſeized the king's treaſure at Wincheſter, amounting to L. 100,000; with part of which money he hired mercenary ſoldiers from the continent; and with another part procured a bull from the Pope, confirming his title to the Engliſh throne.

Matilda, in the mean time, endeavoured to recover her juſt rights of which Stephen had deprived her; but for ſome time ſhe met with no ſucceſs either in England or Normandy. Her huſband Geoffrey himſelf was obliged to conclude a peace with Stephen, on condition of the king's paying him during that time an annual penſion of L. 5000.

Robert Earl of Gloceſter was the firſt who ſhook the power of Stephen. He was natural ſon to the late king; a man of great honour and ability, and was very much attached to the intereſts of Matilda. When Stephen uſurped the throne, he offered to do him homage, and take the oath of fealty; but with an expreſs condition, that the king ſhould maintain all his ſtipulations, and never invade any of Robert's rights or dignities. With this condition Stephen was obliged to comply, on account of the great power of that nobleman, though he knew that it was meant only to afford him a favourable opportunity of revolting when occaſion ſerved. The clergy imitated Robert's example; and annexed to their oath of allegiance the following condition, namely, that they were only bound as long as the king defended the eccleſiaſtical liberties, and ſupported the diſcipline of the church. The barons, in return for their ſubmiſſion, exacted terms of ſtill more pernicious tendency. Many of them required to have the right of fortifying their caſtles, and putting themſelves in a poſture of defence; and with this exorbitant demand the king was forced to comply. All England was immediately filled with theſe fortreſſes; which the noblemen garriſoned either with their vaſſals, or with licentious ſoldiers, who flocked to them from all quarters. The whole kingdom now became a ſcene of rapine and devaſtation. Wars were carried on by the nobles in every quarter; the barons even aſſumed the right of coining money, and of exerciſing, without appeal, every act of juriſdiction; and the inferior gentry, as well as the people, finding no defence from the laws, during this total diſſolution of ſovereign authority, were obliged, for their immediate ſafety, to pay court to ſome neighbouring chieftain, and to purchaſe his protection, both by ſubmitting to his exactions, and by aſſiſting him in his rapine upon others.

In 1137, the Earl of Gloceſter having projected an inſurrection, retired beyond ſea, ſent the king a defiance, and ſolemnly renounced his allegiance. The next year David king of Scotland appeared with an army in defence of his niece's title; and penetrating into Yorkſhire, committed the greateſt devaſtations. He was defeated, however, with great ſlaughter, at Northallerton, by ſome of the northern barons, who had raiſed a powerful army; and this ſucceſs ſo much overawed the malecontents in England, that Stephen's power might have received ſome ſtability, had he not unfortunately engaged himſelf in a conteſt with the clergy. He had already ſeen the miſchief ariſing from the liberty he had granted of fortifying ſo many caſtles in different parts of the kingdom. He therefore determined to abridge this liberty as much as poſſible; and for that purpoſe he began with the caſtles erected by the clergy, who ſeemed to have leſs right to theſe military ſecurities than the barons. Taking advantage therefore of a fray which had ariſen at court between the retinue of the biſhop of Saliſbury and the Earl of Brittany, he ſeized the biſhops both of Saliſbury and Lincoln, threw them into priſon, and obliged them to deliver up the caſtles which they had lately erected. This produced ſuch a violent commotion, that the opportunity ſeemed favourable to the pretenſions of Matilda. On the 22d of September 1139, ſhe landed in England with Robert Earl of Gloceſter, attended only by 140 knights; but her partizans daily increaſed, and ſhe was ſoon in a condition to face Steland. phen with equal forces in the field. Numberleſs encounters happened, the detail of which could afford very little entertainment to the reader. War was ſpread through every quarter; and the turbulent barons having, in a great meaſure, ſhaken off all reſtraint of government, and now obtained the ſanction of fighting in the cauſe of their country, redoubled their oppreſſions, tyrannies, and devaſtations. The caſtles of the nobility became receptacles of licenſed robbers; who, ſallying forth day and night, ſpoiled the open country, plundered the villages, and even cities. They tortured the captives to make them reveal their treaſures; ſold their perſons to ſlavery; and ſet fire to the houſes, after they had pillaged them of every thing valuable. In conſequence of this deſtruction, the land was left untilled; the inſtruments of huſbandry were abandoned; and a grievous famine reduced the nation to the moſt deplorable ſtate that can be imagined.

11 en de- l and pri- After a multitude of indeciſive conflicts, a battle enſued which ſeemed likely to enſure the public peace for ſome time. Stephen had marched his forces to relieve the city of Lincoln; the Earl of Gloceſter led a body of troops to aſſiſt thoſe of Matilda's party, who were beſieging that place. The two armies engaged on the 2d of February within ſight of the city, and a deſperate battle enſued. At laſt Stephen's army was defeated. He himſelf was for ſome time left without attendants; and fought on foot in the midſt of his enemies, aſſaulted by multitudes, and reſiſting all their efforts with aſtoniſhing intrepidity. Being hemmed in on every ſide, he forced a way for ſome time with his battle-ax; but that breaking, he drew his ſword, and with it furiouſly aſſailed his antagoniſts for ſome time longer. But at length the ſword alſo flying in pieces, he was obliged to ſurrender himſelf a priſoner. He was conducted to Gloceſter; and though at firſt treated with reſpect, he was in a ſhort time, upon ſome ſuſpicions, thrown into irons.

12 lda ned. About a month after, Matilda was crowned at Wincheſter with great ſolemnity; but ſoon ſhowed herſelf totally incapable of governing ſuch a turbulent nation. She determined to repreſs the power of the nobles, who had now left only the ſhadow of authority to their ſovereign. But being deſtitute of policy or prudence ſufficient to accompliſh ſo difficult an undertaking, a conſpiracy was ſoon formed againſt her, and the biſhop of Wincheſter detached a party of his friends and vaſſals to block up the city of London where the queen reſided. At the ſame time meaſures were taken to inſtigate the Londoners to a revolt, and to ſeize the queen's perſon. Matilda, having timely notice of this conſpiracy, fled to Wincheſter. Here ſhe was ſoon after beſieged by the biſhop: but the town being diſtreſſed by famine, ſhe with difficulty made her eſcape; while her brother the Earl of Gloceſter, endeavouring to follow, was taken priſoner, and exchanged for Stephen.

3 en ed. Matilda was now obliged to take ſhelter in Oxford, while Stephen reaſcended the throne. The civil war broke out with redoubled fury. Many battles were fought, and both parties were involved in many diſtreſſes. Matilda eſcaped from Oxford at a time when the fields were covered with ſnow, by being dreſſed all in white, with four knights her attendants dreſſed in the ſame colour. Another time Stephen was ſurpriſed by the earl of Gloceſter at Wilton, and made his eſcape with the utmoſt difficulty. At laſt Matilda was obliged to quit the kingdom; and the death of the earl of Gloceſter ſoon after ſeemed to give a fatal blow to her intereſts. In 1153, however, prince Henry, Matilda's ſon by her ſecond huſband Geoffrey, came over to England, in order once more to diſpute Stephen's pretenſions to the crown. After ſome ſucceſs on his firſt landing, he was oppoſed by Stephen with a powerful army, and matters ſeemed likely to come to the deciſion of a general engagement. But while the two armies continued within a quarter of a mile of each other, a treaty was ſet on foot by the interpoſition of William earl of Arundel, for terminating the diſpute in an amicable manner. The death of Euſtace, Stephen's ſon, whom he had deſigned for the throne, which happened during the courſe of the treaty, facilitated its concluſion. It was agreed, that Stephen ſhould reign during his life, and that juſtice ſhould be adminiſtered in his name; that Henry, on Stephen's death, ſhould ſucceed to the kingdom; and that William, Stephen's ſon, ſhould inherit Boulogne and his patrimonial eſtate. This treaty filled all Europe with joy; and after the barons had ſworn to it, Henry left England, and Stephen returned to the peaceable enjoyment of his throne. His reign, however, was but of ſhort continuance; his death happening on the 25th of October 1154. 114 His death.

Henry was on the continent beſieging a caſtle of one of the mutinous barons, when news was brought him of Stephen's death. But, as he was ſenſible of the goodneſs of his title, he did not abandon his enterprize till the place was reduced. He then ſet out on his journey, and was received in England with the utmoſt joy. The firſt acts of his reign ſeemed to promiſe an happy and proſperous adminiſtration. 115 Henry II. He inſtantly diſmiſſed the mercenary ſoldiers who had committed the greateſt diſorders throughout the nation. He ordered all the caſtles which had been erected ſince the death of Henry I. to be demoliſhed, except a few which he retained in his own hands for the protection of the kingdom. The adulterated coin which had been ſtruck during the reign of Stephen was cried down, and new money ſtruck of the right value and ſtandard. He reſumed many of thoſe benefactions which had been made to churches and monaſteries in the former reigns. He gave charters to ſeveral towns, by which the citizens claimed their freedom and privileges independent of any ſuperior but himſelf. Theſe charters were the ground-work of the Engliſh liberty; for thus a new order, namely, the more opulent of the people, began to claim a ſhare in the adminiſtration, as well as the nobility and clergy. Thus the feudal government was at firſt impaired; and liberty began to be more equally diffuſed throughout the nation.

Henry II. on his acceſſion to the Engliſh throne, found himſelf poſſeſſed of very extenſive dominions on the continent. In the right of his father, he poſſeſſed Anjou, Touraine, and Maine; in that of his mother, Normandy; in that of his wife, Guienne, Poictou, Xaintogne, Auvergne, Perigord, Angoumois, and the Limouſin. Soon after, he annexed Brittany to his other ſtates, by marrying his ſon, who was yet a child, to the heireſs of Brittany, who was a child alſo.

alſo, and was already in poſſeſſion of the ſuperiority over that province. Theſe territories compoſed above a third of the French monarchy, and were by far the moſt opulent part of it; ſo that Henry, though vaſſal to the king of France, was greatly ſuperior to him in power: and when England was added to all theſe, the French king had great reaſon to apprehend ſome diſaſter to himſelf and family. The king of England, however, reſided at too great a diſtance to be able to employ this formidable power with ſucceſs againſt the French monarch. He ſoon became a kind of ſtranger in his continental dominions; and his ſubjects there conſidered their allegiance as more naturally due to their ſuperior lord, who lived in their neighbourhood, and who was acknowledged to be the ſupreme head of their nation. Their immediate lord was often at too great a diſtance to protect them; and a commotion in any part of Henry's extenſive dominions gave great advantages againſt him. The wiſe and vigorous adminiſtration of Henry, however, counterbalanced in a great meaſure theſe diſadvantages; and he maintained a ſurpriſing tranquillity throughout his extenſive dominions during the greateſt part of his reign.

116
Monſtrous wickedneſs of the clergy.

Henry found no great difficulty in circumſcribing the power of the barons; but when he attempted to do the ſame thing with the clergy, he met with the moſt violent oppoſition. That body had carried their independence on the civil power ſo far, that now they ſeemed to aim at nothing leſs than a liberty to commit all manner of crimes with impunity. During the reign of Stephen, they had extorted an immunity from all but eccleſiaſtical penalties*; and that grant they were reſolved to maintain for the future. It may eaſily be ſuppoſed, that a law which thus ſcreened their wickedneſs, contributed to increaſe it; and we accordingly find upon record, not leſs than 100 murders committed by men in holy orders, in the ſhort period ſince the king's acceſſion, not one of which was puniſhed even with degradation; while the biſhops themſelves ſeemed to glory in this horrid indulgence. The king did not make any attempts againſt them during the life of Theobald archbiſhop of Canterbury, who was a man of a mild character, and beſides had great merit; becauſe, during the former reign, he had refuſed to put the crown on the head of Euſtace, Stephen's ſon. He died in 1162; and the king, after his death, advanced to the ſee of Canterbury Thomas a Becket, his chancellor, on whoſe compliance he thought he might entirely depend.

117
Conteſts of the king with Thomas a Becket.

The new archbiſhop was the firſt man of Engliſh pedigree, who, ſince the Norman conqueſt, had riſen to any conſiderable ſtation. Before his inſtalment in the ſee of Canterbury, Becket had been exceedingly complaiſant, good-humoured, and agreeable to his maſter; and had alſo been accuſtomed to live very freely. But no ſooner was he inveſted with this high dignity, than he totally altered his conduct, and put on all thoſe airs of affected and oſtentatious humility which could recommend him to the ſuperſtitious and ignorant multitude in that age. The firſt ſtep taken by this hypocrite after his advancement, was to reſign the office of chancellor. This he did without conſulting the king: the reaſon he gave was, that henceforth he muſt detach himſelf from ſecular affairs, and be ſolely employed in the duties of his ſacred function; but in reality, that he might break off all connexion with Henry. As he knew that the king intended to abridge the eccleſiaſtical power, he thought the beſt method would be to become himſelf the aggreſſor. He therefore ſummoned the earl of Clare to ſurrender the barony of Tunbridge; which, ever ſince the Conqueſt, had remained in the family of that nobleman; but which, as it had formerly belonged to the ſee of Canterbury, the primate pretended that his predeceſſors were prohibited by the canons from alienating.—William de Eynsford, a military tenant of the crown, was patron of a living which belonged to a manor that held of the archbiſhop of Canterbury; and Becket, without regard to William's right, preſented, on a new and illegal pretence, one Laurence to that living, who was violently expelled by Eynsford. Upon this, Eynsford was excommunicated. He complained to the king, that he, who held *in capite* of the crown, ſhould, contrary to the practice eſtabliſhed by the Conqueror and maintained ever ſince by his ſucceſſors, be ſubjected to that terrible ſentence, without the previous conſent of the ſovereign. Henry, by a meſſenger, commanded Becket to abſolve Eynsford. The haughty primate anſwered, that it belonged not to the king to inform him whom he ſhould abſolve, and whom excommunicate; but, after all, he was obliged to comply with the king's orders, though with the worſt grace imaginable.

As Henry perceived that the crown was now in danger, through the ſuperſtition of the people, of falling totally under the power of the clergy, he reſolved to exert himſelf to the utmoſt againſt their ſcandalous uſurpations. Among their other inventions to obtain money, they had now inculcated the neceſſity of penance as an atonement for ſin; and having again introduced the practice of paying them large ſums as an equivalent for theſe penances, the ſins of the people had thus become a revenue to the prieſts; and the king computed, that, by this invention alone, they levied more money from his ſubjects than what flowed by all the funds and taxes into the royal exchequer. To eaſe the people of ſo heavy and arbitrary an impoſition, the king required, that a civil officer of his appointment ſhould be preſent in all eccleſiaſtical courts, and ſhould for the future give his conſent to every compoſition made for ſpiritual offences. About this time alſo the king had an opportunity of proceeding againſt the clergy on another footing. A clerk in Worceſterſhire, having debauched a gentleman's daughter, murdered her father. The king required that the clerk ſhould be delivered up to the magiſtrate. Becket pleaded the privileges of the church; confined the criminal in the biſhop's priſon, leſt he ſhould be ſeized by the king's officers; and maintained that no greater puniſhment could be inflicted on him than degradation. The king then required, that, immediately after he was degraded, he ſhould be tried by the civil powers; but the primate aſſerted, that it was iniquitous to try a man twice upon the ſame accuſation, and for the ſame crime. Upon this, Henry ſummoned an aſſembly of all the prelates in England; and put to them this deciſive queſtion, Whether or not they were willing to ſubmit to the ancient laws and cuſtoms of the kingdom? The biſhops unanimouſly replied, that they were willing, *ſaving their own order*. The king was

---

* See (Benefit of) *Clergy*.

provoked to the laſt degree at this equivocal anſwer. He left the aſſembly with evident marks of diſpleaſure; and required the primate inſtantly to ſurrender the caſtles of Eye and Berkham. The other prelates were terrified; but Becket continued inflexible: however, he was at laſt prevailed upon, by the interpoſition of Philip the pope's legate and almoner, to retract the ſaving clauſe, and promiſe without any reſerve to obſerve the ancient cuſtoms.

The king was not now to be ſatisfied with general promiſes from the clergy. He was determined that the ancient laws and cuſtoms ſhould be defined, as well as the privileges of the clergy. He therefore ſummoned another great council of the clergy and nobility at Clarendon, to whom he ſubmitted this important affair. A number of regulations was there drawn up, which were afterwards well known by the title of the *Conſtitutions of Clarendon*. By theſe it was enacted, that clergymen accuſed of any crime ſhould be tried in the civil courts; that laymen ſhould not be tried in ſpiritual courts, except by legal and reputable witneſſes; that the king ſhould ultimately judge in eccleſiaſtical and ſpiritual appeals; that the archbiſhops and biſhops ſhould be regarded as barons, and obliged to contribute to the public expences like other perſons of their rank; that the goods forfeited to the king, ſhould not be protected in churches or church-yards by the clergy; and that the ſons of villeins ſhould not take orders without the conſent of their lord. Theſe, with ſome others of leſs conſequence, to the number of 16, were ſubſcribed by all the biſhops preſent, and even by Becket himſelf; who, at firſt, ſhowed ſome reluctance.

Nothing now remained but to get the conſtitutions ratified by the Pope; but in this the king was diſappointed. The Pope rejected them with the utmoſt indignation; and, out of 16, admitted only ſix, which he thought were not important enough to deſerve cenſure.—Becket was now mortified to the higheſt degree. He retracted his conſent to the conſtitutions, redoubled his auſterities, and even refuſed to execute any part of his ſacerdotal function till he had obtained abſolution from his holineſs. Henry, conſidering theſe humilities as inſults offered to himſelf, deſired the Pope to ſend him a legate. He did ſo; but annexed a clauſe to his commiſſion, by which he was prohibited from acting againſt the archbiſhop of Canterbury. The king ſent back the commiſſion to the Pope; and being now exaſperated beyond all patience, commenced furious proſecutions againſt Becket. He firſt ſued him for ſome lands belonging to his primacy; and Becket being detained by ſickneſs from coming into court, his non-attendance was conſtrued into diſreſpect. The primate afterwards defended his cauſe in perſon; but all his goods and chattels were confiſcated, and the biſhop of Wincheſter was obliged to pronounce the ſentence. Another ſuit was commenced againſt him for L. 300, which he had levied on the honours of Eye and Berkham, and the primate agreed to give ſecurities for the payment of the ſum. The next day a third ſuit was commenced againſt him for 1000 marks, which the king had lent him upon ſome former occaſion: and, immediately upon the back of theſe, a ſtill greater demand was made; namely, that Becket ſhould give an account of the money he had received and expended during the time he was chancellor. The money was computed at no leſs than 40,000 marks; and the primate, unable either to give an account, or find ſecurities, took the following extraordinary method of evading the king's deſigns. He arrayed himſelf in his epiſcopal veſtments; and with the croſs in his hand, went forward to the palace. Having entered the royal apartments, he ſat down, holding up the croſs as his banner and protection. The king, who ſat in an inner apartment, ordered by proclamation all the prelates and nobility to attend him; to whom he loudly complained of Becket's inſolence. The whole council joined in condemning this inſtance of his unaccountable pride; and determined to expoſtulate with him about his inconſiſtency concerning the conſtitutions of Clarendon. But all their meſſages, threats, and arguments, were to no purpoſe. Becket put himſelf, in the moſt ſolemn manner, under the protection of the ſupreme pontiff, and appealed to him againſt any penalty which his iniquitous judges might think proper to inflict. Then leaving the palace, he aſked the king's immediate permiſſion to quit Northampton; but being refuſed, he ſecretly withdrew in diſguiſe, and at laſt found means to croſs over to the continent.

118
Becket flies to the continent.

Becket was received with the greateſt marks of eſteem, firſt by the king of France (who hated Henry on account of his great power), and then by the Pope, whoſe cauſe he had ſo ſtrenuouſly defended in England. Henry at the ſame time ſent ambaſſadors to the Pope, who were treated with coolneſs and contempt, while Becket was honoured with the greateſt marks of diſtinction. Theſe favours beſtowed upon an exile and a perjured traitor (for ſuch had been Becket's ſentence of condemnation in England), irritated the king to ſuch a degree, that he reſolved to throw off at once all dependence upon the Pope. He accordingly iſſued out orders to his juſticiaries; inhibiting, under ſevere penalties, all appeals to the Pope or the archbiſhop; and forbidding any of them to receive mandates from them, or to apply to their authority. He declared it treaſonable to bring over from either of them any interdict upon the kingdom. This he made puniſhable in ſecular clergymen by the loſs of their livings, and by caſtration; in regulars, by the amputation of their feet; and in laymen, by death. On the other hand, the Pope and the archbiſhop did not fail to iſſue forth their fulminations in ſuch a manner as to ſhake the very foundation of the king's authority. Becket excommunicated by name all the king's chief miniſters who had been concerned in ſequeſtrating the revenues of his ſee, and all who obeyed or favoured the conſtitutions of Clarendon. He even threatened to excommunicate the king if he did not ſpeedily repent; and had not the Pope himſelf been threatened every day with the machinations of an antipope, whoſe pretenſions he was afraid the king of England might ſupport, the ſentence of excommunication would certainly have been denounced.

At firſt, Henry paid little regard to theſe fulminations; but afterwards, when he found that his authority over his ſubjects began to decline on that account, and that his rivals on the continent were endeavouring to diſturb the tranquillity of his dominions, he began ſincerely to deſire a reconciliation. This the Pope and

Becket alſo became deſirous of, becauſe they ſaw that their utmoſt endeavours were inſufficient to draw Henry's ſubjects into a revolt againſt him. The treaty of accommodation, however, was often broke off, through the extreme jealouſy of each of the parties; but at length, by the mediation of the Pope's legate, all differences were adjuſted, and Becket was reinſtated in the ſee of Canterbury.

119
Is reſtored, and behaves with his former inſolence.

On the recovery of his dignity, the primate behaved with all his uſual arrogance. Inſtead of retiring quietly to his dioceſe when he landed in England, he made a progreſs through Kent with all the ſplendor and magnificence of a ſovereign pontiff. As he approached Southwark, the clergy, the laity, and all ranks of people, came forth to meet him, and celebrated his triumphal entry with hymns of joy. Being thus confident of the ſupport of the people, he reſolved to make his enemies feel the ſevereſt effects of his vengeance. He ſuſpended the archbiſhop of York, who had crowned Henry's eldeſt ſon in his abſence. He excommunicated the biſhops of London and Saliſbury, with ſome of the principal nobility and prelates who had aſſiſted at the coronation. One man he excommunicated for having ſpoken againſt him, and another for having cut off the tail of one of his horſes. The excommunicated and degraded prelates immediately made their complaints to the king; and he having dropped ſome paſſionate expreſſions, intimating a deſire to have Becket's life taken away, the ſuppoſed will of the king was inſtantly accompliſhed; nor could the king's expreſs orders to the contrary arrive time enough to hinder the execution of this fatal purpoſe. See Becket.

120
Grief of the king for his death.

The king was thrown into the utmoſt conſternation on hearing of Becket's murder. He knew that the primate's death would accompliſh what his moſt violent oppoſition during his life could never have done, and therefore he gave himſelf up to ſorrow; for three days he even refuſed all nouriſhment; till at laſt his courtiers were obliged to break in upon his ſolitude, and induce him to acquieſce in an event which could not poſſibly be recalled. The pope was with ſome difficulty made ſenſible of the king's innocence; but refuſed to grant him a pardon, except on condition that he ſhould make every future ſubmiſſion and perform every injunction the holy ſee thought proper to demand. When things were thus adjuſted, the aſſaſſins who had murdered Becket were allowed to retire in ſafety to the enjoyment of their former dignities; and the king, with a view to divert the minds of the people to a different object, undertook an expedition into Ireland, and totally reduced that iſland. See Ireland.

121
Diſſenſions in Henry's family.

The king was ſcarce freed from the war with Ireland, and the dangerous controverſy which he had engaged in with the church of Rome, when he found himſelf involved in the moſt unnatural conteſts with his children, to whom he had always behaved in the moſt tender and affectionate manner. He had ordered Henry his eldeſt ſon to be anointed king; and had deſtined him for his ſucceſſor in the kingdom of England, the duchy of Normandy, and the counties of Anjou, Maine, and Touraine; territories which lay contiguous, and which might thus eaſily lend their aſſiſtance to one another. Richard his ſecond ſon was inveſted in the duchy of Guienne and county of Poictou: Geoffrey, his third ſon, inherited, in right of his wife, the duchy of Brittany: and the new conqueſt of Ireland was deſtined for the appendage of John his fourth ſon, for whom he had negociated a marriage with Adelais the only daughter of Humbert count of Savoy and Maurienne; and with whom he was to receive as a dowry very conſiderable demeſnes in Piedmont, Savoy, Breſſe, and Dauphiny. This greatneſs of Henry's family alarmed the king of France; and he therefore excited young prince Henry to demand of his father, either the immediate reſignation of the crown of England, or the duchy of Normandy. The king refuſed to comply with ſuch an extravagant demand; upon which the prince made his eſcape to Paris, where he was protected by the French king. This happened in 1173; and the ſame year, queen Eleanor, finding that ſhe was now grown very diſagreeable to the king, communicated her diſcontent to her two younger children Geoffrey and Richard, whom ſhe engaged alſo to demand the territories aſſigned them, and then fly to the court of France. The queen herſelf was meditating an eſcape to the ſame court, and had put on man's apparel for that purpoſe, when ſhe was ſeized and confined by Henry's order. The licentious barons in the mean time wiſhed for a change of government; hoping to have liberty, under young and unexperienced princes, to commit thoſe rapines and violences which they could not do with ſafety when governed by ſuch a prudent and vigilant king as Henry. In the midſt of this univerſal defection, however, the Engliſh monarch ſtill retained his uſual intrepidity, and prepared with as much vigour as poſſible for the conteſt. As he could depend on the fidelity of very few of his nobility, he was obliged to enliſt in his ſervice a number of deſperate ruffians called *Brabençons*, and ſometimes *Routiers* or *Cottereaux*, though for what reaſon is not mentioned in hiſtory. Theſe banditti were very numerous during the times of the feudal government, when many private wars were carried on between the nobles; and 20,000 of theſe, with a few forces furniſhed by his faithful barons, compoſed the whole of Henry's army on this occaſion.

fined.

With this force the king of England totally overthrew the ſchemes of his enemies on the continent; but being very deſirous of putting an end to the war, he this very year (1173) agreed to a conference with the king of France. At this interview, Henry offered his children the moſt advantageous terms. He inſiſted only on retaining the ſovereign authority in all his dominions. To Henry he offered half the revenues of the crown of England, with ſome places of ſurety in that kingdom; or if he choſe rather to reſide in Normandy, half the revenues of that duchy, with all thoſe of Anjou. He made a like offer to Richard in Guienne; he promiſed to reſign all Brittany to Geoffroy; and if theſe conceſſions were not deemed ſufficient, he agreed to add to them whatever the Pope's legates, who were preſent, ſhould require of him. The conference, however, was broke off by the violence of the earl of Leiceſter; who not only reproached Henry in the moſt indecent manner, but even put his hand to his ſword, as if he intended to attempt ſome violence againſt him.

In the mean time, the moſt of the Engliſh nobility united in oppoſition againſt their ſovereign; and an irruption at this time by the king of Scotland aſſiſted their rebellious ſchemes. The earl of Leiceſter ſoon after invaded Suffolk at the head of a body of Flemings; but they were repulſed with great ſlaughter, and the earl himſelf was taken priſoner. Soon after, William king of Scotland, who had been repulſed, and agreed to a ceſſation of arms, broke the truce, and invaded England with an army of 80,000 men, committing the moſt terrible devaſtations. Henry in the mean time, to reconcile himſelf thoroughly to the church, performed the penances at the tomb of Thomas a Becket which he had formerly promiſed to do. As ſoon as he came within ſight of the church of Canterbury, he alighted from his horſe, walked barefoot towards the town, and proſtrated himſelf before the ſhrine of the ſaint. He remained a whole day in prayer and faſting, watched the holy relics all night, made a grant of 50l. a-year to the convent for a conſtant ſupply of tapers to illuminate the ſhrine; and not ſatisfied with theſe ſubmiſſions, he aſſembled a chapter of monks, diſrobed himſelf before them, put a ſcourge into each of their hands, and preſented his bare ſhoulders to their ſtrokes. Next day he received abſolution; and, departing for London, had the agreeable news of the defeat and captivity of William king of Scotland, which happened on the very day of his abſolution.

This victory proved deciſive in Henry's favour. The Engliſh barons who had revolted, or were preparing for a revolt, inſtantly delivered up their caſtles to the victor, and the kingdom was in a few weeks reſtored to perfect tranquillity. Prince Henry, who was ready to embark with a great army to join the Engliſh rebels, abandoned all thoughts of the enterpriſe. Soon after a treaty was concluded with the king of France; in which Henry granted his children much leſs advantageous terms than he had offered them before. The principal were, ſome penſions for their ſupport, caſtles for their reſidence, and an indemnity to all their adherents. The greateſt ſufferer by this war was William king of Scotland. He was compelled to ſign a treaty, by which he obliged himſelf to do homage to Henry for the kingdom of Scotland. It was agreed, that his barons and biſhops ſhould do the ſame; and that the fortreſſes of Edinburgh, Stirling, Berwick, Roxburgh, and Jedburgh, ſhould be delivered into the hands of the conqueror till the articles were performed. This treaty was executed moſt punctually and rigorouſly on the 10th of Auguſt 1175. The king, barons, and prelates of Scotland, did homage to Henry in the cathedral of York; the greateſt humiliation to which the Scottiſh nation had ever been ſubjected.

Henry was now freed from all troubles either at home or abroad, for five years; during which time he made ſeveral ſalutary laws for the good of his kingdom. But, in 1180, the ambitious ſpirits of his children involved him in freſh calamities. Richard, who had been inveſted by his father with the ſovereignty of Guienne, refuſed to do homage to his elder brother, as king Henry had required him to do. Young Henry and Geoffrey, uniting their arms, invaded their brother's dominions; and while the king was endeavouring to compoſe their differences, he found himſelf conſpired againſt by them all. The conſpiracy, however, was defeated by the death of prince Henry in 1183. He had retired to Martel, a caſtle near Turenne, where he was ſeized with a fever; and perceiving the approaches of death, he was at laſt ſtruck with remorſe for his undutiful behaviour towards his father. He ſent a meſſenger to the king, who was not far diſtant; expreſſed his contrition for his faults; and intreated the favour of a viſit, that he might at leaſt die with the ſatisfaction of having received his forgiveneſs. The king, who had ſo often experienced his ſon's ingratitude and violence, apprehended that his ſickneſs was entirely a feint, and dared not truſt himſelf in the prince's hands. But ſoon after, receiving certain intelligence of his death, and proofs of his ſincere repentance, the good old king was affected with the deepeſt ſorrow. He thrice fainted away; he accuſed his own hard-heartedneſs in refuſing the dying requeſt of his ſon; and he lamented that he had deprived the prince of the laſt opportunity of making atonement for his offences.

England.

Prince Henry, who died in the 28th year of his age, left no poſterity. His brother Richard ſucceeded to his dominions, and ſoon diſcovered as turbulent a ſpirit as that which had actuated his brother. He refuſed to give up Guienne, which Henry had deſigned for his fourth ſon John; and even made preparations for carrying on war againſt his father, and brother Geoffrey. Henry ſent for Eleanor his queen, the heireſs of Guienne; to whom Richard, either dreading an inſurrection in her favour, or out of a ſenſe of duty, willingly yielded up the territory, and retired peaceably to his father's court. This breach, however, was no ſooner made up, than Geoffrey, demanded Anjou to be added to his dominions in Brittany. This the king refuſed; upon which he fled to the court of France, and prepared to levy an army againſt his father. Henry, however, was freed from the danger which threatened him from that quarter, by his ſon's death, who was killed in a tournament at Paris. The loſs of this prince gave few, except the king himſelf, any uneaſineſs; for he was univerſally hated, and went among the people by the name of the *Child of Perdition*. The widow of Geoffrey, ſoon after his deceaſe, was delivered of a ſon, who received the name of *Arthur*, and was inveſted in the duchy of Brittany, under the guardianſhip of his grandfather, who, as duke of Normandy, was alſo ſuperior lord of that territory. Philip, as lord paramount, diſputed for ſome time his title to this wardſhip; but was obliged to yield to the inclinations of the Bretons, who preferred the government of Henry. Some other cauſes inflamed the diſſenſion between theſe two monarchs, and Philip once more ſeduced Richard from his duty. He inſiſted, that his marriage with Adelais, Philip's ſiſter, ſhould be immediately completed. and threatened to enforce his pretenſions with a formidable army. This occaſioned another conference between Giſors and Trie, the uſual place of meeting, under a vaſt elm that is ſaid to have ſhaded more than an acre. In the midſt of this conference the archbiſhop of Tyre appeared before the aſſembly in the moſt miſerable habit, and begged aſſiſtance againſt the infidels, who, under Saladin, had almoſt totally expelled the Chriſtians from Aſia. His intelligence appeared ſo very diſmal, that the kings of France and England laid aſide their animoſity. Both of them immediately took the croſs; but Richard, who had long wiſhed to have all the glory of ſuch an expedition to himſelf, could not bear to have even his father for a partner in his victories. He therefore entered into a confederacy with the king of France; ſo that Henry found himſelf at laſt obliged to give up all thoughts of the cruſade, in order to defend himſelf againſt this unnatural combination. The event of the war proved very unfortunate for Henry, who loſt ſeveral towns, and narrowly eſcaped falling into the hands of the enemy himſelf. At laſt a treaty was concluded at the interceſſion of the duke of Burgundy, the count of Flanders, and the archbiſhop of Rheims; but upon terms very humiliating to the king of England. It was agreed, that Richard ſhould marry the princeſs Adelais, and be crowned king of England during the lifetime of his father; that Henry ſhould pay 20,000 marks to the king of France, as a compenſation for the charges of the war; that his own barons ſhould engage to make him obſerve this treaty, and in caſe of violating it, to join Philip and Richard againſt him; and that all his vaſſals who had eſpouſed the cauſe of Richard ſhould receive an indemnity for their offence.

126
His extreme grief and death.

Theſe terms, mortifying as they were, Henry bore with patience; but when, upon receiving a liſt of the barons that were to be pardoned, he found his own ſon John, who was his favourite, among them, he could no longer ſupport his grief. He broke out into the moſt lamentable expreſſions of deſpair; curſed the day in which he received his miſerable being; and beſtowed on his ungrateful children a malediction which he could never afterwards be prevailed upon to retract. Soon after, he fell into a lingering fever occaſioned by his grief; and of this he died on the 6th of July 1189, in the 58th year of his age and 35th of his reign. His natural ſon Geoffrey, who alone had behaved dutifully towards him, attended his corpſe to the nunnery of Fontevrault, where it lay in ſtate in the abbey-church. Next day Richard, who came to viſit the dead body of his father, was ſtruck with horror at the ſight. At his approach, the blood was ſeen to guſh out at the mouth and noſtrils of the corpſe; and this accident was, by the ſuperſtition of the times, interpreted as the moſt dreadful rebuke. Richard could not endure the ſight. He exclaimed that he was his father's murderer; and expreſſed a ſtrong, though too late, ſenſe of his undutiful conduct.

117
Richard I.

Richard ſucceeded to the throne without oppoſition, immediately after his father's death; and, on his acceſſion, ſet his mother Eleanor (who had been again confined) at liberty. A romantic deſire for ſtrange adventures, and an immoderate zeal for the external rites of religion, were the ruling paſſions of the times. By the firſt of theſe Richard was inflamed to the higheſt degree, and therefore behaved as if the whole deſign of his government had been to attempt the recovery of the Holy Land from the Infidels. The ſuperſtition of the people ſhowed itſelf in a moſt violent and tragical manner on the very day of the king's coronation.

128
Maſſacre of the Jews.

The Jews were the objects of univerſal hatred, ſo that Richard had iſſued out orders forbidding any of them from appearing at his coronation. But ſome of them bringing him large preſents from their nation, preſumed, notwithſtanding theſe orders, to approach the hall in which the king dined. Being diſcovered, they were expoſed to the inſults and injuries of the byſtanders; in conſequence of which they fled, and were purſued by the people. A report was ſpread, that the king had given orders to maſſacre all the Jews. This ſuppoſed command was executed in the moſt cruel manner. Multitudes were ſlaughtered in the city of London, and this example was followed in moſt of the cities in England. Five hundred Jews had retired into York caſtle for ſafety: but finding themſelves unable to defend the place, they murdered their wives and children; threw the dead bodies over the wall againſt their enemies who attempted to ſcale it; and then, ſetting fire to the houſes, periſhed in the flames. The gentry in the neighbourhood, who were all indebted to the Jews, ran to the cathedral where their bonds were kept, and made a ſolemn bonefire of them before the altar.

journe
to Pale

Richard immediately began to take meaſures for his expedition into Paleſtine. His father had left him 100,000 merks; and this ſum he augmented by all expedients he could think of, however pernicious to the public, or dangerous to the royal authority. He ſet up to ſale the revenues and manors of the crown, and ſeveral offices of the greateſt truſt and power. Liberties, charters, caſtles, were given to the beſt bidders. His friends warned him of the danger attending this venality; but he told them he would ſell the city of London itſelf, if he could find a purchaſer. Numerous exactions were alſo practiſed upon all ranks and ſtations; menaces, promiſes, and expoſtulations, were uſed to fright the timid, and allure the avaricious. A zealous preacher of thoſe times was emboldened to remonſtrate againſt the king's conduct; and adviſed him to part with his three daughters, which were pride, avarice, and ſenſuality. To this Richard readily replied, "You counſel right, my friend: and I have already provided huſbands for them all. I will diſpoſe of my pride to the templars; my avarice to the monks; and as for my ſenſuality, the clergy ſhall ſhare that among them." At length the king having got together a ſufficient ſupply for his undertaking, and even ſold his ſuperiority over Scotland for a moderate ſum, ſet out for the Holy Land; whither he was impelled by repeated meſſages from the king of France, who was ready to embark in the ſame enterpriſe.

An account of Richard's exploits in this expedition is given under the articles Egypt, Sicily, Cyprus, &c.—Having at laſt concluded a truce with Saladin, he ſet out on his return for England. He was, however, at a loſs how to proceed. He durſt not return by the way he came, as this would put him in the power of the king of France, between whom and the king of England an irreconcileable enmity had taken place. No way therefore was left, but by going more to the north; for which reaſon he took ſhipping for Italy, but was wrecked near Aquileia. From thence he travelled towards Raguſa, and reſolved to make his way through Germany in the habit of a pilgrim.

13
Taken
ſoner
return

But his expences and liberalities having betrayed him notwithſtanding this diſguiſe, he was arreſted by Leopold duke of Auſtria, who commanded him to be loaded with ſhackles. This prince had ſerved under Richard at the ſiege of Acres (the ancient Ptolemais), where having received ſome diſguſt, he took this baſe method of revenging himſelf. Henry VI. emperor of Germany, was then equally an enemy to Richard on account of his having married Berengaria the daughter of Tancred king of Sicily. He therefore required the royal captive to be delivered up to him, and ſtipulated a large ſum of money to the duke as a reward for his ſervice.

The kingdom of England in the mean time was in great confuſion. Richard had left it under the direction of Hugh biſhop of Durham, and Longchamp biſhop of Ely. The tempers of theſe prelates being very different, an animoſity between them ſoon took place. Longchamp at laſt arreſted his colleague, and obliged him to reſign his power in order to obtain his liberty. The king, by many letters, commanded Longchamp to replace his coadjutor, but to no purpoſe. When the ſituation of the king became uncertain, Longchamp tyrannized to ſuch a degree, that John the king's brother thought proper to oppoſe him. He then left the kingdom; and upon this the archbiſhop of Rouen was made juſticiary in his room. The king of France being informed of theſe diſſenſions, ſtrove to increaſe them as much as poſſible; and had even almoſt prevailed upon John to throw off his allegiance, by promiſing to put him in poſſeſſion of all Richard's continental dominions.

r
ery
the
bro-

When the Engliſh firſt received the news of Richard's captivity, a general indignation was excited through the whole nation. The greateſt, and almoſt the only traitor in the kingdom, was the king's own brother John. On the very firſt invitation from the court of France, he went abroad, and held a conſultation with Philip, the object of which was the perpetual ruin and captivity of his unhappy brother. He promiſed to deliver into Philip's hands a great part of Normandy; and, in return, he received the inveſtiture of all Richard's tranſmarine dominions: it is even ſaid, that he did homage to the French king for the crown of England.

In conſequence of this treaty, Philip invaded Normandy, and made conſiderable progreſs in the conqueſt of it. He was, however, at laſt repulſed by the Earl of Leiceſter, who was now returned from the Holy Land; and a truce was concluded on condition of paying the French king 20,000 merks, and putting four caſtles into his hands by way of ſecurity for the payment.—John, who had come over to England, met with ſtill leſs ſucceſs in his enterpriſes. He was only able to make himſelf maſter of the caſtles of Windſor and Wallingford; but when he came to London, and demanded the kingdom as heir to his brother, of whoſe death he pretended to have received certain intelligence, he was rejected by all the barons, and meaſures were taken to oppoſe and ſubdue him. The defence of the kingdom was ſo well provided for, that John, after ſome fruitleſs efforts, was obliged to conclude a truce with his opponents; and, before the expiration of it, he thought proper to retire to France, where he openly acknowledged his alliance with Philip.

All the efforts of Richard's enemies proved ineffectual to detain him in captivity. He was brought before the diet of the empire at Worms, where the emperor Henry brought againſt him a charge of many crimes and miſdemeanours: but to this the king replied with ſo much ſpirit and eloquence, that the German princes exclaimed loudly againſt the conduct of the emperor; the Pope threatened him with excommunication; and Henry, who had hearkened to the propoſals of the king of France and prince John, found that it would be impoſſible for him to execute his and their baſe purpoſes, and detain the king of England any longer in captivity. He therefore concluded a treaty with him for his ranſom; and agreed to reſtore him to his liberty for 150,000 merks, about L. 300,000 of our money, of which 100,000 merks were to be paid immediately, and 67 hoſtages delivered for the remainder.

132
Richard releaſed from captivity.

The money for the king's ranſom was moſt cheerfully raiſed by the Engliſh. The churches and monaſteries melted down their plate to the amount of 30,000 merks; the biſhops, abbots, and monks, paid a fourth part of their yearly rent; the parochial clergy contributed a tenth part of their tythes; and the requiſite ſum being thus collected, queen Eleanor and Walter archbiſhop of Rouen ſet out with it for Germany, paid the money to the emperor and duke of Auſtria at Mentz, delivered them hoſtages for the remainder, and freed Richard from his captivity. His eſcape was very critical. Henry had been detected in the aſſaſſination of the biſhop of Liege, and in an attempt of the like nature on the duke of Louvaine; and finding himſelf extremely obnoxious to the German princes on account of theſe odious practices, he had determined to ſeek ſupport from an alliance with the French king, and to detain Richard in perpetual captivity, notwithſtanding the ſum he had already received for his ranſom. He therefore gave orders that Richard ſhould be purſued and arreſted; but the king making all imaginable haſte, had already embarked at the mouth of the Scheldt, and was out of ſight of land when the emperor's meſſengers reached Antwerp. The king of France no ſooner heard of Richard's deliverance, than he wrote to John his confederate in theſe terms: "Take care of yourſelf: the devil is broke looſe."

133
Returns to England.

The king of England returned from captivity on the 20th of March 1194, and was received with the utmoſt joy by his ſubjects. He had been but one day landed, when his treacherous brother John came to make his ſubmiſſion. At the interceſſion of queen Eleanor he was received into favour. "I forgive him (ſaid the king), and hope I ſhall as eaſily forget his offences as he will my pardon." Richard was impatient to revenge himſelf on the king of France, and therefore inſtantly made war upon him. But though both kings were inflamed with the moſt violent reſentment againſt each other, they found it impoſſible to engage their powerful barons heartily in their cauſe. The war, therefore, produced no remarkable event; and, in 1195, was concluded by a truce for five years. On ſome ſlight occaſion it was ready to break out anew, when the pope's legate interpoſed, and a treaty was about to be concluded. King Richard in the mean time was wounded by an arrow at the ſiege of Chalus, a caſtle of Limoges. The wound was not in itſelf dangerous; but being unſkilfully treated, a mortification enſued, and the king expired on the 6th of April 1199, in the 10th year of his reign and 42d of his

134
His death.

his age. By his will he left the kingdom to his brother John, but diſtributed a fourth part of his treaſure among his ſervants.

135
John ſucceeds to the crown.

John ſucceeded to the crown of England without oppoſition, but ſoon found his affairs embarraſſed on the continent. The king of France, who, during the life of king Richard, had always ſupported the pretenſions of John, now gave a like ſupport to the claims of prince Arthur the ſon of Geoffrey, who, though only 12 years of age, promiſed to be deſerving of the kingdom. But in this matter the king of France ſhowed ſo much regard to his own intereſt, that Conſtantia the mother of the young prince, thinking that her ally deſigned to keep for himſelf the provinces which he pretended to conquer for Arthur, ſubmitted herſelf and her ſon to John, who detained them in Mans; and thus became undiſputed maſter of the whole empire.

136
His bad qualities.

The new king was weak, tyrannical, cruel, and treacherous. In ſhort, he ſeemed to be endowed with almoſt every bad quality that can fall to the ſhare of man. His conduct, therefore, ſoon rendered him univerſally odious. Imagining himſelf now ſecure on the ſide of France, he indulged his paſſion for Iſabella the daughter and heireſs of the count of Angouleme, with whom he was much enamoured. His queen, the heireſs of the family of Gloceſter, was ſtill alive; and Iſabella was married to the count de la Marche, tho', by reaſon of her youth, the marriage had not been conſummated. John perſuaded the count de Angouleme to carry off his daughter from her huſband; at the ſame time that he procured, under ſome pretence or other, a divorce from the queen. Thus he incurred the diſpleaſure of the pope, and alſo of the count de la Marche, and a powerful confederacy was formed againſt him.

As John had neither courage nor policy ſufficient to keep his barons in awe, he took a method for that purpoſe equally baſe and cruel. This was by hiring a ſet of ruffians, whom he called his *champions*, to fight duels with them, in caſes where they required to clear themſelves from any charge by fighting a duel, according to the cuſtom of thoſe times. Thus he propoſed to get rid of his refractory barons; but they, deſpiſing opponents who were ſo far below their rank, refuſed to fight with them, and a dangerous combination was formed among the barons againſt him.

137
Murders his nephew.

The murder of prince Arthur rendered John ſtill more generally deteſted. The young prince with his mother had fled to the court of France, where they were received with the greateſt kindneſs, and found their intereſts more vigorouſly ſupported than before. Their enterpriſes were attended with conſiderable ſucceſs, when Arthur himſelf had the misfortune to be taken priſoner. All the other captives were ſent to England; but the prince was ſhut up in the caſtle of Falaiſe, and from that time was never heard of. It was univerſally believed that John had murdered him with his own hand; and this inflamed the general reſentment againſt him to ſuch a degree, that he ſoon after loſt all his French provinces. In 1205, the duchy of Normandy itſelf was alſo conquered by Philip, and John was forced to fly with diſgrace to England.

The king was reſolved to wreak his vengeance upon the barons, who, he pretended, had deſerted his ſtandard in Normandy. For this reaſon, he levied large ſums on their eſtates; in order, as he ſaid, to undertake an expedition to the continent. This expedition, however, he ſeveral times capriciouſly deferred; and once having ventured out to ſea, returned again without making the ſmalleſt attempt. At laſt, he landed at Rochelle, and burnt the city of Angiers; but hearing that the enemy were preparing to oppoſe him, he returned without attempting any thing elſe.

This irreſolute and cowardly behaviour of John made him contemptible in the eyes of his ſubjects; but the Norman princes had ſo far extended the prerogatives of the Engliſh crown, that the barons, however diſcontented, durſt not yet attempt to change the form of government. John, by entering into a controverſy with the church, completed his ruin. The clergy, who for ſome time had acted as a community totally independent of the civil power, had their elections of each other generally confirmed by the pope, to whom alone they owned ſubjection. The election of archbiſhops, however, had been a ſubject of continual diſpute between the ſuffragan biſhops and the Auguſtine monks. In the mean time the archbiſhop of Canterbury died; and the Auguſtine monks, in a very private manner, elected Reginald, their ſuperior, in his place. The biſhops exclaimed againſt this election, as a manifeſt innovation of their privileges; and a furious theological conteſt was likely to enſue. John very imprudently took a ſide in this controverſy, and eſpouſed the cauſe of the ſuffragan biſhops; in conſequence of which, John de Grey biſhop of Norwich was choſen. The cauſe was appealed to Rome; and Pope Innocent III. ſeizing with avidity an opportunity of extending his power, commanded the monks to chooſe cardinal Stephen Langton, an Engliſhman, then at the court of Rome. The being able to nominate an archbiſhop of Canterbury (a perſon of almoſt equal authority with the king), was an acquiſition that would effectually give the court of Rome an unlimited authority over England. John therefore was reſolved not to ſubmit to this impoſition; but he had not judgment ſufficient to conduct him. He violently expelled the monks from their convent, and ſeized upon their revenues. The pope, perceiving from this abſurd conduct, that John was unequal to the taſk he had undertaken, after ſome intreaties, threatened to put the whole kingdom under an interdict. The prelates threw themſelves on their knees before the king, and in the moſt earneſt manner intreated him to avoid the reſentment of the holy tribunal, by receiving the primate, and reſtoring the monks to their convent. John, however, broke out into the moſt violent invectives. He ſwore by *God's teeth* (his uſual oath), that if the kingdom was put under an interdict, he would baniſh the whole body of the clergy, and confiſcate all their poſſeſſions. The pope at laſt, finding he might do it with ſafety, iſſued forth this terrible ſentence ſo much dreaded by the whole nation. A ſtop was immediately put to divine ſervice, and the adminiſtration of all the ſacraments except baptiſm. The church-doors were ſhut, and the images of the ſaints laid on the ground. The dead were refuſed Chriſtian burial; and were thrown into ditches and on the highways, without any funeral ſolemnity. Marriage was celebrated in the church-yards, and the people prohibited the uſe of meat as

His c
with
Pope.

1
The i
dom
under

in times of public penance. They were debarred from all pleaſure; even from ſhaving their beards, ſaluting each other, or paying any regard to their apparel. The clergy deplored the unhappy ſtate of the nation in the moſt lamentable manner; while John, in revenge, impriſoned all their concubines, and treated the adherents of Langton with the utmoſt rigour.

The furious and imprudent efforts of John proved totally ineffectual. He had ſcarce a friend left in the whole nation; and therefore, in 1209, the pope denounced a ſentence of excommunication againſt him. This was ſoon followed by another ſtill more terrible; namely, the abſolving all the ſubjects of the king of England from their allegiance, and declaring every one to be excommunicated who had any commerce with him at his table, council, or even in private converſation. The king, rendered quite furious by theſe repeated indignities, wreaked his vengeance on his unhappy ſubjects, whoſe affections he ought rather to have attempted to conciliate. The pope, therefore, proceeded to execute the full meaſure of his wrath on this devoted prince, by giving away his kingdom to Philip of France. He publiſhed a cruſade all over Europe againſt king John; exhorting the nobility, the knights and men of every condition, to take up arms againſt him, and enliſt under the French banner. Philip was not leſs active on his part. He ſummoned all the vaſſals of the crown to attend him at Rouen; and having collected a fleet of 1700 veſſels, was ready, in 1213, to invade England.

The pope had now overſtretched his power; and had the Engliſh nation been governed by a prince of any degree of prudence or reſolution, the power of the clergy would in all probability have been totally broken. The people, however ſuperſtitious and ready to obey in matters of religion, could not tamely ſubmit to be given away by the pope as ſlaves from one maſter to another; and therefore this conſideration, added to the natural antipathy ſubſiſting between the French and Engliſh, put John, notwithſtanding all his offences, at the head of an army of 60,000 men. But the pope was too great a politician to ſuffer matters to be carried to extremities. He promiſed himſelf many more advantages from the ſubmiſſion of John than from an alliance with Philip; and therefore came over in perſon, or, according to ſome, ſent over his legate, to England, under pretence of conferring with the barons, but in reality to hold a conference with John. He there repreſented to this forlorn prince, the numbers of the enemy, the hatred of his own ſubjects, and the ſecret confederacy there was againſt him in England. He intimated, that there was but one way to ſecure him from the impending danger; namely, to put himſelf under the protection of the pope, who was a merciful father, and ſtill willing to receive a repenting ſinner. The abject and irreſolute ſpirit of John ſubmitted to this laſt piece of arrogance, and he took an oath to obey whatever the pope ſhould command. In conſequence of this oath, he took another, the moſt extraordinary mentioned in the records of hiſtory; and which, as it was taken while he commanded an army of 60,000 men, diſcovers a meanneſs of ſpirit almoſt incredible. The terms impoſed by it were expreſſed in the following words. "I John, by the grace of God king of England and lord of Ireland, in order to expiate my ſins, from my own free will, and the advice of my barons, *give* to the church of Rome, to pope Innocent and his ſucceſſors, the kingdom of England, and all other prerogatives of my crown. I will hereafter hold them as the pope's vaſſal. I will be faithful to God, to the church of Rome, to the pope *my maſter*, and his ſucceſſors legitimately elected. I promiſe to pay him a tribute of 1000 merks; to wit, 700 for the kingdom of England, and 300 for the kingdom of Ireland."

This oath was taken by the king before all the people, kneeling, and with his hands held up between thoſe of the legate. Having then agreed to reinſtate Langton in the primacy, he received the crown which he had been ſuppoſed to have forfeited; while the legate, to add to his former inſolence, trampled under his feet the tribute which John had conſented to pay. —The king of France was enraged at this behaviour of the pope; and reſolved to execute his project of conquering England, in ſpite of him and all his cenſures. His fleet, however, was attacked in their harbours by the Engliſh, who took 300 veſſels, and deſtroyed about 100 more; while Philip, finding it impoſſible to prevent the reſt from falling into the hands of the enemy, ſet fire to them himſelf, and thus was obliged to give up all hopes of ſucceſs.

142
The barons attempt to reduce the prerogatives of the crown.

John being thus freed from all danger, continued to follow the ſame cruel and tyrannical meaſures which had hitherto rendered him odious to his ſubjects. His ſcandalous ſubjection to the clergy, now gave the barons an opportunity of exerting themſelves, in order to reduce the enormous prerogatives of the crown. Their deſigns were greatly facilitated by the concurrence of Langton the primate, who on all occaſions ſhowed a ſincere regard for the intereſts of the kingdom. At a ſynod of his prelates and clergy, convened in St Paul's, on pretence of examining into the loſſes of ſome biſhops who had been exiled by John, he privately conferred with a number of barons, to whom he expatiated upon the vices and injuſtice of their ſovereign. He ſhowed them a copy of Henry the firſt's charter; (being the only one in the kingdom, and which had been buried in the rubbiſh of an obſcure monaſtery). Langton exhorted the barons to inſiſt on a renewal of it; and this they ſolemnly ſwore to perform. The ſame agreement was afterwards renewed at a more numerous meeting of barons ſummoned by Langton at St Edmonſbury. Here it was reſolved, that at Chriſtmas they would prefer their common petition in a body; and in the mean time they ſeparated with a deſign to put themſelves in a poſture of defence, enliſt men, and fortify their caſtles. In the beginning of January 1215, they repaired to London, accoutred in their military garb and equipage, and preſented their petition to the king, alleging that he had promiſed to grant a confirmation of the laws of Edward the Confeſſor, at the time he was abſolved from his excommunication. John reſented their preſumption; and required a promiſe under their hands and ſeals, that they would never demand, or attempt to extort, ſuch privileges for the future. This they refuſed with ſuch unanimity and reſolution, that the king deſired time to conſider of their demands. He promiſed, that, at the feſtival of Eaſter, he would give a poſitive anſwer to their petition; and offered them the archbiſhop of Canterbury, the biſhop of

England.

Ely, and the earl mareſchal, as ſureties for fulfilling his engagements.

The barons accepted of his ſecurities, and departed peaceably; but John had no deſign of complying with their deſires. He had recourſe to the clergy, whoſe power he had ſeen and felt in ſo many inſtances. He courted their favour, by granting them a charter eſtabliſhing all thoſe rights of which they were already in the poſſeſſion, and which he now pretended to confirm when he had not the liberty to refuſe. To ingratiate himſelf ſtill farther with this body, he took the croſs, and appealed to the pope againſt the uſurpation of the barons. The pope wrote letters to England, reproaching the primate and biſhops with favouring theſe diſſenſions; and commanded them to promote peace between the two parties. He exhorted the barons to conciliate the king, not with menaces, but with humble intreaties; and promiſed, upon their obedience, to interpoſe his own authority in favour of ſuch of their petitions as he ſhould find to be juſt. At the ſame time he annulled their aſſociation, and forbad them to enter into any confederacy for the future.

The barons paid no regard to the pope's remonſtrances; knowing that the fulminations of the court of Rome would be of little avail, unleſs they were ſeconded by the clergy of England. After waiting till Eaſter, when the king promiſed to return them an anſwer, they met by agreement at Stamford. There they aſſembled a force of above 2000 knights, and a prodigious number of foot. Thence they marched to Brackley, about 15 miles from Oxford, the place where the court then reſided. John, hearing of their approach, ſent the archbiſhop of Canterbury, the earl of Pembroke, and others of his council, to know the particulars of their requeſt, and what thoſe liberties were which they ſo much importuned him to grant. The barons delivered a ſchedule containing the chief articles of their demands, founded on the charters of Henry and Edward; but which were in the higheſt degree diſpleaſing to the king. He burſt into a furious paſſion, aſked the barons why they did not alſo demand his kingdom, and ſwore that he would never comply with ſuch exorbitant demands. The confederates then choſe Robert Fitzwalter for their general; whom they dignified with the title of "Mareſchal of the army of God and of the holy church." They laid ſiege to Northampton, took Bedford, and were joyfully received into London. They wrote letters to all the nobility and gentry who had not yet declared in their favour, threatening their eſtates with devaſtation in caſe of refuſal or delay.

In the mean time the king was left at a place called *Odiham* in Surrey, attended only by ſeven knights. He vainly endeavoured to avert the ſtorm by the mediation of his biſhops and miniſters. He appealed to Langton againſt the barons, not ſuſpecting that he was engaged in the confederacy; and deſired him to fulminate the church-cenſures againſt thoſe who had made war upon their lawful prince. Langton declared that he would paſs no cenſure where he found no delinquent, but ſaid, that much might be done if the king would diſmiſs ſome foreign auxiliaries which he had lately brought over. Upon this John diſbanded a great body of Germans and Flemings whom he had hitherto retained in his ſervice, and Langton refuſed to excommunicate a ſingle baron. The king, being now quite defenceleſs, was obliged at laſt to comply with the demands of his ſubjects. A conference was accordingly appointed, and all things were adjuſted for this moſt important treaty.

Chart

The king's commiſſioners met the barons at a place called *Runimede*, between Staines and Windſor; and which is yet held in reverence as the ſpot where the ſtandard of freedom was firſt erected in England. Here the king ſigned the charter called *Magna Charta;* which continues in force to this day, and is ſtill regarded as the great bulwark of Britiſh liberty. See *Magna Charta.*

P inc
article
it.

This charter, however, at the time that it was made, ſecured liberty to the clergy, barons, and gentlemen, much more than to the bulk of the people, who did not for a long time obtain any privileges of importance. Freedom of elections was ſecured to the clergy; and it was determined, that fines on them for any offence, ſhould be laid on in proportion to their eſtates, and not the value of their benefices. The privileges ſecured to the barons were, either abatements in the rigour of the feudal laws, or relief from arbitrary and ambiguous deciſions before the courts. It was alſo decreed, that barons ſhould recover the lands of their vaſſals, even though forfeited by felony, after having been in the poſſeſſion of the crown for a year and a day; and no tax was to be impoſed without conſent of the great council of the nation, excepting in caſe of the captivity of the king, the knighting of his eldeſt ſon, or marrying his eldeſt daughter. No land belonging to any baron was to be ſeized for a crown debt, unleſs the poſſeſſor had not perſonal property enough to pay it; neither was any vaſſal to be allowed to ſell ſo much of his land as to incapacitate him from performing the neceſſary ſervice to his lord. It was alſo determined, that when the great council of the nation was called, the prelates, earls, and barons, ſhould be ſummoned by a particular writ, and the leſſer barons ſhould receive a ſummons from the ſheriff. In favour of the people it was ſtipulated, that they ſhould have from the barons all the immunities and privileges granted by the king to the former. Merchants were to be allowed to carry on their buſineſs without any arbitrary tolls or impoſitions, and to go out of the kingdom and return at pleaſure. The goods of every freeman were to be diſpoſed of according to his will; or if he died inteſtate, the neareſt heir ſhould ſucceed him. No carts, horſes, or wood, were to be taken by the crown officers without the conſent of the owner. The king's courts were to be ſtationary, and no delay to be made in doing juſtice to every one; no freeman ſhould be taken or impriſoned, diſpoſſeſſed of his free tenement, outlawed or baniſhed, unleſs by the legal judgment of his peers, &c. It was likewiſe ſtipulated, that London ſhould remain in the hands of the barons, and the tower be conſigned to the primate, till the 15th of Auguſt following; or till the articles of the charter ſhould be fulfilled To give the more ſecurity for this, the king allowed them to chooſe 25 of their own number, to whoſe authority no limits were ſet either in extent or duration. If any complaint were made of a violation of the charter, either by the king or his officers, any four of the barons might admoniſh the king to redreſs the grievance; and if ſatisfaction were not obtained,

obtained, they might aſſemble the whole council of 25; and they, in conjunction with the great council, were empowered to compel him to fulfil the charter. In caſe of his reſiſtance, they had liberty to levy war againſt him, attack his caſtles, and uſe every kind of violence, except againſt his perſon, or thoſe of the queen or children. All men throughout the kingdom were bound, under the penalty of confiſcation, to ſwear obedience to the 25 barons; and the freeholders of each county were to chooſe 12 knights, whoſe buſineſs it was to report ſuch evil cuſtoms as ought to be redreſſed in terms of Magna Charta.

But although John had thus obliged himſelf, by writing, to allow liberty to his ſubjects, he had no mind that they ſhould enjoy it in reality. The ſenſe of his ſubjection to his own vaſſals ſunk deep in his mind. He became ſullen, ſilent, and reſerved. He ſhunned the ſociety of his former friends; and retired into the Iſle of Wight, as if to hide his diſgrace in ſolitude; but, in reality, to meditate revenge againſt the barons. He ſent to the continent to enliſt a large body of mercenary troops, and made complaints to the pope of the inſurrections of the barons againſt him. The pontiff very warmly eſpouſed his cauſe; a bull was ſent over, annulling the whole charter; and at the ſame time the foreign troops arriving, the king once more found himſelf in a condition to demand his own terms from his ſubjects.

The barons had made no preparations for war, not ſuſpecting the introduction of a foreign army. The king, therefore, was for ſome time undiſputed maſter of the field, and the moſt horrid cruelties were committed by his army. The nobility who had been moſt active in procuring the great charter fled with their families to Scotland, where they obtained the protection of king Alexander by doing homage to him. The barons being totally unable to raiſe an army capable of contending with that of John, applied to their old enemy Philip of France, offering to acknowledge his eldeſt ſon Louis for their ſovereign, on condition of his protecting them from the fury of John and his mercenaries. The French king accepted their propoſal with joy; and twenty-five hoſtages which he demanded being ſent over, began to make the moſt diligent preparations for this expedition, regardleſs of the menaces of the pope, who threatened him with excommunication, and actually excommunicated his ſon Louis ſome time after.

The firſt troops who came to the aſſiſtance of the barons, were only a body of 7000 men; but, ſoon after, Louis with a powerful army landed at Sandwich. The firſt effect of this invaſion was, that moſt of John's foreign troops deſerted, refuſing to ſerve againſt the heir of their monarchy. Many conſiderable noblemen alſo deſerted his cauſe, and Louis daily gained ground. This prince advanced to London, where the barons and burghers did him homage, and took the oath of allegiance, after he had ſworn to confirm the liberties and privileges of the people. His imprudence, however, in preferring on all occaſions his French ſubjects to the Engliſh, ſoon excited a jealouſy againſt him, which proved very prejudicial to his cauſe. This jealouſy was greatly increaſed by the death-bed confeſſion of the count de Melun, one of his courtiers, who declared to thoſe about him, that it was Louis's deſign to exterminate the Engliſh barons as traitors, and to beſtow their dignities and eſtates upon his French ſubjects, on whoſe fidelity he could more ſafely rely. This cauſed a conſiderable deſertion among Louis's party: ſo that John once more found himſelf in a condition to make an effort for his crown. He reſolved to penetrate into the heart of the kingdom; and, for this purpoſe, he departed from Lynn, and took the road towards Lincolnſhire at the head of a great body of troops. His road lay along the ſhore, which was overflowed at high water; but the king, not being appriſed of this, or being ignorant of the tides of the place, loſt all his carriages, treaſure, and baggage by their influx. He himſelf eſcaped with the utmoſt difficulty, and arrived at the abbey of Swinſtead; where his grief for the loſs he had ſuſtained, and the diſtracted ſtate of his affairs, threw him into a fever, which ſoon appeared to be attended with fatal ſymptoms. He died at Newark in the year 1216, the 51ſt of his age, and 18th of his reign. He left two legitimate ſons: Henry, who ſucceeded him on the throne, and was about nine years of age; and Richard, who was about ſeven. He left alſo three daughters; Jane, married to Alexander king of Scotland; Eleanor, married to the Earl of Pembroke; and Iſabella, married to the emperor Frederic II.

147
Death of king John.

When John died, the Earl of Pembroke was mareſchal of England. By this office he was at the head of the army, and of conſequence, in times of ſuch turbulence, at the head of the ſtate. He was a nobleman of great honour and fidelity, and had continued faithful to John in his greateſt reverſes of fortune. He now determined to ſupport the authority of the infant prince Henry; and therefore carried him immediately to Glouceſter, where the ceremony of coronation was performed, in the preſence of Gualo the legate and a very few noblemen, by the biſhops of Wincheſter and Bath. The young prince was obliged to ſwear fealty to the pope, and renew the homage which his father had done for the kingdom; after which the Earl of Pembroke was choſen protector.

148
Henry III.

149
He grants new charter.

Till the king arrived at the years of maturity, the tranſactions of his reign can only be conſidered as the conſequences of the diſpoſition of his tutors. Pembroke cauſed him grant a new charter of liberties, conſiſting of the conceſſions extorted from John, with ſome alterations; and the next year it was renewed, with the addition of ſome other articles. Thus theſe famous charters were brought very nearly to the ſhape in which they have ever ſince ſtood; and they were, during many generations, eſteemed the moſt ſacred rampart to national liberty and independence. As they ſecured the rights of all orders of men, they were anxiouſly defended by all, and became in a manner the baſis of the Engliſh monarchy, and a kind of original contract, which both limited the authority of the king, and enſured the conditional allegiance of his ſubjects. Though often violated, they were ſtill claimed and recalled by the nobility and people; and as no precedents were ſuppoſed valid that infringed them, they rather acquired, than loſt, authority, from the frequent attempts made againſt them, in ſeveral ages, by regal and arbitrary power.

Theſe charters were made uſe of by Pembroke as arguments to draw off the malecontent barons from their allegiance to Louis. He repreſented to them, that, whatever jealouſy they might have entertained againſt the late king, a young prince, the lineal heir of their ancient monarchs, had now ſucceeded to the throne, without ſucceeding either to the reſentments or principles of his predeceſſor: That the deſperate expedient, which they had employed, of calling in a foreign potentate, had, happily for them, as well as for the nation, failed of entire ſucceſs; and it was ſtill in their power, by a quick return to their duty, to reſtore the independence of the kingdom, and to ſecure that liberty for which they ſo zealouſly contended: That, as all paſt offences of the barons were now buried in oblivion, they ought, on their part, to forget their complaints againſt their late ſovereign; who, if he had been anywiſe blameable in his conduct, had left to his ſon the ſalutary warning to avoid his paths, which had led to ſuch fatal extremities: And that, having now obtained a charter for their liberties, it was their intereſt to ſhow, by their conduct, that that acquiſition was not incompatible with their allegiance; and that the rights of the king and people, ſo far from being hoſtile and oppoſite, might mutually ſupport and ſuſtain each other.

150
Decline of prince Louis's party.

Theſe conſiderations, enforced by Pembroke's known character of conſtancy and fidelity, had a very great influence on the barons. Moſt of them began to negociate with him, and many actually returned to their duty. At the ſame time Louis continued to diſguſt thoſe of his own party by the preference which he viſibly gave to the French. Though he went over to France, therefore, and brought freſh ſuccours from thence, he found that his party was greatly weaker than before, by the deſertion of his Engliſh confederates; and that the death of king John had, contrary to his expectations, occaſioned the total ruin of his affairs. In a ſhort time Pembroke was ſo much ſtrengthened by deſerters from Louis's party, that he ventured to inveſt Mount-Sorel; though upon the approach of the count de Perche with the French army, he deſiſted from that enterpriſe. The French general immediately marched to Lincoln; and, being admitted into the town, laid ſiege to the caſtle, and ſoon reduced it to extremity. Pembroke ſummoned his forces from every quarter, in order to relieve this important place; and he appeared ſo much ſuperior to the French, that they ſhut themſelves up within the city, reſolving to take ſhelter there. But the garriſon of the caſtle, having received a ſtrong reinforcement, made a vigorous ſally upon the beſiegers, while the Engliſh army aſſaulted them from without. The French army was totally routed; the count de Perche with only two perſons more were killed; but many of the chief commanders, and about 400 knights, were made priſoners. On the news of this fatal event, Louis raiſed the ſiege of Dover, and retired to London; where he received intelligence of a new diſaſter, which put an end to all his hopes. A French fleet, which carried a ſtrong reinforcement, had appeared on the coaſt of Kent; where they were attacked and repulſed with conſiderable loſs, by Philip D'Albiney. He is ſaid to have gained the victory by the following ſtratagem. Having got the wind of the French, he came down upon them with violence; and throwing on their faces a great quantity of quicklime, which he purpoſely carried on board, they were ſo blinded that they were diſabled from defending themſelves. This misfortune ſo diſcouraged the barons who yet adhered to Louis, that they came from every quarter to make their ſubmiſſion to Pembroke; and Louis himſelf, finding his affairs totally deſperate, was glad to make his eſcape from a country where every thing was become hoſtile to him. He therefore concluded a peace with the Protector; promiſed to evacuate the kingdom; and only ſtipulated, in return, an indemnity to his adherents, and a reſtitution of their honours and fortunes, together with the free and equal enjoyment of thoſe liberties which had been granted to the reſt of the nation.

He l
th k
dom.

When the king grew up, he was found to be very unfit for the government of ſuch a turbulent people as the Engliſh at that time were. Though his temper was mild and humane, he was alſo very weak, fickle, and irreſolute. He diſguſted the people by the careſſes he beſtowed on foreigners; and this diſguſt roſe once to ſuch a height, that the barons refuſed to aſſemble in the general council of the nation, or parliament, at his deſire. When commanded to do ſo, they ſent a meſſage to Henry, deſiring him to diſmiſs his foreigners; otherwiſe they would drive both him and them out of the kingdom, and put the crown on the head of one who was more worthy to wear it. The facility of Henry's temper alſo induced him to heap riches upon his foreign favourites in a manner which he could by no means afford: this often brought him into very great ſtraits; and to relieve himſelf, he was obliged to have recourſe to many arbitrary meaſures, which he could not otherwiſe have choſen. Nothing, however, of very great moment happened till the year 1255, when the Pope found means to embark Henry in a ſcheme for the conqueſt of Naples, or Sicily on this ſide the Fare, as it was called; an enterpriſe which not only brought much diſhonour on the king, but involved him for ſome years in very great expence and trouble. The court of Rome ſome time before had reduced the kingdom of Sicily to the ſame ſtate of feudal vaſſalage which ſhe pretended to exerciſe over England; but Mainfroy, an uſurper, under pretence of governing the kingdom for the lawful heir, had ſeized the crown, and was reſolved to reject the Pope's authority. As the Pope found that his own force alone was not ſufficient to gain his point, he had recourſe to Richard the king of England's brother, who had been created Earl of Cornwall, and had ſuch talents for amaſſing money, that he was reckoned the richeſt prince in Chriſtendom. To him the Pope offered the kingdom of Sicily, upon the ſingle condition of his conquering it from the uſurper. Richard was too wiſe to accept this offer; upon which the Pope applied to Henry, and offered him the crown of Sicily for his ſecond ſon Edmund. Henry, dazzled by this propoſal, without reflecting on the conſequences, or without conſulting his brother or the parliament, gave the Pope unlimited credit to expend whatever ſums he thought neceſſary for completing the conqueſt of Sicily. In conſequence of this unlimited grant, his holineſs determined to exert his apoſtolical authority to the utmoſt, in extorting money from the Engliſh. A cruſade was publiſhed, requiring every one who had taken the croſs againſt the infidels, or even vowed to advance money for that purpoſe, to ſupport the war againſt Mainfroy, whom he accuſed as being a more terrible enemy

enemy to the Chriſtian faith than any Saracen. A tenth on all the eccleſiaſtical benefices in England was levied for three years; and orders were given to excommunicate the biſhops who did not make punctual payment. A grant was made to the king of the goods of inteſtate clergymen, as well as of the revenues of vacant benefices and thoſe of non-reſidents. Theſe taxations, however grievous, were ſubmitted to with little murmuring; but another ſuggeſted by the biſhop of Hereford excited the moſt violent clamours. This prelate, who at that time reſided at the court of Rome, drew bills on all the abbots and biſhops of the kingdom, to the amount of no leſs than 150,540 marks, which he granted to Italian merchants in conſideration of the money they had advanced or pretended to advance for the ſupport of the Sicilian war. As it was apprehended that the Engliſh clergy would not eaſily ſubmit to ſuch an extraordinary demand, a commiſſion was given to Ruſtand, the Pope's legate, to uſe his authority. An aſſembly of the prelates and abbots was accordingly ſummoned; who, on hearing the propoſal ſanctified with the names both of the Pope and King, were ſtruck with the utmoſt ſurpriſe and indignation. A violent altercation took place; during which the legate told them, that all eccleſiaſtical benefices were the property of the Pope, and that he might diſpoſe of them as he pleaſed. The affair ended, however, in the ſubmiſſion of the clergy: but the barons ſtill continued refractory, and for ſome time anſwered the king's demands of ſupplies with expoſtulations; urging the king's partiality to foreigners. and the various injuries the nation had ſuſtained from the ſervants of the crown. The great council of the nation, which had lately obtained the name of *parliament*, was therefore diſſolved, and another called, but with as little ſucceſs as before. The king, however, had involved himſelf in ſo much debt, that a large ſupply was become abſolutely neceſſary; and as that could by no means be obtained from parliament, he was now reduced to the humiliating expedient of going about among ſuch of his ſubjects as he thought moſt attached to him, and begging aſſiſtance from them at their own houſes. At length his barons, perceiving the exigencies to which he was reduced, ſeemed willing to afford him aid; and, upon his promiſing to grant them a plenary redreſs of grievances, a very liberal ſupply was obtained, for which he renewed their charter with more than uſual ſolemnity. All the prelates and abbots were aſſembled with burning tapers in their hands; the magna charta was read in their preſence; and they denounced ſentence of excommunication upon all who ſhould infringe upon its deciſions. They then put out their tapers on the ground, and exclaimed, "May every ſoul that proves falſe to this agreement ſo ſtink and corrupt in hell." The king ſubjoined, "So help me God, I will inviolably keep all theſe things, as I am a man, as I am a Chriſtian, as I am a knight, and as I am a king crowned and anointed."

a
ion.

No ſooner had the king received the ſupplies of which he ſtood ſo much in need, than he forgot all his engagements, put his confidence entirely in foreign counſellors, and evaded or broke through in numberleſs inſtances the charters he had given. This conduct rendered him ſo obnoxious to the barons, that Simon Mountfort Earl of Leiceſter, a man of a very violent and ambitious temper, determined to attempt an innovation in the government. He formed a powerful confederacy againſt the king, and the deſigns of the conſpirators were effectually put in execution in the year 1258. Henry had ſummoned a parliament in expectation of receiving ſupplies for his Sicilian project; when the barons appeared in the hall, clad in complete armour, with their ſwords by their ſides. The king, ſtruck with this unuſual appearance, aſked them what was their purpoſe, and whether they pretended to make him their priſoner? Roger Bigod, Earl Mareſchal, anſwered in name of the reſt, that he was not their priſoner; that they even intended to grant him large ſupplies, in order to fix his ſon on the throne of Sicily; that they only expected ſome return for this expence and ſervice; and that as the king had frequently made ſubmiſſions to the parliament, had acknowledged his paſt errors, and had ſtill allowed himſelf to be carried into the ſame path, which gave them ſuch reaſon of complaint, he muſt now yield to more ſtrict regulations, and confer authority on thoſe who were able and willing to redreſs the public grievances. Henry inſtantly aſſured them of his intentions to grant them all poſſible ſatisfaction; and for that purpoſe ſummoned another parliament at Oxford, to digeſt the new plan of government, and to elect proper perſons who were to be entruſted with the chief authority. This aſſembly, afterwards called the *mad parliament*, went very expeditiouſly to work on the buſineſs of reformation. Twenty-four barons were appointed, with ſupreme authority, to reform the abuſes of the ſtate; and Leiceſter was placed at their head. Their firſt ſtep was to order four knights to be choſen out of each county, who ſhould examine into the ſtate of their reſpective conſtituents, and ſhould attend at the enſuing parliament to give information of their complaints. They ordained that three ſeſſions of parliament ſhould be regularly held every year; that a new high ſheriff ſhould be elected annually; that no wards nor caſtles ſhould be entruſted to foreigners, no new foreſts made, nor the revenues of any counties let to farm.

155
Bad conduct of the new rulers.

Theſe conſtitutions were ſo juſt, that ſome of them remain to this day. But the parliament having once obtained the ſovereign power, took care not to part with it again. They not only protracted the time of their ſitting under various pretences; but at laſt had the effrontery to impoſe an oath upon every individual of the nation, declaring an implicit obedience to all the ſtatutes executed or to be yet executed by the barons who were thus appointed as rulers. They not only abridged the authority of the king, but the efficacy of parliament alſo; giving up to 12 perſons the whole parliamentary power between each ſeſſion.—— Their uſurpations were firſt oppoſed by the knights of the ſhire, whom they themſelves had appointed. Theſe had for ſome time begun to be regularly aſſembled in a ſeparate houſe, to conſider of the national grievances; the firſt of which was the conduct of the 24 rulers. They repreſented, that though the king had performed all that was required of him, the barons had hitherto done nothing on their part that ſhowed an equal regard for the people; that their own intereſt and power ſeemed the only aim of all their decrees; and they even called upon the king's eldeſt ſon prince

Edward to interpoſe his authority, and ſave the ſinking nation.

156
Oppoſed by prince Edward.

The prince was at this time about 22 years of age, and by his active and reſolute conduct had inſpired the nation with great hopes. He told thoſe who made the application to him, that he had ſworn to the late conſtitutions; and, on that account, though they were contrary to his own private opinions, he was reſolved not to infringe them. At the ſame time, however, he ſent a meſſage to the barons, requiring them to bring their undertaking to an end, or otherwiſe to expect the moſt vigorous reſiſtance to their uſurpations. On this the barons were obliged to publiſh a new code of laws, which, though it contained ſcarce any thing material, yet, it was ſuppoſed, would for a while dazzle the eyes of the people, until they could take meaſures to eſtabliſh their authority upon ſurer foundations. In this manner, under various pretences, they continued their power for three years; while the whole nation loudly condemned their treachery, and the Pope himſelf at laſt abſolved the king and his ſubjects from the oath they had taken to obey their injunctions. Soon after this, a parliament was called, and the king reinſtated in his former authority. The barons were obliged to ſubmit for a time; but the Earl of Leiceſter having joined the Welſh, who at this time made an irruption into England, the kingdom was reduced to the moſt deplorable ſituation. The puſillanimity of the king prevented any proper or judicious method from being purſued for extricating the people from their diſtreſſes; and at laſt a treaty was concluded with the barons on the moſt diſadvantageous terms that can be imagined. They were reſtored to the ſovereignty of the kingdom, took poſſeſſion of all the royal caſtles and fortreſſes, and even named the officers of the king's houſehold. They ſummoned a parliament to meet at Oxford, in order more fully to ſettle the plan of government; and by this aſſembly it was enacted, that the authority of the 24 barons ſhould continue not only during the life of king Henry, but alſo during that of prince Edward.

157
Who is defeated and taken priſoner, with the king and his brother.

Theſe ſcandalous conditions would have been eaſily complied with by king Henry; but they were utterly rejected by prince Edward, and a civil war immediately enſued. The prince was at firſt ſucceſsful; but, through his impetuoſity, occaſioned the loſs of a great battle, in which his father and uncle were taken priſoners, and he himſelf was obliged ſoon after to ſurrender to the earl of Leiceſter. The king was now reduced to the moſt deplorable ſituation. His partiſans were totally diſarmed, while thoſe of the earl of Leiceſter ſtill kept themſelves in an offenſive poſture. Leiceſter ſeized the eſtates of no fewer than 18 barons; engroſſed to himſelf the ranſom of all the priſoners; monopolized the ſale of wool to foreign markets; and at laſt ordained that all power ſhould be exerciſed by nine perſons, who were to be choſen by three others, or the majority of them; and theſe three were the earl of Leiceſter himſelf, the Earl of Gloceſter, and the biſhop of Chicheſter.

148
Firſt Houſe of Commons.

The miſerable ſituation to which the kingdom was now reduced, proved at laſt the means of ſettling the government on a more proper foundation. Leiceſter, in order to ſecure himſelf, was obliged to have recourſe to an aid, till now, entirely unknown in England, namely, that of the body of the people. He called a parliament, where, beſides the barons of his own party, and ſeveral eccleſiaſtics who were not proper tenants of the crown, he ordered returns to be made of two knights from every ſhire; and alſo deputies from the boroughs, which had been hitherto conſidered as too inconſiderable to be allowed any ſhare in the legiſlation. This parliament was called on the 20th of January 1265: and here we find the firſt outline of an Engliſh Houſe of Commons; an inſtitution which has ever ſince been conſidered as the bulwark of Britiſh liberty.

The new parliament was far from being ſo compliant to Leiceſter as he had deſired or expected. Many of the barons who had hitherto ſtedfaſtly adhered to his party, were diſguſted with his boundleſs ambition; and the people, who found that a change of maſters was not a change from miſery to happineſs, began to wiſh for the re-eſtabliſhment of royal authority. Leiceſter at laſt, to make a merit of what he could not prevent, releaſed prince Edward from his confinement, and had him introduced at Weſtminſter-hall, where his freedom was confirmed by the unanimous voice of the barons. But though Leiceſter had all the popularity of reſtoring the prince, he was yet politic enough to keep him guarded by his emiſſaries, who watched all his actions. At laſt, however, he found means to make his eſcape in the following manner. The Duke of Gloceſter, being diſguſted with Leiceſter, retired from court, and went to his eſtates on the borders of Wales. His antagoniſt purſued him thither; and to give the greater authority to his arms, carried the king and prince of Wales along with him. This furniſhed young Edward with the opportunity he had ſo long deſired. Being furniſhed by the Earl of Gloceſter with an horſe of extraordinary ſwiftneſs, he took leave of his attendants, who were in fact his guards, but were not able to come up with him. They purſued him, however, for ſome time; but the appearance of a body of troops belonging to Gloceſter ſoon put an end to their purſuit.

15
Prince
ward r
ver hi
berty.

The prince no ſooner recovered his liberty, than the royaliſts joined him from all quarters, and an army was ſoon procured which Leiceſter could not withſtand. This nobleman now found himſelf in a remote quarter of the kingdom; ſurrounded by his enemies; and debarred from all communication with his friends by the river Severn, whoſe bridges Edward had broken down. In this extremity, he wrote to his ſon to haſten to his aſſiſtance from London, with a conſiderable army which he had under his command. With this view his ſon advanced to Kenilworth; but here he was ſurpriſed, and his army entirely diſperſed by prince Edward. The young prince, immediately after this victory, advanced againſt Leiceſter himſelf; who, ignorant of the fate of his ſon's army, had paſſed the Severn in boats. He was by no means able to cope with the royaliſts; his men being inferior both in numbers and reſolution to their antagoniſts. His army was defeated with great ſlaughter. Leiceſter himſelf was ſlain, though he called out for quarter, together with his eldeſt ſon Henry, and about 160 knights and other gentlemen. The old king had been purpoſely placed by the rebels in the front of the battle, where he was wounded, and in great danger of being killed; but, crying out, "I am Henry of Wincheſter your king," he was ſaved and put in a place of ſecurity by his ſon, who

16
Earl o
ceſter
feated
killed.

who had flown to his aſſiſtance. The body of Leiceſter being found among the dead, was barbarouſly mangled by one Roger Mortimer; and then ſent to his widow, as a teſtimony of the royal party's barbarity and ſucceſs.

This victory, gained at Eveſham, proved deciſive in favour of the royal party. Almoſt all the caſtles, garriſoned by the barons, haſtened to make their ſubmiſſions, and opened their gates to the king. The Iſle of Axholme alone, and that of Ely, truſting to the ſtrength of their ſituation, ventured to make reſiſtance; but were at laſt reduced, as well as the caſtle of Dover, by the valour and activity of prince Edward. Adam de Gourdon, a courageous baron, maintained himſelf ſome time in the foreſts of Hampſhire, committing depredations in the neighbourhood; and obliged the prince to lead a body of troops into that country againſt him. Edward attacked the camp of the rebels; and being tranſported by the ardour of action, leaped over the trench with a few followers, and encountered Gourdon himſelf in ſingle combat. The victory was long diſputed between theſe two valiant combatants; but ended at laſt in the prince's favour, who wounded his antagoniſt, threw him from his horſe, and took him priſoner. He not only granted him his life; but introduced him that very night to the queen at Guildford, procured his pardon, and was ever after faithfully ſerved by him.

In 1271, prince Edward, having ſettled the affairs of the kingdom, undertook an expedition to the Holy Land, where he ſignalized himſelf by many acts of valour. The king's health declined viſibly after the departure of his ſon; and at laſt, worn out with cares and the infirmities of age, he expired at St Edmonſbury on the 16th of November 1272, in the 64th year of his age and the 56th of his reign.

Prince Edward had reached Sicily in his return from the Holy Land, when he received an account of his father's death; at which he expreſſed much concern. As he knew that England was at that time in a ſtate of perfect tranquillity, he was in no haſte to return, but ſpent near a year in France before he made his appearance in England. He was received by his ſubjects with the utmoſt joy, and crowned at Weſtminſter by Robert archbiſhop of Canterbury on the 19th of Auguſt 1274. He immediately applied himſelf to the correcting of theſe diſorders which the civil commotions. and weak adminiſtration of his father, had introduced. A ſyſtem of ſtrict juſtice, bordering on ſeverity, was introduced and kept up thro' the whole of this reign. The Jews were the only part of his ſubjects whom Edward oppreſſed. Many arbitrary taxes were levied upon them; 280 of them were hanged at once for adulterating the coin; the goods of the reſt were confiſcated, and all of them baniſhed the kingdom.

In 1276, the king undertook an expedition againſt Lewellyn prince of Wales, who had refuſed to do homage for his crown. The conqueſt of that country was not fully accompliſhed till the year 1283; after which the principality of Wales was annexed to the crown of England, and thenceforth gave a title to the king's eldeſt ſon *.—In 1286, the ſettlement of Wales appeared ſo complete, that the king went abroad in order to make peace between Alfonſo king of Arragon and Philip le Bel king of France, who had a difference about the kingdom of Sicily. He ſucceeded in his negociations; but, ſtaying abroad three years, he found that many diſorders had been introduced in his abſence. Many inſtances of robbery and violence had broke out in all parts of England; but the corruption of the judges, by which the fountains of juſtice were poiſoned, was of ſtill more dangerous conſequence. Edward, in order to remedy this prevailing abuſe, ſummoned a parliament, and brought the judges to a trial; where all of them except two, who were clergymen, were convicted of this flagrant iniquity, were fined, and depoſed from their office. The amount of the fines levied upon them is of itſelf a ſufficient proof of their guilt, being above 100,000 marks; an immenſe ſum in thoſe days, ſufficient to defray the expences of a war betwixt two great nations. The king afterwards made all the new judges ſwear that they would take no bribes; but the depoſing and fining the old ones was the more effectual remedy.

164
Attempts the conqueſt of Scotland.

In 1291, king Edward began to meditate the conqueſt of Scotland, which employed him during the reſt of his life; but which, though that kingdom was by him reduced to the greateſt diſtreſs, he was never able to accompliſh *. At the ſame time, he was engaged in expenſive conteſts with France; and theſe multiplied wars and preparations for war, by obliging him to have frequent recourſe to parliamentary ſupplies, became the remote cauſes of great and important changes in the government. The parliament was modelled into the form which has continued ever ſince. As a great part of the property of the kingdom, by the introduction of commerce and improvements in agriculture, was transferred from the barons to the lower claſs of people, ſo their conſent was thought neceſſary for raiſing the ſupplies. For this reaſon, the king iſſued writs to the ſheriffs, enjoining them to ſend to parliament, along with two knights of the ſhire, two deputies from each borough within their county; and theſe provided with ſufficient powers from their conſtituents to grant ſuch demands as they ſhould think reaſonable for the ſafety of the ſtate. The charges of theſe deputies were to be borne by the boroughs which ſent them; and ſo far were they from conſidering this deputation as an honour, that nothing could be more diſpleaſing to any borough than to be thus obliged to ſend a deputy, or to any individual than to be thus choſen. The authority of theſe commoners, however, increaſed through time. Their union gave them weight; and it became cuſtomary among them, in return for the ſupplies which they granted, to prefer petitions to the crown for the redreſs of thoſe grievances under which the nation was ſuppoſed to labour. The more the king's neceſſities increaſed, the more he found it neceſſary to give them an early redreſs; till, from requeſting, the commons proceeded to requiring; and having all the property of the nation, they by degrees began alſo to be poſſeſſed of the power

166
Dies, and is ſucceeded by Edw. II.

Edward I. died of a dyſentery at Carliſle on the 7th of July 1307, as he was leading a great army into Scotland, againſt the inhabitants of which he had vowed the moſt dreadful vengeance. He was ſucceeded by his ſon Edward II. whom he had charged with his dying breath to proſecute the war againſt Scotland, and never to deſiſt till he had finally ſubdued the king-

---

* See *Scotland.*

kingdom. But the new king was of a very different diſpoſition from his father. The Scots gradually recovered their power; and in 1314 gave the Engliſh ſuch a terrible defeat at Bannockburn, that for many years no ſuperiority of numbers could encourage them to look the Scots in the face. See SCOTLAND.

167 Diſcontents of his ſubjects.

The reign of Edward II. affords no particulars of great moment. Being a prince of a weak underſtanding, though endued with no remarkable bad qualities, his reign was one continued ſeries of quarrels with his turbulent ſubjects. His favourites were the moſt general cauſes of diſcontent. The firſt of theſe was one Piers Gaveſton, the ſon of a Gaſcon knight of ſome diſtinction, who had honourably ſerved the late king, and who, in reward for his ſervices, had obtained an eſtabliſhment for his ſon in the family of the prince of Wales.—To be the favourite of any king whatever, is no doubt in itſelf a ſufficient offence to the reſt of the courtiers. Numberleſs faults were therefore found with Gaveſton by the Engliſh barons. When the king went over to France to eſpouſe the princeſs Iſabella, to whom he had been long contracted, Gaveſton was left guardian of the realm, with more ample powers than had uſually been conferred in ſuch a caſe. But when the queen, who was of an imperious and intriguing ſpirit, arrived, Gaveſton had the misfortune to fall under her diſpleaſure alſo, on account of the aſcendency he had acquired over the king. A conſpiracy was therefore ſoon formed againſt the favourite; at the head of which were, the queen, and the Earl of Lancaſter couſin-german to the king, and the moſt opulent and powerful nobleman in England. The king, unable to reſiſt ſuch a combination, was at laſt obliged to baniſh Gaveſton; but recalled him ſome time after. This was ſufficient to ſpread an alarm over the whole kingdom: a civil war enſued; and the nobility having got Gaveſton into their hands, ſoon freed themſelves of any farther apprehenſions from him, by putting him to death.

After the unfortunate defeat at Bannockburn, king Edward choſe a new favourite named *Hugh Le Deſpenſer*. He was a young man of a noble Engliſh family; ſome merit, and very engaging accompliſhments. His father was a perſon of a much more reſpectable character than the ſon; but the being admitted to a ſhare of king Edward's favour was a ſufficient crime. The king imprudently diſpoſſeſſed ſome lords of their eſtates, in order to beſtow them upon this favourite; and this was a ſufficient pretence for openly attacking both the father and ſon. The Earls of Lancaſter and Hereford flew to arms. Sentence was procured from parliament of perpetual exile againſt the two Spenſers, with a forfeiture of all their eſtates. At laſt the king took the field at the head of 30,000 men, and preſſed the Earl of Lancaſter ſo cloſely, that he had not time to collect his forces together; and, flying from one place to another, he was at laſt ſtopped in his way towards Scotland, and made priſoner. He was immediately condemned by a court-martial; and executed on an eminence near Pomfret, with circumſtances of the greateſt indignity.

Spenſer now triumphed for ſome time over his enemies; moſt of the forfeitures were ſeized for his uſe, and he is ſaid to have been guilty of many acts of rapine and injuſtice. But he was ſoon oppoſed by a more formidable enemy. Queen Iſabella fled to France, and refuſed to return to England till Spenſer was removed from the royal preſence, and baniſhed the kingdom. Thus ſhe made herſelf popular in England, where Spenſer was univerſally diſliked; and ſhe had the pleaſure of enjoying the company of a young nobleman named *Mortimer*, upon whom ſhe had lately placed her affections. The queen's court, therefore, became a ſanctuary for all the malecontents who were baniſhed their own country, or who choſe to come over. When ſhe thought matters were ripe for her purpoſe, ſhe ſet ſail from Dort harbour, accompanied by 3000 armed men. She landed without oppoſition on the coaſt of Suffolk, on the 24th of September 1326; and ſhe no ſooner appeared, than there ſeemed to be a general revolt in her favour. The unfortunate king found the ſpirit of diſloyalty ſpread over the whole kingdom. He had placed ſome dependence on the garriſon of Briſtol, which was under the command of the elder Spenſer: but they mutinied againſt their governor; and that unfortunate favourite was delivered up, and condemned by the tumultuous barons to the moſt ignominious death. He was hanged on a gibbet in his armour; his body was cut in pieces and thrown to the dogs; and his head was ſent to Wincheſter, where it was ſet on a pole, and expoſed to the inſults of the populace. Young Spenſer did not long ſurvive his father. He was taken, with ſome others who had followed the fortunes of the wretched king, in an obſcure convent in Wales. The queen had not patience to wait the formality of a trial; but ordered him to be immediately led forth before the inſulting populace, and ſeemed to take a ſavage pleaſure in beholding his diſtreſs. He was executed on a gibbet 50 feet high; his head was ſent to London, where it was received by the citizens with brutal triumph, and fixed on the bridge.

In the mean time the king, who hoped to find refuge in Wales, was quickly diſcovered, and delivered up to his adverſaries, who inſulted him in the groſſeſt manner. He was conducted to the capital amidſt the inſults and reproaches of the people, and confined in the tower. A charge was ſoon exhibited againſt him; in which no other crimes but his incapacity to govern, his indolence, his love of pleaſure, and his being ſwayed by evil counſellors, were objected againſt him. His depoſition, however, was quickly voted by parliament; he was aſſigned a penſion for his ſupport; his ſon Edward, a youth of 14, was choſen to ſucceed him, and the queen was appointed regent during the minority. The depoſed monarch did not long ſurvive the loſs of his crown. He was at firſt conſigned to the cuſtody of the Earl of Lancaſter; but this nobleman ſhowing ſome marks of reſpect and pity, he was taken out of his hands, and delivered over to the lords Berkeley, Mautravers, and Gournay, who were entruſted alternately, each for a month, with the charge of guarding him. While he was in Berkeley's cuſtody, he was ſtill uſed with ſome degree of humanity; but when the turn of Mautravers and Gournay came, every ſpecies of indignity was practiſed upon him, as if they had deſigned to accelerate his death by the bitterneſs of his ſufferings. It is reported, that one day when Ed-nd.

Edward was to be ſhaved, they ordered cold and dirty water to be brought from a ditch for that purpoſe; and when he deſired it to be changed, and was ſtill denied his requeſt, he burſt into tears and exclaimed, That in ſpite of their inſolence he would be ſhaved with clean and warm water. As his perſecutors, however, ſaw that his death might not arrive, even under every cruelty they could practiſe, and were daily afraid of a revolution in his favour, they determined to rid themſelves of their fears by deſtroying him at once. Mortimer, therefore, ſecretly gave orders to the two keepers, who were at his devotion, inſtantly to diſpatch the king; and theſe ruffians contrived to make the manner of his death as cruel and barbarous as poſſible. Taking advantage of Berkeley's ſickneſs, in whoſe cuſtody he then was, and who was thereby incapacitated from attending his charge, they came to Berkeley-caſtle, and put themſelves in poſſeſſion of the king's perſon. They threw him on a bed, and held him down with a table which they had placed over him. They then ran a horn pipe up his body, through which they conveyed a red-hot iron; and thus burnt his bowels without disfiguring his body. By this infernal contrivance they expected to have their crime concealed: but the horrid ſhrieks of the king, which were heard at a diſtance from the caſtle, gave a ſuſpicion of the murder; and the whole was ſoon after divulged by the confeſſion of one of the accomplices. Gournay and Mautravers were held in deteſtation by all mankind; and when the enſuing revolution deprived their protectors of power, they found it neceſſary to fly the kingdom. Gournay was afterwards ſeized at Marſeilles, delivered over to the ſeneſchal of Guienne, and put on board a ſhip with a view of carrying him over to England; but he was beheaded at ſea, by ſecret orders, as was ſuppoſed, of ſome nobles and prelates in England, anxious to prevent any diſcovery which he might make of his accomplices. Mautravers concealed himſelf for ſome years in Germany; but having found means of rendering ſome ſervices to Edward III. he ventured to approach his perſon, threw himſelf on his knees before him, and received a pardon.

Mor-
r.

By the death of Edward II. the government fell entirely into the hands of the queen and her paramour Mortimer. The parliament, which raiſed young Edward to the throne, had indeed appointed 12 perſons as his privy-council, to direct the operations of government. Mortimer excluded himſelf, under a ſhow of moderation; but at the ſame time ſecretly influenced all the meaſures that came under their deliberation. As this influence began very ſoon to be perceived, and the queen's criminal attachment to Mortimer was univerſally known, theſe governors ſoon became very obnoxious to the people. The firſt ſtroke given to Mortimer's power was during an irruption of the Scots, when the favourite prevented the young king from attacking the enemy. Though it is very probable that the Engliſh army would have been deſtroyed by making an attack on an army ſituated in ſuch an advantageous poſt as the Scots at that time occupied, Mortimer incurred great blame on that account. He was accuſed of having allowed the Scots to make their eſcape; and the general diſguſt on this account was increaſed by his concluding a peace with that kingdom, wherein the Engliſh renounced all title to the ſovereignty of Scotland for the ſum of 30,000 marks. Soon after Mortimer ſeized and executed the earl of Kent, brother to the late king; who, ſuppoſing Edward II. to be ſtill alive, had formed a deſign of reinſtating him in his kingdom. The execution was ſo ſudden, that the young king had not time even to interpoſe in his behalf; and Mortimer ſoon after ſeized this nobleman's eſtate for his own uſe, as he did alſo the immenſe fortunes of the Spenſers.

England.

Edward, finding the power of Mortimer a continual reſtraint upon himſelf, reſolved to ſhake off an authority that was likewiſe grown odious to the whole nation. The queen and Mortimer had for ſome time choſen the caſtle of Nottingham for their reſidence. It was ſtrictly guarded, the gates were locked every night, and the keys carried to the queen. It was therefore agreed between the king and ſome of the barons, who ſecretly entered into his deſigns, to ſeize upon them in this fortreſs. Sir William Eland the governor was induced to admit them through a ſubterraneous paſſage, which had been formerly contrived for an outlet, but was now choked up with rubbiſh, and known only to one or two. Through this paſſage the noblemen in the king's intereſt entered the caſtle in the night-time; and Mortimer, without having it in his power to make any reſiſtance, was ſeized in an apartment adjoining to that of the queen. The parliament, which was then ſitting, condemned him, without either permitting him to make his defence, or examining a ſingle witneſs againſt him. He was hanged on a gibbet at a place called *Elmes*, about a mile from London. A ſimilar ſentence was paſſed againſt ſome of his adherents, particularly Gournay and Mautravers, who found an opportunity of eſcaping as above mentioned. The queen, who was perhaps the moſt culpable of the whole, was ſcreened by the dignity of her ſtation. She was, however, depoſed from all ſhare of power; and confined for life to the caſtle of Riſings, with a penſion of 3000 pounds a-year. From this confinement ſhe was never ſet free, though the king paid her an annual viſit of ceremony. She lived 25 years after her depoſition.

172
Mortimer
executed.

Edward III. proved the greateſt warrior that ever ſat on the Engliſh throne. He firſt attempted to raiſe Edward Baliol to the ſovereignty of Scotland; but this he found impoſſible fully to accompliſh. Edward next formed a project of invading and conquering France, to the ſovereignty of which he pretended a right. His firſt expectations were attended with ſo little ſucceſs, that on his return to England he found the nation very much diſcontented, and himſelf haraſſed by his numerous creditors without any ſufficient reſource for paying them. Being determined, however, not to bear any blame himſelf if he could throw it any where elſe, he took the firſt opportunity of wreaking his vengeance upon his ſubjects. Finding therefore the tower of London negligently guarded on his arrival, he impriſoned the conſtable and all his inferior officers, treating them with the greateſt ſeverity. He then fell upon the ſheriffs and collectors of the revenue, whom he diſmiſſed from their employments, and appointed an inquiry into their conduct to be made by perſons who, knowing the king's humour, were ſure to find every one guilty who came before them. The keeper of the privy-ſeal, the chief-juſtice, the mayor of London, the

174
His arbitrary behaviour on
his return.

the biſhops of Chicheſter and Litchfield, with the chancellor and treaſurer, were depoſed and impriſoned.

175
Is oppoſed by the archbiſhop of Canterbury;

In this career of reſentment and cruelty, however, he found himſelf oppoſed by the archbiſhop of Canterbury, whom he had appointed to collect the taxes laid on for the ſupport of the French war. That prelate happening to be abſent at the time of the king's arrival, did not immediately feel the effects of his reſentment. Being informed, however, of the humour in which his ſovereign was, he iſſued a ſentence of excommunication againſt all who, on any pretence whatever, ſhould exerciſe violence againſt the perſons or eſtates of clergymen, or who infringed thoſe privileges ſecured by the great charter, or who accuſed a prelate of treaſon, or any other crime, in order to bring him under the king's diſpleaſure. A regular combination was formed againſt the king by the clergy, with the primate at their head; who, to execute the indignation of the people as much as poſſible, reported, that the king intended to recal the general pardon and the remiſſion to old debts which had been granted, and to impoſe new and arbitrary taxes without conſent of parliament. The archbiſhop alſo, in a letter to the king, informed him, that there were two powers by which the world was governed, *viz.* the holy pontifical apoſtolical dignity and the regal authority; of which the clerical power was evidently the ſupreme, as the prieſts were to anſwer even for the conduct of kings at the laſt judgment; and were beſides the ſpiritual fathers of all the faithful, kings and princes not excepted; having, beſides, a heavenly charter, intitling them to direct their wills and actions, and to cenſure their tranſgreſſions. On this the king reſolved to mortify him, by ſending no ſummons to him when the parliament was called: but the prelate, undaunted by this mark of reſentment, appeared before the gates of the parliament-houſe with his croſier in his hand, demanding admittance as the firſt peer of the realm. This application was rejected for two days, but at laſt complied with; and the parliament now ſeemed inclined to abridge the king's authority conſiderably.

176
And obliged at laſt to ſubmit.

They began with obſerving, that as the great charter had been violated in many points, particularly by the illegal impriſonment of many freemen and the ſeizure of their goods, it was neceſſary to confirm it anew, and to oblige all the chief officers of the law and others to ſwear to the obſervance of it. It was alſo required, that whenever any of the great offices became vacant, the king ſhould fill them up by the advice of his council and the conſent of ſuch barons as ſhould at the time be found to reſide in the neighbourhood of the court. They enacted alſo, that on the third day of every ſeſſion the king ſhould reſume all ſuch offices into his own hand, excepting thoſe of the juſtices of the two benches and the barons of exchequer; that the miniſters ſhould for the time be reduced to private perſons; that they ſhould in that condition anſwer before parliament to any accuſation preferred againſt them; and that, if they were found in any reſpect guilty, they ſhould be finally deprived of their offices, and others appointed in their ſtead. In return for ſuch ample conceſſions, the king was offered a grant of 20,000 ſacks of wool; and ſuch was his urgent neceſſity, that he was compelled to accept of it even upon theſe terms. Still, however, he determined to adhere to his engagements no longer than till this neceſſity was removed. Though the agreement therefore was ratified in full parliament, he ſecretly entered a proteſt, that, as ſoon as his convenience permitted, he would from his own authority revoke what had been extorted from him. This proteſt was afterwards confirmed by a public edict; in which he aſſerted, that that ſtatute had been made contrary to law; that it was prejudicial to the prerogatives of the crown, which he had only diſſembled when he ſeemed to ratify it; and that in his own breaſt he had never aſſented to it: and declared, that from thenceforth it had no force or authority.

177
But reg
his pow

This exertion of arbitrary power, which it might have been imagined would have occaſioned a prodigious clamour, was not taken notice of by any of the ſubſequent parliaments; ſo that in the courſe of two years Edward had entirely regained his authority, and obtained a repeal of the obnoxious ſtatute juſt mentioned.

178
Perfor
great e
ploits i
France

Having thus ſettled matters to his ſatisfaction, the king reſumed his expedition againſt France, where he gained great advantages. In his abſence the Scots invaded England; but were entirely defeated at Durham, and their king himſelf taken priſoner. The Engliſh king in the mean time continued his victories on the continent; in which he was greatly aſſiſted by Edward ſurnamed the *Black Prince*, the greateſt hero recorded in the Engliſh annals. But for the wars of Edward III. and the exploits of this famous prince, ſee the articles SCOTLAND and FRANCE. The Black Prince died on the 8th of June 1376, and the king ſurvived only about a year.

179
Richar

He expired on the 21ſt of June 1377, and was ſucceeded by his ſecond ſon Richard.

As the new king was only eleven years old when he aſcended the throne, the government was veſted in the hands of his three uncles the dukes of Lancaſter, York, and Glooeſter. The different diſpoſitions of theſe noblemen, it was thought, would cauſe them check the deſigns of each other. Lancaſter was neither popular nor enterpriſing; York was indolent and weak; and Glooeſter turbulent, popular, and ambitious. Diſcontents firſt aroſe among the common people. They had now acquired a ſhare of liberty ſufficient to inſpire them with a deſire for more, and this deſire was greatly encreaſed by the diſcourſes of one John Ball a ſeditious preacher. He went about the country, and inculcated on his audience, that mankind were all derived from one common ſtock; and that all of them had equal right to liberty and the goods of nature, of which they had been deprived by the ambition of a few inſolent rulers.

Theſe doctrines were greedily ſwallowed by the populace, who were farther inflamed by a new impoſition of three groats a-head upon every perſon in the kingdom above 15 years of age. This had been granted as a ſupply by parliament, and was no doubt neceſſary on account of the many expenſive wars in which the kingdom was engaged; but its apparent injuſtice, in laying no more burden upon the rich than the poor, excited the utmoſt reſentment of the people. The manner, too, of collecting this tax, ſoon furniſhed them with an occaſion of revolt. It began in Eſſex, where a report was induſtriouſly ſpread that the peaſants were to be deſtroyed, their houſes burned, and their farms plundered. A blackſmith, well known by the name of of *Wat Tyler*, was the firſt that excited them to arms. The tax-gatherers coming to this man's houſe while he was at work, demanded payment for his daughter. This he refuſed, alleging that ſhe was under the age mentioned in the act. One of theſe fellows offered to produce a very indecent proof to the contrary, and at the ſame time laid hold of the maid. This the father reſenting, immediately knocked out the ruffian's brains with his hammer. The byſtanders applauded the action; and exclaimed that it was high time for the people to take vengeance on their tyrants, and to vindicate their native liberty. The whole country immediately took arms, and the inſurgents ſoon amounted to about 100,000 men. They advanced to Blackheath, where they ſent a meſſage to the king, who had taken ſhelter in the tower, deſiring a conference with him. The king was deſirous of complying with their demands, but was intimidated by their fierce behaviour In the mean time they entered the city, burning and plundering the houſes of ſuch as were obnoxious for their power or riches. Their animoſity was particularly levelled againſt the lawyers, to whom they ſhowed no mercy. The king at laſt, knowing that the tower was not able to reſiſt their aſſaults, went out among them, and deſired to know their demands. To this they made a very humble remonſtrance; requiring a general pardon, the abolition of ſlavery, freedom of commerce in the market-towns, and a fixed rent inſtead of thoſe ſervices required by the tenure of villenage. The king granted all theſe requeſts; and charters were made out by which the grant was ratified. In the mean time, however, another body of theſe inſurgents had broke into the tower, and murdered the chancellor, the primate, and the treaſurer, with ſome other officers of diſtinction. They then divided themſelves into bodies, and took up their quarters in different parts of the city. At the head of one of theſe was Wat Tyler, who led his men into Smithfield, where he was met by the king, who invited him to a conference under pretence of hearing and redreſſing his grievances. Tyler ordered his companions to retire till he ſhould give them a ſignal, and boldly ventured to begin a conference with the king in the midſt of his retinue. His demands were, That all ſlaves ſhould be ſet free; that all commonages ſhould be open to the poor as well as to the rich; and that a general pardon ſhould be paſſed for the late outrages. Whilſt he made theſe demands, he now and then lifted up his ſword in a menacing manner: which inſolence ſo raiſed the indignation of William Walworth lord mayor of London, that, without conſidering the danger to which he expoſed his majeſty, he ſtunned Tyler with a blow of his mace; while one of the king's knights riding up, diſpatched him with his ſword. The mutineers, ſeeing their leader fall, prepared themſelves to take revenge. Their bows were already bent for execution; when Richard, though not yet 16 years of age, rode up to the rebels, and with admirable preſence of mind cried out: "What, my people, will you kill your king? Be not concerned for the loſs of your leader. I myſelf will now be your general. Follow me into the field, and you ſhall have whatever you deſire." The multitude immediately deſiſted, and followed the king into the fields, where he granted them the ſame charters that he had before granted to their companions. Theſe charters, however, were ſoon after revoked, and the common people reduced to the ſame ſituation in which they had formerly been.

The courage, addreſs, and preſence of mind, which the king had diſcovered in quelling ſuch a dangerous tumult, gave great hopes to the nation: but, in proportion as Richard advanced in years, theſe hopes were blaſted; and his want of capacity, or at leaſt of ſolid judgment, appeared in every enterpriſe he attempted. The king had unluckily loſt the favour of the common people after the inſurrection juſt mentioned. He allowed the parliament to revoke the charters of enfranchiſement and pardon which had been granted; ſome of the ringleaders in the late diſorders had been ſeverely puniſhed, and ſome even put to death without any form of proceſs or trial. Thus the popular leaders were greatly exaſperated by this cruelty, though probably the king did not follow the dictates of his own mind ſo much in it as the advice of his counſellors. But having thus loſt the favour of one party, he quickly after fell under the diſpleaſure of the other alſo. Suppoſing himſelf to be in too great ſubjection to his uncles, particularly the Duke of Glouceſter, he attempted to ſhake off the yoke, by raiſing others to ſuch a degree of power as might enable them to rival them. His firſt favourite was Robert de Vere Earl of Oxford, a young man of an agreeable perſon, but diſſolute in his behaviour, who ſoon acquired an abſolute aſcendant over him. So much was he determined to ſhow his attachment to this nobleman, that he firſt created him Marquis of Dublin, a title never known in England before; then Duke of Ireland; transferring to him the entire ſovereignty of that iſland by patent for life. He gave him in marriage his couſin-german, the daughter of the Earl of Bedford; but ſoon after permitted him to divorce her for another lady with whom he had fallen in love. This nobleman ſoon became the diſpenſer of all the king's favours to ſuch a degree, that a conſpiracy was formed againſt him. At the head of which were, Mowbray Earl of Nottingham, Fitz Alan Earl of Arundel, Percy Earl of Northumberland, Montacute Earl of Saliſbury, and Beauchamp Earl of Warwick. Vere was impeached in parliament; and tho' nothing of moment was even alleged againſt him, he was condemned and deprived of his office. They next proceeded to attack the royal authority itſelf. Under pretence that the king was yet unable to govern the kingdom, though at that time 21 years of age, they appointed a commiſſion of 14 perſons to whom the ſovereignty was to be transferred for a year. This meaſure was driven forward by the duke of Glouceſter, and none but his own faction were admitted as members of the committee. The king could not without regret perceive himſelf thus totally deprived of authority. He firſt endeavoured to gain over the parliament to his intereſts, by influencing the ſheriffs of each county, who were then the only returning officers. This meaſure failing, he next applied to the judges. They declared, that the commiſſion which had deprived the king of his authority was unlawful, and that thoſe who procured or adviſed it were puniſhable with death. Their ſentence was quickly oppoſed by declarations from the lords. The Duke of Glouceſter armed his partiſans; and appeared at Haringay park near Highgate,

A conſpiracy againſt the king.

England.

Highgate, at the head of a body of men ſufficient to intimidate the king and all his adherents. Theſe inſurgents, ſenſible of their own power, began by demanding of the king the names of thoſe who had adviſed him to his late raſh meaſures. A few days afterwards they appeared armed in his preſence, and accuſed by name the Archbiſhop of York, the Duke of Ireland, the Earl of Suffolk, and Sir Robert Treſilian, one of the judges who had declared in his favour, together with Sir Nicholas Bember, as public and dangerous enemies to the ſtate. The duke of Ireland fled into Cheſhire, where he attempted to raiſe a body of forces; but waa quickly obliged to fly into Flanders, on the arrival of the Duke of Gloceſter with a ſuperior army. Soon after, the king was obliged to ſummon a parliament, where an accuſation was drawn up againſt five of his counſellors. Of theſe only Sir Nicholas Bember was preſent; and he was quickly found guilty, condemned, and executed, together with Sir Robert Treſilian, who had been diſcovered and taken during the interval. Lord Beauchamp of Holt was ſoon after condemned and executed; and Sir Simon Burley, who had been appointed the king's governor, ſhared the ſame fate, though the queen continued for three hours on her knees before the Duke of Gloceſter, imploring his pardon.

285
The king takes the power into his own hands.

Such unparalleled inſolence and barbarity in a ſubject could not go unpuniſhed. In 1389, the king, at an extraordinary council of the nobility aſſembled after Eaſter, to the aſtoniſhment of all preſent, deſired to know his age. Being told that he was turned of two and twenty, he alleged that it was then time for him to govern without help; and that there was no reaſon why he ſhould be deprived of thoſe rights which the meaneſt of his ſubjects enjoyed. The lords anſwered in ſome confuſion, that he had certainly an undiſputed right to take upon himſelf the government of the kingdom. "Yes (replied the king), I have long been under the government of tutors; and I will now firſt ſhow my right to power by their removal." He then ordered Thomas Arundel, whom the commiſſioners had lately appointed chancellor, to give up the ſeals; which he next day delivered to William Wickham biſhop of Wincheſter. He next removed the Duke of Gloceſter, the Earl of Warwick, and other lords of the oppoſition, from the council; and all the great officers of the houſehold, as well as the judges, were changed.

The king being thus left at liberty to govern as he thought proper, for ſome time behaved in ſuch a manner as to gain the affections of the people. It does not appear indeed that he ever gave much cauſe of complaint; but it was impoſſible for any prince in thoſe days to keep himſelf ſecure on the throne but by a very ſevere and vigorous adminiſtration. The Duke of Gloceſter, perceiving that Richard was not of a warlike diſpoſition, frequently ſpoke with contempt of his perſon and government, and deliberated concerning the lawfulneſs of throwing off all allegiance to him. The king being informed of his conduct by ſpies appointed for that purpoſe, at laſt formed a reſolution of ridding himſelf of Gloceſter and his faction at once. He therefore ordered that nobleman to be immediately arreſted and ſent over to Calais, where there was no danger of his being reſcued by his numerous adherents. The earls of Arundel and Warwick were ſeized at the ſame time; and a new parliament, which the king knew would be perfectly obedient to his will, was ſummoned to Weſtminſter. Here the commiſſion of 14, who had uſurped on the royal authority, was annulled for ever; all thoſe acts which had condemned his former miniſters were repealed; and the general pardon which the king had formerly given when he aſſumed the government into his own hands, was revoked. Several of Gloceſter's party were condemned and executed, and at laſt that nobleman himſelf was called for to take his trial as well as the reſt; but he had before been privately diſpatched in priſon.

After the deſtruction of the Duke of Gloceſter and the heads of his party, a miſunderſtanding aroſe among the noblemen who had joined in the proſecution. The Duke of Hereford appeared in parliament, and accuſed the Duke of Norfolk of having ſpoken ſeditious words againſt his majeſty in a private converſation. Norfolk denied the charge, gave Hereford the lie, and offered to prove his innocence by ſingle combat. The challenge was accepted; but on the day appointed for the duel, the king would not ſuffer the combatants to engage, but commanded both of them to leave the kingdom. The Duke of Norfolk he baniſhed for life, but the Duke of Hereford only for ten years. The former retired to Venice, where in a ſhort time he died of a broken heart. Hereford behaved in a reſigned and ſubmiſſive manner; which ſo pleaſed the king, that he conſented to ſhorten the time of his baniſhment four years: he alſo granted him letters patent, enſuring him of the enjoyment of any inheritance which ſhould fall to him during his abſence; but upon the death of his father the Duke of Lancaſter, which happened ſhortly after, Richard revoked thoſe letters, and kept the eſtate to himſelf.

This laſt injury inflamed the reſentment of Hereford to ſuch a degree, that he formed a deſign of dethroning the king. He was a great favourite both with the army and people; he was immenſely rich, and connected by blood or alliance with all the great families of the nation. The king at the ſame time, it is ſaid, gave himſelf up to an idle, effeminate life; and his miniſters following his example, the national honour was loſt. The number of malecontents daily increaſed, and only waited for the abſence of the king, in order to put their ſchemes in execution; and this opportunity ſoon offered.

The Earl of March, preſumptive heir to the crown, having been appointed the king's lieutenant in Ireland, was ſlain in a ſkirmiſh with the natives of that country; which ſo incenſed Richard, that, unmindful of his precarious ſituation at home, he went over to Ireland with a conſiderable army, in order to revenge his death in perſon. The Duke of Lancaſter (for that was the title which Hereford aſſumed on the death of his father) hearing of the king's abſence, inſtantly embarked at Nantz; and with a retinue only of 60 perſons in three ſmall veſſels, landed at Ravenſpur in Yorkſhire. The Earl of Northumberland, who had long been a malecontent, together with Henry Percy his ſon, who from his ardent valour was ſurnamed *Hotſpur*, immediately joined him with their forces; and the people flocked to him in ſuch numbers, that in a few days his army amounted to 60,000 men.

and.

Richard, in the mean time, continued in perfect ſecurity in Ireland for ſome time. Contrary winds for three weeks together prevented his receiving any news of the rebellion which was begun in his native dominions. He landed therefore at Milford Haven without ſuſpicion, attended by a body of 20,000 men; but immediately found himſelf oppoſed by a power which he could by no means reſiſt. His army gradually deſerted him, till at laſt he was obliged to acquaint the duke, that he would ſubmit to whatever terms he pleaſed to preſcribe. The duke did not think proper to enter into any treaty with the king; but carried him to London, where he was confined cloſe priſoner in the Tower, formally depoſed by parliament, or rather by the Duke of Lancaſter, and at laſt put to death. The manner of his death is variouſly related. According to ſome, eight or nine ruffians were ſent to the caſtle of Pomfret, whither the unhappy prince had been removed, in order to diſpatch him. They ruſhed unexpectedly into his apartment; but Richard, knowing their deſign, reſolved to ſell his life as dear as poſſible. He wreſted a pole-ax from one of the murderers, with which he killed four of them; but was at length overpowered and killed. Others relate that he was ſtarved in priſon; and that, after he was denied all nouriſhment, he prolonged his life 14 days, by feeding on the flocks of his bed. He died in the year 1399, in the 34th year of his age, and 23d of his reign.—It was during the reign of Richard II. that Wickliff, the noted reformer, publiſhed his doctrines in England. After ſentence of depoſition had been pronounced on Richard by both houſes of parliament, the throne being then vacant, the Duke of Lancaſter ſtepped forth; and having croſſed himſelf on the forehead and on the breaſt, and called on the name of Chriſt, gave in his claim to the throne in the following words, which we ſhall give in the original language. "In the name of Fadher, Son, and Holy Ghoſt, I Henry of Lancaſter, challenge this rewme of Ynglonde, and the croun, with all the membres and the appurtenances; als I that am deſcendit by right line of the blode, coming fro the gude King Henry therde, and throge that right that God of his grace hath ſent me, with help of kyn, and of my frendes to recover it; the which rewme was in poynt to be ondone by defaut of governance, and ondoying of the gude laws."

The right which the duke here claimed by deſcent from Henry III. proceeded on a falſe ſtory that Edmond Earl of Lancaſter, ſon of Henry III. was really the elder brother of Edward I.; but that, by reaſon of ſome deformity in his perſon, he had been poſtponed in the ſucceſſion, and Edward the younger brother impoſed on the nation in his ſtead. The preſent Duke of Lancaſter inherited from Edmund, by his mother, the right which he now pretended to the crown; though the falſehood of the ſtory was ſo generally known, that he thought proper to mention it only in general terms.—No oppoſition, however, was made to the validity of this title in parliament; and thus commenced the differences between the houſes of York and Lancaſter, which were not terminated but by many bloody and ruinous wars.

r
y IV.

The reign of Henry IV. was little elſe than a continued ſeries of inſurrections. In the very firſt parliament he called, no fewer than 40 challenges were given and accepted by different barons; and though Henry had ability and addreſs enough to prevent theſe duels from being fought, it was not in his power to prevent continual inſurrections and combinations againſt himſelf. The moſt formidable one was conducted by the Earl of Northumberland, and commenced A. D. 1402. The occaſion of it was, that Henry denied the Earl liberty to ranſom ſome Scots priſoners which had been taken in a ſkirmiſh with that nation. The king was deſirous of detaining them in order to increaſe his demands upon Scotland in making peace; but as the ranſom of priſoners was in that age looked upon as a right belonging to thoſe who had taken them, the earl thought himſelf grievouſly injured. The injury appeared ſtill the greater, becauſe Northumberland conſidered the king as indebted to him both for his life and crown. He reſolved therefore to dethrone Henry; and to raiſe to the throne young Mortimer, who was the true heir to the crown, as being the ſon of Roger Mortimer Earl of March, whom Richard II. had declared his ſucceſſor. For this purpoſe he entered into an alliance with the Scots and Welſh, who were to make an irruption into England at the ſame time that he himſelf was to raiſe what forces he could in order to join them. But when all things were prepared for this inſurrection, the Earl found himſelf unable to lead on the troops, by a ſudden fit of illneſs with which he was ſeized at Berwick. On this, young Piercy (ſurnamed *Hotſpur*) took the command; and marched towards Shrewſbury, in order to join the Welſh. But the king had happily a ſmall army with which he intended to have acted againſt the Scots; and knowing the importance of celerity in civil wars, inſtantly hurried down, that he might give battle to the rebels. He approached Shrewſbury before a junction with the Welſh could be effected; and the impatience of Piercy urged him to an engagement, which at that time he ought to have declined. The evening before the battle, he ſent a manifeſto to Henry; in which he renounced his allegiance, ſet the king at defiance, and enumerated all the grievances of which he imagined the nation might juſtly complain. He reproached him (and very juſtly) with his perjury; for Henry, on his firſt landing in England, had ſworn upon the goſpels, before the Earl of Northumberland, that he had no other intention but to recover poſſeſſion of the duchy of Lancaſter, and that he would ever remain a faithful ſubject to King Richard. He aggravated his guilt, in firſt dethroning and then murdering that prince; and in uſurping on the title of the houſe of Mortimer; to whom, both by lineal ſucceſſion and by declarations of parliament, the throne, then vacant by Richard's death, did of right belong. Several other heavy charges were brought againſt him; which, at that time, could be productive of no other effect than to irritate the king and his adherents to the utmoſt.

England.

192
Inſurrection of the Earl of Northumberland.

193
His ſon defeated and killed at Shrewſbury.

The armies on each ſide were in number about 12,000; ſo that they were not unmanageable by their commanders; and as both leaders were men of known bravery, an obſtinate engagement was expected. The battle was fought on the 20th of July 1403; and we can ſcarce find in thoſe ages any other in which the ſhock was ſo terrible and conſtant. At laſt Piercy being killed by an unknown hand, the victory was decided

cided in favour of the royaliſts. There are ſaid to have fallen on that day near 2300 gentlemen, and 6000 private men, of whom near two thirds were of Piercy's army.

The Earl of Northumberland having recovered from his ſickneſs, and levied an army, was on his march to join his ſon; but being oppoſed by the Earl of Weſtmoreland, and hearing of the defeat at Shrewſbury, he diſmiſſed his forces, and came with a ſmall retinue to the king at York. He pretended that his ſole intention was to mediate between the contending parties; and the king thought proper to accept of his apology, and grant him a pardon for his offence. The other rebels were treated with equal lenity; and none of them, except the Earl of Worceſter and Sir Richard Vernon, who were regarded as the chief authors of the inſurrection, periſhed by the hands of the executioner. This lenity, however, was not ſufficient to keep the kingdom quiet; one inſurrection followed another almoſt during the whole of this reign; but either through Henry's vigilance, or the bad management of the conſpirators, they never could unite their forces in ſuch a manner as was neceſſary for bringing their projects to bear.

194 Archbiſhop of York executed.

This reign is remarkable for the firſt capital puniſhment inflicted on a clergyman of high rank. The Archbiſhop of York having been concerned in an inſurrection againſt the king, and happening to be taken priſoner, was beheaded without either indictment, trial, or defence; nor was any diſturbance occaſioned by this ſummary execution. But the moſt remarkable tranſaction of this reign was, the introduction of that abſurd and cruel practice of burning people on account of their religion. Henry, while a ſubject, was thought to have been very favourable to the doctrines of Wickliffe; but when he came to the throne, finding his poſſeſſion of it very inſecure, he thought ſuperſtition a neceſſary implement of his authority, and therefore determined by all means to pay court to the clergy. There were hitherto no penal laws againſt hereſy; not indeed through the toleration of the court of Rome, but through the ſtupidity of the people, who could not perceive the abſurdities of the eſtabliſhed religion. But when the learning and genius of Wickliffe had once broken the fetters of prejudice, the eccleſiaſtics called aloud for the puniſhment of his diſciples; and Henry, who was very little ſcrupulous in his conduct, reſolved to gratify them. He engaged parliament to paſs a law for this purpoſe: it was enacted, that when any heretic, who relapſed, or refuſed to abjure his opinions, was delivered over to the ſecular arm by the biſhop or his commiſſaries, he ſhould be committed to the flames before the whole people. This weapon did not remain long unemployed in the hands of the clergy. William Sautré, rector of St Oſithes in London, had been condemned by the convocation of Canterbury; his ſentence was ratified by the houſe of Peers; the king iſſued his writ for the execution; and the unhappy man was burnt alive in the year 1401. The doctrines of Wickliffe, however, ſeem to have already gained ground very conſiderably in England. In 1405, the commons, who had been required to grant ſupplies, propoſed in plain terms to the king to ſeize all the temporalities of the church, and employ them as a perpetual fund to ſerve the exigencies of the ſtate. They inſiſted that the clergy poſſeſſed a third of the lands of the kingdom; and they contributed nothing to the public burdens; and that their exorbitant riches tended only to diſqualify them from performing their miniſterial functions with proper zeal and attention. When this addreſs was preſented, the Archbiſhop of Canterbury, who then attended the king, objected that the clergy, though they went not in perſon to the wars, ſent their vaſſals and tenants in all caſes of neceſſity; while at the ſame time, they themſelves who ſtaid at home were employed night and day in offering up their prayers for the happineſs and proſperity of the ſtate. The ſpeaker anſwered with a ſmile, that he thought the prayers of the church but a very ſlender ſupply. The archbiſhop, however, prevailed in the diſpute; the king diſcouraged the application of the commons; and the lords rejected the bill which the lower houſe had framed for deſpoiling the church of her revenues. The commons were not diſcouraged by this repulſe. In 1410, they returned to the charge with more zeal than before. They made a calculation of all the eccleſiaſtical revenues, which, by their account, amounted to 485,000 marks a-year, and included 18,400 ploughs of land. They propoſed to divide this property among 15 new earls, 1500 knights, 6000 eſquires, and 100 hoſpitals; beſides 20,000 pounds a-year, which the king might keep for his own uſe: and they inſiſted that the clerical functions would be better performed than at preſent, by 15,000 pariſh-prieſts, at the rate of 7 marks a-piece of yearly ſtipend. This application was accompanied with an addreſs for mitigating the ſtatutes enacted againſt the Wickliffites or Lollards, ſo that the king knew very well from what ſource it came. He gave the commons, however, a ſevere reply; and further to ſatisfy the church that he was in earneſt, ordered a Lollard to be burnt before the diſſolution of parliament.

195 Burning of heretics introduced.

The king had been for ſome time ſubject to fits, which continued to increaſe, and gradually brought him to his end. He expired at Weſtminſter in 1413, in the 46th year of his age, and the 13th of his reign. He was ſucceeded by his ſon Henry V. whoſe martial talents and character had at firſt occaſioned unreaſonable jealouſies in the mind of his father, ſo that he thought proper to exclude him from all ſhare of public buſineſs. The active ſpirit of Henry being thus reſtrained from its proper exerciſe, broke out in every kind of extravagance and diſſipation. It is even reported, that, when heated with liquor, he ſcrupled not to accompany his riotous aſſociates in attacking the paſſengers on the ſtreets and highways, and robbing them of their goods. No ſooner, however, did he aſcend the throne, than he called together his former companions, acquainted them with his intended reformation, exhorted them to imitate his example; but ſtrictly prohibited them, till they had given proofs of their ſincerity in this particular, to appear any more in his preſence: after which, he diſmiſſed them with liberal preſents. His father's wiſe miniſters, who had checked his riots, found that they had, unknown to themſelves, been paying the higheſt court to their ſovereign; and were received with all the marks of favour and confidence. The chief juſtice, who had formerly impriſoned the prince himſelf, and therefore trembled to approach the royal preſence, met with praiſes

196 Henry

5 praiſes

praiſes inſtead of reproaches for his paſt conduct, and was exhorted to perſevere in the ſame rigorous and impartial execution of the laws. The king was not only anxious to repair his own miſconduct, but alſo to make amends for thoſe iniquities into which policy or neceſſity of affairs had betrayed his father. He expreſſed the deepeſt ſorrow for the fate of the unhappy King Richard, and even performed his funeral obſequies with pomp and ſolemnity, and heaped favours upon all thoſe who had ſhown themſelves attached to him. He took into favour the young Earl of March, though his competitor for the throne; and gained ſo far on his gentle and unambitious nature, that he remained ever after ſincerely attached to him. The family of Piercy was reſtored to its fortune and honours; and the king ſeemed deſirous to bury all diſtinctions in oblivion. Men of merit were preferred, whatever party they had been of; all men were unanimous in their attachment to Henry; and the defects of his title were forgot amidſt the perſonal regard which was univerſally paid him.

17 ces ws a- here-

The only party which Henry was not able to overcome was the new ſect of Lollards, or reformers of religion. Theſe were now gaining ſuch ground in England, that the Romiſh clergy were greatly alarmed, and Henry was determined to execute the laws upon them. The head of that party at preſent was Sir John Oldcaſtle, Lord Cobham; a nobleman who had diſtinguiſhed himſelf by his valour and military talents on many occaſions, and acquired the eſteem both of the late and preſent king. His high character and zeal for the new ſect pointed him out to Arundel Archbiſhop of Canterbury as a proper object of eccleſiaſtical fury, and therefore he applied to Henry for permiſſion to indict him. The king deſired him firſt to try gentle methods, and undertook to converſe with Lord Cobham himſelf upon religious ſubjects. He did ſo, but could not prevail, and therefore abandoned Cobham to his enemies. He was immediately condemned to the flames: but having found means to make his eſcape, he raiſed an inſurrection; which was ſoon ſuppreſſed, without any other conſequence than that of bringing a ſtain on the ſect to which he belonged. Cobham himſelf made his eſcape, but four years afterwards was taken and executed as a traitor. Immediately after, the moſt ſevere laws were enacted againſt the Lollards. It was enacted, that whoever was convicted of Lollardy, beſides ſuffering capital puniſhment according to the laws formerly eſtabliſhed, ſhould alſo forfeit his lands and goods to the king; and that the chancellor, treaſurer, juſtices of the two benches, ſheriffs, juſtices of the peace, and all the chief magiſtrates in every city and borough, ſhould take an oath to uſe their utmoſt endeavours for the extirpation of hereſy.

Notwithſtanding theſe terrible laws, the very parliament which enacted them, namely that of 1414, when the king demanded a ſupply, renewed the offer formerly preſſed upon Henry IV. and intreated the king to ſeize all the eccleſiaſtical revenues, and convert them to the uſe of the crown. The clergy were greatly alarmed. They could offer the king nothing of equal value. They agreed, however, to confer on him all the priories alien, which depended on capital abbeys in Normandy, and which had been bequeathed to them when that province was united to England. The moſt effectual method, however, of warding off the blow at preſent was by perſuading the King to undertake a war with France, in order to recover the provinces in that kingdom which had formerly belonged to England. This was agreeable to the dying injunction of Henry IV. He adviſed his ſon never to let the Engliſh remain long in peace, which was apt to breed inteſtine commotions; but to employ them in foreign expeditions, by which the prince might acquire honour, the nobility in ſharing his dangers might attach themſelves to his perſon, and all the reſtleſs ſpirits find occupation for their inquietude. The natural diſpoſition of Henry ſufficiently inclined him to follow this advice, and the civil diſorders of France gave him the faireſt proſpect of ſucceſs. 198 France invaded. Accordingly, in 1415, the king invaded France at the head of 30,000 men. The great progreſs he made there is related at length under the article FRANCE. He had eſpouſed the king's daughter, and conquered the greateſt part of the kingdom. His queen was delivered of a ſon named *Henry*, whoſe birth was celebrated by the greateſt rejoicings both at London and Paris; and the infant prince ſeemed to be univerſally regarded as heir to both monarchies. But Henry's glory, when it ſeemed to be approaching the ſummit, was blaſted at once by death, and all his mighty projects vaniſhed. He was ſeized with a fiſtula, a diſtemper which at that time the phyſicians had not ſkill enough to cure; and he expired on the 31ſt of Auguſt 1422, in the 34th year of his age, and the 10th of his reign. 199 Death of Henry V.

200 Henry VI. Henry VI. ſucceeded to the throne before he was quite a year old, and his reign affords only the moſt diſmal accounts of misfortunes and civil wars. His relations very ſoon began to diſpute about the adminiſtration during the minority. The Duke of Bedford, one of the moſt accompliſhed princes of the age, was appointed by parliament protector of England, defender of the church, and firſt counſellor to the king. His brother, the Duke of Gloceſter, was fixed upon to govern in his abſence, while he conducted the war in France; and in order to limit the power of both brothers, a council was named, without whoſe advice and approbation no meaſure could be carried into execution.

The kingdom of France was now in the moſt deſperate ſituation. The Engliſh were maſters of almoſt the whole of it. Henry VI. though but an infant, was ſolemnly inveſted with regal power by legates from Paris; ſo that Charles VII. of France ſucceeded only to a nominal kingdom. With all theſe great advantages, however, the Engliſh daily loſt ground; and in the year 1450 were totally expelled from France †. It may eaſily be imagined, that ſuch a train of bad ſucceſs would produce diſcontents among the rulers at home. The Duke of Gloceſter was envied by many on account of his high ſtation. Among theſe was Henry Beaufort, Biſhop of Wincheſter, great uncle to the king, and the legitimate ſon of John of Gaunt brother to Richard II. The prelate, to whom the care of the king's education had been committed, was a man of great capacity and experience, but of an intriguing and dangerous diſpoſition. He had frequent diſputes with the Duke of Gloceſter, over whom he gained ſeveral advantages on account of his open temper. The Duke of Bedford

† See *France*.

ford employed both his own authority and that of parliament to reconcile them, but in vain; their mutual animoſities ſerved for ſeveral years to embarraſs government, and to give its enemies every advantage. The ſentiments of the two leaders were particularly divided with regard to France. The biſhop laid hold of every proſpect of accommodation with that country; and the Duke of Gloceſter was for maintaining the honour of the Engliſh arms, and regaining whatever had been loſt by defeats or delay. Both parties called in all the auxiliaries they could. The biſhop reſolved to ſtrengthen himſelf by procuring a proper match for Henry, at that time 23 years old; and then bringing over the queen to his intereſts. Accordingly, the Earl of Suffolk, a nobleman whom he knew to be ſtedfaſt in his attachments, was ſent over to France, apparently to ſettle the terms of a truce which had then been begun, but in reality to procure a ſuitable match for the king. 201

Married to Margaret of Anjou.

The biſhop and his friends had caſt their eye on Margaret of Anjou, daughter of Regnier, titular king of Sicily, Naples, and Jeruſalem; but without either real power or poſſeſſions. She was conſidered as the moſt accompliſhed princeſs of the age, both in mind and perſon; and it was thought would, by her own abilities, be able to ſupply the defects of her huſband, who appeared weak, timid, and ſuperſtitious. The treaty was therefore haſtened on by Suffolk, and ſoon after ratified in England. The queen came immediately into the biſhop's meaſures: Gloceſter was deprived of all real power, and every method taken to render him odious to the public. One ſtep taken for this purpoſe was to accuſe his ducheſs of witchcraft. She was charged with converſing with one Roger Bolingbroke, a prieſt and reputed necromancer; and alſo with one Mary Gourdemain, who was ſaid to be a witch. It was aſſerted that theſe three in conjunction had made an image of the king in wax, which was placed before a gentle fire; and as the wax diſſolved, the King's ſtrength was expected to waſte; and upon its total diſſolution, his life was to be at an end. This accuſation was readily believed in that ſuperſtitious age. The priſoners were pronounced guilty; the ducheſs was condemned to do penance and ſuffer perpetual impriſonment; Bolingbroke the prieſt was hanged, and the woman burnt in Smithfield.

The biſhop, called alſo the *Cardinal*, of Wincheſter, was reſolved to carry his reſentment againſt Gloceſter to the utmoſt. He procured a parliament to be ſummoned, not at London, which was too well affected to the duke, but at St Edmundſbury, where his adherents were ſufficiently numerous to overawe every opponent. 202 As ſoon as Gloceſter appeared, he was accuſed of treaſon and thrown into priſon; and on the day on which he was to make his defence, he was found dead in his bed, though without any ſigns of violence upon his body.

Duke of Gloceſter murdered.

The death of the Duke of Gloceſter was univerſally aſcribed to the Cardinal of Wincheſter, who himſelf died ſix weeks after, teſtifying the utmoſt remorſe for the bloody ſcene he had acted. What ſhare the queen had in this tranſaction, is uncertain; but moſt people believed that without her knowledge the duke's enemies durſt not have ventured to take away his life. The king himſelf ſhared in the general ill-will, and he never had the art to remove the ſuſpicion. His incapacity alſo began every day to appear more clearly, and a pretender to the throne ſoon made his appearance.

20

Duke

Yo:k's

to the crown.

In the year 1450, Richard Duke of York began to think of preferring his claims to the crown. All the males of the houſe of Mortimer were extinct; but Anne, the ſiſter of the laſt Earl of March, having eſpouſed the Earl of Cambridge, who had been beheaded for treaſon in the reign of Henry V. had tranſmitted her latent, but not yet forgotten claim, to her ſon Richard. This prince, deſcended by his mother from Philippa only daughter of the Duke of Clarence, ſecond ſon of Edward III. ſtood plainly in order of ſucceſſion before the King; who derived his deſcent from the duke of Lancaſter, third ſon of that monarch. The duke was a man of valour and abilities, as well as of ſome ambition; and he thought the weakneſs and unpopularity of the preſent reign afforded a favourable opportunity to aſſert his title. The enſign of Richard was a white roſe, that of Henry a red one; and this gave names to the two factions, who were now about to drench the kingdom in blood.

20

Duke

Suffol

niſhed

After the Cardinal of Wincheſter's death, the Duke of Suffolk, who alſo had been concerned in the aſſaſſination of Gloceſter, governed every thing with uncontrollable ſway. His conduct ſoon excited the jealouſy of the other nobility, and every odious or unſucceſsful meaſure was attributed to him. The duke, however, imagining that his crimes were of ſuch a nature as could not be proved, boldly called upon his enemies to ſhow an inſtance of his guilt. The houſe of commons immediately opened againſt him a charge of corruption, tyranny, and treaſon. He was accuſed of being the cauſe of the loſs of France; of perſuading the French king, with an armed force, to invade England; and of betraying the ſecrets of ſtate. The popular reſentment againſt him was ſo ſtrong, that Henry, in order to ſecure him as much as poſſible, ſentenced him to five years baniſhment. This was conſidered by his enemies as an eſcape from juſtice. The captain of a ſhip was therefore employed to intercept him in his paſſage to France. He was ſeized near Dover, his head ſtruck off on the ſide of a long-boat, and his body thrown into the ſea.

Inſurr

tion o

Cade.

The complaints againſt Henry's government were heightened by an inſurrection headed by one John Cade, a native of Ireland. He had been obliged to fly over into France for his crimes: but, on his return, ſeeing the people prepared for violent meaſures, he aſſumed the name of *Mortimer*; and, at the head of 20,000 Kentiſh men, advanced towards Blackheath. The king ſent a meſſage to demand the cauſe of their riſing in arms. Cade in the name of the community anſwered, That their only aim was to puniſh evil miniſters, and procure a redreſs of grievances for the people. On this a body of 15,000 troops were levied, and Henry marched with them in perſon againſt Cade, who retired on his approach, as if he had been afraid of coming to an engagement. He lay in ambuſh, however, in a wood; not doubting but he ſhould be purſued by the king's whole army: but Henry was content with ſending a detachment after the fugitives, and returning to London himſelf; upon which Cade iſſued from his ambuſcade, and cut the detachment in pieces.

Soon after, the citizens of London opened their gates to the victor; and Cade, for ſome time, maintained great order and regularity among his followers. He always led them out into the fields in the night-time, and publiſhed ſeveral edicts againſt plunder and violence of any kind. He was not, however, long able to keep his people in ſubjection. He beheaded the treaſurer Lord Say, without any trial; and ſoon after, his troops committing ſome irregularities, the citizens reſolved to ſhut their gates againſt him. Cade endeavouring to force his way, a battle enſued, which laſted all day, and was ended only by the approach of night. The Archbiſhop of Canterbury, and the chancellor, who had taken refuge in the Tower, being informed of the ſituation of affairs, drew up, during the night, an act of amneſty, which was privately diſperſed among the rebels. This had ſuch an effect, that in the morning Cade found himſelf abandoned by his followers; and retreating to Rocheſter, was obliged to fly alone into the woods. A price being ſet on his head by proclamation, he was diſcovered and ſlain by one Alexander Eden; who, in recompence for this ſervice, was made governor of Dover caſtle.

07 of . ſuſ- ed by ourt.

The court now began to entertain ſuſpicions that the inſurrection of John Cade had not happened merely in conſequence of his own machinations and ambition, but that he had been inſtigated thereto by the Duke of York, who, as we have already ſeen, pretended a right to the crown. As he was about this time expected to return from Ireland, and a report took place that he was now to aſſert his ſuppoſed right by force of arms, orders were iſſued in the king's name to deny him entrance into England. This was prevented by his appearing with no more than his ordinary attendants; but though he thus eſcaped the danger for the preſent, he inſtantly ſaw the neceſſity of proceeding in ſupport of his claim. His partizans were inſtructed to diſtinguiſh between his right by ſucceſſion and by the laws of the kingdom. The adherents of Lancaſter maintained, that though the advancement of Henry IV. might be looked upon as irregular, yet it was founded upon general conſent; or even allowing it to have been at firſt invalid, it had now been for a long time eſtabliſhed, and acquired ſolidity of conſequence; nor could the right of ſucceſſion at any rate be pleaded for the purpoſe of overthrowing the general peace and tranquillity of the kingdom. The principles of liberty as well as the maxims of true policy had been injured by the houſe of York; while the public were bound to thoſe of Lancaſter, no leſs by political than moral duty, in conſequence of the oaths of fealty that had been ſo often ſworn to them; the Duke of York himſelf having repeatedly ſworn allegiance to them, and thus indirectly renounced thoſe claims which he now brought forward to diſturb the public tranquillity. On the part of the Duke of York, it was replied, that the good of the people required the maintenance of order in the ſucceſſion of princes; that, by adhering conſtantly to this rule, a number of inconveniences would be prevented which muſt otherwiſe enſue; and though that order had been broken through in the caſe of Henry IV. it was never too late to remedy any pernicious precedent. It would indeed be a great encouragement to uſurpers, if the immediate poſſeſſion of power, or their continuance in it for a few years, could convert them into legal princes; and the people muſt be in a very miſerable ſituation, if all reſtraints on violence and ambition were taken off, and full liberty given to every innovator to make what attempts he pleaſed. They did not indeed deny that time might confer ſolidity on a government originally founded in uſurpation; but a very long courſe of years was not only required for this purpoſe, but a total extinction of thoſe who had any juſt title. The depoſition of Richard II. and advancement of Henry IV. were not legal acts, but the effects of mere levity in the people; in which the houſe of York had acquieſced from neceſſity, and not from any belief of the juſtice of their cauſe; nor could this be ever interpreted into any renunciation of their pretenſions; neither could the reſtoration of the true order of ſucceſſion be conſidered as an encouragement to rebellion and turbulence, but the correction of a former abuſe by which rebellion had been encouraged. Beſides, the original title of Henry IV. was founded entirely on preſent convenience; and even this was now entirely ſhifted to the houſe of York. The preſent prince was evidently incapable of governing the kingdom by reaſon of his imbecillity; ſo that every thing was governed either by corrupt miniſters or an imperious queen, who engaged the nation in foreign connections entirely contrary to its intereſts; while on the other hand, the true heir of the crown was a prince of approved judgment and experience, and a native of England, who, by his reſtoration, would undoubtedly correct all thoſe abuſes of which there was now ſuch juſt reaſon to complain.

08 uments nd a t the es of and after.

In this diſpute it was evident that the houſe of York had the better in point of argument: nevertheleſs, as a prince of the houſe of Lancaſter was in immediate poſſeſſion of the throne, and could by no means be charged with any crime, the cauſe of the former was leſs generally intereſting; eſpecially as it muſt always have been uncertain, *a priori*, whether the Duke of York would have governed any better than King Henry. After his return from Ireland, however, the former uſed all his power and influence to foment the diſcontents which had for ſome time prevailed in the kingdom; and the conduct of the next parliament manifeſted the ſucceſs of his intrigues. A violent attack was made upon ſuch noblemen as were known to be moſt in favour with the king. The houſe of commons preſented a petition againſt the Duke of Somerſet, the Ducheſs of Suffolk, the Biſhop of Cheſter, Lord Dudley, and ſeveral others of inferior rank; praying not only that the king would remove them from his council, but that he would prohibit them from coming within twelve miles of the court. Henry not daring to refuſe this petition altogether, conſented to baniſh all thoſe of inferior rank, whom the commons had ſpecified, but only for a year; and this too on condition that he had no uſe for their aſſiſtance in quelling any rebellion. But he rejected a bill for attainting the late Duke of Suffolk, and propoſed ſome other meaſures which ſeemed to militate againſt the court, though it had paſſed both the houſe of lords and the houſe of commons.

209 The Duke of York foments diſſenſions between the king and parliament.

and his parliament, the Duke of York raiſed an army of 10,000 men, with whom he marched towards London, demanding a reformation in matters of government, and the removal of the Duke of Somerſet. This firſt enterpriſe, however, proved unſucceſsful; the gates of the city were ſhut againſt him, and he was purſued by the king at the head of a ſuperior army. On this he retired into Kent; and as there was a number of his own friends in the army of the king, a conference took place, in which Richard ſtill inſiſted upon the removal of the Duke of Somerſet, and his ſubmitting to be tried in parliament. This requeſt was in appearance complied with, and Somerſet arreſted: the Duke of York was then perſuaded to wait upon the king in his royal pavilion; but, on repeating his charge againſt the duke, he was ſurpriſed to ſee the latter come out from behind the curtain, and offer to maintain his innocence. Richard perceiving that he had not ſufficient intereſt to ruin his adverſary, pretended to be ſatisfied, and retired to his ſeat at Wigmore in Wales; and during the time he reſided there, a better opportunity was given him of accompliſhing his deſigns than he could have hoped for. The king fell into a kind of lethargic diſorder, which increaſed his natural imbecillity to ſuch a degree, that he could no longer retain a ſhadow of royalty. Richard now had intereſt enough to get himſelf appointed protector, with power to hold parliaments at pleaſure; with which high office he was no ſooner inveſted, than he turned out all the Lancaſtrian party from their offices, and ſent the Duke of Somerſet to the Tower: but on the recovery of the king, which happened in no long time after, he himſelf was diſmiſſed from his employment, the Duke of Somerſet releaſed, and the adminiſtration once more put into his hands. On this the duke of York levied an army, merely, as he pretended, to enforce the reformation of government and the removal of the Duke of Somerſet. Thus Henry, though ſore againſt his will, was obliged to face him in the field. A battle enſued at St Alban's; in which the royaliſts were defeated, and the Duke of Somerſet, the chief partiſan of their cauſe, killed in the action. The king himſelf was wounded, and took ſhelter in a cottage near the field of battle; where he was taken priſoner, but was afterwards treated with great reſpect and kindneſs by the Duke of York.

Henry, though he was now only a priſoner treated with the forms of royalty, was nevertheleſs pleaſed with his ſituation; but his queen, a woman of a bold and maſculine ſpirit, could not bear to have only the appearance of authority, while others enjoyed all the real power. She therefore excited the king once more to aſſert his right by force of arms; and after ſeveral manœuvres, the Duke of York was obliged to retire from court. A negociation for peace was at firſt ſet on foot, but the mutual diſtruſts of both parties ſoon broke it off. The armies met at Bloreheath on the borders of Staffordſhire, on the 23d of September 1459; and the Yorkiſts at firſt gained ſome advantages. But when a more general engagement was about to enſue, a body of veterans who ſerved under the Duke of York deſerted to the king; and this ſo intimidated the duke's party, that they ſeparated the next day without ſtriking a blow. The Duke of York fled to Ireland; and the Earl of Warwick, one of his ableſt and beſt ſupporters, eſcaped to Calais, with the government of which he had been entruſted during the late protectorſhip.

The York party, though thus in appearance ſuppreſſed, only waited a favourable opportunity of retrieving their affairs. Nor was this opportunity long wanting. Warwick having met with ſome ſucceſſes at ſea, landed in Kent; and being there joined by other barons, marched up to London amidſt the acclamations of the people. The city immediately opened its gates to him, and he ſoon found himſelf in a condition to face the royal army. An engagement enſued at Northampton on the 10th of July 1460; in which the royaliſts were entirely defeated, and the king again taken priſoner. The Duke of York then openly laid claim to the crown; and on this occaſion the firſt inſtance of a ſpirit of national liberty is ſaid to have appeared in the Houſe of Lords. The cauſe of Henry and the Duke of York was ſolemnly debated; and the latter, though a conqueror, did not abſolutely gain his cauſe. It was determined that Henry ſhould poſſeſs the throne during his life; and that the Duke of York ſhould be appointed his ſucceſſor, to the utter excluſion of the Prince of Wales, who was then a child.

215 Duke o York k ed.

Though the royal party now ſeemed deſtitute of every reſource, the queen ſtill retained her intrepidity. She fled into Wales, where ſhe endeavoured to raiſe another army. The northern barons, provoked at the ſouthern ones for ſettling the government and ſucceſſion to the crown without their conſent, ſoon furniſhed her with an army of 20,000 men. Another battle was fought near Wakefield Green, on the 24th of December 1460. The Yorkiſts were defeated, and the duke himſelf was killed in the action. His head was afterwards cut off by the queen's orders, and fixed on one of the gates of York, with a paper-crown, in deriſion of his pretended title. His ſon the Earl of Rutland, a youth of 17, was taken priſoner, and killed in cold blood by Lord Clifford, in revenge for his father's death, who had fallen in the battle of St Alban's.

After this victory, Margaret marched towards London, in order to ſet the king at liberty: but the Earl of Warwick, who now put himſelf at the head of the Yorkiſts, led about the captive king, in order to give a ſanction to his proceedings. He engaged the queen's forces at St Alban's; but through the treachery of Lord Lovelace, who deſerted during the heat of the engagement with a conſiderable body of forces, Warwick was defeated, and the king fell once more into the hands of his own party.

The ſubmiſſion of the city of London ſeemed now to be the only thing wanting to complete the queen's ſucceſs; but Warwick had ſecured it in his intereſts, and the citizens refuſed to open their gates to the queen. In the mean time, young Edward, eldeſt ſon of the late Duke of York, put himſelf at the head of his father's party. He was now in the bloom of youth, remarkable for the beauty of his perſon and his bravery, and was a great favourite of the people. He defeated Jaſper Tudor Earl of Pembroke, at Mortimer's croſs in Herefordſhire. The earl himſelf was taken priſoner, and immediately beheaded by Edward's orders.

16
ardIV.

ders. After this, he advanced to London; and being joined by the remainder of Warwick's army, he ſoon obliged Margaret to retire, entered the city amidſt the acclamations of the people, and was crowned king on the 5th of March 1461.

yrain-

Notwithſtanding all her misfortunes, however, Margaret ſtill continued undaunted. She retired to the north, where ſhe was ſoon joined by ſuch numbers, that her army amounted to 60,000 men She was oppoſed by young Edward and Warwick at the head of 40,000; and both armies met near Touton in the county of York, on the 29th of March 1461. A bloody battle enſued, in which the queen's army was totally defeated; and as Edward, prompted by his natural cruelty, had ordered no quarter to be given, 40,000 of the Lancaſtrians were ſlain in the field or in the purſuit. Edward is ſaid to have gained this victory by means of a violent ſtorm of ſnow, which blew full in the face of the queen's army, and ſo blinded them that they could ſcarce make any uſe of their arms. After this diſaſter the queen fled to Scotland with her huſband and ſon; and notwithſtanding all the misfortunes ſhe had already met with, reſolved once more to enter England at the head of 5000 men granted her by the king of France. But even here ſhe was attended by her uſual bad fortune. Her little fleet was diſperſed by a tempeſt, and ſhe herſelf eſcaped with the utmoſt difficulty by entering the mouth of the Tweed. Soon after, a defeat, which her few forces ſuſtained at Hexham, ſeemed to render her cauſe entirely deſperate; and the cruelties practiſed upon all her adherents rendered it very dangerous to befriend her.

8
urces
king
ueen,

By theſe repeated misfortunes the houſe of Lancaſter was ſo effectually ruined, that Margaret was obliged to ſeparate from her huſband, and both of them to ſhift for themſelves the beſt way they could. The king was ſtill protected by ſome of his friends, who conveyed him to Lancaſhire, where he remained in ſafety for a twelvemonth; but being at laſt diſcovered, he was thrown into the Tower and kept cloſe priſoner. The queen fled with her ſon to a foreſt, where ſhe was ſet upon by robbers, who ſtripped her of her rings and jewels, treating her otherwiſe with the utmoſt indignity. A quarrel which happened among them about the diviſion of the ſpoil afforded her an opportunity of eſcaping from their hands into another part of the foreſt, where ſhe wandered for ſome time without knowing what to do. At laſt, when quite ſpent with hunger and fatigue, ſhe ſaw a robber coming up to her with a drawn ſword in his hand. Finding it altogether impoſſible to eſcape, ſhe ſuddenly took the reſolution of putting herſelf under his protection. Advancing towards him, therefore, and preſenting the young prince, "Here (ſays ſhe), my friend, I commit to your care the ſafety of your king's ſon." This addreſs ſo much ſurpriſed the robber, that, inſtead of offering her any injury, he profeſſed himſelf entirely devoted to her ſervice. After living for ſome time concealed in the foreſt, ſhe was at laſt conducted to the ſea-ſide, where ſhe found a ſhip which conveyed her to Flanders. On her arrival there, ſhe went to her father's houſe, who, though very poor, gave her ſuch entertainment as he could afford; and in this retreat ſhe ſtaid ſome years in expectation of finding an opportunity of retrieving her affairs.

222
An inſurrection in
Yorkſhire,

Edward, in the mean time, thinking himſelf ſecurely fixed on the throne, gave a looſe to his favourite paſſions; one of which was an immoderate love of women. To divert him from this, the Earl of Warwick, to whom he was indebted for his crown, adviſed him to marry. Edward conſented, and ſent him over to the continent to negociate a match with the princeſs of Savoy. The negociation proved ſucceſsful; but, in the mean time, the king had privately eſpouſed Elizabeth Woodville, daughter of Sir Philip Woodville, who had married the Ducheſs of Bedford after the death of her firſt huſband. Edward had employed his arts of ſeduction againſt this lady in vain before he married her; but unfortunately the match was concluded juſt at the time that the Earl of Warwick had proved ſucceſsful in his negociation with the princeſs of Savoy. The miniſter therefore returned full of indignation againſt his ſovereign: and Edward, forgetting how great cauſe he had to be offended, determined to remove him entirely from his councils. Warwick was likewiſe diſguſted by the favour ſhown to the queen's party; which, though certainly a piece of very commendable policy in Edward, was entirely diſagreeable to the ambitious diſpoſition of that nobleman. A plan of revenge was therefore thought of; and a moſt powerful combination was formed againſt Edward: to accompliſh which, Warwick not only employed his own influence, which was very extenſive, but likewiſe that of the Duke of Clarence, Edward's brother, to whom the earl had allied himſelf by giving him his daughter in marriage; after which he perſuaded him to embrace his cauſe. Some circumſtances which took place about this time alſo favoured the ſcheme. The inhabitants about St Leonard's in Yorkſhire complained, that the duties levied for that inſtitution, and which had been originally appointed for pious purpoſes, were ſecreted by the managers, who refuſed to contribute their part. As the clergy were concerned in this affair, they attempted to ſilence their antagoniſts by eccleſiaſtical fulminations againſt them; upon which the latter took up arms, fell upon the officers of the hoſpital, and having maſſacred them, proceeded towards York, to the number of 15,000. In the firſt ſkirmiſh, they had the misfortune to loſe their leader, who was inſtantly executed. The rebels, however, ſtill continued in arms, and in a ſhort time appeared in ſuch numbers as to become formidable to government. Henry Earl of Pembroke was ſent againſt them with a body of 5000 men; and having taken Sir Henry Nevil, one of the leaders of the inſurgents, priſoner, inſtantly put him to death; but this was ſoon revenged by a ſimilar execution on himſelf, who happened to be defeated and taken priſoner a ſhort time after This defeat had been occaſioned by a diſagreement betwixt the Earls of Pembroke and Devonſhire; in conſequence of which the latter had gone off with his troops, leaving Pembroke to ſhift for himſelf the beſt way he could. The king, enraged at this, cauſed Devonſhire to be executed in a like ſummary manner: but this was of no ſervice to his cauſe; a new body of inſurgents appeared under Sir Robert Welles, ſon to a nobleman of that name. The latter, in order to ſecure himſelf from all ſuſpicions of diſloyalty, fled to a monaſtery; but he was ſoon enticed from thence and put to death by the inſidious promiſes of king Edward, whoſe treachery was equal to his cruelty. His ſon ſoon after ſhared the ſame fate, being defeated and taken priſoner by Edward, who inſtantly ordered him to be beheaded, along with Sir Thomas Launde and other perſons of diſtinction.

223
Warwick and Clarence join the inſurgents.

Notwithſtanding ſuch an appearance of a general inſurrection, the king had ſo little ſuſpicion of the loyalty of Warwick and Clarence, that he employed them in raiſing troops to quell the inſurgents. Inſtead of executing their commiſſion with fidelity, however, they joined the malecontents with all the forces they could raiſe; but being quite diſconcerted by the defeat and death of Sir Robert Welles, they retired to Lancaſhire, in hopes of being joined by Lord Stanley, who had married the Earl of Warwick's ſiſter. Being diſappointed in this, they were obliged to diſband their army, and fly into Devonſhire, whence they ſet ſail for Calais. Upon their arrival on the continent, matters ſeemed not to be much mended: the deputy-governor, whom Warwick had left, refuſed him admittance; nor would he even allow the Ducheſs of Clarence to land, though ſhe had been delivered of a ſon on board only a very few days before, and was at that time extremely ill. Being well acquainted, however, with the uncertainty of the affairs of England at that time, he afterwards made an apology to Warwick for this behaviour. The latter pretended to be eaſily reconciled; but immediately left the place, having ſeized ſome Flemiſh veſſels which he found lying in the neighbourhood.

224
Reconciliation betwixt Warwick and the queen

As a very cloſe alliance ſubſiſted between Warwick and the Duke of Burgundy, the king of France became uneaſy; and therefore, as ſoon as the earl landed on his dominions, received him with the greateſt marks of eſteem. The reconciliation betwixt him and the unfortunate Queen Margaret now ſeemed to be natural, though, conſidering all circumſtances, this muſt have formerly appeared in a manner impoſſible. The earl's father had been put to death by the orders of Margaret; and Warwick, in return, had twice taken priſoner King Henry, baniſhed the queen, and put to death almoſt all their faithful adherents. By the mediation of the French monarch, however, all differences were accommodated. A fleet was prepared to reconduct them to England; and ſeizing a proper opportunity, they landed at Dartmouth with a ſmall body of troops, while Edward was in the north ſuppreſſing an inſurrection which had lately appeared there. Warwick was attended with aſtoniſhing ſucceſs on his arrival in England, and in leſs than ſix days ſaw himſelf at the head of 60,000 men. Edward was now obliged in his turn to fly the kingdom. Having narrowly eſcaped an attempt made upon his perſon by the Marquis of Montague, he embarked on board a ſmall fleet which lay off Lynn in Norfolk. While at ſea, he was chaſed by ſome ſhips belonging to the Hans Towns that were then at war both with France and England; but at length, having eſcaped all dangers, Edward landed ſafely in Holland, where he met with but an indifferent reception from the Duke of Burgundy, with whom he had lately entered into an alliance.

225
He lands in England.

Warwick in the mean time advanced to London, and once more releaſed and placed on the throne the miſerable king Henry VI. A parliament was called, which very ſolemnly confirmed Henry's title to the throne, and Warwick himſelf was dignified by the people with the title of the *king maker*. All the attainders of the Lancaſtrians were reverſed; and every one was reſtored who had loſt either honours or fortune by his former adherence to Henry's cauſe. All the adherents of Edward fled to the continent, or took ſhelter in monaſteries, where they were protected by the eccleſiaſtical privileges. But Edward's party was not yet deſtroyed. After an abſence of nine months, being ſeconded by a ſmall body of troops granted him by the Duke of Burgundy, he made a deſcent at Ravenſpur in Yorkſhire. At firſt he met with little ſucceſs; but his army increaſing on his march, he was ſoon in a condition to appear before the capital, which immediately opened its gates.

The unfortunate Henry was thus again plucked from the throne; and the hopes of Warwick were almoſt totally blaſted by the defection of Clarence, Edward's brother. Nothing now remained but to come to an engagement as ſoon as poſſible. Warwick knew his forces to be inferior to thoſe of Edward, but placed great dependence on his own generalſhip. He therefore advanced to Barnet, within ten miles of London, where he reſolved to wait the coming of Edward. The latter ſoon came up with him, and on the 14th of April 1471, a moſt obſtinate and bloody battle was fought. Edward, according to cuſtom, had ordered no quarter to be given; and obtained the victory through a miſtake of a body of Warwick's forces, who fell with fury on their own party inſtead of the enemy. The earl himſelf was ſlain, together with his brother, and 10,000 of his braveſt followers.

The queen was juſt then returned with her ſon from France, where ſhe had been ſoliciting ſupplies. She had ſcarce time to refreſh herſelf from the fatigues of the voyage, when ſhe received the fatal news of the death of Warwick, and the total deſtruction of her party. All her reſolution was not able to ſupport her under ſuch a terrible diſaſter. Her grief now for the firſt time, it is ſaid, manifeſted itſelf by her tears; and ſhe immediately took ſanctuary in the abbey of Beaulieu in Hampſhire. Here ſhe ſtill found ſome friends willing to aſſiſt her. Tudor Earl of Pembroke, Courtney Earl of Devonſhire, the Lords Wenlock and St John, with ſome other men of rank, encouraged her yet to hope for ſucceſs, and promiſed to ſtand by her to the laſt. On this aſſurance, ſhe reſumed her courage; and advancing through the counties of Devon, Somerſet, and Gloceſter, increaſed her army every day. At laſt, however, ſhe was overtaken by Edward with his victorious army at Tewkeſbury, on the banks of the Severne. The Quen's army was totally defeated; the Earl of Devonſhire and Lord Wenlock were killed in the field; the Duke of Somerſet, and about 20 other perſons of diſtinction, who had taken ſhelter in a church, were ſurrounded, dragged out, and immediately beheaded; about 3000 of their party fell in battle, and the army was entirely diſperſed. Queen Margaret and her ſon were taken priſoners, and brought to the king, who aſked the prince in an inſulting manner, how he dared to invade his dominions? The young prince replied, that he came thither to claim his juſt inheritance; upon which Edward ſtruck him on the face with his gauntlet. The Dukes of Clarence and Gloceſter, Lord Haſtings, and Sir Thomas Gray, taking this blow as a ſignal for farther violence, hurried the prince into the next apartment, and there diſpatched him with their

England.

their daggers. Margaret was thrown into the Tower along with her huſband Henry, who expired in that confinement a few days after. It was univerſally believed that he was murdered by the duke of Gloceſter, though of this there was no direct evidence. Margaret was ranſomed by the king of France for 50,000 crowns, and died a few years after in a moſt miſerable ſituation.

Edward being now freed from all his enemies, began to inflict puniſhment on thoſe who had formerly appeared againſt him. Among the cruelties he committed, that on his brother the duke of Clarence was the moſt remarkable. The king happening to be one day hunting in the park of Thomas Burdet, a ſervant of the duke killed a white buck which was a great favourite of the owner. Burdet, vexed at the loſs, broke out into a paſſion, and wiſhed the horns of the deer in the belly of the perſon who adviſed the king to that inſult. For this exclamation Burdet was tried for his life, and executed at Tyburn. The duke of Clarence exclaimed againſt the iniquity of this ſentence; upon which he was arraigned before the houſe of peers, found guilty, and condemned to death. The only favour granted him was to have the choice of his death; and his choice was a very ſingular one, namely, to be drowned in a butt of Malmſey wine; which was accordingly done.—The reſt of this reign affords little elſe than an hiſtory of the king's amours Among his many miſtreſſes, Jane Shore was the moſt remarkable; (ſee SHORE.) The king died on the 9th of April 1482, in the 42d year of his age, and 21ſt of his reign, counting from his firſt aſſuming the crown. Beſides five daughters, he left two ſons; Edward prince of Wales, his ſucceſſor, then in his 13th year; and Richard duke of York in his 9th.

18
rd V.

On the death of Edward IV. the kingdom was divided into two new factions. The queen's family, which during the laſt reign had come into power, was become obnoxious to the old nobility, who conſidered them as their inferiors. The king had endeavoured to prevent theſe animoſities from coming to a height, by deſiring on his death-bed that his brother Richard duke of Gloceſter ſhould be entruſted with the regency; and recommended peace and unanimity during the minority of his ſon. But the king was no ſooner dead than the former reſentment between theſe parties broke out with violence; and the duke of Gloceſter, who was endued with almoſt every bad quality, reſolved to profit by their contentions. His firſt ſtep was to get himſelf declared protector of the realm; and having arreſted the earl of Rivers, the king's uncle and guardian, he met young Edward in his way from Ludlow caſtle, where the late king had reſided during the latter part of his reign, and reſpectfully offered to conduct him to London. Having thus ſecured the perſon of the king, he next got poſſeſſion of his brother's perſon alſo. The queen had retired with this child into Weſtminſter abbey; and it was not without extreme regret that ſhe delivered him up at the interceſſion of the primate and archbiſhop of York.

29
of
fter
ed
ctor.

In a few days after Gloceſter had made himſelf maſter of the perſons of the two princes, he had them confined in the Tower, under pretence of guarding them from danger; and ſoon after ſpread reports of their illegitimacy, and by pretended obſtacles put off the young king's coronation. Lord Stanley firſt began to ſuſpect his deſigns; and communicated his ſuſpicions to lord Haſtings, who had long been firmly attached to the king's family. Lord Haſtings would not at firſt give credit to this ſurmiſe; but he very ſoon had a fatal proof of the truth of what had been communicated to him. On the 13th of June 1483, he was hurried out of the council-room in the Tower by Gloceſter's order, and beheaded on a log of timber. The ſoldiers who carried him off made a buſtle as though an attempt had been made to reſcue him, and one of them diſcharged a blow at Lord Stanley's head with a pole-ax; but he happily eſcaped by ſhrinking under the table. The ſame day were executed the Earl Rivers, and ſome others, who had committed no other crime than being faithful to the young king.

The protector now thought he might with ſafety lay claim to the throne. He had previouſly gained over the duke of Buckingham, a nobleman of great influence among the people. He uſed his utmoſt endeavours to inſpire the people with a notion of the illegitimate birth of the late king, and conſequently of his children. Dr Shaw, a popular preacher, was alſo hired to harangue the people to the ſame purpoſe from St Paul's croſs. Having expatiated on the incontinence of the queen, and the illegality of the young king's title, he then made a panegyric on the virtues of the protector. “It is the protector (continued he) who carries in his face the image of virtue, and the marks of a true deſcent. He alone can reſtore the loſt glory and honour of the nation.” It was hoped that upon this occaſion ſome of the populace would have cried out, “Long live King Richard!” but the audience remaining ſilent, the duke of Buckingham undertook in his turn to perſuade them. Having expatiated on the calamities of the laſt reign and the illegitimacy of the preſent race, he told the people, that he ſaw only one method of warding off the miſeries which threatened the ſtate, which was by electing the protector; but he ſeemed apprehenſive that he would never be prevailed upon to accept a crown accompanied with ſuch difficulty and danger. He next aſked his auditors, whether they would have the protector for their king? but was mortified to find that a total ſilence enſued. The mayor, who was in the ſecret, willing to relieve him in this embarraſſed ſituation, obſerved, that the citizens were not accuſtomed to be harangued by a man of his quality, and would only give an anſwer to their recorder. This officer, therefore, repeated the duke's ſpeech; but the people continuing ſtill ſilent, “This is ſtrange obſtinacy (cried the duke): we only require of you, in plain terms, to declare, whether or not you will have the duke of Gloceſter for your king; as the lords and commons have ſufficient power without your concurrence?” At this, ſome of the meaneſt apprentices, incited by the ſervants of the protector and Buckingham, raiſed a feeble cry of “God ſave King Richard!” The mob at the door repeated the cry; and throwing up their caps into the air, cried out, “A Richard! A Richard!” After this farce was acted, Buckingham, on the 24th of June 1483, waited on Richard with offers of the crown: but the protector, with hypocritical modeſty, at firſt declined the offer; till being told, that the people, in caſe of his refuſal, muſt look out for one that would be more compliant,

230
Richard III.

he accepted the government of England and France, with a reſolution, as he ſaid, to defend the one and ſubdue the other.

231
Edward V. and his brother murdered.

The firſt ſtep taken by the new king was to ſend orders to Sir Robert Brackenbury governor of the Tower, to put the young princes to death. But this he refuſed; and ſubmiſſively anſwered, that he knew not how to embrue his hands in innocent blood. A fit inſtrument for this purpoſe, however, was not long wanting. Sir James Tyrrel readily undertook the office; and Brackenbury was ordered to reſign the keys to him for one night. Tyrrel chooſing three aſſociates, Slater, Deighton, and Foreſt, came in the night-time to the door of the chamber where the princes were lodged; and ſending in the aſſaſſins, bid them execute their commiſſion, while he himſelf ſtaid without. They found the young princes in bed, and fallen into a ſound ſleep. The aſſaſſins ſmothered them with the bolſter and pillows; after which they ſhowed their naked bodies to Tyrrel, who ordered them to be buried at the ſtair-foot under an heap of ſtones (c.)

232
Buckingham determines to ſupport the claim of the Earl of Richmond to the throne.

Richard having thus ſecured himſelf on the throne by the moſt iniquitous methods, attempted to ſtrengthen his intereſt by foreign alliances, and procuring the favour of the clergy at home by great indulgences; but he found his power threatened from a quarter where he leaſt expected an attack. The duke of Buckingham, who had been ſo inſtrumental in raiſing him to the throne, did not think himſelf properly rewarded. He made a demand of ſome confiſcated lands in Hereford, to which his family had an ancient claim. Richard either reluctantly complied with his requeſt, or only granted it in part; ſo that a coolneſs ſoon enſued between them, and in a little time Buckingham came to a reſolution of dethroning the monarch whom he had juſt raiſed. For ſome time he remained in doubt, whether he ſhould aſſume the crown himſelf or ſet up another. At length he determined on the latter; and reſolved to declare for Henry earl of Richmond, who was at that time an exile in Brittany, and was conſidered as the only ſurviving branch of the houſe of Lancaſter. He was one of thoſe who had the good fortune to eſcape the numerous maſſacres of the former reigns; but as he was a deſcendant of John of Gaunt by the female line, he was for that reaſon obnoxious to thoſe in power. He had long lived in exile, and was once delivered over to the ambaſſadors of Edward IV. who were preparing to carry him to England; when the duke of Brittany, who delivered him, repented of what he had done, and took him from the ambaſſadors juſt as they were carrying him on ſhipboard. His right to the crown by ſucceſſion was very doubtful: but the cruel behaviour of Richard inclined the people in general greatly to favour him; and, to give an additional ſtrength to his title, a match was projected betwixt him and the princeſs Elizabeth, the eldeſt daughter of Edward IV. which, by uniting the two rival families, would put an end to thoſe diſſenſions which had ſo long filled the kingdom with bloodſhed and confuſion. Richard, in the mean time, from ſome reaſons which have not been particularized by hiſtorians, began to entertain doubts of the fidelity of Buckingham, and determined to cut him off. For this purpoſe he ſent for him to court: but Buckingham, inſtead of obeying the ſummons, fled into Wales, where he raiſed a conſiderable army, and forthwith ſet out to the eaſtward with a deſign to invade England. Richard haſtened to meet him with what forces he could raiſe; but the march of Buckingham being retarded by a moſt uncommon inundation of the Severn which laſted 10 days, his troops were ſo diſheartened at this event, that they almoſt all deſerted him. The duke was therefore obliged to fly in diſtreſs, and Richard inſtantly ſet a price upon his head. Buckingham was now obliged to truſt his life in the hands of an old ſervant of his own, named *Baniſter*; but this man, tempted by the greatneſs of the reward, betrayed him to the ſheriff of Shropſhire, by whom he was ſeized and conducted to Richard at Saliſbury, who cauſed him to be executed without delay. The earl of Richmond, in the mean time, had ſet ſail from St Maloes with a body of 5000 men: but after his arrival in England, receiving the diſagreeable news of Buckingham's misfortune, he ſet ſail again for Bretagne; while Richard, emboldened by the bad ſucceſs of his enemies, determined to confirm his title to the throne by calling a parliament, which till this time he had not ventured to do. At preſent, matters were ſo circumſtanced, that the parliament had no other reſource than to comply with his deſires, and acknowledge his right to the crown. An act was paſſed confirming the illegitimacy of Edward's children; and an attainder was alſo confirmed againſt the earl of Richmond; the duties of tonnage and poundage were granted to the king for life; and his only ſon Edward, then about 12 years of age, was created Prince of Wales. In return for theſe conceſſions, Richard paſſed ſeveral popular laws, particularly againſt the extorting of money by benevolences, and ſome others calculated to gain the good will of the oppoſite party. He paid his court alſo to the queen-dowager with ſuch aſſiduity and ſucceſs, that ſhe left her ſanctuary, and put herſelf and her daughters into his hands. The ambition and cruelty of this man indeed are ſaid to have extinguiſhed every ſentiment of natural affection as well as humanity. He had married Anne, the ſecond daughter of the earl of Warwick, and widow of Edward prince of Wales, whom he himſelf had murdered; but having born him but one ſon who died about this time, he conſidered her as an invincible obſtacle to the accompliſhment of his deſires; for which reaſon it was thought he put an end to her life by poiſon: and as he knew that the projected match between the earl of Richmond and the Princeſs Elizabeth could only make the rivalſhip of the former any way formidable, he reſolved to obtain a diſpenſation

(c) Theſe circumſtances are ſaid to have been confeſſed in the ſucceeding reign, though the perpetrators eſcaped puniſhment. The bodies of the two princes were ſought for without any ſucceſs under the reign of Henry VII. but in the time of Charles V. the bones of two perſons anſwering to their age were found in the ſpot where they were ſaid to have been buried; which, being ſuppoſed to be the remains of theſe two unfortunate youths, they were buried under a marble monument in Weſtminſter abbey.

tion from the pope for marrying her himſelf. The queen-dowager is even ſaid to have come into this ſcheme with a view to recover her power; but the princeſs herſelf always rejected his addreſſes with abhorrence. The refuſal of the princeſs occaſioned no ſmall perplexity in Richard; and before he could determine on any proper method of accompliſhing his purpoſe, he received news of Richmond's preparations for landing in England. Theſe being ſoon accompliſhed, Henry ſet ſail from Harfleur in Normandy, and landed without oppoſition, on the 17th of Auguſt 1485, at Milford haven in Wales. Richard in the mean time, not knowing where the invaſion was to take place, had poſted himſelf at Nottingham; which being almoſt in the centre of the kingdom, was therefore proper for reſiſting any invader. Sir Rice ap Thomas and Sir Walter Herbert were commiſſioned by Richard to oppoſe his rival in Wales; but the former immediately deſerted to him, and the latter made but a very feeble reſiſtance. Richard inſtantly reſolved to meet his antagoniſt, and to riſk every thing on the event of a battle. Richmond, though he had not above 6000 men, and the king near double that number, did not decline the combat; being chiefly encouraged by the promiſes of Lord Stanley to join him with a body of 7000 men, and with whom he hovered at a little diſtance from the intended field of battle, ſeemingly indetermined to join either ſide.

36 mond s in land a nd

37 ard de- d and l.

The king having commanded his army to form themſelves in order of battle, intruſted the van to the duke of Norfolk, while he himſelf, with the crown on his head, took the command of the main body. Lord Stanley in the mean time poſted himſelf on one flank between the two armies, while his brother Sir William took his ſtation directly oppoſite. As his intention of either joining the enemy or keeping neutral during the time of the engagement was now far from being doubtful, Richard ſent him orders to join the main body; which not being complied with, the tyrant determined to put to death Stanley's ſon, who had been left with him as a pledge of his father's fidelity. He was perſuaded, however, to defer the execution till after the engagement, that Stanley might thereby be induced to delay his purpoſe in joining the enemy. This, however, did not anſwer the expectation. Soon after the engagement was begun, Stanley deſerted Richard's party, and joining Richmond entirely decided the fortune of the day. The tyrant perceiving his ſituation to be quite deſperate, and ſeeing his rival at no great diſtance from him, drove up againſt him with fury, in hopes that either Henry's death or his own would decide the victory between them. He killed Sir William Brandon the earl's ſtandard-bearer; he diſmounted Sir John Cheyney; and was within reach of Richmond, when Sir William Stanley breaking in with his troops, Richard was ſurrounded and overwhelmed by numbers. His body was found in the field, covered with dead enemies, and beſmeared with blood. It was thrown careleſsly acroſs a horſe, carried to Leiceſter amidſt the ſhouts of inſulting ſpectators, and interred in the Gray-Friar's church of that place.

The uſurper's crown being found on the field of battle, was placed on the head of the conqueror, while the whole army cried out, "Long live king Henry!" Two days after the battle, Henry gave orders to confine Edward Plantagenet earl of Warwick, and ſon of the unfortunate duke of Clarence; and to releaſe the Princeſs Elizabeth, who had been confined in the Tower. He then advanced by ſlow and gradual marches to the city of London, where he was received with the greateſt demonſtrations of joy. He was crowned King of England on the 30th of October 1485; and, to heighten the ſplendor on that occaſion, he beſtowed the rank of knights-banneret on 12 perſons, and conferred peerages on three. Jaſper earl of Pembroke, his uncle, he created duke of Bedford; Thomas Lord Stanley his father-in-law, earl of Derby; and Edward Courtenay, Earl of Devonſhire. At the coronation likewiſe appeared a new inſtitution, which the king had eſtabliſhed for perſonal ſecurity as well as pomp; a band of 50 archers, who were denominated Yeomen of the Guard. But leſt the people ſhould take umbrage at this ſtep, as if it implied a diffidence of his ſubjects, he declared the inſtitution to be perpetual. The ceremony of the coronation was performed by Cardinal Bourchier archbiſhop of Canterbury.—On the 18th of January 1486, he was married to the Princeſs Elizabeth; and his marriage was celebrated at London with greater appearance of joy than either his firſt entry or his coronation had been. Henry remarked, with much diſpleaſure, this general favour borne to the houſe of York; and the ſuſpicions ariſing from it, not only diſturbed his tranquillity during the whole of his reign, but bred diſguſt towards his conſort herſelf, and poiſoned all his domeſtic enjoyments.

238 Henry VII.

The reign of Henry VII. was for ſeveral years diſturbed by plots and inſurrections. The people, by a long courſe of civil war, had become ſo turbulent and factious, that no governor could rule, nor could any king pleaſe them. The violent animoſity expreſſed by this monarch, however, againſt the houſe of York, may juſtly be conſidered as one of the cauſes of the extreme proneneſs to rebellion manifeſted by his ſubjects. Inſtead of endeavouring to conciliate the affections of the oppoſite party, he always ſtrove to quell them by abſolute force and violence. For this purpoſe he took a journey, ſoon after his acceſſion, to the north of England, where the Yorkiſts were very numerous; hoping to get the better of them by his preſence. In his journey thither, he received intelligence of an inſurrection againſt him by Viſcount Lovel, with Sir Henry Stafford, and Thomas his brother, who had raiſed an army, and were marching to beſiege the city of Worceſter, while Lovel approached to aſſiſt them with a body of three or four thouſand men. They were diſperſed, however, by the offer of a general pardon; which induced Lovel to withdraw from his troops, who were thereupon obliged to ſubmit to the king's mercy. The Staffords took ſanctuary in the church of Colnham near Abingdon; but as it was found that this church had not the privilege of protecting rebels, they were taken from thence: the elder was executed at Tyburn; but the younger, pleading that he had been miſled by his brother, received a pardon.

239 His reign diſturbed by frequent rebellions.

240 Lovel and Stafford's inſurrection ſuppreſſed.

241 Prince Arthur born.

This ſucceſs was ſoon after followed by the birth of a prince; whom Henry named in honour of the celebrated king Arthur, who is ſaid to have been the direct anceſtor of the houſe of Tudor. All this ſucceſs, however, as well as the general ſatisfaction which the birth of a prince deſcended from the houſes both of

242
Diſcontents
of the
people.

York and Lancaſter neceſſarily occaſioned, were not ſufficient to reconcile the hearts of the Engliſh to their ſovereign. His extreme ſeverity towards the houſe of York ſtill continued; and unfortunately this was much more beloved by the generality of the nation, than that of Lancaſter. Many of the Yorkiſts had been treated with great cruelty, and deprived of their fortunes under pretence of treaſon; a general reſumption had likewiſe been made of the grants made by the princes of the houſe of York. It was likewiſe univerſally believed that the queen herſelf met with harſh treatment, on account of her being one of that unfortunate houſe; and, from all theſe circumſtances, it was not unreaſonably imagined that his enmity was inveterate and invincible. Hence, nothwithſtanding his politic and vigorous adminiſtration, people made no ſcruple of openly expreſſing their diſapprobation of his conduct and government; and one rebellion ſeemed to be extinguiſhed only to give birth to another.

243
Impoſture
of Robert
Simnel.

The king had, at the commencement of his reign, confined the duke of Clarence's ſon, as has already been mentioned. This unfortunate youth, who had obtained the title of the earl of Warwick, was, through long confinement, entirely unacquainted with the affairs of the world. Simple as he was, however, he was now made uſe of to diſturb the public tranquillity. The queen-dowager was with great reaſon ſuſpected to be at the bottom of this conſpiracy; but not chooſing to interfere openly in the matter herſelf, ſhe employed one Simon a prieſt of Oxford to execute her purpoſes. This man caſt his eyes upon one Lambert Simnel a baker's ſon in the ſame place, a youth of only 15 years of age; but who, from his graceful appearance and accompliſhments, ſeemed proper for perſonating a man of quality. A report had been ſpread among the people, that Richard duke of York, ſecond ſon of Edward IV. had ſecretly made his eſcape from the cruelty of his uncle, and lay ſomewhere concealed in England. Simon had at firſt inſtructed his pupil to aſſume that name, which he found to be much the object of public affection; but hearing aferwards a new report, that Warwick had eſcaped from the Tower, and obſerving that this news was attended with no leſs general ſatiſfaction, he changed the plan of his impoſture, and made Simnel perſonate that unfortunate prince. The pliant youth was therefore directed by his inſtructor to talk upon many occurrences, as happening to him in the court of Edward. But as the impoſture was not calculated to bear a cloſe examination, he was removed to Ireland; and ſo well had he profited by the leſſons given him, that he no ſooner preſented himſelf to the earl of Kildare the deputy, claiming his protection as the unfortunate earl of Warwick, than he began to conſult with ſeveral other noblemen with regard to him. Theſe expreſſed even a ſtronger belief in Simnel's ſtory than the deputy himſelf had done; and in proportion as the ſtory was ſpread abroad, the more credit it obtained. The impoſtor was lodged in the caſtle of Dublin; the inhabitants univerſally took an oath of allegiance to him, as the true deſcendant of the Plantagenets; he was crowned with a diadem taken from the ſtatue of the bleſſed virgin, and proclaimed king by the title of Edward VI.; and the whole kingdom followed the example of the capital.

Such an unexpected event alarmed Henry ſo much, that he would have gone over to Ireland on purpoſe to quell the rebellion in perſon, had he not been afraid of the machinations of the queen-dowager in his abſence.

24
The q
dowa
confi

To prevent any thing of this kind, it was reſolved to confine her for life in a monaſtery; under pretence, however, that it was done on account of her having formerly delivered up the princeſs her daughter to King Richard. The queen murmured againſt the ſeverity of her treatment; but the king perſiſted in his reſolution, and ſhe remained in confinement till the time of her death, which happened ſome years after.

The next meaſure was to ſhow Warwick to the people. He was taken from the Tower, and led thro' the principal ſtreets of London; after which he was conducted in ſolemn proceſſion to St Paul's, where great numbers were aſſembled to ſee him. Still, however, they proceeded in Dublin to honour their pretended monarch; and he was crowned with great ſolemnity in the preſence of the earl of Kildare, the chancellor, and the other officers of ſtate. At laſt, being furniſhed by the ducheſs of Burgundy with a body of 2000 veteran Germans under the command of Martin Swart, a brave and experienced officer, he reſolved to invade England. He landed in Lancaſhire, from whence he marched to York, expecting that the country-people would riſe and join him on his march. But in this he was deceived: the people were unwilling to join a body of foreigners; and were beſides kept in awe by the great reputation of Henry. Lord Lincoln, therefore, who commanded the rebel army, determined to bring the matter to a ſpeedy iſſue. Accordingly he met the royal army at Stoke in the county of Nottingham. An obſtinate engagement enſued, but at length King Henry obtained a complete victory. Lord Lincoln, with 4000 private men, periſhed in the battle; and Simnel with his tutor Simon were taken priſoners. Simon being a prieſt, could not be tried by the civil power, and was only committed to cloſe confinement. Simnel was pardoned, and made a ſcullion in the king's kitchen, whence he was afterwards advanced to the rank of falconer, in which employment he died.

24
Henry
niſhes
enemi

Henry being now freed from all danger from that quarter, determined to take ample vengeance on his enemies. For this purpoſe he took a journey into the north; but though he found many delinquents, his natural avarice prompted him to exact heavy fines from them rather than to put them to death. His proceedings, however, were extremely arbitrary; the criminals being tried, not by the ordinary judges, but either by commiſſioners appointed for the occaſion, or ſuffering puniſhment by ſentence of a court-martial.

24
Preten
deſire
chievi
martia
ploits.

Having thus fully eſtabliſhed his authority as far as it could be done by ſuppreſſing and puniſhing domeſtic enemies, he next determined to recommend himſelf to his ſubjects by a report of his military diſpoſition; hoping, that by undertaking, or pretending to undertake, ſome martial enterpriſes, he would thus gain the favour of a people naturally turbulent, and unaccuſtomed to live long at peace with their neighbours. He certainly had not, however, the leaſt intention of proſecuting foreign conqueſts; though, to pleaſe the people, he frequently gave out that he deſigned to invade France, and lay waſte the whole country, rather than not recover his continental poſſeſſions. Under theſe pretences, particularly that of aſſiſting the Bretons whom the king of France had lately ſubdued, and who had applied to him for relief, he perſuaded his parliament to grant him a conſiderable ſupply; but this involved him in ſome difficulties. The counties of Durham and York, who had always been diſcontented with Henry's government, and ſtill farther provoked by the oppreſſions under which they had laboured after the extinction of Simnel's rebellion, oppoſed the commiſſioners ſent by the king to levy the tax. The latter applied to the earl of Northumberlad, requeſting his advice and aſſiſtance in the execution of their office; but inſtead of being able to enforce the levying of the tax, he himſelf was attacked and put to death by the inſurgents. This act of violence committed by themſelves, ſeemed to render the inſurgents deſperate, ſo that without more ado they prepared to reſiſt the royal power, under the conduct of one Sir John Egremond; but in this ill-conducted and precipitate ſcheme they met with no ſucceſs. Henry inſtantly levied a conſiderable force, which he committed to the charge of the earl of Surrey; by whom the rebels were quickly defeated, and one of their leaders taken priſoner. Sir John Egremond fled to the ducheſs of Burgundy, who afforded him protection.

Thus Henry obtained the ſubſidy which he had ſolicited under pretence of invading France, though he would willingly have avoided any expence in preparations for that purpoſe in order to keep the money in his poſſeſſion; but as the Bretons had applied to him for aſſiſtance, and their diſtreſſes became every day more urgent, he found himſelf obliged to attempt ſomething. With this view he ſet ſail for Calais with an army of 25,000 foot and 1600 horſe, of which he gave the command to the duke of Bedford and the earl of Oxford: but notwithſtanding this apparent hoſtile diſpoſition, negociations for peace had been ſecretly begun, and commiſſioners even appointed to conſider of the terms, three months before King Henry ſet out for the continent. As the love of money was the prevailing paſſion of the Engliſh monarch, and the poſſeſſion of Bretagne was a great object to France, an accommodation ſoon took place betwixt the contending parties. The king of France engaged to pay Henry near L.200,000 as a reimburſement for the expences of his expedition, and ſtipulated at the ſame time to pay him and his heirs an annual penſion of 25,000 crowns more.

Thus the authority of Henry ſeemed to be ſo firmly eſtabliſhed, as to leave no reaſon to dread any rival in time to come; but ſtill he found himſelf miſtaken. The ducheſs of Burgundy, reſenting the depreſſion of her family, and exaſperated by her frequent miſcarriages in the attempts already made, reſolved to make a final effort againſt Henry, whom ſhe greatly hated. For this purpoſe, ſhe propagated a report that her nephew Richard Plantagenet, duke of York, had eſcaped from the Tower where his elder brother was murdered, and that he ſtill lay ſomewhere concealed. Finding this report eagerly received, ſhe ſoon found a young man who aſſumed both his name and character. The perſon choſen to act this part was the ſon of one Oſbeck, or Warbeck, a converted Jew, who had been in England during the reign of Edward IV. His name was *Peter*; but it had been corrupted after the Flemiſh manner into *Peterkin*, or *Perkin*. It was by ſome believed, that Edward, among his other amorous adventures, had a ſecret correſpondence with Warbeck's wife, which might account for the great ſimilarity of features between Perkin and that monarch. The ducheſs of Burgundy found this youth entirely ſuited to her purpoſes. The leſſons ſhe gave him were eaſily learned and ſtrongly retained. His graceful air, his courtly addreſs, his eaſy manners, and elegant converſation, were capable of impoſing upon all but thoſe who were privy to the impoſture. The kingdom of Ireland was pitched upon for Perkin's firſt appearance, as it had been before for that of Simnel. He landed at Cork; and immediately aſſuming the name of *Richard Plantagenet*, was followed by great numbers of credulous people. He wrote letters to the earls of Deſmond and Kildare, inviting them to join his party; he diſperſed every where the ſtrange intelligence of his eſcape from his uncle Richard's cruelty; and his ſtory meeting with general credit, he ſoon became an object of the public favour. All thoſe who were diſguſted with the king, prepared to join Perkin; but particularly thoſe who formerly were Henry's favourites, and had contributed to place him on the throne. Theſe, thinking their ſervices had not been ſufficiently repaid, now became heads of the conſpiracy. Their attempts, however, were all fruſtrated by the vigilance of the king, and moſt of the conſpirators of any note were publicly executed.

151
oſture
erkin
beck.

Perkin finding it was in vain to attempt any thing in England, went to the court of James IV. of Scotland. Here he was received with great cordiality; and James carried his confidence in him ſo far, that he even gave him in marriage lady Catherine Gordon, daughter to the earl of Huntley, and a near kinſwoman of his own. But when he attempted to ſet him on the throne of England, he found himſelf totally diſappointed; and on the concluſion of peace between the two kingdoms, Perkin was obliged to leave Scotland. From thence he went to Flanders; and meeting with but a cool reception there, he reſolved to try the affections of the people of Cornwall, who had lately riſen againſt the king on account of a new tax which had been levied upon them. On his firſt appearance, Perkin was joined by about 3000 of theſe people, with which force he laid ſiege to Exeter. Henry, however, having marched againſt him with a conſiderable army, Perkin's heart failed him, though his followers now amounted to 7000; and he took ſhelter in a monaſtery. His wife fell into the conqueror's hands; who placed her in a reſpectable ſituation near the queen's perſon, with a ſuitable penſion, which ſhe enjoyed till her death. Perkin being perſuaded to deliver himſelf into the king's hand, was compelled to ſign a confeſſion of his former life and conduct; but this was ſo defective and contradictory, that very little regard was paid to it. His life was granted him; though he was ſtill detained in cuſtody, and keepers were appointed to watch his conduct. From theſe, however, he broke looſe; and flying to the ſanctuary of Shyne, put himſelf into the prior's hands. He was once more prevailed upon to truſt himſelf in the king's hands, and was committed to the Tower; but having here entered into a correſpondence with the earl of Warwick in order to make their eſcape, both of them were condemned and executed.

To Henry VII. in a great meaſure is owing the pre-

[251] Engliſh nation civilized by Henry.

preſent civilized ſtate of the Engliſh nation. He had all along two points principally in view; the one to depreſs the nobility and clergy, and the other to exalt and humanize the populace. In the feudal times every nobleman was poſſeſſed of a certain number of vaſſals, over whom he had, by various methods, acquired an almoſt abſolute power; and, therefore, upon every ſlight diſguſt, he was able to influence them to join him in his revolt or diſobedience. Henry conſidered, that the giving of his barons a power to ſell their eſtates, which were before unalienable, muſt greatly weaken their intereſt. This liberty therefore he gave them; and it proved highly pleaſing to the commons, nor was it diſagreeable to the nobles themſelves. His next ſcheme was to prevent their giving liveries to many hundreds of their dependents, who were thus kept like the ſoldiers of a ſtanding army to be ready at the command of their lord. By an act paſſed in this reign, none but menial ſervants were allowed to wear a livery; and this law was enforced under ſevere penalties.

With the clergy, Henry was not ſo ſucceſsful. The number of criminals of all kinds who found protection in monaſteries and other places appointed for religious worſhip, ſeemed to indicate little leſs than an abſolute toleration of all kinds of vice. Henry uſed all his intereſt with the pope to get theſe ſanctuaries aboliſhed, but to no purpoſe. All that he could procure was, that if thieves, murderers, or robbers, regiſtered as ſanctuary men, ſhould ſally out and commit freſh offences, and retreat again, in ſuch caſes they might be taken out of the ſanctuary and delivered up to juſtice.

In 1500, the king's eldeſt ſon Arthur was married to the Infanta Catharine of Spain, which marriage had been projected and negociated ſeven years. But the prince dying in a few months after marriage, the princeſs was obliged to marry his younger brother Henry, who was created Prince of Wales in his room. Henry himſelf made all the oppoſition which a youth of 12 years of age is capable of; but as the king perſiſted in his reſolution, the marriage was by the pope's diſpenſation ſhortly after ſolemnized.—In the latter part of this king's reign, his economy, which had always been exact, degenerated into avarice, and he oppreſſed the people in a very arbitrary manner. He had two miniſters, Empſon and Dudley, perfectly qualified to ſecond his avaricious intentions. They were both lawyers, and uſually committed to priſon by indictment ſuch perſons as they intended to oppreſs; from whence they ſeldom got free but by paying heavy fines, which were called mitigations and compoſitions: but by degrees the very forms of law were omitted; and they determined in a ſummary way upon the properties of the ſubjects, and confiſcated their effects to the
252 Death of Henry VII. royal treaſury.—Henry VII. died of the gout in his ſtomach, in the year 1509, having lived 52 years, and reigned 23; and was ſucceeded by his ſon Henry VIII. In Henry VII.'s reign was built a large ſhip of war called the *Great Harry*, which coſt L. 14,000. This was, properly ſpeaking, the firſt ſhip in the Engliſh navy. Before this period, when the king wanted a fleet, he had no other expedient than to hire ſhips from the merchants.

253 Henry VIII. Henry VIII. aſcended the throne when he was about 18 years of age, and had almoſt every advantage which a prince can have on his acceſſion. He had a well-ſtored treaſury, an indiſputed title, and was at peace with all the powers in Europe. Commerce and arts had been ſome time introduced into England, where they met with a favourable reception. The young prince himſelf was beautiful in his perſon, expert in all polite exerciſes, open and liberal in his air, and loved by all his ſubjects. The old king, who was himſelf a ſcholar, had inſtructed him in all the learning of the times, ſo that he was an adept in ſchool-divinity before the age of 18.

All theſe advantages, however, ſeemed to have been loſt upon the new king. Being deſtitute of a good heart and ſolid underſtanding, he proved a tyrant. Being always actuated not by reaſon but the paſſion which happened to be uppermoſt in his mind, he behaved in the moſt abſurd and contradictory manner; and however fortunate ſome of his meaſures proved at laſt, it is impoſſible that either his motives, or the means he took for the accompliſhment of his purpoſes, can be approved of by any good man.

One of Henry's firſt actions in his royal capacity was to puniſh Empſon and Dudley, who were obnoxious to the populace on account of their having been the inſtruments of the late king's rapacity. As they could not be impeached merely on account of their having ſtrictly executed the will of the king, they were accuſed of having entered into a treaſonable conſpiracy, and of having deſigned to ſeize by force the adminiſtration of government; and though nothing could be more improbable than ſuch a charge, the general prejudice againſt them was ſo great, that they were both condemned and executed.

In 1510, the king entered into a league with pope Julius II. and Ferdinand king of Spain, againſt Louis XII. of France. In this alliance Henry was the only diſintereſted perſon. He expected nothing beſides the glory which he hoped would attend his arms, and the title of *Moſt Chriſtian King*, which the pope aſſured him would ſoon be taken from the king of France to be conferred upon him. The pope was deſirous of wreſting from Louis ſome valuable provinces which he poſſeſſed in Italy, and Ferdinand was deſirous of ſharing in the ſpoil. Henry ſummoned his parliament; who very readily granted him ſupplies, as he gave out that his deſign was to conquer the kingdom of France, and annex it to the crown of England. It was in vain that one of his old prudent counſellors objected, that conqueſts on the continent would only drain the kingdom without enriching it; and that England, from its ſituation, was not fitted to enjoy extenſive empire. The young king, deaf to all remonſtrances, and hurried away by his military ardour, reſolved imediately to begin the war. But after ſeveral attempts, which were rendered unſucceſsful only by the miſmanagement of thoſe who conducted them, a peace was concluded with France on the 7th of Auguſt 1514.

Henry's arms were attended with more ſucceſs in Scotland; where King James IV. with the greateſt part of the Scot's nobility, and 10,000 of the common people, were cut off in the battle of Flowden*. Henry in the mean time, puffed up with his imaginary ſucceſſes againſt France, and his real ones againſt Scotland,

Wol-

land, continued to laviſh his treaſures by expenſive pleaſures and no leſs expenſive preparations for war. The old miniſters who had been appointed by his father to direct him, were now diſregarded; and the king's confidence was entirely placed in Thomas afterwards Cardinal Wolſey, who ſeconded him in all his favourite purſuits, and who, being the ſon of a private gentleman at Ipſwich, had gradually raiſed himſelf to the firſt employments of the ſtate*. He doth not ſeem to have had many bad qualities beſides his exceſſive pride, which diſguſted all the nobility; but the great ſhare he poſſeſſed in the favour of ſuch an abſolute prince as Henry VIII. put him quite out of the reach his enemies.

55
rary
viour
king.

The king having ſoon exhauſted all the treaſures left him by his father, as well as the ſupplies which he could by fair means obtain from his parliament, applied to Wolſey for new methods of repleniſhing his coffers. The miniſter's firſt ſcheme was to get a large ſum from the people under the title of *benevolence;* though no title could be more improperly applied, as it was not granted without the greateſt murmurings and complaints. Wolſey even met with oppoſition in the levying of it. In the firſt place, having exacted a conſiderable ſum from the clergy, he next applied himſelf to the houſe of commons; but they only granted him half the ſum he demanded. The miniſter at firſt was highly offended, and deſired to be heard in the houſe; but they replied, that none could be permitted to ſit and argue there except ſuch as were members. Soon after, the king having occaſion for new ſupplies, by Wolſey's advice attempted to procure them by his prerogative alone, without conſulting his parliament. He iſſued out commiſſions to all the counties of England for levying four ſhillings in the pound from the clergy, and three ſhillings and fourpence from the laity. This ſtretch of royal power was ſoon oppoſed by the people, and a general inſurrection ſeemed ready to enſue. Henry endeavoured to pacify them by circular letters; in which he declared, that what he demanded was only by way of benevolence. The city of London, however, ſtill heſitated on the demand; and in ſome parts of the country inſurrections were actually begun. Theſe were happily ſuppreſſed by the duke of Suffolk; but the cardinal loſt ſomewhat of the king's favour on account of the improper advice he had given him. To reinſtate himſelf in his good graces, Wolſey made the king a preſent of a noble palace called *York-place*, at Weſtminſter, aſſuring him that from the firſt he had intended it for the king's uſe. In order to have a pretence for amaſſing more wealth, Wolſey next undertook to found two new colleges at Oxford; and for this pupoſe he received every day freſh grants from the pope and the king. The former imprudently gave him liberty to ſuppreſs ſome monaſteries, and make uſe of their revenues for the erection of his new colleges; but this was a fatal precedent for the pontiff's intereſts, as it taught the king to ſeize on the monaſtic revenues whenever he ſtood in need of money.

256
Cauſe of Wolſey's diſgrace.

257
Scruples concerning the legality of Henry's marriage.

For a conſiderable time Wolſey continued to enjoy the king's favour in an extreme degree; and as no monarch was ever more deſpotic than Henry VIII. no miniſter was ever more powerful than Wolſey. This extraordinary elevation ſerved only to render his fall the more conſpicuous, and himſelf the more miſerable, when it took place; and what was worſe, he had long foreſeen, from what he knew of the king's capricious and obſtinate temper, that it certainly would happen one time or other. The cauſe of his final overthrow was the deſire King Henry began to entertain of having his Queen Catherine divorced. The doctrines of the reformation, propagated by Luther in 1517, had gained conſiderable ground in England, and many profeſſed a belief in them, notwithſtanding the ſevere perſecution which had been carried on againſt heretics during ſome of the preceding reigns. The clergy had become ſo exceedingly corrupt, and were immerſed in ſuch monſtrous ignorance, that they were univerſally hated even by their own party, while no regard at all was paid to their deciſions, or rather they were looked upon with the utmoſt abhorrence, by the reformers. Even the papal authority, though ſtill very great, had, in no greater a ſpace of time than ten years (viz. from 1517, when Luther firſt began to attack it, to the preſent year 1527), declined very ſenſibly The marriage of King Henry therefore being in itſelf looked upon by all parties as illegal in itſelf, and only ſanctified by a diſpenſation from the pope, had been frequently objected to on different occaſions. We are informed by ſome authors, that when Henry VII. betrothed his ſon, at that time only 12 years of age, he evidently ſhowed an intention of taking afterwards a proper opportunity to annul the contract; and that he ordered Prince Henry, as ſoon as he ſhould come of age, to enter a proteſtation againſt the marriage; charging him on his death-bed not to finiſh an alliance ſo unuſual, and liable to ſuch inſuperable objections. Some members of the privy council, particularly Warham the primate, afterwards declared againſt the completion of the marriage; and even after it was completed, ſome incidents which in a ſhort time took place were ſufficient to make him ſenſible of the general ſentiments of the public on that ſubject. The ſtates of Caſtile had oppoſed a marriage betwixt the emperor Charles and the Engliſh princeſs Mary, Henry's daughter, urging among other things the illegitimacy of her birth. The ſame objection afterwards occurred on opening a negociation with France for a marriage with the duke of Orleans.

258
Other reaſons for Henry's deſire of a divorce.

259
His love for Anne Boleyn.

If theſe accounts are to be depended upon as authentic, we can ſcarce conceive it poſſible but Henry himſelf muſt have been ſomewhat ſtaggered by them; though it is by no means probable that they were his only motives. The queen was ſix years older than the king, her perſonal charms were decayed, and his affection leſſened in proportion. All her children had died in infancy except one daughter, the Princeſs Mary above mentioned; and Henry was, or pretended to be, greatly ſtruck with this, as it ſeemed ſomething like the curſe of being childleſs, pronounced in the Moſaic law againſt ſome evil-doers. Another point of the utmoſt importance was the ſucceſſion to the crown, which any queſtion concerning the legitimacy of the king's marriage would involve in confuſion. It was alſo ſuppoſed, with great reaſon, that ſhould any obſtacles of this kind occur, the king of Scotland would ſtep in as the next heir, and advance his pretenſions to the crown of England. But above all, it is probable that he was influenced by the love he had now contracted for Anne Boleyn, who had

lately

lately been appointed maid of honour to the queen. In this ſtation Henry had frequent opportunities of ſeeing her, and ſoon became deeply enamoured; and finding that his paſſion could not be gratified but by a marriage, it is not to be doubted that he was thus obſtinately ſet upon the divorce; for which purpoſe he ſent his ſecretary to Rome to obtain from Clement a bull for diſſolving his marriage with Catharine. That he might not ſeem to entertain any doubt of the pope's prerogative, he inſiſted only on ſome grounds of nullity in the bull granted by his predeceſſor Julius for the accompliſhment of the marriage. In the preamble to this bull, it had been ſaid, that it was granted only upon the ſolicitation of Henry himſelf; though it was known that he was then a youth under 12 years of age: it was likewiſe aſſerted, that the bull was neceſſary for maintaining the peace between the two crowns; though otherwiſe it is certain that there was no appearance of a quarrel betwixt them. Theſe falſe premiſes ſeemed to afford a very good pretence for diſſolving it; but, as matters then ſtood, the pope was involved in the utmoſt perplexity. Queen Catharine was aunt to the emperor, who had lately made Clement himſelf a priſoner, and whoſe reſentment he ſtill dreaded: and beſides, he could not with any degree of prudence declare the bull of the former pope illicit, as this would give a mortal blow to the doctrine of papal infallibility. On the other hand, Henry was his protector and friend; the dominions of England were the chief reſource from whence his finances were ſupplied; and the King of France, ſome time before, had got a bull of divorce in circumſtances nearly ſimilar. In this exigence he thought the wiſeſt method would be to ſpin out the affair by negociation; and in the mean time he ſent over a commiſſion to Wolſey, in conjunction with the archbiſhop of Canterbury or any other Engliſh prelate, to examine the validity of the king's marriage and of the former diſpenſation; granting them alſo a proviſional diſpenſation for the king's marriage with any other perſon.

260
Sends to Rome to obtain a divorce.

261
Extreme perplexity of the Pope.

The pope's meſſage was laid before the council in England: but they conſidered, that an advice given by the pope in this ſecret manner might very eaſily be diſavowed in public; and that a clandeſtine marriage would totally invalidate the legitimacy of any iſſue the king might have by ſuch a match. In conſequence of this, freſh meſſengers were diſpatched to Rome, and evaſive anſwers returned; the pope never imagining that Henry's paſſion would hold out during the tedious courſe of an eccleſiaſtical controverſy. But in this he was miſtaken. The king of England had been taught to diſpute as well as the pope, and valued himſelf not a little in his knowledge on theology: and to his arguments he added threats; telling him, that the Engliſh were but too well diſpoſed to withdraw from the holy ſee; and that if he continued uncomplying, the whole country would readily follow the example of their monarch, who ſhould always deny obedience to a pontiff that had treated him with ſuch falſehood and duplicity. The king even propoſed to his holineſs, whether, if he were not permitted to divorce his preſent queen, he might not have a diſpenſation for having two wives at once?

262
Henry's controverſy with him.

The pope, perceiving the king's eagerneſs, at laſt ſent Cardinal Campegio his legate to London; who, with Wolſey, opened a court for trying the legitimacy of the king's marriage with Catharine, and cited the king and queen to appear before them. The trial commenced the 31ſt of May 1529; and both parties preſented themſelves. The king anſwered to his name when called: but the queen, inſtead of anſwering to hers, roſe from her ſeat, and throwing herſelf at the king's feet, made a very pathetic harangue; which her dignity, her virtue, and misfortunes, rendered ſtill more affecting. She told her huſband, "That ſhe was a ſtranger in his dominions, without protection, without counſel, and without aſſiſtance; expoſed to all the injuſtice which her enemies were pleaſed to impoſe upon her: That ſhe had quitted her native country, without any other reſource than her connections with him and his family; and that, inſtead of ſuffering thence any violence or iniquity, ſhe had been aſſured of having in them a ſafeguard againſt every misfortune: That ſhe had been his wife during 20 years; and would here appeal to himſelf, whether her affectionate ſubmiſſion to his will had not merited other treatment than to be thus, after ſo long a time, thrown from him with indignity: That ſhe was conſcious,—he himſelf was aſſured,—that her virgin honour was yet unſtained when he received her into his bed; and that her connections with his brother had been carried no farther than the mere ceremony of marriage: That their parents, the kings of England and Spain, were eſteemed the wiſeſt princes of their time, and had undoubtedly acted by the beſt advice when they formed the agreement for that marriage, which was now repreſented as ſo criminal and unnatural: And that ſhe acquieſced in their judgment, and would not ſubmit her cauſe to be tried by a court whoſe dependence on her enemies was too viſible ever to allow her any hopes of obtaining from them an equitable or impartial deciſion." Having ſpoken theſe words, the queen roſe, and, making the king a low reverence, left the court; nor would ſhe ever again appear in it. The legate having again ſummoned the queen to appear before them, on her refuſal, declared her contumacious, and the trial proceeded in her abſence. But when the buſineſs ſeemed to be nearly decided, Campegio, on ſome very frivolous pretences, prorogued the court, and at laſt transferred the cauſe before the ſee of Rome.

26
Trial
king a
queen
fore t
pope's
gate.

All this time Cardinal Wolſey ſeemed to be in the ſame dilemma with the pope, and indeed much worſe; as he could not boaſt of the ſame independence which his holineſs poſſeſſed. On the one hand, he was very ſolicitous to gratify the king his maſter, who had diſtinguiſhed him by ſo many and extraordinary marks of favour; on the other, he feared to offend the pope, whoſe ſervant he more immediately was, and who likewiſe had power to puniſh his diſobedience. He had long known that this affair was certainly to end in his ruin; and by attempting to pleaſe all parties, he fell under the diſpleaſure of every one; ſo that he was at laſt left without a ſingle friend in the world. The king was diſpleaſed on account of his not entering into his cauſe with the warmth he thought he had reaſon to expect; Anne Boleyn imputed to him the diſappointment of her hopes; while even queen Catharine and her friends expreſſed the greateſt indignation againſt him on account of the part he had openly taken in the affair of her divorce. In this miſerable ſituation the

king ſent him a meſſage by the dukes of Norfolk and Suffolk, demanding the great ſeal: the cardinal refuſed to deliver it without a more expreſs warrant; upon which Henry wrote him a letter, and on receipt of this it was inſtantly given up. The ſeal was beſtowed on Sir Thomas More; a man who, beſides elegant literary talents, was poſſeſſed of the higheſt capacity, integrity, and virtue. Wolſey was next commanded to depart from York-place palace which he had built in London; and which, though it belonged to the ſee of York, was now ſeized by the king, and afterwards became the reſidence of the Britiſh ſovereigns, under the name of *Whitehall.* All his furniture and plate, the richneſs of which ſeemed rather proper for a monarch than a ſubject, was ſeized for the king's uſe. He was then commanded to retire to Eſher, a country-ſeat which he poſſeſſed near Hampton court, and there to wait the king's pleaſure. One diſgrace followed another; and his fall was at length completed by a ſummons to London to anſwer a charge of high-treaſon. This ſummons he at firſt refuſed to anſwer, as being a cardinal. However, being at length perſuaded, he ſet out on his journey; but was taken ill, and died by the way. See the article Wolsey.

e *Cran-*

After the death of Wolſey, the king, by the advice of Cranmer*, had the legality of his marriage debated in all the univerſities of Europe; and the votes of theſe were obtained in his favour by dint of money. The deburſements made on the occaſion have even been preſerved to this day. To a ſubdeacon he gave a crown, to a deacon two crowns, and ſo to the reſt in proportion to the importance of their ſtation or opinion.—Being thus fortified by the opinions of the univerſities, and even of the Jewiſh rabbies (for them alſo he had conſulted), Henry began to think he might ſafely oppoſe the pope himſelf. He began by reviving in parliament an old law againſt the clergy, by which all thoſe who had ſubmitted to the authority of the pope's legate were condemned to ſevere penalties. The clergy, to conciliate the king's favour, were obliged to pay a fine of 118,000 pounds. A confeſſion was likewiſe extorted from them, that the king, and not the pope, was the ſupreme head of the church and clergy of England. An act was ſoon after paſſed againſt levying the firſt-fruits, or a year's rent of all the biſhoprics that fell vacant. After this the king privately married his beloved Anne Boleyn; and ſhe proving with child ſoon after marriage, he publicly owned her for his wife, and paſſed with her through London, with a greater magnificence than had ever been known before. The ſtreets were ſtrewed with flowers, the walls of the houſes hung with tapeſtry, and an univerſal joy ſeemed to be diffuſed among the people. The unfortunate queen Catharine, perceiving all further oppoſition to be vain, retired to Amphthill near Dunſtable, where ſhe continued the reſt of her days in privacy and peace. Her marriage with Henry was at laſt declared invalid, but not till after the latter had been married to Anne Boleyn, though this declaration ought undoubtedly to have preceded it. See Boleyn.

67
ry's fi-
quarrel
the
.

The pope was no ſooner informed of theſe proceedings, than he paſſed a ſentence, declaring Catharine to be the king's only lawful wife; requiring him to take her again, and denouncing his cenſures againſt him in caſe of a refuſal. Henry, on the other hand, knowing that his ſubjects were entirely at his command, reſolved to ſeparate totally from the church of Rome. In the year 1534, he was declared head of the church by parliament; the authority of the pope was completely aboliſhed in England; all tributes formerly paid to the holy ſee were declared illegal; and the king was entruſted with the collation to all eccleſiaſtical benefices. The nation came into the king's meaſures with joy, and took an oath called the *oath of ſupremacy:* all the credit which the popes had maintained over England for ages, was now overthrown at once; and none ſeemed to repine at the change, except thoſe who were immediately intereſted by their dependence on Rome.

268
Is declared
head of the
church.

But though the king thus ſeparated from the church of Rome, he by no means adhered to the doctrines of Luther which had been lately publiſhed. He had written a book againſt this celebrated reformer, which the pope pretended greatly to admire; and honoured King Henry, on its account, with the title of "Defender of the faith." This character he ſeemed to be determined to maintain, and therefore perſecuted the reformers moſt violently. Many were burnt for denying the popiſh doctrines, and ſome alſo were executed for maintaining the ſupremacy of the pope. The courtiers knew not which ſide to take, as both the new and old religions were equally perſecuted; and as both parties equally courted the favour of the king, he was by that means enabled to aſſume an abſolute authority over the nation. As the monks had all along ſhown the greateſt reſiſtance to Henry's eccleſiaſtical character, he reſolved at once to deprive them of the power of injuring him. He accordingly empowered Cromwell, ſecretary of ſtate, to ſend commiſſioners into the ſeveral counties of England to inſpect the monaſteries; and to report, with rigorous exactneſs, the conduct and deportment of ſuch as were found there. This employment was readily undertaken by ſome creatures of the court, whoſe names were Layton, London, Price, Gage, Petre, and Belaſis. They are ſaid to have diſcovered monſtrous diſorders in many of the religious houſes; whole convents of women abandoned to all manner of lewdneſs; friars accomplices in their crimes; pious frauds every where committed, to increaſe the devotion and liberality of the people; and cruel and inveterate factions maintained between the inhabitants. Thus a general horror was excited againſt theſe communities; and therefore the king, in 1536, ſuppreſſed the leſſer monaſteries, amounting to 376 in number. Their revenues, computed at 32,000 pounds a-year, were confiſcated to the king's uſe; beſides their plate and other goods, computed at 100,000 pounds more. In 1538, the greater monaſteries alſo were demoliſhed. The better to reconcile the people to this great innovation, ſtories were publiſhed, perhaps with aggravations, of the deteſtable lives which the friars led in their convents. The reliques alſo, and other objects of ſuperſtitious veneration, were now brought forth, and became objects of deriſion to the reformers. A great number of theſe are enumerated by Proteſtant writers; ſuch as the parings of St Edmund's toes; ſome of the coals that roaſted St Laurence; the girdle of the Virgin Mary, ſhown in no fewer than eleven different places; two or three heads of St Urſula; the felt of St Thomas of Lancaſter, an infallible cure for the headach; part of St Thomas of Canterbury's ſhirt, much

269
Suppreſſion
of the monaſteries.

much reverenced among big-bellied women; ſome reliques, an excellent preſervative againſt rain, others againſt weeds in corn; &c. Some impoſtures, however, were diſcovered, which diſplayed a little more ingenuity in the contrivance. At Hales in the county of Glouceſter had been ſhown, during ſeveral ages, the blood of Chriſt brought from Jeruſalem. The veneration for this precious relique may eaſily be imagined; but it was attended with a moſt remarkable circumſtance not obſerved in any other reliques. The ſacred blood was not viſible to any one in mortal ſin, even when ſet before him; nor could it be diſcovered till he had performed good works ſufficient for his abſolution. At the diſſolution of the monaſtery, the whole contrivance was diſcovered. Two of the monks who were let into the ſecret, had taken the blood of a duck, which they renewed every week: they put it into a phial, one ſide of which was thin and tranſparent cryſtal, the other thick and opaque. When any rich pilgrim arrived, they were ſure to ſhow him the dark ſide, till maſſes and offerings had expiated his offences; after which they made him happy, by turning the phial.—A miraculous crucifix had been kept at Boxely in Kent, and bore the appellation of the *rood of grace*. The lips, eyes, and head of the image, moved on the approach of its votaries. Helſey biſhop of Rocheſter broke the crucifix at St Paul's croſs, and ſhowed to all the people the ſprings and wheels by which it had been ſecretly moved. A great wooden idol, called *Darvel Gatherin*, was alſo brought to London and cut in pieces: and, by a cruel refinement of vengeance, it was employed as fuel to burn Friar Foreſt; who was puniſhed for denying the king's ſupremacy, and for ſome pretended hereſies. A finger of St Andrew, covered with a thin plate of ſilver, had been pawned for a debt of 40 pounds; but as the king's commiſſioners refuſed to releaſe the pawn, people made themſelves very merry with the poor creditor on account of his ſecurity. On this occaſion alſo was demoliſhed the noted ſhrine of Thomas a Becket, commonly called *St Thomas of Canterbury* *. The riches of it were inconceivable when broken down; the gold with which it was adorned filled two large cheſts that eight ſtrong men could ſcarce carry out of the church. The king, on the whole, ſuppreſſed 645 monaſteries, of which 28 had abbots who enjoyed a ſeat in parliament. Ninety colleges were demoliſhed in ſeveral counties; 2374 chantries and free chapels, and 110 hoſpitals. The whole revenue of theſe eſtabliſhments amounted to 161,100 pounds.

It is eaſy to imagine the indignation which ſuch an uninterrupted courſe of ſacrilege and violence would occaſion at Rome. In 1535, the king had executed Biſhop Fiſher, who was created a cardinal while in priſon, and Sir Thomas More, for denying or ſpeaking ambiguouſly about his ſupremacy. When this was reported in Italy, numerous libels were publiſhed all over the country, comparing the king of England to Nero, Domitian, Caligula, and the moſt wicked tyrants of antiquity. Clement VII. died about ſix months after he had threatened the king with a ſentence of excommunication; and Paul III. who ſucceeded him in the Papal throne, entertained ſome hopes of an accommodation. But Henry was ſo much accuſtomed to domineering, that the quarrel was ſoon rendered totally incurable. The execution of Fiſher was reckoned ſuch a capital injury, that at laſt the pope paſſed all his cenſures againſt the king, citing him and all his adherents to appear in Rome within 90 days, in order to anſwer for their crimes. If they failed, he excommunicated them; deprived the king of his realm; ſubjected the kingdom to an interdict; declared his iſſue by Anne Boleyn illegitimate; diſſolved all leagues which any Catholic princes had made with him; gave his kingdom to any invader; commanded the nobility to take up arms againſt him; freed his ſubjects from all oaths of allegiance; cut off their commerce with foreign ſtates; and declared it lawful for any one to ſeize them, to make ſlaves of their perſons, and to convert their effects to his own uſe. But though theſe cenſures were then paſſed, they were not openly denounced. The pope delayed the publication till he ſhould find an agreement with England totally deſperate, and till the emperor, who was then hard preſſed by the Turks and the Proteſtant princes of Germany, ſhould be in a condition to carry the ſentence into execution. But in 1538, when news arrived at Rome that Henry had proceeded with the monaſteries as above related, the pope was at laſt provoked to publiſh the cenſures againſt him. Libels were again diſperſed, in which he was anew compared to the moſt furious perſecutors of antiquity, and the preference was now given on their ſide. Henry, it was ſaid, had declared war with the dead, whom the Pagans themſelves reſpected; was at open enmity with heaven; and had engaged in profeſſed hoſtility with all the ſaints and angels. Above all, he was reproached with his reſemblance to the emperor Julian, whom (it was ſaid) he imitated in his apoſtacy and learning, though he fell ſhort of him in his morals. But theſe terrible fulminations had now loſt their effect. Henry had long ago denied the ſupremacy of the Pope, and therefore had appealed from him to a general council; but now, when a general council was ſummoned at Mantua, he refuſed to be ſubject to it, becauſe it was called by the pope, and lay entirely under ſubjection to that ſpiritual uſurper. He engaged his clergy to make a declaration to the like purpoſe, and preſcribed to them many other alterations with regard to their ancient tenets and practices. It was expected that the ſpirit of oppoſition to the church of Rome would have at laſt made him fall in with the doctrines of the reformed; but though he had been gradually changing the theological ſyſtem in which he was educated, ever ſince he came to the years of maturity, he was equally poſitive and dogmatical in the few articles he retained, as tho' the whole fabric had continued entire and unſhaken: and though he ſtood alone in his opinion, the flattery of courtiers had ſo much inflamed his tyrannical arrogance, that he thought himſelf intitled to regulate by his own particular ſtandard, the religious faith of the whole nation. The point on which he chiefly reſted his orthodoxy was the moſt abſurd in the whole Popiſh doctrine, namely, that of tranſubſtantiation. All departure from this he held to be a damnable error; and nothing, he thought, could be more honourable for him, than, while he broke off all connections with the Roman pontiff, to maintain, in this eſſential article, the purity of the Catholic faith.

In 1539, a parliament was called, which met on the 28th day of April. The chancellor opened this

par-

---

* See *Becket*.

parliament by informing the Houſe of Lords, that it was his majeſty's earneſt deſire to extirpate from his kingdom all diverſity of opinions with regard to religion; and as this enterpriſe was, he owned, difficult and important, he deſired them to chooſe a committee from among themſelves, who might frame certain articles, and communicate them afterwards to parliament. The lords named the vicar-general Cromwell, now created a peer, the archbiſhops of Canterbury and York, the biſhops of Durham, Carliſle, Worceſter, Bath and Wells, Bangor and Ely. This ſmall committee itſelf was agitated with ſuch diverſity of opinions, that it could come to no concluſion. The Duke of Norfolk then moved, that ſince there was no hope of having a report from the committee, the articles of faith propoſed to be eſtabliſhed ſhould be reduced to ſix, and a new committee be appointed to frame an act with regard to them. As this peer was underſtood to ſpeak the king's mind, his motion was immediately complied with; and after a ſhort prorogation, the bill of the ſix articles, or the *bloody bill*, as the Proteſtants juſtly termed it, was introduced; and having paſſed the two houſes, received the king's aſſent. By this law the doctrine of the real preſence was eſtabliſhed; the communion in one kind; the perpetual obligation of vows of chaſtity; the utility of private maſſes; the celibacy of the clergy; and the neceſſity of auricular confeſſion. The denial of the real preſence ſubjected the perſon to death by fire, and to the ſame forfeiture as in caſes of treaſon; and admitted not the privilege of abjuring: an unheard-of cruelty, unknown even to the inquiſition itſelf. The denial of any of the other articles, even though recanted, was puniſhable by the forfeiture of goods and chattels, and impriſonment during the king's pleaſure: an obſtinate adherence to error, or a relapſe, was adjudged to be felony, and puniſhable by death. The marriage of prieſts was ſubjected to the ſame puniſhment. Their commerce with women, was, for the firſt offence, forfeiture and impriſonment; and for the ſecond, death. Abſtaining from confeſſion, and from receiving the euchariſt at the accuſtomed times, ſubjected the perſon to fine, and to impriſonment during the king's pleaſure; and if the criminal perſevered after conviction, he was puniſhable by death and forfeiture, as in caſes of felony. Commiſſioners were to be appointed by the king for inquiring into theſe hereſies and irregular practices, and the criminals were to be tried by a jury.

72
of the
ticles
d.

The parliament having thus ſurrendered their eccleſiaſtical privileges, next proceeded to ſurrender their civil ones alſo. They gave to the king's proclamations the ſame force as to ſtatutes enacted by parliament, and thus by one blow made a total ſubverſion of the Engliſh conſtitution; and to render the matter worſe, if poſſible, they framed this law as if it were only declaratory, and intended to explain the natural extent of the royal authority.— Notwithſtanding this, however, they afterwards pretended to make ſome limitations in the regal power; and they enacted, that no proclamation ſhould deprive any perſon of his lawful poſſeſſions, liberties, inheritances, &c. nor yet infringe any common law or laudable cuſtom of the realm.

As ſoon as the act of the ſix articles had paſſed, the Catholics were extremely vigilant to inform againſt offenders; and, in a ſhort time, no fewer than 500 perſons were thrown into priſon. But ſome of the chief officers of ſtate remonſtrating againſt the cruelty of puniſhing ſuch a number of delinquents, they were all of them ſet at liberty; and ſoon after this, Henry, as if he had reſolved to give each party the advantage by turns, granted every one permiſſion to have a tranſlation of the Bible, which had been newly made, in his family.

In 1540, the king again complained to parliament of the great diverſity of religious tenets which prevailed among his ſubjects; a grievance, he affirmed, which ought the leſs to be endured, becauſe the ſcriptures were now publiſhed in England, and ought univerſally to be the ſtandard of belief to mankind. But he had appointed, he ſaid, ſome biſhops and divines to draw up a liſt of tenets; and he was determined that Chriſt and the truth ſhould have the victory; whence he ſeems to have expected more from this new book of his doctors, than had enſued from the publication of the ſcriptures. Cromwell, as vicar-general, alſo made a ſpeech in the upper houſe; and the peers in return told him, that he deſerved to be vicar-general to the univerſe: To ſuch a degree of mean and ſervile ſubmiſſion was the Engliſh parliament at this time reduced.

273
Suppreſſion of the knights of Malta,

This year alſo the king ſuppreſſed the only religious order remaining in England; namely, the knights of St John of Jeruſalem, or the *knights of Malta*, as they are commonly called. This order had by their valour done great ſervice to Chriſtendom; and had very much retarded, at Jeruſalem, Rhodes, and Malta, the rapid progreſs of the barbarians. During the general ſurrender of the religious houſes in England, they had obſtinately refuſed to give up their revenues to the king; and Henry, who would endure no ſociety that profeſſed obedience to the pope, was obliged to have recourſe to parliament for the diſſolution of this order. Their revenues were large, and formed a conſiderable addition to the acquiſitions which the king had already made. But he had been ſuch a bad economiſt, that, notwithſtanding the immenſe plunder afforded him by the church, he now demanded from parliament a very conſiderable ſupply. The commons, however, though laviſh of the blood of their fellow-ſubjects, were extremely frugal of their money; and it was not without murmuring that the grant could be obtained, even by this abſolute and dreaded monarch.

The king all this time continued to puniſh with unrelenting ſeverity the Proteſtants who offended againſt the law of the ſix articles, and the Papiſts who denied his ſupremacy; which gave occaſion to a foreigner at that time to ſay, that thoſe who were againſt the Pope were burned, and thoſe who were for him were hanged. The king even ſeemed to diſplay in an oſtentatious manner his tyrannical juſtice and impartiality which reduced both parties to ſubjection. This year he executed three Proteſtants and three Papiſts coupled together. The latter declared, that the moſt grievous part of their puniſhment was the being coupled to ſuch heretical miſcreants as ſuffered with them.

274
And of many colleges, hoſpitals, &c.

In 542, Henry proceeded to the further diſſolution of colleges, hoſpitals, and other foundations of that nature. The courtiers had been dealing with the preſidents and governors to make a ſurrender of their

275
Extreme abſurdity of the king's conduct.

revenues to the king; and they had ſucceeded with eight. But there was an obſtacle to their farther progreſs: it had been provided by the local ſtatutes of moſt of theſe foundations, that no preſident nor any fellows could make ſuch a deed without the unanimous conſent of all the fellows. This conſent would not have been eaſily obtained; but the parliament proceeded in a ſummary manner to annul all theſe ſtatutes; by which means the revenues of thoſe houſes were expoſed to the rapacity of the king and his favourites. Henry alſo now extorted from many biſhops a ſurrender of their chapter-lands; by which means he pillaged the ſees of Canterbury, York, and London, and enriched his favourites with their ſpoils. He engaged the parliament to mitigate the penalties of the ſix articles, as far as regarded the marriage of prieſts, which was now only ſubjected to a forfeiture of goods, chattels, and lands during life: he was ſtill equally bent on maintaining a rigid purity in ſpeculative principles. He had appointed a commiſſion conſiſting of two archbiſhops and ſeveral biſhops of both provinces, together with a conſiderable number of doctors of divinity; and by virtue of his eccleſiaſtical ſupremacy he had charged them to chooſe a religion for his people. Before the commiſſioners, however, had made any progreſs in this arduous undertaking, the parliament had paſſed a law by which they ratified all the tenets which theſe divines ſhould eſtabliſh with the king's conſent; and thus they were not aſhamed of declaring expreſly that they took their religion upon truſt, and had no other rule either in religious or temporal concerns than the arbitrary will of their maſter. One clauſe of the ſtatute, however, ſeems to favour ſomewhat of the ſpirit of liberty. It was enacted, that the eccleſiaſtical commiſſioners ſhould eſtabliſh nothing repugnant to the laws and ſtatutes of the realm. But in reality this proviſo was inſerted by the king, to ſerve his own purpoſes. By introducing a confuſion and contradiction into the laws, he became more the maſter of every one's life and property; and as the ancient independence of the church ſtill gave him jealouſy, he was well pleaſed, under colour of ſuch a clauſe, to introduce appeals from ſpiritual to civil courts. For the ſame reaſon he would never promulgate a body of canon law; and he encouraged the judges on all occaſions to interpoſe in eccleſiaſtical cauſes, wherever they thought the law or the prerogative concerned. Being thus armed by the authority of parliament, or rather by their acknowledgment of his ſpiritual ſupremacy, the king employed his commiſſioners to ſelect a ſyſtem of tenets for the aſſent and belief of the nation. A ſmall volume was publiſhed, under the title of *The Inſtitution of a Chriſtian Man*, which was received by the convocation, and made the infallible ſtandard of orthodoxy. In this book the points of juſtification, faith, free-will, good works, and grace, were diſcuſſed in a manner ſomewhat favourable to the opinions of the reformers. The ſacraments, which a few years before were only allowed to be three, were now increaſed to ſeven, conformably to the ſentiments of the Catholics. Throughout the whole of this book the king's caprice is very diſcernible; and the book is in reality to be regarded as his compoſition. For Henry, while he made his opinion a rule for the nation, would himſelf ſubmit to no authority whatever; not even to any which he had formerly eſtabliſhed. The ſame year the people had a farther inſtance of the king's inconſiſtency. He ordered a new book to be compoſed, called the *Erudition of a Chriſtian Man*; and without aſking the conſent of the convocation, he publiſhed by his own authority this new model of orthodoxy. He was no leſs poſitive in his new creed than he had been in the old one; but though he required the faith of the nation to veer about at his ſignal, he was particularly careful to inculcate the doctrine of paſſive obedience in all his books, and he was no leſs careful to retain the nation in the practice.

But while the king was thus ſpreading his own books among the people, both he and the clergy ſeem to have been very much perplexed with regard to the ſcriptures. A review had been made by the eccleſiaſtical ſynod of the new tranſlation of the Bible; and Biſhop Gardiner had propoſed, that inſtead of employing Engliſh expreſſions throughout, ſeveral Latin words ſhould ſtill be preſerved, becauſe they contained, as he pretended, ſuch peculiar energy and ſignificance, that they had no correſpondent terms in the Engliſh tongue. Among theſe were *eccleſia*, *pœnitentia*, *pontifex*, *contritus*, &c. But as this mixture would appear extremely barbarous, and was plainly calculated for no other purpoſe than to retain the people in their ancient ignorance, the propoſal was rejected. The knowledge of the people, however, ſeemed to be ſtill more dangerous than their ignorance; and the king and parliament, ſoon after the publication of the ſcriptures, retracted the conceſſion which they had formerly made, and prohibited all but gentlemen and merchants to peruſe them. Even that liberty was not granted without an apparent heſitation, and dread of the conſequences. Theſe perſons were allowed to read, *ſo it be done quietly and with good order*. And the preamble to the act ſets forth, "That many ſeditious and ignorant perſons had abuſed the liberty granted them of reading the Bible; and that great diverſity of opinion, animoſities, tumults, and ſchiſms, had been occaſioned by perverting the ſenſe of the ſcriptures." The maſs-book alſo paſſed under the king's examination; but little alteration was yet made in it. Some doubtful or fictitious ſaints only were ſtruck out; and the name of the pope was eraſed. The latter precaution was alſo uſed with every new book that was printed, and even every old one that was ſold. The word *pope* was carefully omitted or blotted out; as if that precaution could aboliſh the term from the language, or cauſe the people forget that ſuch a perſon exiſted. About this time alſo, the king prohibited the acting of plays, interludes, and farces, in deriſion of the Popiſh ſuperſtitions; which the Proteſtants had been in uſe to practiſe: and this prohibition was in the higheſt degree pleaſing to the Roman Catholics.

In this tyrannical and head ſtrong manner Henry proceeded with regard to eccleſiaſtical affairs. In other reſpects his conduct was equally violent. With regard to his domeſtic concerns, hiſtory ſcarce affords his parallel. We have already taken notice of his extreme love for Anne Boleyn, whom he married, contrary even to his own principles, before the marriage with Catharine was diſſolved. His affection for the former was carried to ſuch an height, that he even procured an act excluding from the ſucceſſion the iſſue of Queen Catharine, in favour of the children of

land.

Anne Boleyn; and failing them to the king's heirs for ever. An oath to this purpoſe was likewiſe enjoined, under penalty of impriſonment during the king's pleaſure, and forfeiture of goods and chattels. All ſlander againſt the king and his new queen or their iſſue, was ſubjected to the penalty of treaſon or miſpriſion of treaſon. The reaſon given for this extreme ſeverity toward his own child was, that her mother had obſtinately refuſed to quit the kingdom, notwithſtanding all the methods he could take to induce her to do ſo. The oath was generally taken throughout the kingdom; Sir Thomas More the chancellor, and Fiſher biſhop of Rocheſter, being the only perſons who refuſed; for which both of them were impriſoned, and ſoon after executed. The unfortunate queen Catharine died, in her retreat at Amphthill, in the year 1536. On her death-bed ſhe wrote a moſt pathetic letter to the king, in which ſhe forgave him all the injuries ſhe had received, and recommended to him in the ſtrongeſt terms their daughter the princeſs Mary. This letter affected Henry ſo much, that he could not read it without tears; but the new queen is ſaid to have exulted in ſuch a manner on hearing of the death of her rival, as was quite inconſiſtent with either decency or humanity. Her triumph, however, was of ſhort duration. Henry had no ſooner poſſeſſed her, ſecure from every diſquieting thought by the death of queen Catharine, than his paſſion began to decline; and to this her delivery of a dead ſon did not a little contribute; for ſo impetuous and abſurd were his paſſions, and ſuch was his deſire for male iſſue, that the diſappointment in this reſpect alone was ſufficient to alienate his affection from his wife. The levity of her temper, and her extreme gaiety of behaviour bordering upon licentiouſneſs, as related under the article Boleyn, alſo gave an opportunity to her enemies of enflaming the king's jealouſy againſt her. The viſcounteſs of Rocheford, in particular, a woman of profligate manners, and who was married to the queen's brother, had the cruelty to report to the king that her huſband committed inceſt with his own ſiſter; and, not content with this, ſhe interpreted every inſtance of favour ſhown by her to a man, as proof of a criminal intercourſe between them. At the ſame time it muſt not be forgot, that he who inſiſted on ſuch rigid fidelity from his wives, was himſelf the moſt faithleſs of mankind. He had doubts, it may be allowed, about the legality of his marriage with Queen Catharine, but his doubts were evidently confirmed by the charms of Anne Boleyn. After being ſatiated with the poſſeſſion of her for ſix years, perhaps he really doubted her fidelity; but here again his doubts were confirmed by the beauty of Jane Seymour, with whom he had now fallen in love. It may eaſily be believed, that from this conſideration alone there was no reaſon to hope that ever the unfortunate Anne would be able to exculpate herſelf. Had ſhe really been guilty, her monſter of a huſband might have allowed her to live; but his cruelty was as unbounded and inſatiable as his other perverſe paſſions. She was condemned; and the ſentence pronounced againſt her was, that ſhe ſhould be burned or beheaded at the king's pleaſure. On hearing this dreadful denunciation, ſhe exclaimed, "O Father! O Creator! thou who art the way, the truth, and the life! thou knoweſt that I have not deſerved this fate." She then made the moſt ſolemn proteſtations of innocence before her judges; but theſe, as they had been from the beginning ineffectual, ſo it was not to be ſuppoſed that they could now avail any thing. Anne was beheaded by the executioner of Calais, who was reckoned more expert than any in England; and Henry enjoyed the pleaſure of marrying his beloved Jane Seymour. His ſatisfaction, however, was of no long continuance: for the queen, becoming pregnant immediately after marriage, died in two days after the birth of the child; who being a ſon, was baptiſed by the name of Edward VI. As this lady had been more beloved by Henry than any of his other wives, his grief for the loſs of her was extreme. However, it did not hinder him from entering very ſoon afterwards into a new matrimonial ſcheme; in which he met with many difficulties. His firſt propoſals were made to the ducheſs dowager of Milan, niece to the emperor and to Catharine his own former queen; but as he had behaved ſo indifferently to the aunt, it is ſcarce to be ſuppoſed that his addreſſes could prove agreeable to the niece. On this he demanded the ducheſs-dowager of Longueville, daughter of the duke of Guiſe; but on making the propoſal to the French monarch, Francis I. he was informed that the princeſs had been already betrothed to the king of Scotland. Henry, however, would take no refuſal. He had learned that the object of his affection was endowed with many accompliſhments, was very beautiful, and of a large ſize, which laſt property he looked upon to be neceſſary for him who was now become ſomewhat corpulent himſelf. Francis, to prevent any more ſolicitations on this ſubject, ſent the princeſs to Scotland, but at the ſame time made Henry an offer of Mary of Bourbon, daughter of the Duke of Vendoſme. This princeſs was rejected by Henry, becauſe he had heard of her being formerly refuſed by the king of Scotland. He was then offered his choice of the two younger ſiſters of the queen of Scotland, both of them being equal in merit as well as ſize to the one whom he had deſired: but Henry, unwilling to truſt to any reports concerning the beauty of theſe ladies, or even to their pictures, propoſed to Francis, that they ſhould have a conference at Calais under pretence of buſineſs, and that the latter ſhould bring with him the two princeſſes of Guiſe with the fineſt ladies of quality in France, that he might make a choice. This indelicate propoſal ſhocked Francis: he returned for anſwer, that he was too much impreſſed with regard for the fair-ſex to carry ladies of the firſt quality, like geldings, to a market, to be choſen or rejected according to the humour of the purchaſer. Henry remonſtrated and ſtormed as uſual; but though Francis at this time earneſtly wiſhed to oblige him, he at laſt totally rejected the propoſal. Negociations were then entered into for a German match; and the princeſs of Cleves was propoſed by Cromwell, on account of the great intereſt her father had with the Proteſtant princes of Germany. Henry had alſo become enamoured of her perſon from a picture of her he had ſeen: but this, tho' drawn by an eminent artiſt, was unluckily done ſo much to the advantage, that when the negociation was quite finiſhed, and the bride arrived in England, he loſt all patience, ſwearing that ſhe was a great Flanders mare, and that he could never bear her the ſmalleſt affection. The matter was ſtill worſe, when he found that ſhe could

Marriage with Anne of Cleves.

could ſpeak no language but Dutch, of which he was entirely ignorant. Notwithſtanding all theſe objections, however, he reſolved to complete the marriage, telling Cromwell, that ſince he had gone ſo far, he muſt now put his neck into the yoke. The reaſon of this was, that the friendſhip of the German princes was now more than ever neceſſary for Henry; and it was ſuppoſed that the affront of ſending the princeſs back to her own country might be reſented. Cromwell, who knew that his own life depended on the event of the matter, was very anxious to learn from the king how he liked his ſpouſe after having paſſed a night with her; but was ſtruck with terror when he replied that he now hated her more than ever; that he was reſolved not to cohabit with her, and even ſuſpected that ſhe was not a virgin; a matter in which he pretended to be a *connoiſſeur*, and about which he was extremely ſcrupulous. In a little time his averſion increaſed to ſuch a degree, that he determined at any rate to get rid of his queen and prime miniſter both at once. Cromwell had long been an object of averſion to the nobility, who hated him on account of his obſcure birth; his father being no other than a blackſmith, though the ſon had obtained the firſt employments in the kingdom. By his office of vicar-general, he had an almoſt abſolute authority over the clergy; he was alſo lord privy-ſeal, lord-chamberlain, and maſter of the wards. He had alſo been inveſted with the order of the garter, and was created earl of Eſſex. This was ſufficient to raiſe the envy of the courtiers: but he had alſo the misfortune to fall under the diſpleaſure of both Proteſtants and Papiſts; the former hating him on account of his concurrence with Henry in their perſecution, and the latter looking upon him as the greateſt enemy of their religion. To theſe unfortunate circumſtances on the part of Cromwell, was added the uſual ſituation of Henry himſelf, who had now fallen in love with Catharine Howard, niece to the Duke of Norfolk; to enjoy whom, he now determined to divorce Anne of Cleves. By the inſinuations of this lady and her uncle, Cromwell's ruin was accompliſhed; and he was condemned, not only without any trial, but even without examination. The charge was of hereſy and high treaſon; but the inſtances of the latter were quite abſurd and ridiculous. He ſubmitted, however, to his ſentence without murmuring, as knowing that his complaints on this ſubject would be revenged on his ſon. He was terribly mangled by the executioner before his head could be ſtruck off. His death was ſoon followed by the diſſolution of the marriage with the princeſs of Cleves, which was annulled by the conſent of both parties. The princeſs parted from him with great indifference; and accepted of L. 3000 a-year as a compenſation, but refuſed to return to her own country after the affront ſhe had received.

285
The marriage annulled and Cromwell put to death.

286
Henry falls in love with Catherine Howard.

287
Infidelity and death of the new queen.

The king's marriage with Catharine Howard ſoon followed the diſſolution of that with Anne of Cleves; but the event may ſurely be regarded as a providential puniſhment upon this tyrant, whoſe cruelty, luſt, and other bad qualities, can ſcarcely be matched in hiſtory. We have already mentioned his inſinuations againſt the virtue of the unfortunate princeſs of Cleves, were amply repaid by the actual infidelities of his new queen, whom we muſt ſuppoſe he believed to be a pure and perfect virgin at the time he married her. So happy indeed did he imagine himſelf in this new marriage, that he publicly returned thanks for his conjugal felicity, when a moſt unfortunate information concerning the queen's incontinence was given to Cranmer by one of the name of Laſcelles, whoſe ſiſter had been ſervant to the ducheſs-dowager of Norfolk. He not only gave intelligence of her amours before marriage, but affirmed that ſhe had continued the ſame criminal practices ever ſince. Two of her paramours were arreſted, and confeſſed their crimes: the queen herſelf alſo confeſſed guilt before marriage, but denied having ever been falſe to the king's bed; which, however, had very little probability. She was beheaded on Tower-hill, along with the viſcounteſs of Rochford, who had been a confident in her amours. The latter, as has already been obſerved, was a principal inſtrument in procuring the deſtruction of the unhappy Anne Boleyn, and therefore died unpitied; while the virtuous character of that unfortunate lady received an additional confirmation from the diſcovery of this woman's guilt.

28
Abſur
of the

To ſecure himſelf from any farther diſaſters of this kind, Henry paſſed a moſt extraordinary law, enacting that any one who ſhould know, or ſtrongly ſuſpect any guilt in the queen, might, within 20 days, diſcloſe it to the king or council, without incurring the penalty of any former law againſt defaming the queen; though at the ſame time every one was prohibited from ſpreading the matter abroad, or even privately whiſpering it to others. It was alſo enacted, that if the king married any woman who had been incontinent, taking her for a true maid, ſhe ſhould be guilty of treaſon if ſhe did not previouſly reveal her guilt to him.

These laws afforded diverſion to the people, who now ſaid that the king muſt look out for a widow; as no reputed maid would ever be perſuaded to incur the penalty of the ſtatute. This in truth happened to be the caſe at laſt; for about a year after the death of Catharine Howard, he married, for his ſixth wife, Catharine Parr, widow of Nevil Lord Latimer. This lady, being ſomewhat inclined to the doctrines of the reformation, and having the boldneſs to tell her huſband her mind upon the ſubject, had like to have ſhared the fate of the reſt. The furious monarch, incapable of bearing the leaſt contradiction, inſtantly complained to Biſhop Gardiner, who inflamed the quarrel as much as poſſible; ſo that at laſt the King conſented that articles of impeachment ſhould be drawn up againſt her. But theſe were rendered abortive by the prudence and addreſs of the queen, as related under the article Parr.

All this time Henry had tyrannized over his nobility in the moſt cruel manner. The old counteſs of Saliſbury, the laſt of the houſe of Plantagenet, was executed with circumſtances of great cruelty. She had been condemned, as uſual, without any trial; and when ſhe was brought to the ſcaffold, refuſed to lay her head on the block in obedience to a ſentence, to the juſtice of which ſhe had never conſented. She told the executioner, therefore, that if he would have her head, he muſt win it the beſt way he could; and thus ſhe ran about the ſcaffold, purſued by the executioner, and.

England.

tioner, who aimed many fruitleſs blows at her neck before he was able to put an end to her life. Soon after her, the lord Leonard Grey was likewiſe executed for treaſon, but we have very little account of this tranſaction.

urry.

The laſt inſtances of the king's injuſtice and cruelty were the duke of Norfolk and his ſon the earl of Surry. The former had ſerved the king with fidelity, and the latter was a young man of the moſt promiſing hopes. His qualifications, however, were no ſecurity againſt the violence of Henry's temper. He had dropped ſome expreſſions of reſentment againſt the king's miniſters, who had diſplaced him from the government of Boulogne; and the whole family had become obnoxious on account of the late Queen Catharine Howard. From theſe motives, orders were given to arreſt both the father and ſon; and accordingly they were arreſted both on the ſame day, and confined to the Tower. The ducheſs-dowager of Richmond, Surry's own ſiſter, was among the number of his accuſers; and Sir Richard Southwell alſo, his moſt intimate friend, charged him with infidelity to the king. Surry denied the charge, and challenged his accuſer to a ſingle combat. This favour was denied him; and, notwithſtanding his eloquent and ſpirited defence, he was condemned and executed at Tower-hill.—The duke of Norfolk vainly endeavoured to mollify the king by letters and ſubmiſſions. An attainder was found againſt him though the only crime his accuſers could allege was, that he had once ſaid that the king was ſickly, and could not hold out long; and that the kingdom was likely to be torn between the contending parties of different perſuaſions. Cranmer, though engaged for many years in an oppoſite party to that of Norfolk, and though he had received many and great injuries from him, would have no hand in ſuch an unjuſt proſecution; but retired to his ſeat at Croydon. The death-warrant, however, was made out, and immediately ſent to the lieutenant of the Tower; but a period was put to the cruelties and violence of the king by his death, which happened on the 14th of January 1547, the night before Norfolk was to have been executed.

2

l by
rd VI.

Henry was ſucceeded by his only ſon Edward, a boy of nine years of age. The moſt remarkable tranſactions of his reign are thoſe with regard to religion. The reſtraint which Henry VIII. had laid upon the Proteſtants was now taken off; and they not only maintained their doctrines openly, but ſoon became the prevailing party. Henry had fixed the majority of his ſon at 18 years of age; and, in the mean time, appointed 16 executors of his will, to whom, during the minority, he entruſted the government of the king and kingdom. This will, he imagined, would be obeyed as implicitly after his death as though he had been alive. But the firſt act of the executors was to chooſe the earl of Hertford, afterwards duke of Somerſet, protector of the realm; and in him was lodged all the regal power, together with a privilege of naming whom he pleaſed for his privy council.

3
na-
om-

The duke of Somerſet had long been reckoned a ſecret partiſan of the reformers; and, immediately on his elevation to his preſent high dignity, began to expreſs his intention of reforming the abuſes of the ancient religion. Under his direction and that of Cranmer, therefore, the reformation was carried forward and completed. The only perſon of conſequence who oppoſed the reformers was Gardiner biſhop of Wincheſter; and, to the diſgrace of their own principles, the reformers now ſhowed that they could perſecute as ſeverely as the Papiſts had formerly perſecuted them. Gardiner was committed to the Fleet priſon, where he was treated with great ſeverity. He was afterwards ſent to the Tower; and having continued there two years, he was commanded to ſubſcribe ſeveral articles, among which was one confeſſing the juſtice of his own impriſonment. To all the articles but this he agreed to ſubſcribe; but that did not give ſatisfaction. He was then committed to cloſe cuſtody; his books and papers were ſeized; all company was denied him, and he was not even permitted the uſe of pen and ink. The biſhops of Chicheſter, Worceſter, and Exeter, were in like manner deprived of their offices; but the biſhops of Landaff, Saliſbury, and Coventry, eſcaped by ſacrificing the moſt conſiderable ſhare of their revenues. The libraries of Weſtminſter and Oxford were ordered to be ranſacked, and purged of the Romiſh legends, miſſals, and other ſuperſtitious volumes; in which ſearch, great devaſtation was made even in uſeful literature. Many volumes claſped in ſilver were deſtroyed for the ſake of their rich bindings; many of geometry and aſtronomy were ſuppoſed to be magical, and deſtroyed on that account; while the members of the univerſity, unable to put a ſtop to theſe ravages, trembled for their own ſafety.

294
The reformers perſecute the catholics.

The reformers, however, were not contented with ſeverities of this kind. A commiſſion was granted to the primate and others, to ſearch after all Anabaptiſts, heretics, or contemners of the new liturgy. Among the numbers who were found guilty upon this occaſion, was one Joan Boucher, commonly called *Joan of Kent*; who was ſo very obſtinate, that the commiſſioners could make no impreſſion upon her. She maintained an abſtruſe metaphyſical ſentiment, that Chriſt, as man, was a ſinful man; but, as the Word, he was free from ſin, and could be ſubject to none of the frailties of the fleſh with which he was clothed. For maintaining this doctrine, the poor woman was condemned to be burnt to death as an heretic. The young king, who it ſeems had more ſenſe than his teachers, refuſed at firſt to ſign the death-warrant: but at laſt, being overcome by the importunities of Cranmer, he reluctantly complied; declaring, that if he did wrong, the ſin ſhould be on the head of thoſe who had perſuaded him to it. The primate, after making another unſucceſsful effort to reclaim the woman from her opinions, committed her to the flames. Some time after, one Van Paris, a Dutchman, was condemned to death for Arianiſm. He ſuffered with ſo much ſatisfaction, that he hugged and careſſed the faggots that were conſuming him.

The reſt of this reign affords only the hiſtory of intrigues and cabals of the courtiers one againſt another. The protector was firſt oppoſed by his own brother admiral Sir Thomas Seymour, who had married Catharine Parr the late king's widow. She died ſoon after the marriage; and he then made his addreſſes to the princeſs Elizabeth, who is ſaid not to have been averſe to the match. His brother the duke, who was at that time in the north, being informed of

his

295 Lady Jane Gray declared heir to the crown.

his ambitious projects, ſpeedily returned, had him attainted of high treaſon, and at laſt condemned and executed. The duke of Somerſet himſelf, however, was ſome time afterwards deprived of his office by Dudley duke of Northumberland; who at laſt found means to get him accuſed of high treaſon, and executed. Not ſatisfied with the office of protector, which he aſſumed on the death of Somerſet, this ambitious nobleman formed a ſcheme of engroſſing the ſovereign power altogether. He repreſented to Edward, who was now in a declining ſtate of health, that his ſiſters Mary and Elizabeth, who were appointed by Henry's will to ſucceed, in failure of direct heirs, to the crown, had both been declared illegitimate by parliament; that the queen of Scots his aunt, ſtood excluded by the king's will; and, being an alien alſo, loſt all right of ſucceeding. The three princeſſes being thus excluded, the ſucceſſion naturally devolved to the marchioneſs of Dorſet eldeſt daughter of the French queen, Henry's ſiſter, who had married the earl of Suffolk after her firſt huſband's death. The next heir to the marchioneſs was Lady Jane Gray, a lady univerſally reſpected, both on account of the charms of her perſon, and the virtues and endowments of her mind. The king, who was accuſtomed to ſubmit to the politic views of this miniſter, agreed to have the ſucceſſion ſubmitted to council, where Northumberland hoped to procure an eaſy concurrence. The judges, however, who were appointed to draw up the king's letters patent for this purpoſe, warmly objected to the meaſure; and gave their reaſons before the council. They begged that a parliament might be ſummoned, both to give it force, and to free its partiſans from danger: they ſaid that the form was invalid, and would not only ſubject the judges who drew it, but every counſellor who ſigned it, to the pains of treaſon. Northumberland could not brook their demurs; he threatened them with his authority, called one of them a *traitor*, and ſaid he would fight with any man in his ſhirt in ſuch a juſt cauſe as that of Lady Jane's ſucceſſion. A method was therefore found out of ſcreening the judges from danger, by granting them the king's pardon for what they ſhould draw up; and at length the patent for changing the ſucceſſion was completed, the princeſſes Mary and Elizabeth were ſet aſide, and the crown ſettled on the heirs of the ducheſs of Suffolk (for ſhe herſelf was contented to forego her claim.)

296 Death of Edward VI.

For ſome time the king had languiſhed in a conſumption. After this ſettlement of the crown, his health viſibly declined every day, and little hopes were entertained of his recovery. To make matters worſe, his phyſicians were diſmiſſed by Northumberland's advice, and by an order of council; and he was put into the hands of an ignorant old woman, who undertook in a little time to reſtore him to health. After the uſe of her medicines all his bad ſymptoms increaſed to the moſt violent degree. He felt a difficulty of ſpeech and breathing; his pulſe failed, his legs ſwelled, his colour became livid, and many other ſigns of approaching death made their appearance. He expired at Greenwich on the 6th of July 1553, in the 16th year of his age and 7th of his reign.

After the death of King Edward, very little regard was paid to the new patent by which Lady Jane Gray had been declared heir to the throne. The undoubted title of Mary, notwithſtanding the ſcandalous behaviour of her father and his ſervile parliaments, was acknowleged by the whole nation. Northumberland, however, was reſolved to put the late king's will in execution. He therefore carefully concealed the death of Edward, in hopes of ſecuring the perſon of Mary, who by an order of council had been required to attend her brother during his illneſs; but ſhe being informed of his death, immediately prepared to aſſert her right to the crown. Northumberland then, accompanied by the duke of Suffolk, the earl of Pembroke, and ſome other noblemen, ſaluted Lady Jane Gray queen of England. Jane was in a great meaſure ignorant of theſe tranſactions, and it was with the utmoſt difficulty ſhe was perſuaded to accept of the dignity conferred upon her. At laſt ſhe complied, and ſuffered herſelf to be conveyed to the Tower, where it was then uſual for the ſovereigns of England to paſs ſome days after their acceſſion. Mary, however, who had retired to Kenning-hall in Norfolk, in a very few days found herſelf at the head of 40,000 men; and Lady Jane reſigned the ſovereignty in ten days, with much more pleaſure than ſhe had received it. She retired with her mother to their own habitation; and Northumberland finding his affairs quite deſperate, attempted to quit the kingdom. But he was ſtopped by the band of penſioner guards, who informed him that he muſt ſtay to juſtify their conduct in taking arms againſt their lawful ſovereign. He therefore ſurrendered himſelf to Mary; and was ſoon after executed, together with Sir John Gates and Sir Thomas Palmer, two infamous tools of his power. Sentence was alſo pronounced againſt Lady Jane Gray and her huſband Lord Guildford; but without any intention of putting it in execution againſt them at preſent, as their youth and innocence pleaded ſo ſtrongly in their favour, neither of them having yet reached their 17th year.

Mary now entered London, and was peaceably ſettled on the throne without any effuſion of blood. The Engliſh, however, ſoon found reaſon to repent their attachment to her cauſe. Though ſhe had at firſt ſolemnly promiſed to defend the religion and laws of her predeceſſor, ſhe no ſooner ſaw herſelf firmly eſtabliſhed on the throne, than ſhe reſolved to reſtore the Popiſh religion, and give back their former power to the clergy. Gardiner, Bonnar, and the other biſhops who had been impriſoned or ſuffered loſs during the laſt reign, were taken from priſon, reinſtated in their ſees, and now triumphed in their turn. On pretence of diſcouraging controverſy, the queen by her prerogative ſilenced all preachers throughout England, except ſuch as ſhould obtain a particular licenſe, and this ſhe was reſolved to give only to thoſe of her own perſuaſion. The greater part of the foreign Proteſtants took the firſt opportunity of leaving the kingdom; and many of the arts and manufactures, which they had ſucceſsfully introduced, fled with them. Soon after, the queen called a parliament, which ſeemed willing to concur in all her meaſures. They at once repealed all the ſtatutes with regard to religion that had paſſed during the reign of Edward VI. and the national religion was again placed on the ſame footing in which it had been at the death of Henry VIII.

To ſtrengthen the cauſe of the Catholics, and give

the

iage to
n Ma-

the queen more power to eſtabliſh the religion to which ſhe was ſo much attached, a proper match was to be ſought for her; and it was ſuppoſed that three had already been propoſed as candidates for her favour. Her affection ſeemed to be engaged by the earl of Devonſhire; but as he was rather attached to the Princeſs Elizabeth, he received the overtures which were made him from the queen with neglect. The next perſon mentioned as a proper match for her was Cardinal Pole, a man greatly reſpected for his virtues; but as he was now in the decline of life, Mary ſoon dropped all thoughts of that alliance. At laſt ſhe caſt her eye on Philip II. of Spain, ſon to the Emperor Charles V. He was then in the 27th year of his age, and conſequently agreeable in that reſpect to Mary, who was in her 48th year; but when her intentions with regard to this match became known, the greateſt alarm took place throughout the whole nation. The commons preſented ſuch a ſtrong remonſtrance againſt a foreign alliance, that the queen thought proper to diſſolve the parliament in order to get quit of their importunity. To obviate, however, all clamour, the articles of marriage were drawn up as favourably as poſſible for the intereſts of England. It was agreed, that though Philip ſhould have the title of king, the adminiſtration ſhould be entirely in the queen; that no foreigner ſhould be capable of holding any office in the kingdom; nor ſhould any innovation be made in the laws, cuſtoms, and privileges of the people; that Philip ſhould not carry the queen abroad without her conſent, or any of her children without the conſent of the nobility. Sixty thouſand pounds a-year were to be ſettled upon her as a jointure; and the male iſſue of this marriage were to inherit Burgundy and the Low Countries as well as the crown of England: and in caſe of the death of Don Carlos, Philip's ſon by his former marriage, without any heir, the queen's iſſue ſhould inherit all the reſt of the Spaniſh dominions alſo.

o
nce
S ain
ally
ee-

All theſe conceſſions, however, were not ſufficient to quiet the apprehenſions of the people: they were conſidered merely as words of courſe, which might be retracted at pleaſure; and the whole nation murmured loudly againſt a tranſaction ſo dangerous to its ancient liberty and independence. An inſurrection was raiſed by Sir Thomas Wyatt, a Roman Catholic, at the head of 4000 men, who ſet out from Kent to London, publiſhing a declaration againſt the Spaniſh match and the queen's evil counſellors. Having advanced as far as Southwark, he required that the queen ſhould put the Tower of London into his hands; that ſhe ſhould deliver four counſellors as hoſtages; and, in order to enſure the liberty of the nation, ſhould marry an Engliſhman. But his force was at preſent by far too ſmall to ſupport ſuch magnificent pretenſions; and he unluckily waſted ſo much time without attempting any thing of importance, that the popular ferment entirely ſubſided, his followers abandoned him gradually, and he was at laſt obliged to ſurrender himſelf to Sir Maurice Berkeley near Temple-bar. His followers were treated with great cruelty, no fewer than 400 of them ſuffering by the hand of the executioner; 400 more were conducted with ropes about their necks into the queen's preſence, and there received their pardon. Wyatt himſelf was condemned and executed.

303
Princeſs Elizabeth harſhly treated.

This rebellion had almoſt proved fatal to the Princeſs Elizabeth, who for ſome time paſt had been treated with great ſeverity by her ſiſter. Mary, who poſſeſſed a moſt malignant and cruel heart, had never forgot the quarrel between their mothers; and when a declaration was made after her own acceſſion, recogniſing Queen Catharine's marriage as legal, ſhe was thus furniſhed with a pretence for accounting Elizabeth illegitimate. She was likewiſe obnoxious on account of her religion, which Elizabeth at firſt had not prudence ſufficient to conceal; though afterwards ſhe learned full well to diſguiſe her ſentiments. But above all, her ſtanding ſo high in the affection of the Earl of Devonſhire, was a crime not to be forgiven; and Mary made her ſenſible of her diſpleaſure by numberleſs mortifications. She was ordered to take place at court after the Ducheſs of Suffolk and the Counteſs of Lenox; to avoid which, and other indignities, Elizabeth at laſt retired from court altogether into the country. After the ſuppreſſion of Wyatt's rebellion ſhe was committed to the Tower, and underwent a ſtrict examination before the council; but as Wyatt had made a declaration on the ſcaffold that ſhe was in no manner of way concerned, the queen found herſelf under a neceſſity of releaſing her. To get rid of ſuch a troubleſome rival, however, ſhe was offered in marriage to the Duke of Savoy; and on Elizabeth's declining the propoſal, ſhe was committed cloſe priſoner to Woodſtoke. The rebellion proved fatal, however, to many perſons of diſtinction, and gave the queen an opportunity of manifeſting that unbounded cruelty which reigned in her heart. The Tower, and all the priſons in the kingdom, were filled with nobility and gentry, who became objects of royal vengeance, more on account of their credit and intereſt with the people than any concern they were ſuppoſed to have had with Wyatt. Sir Nicholas Throgmorton was tried in Guildhall; but as no ſatisfactory evidence appeared againſt him, the jury gave a verdict in his favour. The queen was ſo much enraged at this diſappointment, that ſhe recommitted him to the Tower, ſummoned the jury before the council, and at laſt ſent them all to priſon, fining them afterwards ſome of 1000 l. and others of 2000 l. each. Sir John Throgmorton, brother to Sir Nicholas juſt mentioned, was condemned and executed upon evidence which had been already rejected as inſufficient. But of all thoſe who periſhed on this occaſion, none excited more univerſal compaſſion than the unfortunate Lady Jane Grey and her huſband Lord Guilford Dudley. They had already received ſentence of death, as has been mentioned; and two days after the execution of Wyatt, they received orders to prepare for eternity. Lady Jane, who had been in expectation of this blow, was no way intimidated, but received the news with the moſt heroic reſolution. The place intended at firſt for their execution was Tower-hill; but the council, dreading the effects of the people's compaſſion for their youth, beauty, and innocence, gave directions that they ſhould be beheaded within the verge of the Tower. The duke of Suffolk was ſoon after tried, condemned, and executed; but would have met with more compaſſion, had not his am-

304
Execution of Lady Jane Grey and her huſband.

305
The people
diſarmed.

ambition been the cauſe of his daughter's unhappy fate juſt mentioned. Sir Thomas Gray alſo loſt his life on the ſame account: but the cruel ſpirit of Mary was ſtill unſatisfied; and finding herſelf univerſally odious, that ſhe might free herſelf from any apprehenſions for what was paſt, as well as tyrannize with the more freedom in time to come, ſhe diſabled the people from reſiſtance, by ordering general muſters, and cauſing the commiſſioners ſeize their arms and lay them up in forts and caſtles.

306
Marriage
with Philip
ſolemnized.

Notwithſtanding this unpopularity, however, the rebellion of Wyatt had ſo ſtrengthened the hands of government, that a parliament was aſſembled in hopes of gratifying the queen's wiſhes in regard to her marriage with Philip of Spain. To facilitate this purpoſe alſo, the emperor of Germany ſent over to England 400,000 crowns to be diſtributed among the members of parliament in bribes and penſions; a practice of which there had hitherto been no example in England. The queen, notwithſtanding her bigotry, reſumed the title of *Supreme Head of the Church*, which ſhe had dropped three months before. Gardiner made a ſpeech, in which he propoſed, that they ſhould inveſt the queen with a legal power of diſpoſing of the crown, and appointing her ſucceſſor; but the parliament, however obſequious in other reſpects, did not chooſe to gratify their ſovereign in a meaſure by which the kingdom of England might become a province of the Spaniſh monarchy. They would not even declare it treaſon to imagine or attempt the death of the queen's huſband during her life-time, though they agreed to ratify the articles of marriage. Finding therefore that the parliament even yet was not ſufficiently obſequious, it was thought moſt proper to diſſolve them. Soon after this the marriage with Philip was ſolemnized; but as the latter had eſpouſed his queen merely with a view to become king of England, he no ſooner found himſelf diſappointed in this than he ſhowed a total want of affection for her as a wife. He paſſed moſt of his time at a diſtance from her in the Low Countries; and ſeldom wrote to her except when he wanted money, with which Mary would at all times gladly have ſupplied him even had it been at the expence of her kingdom, if in her power.

307
Proteſtants
perſecuted.

The enemies of the ſtate being ſuppoſed to be ſuppreſſed, thoſe of the Catholic religion were next perſecuted. The old ſanguinary laws which had been rejected by a former parliament were now revived. Orders were given, that the prieſts and biſhops who had married ſhould be ejected; that the maſs ſhould be reſtored, and the pope's authority eſtabliſhed; and that the church and its privileges, all but their goods and eſtates, ſhould be put on the ſame footing on which they were before the commencement of the reformation. But as the gentry and nobility had already divided the church-lands among them, it was thought inconvenient, and indeed impoſſible, to make a reſtoration of theſe. The perſons who chiefly promoted theſe meaſures were Gardiner biſhop of Wincheſter, and Cardinal Pole, who was a kinſman of Henry VIII. but had been long in Italy, and was now returned from it. The latter was for tolerating the Proteſtants; but the former, perceiving that rigorous meaſures would be moſt agreeable to the king and queen, declared himſelf againſt it. He was too prudent, however, to appear in perſon at the head of the perſecution; and therefore conſigned that office to Bonner biſhop of London, a man of a very abandoned character. The bloody ſcene began by the execution of Hooper biſhop of Gloceſter, and Rogers prebendary of St Paul's. Theſe were quickly followed by others, of whom the principal were Archbiſhop Cranmer, Ridley biſhop of London, and Latimer biſhop of Worceſter*. Theſe perſecutions ſoon became odious to the whole nation, and the perpetrators of them were all willing to throw the blame from themſelves upon others. Philip endeavoured to faſten the whole reproach upon Bonnar; but that biſhop would not take the whole, and therefore retorted on the court. A bold ſtep was now taken to introduce a court ſimilar to the Spaniſh inquiſition, that ſhould be empowered to try heretics, and condemn them without any other law but its own authority. But even this was thought a method too dilatory in the preſent exigence of affairs. A proclamation iſſued againſt books of hereſy, treaſon, and ſedition, declared, that whoſoever had ſuch books in his poſſeſſion, and did not burn them without reading, ſhould ſuffer as a rebel. This was attended with the execution of ſuch numbers, that at laſt the magiſtrates who had been inſtrumental in theſe cruelties refuſed to give their aſſiſtance any longer. It was computed, that during this perſecution, 277 perſons ſuffered by fire, beſides thoſe puniſhed by impriſonments, fines, and confiſcations. Among thoſe who ſuffered by fire were 5 biſhops, 21 clergymen, 8 lay-gentlemen, 84 tradeſmen, 100 huſbandmen, 55 women, and 4 children.

The only remarkable tranſaction which happened during this reign with regard to the temporal affairs of the kingdom was the loſs of Calais, which had been in the poſſeſſion of the Engliſh for upwards of 200 years*. This loſs filled the whole kingdom with complaints, and the queen with grief. She was heard to ſay, that, when dead, the name of *Calais* would be found engraven on her heart. She did not long ſurvive this loſs; but died in the year 1558, of a lingering illneſs, after a reign of five years four months and eleven days.

30
Mary
and i
ceede
Eliza

After the death of Mary, the Princeſs Elizabeth ſucceeded to the throne without oppoſition. She was at Hatfield when news of her ſiſter's death were brought her; upon which ſhe haſtened up to London, where ſhe was received with great joy. This princeſs was well qualified for government. She had judgment ſufficient to make choice of proper miniſters, and authority enough to keep her ſubjects in awe. The reſtraints alſo, to which ſhe had been ſubjected during her ſiſter's reign, had taught her ſo well to conceal her ſentiments, that ſhe had become a perfect miſtreſs of diſſimulation; which, though no commendable part of her character, proved occaſionally of great ſervice to her government. She perfected the reformation, and put the religion of England upon the ſame plan which ſubſiſts at preſent. This was accompliſhed without the leaſt difficulty; for the perſecutions in Mary's reign had ſerved only to give the whole nation an averſion for popery. In the time of Edward VI. the people had been compelled to embrace the Proteſtant religion, and their fears induced them to conform; but now, almoſt the whole nation were Proteſtants from inclination. The reformation was confirmed by act of parliament in 1559, and thus

---

*Calai.*

thus England was ſeen to change its religion four times in the ſpace of 32 years.

309 ce with nce.

During the time that the queen and her counſellors were employed in ſettling the religious affairs of the nation, negociations were likewiſe carried on for a peace between England and France; which was at laſt concluded on the following terms, viz. that Henry ſhould reſtore Calais at the expiration of eight years; that in caſe of failure, he ſhould pay 500,000 crowns, and Elizabeth's title to Calais ſtill remain; that for the payment of this ſum he ſhould find the ſecurity of eight foreign merchants, not natives of France; and until that ſecurity were provided he ſhould deliver five hoſtages. If during this interval Elizabeth ſhould break the peace with France or Scotland, ſhe ſhould forfeit all title to Calais; but if Henry made war on Elizabeth, he ſhould be obliged to reſtore the fortreſs immediately. This pacification was ſoon followed by an irreconcileable quarrel with Mary queen of Scotland; which was not extinguiſhed but by the death of the Scottiſh princeſs; and that with ſuch circumſtances of accumulated treachery, hypocriſy, and diſſimulation, as have ſtamped an indelible diſgrace on the memory of Elizabeth. See the articles Mary and Scotland.

310 para- for with in.

Elizabeth having at laſt got rid of her rival in the year 1587, began to make preparations for reſiſting the Spaniſh invaſion. Hearing that Philip was ſecretly fitting out a great navy to attack her, ſhe ſent Sir Francis Drake with a fleet to pillage his coaſts and deſtroy his ſhipping. On this expedition he ſet ſail with four capital ſhips furniſhed by the queen, and 26 others of various ſizes furniſhed him by the merchants of London in hopes of ſharing the plunder.

311 loits of Francis ke.

Having learned that a Spaniſh fleet richly laden was lying at Cadiz in readineſs to ſet ſail for Liſbon, he directed his courſe towards the former port, where he boldly attacked the enemy. Six galleys were obliged to take ſhelter under the cannon of the forts; he burned about 100 veſſels laden with ammunition and naval ſtores; and deſtroyed a great ſhip belonging to the Marquis de Santa Croce. Thence ſetting ſail for Cape St Vincent, he took by aſſault the caſtle ſituated on that promontory, with three other fortreſſes. Having next inſulted Liſbon, he ſailed to the Teneras, where after lying in wait for ſome time, he took a rich prize, and then returned to England; having by this ſhort expedition taught the Engliſh to deſpiſe the huge and unwieldy ſhips of the enemy, and thus prepared them to act with more reſolution againſt the formidable armament that now threatened to invade them.

12 arriage hilip's ne of vaſion.

But though the expedition of Sir Francis Drake had retarded the intended invaſion of England for a twelvemonth, it had not by any means induced Philip to abandon his deſign. During that interval he continued his preparations with the greateſt aſſiduity, the more eſpecially as the invaſion of England ſeemed to be a neceſſary preparative for regaining his authority over the Netherlands, the revolted provinces having been ſtrongly ſupported by Elizabeth. The fleet prepared at this time was ſuperior to any thing then exiſting in the world; and no doubt being entertained of its ſucceſs, it was oſtentatiouſly ſtyled the *Invincible Armada*. The miſerable event of this expedition, and the total failure of all the mighty hopes of Philip, are related under the article Armada. The ſpirit and courage of the Engliſh were now excited to attempt invaſions in their turn; which they executed in numerous deſcents on the Spaniſh coaſts; though theſe were only temporary, and deſigned not for permanent conqueſt, but to haraſs the enemy. It would be endleſs to relate all the advantages obtained over the enemy at ſea, where the capture of every ſhip muſt have made a ſeparate narrative. It is ſufficient to obſerve, that the ſea-captains of that reign are ſtill conſidered as the boldeſt and moſt enterpriſing ſet of men that England ever produced; and among this number we are to reckon Raleigh and Howard, Drake, Cavendiſh, and Hawkins. The Engliſh navy then began to take the lead; and has ſince continued irreſiſtible in all parts of the ocean.

Elizabeth continued to reign with great glory till the year 1603; but all her greatneſs could not prevent her from being extremely miſerable before her death. She had cauſed her greateſt favourite, and probably her lover, the earl of Eſſex *, to be executed. Though this execution could not be called unjuſt, the queen's affection (on being informed that he had at laſt thrown himſelf entirely on her clemency) returned to ſuch a degree, that ſhe thenceforth gave herſelf entirely over to deſpair.

313 Grief and miſery of Elizabeth.

She refuſed food and ſuſtenance; ſhe continued ſilent and gloomy; ſighs and groans were the only vent ſhe gave to her deſpondence; and ſhe lay for ten days and nights upon the carpet, leaning on cuſhions, which her maids brought her. Perhaps the faculties of her mind were impaired by long and violent exerciſe; perhaps ſhe reflected with remorſe on ſome paſt actions of her life, or perceived, but too ſtrongly, the decays of nature, and the approach of her diſſolution. She ſaw her courtiers remitting in their aſſiduity to her, in order to pay their court to James the apparent ſucceſſor. Such a concurrence of cauſes was more than ſufficient to deſtroy the remains of her conſtitution; and her end was now viſibly ſeen to approach. Feeling a perpetual heat in her ſtomach, attended with an unquenchable thirſt, ſhe drank without ceaſing, but refuſed the aſſiſtance of her phyſicians. Her diſtemper gaining ground, Cecil and the lord admiral deſired to know her ſentiments with regard to the ſucceſſion. To this ſhe replied, That as the crown of England had always been held by kings, it ought not to devolve upon any inferior character, but upon her immediate heir the king of Scotland. Being then adviſed by the archbiſhop of Canterbury to fix her thoughts upon God, ſhe replied, that her thoughts did not in the leaſt wander from him. Her voice ſoon after left her; ſhe fell into a lethargic ſlumber, which continued ſome hours; and ſhe expired gently without a groan, in the 70th year of her age, and 45th of her reign.

314 Her death.

She was ſucceeded by James I. king of Scotland; ſince which time, the hiſtory of both England and Scotland is comprehended under the article Britain.

315 England, how divided.

Since the Norman conqueſt, England has been divided into ſix circuits, each circuit containing a certain number of counties. Two judges are appointed for each circuit, which they viſit in the ſpring and autumn, for adminiſtering juſtice to the ſubjects who are at a diſtance from the capital. In holding the lent (or ſpring) aſſizes, the northern circuit extends only to York and Lancaſter; the aſſizes at Durham, Newcaſtle, Carliſle, and Appleby, being held only in the autumn,

* See Devereux.

England.

autumn, and diſtinguiſhed by the appellation of the *long circuit*. Theſe circuits and counties are :

1. *Home Circuit* contains the counties of Eſſex, Hertford, Kent, Surry, and Suſſex.

2. *Norfolk Circuit* contains thoſe of Bucks, Bedford, Huntingdon, Cambridge, Suffolk, and Norfolk.

3. *Oxford Circuit.* Oxon, Berks, Glouceſter, Worceſter, Monmouth, Hereford, Salop, and Stafford.

4. *Midland Circuit.* Warwick, Leiceſter, Derby, Nottingham Lincoln, Rutland, and Northampton.

5. *Weſtern Circuit.* Hants, Wilts, Dorſet, Somerſet, Devon, and Cornwal.

6. *Northern Circuit.* York, Durham, Northumberland, Lancaſter, Weſtmoreland, and Cumberland.

Middleſex and Cheſhire are not comprehended in the above circuits ; the former being the ſeat of the ſupreme courts of juſtice, and the latter a county palatine. There is ſtill a court of chancery in Lancaſter and Durham, with a chancellor ; and there is a court of exchequer at Cheſter, of a mixed kind, both for law and equity, of which the chamberlain of Cheſter is judge : there are alſo other juſtices in the counties palatine to determine civil actions and pleas of the crown.

Beſides the 40 counties into which England is divided, there are counties corporate, conſiſting of certain diſtricts, to which the liberties and juriſdictions peculiar to a county have been granted by charter from the throne. Thus the city of London is a county diſtinct from Middleſex ; the cities of York, Cheſter, Briſtol, Norwich, Worceſter, and the towns of Kingſton upon Hull and Newcaſtle upon Tyne, are counties of themſelves, diſtinct from thoſe in which they lie. The ſame may be ſaid of Berwick upon Tweed, which lies in Scotland, and has within its juriſdiction a ſmall territory of two miles on the north ſide of the river. Under the name of a *town*, boroughs and cities are contained : for every borough or city is a town, though every town is not a borough or city.—An account of the Engliſh conſtitution and government is given under the articles KING, LORDS, COMMONS, PARLIAMENT, LAW, LIBERTY, RIGHTS, &c.

316 Religion

The eſtabliſhed religion of England is Epiſcopacy. Since the reign of Henry VIII. the ſovereigns of England have been called, in public writs, the ſupreme heads of the church; but this title conveys no ſpiritual meaning, as it only denotes the regal power to prevent any eccleſiaſtical differences, or, in other words, to ſubſtitute the king in place of the pope before the reformation, with regard to temporalities and the internal economy of the church. The kings of England never intermeddle in eccleſiaſtical diſputes, and are contented to give a ſanction to the legal rights of the clergy.

The church of England, under this deſcription of the monarchical power over it, is governed by two archbiſhops, and 24 biſhops, beſides the biſhop of Sodor and Man, who, not being poſſeſſed of an Engliſh barony, does not ſit in the houſe of peers. See ARCHBISHOP and BISHOP.

England contains about 60 archdeacons. Subordinate to them are the rural deacons, formerly ſtyled *archpreſbyters*, who ſignify the biſhop's pleaſure to his clergy, the lower claſs of which conſiſts of pariſh-prieſts (who are called *rectors* or *vicars*), deacons, and curates. See the articles CURATE, DEACON, PARSON, and VICAR.

31 Reven of the c.ergy

The following is a liſt of the Engliſh biſhoprics, with their revenues, as charged in the king's books: though that ſum is far from being the real annual value of the ſee, yet it aſſiſts in forming a comparative eſtimate between the revenues of each ſee with thoſe of another.

The eccleſiaſtical government of England is, properly ſpeaking, lodged in the convocation ; which is a national repreſentative or ſynod, and anſwers pretty near to the ideas we have of a parliament. They are convoked at the ſame time with every parliament; and their buſineſs is to conſider of the ſtate of the church, and to call thoſe to an account who have advanced new opinions, inconſiſtent with the doctrines of the church of England. Some high-flying clergymen during the reign of queen Anne, and in the beginning of that of George I. raiſed the powers of the convocation to a height that was inconſiſtent with the principles of religious toleration, and indeed of civil liberty: ſo that the crown was obliged to exert its prerogative of calling the members together, and of diſſolving them; and ever ſince they have not been permitted to ſit for any time, in which they could do buſineſs.

NEW ENGLAND, late a province of the Britiſh empire in America, is bounded on the north by Canada, on the eaſt by Nova Scotia and the Atlantic ocean, on the ſouth by the Atlantic and Long Iſland Sound, and on the weſt by New York. It lies in the form of a quarter of a circle. Its weſt line, beginning at the mouth of Byram river which empties into Long Iſland Sound at the ſouth-weſt corner of Connecticut, latitude 41°, runs a little eaſt of north, until it ſtrikes the 45th degree of latitude, and then curves to the eaſtward almoſt to the gulph of St Lawrence.

1
en firſt
overed.

This country was diſcovered in the beginning of the laſt century, and called *North Virginia;* but no Europeans ſettled there till the year 1608. The firſt colony, which was weak and ill-directed, did not ſucceed; and, for ſome time, there were only a few adventurers who came over at times in the ſummer, built themſelves temporary huts for the ſake of trading with the ſavages, and, like them, diſappeared again for the reſt of the year. At laſt ſome Browniſts, headed by Mr Robinſon, whom Neal ſtyles the Father of the Independents, who in 1610 had been driven from England by perſecution, fled to Holland, and ſettled at Leyden; but in 1621 determined, with Mr Brewſter aſſiſtant preacher to Mr Robinſon, to found a church for their ſect in the new hemiſphere. They therefore purchaſed, in 1521, the charter of the Engliſh North Virginia company. Forty one families, making in all 120 perſons, landed in the beginning of a very hard winter, and found a country entirely covered with wood, which offered a very melancholy proſpect to men already exhauſted with the fatigues of their voyage. Near one half periſhed either by cold, the ſcurvy, or other diſtreſs. The courage of the reſt was beginning to fail; when it was revived by the arrival of 60 ſavage warriors, who came to them in the ſpring, headed by their chief. The old tenants aſſigned for ever to the new ones all the lands in the neighbourhood of the ſettlement they had formed, under the name of *New Plymouth;* and one of the ſavages who underſtood a little Engliſh, ſtaid to teach them how to cultivate the maize, and inſtruct them in the manner of fiſhing upon their coaſt.

This kindneſs enabled the colony to wait for the companions they expected from Europe with ſeeds, with domeſtic animals, and with every aſſiſtance they wanted. At firſt theſe ſuccours arrived but ſlowly; but the perſecution of the Puritans in England increaſed the number of proſelytes to ſuch a degree in America, that in 1630 they were obliged to form different ſettlements, of which Boſton ſoon became the principal. Theſe firſt ſettlers were not merely eccleſiaſtics, who had been deprived of their preferments on account of their opinions; nor thoſe ſectaries influenced by new opinions, that are ſo frequent among the common people. There were among them ſeveral perſons of high rank, who, having embraced Puritaniſm, had taken the precaution to ſecure themſelves an aſylum in theſe diſtant regions. They had cauſed houſes to be built, and lands to be cleared, with a view of retiring there, if their endeavours in the cauſe of civil and religious liberty ſhould prove abortive.

al's

can
nents.

The inhabitants of New England lived peaceably for a long time, without any regular form of policy. Their charter had indeed authorized them to eſtabliſh any mode of government they might chooſe; but theſe enthuſiaſts were not agreed among themſelves upon the plan of their republic and government did not pay ſufficient attention to them to urge them to ſecure their own tranquillity. At length they grew ſenſible of the neceſſity of a regular legiſlation; and this great work, which virtue and genius united have never attempted but with diffidence, was boldly undertaken by blind fanaticiſm. It bore the ſtamp of the rude prejudices on which it had been formed. There was in this new code a ſingular mixture of good and evil, of wiſdom and folly. No man was allowed to have a ſhare in the government except he were a member of the eſtabliſhed church. Witchcraft, perjury, blaſphemy, and adultery, were made capital offences; and children were alſo puniſhed with death, either for curſing or ſtriking their parents. Marriages, however, were to be ſolemnized by the magiſtrate. The price of corn was fixed at 2 s. 11$\frac{1}{2}$ d. per buſhel. The ſavages who neglected to cultivate their lands were to be deprived of them; and Europeans were forbidden under a heavy penalty to ſell them any ſtrong liquors or warlike ſtores. All thoſe who were detected either in lying, drunkenneſs, or dancing, were ordered to be publicly whipped. But at the ſame time that amuſements were ſorbidden equally with vices and crimes, one might be allowed to ſwear by paying a penalty of 11$\frac{3}{4}$d. and to break the ſabbath for 2 l. 19 s. 9$\frac{3}{4}$d. Another indulgence allowed was, to atone, by a fine, for a neglect of prayer, or for uttering a raſh oath. But it is ſtill more extraordinary, that the worſhip of images were forbidden to the Puritans on pain of death; which was alſo inflicted on Roman Catholic prieſts, who ſhould return to the colony after they had been baniſhed; and on Quakers who ſhould appear again after having been whipped, branded, and expelled. Such was the abhorrence for theſe ſectaries, who had themſelves an averſion for every kind of cruelty, that whoever either brought one of them into the country, or harboured him but for one hour, was liable to pay a conſiderable fine.

New
England.

2
Firſt code
of laws.

Quakers
perſecuted.

Thoſe unfortunate members of the colony, who, leſs violent than their brethren, ventured to deny the coercive power of the magiſtrate in matters of religion, were perſecuted with ſtill greater rigour. This was conſidered as blaſphemy by thoſe very divines who had rather choſen to quit their country than to ſhow any deference to Epiſcopal authority. This ſyſtem was ſupported by the ſeverities of the law, which attempted to put a ſtop to every difference in opinion, by inflicting capital puniſhment on all who diſſented. Thoſe who were either convicted, or even ſuſpected, of entertaining ſentiments of toleration, were expoſed to ſuch cruel oppreſſions, that they were forced to fly from their firſt aſylum, and ſeek refuge in another. They found one on the ſame continent; and as New England had been firſt founded by perſecution, its limits were extended by it.

This intemperate religious zeal extended itſelf to matters in themſelves of the greateſt indifference. A proof of this is found in the following public declaration, tranſcribed from the regiſters of the colony.

4
Law againſt
wearing
long hair.

"It is a circumſtance univerſally acknowledged, "that the cuſtom of wearing long hair, after the "manner of immoral perſons and of the ſavage In-"dians, can have been introduced into England only "in ſacrilegious contempt of the expreſs command of "God, who declares that it is a ſhameful practice for "any man who has the leaſt care for his ſoul to wear "long hair. As this abomination excites the indig-"nation of all pious perſons; we, the magiſtrates, in "our zeal for the purity of the faith, do expreſsly "and authentically declare, that we condemn the im-

"pious

“ pious cuſtom of letting the hair grow ; a cuſtom which we look upon to be very indecent and diſhoneſt, which horribly diſguiſes men, and is offenſive to modeſt and ſober perſons, in as much as it corrupts good manners. We therefore, being juſtly incenſed againſt this ſcandalous cuſtom, do deſire, adviſe, and earneſtly requeſt all the elders of our continent, zealouſly to ſhow their averſion for this odious practice, to exert all their power to put a ſtop to it, and eſpecially to take care that the members of their churches be not infected with it; in order that thoſe perſons who, notwithſtanding theſe rigorous prohibitions, and the means of correction that ſhall be uſed on this account, ſhall ſtill perſiſt in this cuſtom, ſhall have both God and man at the ſame time againſt them.”

This ſeverity ſoon exerted itſelf againſt the Quakers. They were whipped, baniſhed, and impriſoned. The behaviour of theſe new enthuſiaſts, who in the midſt of tortures and ignominy praiſed God, and called for bleſſings upon men, inſpired a reverence for their perſons and opinions, and gained them a number of proſelytes. This circumſtance exaſperated their perſecutors, and hurried them on to the moſt atrocious acts of violence ; and they cauſed five of them, who had returned clandeſtinely from baniſhment, to be hanged. This ſpirit of perſecution was, however, at laſt ſuppreſſed by the interpoſition of the mother-country, from whence it had been brought. Charles II. moved with the ſufferings of the Quakers, put a ſtop to them by a proclamation in 1661 ; but he was never able totally to extinguiſh the ſpirit of perſecution that prevailed in America.

The colony had placed at their head Henry Vane, the ſon of that Sir Henry Vane who had ſuch a remarkable ſhare in the diſturbances of his country. This obſtinate and enthuſiaſtic young man had contrived to revive the queſtions of grace and free-will. The diſputes upon theſe points ran very high ; and would probably have plunged the colony into a civil war, if ſeveral of the ſavage nations united had not happened at that very time to fall upon the plantations of the diſputants, and to maſſacre great numbers of them. The coloniſts, heated with their theological conteſts, paid at firſt very little attention to this conſiderable loſs. But the danger at length became ſo urgent and ſo general, that all took up arms. As ſoon as the enemy was repulſed, the colony reſumed its former diſſentions ; and the phrenzy which they excited broke out in 1692 in a war, marked with as many atrocious inſtances of violence as any ever recorded in hiſtory.

5
Extraordinary perſecution of witches.

There lived in a town of New England, called *Salem*, two young women who were ſubject to convulſions, accompanied with extraordinary ſymptons. Their father, miniſter of the church, thought that they were bewitched ; and having in conſequence caſt his ſuſpicions upon an Indian girl who lived in his houſe, he compelled her by harſh treatment to confeſs that ſhe was a witch. Other women, upon hearing this, immediately believed, that the convulſions, which proceeded only from the nature of their ſex, were owing to the ſame cauſe. Three citizens, caſually named, were immediately thrown into priſon, accuſed of witchcraft, hanged, and their bodies left expoſed to wild beaſts and birds of prey. A few days after, 16 other perſons, together with a counſellor, who, becauſe he refuſed to plead againſt them, was ſuppoſed to ſhare in their guilt, ſuffered in the ſame manner. From this inſtant, the imagination of the multitude was inflamed with theſe horrid and gloomy ſcenes. Children of ten years of age were put to death, young girls were ſtripped naked, and the marks of witchcraft ſearched for upon their bodies with the moſt indecent curioſity; and thoſe ſpots of the ſcurvy which age impreſſes upon the bodies of old men, were taken for evident ſigns of the infernal power. In default of theſe, torments were employed to extort confeſſions dictated by the executioners themſelves. If the magiſtrates, tired out with executions, refuſed to puniſh, they were themſelves accuſed of the crimes they tolerated ; the very miniſters of religion raiſed falſe witneſſes againſt them, who made them forfeit with their lives the tardy remorſe excited in them by humanity. Dreams, apparitions, terror, and conſternation of every kind, increaſed theſe prodigies of folly and horror. The priſons were filled, the gibbets left ſtanding, and all the citizens involved in gloomy apprehenſions. The moſt prudent quitted the country ſtained with the blood of its inhabitants ; and nothing leſs than the total and immediate ſubverſion of the colony was expected, when, on a ſudden, all eyes were opened at once, and the exceſs of the evil awakened the minds which it had firſt ſtupified. Bitter and painful remorſe was the immediate conſequence; the mercy of God was implored by a general faſt, and public prayers were offered up to aſk forgiveneſs for the preſumption of having ſuppoſed that heaven could have been pleaſed with ſacrifices with which it could only have been offended.

Poſterity will, probably, never know exactly what was the cauſe or remedy of this dreadful diſorder. It had, perhaps, its firſt origin in the melancholy which thoſe perſecuted enthuſiaſts had brought with them from their own country, which had increaſed with the ſcurvy they had contracted at ſea, and had gathered freſh ſtrength from the inconveniences and hardſhips inſeparable from a change of climate and manner of living. The contagion, however, ceaſed like all other epidemical diſtempers, exhauſted by its very communication. A perfect calm ſucceeded this agitation ; and the Puritans of New England have never ſince been ſeized with ſo gloomy a fit of enthuſiaſm.

But though the colony has renounced the perſecuting ſpirit which hath ſtained all religious ſects with blood, it has preſerved ſome remains, if not of intoleration, at leaſt of ſeverity, which remind us of thoſe melancholy days in which it took its riſe. Some of its laws are ſtill too ſevere.

New England had, however, ſome remedy againſt bad laws, in the conſtitution of its mother-country, where the people who have the legiſlative power in their own hands are at liberty to correct abuſes; and it has others derived from its ſituation, which open a vaſt field to induſtry and population.

6
Manner
ſettleme
in this c
lony.

The clearing of the lands in this colony is not directed by chance as in the other provinces. This matter from the firſt was ſubjected to laws which are ſtill religiouſly obſerved. No citizen whatever has the liberty of ſettling even upon unoccupied land. The government, deſirous of preſerving all its members from the inroads of the ſavages, and of placing them in a condition to ſhare in the protection of a well-regulated ſociety, hath ordered that whole villages ſhould be formed at once. As ſoon as 60 families offer to build a church, maintain a clergyman, and pay a ſchoolmaſter, the general aſſembly allot them a ſituation, and permit them to have two repreſentatives in the legiſlative body of the colony. The diſtrict aſſigned them always borders upon the lands already cleared, and generally contains 60,000 ſquare acres. Theſe new people chooſe the ſituation moſt convenient for their habitation, which is uſually of a ſquare figure. The church is placed in the centre; the coloniſts divide the land among themſelves, and each incloſes his property with a hedge. Some woods are reſerved for a common; and thus New England is conſtantly enlarging its territory, though it ſtill continues to make one complete and well conſtituted province.

7 iſion, The country was divided into four ſtates, which at firſt had no connection with one another. The neceſſity of maintaining an armed force againſt the ſavages, obliged them to form a confederacy in 1643, when they took the name of the *United Colonies*. In conſequence of this league, two deputies from each eſtabliſhment uſed to meet in a ſtated place to deliberate upon the common affairs of New England, according to the inſtructions they had received from the aſſembly by which they were ſent. This aſſociation laid no conſtraint upon the right of every individual to act entirely as he pleaſed, without either the permiſſion or approbation of the mother-country. All the ſubmiſſion required of theſe provinces was merely to acknowledge the kings of England for their ſovereigns. Charles II. wiſhed to make them more dependent. The province of Maſſachuſet's bay, which, though the ſmalleſt, was the richeſt and the moſt populous of the four, being guilty of ſome miſdemeanour againſt government, the king ſeized that opportunity of taking away its charter in 1684: and it remained without one till the revolution; when it received another, which, however, did not anſwer its claims or expectations. The crown reſerved to itſelf the right of nominating the governor, and appointing to all military employments, and to all principal poſts in the civil and juridical departments: it allowed the people of the colony their legiſlative power, and gave the governor a negative voice and the command of the troops, which ſecured him a ſufficient influence to enable him to maintain the prerogative of the mother-country in all its force. The provinces of Connecticut and Rhode-Iſland, by timely ſubmiſſion, prevented the puniſhment which that of Maſſachuſets had incurred, and retained their original charter. That of New-Hampſhire had been always regulated by the ſame mode of adminiſtration as the province of Maſſachuſets bay. The ſame governor preſided over the whole colony, but with regulations adapted to the conſtitution of each province. To the above ſtates, another has been added ſince the late revolution, *viz.* VERMONT. Theſe ſtates are ſubdivided into counties, and the counties into townſhips.

8 of the try, ntains, New England is a high, hilly, and in ſome parts a mountainous country, formed by nature to be inhabited by a hardy race of free, independent republicans.—The mountains are comparatively ſmall, running nearly north and ſouth in ridges parallel to each other. Between theſe ridges flow the great rivers in majeſtic meanders, receiving the innumerable rivulets and larger ſtreams which proceed from the mountains on each ſide. To a ſpectator on the top of a neighbouring mountain, the vales between the ridges, while in a ſtate of nature, exhibit a romantic appearance. They ſeem an ocean of woods, ſwelled and depreſſed in its ſurface like that of the great ocean itſelf. A richer though leſs romantic view is preſented, when the valleys, by induſtrious huſbandmen, have been cleared of their natural growth; and the fruit of their labour appears in loaded orchards, extenſive meadows, covered with large herds of ſheep and neat cattle, and rich fields of flax, corn, and the various kinds of grain. Theſe valleys, which have received the expreſſive name of *interval lands*, are of various breadths, from 2 to 20 miles; and by the annual inundations of the rivers which flow through them, there is frequently an accumulation of rich, fat ſoil, left upon their ſurface when the waters retire.

There are four principal ranges of mountains, paſſing nearly from north-eaſt to ſouth-weſt through New-England. Theſe conſiſt of a multitude of parallel ridges, each having many ſpurs, deviating from the courſe of the general range; which ſpurs are again broken into irregular hilly land. The main ridges terminate, ſometimes in high bluff heads, near the ſea-coaſt, and ſometimes by a gradual deſcent in the interior part of the country. One of the main ranges runs between Connecticut and Hudſon's rivers. This range branches and bounds the vales through which flows the Houſatonick river. The moſt eaſtern ridge of this range terminates in a bluff head at Meriden; a ſecond ends in like manner at Willingford, and a third at New Haven. In Lyme, on the eaſt ſide of Connecticut river, another range of mountains commences, forming the eaſtern boundary of Connecticut vale. This range trends northerly, at the diſtance, generally, of about 10 or 12 miles eaſt from the river, and paſſes through Maſſachuſets, where the range takes the name of *Chickabee Mountain*; thence croſſing into New Hampſhire, at the diſtance of about 20 miles from the Maſſachuſets line, it runs up into a very high peak, called *Monadnick*, which terminates this ridge of the range. A weſtern ridge continues, and in about latitude 43° 20′ runs up into Sunipee mountains. About 50 miles further, in the ſame ridge, is Mooſcoog mountain, A third range begins near Stonington in Connecticut. It takes its courſe north-eaſterly, and is ſometimes broken and diſcontinued; it then riſes again, and ranges in the ſame direction into New Hampſhire, where, in latitude 43° 25′, it runs up into a high peak called *Cowſawaſkog*. The fourth range has a humble beginning about Hopkinton in Maſſachuſets. The eaſtern ridge of this range runs north by Watertown and Concord, and croſſes Merrimack river at Pantucket Falls. In New Hampſhire, it riſes into ſeveral high peaks, of which the White mountains is the principal. From theſe White mountains a range continues north eaſt, croſſing the eaſt boundary of New Hampſhire, in latitude 44° 30′, and forms the height of land between Kennebek and Chaudiere rivers. Theſe ranges of mountains are full of lakes, ponds, and ſprings of water, that give riſe to numberleſs ſtreams of various ſizes, which, interlocking

ing each other in every direction, and falling over the rocks in romantic caſcades, flow meandering into the rivers below. No country on the globe is better watered than New England.

On the ſea-coaſt the land is low, and in many parts level and ſandy. In the valleys, between the forementioned ranges of mountains, the land is generally broken, and in many places rocky, but of a ſtrong rich ſoil, capable of being cultivated to good advantage, which alſo is the caſe with many ſpots even on the tops of the mountains.

The principal river in New England is Connecticut. See CONNECTICUT.

9 Soil, productions, &c.

The ſoil, as may be collected from what has been ſaid, muſt be very various. Each tract of different ſoil is diſtinguiſhed by its peculiar vegetation, and is pronounced good, middling, or bad, from the ſpecies of trees which it produces; and from one ſpecies generally predominating in each ſoil, has originated the deſcriptive names of oak land, birch, beech, and cheſnut lands, pine, barren, maple, aſh, and cedar ſwamps, as each ſpecies happens to predominate. Intermingled with thoſe predominating ſpecies are walnut, firs, elm, hemlock, magnolia, mooſe wood, ſaſſafras, &c. &c. The beſt lands produce walnut and cheſnut; the next, beech and oak; lands of the third quality produce fir and pitch pine; the next, whortleberry and barberry buſhes; and the pooreſt produce nothing but marſhy imperfect ſhrubs. Among the flowering trees and ſhrubs in the foreſts, are the red-flowering maple, the ſaſſafras, the locuſt-tree, the tulip-tree, honeyſuckle, wild roſe, dogwood, elm, leather-tree, laurel, hawthorn, &c. which in the ſpring of the year give the woods a moſt beautiful appearance, and fill them with a delicious fragrance. Among the fruits which grow wild, are the ſeveral kinds of grapes; which are ſmall, ſour, and thick ſkinned. The vines on which they grow are very luxuriant, often overſpreading the higheſt trees in the foreſts; and without doubt, might be greatly meliorated by proper cultivation. Beſides theſe, are the wild cherries, white and red mulberries, cranberries, walnuts, hazelnuts, cheſnuts, butter nuts, beech nuts, wild plums and pears, whortle-berries, bilberries, gooſeberries, ſtrawberries, &c.

The ſoil in the interior country is calculated for the culture of Indian corn, rye, oats, barely, flax, and hemp (for which the ſoil and climate are peculiarly proper), buck-wheat, beans, peas, &c In many of the inland parts wheat is raiſed in large quantities; but on the ſea-coaſt it has never been cultivated with ſucceſs, being ſubject to blaſts. The fruits which the country yields from culture, are, apples in the greateſt plenty; of theſe cyder is made, which conſtitutes the principal drink of the inhabitants; alſo, pears of various ſorts, quinces, peaches (from which is made peach brandy,) plums, cherries, apricots, &c. The culinary plants are ſuch as have already been enumerated. New England is a fine grazing country; the valleys between the hills are generally interſected with brooks of water, the banks of which are lined with a tract of rich meadow or interval land. The high and rocky ground is, in many parts, covered with honeyſuckle, and generally affords the fineſt of paſture. It will not be a matter of wonder, therefore, that New England boaſts of raiſing ſome of the fineſt cattle in the world; nor will ſhe be envied, when the labour of raiſing them is taken into view. Two months of the hotteſt ſeaſon in the year the farmers are employed in procuring food for their cattle; and the cold winter is ſpent in dealing it out to them. The pleaſure and profit of doing this, is however a ſatiſfying compenſation to the honeſt and induſtrious farmer.

10 Populati manners, cuſtoms, and dive ſions,

New England is the moſt populous part of the United States. It contains at leaſt 823,000 ſouls. One fifth of theſe are fencible men. New England then, ſhould any great and ſudden emergency require it, could furniſh an army of 164,600 men. The great body of theſe are land-holders and cultivators of the ſoil. The former attaches them to their country; the latter, by making them ſtrong and healthy, enables them to defend it. The boys are early taught the uſe of arms, and make the beſt of ſoldiers. Few countries on earth, of equal extent and population, can furniſh a more formidable army than this part of the union.

New England may, with propriety, be called a nurſery of men, whence are annually tranſplanted, into other parts of the United States, thouſands of its natives. The State of Vermont, which is but of yeſterday, and contains about 100,000 ſouls, has received more inhabitants from Connecticut than from any other ſtate; and yet between the years 1774 and 1782, notwithſtanding her numerous emigrations to Vermont, Suſquehannah, and other places, and the depopulation occaſioned by a ſeven years bloody war, it is found, from an actual cenſus of the inhabitants in the years before-mentioned, that they have increaſed from 197,856, their number in 1774, to 290,150, their number in 1782. Vaſt numbers of the New Englanders, ſince the war, have emigrated into the northern parts of New York, into Kentucky and the Weſtern Territory, and into Georgia; and ſome are ſcattered into every State, and every town of note in the union.

The New Englanders are generally tall, ſtout, and well built. They glory, and perhaps with juſtice, in poſſeſſing that ſpirit of freedom which induced their anceſtors to leave their native country, and to brave the dangers of the ocean and the hardſhips of ſettling a wilderneſs. Their education, laws, and ſituation, ſerve to inſpire them with high notions of liberty. Their jealouſy is awakened at the firſt notion toward an invaſion of their rights. They are indeed often jealous to exceſs; a circumſtance which is a fruitful ſource of imaginary grievances, and of innumerable groundleſs ſuſpicions and unjuſt complaints againſt government. A law, reſpecting the deſcent of eſtates which are generally held in fee ſimple, which for ſubſtance is the ſame in all the New England ſtates, is the chief foundation and protection of this liberty. By this law, the poſſeſſions of the father are to be equally divided among all the children, excepting the eldeſt ſon, who has a double portion. In this way is preſerved that happy mediocrity among the people, which, by inducing economy and induſtry, removes from them temptations to luxury, and forms them to habits of ſobriety and temperance. At the ſame time, their induſtry and frugality exempt them from want, and from the neceſſity of ſubmitting to any encroachment on their liberties.

In New England, learning is more generally diffuſed among all ranks of people than in almoſt any other part of the globe; ariſing from the excellent eſtabliſhment of ſchools in every townſhip. Another ſource of information to the people is the newſpapers, of which not leſs than 30,000 are printed every week in New England, and circulated in almoſt every town and village in the country. A perſon of mature age, who cannot both read and write, is rarely to be found. By means of this general eſtabliſhment of ſchools, the extenſive circulation of newſpapers, and the conſequent ſpread of learning, every townſhip throughout the country is furniſhed with men capable of conducting the affairs of their town with judgment and diſcretion. Theſe men are the channels of political information to the lower claſs of people; if ſuch a claſs may be ſaid to exiſt in New England, where every man thinks himſelf at leaſt as good as his neighbour, and believes that all mankind are, or ought to be, equal. The people from their childhood form habits of canvaſſing public affairs, and commence politicians. This naturally leads them to be very inquiſitive. This deſire after knowledge, in a greater or leſs degree, prevails throughout all claſſes of people in New England: and from their various modes of expreſſing it, ſome of which are blunt and familiar, bordering on impertinence, ſtrangers have been induced to mention impertinent inquiſitiveneſs as a diſtinguiſhing characteriſtic of New England people.—Each man alſo has his independent ſyſtem of politics; and each aſſumes a dictatorial office. Hence originates that reſtleſs, litigious, complaining ſpirit, which forms a dark ſhade in the character of New Englandmen.

Before the late war, which introduced into New England a flood of corruptions, with many improvements, the Sabbath was obſerved with great ſtrictneſs; no unneceſſary travelling, no ſecular buſineſs, no viſiting, no diverſions were permitted on that ſacred day. They conſidered it as conſecrated to divine worſhip, and were generally punctual and ſerious in their attendance upon it. Their laws were ſtrict in guarding the Sabbath againſt every innovation. The ſuppoſed ſeverity with which theſe laws were compoſed and executed, together with ſome other traits in their religious character, have acquired, for the New Englanders, the name of a ſuperſtitious bigotted people. But ſuperſtition and bigotry are ſo indefinite in their ſignifications, and ſo variouſly applied by perſons of different principles and educations, that it is not eaſy to determine how far they deſerved that character. Leaving every perſon to enjoy his own opinion in regard to this matter, we will only obſerve, that, ſince the war, a catholic tolerant ſpirit, occaſioned by a more enlarged intercourſe with mankind, has greatly increaſed, and is becoming univerſal; and if they do not break the proper bound, and liberalize away all true religion, of which there is much danger, they will counteract that ſtrong propenſity in human nature, which leads men to vibrate from one extreme to its oppoſite.

There is one diſtinguiſhing characteriſtic in the religious character of this people, which we muſt not omit to mention; and that is, the cuſtom of annually celebrating faſts and thankſgivings. In the ſpring, the ſeveral governors iſſue their proclamations, appointing a day to be religiouſly obſerved in faſting, humiliation, and prayer, throughout their reſpective ſtates, in which the predominating vices, that particularly call for humiliation, are enumerated. In autumn, after harveſt, that gladſome era in the huſbandman's life, the governors again iſſue their proclamations appointing a day of public thankſgiving, enumerating the public bleſſings received in the courſe of the foregoing year. This pious cuſtom originated with their venerable anceſtors, the firſt ſettlers of New England; and has been handed down as ſacred through the ſucceſſive generations of their poſterity. A cuſtom ſo rational, and ſo happily calculated to cheriſh in the minds of the people a ſenſe of their dependence on the great Benefactor of the world for all their bleſſings, it is hoped will ever be ſacredly preſerved.

The people of New England generally obtain their eſtates by hard and perſevering labour: They of conſequence know their value, and ſpend with frugality. Yet in no country do the indigent and unfortunate fare better. Their laws oblige every town to provide a competent maintenance for their poor; and the neceſſitous ſtranger is protected and relieved from their humane inſtitutions. It may in truth be ſaid, that in no part of the world are the people happier, better furniſhed with the neceſſaries and conveniences of life, or more independent than the farmers in New England. As the great body of the people are hardy independent freeholders, their manners are, as they ought to be, congenial to their employment, plain, ſimple, and unpoliſhed. Strangers are received and entertained among them with a great deal of artleſs ſincerity and friendly unformal hoſpitality. Their children, thoſe imitative creatures, to whoſe education particular attention is paid, early imbibe the manners and habits of thoſe around them; and the ſtranger, with pleaſure, notices the honeſt and decent reſpect that is paid him by the children as he paſſes through the country.

As the people, by repreſentation, make their own laws and appoint their own officers, they cannot be oppreſſed; and living under governments which have few lucrative places, they have few motives to bribery, corrupt canvaſſings, or intrigue. Real abilities and a moral character unblemiſhed are the qualifications requiſite in the view of moſt people for offices of public truſt. The expreſſion of a wiſh to be promoted is the direct way to be diſappointed.

The inhabitants of New England are generally fond of the arts, and have cultivated them with great ſucceſs. Their colleges have flouriſhed beyond any others in the United States. The illuſtrious characters they have produced, who have diſtinguiſhed themſelves in politics, law, divinity, the mathematics and philoſophy, natural and civil hiſtory, and in the fine arts, particularly in poetry, evince the truth of theſe obſervations.

Many of the women in New England are handſome. They generally have fair, freſh, and healthful countenances, mingled with much female ſoftneſs and delicacy. Thoſe who have had the advantages of a good education (and they are conſiderably numerous), are genteel, eaſy, and agreeable in their manners, and are ſprightly and ſenſible in converſation. They are early taught to manage domeſtic concerns with neatneſs and economy. Ladies of the firſt rank and fortune make it a part of their daily buſineſs to ſuperintend the affairs of the family. Employment at the needle, in cookery, and at the ſpinning-wheel, with them is honourable. Idleneſs, even in thoſe of independent fortunes, New England, Engliſh.

tunes, is univerſally diſreputable. The women in the country manufacture the greateſt part of the clothing of their families. Their linen and woollen cloths are ſtrong and decent. Their butter and cheeſe is not inferior to any in the world.

Dancing is the principal and favourite amuſement in New England; and of this the young people of both ſexes are extremely fond. Gaming is practiſed by none but thoſe who cannot or rather will not find a reputable employment. The gameſter, the horſe-jockey, and the knave, are equally deſpiſed, and their company is avoided by all who would ſuſtain fair and irreproachable characters. The odious and inhuman practices of duelling, gouging, cock-fighting, and horſe-racing, are ſcarcely known here.—The athletic and healthy diverſions of cricket, football, quoits, wreſtling, jumping, foot-races, &c. are univerſally practiſed in the country, and ſome of them in the moſt populous places, and by people of almoſt all ranks. Squirrel-hunting is a noted diverſion in country places, where this kind of game is plenty. Some divert themſelves with fox-hunting, and others with the more profitable ſports of fiſhing and duck-hunting; and in the frontier ſettlements where deer and fur game abound, the inhabitants make a lucrative ſport of hunting them. In the winter ſeaſon, while the ground is covered with ſnow, which is commonly two or three months, ſleighing is the general diverſion. A great part of the families throughout the country are furniſhed with horſes and ſleighs.

11 Trade.

New England has no one ſtaple commodity. The ocean and the foreſts afford the two principal articles of export. Codfiſh, mackarel, ſhad, ſalmon, and other fiſh—whale oil and whale bone—maſts, boards, ſcantling, ſtaves, hoops, and ſhingles, have been and are ſtill exported in large quantities. The annual amount of cod and other fiſh for foreign exportation, including the profits ariſing from the whale-fiſhery, is eſtimated at upwards of half a million.—Beſides the articles enumerated, they export from the various parts of New England ſhips built for ſale, horſes, mules, live ſtock—pickled beef and pork, potaſh, pearl-aſh, flax, ſeed, butter and cheeſe, rum, &c. The balance of trade, as far as imperfect calculations will enable us to judge, has generally been againſt New England; not from any unavoidable neceſſity, but from her extravagant importations. From a view of the annual imports into New England, it appears that the greateſt part of them conſiſts of the luxuries, or at beſt the diſpenſable conveniences of life; the country affords the neceſſaries in great abundance.

ENGLISH, or the *English Tongue*, the language ſpoken by the people of England, and, with ſome variation, by thoſe of Scotland, as well as part of Ireland, and the reſt of the Britiſh dominions.

The ancient language of Britain is generally allowed to have been the ſame with the Gallic, or French; this iſland, in all probability, having been firſt peopled from Gallia, as both Cæſar and Tacitus affirm, and prove by many ſtrong and concluſive arguments, as by their religion, manners, cuſtoms, and the nearneſs of their ſituation. But now we have very ſmall remains of the ancient Britiſh tongue, except in Wales, Cornwall, the iſlands and Highlands of Scotland, part of Ireland, and ſome provinces of France; which will not appear ſtrange, when what follows is conſidered.

Engliſh.

Julius Cæſar, ſome time before the birth of our Saviour, made a deſcent upon Britain, though he may be ſaid rather to have diſcovered than conquered it; but about the year of Chriſt 45, in the time of Claudius, Aulus Plautius was ſent over with ſome Roman forces, by whom two kings of the Britons, Togodumnus and Caractacus, were both overcome in battle: whereupon a Roman colony was planted at Malden in Eſſex, and the ſouthern parts of the iſland were reduced to the form of a Roman province: after that, the iſland was conquered as far north as the friths of Dunbarton and Edinburgh, by Agricola, in the time of Domitian; whereupon a great number of the Britons, in the conquered part of the iſland, retired to the weſt part called *Wales*, carrying their language with them.

The greateſt part of Britain being thus become a Roman province, the Roman legions, who reſided in Britain for above 200 years, undoubtedly diſſeminated the Latin tongue; and the people being afterwards governed by laws written in Latin, muſt neceſſarily make a mixture of languages. This ſeems to have been the firſt mutation the language of Britain ſuffered.

Thus the Britiſh tongue continued, for ſome time, mixed with the provincial Latin, till, the Roman legions being called home, the Scots and Picts took the opportunity to attack and haraſs England: upon which, K. Vortigern, about the year 440, called the Saxons to his aſſiſtance; who came over with ſeveral of their neighbours, and having repulſed the Scots and Picts, were rewarded for their ſervices with the iſle of Thanet and the whole county of Kent; but growing too powerful, and not being contented with their allotment, diſpoſſeſſed the inhabitants of all the country on this ſide of the Severn *: thus the Britiſh tongue was in a great meaſure deſtroyed, and the Saxon introduced in its ſtead.

* See *England*, nº 42.

What the Saxon tongue was long before the conqueſt, about the year 700, we may obſerve in the moſt ancient manuſcript of that language, which is a gloſs on the Evangeliſts, by biſhop Edfrid, in which the three firſt articles of the Lord's prayer run thus:

"Uren fader thic arth in heofnas, ſic gehalgud thin noma, ſo cymeth thin ric. Sic thin willa ſue is heofnas, aud in eortho," &c.

In the beginning of the ninth century the Danes invaded England; and getting a footing in the northern and eaſtern parts of the country, their power gradually increaſed, and they became ſole maſters of it in about 200 years. By this means the ancient Britiſh obtained a tincture of the Daniſh language; but their government being of no long continuance, did not make ſo great an alteration in the Anglo-Saxon as the next revolution, when the whole land, A. D. 1067, was ſubdued by William the conqueror, Duke of Normandy in France: for the Normans, as a monument of their conqueſt, endeavoured to make their language as generally received as their commands, and thereby rendered the Britiſh language an entire medley.

About the year 900, the Lord's prayer, in the ancient Anglo-Saxon, ran thus:

"Thue ur fader the eart on heofenum, ſi thin nama gehalgod;

gehalgod ; cume thin rice ſi thin willa on eorthan ſwa, ſwo on heofenum," &c.

About the year 1160, under Henry II. it was rendered thus by Pope Adrian, an Engliſhman, in rhyme :

" Ure fader in heaven rich,
" Thy name be halyed ever lich,
" Thou bring us thy michel bliſſe:
" Als hit in heaven y doe,
" Evar in yearth been it alſo," &c.

Dr Hicks gives us an extraordinary ſpecimen of the Engliſh, as ſpoken in the year 1385, upon the very ſubject of the Engliſh tongue.

" As it is knowe how meny maner peple beeth in this lond ; ther beeth alſo ſo many dyvers longages and tonges. Notheleſs Walſchemen and Scots that beeth nought medled with other nation, holdeth wel nyh hir firſte longage and ſpeche ; but yif the Scottes, that were ſometime confederate and woned with the Pictes, drawe ſomewhat after hir ſpeche ; but the Flemynges, that woneth on the weſt ſide of Wales, haveth loſt her ſtrange ſpech, and ſpeketh Sexonliche now. Alſo Engliſhemen, they had from the bygynnynge thre maner ſpeche ; northerne, ſoutherne, and middel ſpeche in the middel of the lond, as they come of thre maner of peple of Germania : notheleſs by commyxtion and mellynge firſt with Danes, and afterwards with Normans, in meny the contrary longage is apayred *(corrupted.)*

" This apayrynge of the burth of the tunge is bycauſe of tweie things ; oon is for children in ſcole agenſt the uſuage and maner of all other nations, beeth compelled for to leve hir own longage, and for to conſtrue hir leſſons and here thinges in Frenſche, and ſo they haveth ſethe Normans come firſt into Engelond. Alſo gentlemen children beeth taught to ſpeke Frenſche from the tyme that they beeth roked in here cradel, and kunneth ſpeke and play with a childe's broche ; and uplondiſſche men will lykne hymſelf to gentilmen, and fondeth with great beſyneſſe for to ſpeak Frenſche to be told of.—Hit ſeemeth a greet wonder how Engliſchemen and hir own longage and tonge is ſo dyverſe of ſown in this oon iland : and the longage of Normandie is comlynge of another lond, and hath oon maner ſoun amonge alle men that ſpeketh hit arigt in Engelond. Alſo of the foreſaid Saxon tonge that is deled *(divided)* a three, and is abide ſcarceliche with fewe uplondiſſche men, is greet wonder. For men of the eſt, with men of the weſt, is, as it were, undir the ſame partie of hevene accordeth more in ſownynge of ſpeche, than men of the north with men of the ſouth. Therefore it is that Mercii, that beeth men of myddel Engelond, as it were, parteners of the endes, underſtondeth bettre the ſide longes northerne and ſoutherne, than northerne and ſoutherne underſtondeth either other.—All the longage of the Northumbers and ſpechialliche at York, is ſo ſcharp, ſlitting and frotynge, and unſchape, that we ſoutherne men may that longage unnethe underſtonde," &c.

In the year 1537, the Lord's prayer was printed as follows : " O oure father which arte in heven, hallowed be thy name : let thy kingdome come, thy will be fulfilled as well in erth as it is in heven ; geve us this daye in dayly bred," &c. Where it may be obſerved, that the diction is brought almoſt to the preſent ſtandard, the chief variations being only in the orthography. By theſe inſtances, and many others that might be given, it appears, that the Engliſh Saxon language, of which the Normans deſpoiled us in a great meaſure, had its beauties, was ſignificant and emphatical, and preferable to what they impoſed on us. " Great, verily (ſays Cambden), was the glory of our tongue before the Norman conqueſt, in this, that the old Engliſh could expreſs moſt aptly, all the conceptions of the mind in their own tongue, without borrowing from any." Of this he gives ſeveral examples.

Having thus ſhown how the ancient Britiſh language was in a manner extirpated by the Romans, Danes, and Saxons, and ſucceeded by the Saxon, and after that the Saxon blended with the Norman French, we ſhall now mention two other cauſes of change in the language. The firſt of theſe is owing to the Britons having been a long time a trading nation, whereby offices, dignities, names of wares, and terms of traffic, are introduced, which we take with the wares from the perſons of whom we have them, and form them anew, according to the genius of our own tongue ; and beſides this change in the language, ariſing from commerce, Britain's having been a conſiderable time ſubject to the ſee of Rome, in eccleſiaſtical affairs, muſt unavoidably have introduced ſome Italian words among us. Secondly, As to the particular properties of a language, our tongue has undergone no ſmall mutation, or rather has received no ſmall improvement upon that account : for, as to the Greek and Latin, the learned have, together with the arts and ſciences now rendered familiar among us, introduced abundance ; nay, almoſt all the terms of art in the mathematics, philoſophy, phyſic, and anatomy ; and we have entertained many more from the Latin, French, &c. for the ſake of neatneſs and elegancy ; ſo that, at this day, our language, which, about 1800 years ago, was the ancient Britiſh, or Welſh, &c. is now a mixture of Saxon, Teutonic, Dutch, Daniſh, Norman, and modern French, embelliſhed with the Greek and Latin. Yet this, in the opinion of ſome, is ſo far from being a diſadvantage to the Engliſh tongue as now ſpoken (for all languages have undergone changes, and do continually participate with each other), that it has ſo enriched it, as now to render it the moſt copious, ſignificant, fluent, courteous, and maſculine language in Europe, if not in the world.

**ENGRAFTING**, in gardening. See GRAFTING.

**ENGRAILED**, or INGRAILED, in heraldry, a term derived from the French *greſly*, "hail ;" and ſignifying a thing the hail has fallen upon and broke off the edges, leaving them ragged, or with half rounds, or ſemicircles, ſtruck out of their edges.

**ENGRAVING**, the art of cutting metals and precious ſtones, and repreſenting thereon figures, letters, or whatever device or deſign the artiſt fancies.

Engraving, properly a branch of ſculpture, is divided into ſeveral other branches, according to the matter whereon it is employed, and the manner of performing it. For the rudeſt branch, that of

*ENGRAVING on Wood.* See *CUTTING in Wood.*

*ENGRAVING on Copper*, the making, correſpondently to ſome delineated figure or deſign, ſuch concave lines on a ſmooth ſurface of copper, either by cutting or corroſion, as render it capable, when charged properly with any coloured fluid, of imparting by compreſſion an an exact repreſentation of the figure or deſign to paper or parchment.

Whether we conſider the art of engraving, with regard to the utility and pleaſure it affords, or the difficulty that attends its execution, we cannot but confeſs, that on every account it deſerves a diſtinguiſhed rank among the polite arts †. It is by means of this art that the cabinets of the curious are adorned with the portraits of the greateſt men of all ages and all nations; that their memories, their moſt remarkable and moſt glorious actions, are tranſmitted to the lateſt poſterity. It is by this art alſo, that the paintings of the greateſt maſters are multiplied to a boundleſs number; and that the lovers of the polite arts, diffuſed over the face of the whole earth, are enabled to enjoy thoſe beauties from which their diſtant ſituations ſeemed to have for ever debarred them; and perſons of moderate fortune are hereby enabled to become poſſeſſed of all the ſpirit, and all the poetry, that are contained in thoſe miracles of art, which ſeemed to have been reſerved for the temples of Italy, or the cabinets of princes. When we reflect, moreover, that the engraver, beſide the beauties of poetic compoſition, and the artful ordinance of deſign, is to expreſs, merely by the means of light and ſhade, all the various tints of colours and clair obſcure; to give a relief to each figure, and a truth to each object; that he is now to paint a ſky ſerene and bright, and then loaded with dark clouds; now the pure tranquil ſtream, and then the foaming, raging ſea; that here he is to expreſs the character of the man, ſtrongly marked in his countenance, and there the minuteſt ornament of his dreſs; in a word, that he is to repreſent all even the moſt difficult objects in nature; we cannot ſufficiently admire the vaſt improvements in this art, and that degree of perfection to which it is at this day arrived. See the article PRINTS.

† See *Polite* ARTS, n° 13.

Engraving is an art, for the greateſt part, of modern invention; having its riſe no earlier than the middle of the 15th century. The ancients, it is true, practiſed engraving on precious ſtones and cryſtals with very good ſucceſs; and there are ſtill many of their works remaining equal to any production of the later ages. But the art of engraving on plates and blocks of wood, to afford prints or impreſſions, was not known till after the invention of painting in oil.

The different modes of engraving are the following:

In ſtrokes cut through a thin wax, laid upon the copper, with a point, and theſe ſtrokes bitten or corroded into the copper with aquafortis. This is called *etching*.

In ſtrokes with the graver alone, unaſſiſted by aquafortis. In this inſtance, the deſign is traced with a ſharp tool, called a *dry point*, upon the plate; and the ſtrokes are cut or ploughed upon the copper with an inſtrument diſtinguiſhed by the name of a *graver*.

In ſtrokes firſt etched and afterwards finiſhed with the graver: by this expedient the two former methods are united.

In dots without ſtrokes, which are executed with the point upon the wax or ground, bitten in with the aquafortis, and afterwards harmonized with the graver, by the means of which inſtrument ſmall dots are made; or with the graver alone, as in the fleſh and finer parts, unaſſiſted with the point.

In dots firſt etched and afterwards harmonized with the dry point, performed by a little hammer called *opus mallei*, or *the work of the hammer*, as practiſed by Lutma and others.

In mezzotinto, which is performed by a dark barb or ground being raiſed uniformly upon the plate with a toothed tool. The deſign being traced upon the plate, the light parts are ſcraped off by inſtruments for that purpoſe, in proportion as the effect requires.

In aquatinta, a newly invented method of engraving. The outline is firſt etched, and afterwards a ſort of waſh is laid by the aquafortis upon the plate, reſembling drawings in Indian ink, biſter, &c.

On wood, performed with a ſingle block, on which the deſign is traced with a pen, and thoſe parts which ſhould be white carefully hollowed out; and this block is afterwards printed by the letter-preſs printers, in the ſame manner as they print a book.

On wood, performed with two, three, or more blocks; the firſt having the outlines cut upon it; the ſecond is reſerved for the darker ſhadows; and the third for the ſhadows which terminate upon the lights; and theſe are ſubſtituted in their turn, each print receiving an impreſſion from every block. This mode of engraving is called *chiaro ſcuro*, and was deſigned to repreſent the drawings of the old maſters.

On wood and on copper: in theſe the outline is engraved in a bold dark ſtyle upon the copper; and two or more blocks of wood are ſubſtituted to produce the darker and lighter ſhadows, as before.

Of all theſe modes of engraving, the moſt ancient is that on *wood*; or, to ſpeak more properly, the firſt impreſſions on paper were taken from carved wooden blocks. For this invention it appears that we are indebted to the brief-malers or makers of playing-cards, who practiſed the art in Germany about the beginning of the 15th century. From the ſame ſource may perhaps be traced the firſt idea of moveable types, which appeared not many years after; for theſe brief-malers did not entirely confine themſelves to the printing and painting of cards, but produced alſo ſubjects of a more devout nature; many of which, taken from holy writ, are ſtill preſerved in different libraries in Germany, with the explanatory text facing the figures; the whole engraved in wood. In this manner they even formed a ſpecies of books; ſuch as, *Hiſtoria ſancti Johannis, ejuſque Viſiones Apocalypticæ; Hiſtoria Veteris & Novi Teſtamenti*, known by the name of the *Poor Man's Bible*. Theſe ſhort mementos were printed only on one ſide; and two of them being paſted together, had the appearance of a ſingle leaf. The earlieſt date on any of theſe wooden cuts is 1423. The ſubject is *St Chriſtopher carrying the Infant Jeſus over the Sea*, preſerved in a convent at Buxheim near Menningen. It is of a folio ſize, illuminated in the ſame manner as the playing cards; and at the bottom is this inſcription, *Criſtoferi faciem die quacunque tueris. Illa nempe die morte mala non morieris. Milleſimo CCCC° XX° tertio.*

Upon the invention of moveable types, that branch of the brief-malers buſineſs, ſo far as it regarded the making of books, was gradually diſcontinued; but the art itſelf of engraving on wood continued in an improving ſtate; and towards the end of the 15th and beginning of the 16th century, it became cuſtomary for almoſt every one of the German engravers on copper

*Strutt' Hiſt. o graving*

copper to engrave on wood alſo. The works of Albert Durer in this ſtyle of engraving are juſtly held in the higheſt eſteem. Italy, France, and Holland, have produced many capital artiſts of this kind; but for boldneſs and ſpirit, we muſt ſee the prints of Chriſtopher Jegher, who worked under the direction of Rubens, and was without doubt aſſiſted by that great maſter.

The invention of that ſpecies of engraving diſtinguiſhed by the appellation of *chiaro-ſcuro*, ſeems alſo to be juſtly claimed by the Germans, and firſt practiſed by Mair; one of whoſe prints of this kind is dated 1499. Many excellent works in chiaro-ſcuro have been produced in France; and in Italy it was honoured with the performances of Titian and Parmegiano; but the attempts of Jackſon, Kirkall, and others in England, have not been equally ſucceſsful. A ſet of excellent prints in this way have lately been publiſhed by J. Skippe, Eſq; a connoiſſeur and dillettante.

*ti's*
*of En-*
*ing.*

In Germany, about the year 1450, prints from engraved *copper* firſt made their appearance. The earlieſt date of a copperplate print is indeed only 1461; but however faulty this print may be with reſpect to the drawing, or defective in point of taſte, the mechanical part of the execution of it has by no means the appearance of being one of the firſt productions of the graver. We have alſo ſeveral other engravings, evidently the work of the ſame maſter; in which the impreſſions are ſo neatly taken from the plates, and the engravings ſo clearly printed in every part, that, according to all appearance, they could not be executed in a much better manner in the preſent day, with all the conveniences which the copperplate printers now poſſeſs, and the additional knowledge they muſt neceſſarily have acquired in the courſe of more than three centuries. Hence we may fairly conclude, that if they were not the firſt ſpecimens of the engravers workmanſhip, they were much leſs the firſt efforts of the copperplate printer's ability. It is likewiſe to be obſerved, that Martin Schoen, who is ſaid, with great appearance of truth, to have worked from 1460 to 1486, was apparently the ſcholar of Stoltzhirs; for he followed his ſtyle of engraving, and copied from him a ſet of prints, repreſenting the paſſion of our Saviour. Now, allowing Stoltzhirs to have preceded his diſciple only ten years, this carries the era of the art back to 1450, as was ſaid above. There is no ground to ſuppoſe that it was known to the Italians till at leaſt ten years afterwards. The earlieſt prints that are known to be theirs are a ſet of the ſeven planets, and an almanack by way of frontiſpiece; on which are directions for finding Eaſter from the year 1465 to 1517 incluſive: and we may be well aſſured, that the engravings were not antedated, for the almanack of courſe became leſs and leſs valuable every year. In all probability, therefore, theſe prints muſt have been executed in the year 1464; which is only four years later than the Italians themſelves lay any claim to. The three earlieſt Italian engravers are, Finiguerra, Boticelli, and Baldini. If we are to refer theſe prints to any of the three, we ſhall naturally conclude them to be the work of Finiguerra or Baldini; for they are not equal either in drawing or compoſition to thoſe aſcribed to Boticelli, which we know at leaſt were deſigned by him; and as Baldini is expreſsly ſaid to have worked from the deſigns of Boticelli, it will appear moſt probable that they belong to Finiguerra.

With reſpect to the invention of *etching*, it ſeems to be not well known to whom it is to be aſcribed. One of the moſt early ſpecimens is that print by Albert Durer, known by the name of the *Cannon*, dated 1518, and thought by ſome, with little foundation, to have been worked on a plate of iron. Another etching by the ſame artiſt is Moſes receiving the Tables of the Law, dated 1524. It was alſo practiſed in Italy ſoon after this by Parmegiano, in whoſe etchings we diſcover the hand of the artiſt working out a ſyſtem as it were from his own imagination, and ſtriving to produce the forms he wanted to expreſs. We ſee the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no inſtruction; and that it was ſomething entirely new to him. If the ſtory is true, that he kept an engraver by profeſſion in his houſe, the novelty of the art is rendered ſo much the more probable. He died in 1540

As to that ſpecies of engraving in which the modes of *etching* and *cutting* with the graver are united, it muſt have been found neceſſary immediately upon the invention of etching; it was, however, firſt carried to perfection by G. Audran, and is now almoſt univerſally practiſed, whether the work is in ſtrokes or in dots.

Engraving in *dots*, the preſent faſhionable method, is a very old invention, and the only mode diſcovered by the Italians. Agoſtino de Muſis, commonly called *Auguſtine of Venice*, a pupil of Marc Antonio, uſed it in ſeveral of his earlieſt works, but confined it to the fleſh, as in the undated print of An Old Man ſeated upon a Bank, with a Cottage in the back ground. He flouriſhed from 1509 to 1536. We alſo find it in a print of "A ſingle Figure ſtanding, holding a Cup and looking upwards," by Giulio Campagnola, who engraved about the year 1516. The back ground is executed with round dots, made apparently with a dry point. The figure is outlined with a ſtroke deeply engraved, and finiſhed with dots, in a manner greatly reſembling thoſe prints which Demarteau engraved at Paris in imitation of red chalk. The hair and beard are expreſſed by ſtrokes. Stephen de Laulne, a native of Germany, followed the ſteps of Campagnola; and many of his ſlight works are executed in dots only. John Boulanger, a French artiſt, who flouriſhed in the middle of the laſt century, and his contemporary Nicholas Van Plattenberg, improved greatly on this method, and practiſed it with much ſucceſs. It is only, however, of late, that it has been conſidered as an object worthy of general imitation. John Lutma executed this kind of work with a hammer and a ſmall punch or chiſſel.

The method of engraving in *mezzotinto* was invented about the middle of the 17th century; and the invention has generally been attributed to Prince Rupert, though it has alſo been aſſerted that he learnt the ſecret from another. See Mezzotinto.

Engraving in *aquatinta* is quite a recent invention, and ſeems at once to have been carried to perfection by Sandby and other living artiſts. See Aquatinta.

Engraving with the tool was the kind originally practiſed, and it is yet retained for many purpoſes. For though the manœuvre of etching be more eaſy, and other advantages attend it; yet where great regularity and exactneſs of the ſtroke or lines are required, the working with the graver is much more effectual: on which account it is more ſuitable to the preciſion neceſſary in the execution of portraits; as there every thing the moſt minute muſt be made out and expreſſed, according to the original ſubject, without any licenſe to the fancy of the deſigner in deviating from it, or varying the effect either by that maſterly negligence and ſimplicity in ſome parts, or thoſe bold ſallies of the imagination and hand in others, which give ſpirit and force to hiſtory-painting.

The principal inſtruments uſed in engraving with the tool are, gravers, ſcrapers, a burniſher, an oil-ſtone, and a cuſhion for bearing the plates.

Gravers are made in ſeveral forms with reſpect to the points, ſome being ſquare, others lozenge; the ſquare graver for cutting broad and deep, and the lozenge for more delicate and fine ſtrokes and hatches. La Boſſe recommends, as the moſt generally uſeful, ſuch as are of a form betwixt the ſquare and lozenge: and he adviſes, that they ſhould be of a good length; ſmall towards the point, but ſtronger upwards, that they may have ſtrength enough to bear any ſtreſs there may be occaſion to lay upon them: for if they be too ſmall and mounted high, they will bend; which frequently cauſes their breaking, eſpecially if they be not employed for very ſmall ſubjects.

The burniſher is uſed to aſſiſt in the engraving on ſome occaſions, as well as to poliſh the plates. It is ſeven inches in length, and made of fine ſteel well poliſhed. The burniſher is formed at one end, and a ſcraper on the other, each about an inch and a half long from the point: betwixt them, about four inches of the inſtrument is made round, and ſerves as a handle; and is thicker in the middle than at the necks, where the burniſher and ſcraper begin, which necks are only one quarter of an inch in diameter. The principal application of it in engraving, beſides its uſe in poliſhing the plates, is to take out any ſcratches or accidental defacings that may happen to the plates during the engraving; or to leſſen the effect of any parts that may be too ſtrongly marked in the work, and require to be taken down.

A cuſhion, as it is called, is likewiſe generally uſed for ſupporting the plate in ſuch a manner, that it may be turned every way with eaſe. It is a bag of leather filled with ſand, which ſhould be of the ſize that will beſt ſuit the plates it is intended to bear. They are round, and about nine inches over, and three inches in thickneſs.

The cuſhion, made as above directed, being laid on the table, the plate muſt be put upon it; and the graver being held in the hand in a proper manner, the point muſt be applied to the plate, and moved in the proper direction for producing the figures of the lines intended: obſerving, in forming ſtraight lines, to hold the plate ſteady on the cuſhion; and where they are to be finer, to preſs more lightly, uſing greater force where they are to be broader and deeper. In making circular or other curve lines, hold your hand and graver ſteadily; and as you work, turn your plate upon the cuſhion againſt your graver, otherwiſe it will be impoſſible for you to make any circular or curved line with that neatneſs and command of hand you by this means may. After part of the work is engraved, it is neceſſary to ſcrape it with the ſcraper or graver, paſſed in the moſt level direction over the plate to take off the roughneſs formed by the cutting of the graver; but great care muſt be taken not to incline the edge of the ſcraper or tool uſed, in ſuch a manner that it may take the leaſt hold of the copper, as it would otherwiſe produce falſe ſtrokes or ſcratches in the engraving; and that the engraved work may be rendered more viſible, it may afterwards be rubbed over with a roll of felt dipped in oil. In uſing the graver, it is neceſſary to carry it as level as poſſible with the ſurface of the plate; for otherwiſe, if the fingers ſlip betwixt them, the line that will be produced, whether curve or ſtraight, will become deeper and deeper in the progreſs of its formation; which entirely prevents ſtrokes being made at one cut, that will be fine at their extremities, and larger in the middle; and occaſions the neceſſity of retouching to bring them to that ſtate. For this reaſon, it is very neceſſary for thoſe who would learn to engrave in perfection, to endeavour, by frequent trials, to acquire the habit of making ſuch ſtrokes both ſtraight and curving, by lightening or ſinking the graver with the hand, according to the occaſion. If, after finiſhing the deſign, any ſcratches appear, or any part of the engraving be falſely executed, ſuch ſcratches, or faulty parts, muſt be taken out by the burniſher, and further poliſhed, if neceſſary, by the above mentioned roll.

The plate being thus engraved, it is proper to round off the edges, by uſing firſt a rough file, and afterwards a ſmoother; and to blunt the corners a little by the ſame means: after which, the burniſher ſhould be paſſed over the edges to give it a farther poliſh.

The dry point, or needle, which has been of late much uſed in engraving, is a tool like an etching point, which being drawn hard on the copper, cuts a ſtroke, and raiſes a burr; the burr is ſcraped off, and there remains a ſtroke more ſoft and delicate than can be produced in any other way.

In the conduct of the graver and dry point conſiſts all the art; for which there are no rules to be given; all depending on the habitude, diſpoſition, and genius, of the artiſt. However, beſides the explanations already given, ſome general obſervations and directions may not be improper. As the principles of engraving are the ſame with thoſe of painting, a perſon cannot expect to attain any conſiderable degree of perfection in this art who is not a good maſter of deſign; and therefore he ought to be well acquainted both with perſpective and architecture: for the former, by the proper gradations of ſtrong and faint colours, will enable him to throw backwards the figures and other objects of the picture or deſign which he propoſes to imitate; and the latter will teach him to preſerve the due proportion of its ſeveral orders, which the painter often entruſts to the diſcretion of the engraver. In order to preſerve equality and union in his works, the engraver ſhould always ſketch out the principal objects of his piece before he undertakes to finiſh them. In working, the ſtrokes of the graver ſhould never be croſſed too much in a lozenge manner, particularly in the

the repreſentation of fleſh, becauſe ſharp angles produce the unpleaſing effect of lattice-work, and take from the eye the repoſe which is agreeable to it in all kinds of pictureſque deſigns: we ſhould except the caſe of clouds, tempeſts, waves of the ſea, the ſkins of hairy animals, or the leaves of trees, where this method of croſſing may be admitted. But in avoiding the lozenge, it is not proper to get entirely into the ſquare, which would give too much of the hardneſs of ſtone. In conducting the ſtrokes, the action of the figures, and of all their parts, ſhould be conſidered; and it ſhould be obſerved how they advance towards, or recede from the eye; and the graver ſhould be guided according to the riſings or cavities of the muſcles or folds, making the ſtrokes wider and fainter in the light, and cloſer and firmer in the ſhades. Thus the figures will not appear jagged; and the hand ſhould be lightened in ſuch a manner, that the outlines may be formed and terminated without being cut too hard; however, though the ſtrokes break off where the muſcle begins, yet they ought always to have a certain connection with each other, ſo that the firſt ſtroke may often ſerve by its return to make the ſecond, which will ſhow the freedom of the engraver.

In engraving the fleſh, the effect may be produced in the lighter parts and middle tints by long pecks of the graver, rather than by light lines; or by round dots; or by dots a little lengthened by the graver; or, beſt of all, by a judicious mixture of theſe together.

In engraving the hair and the beard, the engraver ſhould begin his work by laying the principal grounds, and ſketching the chief ſhades in a careleſs manner, or with a few ſtrokes; and he may finiſh it at leiſure with finer and thinner ſtrokes to the extremities. When architecture or ſculpture is to be repreſented, except it be old and ruinous buildings, the work ought not to be made very black; becauſe, as edifices are commonly conſtructed either of ſtone or white marble, the colour, being reflected on all ſides, does not produce dark or brown ſhades as in other ſubſtances. White points muſt not be put in the pupils of the eyes of figures, as in engravings after paintings; nor muſt the hair or beard be repreſented as in nature, which makes the locks appear flowing in the air; becauſe in ſculpture there can be no ſuch appearances.

In engraving cloths of different kinds, linen ſhould be done with finer and cloſer lines than other ſorts, and be executed with ſingle ſtrokes. Woollen cloth ſhould be engraved wide, in proportion to the coarſeneſs or fineneſs of the ſtuff, and with only two ſtrokes; and when the ſtrokes are croſſed, the ſecond ſhould be ſmaller than the firſt, and the third than the ſecond. Shining ſtuffs, which are generally of ſilk or ſatin, and which produce flat and broken folds, ſhould be engraved more hard and more ſtraight than others, with one or two ſtrokes, as their colours are bright or brown; and between the firſt ſtrokes other ſmaller muſt be joined, which is called interlining. Velvet and pluſh are expreſſed in the ſame manner, and ſhould always be interlined. Metals, as armour, &c. are alſo repreſented by interlining, or by clear ſingle ſtrokes. In architecture, the ſtrokes which form the rounding object ſhould tend to the point of ſight; and when whole columns occur, it is proper to produce the effect as much as poſſible by perpendicular ſtrokes. If a groſs ſtroke is put, it ſhould be at right angles, and wider and thinner than the firſt ſtroke. In engraving mountains, the ſtrokes ought to be frequently diſcontinued and broken, for ſharp and craggy objects; and they ſhould be ſtraight, in the lozenge manner, and accompanied with long points or dots; and rocks ſhould be repreſented by croſs ſtrokes more ſquare and even. Objects that are diſtant towards the horizon ſhould be kept very tender, and ſlightly charged with black. Waters that are calm and ſtill are beſt repreſented by ſtrokes that are ſtraight, and parallel to the horizon, interlined with thoſe that are finer; omitting ſuch places as, in conſequence of gleams of light, exhibit the ſhining appearance of water; and the form of objects reflected from the water, at a ſmall diſtance upon it, or on the banks of the water, are expreſſed by the ſame ſtrokes, retouched more ſtrongly or faintly as occaſion may require, and even by ſome that are perpendicular. For agitated waters, as the waves of the ſea, the firſt ſtrokes ſhould follow the figure of the waves, and may be interlined, and the croſs ſtrokes ought to be very lozenge. In caſcades, the ſtrokes ſhould follow the fall, and be interlined. In engraving clouds, the graver ſhould ſport when they appear thick and agitated, in turning every way according to their form and their agitation. If the clouds are dark, ſo that two ſtrokes are neceſſary, they ſhould be croſſed more lozenge than the figures, and the ſecond ſtrokes ſhould be rather wider than the firſt. The flat clouds, that are loſt inſenſibly in the clear ſky, ſhould be made by ſtrokes parallel to the horizon, and a little waving; if ſecond ſtrokes are required, they ſhould be more or leſs lozenge; and when they are brought to the extremity, the hand ſhould be ſo lightened, that they may form no outline. The flat and clear ſky is repreſented by parallel and ſtraight ſtrokes, without the leaſt turning. In landſcapes, the trees, rocks, earth, and herbage, ſhould be etched as much as poſſible; nothing ſhould be left for the graver but perfecting, ſoftening, and ſtrengthening. The dry point produces an effect more delicate than the graver can, and may be uſed to great advantage in linen, ſkies, diſtances, ice, and often in water, eſpecially in ſmall engravings. In moſt things it is proper to etch the ſhadows, only leaving the lighter tints for the dry point, graver, &c.

To imitate *chalk-drawings*, a mixture of varied and irregular dots are uſed, made more or leſs ſoft, ſo as to reſemble the grain produced by the chalks on paper. Every ſtroke of the chalks on paper may be conſidered as an infinite number of adjoining points, which are the ſmall eminences of the grain of the paper touched by the chalk in paſſing over it. When the copper-plate has been poliſhed and varniſhed, or properly prepared, as in the common method of engraving, the drawing to be imitated may be counterproved on the varniſh of the plate. If this cannot be conveniently done, black lead pencil, or red chalk, muſt be applied to varniſhed or oiled paper; and by means of this chalk or pencil, all the traces of the original will be tranſmitted to the varniſh. The outlines of the object muſt be formed in the etching by points, whoſe magnitude and diſtance muſt be determined by the quality of the ſtrokes in the original drawing. The artiſt may be provided with pointed inſtruments or needles of various ſizes with ſingle or double points. In forming the light and ſhade, he ſhould diſtinguiſh between thoſe hatches which ſerve to expreſs the perſpective of the object and thoſe which form the ground of it. The principal hatches ſhould be more ſtrongly marked; the middle tints, if etched, ſhould be marked lightly, or they may be left till the varniſh is taken off, and be perfected with a greater degree of ſoftneſs, by needles or the point of the graver, as the original may require. There is nothing peculiar in the method of applying the aquafortis in this kind of engraving; but it may be obſerved, that it ſhould not be left ſo long as to corrode the lighter parts too much: if the light parts are ſufficiently corroded, they may be ſtopped out with turpentine varniſh and lamp-black mixed together, and the aquafortis may be applied again to the ſtronger parts; for it will be no detriment to them, if the points which compoſe the ſhade burſt into one another, provided the extreme be avoided. When the work of the aquafortis is finiſhed, and the varniſh taken off the copper, it will be neceſſary in the ſofteſt parts, ſuch as the fleſh, &c. to interſtipple with proper points; as an effect will be thus produced more delicate than it is poſſible to attain with the aquafortis only; and the ſtrongeſt ſhades will require additional ſtrength to be given them with ſmall ſtrokes of the graver. Drawings made with chalks of different colours may be imitated in this manner, if a plate be provided for every colour.—This method of engraving is intended to form a kind of deception, ſo that the connoiſſeur may not be able, on the firſt inſpection, to diſtinguiſh between the original drawing and the engraving made in imitation of it; and it is extremely uſeful, as it ſerves to multiply copies of drawings left by thoſe maſters who excelled in the uſe of chalks, and thus to form and improve young artiſts, who could not have acceſs to the originals in the practice of drawing.

*Engraving upon Glaſs.* See Chemistry, 2d N°857.

Engraving *on Precious Stones*, is the repreſenting of figures, or devices, in relievo or indented, on divers kinds of hard poliſhed ſtones.

The art of engraving on precious ſtones is one of thoſe wherein the ancients excelled; there being divers antique agates, cornelians, and onyxes, which ſurpaſs any thing of that kind the moderns have produced. Pyrgoteles among the Greeks, and Dioſcorides under the firſt emperors of Rome, are the moſt eminent engravers we read of: the former was ſo eſteemed by Alexander, that he forbad any body elſe to engrave his head; and Auguſtus's head, engraven by the latter, was deemed ſo beautiful, that the ſucceeding emperors choſe it for their ſeal.

All the polite arts having been buried under the ruins of the Roman empire, the art of engraving on ſtones met with the ſame fate. It was retrieved in Italy at the beginning of the 15th century, when one John of Florence, and after him Dominic of Milan, performed works of this kind no way to be deſpiſed. From that time, ſuch ſculptures became common enough in Europe, and particularly in Germany, whence great numbers were ſent into other countries: but they came ſhort of the beauty of thoſe of the ancients, eſpecially thoſe on precious ſtones; for, as to thoſe on cryſtal, the Germans, and, after their example, the French, &c. have ſucceeded well enough.

In this branch of engraving, they make uſe either of the diamond or of emery.

The diamond, which is the hardeſt of all ſtones, is only cut by itſelf, or with its own matter. The firſt thing to be done in this branch of engraving is, to cement two rough diamonds to the ends of two ſticks big enough to hold them ſteady in the hand, and to rub or grind them againſt each other till they be brought to the form deſired. The duſt or powder that is rubbed off ſerves afterwards to poliſh them, which is performed with a kind of mill that turns a wheel of ſoft iron. The diamond is fixed in a braſs diſh; and, thus applied to the wheel, is covered with diamond duſt, mixed up with oil of olives; and when the diamond is to be cut facet-wiſe, they apply firſt one face, then another, to the wheel. Rubies, ſapphires, and topazes, are cut and formed the ſame way on a copper wheel, and poliſhed with tripoli diluted in water. As to agates, amethyſts, emeralds, hyacinths, granites, rubies, and others of the ſofter ſtones, they are cut on a leaden wheel, moiſtened with emery and water, and poliſhed with tripoli on a pewter wheel. Lapis-lazuli, opal, &c. are poliſhed on a wooden wheel. To faſhion and engrave vaſes of agate, cryſtal, lapis lazuli, or the like, they make uſe of a kind of lathe, like that uſed by pewterers, to hold the veſſels, which are to be wrought with proper tools: that of the engraver generally holds the tools, which are turned by a wheel; and the veſſel is held to them to be cut and engraved, either in relievo or otherwiſe; the tools being moiſtened from time to time with diamond duſt and oil, or at leaſt emery and water. To engrave figures or devices on any of theſe ſtones, when poliſhed, ſuch as medals, ſeals, &c. they uſe a little iron wheel, the ends of whoſe axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought cloſer, or ſet further apart, at pleaſure; at one end of the axis are fitted the proper tools, being kept tight by a ſcrew. Laſtly, The wheel is turned by the foot, and the ſtone applied by the hand to the tool, and is ſhifted and conducted as occaſion requires.

The tools are generally of iron, and ſometimes of braſs; their form is various, but it generally bears ſome reſemblance to chiſels, gouges, &c. Some have ſmall round heads, like buttons, others like ferrels, to take the pieces out, and others flat, &c. When the ſtone has been engraven, it is poliſhed on wheels of hair-bruſhes and tripoli.

*Engraving on Steel* is chiefly employed in cutting ſeals, punches, matrices, and dyes, proper for ſtriking coins, medals, and counters. The method of engraving with the inſtruments, &c. is the ſame for coins as for medals and counters: All the difference conſiſts in their greater or leſs relievo; the relievo of coins being much leſs conſiderable than that of medals, and that of counters ſtill leſs than that of coins.

Engravers in ſteel commonly begin with punches, which are in relievo, and ſerve for making the creux or cavities of the matrices and dyes: though ſometimes they begin with the creux or hollowneſs; but then it is only when the intended work is to be cut very

very ſhallow. The firſt thing done, is that of deſigning the figures; the next is the moulding them in wax, of the ſize and depth they are to lie, and from this wax the punch is engraven. When the punch is finiſhed, they give it a very high temper, that it may the better bear the blows of the hammer with which it is ſtruck to give the impreſſion to the matrice.

The ſteel is made hot to ſoften it, that it may the more readily take the impreſſion of the punch; and after ſtriking the punch on it in this ſtate, they proceed to touch up or finiſh the ſtrokes and lines, where by reaſon of their fineneſs or the too great relievo they are any thing defective, with ſteel gravers of different kinds, chiſels, flatters, &c. being the principal inſtruments uſed in graving on ſteel.

The figure being thus finiſhed, they proceed to engrave the reſt of the medal, as the mouldings of the border, the engrailed ring, letters, &c with little ſteel punches, well tempered, and very ſharp.

ENGUICHE', in heraldry, is ſaid of the great mouth of a hunting horn, when its rim is of a different colour from that of the horn itſelf.

ENHARMONIC, in muſic. The Greeks had three different ſpecies of muſic; the *diatonic*, the *chromatic*, and the *enharmonic*. This laſt was eſteemed by much the moſt agreeable and powerful of the three; but the difficulty of its execution rendered its duration ſhort, and latter artiſts were upbraided for having ſacrificed it to their indolence. It proceeded upon leſſer intervals than either the diatonic or chromatic; and as the chromatic ſemitone is ſtill leſs than the diatonic, the *enharmonic* intervals muſt have conſiſted of that ſemitone divided into parts more minute. In Rouſſeau's Muſical Dictionary (at the word *Enharmonique*), the reader may ſee how that interval was found in the tetrachords of the ancients. It is by no means eaſy for modern ears, inured to intervals ſo widely different, to imagine how a piece of muſic, whoſe tranſitions were formed either chiefly or ſolely upon ſuch minute diviſions, could have ſuch wonderful effects; yet the melody of ſpeech, which riſes or falls by intervals ſtill more minute than the enharmonic, when properly modulated and applied with taſte, has an aſtoniſhing power over the ſoul. As to the modern *enharmonic* ſyſtem, we may likewiſe refer the reader to the ſame work for an account of its nature and uſe; though he will find it accurately and clearly explained by D'Alembert, in the Treatiſe of Music given in the preſent work, (art. 144. 145. 146.)

ENHYDRUS, in natural hiſtory, a genus of ſiderochita or cruſtated ferruginous bodies, formed in large and in great part empty caſes, incloſing a ſmall quantity of an aqueous fluid.

Of this genus there are only two ſpecies: 1. The thick-ſhelled enhydrus, with black, reddiſh-brown, and yellow cruſts. 2. The thinner-ſhelled kind, with yellowiſh-brown and purple cruſts; neither of which ferments with aquafortis or gives fire with ſteel.

ENIGMA. See Ænigma.

ENIXUM, among chemiſts, a kind of natural ſalt, generated of an acid and an alkali.

The ſal enixum of Paracelſus, is the caput mortuum of ſpirits of nitre with oil of vitriol, or what remains in the retort after the diſtillation of this ſpirit; being of a white colour, and pleaſing acid taſte.

ENMANCHE', in heraldry, is when lines are drawn from the centre of the upper edge of the chief to the ſides, to about half the breadth of the chief; ſignifying ſleeved, or reſembling a ſleeve, from the French *manche*.

ENNA, (anc. geog.), a town of Sicily, ſituated on an eminence to the ſouth of the Chryſas; called the *centre of Sicily*. It was famous for a ſacred grove, in which the rape of Proſerpina happened; for a temple of Ceres, thence ſurnamed *Ennæa*, and *Ennenſis*; and for fine ſprings, whence the name (Bochart.)

ENNEAGON, in geometry, a polygon with nine ſides. See Polygon.

ENNEAHEDRIA, in natural hiſtory, a genus of columnar, cryſtalliform, and double-pointed ſpars, compoſed of a trigonal column, terminated at each end by a trigonal pyramid.

Of this genus there are ſeveral ſpecies, diſtinguiſhed by the length or ſhortneſs of the column and pyramids, none of which give fire with ſteel, but all of them ferment with aquafortis. See Spar.

ENNEANDRIA, in botany (from εννεα *nine*, and ανηρ a *man* or *huſband*), the name of the ninth claſs in Linnæus's ſexual ſyſtem, conſiſting of plants which have hermaphrodite flowers with nine ſtamina or male organs. See Botany, p. 430. the *Scheme*.

ENNIUS (Quintus), an ancient Latin poet, born at Rudii, a town in Calabria. He came firſt to Rome when M. Porcius Cato was queſtor, whom he had inſtructed in the Greek language in Sardinia; and by his genius and behaviour he gained the eſteem of the moſt eminent perſons in the city. According to Horace, Ennius never applied himſelf to writing till he had drank freely of wine. Hence he contracted the gout, of which he died nine years B. C. He was interred in Scipio's ſepulchre; who had a great eſteem and friendſhip for him, and cauſed a ſtatue to be erected to him upon his monument. He endeavoured to introduce the treaſures of the Greek tongue among the Latins, and was the firſt among the Romans who made uſe of heroic verſes. He wrote the *Annals of Rome*; he tranſlated ſeveral tragedies from the Greek, and wrote others, beſide ſeveral comedies. We have only ſome fragments of his works, which were firſt collected by the two Stephens, and afterwards publiſhed at Naples, with a learned commentary, by Jerom Columna, in quarto, 1590; and reprinted at Amſterdam in 1707, in quarto, with additions by Heſſelius.

ENOCH, the ſon of Cain (Gen. iv. 17.), in honour of whom the firſt city taken notice of in ſcripture was called *Enoch* by his father Cain, who built it. It was ſituated to the eaſt of the province of Eden.

Enoch, the ſon of Jared and father of Methuſelah, was born in the year of the world 622. At the age of 65 he begat Methuſelah, and lived 300 years after, and had ſeveral ſons and daughters. Enoch walked with God; and after that he had lived in all 365 years, "he was not, for God took him." Some conſtrue theſe laſt words, as if they intimated that Enoch died a natural death, becauſe in reality he lived not near ſo long as the other patriarchs of thoſe times; as if God, to ſecure him from corruption, had been pleaſed to take him early out of this world. But the generality of the fathers and commentators aſſert that he died not, but was tranſlated out of the ſight of men, in like manner as Elijah was. The apoſtle Paul (Heb. xi. 5.) ſhows very clearly that Enoch was tranſlated, and did not ſee death.

The apoſtle Jude (ver. 14, 15.) cites a paſſage from the book of Enoch, which has very much exerciſed interpreters. The queſtion is, whether the apoſtle took this paſſage out of any particular book written by Enoch, which might be extant in the firſt ages of the church? whether he received it by tradition? or laſtly, by ſome particular revelation? It is thought probable, that he read it in the book we have been ſpeaking of, which, tho' apocryphal, might contain ſeveral truths that St Jude, who was favoured with a ſupernatural degree of underſtanding, might make uſe of to the edification of the faithful.

The ancients greatly eſteemed the prophecy of Enoch. Tertullian expreſſes his concern, that it was not generally received in the world. That father, on the authority of this book, deduces the original of idolatry, aſtrology, and unlawful arts, from the revolted angels, who married with the daughters of men. St Auguſtin allows indeed that Enoch wrote ſomething divine, becauſe he is cited by St Jude; but he ſays it was not without reaſon that this book was not inſerted in the canon which was preſerved in the temple at Jeruſalem. This father ſufficiently inſinuates, that the authority of this book is doubtful, and that it cannot be proved that it was really written by Enoch. Indeed the account it gives of giants engendered by angels, and not by men, has manifeſtly the air of a fable, and the moſt judicious critics believe it ought not to be aſcribed to Enoch.

This apocryphal book lay a long time buried in darkneſs, till the learned Joſeph Scaliger recovered a part of it. Scaliger, Voſſius, and other learned men, attribute this work to one of thoſe Jews who lived between the time of the Babyloniſh captivity and that of Jeſus Chriſt. Others are of opinion, that it was written after the riſe and eſtabliſhment of Chriſtianity, by one of thoſe fanatics with whom the primitive church was filled, who made a ridiculous mixture of the Platonic philoſophy and the Chriſtian divinity.

The eaſtern people, who call Enoch by the name of *Edris*, believe that he received from God the gift of wiſdom and knowledge; and that God ſent him 30 volumes from heaven, filled with all the ſecrets of the moſt myſterious ſciences. The Rabbins maintain, that when Enoch was tranſlated to heaven, he was admitted into the number of the angels, and is the perſon generally known by the name of *Michael*.

ENORMOUS, ſomething exceſſive or monſtrous, eſpecially in bulk.—The word is formed of the privative *e*, and *norma*, "rule;" q. d. "void of, or contrary to, rule or meaſure;" *contra normam*. In the corrupt ages of Latinity, they uſed *innormis*, and *inormis*.

In the French juriſprudence, *læſio enormis*, "enormous damage," is that which exceeds half the value of the thing ſold.

ENOS, the ſon of Seth and father of Cainan, was born in the year of the world 235. Moſes tells us (Gen. iv. 26.), that then "*men* began to call upon the name of the Lord;" or, as others tranſlate it, that "Enos began to call upon the name of the Lord;" that is to ſay, that he was the inventor of religious rites and ceremonies in the external worſhip which was paid to God. This worſhip was kept up and preſerved in Enos's family, while Cain's family was plunged in all manner of irregularities and impieties. Several Jews are of opinion, that idolatry was at firſt introduced into the world in the time of Enos. They tranſlate the Hebrew thus, "Then men began to profane the name of the Lord." Good men, to diſtinguiſh themſelves from the wicked, began to take upon them the quality of ſons or ſervants of God; for which reaſon, Moſes (Gen. vi. 1, 2.) ſays, that *the ſons of God* (that is to ſay, the deſcendants of Enos, who had hitherto preſerved the true religion), ſeeing the daughters of men, that they were fair, took them wives of all which they choſe. Enos died at the age of 905 years, in the year of the world 1140.

ENS, among metaphyſicians, denotes entity, being, or exiſtence: this the ſchools call *ens reale*, and *ens poſitivum*; to diſtinguiſh it from their *ens rationis*, which is only an imaginary thing, or exiſts but in the imagination.

Ens, among chemiſts, imports the power, virtue, and efficacy, which certain ſubſtances exert upon our bodies.

Ens, in geography, a city of Germany, ſituated at the confluence of the Danube and the river Ens, about 80 miles ſouth of Vienna. E. Long. 14. 20. N. Lat. 48. 16.

ENSATÆ, in botany (from *enſis*, "a ſword"); the name of the ſixth order in Linnæus's natural method, conſiſting of plants with ſword-ſhaped leaves *. It contains the following genera, viz. Antholyza, Calliſia, Commelina, Crocus, Eriocaulon, Ferraria, Gladiolus, Iris, Ixia, Moræa, Pontæderia, Siſyrinchium, Tradeſcantia, Wachendorffa, Xyris.

ENSEELED, in falconry, is ſaid of a hawk that has a thread drawn through her upper eye-lid, and made faſt under her beak, to take away the ſight.

ENSEMBLE, a French term, ſometimes uſed in our language; literally ſignifying *together*, or *one with another*:—being formed from the Latin *in* and *ſimul*.

In architecture, we ſay *the enſemble*, or *tout enſemble*, of a building; meaning the whole work, or compoſition, conſidered together, and not in parts; and ſometimes alſo, the relative proportion of the parts to the whole.—"All thoſe pieces of building make a fine *enſemble*."

To judge well of a work, a ſtatue, or other piece of ſculpture, one muſt firſt examine whether the *enſemble* be good. The *tout enſemble* of a painting, is that harmony which reſults from the diſtribution of the ſeveral objects or figures whereof it is compoſed.—"This picture is good, taking the parts ſeparately; but the *tout enſemble* is bad."

ENSIFORMIS CARTILAGO. See XIPHOIDES.

ENSIGN, in the military art, a banner or colours under which ſoldiers are ranged, according to the different companies or parties they belong to. See FLAG, COLOURS, STANDARD, &c.

The Turkiſh enſigns are horſes tails; thoſe of the Europeans are pieces of taffety, with divers figures, colours, arms, and devices thereon. Xenophon tells us, that the enſign bore by the Perſians was a golden eagle on a white flag; the Corinthians bore the winged horſe, or Pegaſus, in theirs; the Athenians, an owl;

* See *tany*, p col. 2.

the Meſſenians, the Greek letter M; the Lacedæmonians, the Λ. The Romans had a great diverſity of enſigns; the wolf, minotaur, horſe, boar, and at length the eagle, where they ſtopped: this was firſt aſſumed in the ſecond year of the conſulate of Marius †. A military enſign on a medal of a Roman colony, denotes it a colony peopled with old ſoldiers.

Ensign is alſo the officer that carries the colours, being the loweſt commiſſioned officer in a company of foot, ſubordinate to the captain and lieutenant. It is a very honourable and proper poſt for a young gentleman at his firſt coming into the army: he is to carry the colours both in aſſault, day of battle, &c. and ſhould not quit them but with his life: he is always to carry them himſelf on his left ſhoulder: only on a march he may have them carried by a ſoldier. If the enſign is killed, the captain is to carry the colours in his ſtead.

*Naval Ensign*, a large ſtandard or banner hoiſted on a long pole erected over the poop, and called the *enſign ſtaff*.—The enſign is uſed to diſtinguiſh the ſhips of different nations from each other, as alſo to characteriſe the different ſquadrons of the navy. The Britiſh enſign in ſhips of war is known by a double croſs, viz. that of St George and St Andrew, formed upon a field which is either red, white, or blue.

ENSISHEIM, a town of France, in Upper Alſace. It is a pretty little place, well built, and conſiſts of about 200 houſes. E. Long. 7. 41. N. Lat. 47. 49.

ENT (Sir George), an eminent Engliſh phyſician, born at Sandwich in Kent in 1604. He was educated at Sidney college, Cambridge; and, afterwards travelling into foreign countries, received the degree of doctor of phyſic at Padua. After his return he obtained great practice, was made preſident of the college of phyſicians in London, and at length received the honour of knighthood from King Charles II. He was extremely intimate with Doctor Harvey; whom he learnedly defended in a piece intitled, *Apologia pro Circulatione Sanguinis, contra Æmilium Pariſanum.* He alſo publiſhed, *Animadverſiones in Malachiæ Thruſtoni;* and ſome obſervations in the Philoſophical Tranſactions. Glanville, ſpeaking of his Plus Ultra of the modern improvements in anatomy, numbers Sir George Ent, Doctor Gliſſon, and Doctor Wallis, with the moſt celebrated diſcoverers in that ſcience. The two former were among the firſt members of the Royal Society. Sir George Ent died in October 1689.

ENTABLATURE, or Entablement, in architecture, is that part of an order of a column which is over the capital, and comprehends the architrave, frieze, and corniche. See Architecture, chap i.

ENTABLER, in the manege, the fault of a horſe whoſe croupe goes before his ſhoulders in working upon volts; which may be prevented by taking hold of the right rein, keeping your right leg near, and removing your left leg as far from the horſe's ſhoulder as poſſible.

This is always accompanied with another fault called *aculer*. See Aculer.

ENTAIL, in law, ſignifies *feetail*, or *fee entailed;* that is, abridged, curtailed, or limited, to certain conditions. See Fee, and Tail.

ENTE', in heraldry, a method of marſhalling, more frequent abroad than with us, and ſignifying grafted or ingrafted.

We have, indeed, one inſtance of enté in the fourth grand quarter of his majeſty's royal enſign, whoſe blazon is Brunſwick and Lunenburg impaled with ancient Saxony, *enté en pointé*, "grafted in point."

ENTEROCELE, in ſurgery, a tumor formed by a prolapſion of the inteſtines through the rings of the abdomen and proceſſes of the peritonæum, into the ſcrotum. See Surgery.

ENTHUSIASM, an ecſtaſy of the mind, whereby it is led to think and imagine things in a ſublime, ſurpriſing, yet probable manner. This is the enthuſiaſm felt in poetry, oratory, muſic, painting, ſculpture, &c.

Enthusiasm, in a religious ſenſe, implies a tranſport of the mind, whereby it fancies itſelf inſpired with ſome revelation, impulſe, &c. from heaven. Mr Locke gives the following deſcription of enthuſiaſm. "In all ages, men in whom melancholy has mixed with devotion, or whoſe conceit of themſelves has raiſed them into an opinion of a great familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themſelves with a perſuaſion of an immediate intercourſe with the Deity, and frequent communications from the Divine Spirit. Their minds being thus prepared, whatever groundleſs opinion comes to ſettle itſelf ſtrongly upon their fancies, is an illumination from the Spirit of God. And whatſoever odd action they find in themſelves a ſtrong inclination to do, that impulſe is concluded to be a call or direction from heaven, and muſt be obeyed. It is a commiſſion from above, and they cannot err in executing it. This I take to be properly enthuſiaſm, which, though ariſing from the conceit of a warm and overweening brain, works, when it once gets footing, more powerfully on the perſuaſions and actions of men, than either reaſon or revelation, or both together; men being moſt forwardly obedient to the impulſes they receive from themſelves." Devotion, when it does not lie under the check of reaſon, is apt to degenerate into enthuſiaſm. When the mind finds itſelf inflamed with devotion, it is apt to think that it is not of its own kindling, but blown up with ſomething divine within it. If the mind indulges this thought too far, and humours the growing paſſion, it at laſt flings itſelf into imaginary raptures and ecſtaſies; and when once it fancies itſelf under the influence of a divine impulſe, no wonder if it ſlights human ordinances, and refuſes to comply with the eſtabliſhed form of religion, as thinking itſelf directed by a much ſuperior guide.

ENTHUSIAST, a perſon poſſeſſed with enthuſiaſm. See the preceding article.

ENTHYMEME, in logic and rhetoric, an argument conſiſting only of two propoſitions, an antecedent, and a conſequent deduced from it. The word is Greek, ενθυμημα, formed of the verb ενθυμεισθαι, "to think, conceive," a compound of εν and θυμος, "mind."

The enthymeme is the moſt ſimple and elegant of all argumentations; being what a man, in arguing cloſely, commonly makes, without attending at all to the form. Thus, that verſe remaining of Ovid's tragedy, intitled *Medea*, contains an enthymeme; *Servare potui, perdere an poſſum rogas:* "I was able to ſave you; conſequently to have deſtroyed you." All the beauty would

† See Eagle.

would have been loſt, had all the propoſitions been expreſſed; the mind is diſpleaſed with a rehearſal of what is no ways neceſſary.

Sometimes, alſo, the two propoſitions of an enthymeme are both included in a ſingle propoſition, which Ariſtotle calls an *enthymematical ſentence*, and gives this inſtance thereof: *Mortal, do not bear an immortal hatred.* The whole enthymeme would be, *Thou art mortal; let not, therefore, thy hatred be immortal.*

ENTITY, the ſame with Ens.

# ENTOMOLOGY;

THE ſcience of inſects, or that part of zoology which treats of inſects.

By ſome natural hiſtorians, this claſs of animals is conſidered as the moſt imperfect of any, while others prefer them to the larger animals. One mark of their imperfection is ſaid to be, that many of them can live a long time, though deprived of thoſe organs which are neceſſary to life in the higher ranks of nature. Many of them are furniſhed with lungs and an heart, like the nobler animals; yet the caterpillar continues to live, though its heart and lungs, which is often the caſe, are entirely eaten away.—It is not, however, from their conformation alone that inſects are inferior to other animals, but from their inſtincts alſo. It is true, that the ant and the bee preſent us with ſtriking inſtances of aſſiduity; yet even theſe are inferior to the marks of ſagacity diſplayed by the larger animals. A bee taken from the ſwarm is totally helpleſs and inactive, incapable of giving the ſmalleſt variations to its inſtincts. It has but one ſingle method of operating; and if put from that, it can turn to no other. In the purſuits of the hound, there is ſomething like choice; but in the labours of the bee, the whole appears like neceſſity and compulſion.—All other animals are capable of ſome degree of education; their inſtincts may be ſuppreſſed or altered; the dog may be taught to fetch and carry, the bird to whiſtle a tune, and the ſerpent to dance: but the inſect has only one invariable method of operating; no arts can turn it from its inſtincts; and indeed its life is too ſhort for inſtruction, as a ſingle ſeaſon often terminates its exiſtence.—Their amazing number is alſo an imperfection. It is a rule that obtains through all nature, that the nobler animals are ſlowly produced, and that nature acts with a kind of dignified economy; but the meaner births are laviſhed in profuſion, and thouſands are brought forth merely to ſupply the neceſſities of the more favourite part of the creation. Of all productions in nature, inſects are by far the moſt numerous. The vegetables which cover the ſurface of the earth bear no proportion to the multitudes of inſects; and though, at firſt ſight, herbs of the field ſeem to be the parts of organized nature produced in the greateſt abundance, yet, upon more minute inſpection, we find every plant ſupporting a mixture of ſcarce perceptible creatures, that fill up the compaſs of youth, vigour, and age, in the ſpace of a few days exiſtence.—In Lapland, and ſome parts of America, the inſects are ſo numerous, that if a candle is lighted they ſwarm about it in ſuch multitudes, that it is inſtantly extinguiſhed by them; and in theſe parts of the world, the miſerable inhabitants are forced to ſmear their bodies and faces with tar, or ſome other unctuous compoſition, to protect them from the ſtings of their minute enemies.

On the other hand, Swammerdam argues for the perfection of inſects in the following manner. "After an attentive examination (ſays he) of the nature and anatomy of the ſmalleſt as well as the largeſt animals, I cannot help allowing the leaſt an equal, or perhaps a ſuperior, degree of dignity. If, while we diſſect with care the larger animals, we are filled with wonder at the elegant diſpoſition of their parts, to what an height is our aſtoniſhment raiſed, when we diſcover all theſe parts arranged, in the leaſt, in the ſame regular manner! Notwithſtanding the ſmallneſs of ants, nothing hinders our preferring them to the largeſt animals, if we conſider either their unwearied diligence, their wonderful ſtrength, or their inimitable propenſity to labour. Their amazing love to their young is ſtill more unparalleled among the larger claſſes. They not only daily carry them to ſuch places as may afford them food; but if by accident they are killed, and even cut into pieces, they will with the utmoſt tenderneſs carry them away piecemeal in their arms. Who can ſhow ſuch an example among the larger animals which are dignified with the title of *perfect?* Who can find an inſtance in any other creature that can come in competition with this?"

On this diſpute it is only neceſſary to obſerve, that the wiſdom of the Creator is ſo conſpicuous in all his works, and ſuch ſurpriſing art is diſcovered in the mechaniſm of the body of every creature, that it is very difficult, if not impoſſible, to ſay where it is moſt, and where it is leaſt, to be obſerved.

Whoever is deſirous of attaining a ſyſtematic knowledge of inſects, ought primarily to be ſolicitous about acquiring the terms made uſe of in the ſcience, that ſo he may be able rightly to denominate every part of an inſect. The ſtudent is firſt to know what an inſect is, leſt he miſtake hippocampi, and other amphibious animals, for them, as was formerly done; or confound them with the *vermes*, which Linnæus firſt diſtinguiſhed from inſects, and which differ as eſſentially from them as the claſs mammalia do from birds. Every inſect is furniſhed with a head, antennæ, and feet, of all which the vermes are deſtitute. All inſects have ſix or more feet; they reſpire through pores placed on the ſides of their bodies, and which are termed *ſpiracula:* their ſkin is extremely hard, and ſerves them inſtead of bones, of which they have internally none. From this definition, the acus marina is evidently no inſect. But the antennæ placed on the fore-part of the head, conſtitute the principal diſtinction. Theſe are jointed and moveable in every part, in which they differ from the horns of other animals: they are organs conveying ſome kind of ſenſe; but we have no more idea of what this kind of ſenſe is, than a man has, who, without eyes, attempts to determine the particular action of the rays of light on the retina of the eye, or to explain the changes which from thence take place in the human mind. That they are the organs of ſome kind

of

ns of
g, &

of ſenſe, is apparent from their perpetually moving them forward; yet the hard cruſt with which they are inveſted, and their ſhortneſs in flies and other inſects, would induce one to believe them not to be the organs of touch: Mr Barbut ſuppoſes them to conſtitute or to contain the organs of hearing. That they are tubular, and filled with air, and ſome kind of humour, appears from the antennæ of butterflies immerſed in water.—To come now to the terms of the art. A knowledge of the external parts of the body is firſt to be eſtabliſhed; which, after the method of anatomiſts, we divide into head, trunk, abdomen, and extremities.

### Sect. I. *External Parts of the Body.*

3.

I. CAPUT, the Head. This part in inſects without brain. The difference between the brain and ſpinal marrow conſiſts in the former being a medullary part organized. We do not deny the exiſtence of a medullary thread in the heads of inſects, but we never could diſcover it to be organized: hence the hippoboſca equina, or horſe fly, will live, run, nay even copulate, after being deprived of its head; to ſay nothing of many others which are capable of living a long while in the ſame ſituation.

As they are not apparently furniſhed with ears, they have been apprehended incapable of hearing; as we can no more conceive that ſenſe to exiſt without ears than viſion without eyes. That they are nevertheleſs ſuſceptible of any ſhrill or loud noiſe, as well as fiſhes, is indiſputable; but it has been ſuppoſed to be in a manner different from that of hearing. Mr Barbut, however, ſuppoſes them to poſſeſs this ſenſe in a very diſtinct manner. Many inſects, he obſerves, are well known to be endowed with the power of uttering ſounds, ſuch as large beetles, the bee, waſp, common fly, gnat, &c. The ſphinx atropos ſqueaks, when hurt, nearly as loud as a mouſe. Now, if inſects are endowed with the power of uttering ſounds, it certainly muſt be for ſome purpoſe. As they vary their cry occaſionally, it muſt certainly be deſigned either to give notice of pleaſure or pain, or ſome affection in the creature who poſſeſſes it. "The knowledge of their ſounds (ſays our author) is undoubtedly confined to their tribe, and is a language intelligible to them only; ſaving when violence obliges the animal to exert the voice of nature in diſtreſs, craving compaſſion; then all animals underſtand the doleful cry. For inſtance, attack a bee or waſp near the hive or neſt, or a few of them: the conſequence of that aſſault will be, the animal or animals, by a different tone of voice, will expreſs his or their diſapprobation or pain; that ſound is known to the hive to be plaintive, and that their brother or brethren require their aſſiſtance; and the offending party ſeldom eſcapes with impunity. Now, if they had not the ſenſe of hearing, they could not have known the danger their brother or brethren were in by the alteration of their tone."

Organs of hearing, &c

Another proof, which he reckons ſtill more deciſive, was taken from an obſervation made by himſelf on a large ſpider in St James's Park. This creature had made a very large web on a wooden railing; and was, at the time of obſervation, on one of the rails at a conſiderable diſtance from the place where a large fly entangled itſelf. Nevertheleſs, the moment the fly was entangled, the ſpider became ſenſible of it; tho', from the ſituation of the rail, he could not poſſibly have ſeen it. In this, however, Mr Barbut might poſſibly be deceived; becauſe the ſpider was perhaps alarmed by the tremulous motion of the threads, occaſioned by the fluttering of the fly; which he might well know how to diſtinguiſh from their vibration by the wind. The organ of hearing, in our author's opinion, is ſituated in the antennæ; both from their ſituation in the part of the head moſt favourable to ſuch organs, their inward ſtructure being moveable, the ears of moſt inferior animals being ſo. He has never conſidered the antennæ as either offenſive or defenſive, but has obſerved them to be endowed with an exquiſite ſenſe of feeling; that the animal appeared to be in agony when its antennæ were pinched; and that it takes care to avoid the touching any hard ſubſtance with them roughly. "This tenderneſs in the organ of hearing (ſays he) is common to all animals; and inſects ſeem to be particularly tender in theſe parts by quickly withdrawing them from the touch."

Our author further obſerves, that the antennæ of all inſects are compoſed of joints varying in ſize, form, and number. Thoſe who are chiefly confined to live under water have their antennæ in general ſhorter than thoſe who live on land. Some who roam at large in the air, have them long and ſlender. They are all hollow, and are rendered flexible by the joints, which are very viſible in the horns of the crab and lobſter. This hollowneſs, in our author's opinion, is to receive the ſound communicated to the extremities of the antennæ by the repercuſſion of the air affected by any noiſe, and convey it, by means of the joints, from one to another, till it arrives in that leſſened degree of tone beſt ſuited to the timid nature of the animal. In this circumſtance there may be many variations in point of perfection in thoſe organs; the ſtrength, utility, and degree of power in receiving ſound being proportioned to the neceſſities of the animals, different in their nature and requiſites. In moſt animals, the entrance to the auricular organ is patulous; but in this caſe the animal would ſuffer great inconvenience from ſuch an organization, as the organ would often be clogged with dirt, &c.

It has alſo appeared dubious if they have the ſenſe of ſmell, no organ being found in them adapted to that purpoſe: and although it was evident they had a perception of agreeable and fetid effluvia, it was thought to be in a manner altogether unknown to us. Mr Barbut is of opinion that the organs of ſmell reſide in the palpi or feelers. Many inſects have four and ſome ſix, two of which are in general cheliform, in order to aſſiſt the inſect in conveying its food to its mouth. It may be likewiſe obſerved, that the palpi are in continual motion; the animal thruſting them into every kind of putrid or other matter, as a hog would do his noſe, ſmelling and ſearching after food. Inſects which apparently do not poſſeſs palpi or ſpiral tongues, have undoubtedly ſome organ concealed within the mouth analogous to them in function and utility; the fleſhy proboſcis of the fly is thruſt into every ſubſtance in which the animal expects to find food; and when it is extended, nearly in the middle are ſituated, in our author's opinion, two upright palpi, which, no

Eyes, Antennæ, &c.

doubt, perform in their turn ſome office, perhaps that of ſmell.

Many inſects have no tongue, nor make any ſound with their mouth; but for this purpoſe ſome uſe their feet, others their wings, and others ſome elaſtic inſtrument with which they are naturally furniſhed.

Eyes. Moſt inſects have two; but the gyrinus has four, the ſcorpion ſix, the ſpider eight, and the ſcolopendra three. They have no eye-brows, but the external tunic of their eyes is hard and tranſparent like a watch-glaſs; their eyes have no external motion, unleſs it be in the crab. They conſiſt for the moſt part of one lens only; but in thoſe of the butterfly, dipteræ, and many of the beetles, they are more numerous. Pugett diſcovered 17,325 lenſes in the cornea of a butterfly, and Lieuwenhoek 800 in a fly.

Antennæ. Of theſe there are in general two (unleſs four are allowed to ſome kind of crabs), and placed on the fore-part of the head: they are peculiar to inſects; and are plainly diſtinguiſhable from the tentaculæ of the vermes, in being cruſtaceous; and from the palpi of inſects, which are more numerous, placed near the mouth, and are ſometimes wanting. As the antennæ are of great moment in diſtinguiſhing the various kinds of inſects, we ſhall enumerate and explain the ſeveral different forms of them.

*Setaceæ*, are thoſe which grow gradually taper towards the extremity.

*Filiformes*, ſuch as are of the ſame thickneſs throughout.

*Moniliformes*, are filiform, like the preceding, but conſiſt of a ſeries of round knobs, like a necklace of beads.

*Clavatæ*, ſuch as gradually increaſe in ſize toward the extremity.

*Capitatæ*, are *clavatæ*, but have the extremity ſomewhat round.

*Fiſſiles*, are *capitatæ*; but have the capitulum, or knob, divided longitudinally into three or four parts, or laminæ, as in the ſcarabæi.

*Perfoliatæ*, are alſo *capitatæ*; but have the capitulum horizontally divided, as in the dermeſtes.

*Pectinatæ*, ſo called from their ſimilitude to a comb, though they more properly reſemble a feather, as in the moths and elateres. This is moſt obvious in the male.

*Ariſtatæ*, ſuch as have a lateral hair, which is either naked or furniſhed with leſſer hairs, as in the fly; *Breviores*, thoſe which are ſhorter than the body; *longiores*, thoſe which are longer than the body; *mediocres*, thoſe which are of the ſame length with the body; all three of which varieties are diſtinguiſhable in the cerambyces.

Palpi, or *Feelers*, reſemble filiform, articulated, moveable antennæ. They are moſt commonly four in number, ſometimes ſix; they are ſufficiently diſtinguiſhed from antennæ, in being naked, ſhort, and always placed at the mouth.

Os, the *Mouth*, is generally placed in the anterior part of the head, extending ſomewhat downwards. In ſome inſects, it is placed under the breaſt, as in the chermes, coccus, cancer (crab), and curculio.

Rostrum, or *Proboſcis*, is the mouth drawn out to a rigid point: in many of the hemiptera claſs it is bent downward toward the breaſt and belly, as in the cicada, nepa, notonecta, cimex (bug), aphis, and remarkably ſo in ſome curculiones.

Tongu
Legs, &

Maxillæ, the *Jaws*, are two in number, ſometimes four, and at other times more; they are placed horizontally; the inner edge of them in ſome inſects is ſerrated or furniſhed with little teeth.

Lingua, the *Tongue*, in ſome inſects is taper and ſpiral, as in the butterfly; in others it is fleſhy, reſembling a proboſcis, and tubular, as in the fly.

Labium *ſuperius*, the *upper Lip*, is ſituated above the jaws; as in the ſcarabæus and gryllus.

Stemmata, or *Crown*, are three ſmooth hemiſpheric dots, placed generally on the top of the head; as in moſt of the hymenoptera, and others.

II. TRUNCUS, the Trunk, is that part which comprehends the breaſt or thorax: it is ſituated between the head and abdomen; and has the legs inſerted into it, that its parts may be diſtinctly determined. It is divided into *thorax*, *ſcutellum*, and *ſternum*.

Thorax, the *Thorax*, is the back part of the breaſt; and is very various in its ſhape. It is called *dentatus*, when its ſides are armed with points; *ſpinoſus*, when its back is furniſhed with them, as in the cerambyx; and *marginatus*, when its margin is laterally dilated, as in the ſilpha and caſſida.

Scutellum, or *Eſcutcheon*, is the poſterior part of the thorax: it is frequently triangular; and appears to be divided from the thorax by an intervening ſuture, as in moſt of the coleoptera.

Sternum, the *Sternum*, is ſituated on the inferior part of the thorax; it is pointed behind in the elateres, and bifid in ſome of the dytiſci.

III. ABDOMEN, the Abdomen is in moſt inſects diſtinct from the thorax; it is the poſterior part of the body of the inſect; and is compoſed of a number of annular ſegments, which ſerve occaſionally to lengthen or ſhorten it, and to contain the organs of chylification, &c.

Spiracula, are little holes or pores, placed ſingly on each ſide of every ſegment of the abdomen: thro' theſe the inſect breathes; and if oil be applied ſo as to ſtop them up, it proves fatal to moſt of them.

Tergum, the *Back*, is the ſuperior part of the abdomen.

Venter, the *Belly*, is the inferior part.

Anus, is the poſterior part of the abdomen, perforated for the evacuation of the excrement. This part alſo frequently contains the organs of generation.

IV. ARTUS, the Limbs or Extremities, are the various inſtruments of motion.

Pedes, the *Legs*, are generally ſix. There is an exception to this, however, in the claſs Aptera, many of which have eight; as acari (mites), phalangii, moſt of the aranei (ſpiders), ſcorpiones (ſcorpions), and cancri (crabs). The oniſcus has 14, and the iuli and ſcolopendri ſtill more.

The firſt joint of the leg, which is generally thickeſt, is called *femur*; the ſecond, which is generally of the ſame ſize throughout, *tibia*; the third, which is jointed, is diſtinguiſhed by the name of *tarſus*; and ws, &c Inſects

the laſt, which in moſt inſects is double, by that of *unguis*. The legs of inſects, in general, are named from the various motions they produce: *Curſorii*, from that of running, which are the moſt numerous; *ſaltatorii*, from that of leaping; *natatorii*, from that of ſwimming, &c.—In the *ſaltatorii*, the thighs are remarkably large, by which means they are able to leap to a conſiderable diſtance, as in the gryllus, graſshopper, &c. In thoſe of the *Natatorii*, the feet are flat, and edged with hairs, which anſwer the purpoſe of oars in aſſiſting them to ſwim, as in the dytiſcus.—*Mutici*, are ſuch feet as have no claws. —*Chelæ*, or claws, are the fore-feet enlarged towards their extremities, each of which is furniſhed with two leſſer claws, which act like a thumb and finger; as in the crab.

Alæ, *Wings*, the inſtmruments which enable the to fly. Theſe are membranous and undivided, except in the inſtnce of the phalænæa alucitæ, in which they are in part divided. Moſt inſects have four; the diptera claſs, and the coccus, however, have two only.

The wing is divided into its ſuperior and inferior ſurfaces: its anterior part in a butterfly, is that towards the anterior margin, or next to the head; its poſterior part, that towards the anus; its exterior part, that towards the outer edge; and the interior, that next the abdomen.

They are called *plicatiles*, when they are folded at the time the inſect is at reſt, as in the waſp; oppoſite to theſe are the *planæ*, which are incapable of being folded.

*Erectæ*, ſuch as have their ſuperior ſurfaces brought in contact when the inſect is at reſt; as in the ephemera, libellula puella and virgo, and papiliones (butterflies.)

*Patentes*, which remain horizontally extended when the inſect is at reſt; as in the phalænæ geometræ, and moſt of the libellulæ.

*Incumbentes*, ſuch as cover horizontally the ſuperior part of the abdomen when the inſect is at reſt.

*Deflexæ*, are incumbentes, but not horizontally, the outer edges declining toward the ſides.

*Reverſæ*, are deflexæ, with this addition, that the edge of the inferior wings projects from under the anterior part of the ſuperior ones.

*Dentatæ*, in which the edge is ſerrated, or ſcolloped.

*Caudatæ*, in which one or more projections in the hinder wings are extended into proceſſes.

*Reticulatæ*, when the veſſels of the wings put on the appearance of network, as in the hemerobius perla; the two anterior wings generally become ſuperior, and the poſterior ones inferior, in moths, when their wings are cloſed; but the anterior wings are called *primary*, and the inferior ones *ſecondary*, in butterflies, as they cannot with propriety be called *inferior* when the wings are erect.

*Colores*, the colours, theſe are ſelf-apparent: but according to their ſeveral ſhapes, they take the different names of *punctæ*, dots; *maculæ*, ſpots; *faſciæ*, bands, which frequently run acroſs and ſometimes ſurround the edge of the wings; *ſtrigæ*, ſtreaks, which are very ſlender faſciæ; and *lineæ*, lines, which are longitudinally extended.

Wings of Inſects.

*Ocellus*, is a round ſpot, containing a leſſer ſpot of a different colour in its centre.

*Stigmata*, another term lately introduced by Linnæus, ſignifies the ſpot, or anaſtamoſis, in the middle of the wing near the anterior margin; it is conſpicuous in moſt of the hymenoptera and neuroptera, and even in the coleoptera. The ſingle or double kidney-ſhaped ſpot, ſituated in the ſame part of the anterior wings, and frequently occurring in the phalænæ paganæ, is diſtinguiſhed likewiſe by the name of *ſtigma*.

*Elytra* (in the ſingular number elytron). The upper wings, which are of a hard ſubſtance, in ſome degree reſembling leather, and which in moſt inſects are of a very hard texture, but in others flexible, are called *elytra*; their ſuperior ſurface is generally convex, their inferior one concave. When the inſect flies, they are extended; and ſhut when it reſts, cloſing together, and forming a longitudinal ſuture down the middle of the back, as in the coleoptera.

They are of various ſhapes. *Abbreviata*, when ſhorter than the abdomen. *Truncata*, when ſhorter than the abdomen, and terminating in a tranſverſe line. *Faſtigiata*, when of equal or greater length than the abdomen, and terminating in a tranſverſe line. *Serrata*, when the exterior margin towards the apex is notched or ſerrated, as in ſome of the bupreſtes. *Spinoſa*, when their ſurface is covered with ſharp points or prickles. *Scabra*, when their ſurface is ſo uneven as to grate againſt the fingers. *Striata*, when marked with ſlender longitudinal furrows. *Porcata*, when with elevated longitudinal ſulci or ridges. *Sulcata*, when theſe ridges are concave. *Hemelytra*, when the ſuperior wings are of a middle ſubſtance betwixt leather and membrane; either totally ſo, as in the grylli; or partially ſo, as in the cimices, nepæ, and notonectæ: Theſe are commonly diſtinguiſhed by the name *hemiptera*.

*Halteres*, poiſers, (a term alſo introduced by Linnæus), are little heads placed on a ſtalk or peduncle, moſt frequently under a little arched ſcale. They are found only in the claſs diptera, and appear to be nothing more than the rudiments of the hinder wings.

Cauda, the *Tail*, in moſt inſects is,

*Simplex*, ſimple, capable of being extended, and again drawn back at pleaſure. In the crab and ſcorpion, however, it is

*Elongata*, elongated, or lengthened out.

*Setacea*, briſtle-ſhaped, or taper; as in the raphidea.

*Triſeta*, conſiſting of three briſtles; as in the ephemera.

*Furcata*, being forked, as in the podura.

*Forcipata*, reſembling a pair of forceps; as in the forficula.

*Folioſa*, reſembling a leaf; as in the blatta, grylli, and ſome ſpecies of cancri.

*Teliſera*, ſuch as are armed with a dart or ſting; as in the ſcorpion and panorpa.

*Aculeus*, an inſtrument with which they wound, and at the ſame time inſtil a poiſon; with ſuch the bee, waſp, ſcorpion, &c. are furniſhed.

### Explanation *of* Plate CLXXXII.

Fig. 1. Antennæ pectinatæ, or feathered; as in the *phalænæ*, moths.

2. An-

Of the Sexes of Inſects.

2. ANTENNÆ PERFOLIATÆ, or perfoliated ; as in the *dermeſtes* and *dytiſcus*.
3. ——— FISSILES, or fiſſile, divided into laminæ at the extremity, as in the *ſcarabæi*, beetles.
4. ——— CLAVATÆ, or club-ſhaped, as in the *papilio*, butterfly.
5. ——— MONILIFORMES, like a necklace of beads ; as in the *chryſomela*.
6. ——— SETACEÆ, ſetaceous, or briſtle ſhaped ; as in many of the *phalænæ*.
7. ——— ARISTATÆ, furniſhed with a lateral hair, as in the *fly*.
8. 9 *a* Caput, the head.
  *b* Palpi, or feelers.
  *c* Antennæ, or horns.
  *d* Oculi, the eyes.
  *e* Thorax.
  *f* Scutellum, or eſcutcheon.
  *g* Pectus, or breaſt.
  *h* Sternum, or breaſt-bone.
  *i* Abdomen, and its ſegments.
  *k* Anus.
  *l* Elytra, or ſhells.
  *m* Membranous wings.
  *n* Pedes, or feet, which are natatorii.
10. *o* Femur, or thigh.
  *p* Tibia, or leg.
  *q* Tarſus, or foot.
  *r* Unguis, or claw.
11. *a* The anterior part of the wing.
  *b* The poſterior part.
  *c* The exterior part.
  *d* The interior part.
  *e* The margin.
  *f* The diſk, or middle.
  *g* Oculus, or eye.
12, 13, 14, 15, Repreſent the inſect in its egg, caterpillar, pupa, and perfect ſtate.

## SECT. II. *Of the Sexes of Inſects.*

THE ſame difference of ſex exiſts in inſects as in other animals, and they even appear more diſpoſed to increaſe their ſpecies than other animals ; many of them, when become perfect, ſeeming to be created for no other purpoſe but to propagate their ſpecies. Thus the ſilk-worm, when it arrives at its perfect or moth-ſtate, is incapable of eating, and can hardly fly : it endeavours only to propagate its ſpecies ; after which the male immediately dies, and the female as ſoon as ſhe has depoſited her eggs.

In many inſects, the male and female are with difficulty diſtinguiſhed ; and in ſome they differ ſo widely, that an unſkilful perſon might eaſily take the male and female of the ſame inſect for different ſpecies ; as for inſtance, in the phalæna humuli, piniaria, ruſſula ; each ſex of which differs in colour. This unlikeneſs is ſtill more apparent in ſome inſects, in which the male has wings and the female none ; as in the coccus, lampyris, phalæna antiqua, brumata, lichenella. And as moſt inſects remain a long while in copulation, as we may ſee in the tipula and ſilk-worm, the winged males fly with the wingleſs females, and carry them about from one place to another; as in the phalæna antiqua. It is, however, no certain rule, that when one inſect of the ſame ſpecies is found to have wings, and the other to be without, the former muſt neceſſarily be the male, and the latter the female. The aphides, for inſtance, are an exception ; and beſides theſe, individuals of both ſexes, and of the ſame ſpecies, are found without wings, as the carabi majores, tenebriones, meloes, cimices. The gryllus pedeſtris is likewiſe deſtitute of wings ; and might have paſſed for a gryllus in its pupa ſtate, had it not been ſeen in copulation ; for it is well known that no inſect can propagate its ſpecies till it arrives at its laſt or perfect ſtate.

Propa tion, &

“ Pleraque inſectorum genitalia ſua intra anum habent abſcondita, et penes ſolitarios, ſed nonnulla penem habent bifidum : Cancri autem et Aranei geminos, quemadmodum nonnulla amphibia, et quod mirandum in loco alieno, ut Cancer, ſub baſi caudæ. *Araneus mas* palpos habet clavatos, qui penes ſunt, juxta os utrinque unicum, quæ clavæ ſexum nec ſpeciem diſtinguunt ; et fœmina vulvas ſuas habet in abdomine juxta pectus. Heic vero ſi unquam vere dixeris, “ *Res plena timoris amor :* ſi enim procus in auſpicato acceſſerit, fœmina ipſum devorat ; quod etiam fit, ſi non ſtatim ſe retraxerit. Libellula fœmina genitale ſuum ſub apice gerit caudæ, et mas ſub pectore ; adeo ut cum mas collum fœminæ forcipe caudæ arripit, illa caudam ſub pectore ejus adplicit, ſicque peculiari ratione connexæ volitent.”

Beſides thoſe of the male and female, a third ſex exiſts in ſome inſects which we call *neuter :* As theſe have not the diſtinguiſhing parts of either ſex, they may be conſidered as eunuchs or infertile.

We know of no inſtance of this kind in any other claſs of animals, nor in vegetables, except in the claſs Syngeneſiæ, and in the Opulus. This kind of ſex is only found among thoſe inſects which form themſelves into ſocieties, as bees, waſps, and ants : and here theſe kind of eunuchs are real ſlaves, as on them lies the whole buſineſs of the economy; while thoſe of the other ſex are idle, only employing themſelves in the increaſe of the family. Each family of *Bees* has one female only (called the *queen*), many males, and an almoſt innumerable quantity of neuters. Of thoſe, the neuters (whoſe antennæ have 11 joints) do the working part ; they extract and collect honey and wax, build up the cells, keep watch, and do a variety of other things. The males, whoſe antennæ conſiſt of 15 joints, do no work ; they ſerve the female once, and that at the expence of their lives ; they may be conſidered in the light of a ſet of paraſites, or ceciſbei ; but as ſoon as their buſineſs of impregnation is over, they are expelled by their ſervants the neuters, who now ſhake off the yoke, but yet pay all due reſpect to their common mother the queen. The ſame economy nearly takes place in *Waſps*, where the young females, which are impregnated in the autumn, live through the winter, and in the ſpring propagate their ſpecies; but the queen, together with all the males, periſh in the winter. Among *Ants*, the neuters form a hill in the ſhape of a cone, that the water may run off it, and place thoſe which are in the pupa ſtate on that ſide of it which is leaſt expoſed to the heat of the ſun. At a conſiderable diſtance from theſe are found the habitations of the males and females, to whom the moſt ready obedience is yielded by the neuters, till a new offſpring ſucnges of nſects.

ſucceeds, and then they oblige them to quit their habitations. But thoſe ants which live entirely under ground, provide better for themſelves in this reſpect: for a little before their nuptials, they quit their habitation of their own accord, and after ſwarming in the manner of bees, they copulate in the air; and each retiring to ſome new habitation, founds a new family.

No *hermaphrodites* have as yet been diſcovered among inſects. There is ſomething very ſingular, however, in the propagation of the aphides. A female aphis once impregnated, can produce young, which will continue to produce others without any freſh impregnation, even to the fifth progeny; afterwards a new impregnation muſt take place. See APHIS.

The male inſects, like male hawks, are always ſmaller than the females.

In the propagation of their ſpecies they are remarkably careful; ſo that it is with the greateſt difficulty the flies are kept from depoſiting their eggs on freſh meat, the cabbage butterfly from laying them on cabbage, and other inſects from depoſiting them in the ſeveral places peculiar to each. The ſcarabæus pilularius and carnifex, are deſerving of our attention, as they afford a mutual aſſiſtance to each other: for when the female has laid her eggs in a little ball of dung, the males with their feet, which are axiform, aſſiſt the female to roll it to ſome ſuitable place; as Ariſtotle and Pliny formerly, and Loefling has lately, obſerved.

It is very wonderful to obſerve, that in the coccus and oniſcus, the female has no ſooner brought forth her young, than ſhe is devoured by it; and that the ſphex ſhould be able ſo readily to kill the caterpillar of a moth, then bury it in the earth, and there depoſit her eggs in it. Nor can we without admiration behold the ſame ſpecies of aphis, which was viviparous in the ſummer, become oviparous in the autumn.

Almoſt innumerable examples might be brought of the ſingularities in the eggs of inſects: we ſhall, however, only mention thoſe of the hemerobius, which are depoſited on a footſtalk; thoſe of the phalæna neuſtria, which are placed regularly in a ring round the branch of ſome tree; and the compound eggs of the blatta.

## SECT. III. *Metamorphoſes of Inſects.*

THERE are no inſects, except thoſe of the aptera claſs, but what are continually undergoing ſome tranſformation. Inſects change firſt from the (ovum) egg, into the (larva) caterpillar or maggot; then into the (pupa) chryſalis; and laſtly into the (imago) fly or perfect ſtate. During each of thoſe changes, their appearance differs as much as night and day.

The inſect, as ſoon as it came out of the egg, was by former entomologiſts called *eruca*; but as this is ſynonymous with the botanic name *ſiſymbrium*, it was changed by Linnæus for the term

*Larva*; a name expreſſive of the inſect's being, in this ſtate, as it were maſked, having its true appearance concealed. Under this maſk or ſkin the entire inſect, ſuch as it afterwards appears when perfect, lies concealed, inveloped only in its tender wings, and putting on a ſoft and pulpy appearance; inſomuch that Swammerdam was able to demonſtrate the butterfly with its wings to exiſt in a caterpillar, though it bore but a faint reſemblance to its future perfection. The inſect, therefore, in this ſtate, undergoes no other alteration but the change of its ſkin. The larvæ are, for the moſt part, larger than the inſect, when perfect, and are very voracious. The caterpillar of the cabbage-butterfly eats double what it would ſeem to require from its ſize; but its growth is not adequate to its voracity.

Changes of Inſects.

*Pupa*. The inſect in this ſtate was formerly called *chryſalis*, or *aurelia*; but as the appearance of gilding is confined to a few butterflies only, the term of *pupa* has been adopted in its ſtead; becauſe the lepidoptera, eſpecially, reſemble an infant in ſwaddling clothes; and in this ſtate all, except thoſe of the hemiptera claſs, take no nouriſhment.

*Imago*, is the third ſtate. This name is given by Linnæus to this third change, in which the inſect appears in its proper ſhape and colours; and as it undergoes no more transformations, it is called *perfect*. In this ſtate it flies, is capable of propagating its ſpecies, and receives true antennæ; which before, in moſt inſects, were ſcarce apparent.

As the ſhape of the pupa is different in different claſſes of inſects, it aſſumes different names; thus it is called

*Coarctata*, when it is round, and as it were turned, without the leaſt reſemblance of the ſtructure of the inſect; as in the diptera.

*Obtecta*, when it conſiſts as it were of two parts, one of which ſurrounds the head and thorax, and the other the abdomen.

*Incompleta*, when they have wings and feet, but are not capable of moving them; as in moſt of the hymenoptera.

*Semicompleta*, in which they walk or run, but have only the rudiments of wings.

*Completa*, in which they immediately obtain the perfect form of the inſect, without undergoing any more change: as in thoſe of the aptera claſs, except only the flea. The bed-bug alſo belongs to this claſs.

The ſpider undergoes frequent tranſformations, though only in the colour of its ſkin. The cruſtaceous inſects, as crabs, lobſters, &c. yearly caſt their ſhells, as their growth would otherwiſe be impeded.

The ſcolopendri, when young, have fewer feet than when they are full grown.

All inſects, as ſoon as they undergo the third change, are arrived at their full growth; nor do we find any difference in the ſize of the ſame ſpecies of inſect in the ſame countries, unleſs, during its caterpillar ſtate, it has not had a ſufficiency of proper food.

## SECT IV. *Claſſification of Inſects.*

As inſects are endowed with the various powers of creeping, flying, and ſwimming, there is ſcarce any place, however remote and obſcure, in which they are not to be found. The great confuſion which appeared to the ancients to ariſe from their number, made them never dream of reducing them to any ſyſtem. Swammerdam, that indefatigable inquirer into nature, obſerved that their metamorphoſes were divided by nature into ſeveral ſtates or orders. Their external appearance alſo carried with it ſome mark of diſtinction: ſo that entomologiſts called all thoſe of the coleoptera

Claſſification of Inſects.

claſs *Scarabæi* (beetles); thoſe of the lepidoptera *Papiliones;* and thoſe of the gymnoptera claſs that had two wings only, *Muſcæ* (flies); thoſe of the ſame claſs that had four wings, were called *Apes* (bees). No farther progreſs was made in the ſyſtematic part of this ſcience till the time of Linnæus. He was the firſt that undertook to determine the genera, and aſſign them their proper characters, in the *Syſtema Naturæ;* and thus reduced this ſcience to a ſyſtematic form. This ſyſtem, in ſubſequent editions, was conſiderably enriched and amended by him, inſomuch that the ſcience of inſects now ſhines forth in its full luſtre. He it was who firſt inſtituted natural orders, and reduced them into genera by expreſſive names; determined an infinite number of ſpecies in the *Fauna Suecica* and *Muſeum Reginæ;* collected with incredible pains the ſynonymous names of the various authors who had written on them; and laſtly, added their deſcriptions, and the places in which they were to be found. So that the ſyſtem of this illuſtrious author will lead any perſon, without the aſſiſtance of a maſter, for the moſt part, eaſily to aſcertain the name of any inſect he may meet with. Before his time ſcarce any more than 200 inſects were known; whereas, in the laſt edition of his ſyſtem, he has determined the names of nearly 3000 diſtinct ſpecies; though this is not the ſixth part of the number that is now known.

Orders. The claſs of *inſects* is divided by Linnæus into ſeven orders.

Plate CLXXXII. 1. The *Coleoptera* (from κωλεος *a ſheath*, and πτερον *a wing*), are ſuch inſects as have cruſtaceous elytra or ſhells, which ſhut together, and form a longitudinal ſuture down the back of the inſect; as the beetle (*bupreſtris ignita*), fig. 16.

2. *Hemiptera* (from ημισυ *half*, and πτερον *a wing*), have their upper wings uſually half cruſtaceous and half membranaceous, not divided by a longitudinal ſuture, but incumbent on each other; as the cimex, fig. 17.

3. *Lepidoptera* (from λεπις *a ſcale*, and πτερον *a wing*), are inſects having four wings, covered with fine ſcales in the form of powder or meal; as in the butterfly (*papilio antiopa*,) fig. 18.

4. *Neuroptera*, from νευρον *a nerve*, and πτερον *a wing*,) have four membranous tranſparent naked wings, generally like network; as in the *panorpa coa*, fig. 19.

5. *Hymenoptera* (from υμην *a membrane*, and πτερον *a wing*), are inſects with four membranous wings, tail furniſhed with a ſting; as in the *tenthredo*, fig. 20.

6. *Diptera* (from δυω *two*, and πτερον *a wing*), are ſuch as have only two wings, and poiſers; as in the fly (*muſca*), fig. 21.

7. *Aptera* (from α *without*, and πτερον *a wing*), inſects having no wings This laſt diviſion contains ſcorpions, ſpiders, crabs, lobſters, &c. See Aranea, Cancer, &c.

Genera. To inſert here the characters of all the different genera which may be found in Linnæus's Syſt. Nat. would be unneceſſary. It will be ſufficient to enumerate ſome new genera mentioned by ſubſequent ſyſtematic writers, that, by being acquainted with the ſubtile diſtinctions on which they are built, the ſtudent may avoid running into confuſion. It is among the moderns only that genera of this kind are to be met with, and new names given them. To remove this difficulty, we ſhall firſt enumerate the names of thoſe authors which are ſynonymous with thoſe of Linnæus.

*New* Genera *of authors ſynonymous with thoſe of Linnæus.*

| *Linnæus's Names.* | Names of other Authors. |
|---|---|
| Lucanus | *Platyceros* |
| Hiſter | *Attelabus* |
| Byrrhus | *Anthrenus ciſtela* |
| Mylabris | *Laria* Scop. |
| Attelabus | *Clerus* |
| Silpha | *Peltis* |
| Bruchus | *Mylabris* |
| Ptinus | *Byrrhus* |
| Chryſomela | *Galericula* |
| Hiſpa | *Crioſeris* |
| Cantharis | *Cicindela* |
| Bupreſtis | *Cucujus* |
| Carabus | *Bupreſtis* |
| Myrmeleon | *Formica-leo* |
| Sirex | *Uroceros.* |

*New genera of authors.*

*Copris.* Scarabæus abſque ſcutello
*Boſtricius.* Dermeſtes capecinus
*Ciſtela.* Byrrhus pilula
*Rhinomancer.* Attelabus roſtro producto fere curculionis.
*Anthribus.* Silpha
*Bruchus.* Ptinus Fur ob ſpinas thoracis
*Melolontha.* Chryſomela cylindrica
*Altica.* —— ſaltatoria
*Diaperis.* —— fungorum
*Pyrochora.* Cantharis
*Telephorus.* Cantharis
*Cantharis.* Meloë alata
*Cerocoma.* Meloë ſhafferi
*Notaxis.* Meloë monoceros
*Prionus.* Cerambyx thoracis margine denticulato
*Stenocoris.* Leptura thorace ſpinoſa
*Hydrophilus.* Dytiſcus antennis clavatis
*Mylabris.* Necydalis minor
*Acridium.* Gryllus muticus
*Locuſta.* —— tettigonia
*Tettigonia.* Cicada
*Corixa.* Notonecta
*Naucoceris.* Nepa
*Perla.* Hemerobius cauda biſecta
*Libelluloides.* Myrmeleon antennis capitatis
*Crabro.* Tenthredo antennis clavatis
*Pterophorus.* Phalæna alucita
*Bibio.* Tipula thorace ſpinoſo
*Stomoxoides.* Aſilus bucca inflata
*Strationymus.* Muſca
*Nemotelus.* Muſca.
*Volucella.* Muſca.

Claſſific tion of I ſects.

Theſe genera appear to be in a great meaſure like thoſe which were introduced into botany by the followers of Rivinus. Paying too little regard to nature, they disunited natural genera, on account of the moſt trifling diſtinctions. This made their continuance in the ſcience of very ſhort duration; our buſineſs here is not to ſuppoſe, but to examine, what nature will allow of, and what ſhe will not. Knowledge of this kind, built on opinion only, will not ſtand. We are therefore to look into the ſcience with great accuracy; and the larva of the inſect, its manner of changing, and other ifica- of In-

Claſſification of Inſects.

other things of moment, are to be known, before we preſume to form a new genus.

Coining of new names, and changing of one old one for another, has been the ſource of the greateſt confuſion. Thus, in order to reduce the cicindela and carabus to the ſame genus, *bupreſtis* has been adopted for the generic name; but as that genus had long ago received a very different application, it was changed for that of *cucujus*.

Again, that the officinal cantharides might be ranged among the cerambyces, the cantharides have been removed from the genus of meloë (to which they naturally belong), and referred to the genus of cicindela, obtaining thus a new name. And ſo of many others.

Thus alſo, to mention no more, how needleſs and raſh was it to ſeparate the acridium and locuſta from the genus of gryllus, the crabro from the tenthredines, and the mylabris from the necydalis!

TRIVIAL NAMES. The trivial names placed under their reſpective genera will occaſion little or no controverſy; they are current like money, and of the ſame utility as the proper names of men, Peter or Paul, &c. Inſects living on vegetables ſhould receive their names from the particular plants on which they moſtly feed, as they are preferable to all others. Thus the names of the *phalæna mori*, &c. are excellent; and when we are able to give ſuch to inſects, the old ones are to be diſcarded. But we are to be cautious of not being too haſty in our judgment in this reſpect; as inſects, when they cannot get their favourite food, will often eat other plants. Thus the ſilk-worm, for want of mulberry leaves, will eat thoſe of lettuce, though it will not thrive ſo well on them.

Many other inſtances of the invention of trivial names will be met with in the *Syſtema Naturæ*, particularly among the butterflies and moths. To prevent confuſion from the great number of ſpecies which conſtitute the genus of phalæna, they are diſtributed into ſections, and diſtinguiſhed by the terms of *bombyces*, *noctuæ*, *geometræ*, *tortrices*, *pyralides*, *tineæ*, and *alucitæ*. The bombyces and noctuæ, which are ſo much alike, that the females of the bombyces are with great difficulty diſtinguiſhed from the noctuæ, are named promiſcuouſly.

All thoſe of the geometræ have their names terminating in *aria* and *ata*, according as their antennæ are ſetaceous or pectinated. The tortrices, in *aria*; the pyralides, in *alis*; the tineæ, in *ella*; and the alucitæ, in *dactyla*: ſo that it is evident from the termination itſelf to what ſection the inſect is to be referred.

It were to be wiſhed that ſimilar inſtitutions could be formed throughout the whole ſcience, as here the name itſelf ſerves to diſtinguiſh the inſect.

Butterflies are divided into ſections, by the names of *Equites*, *Heliconii*, *Danai*, *Nymphales*, and *Plebeii*.

In ſuch a multitude of butterflies, the greateſt part of which are foreign and extra European, and to whoſe food and manner of life we are utter ſtrangers, it was impoſſible to give ſignificant trivial names. Linnæus, therefore, by way of ſimile, has taken the names of the *Equites* from the Trojan hiſtory. Theſe conſiſt, as it were, of two troops or bodies; of which one contains the ſable, and as it were mourning nobles, having red or bloody ſpots at the baſis of their wings. Theſe receive names from the Trojan nobles; and as Priam was king of Troy, the moſt ſplendid among theſe bear his name. The other body, ornamented with a variety of gay colours, are diſtinguiſhed by the names of the Grecian heroes; and as in both armies there were kings as well as officers of an inferior rank, thoſe elegant butterflies, whoſe hinder wings reſembled tails, were diſtinguiſhed by ſome royal name. Thus when Paris is mentioned (knowing from hiſtory that he was a Trojan, and of royal blood), we find him among thoſe of the firſt ſection; that is, thoſe of a ſable colour, ſpotted in the breaſt with red, and having their hinder-wings reſembling tails. When Agamemnon is named, we remember him to be a noble Greek, and find him among thoſe nobles which have variegated and ſwallow-tailed wings. But when Nereus is ſpoken of, we readily know him to belong to the laſt ſection, with wings having no tails.

The ſecond claſs, which contains the *Heliconii*, derive their names from the muſes, as Urania. The names of the ſons and daughters of Danaus are beſtowed on the third ſection. And as theſe ſpecies are ſubdivided into two other ſections, viz. the white and parti-coloured, the metaphor is ſo conducted, that the white ones preſerve the names of the daughters of Danaus, and the parti-coloured ones thoſe of the ſons of Egyptus: ſo that it is evident from the name itſelf to what ſection the butterfly is to be referred.

The names of the fourth ſection, *Nymphales*, are taken from various nymphs of antiquity; and thoſe of the fifth ſection, *Plebeii*, are ſelected from different men among the ancients whoſe names are worthy of remembrance: ſo that by this means a knowledge of the ancients may be interſperſed, and this agreeable ſcience be made doubly pleaſing.

Thoſe, therefore, who ſhall find new lepidoptera, and give them new names, will do well to follow this method, unleſs it be apparent what food the inſect chiefly ſubſiſts on.

trepas, tring.

ENTREPAS, in the manege, a broken pace or going, that is neither walk nor trot, but has ſomewhat of an amble.

This is a pace or gait of ſuch horſes as have no reins or back, and go upon their ſhoulders; or, of ſuch as are ſpoiled in their limbs.

ENTRING-LADDERS, in a ſhip, are of two ſorts; one uſed by the veſſel's ſides, in a harbour, or in fair weather, for perſons to go in and out of the ſhip: the other is made of ropes, with ſmall ſtaves for ſteps; and is hung out of the gallery to enter into the boat, or to come aboard the ſhip, when the ſea runs ſo high that they durſt not bring the boat to the ſhip's ſide for fear of ſtaving it.

Entrochus.

ENTROCHUS, in natural hiſtory, a genus of extraneous foſſils, uſually of about an inch in length, and made up of a number of round joints, which, when ſeparate and looſe, are called *trochitæ*: they are compoſed of the ſame kind of plated ſpar with the foſſil ſhells of the echini, which is uſually of a bluiſh-grey colour, and

and very bright where freſh-broken; they are all ſtriated from the centre to the circumference, and have a cavity in the middle. See Plate CLXXXII.

The entrochi are found of all ſizes, from that of a pin's head to a finger's length, and the thickneſs of one's middle finger; and are plainly of marine origin, having often ſea-ſhells adhering to them. They ſeem to be the petrified arms of that ſingular ſpecies of the ſea ſtar-fiſh, called *ſtella arboreſcens*.

They are eſteemed very powerful diuretics, and preſcribed in nephritic caſes with good ſucceſs; the doſe being as much of the powder as will lie on a ſhilling.

ENTRY, in law, ſignifies taking poſſeſſion of lands or tenements, where a perſon has a right ſo do.

*Entry of an Heir*, in Scots law, that form of law by which an heir veſts in himſelf a proper title to his predeceſſor's eſtate.

*Bill of Entry*, in commerce. See Bill.

In making entries inwards, it is uſual for merchants to include all the goods they have on board the ſame ſhip in one bill, though ſometimes they may happen to be upwards of 20 ſeveral kinds: and in caſe the goods are ſhort entered, additional or poſt entries are now allowed; though formerly the goods, ſo entered, were forfeited. As to bills of entry outwards, or including goods to be exported, upon delivering them, and paying the cuſtoms, you will receive a ſmall piece of parchment called a *cocket*, which teſtifies your payment thereof, and all duties for ſuch goods.

If ſeveral ſorts of goods are exported at once, of which ſome are free, and others pay cuſtoms; the exporter muſt have two cockets, and therefore muſt make two entries; one for the goods that pay, and the other for the goods that do not pay cuſtom.

Entries of goods, on which a drawback is allowed, muſt likewiſe contain the name of the ſhip in which the goods were imported, the importer's name, and time of entry inwards. The entry being thus made, and an oath taken that the cuſtoms for thoſe goods were paid as the law directs, you muſt carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant warrant, which muſt be given to the ſurveyor, ſearcher, or land-waiter, for them to certify the quantity of goods; after which the certificate muſt be brought back to the collector and comptroller, or their deputies, and oath made that the ſaid goods are really ſhipped, and not landed again in any part of Great Britain.

ENVELOPE, in fortification, a work of earth, ſometimes in form of a ſimple parapet, and at others like a ſmall rampart with a parapet: it is raiſed ſometimes on the ditch, and ſometimes beyond it.

ENVIRONNE', in heraldry, ſignifies ſurrounded with other things: thus, they ſay, a lion enveronné with ſo many bezants. See Bezant.

ENUMERATION, an account of ſeveral things, in which mention is made of every particular article.

Enumeration, in rhetoric, a part of peroration; in which the orator, collecting the ſcattered heads of what has been delivered throughout the whole, makes a brief and artful relation or recapitulation thereof.

ENVOY, a perſon deputed to negociate ſome affair with any foreign prince or ſtate. Thoſe ſent from the courts of Britain, France, Spain, &c. to any petty prince or ſtate, ſuch as the princes of Germany, the republics of Venice, Genoa, &c. go in quality of envoys, not ambaſſadors; and ſuch a character only do thoſe perſons bear, who go from any of the principal courts of Europe to another, when the affair they go upon is not very ſolemn or important. There are envoys ordinary and extraordinary, as well as ambaſſadors; they are equally under the protection of the law of nations, and enjoy all the privileges of ambaſſadors; only differing from them in this, that the ſame ceremonies are not performed to them.

ENVY, in ethics; pain felt, and malignity conceived, at the ſight of excellence or happineſs in another. See Emulation.

EON, or Æon. See Æon.

EONIANS, in church hiſtory, the followers of Eon, a wild fanatic of the province of Bretagne, in the 12th century, whoſe brain was diſordered. He concluded from the reſemblance between *eum*, in the form for exerciſing malignant ſpirits, viz. *Per eum, qui venturus eſt judicare vivos & mortuos*, and his own name Eon, that he was the ſon of God, and ordained to judge the quick and dead. Eon, however, was ſolemnly condemned by the council at Rheims in 1148, at which Pope Eugenius III. preſided, and ended his days in a miſerable priſon. He left behind him a number of followers and adherents, whom perſecution and death ſo weakly and cruelly employed, could not perſuade to abandon his cauſe, or to renounce an abſurdity which, ſays Moſheim, one would think could never have gained credit but in ſuch a place as Bedlam.

EORIA, in mythology, a feaſt celebrated by the Athenians in honour of Erigonus, who, by way of puniſhment, for their not avenging the death of his father Icarus, engaged the gods to inflict the curſe on their daughters, that they ſhould love men who never returned their paſſion. The feaſt was inſtituted by the order of Apollo.

EOSTRE, in mythology, a Saxon goddeſs to whom they ſacrificed in the month of April, called the month of *Eoſtra*; and thence the name *Eaſter*, which the Saxons retained after their converſion to Chriſtianity, applying it to the feſtival celebrated in commemoration of our Saviour's reſurrection.

EPACRIS, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants. The calyx is a five-parted perianthium; the corolla monopetalous and tubular; the ſtamina five very ſhort filaments; the pericarpium a roundiſh, depreſſed, quinquelocular, quinquevalvular, gaping capſule; the ſeeds are numerous and very ſmall.

EPACTS, in chronology, the exceſſes of the ſolar month above the lunar ſynodical month, and of the ſolar year above the lunar year of twelve ſynodical months; or of ſeveral ſolar months above as many ſynodical months, and ſeveral ſolar years above as many dozen of ſynodical months.

The epacts, then, are either *annual* or *menſtrual*.

Menſtrual epacts are the exceſſes of the civil or kalendar month above the lunar month. Suppoſe, *e. gr.* it were new-moon on the firſt day of January; ſince the lunar month is 29 days 12 h. 44 3″, and the month of January contains 31 days, the menſtrual epact is 1 day 11 h. 15′ 57″.

Annual epacts are the exceſſes of the ſolar year above the lunar. Hence, as the Julian ſolar year is 365 days 6 h. and the Julian lunar year 354 days 8 h.

48′ 38″, the annual epact will be 10 days 21 h. 11′ 22″; that is, nearly 11 days. Conſequently the epact of 2 years is 22 days; of 3 years, 33 days; or rather 3, ſince 30 days make an *emboliſmic* or intercalary mouth.

Thus the epact of 4 years is 14 days, and ſo of the reſt; and thus, every 19th year, the epact becomes 30 or 0; conſequently the 20th year the epact is 11 again; and ſo the cycle of epacts expires with the golden number, or lunar cycle of 19 years, and begins with the ſame, as in the following table:

| Gold. Numb. | Epacts. | Gold. Numb. | Epacts. | Gold. Numb. | Epacts. |
|---|---|---|---|---|---|
| 1 | XI | 7 | XVII | 13 | XXIII |
| 2 | XXII | 8 | XXVIII | 14 | IV |
| 3 | III | 9 | IX | 15 | XV |
| 4 | XIV | 10 | XX | 16 | XXVI |
| 5 | XXV | 11 | I | 17 | VIII |
| 6 | VI | 12 | XII | 18 | XIX |
|  |  |  |  | 19 | XXX |

Again, as the new moons are the ſame, that is, as they fall on the ſame day every 19 years, ſo the difference between the lunar and ſolar years is the ſame every 19 years. And becauſe the ſaid difference is always to be added to the lunar year, in order to adjuſt or make it equal to the ſolar year; hence the ſaid difference reſpectively belonging to each year of the moon's cycle is called the *epact of the ſaid year*, that is, the number to be added to the ſaid year, to make it equal to the ſolar year; the word being formed from the Greek επαγω, *induco*, *intercalo*.

Upon this mutual reſpect between the cycle of the moon and the cycle of the epacts, is founded this rule for finding the Julian epact, belonging to any year of the moon's cycle. Multiply the year given of the moon's cycle into 11; and if the product be leſs than 30, it is the epact ſought; if the product be greater than 30, divide it by 30, and the remainder of the dividend is the epact. For inſtance, I would know the epact for the year 1712, which is the third year of the moon's cycle. Wherefore 3 is the epact for 1712; for 11×3=33, and 33 being divided by 30, there is left 3 of the dividend for the epact. But the difference of the Julian and Gregorian years being equal to the exceſs of the ſolar above the lunar year, or 11 days, it happens that the Gregorian epact for one year is the ſame with the Julian epact for the preceding year.

EPAMINONDAS, a celebrated Theban, the ſon of Polymnus, and one of the greateſt captains of antiquity. He learned philoſophy and muſic under Lyſis, a Pythagorean philoſopher; and was from his infancy inured to all the exerciſes of body and mind. He was learned, generous, well-ſkilled in war, brave, modeſt, and prudent; and had ſuch a regard for truth, that he would not tell a falſehood even in jeſt. He ſerved firſt under the Lacedemonians; ſaved the life of Pelopidas their chief, who received in a battle ſeven or eight wounds; and contracted a ſtrict friendſhip with that general, which laſted till his death. At his perſuaſions, Pelopidas delivered the city of Thebes from the yoke of the Spartans, who had rendered themſelves maſters of Cadmea, which occaſioned a bloody war between the two nations. Epaminondas was made general of the Thebans; on which he gained the celebrated battle of Leuctra, in which Cleombrotus, the valiant king of Sparta, was killed. He then ravaged the enemy's country, and cauſed the city of Meſſina to be rebuilt and peopled. At length, the command of the army was given to another, becauſe Epaminondas had kept his troops in the field four months longer than he had been ordered by the people; but, inſtead of retiring in diſguſt, he now ſerved as a common ſoldier, and diſtinguiſhed himſelf by ſo many brave actions, that the Thebans, aſhamed of having deprived him of the command, reſtored him to his poſt, in order to carry the war into Theſſaly, where his arms were always victorious. A war breaking out between the Elians and the inhabitants of Mantinea, the Thebans took the part of the former. Epaminondas then reſolved to endeavour to ſurpriſe Sparta and Mantinea; but not ſucceeding, he gave the enemy battle, in which he received a mortal wound with a javelin, the bearded iron remaining in the wound. Knowing that it could not be drawn out without occaſioning immediate death, he would not ſuffer it to be touched, but continued to give his orders: and on his being told, that the enemy were entirely defeated, "I have lived long enough (he cried), ſince I die without being conquered;" and at the ſame time he plucked the javelin from his wound, and expired, 363 B. C.

EPANALEPSIS. See ORATORY. n° 73.

EPANODOS. *Ibid.* n° 75.

EPANORTHOSIS. *Ibid.* n° 86.

EPARER, in the manege, ſignifies the flinging of a horſe, or his yerking and ſtriking with his hind-legs.

EPAULEMENT, in fortification, a work raiſed to cover ſidewiſe, is either of earth, gabions, or faſcines loaded with earth. The epaulements of the places of arms for the cavalry, at the entrance of the trenches, are generally of faſcines mixed with earth.

EPAULETTES, are a kind of ſhoulder-knots choſen for the ſoldiers, which are to be of the colour of the facing, with a narrow yellow or white tape round it, and worſted fringe: thoſe for the officers are made of gold or ſilver lace, with a rich fringe; they are badges of diſtinction worn on one or both ſhoulders. Thoſe of the dragoon-guards, horſe, and dragoons, are worn on the left ſhoulder: the light dragoons, and officers of grenadiers, have one on each ſhoulder: thoſe of the battalion wear one on the right ſhoulder only, which is to be made of embroidery or lace with a gold or ſilver fringe. Thoſe of the royal regiment of artillery are to be gold and embroidery, with gold fringe on ſcarlet cloth, and worn on the right ſhoulder.

EPENTHESIS, in grammar, the interpoſition or inſertion of a letter or ſyllable in the middle of a word; as *alituum*, for *alitum*; *relligio*, for *religio*; *induperator*, for *imperator*, &c.

EPEUS, of the line of Endymion, the inventor of the battering ram, an engine of great ſervice in ſieges to make a breach. He is thought to have built the Trojan horſe, and to have founded the city Metapontum.

EPHA, or EPHAH, in Jewiſh antiquity, a meaſure for things dry, equal to 3 pecks and 3 pints.

EPHEBÆUM, in antiquity, the place where the ephebi or youth exerciſed; or, as ſome ſay, where thoſe who deſigned to exerciſe met, and agreed what kind of exerciſe they ſhould contend in, and what ſhould be the victor's reward.

EPHEBI, among the Athenians, a deſignation given to their young men when they arrived at 18 years of age, at which time they had their names entered in a public regiſter.

EPHEDRA, in botany, a genus of the monodelphia order, belonging to the diœcia claſs of plants; and in the natural method ranking under the 51ſt order, *Coniferæ*. The male calyx is bifid; there is no corolla, but ſeven ſtamina; four antheræ inferior; three ſuperior. The female calyx is bipartite, and fivefold, one upon another; there is no corolla; there are two piſtils, and two ſeeds covered by the calyx, reſembling a berry.

EPHEMERA, from ημερα, "a day;" a diary fever, or a fever of one day's continuance only. In this caſe, ſuch a heat as attends an exceſs of wine, a pulſe ſomewhat full and quick, but ſoft and regular, a ſlight headach, a nauſea, and reſtleſſneſs, are all the ſymptoms, and which terminate without any ſenſible evacuation. If it continue unto the third day, it is not a diary fever; and if the conſtitution is very dry, an hectic is to be dreaded.

EPHEMERA, the *Day fly*, in zoology, a genus belonging to the order of neuroptera. It has no teeth or palpæ; there are two large protuberances above the eyes; the wings are erect, the two hind ones being largeſt; and the tail is briſtly. Theſe flies, who take their name from the ſhortneſs of their life, are diſtinguiſhed into ſeveral ſpecies. Some live ſeveral days, others do not take flight till the ſetting of the ſun, and live not to ſee the riſing of that luminary. Some exiſt but one hour, others but half that time; in which ſhort period they comply with the call of nature. With reſpect to thoſe who live ſeveral days, there is a peculiarity obſerved, incident to themſelves alone. They have to caſt off one ſlough more, an operation which ſometimes takes 24 hours to complete. To bring this about, they cling faſt to a tree. The ephemeræ, before they flutter in air, have in ſome manner been fiſhes. They remain in the ſtates of larva and chryſalis for one, two, or three years. The chryſalis only differs from the larva by there being obſervable on its back caſes for wings. Both have on their ſides ſmall fringes of hair, which, when put into motion, ſerve them as fins. Nothing can be more curious than the plying of thoſe little oars in the water. Their abdomen is terminated, as well as in their ſtate of flies, by three threads. Theſe larvæ ſcoop themſelves out dwellings in the banks of rivers; and they are ſmall tubes made like ſiphons, the one ſerving for an entrance, the other affording them an outlet. The banks of ſome rivers are often perforated with them. When the waters decreaſe, they dig freſh holes lower down, in order to enjoy their element the water. The ſeaſon and hour when the chryſalids of the different ſpecies of the ephemeræ turn into flies, maintain a kind of regularity. The heat, the riſe or fall of the waters, accelerate, however, or poſtpone their final diſplay. The ephemeræ of the Rhine appear in the air two hours before ſunſet. Theſe flies are hatched almoſt all at the ſame inſtant in ſuch numbers as to darken the air. The moſt early of thoſe on the Marne and Seine in France do not begin to fly till two hours after the ſetting of the ſun, towards the middle of Auguſt. They are ſeen fluttering and ſporting on the brink of their tomb. The glare of light attracts them, round which they perform a thouſand circles with amazing regularity. Their coming together for the purpoſe of generation can only be ſurmiſed, the ſhortneſs of their life requiring that all its functions ſhould be proportionable to their duration. Some naturaliſts have been of opinion, that the males impregnated the eggs after the manner of fiſhes. The females, by the help of the threads of their tail and the flapping of their wings, ſupport themſelves on the ſurface of the water, and in that almoſt upright ſituation drop their eggs in cluſters. One ſingle female will lay 700 or 800 eggs, which ſink to the bottom. The larvæ that eſcape from the voraciouſneſs of the fiſhes, ſet about the conſtruction of habitations to ſhelter them from every kind of danger. When the flies have propagated, they are ſeen to die and fall by heaps. The land and water are ſtrewed with them to a conſiderable thickneſs. The fiſhermen conſider theſe multitudes of deſtroyed inſects as manna for the fiſhes.

Barbut's Inſects.

Plate CLXXXII.

EPHEMERIDES, in aſtronomy, tables calculated by aſtronomers, ſhowing the preſent ſtate of the heavens for every day at noon; that is, the places wherein all the planets are found at that time. It is from theſe tables that the eclipſes, conjunctions, and aſpects of the planets, are determined; horoſcopes or celeſtial ſchemes conſtructed, &c. We have ephemerides of Origan, Kepler, Argoli, Heckerus, Mezzaracchis, Wing, De la Hire, Parker, &c. S. Caſſini has calculated ephemerides of the ſidera medicæa or ſatellites of Jupiter, which are of good uſe in determining the longitude.

In England, the Nautical Almanac, or Aſtronomical Ephemeris, publiſhed annually by anticipation, under the direction of the commiſſioners of longitude, is the moſt conſiderable. In France, celeſtial ephemerides have been publiſhed by M. Deſplaces every ten years, from 1715 to 1745: they were afterwards continued by the Abbé Caille, with many additions; of which an account may be ſeen in the Hiſtory of the Academy of Sciences for 1743. The Academy of Sciences have likewiſe publiſhed annually, from the beginning of the preſent century, a kind of ephemeris, under the title of *Connoiſſance des Tems*.

EPHESUS, a city of antiquity, much celebrated on account of its temple of Diana, and for being the moſt famous mart or ſtaple town of Hither Aſia. Epheſus was in ancient times the metropolis of all Aſia. Stephenus gives it the title of *Epiphaneſtate*, or *moſt illuſtrious*; and Pliny ſtyles it the ornament of Aſia. The ancient city ſtood about 50 miles ſouth of Smyrna, near the mouth of the river Cayſter, and the ſhore of the Icarian ſea, which is a bay of the Ægæan; but as it has been ſo often deſtroyed and rebuilt, it is no eaſy matter to determine the preciſe place. Moſt of our modern travellers are of opinion, that the ancient city ſtood more to the ſouth than the preſent; which they argue from the ruins that ſtill remain. Epheſus was, in ancient times, known by the names of *Alopes*, *Ortygia*, *Morges*, *Smyrna*, *Trachæa*, *Samornion*, and *Ptela*. It was called *Epheſus*, according to Heraclides, from the Greek word *epheſus*, ſignifying *permiſſion*; becauſe Hercules (ſays he) permitted the Amazons to live and build a city in that place. Others tell us, that Epheſus was the name of the Amazon that founded the city; for Pliny, Juſtin, and Oroſius, unanimouſly affirm that it was built by an Amazon; while others beſtow this honour upon Androclus, the ſon of Codrus, king of Athens, who was the chief of the Ionians that ſettled in Aſia. But in matters of ſo early a date, it is impoſſible to come at the truth, and therefore not worth our while to dwell on ſuch fruitleſs inquiries. What we know for certain is, that the city, which in the Roman times was the metropolis of all Aſia, acknowledged Lyſimachus for its founder; for that prince, having cauſed the ancient city to be entirely demoliſhed, rebuilt, at a vaſt expence, a new one, in a place more convenient, and nearer the temple. Strabo tells us, that, as the inhabitants ſhowed a great reluctance to quit their ancient habitations, Lyſimachus cauſed all the drains that conveyed the water into the neighbouring fens and the Cayſter to be privately ſtopped up; whereby the city being on the firſt violent rains in great part laid under water, and many of the inhabitants drowned, they were glad to abandon the ancient and retire to the new city. This new Epheſus was greatly damaged by an earthquake in the reign of Tiberius, but by that emperor repaired and adorned with ſeveral ſtately buildings, of which there are now but few ruins to be ſeen, and ſcarce any thing worthy of ancient Epheſus. The aqueduct, part of which is ſtill ſtanding, is generally believed to have been the work of the Greek emperors; the pillars which ſupport the arches are of fine marble, and higher or lower as the level of the water required. This aqueduct ſerved to convey water into the city from the ſpring of Halitee, mentioned by Pauſanias. The gate, now called by the inhabitants, for what reaſon we know not, *the Gate of Perſecution*, is remarkable for three bas-reliefs on the mould of an exquiſite taſte. The port, of which ſo many medals have been ſtruck, is at preſent but an open road, and not much frequented. The Cayſter was formerly navigable, and afforded a ſafe place for ſhips to ride in, but is now almoſt choked up with ſand.

But the chief ornament of Epheſus was the temple of Diana, built at the common charge of all the ſtates in Aſia, and for its ſtructure, ſize, and furniture, accounted among the wonders of the world. This great edifice was ſituated at the foot of a mountain, and at the head of a marſh; which place they choſe, if we believe Pliny, as the leaſt ſubject to earthquakes. This ſite doubled the charges; for they were obliged to be at a vaſt expence in making drains to convey the water that came down the hill into the moraſs and the Cayſter. Philo Byzantius tells us, that in this work they uſed ſuch a quantity of ſtone, as almoſt exhauſted all the quarries in the country; and theſe drains or vaults are what the preſent inhabitants take for a labyrinth. To ſecure the foundations of the conduits or ſewers, which were to bear a building of ſuch a prodigious weight, they laid beds of charcoal, ſays Pliny, well rammed, and upon them others of wool. Two hundred and twenty years, Pliny ſays 400, were ſpent in building this wonderful temple by all Aſia. It was 425 feet in length, and 200 in breadth, ſupported by 127 marble pillars, 70 feet high, of which 27 were moſt curiouſly carved, and the reſt poliſhed. Theſe pillars were the works of ſo many kings, and the bas-reliefs of one were done by Scopas, the moſt famous ſculptor of antiquity; the altar was almoſt wholly the work of Praxiteles. Cheiromocrates, who built the city of Alexandria, and offered to form Mount Athos into a ſtatue of Alexander, was the architect employed on this occaſion. The temple enjoyed the privilege of an aſylum, which at firſt extended to a furlong, was afterwards enlarged by Mithridates to a bow-ſhot, and doubled by Marc Antony, ſo that it took in part of the city: but Tiberius, to put a ſtop to the many abuſes and diſorders that attend privileges of this kind, revoked them all, and declared that no man guilty of any wicked or diſhoneſt action ſhould eſcape juſtice, though he fled to the altar itſelf.

The prieſts who officiated in this temple were held in great eſteem, and truſted with the care of ſacred virgins, or prieſteſſes, but not till they were made eunuchs. They were called *Eſtiatores* and *Eſſenæ*, had a particular diet, and were not allowed by their conſtitutions to go into any private houſe. They were maintained with the profits accruing from the lake Selinuſius, and another that fell into it, which muſt have been very conſiderable, ſince they erected a golden ſtatue to one Artemidorus, who being ſent to Rome, recovered them after they had been ſeized by the farmers of the public revenues. All the Ionians reſorted yearly to Epheſus, with their wives and children, where they ſolmnized the feſtival of Diana with great pomp and magnificence, making on that occaſion rich offerings to the goddeſs, and valuable preſents to her prieſts. The aſiarchæ, mentioned by St Luke, were, according to Beza, thoſe prieſts whoſe peculiar province it was to regulate the public ſports that were annually performed at Epheſus in honour of Diana: they were maintained with the collections made during the ſports; for all Aſia flocked to ſee them. The great Diana of the Epheſians, as ſhe was ſtyled by her blind adorers, was, according to Pliny, a ſmall ſtatue of ebony, made by one Canitia, though commonly believed to have been ſent down from heaven by Jupiter. This ſtatue was firſt placed in a nich, which, as we are told, the Amazons cauſed to be made in the trunk of an elm. Such was the firſt riſe of the veneration that was paid to Diana in this place. In proceſs of time the veneration for the goddeſs daily increaſing among the inhabitants of Aſia, a moſt ſtately and magnificent temple was built near the place where the elm ſtood, and the ſtatue of the goddeſs placed in it. This was the firſt temple; but not quite ſo ſumptuous as that which we have deſcribed, though reckoned, as well as the ſecond, among the wonders of the world. The ſecond, being that above deſcribed, was remaining in Pliny's time, and in Strabo's; and is ſuppoſed to have been deſtroyed in the reign of Conſtantine, purſuant to the edict by which that emperor commanded all the temples of the heathens to be thrown down and demoliſhed: the former was burnt the ſame day that Alexander was born, by one Eroſtratus, who owned on the rack, that the only thing which had prompted him to deſtroy ſo excellent a work, was the deſire of tranſmitting his name to future ages. Whereupon the common council of Aſia made a decree, forbidding any one to name him; but this prohibition ſerved only to make his name more memorable, ſuch a remarkable extravagance, or rather madneſs, being taken notice of by all the hiſtorians who have written of thoſe times. Alexander offered to rebuild the temple at his own expence, provided the Epheſians would agree to put his name on the front; but they rejected his offer in ſuch a manner as prevented the reſentment of that vain prince, telling him, that "it was not fit one god ſhould build a temple to another." The pillars, and other materials that had been ſaved out of the flames, were ſold, and alſo the jewels of the Epheſian women, who on that occaſion willingly parted with them; and the ſum raiſed from thence ſerved for the carrying on of the work till other contributions came in, which, in a ſhort time, amounted to an immenſe treaſure. This is the temple which Strabo, Pliny, and other Roman writers ſpeak of. It ſtood between the city and the port, and was built, or rather finiſhed, as Livy tells us, in the reign of king Servius. Of this wonderful ſtructure there is nothing at preſent remaining but ſome ruins, and a few broken pillars.

The Ionians firſt ſettled at Epheſus under the conduct of Androclus, who drove out the Carians and Leleges, by whom thoſe places were poſſeſſed at his arrival. The city, whither built by him, as Strabo affirms, or by one Crœſus or Epheſus, long before the Ionic migration, as others maintain, became ſoon the metropolis of Ionia. It was at firſt governed by Androclus, and his deſcendants, who aſſumed the royal title, and exerciſed the regal authority over the new colony: whence, even in Strabo's time, the poſterity of Androclus were ſtyled kings, and allowed to wear a ſcarlet robe, with a ſceptre, and all the enſigns of the royal dignity. In proceſs of time, a new form of government was introduced, and a ſenate eſtabliſhed; but when, or on what occaſion, this change happened, we know not. This kind of government continued till the time of Pythagoras, who lived before Cyrus the Great, and was one of the moſt cruel and inhuman tyrants we read of in hiſtory; for, having driven out the ſenate, and taken all the power into his own hands, he filled the city with blood and rapine, not ſparing even thoſe who fled to the temple of Diana for ſhelter. Pythagoras was ſucceeded by Pindarus, who bore the ſame ſway in the city; but treated the citizens with more humanity. In his time Epheſus being beſieged by Crœſus king of Lydia, he adviſed the inhabitants to devote their city to Diana, and faſten the wall, by a rope, to the pillars of her temple. They followed his advice, and were, from reverence to the goddeſs, not only treated with great kindneſs by Crœſus, but reſtored to their former liberty. Pindarus being obliged to reſign his power, retired to Peloponneſus. He was, according to Ælian, grandſon to Alyattes king of Lydia, and Crœſus's nephew. The other tyrants of Epheſus mentioned in hiſtory are, Athenagoras, Comas, Ariſtarchus, and Hegeſias; of whom the laſt was expelled by Alexander, who, coming to Epheſus, after having defeated the Perſians on the banks of the Granicus, beſtowed upon Diana all the tributes which the Epheſians had paid to the Perſians, and eſtabliſhed a democracy in the city. In the war between Mithridates and the Romans, they ſided with the former, and, by his direction, maſſacred all the Romans that reſided in their city; for which barbarity they were ſeverely fined, and reduced almoſt to beggary by Sylla, but afterwards treated kindly, and ſuffered to live according to their own laws, as is plain from ſeveral ancient inſcriptions and medals. The Epheſians were much addicted to ſuperſtition, ſorcery, and curious arts, as the ſcripture ſtyles them; whence came the proverb "Epheſian letters," ſignifying all ſorts of ſpells or charms.

In the time of the apoſtle Paul, Epheſus retained a great deal of its ancient grandeur. But it was a ruinous place, when the emperor Juſtinian filled Conſtantinople with its ſtatues, and raiſed his church of St Sophia upon its columns. Since then it has been almoſt quite exhauſted. Towards the end of the 11th century, a Turkiſh pirate, named *Tangripermes*, ſettled there. But the Greek admiral, John Ducas, defeated him in a bloody battle, and purſued the flying Turks up the Mæander. In 1306, it was among the places which ſuffered from the exactions of the grand-duke Roger; and two years after, it ſurrendered to ſultan Sayſan, who, to prevent future inſurrections, removed moſt of the inhabitants to Tyriæum, where they were maſſacred. Epheſus appears to have ſubſiſted as an inconſiderable place for ſome time. But now, the Epheſians are only a few Greek peaſants, living in extreme wretchedneſs, dependence, and inſenſibility; the repreſentatives of an illuſtrious people, and inhabiting the wreck of their greatneſs; ſome, the ſubſtructions of the glorious edifices which they raiſed; ſome, beneath the vaults of the Stadium, once the crowded ſcene of their diverſions; and ſome, by the abrupt precipice, in the ſepulchres which received their aſhes.

EPHETÆ (from ἐφίημι, "I ſend forth"), in antiquity, a ſort of magiſtrates among the Athenians, inſtituted by king Demophoon, to take cognizance of murder, man-ſlaughter, and chance-medley.

Their number was 100, whereof 50 were Athenians, and 50 Argians: they were not admitted to the poſt till upwards of 50 years of age. Draco new modelled it, excluded the Argians out of it, and made it to conſiſt of 51 Athenians, each above 50 years of age: Ubbo Emmius de Rep. Athen. ſays, he transferred to them part of the juriſdiction of the Areopagites. See AREOPAGUS.

EPHOD, in Jewiſh antiquity, one part of the prieſtly habit; being a kind of girdle, which, brought from behind the neck over the two ſhoulders, and hanging down before, was put acroſs the ſtomach, then carried round the waiſt, and made uſe of as a girdle to the tunic.—There were two ſorts of ephods, one of plain linen for the prieſts, and the other embroidered for the high prieſt.

EPHORI, in Grecian antiquity, magiſtrates eſtabliſhed in ancient Sparta to balance the regal power. The authority of the ephori was very great. They ſometimes expelled and even put to death the kings, and aboliſhed or ſuſpended the power of the other magiſtrates, calling them to account at pleaſure. There were five of them, others ſay nine. They preſided in the public ſhows and feſtivals. They were entruſted with the public treaſure; made war and peace; and were ſo abſolute, that Ariſtotle makes their government equal to the prerogative of a monarchy. They were eſtabliſhed by Lycurgus, according to the generality of authors: though this is denied by others, who date their origin 130 years after the time of that legiſlator. Thus Plutarch, in his Life of Cleomenes, aſcribes their inſtitution to Theopompus king of Sparta; which is alſo confirmed by the authority of Ariſtotle.

EPHORUS, an orator and hiſtorian of Cumæ in Æolia, about 352 years before Chriſt. He was diſciple to Iſocrates, by whoſe advice he wrote an hiſtory which gave an account of all the actions and battles that had happened between the Greeks and barbarians for 750 years. It was greatly eſteemed by the ancients; but is now loſt.

EPHRAIM (anc. geog.), one of the diviſions of Paleſtine by tribes: Ephraim and the half tribe of Manaſſeh are blended together by the ſacred writer; and it only appears that Ephraim occupied the more ſouthern, and the half tribe of Manaſſeh the more northern parts, but both ſeem to have extended from the Jordan to the ſea. Ephraim alſo denotes a kingdom, on the ſeparation of the 10 tribes from the houſe of David, called alſo the kingdom of Iſrael and of Samaria.

EPHRATA, a ſmall town of Pennſylvania in America, and the principal ſettlement of the religious ſect called *Dunkards* or *Tunkers*. See Tunkers.

EPHREM (Syrus), an ancient Chriſtian writer, in the fourth century, deacon of Edeſſa, was born at Niſibe, in Syria. He was greatly eſteemed by St Baſil, St Gregory, Nyſſen, and other great men. He wrote againſt the opinions of Sabellius, Arius, Apollonarius, the Manichees, &c. and acquired ſuch reputation by his virtue and his works, that he was called the *doctor and the prophet of the Syrians*. He died in 378. The beſt editions of his works are, that of Oxford, in 1708, in folio, and that of Rome, from 1732 to 1736, in Syriac, Greek, and Latin, 6 vols folio.

EPHYDOR, in antiquity, an officer in the Athenian courts of juſtice, who was to provide the plaintiff and defendant with equal water hour-glaſſes. When the glaſs was run out, they were not permitted to ſpeak any farther; and, therefore, we find them very careful not to loſe or miſpend one drop of their water. Whilſt the laws quoted by them were reciting, or if any other buſineſs happened to intervene, they gave orders that the glaſs ſhould be ſtopped.

EPIBATÆ, Επιϐαται, among the Greeks, marines or ſoldiers who ſerved on board the ſhips of war. They were armed in the ſame manner as the land-forces, only that more of them wore full or heavy armour.

EPIBATERION, a poetical compoſition, in uſe among the ancient Greeks. When any perſon of condition and quality returned home after a long abſence or journey into another country, he called together his friends and fellow-citizens, and made them a ſpeech, or rehearſed them a copy of verſes, wherein he returned ſolemn thanks to the immortal gods for his happy return; and ended with an addreſs by way of compliment to his fellow-citizens.—Theſe verſes made what the Greeks call επιϐατεριον, *epibaterium*, of επιϐαινω, "I go abroad". At going away they had another, called *apobaterium*.

EPIBATERIUM, in botany: A genus of the hexandria order, belonging to the monœcia claſs of plants. In the male flowers the calyx is a double perianthium, the outward one with ſix leaves, very ſmall; the inner one three-leaved, and three times larger than the former, with egg-ſhaped leaves. The corolla has ſix petals ſmaller than the interior calyx and roundiſh. The ſtamina are ſix capillary filaments, crooked, and as long as the petals; the antheræ are roundiſh. The female flowers are on the ſame plant. The calyx and corolla are as in the male. The pericarpium conſiſts of three roundiſh, monoſpermous plums; the ſeed a kidney-ſhaped compreſſed nut, ſomewhat furrowed.

EPIC, or Heroic, *Poem*, a poem expreſſed in narration, formed upon a ſtory partly real and partly feigned; repreſenting, in a ſublime ſtyle, ſome ſignal and fortunate action, diſtinguiſhed by a variety of great events, to form the morals, and affect the mind with the love of heroic virtue.

We may diſtinguiſh three parts of the definition, namely, the matter, the form, and the end. The matter includes the action of the fable, under which are ranged the incidents, epiſodes, characters, morals, and machinery. The form comprehends the way or manner of the narration, whether by the poet himſelf, or by any perſons introduced, whoſe diſcourſes are related: to this branch likewiſe belong the moving of the paſſions, the deſcriptions, diſcourſes, ſentiments, thoughts, ſtyle, and verſification; and beſides theſe, the ſimilies, tropes, figures, and, in ſhort, all the ornaments and decorations of the poem. The end is to improve our morals and increaſe our virtue. See Poetry.

EPICEDION (formed of επι *upon*, and κηδος *funeral*), in the Greek and Latin poetry, a poem, or poetical compoſition, on the death of a perſon.—At the obſequies of any man of figure, there were three kinds of diſcourſes uſually made; that rehearſed at his *buſtum* or funeral pile, was called *nenia*; that engraven on his tomb, *epitaph*; and that ſpoken in the ceremony of his funeral, *epicedion*. We have two beautiful epicedions in Virgil, that of Euryalus and that of Pallas.

EPICEDIUM, in ancient poetry, a poem rehearſed during the funeral ſolemnity of perſons of diſtinction.

EPICHARMUS, an ancient poet and philoſopher, born in Sicily, was a ſcholar of Pythagoras. He is ſaid to have introduced comedy at Syracuſe in the reign of Hiero. Horace commends Plautus for imitating him, in following the chace of the intrigue ſo cloſely as not to give the readers or ſpectators time to trouble themſelves with doubts concerning the diſcovery. He wrote likewiſe treatiſes concerning philoſophy and medicine; but none of his works have been preſerved. He died aged 90, according to Laertius, who has preſerved four verſes inſcribed on his ſtatue.

EPICHIROTONIA, among the Athenians. It was ordained by Solon, that once every year the laws ſhould be carefully reviſed and examined; and if any of them were found unſuitable to the preſent ſtate of affairs, they ſhould be repealed. This was called επιχειροτονια των νομων, from the manner of giving their ſuffrages by *holding up their hands*. See a farther account of this cuſtom in Pott. Archæol. Græc. lib. 1. cap. 26. tom. i. p. 142.

EPICOENE, in grammar, a term applied to nouns, which, under the ſame gender and termination, mark indifferently the male and female ſpecies. Such in Latin is *aquila*, *veſpertilio*, &c. which ſignify equally a male or female eagle or bat.

Grammarians diſtinguiſh between *epicœne* and *common*. A noun is ſaid to be common of two kinds, when it may be joined either with a maſculine or a feminine article; and epicœne, when it is always joined to ſome of the two articles, and yet ſignifies both genders.

EPICTETUS, a celebrated Stoic philoſopher, born at Hierapolis in Phrygia, in the firſt century, was the ſlave of Epaphroditus, a freedman and one of Nero's guard. Domitian baniſhing all philoſophers from Rome, about the year 94, Epictetus retired to Nicopolis in Epirus, where he died in a very advanced age; and after his death, the earthen lamp he made uſe of ſold for 3000 drachmas. He was a man of great modeſty; which was eminent in his own practice, as well as in his recommendation to others: hence he uſed to ſay, "That there is no need of adorning a man's houſe with rich hangings or paintings, ſince the moſt graceful furniture is temperance and modeſty, which are laſting ornaments, and will never be the worſe for wearing." Of all the ancient philoſophers, he ſeems to have made the neareſt approaches to the Chriſtian morality, and to have had the moſt juſt ideas of God and providence. He always poſſeſſed a cool and ſerene mind, unruffled by paſſion; and was uſed to ſay, that the whole of moral philoſophy was included in theſe words, *ſupport* and *abſtain*. One day, his maſter Epaphroditus ſtrove in a frolic to wrench his leg; when Epictetus ſaid, with a ſmile, and free from any emotion, "If you go on, you will certainly break my leg:" but the former redoubling his effort, and ſtriking it with all his ſtrength, he at laſt broke the bone; when all the return Epictetus made was, "Did not I tell you, Sir, that you would break my leg?" No man was more expert at reducing the rigour of the maxims of the Stoics into practice. He conformed himſelf ſtrictly, both in his diſcourſe and behaviour, to the manners of Socrates and Zeno. He waged continual war with fancy and fortune; and it is an excellence peculiar to himſelf, that he admitted all the ſeverity of the Stoics without their ſourneſs, and reformed Stoiciſm as well as profeſſed it; and beſides his vindicating the immortality of the ſoul as ſtrenuouſly as Socrates or any Stoic of them all, he declared openly againſt ſelf murder, the lawfulneſs of which was maintained by the reſt of the ſect. Arrian, his diſciple, wrote a large account of his life and death, which is loſt; and preſerved four books of his diſcourſes and his Enchiridion, of which there have been ſeveral editions in Greek and Latin; and, in 1758, a tranſlation of them into Engliſh was publiſhed by the learned and ingenious Miſs Carter.

EPICUREAN PHILOSOPHY, the doctrine or ſyſtem of philoſophy maintained by Epicurus and his followers.

His philoſophy conſiſted of three parts; canonical, phyſical, and ethereal. The firſt was about the canons or rules of judging. The cenſure which Tully paſſes upon him for his deſpiſing logic, will hold true only with regard to the logic of the Stoics, which he could not approve of, as being too full of nicety and quirk. Epicurus was not acquainted with the analytical method of diviſion and argumentation, nor was he ſo curious in modes and formation as the Stoics. Soundneſs and ſimplicity of ſenſe, aſſiſted with ſome natural reflections, was all his art. His ſearch after truth proceeded only by the ſenſes; to the evidence of which he gave ſo great a certainty, that he conſidered them as an infallible rule of truth, and termed them the *firſt natural light of mankind*.

In the ſecond part of this philoſophy he laid down atoms, ſpace, and gravity, as the firſt principles of all things: he did not deny the exiſtence of God, but thought it beneath his majeſty to concern himſelf with human affairs; he held him a bleſſed immortal Being, having no affairs of his own to take care of, and above meddling with thoſe of others.

As to his ethics, he made the ſupreme good of man to conſiſt in pleaſure, and conſequently ſupreme evil in pain. Nature itſelf, ſays he, teaches us this truth; and prompts us from our birth to procure whatever gives us pleaſure, and avoid what gives us pain. To this end he propoſes a remedy againſt the ſharpneſs of pain: this was to divert the mind from it, by turning our whole attention upon the pleaſures we have formerly enjoyed. He held that the wiſe man muſt be happy, as long as he is wiſe: the pain, not depriving him of his wiſdom, cannot deprive him of his happineſs.

There is nothing that has a fairer ſhow of honeſty than the moral doctrine of Epicurus. Gaſſendus pretends, that the pleaſure in which this philoſopher has fixed the ſovereign good, was nothing elſe but the higheſt tranquillity of mind, in conjunction with the moſt perfect health of body: but Tully, Horace, and Plutarch, as well as almoſt all the fathers of the church, give us a very different repreſentation: indeed the nature of this pleaſure, in which the chief happineſs is ſuppoſed to be ſeated, is a grand problem in the morals of Epicurus. Hence there were two kinds of Epicureans, the rigid and the remiſs: the firſt were thoſe who underſtood Epicurus's notion of pleaſure in the beſt ſenſe, and placed all their happineſs in the pure pleaſures of the mind, reſulting from the practice of virtue: the looſe or remiſs Epicureans, taking the words of that philoſopher in a groſs ſenſe, placed all their happineſs in bodily pleaſures or debauchery.

EPICURUS, the greateſt philoſopher of his age, was born at Gargettium in Attica, about 340 B. C. in the 109th Olympiad. He ſettled at Athens in a fine garden he had bought; where he lived with his friends in great tranquillity, and educated a great number of diſciples. They lived all in common with their maſter. The reſpect which his followers paid to his memory is admirable: his ſchool was never divided, but his doctrine was followed as an oracle. His birth-day was ſtill kept in Pliny's time; the month he was born in was obſerved as a continued feſtival; and they placed his picture every where. He wrote a great many books, and valued himſelf upon making no quotations. He raiſed the atomical ſyſtem to a great reputation, though he was not the inventor of it, but had only made ſome change in that of Democritus. As to his doctrine concerning the ſupreme good or happineſs, it was very liable to be miſrepreſented, and ſome ill effects proceeded from thence, which diſcredited his ſect. He was charged with perverting the worſhip of the gods, and inciting men to debauchery; but he did not forget himſelf on this occaſion: he publiſhed his opinions to the whole world; he wrote ſome books of devotion; recommended the veneration of the gods, ſobriety, and chaſtity; and it is certain that he lived in an exemplary manner, and conformably to the rules of philoſophical wiſdom and frugality. Timocrites, a deſerter of his ſect, ſpoke very ſcandalouſly of him. Gaſſendus has given us all he could collect from the ancients concerning the perſon and doctrine of this philoſopher; who died of a ſuppreſſion of urine, aged 72.

EPICYCLE, in the ancient aſtronomy, a little circle whoſe centre is in the circumference of a greater circle: or it is a ſmall orb or ſphere, which being fixed in the deferent of a planet, is carried along with it; and yet, by his own peculiar motion, carries the planet faſtened to it round its proper centre.

It was by means of epicycles that Ptolemy and his followers ſolved the various phenomena of the planets, but more eſpecially their ſtations and retrogradations.

EPICYCLOID, in geometry, a curve generated by the revolution of the periphery of a circle, along the convex or concave ſide of the periphery of another circle.

EPICYEMA, among phyſicians, denotes a ſuperfetation; being a falſe conception or mole happening after the birth of a regular fetus.

EPIDAURUM, EPIDAURUS, or EPITAURUM, (anc. geog.), a town of Dalmatia, on the Adriatic, built the ſame year, as is ſaid, with Dyrrachium, 430 years after the deſtruction of Troy: A conſiderable town formerly, but now reduced to a ſmall village, called *Raguſi Vecchio*; diſtant ſix miles from the modern Raguſi. E. Long. 19°. Lat. 42°, 20′.

EPIDAURUS (anc. geog.), a town of Argolis, in Peloponneſus, on the Saronic bay, to the ſouth of the promontory *Spiræum*; called *ſacred*, becauſe of the religious veneration paid to Æſculapius, whoſe temple ſtood at the diſtance of five miles from the town. The Romans, during a peſtilence, being adviſed to convey the god to Rome, ſent a ſhip, with a ſolemn embaſſy, for his conveyance: but while the Epidaurians were in ſuſpenſe to part with him, a huge ſerpent ſailed to the ſhip; and, being taken for the god, was carried to Rome in great ſolemnity. Epidaurus ſtood in a receſs of the bay, fronting the eaſt; and was fortified by nature, being incloſed by high mountains reaching to the ſea, and rendering it difficult of acceſs. It had ſeveral temples, and in the acropolis or citadel was a remarkable ſtatue of Minerva. The ſite is now called *Epi-thavro*. The traces are indiſtinct, and it has probably been long deſerted. The harbour of Epidaurus is long. Its periplus or circuit was 15 ſtadia or near two miles. The entrance is between mountains, and on a ſmall rocky peninſula on the left hand are ruins of a modern fortreſs. This, it ſeems, was the point on which a temple of Juno ſtood. It is frequented by veſſels for wood or corn. The grove of Æſculapius was incloſed by mountains, within which all the ſacrifices as well of the Epidaurians as of ſtrangers were conſumed. One was called Titthion; and on this the god when an infant was ſaid to have been expoſed, and to have been ſuckled by a ſhe-goat. He was a great phyſician, and his temple was always crowded with ſick perſons. Beyond it was the dormitory of the ſuppliants; and near it, a circular edifice called the *Tholus*, built by Polycletus, of white marble, worth ſeeing. The grove, beſides other temples, was adorned with a portico, and a fountain remarkable for its roof and decorations. The bath of Æſculapius was one of the benefactions of Antoninus Pius, while a Roman ſenator; as was alſo a houſe for the reception of pregnant women and dying perſons, who before were removed out of the incloſure, to be delivered or to expire in the open air. The remains are heaps of ſtones, pieces of brick wall, and ſcattered fragments of marble; beſides ſome churches or rather piles of rubbiſh miſ-called, being deſtitute of doors, roofs, or any kind of ornament. The ſtatue of Æſculapius was half as big as that of Jupiter Olympius at Athens. It was made of ivory and gold, and, as the inſcription proved, by Thraſymedes ſon of Arignotus of Paros. He was repreſented ſitting, holding his ſtaff, with one hand on the head of a ſerpent, and a dog lying by him. Two Argive heroes, Bellerophon combating with the monſter Chimæra, and Perſeus ſevering the head of Meduſa, were carved on the throne. Many tablets deſcribed the cures performed by the deity, yet he had not eſcaped contumely and robbery. Dionyſius deprived him of his golden beard. affirming it was very unſeemly in him to appear in that manner when his father Apollo was always ſeen with his face ſmooth. Sylla amaſſed the precious offerings belonging to him and to Apollo and Jupiter at Delphi and Olympia, to pay his army before Athens. The marks in the walls teſtified that a great number had been plucked down. A few fragments of white marble exquiſitely carved occur in the heap of the temple. The incloſure of the temple once abounded in inſcriptions. In the ſecond century ſix marbles remained, on which were written in the Doric dialect the names of men and women who had been patients of the god, with the diſtemper each had laboured under, and the remedies he had directed. Dr Chandler found only a couple of votive inſcriptions, and two pedeſtals of ſtatues, one of which repreſented a Roman, and was erected by the city of the Epidaurians. The Stadium was near the temple. It was of earth, as moſt in Greece were. At the upper end are ſeats of ſtone, but theſe were continued along the ſides only a few yards. A vaulted paſſage leading underneath into the area, now choked up, was a private way by which the Agonothetæ or preſidents with the prieſts and perſons of diſtinction entered. Two large ciſterns or reſervoirs remain, made by Antoninus for the reception of rain-water. Beyond them is a dry water-courſe; and in the mountain-ſide on the right-hand are the marble ſeats of the theatre, overgrown with buſhes. The ſprings and wells by the ruins are now ſuppoſed to poſſeſs many excellent properties. To theſe and a good air, Dr Chandler thinks, with the recreations of the theatre and of the ſtadium, and to the medicinal knowledge and experience of the prieſts, may be attributed both the recovery of the ſick and the reputation of Æſculapius.

EPIDAURUS, with the ſurname *Limera*, to diſtinguiſh it from the Epidaurus of Argolis; called ſo, either from its meadows or its commodious harbours (Stephanus, Apollodorus): a town of Laconica, on the Ionian ſea, to the ſouth of the Sinus Argolicus, ſituated where now Molvaſia ſtands, in the Morea. E. Long. 23. 30. Lat. 35. 40.

EPIDEMIA, in Grecian antiquity, feſtivals kept in honour of Apollo and Diana, at the ſtated ſeaſons when

when thoſe deities, who could not be preſent every where, were ſuppoſed to viſit different places, in order to receive the vows of their adorers.

EPIDEMIC, among phyſicians, an epithet of diſeaſes which at certain times are popular, attacking great numbers at or near the ſame time.

EPIDENDRUM, in botany: A genus of the diandria order, belonging to the gynandria claſs of plants; and in the natural method ranking under the ſeventh order, *Orchideæ*. The nectarium is turbinated, oblique, and reflexed. This is the plant which produces the fruit called *vanilla*, and which is uſed in the making of chocolate. It is a native of Mexico, and alſo of ſome parts of the Eaſt Indies. It is a paraſitic plant; the leaves of which greatly reſemble the vine, and are about 18 inches long and three inches broad. The flowers are of a white colour intermixed with ſtripes of red and yellow. When theſe fall off, they are quickly ſucceeded by the pods, which at firſt are green, but afterwards, as they ripen, become yellow, and are gathered for uſe. The pods of the beſt vanilla are long, ſlender, and well filled with ſeeds. If opened when freſh, the cavity of the pod is found to contain a humid ſubſtance that is black, oily, and balſamic, of ſuch a ſtrong ſmell, that it frequently cauſes headachs, and even a ſort of temporary intoxication. The ſeaſon for gathering the pods begins about the latter end of September, and laſts till the end of December. They are dried in the ſhade; and when dry and fit for keeping, they are rubbed externally with a little oil of cocoa or calba, to render them ſupple, or preſerve them the better, and to prevent them from becoming too dry or brittle. The uſe of this fruit is only for perfuming chocolate. In New Spain it is reckoned unwholeſome; and therefore never uſed: but in England and other countries of Europe, it is a conſtant ingredient; and perhaps its noxious qualities may be corrected by the ſea-air. In thoſe countries where they grow, the plants are very eaſily propagated by cuttings. In this country they require to be kept in a ſtove, and alſo to be placed near ſome American tree, round which they may climb for their ſupport.

EPIDERMIS, in anatomy, the cuticle or ſcarfſkin. See Anatomy, n° 74. The word is formed of the Greek επι, *on, over*; and δερμα, *ſkin.*

EPIDICASIA, among the Athenians. Daughters inheriting their parents eſtate, were obliged to marry their neareſt relation; which gave occaſion to perſons of the ſame family to go to law with one another, each pretending to be more nearly allied to the heireſs than the reſt. The ſuit was called επιδικασιας δικη: and the virgin, about whom the relations conteſted, επιδικος.

EPIDIDYMIS, in anatomy, a little round body, on the back of each teſticle; called alſo *paraſtata*. See Anatomy, p. 738, col. 1.

EPIGÆA, in botany: A genus of the monogynia order, belonging to the decandria claſs of plants; and in the natural method ranking under the 18th order, *Bicornes*.

EPIDOTÆ, certain deities who preſided over the growth of children. They were worſhipped by the Lacedæmonians, and chiefly invoked by thoſe who were perſecuted by the ghoſts of the dead, &c.

EPIGASTRIC region, a part or ſubdiviſion of the abdomen. See Anatomy, n° 88.

EPIGLOTTIS, in anatomy, one of the cartilages of the larynx or wind-pipe. See Anatomy, n° 104, par. 3. and n° 116.

EPIGONI, the ſons and deſcendants of the Grecian heroes who were killed in the firſt Theban war. The war of the Epigoni is famous in ancient hiſtory. It was undertaken ten years after the firſt. The ſons of thoſe that had periſhed in the firſt war, reſolved to avenge the death of their fathers, and marched againſt Thebes, under the command of Therſander; or, according to others, of Alcmæon the ſon of Amphiaraus, about 1307 years before Chriſt. The Argives were aſſiſted by the Corinthians, the people of Meſſenia, Arcadia, and Megara. The Thebans had engaged all their neighbours in their quarrel, as in one common cauſe. Theſe two hoſtile armies met and engaged on the banks of the Gliſſas. The fight was obſtinate and bloody, but victory declared for the Epigoni, and ſome of the Thebans fled to Illyricum with Leodamas their general, while others retired into Thebes, where they were ſoon beſieged, and forced to ſurrender. In this war Ægialeus was the only one who was killed, and his father Adraſtus was the only one who eſcaped alive in the firſt war. This whole war, as Pauſanias obſerves, was written in verſe; and Callinus, who quotes ſome of the verſes, aſcribes them to Homer, which opinion has been adopted by many writers. "For my part (continues the geographer), I own, that next to the Iliad and Odyſſey of Homer, I have never ſeen a finer poem." The deſcendants of the veteran Macedonians, who ſerved under Alexander the Great, and who had children by Aſiatic women, were alſo called *Epigoni*, (Juſtin.)

EPIGRAM, in poetry, a ſhort poem in verſe, treating only of one thing, and ending with ſome lively, ingenious, and natural thought or point. The word is formed of επιγραμμα *inſcription*, of επιγραφειν *to inſcribe* or *write upon.*

Epigrams then, originally, ſignify inſcriptions, and they derive their origin from thoſe inſcriptions placed by the ancients on their tombs, ſtatues, temples, triumphal arches, &c. Theſe, at firſt, were only ſimple monograms: afterwards, increaſing their length, they made them in verſe, to be the more eaſily retained: Herodotus, and others, have tranſmitted to us ſeveral of them. Such little poems retained the name of epigrams, even after the deſign of their firſt inſtitution was varied, and people began to uſe them for the relation of little facts and accidents, the characterizing of perſons, &c. The point or turn is a quality much inſiſted on by the critics, who require the epigram conſtantly to cloſe with ſomething poignant and unexpected, to which all the reſt of the compoſition is only preparatory; while others, on the contrary, exclude the point, and require the thought to be equally diffuſed throughout the poem, without laying the whole ſtreſs on the cloſe: the former is uſually Martial's practice, and the latter that of Catullus.

The Greek epigrams have ſcarce any thing of the point or briſkneſs of the Latin ones: thoſe collected in the Anthology, have moſt of them a remarkable air of eaſe and ſimplicity, attended with ſomething juſt and witty; ſuch as we find in a ſenſible peaſant, or a child that has wit. They have nothing that bites, but ſomething that tickles. Though they want the ſalt of Martial, yet to a good taſte they are not inſipid; except a few of them, which are quite flat and ſpiritleſs. However, the general faintneſs and delicacy of the pleaſantry in them, has given occaſion for a Greek epigram, or *epigram à la Greque*, to denote, among the French, an epigram void of ſalt or ſharpneſs.

The epigram admits of great variety of ſubjects: ſome are made to praiſe, and others to ſatirize; which laſt are much the eaſieſt, ill-nature ſerving inſtead of point and wit. Boileau's epigrams are all ſatires on one or another; thoſe of des Reaux are all made in honour of his friends; and thoſe of Mad. Scudery are ſo many eloges. The epigram being only a ſingle thought, it would be ridiculous to expreſs it in a great number of verſes.

EPIGRAPHE, among antiquarians, denotes the inſcription of a building, pointing out the time when, the perſons by whom, the uſes, and the like, for which it was erected.

EPILEPSY, in medicine, the ſame with what is otherwiſe called the *falling-ſickneſs*, from the patient's falling ſuddenly to the ground. See *Medicine-Index*.

EPILOBIUM, the WILLOW-HERB, in botany: A genus of the monogynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 17th order, *Calycanthemæ*. The calyx is quadrifid; the petals four; the capſule oblong inferior; the ſeeds pappous or downy. There are ſeven ſpecies, all of them natives of Britain. They grow in marſhes, or under hedges in moiſt and ſhady places; having bloſſoms generally of a red colour, and ſometimes of conſiderable beauty. The moſt remarkable is the hirſutum, commonly called *codlins and cream*. The top-ſhoots of this plant have a very delicate fragrancy; but ſo tranſitory, that before they have been gathered five minutes, it is no longer perceptible. Horſes, ſheep, and goats eat this plant; cows are not fond of it; ſwine refuſe it. An infuſion of the leaves of another ſpecies, the anguſtifolium, or roſebay willow-herb, has an intoxicating quality, as the inhabitants of Kamtſchatka have learned. Theſe people alſo eat the white young ſhoots which creep under the ground, and have a ſort of ale brewed from the dried pith of it. The down of the ſeeds has been lately manufactured by mixing it with cotton or beaver's hair.

EPILOGUE, in oratory, the end or concluſion of a diſcourſe, ordinarily containing a recapitulation of the principal matters delivered.

EPILOGUE, in dramatic poetry, a ſpeech addreſſed to the audience, after the play is over, by one of the principal actors therein; uſually containing ſome reflections on certain incidents in the play, eſpecially thoſe in the part of the perſon that ſpeaks it; and having ſomewhat of pleaſantry, intended to compoſe the paſſions raiſed in the courſe of the repreſentation: A practice which is ridiculed by the *Spectator*; and compared to a merry jigg upon the organ after a good ſermon, to wipe away any impreſſions that might have been made thereby, and ſend the people away juſt as they came.

EPIMEDIUM, BARREN-WORT, in botany: A genus of the monogynia order, belonging to the tetrandria claſs of plants; and in the natural method ranking under the 24th order, *Corydales*. There are four nectaria, cup-ſhaped, and lying on the petals. The corolla is tetrapetalous, the calyx dropping off. The ſeed-veſſel is a pod. There is only one ſpecies, *viz.* the alpinum. It is a low herbaceous plant, with a creeping root, having many ſtalks about nine inches high, each of which has three flowers compoſed of four leaves placed in the form of a croſs. They are of a reddiſh colour, with yellow ſtripes on the border.

EPIMENIDES, an ancient poet and philoſopher, was born at Gnoſſus in Crete. Contrary to the cuſtom of his country, he always wore his hair long; which, according to ſome, was becauſe he was aſhamed of being thought a Cretan: and indeed he does not ſeem to have had a high opinion of his countrymen, if that verſe cited by St Paul be, as it is generally believed to be, his; "The Cretans are always liars, evil beaſts, ſlow bellies." Many ſtories are related of him, too wonderful to merit attention; however, his reputation was ſo great over all Greece, that he was there eſteemed a favourite of the gods. The Athenians being afflicted with the plague, and commanded by the oracle to make a ſolemn luſtration of the city, ſent Nicias, the ſon of Niceratus, with a ſhip to Crete, to deſire Epimenides to come to them. He accepted their invitation, accompanied the meſſengers to Athens, performed the luſtration of the city, and the plague ceaſed. Here he contracted an acquaintance with Solon, whom he privately inſtructed in the proper methods for the regulation of the Athenian commonwealth. Having finiſhed his buſineſs at Athens, the citizens offered him many valuable preſents and high honours, and appointed a ſhip to carry him back to Crete: but he returned their preſents, and would accept of nothing except a little branch of the ſacred olive preſerved in the citadel; and deſired the Athenians to enter into an alliance with the Gnoſſians. Having obtained this, he returned to Crete; where he died ſoon after, aged 157 years; or as the Cretans, conſiſtently with their character, pretended, 299. He was a great poet, and wrote 5000 verſes on "the genealogy of the gods," 6500 "on the building of the ſhip Argos and Jaſon's expedition to Colchis," and 4000 "concerning Minos and Rhadamanthus." He wrote alſo in proſe, "Concerning ſacrifices and the commonwealth of Crete." St Jerom likewiſe mentions his "book of oracles and reſponſes." The Lacedemonians procured his body, and preſerved it among them by the advice of an oracle; and Plutarch tells us, that he was reckoned the ſeventh wiſe man by thoſe who refuſed to admit Periander into the number.

EPIMETHEUS, a ſon of Japetus and Clymene, one of the Oceanides, who inconſiderately married Pandora, by whom he had Pyrrha, the wife of Deucalion. He had the curioſity to open the box which Pandora had brought with her, and from thence iſſued a train of evils, which from that moment have never ceaſed to afflict the human race. Hope was the only one which remained at the bottom of the box, not having a ſufficient time to eſcape, and it is ſhe alone which comforts men under misfortunes. Epimetheus was changed into a monkey by the gods, and ſent into the iſland Pithecuſa.

EPIPHANIUS (St), an ancient father of the church, born at Beſanducan, a village in Paleſtine, about the year 332. He founded a monaſtery near the place of his birth, and preſided over it. He was afterwards elected biſhop of Salamis; when he ſided with Paulinus againſt Meletius, and ordained in Paleſtine, Paulinian the brother of St Jerom; on which a conteſt aroſe between him and John biſhop of Jeruſalem. He afterwards called a council in the iſland of Cyprus, in which he procured a prohibition of the reading of Origen's writings; and made uſe of all his endeavours to prevail on Theophilus biſhop of Alexandria to engage St Chryſoſtom to declare in favour of that decree: but not meeting with ſucceſs, he went himſelf to Conſtantinople, where he would not have any converſation with St Chryſoſtom: and formed the deſign of entering the church of the apoſtles, to publiſh his condemnation of Origen; but being informed of the danger to which he would be expoſed, he reſolved to return to Cyprus; but died at ſea, in the year 403. His works were printed in Greek, at Baſil, 1544, in folio; and were afterwards tranſlated into Latin, in which language they have been often reprinted. Petavius reviſed and corrected the Greek text by two manuſcripts, and publiſhed it together with a new tranſlation at Paris in 1622. This edition was reprinted at Cologne in 1682.

EPIPHANY, a Chriſtian feſtival, otherwiſe called the *Manifeſtation of Chriſt to the Gentiles*, obſerved on the ſixth of January, in honour of the appearance of our Saviour to the three magi or wiſe men, who came to adore him and bring him preſents. The feaſt of epiphany was not originally a diſtinct feſtival; but made a part of that of the nativity of Chriſt, which being celebrated 12 days, the firſt and laſt of which were high or chief days of ſolemnity, either of theſe might properly be called *epiphany*, as that word ſignifies the appearance of Chriſt in the world.

The word in the original Greek, επιφανια, ſignifies *appearance* or *apparition*; and was applied, as ſome critics will have it, to this feaſt, on account of the ſtar which appeared to the magi.— St Jerom and St Chryſoſtom take the epiphany for the day of our Saviour's baptiſm, when he was declared to men by the voice, *Hic eſt filius meus dilectus, in quo mihi complacui:* "This is my beloved Son, in whom I am well pleaſed." And accordingly it is ſtill obſerved by the Cophtæ and Ethiopians in that view. Others contend, that the feaſt of Chriſtmas, or the nativity of our Saviour, was held in divers churches on this day; which had the denomination *epiphany*, or *appearance*, by reaſon of our Saviour's firſt appearance on earth at that time. And it muſt be allowed, that the word is uſed among the ancient Greek fathers, not for the appearance of the ſtar to the magi, but for that of our Saviour to the world: In which ſenſe, St Paul uſes the word *epiphania*, in his ſecond epiſtle to Timothy, i. 10.

EPIPHONEMA. See ORATORY, n° 96.

EPIPHORA, in medicine, a preternatural defluxion of the eyes, when they continually diſcharge a ſharp ſerous humour, which excoriates the cheeks.

EPIPHYSIS, in anatomy. See ANATOMY, p. 677. col. 2.

EPIPLOCELE, in medicine, is a kind of hernia or rupture, in which the omentum ſubſides into the ſcrotum.

EPIPLOOMPHALON, in medicine, an hernia umbilicalis, proceeding from the omentum falling into the region of the umbilicus or navel.

EPIPLOON. See OMENTUM.

EPIRUS, a diſtrict of ancient Greece, bounded on the eaſt by Etolia, on the weſt by the Adriatic, on the north by Theſſaly and Macedon, and on the ſouth by the Ionian ſea. This country was anciently governed by its own princes, in which ſtate it made a very conſiderable figure. The country, according to Joſephus, was firſt peopled by Dodanim the ſon of Javan and grandſon of Japhet. The people were very warlike: but they continued in their ſavage ſtate long after their neighbours were civilized; whence the Iſlanders uſed to threaten their offenders with tranſportation to Epirus. Their horſes were in great requeſt among the ancients, as well as the dogs produced in one of the diviſions called *Moloſſus*; and hence theſe dogs were called by the Romans *Moloſſi*.

The hiſtory of Epirus commences with the reign of Pyrrhus the ſon of Achilles by Deidamia the daughter of Lycomedes king of Scyros. He is ſaid to have behaved with great bravery at the ſiege of Troy; but it would appear that he behaved with no leſs barbarity. After the city was taken, he is ſaid to have killed old king Priam with his own hand; to have thrown Aſtyanax the ſon of Hector and Andromache headlong from an high tower; and ſacrificed Polyxena the daughter of Priam on the tomb of his father. He carried Andromache with him into Epirus, where he ſettled by the advice of the famous ſoothſayer Helenus, one of Priam's ſons, who had ſerved during the Trojan war both under his father and himſelf. The only remarkable period of the hiſtory of Epirus is the reign of Pyrrhus II. who made war upon the Romans. He was invited into Italy by the Tarentines; and embarked about 280 B. C. After having eſcaped many dangers by ſea, he landed in that country, and with great difficulty gained a victory over the Romans; but he was afterwards utterly defeated by them [†], and obliged to return into his own country. To retrieve his honour, he then undertook an expedition againſt Macedon; where he overthrew Antigonus, and at laſt made himſelf maſter of the whole kingdom. He then formed a deſign of ſubduing all the other Grecian ſtates; but met with ſuch an obſtinate reſiſtance at Lacedæmon, that he was obliged to drop the enterprize; and was ſoon after killed at the ſiege of Argos by a woman, who from the wall threw a tile upon his head. Deidamia, the grand-daughter of Pyrrhus, was the laſt that ſat on the throne of Epirus. She is ſaid to have been murdered after a ſhort reign; upon which the Epirots formed themſelves into a republic.

Under the new form of government Epirus never made any conſiderable figure, but ſeems rather to have been dependent on the kingdom of Macedon. The Romans having conquered Philip king of that country, reſtored the Epirots to their ancient liberty; but they, forgetful of this favour, ſoon after took up arms in favour of Perſeus. As a puniſhment for this ingratitude, the Romans gave orders to Paulus Emilius, after the reduction of Macedon, to plunder the cities of Epirus, and level them with the ground. This was punctually executed throughout the whole country on the ſame day and at the ſame hour. The booty was ſold, and each

[†] See *Ro*

irus,
pac)

each foot-ſoldier had 200 denarii, that is, ſix pounds nine ſhillings and two pence, and each of the horſe the double of this ſum. An hundred and fifty thouſand men were made ſlaves, and ſold to the beſt bidder for the benefit of the republic. Nor did the vengeance of Rome ſtop here; all the cities of Epirus, to the number of 70, were diſmantled, and the chief men of the country carried to Rome, where they were tried, and moſt of them condemned to perpetual impriſonment. After this terrible blow, Epirus never recovered its ancient ſplendor. Upon the diſſolution of the Achæan league, it was made part of the province of Macedon; but when Macedon became a dioceſe, Epirus was made a province of itſelf, called the province of *Old Epirus*, to diſtinguiſh it from *New Epirus*, another province lying to the eaſt of it. On the diviſion of the empire, it fell to the emperors of the eaſt, and continued under them till the taking of Conſtantinople by the Latins, when Michael Angelus, a prince nearly related to the Greek emperor, ſeized on Etolia and Epirus, of which he declared himſelf deſpot or prince; and was ſucceeded by his brother Theodorus, who took ſeveral towns from the Latins, and ſo far enlarged his dominions, that, diſdaining the title of *deſpot*, he aſſumed that of *emperor*, and was crowned by Demetrius archbiſhop of Bulgaria. Charles, the laſt prince of this family, dying without lawful iſſue, bequeathed Epirus and Acarnania to his natural ſons, who were driven out by Amurath the ſecond. Great part of Epirus was afterwards held by the noble family of the Caſtriots; who, though they were maſters of all Albania, yet ſtyled themſelves princes of Epirus. Upon the death of the famous George Caſtriot, ſurnamed *Scanderbeg*, Epirus fell to the Venetians, who were ſoon diſpoſſeſſed of it by the Turks; in whoſe hands it ſtill continues, being now known by the name of *Albania*, which comprehends the Albania of the ancients, all Epirus, and that part of Dalmatia which is ſubject to the Turks.

rſy.

EPISCOPACY, that form of church-government, in which dioceſan biſhops are eſtabliſhed as diſtinct from and ſuperior to prieſts or preſbyters. We have already obſerved, that it is a long time ſince the miniſters of religion have been diſtinguiſhed into different orders, and that it has been much controverted whether the diſtinction be of divine or human right; whether it was ſettled in the apoſtolic age or afterwards. (See BISHOP.) This controverſy commenced ſoon after the Reformation; and has been agitated with great warmth between the *Epiſcopalians* on the one ſide, and the *Preſbyterians* and *Independents* on the other. Among the proteſtant churches *abroad*, thoſe which were reformed by *Luther* and his aſſociates are in general *epiſcopal;* whilſt ſuch as follow the doctrines of *Calvin* have for the moſt part thrown off the order of biſhops as one of the corruptions of popery. In *England*, however, the controverſy has been conſidered as of greater importance than on the *Continent:* for it has there been ſtrenuouſly maintained by one party, that the *epiſcopal order* is eſſential to the conſtitution of the church; and by others, that it is a pernicious encroachment on the rights of men, for which there is no authority in ſcripture. Though the queſtion has for ſome time lain almoſt dormant, and though we have no deſire to revive it; yet as a work of this kind might perhaps be deemed defective, did it contain no account whatever of a controverſy which has employed ſome of the ableſt writers of the paſt and preſent centuries, we ſhall give a fair though ſhort view of the chief arguments, by which the advocates of each contending party have endeavoured to ſupport their own cauſe, leaving our readers to judge for themſelves where the truth lies. See INDEPENDENTS and PRESBYTERIANS.

Epiſcopacy.

2
The Independent ſcheme.

The *Independent* maintains, that under the goſpel diſpenſation there is nothing which bears the ſmalleſt reſemblance to an excluſive prieſthood; that Chriſt and his apoſtles conſtituted no permanent order of miniſters in the church; but that any man who has a firm belief in revelation, a principle of ſincere and unaffected piety, a capacity for leading devotion and communicating inſtruction, and a ſerious inclination to engage in the important employment of promoting the everlaſting ſalvation of mankind; is to all intents and purpoſes a regular miniſter of the New Teſtament, eſpecially if he have an invitation to the paſtoral office from ſome particular ſociety of Chriſtians.

3
Epiſcopal arguments againſt it.

Againſt this ſcheme, which ſuppoſes the rights of Chriſtians all equal and common, and acknowledges no authority in the church except what may be derived from the election of her members, the Proteſtant Epiſcopalian reaſons in the following manner He admits, as an undoubted truth, that our bleſſed Lord gave to none of his immediate followers authority or juriſdiction of ſuch a nature as could interfere with the rights of the civil magiſtrate, for all ſuch authority was diſclaimed by himſelf: " My kingdom (ſaid he to Pilate) is not of this world:" and to a certain perſon who aſked him to decide a queſtion of property between him and his brother, he replied, " Man, who made me a judge or a divider over you?" But when it is conſidered, that Chriſt came into this world to " turn men from darkneſs to light, and from the power of Satan to the living God; that he gave himſelf for us, that he might redeem us from all iniquity, and purify to himſelf a peculiar people zealous of *good works;*" that of theſe works many are ſuch as unregenerate humanity has no inclination to perform, and that the doctrines which he revealed are ſuch as human reaſon could never have diſcovered; the advocate for epiſcopacy thinks it was extremely expedient, if not abſolutely neceſſary, that, when he aſcended into heaven, he ſhould eſtabliſh upon earth ſome authority to illuſtrate the revelation which he had given, and to enforce obedience to the laws which he had enacted. There is nothing, continues he, more ſtrictly required of Chriſtians, than that they live together in unity, profeſſing the ſame faith, joining in the ſame worſhip, and practiſing the ſame virtues. But as men have very different paſſions, prejudices, and purſuits, ſuch unity would be impoſſible, were they not linked together in *one ſociety* under the government of perſons authoriſed to watch over the purity of the faith, to preſcribe the forms of public worſhip, and to explain the nature and inculcate the neceſſity of the ſeveral virtues. The ſociety of Chriſtians, in reſpect of its unity and organization, is compared to the human body: for " as we have many members in one body, and all members have not the ſame office; ſo we being many are one body in Chriſt, and every one members one of another," (Rom. xii. 4, 5.) It is called the *church*, the *kingdom of heaven*, and

4
Chriſtians linked together in one ſociety called the *church*, the *kingdom of heaven*, and the *kingdom of God*.

and

and *the kingdom of God*; and its affairs, like thoſe of every other kingdom, are adminiſtered by proper officers in ſubordination to the ONE LORD, who, "when he aſcended up on high, and led captivity captive, gave ſome apoſtles, and ſome prophets, and ſome paſtors and teachers, for the perfecting of the ſaints, for the work of the miniſtry, for the edifying of the body of Chriſt:" (Epheſ. iv. 8—13.) That thoſe various orders of miniſters were veſted with real authority in the church, might be inferred from principles of reaſon as well as from the dictates of revelation. A ſociety without ſome ſort of government, government without laws, or laws without an executive power, is a direct abſurdity.

5
The church governed by proper officers.

Where there are laws, ſome muſt govern, and others be governed; ſome muſt command, and others obey; ſome muſt direct, and others ſubmit to direction. This is the voice of *nature*; it is likewiſe the language of *ſcripture*. "Obey them (ſays the inſpired author of the epiſtle to the Hebrews) who have the rule over you, and ſubmit yourſelves: for they watch for your ſouls as they that muſt give account." A text which ſhows that the authority of the miniſters of religion was diſtinct from that of the civil magiſtrate, whoſe duty is to watch, *not for the ſouls*, but for the *lives* and *properties*, of his ſubjects.

6
All Chriſtians required to be members of the church.

Of the ſociety thus conſtituted, it was not, as of a philoſophical ſect, left to every man's *choice* whether or not he would become a member. All who embrace the faith of the Redeemer of the world are required to be *baptized*, under the pain of forfeiting the benefits of redemption: but one great purpoſe for which baptiſm was inſtituted, is to be the rite of initiation into the church of Chriſt; "for by one ſpirit are we all baptized into one body, whether we be Jews or Gentiles, whether we be bond or free," (1 Cor. xii. 13.) Of baptiſm, whatever be the importance, it is evident, that to receive it, is not, like the practice of juſtice, or the veneration of the Supreme Being, a duty reſulting from the relations of man to his Creator and fellow-creatures; that its whole efficacy, which in ſcripture is ſaid to be nothing leſs than the remiſſion of ſins, is derived from *poſitive inſtitution*; and therefore, that the *external rite* can be of no avail, but when it is adminiſtered in the *manner preſcribed*, and by a perſon *authoriſed* to adminiſter it.

7
All Chriſtians not authoriſed to adminiſter the ſacraments.

That *all* Chriſtians are not veſted with this authority, as one of the common privileges of the faith, appears from the commiſſion which our Saviour after his reſurrection gave to his apoſtles. At that period, we are aſſured that the number of his followers was not leſs than *five hundred*; yet we find, that to the *eleven diſciples* only did "he come and ſpeak, ſaying, All power is given unto me in heaven and in earth; go ye, therefore, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghoſt."

Of the 500 diſciples there is ſurely no reaſon to believe that there were not *many* well qualified to inſtruct either a Jew or a Gentile in the doctrines of the goſpel; and it is certain, that *any one* of them could have waſhed his convert with water in the name of the Holy Trinity as well as St Peter or St John: but ſuch an unauthoriſed waſhing would not have been Chriſtian baptiſm, nor of equal validity with it, any more than the opinion of a lawyer at the bar is the judgment of a court of juſtice, or of equal obligation. It is the commiſſion of the ſovereign which gives force to the judgement of the court; it is the commiſſion of Chriſt which gives validity to baptiſm. The ſame reaſoning is applicable to the Lord's ſupper, which, if it be not adminiſtered by thoſe who have authority for ſuch adminiſtration, cannot be deemed a ſacrament of Chriſt's inſtitution.

Theſe two rites are the external badges of our profeſſion. By the *one*, we are incorporated into that ſociety of which our Redeemer is the head and ſovereign: in the celebration of the *other*, we have a right to join, whilſt of that ſociety we continue members. But if by an open and ſcandalous diſregard of the precepts of the goſpel, we ſhould prove ourſelves unworthy of its privileges, the ſame perſons who are authoriſed to admit us into the church, are likewiſe veſted with authority to caſt us out of it; for to them were given "the keys of the kingdom of heaven (or the church), with aſſurance, that whatſoever they ſhould bind on earth, ſhould be bound in heaven; and whatſoever they ſhould looſe on earth, ſhould be looſed in heaven," (Mat. xviii. 18.) As baptiſm is to be adminiſtered ſo long as there ſhall be perſons to be enliſted under the banners of Chriſt, and the Lord's Supper to be celebrated ſo long as it ſhall be the duty of ſoldiers to adhere to the ſtandard of their leader and their head; and as it is likewiſe to be feared that there will never come a time when all Chriſtians ſhall "walk worthy of the vocation wherewith they are called;" it follows, that this *power of the keys* which was originally given to the apoſtles, muſt continue in the church through all ages, even unto the end of the world.

But as we have ſeen, that it was not at firſt intruſted to *all* the diſciples in common, as one of the privileges inſeparable from their profeſſion, and as no body of men can poſſibly *transfer* an authority of which they themſelves were *never poſſeſſed*; it is certain, that even now it cannot, by the election of one claſs of Chriſtians, be delegated to another, but muſt, by ſome mode of ſucceſſion, be derived from the apoſtles, who were ſent by Chriſt as he was ſent by his Father. To argue from the origin of *civil* to that of *eccleſiaſtical* government, although not very uncommon, the Epiſcopalian deems extremely fallacious. Of the various nations of the world, many of the ſovereigns may indeed derive their authority from the ſuffrages of their ſubjects; becauſe in a ſtate of nature, every man has an inherent right to defend his life, liberty, and property; and what he poſſeſſes in his own perſon, he may for the good of ſociety transfer to another: but no man is by *nature*, or can *make himſelf*, a member of the Chriſtian church; and therefore authority to govern that ſociety can be derived only from him by whom it was founded, and who died that he might "gather together in one all the children of God."

Againſt ſuch reaſoning as this it hath been urged, that to make inſtitutions, which like baptiſm and the Lord's ſupper are generally neceſſary to the ſalvation of *all* Chriſtians, depend for their efficacy upon the authority or commiſſion of a *particular order*, appears inconſiſtent with the wiſdom and goodneſs of God; as by ſuch an economy an intolerable domination would be eſtabliſhed over the ſouls of men, and the purpoſe for which the Saviour of the world died might be in ſome degree defeated by the caprice of an ignorant and arbitrary prieſthood. The objection is certainly plauſible; but the Epiſcopalian affirms, that either it has no weight, or militates with equal force againſt all religion, natural as well as revealed, and even againſt the wiſdom of Providence in the government of this world.—In every thing, he obſerves, relating to their temporal and to their ſpiritual intereſts, mankind are all ſubjected to mutual dependence. The rich depend upon the poor, and the poor upon the rich. An infant neglected from the birth, would barely cry and ceaſe to live; nor is it eaſily to be conceived, that in the more rigid climates of the earth, a full grown man could provide even the neceſſaries of mere animal life. Of religion, it is certain that in ſuch a ſtate nothing could be known; for there is not the ſmalleſt reaſon to imagine that any individual of the human race—an *Ariſtotle*, a *Bacon*, or a *Newton*, had he been left alone from his infancy, without culture and without education,—could ever, by the native vigour of his own mind, have diſcovered the exiſtence of a God, or that ſuch ſpeculations as lead to that diſcovery would have employed any portion of his time or his thoughts. Even in civilized ſociety it would be impoſſible, in the preſent age, for any man, without the aſſiſtance of others, to underſtand the very firſt principles of our common Chriſtianity; for the ſcriptures, which alone contain thoſe principles, are written in languages which are now no where vernacular. In the fidelity of tranſlators, therefore, every illiterate diſciple of Jeſus *muſt* confide, for the truth of thoſe doctrines which conſtitute the foundation of all his hopes; and as no man ever pretended that the Chriſtian *ſacraments* are more neceſſary to ſalvation than the Chriſtian *faith*, the Epiſcopalian ſees no impropriety or inconſiſtency in making thoſe perſons receive baptiſm and the Lord's ſupper by the miniſtration of others, who by ſuch miniſtration muſt of neceſſity receive the truths of the goſpel.

11
rma-
order
iniſters
ituted
hriſt.

By ſuch arguments as theſe does the Epiſcopalian endeavour to prove that Chriſt conſtituted ſome *permanent order of miniſters* in the church, to whom in the externals of religion the great body of Chriſtians are commanded to pay obedience; and thus far the Preſbyterian agrees with him: but here their agreement ends. They hand in hand attack the Independent with the ſame weapons, and then proceed to attack each other. The *one* maintains, that originally the officers of the Chriſtian church were all *preſbyters* or *elders* of *one order*, and veſted with *equal powers;* whilſt the *other* holds, that Chriſt and his apoſtles appointed *divers orders* of miniſters in the church; that of theſe orders the higheſt alone was empowered to ordain others; and that therefore obedience, as to thoſe who watch for our ſouls, can be due only to ſuch as are *epiſcopally ordained*.

Preſ-
rian

In behalf of the Preſbyterian plea it is urged, that the titles of *biſhop* and *preſbyter*, being in the New Teſtament indifferently given to the ſame perſons, cannot be the titles of diſtinct eccleſiaſtical officers; which appears ſtill more evident from the ordination of *Timothy*, who, although he was the firſt *biſhop* of Epheſus, received his epiſcopal character by the impoſition of the hands of the *preſbytery*.—That one and the ſame man is, in the New Teſtament, ſtyled ſometimes a *biſhop* and ſometimes a *preſbyter*, cannot be denied; but although every apoſtolic biſhop was therefore undoubtedly a preſbyter, it does not of courſe follow, ſays the Epiſcopalian, that every preſbyter was likewiſe a biſhop. In the *Old* Teſtament, Aaron and his ſons are without any diſcrimination of order frequently ſtyled *prieſts;* and in the *New*, both St Peter and St John call themſelves *preſbyters*, as St Paul, upon one occaſion, ſtyles himſelf a *deacon*—διακονος, (Eph. iii. 7.): yet no man ever ſuppoſed thoſe apoſtles to have been ſuch eccleſiaſtical officers as modern preſbyters and deacons; and it is univerſally known that in the Jewiſh prieſthood there were different orders, and that Aaron was of an order ſuperior to his ſons. This being the caſe, the preſbyters, by the laying on of whoſe hands Timothy was made a biſhop, *may have been* of the ſame order with St Peter and St John; and if ſo, it follows that his ordination was *epiſcopal*. At all events, we are certain, continues the advocate for Epiſcopacy, that it was not, in the modern ſenſe of the word, *Preſbyterian;* for the gift, which in the firſt epiſtle is ſaid to have been "given by prophecy *with* the laying on of the hands of the preſbytery," is in the ſecond ſaid to have been "in him *by* the putting on of the hands of St Paul." And here it is worthy of obſervation, that the prepoſition uſed in the former caſe is μετα which ſignifies *concurrence* rather than inſtrumentality; but *that* in the latter is δια, which, as every Greek ſcholar knows, is prefixed to the *inſtrumental cauſe* by which any thing is effected: ſo that whatever may have been the order of the preſbyters who *concurred*, St Paul appears to have been the *ſole* ordainer. But by the confeſſion of all parties, St Paul was a biſhop in the higheſt ſenſe in which that word is ever uſed; and the powers of the epiſcopate not being parcelled out among various partners, of whom each poſſeſſes only a ſhare, the impoſition of his hands was ſufficient for every purpoſe which could have been effected by the hands of the whole college of apoſtles.

13
Epiſcopal
arguments
againſt it.

It appears, therefore, that from the promiſcuous uſe of the titles *biſhop* and *preſbyter*, and from the *ordination of Timothy*, nothing can with certainty be concluded on either ſide of this celebrated queſtion. But if, inſtead of reſting in mere *words*, which, when taken alone and without regard to the context, are almoſt all of ambiguous ſignification, we attend to ſome important *facts* recorded in the New Teſtament, the Epiſcopalian thinks we ſhall in them diſcover ſufficient evidence that the goverment of the primitive church was prelatical.

14
Three orders of Chriſtian miniſters during our Saviour's ſtay upon earth; and likewiſe after his aſcenſion into heaven.

During our Saviour's ſtay upon earth, it is undeniable that he had under him two diſtinct orders of miniſters—the twelve, and the ſeventy; and after his aſcenſion, immediately before which he had enlarged the powers of the *eleven*, we read of *apoſtles*, *preſbyters*, and *deacons*, in the church. That the preſbyters were ſuperior to the deacons, and the apoſtles ſuperior to both, is univerſally acknowledged; but it has been ſaid that in ſcripture we find no intimation that the apoſtolic order was deſigned for continuance. A Quaker ſays the ſame thing of water-baptiſm; and the Epiſcopalian obſerves, that it would be difficult to point out by what paſſage of ſcripture, or what mode of reaſoning, thoſe who, upon this plea, reject the apoſtolic order of Chriſtian miniſters, could overthrow the principles upon which the diſciples of *George Fox* reject the uſe of that rite which our Saviour inſtituted for the initiation of mankind into his church. They were the *eleven* alone to whom Chriſt ſaid, "Go ye therefore and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghoſt:" and therefore, although we frequently find preſbyters and deacons adminiſtering the ſacrament of baptiſm, we muſt conclude, that as a *judge* adminiſters juſtice by authority derived from his *ſovereign*, ſo thoſe *inferior officers* of the church adminiſtered baptiſm by authority derived from the *apoſtles*. Indeed, had they pretended to act by any other authority, it is not eaſily to be conceived how *their* baptiſm could have been the baptiſm inſtituted by Chriſt; for it was not with the *external waſhing* by whomſoever performed, but with the *eleven* and their ſucceſſors, that he promiſed to be "always, even unto the end of the world."

15
The apoſtolic or higheſt order deſigned to be permanent.

That the *eleven* did not conſider this promiſe, or the commiſſion with which it was given, as terminating with their lives, is evident from their admitting others into their own order; for which they had competent authority, as having been ſent by Chriſt as he was ſent by his Father. When St Paul, to magnify his office and procure to it from the Galatians due reverence, ſtyles himſelf, "an apoſtle not of men, neither by man, but by Jeſus Chriſt and God the Father," he muſt have known ſome who derived their apoſtolic miſſion *by man;* otherwiſe he could with no propriety have claimed particular reſpect, as he evidently does, from what was in his own apoſtleſhip no particular diſtinction. At that very early period, therefore, there muſt have been in the church *ſecondary* apoſtles, if they may be ſo called, upon whom, by impoſition of hands, or by ſome other ſignificant ceremony, the eleven had conferred that authority which was given to them by their Divine Maſter. Such were *Matthias* and *Barnabas;* ſuch likewiſe were *Timothy*, *Titus*, and the *angels* of the ſeven churches in Aſia, with many others whoſe names and offices are mentioned in the New Teſtament.

16
Matthias, Barnabas, Timothy, Titus, and the angels of the ſeven churches in Aſia, *biſhops*.

That *Matthias* and *Barnabas* were of the apoſtolic order, has never been controverted; and that *Timothy* and *Titus* were ſuperior to modern preſbyters, is evident from the offices aſſigned them. Timothy was, by St Paul, empowered to *preſide* over the preſbyters of Epheſus, to receive accuſations againſt them, to *exhort*, to *charge*, and even to *rebuke* them; and Titus was, by the ſame apoſtle, left in Crete for the expreſs purpoſe of ſetting things in order, and ordaining *preſbyters* in *every* city. To *exhort*, to *charge*, and with authority to *rebuke* one's equal, is certainly incongruous; and therefore the Epiſcopalian thinks the powers conferred on Timothy altogether inconſiſtent with that parity of order and of office for which his antagoniſts ſo ſtrenuouſly plead. Even the commiſſion given to Titus appears in his eyes by much too extenſive for a Preſbyterian miniſter, who, after having ordained in *one* city, could not have proceeded to ordain in *another* without the conſent and aſſiſtance of his brother and fellow-labourer. With reſpect to the *angels* of the Aſiatic churches, he obſerves, that in the Old Teſtament the title of *angel* is ſometimes given to the *Jewiſh high-prieſt*, and particularly by the prophet Malachi, who calls him "the *meſſenger* (αγγελος) of the Lord of Hoſts;" and that the *angels* of the churches mentioned by St John, were *Chriſtian high prieſts*, or *biſhops* preſiding over more than one congregation, as it is affirmed by all the ancient writers, cannot, he thinks, be denied by any man who will take the trouble to compare ſcripture with ſcripture. We read (Acts xix. 10, and 20.), that "in the ſpace of two years *all they* who dwelt in Aſia heard from St Paul the word of the Lord Jeſus, both Jews and Greeks; and that there the word of God *grew mightily* and *prevailed:*" but with what truth or propriety could this have been ſaid, if at the time of St John's writing the Apocalypſe, which was 30 years after St Paul's death, all the Chriſtians of Proconſular Aſia were compriſed in *ſeven congregations*, which aſſembled, each with its proper paſtor, to perform, in *one place*, the duties of public worſhip? In a word, the advocate for epiſcopacy inſiſts, that no man, who reads without prejudice the acts of the apoſtles, the epiſtles of St Paul, and the Apocalypſe of St John, can ſeriouſly believe that *Timothy*, *Titus*, *Epaphroditus*, *Soſthenes*, and *Silvanus*, with the *angels* of the ſeven churches in Aſia, were *mere preſbyters*, or that the government of the church was, in thoſe days, by a college of elders.

When from the inſpired penmen of the New Teſtament he proceeds to examine the ſucceeding writers of the Chriſtian church, the Epiſcopalian finds ſuch multiplied and concurring evidence of the apoſtolic inſtitution of epiſcopacy, as he thinks it impoſſible to reſiſt without denying the truth of all ancient hiſtory, and even ſhaking the pillars of revelation itſelf; for "in the noble army of martyrs," the witneſſes of the epiſcopal government of the church are earlier, and by far more numerous, than thoſe who teſtify that the *goſpel* of *St Matthew* was written by that apoſtle, or that the book of the *Apocalypſe* is canonical ſcripture. The authority of the *fathers* indeed is at preſent very low; but ſhould they be allowed to be as fanciful divines and as bad critics as their worſt enemies are pleaſed to repreſent them, this would detract nothing from their evidence when they bear witneſs to the conſtitution of the church in their own times; for of their *integrity* there can be no doubt: and what the Epiſcopalian wants of them is only their teſtimony to matters of fact which fell under the cognizance of their own ſenſes, and about which therefore they could not be deceived. It is here indeed chiefly that he triumphs over his antagoniſts. In the ſecond and third centuries there was no general council, nor any Chriſtian ſovereign. A prelacy therefore, he urges, could not have been *univerſally* introduced, during that period, either by a concert among the clergy, or by the authority of the civil magiſtrate. Yet that even *then* there was no church under heaven, of which the government was not epiſcopal, has been confeſſed by ſome of the moſt learned writers among the Preſbyterians themſelves; whence he concludes that epiſcopacy is of divine inſtitution.

The d
right c
piſcopa

The candid Epiſcopalian, however, allows, that in the apoſtolic age there may have been ſome churches which at firſt had only biſhops and deacons to perform the offices of religion; for when the number of diſciples in any place was ſo ſmall that they could all meet in one aſſembly, there was no neceſſity for any other order of miniſters: but it appears that, from the very *beginning*, *biſhops*, *preſbyters*, and *deacons*, were ſettled in

all

ſcopacy.

all the *larger* cities of the Roman empire; and it was in thoſe days an allowed maxim, that without a *biſhop* there could be *no church*. The better to underſtand the original ſtate and inſtitution of epiſcopacy, it is neceſſary to obſerve, that the empire, which contained almoſt all the known part of the Chriſtian world, was by Auguſtus Cæſar divided into provinces, ſubjected each to the authority of one chief magiſtrate, who was commonly a *prætor* or *proconſul*, and who reſided in the metropolis or chief city of the province. A province comprehended the cities of a whole region; and in the age of the apoſtles, each city was under the immediate government of certain magiſtrates within its own body, known by the name of βουλη, or *ſenatus*, *ordo* and *curia*, "the ſtates and court of the city." Thoſe magiſtrates were ſubordinate to the *prætor* or *proconſul*: but among them there was *one* ſuperior to the reſt, called ſometimes *dictator*, and ſometimes *defenſor civitatis*, whoſe juriſdiction extended not only over the city itſelf, but likewiſe over all the adjacent territory. That territory was denominated προαστεια, or the ſuburbs, and often reached to the diſtance of 10 or 12 miles round the city, and ſometimes much farther, containing within it many villages and ſmall towns under the government of the city magiſtrates.

18
origin
ioceſes.

From ſome paſſages in the New Teſtament, and from the concurring evidence of the earlieſt writers of the church, it appears to have been the purpoſe of the apoſtles to ſettle a biſhop in *every* city where there was a civil magiſtracy: but as they could not be perſonally preſent in all places at once, it was natural for them to *enter* upon the great work of converting the nations, by *firſt* preaching the goſpel in that city of each province which was the ordinary reſidence of the governor; becauſe to it there muſt have been the greateſt reſort of people, who would carry the glad tidings with them into the country when they returned. Accordingly, having diſperſed themſelves over the empire, and made numbers of proſelytes in the principal cities, they fixed in each, where they ſaw it neceſſary, a *biſhop*, with a college of *preſbyters* and *deacons*; and gave to thoſe biſhops, who were at firſt called *apoſtles*, a commiſſion, as the *other* cities of the province ſhould be converted, to fix in them biſhops alſo.

In ſome of the ſmaller cities, it is extremely probable that a biſhop and a deacon were for a ſhort time the only eccleſiaſtical officers, till the number of Chriſtians increaſed ſo much as to make it impoſſible for them all to aſſemble in one houſe for the purpoſes of public worſhip. The biſhop then ordained *preſbyters* to officiate in thoſe congregations where he himſelf could not be preſent, and to aſſiſt him in other parts of his paſtoral office; but in all their miniſtrations the preſbyters were ſubordinate to him, who was the chief paſtor within the city, who compoſed the prayers which were offered up in public, and to whom all the other miniſters of religion were accountable for their conduct. So long as the number of the faithful was confined within the *walls* of the city, it appears that the biſhop with his preſbyters and deacons lived together as in a college; that divine ſervice was every Lord's-day, or oftener, performed in what was afterwards called the cathedral or mother-church, by the biſhop himſelf, aſſiſted by ſome of his clergy; and that the congregations which met in other churches, having no *fixed* paſtors, were ſupplied by ſuch preſbyters as the biſhop choſe to ſend to them from his own church. Whilſt matters continued in this ſtate, the clergy had no other revenues than what aroſe from the voluntary oblations of the people; which were indeed ſo large as not only to ſupport them with decency, but likewiſe to anſwer other ends of charity and munificence. They were commonly divided into four equal parts; of which one was allotted to the biſhop, a ſecond to the inferior clergy, a third to the poor, and a fourth to keep the churches in repair; and it was conſidered as part of the biſhop's duty to take care that the offerings ſhould be faithfully applied to theſe purpoſes.

Epiſcopacy.

19
The origin of pariſhes.

When converts increaſed in number, and churches were built in the ſuburbs, each of thoſe churches had a fixed paſtor ſimilar to a pariſh-prieſt among us; but ſtill thoſe paſtors, as well as the city-clergy, miniſtered in ſubordination to the biſhop, whoſe authority extended as far as the civil authority of the Roman magiſtrate, within which diſtrict or dioceſe it was ſupreme over all orders of Chriſtians. This every man knows who is acquainted with eccleſiaſtical hiſtory; for the biſhop alone could ordain *prieſts* and *deacons*, adminiſter the rite of *confirmation*, *abſolve penitents* who were under church-cenſure, and *exclude from communion* heretics and notorious offenders; and from his ſentence there lay no appeal but to a ſynod of comprovincial biſhops.

20
The origin of metropolitans or archbiſhops.

Such ſynods were in each province convened by the biſhop of the chief city; for the apoſtles having been careful to place in thoſe cities men of the moſt eminent gifts and abilities, the other biſhops of the provinces applied to them for advice upon every emergency, and paid a particular deference to them upon every occaſion. So that though all biſhops were of equal authority as *biſhops*, yet when they met to conſecrate a new biſhop, or to deliberate upon the affairs of the church, they yielded a precedency to the biſhop of the metropolis, who called them together, and who ſat as *preſident* or *moderator* of the ſynod. Hence the origin of metropolitans or *archbiſhops*; whoſe authority was ſo conſiderable, that though there is not a doubt but the *election* of biſhops was anciently placed in the clergy and people of the vacant dioceſe, yet the biſhop *elect* could not be *conſecrated* without the conſent of the archbiſhop of the province.

In conſequence of the extenſive powers with which the primitive biſhops were veſted, they are commonly ſtyled in the writings of thoſe times *preſidents*, *provoſts*, or *inſpectors* of the church, *chief prieſts*, *princes of the clergy*, and even *princes of the people*; but their authority was wholly ſpiritual. Thoſe prelates, imitating the example of their Divine Maſter when on earth, neither poſſeſſed nor aſſumed to themſelves any juriſdiction over the *properties* or *civil rights* of men. In conſequence of St Paul's having reprimanded the Corinthians for going to law before the *unbelievers*, they were indeed often choſen as *arbiters* of ſuch civil diſputes as aroſe between individuals under their epiſcopal government; but on theſe occaſions they could not act unleſs the ſubmiſſion was *voluntarily* made by *both* the contending parties, and *then* their deciſion was final. When the empire became Chriſtian, this privilege was confirmed to them by law; for any *civil* cauſe depending before a court of juſtice could be withdrawn, and by the mutual conſent of parties be ſubmitted to the arbitration of the biſhop, whoſe award, which in former times could be enforced only by the terror of church-cenſures, was then enforced by the ſecular magiſtrate. In *criminal* cauſes, where the trial might be for life or death, they were prohibited both by the canons of the church and by the laws of the ſtate from acting as judges; and therefore they never ſuffered ſuch cauſes to come before them, except when it was neceſſary that the perſon accuſed, if found guilty, ſhould be excluded from the communion of the faithful. But they had ſo many civil cauſes flowing in upon them, that they were ſoon obliged to devolve part of that care upon other perſons in whoſe knowledge, prudence, and integrity, they could fully confide; and as the perſons employed to act in the biſhop's ſtead were often *laymen*, it has been conjectured that they gave riſe to the office of *lay-chancellor* in the church, and to all that train of ſpiritual judges and ſpiritual courts againſt which ſuch numbers are diſpoſed to clamour.

21
The probable origin of ſpiritual courts.

22
Biſhops had no civil rank till after the ſubverſion of the Roman empire and the converſion of the Gothic nations.

Be this as it may, it is certain that, through the piety and munificence of the Chriſtian emperors, the biſhops enjoyed large revenues and many valuable privileges; but it does not appear that they had any rank or authority, as *barons* or *temporal princes*, till the Gothic nations, which ſubverted the Roman empire, had embraced the Chriſtian faith. As Chriſtianity incapacitated the leaders of thoſe tribes from officiating as chief prieſts at the religious rites which were uſually celebrated at the opening of their public aſſemblies, the biſhops came naturally to diſcharge that duty on ſuch occaſions, when they muſt have ſhared in the rank by ſharing in the functions of the chief. The ſituation in which they thus appeared at the opening of all political conventions, would enable them to join with much effect in the deliberations which enſued; and their ſuperior knowledge, their ſacred character, and their influence with the people, would ſoon acquire them power equal to their rank. They muſt therefore have been well intitled to demand admiſſion into that council which was formed by the king and the lay-chiefs at the national aſſemblies: and as they balanced the authority of thoſe chiefs, we cannot doubt that the king would be diſpoſed to give the utmoſt effect to their claim. Accordingly, we find the dignified clergy, who received large grants of land to be held on the ſame tenures with the lands of the lay magiſtrates, preſiding along with thoſe magiſtrates in the provincial aſſemblies of every degree in all the Gothic nations, and enjoying every advantage in point of rank and authority in their national diets. Hence the biſhop of Rome, and ſeveral biſhops in Germany, have, like the dukes and marquiſes of that empire, been for a long time ſovereign princes; and hence too the biſhops of England and Ireland have always ſat, and have an equal right with the lay-peers to ſit, in the upper houſe of parliament. It is however obvious, that, ſo far as epiſcopacy is of *apoſtolical* inſtitution, thoſe peers and princes poſſeſs not the *original* character in any higher degree than the biſhops in America, who are barely tolerated, or than thoſe in Scotland who do not enjoy that privilege; and that confirmation adminiſtered, or holy orders conferred, by a perſecuted prelate, muſt be as effectual to the purpoſes of religion, as if given by a German prince or an Engliſh peer.

In this ſhort view of epiſcopacy, it has been our endeavour to do juſtice to the ſubject, without ſuffering ourſelves to be influenced by partiality or prejudice. As we are not ourſelves epiſcopalians, we have advanced nothing of our own; but have ſelected from Engliſh writers, who have at different times undertaken to defend the *divine right* of epiſcopacy, ſuch facts and arguments as to us appear to be of the moſt importance, or to have the greateſt weight, without remarking upon them, or offering any anſwer. The reaſoning employed to prove that the order of biſhops was inſtituted by the apoſtles, is taken from a work prepared for the preſs by Dr Berkeley prebendary of Canterbury, and ſon of the celebrated biſhop of Cloyne. For the reſt of the detail, we are indebted chiefly to Bingham's *Origines Eccleſiaſticæ;* a performance in great eſtimation with thoſe Engliſh divines who are commonly known by the appellation of *high churchmen*. As editors of a work of this kind, it is not *our* buſineſs to be of *any party*, or to ſupport, in oppoſition to all others, a *particular* church, though that church ſhould be our own: We ſhall therefore treat *independency* and *preſbytery* as we have treated *epiſcopacy*, by employing ſome able writer of each ſociety to plead his own cauſe. Mean while, we ſhall conclude this article with a few reflections, which, though they come from the pen of an obſcure author, deſerve to be engraved deep in the memory of every controvertiſt of every communion.

23
Moderation in controverſy recommended.

"On complicated queſtions (ſays a late apologiſt for the epiſcopal church in Scotland), men will always differ in opinion; but conſcious each of the weakneſs of his own underſtanding, and ſenſible of the bias which the ſtrongeſt minds are apt to receive from thinking long in the ſame track, they ought to differ with charity and meekneſs. Since unhappily there are ſtill ſo many ſubjects of debate among thoſe who name the name of Chriſt; it is doubtleſs every man's duty, after diveſting himſelf as much as poſſible of prejudice, to inveſtigate thoſe ſubjects with accuracy, and to adhere to that ſide of each diſputed queſtion which, after ſuch inveſtigation, appears to him to be the truth: but he tranſgreſſes the favourite precept of his divine Maſter, when he caſts injurious reflections, or denounces anathemas, upon thoſe who, with equal ſincerity, may view the matter in a different light; and by his want of charity does more harm to the religion of the *Prince of Peace*, than he could poſſibly do good, were he able to convert all mankind to his own orthodox opinions."

EPISCOPAL, ſomething belonging to Bishops.

EPISCOPALIANS, in church-hiſtory, an appellation given to thoſe who prefer the epiſcopal government and diſcipline to all others. See Episcopacy.

By the teſt act, none but Epiſcopalians, or members of the church of England, are qualified to enjoy any office civil or military.

EPISCOPIUS (Simon), one of the moſt learned men of the 17th century, and the chief ſupporter of the Arminian ſect, was born at Amſterdam in 1583. In 1612, he was choſen divinity profeſſor at Leyden, in the room of Gomarus, who reſigned; and the functions of his office, with his private ſtudies, were light burdens to him, compared with the difficulites he ſuſtained on account of the Arminian controverſy: which, though it began in the univerſities, ſoon flew to the pulpits,

pulpits, from whence it ſpread and inflamed the people. The ſtates of Holland having invited Epiſcopius to take his place at the ſynod of Dort, he went thither accompanied by ſome remonſtrant miniſters; but the ſynod would not allow them to ſit as judges, nor to appear in any other capacity than as perſons ſummoned before them: they ſubmitted, were depoſed from their functions, and baniſhed the territories of the commonwealth. Epiſcopius and his perſecuted brethren retired to Antwerp; but the times growing more favourable, he returned to Holland in 1626, and was made miniſter of the church of the Remonſtrants at Rotterdam: in 1634, he was choſen rector of the college founded by his ſect at Amſterdam, where he ſpent the remainder of his days. He died in 1643, of the ſame diſorder which had killed his wife before, a retention of urine; having loſt his ſight ſome weeks previous to his end. The learned have beſtowed great eulogiums on Epiſcopius; but he did not always write with that moderation which might have been wiſhed. His works make two volumes in folio, of which the ſecond conſiſts of poſthumous publications.

EPISCOPUS, the ſame with biſhop. See Bishop and Episcopacy.

EPISODE, in poetry, a ſeparate incident, ſtory, or action, which a poet invents, and connects with his principal action, that his work may abound with a greater diverſity of events; though, in a more limited ſenſe, all the particular incidents whereof the action or narration is compounded, are called *epiſodes*. See Poetry.

EPISPASTIC, in medicine, a topical remedy, which being applied to the external parts of the body, attracts the humours to that part.

EPISTATES, in the Athenian government, was the preſident of the proedri. See Proedri.

EPISTEMONARCH, in the ancient Greek church, an officer of great dignity, who had the care of every thing relating to faith, in the quality of cenſor. His office anſwered pretty nearly to that of maſter of the ſacred palace at Rome.

EPISTLE, denotes the ſame with a miſſive letter; but is now chiefly uſed in ſpeaking of ancient writings, as the epiſtles of St Paul, epiſtles of Cicero, epiſtles of Pliny, &c.

*Epistles and Goſpels*, in the liturgy of the church of England, are ſelect portions of ſcripture, taken out of the writings of the evangeliſts and apoſtles, and appointed to be read, in the communion-ſervice, on Sundays and holidays. They are thought to have been ſelected by St Jerom, and by him put into the lectionary. It is certain, they were very anciently appropriated to the days whereon we now read them, ſince they are not only of general uſe throughout the weſtern church, but are alſo commented upon in the homilies of ſeveral ancient fathers, which are ſaid to have been preached upon thoſe very days to which theſe portions of ſcripture are now affixed.

The epiſtles and goſpels are placed in an admirable order and method, and bear a ſpecial relation to the ſeveral days whereon they are read. The year is diſtinguiſhed into two parts; the firſt being deſigned to commemorate Chriſt's living among us, the other to inſtruct us to live after his example. The former takes in the whole time from Advent to Trinity-Sunday; the latter, all the Sundays from Trinity to Advent. During the firſt of theſe ſeaſons, the epiſtles and goſpels are calculated to raiſe in us a grateful ſenſe of what our Saviour did and ſuffered for us, and ſet before our eyes his nativity, circumciſion, and maniſeſtation to the Gentiles; his doctrines and miracles; his baptiſm, faſting, and temptation; his agony and bloody ſweat; his croſs and paſſion; his death, burial, reſurrection, and aſcenſion; and his miſſion of the Holy Ghoſt. During the ſecond ſeaſon of the year, the epiſtles and goſpels tend to inſtruct us in the true paths of Chriſtianity. See Collects.

EPISTOLARY, ſomething belonging to an epiſtle. See Epistle.

*Epistolary Compoſition.* See Letter; and the article Poetry.

EPISTROPHE. See Oratory, n° 71.

EPISTYLE, in the ancient architecture, a term uſed by the Greeks for what we call *architrave*, viz. a a maſſive piece of ſtone or wood, laid immediately over the capital of a column.

EPITAPH (from επι *upon*, and ταφος *ſepulchre)*, a monumental inſcription, in honour or memory of a perſon deceaſed. It has been diſputed whether the ancient Jews inſcribed epitaphs on the monuments of the dead; but be this as it will, epitaphs it is certain, of very ancient date, are found amongſt them.—The Athenians, by way of epitaph, put only the name of the dead, with the epithet χρηστος, ſignifying "good," or ηρως "hero," and the word χαιρε, ſignifying their good wiſhes: The name of the deceaſed's father and his tribe were frequently added.—The Lacedemonians allowed epitaphs to none but thoſe who had died in battle. The Romans inſcribed their epitaphs to the *manes*, *diis manibus*; and frequently introduced the dead by way of proſopopœia, ſpeaking to the living; of which we have a fine inſtance, worthy the Auguſtan age, wherein the dead wife thus beſpeaks her ſurviving huſband:

*Immatura peri; ſed tu, felicior, annos*
*Vive tuos, conjux optime, vive meos.*

The epitaphs of the preſent day are generally crammed with fulſome compliments which were never merited, characters which human nature in its beſt ſtate could ſcarce lay claim to, and expreſſions of reſpect which were never paid in the life-time of the deceaſed. Hence the proverb with great propriety took its riſe, "He lies like an epitaph."

Epitaph, is alſo applied to certain eloges, either in proſe or in verſe, compoſed without any intent to be engraven on tombs; as, That of Alexander,

*Sufficit huic tumulus, cui non ſufficeret orbis;*

and that of Newton,

*Iſaacum Newton,*
*Quem immortalem*
*Teſtantur Tempus, Natura, Cœlum,*
*Mortalem hoc marmor*
*Fatetur.*

EPITASIS, in ancient poetry, the ſecond part or diviſion of a dramatic poem, wherein the plot, entered upon in the firſt part or *protaſis*, was carried on, heightened, and worked up, till it arrived at its ſtate or height, called *cataſtaſis*.

Epitasis, in medicine, the increaſe of a diſeaſe or beginning of a paroxyſm, particularly in a fever.

EPITHALAMIUM, in poetry, a nuptial ſong or compoſition in praiſe of the bride and bridegroom, praying for their proſperity, for a happy offspring, &c.

Epithalamia were ſung amongſt the Jews, at the door of the bride, by her friends and companions, the evening before the marriage. Pſalm xlv. is an epithalamium. Among the Greeks the epithalamium was ſung as ſoon as the married couple were gone to bed, and attended with ſhouts and ſtamping of the feet to drown the cries of the bride. They returned in the morning, and with the ſame ſong, a little altered, ſaluted them again. The evening ſong was called επιθαλαμια κοιμητικα, the morning ſalute was called επιθαλαμια εγερτικα. This was the practice amongſt the Romans alſo, but their epithalamia were often obſcene.

EPITHEM, in pharmacy, a kind of fomentation, or remedy of a ſpirituous or aromatic kind, applied externally to the regions of the heart, liver, &c. to ſtrengthen and comfort the ſame, or to correct ſome intemperature thereof.

EPITHET, in poetry and rhetoric, an adjective expreſſing ſome quality of a ſubſtantive to which it is joined; or ſuch an adjective as is annexed to ſubſtantives by way of ornament and illuſtration, not to make up an eſſential part of the deſcription. Nothing, ſays Ariſtotle, tires the reader more than too great a redundancy of epithets, or epithets placed improperly; and yet nothing is ſo eſſential in poetry as a proper uſe of them. The writings of the beſt poets are full of them.

EPITOME, in literary hiſtory, the ſame with ABRIDGEMENT.

EPITRITUS, in proſody, a foot conſiſting of three long ſyllables and one ſhort. Of theſe, grammarians reckon four kinds: the firſt conſiſting of an iambus and ſpondee, as ſălūtāntēs; the ſecond, of a trocheus and ſpondee, as cōncĭtātī; the third, of a ſpondee and an iambus, as cōmmūnĭcāns; and the fourth, of a ſpondee and trocheus, as īncāntārĕ. See the articles SPONDEUS, TROCHEUS, &c.

EPITROPE. See ORATORY, n° 83.

EPITROPUS, a kind of judge, or rather an arbitrator, which the Greek Chriſtians under the dominion of the Turks elect in the ſeveral cities, to terminate the differences that ariſe among them, and avoid carrrying them before the Turkiſh magiſtrates. See ARBITRATOR.

Anciently the Greeks uſed the term επιτροπος in the ſame ſenſe as the Latins did *procurator*, viz. for a commiſſioner or intendant. Thus the commiſſioners of proviſions in the Perſian army are called by Herodotus and Xenophon *epitropi*. In the New Teſtament, επιτροπος denotes the ſteward of a houſhold, rendered in the vulgate *procurator*.

EPIZEUXIS. See ORATORY, n° 68.

EPOCHA, in chronology, a term or fixed point of time whence the ſucceeding years are numbered or counted. See ÆRA.

EPODE, in lyric poetry, the third or laſt part of the ode, the ancient ode being divided into ſtrophe, antiſtrophe, and epode. See ODE, &c.

The epode was ſung by the prieſts, ſtanding ſtill before the altar, after all the turns and returns of the ſtrophe and antiſtrophe, and was not confined to any preciſe number or kind of verſes.

The epode is now a general name for all kinds of little verſes that follow one or more great ones, of what kind ſoever they be: and in this ſenſe, a pentameter is an epode after an hexameter. And as every little verſe, which, being put after another, cloſes the period, is called *epode;* hence the ſixth book of Horace's odes is intitled *liber epodon*, "book of epodes," becauſe the verſes are all alternately long and ſhort, and the ſhort ones generally, though not always, cloſe the ſenſe of the long one.

EPOPOEIA, in poetry, the hiſtory, action, or fable, which makes the ſubject of an epic poem. The word is derived from the Greek επος *carmen*, "verſe;" and ποιεω *facio*, "I make."

In the common uſe of the word, however, *epopœia* is the ſame with *epos*, or epic poem itſelf. See the article POETRY.

EPOPS, or HOOPOE. See UPUPA.

EPSOM, a town of Surry, about 16 miles ſouth-weſt from London, long famous for its mineral waters. Theſe were diſcovered in 1618; and though not in ſuch repute as formerly, yet they are not impaired in virtue, and the ſalt * made from them is famous all over Europe, for gently cleanſing and cooling the body. The hall, galleries, and other public apartments, are now run to decay; and there remains only one houſe on the ſpot, which is inhabited by a countryman and his wife, who carry the waters in bottles to the adjacent places, and ſupply the demands of dealers in London. On the neighbouring downs are annually horſe-races; but the inns, ſhops, and bowling-greens are not near ſo much frequented as formerly. The market is on Friday; fair, July 25. The town is about one mile and an half in ſemicircle, from the church to the palace at Durdans, which was burnt down ſome years ſince, but has been rebuilt. It was once inhabited by his preſent majeſty's father. In Hudſon's-Lane here was Epſom-Court, an ancient Saxon ſeat, long ſince converted into a farm. Here are ſo many fields, meadows, orchards, gardens, and the like, that a ſtranger would be at a loſs to know whether this was a town built in a wood, or a wood ſurrounded by a town.

* See *miſtry.*

Epſom water is eaſily imitated by art; *i. e.* by only diſſolving half an ounce of Epſom ſalt in a quart of pure water, made ſomewhat briſk or quick by a few drops of ſpirit of vitriol and oil of tartar, ſo as to let the alkali prevail.

EPULARES, in antiquity, an epithet given to thoſe who were admitted to the ſacred *epulæ* or entertainments, it being unlawful for any to be preſent at them who were not pure and chaſte.

EPULO, in antiquity, the name of a miniſter of ſacrifice among the Romans.

The pontifices, not being able to attend all the ſacrifices performed at Rome to ſo many gods as were adored by that people, appointed three miniſters, whom they called *epulones*, becauſe they conferred on them the care and management of the *epula*, feaſts in the ſolemn games and feſtivals. To them belonged the ordering and ſerving the ſacred banquet, offered on ſuch occaſions to Jupiter, &c. They wore a gown bordered with purple like the pontifices. Their number was at length augmented from three to ſeven, and afterwards by Cæſar to ten. Their firſt eſtabliſhment was in the year of Rome 558, under the conſulate of L. Furius Purpureo, and M. Claudius Marcellus.

EPULUM, in antiquity, a holy feaſt prepared for the gods in times of public danger. The feaſt was ſumptuous, and the gods were formally invited and attended; for the ſtatues were brought on rich beds furniſhed with ſoft pillows, called *pulvinaria*: Thus accommodated, their godſhips were placed on their couches at the moſt honourable part of the table. The care of the *epula* belonged to the *epulones*, and the gods were plentifully ſerved with the richeſt dainties, as if they were able to eat; but the *epulones* performed that function for them, and doubtleſs were competent proxies! No wonder that Pliny ſolicited Trajan to be admitted of their order.

EPULUM is alſo uſed to ſignify any ſolemn feaſt; ſo we meet with *epulum ferale*, "a funeral entertainment."

EQUABLE, an appellation given to ſuch motions as always continue the ſame in degree of velocity, without being either accelerated or retarded.

EQUAL, a term of relation between two or more things of the ſame magnitude, quantity, or quality.

Mathematicians ſpeak of *equal* lines, angles, figures, circles, ratios, ſolids.

EQUALITY, that agreement between two or more things, whereby they are denominated equal.

EQUANIMITY, in ethics, denotes that even and calm frame of mind and temper, under good or bad fortune, whereby a man appears to be neither puffed up nor overjoyed with proſperity, nor diſpirited, ſoured, or rendered uneaſy by adverſity.

EQUATIONS, in algebra. See ALGEBRA, chap. iii.

*EQUATION of Time*, in aſtronomy and chronology, the reduction of the apparent time or motion of the ſun, to equable, mean, or true time. See ASTRONOMY, n° 383.

EQUATOR, or ÆQUATOR, in aſtronomy and geography, a great circle of the ſphere, equally diſtant from the two poles of the world, or having the ſame poles with thoſe of the world. It is called the *equator*, becauſe when the ſun is in it the days and nights are *equal*; whence alſo it is called the *equinoctial*; and when drawn on maps and planiſpheres, the *equinoctial line*, or ſimply the *line*. Every point of the equator is a quadrant's diſtance from the poles of the world; whence it follows, that the equator divides the ſphere into two hemiſpheres, in one of which is the northern, and in the other the ſouthern pole.

EQUATORIAL INSTRUMENT. See ASTRONOMY, n° 499, 504.

EQUERY, or ECURY, a grand ſtable or lodge for horſes, furniſhed with all the conveniences thereof; as ſtalls, manger, rack, &c. The word is formed from the French *eſcurie*, which ſignifies the ſame thing. Some again derive *eſcurie* from the Latin *ſcuria*, which not only denotes a place for beaſts to be put up in, but alſo a grange or barn. But a more probable derivation is from *equile* "a ſtable for horſes," of *equus* "horſe." Some hold that the word *ſtable*, in propriety, relates only to bullocks, cows, ſheep, hogs, &c. and *equery*, to horſes, mules, &c.

A *ſimple equery* is that provided for one row of horſes; a *double equery* that provided for two, with a paſſage in the middle, or two paſſages: the horſes being placed head to head, as in the little equery at Verſailles.

Under equery are ſometimes alſo comprehended the lodgings and apartments of the equerries, grooms, pages, &c.

EQUERY (*eſcuyer*), is alſo an officer who has the care and management of the horſes of a king or prince.

EQUERIES, or EQUERRIES, popularly called *Querries*, are particularly uſed among us for officers of the king's ſtables, under the maſter of the horſe, ſeven in number, who, when his majeſty goes abroad, ride in the leading coach, are in waiting one at a time monthly, and have a table with the gentlemen-uſhers during the time, and a ſalary of L. 300 a-year each. They uſed to ride on horſeback by the coach-ſide when the king travelled; but that being more expenſive to them than neceſſary to the ſovereign, it has been diſcontinued.

*EQUERIES of the Crown Stable* have that appellation, as being employed in managing and breaking the ſaddle-horſes, and preparing them for the king's riding. Theſe are two in number; the firſt having an annual ſalary of L. 256, and the ſecond L. 200, whereof one is, or always ſhould be, in cloſe waiting at court; and when his majeſty rides, holds the ſtirrup, while the maſter of the horſe, or one of the equeries in his abſence, aſſiſts in mounting him; and when his majeſty rides, they uſually attend him.

EQUES, in antiquity. See EQUESTRIAN *Order*, and EQUITES.

*EQUES Auratus*, is uſed to ſignify a knight-bachelor, called *auratus*, q. d. *gilt*, becauſe anciently none but knights might gild or beautify their armour or other habiliments of war with gold. In law this term is not uſed, but inſtead of it *miles*, and ſometimes *chevalier*.

EQUESTRIA, among the Romans, a place in the theatre where the equites or knights ſat.

EQESTRIAN (*Equeſtris*), a term chiefly uſed in the phraſe *equeſtrian ſtatue*, which ſignifies a ſtatue repreſenting a perſon mounted on horſeback. The word is formed of the Latin *eques*, "knight, horſeman," of *equus*, "horſe."

*EQUESTRIAN Games*, among the Romans, horſe-races, of which there were five kinds, the *prodromus* or *plain horſe-race*, the *chariot-race*, the *decurſory-race* about funeral piles, the *ludi ſevirales*, and the *ludi neptunales*.

*EQUESTRIAN Order*, among the Romans, ſignified their knights or equites; as alſo their troopers or horſemen in the field; the firſt of which orders ſtood in contradiſtinction to the ſenators; as the laſt did to the foot, military, or infantry. Each of theſe diſtinctions was introduced into the ſtate by Romulus.

EQUIANGULAR, in geometry, an epithet given to figures whoſe angles are all equal: ſuch are a ſquare, an equilateral triangle, &c.

EQUIDISTANT, an appellation given to things placed at equal diſtances from ſome fixed point or place to which they are referred.

EQUILATERAL, in general, ſomething that hath equal ſides; as an equilateral triangle.

EQUILIBRIUM, in mechanics, is when the two ends of a lever or balance hang ſo exactly even and level, that neither doth aſcend or deſcend, but both keep in a poſition parallel to the horizon; which is occaſioned by their being both charged with an equal weight.

EQUIMULTIPLES, in arithmetic and geometry, are numbers or quantities multiplied by one and the ſame number or quantity. Hence, equimultiples are always in the ſame ratio to each other as the ſimple quantities before multiplication: thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other as 6 to 8.

EQUINOCTIAL, or ÆQUINOCTIAL, in aſtronomy, a great and immoveable circle of the ſphere, under which the equator moves in its diurnal motion.

The equinoctial or equinoctial line, is ordinarily confounded with the equator: but there is a difference; the equator being moveable, and the equinoctial immoveable; and the equator being drawn about the convex ſurface of the ſphere, but the equinoctial on the concave ſurface of the magnus orbis.

Whenever the ſun in his progreſs through the ecliptic comes to this circle, it makes equal days and nights all around the globe; as then riſing due eaſt and ſetting due weſt, which he never does at any other time of the year. And hence the denomination from *æquus* and *nox*, "night," *quia æquat diem nocti.*

The equinoctial then is the circle which the ſun deſcribes, or appears to deſcribe, at the time of the equinoxes; that is, when the length of the day is every where equal to that of night, which happens twice a-year. See EQUINOX.

EQUINOCTIAL, in geography. See EQUATOR.

The ſhadows of thoſe who live under this circle are caſt to the ſouthward of them for one half of the year, and to the northward of them during the other half; and twice in a year, *viz.* at the equinoxes, the ſun at noon caſts no ſhadow, being in their zenith.

From this circle is the declination or latitude of places accounted in the degrees of the meridian.

*EQUINOCTIAL Points*, are the two points wherein the equator and ecliptic interſect each other: the one being in the firſt point of Aries, is called the *vernal point* or *equinox;* and the other in the firſt point of Libra, the *autumnal point* or *equinox.*

*EQUINOCTIAL Dial,* is that whoſe plane lies parallel to the equinoctial. See DIAL.

EQUINOX, or ÆQUINOX, in aſtronomy, the time when the ſun enters one of the equinoctial points.

The equinoxes happen when the ſun is in the equinoctial circle; when of conſequence the days are equal to the nights throughout the world, which is the caſe twice a year, *viz.* about the 20th of March and the 23d of September, the firſt of which is the vernal and the ſecond the autumnal equinox.

It is found by obſervation, that the equinoctial points, and all the other points of the ecliptic, are continually moving backward, or *in antecedentia*, that is, weſtward. This retrograde motion of the equinoctial points, is that famous and difficult phenomenon called the *preceſſion of the equinoxes.* See ASTRONOMY, n° 348, 349.

EQUIPAGE, in the military art, denotes all ſorts of utenſils, artillery, &c. neceſſary for commencing and proſecuting with eaſe and ſucceſs any military operations. Camp and field equipage conſiſts of tents, kitchen-furniture, ſaddle-horſes, baggage, waggons, bat-horſes, &c.

To EQUIP, in naval language, a term borrowed from the French marine, and frequently applied to the buſineſs of fitting a ſhip for ſea, or arming her for war.

EQUIPOLLENCE, in logic, is when there is an equivalence between any two or more terms or propoſitions; *i. e.* when they ſignify one and the ſame thing, though they expreſs it differently. Such propoſitions, &c. are ſaid to be *equipollent.*

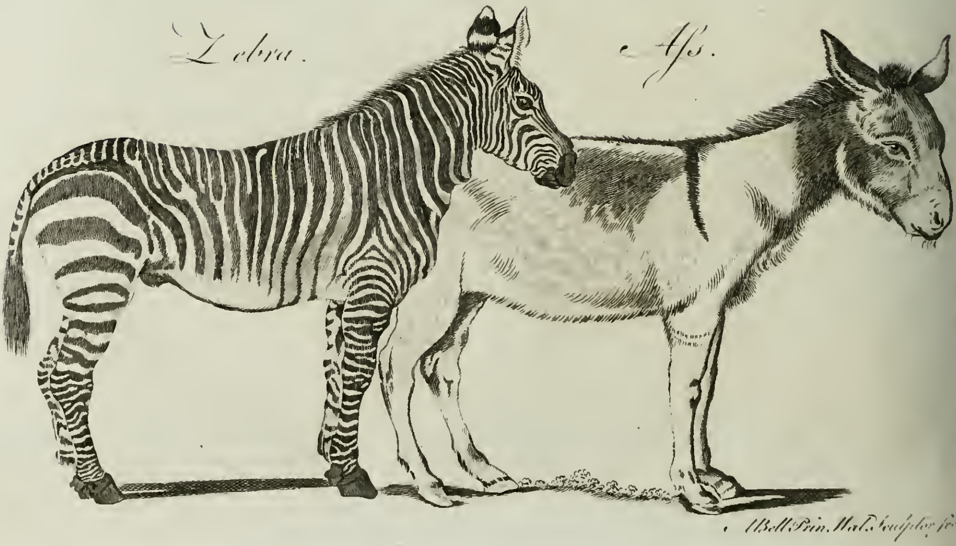
EQUIRIA, in antiquity, a feſtival inſtituted by Romulus, and celebrated on the 27th of February, in honour of Mars, at which there were horſe-races.

EQUISETUM, HORSE-TAIL: A genus of the order of filices, belonging to the cryptogamia claſs of plants; and in the natural method ranking under the 51ſt order, *Coniferæ.* There is a ſpike of peltated or ſhielded fructifications opening at the baſe. There are ſeven ſpecies; of which the moſt remarkable are, 1. The ſylvaticum, or wood horſe-tail. It grows in woods and moiſt ſhady places in many parts of England and Scotland. The ſtalk riſes from 12 to 18 inches high, angular, and rough to the touch; the angles being edged with ſharp *ſpiculæ*, ſcarce viſible without a microſcope. The leaves grow verticillate, 12 or more in a whorl, and theſe whorls are about an inch diſtant from one another. The leaves are very ſlender, nearly quadrangular, about five inches long, pendent, and beſet with ſeveral other ſecondary whorls, ſo that it reſembles a pine-tree in miniature. Horſes are very fond of this plant, and in ſome parts of Sweden it is collected to ſerve them as winter food. 2. The arvenſe, common or corn horſe-tail, grows in wet meadows and corn-fields. The moſt remarkable property of this is, that its ſeeds, when viewed by a microſcope, are ſeen to leap about as if they were animated. It has a very aſtringent and diuretic quality, and has been eſteemed ſerviceable in the *hæmaturia* and *gonorrhœa*, but is diſregarded by the preſent practice. It is a troubleſome plant in paſtures; and diſagreeable to cows, being never touched by them unleſs they are compelled by hunger, and then it brings on an incurable diarrhœa. It does not ſeem to affect horſes or ſheep. 3. The paluſtre, marſh horſe-tail, or paddock pipe, is frequent in marſhes and ditches. It is not ſo rough as the former, but is likewiſe prejudicial to cattle. 4. The fluviatile, or great river horſe-tail, is frequent in ſhady marſhes, and on the brinks of ſtagnant waters. It is the largeſt of all the ſpecies, growing ſometimes to the height of a yard, and near an inch in diameter. Haller tells us, that this kind of equiſetum was eaten by the Romans; and Linnæus affirms, that oxen and rein-deer are fond of it, but that horſes refuſe it. 5. The hyemale, rough horſe-tail, ſhave-graſs, or Dutch ruſhes. This is much uſed by the whiteſmiths and cabinet-makers, under the name of *Dutch ruſhes*, for poliſhing their metals and wood. All the other ſpecies will anſwer this purpoſe in ſome degree, but the laſt better than any of the reſt. In Northumberland the dairy-maids ſcour and clean their milk-pails with it. Some imagine, that if cows are fed with this ſpecies, their teeth will fall out.

EQUITES, amongſt the Romans, were perſons of the ſecond degree of nobility, immediately ſucceeding the ſenators in point of rank. The *equites* or knights were required to be poſſeſſed of 400 *ſeſtertia* before they could be admitted into that order; and when the knights were ſo reduced as to fall ſhort of the preſcribed

*Horse.*

*Zebra.* *Ass.*



*I. Bell Prin. Mal. Sculptor fecit*

ſcribed revenue, they were expunged out of the equeſtrian liſt. The equeſtrian revenue juſt mentioned amounted to about 10,000 crowns.

Part of the ceremony whereby the honour of knighthood was conferred amongſt the Romans was the giving of a horſe; for every *eques* or knight had a horſe kept at the public charge, he received alſo the ſtipend of an horſeman to ſerve in the wars, and wore a ring which was given him by the ſtate. The *equites* compoſed a large body of men, and conſtituted the Roman cavalry; for there was always a ſufficient number of them in the city, and nothing but a review was requiſite to fit them for ſervice.

The knights at laſt grew too powerful, were a balance for the ſenate and people, neglected the exerciſes of war, and betook themſelves to civil employments. The *equites* were liable to be puniſhed by the cenſors, and to ſuffer degradation. They were degraded by taking from them the horſe which was kept for each of them at the public charge; this was called *equum adimere*.

EQUITY, in a general ſenſe, the virtue of treating all other men according to reaſon and juſtice, or as we would gladly be treated ourſelves when we underſtand aright what is our due. See JUSTICE.

EQUITY, in juriſprudence, is defined a correction or qualification of the law, generally made in that part wherein it faileth or is too ſevere. It likewiſe ſignifies the extenſion of the words of the law to caſes unexpreſſed, yet having the ſame reaſon; ſo that where one thing is enacted by ſtatute, all other things are enacted that are of the like degree. For example, the ſtatute of *Glouc.* gives action of waſte againſt him that holds lands for life or years; and by the equity thereof, a man ſhall have action of waſte againſt a tenant that holds but for one year, or one half-year, which is without the words of the act, but within the meaning of it; and the words that enact the one, by *equity* enact the other. So that equity is of two kinds. The one abridges and takes from the letter of the law: the other enlarges and adds to it; and ſtatutes may be conſtrued according to equity, eſpecially where they give remedy for wrong, or are for expedition of juſtice. Equity ſeems to be the interpoſing *law of reaſon*, exerciſed by the lord chancellor in extraordinary matters to do equal juſtice; and by ſupplying the defects of the law, gives remedy in all caſes. See CHANCERY.

EQUITY, in mythology, ſometimes confounded with *Juſtice*, a goddeſs among the Greeks and Romans, repreſented with a ſword in one hand and a balance in the other.

EQUIVALENT, is underſtood of ſomething that is equal in value, force, or effect, to another.

Equivalence is of various kinds, in propoſitions, in terms, and in things.

*EQUIVALENT Propoſitions.* See EQUIPOLLENCE.

*EQUIVALENT Terms* are where ſeveral words that differ in ſound have yet one and the ſame ſignification; as *every body was there*, and *nobody was abſent*, *nihil non*, and *omne*.

*EQUIVALENT Things*, are either *moral*, *phyſical*, or *ſtatical*. *Moral*, as when we ſay that the commanding or adviſing a murder is a guilt equivalent to that of the murderer. *Phyſical*, as when a man who has the ſtrength of two men is ſaid to be equivalent to two men. *Statical*, whereby a leſs weight becomes of equal force with a greater, by having its diſtance from the centre increaſed.

EQUIVOCAL TERMS or WORDS, among logicians, are thoſe which have a doubtful or double meaning.

According to Mr Locke, the doubtfulneſs and uncertainty of words has its cauſe more in the ideas themſelves, than in any incapacity of the words to ſignify them; and might be avoided, would people always uſe the ſame term to denote the ſame idea or collection of ideas: but, adds he, it is hard to find a diſcourſe on any ſubject where this is the caſe; a practice which can only be imputed to folly or great diſhoneſty; ſince a man, in making up his accounts, might with as much fairneſs uſe the numeral characters ſometimes for one ſometimes for another collection of units.

*EQUIVOCAL Generation*, the production of animals without the intercourſe between the ſexes, by the influence of the ſun or ſtars, &c.

This kind of generation is now quite exploded by the learned.

EQUIVOCATION, the uſing a term or expreſſion that has a double ſignification. Equivocations are expedients to ſave telling the truth, and yet without telling a falſity. The fathers are great patrons of equivocations and mental reſervations, holding that the uſe of ſuch ſhifts and ambiguities is in many caſes allowable.

EQUULEUS, or ECCULEUS, in antiquity, a kind of rack uſed for extorting a confeſſion, at firſt chiefly practiſed on ſlaves, but afterwards made uſe of againſt the Chriſtians.

The equuleus was made of wood, having holes at certain diſtances, with a ſcrew, by which the criminal was ſtretched to the third, ſometimes to the fourth, or fifth holes, his arms and legs being faſtened on the equuleus with cords; and thus was hoiſted aloft, and extended in ſuch a manner, that all his bones were diſlocated. In this ſtate red-hot plates were applied to his body, and he was goaded in the ſides with an inſtrument called *ungula*.

EQUULEUS, EQUICULUS, and *Equus Minor*, the horſe's head, in aſtronomy, a conſtellation of the northern hemiſphere, whoſe ſtars in Ptolemy's catalogue are 4, in Tycho's 4, in Hevelius's 6, and in Mr Flamſteed's 10.

Plate CLXXXIII.

EQUUS, in zoology, a genus of quadrupeds belonging to the order of belluæ. This genus comprehends the horſe, the mule, the aſs, the zebra, and the quagga: they have ſix erect and parallel fore-teeth in the upper jaw, and ſix ſomewhat prominent ones in the under jaw; the dog-teeth are ſolitary, and at a conſiderable diſtance from the reſt; and the feet conſiſt of an undivided hoof.

1. The *caballus*, or HORSE, has a long flowing mane, and the tail covered on all parts with long hairs.

*Buffon Hiſtoire Naturelle.*

The horſe, in a domeſtic ſtate, is a bold and fiery animal; equally intrepid as his maſter, he faces danger and death with ardour and magnanimity. He delights in the noiſe and tumult of arms, and ſeems to feel the glory of victory: he exults in the chaſe; his eyes ſparkle with emulation in the courſe. But though bold and intrepid, he is docile and tractable: he knows how to govern and check the natural vivacity and fire of his temper. He not only yields to the hand, but ſeems to conſult the inclination of his rider. Conſtantly obedient to the impreſſions he receives, his motions are entirely regulated by the will of his maſter. He in ſome meaſure reſigns his very exiſtence to the pleaſure of man. He delivers up his whole powers; he reſerves nothing; he will rather die than diſobey. Who could endure to ſee a character ſo noble abuſed! who could be guilty of ſuch groſs barbarity!

This character, though natural to the animal, is in ſome meaſure the effect of education. His education commences with the loſs of liberty, and is finiſhed by conſtraint. The ſlavery of the horſe is ſo ancient and ſo univerſal, that he is but rarely ſeen in a natural ſtate. Several ancient writers talk of wild horſes, and even mention the places where they were to be found. Herodotus takes notice of white ſavage horſes in Scythia; Ariſtotle ſays they are to be found in Syria; Pliny, in the northern regions; and Strabo, in Spain and the Alps. Among the moderns, Cardan ſays, that wild horſes are to be found in the Highlands of Scotland and the Orkney iſles; Olaus, in Muſcovy; Dapper, in the iſland of Cyprus; Leo and Marmol, in Arabia and Africa, &c. But as Europe is almoſt equally inhabited, wild horſes are not to be met with in any part of it: and thoſe of America were originally tranſported from Europe by the Spaniards; for this ſpecies of animals did not exiſt in the new world. The Spaniards carried over a great number of horſes, left them in different iſlands, &c. with a view to propagate that uſeful animal in their colonies. Theſe have multiplied incredibly in the vaſt deſarts of thoſe thinly peopled countries, where they roam at large without any reſtraint. M. de Salle relates, that he ſaw, in the year 1685, horſes feeding in the meadows of North America, near the bay of St Louis, which were ſo ferocious that nobody durſt come near them. Oexmelin ſays, that he has ſeen large troops of them in St Domingo running in the valleys: that when any perſon approached, they all ſtopped; and one of them would advance till within a certain diſtance, then ſnort with his noſe, take to his heels, and the whole troop after him. Every author who takes notice of theſe horſes of America, agree that they are ſmaller and leſs handſome than thoſe of Europe. Theſe relations ſufficiently prove, that the horſe, when at full liberty, though not a fierce or dangerous animal, has no inclination to aſſociate with mankind; that all the ſoftneſs and ductility of his temper proceeds entirely from the culture and poliſh he receives in his domeſtic education, which in ſome meaſure commences as ſoon as he is brought forth.

The motions of the horſe are chiefly regulated by the bit and the ſpur; the bit informs him how to direct his courſe, and the ſpur quickens his pace. The mouth of the horſe is endowed with an amazing ſenſibility: the ſlighteſt motion or preſſure of the bit gives him warning, and inſtantly determines his courſe.

The horſe has not only a grandeur in his general appearance, but there is the greateſt ſymmetry and proportion in the different parts of his body. The regularity and proportion of the different parts of the head gives him an air of lightneſs, which is well ſupported by the ſtrength and beauty of his cheſt. He erects his head, as if willing to exalt himſelf above the condition of other quadrupeds: his eyes are open and lively; his ears are handſome, and of a proper height; his mane adorns his neck, and gives him the appearance of ſtrength and boldneſs.

At the age of two years, or two years and a half, the horſe is in a condition to propagate; and the mare, like moſt other females, is ready to receive him ſtill ſooner. But the foals produced by ſuch early embraces are generally ill-made and weakly. The horſe ſhould never be admitted to the mare till he is four or four and a half; this is only meant with regard to draught-horſes. Fine horſes ſhould not be admitted to the mare before they be ſix years old; and Spaniſh ſtallions not till ſeven. The mares are generally in ſeaſon from the beginning of April to the end of June; but their chief ardour for the horſe laſts but about 15 or 20 days, and this critical ſeaſon ſhould always be embraced. The ſtallion ought to be ſound, well made, vigorous, and of a good breed. For fine ſaddle-horſes, foreign ſtallions, as Arabians, Turks, Barbs, and Andaluſians, are preferable to all others. Next to theſe, Britiſh ſtallions are the beſt; becauſe they originally ſprang from thoſe above-mentioned, and are very little degenerated. The ſtallions of Italy, and eſpecially the Neapolitans, are very good. The beſt ſtallions for draught or carriage horſes, are thoſe of Naples, Denmark, Holſtein, and Freezeland. The ſtallions for ſaddle-horſes ſhould be from 14 to 15 hands high, and for draught horſes at leaſt 15 hands. Neither ought the colour of ſtallions to be overlooked; as a fine black, grey, bay, ſorrel, &c. Beſides theſe external qualities, a ſtallion ought to have courage, tractability, ſpirit, agility, a ſenſible mouth, ſure limbs, &c. Theſe precautions in the choice of a ſtallion are the more neceſſary, becauſe he has been found by experience to communicate to his offspring almoſt all his good or bad qualities, whether natural or acquired.

The mare contributes leſs to the beauty of her offſpring than the ſtallion; but ſhe contributes perhaps more to their conſtitution and ſtature: for theſe reaſons, it is neceſſary that the mares for breed be perfectly ſound, and make good nurſes. For elegant horſes, the Spaniſh and Italian mares are beſt; but for draught-horſes, thoſe of Britain and Normandy are preferable. However, when the ſtallions are good, the mares of any country will produce fine horſes, provided they be well made and of a good breed.

Mares go with young 11 months and ſome days. They bring forth ſtanding; contrary to the courſe of moſt other quadrupeds, who lie during this operation. They continue to bring forth till the age of 16 or 18 years; and both horſes and mares live between 25 and 30 years. Horſes caſt their hair once a-year, generally in the ſpring, but ſometimes in the autumn. At this time they are weak, and require to be better fed and taken care of than at any other ſeaſon.

In Perſia, Arabia, and moſt eaſtern countries, they never geld their horſes, as is done in Europe and China. This operation greatly diminiſhes their ſtrength, courage, and ſpirit; but it makes them good humoured, gentle, and tractable. With regard to the time of performing this operation, the practice of different countries is different: ſome geld their horſes when a year old, and others at 18 months. But the beſt and moſt general practice is to delay the operation till they be two years old at leaſt: becauſe, when the gelding is delayed for two years or more, the animals retain more of the ſtrength and other qualities which naturally belong to the male.

As the utility of horſes ſurpaſſes that of all other domeſtic animals, it may be of uſe to ſubjoin ſome marks by which the age and other properties of horſes may be diſtinguiſhed.

In old horſes, the eye-pits are generally deep; but this is only an equivocal mark, being alſo found in young horſes begot by old ſtallions. The moſt certain knowledge of the age is to be obtained from the teeth. Of theſe a horſe has 40; 24 grinders or double-teeth, four tuſhes, and 12 fore-teeth: mares have no tuſhes, or at leaſt very ſhort ones. It is not from the grinders that we know the age; it is diſcovered firſt by the fore-teeth, and afterwards by the tuſhes. The 12 fore-teeth begin to ſhoot within 12 days after the colt is foaled. Theſe firſt, or foal-teeth, are round, ſhort, not very ſolid, and are caſt at different times, to be replaced by others. At the age of two years and a half, the four middle fore-teeth are caſt, two in the upper jaw, and two in the lower. In one year more, four others drop out, one on each ſide of the former, which are already replaced. When he is about four years and a half old, he ſheds four others, and always next to thoſe which have fallen out and been replaced. Theſe four foal-teeth are replaced by four others, but are far from growing ſo faſt as thoſe which replaced the eight former, and are called the *corner teeth*; they replace the four laſt foal-teeth, and by theſe the age of a horſe is diſcovered. They are eaſily known, being the third both above and below, counting from the middle of the jaw. They are hollow, and have a black mark in their cavity. When the horſe is four years and a half old, they are ſcarce viſible above the gum, and the cavity is very ſenſible: at ſix and a half, they begin to fill; and the mark continually diminiſhes and contracts till ſeven or eight years, when the cavity is quite filled up, and the black ſpot effaced. After eight years, theſe teeth ceaſing to afford any knowledge of the age, it is judged of by the tuſhes: which are four teeth adjoining to thoſe laſt mentioned; and, like the grinders, are not preceded by any other teeth. The two in the lower jaw uſually begin to ſhoot at three years and a half, and thoſe of the upper jaw at four; continuing very ſharp-pointed till ſix. At 10, the upper ſeem blunted, worn out, and long, the gum contracting itſelf as its years increaſe; the barer therefore they are, the older is the horſe. From 10 to 13 or 14 years, little can be ſeen to indicate the age; but at that time ſome hairs of the eye-brows begin to turn grey. This mark, however, is equivocal, like that drawn from the depth of the eye-pits; horſes from old ſtallions or mares, having grey hairs in the eye-brows when they are not above nine or ten years old. In ſome horſes the teeth are of ſuch a hardneſs as not to wear; and in ſuch the black mark always ſubſiſts, being never effaced by time: but the age of theſe horſes, which are called *beguts* by the French, is eaſily known; the hollow of the tooth being filled up, and at the ſame time the tuſhes very long. It has been farther obſerved, that this is more common in mares than in horſes. The age of a horſe may be alſo known, though leſs accurately, by the bars in his mouth, which wear away as he advances in years.

When the horſe is without blemiſh, the legs and thighs are clean, the knees ſtraight, the ſkin and ſhank thin, and the back-ſinew ſtrong and well-braced. The ſinews and the bones ſhould be ſo diſtinct, as to make the legs appear thin and lathy, not full and round. The paſtern joints ſhould never be large and round; nor muſt there be any ſwelling near the coronet. The hock ſhould be lean and dry, not puffed up with wind. With regard to the hoof, the coronet ſhould be equally thick, and the horn ſhining and greyiſh. A white horn is a ſign of a bad foot, for it will wear out in a ſhort time; and likewiſe when the horn is thin, it is liable to be ſpoiled in ſhoeing, and by travelling hard on ſtony grounds. This is beſt known when the ſhoe is taken off; for then the verge all round the foot will appear thin, and the horſe will wince at the leaſt touch of the pincers.

A ſtrong foot has the fibres of the hoof very diſtinct running in a direct line from the coronet to the toe, like the grain of wood. In this caſe, care muſt be taken to keep the foot moiſt and pliable. The greateſt inconvenience attending a hard ſtrong foot, is its being ſubject to rifts and fiſſures, which cleave the hoof quite through ſometimes from the coronet down to the bottom.

A narrow heel is likewiſe a defect; and when it is not above two fingers in breadth, the foot is bad. A high heel cauſes a horſe to trip and ſtumble often; and the low one, with long yielding paſterns, is very apt to be worn quite away on a journey. Too large a foot in proportion to the reſt of the body, renders a horſe weak and heavy.

The head of a horſe ſhould be ſmall, and rather lean than fleſhy. The ears ſhould be ſmall, erect, thin, ſprightly, and pointed. The forehead, or brow, ſhould be neither too broad nor too flat, and ſhould have a ſtar or ſnip thereon. The noſe ſhould riſe a little, and the noſtrils ſhould be wide that he may breathe more freely. The muzzle ſhould be ſmall, and the mouth neither too deep nor too ſhallow. The jaws ſhould be thin, and not approach too near together at the throat, nor too high upwards towards the onſet, that the horſe may have ſufficient room to carry his head in an eaſy graceful poſture. The eyes ſhould be of a middle ſize, bright, lively, and full of fire. The tongue ſhould be ſmall, that it may not be too much preſſed by the bit; and it is a good ſign when his mouth is full of white froth, for it ſhows that he will not ſoon be overheated.

The neck ſhould be arched towards the middle, growing ſmaller by degrees from the breaſt and ſhoulders to the head. The hair of the main ſhould be long, ſmall, and fine; and if it be a little frizzled, ſo much the better. The ſhoulders ſhould be pretty long; the withers thin, and enlarge gradually from thence downwards; but ſo as to render his breaſt neither too narrow nor too groſs. A thick-ſhouldered horſe ſoon tires, and trips and ſtumbles every minute; eſpecially if he has a thick large neck at the ſame time. When the breaſt is ſo narrow that the fore-thighs almoſt touch, they are never good for much. A horſe of a middle ſize ſhould have the diſtance of five or ſix inches between his fore-thighs, and there ſhould be leſs diſtance between his feet than his thighs near the ſhoulders when he ſtands upright.

The body or carcaſe of a horſe ſhould be of a middling ſize in proportion to his bulk, and the back ſhould ſink a little below the withers; but the other parts ſhould be ſtraight, and no higher behind than before. He ſhould alſo be home-ribbed; but the ſhort ribs ſhould not approach too near the haunches, and then he will have room to fetch his breath. When a horſe's back is ſhort in proportion to his bulk, and yet otherwiſe well limbed, he will hold out a journey, tho' he will travel ſlow. When he is tall, at the ſame time with very long legs, he is but of little value.

The wind ſhould never be overlooked in the choice of a horſe: and it may eaſily be known by his flanks, if he is broken-winded, when he ſtands quiet in the ſtable; becauſe he always pinches them in with a very ſlow motion, and drops them ſuddenly. A thick-winded horſe fetches his breath often, and ſometimes rattles and wheezes. This may be always diſcovered when he is put to briſk exerciſes.

The temper of a horſe ſhould always be obſerved; a vicious horſe generally lays his ears cloſe to his pole, ſhows the whites of his eyes, and looks ſullen and dogged. An angry horſe may be known by his frowning looks; and he generally ſeems to ſtand in a poſture of defence. When he is very vicious, he pays no regard to the groom that feeds him: However, ſome horſes that are ticklиſh will lay back their ears, and yet be of a good diſpoſition. A fearful horſe is apt to ſtart, and never leaves it off till he is old and uſeleſs. A fretful horſe is very unfit for a journey; and you may diſcover his temper as ſoon as he gets out of the ſtable. A dull, heavy, ſluggiſh horſe may be eaſily known, whatever tricks are uſed to rouſe his ſpirits.

With regard to the colour of a horſe, the bright bay, and indeed all kinds of bays in general, are accounted good colours. The cheſnut horſe is generally preferable to the ſorrel, unleſs the former happens to be bald, or party-coloured, with white legs. Brown horſes have generally black manes and tails, and their joints are of a ruſty black. Thoſe of this colour that are dappled, are much handſomer than the reſt. Horſes of a ſhining black, and well marked without too much white, are in high eſteem for their beauty. A ſtar, or blaze, or white muzzle, or one or more feet tipped with white, are thought to be rather better than thoſe that are quite black.

Of greys, the dappled are accounted beſt; though the ſilver grey make a more beautiful appearance, and often prove good. The iron grey with white manes and tails are thought not to be ſo hardy. Greys of every kind will turn white ſooner or later; but the nutmeg grey, when the dappled parts incline to bay or cheſnut, are ſaid to be good hardy horſes. Roan horſes have a diverſity of colours mixed together; but the white is more predominant than the reſt. They are all generally hardy, and fit for the road; and ſome are exceeding good. Thoſe of a ſtrawberry colour moſt reſemble the ſorrel, and they are often marked with white on the face and legs. When the bay is blended with it, he ſeems to be tinctured with claret; and ſome of theſe prove to be very good. Dun, ſallow, and cream-coloured horſes have a liſt down their backs; and their manes and tails are black. Dun horſes are ſeldom choſen by gentlemen, and yet they may be very uſeful to the country farmer. The ſallow and cream-coloured are more eſteemed, both for beauty and uſe. Thoſe horſes that are finely ſpotted with gay colours like leopards are a great rarity, and for that reaſon are only in the hands of great men.

There is ſome difference in horſes according to the different countries where they are bred. For inſtance, in France, thoſe of Bretagne are pretty ſtrong made, and have generally black hair, or brown bay; and they have good legs and feet, with a hardy mouth, and a head ſhort and fleſhy; but in general they are pretty clumſy. The horſes of Franche Compté are ſaid to have the legs of tigers, and the belly of a hind; but they are ſhort and thick, and of a middle ſize; being much more proper for drawing than riding. The horſes of Gaſcony are not unlike thoſe of Spain; but they are not ſo handſome nor ſo active, and therefore they are more proper to draw carriages. The Limoſin horſes are very vicious, and are good for little till they are ſix years old. Their colour is generally bay, or a bay brown. The horſes of Normandy are much like thoſe of Bretagne; and thoſe of Poitou have good bodies, legs, feet, and eyes; but they are far from being handſome.

The horſes of Germany are much better and more handſome than thoſe of the Low Countries. They are of great uſe for carriages; but much more for the army, and for drawing the artillery. They have a great deal of hair, eſpecially about the legs. They are not large, but they are well ſet; and yet they have tender feet. The Hungarian horſes are excellent for the coach, as well as for riding: but they are large, though well proportioned; and they are of all colours, and in general very ſwift.

The Daniſh horſes are low, ſhort, and ſquare; but they have a fine head, and ſhort hair. The horſes of the Low Countries are very fit for the coach, and they are beſt known by the name of *Flanders-mares*. The Poliſh horſes are like the Daniſh; only they have not ſo fine a fore-hand: their colour is generally a bright bay, and that of the outward peel of an onion; and they are fiery and vicious. The horſes of Switzerland are pretty much like thoſe of Germany; which is no wonder, ſince the Germans purchaſe a great number of them. The horſes of Piedmont are fiery, of a middle ſize, and of all ſorts of colours; their legs are good and handſome, their eyes fine, their ears ſmall, and their mouths good; but they do not carry their heads well.

The horſes of Naples and Italy are generally ill-made and lean; and yet they are good and uſeful, for they are light and proper for racing, though not for a long courſe; they never do well in a colder climate. The Spaniſh horſes are very well made and handſome, as well as very active and nimble; they have good eyes, handſome legs and heads, and are eaſily managed; they are alſo good for racing, if they are well kept: however, they are not ſo good in northern climates as in their own country. The Turkiſh horſes are of different ſhapes; but they are generally ſwift, tho' their mouths are bad. Moſt of them are white; tho' there are other colours; and they are large, hardy, ſtrong, and fit for the road.

The horſes of Barbary, commonly called *barbs*, have ſtrong hoofs, and are more proper for racing than any others whatever: ſome have ſaid they never grow old, becauſe they preſerve their vigour to the laſt. They are excellent ſtallions; and ſome of them are uſed as ſuch in Britain: however, the Arabian horſes are not quite ſo good as the Barbary, though ſome think they are both of the ſame kind; only thoſe that are uſed to the deſerts of Arabia are always in action. The horſes of the Gold Coaſt of Guinea are very few in number, and in other parts of that coaſt there are none at all; for many of the negroes, when they have been firſt brought over to our American plantations, have expreſſed great admiration at the ſight of a horſe, and even been afraid to come near one.

The horſes of the Cape of Good Hope were originally brought from Perſia: and they are generally ſmall, and of a cheſnut colour; for thoſe that are natives of that country are all wild, and could never yet be tamed. The horſes of China are good, and more particularly thoſe in the province of Yun Nan; for they are very vigorous, though a little low. The horſes of the Eluth Tartars are good and full of fire; and their ſize is much the ſame as the Poliſh horſes: they are afraid of nothing; not even of lions and tigers: but perhaps this may be owing to uſe. In the country of the Mogul they are very numerous, and of all colours: they are generally of the middle ſize, though there are ſome as large and as handſome as thoſe in Europe. The wild horſes of Tartary differ very little from the tame; but they are ſo ſwift, that they avoid the arrows of the moſt ſkilful hunters.

The breed of horſes in Great Britain is as mixed as that of its inhabitants: the frequent introduction of foreign horſes has given us a variety that no ſingle country can boaſt of: moſt other countries produce only one kind; while ours, by a judicious mixture of the ſeveral ſpecies, by the happy difference of our ſoils, and by our ſuperior ſkill in management, may triumph over the reſt of Europe, in having brought each quality of this noble animal to the higheſt perfection.

In the annals of Newmarket may be found inſtances of horſes that have literally outſtripped the wind, as the celebrated M. Condamine has lately ſhown in his remarks on thoſe of Great Britain. Childers is an amazing inſtance of rapidity; his ſpeed having been more than once exerted equal to 82½ feet in a ſecond, or near a mile in a minute.

The ſpecies uſed in hunting, is a happy combination of the former with others ſuperior in ſtrength, but inferior in point of ſpeed and lineage: an union of both is neceſſary; for the fatigues of the chace muſt be ſupported by the ſpirit of the one, as well as by the vigour of the other.

No country can bring a parallel to the ſtrength and ſize of our horſes deſtined for the draught; or to the activity and ſtrength united of thoſe that form our cavalry. In London, there are inſtances of ſingle horſes that are able to draw on a plain, for a ſmall ſpace, the weight of three tuns; but could with eaſe, and for a continuance, draw half that weight. The pack-horſes of Yorkſhire, employed in conveying the manufactures of that country to the moſt remote parts of the kingdom, uſually carry a burden of 420 pounds; and that indifferently over the higheſt hills of the north, as well as the moſt level roads. But the moſt remarkable proof of the ſtrength of our Britiſh horſes, is to be drawn from that of our mill horſes: ſome of theſe will carry at one load 13 meaſures, which at a moderate computation of 70 pounds each, will amount to 910; a weight ſuperior to that which the leſſer ſort of camels will bear: this will appear leſs ſurpriſing, as theſe horſes are by degrees accuſtomed to the weight; and the diſtance they travel no greater than to and from the adjacent hamlets.

Our cavalry, in the late campaigns (when they had opportunity), ſhowed over thoſe of our allies, as well as of the French, a great ſuperiority both of ſtrength and activity: the enemy was broken through by the impetuous charge of our ſquadrons; while the German horſes, from their great weight and inactive make, were unable to ſecond our efforts; though thoſe troops were actuated by the nobleſt ardour.

The preſent cavalry of this iſland only ſupports its ancient glory. It was eminent in the earlieſt times: our ſcythed chariots, and the activity and good diſcipline of our horſes, even ſtruck terror into Cæſar's legions: and the Britons, as ſoon as they became civilized enough to coin, took care to repreſent on their money the animal for which they were ſo celebrated. It is now impoſſible to trace out this ſpecies; for thoſe which exiſt among the *indigenæ* of Great Britain, ſuch as the little horſes of Wales and Cornwall, the hobbies of Ireland, and the ſhelties of Scotland, though admirably well adapted to the uſes of thoſe countries, could never have been equal to the work of war: but probably we had even then a larger and ſtronger breed in the more fertile and luxuriant parts of the iſland. Thoſe we employ for that purpoſe, or for the draught, are an offſpring of the German or Flemiſh breed, meliorated by our ſoil and a judicious culture.

The Engliſh were ever attentive to an exact culture of theſe animals; and in very early times ſet a high value on their breed. The eſteem that our horſes were held in by foreigners ſo long ago as the reign of Athelſtan, may be collected from a law of that monarch, prohibiting their exportation, except they were deſigned as preſents. Theſe muſt have been the native kind, or the prohibition would have been needleſs; for our commerce was at that time too limited to receive improvement from any but the German kind, to which country their own breed could be of no value. But when our intercourſe with the other parts of Europe was enlarged, we ſoon laid hold of the advantages this gave of improving our breed. Roger de Beleſme, earl of Shrewſbury, is the firſt that is on record: he introduced the Spaniſh ſtallions into his eſtate in Pow-iſland, from which that part of Wales was for many ages celebrated for a ſwift and generous race of horſes. Giraldus Cambrenſis, who lived in the reign of Hen. II. takes notice of it; and Michael Drayton, cotemporary with Shakeſpear, ſings their excellence in the ſixth part of his Polyolbion. This kind was probably deſtined to mount our gallant nobility, or courteous knights for feats of chivalry, in the generous conteſts of the tilt-yard. From theſe ſprung, to ſpeak the language of the times, the flower of courſers, whoſe elegant form added charms to the rider, and whoſe activity and managed dexterity gained him the palm in that field of gallantry and romantic honour.

The increaſe of our inhabitants, and the extent of our manufactures, together with the former neglect of internal navigation to convey thoſe manufactures, multiplied the number of our horſes: an exceſs of wealth, before unknown in theſe iſlands, increaſed the luxury of carriages, and added to the neceſſity of an extraordinary culture of theſe animals: their high reputation abroad has alſo made them a branch of commerce, and proved another cauſe of their vaſt increaſe.

The all-wiſe Creator hath finely limited the ſeveral ſervices of domeſtic animals towards the human race; and ordered that the parts of ſuch, which in their lives have been the moſt uſeful, ſhould after death contribute the leaſt to our benefit. The chief uſe that the *exuviæ* of the horſe can be applied to, is for collars, traces, and other parts of the harneſs; and thus, even after death. he preſerves ſome analogy with his former employ. The hair of the mane is of uſe in making wigs; of the tail, in making the bottoms of chairs, floor-cloths, and chords; and to the angler in making lines.

Plate CLXXXIII. TECHNICAL DESCRIPTION *of the Parts of a* HORSE. *The Fore Part.* 1. The forehead. 2. The temples. 3. Cavity above the eye. 4. The jaw. 5. The lips. 6. The noſtrils. 7. The tip of the noſe. 8. The chin. 9. The beard. 10. The neck. 11. The mane. 12. The fore-top. 13. The throat. 14. The withers. 15. The ſhoulders. 16. The cheſt. 17. The elbow. 18. The arm. 19. The plate vein. 20. The cheſnut. 21. The knee. 22. The ſhank. 23. The main tendents. 24. The fetlock joint. 25. The fetlock. 26. The paſtern. 27. The coronet. 28. The hoof. 29. The quarters. 30. The toe. 31. The heel.—*The Body.* 32. The reins. 33 The fillets. 34. The ribs. 35. The belly. 36. The flanks.—*The Hind Part.* 37. The rump. 38. The tail. 39. The buttocks. 40. The haunches. 41. The ſtifle. 42. The thighs. 43. The hock. 44. The kerb. 45. The point of the hock.

For the breeding, rearing, &c. of horſes, ſee the articles, COLT, HORSE, and STALLION; for the method of training and managing them, ſee HORSEMANSHIP; and for their diſeaſes and cure, ſee FARRIERY.

2. The *Aſinus*, or *Aſs*, has long ſlouching ears, ſhort mane, tail covered with long hairs at the end. The body is uſually of an aſh colour, with a black bar croſs the ſhoulders.

The *Koulan*, or aſs in a wild ſtate (the *onager* of the ancients), varies from the tame in ſeveral reſpects, and requires a more particular deſcription. The forehead is very much arched: the ears are erect, even when the animal is out of order; ſharp-pointed, and lined with whitiſh curling hairs; the irides are of a livid brown; the lips thick; and the end of the noſe ſloping ſteeply down to the upper lip: the noſtrils are large and oval. It is much higher on its limbs than the tame aſs, and its legs are much finer, but it again reſembles it in the narrowneſs of its cheſt and body: it carries its head much higher; and its ſkull is of a ſurpriſing thinneſs. The mane is duſky, about three or four inches long, compoſed of ſoft woolly hair, and extends quite to the ſhoulders: the hairs at the end of the tail are coarſe, and about a ſpan long. The colour of the hair in general is a ſilvery white; the upper part of the face, the ſides of the neck and body, are of a flaxen-colour; the hind part of the thighs are the ſame; the fore part divided from the flank by a white line, which extends round the rump to the tail: the belly and legs are alſo white: along the very top of the back, from the mane quite to the tail, runs a ſtripe of buſhy waved hairs of a coffee-colour, broadeſt above the hind part, growing narrower again towards the tail; another of the ſame colour croſſes it at the ſhoulders (of the males only), forming a mark, ſuch as diſtinguiſhes the tame aſſes: the dorſal band and the mane are bounded on each ſide by a beautiful line of white, well deſcribed by Oppian, who gives an admirable account of the whole. Its winter coat is very fine, ſoft, and ſilky, much undulated, and likeſt to the hair of the camel; greaſy to the touch: and the flaxen colour, during that ſeaſon, more exquiſitely bright. Its ſummer coat is very ſmooth, ſilky, and even, with exception of certain ſhaded rays that mark the ſides of the neck, pointing downwards.

Theſe animals inhabit the dry and mountainous parts of the deſerts of Great Tartary, but not higher than lat. 48. They are migratory, and arrive in vaſt troops to feed, during the ſummer, in the tracts eaſt and north of lake Aral. About autumn they collect in herds of hundreds, and even thouſands, and direct their courſe towards the north of India, to enjoy a warm retreat during winter. But Perſia is their moſt uſual place of retirement: where they are found in the mountains of Caſbin, ſome even at all times of the year. If we can depend on Barboga, they penetrate even into the ſouthern parts of India, to the mountains of Malabar and Golconda. According to Leo Africanus, wild aſſes of an aſh-colour are found in the deſerts of northern Africa. The Arabs take them in ſnares for the ſake of their fleſh. If freſh killed, it is hot and unſavory: if kept two days after it is boiled, it becomes excellent meat. Theſe people, the Tartars and Romans, agreed in their preference of this to any other food: the latter indeed choſe them young, at a period of life in which it was called *Laliſio*; (vide *Martial.* xiii. 97.) The epicures of Rome preferred thoſe of Africa to all others. The grown onagri were introduced among the ſpectacles of the theatre; and their combats were preferred even to thoſe of the elephants.

The manners of the wild aſs are very much the ſame with thoſe of the wild horſe and the dſhikketei. They aſſemble in troops under the conduct of a leader; and are very ſhy. They will, however, ſtop in the midſt of their courſe, and even ſuffer the approach of man at that inſtant, but will then dart away with the rapidity of an arrow diſmiſſed from the bow. This Herodotus ſpeaks to, in his account of thoſe of Meſopotamia; and Leo Africanus, in that of the African.

They are extremely wild. Holy writ is full of alluſions to their ſavage nature. "He ſcorneth the multitude of the city, neither regardeth he the crying of the driver," (Job xxxix. 7.). Yet they are not untameable. The Perſians catch and break them for the draught: they make pits, half-filled with plants to leſſen the fall, and take them alive. They break, and hold them in great eſteem, and ſell them at a high price. The famous breed of aſſes in the eaſt is produced from the koulan reclaimed from the ſavage ſtate, which highly improves the breed. The Romans reckoned the breed of aſſes produced from the onager and tame aſs to excel all others. The Tartars, who kill them only for the ſake of the fleſh and ſkins, lie in ambuſh and ſhoot them. They have been at all times celebrated for their amazing ſwiftneſs; for which reaſon the Hebreans called them *Pere;* as they ſtyled them *Arod* from their braying. Their food is the ſalteſt plants of the deſerts, ſuch as the kalis, atriplex, chenopodium, &c.; and alſo the bitter milky tribe of herbs: they alſo prefer ſalt-water to freſh. This is exactly conformable to the hiſtory given of this animal in the book of Job; for the words "barren land", expreſſive of its dwelling, ought, according to the learned Bochart, to be rendered "ſalt places." The hunters lie in wait for them near the ponds of brackiſh water, to which they reſort to drink: but they are not of a thirſty nature, and ſeldom have recourſe to water. Theſe animals were anciently found in the Holy Land, Syria, the land of Uz or Arabia Deſerta, Meſopotamia, Phrygia, and Lycaonia. But at preſent they are entirely confined to the countries above mentioned. Chagrin, a word derived from the Tartar ſoghré, is made of the ſkin of theſe animals, which grows about the rump, and alſo thoſe of horſes, which is equally good. There are great manufactures of it at Aſtracan and in all Perſia. It is a miſtake to ſuppoſe it to be naturally granulated, for its roughneſs is entirely the effect of art. The Perſians uſe the bile of the wild aſs as a remedy againſt the dimneſs of ſight: and the ſame people, and the Nogayan Tartars, have been known to endeavour the moſt infamous beſtialities with it, in order to free themſelves from the diſorders of the kidneys.

The tame or *domeſtic aſs*, is a humble, patient, and tranquil, animal. He ſubmits with firmneſs to ſtrokes and chaſtiſement: he is temperate both as to the quantity and quality of his food; he contents himſelf with the rigid and diſagreeable herbage which the horſe and other animals leave to him and diſdain to eat: he is more delicate with regard to his drink, never uſing water unleſs it be perfectly pure. As his maſter does not take the trouble of combing him, he often rolls himſelf on the turf among thiſtles, ferns, &c. Without regarding what he is carrying, he lies down to roll as often as he can, ſeeming to reproach his maſter for neglect and want of attention. When very young, the aſs is a gay, ſprightly, nimble, and gentle animal. But he ſoon loſes theſe qualities, probably by the bad uſage he meets with; and becomes lazy, untractable, and ſtubborn. When under the influence of love, he becomes perfectly furious. The affection of the female for her young is ſtrong: Pliny aſſures us, that when an experiment was made to diſcover the ſtrength of maternal affection in a ſhe-aſs, ſhe run through the flames in order to come at her colt. Although the aſs be generally ill uſed, he diſcovers a great attachment to his maſter; he ſmells him at a diſtance, ſearches the places and roads he uſed to frequent, and eaſily diſtinguiſhes him from the reſt of mankind. The aſs has a very fine eye, an excellent ſcent, and a good ear. When overloaded, he hangs his head, and ſinks his ears: when too much teazed or tormented, he opens his mouth and retracts his lips in a diſagreeable manner, which gives him an air of ridicule and deriſion. If you cover his eyes, he will not move another ſtep; if you lay him on his ſide, and place his head ſo that one eye reſts on the ground, and cover the other with a cloth, he will remain in this ſituation without making any attempt to get up. He walks, trots, and gallops in the ſame manner as the horſe; but all his motions are ſlower. Whatever be the pace he is going at, if you puſh him, he inſtantly ſtops.

The cry of the horſe is known by the name of *neighing;* that of the aſs, by *braying*, which is a long, diſagreeable noiſe, conſiſting of alternate diſcords from ſharp to grave and from grave to ſharp; he ſeldom cries but when preſſed with hunger or love: the voice of the female is clearer and more piercing than that of the male.

The aſs is leſs ſubject to vermin than other animals covered with hair; he is never troubled with lice, probably owing to the hardneſs and dryneſs of his ſkin; and it is probably for the ſame reaſon that he is leſs ſenſible to the whip and ſpur than the horſe. The teeth of the aſs fall out and grow at the ſame age and in the ſame manner as thoſe of the horſe; and he has nearly the ſame marks in his mouth.

Aſſes are capable of propagating when two years old. The females are in ſeaſon during the months of May and June. The milk appears in the dugs ten months after impregnation; ſhe brings forth in the twelfth month, and always one at a time. Seven days after the birth, the ſeaſon of the female returns, and ſhe is again in a condition to receive the male. The colt ſhould be taken from her at the end of five or ſix months, that the growth and nouriſhment of the fetus may not be obſtructed. The ſtallion or jack-aſs ſhould be the largeſt and ſtrongeſt that can be found; he ſhould be at leaſt three years old, and never ought to exceed ten. The aſs, like the horſe, takes three or four years in growing, and lives till he be 25 or 30: he ſleeps leſs than the horſe, and never lies down to ſleep but when exceſſively fatigued. He is more robuſt, and leſs ſubject to diſeaſes, than the horſe.

Travellers inform us that there are two ſorts of aſſes in Perſia; one of which is uſed for burdens, they being ſlow and heavy: the other is kept like horſes for the ſaddle; for they have ſmooth hair, carry their head well, and are much quicker in their motion; but when they ride them, they ſit nearer their buttocks than when on a horſe: they are dreſſed like horſes, and are taught to amble like them; but they generally cleave their noſtrils to give them more room for breathing. Dr Ruſſel likewiſe tells us they have two ſorts in Syria; one of which is like ours; and the other very large, with remarkable long ears; but they are both put to the ſame uſe, which is, to carry burdens.

In America there were originally no aſſes at all, nor yet horſes: but they were carried thither long ago, at firſt by the Spaniards, and afterwards by other nations, where they multiplied greatly; inſomuch, that, in ſome places, there are whole droves of them that run wild, and are very hard to be caught. Aſſes in general carry the heavieſt burdens in proportion to their bulk; and, as their keeping coſts little or nothing, it is a great wonder that they are not put to more uſes than they generally are among us. The fleſh of the common aſs is never eaten in theſe parts of the world; though ſome pretend their colts are tender, and not diſagreeable.

3. The *Hemionus* of Pallas, or Wild Mule, is of the ſize and appearance of the common mule; with a large head, flat forehead growing narrow toward the noſe, eyes of a middle ſize, the irides of an obſcure aſh-colour; 38 teeth in all, being two in number fewer than in a common horſe; ears much longer than thoſe of a horſe, quite erect, lined with a thick whitiſh curling coat; neck ſlender, compreſſed; mane upright, ſhort, ſoft, of a greyiſh colour; in place of the foretop, a ſhort tuft of downy hair about an inch and three quarters long. The body is rather long, and the back very little elevated; the breaſt protuberant and ſharp. The limbs are long and elegant; the thighs thin, as in a mule's. Within the fore-legs there is an oval callus; in the hind legs none. The hoofs are oblong, ſmooth, and black; the tail is like that of a cow, ſlender, and for half of its length naked, the reſt covered with long aſh-coloured hairs. Its winter coat grey at the tips, of a browniſh aſh-colour beneath; about two inches long, in ſoftneſs like the hair of a camel, and undulated on the back. Its ſummer coat is much ſhorter, of a moſt elegant ſmoothneſs, and in all parts marked moſt beautifully with ſmall vortexes. The end of the noſe is white; from thence to the foretop inclining to tawny. The buttocks are white; as are the inſide of the limbs and belly. From the mane a blackiſh teſtaceous line extends along the top of the back to the tail, broadeſt on the loins, and growing narrower towards the tail. The colour of the upper part of the body is a light yellowiſh grey, growing paler towards the ſides. The length, from the tip of the noſe to the baſe of the tail, is ſix feet ſeven inches; length of the trunk of the tail one foot four; of the hairs beyond the end, eight inches. The height of the animal is three feet nine. This ſpecies inhabits the deſerts between the rivers Onon and Argun in the moſt ſouthern part of Siberia, and extends over the vaſt plains and deſerts of weſtern Tartary, and the celebrated ſandy deſert of Gobi, which reaches even to India. In Siberia they are ſeen only in ſmall numbers, as if detached from the numerous herds to the ſouth of the Ruſſian dominions. In Tartary they are particularly converſant about Tarienoor, a ſalt lake at times dried up. They ſhun wooded tracts and lofty ſnowy mountains. They live in ſeparate herds, each conſiſting of a chief, a number of mares and colts, in all to the number of about 20; but ſeldom ſo many, for commonly each male has but five and ſometimes fewer females. They copulate towards the middle or end of Auguſt; and bring for the moſt part but one at a time, which by the third year attains its full growth, form, and colour. The young males are then driven away from their paternal herds, and keep at a diſtance till they can find mates of their own age which have quitted their dams. Theſe animals always carry their heads horizontally; but when they take to flight, hold them upright, and erect their tail. Their neighing is deeper and louder than that of a horſe. They fight by biting and kicking, as uſual with the horſe: they are fierce and untameable; and even thoſe which have been taken young, are ſo intractable as not to be broken by any art which the wandering Tartars could uſe. Yet was it poſſible to bring them into fit places, and to provide all the conveniencies known in Europe, the taſk might be effected: but it is doubted whether the ſubdued animal would retain the ſwiftneſs it is ſo celebrated for in its ſtate of nature. It exceeds that of the antelope; it is even proverbial; and the inhabitants of Thebet, from the fame of its rapid ſpeed, mount on it Chammo their god of fire. The Mongalians deſpair of ever taking them by the chace; but lurk behind ſome tomb, or in ſome ditch, and ſhoot them when they come to drink or eat the ſalt of the deſert. They are exceſſively fearful animals, and provident againſt danger. A male takes on him the care of the herd, and always is on the watch. If they ſee a hunter, who by creeping along the ground has got near them, the centinel takes a great circuit, and goes round and round him, as diſcovering ſomewhat to be apprehended. As ſoon as the animal is ſatisfied, it rejoins the herd, which ſets off with great precipitation. Sometimes its curioſity coſts it its life; for it approaches ſo near as to give the hunter an opportunity of ſhooting it. But it is obſerved, that in rainy or in ſtormy weather, theſe animals ſeem very dull, and leſs ſenſible of the approach of mankind. The Mongalians and Tunguſi, according to Du Halden, kill them for the ſake of the fleſh, which they prefer to that of horſes, and even to that of the wild boar, eſteeming it equally nouriſhing and wholeſome. The ſkin is alſo uſed for the making of boots. Their ſenſes of hearing and ſmelling are moſt exquiſite: ſo that they are approached with the utmoſt difficulty. The Mongalians call them *dſhikketaei*, which ſignifies "the eared;" the Chineſe, *yo to tſe*, or "mule." In ancient times the ſpecies extended far to the ſouth. It was the hemionos or half aſs of Ariſtotle, found in his days in Syria, and which he celebrates for its amazing ſwiftneſs and its fecundity, a breeding mule being thought a prodigy; and Pliny, from the report of Theophraſtus, ſpeaks of this ſpecies being found in Cappadocia, but adds they were a particular kind.

The domeſtic mules of preſent times (*equus mulus* of Geſner and Linnæus) are the offspring of the horſe and the aſs, or aſs and mare; are very hardy, and have more the form and diſpoſition of the aſs than the horſe. The fineſt are bred in Spain; very large ones in Savoy.

4. The Zebra. This animal has the figure and gracefulneſs of the horſe, joined to the ſwiftneſs of the ſtag. He is about ſeven feet long, from the point of the muzzle to the origin of the tail, and about four feet high. The colour of his ſkin is beautiful and uniform, conſiſting of alternate parallel rings of black and white, diſpoſed in the moſt regular manner, as repreſented in the plate. He is generally leſs than the horſe and larger than the aſs. The zebra is found no where but in the eaſtern and ſouthern provinces of Africa, from Ethiopia to the Cape of Good Hope, and from the Cape of Good Hope to Congo. The Dutch have been at great pains to tame and uſe them for domeſtic purpoſes, but with little ſucceſs. He is hard-mouthed, and kicks when any perſon attempts to touch or come near him. He is reſtleſs and obſtinate as a mule: but perhaps the wild horſe is naturally as

untractable as the zebra; for it is probable, if he were early accuſtomed to obedience and a domeſtic life, he would become as docile as the horſe.

5. The quacha, or quagga, is ſtriped like the former on the head and body, but with fewer lines. The flanks are ſpotted; the rump is plain; the ground colour of the head, neck, body, and rump, a bright bay: the belly, thighs, and legs are white, and free from all marks. This ſpecies, till of late, has been ſuppoſed to be the female of the zebra; but recent obſervations prove that the male and female zebra are marked alike. This differs likewiſe in being thicker and ſtronger made, and in being more tractable; for inſtance, one had been ſo far broken as to draw in a cart. The Hottentots alſo diſtinguiſh them from the former, by the names of *quagga* and *opeagha*.

ERA, in chronology. See Æra.

ERANARCHA, a public officer among the ancient Greeks. whoſe buſineſs was to preſide over and direct the alms and proviſions made for the poor. Cornelius Nepos, in his life of Epaminondas, deſcribes his office thus: When any perſon was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, &c. the eranarcha called an aſſembly of friends and neighbours, and taxed each according to his means and eſtate, to contribute towards his relief.

ERANTHEMUM, in botany: A genus of the monogynia order, belonging to the diandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is quinqueſid, with the tube ſiliform; the antheræ without the tube; the ſtigma ſimple.

ERASISTRATUS, a celebrated phyſician, grandſon to the philoſopher Ariſtotle. He diſcovered by the motion of the pulſe the love which Antiochus had conceived for his mother-in-law Stratonice, and was rewarded with 100 talents for the cure by the father of Antiochus. He was a great enemy to bleeding and violent phyſic.

ERASMUS (Deſiderius), born at Rotterdam in 1467. He loſt his father and mother at 14 years of age; and was committed to the care of certain guardians, who would force him to be an eccleſiaſtic, which he refuſed for a long time. However, he was obliged to aſſume the religious habit among the canons regular in the monaſtery of Stein near Tergou; but afterwards obtained a diſpenſation from his vows. He was the moſt learned man of the age in which he lived; and contributed, by his example and his writings, to the reſtoration of learning in the ſeveral countries in which he occaſionally reſided, viz. Italy, Switzerland, Holland, France, and England: with the laſt, he was moſt ſatisfied; and found the greateſt encouragement from Henry VIII. Sir Thomas More, and all the learned Engliſhmen of thoſe days. He publiſhed a great many books; and died at Baſil in 1536. He was buried honourably, and his memory is ſtill held in veneration. He had, however, many enemies; and as he did not embrace the reformation, and yet cenſured many things in popery, he hath been treated injuriouſly both by Catholics and Proteſtants. The works of Eraſums in 10 vols folio were publiſhed at Leyden in 1706, in a very handſome manner, under the care of M. Le Clerc. Dr Jortin publiſhed his life in one vol. 4to, 1758.

ERASTIANS, a religious ſect or faction which aroſe in England during the time of the civil wars in 1647, thus called from their leader Thomas Eraſtus, whoſe diſtinguiſhing doctrine it was, that the church had no right to diſcipline, that is, no regular power to excommunicate, exclude, cenſure, abſolve, decree, or the like.

ERATO (from ερω *I love*), in mythology, the name of one of the nine muſes who preſided over love-poetry. To this muſe ſome have aſcribed the invention of the lyre and lute; and ſhe is repreſented with a garland of myrtles and roſes, holding a lyre in one hand and a bow in the other, and at her ſide a Cupid with his torch. There is alſo a Nereid of the ſame name.

ERATOSTHENES, a Cyrenæan philoſopher, hiſtorian, and poet; called for his learning *Plato Minor*. He was keeper of the famous library at Alexandria; and was greatly in favour with Ptolemy Euergetes, by whoſe order he wrote a hiſtory of the Theban kings of Egypt, which ſucceſſion was entirely omitted by Manetho. He thus fixed the Egyptian chronology, and his authority is by many preferred to that of Manetho. He wrote many other things, a catalogue of which is to be ſeen in Fabricius, Voſſius, &c. but his only piece now remaining entire is a deſcription and fabulous account of the ſtars. He ſtarved himſelf in old age through grief for the dimneſs of his ſight, about the 10th or 12th year of Ptolemy Epiphanes, 194 B. C.

ERATOSTRATUS, an Epheſian who burnt the famous temple of Diana the ſame night that Alexander the Great was born. This burning, as ſome writers have obſerved, was not prevented or ſeen by the goddeſs of the place, who was then preſent at the labours of Olympias, and at the birth of the conqueror of Perſia. Eratoſtratus did this villany merely to eternize his name by ſo uncommon an action.

EREBUS (Ερεβος, from ערב *night)*, in mythology, a term denoting darkneſs. According to Heſiod, Erebus was the ſon of Chaos and the night, and the father of the day. This was alſo the name of part of the *inferi* among the ancients: they had a peculiar expiation for thoſe who were detained in Erebus.

Erebus was properly the gloomy region, and diſtinguiſhed both from Tartarus the place of torment, and Elyſium the region of bliſs: according to the account given of it by Virgil, it forms the third grand diviſion of the inviſible world beyond the Styx, and comprehends ſeveral particular diſtricts, as the *limbus infantum*, or receptacle for infants; the *limbus* for thoſe who have been put to death without cauſe; that for thoſe who have deſtroyed themſelves; the fields of mourning, full of dark groves and woods, inhabited by thoſe who died for love; and beyond theſe, an open champaign country for departed warriors.

ERECTION, in a general ſenſe, the art of raiſing or elevating any thing; as the erection of a perpendicular, &c. It is alſo uſed in a figurative ſenſe; as the erection of a biſhopric, marquiſate, &c.

Erection is particularly uſed by medical writers for the ſtate of the penis when ſwelled and diſtended by the action of the muſcles called *erectores*. See Anatomy, p. 739.

There is alſo an erection of the clitoris which is performed by muſcles for that purpoſe.

EREMIT. See Hermit.

ERETRIA (anc. geog.), a town of Eubœa, ſituated on the Euripus, in the ſouth-weſt of the iſland. A very ancient city, and the largeſt of the iſland, after Chalcis. After being demoliſhed by the Perſians, it was reſtored on an adjoining ſpot, according to Strabo, who mentions a ſchool of Eretrian philoſophers there. The Abantes of Homer were of Eubœa.

ERFORT, a town of Germany, in the circle of Upper Saxony, the capital of Thuringia, and ſubject to the elector of Mentz. It is defended by good ramparts; and has a caſtle on an eminence, which commands the town. Its inhabitants are almoſt all Lutherans, but its principal churches belong to the Catholics. There are ſeveral handſome ſtructures, both public and private; but the houſes in general are but indifferently built. E. Long. 11. 14. N. Lat. 50. 49.

ERGASTULUM, among the Romans, was a priſon, work-houſe, or houſe of correction, where ſlaves by the private authority of their maſters were confined and kept for their offences to hard labour. The Greeks had a place of confinement of this ſort called Σωφρονιςηριον.

ERGOT, in farriery, is a ſtub, like a piece of ſoft horn, about the bigneſs of a cheſnut, placed behind and below the paſtern-joint, and commonly hid under the tuft of the fetlock.

ERICA, heath, in botany: A genus of the monogynia order, belonging to the octandria claſs of plants; and in the natural method ranking under the 18th order, *Bicornes*. The calyx is tetraphyllous; the corolla quadrifid; the filaments inſerted into the receptacle; the antheræ bifid; the capſule quadrilocular. Of this there are four ſpecies, natives of Britain; which are ſo well known, that no deſcription needs be given of them. In the Highlands of Scotland this plant is made ſubſervient to a great variety of purpoſes. The poorer inhabitants make walls for their cottages with alternate layers of heath and a kind of mortar made of black earth and ſtraw. The woody roots of the heath are placed in the centre; the tops externally and internally. They make their beds of it, by placing the roots downwards; and the tops only being uppermoſt, they are ſufficiently ſoft to ſleep upon. Cabbins are alſo thatched with it. In the iſland of Ilay, ale is frequently made by brewing one part of malt and two of the tops of young heath; ſometimes adding hops. Boethius relates, that this liquor was much uſed by the Picts. Woollen cloth boiled in alum water, and afterwards in a ſtrong decoction of heath-tops, comes out of a fine orange colour. The ſtalks and tops will tan leather. Beſoms and faggots to burn in ovens are alſo made of this plant. It is alſo uſed for filling up drains that are to be covered over. Sheep and goats will ſometimes eat the tender ſhoots, but they are not fond of them. Cattle not accuſtomed to feed on heath, give bloody milk; but they are ſoon relieved by drinking plentifully of water. Horſes will eat the tops. Bees extract a great deal of honey from the flowers; and, where heath abounds, the honey has a reddiſh caſt. There are many exotic ſpecies with which our green-houſe collections are enriched and adorned, as the triflora, tubiflora, auſtralis, &c.

ERIDANUS (anc. geog.) a river of Attica, falling into the Iliſſus.—Another Eridanus, the more ancient name of the Padus, an appellation aſcribed by Pliny to the Greeks; followed in this by Virgil. It riſes in mount Veſulus, in the Alpes Cottiæ, and dividing the Ciſalpine Gaul into the Ciſpadana and Tranſpadana, and ſwelled on each hand with no inconſiderable rivers from the other Alps and the Apennine, falls at ſeven mouths into the Adriatic. Famous in mythology, from the ſtory of Phaëton; whoſe ſiſters, the Heliades, were here changed into poplars, according to Ovid.

Eridanus, in aſtronomy, a conſtellation of the ſouthern hemiſphere, in form of a river.—The ſtars in the conſtellation Eridanus, in Ptolemy's catalogue, are 34; in Tycho's, 19; and in the Britiſh Catalogue, 84.

ERIE, a vaſt lake to the weſtward of Pennſylvania, in North America, ſituated between 80° and 87° W. Long. and between 41° and 42° N. Lat.

ERIGENA, or Scotus, (John), a famous ſcholaſtic divine, born about the beginning of the ninth century; but where, is a matter of diſpute among authors. Bale and Pits ſay he was born at St David's in Wales; Dempſter, Mackenzie, and Henry, that he was born at Ayr in Scotland; which they infer from his names *Erigina* and *Scotus*, by the latter of which he was generally diſtinguiſhed by his cotemporary writers. But Du Pin and Sir James Ware aſſert that he was by birth an Iriſhman; Ireland being in thoſe days called *Scotia*, and by the natives *Erin*. They agree, however, in relating that he travelled to Athens, where he acquired a competent knowledge of the Greek and other oriental languages; and that he afterwards reſided many years in the court of Charles the Bald, king of France, who, on account of his ſingular abilities, treated him as his intimate friend and companion. He ſlept frequently in the royal apartment; and was conſtantly admitted to the king's table. "We may judge (ſays a modern hiſtorian) of the freedom which he uſed with Charles, by the following repartee. As the king and Scotus were ſitting one day at table, oppoſite to each other, after dinner, drinking a cheerful glaſs, the philoſopher having ſaid ſomething that was not quite agreeable to the rules of French politeneſs, the king in a merry humour aſked him, Pray what is between a *Scot* and a *ſot?* To which he anſwered, "Nothing but the table." See *Henry's Hiſtory of Great Britain*, vol. I. p. 344. who quotes this ſtory from *Hovedeni Annal. ad an.* 86. Quer. What language were they talking when this *bon mot* was uttered?

During his reſidence with Charles, he wrote ſeveral books of ſcholaſtic divinity; which, though abſurd enough, were at that time not ſufficiently ſo to ſecure him from the imputation of heterodoxy; and on that account the pope commanded Charles the Bald to ſend him to Rome; but the king had too great a regard for his companion to truſt him with his holineſs. One of the chief controverſies in which Scotus was engaged, and with which the pope was much offended, was concerning the real preſence and blood of Chriſt in the wafer. His opinion of this weighty matter is expreſſed in theſe few words: "What we receive corporally is not the body of our Lord; but that which feeds the ſoul and is only perceived by faith." He was alſo engaged in two other controverſies of equal importance, but of a ſomewhat leſs delicate nature. The firſt was, Whether any part of the euchariſt be evacuated by ſtool? and the ſecond, Whether Chriſt was born of the Virgin Mary *aperta vulva*; Paſchaſius was of opinion, that this could not be without ſome injury to her perpetual virginity; and therefore believed that Chriſt came into the world *per vulvam clauſam*, as he came into the place where his diſciples were aſſembled, through the door and not through the wall, without opening the door. Concerning the firſt of theſe delicate queſtions, Scotus with ſeveral others declared, that part of the euchariſt was certainly evacuated by ſtool; for which they were honoured with the appellation of *Stercoriſts*. And as to the ſecond queſtion, he ſaid, that the *vulva clauſa* was a dangerous opinion: for it would thence follow, that he was not born, but iſſued; *non eſt naſci, ſed erumpi*. See Mackenzie, vol. I. p. 55.

Whether this John Scotus returned to England, or ended his days in France, is a matter of doubt. Some of our hiſtorians tell us, that he left France in the year 864; and that, after reſiding about three years in Oxford, he retired to the abbey of Malmſbury, where his ſcholars ſtabbed him with their pen-knives. There is no foundation for this ſtory. Probably he died about the year 874; but whether in France or England, is uncertain, and of little importance. Some have related, that he was invited to England by king Alfred: but in this they confound him with John, abbot of Etheling, who was aſſaſſinated in 895; and to this miſtake the various accounts concerning this author are to be attributed. Regardleſs of his hiſtory, he appears from his writings to have been a man of parts, and, in point of learning, ſuperior to any of his cotemporaries. He wrote, 1. *De diviſione naturæ*, lib. v. 2. *De prædeſtinatione Dei*. 3. *Excerpta de differentiis & ſocietatibus Græci Latinique verbi*. 4. *De corpore et ſanguine Domini*. 5. *Ambigua S. Maximi ſeu ſcholia ejus in difficiles locos S. Gregorii Nazianzeni, Latine verſa*. 6. *Opera S. Dionyſii quatuor in Latinam ling. converſa*. All publiſhed. 7. *De viſione Dei*, and ſeveral other works, in manuſcript, preſerved in different libraries.

ERIGERON, FLEA-BANE, in botany: A genus of the polygamia ſuperflua order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is naked; the pappus hairy; the florets of the radius are linear, and very narrow. There are five ſpecies; of which the moſt remarkable is the viſcoſum, or male flea-bane of Theophraſtus, and greater flea-bane of Dioſcorides. It is a native of the ſouth of France and Italy; and hath a perennial root, from whence ariſe many upright ſtalks near three feet high. The leaves in warm weather ſweat out a clammy juice; the flowers are produced ſingle upon pretty long footſtalks, are of a yellow colour, and have an agreeable odour. The plants are eaſily propagated by ſeeds; and thrive beſt in a dry ſoil and ſunny expoſure.

ERIGONE, in fabulous hiſtory, daughter to Icarius, died of grief for her father's death, was tranſlated into heaven, and makes the ſign Virgo.

Plate CLXXXV.

ERINACEUS, or HEDGEHOG, in zoology; a genus of quadrupeds belonging to the order of feræ, the characters of which are theſe: They have two fore-teeth in the upper jaw, at a conſiderable diſtance from one another, and two in the under jaw, leſs diſtant; and they have two recumbent dog-teeth, one on each ſide. The hedge-hog has a very uncommon method of defending himſelf from the attacks of other animals: being poſſeſſed of little ſtrength or agility, he does not attempt to fly from or aſſail his enemies; but erects his briſtles, and rolls himſelf up like a ball, expoſing no part of his body that is not furniſhed with ſharp weapons of defence; he will not unfold himſelf, unleſs thrown into water: the more he is frightened or haraſſed, the cloſer he ſhuts himſelf up; and frequently diſcharges his urine, which has a very fetid and lothſome ſmell. While in this ſtate, moſt dogs, inſtead of biting him, ſtand off and bark, not daring to ſeize him; or, if they attempt it once, their mouths are ſo prickled with his briſtles, that they cannot be prevailed upon to attempt it a ſecond time. Both the male and female are covered with briſtles from the head to the tail. Theſe briſtles are of great uſe in defending them from other animals; but muſt be very inconvenient when they incline to copulate. This operation they cannot perform in the manner of other quadrupeds; but do it face to face, either ſtanding on end, or the female lying on her back. The females come in ſeaſon in the ſpring, and bring forth their young in the beginning of ſummer. They commonly bring forth three or four, and ſometimes five at a time. The young ones are of a whitiſh colour, and only the points of the briſtles appear above the ſkin. It is impoſſible to tame them: the mother and her young have frequently been confined together, and furniſhed with plenty of proviſions; but, inſtead of nouriſhing them, ſhe uniformly devoured them one after another. Males and females have likewiſe been kept in one apartment, where they lived, but never copulated. Hedge-hogs feed upon fallen fruits, ſome roots, and inſects: they are very fond of fleſh-meat, whether raw or roaſted. They frequent woods, and live under the trunks of old trees, in the chinks of rocks, or under large ſtones. Naturaliſts allege, that they go into gardens, mount the trees, and come down with pears, apples, or plums, ſtuck upon their briſtles. But this is a miſtake: although kept in a garden, they never attempt to climb trees, or ſtick even fallen fruit upon their briſtles, but lay hold of their food with their mouth. They never come out of their holes in the day, but go about in queſt of food during the night. They eat but little, and can live very long without taking any nouriſhment. They do not lay up any ſtore of proviſions in harveſt; ſuch an inſtinct would be uſeleſs, as they ſleep all the winter. They lie under the undeſerved reproach of ſucking cattle and hurting their udders; but the ſmallneſs of their mouth renders that impoſſible. There are three ſpecies, viz.

1. The europæus, or common hedgehog, with round ears, and creſted noſtrils. It is about nine inches long; the upper part of the body is totally covered with ſharp prickles, and the under part is covered with hair. The hedgehog, even when ſtanding on

his legs, has a very ugly aſpect. His body is an oblong maſs, convex above, terminated on the fore-part by a very ſharp muzzle, and mounted on four ſhort legs, of which nothing appears but the feet, and the tail is not diſcernible. His ears are broad, round, and ſhort; and his eyes are ſmall and protuberant. The length of his body, from the point of the muzzle to the anus is about nine inches.—2. The inauris, or white hedge-hog, has no external ears. It is a native of America. 3. The malaccenſis has hanging ears, and is a native of Aſia.

ERINGO, in botany. See Eryngium.

ERINUS, in botany: A genus of the angioſpermia order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx is pentaphyllous; the limb of the corolla quinquefid and equal; with its lobes emarginated, and the upper lip very ſhort and reflexed; the capſule bilocular. There are ſix ſpecies, none of them natives of Britain. They grow from two inches to four feet in height, and are adorned with flowers of a white or purple colour. They are propagated by ſeeds, but in this country generally require to be kept in a ſtove.

ERIOCAULON, in botany: A genus of the trigynia order, belonging to the triandria claſs of plants; and in the natural method ranking with the ſixth order, *Enſatæ*. The common calyx is an imbricated capitulum or knob; there are three equal petals; and the ſtamina are on the germen.

ERIOCEPHALUS, in botany: A genus of the polygamia neceſſaria order, belonging to the ſyngeneſia claſs of plants; and in the natural method ranking under the 49th order, *Compoſitæ*. The receptacle is ſomewhat villous; there is no pappus; the calyx is decaphyllous and equal; the radius has five florets.

ERIOPHORUM, in botany: A genus of the monogynia order, belonging to the triandria claſs of plants; and in the natural method ranking under the third order, *Calamariæ*. The glumes are paleaceous and imbricated all round; there is no corolla; and only one ſeed furniſhed with a very long down.

ERITHALIS, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants; and in the natural method ranking with thoſe of which the order is doubtful. The corolla is quinquepartite; the calyx urceolated or bladder-like, the berry decemlocular inferior.

ERIVAN, a city of Perſia, in Aſia, and capital of Perſian Armenia. It is a large, dirty, ill-looking place, in which are no handſome buildings, the houſes being very mean, and raiſed with earth or mud; but it is full of gardens or vineyards. It is ſituated in a plain which is ſurrounded on all ſides with mountains. Two rivers paſs near it, the Zengui to the north-weſt, and the Queur Boulac to the ſouth-weſt. The fortreſs may paſs for a town of itſelf; it is of an oval form, and is four miles in circumference, containing about 800 houſes. It is inhabited by none but the native Perſians. The Armenians have ſhops in it, where they work and trade in the day-time, but at night return to their habitations in the city. The fortreſs is ſurrounded with three walls, made with bricks dried in the ſun, which have battlements, and are flanked with towers, and defended with ramparts. On the north-eaſt there is a dreadful precipice, above 200 yards in depth, at the bottom of which the river runs. The garriſon uſually conſiſted of 2000 men; but how many there are ſince the revolution, is hard to ſay. The palace of the governor of the province is within the fortreſs. The city is about a cannon's ſhot diſtant from the fortreſs, and the ſpace between is full of houſes and markets. E. Long. 44. 50. N. Lat. 40. 20.

ERIPHYLE (fab. hiſt.), a ſiſter of Adraſtus king of Argos, who married Amphiaraus. She was daughter of Talaus and Liſimache. When her huſband concealed himſelf that he might not accompany the Argives in their expedition againſt Thebes, where he knew he was to periſh, Eriphyle ſuffered herſelf to be bribed by Polynices with a golden necklace which had been formerly given to Hermione by the goddeſs Venus, and ſhe diſcovered where Amphiaraus was. This treachery of Eriphyle compelled him to go to the war; but before he departed, he charged his ſon Alcmæon to murder his mother as ſoon as he was informed of his death. Amphiaraus periſhed in the expedition; and his death was no ſooner known than his laſt injunctions were obeyed, and Eriphyle was murdered by the hands of her ſon.

ERIS, the goddeſs of diſcord among the Greeks. She is the ſame as the *Diſcordia* of the Latins.

ERISICHTHON (fab. hiſt.), a Theſſalian, ſon of Triops, who derided Ceres and cut down her groves. This impiety irritated the goddeſs, who afflicted him with continual hunger. He ſquandered all his poſſeſſions to gratify the cravings of his appetite, and at laſt he devoured his own limbs for want of food. Some ſay that his daughter had the power of transforming herſelf into whatever animal ſhe pleaſed, and that ſhe made uſe of that artifice to maintain her father, who ſold her, after which ſhe aſſumed another ſhape, and became again his property.

ERMIN, in zoology. See Mustela.

Ermin, or *Ermine*, in heraldry, denotes a white field or fur, powdered or interſperſed with black ſpots, called *powdering*. It is ſuppoſed to repreſent the ſkin of an animal of the ſame denomination (ſee Mustela). There is however no animal whoſe ſkin naturally correſponds to the herald's ermin.

The animal is milk white; and ſo far is it from having ſpots, that tradition reports, that it will rather die or be taken than ſully its whiteneſs. Whence its ſymbolical uſe.

But white ſkins having for many ages been uſed for the linings of the robes of magiſtrates and great men; the furriers at length, to add to their beauty, uſed to ſew bits of the black tails of thoſe creatures upon the white ſkins, to render them the more conſpicuous. Which alteration was introduced into armoury.

The ſable ſpots in ermin are not of any determinate number, but they may be more or leſs at the pleaſure of the painter or furrier.

Ermin, an order of knights, inſtituted in 1450 by Francis I. duke of Bretagne, and formerly ſubſiſting in France. The collar of this order was of gold, compoſed of ears of corn in ſaltier; at the end of which hung the ermin, with this inſcription, *a ma vie*. But the order expired when the dukedom of Bretagne was annexed to the crown of France.

ERMINES, in heraldry, the reverſe of ermine, i. e. white ſpots on a black field.

ERMINITES, in heraldry, ſhould ſignify little ermines, but it is otherwiſe; for it ſignifies a white field powdered with black, only that every ſuch ſpot hath a little red hair on each. Erminites alſo ſignify a yellow field powdered with black, which the French expreſs much better by *or ſemée d'ermine de ſable*.

ERMINOIS, in heraldry, ſignifies the field or, and the ſpots black.

EROORO, in ornithology See ALCEDO, of which it is a ſpecies.

EROS (of ερως "love"), in mythology, one of two chiefs over all the other Cupids, being the cauſe of love. See ANTEROS.

EROTIA, a feſtival in honour of Eros the god of love. It was celebrated by the Theſpians every fifth year with ſports and games, when muſicians and others contended If any quarrels or ſeditions had ariſen among the people, it was then uſual to offer ſacrifices and prayers to the god, that he would totally remove them.

EROTIC (derived from ερως "love;" whence ερωτικος), is applied to any thing which has a relation to the paſſion of love.

In medicine we find the phraſe *delirium eroticum* uſed for a kind of melancholy contracted through exceſs of love.

EROSION, among phyſicians, denotes much the ſame with CORROSION, only in a ſtronger degree.

EROTESIS. See ORATORY, n° 94.

ERPENIUS (Thomas), in Dutch THOMAS of ERFE; a celebrated profeſſor of the Arabic language, was born at Gorcum in Holland, in 1584. and educated at Leyden. He applied himſelf to the oriental languages at the perſuaſion of Joſeph Scaliger; and afterwards travelled into England, France, Italy, and Germany, and every where obtained the eſteem of the learned. On his return to Holland, he was made profeſſor of Arabic in the univerſity of Leyden, and died there in 1624. He publiſhed a great many excellent works, which ſpread his reputation through the whole learned world. It is ſaid, that the king of Morocco admired ſo greatly the letters Erpenius wrote to him in Arabic in the name of the United Provinces, that he could not ceaſe reading them, and ſhowing them to thoſe who ſpoke that language naturally.

ERRATIC, in general, ſomething that wanders, or is not regular: hence it is the planets are called *erratic ſtars*.

ERRHINES, in pharmacy, medicines which when ſnuffed up the noſe promote a diſcharge of mucus from that part.

Among the milder kinds of the errhines we may reckon marjoram, baſilicon, thyme, hyſſop, ſavory, marum ſyriacum, the tops of origanum, flowers of lilies of the valley, and gum benzoin, the reſin of guaiacum, fine raſpings of aloes wood, dry volatile ſalt of ſal ammoniac perfumed with oil of marjoram, as alſo white vitriol. On the contrary, violent errhines are, euphorbium, the powder of white hellebore, and, in a milder degree, ſeveral ſorts of ſnuffs, precipitate mercury, and pepper.

Errhines are more friendly to the conſtitution and nerves than ſternutatories, by their ſubtile, acrid, and volatile ſalt gently ſtimulating the pituitary membrane, and drawing the mucid humour from it. They are alſo much ſafer than ſternutatories in their effects.

Errhines prepared of cephalic herbs are of ſingular ſervice in oppreſſive pains of the head, a hermicrania, lethargic diſorders, weakneſſes of memory, ſtuffings of the head, and coryza, mucous defluxions of the eyes, drowſineſs, vertigoes, and in caſes where the malignant humours generated by the lues venerea are lodged in the membranes of the noſtrils.

ERROR, in philoſophy, a miſtake of our judgment, giving aſſent to that which is not true.

Mr Locke reduces the cauſes of error to theſe four; firſt, want of proofs; ſecondly, want of ability to uſe them; thirdly, want of will to uſe them; and, fourthly, wrong meaſures of probability.

He obſerves upon the firſt of theſe cauſes of error, that the greateſt part of mankind want conveniences and opportunities of making experiments and obſervations themſelves, or of collecting the teſtimony of others, being prevented by the neceſſity of their condition. Upon the ſecond of theſe cauſes, he obſerves, that there are many, who, from the ſtate of their condition, might beſtow time in collecting proofs, but yet are not able to carry a train of conſequences in their heads, nor weigh exactly the preponderancy of contrary proofs and teſtimonies, merely from the difference in mens underſtandings, apprehenſions, and reaſonings. Thirdly, he remarks, that though ſome have opportunities and leiſure enough, and want neither parts, learning, nor other helps, that they never come to the knowledge of ſeveral truths within their reach, either upon account of their attachment to pleaſure or buſineſs; or otherwiſe becauſe of their lazineſs or averſion to ſtudy. The fourth cauſe of error, *viz.* wrong meaſures of probability, he imputes, 1. To the practice of taking for principles propoſitions that are not in themſelves certain and evident, but, on the contrary, doubtful and falſe. 2. To received hypotheſes 3. To predominant paſſions or inclinations. And, 4 To authority, or the giving up our aſſent to the common received opinions either of our friends or party, neighbours or country.

The cauſes of error in philoſophy, or the reaſons why all former philoſophers have through ſo many ages erred, according to Lord Bacon, are theſe following. 1. Want of time ſuited to learning. 2. The little labour beſtowed upon natural philoſophy. 3. Few entirely addicted to natural philoſophy. 4. The end of the ſciences wrong fixed. 5. A wrong way choſen. 6. The neglect of experiments. 7. Regard to antiquity and authority. 8. Admiration of the works in uſe. 9. The artifice of teachers and writers in the ſciences. 10. Oſtentatious promiſes of the moderns. 11. Want of propoſing worthy taſks. 12. Superſtition and zeal being oppoſite to natural philoſophy, as thinking philoſophy dangerous, on account of the ſchool theology; from the opinion that deep natural inquiries ſhould ſubvert religion. 13. Schools and academies proving unfavourable to philoſophy. 14. Want of rewards. And, 15. Deſpair, and the ſuppoſition of impoſſibility.

*ERROR Loci.* Boerhaave is ſaid to have introduced the term, from the opinion that the veſſels were of dif-

different ſizes for the circulation of blood, ſerum, and lymph; and that when the larger-ſized globules were forced into the leſſer veſſels by an error of place, they were obſtructed. But this opinion does not ſeem well grounded.

ERUCA, in general, denotes caterpillars of all kinds.

The caterpillar ſtate is that through which every butterfly muſt paſs before it arrives at its perfection and beauty: and, in the ſame manner, all the known winged animals, except only the puceron, paſs through a reptile ſtate; none of them, except this, being produced in their winged form. The change from caterpillar to butterfly was long eſteemed a ſort of metamorphoſis; a real change of one animal into another: but this is by no means the caſe. The egg of a butterfly produces a butterfly, with all lineaments of its parent; only theſe are not diſcloſed at firſt, but for the greater part of the animal's life they are covered with a ſort of caſe or muſcular coat, in which are legs for walking, which only ſuit it in this ſtate; but its mouth takes in nouriſhment, which is conveyed to the included animal; and after a proper time this covering is thrown off, and the butterfly, which all the while might be diſcovered in it by an accurate obſerver with the help of a microſcope, appears in its proper form. Before it paſſes into this ſtate, however, there requires a ſtate of reſt for the wings to harden, and the ſeveral other parts to acquire their proper firmneſs; this is tranſacted in a time of perfect reſt, when the animal lies in what is called the *nymph* or *chryſalis* ſtate, in appearance only a lump of inanimate matter. There is a ſettled and determined time for each of theſe changes in every ſpecies; but, in the ſeveral different kinds, the periods are very different.

There is no ſign of ſex in the animal while in the caterpillar ſtate: the propagation of the ſpecies is the buſineſs of the creature in its ultimate perfection; and till that, theſe parts are never excluded: one female butterfly, when ſhe has been impregnated by the male, will produce 300 or 400 eggs, or even more.

There is no way of knowing the ſexes of theſe little creatures by viewing the parts; but the whole figure and manner of the animal makes the difference. The females are always larger than the males; they are alſo more ſlow in their motions; and ſome of them have no wings, or, at the moſt, only very ſmall ones. The males, however, have a ſort of beards, more beautiful than the antennæ or horns of the females: the female is much ſtronger as well as bigger than the male; and not unfrequently, in caſe of danger or diſturbance, ſhe flies away with him in time of copulation.

On diſſecting the female, her uterus affords an aſtoniſhing ſight. The number of eggs in the tubes is amazing: but theſe have not all the ſame figure; and, in ſome ſpecies, as the ſilk-worm, &c. the eggs are of a beautiful blue; if any yellowiſh ones are ſeen among them, they are judged to be defective.

The care of all the butterfly tribe to lodge their eggs in ſafety is ſurpriſing. Thoſe whoſe eggs are to be hatched in a few weeks, and who are to live in the caterpillar ſtate during part of the remaining ſummer, always lay them on the leaves of ſuch plants as will afford a proper nouriſhment; but, on the contrary, thoſe whoſe eggs are to remain unhatched till the following ſpring, always lay them on the branches of trees and ſhrubs, and uſually are careful to ſelect ſuch places as are leaſt expoſed to the rigour of the enſuing ſeaſon, and frequently cover them from it in an artful manner. Some make a general coat of a hairy matter over them, taking the hairs from their own bodies for that purpoſe; others hide themſelves in hollow places in trees, and in other ſheltered cells, and there live in a kind of torpid ſtate during the whole winter, that they may depoſit their eggs in the ſucceeding ſpring, at a time when there will be no ſeverities of weather for them to combat. The day-butterflies only do this, and of theſe but a very few ſpecies; but the night ones, or phalenæ, all without exception, lay their eggs as ſoon as they have been in copulation with the male, and die immediately afterwards.

It is well known, that the common and natural food of theſe creatures is the leaves and verdure of vegetables; yet, as weak and harmleſs as they ſeem, they will many of them deſtroy their fellows whenever they get an opportunity. M. Reamur gives us an inſtance of this in 20 caterpillars of the oak, which he kept in a box with a ſufficient quantity of their natural food: yet their numbers daily decreaſed, till at laſt there remained only one. This is, however, only the caſe in ſome few ſpecies, the generality of theſe animals being very peaceable, many ſpecies living together in the ſame place without moleſting one another. Theſe ſpecies, however, though freed from ſuch dangers, are expoſed to others of a much more terrible kind; the worms or maggots of ſeveral ſorts of flies are frequently found about them, ſome preying upon their outſide, others lodged within them under the ſkin, but both kinds eating the poor defenceleſs creature up alive. Thoſe which feed on the outſides are eaſily diſcovered, the others are more hid; and frequently the caterpillar, which ſeems very hearty and vigorous, and very fleſhy, ſhall be found, upon opening, to be a mere ſkin, the internal parts being found to be all eaten away, and all the food that he ſwallows ſerving only to feed a vaſt number of worms, or maggots, which crawl about at liberty within him. Theſe devouring worms are of many different ſpecies; ſome being of the gregarious, ſome of the ſolitary kinds, and ſome ſpinning webs of their own ſilk to transform themſelves in; others undergoing that change without any ſuch covering. The beautiful cabbage-caterpillar is one of thoſe unhappy kinds which frequently are infeſted with the gregarious kinds, large numbers of which ſpin themſelves webs one after another, and afterwards come out in the ſhape of the parent-fly to whoſe eggs they owed their origin.

Theſe inteſtine enemies are a ſure prevention of the butterfly's appearing at its proper time; and as many of the former naturaliſts, who knew what butterfly to expect from a peculiar ſpecies of caterpillar which they preſerved, often ſaw a parcel of flies come out in the place of it, they having no idea that the fly had laid its eggs in the fleſh of the poor creature, ſuppoſed that this was one of its natural transformations, and that certain ſpecies of caterpillars ſometimes produced butterflies, ſometimes ſmall flies.

Theſe, and many other deſtroyers, among which the birds are to be reckoned in the principal place, ſerve a noble purpoſe in preventing the too great number of theſe miſchievous animals. Their uſual habitation

tion being the leaves and flowers of plants, they are, in their feeding, much expoſed to all thoſe deſtroyers: yet nature has taken care to preſerve a great number, by making many of them ſo exactly of the colour of the leaves they feed on, that they are not eaſily diſtinguiſhed from them; and by giving others a caution of keeping on the under part of the leaves, and being by that means out of ſight. But ſome ſpecies are much leſs expoſed, and of much more miſchief to the plants they feed on, by devouring more eſſential parts of them. Of theſe ſome eat the roots, and others the interior part of the trunk, deſtroying the veſſels that imbibe, and thoſe that diſtribute the juices. Theſe are different from the common caterpillars, in that their ſkin is much leſs rough and hard; and theſe are ſecure from our obſervation, and in general from their great deſtroyers the birds. They are not, however, abſolutely ſafe from the common dangers of the other ſpecies; for there is a kind of worms that find their food and habitation even in the bodies of theſe.

The root-caterpillars, and thoſe which live within the branches of plants, are much more eaſily found out. The roots of ſcrophularia, and the ſtalks of lettuces, and ſome other plants, afford caterpillars which ſeem all of the ſame ſpecies. Thoſe found in the lettuces are extremely plentiful ſome years, and deſtroy vaſt quantities of that plant. Theſe uſually have their firſt habitation in the ſtalk, near the root.

Nothing more ſurpriſes us, in regard to inſects, than their induſtry; and in this the caterpillars yield to no kind, not to mention their ſilk, the ſpinning of which is one great proof of it. The ſheaths and caſes which ſome of theſe inſects build for the paſſing their transformations under, are, by ſome, made of the ſilk, with their own hair, mixed with pieces of bark, leaves, and other parts of trees, with paper, and other materials; and the ſtructure of theſe is well worthy our attention.

There are others whoſe workmanſhip, in this article, far exceeds theſe. There is one which builds in wood, and is able to give its caſe a hardneſs greater than that of the wood itſelf in its natural ſtate. This is the ſtrange horned caterpillar of the willow, which is one of thoſe that eat their *exuviæ*. This creature has extremely ſharp teeth, and with theſe it cuts the wood into a number of ſmall fragments: theſe fragments it afterwards unites together into a caſe, of what ſhape it pleaſes, by means of a peculiar ſilk; which is no other than a tough and viſcous juice, which hardens as it dries, and is a ſtrong and firm cement. The ſolidity of the caſe being thus provided for, we are to conſider, that the caterpillar incloſed in it is to become a butterfly; and the wonder is, in what manner a creature of this helpleſs kind, which has neither legs to dig nor teeth to gnaw with, is to make its way out of ſo firm and ſtrong a lodgment as this is in which it is hatched. It has been ſuppoſed by ſome, that the butterfly, as ſoon as hatched, diſcharged a liquor which ſoftened the viſcous matter that holds the caſe together, and ſo its ſeveral fragments falling to pieces, the way out lies open. This is evidently the truth of the caſe; though thoſe who ſuppoſed it, did it by mere conjecture: for, on a ſtrict examination, this liquor is always to be found in the animal, and is of the moſt proper kind for ſuch a ſervice. Reaumur judged, from the effects, that this liquor muſt be of a ſingular nature, and very different from the generality of animal fluids: and in diſſecting this creature in the caterpillar ſtate, there will always be found near the mouth, and under the œſophagus, a bladder of the bigneſs of a ſmall pea, full of a limpid liquor, of a very quick and penetrating ſmell, and which, upon divers trials, proves to be a very powerful acid; and among other properties, which it has in common with other acids, it ſenſibly ſoftens the glue of the caſe, on a common application.

It is evident that this liquor, beſides its uſe to the caterpillar, remains with it in the chryſalis ſtate, and is the very thing that gives it a power of diſſolving the ſtructure of the caſe, and making its way through in a proper manner at the neceſſary time. Dr Boerhaave has adopted the opinion, that there are no true acids in animals, except in the ſtomach or inteſtines; but this familiar inſtance proves the error of that determination. Phil. Tranſ. abr. ix. p. 39, &c.

Another very curious and myſterious artifice, is that by which ſome ſpecies of caterpillars, when the time of their changing into the chryſalis ſtate is coming on, make themſelves lodgments in the leaves of the trees, by rolling them up in ſuch a manner as to make themſelves a ſort of hollow cylindric caſe, proportioned to the thickneſs of their body, well defended againſt the injuries of the air, and carefully ſecured for their ſtate of tranquillity.

Beſides theſe caterpillars, which in this manner roll up the leaves of plants, there are other ſpecies which only bend them once; and others which, by means of thin threads, connect many leaves together to make them a caſe. All this is a very ſurpriſing work, but all much inferior to this method of rolling.

The different ſpecies of caterpillars have different inclinations, not only in their ſpinning and their choice of food, but even in their manners and behaviour one to another. Some never part company from the time of their being hatched to their laſt change; but live and feed together, and undergo together their laſt change into the chryſalis ſtate. Others ſeparate one from another as ſoon as able to crawl about, and each hunts its fortune ſingle; and there are others which regularly live to a certain time of their lives in community, and then ſeparate each to ſhift for itſelf, and never to meet again in that ſtate. *Reamur, Hiſt. Inſect.* vol. ii. *paſſim.*

Caterpillars are very deſtructive and pernicious in gardens, particularly thoſe of two ſpecies. The one of theſe is that which afterwards becomes the common white butterfly. This is of a yellowiſh colour, ſpotted with black; and infeſts the leaves of cabbages, cauliflowers, and the Indian creſs, of which it eats off all the tender parts, leaving only the fibres entire; ſo that whole plantations are often ſeen deſtroyed by them in autumn, eſpecially ſuch as are near large buildings, or are crowded with trees. There is no remedy againſt this evil but the pulling the creatures off before they are ſpread from their neſts, and watching the butterflies, which are daily, in the hot weather, depoſiting their eggs on theſe plants. Theſe, however, feed principally on the outſide of the leaves of the plants, and are therefore the eaſier taken off; but the other kind lies near the centre, and therefore is with much more difficulty diſcovered. This is much larger; and the ſkin is very tough, and of a brown colour. It is called by the gardeners a *grub*, and is extremely pernicious. The eggs which produce it are uſually depoſited in the very heart or centre of the plant, particularly in cabbages; and the creature, when formed, and grown to ſome ſize, eats its way through all the blades, and leaves its dung in great quantity behind it, which ſpoils the cabbage. This inſect alſo burrows under the ſurface of the ground, and makes ſad havock among young plants, by eating off their tender ſhanks, and drawing them into its holes. This miſchief is chiefly done in the night; but wherever a plant is ſeen thus deſtroyed, if the earth be ſtirred with a finger an inch deep, the creature will be certainly found, and this is the only way of deſtroying them. *Miller*.

When theſe animals attack fruit-trees, the beſt method of driving them off is to boil together a quantity of rue, wormwood, and the common tobacco, of each equal parts, in common water; to make the liquor very ſtrong, and ſprinkle it on the leaves and young branches every night and morning, during the time when the fruit is ripening. See alſo the article CATERPILLAR.

In Dr Hawkeſworth's Account of the Voyages to the South Sea. vol. iii. p. 520. we have the following account of a kind of ſmall green caterpillar, which the voyagers found in great numbers on the true Weſt Indian mangroves. Their bodies were thick ſet with hairs, and they were ranging on the leaves ſide by ſide like files of ſoldiers, to the number of 20 or 30 together. When they touched them, they found that the hairs on their bodies had the quality of a nettle, and gave them a much more acute though leſs durable pain.

*ERUCÆ Aquaticæ, Water Caterpillars.* It may ſeem incredible, that there is any ſuch thing as a caterpillar whoſe habitation is under water; but experience and obſervation prove, that there are ſuch, and that they feed on the water-plants as regularly as the common kinds do on thoſe at land. Theſe are not named at random like many of the aquatic animals of the larger kinds, as the ſea-wolf, the ſea-horſe, &c. which might as well be called any thing elſe as *wolves* and *horſes*; but they are properly what they are called, and do not reſpire in the manner of the fiſh-tribe, but by their ſtigmata as other caterpillars. M. Reaumur, in his obſervations, met with two ſpecies of theſe; the one upon the potamogiton or pond-weed, the other upon the lenticula or duck-meat. Theſe are both very induſtrious animals; but the firſt being much the largeſt, its operations are more eaſily diſtinguiſhed.

This, though truly an aquatic animal, ſwims but badly, and does not at all love to wet itſelf. The parent butterfly lays her egg on the leaf of a certain plant; and as ſoon as the young caterpillar is hatched, it gnaws out a piece of the leaf, of a roundiſh ſhape. This it carries to another part of the ſame leaf, and lays it in ſuch a manner, that there may be a hollow between, in which it may lodge. It then faſtens down this piece to the larger leaf with ſilk of its own ſpinning; only leaving certain holes at which it can put out its head, and get to gnaw any of the leaves that are near. It eaſily gets out, though the aperture be naturally ſmall, ſince a little force from its body bends up the upper leaf and down the lower, both being flexile; and when the creature is out, it has a ſort of down that defends it from being wetted, and the natural elaſticity of the leaves and of the ſilk joins the aperture up again, ſo that no water can get in. The leaves of this kind of plant are alſo naturally very ſlippery, and not eaſily wetted by water. It ſoon happens that this habitation becomes too ſmall for the animal, in which caſe it makes juſt ſuch another; and after that, at times, ſeveral others; each being only made fit for it at the ſize it is then of. The changes of this creature into the chryſalis and butterfly ſtates are in the common method. The butterfly gets out of a chryſalis which was placed on the ſurface of the water; the lightneſs of the animal eaſily ſuſtains it on the water till its wings are dried, and then it leaves that element, never to return to it again.

*ERUCÆ Sylveſtris, Wood-caterpillars*; the name of a ſort of caterpillars which do not live, after the manner of others, on leaves of trees or plants, or open to our obſervation; but under the bark, in the trunk and branches, and in the roots of trees, and ſometimes in the body of fruits.

Theſe are eaſily diſtinguiſhed from thoſe worms and maggots which are found in roots and fruits, and owe their origin to flies of another kind; but are liable to be confounded with a ſort of animals, called by M. Reaumur, *falſe* or *baſtard caterpillars*, which carry a great reſemblance in their figure to real caterpillars, but which have more legs than any of the true ones have, and are finally transformed into four-winged flies, which are not true butterflies.

The butterflies which are the parents of thoſe caterpillars that lie immured in trees or fruits, lay their eggs on the ſurface; and the young caterpillars, when hatched, eat their way in. What appears ſomething ſurpriſing, however, in this, is, that there uſually is only one caterpillar in a fruit which is large enough to afford food to a great number; and if there are ſometimes found two creatures within, one is uſually a caterpillar, the other a worm of ſome other kind. The whole occaſion of which is, that the operation of penetrating into the fruit is ſo difficult to the young animal, that it ſeldom ſucceeds in it; and tho' the butterfly depoſits many eggs on each fruit, and theſe all hatch, yet it is only here and there one on a fruit that can find the way into it.

Theſe creatures, when once lodged in their priſon, have nothing to do but to eat up the ſubſtances which incloſe them, leaving the outer hard ſhell unhurt, which ſtill ſerves as a caſe for them. This is a very frequent caſe in the grains of corns, where the farinaceous ſubſtance ſerves as aliment, and the hard outer ſkin becomes a firm hollow caſe afterwards for the animal. The farinaceous ſubſtance in this caſe uſually proves enough for the animal in its caterpillar ſtate; but if it does not, the creature has recourſe to a very ſingular expedient: it eats again its own excrements; and finds its now ſtronger ſtomach able to ſeparate nouriſhment from that very matter which had before paſſed off from its weaker ſtomach undigeſted.

Of theſe ſpecies of caterpillars, ſome go out of their priſon in order to change into their chryſalis, and thence into their butter-fly ſtate; but the greater number

ber remain there, and paſs through all their changes within. Theſe caterpillars, like all the other kinds, have certain fleſh-eating worms, whoſe parents are of the fly-kind, for their terrible enemies and deſtroyers; and it is not unfrequent, on opening one of theſe ſpoiled fruits, inſtead of the expected caterpillar, to find a fly juſt ready to come out: this has been produced from the chryſalis of a worm, which had before found its way into the fruit, and eat up the caterpillar, which was the original poſſeſſor of the place.

ERUDITION, denotes learning or knowledge; and chiefly that of hiſtory and antiquity, of languages and of books, which is the reſult of hard ſtudy and extenſive reading. The Scaligers were men of deep erudition: the writings of M. Launoy, a prieſt of the Oratory, are full of erudition.

Mr Locke ſays, it is of more uſe to fill the head with reflections than with points of erudition. If the mind be not juſt and right, ignorance is better than erudition, which only produces confuſion and obſcurity. M. Balzac calls a heap of ill choſen erudition the luggage of antiquity.

ERUPTION, in medicine, a ſudden and copious excretion of humours, as pus or blood: it ſignifies alſo the ſame with exanthema, any breaking out, as the puſtules of the plague, ſmall-pox, meaſles, &c.

ERUPTION *of Volcanoes*. See ÆTNA, ETNA, VESUVIUS, VOLCANO, &c.

ERVUM, the LENTIL: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The calyx is quinquepartite, the length of the corolla. There are ſix ſpecies; of which the moſt remarkable is the lens, or common lentil. It is cultivated in many parts of England, either as fodder for cattle, or for the ſeeds which are frequently uſed in meagre ſoups. It is an annual plant, and riſes with weak ſtalks about 18 inches high, garniſhed with winged leaves compoſed of ſeveral pairs of narrow lobes, terminated by a claſper or tendril, which faſtens to any neighbouring plant, and is thereby ſupported: the flowers come out three or four together, upon ſhort footſtalks from the ſide of the branches. They are ſmall, of a pale purple colour, and are ſucceeded by ſhort flat pods, containing two or three ſeeds which are flat, round, and a little convex in the middle. The ſeeds of this plant are moſt commonly ſown in the month of March, where the land is dry; but in moiſt ground, the beſt time is April. The uſual quantity of ſeed allowed for an acre of land is from one buſhel and a half to two buſhels. If theſe are ſown in drills in the ſame manner as peaſe, they will ſucceed better than when ſown in broadcaſt: the drills ſhould be a foot and a half aſunder, to allow room for the Dutch hoe to clean the ground between them; for if the weeds are permitted to grow among them, they will get above the lentils and ſtarve them.

There is another ſort of lentil alſo cultivated in this country under the name of *French lentil*. It is twice the ſize of the former, both in plant and ſeed; and is much better worth cultivation than the other. It ſhould be ſown in March, after a ſingle ploughing, in the ground that bore corn the year before. Manure is not abſolutely neceſſary, though it will undoubtedly increaſe the crop. Its graſs is ſaid to be very copious; it may be mowed many times in the year, and affords a healthy as well as an agreeable food to horſes, cows, and ſheep: the milk of cows fed with it is ſaid to be very copious and good. Long and numerous pods ripen about the beginning of winter, which afford a new kind of legumen, to be eaten as common lentils: when freſh, it makes admirable peaſe-ſoup; dry, it is greedily eaten by the poultry. The dried herb is alſo a good reſource for cattle in winter. It grows on any kind of ground.

ERYMANTHUS, a mountain, river, and town of Arcadia, where Hercules killed a prodigious boar, which he carried on his ſhoulders to Euryſtheus; who was ſo terrified at the ſight, that he hid himſelf in a brazen veſſel.

ERYNGIUM, SEA-HOLLY, or *Eryngo:* A genus of the digynia order, belonging to the pentandria claſs of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The flowers are collected into a round head, and the receptacle is paleaceous. There are nine ſpecies; moſt of which are hardy herbaceous perennials, producing erect ſtalks from one to two or three feet high; with ſimple, entire, or divided prickly leaves; and the ſtalks terminated by roundiſh aggregate heads of quinquepetalous flowers, of white, blue, or purple colours. They all flower moſtly in July, and the ſeeds ripen in September. They are propagated by ſeeds ſown in a bed or border, either in ſpring or autumn. The plants are to be removed the autumn after they come up, into thoſe places where they are deſigned to remain. The leaves of one of the ſpecies (viz. the maritimum, which grows naturally on the ſea-coaſts of England and Scotland) are ſweetiſh, with a light aromatic warmth and pungency. The roots are accounted aphrodiſiac, and are ordered to be kept candied in the ſhops. The young flowering ſhoots eaten like aſparagus are very grateful and nouriſhing.

ERYSIMUM, HEDGE-MUSTARD: A genus of the ſiliquoſa order, belonging to the tetradynamia claſs of plants; and in the natural method ranking under the 39th order, *Siliquoſæ*. The ſiliqua is long, linear, and exactly tetragonal; the calyx cloſe. There are ſix ſpecies; of which the moſt remarkable is the officinale, hedge-muſtard, or bank-creſſes. It grows naturally in Britain under walls, by the ſides of highways, and among rubbiſh. It is warm and acrid to the taſte; and when cultivated, is uſed as a vernal pot-herb. Birds are fond of the ſeeds; ſheep and goats eat the herb; cows, horſes, and ſwine refuſe it. The ſeeds are ſaid to promote expectoration, excite urine and the other fluid ſecretions, and to attenuate and diſſolve viſcid juices, &c. This they are ſuppoſed to perform by an acrimonious ſtimulating quality; but the taſte diſcovers in them only an herbaceous ſoftneſs void of acrimony: the ſeeds indeed are conſiderably pungent, and the roots in ſome ſmall degree.

ERYSIPELAS, in medicine, an eruption of a fiery or acrid humour, from which no part of the body is exempted, though it chiefly attacks the face. See MEDICINE-*Index*.

ERYTHEA, or ERYTHIA, an iſland adjoining, according to the ancients, either to or a part of Gades; no where now to be found by the deſcription given of it by ancient authors. The poets feign this to be the habitation of the fabulous Geryon, diſarmed by Hercules, who drove away his cattle.

ERYTHRÆ (anc. geog.), a port town of Ætolia, on the Corinthian bay. Another Erythræ of Bœotia, near Platæa and mount Cithæron. A third Erythræ, a town of Ionia in the Hither Aſia, ſituated in the peninſula, at its extremity, with a cognominal port. The Erythræans laid claim to the Sibyl Herophile, as their country-woman, ſurnamed thence *Erythræa*. Erythræ was famous for an ancient temple of Hercules.

ERYTHRÆA, a town of Crete, ſituated in the ſouth-eaſt of the iſland, at the promontory Erythræum.

ERYTHRÆUM MARE, erroneouſly called *Rubrum* by the Romans. Thus the ocean that waſhes Arabia and Perſia, and extends a great way farther, is denominated. Hence it is, Herodotus ſays, that the Euphrates and Tigris fall into the Mare Erythræum. He alſo calls it the *South Sea*, on which the Perſians dwell. It takes its name, not from its colour, the error of the Romans, who tranſlated *Erythræum*, "Rubrum;" but from *Erythras*, ſon of Perſeus and Andromeda, whoſe kingdom lay on the confines of that ſea; whence its name *Erythræum*.

ERYTHRINA, CORAL-TREE: A genus of the decandria order, belonging to the diadelphia claſs of plants; and in the natural method ranking under the 32d order, *Papilionaceæ*. The calyx is bilabiate, the one lip above, the other below; the vexillum of the corolla is very long and lanceolated. There are four ſpecies, all of them ſhrubby flowering exotics for the ſtove, adorned chiefly with trifoliate or three-lobed leaves, and ſcarlet ſpikes of papilionaceous flowers. They are all natives of the warm parts of Africa and America; and muſt always be kept in pots, which are to remain conſtantly in ſtoves in this country. They are propagated by ſeeds, which are annually imported hither from Africa and America. They are to be ſown half an inch deep in pots of light rich earth, which are then to be plunged in the bark-bed of the ſtove; and when the plants are two inches high, they are to be ſeparated into ſmall pots, plunging them alſo in the bark-bed, giving them frequent waterings, and as they increaſe in growth ſhifting them into larger pots. The inhabitants of Malabar make ſheaths of the wood, for ſwords and knives. They uſe the ſame, together with the bark, in waſhing a ſort of garments which they call ſaraſſas; and make of the flowers the confection caryl. The leaves pulveriſed and boiled with the mature cocoa-nut, conſume venereal buboes, and eaſe pains in the bones; bruiſed and applied to the temples, they cure the cephalea and ulcers: mixed with the ſugar called *jagra*, they mitigate pains in the belly, eſpecially in women; and the ſame effect follows from the uſe of the bark levigated with vinegar, or ſwallowing the kernel ſtripped of its red pellicle. The juice of the leaves taken with oil mitigates venereal pains; drank with an infuſion of rice, it ſtops fluxes; made into a cataplaſm with the leaves of betel, it deſtroys worms in old ulcers; and worked with oil, it cures the pſora and itch.

ERYTHRINUS, in ichthyology, a ſpecies of SPARUS.

ERYTHROIDES, in anatomy, the firſt of the proper tunics or coats which cover the teſticles.

ERYTHRONIUM, DOG'S-TOOTH VIOLET: A genus of the monogynia order, belonging to the hexandria claſs of plants; and in the natural method ranking under the 11th order, *Sarmentaceæ*. The corolla is hexapetalous and campanulated; with a nectarium of two tubercles adhering to the inner baſe of every other petal. There is only one ſpecies, which, however, admits of ſeveral varieties in its flowers, as white, purple, pale red, dark red, crimſon, and yellow. The plants are low and herbaceous, with a purple ſtalk and hexapetalous flowers. All the varieties are hardy and durable; and may be planted in ſmall patches in borders, where they will make a good appearance. They rarely perfect their ſeeds in this country, but may be propagated by offſets. In Siberia, according to Gmelin, they dry and mix the root of this plant with their ſoups. It grows there in great abundance; and is called by the people of the country *beſs*.

ERYTHROXYLON, in botany: A genus of the trigynia order, belonging to the decandria claſs of plants; and in the natural method ranking with thoſe the order of which is doubtful. The calyx is turbinated; the petals of the corolla have each a nectariferous emarginated ſcale at the baſe; the ſtamina are connected at the baſe; the fruit a bilocular plum.

ERYX, a ſon of Butes and Venus, who relying upon his ſtrength, challanged all ſtrangers to fight with him in the combat of the ceſtus. Hercules accepted his challenge after many had yielded to his ſuperior dexterity; and Eryx was killed in the combat, and buried on the mountain, where he had built a temple to Venus. Virg. Æn. 5. v. 402. A mountain of Sicily near Drepanum, which received its name from Eryx, who was buried there. This mountain was ſo ſteep, that the houſes which were built upon it ſeemed every moment ready to fall. Dædalus had enlarged the top, and incloſed it with a ſtrong wall. He alſo conſecrated there to Venus Erycina a golden heifer, which reſembled life ſo much, that it ſeemed to exceed the power of art.

ERZERUM, or ERZERON, a city of Turky in Aſia, and capital of Armenia, or Turkomania. It is a pretty large town, five days journey from the Black Sea, and ten from the frontiers of Perſia. It ſtands in a delightful plain, at the foot of a chain of mountains, which hinder the Frat, or Euphrates, from falling into the Black Sea. A neighbouring hill ſupplies very fine ſprings, which not only water the fields, but the ſtreets of the town. Erzerum is ſurrounded with double walls, defended by pentagonal towers; but the ditches are neither deep nor well kept up. The beglerbeg, or baſhaw of the province, lives in the ſeraglio, which is very ill built. They reckon that there are 18,000 Turks at Erzerum, 6000 Armenians, and 10,000 Greeks. The Armenians have a biſhop and two churches; and the Greeks have alſo a biſhop, but the church is a miſerable place. The laſt are moſtly braziers, inhabiting the ſuburbs, who work the copper brought from the neighbouring mountains. They drive a great trade in copper utenſils and furs, particularly martins ſkins. Five or ſix days journey from the town there are oaks that produce plenty of gall-nuts, which are brought hither. This place is the thoroughfare and reſting place of all the merchants trading to the Indies, eſpecially when the Arabs are watching for their prey round Aleppo and Bagdad. E Long. 40. 50. N. Lat. 29. 46.

ESARHADDON, the ſon of Sennacherib, and his ſucceſſor in the kingdom of Aſſyria. He is ſaid to have reigned 29 years at Nineveh, from the year 3294 to 3322; beſides which he reigned 13 years at Babylon, in all 42 years. He died in the year of the world 3336, and was ſucceeded by Saoſduchinus. Eſarhaddon, in the opinion of Sir Iſaac Newton, ſeems to be the Sardanapalus who died, as Clectarchus ſays, of old age, after the revolt of Syria; the name *Sardanapalus* being derived from *Aſſerhadon Pul.*

ESCALADE, or Scalade, a furious attack of a wall or a rampart; carried on with laders, to paſs the ditch or mount the rampart; without proceeding in form, breaking ground, or carrying on regular works to ſecure the men.

When the troops are prepared to paſs the ditch, either with the aſſiſtance of boards, hurdles, and faſcines, when it is muddy, or with ſmall boats of tin, or baſkets covered with ſkins or oil-cloth, when it is deep and filled with water, a party muſt be placed on the counterſcarp, oppoſite to the landing-place, ready to fire at the garriſon if they are alarmed, and oppoſe the mounting on the rampart. If the ditch is dry, the ladders are fixed in ſome place fartheſt diſtant from the centry; and as ſoon as they get upon the rampart, they put themſelves in order to receive the enemy; if the centry ſhould be ſurpriſed and ſilently overcome, the detachment haſtens to break open the gate, and to let in the reſt of the party. If the ditch is wet, the rampart high, and provided with a revetement, it will be difficult to ſurpriſe the town in this way; but if there is no revetement, the troops may hide themſelves along the outſide of the rampart till all are over. Since the invention and uſe of gunpowder, and the walls of cities have been flanked, they are ſeldom taken by eſcalade.

ESCALLONIA, in botany: A genus of the monogynia order, belonging to the pentandria claſs of plants. The fruit is bilocular and polyſpermous; the petals diſtant and tongue-ſhaped; the ſtigma headed.

ESCAPE, in law; a violent or privy evaſion out of ſome lawful reſtraint, without being delivered by due courſe of law. There are two ſorts of eſcapes, voluntary and negligent. Voluntary, when a man arreſts another for felony, or other crime, and afterwards lets him go freely by conſent; in which caſe, the party that permits ſuch eſcape is held guilty, committed, and muſt anſwer for it. Negligent eſcape, on the contrary, is where one is arreſted, and afterwards eſcapes againſt the will of the perſon that arreſted him, and is not purſued with freſh ſuit, and retaken before the perſon purſuing hath loſt ſight of him. By ſtat. 8 and 9 Will. III. c. 26. the keepers of priſons conniving at eſcapes ſhall forfeit 500l; and in civil caſes the ſheriff is anſwerable for the debt.

ESCHALOT, or Shallot. See Allium.

ESCHAR, in ſurgery, the cruſt or ſcab occaſioned by burns or cauſtic medicines.

ESCHARA, in natural hiſtory, the name of a ſpecies of coralline, &c. the characters of which are theſe: they are of a ſtony or coral-like hardneſs, and reſemble a woven cloth in their texture; and the microſcope informs us, that they conſiſt of arrangements of very ſmall cells, whoſe ſurfaces appear much in that form. Linnæus makes it a ſpecies of millepora, in the claſs of lithophytes. See Plate CXLVIII. fig. 9. 10.

The narrow-leaved hornwrack, fig. 9. divides as it riſes, into narrow leaves made up of regular rows of oblong ſquare-ſhaped cells placed alternately by each other, and oppoſite to an equal number on the other ſide of the leaf, like an honeycomb: from theſe leaves proceed other ſtill ſmaller foliaceous ramifications, many of which ſeem to be connected at the lower part by tubuli, as in the corallines; by which means they can ply to and fro more freely in the water.—*e*, Gives the natural appearance of this coralline. E repreſents two leaves with their tubuli and cells magnified. E 1 is a croſs ſection of one of the leaves at E, ſhowing the partition and inner form of their cells.

The broad-leaved hornwrack, fig. 10. when freſh taken out of the ſea, is of a ſpongy ſoft texture, and ſmells very fiſhy; but when it has lain for ſome time on the ſhore, it becomes ſtiff and horny, like ſome ſort of withered leaves. Both ſurfaces, when examined by glaſſes, appear to be covered with cells; and, when a piece of it is cut acroſs, one may diſcover the thin membrane that ſerves as a baſe to the cells of each ſurface. The form of the cells is very remarkable, each one being arched at the top, and contracted a little at the lower part of the ſides to make way for the arches of the two next adjoining cells; ſo that by this particular conſtruction no room is loſt. The entrance of the cells is immediately under the arch of each cell, and the walls of the cells ſeem to be fortified with ſpines. Juſſieu diſcovered ſmall polypes extending themſelves out of theſe cells, which he has deſcribed in the memoirs of the Academy of Sciences 1742.—*f*, Gives the natural appearance of a leafy branch of this coralline. F is a part of a leaf magnified to ſhow the ſuperficial figure of the cells, and the manner in which they are diſpoſed. F 1 ſhows a croſs ſection of a leaf, and diſcovers the ſeveral partitions of the cells.

At the entrance of many of the cells a ſmall teſtaceous body like a bivalve ſhell is diſcovered: F 2, the figure of the cell, with the ſhell in it; it is of a tranſparent amber colour, ſo clear that one may ſee the dead animal through it, repreſented by the black ſpot.

ESCHEAT, in law, ſignifies any lands or tenements that caſually fall to a lord within his manor. It is one of the conſequences of tenure in chivalry: (See *Feodal Syſtem*, *Knight-Service*, and Tenure). It is the determination of the tenure or diſſolution of the mutual bond between the lord and tenant, from the extinction of the blood of the latter by either natural or civil means: if he died without heirs of his blood, or if his blood was corrupted and ſtained by commiſſion of treaſon or felony; whereby every inheritable quality was entirely blotted out and aboliſhed. In ſuch caſes the land eſcheated or fell back to the lord of the fee; that is, the tenure was determined by breach of the original condition, expreſſed or implied in the feodal donation. In the one caſe, there were no heirs ſubſiſting of the blood of the firſt feudatory or purchaſer, to which heirs alone the grant of the feud extended: in the other, the tenant, by perpetrating an atrocious crime, ſhowed that he was no longer to be truſted as a vaſſal, having forgotten his duty as a ſubject; and therefore forfeited his feud, which he held under the implied condition that he ſhould not be a traitor or a felon. The conſequence of which in both caſes was, that the gift being determined, reſulted back to the lord who gave it.

The word *eſcheat* is ſometimes uſed for the place or circuit within which the king or other lord is intitled to eſcheats; alſo for a writ to recover the ſame from the perſon in poſſeſſion after the tenant's death.

Escheat, in Scots law, is that forfeiture which is incurred upon a perſon's being denounced a rebel. See Law, Part III. N° clxvi. 12.

ESCHEVIN, or Echevin *(Scabinus)*, in the French and Dutch polity, a magiſtrate elected by the inhabitants of a city, to take care of their common concerns, the good order, conveniency, and decoration of the city, &c.

At Paris there is a prevot and four *eſchevins;* in moſt other cities a mayor and *eſchevins*. In Languedoc, Provence, and Dauphiné, they are called *conſuls;* at Toulouſe, *capitouls;* and *jurats* at Bourdeaux.

Anciently the *eſchevins* were the aſſeſſors and counſellors of the comites or judges of cities; on which account they were called in ſome places *pairs*, *pares;* they even took cognizance of petty cauſes themſelves.

Du-Cange obſerves, that the judges and their aſſeſſors, who were choſen by the inhabitants, were called *ſcabini* "eſchevins," and their college *ſcabinagium* or "eſchevinage."

In Holland, the *ſcabins* or *eſchevins* judge of all civil affairs at firſt hand. They alſo take cognizance of criminal matters: and if the criminal confeſs himſelf guilty, they can ſee their ſentence executed without appeal. They can even give torture. The number is not the ſame in all cities; at Amſterdam there are nine, at Rotterdam ſeven, &c.

ESCHRAKITES, or Esrakites, a ſect of philoſophers, among the Mahometans, who adhere to the doctrines and opinions of Plato. The word is derived from the Arabic שרק *ſchraca*, which in the fourth conjugation אשרק *aſchraca*, ſignifies "to ſhine, glitter like the ſun;" ſo that *Eſchrakite* ſeems to import "illumined."

The *Eſchrakites*, or Mahometan Platoniſts, place their higheſt good and happineſs in the contemplation of the Divine Majeſty; deſpiſing the groſs imaginations of the Alcoran touching paradiſe. They are very careful in avoiding all vice; they preſerve an equal and eaſy temper, love muſic, and divert themſelves with compoſing little poems or ſpiritual ſongs. The ſhaeicks or prieſts, and the chief among the preachers of the imperial moſques, are Eſchrakites.

ESCLAIRCISSEMENT, a French term adopted into our language, ſignifying the explaining or clearing up of ſome difficulty or obſcurity.

ESCORT, a French term, ſometimes uſed in Engliſh authors, to denote a convoy or company of armed men, attending ſome perſon or thing, in a journey or voyage, to defend or ſecure it from inſults. Some derive the word from the Latin *cohors*.

ESCOUADE, or Squad, is uſually the third or fourth part of a company of foot; ſo divided for mounting guards, and for the more convenient relieving of one another. It is equivalent to a brigade of a troop of horſe. See Brigade.

ESCUAGE, in our old cuſtoms, a kind of knight-ſervice, called *ſervice of the ſhield*, by which the tenant was bound to follow his lord to the wars at his own charge. See the articles Chivalry, *Feodal Syſtem*, and *Knight-Service*.

ESCULAPIUS. See Æsculapius.

ESCULENT, an appellation given to ſuch plants or the roots of them as may be eaten: ſuch are beets, carrots, artichokes, leeks, onions, parſnips, potatoes, radiſhes, ſcorzonera, &c.

ESCURIAL, a royal reſidence of Spain, ſituated about 15 miles north-weſt of Madrid. It is the largeſt and moſt ſuperb ſtructure in the whole kingdom, and perhaps one of the fineſt in Europe. The word is Arabic, meaning "a place full of rocks." It is built in a dry barren ſpot, ſurrounded with rugged mountains, inſomuch that every thing which grows there is owing to art. This place was choſen, it is ſaid, for the ſake of the ſtone wherewith the fabric is built, which is got from a mountain juſt by, and is very durable; and the deſign of erecting it was to commemorate a victory which Philip II. obtained over the French (but by the aſſiſtance of the Engliſh forces) at St Quintin, on St Laurence's day, in the year 1557. The Spaniſh deſcription of this ſtructure forms a ſizeable quarto volume, and it is ſaid that its founder expended upon it ſix millions of ducats. The apartments are decorated with an aſtoniſhing variety of paintings, ſculpture, tapeſtry, ornaments of gold and ſilver, marble, jaſper, gems, and other curious ſtones, ſurpaſſing all imagination. This building, beſides its palace, contains a church, large and richly ornamented; a mauſoleum; cloiſters; a convent; a college; and a library, containing about 30,000 volumes; beſides large apartments for all kinds of artiſts and mechanics, noble walks, with extenſive parks and gardens, beautified with fountains and coſtly ornaments. The fathers that live in the convent are 200, and they have an annual revenue of 12,000l. It was begun by Philip in 1562, five years after the battle; and completed in 22 years. It conſiſts of ſeveral courts and quadrangles, which altogether are diſpoſed in the ſhape of a gridiron, the inſtrument of the martyrdom of St Laurence; the apartment where the king reſides forms the handle. The building is a long ſquare of 640 by 580, and the height up to the roof is all round 60 feet, except on the garden ſide, where the ground is more taken away. At each angle is a ſquare tower 200 feet high. The number of windows in the weſt front is 200; in the eaſt front 366. The orders employed are Doric and Ionic. There are three doors in the principal front. Over the grand entrance are the arms of Spain, carved in ſtone; and a little higher in a nich, a ſtatue of St Laurence in a deacon's habit, with a gilt gridiron in his right hand, and a book in his left. Directly over the door is a baſſo relievo of two enormous gridirons in ſtone. This vaſt ſtructure, however, with its narrow high towers, ſmall windows, and ſteep ſloping roof, exhibits a very uncouth ſtyle of architecture; at the ſame time that the domes, and the immenſe extent of its fronts, render it a wonderfully grand object from every point of view. The church, which is in the centre of all, is large,

large, awful, and richly but not affectedly ornamented. The cupola is bold and light. The high altar is compoſed of rich marbles, agates, and jaſpers of great rarity, the produce of this kingdom. Two magnificent *catafalquas* fill up the ſide arcades of this ſanctuary: on one the emperor Charles V. his wife, daughter, and two ſiſters, are repreſented in bronze, larger than life, kneeling; oppoſite are the effigies of Philip II. and of his three wives, of the ſame materials, and in the ſame devout attitude. Underneath is the burial-place of the royal family, called the *Pantheon*. Twenty-five ſteps lead down to this vault, over the door of which is an inſcription, denoting, that

*Hic locus, ſacer mortalitatis exuviis Catholicorum Regum, &c.*

was intended by Charles the emperor, reſolved upon by Philip II. begun by Philip III. and completed by Philip IV. The mauſoleum is circular, 36 feet diameter, incruſted with fine marbles in an elegant taſte. The bodies of the kings and queens lie in tombs of marble, in niches, one above the other. The plan of theſe ſepulchres is grand, and executed with a princely magnificence; but, as a modern traveller obſerves, in a ſtyle rather too gay, too light, and too delicately fitted up for the idea we are apt to form of a chapel deſtined for the reception of the dead. The collection of pictures diſperſed about various parts of the church, ſacriſty, and convent, has been conſidered as equal, if not ſuperior, to any gallery in Europe except that of Dreſden. Formed out of the ſpoils of Italy, and the waſted cabinet of that unfortunate dilettante Charles I. of England, it contains ſome of the moſt capital works of the greateſt painters that have flouriſhed ſince the revival of the art. In the ſacriſty is an altar called *La ſanta Forma*: this is a kind of tabernacle or *cuſtioda* of gems, marbles, woods, and other precious materials, inlaid in gilt bronze; in which, rather than in the excellence of the workmanſhip or taſte of the deſign, conſiſts the merit of this rock of riches. Before it hangs a curtain, on which Coello has repreſented Charles II. and all his court in proceſſion, coming to place this *Forma*. This is eſteemed one of the moſt curious collections of portraits in the world; for all the perſons are drawn with the greateſt ſtrength of colour and truth of expreſſion, and are ſaid to be perfect reſemblances not only of the monarch and grandees, but even of the monks, ſervants, and guards. The ſtatues, buſts, and medallions of the Eſcurial, are not in any great number, nor very remarkable for their excellence: but the library contains a moſt precious collection of manuſcripts, many fine drawings, and other curioſities. Notwithſtanding the coldneſs of the expoſure, the late king, for the ſake of hunting, uſed to paſs here ſeveral months of the year; and to make the place leſs inconvenient to his attendants and the nobility, he built an entire new town adjoining to it.

ESCUTCHEON, or SCUTCHEON, in heraldry, is derived from the French *eſcuſſon*, and that from the Latin *ſcutum*, and ſignifies the ſhield whereon coats of arms are repreſented.

Moſt nations of the remoteſt antiquity were wont to have their ſhields diſtinguiſhed by certain marks painted on them; and to have ſuch on their ſhields was a token of honour, none being permitted to have them till they had performed ſome honourable action.

The eſcutcheon, as uſed at preſent, is ſquare, only rounded off at the bottom.

ESDRAS, a Jewiſh prieſt, and doctor of the law. Artaxerxes Longimanus ſent him with rich preſents for the uſe and ornament of the temple at Jeruſalem, rebuilt under Zerubbabel; the king alſo ordered the neighbouring governors to provide him with what conduced to the pomp of the Jewiſh religion, and to exempt the prieſts from paying taxes. He is ſuppoſed to be the collector of the Canon of Scripture; and that, by divine inſpiration, he added ſome things which happened after the deaths of the authors. It is gueſſed he wrote the Chronicles, beſides thoſe books which bear his name, the two laſt of which are exploded even by the church of Rome.

ESK, the name of ſeveral rivers both in England and Scotland, particularly of one which forms part of the boundary between the two kingdoms. It runs from north-eaſt to ſouth-weſt, and gives name to the county of Eſkdale.

ESKI-HISSAR. See STRATONICEA.

ESKIMAUX. See ESQUIMAUX.

ESNE, a conſiderable ſea-port town of Upper Egypt. It is governed by an Arabian prince, and by a cachef, dependant on the bey of Girze. The Mahometans have ſeveral moſques here, and the coptis a church ſerved by two prieſts. "Eſne (ſays Abulfeda), remarkable for its public baths and its commerce, is built on the weſtward of the Nile, between Aſſouan and Cous, but nearer to this latter. It acknowledges, adds the geographer of Nubia, the coptis for founders. Its well cultivated territory abounds in grain and palm trees. It is ſurrounded by gardens filled with fruit trees. One admires here ſeveral ancient monuments conſtructed by the coptis, and ſuperb ruins." This deſcription anſwers to Eſne in our time, which is ſituated on the edge of a rich country, and ſhaded by groves of orange trees loaded with fruits and flowers. This town, formerly called *Latopolis*, revered Minerva and the fiſh *Latus* (Strabo). It contains within its boundary an antique temple; thick walls incloſe it on three ſides. Six large fluted columns, crowned by a capital ornamented with the palm leaf, form the facade of it; 18 others ſupport the roof, which is compoſed of large ſquares of marble; the building is ſurrounded by a freeze, and innumerable hieroglyphics cover its exterior aſpects.

A little to the ſouth of the town are ſeen the ruins of a monaſtery founded by St Helena, and near it the burying place of the martyrs, adorned with tombs crowned by cupolas, ſupported by arcades. The inhabitants of Eſne having revolted againſt the perſecution of Diocleſian, that emperor deſtroyed this town and put them to the ſword. This place, conſecrated by religion, is become a celebrated pilgrimage among the Coptis. They repair thither from the moſt diſtant provinces of the kingdom. In the chain of mountains which ſtretches to the eaſtward of the Nile, and nearly oppoſite Eſne, are quarries of a ſoft ſtone, called *Baram*. It is made uſe of for kitchen utenſils. It hardens in the fire, and forms excellent kettles and pans, which give no bad taſte to the victuals.

ESOX, in ichthyology, a genus of fiſhes belonging to the order of abdominales. The body is elongated; the head is plainiſh above; the upper jaw is plain, and ſhorter than the under one, which is dotted; and the branchioſtege membrane has from ſeven to twelve rays.

1. The Lucius, or Pike, has a flat head: the upper jaw is broad, and ſhorter than the lower: the under jaw turns up a little at the end, and is marked with minute punctures. The teeth are very ſharp, diſpoſed only in the front of the upper jaw, but in both ſides of the lower; in the roof of the mouth, and often in the tongue. The ſlit of the mouth, or the gape, is very wide; the eyes ſmall. The pike is common in moſt of the lakes of Europe; but the largeſt are thoſe taken in Lapland, which, according to Scheffer, are ſometimes eight feet long. They are taken there in great abundance, dried, and exported for ſale. The largeſt fiſh of this kind ſaid to be caught in England, weighed 35 pounds. All writers who treat of this ſpecies bring inſtances of its voraciouſneſs. It hath been known to choke itſelf by attempting to ſwallow one of its own ſpecies which proved too large a morſel. Yet its jaws are very looſely connected, and have on each ſide an additional bone like the jaw of a viper, which renders them capable of greater diſtenſion when it ſwallows its prey. It does not confine itſelf to feed on fiſh and frogs; it will devour the water-rat, and draw down the young ducks as they are ſwimming about. But there are inſtances of its fierceneſs ſtill more ſurpriſing, and which indeed border a little on the marvellous. Geſner relates, that a famiſhed pike in the Rhone, ſeized on the lips of a mule that was brought to water, and that the beaſt drew the fiſh out before it could diſengage itſelf; that people have been bit by theſe voracious creatures while they were waſhing their legs; and that the pike will even contend with the otter for its prey, and endeavour to force it out of its mouth. Small fiſhes ſhow the ſame uneaſineſs and deteſtation at the preſence of this tyrant, that the little birds do at the ſight of the hawk or owl. When the pike lies dormant near the ſurface, as is frequently the caſe, the leſſer fiſhes are often obſerved to ſwim around it in vaſt numbers and in great anxiety. Pikes are often haltered in a nooſe, and taken while they thus lie aſleep, as they are often found in the ditches near the Thames, in the month of May. In the ſhallow water of the Lincolnſhire fens they are often taken in a manner, we believe, peculiar to that country and to the iſland of Ceylon. The fiſherman makes uſe of what is called a *crown net;* which is no more than a hemiſpherical baſket, open at top and bottom. He ſtands at the end of one of the little fen-boats, and frequently puts his baſket down to the bottom of the water; then poking a ſtick into it, diſcovers whether he has any booty by the ſtriking of the fiſh; and vaſt numbers of pike are taken in this manner. The longevity of this fiſh is very remarkable, if we may credit the accounts given of it. Rzaczynſki tells us of one that was 90 years old; but Geſner relates, that, in the year 1497, a pike was taken near Hailbrun in Suabia, with a brazen ring affixed to it, on which were theſe words in Greek characters: "I am the fiſh which was firſt put into this lake by the governor of the univerſe, Frederick the Second, the 5th of October 1230:" So that the former muſt have been an infant to this Methuſalem of a fiſh. Pikes ſpawn in March or April, according to the coldneſs or warmneſs of the weather. When they are in high ſeaſon, their colours are very fine, being green, ſpotted with bright yellow; and the gills are of a moſt vivid and full red. When out of ſeaſon, the green changes to a grey, and the yellow ſpots turn pale.

2. The Belone, or Gar, ſometimes grows to the length of three feet or more. The jaws are very long, ſlender, and ſharp-pointed; the under jaw extends much farther than the upper; and the edges of both are armed with numbers of ſhort and ſlender teeth: the tongue is ſmall: the eyes are large; the irides ſilvery; the noſtrils wide and round. The body is ſlender, the belly quite flat, bounded on both ſides by a rough line. The tail is much forked. The colours are extremely beautiful when the fiſh is in the water: the back is of a fine green, beneath which appears a rich changeable blue and purple: the ſides and belly are of a fine ſilvery hue. This fiſh, which is found in many places, is known by the name of the *ſee-needle*. It comes in ſhoals on our coaſts in the beginning of ſummer, and precedes the mackerel: it has a reſemblance to it in taſte; but the light green which ſtains the back-bone of this fiſh gives many people a diſguſt to it.

3. The Saurus, or Saury, is 11 inches in length: the noſe ſlender; the jaws produced like thoſe of the ſea-needle, but of equal length: the eyes large: the body anguilliform; but towards the tail grows ſuddenly ſmaller, and tapers to a very inconſiderable girth. The tail is much forked: the back duſky: the belly bright and ſilvery. Great numbers of theſe fiſh were thrown aſhore on the ſands of Leith near Edinburgh, after a great ſtorm in November 1768. Rondeletitius deſcribes this ſpecies among the fiſh of the Mediterranean; but ſpeaks of it as a rare kind.

4. The Barracuda of Cateſby, is found in great numbers about the ſeas of the Bahamas and as far as Jamaica. Its body and head very much reſemble the European pike: the eyes are large: the mouth is very wide: the under jaw longer than the upper: there are four very large and ſharp teeth in the front of the upper jaw; in that of the lower, a ſingle great and ſharp tooth: there are two dorſal fins: the tail is large and forked: colour a deep brown, whitiſh on the belly. It grows to the length of 10 feet. It ſwims exceedingly ſwift, and is of dreadful voracity: will attack and devour men when they are bathing. The fleſh has a diſagreeable ſmell and taſte, and is frequently poiſonous; cauſing great ſickneſs, vomiting, intolerable pains in the head, and loſs of hair and nails: yet the hungry Bahamans formerly were under the neceſſity, at times, of feeding on it.

ESPALIERS, in gardening, are rows of trees planted about a whole garden or plantation, or in hedges, in ſuch a manner as to incloſe quarters or ſeparate parts of a garden; and are trained up regularly to a lattice of wood-work in a cloſe hedge for the defence of tender plants againſt the injuries of wind and weather. They are of admirable uſe and beauty in a kitchen-garden, ſerving not only to ſhelter the tender plants, but ſcreen them from the ſight of perſons in the walks.

The trees chiefly planted for eſpaliers, are apples, pears, and ſome plums: ſome plant apples grafted upon paradiſe-ſtocks: but as theſe are of ſhort duration, it is better to plant thoſe grafted upon crabſtock, or

upon

upon what the gardeners call *Dutch-ſtocks;* which will both cauſe them to bear ſooner, and prevent their growing too luxuriant. The beſt kind of apple for this purpoſe, are the golden pippen, nonpareil, rennet, &c. and the beſt ſort of pear, are the jargonelle, blanquette, &c. Theſe laſt, if deſigned for a ſtrong moiſt ſoil, ſhould be grafted upon quince-ſtocks; but if for a dry ſoil, upon free-ſtocks.

While the trees are young, it will be ſufficient to drive a few ſtakes into the ground on each ſide of them; faſtening the branches to theſe in an horizontal poſition, as they are produced. This method will do for the three firſt years; after which an eſpalier ſhould be made of aſh-poles, whereof there muſt be two ſorts, larger and ſmaller: the former to be driven upright into the ground a foot aſunder, and the latter, or ſlender poles, to be nailed acroſs theſe, at about nine inches. Some prefer to this another ſort of eſpalier, made of ſquare timber cut to any ſize: theſe are, indeed, more ſightly, but withal vaſtly more expenſive.

When the eſpalier is thus framed, the branches are to be faſtened to it with oſier-twigs; obſerving to train them in an horizontal poſition, and at equal diſtances. Fruit-trees thus managed are preferable to any others; not only as bearing better-taſted fruit, but as taking up very little room in a garden, ſo as to be leſs hurtful to plants which grow in the quarters.

ESPLANADE, in fortification, the ſloping of the parapet of the covered-way towards the campaign.

ESPLEES, in law, the general products which lands yield, or the profit or commodity that is to be taken or made of a thing.

ESPOUSALS, in law, ſignify a contract or promiſe made between a man and a woman to marry each other; and in caſes where marriages may be conſummated eſpouſals go before. Marriage is termed an eſpouſal *de præſenti.*

The eſpouſals amongſt the Jews were either by writing, or by a piece of ſilver given and received, or by cohabitation. Amongſt the Greeks, after the parents and friends of the young couple had finiſhed their negociation, the couple themſelves pledged their faith to each other, the man ſwearing that he would be conſtant and true, the woman that ſhe would marry him, and make him maſter of all ſhe had. Then they ratified their agreement by a kiſs and joining right hands.

Amongſt the Romans the eſpouſals conſiſted in an engagement of friends on both ſides, whether abſent or preſent, in public or without witneſſes. But the common way was by writings drawn up by common conſent, and ſealed by both parties; beſides this, the man ſent a ring to the woman, conſiſting of iron and without a ſtone.

ESQUILIÆ (anc. geog.), one of the ſeven hills of Rome, which Varro will have to be two, viz. Ciſpius and Oppius; alſo Mons Eſquilinus, ſoftened from Exquilinus; and this again from Excubinus, the watch or guard Romulus kept here, from a jealouſy he entertained of his colleauge Titus Tatius. On the eaſt ſide it reached the city walls; on the ſouth, the Via Lavicana; on the weſt, the wide valley between mount Coelius and the Palatine; on the north, the Mons Viminalis; on the eaſt ſide was the Porta Eſquilina. This hill by ſome of the ancients was called *Suburranus,* from the ſtreet *Suburra* to the north of it: by the poets, *Eſquilius.*

ESQUIMAUX, a people of North America inhabiting all that vaſt tract of land known by the name of *Labrador,* or *New Britain.*—They differ very conſiderably, both in aſpect and behaviour, from the other American nations; agreeing in moſt reſpects with the inhabitants of Weſt Greenland. See *New Britain,* and Greenland.

ESQUIRE (from the French *eſcu,* and the Latin *ſcutum,* in Greek σκυτος, which ſignifies an hide, of which ſhields were anciently made, and afterwards covered; for, in the time of the Anglo-Saxons, the ſhields had a covering of leather), was originally he who, attending a knight in time of war, did carry his ſhield; whence he was called *eſcuier* in French, and *ſcutifer,* or *armiger,* i. e. armour-bearer, in Latin. Hotoman ſays, that thoſe whom the French call *eſquires,* were a military kind of vaſſals, having *jus ſcuti,* viz. liberty to bear a ſhield, and in it the enſigns of their family, in token of their gentility or dignity. But this addition hath not of long time had any relation to the office or employment of the perſon to whom it hath been attributed, as to carrying of arms, &c. but hath been merely a title of dignity, and next in degree to a knight. For thoſe to whom this title is now due, ſee the article Commonalty. Officers of the king's courts, and of the king's houſehold, counſellors at law, juſtices of the peace, are only *eſquires* in reputation; and he who is a juſtice of peace has this title only during the time he is in commiſſion, and no longer, if he is not otherwiſe qualified to bear it. A ſheriff of a county being a ſuperior officer, bears the title of *eſquire* during his life; in reſpect of the great truſt he has in the commonwealth. The chief of ſome ancient families are eſquires by preſcription; and in late acts of parliament for poll-money, many wealthy perſons commonly reputed to be ſuch, were ranked among the eſquires of this kingdom.

There is a general opinion, that every gentleman of landed property who has L.300 a-year, is an eſquire; which is a vulgar error: for no money whatſoever, or landed property, will give a man properly this title, unleſs he comes within one of the above rules: and no perſon can aſcribe this title where it is not due, unleſs he pleaſes; there being no difficulty in drawing the line by the accounts given above and in the article Commonalty: but the meaner ranks of people, who know no better, do often baſely proſtitute this title; and, to the great confuſion of all rank and precedence, every man who makes a decent appearance, far from thinking himſelf any way ridiculed by finding the ſuperſcription of his letters thus decorated, is fully gratified by ſuch an addreſs.

Esquires *of the King,* are ſuch as have that title by creation, wherein there is ſome formality uſed, as the putting about their necks a collar of SS, and beſtowing on them a pair of ſilver ſpurs, &c.

ESRAKITES. See Eschrakites.

ESSAY, a trial or experiment for proving the quality of any thing; or an attempt to learn, whether or not any invention will ſucceed.

Essay, in literature, a peculiar kind of compoſition, the character whereof is to be free, eaſy, and natural;

tural; not tied to ſtrict order or method, nor worked up and finiſhed like a formal ſyſtem.

ESSAYING, or Assaying, in chemiſtry and metallurgy, ſignifies the examination of a ſmall quantity of any ore or mineral by fire, in order to diſcover its contents. This is very neceſſary for thoſe who intend to deal largely in metallurgic operations, in order to avoid unneceſſary expence, by becoming previouſly acquainted with the nature of the ore.

1
Hiſtory of the art.

The firſt attempts in this way were no doubt extremely rude; but ſucceeding trials have advanced it to the form of a ſcience or art practiſed by numbers of people under the title of *eſſay-maſters*. No treatiſe was publiſhed on this ſubject till after the middle of the 16th century; and the firſt book we have upon it is attributed to Lazarus Ercker, which appeared in 1574. Agricola, however, in his ſeventh book *De re Metallica*, publiſhed in 1576, deſcribed both the inſtruments and proceſſes, illuſtrating the whole with plates; and there is inconteſtable evidence that this treatiſe had been preſented to the elector of Saxony in 1567, tho' it did not appear to the world till after the publication of Ercker's book. Since that time, the art has been greatly improved; but the operations in the dry way are not materially different from thoſe deſcribed under Metallurgy. The Blow-pipe likewiſe affords an excellent method of examining ſmall quantities of metal in the dry way; but the greateſt improvement hitherto made in it is that of eſſaying by the moiſt way introduced by Mr Bergman.

2
The moiſt way of eſſaying introduced by Mr Bergman.

3
Requiſites for eſſaying in the dry way.

This celebrated chemiſt obſerves, that in the *Docimaſia Sicca*, or eſſaying in the dry way, three things are requiſite: 1. That the metal contained in the ore be all reduced to a complete form; for ſuch part of it as is deficient in that reſpect cannot be united with the eliquated metal. 2. That the whole be collected into one maſs; for when it is diſperſed in numerous ſmall grains, ſome of them are very eaſily ſcattered, and diminiſh the weight. 3. That the metallic form be preſerved; for the extracted regulus muſt inevitably be diminiſhed more or leſs by calcination. All theſe requiſites are frequently effected conveniently enough in a crucible by fuſion with proper ſtrata of charcoal, provided the ore is free from ſulphur and other volatile mixtures, and is entirely without a matrice, or united to one that can be melted by a moderate degree of heat; but if the matrice be refractory, notwithſtanding the moſt ſubtile pulveriſation, it will cover many of the metallic particles, and thus the reduction and fuſion will be in ſome meaſure prevented. When this happens to be the caſe, we muſt add ſuch other ſubſtances as not only promote fuſion, but make the matter flow ſufficiently thin to allow the reguline particles to fall to the bottom. Theſe ſubſtances, which from the effect they have on the matter are called *fluxes*, are of a ſaline nature, and muſt therefore neceſſarily corrode the metals more or leſs; and hence the ſcoria, which are almoſt always tinged, contain a quantity of calcined metal. But as long as we are deſtitute of a ſure method of meaſuring intenſe degrees of heat, and as long as it is neceſſary to perform the operation in cloſe veſſels to prevent the acceſs of air, the force and proper continuance of the fire will be uncertain (A). Now, by every exceſs or defect in this point ſome part of the regulus is loſt; ſo that any judgment of the goodneſs of the ore, formed from the weight of the regulus, muſt be fallacious, or at leaſt ſomewhat inaccurate.

4
Deficien f the d way of ſaying.

Hence we may underſtand, that experiments upon ores made in the dry way, are liable to many faults and imperfections; to which we may add the following, viz. that a given quantity of ore ſubjected to trial almoſt always exceeds in weight the regulus to be extracted from it. Now, ſince it is impoſſible to avoid a certain loſs both during calcination and fuſion, this loſs will be the more remarkable, as the maſs to be weighed becomes ultimately lighter. The caſe is quite otherwiſe with experiments made in the moiſt way; for here the weighty ſediment, from which the quantity of the contents is judged, is never leſs, but often greater, than that obtained by fire.

5
Metho eſſaying the mo way pr ous to B man's i rovem

In the attempts made to eſſay ores in the humid way previous to thoſe of Mr Bergman, both methods were uſed, the metallic part being extracted by a menſtruum, and afterwards reduced by fire. Our author, however, has now ſhown a method of performing the operation without either calcination or fuſion. "It muſt indeed be confeſſed (ſays he), that experiments in the humid way often require more care and pains than the other; but if accurate concluſions are thereby obtained, we ought not to grudge the ſlowneſs. Beſides, in many caſes this method is more expeditious than the other; and indeed almoſt always, if we content ourſelves with ſuch diſcoveries as can be made by the common calcinations and fuſions: nay, ſometimes the dry method is obviouſly inſufficient, when the metallic content is either very ſmall or volatile; but particularly if it be inflammable, as is the caſe with zinc."

6
Di ecti for eſſa in the m way.

In this method the ores to be examined ſhould be reduced to to a very ſubtile powder by pulverization and calcination. In diſſolving ſuch ores as contain ſulphur, we ought to employ the vitriolic or marine acid; for the nitrous, by long continued heat, deſtroys the ſulphur. Too great heat alſo diſſipates ſome of it in vapours, or melts it into globules containing heterogeneous matters; therefore boiling ought to be avoided where it can be done. All the precipitates muſt be carefully collected, waſhed, and dried. Diſtilled water ought conſtantly to be uſed, and all the menſtrua carefully depurated. Vitriolic acid our author calls *diluted*, when its ſpecific gravity is below 1.3, the nitrous when below 1.2, and the marine when below 1.1. The precipitations ſhould be carefully made in glaſs veſſels; ſo that nothing may remain either through the deficiency of the precipitant, or be rediſſolved through its too great quantity. The clear liquor is to be decanted from the precipitate, water poured on in its place, the veſſel ſhaken, and then ſuffered to ſtand; the water again decanted off, and more poured on in its ſtead, until it will no longer affect certain precipitants by which it muſt be examined. The ſediment is then to be collected on a filter, the latter being previouſly weighed,

---

(A) The newly-invented thermometer of Mr Wedgewood has furniſhed us with a method of meaſuring intenſe degrees of heat; but we have not yet heard how far this has been found uſeful in practice.

weighed, and made of paper not impregnated with alum. It is to be dried at firſt with a gentle heat, but afterwards expoſed for five minutes to a heat of 100°. On cooling, it is to be weighed together with the filter; the known weight of which muſt afterwards be ſubtracted. The ſediment is beſt waſhed in a bottle; for a filter when once impregnated with ſaline matter cannot be freed from it again without great difficulty, eſpecially if an interval of ſome hours intervenes.

7
ka'ies re and logiſtica-, uſed by - Berg- n.

The alkali made uſe of in Mr Bergman's experiments, was that of ſoda ſaturated with aerial acid. His phlogiſticated alkali is made by deflagrating equal weights of pure nitre and cream of tartar intimately mixed together; the reſiduum is the common white flux. Half an ounce of this is diſſolved in half a quadrans of diſtilled water. To this he adds, in a digeſting heat, two ounces of Pruſſian blue, carefully avoiding ſuch an effervescence as may throw any thing over, which eaſily happens if the quantity be too large. The pigment ſoon loſes its beautiful blue colour, growing not red but black; which ſhows that a decompoſition has taken place. The Pruſſian blue uſed in his experiments contained in 100 parts only 23 of the pigment and 77 of the clay; ſo that if we employ the blue made without any alum, 221 grains of it will ſaturate the half ounce of alkaline ſalt more completely than the two ounces of the kind already deſcribed. But in whatever manner the operation is performed, after the addition of the laſt quantity, the whole muſt be expoſed to a ſtronger digeſting heat, and ſtirred with a wooden ſpatula. If the liquor be too much diminiſhed by evaporation, the defect muſt be ſupplied by adding more water. When the liquor becomes clear, the reſiduum muſt be collected upon filtering paper, and gradually waſhed with warm water until all the ſoluble part is extracted; when, if the operation has been properly conducted, the filtered liquor amounts to a whole quadrans, of a browniſh yellow colour, and ſo well ſaturated with colouring matter, that it does not change the colour of paper tinged with Braſil wood. This lixivium, however, contains a ſmall quantity of Pruſſian blue, about 4 lb. to a cwt. of the alkali. Theſe ſhould be previouſly ſeparated by an acid, or, which is better, corrected by ſubtracting from the weight of the ſediment 16 eſſay pounds for each quadrans of the lixivium. When we wiſh to examine the colour of the precipitate exactly, however, the lixivium we employ muſt neceſſarily be well depurated; for by neglecting this precaution we may eaſily perſuade ourſelves that any metal precipitated by the lixivium has a blue colour. When we only wiſh to aſcertain the weight, the lixivium, having the ſmall proportion of Pruſſian blue intermixed, may be employed: but ſtill the proper correction muſt ultimately be made uſe of; for the precipitating acid is wont to impair the qualities of the lixivium, and even to deſtroy them altogether, eſpecially in a warm temperature. Calcareous earth, whether in its mild or cauſtic ſtate, is alſo capable of abſtracting a coloured ſubſtance from iron and other metals.

8
' to p'tate 's by ls.

In the precipitation of metals by metals, it is to be obſerved, that the acid of the ſolution ought to be ſomewhat predominant; but any conſiderable exceſs muſt be corrected occaſionally, either by alkali, water, or ſpirit of wine.

9
Weights uſed in Mr Bergman's experiments.

In the following experiments an eſſay cwt. was always employed, unleſs where it is expreſsly mentioned otherwiſe: concluſions ſufficiently accurate may indeed be obtained from 25 lb. nay ſometimes from ſmaller quantities. In theſe caſes our author mentions the uſual quantity; applying to them thoſe formulæ of calculation which are founded on the mutual proportions of the proximate principles conſtituting metallic ſalts. By an eaſy ſubſtitution, the ſame formulæ may be uſed by thoſe who employ $\frac{1}{4}$ or $\frac{1}{2}$ cwt. We now come to deſcribe the method of eſſaying the ores of the particular metals.

10
How to eſſay the ores of gold.

1. *Ores of Gold.* This metal occurs in the bowels of the earth native, poſſeſſing a complete metallic form, although in general the ſmall particles of it are ſo interſperſed in various matrices, that they are entirely inviſible. It is alſo found mineralized, or united with ſulphur by means of iron or ſome other metal. Theſe two ſpecies of ore we ſhall conſider ſeparately.

11
Native gold.

Native gold is very ſeldom, if ever, free from heterogeneous matters; the moſt uſual mixtures are copper, ſilver, and ſometimes iron. The firſt of theſe remains in the menſtruum, and may be ſeparately collected by diſſolving the gold in aqua-regia, and precipitating it by martial vitriol: the ſecond falls during the ſolution, yielding a ſalited ſilver; which, being waſhed and dried, ſhows the weight of the ſilver contained; and the iron may be diſcovered by phlogiſticated alkali. The precipitate occaſioned by martial vitriol is pure gold in its metallic ſtate, but very ſubtilely divided, and therefore its weight requires no correction.

Hence it appears how ſmall a portion of gold inherent in the ores of other metals may be extracted; beſides, a ſolution containing the moſt minute particle of gold inſtantly produces the purple precipitate of Caſſius, with a ſolution of tin properly prepared.

12
Ores of this metal properly ſo called.

As to the ore which contains gold adhering to and ſurrounded by ſtony particles, 1. We muſt reduce a determined weight to an impalpable powder by triture and elutriation. Then let the powder, weighed a ſecond time, be boiled in aqua regia, as long as any thing is taken up by the menſtruum; after which, let the exhauſted ore, well waſhed, be collected, exſiccated to ignition, and weighed. Let the clear ſolution (the colour of which, in ſome degree, affords a method of judging) be precipitated in the uſual way by martial vitriol; the precipitate well waſhed, dried, and weighed, ſhows the gold, which, added to the weight of the exhauſted ore, ought to be equal to the original weight, unleſs ſomewhat has been diſperſed by the pulveriſation, or unleſs ſome of the matrice has entered the menſtruum. The former of theſe is diſcovered by comparing the weights before and after pulveriſation; the latter by precipitants.

When grains of gold are mixed with looſe earthy particles, they are ſometimes eaſily ſeparated by mechanical application of water.

13
Gold mineralized by ſulphur.

When the metal is mineraliſed by ſulphur, as in the golden pyrites, let one or more eſſay cwts. reduced to powder be gently boiled in the nitrous acid, or rather digeſted in a heat of 50°—80°, leſt the ſulphur ſhould be deſtroyed. It is even neceſſary to employ a more gentle heat for this purpoſe, that the ſulphureous particles, gradually ſeparating, may remain in their natural ſtate; for if they melt, the heterogeneous particles, which ought to have been removed, will be incloſed in the melted maſs. The menſtruum ought to be added in ſeveral portions, about ſix times the quantity of the ore at each turn. The pyrites is acted upon by this menſtruum; an efferveſcence enſues, which continues for ſome time; after which a freſh quantity of the acid is to be added, until the ſulphur is obtained pure and of its proper colour. From 12 to 16 parts of the acid are uſually required to one of the ore. The purity of the ſulphur is eaſily aſcertained by cauſtic alkali.

The matrice, if inſoluble in the menſtruum, remains at bottom, together with the gold; which is diſtinguiſhed by its peculiar colour and ſplendor, and may be ſeparated from the matrice by careful elutriation. The particles of gold aſſume the form of very ſmall grains, yet ſuch as have angular points diſcernible by a good eye; and their appearance gives ſome reaſon for ſuppoſing that they have rather been intimately mixed with the pyrites than diſſolved in it. The clear ſolution, which is generally green, muſt be evaporated, made red hot, and then weighed. Any other metals that happen to be preſent beſides iron, may be extracted by ſuitable menſtrua; as copper by the volatile alkali, manganeſe by dilute nitrous acid, with the addition of a little ſugar: zinc is ſcarce ever met with in gold pyrites; but if it ſhould happen to exiſt, may be extracted by any menſtruum; and ſilver by pure nitrous acid. Calcareous earth, when it happens to form the matrice, unites with nitrous acid, and clay with that of vitriol. The ſum of the weights of all the ingredients ought to be equal to the original weight of the ore; and unleſs any loſs has been ſuſtained during the operation, any deficiency may be attributed to the conſumption of the ſulphur.

14 Of platina.

2. *Ores of Platina.* The only metal with which platina is known to be alloyed is iron. This may be ſeparated in a great meaſure by boiling the grains of platina, reduced to as fine a powder as poſſible, in marine acid, by which the original weight of the grains is generally reduced by about 0.05 of the whole. The depurated platina, diſſolved in aqua-regia, eaſily diſcovers itſelf by precipitation with martial vitriol, if any gold be preſent: and, on the other hand, if platina contains a ſmall quantity of gold, the latter may be diſcovered by any neutral ſalt containing vegetable or volatile alkali.

15 Of ſilver,

3. *Ores of Silver.* This metal, when found in its native ſtate, is generally alloyed with gold or copper, or both. The ſilver and copper will be taken up by nitrous acid, leaving the gold at bottom in the form of a black powder, which may be made to aſſume a more metallic apppearance by ſolution in aqua-regia and precipitation by martial vitriol. The copper remaining in the ſolution may then be collected by means of iron or aerated alkali.

16 Mineralized by various ſubſtances.

Silver united with ſulphur alone (the glaſſy ore of ſilver) is of a black colour. To diſcover the contents of this ore, let it be divided and powdered as much as poſſible, and then gently boiled for an hour in 25 cwt. of diluted nitrous acid: then after decantingthe liquor, the operation is to be repeated with an equal quantity of the menſtruum; and even a third time, unleſs the pure ſulphur be now ſeparated. The laſt particles of the ſilver adhere obſtinately to the ſulphur. If any gold be preſent, it remains undiſſolved at the bottom of the veſſel. The decanted liquors being collected, are to be deprived of the ſilver by adding common ſalt; then if we ſuppoſe the precipitate when collected, waſhed, and dried, to be $=a$, the ſilver required will be $\frac{100a}{129}$. The weight of the ſulphur added to the above ought to be 100 lb. if the operation has been rightly performed, and no decompoſition of the ſulphur taken place. The clear liquor, which paſſes in filtering the luna cornea, eaſily diſcovers any other metal which may originally have been mixed with the ſilver; after which, the earth may be precipitated by means of a common fixed alkali.

It is difficult to ſeparate the remains of the matrice from the ſulphureous particles. To effect this, however, let the ſum of the weights be firſt obſerved; then pour on cauſtic lixivium, which will diſſolve the ſulphur by a gentle digeſting heat; the matrice then remains alone, and by its weight we can determine that of the ſulphur; but we muſt not continue the digeſtion longer than is neceſſary to diſſolve the ſulphur, leſt ſome of the ſiliceous earth ſhould alſo be taken up, tho' Mr Bergman thinks there is no great reaſon to apprehend any inconvenience of this kind.

17 Red ſilv ore.

The red ore of ſilver may be examined by reducing it to a very ſubtile powder, and boiling it twice gently in diluted nitrous acid. A part of the menſtruum being decanted off, waſh the reſiduum well, then precipitate the ſilver by means of ſea-ſalt; boil the above-mentioned white powder quickly in aqua-regia until the arſenic be diſſolved and the ſulphur appear pure. The yellow ſolution, cautiouſly decanted, lets fall a very white powder on the addition of a proper quantity; and the ſmall quantity taken up by the water may be obtained by evaporating to dryneſs. The ſulphur ſeparated in this manner, though it ſeems pure, yet contains ſome ſilver which the nitrous acid could not diſſolve on account of the arſenic contained in the ore; but when this is taken away by the aqua-regia, the remaining parts of the ſilver adhere to the marine acid entangled among the ſulphureous particles. This luna cornea may be freed from the ſulphur by cauſtic volatile alkali diluted with water, and kept in a well-cloſed veſſel for ſome days. A weight of alkaline liquor equal to that of the ſulphur is ſufficient. By weighing the ſulphur both before and after the operation, we know the weight of it as well as the luna cornea. Iron may be diſcovered by means of the phlogiſticated alkali.

18 White o

The white ore of ſilver, conſiſting of the metal united with ſulphur, arſenic, and copper, is eſſayed in the following manner. Let 1 cwt. of the ore, reduced to powder, be gently boiled for an hour in a little more than 12 times its weight of diluted nitrous acid. The dry powder becomes black, foul, and ſends forth the ſmell of hepar ſulphuris. Part of it is diſſolved, and a white reſiduum remains at length at the bottom. The liquor cleared by ſubſiding or filtration, contains the ſilver and copper; the former cannot be precipitated alone by ſea-ſalt, becauſe the marine acid attracts the copper more ſtrongly. A white precipitate indeed, conſiſting of ſmall needle-like cryſtals, is thrown down; but it is found on examination to conſiſt of a peculiar combination of marine acid, ſilver, and copper. The ſilver therefore muſt be precipitated by a determined weight of copper, and the latter may be afterwards ſeparated by iron or mild fixed alkali; but from the ultimate weight we muſt ſubtract that of ſuch part of the precipitant as has entered the menſtruum. The white menſtruum muſt next be boiled in marine acid, and precipitated by water; by which means we obtain the arſenic, along with a ſmall quantity of marine acid which it retains obſtinately. After the ſeparation of the arſenic, it remains only to prove the purity of the ſulphur by volatile alkali, in order to determine whether it ſtill contains any luna cornea, or copper.

19 ineralized by ſul-ur.

Silver mineralized by ſulphur ſometimes contains antimony alſo; and this ore often appears in the form of capillary threads of an hoary brown colour. To analiſe this, let it be gently boiled, or rather digeſted, for an hour, in ſix times its weight of diluted nitrous acid, until the ſilver is thoroughly diſſolved, and all the antimony reduced to a white calx; which, after decanting the liquor, may be ſeparated from the ſulphur by marine acid, and precipitated by water. The ſolution of ſilver may be precipitated by ſea-ſalt, and 1 cwt. ſeldom contains more than four ounces. Sometimes there is preſent in this kind of ore a little copper and iron beſides the ſulphur and antimony; in which caſe we may conduct the experiment in the ſame manner, only with the addition of a double portion of acid. All the metals are eaſily obtained by precipitating the ſilver by copper, and the iron by zinc or an alkaline ſalt.

20 rneous ver ore.

The corneous ſilver ore, in which the metal is mineralized by the marine and vitriolic acids, has two remarkable varieties; one of which may be cut, and is ſomewhat malleable; the other brittle, and containing ſome ſulphur beſides the acid. An hundred parts of the former, reduced to a fine powder, is to be digeſted for one day in marine acid, ſhaking the mixture from time to time. The liquor is then to be decanted clear, and the reſiduum, previouſly well waſhed in water, added to the liquor. A ſolution of terra ponderoſa is to be gradually dropped into the liquor, until it ceaſes to occaſion any precipitation. Suppoſe the weight of the precipitate, waſhed and dried, $=a$: now vitriolated terra ponderoſa, whoſe weight is $a$, contains of acid $0.15a$, which correſponds with vitriolated ſilver $0.48\,a$; for from 100 lb. of vitriol of ſilver, 68.75 of metal is obtained by reduction. But as all the ſilver is not precipitated from nitrous acid by mineral alkali combined with vitriolic acid, the luna cornea will therefore be $100-0.48a$. In the former ſalt, the ſilver contained is expreſſed by $0.33\,a$; in the latter, by $75.19-0.36\,a$; and therefore the ſum required for the 100 will be $75.19-0.03\,a$. The brittle corneous ore likewiſe contains ſulphur; but the ſaline part may be extracted by volatile alkali, and the quantity of metal afterwards aſcertained by the method already deſcribed. Or this compound may be reduced in the following manner: Let the maſs be mixed with an equal bulk of alkaline ſalt in a glaſs mortar, and be formed into a globule by means of a few drops of water: let this globule be put into a crucible, the bottom of which has been previouſly ſtrewed with ſal ſodæ, compreſſed, and covered with the ſame alkali. On applying a melting heat, the whole of the metal will then be reduced if the luna cornea has been properly collected.

21 Native mercury.

4. *Ores of Mercury.* Native quickſilver is ſeldom mixed with any other metals than gold, ſilver, and biſmuth. The firſt remains at the bottom on diſſolving the fluid maſs in nitrous acid; the ſecond is diſcovered by ſea-ſalt, which at the ſame time precipitates the mercury combined with ſea-ſalt; and the third, though it is taken up by the ſpirit of nitre, is yet precipitated by the mere affuſion of water.

22 Cinnabar.

The combination of quickſilver with ſulphur (native cinnabar) cannot be decompoſed either by vitriolic, nitrous, or marine acid. Our author has even attempted in vain to diſunite them by boiling for many hours in a ſolution of cauſtic fixed alkali in water. There are, however, he tells us, two ways of effecting a perfect decompoſition; one by gently boiling for an hour the cinnabar with eight times its weight of an aqua regia, one fourth of which is marine acid; the other by boiling it in marine acid, with the addition of one tenth of the weight of the cinnabar of the black calx of manganeſe; but the former method is preferable, as no heterogeneous matter is thus added to the mercury. The menſtruum is the ſame in both, *viz.* the dephlogiſticated marine acid; the only difference is, that in the former method it is dephlogiſticated by the nitrous acid, and in the latter by the manganeſe. In whatever manner, however, the ſulphur be ſeparated, it may be collected by a filter, and the mercury precipitated by zinc: copper precipitates mercury from the marine acid in a more imperfect manner.—If the ore under examination be very much entangled in the matrice, it muſt be mechanically freed from it by lotion; after which the ſoluble parts of the matrice being taken up by the nitrous, marine, or vitriolic acid, the metal itſelf is ſeparated by aqua-regia.

23 Mercury mineralized by vitriolic acid.

When mercury is mineralized by the vitriolic acid, it may be ſeparated by the help of the marine acid by trituration or digeſtion, and the metal precipitated by terra ponderoſa diſſolved in nitrous acid; after which the weight of the new earthy ſalt $a$ being given, we can eaſily learn the quantity of metal contained; yet, as ſolution of mercury in nitrous acid is not totally precipitated by Glauber's ſalt, we muſt not here depend on the weight of the precipitate. By another proceſs, therefore, our author obtained from 100 lb. of vitriol of mercury 33.899 of pure metal, and from an equal weight of corroſive ſublimate 75.5; from whence a calculation is eaſily deduced in the following manner. Let the quantity of vitriolic acid be $=0.15\,a$; the vitriol of mercury containing this, $=0.44a$; and the combination of mercury with marine acid, $=100-0.44\,a$. In the former ſalt the mercury conſtitutes $0.29\,a$, and in the latter $72.5=32\,a$; ſo that the whole metallic content in 100 lb. is $72.5-.03\,a$. The ſcarcity of this ore, however, renders it ſtill uncertain whether this combination of mercury with marine acid approaches to the nature of corroſive ſublimate or mercurius dulcis. In the latter caſe the calculation comes out different; for mercurius dulcis contains above 0.91 of metal, and the whole content is expreſſed by $91.18\,a+0.29a-0.40a=91.18-0.11a$.

*N. B.* The weights on which all theſe calculations are founded, may be found in Bergman's table of precipitates under the article Chemistry.

24 Lead,

5. *Ores of Lead.* This metal, if ever found native, may be eaſily examined as to its purity by means of nitrous acid, which diſcovers copper both by its blue colour and precipitation by iron; and ſilver is diſcovered by the addition of copper.

25 Mineralized by ſulphur;

When lead is mixed with ſulphur, and freed from any matrice, it is to be reduced to a fine powder, and then boiled in nitrous or marine acid until the ſulphur is obtained pure, which may be aſcertained by the cauſtic fixed alkali. The ſolution is then to be precipitated by mild mineral alkali, when the lead is either alone or mixed with ſilver. In the former caſe, if $a$ be the weight of the precipitate, that of the lead will be $\frac{100a}{32.}$ In the latter, the ſilver is to be extracted by volatile alkali, and the reſiduum multiplied by $\frac{100a}{132}$ will give the weight of the lead. The aerated ſilver is known by the diminution of weight; and if this be called $b$, then the ſilver in a metallic ſtate will be $\frac{100b}{129}$.

During this operation the ſolution in marine acid depoſits a large quantity of plumbum corneum, which is to be diſſolved in water before the precipitation. If antimony happens to be preſent, it is ſo much dephlogiſticated by the concentrated nitrous acid, that it is calcined and falls to the bottom: the given weight of this multiplied by $\frac{100}{138}$ ſhows the quantity of regulus diſſolved in marine acid, which falls ſpontaneouſly upon being dropped into water, and the plumbum corneum is taken up in its place.

Iron is ſeldom found in galena; however, in caſe it ſhould happen to exiſt, its preſence may be diſcovered in the following manner. Let the ſolution in marine acid be firſt ſo far ſaturated with fixed alkali, that the acid may predominate only a little, and yet all precipitation be carefully avoided. The lead will then be precipitated by a poliſhed plate of iron added during boiling; as will alſo the ſilver, which almoſt always exiſts in lead. The iron is then to be precipitated by aerated or phlogiſticated alkali, and its weight corrected by the part of the metallic plate which is diſſolved during precipitation.—When the ore contains any matrice, this is either ſoluble, and may at firſt be ſeparated by vinegar; or elſe is inſoluble in common acids, and is found collected at the bottom.

26 By fixed air;

When this metal is mineralized by fixed air, and deprived of all heterogeneous ſoluble mixtures, it may be diſſolved in nitrous acid, and precipitated by aerated mineral alkali; which being done, the quantity of lead is known by the weight of the precipitate as before. But if the matrice be ſoluble, we muſt employ the marine acid, and precipitate the metal by iron, as already directed.

27 By acid of phoſporus.

Lead has lately been found mineralized by acid of phoſphorus. An hundred pounds of this in powder is diſſolved in nitrous acid by means of heat, excepting a few martial particles which commonly remain at the bottom. On adding the vitriolic acid, the diſſolved lead falls in the form of a ſnow-white precipitate; which, when waſhed, collected, and dried, we may ſuppoſe to weigh $a$; in which caſe the correſponding lead $=\frac{100a}{143}$. The liquor remaining after precipitation yields, on being evaporated, a phoſphoric acid.

28 Copper,

6. *Ores of Copper.* This metal, when native, readily diſſolves in nitrous acid. Gold, when mixed with it, falls untouched to the bottom in form of a black powder. Silver is ſoon precipitated by copper; and iron, by boiling the ſolution for ſome time, and inſpiſſating to dryneſs, is gradually calcined and falls to the bottom.

29 Minera zed by ſ phur.

Copper mineralized by ſulphur is to be powdered, and gently boiled to dryneſs in five times its weight of concentrated vitriolic acid. The reſiduum muſt then be well waſhed with water, until all the metallic part has entered the menſtruum. The quantity of water uſed for the ſolution ought to be in ſome degree proportioned to the goodneſs of the ore; that which contains 0.05 of copper requires about 0.08 of water, and ſo on. A poliſhed plate of iron, about twice the weight of the copper, is then to be immerſed in the ſolution properly diluted, and the boiling continued until all precipitation ceaſes. If the quantity of water be too ſmall, the precipitated metal adheres very obſtinately to the ſurface of the iron plate; which, however, may always be freed by making uſe of a proper quantity of liquid. The precipitated copper, after being well waſhed, is to be ſpeedily dried; "but yet (ſays our author) with ſuch a degree of heat as to make the ſurface of the metal of different colours, which inſtantly and ſenſibly increaſes the weight."

30 To ſepa iron fro precipit ted cop.

Sometimes the precipitated copper is found mixed with iron, eſpecially in a poor ore; in which caſe the precipitate muſt be rediſſolved in order to obtain a richer ſolution; and this depoſits pure copper, if the operation has been properly conducted. A ſimilar circumſtance alſo takes place in the precipitation of ſilver by copper; a rich ſolution yielding the metal pure, but a poor one affording it mixed with copper. When the precipitated copper is alloyed with other metals, they may eaſily be ſeparated by ſolution in the nitrous acid. Gold, as has already been obſerved, remains at the bottom in form of a black powder, and ſilver is precipitated on a copper plate.

During this proceſs almoſt all the ſulphur is diſſipated by the intenſe heat neceſſary for evaporating the vitriolic acid to dryneſs: however, we may judge of its quantity from the ſum of the weights of the other ingredients, compared with that of the whole; or a ſolution in aqua-regia may be made on purpoſe for collecting the ſulphur.

31 Malach

The beautiful green ores of copper called *malachites*, in which the metal is mineralized by fixed air, are totally ſoluble in acids, and may be precipated by iron or aerated fixed alkali. In the latter caſe, ſuppoſing the weight of the precipitate to be $a$, that of the copper will be $\frac{100a}{194}$. Calcareous earth, when any happens to be preſent, may be thrown down by aerated alkali, and the metal precipitated by phlogiſticated alkali.—Blue calciform copper, in which the metal is alſo mineralized by aerial acid, is to be analyſed in the ſame way. Calciform red copper is alſo totally or in great part diſſolved with effervеſcence, though ſomewhat weaker than the other.

32 d quartz ords no pper by rgman's peri- nts.

Mr Bergman has examined by many different ways the red quartz of Mr Cronſtedt, ſuppoſed to contain a red calx of copper. None of this metal, however, was extracted either by volatile alkali, or boiling the vitriolic acid to dryneſs upon it. As the ſiliceous matrices, however, cannot eaſily be diſſolved by the common menſtrua, a quantity of mineral fluor was added to the vitriolic acid. The fluor acid has the property of diſſolving the particles of quartz, and ſetting at liberty thoſe of copper which might be entangled among them: but though this experiment always ſucceeds when copper is preſent, yet in this ſubſtance not the ſmalleſt ſign of metal could be diſcovered, and therefore it is probable that Mr Cronſtedt was miſtaken.

33

7. *Ores of Iron.* Though ſome traces of this metal are found almoſt every where in the mineral kingdom; yet the ores which contain it in conſiderable quantity, have it either mineralized by ſulphur or more or leſs calcined. Ores of iron are frequently found in Sweden ſo perfect that they obey the magnet, or are themſelves magnetic. Theſe attractive and magnetic ores, though they do not contain much ſulphur, are yet ſeldom entirely without it, though more can be extracted by menſtrua. Thoſe ſaturated with ſulphur are called *ſulphureous pyrites*, nothing but ſulphur being extracted from them; for though they ſometimes contain the metal in ſufficient quantity to pay the expence of ſmelting, it is always brittle and untractable in the fire, and is eaſily corroded by ruſt on expoſure to the open air.

All the ores of iron, when reduced to a very ſubtile powder, and repeatedly boiled in marine acid, part with their metal; the ſolution of the pyrites is accelerated by the addition of a ſmall quantity of nitrous acid. In order to obtain the metal by itſelf, we muſt precipitate it by phlogiſticated alkali; when, if we ſuppoſe the weight of the precipitate to be *a*, the correſponding quantity of metal will be $\frac{a}{6}$; but this muſt be corrected according to the quantity of the precipitant. That ore which is naturally ſoluble by vitriolic acid requires nothing but water to precipitate by means of phlogiſticated alkali.

34 anganeſe.

Manganeſe, which is frequently mixed with iron, may eaſily be diſcovered by immerſing the blue ſediment (carefully weighed) in water ſharpened by nitrous acid; by which means the part ariſing from the manganeſe is diſſolved. Other metals ſometimes enter the ore of iron in larger quantities; which for the moſt part render the former uſeleſs, by imparting bad qualities to the ſmelted iron.

35 native

8. *Ores of Tin.* The examination of native tin by the humid method is attended with no difficulty: for the addition of nitrous acid quickly deprives it ſo far of its phlogiſton, that it is reduced to the form of a white calx; the iron and copper, if any be preſent, remaining in the liquor. An hundred parts of tin corroded by nitrous acid, waſhed and dried, yielded 140 of calx. Arſenic may be ſeparated by waſhing with large quantities of warm water; for little enters the acid menſtruum. The other metals are but rarely united with native tin.

36 ure ore.

The pure ore, is commonly called, according to the magnitude of its cryſtals, *zinngrauſſen* or *zwitter*, by the Germans. Theſe forms cannot be examined in the moiſt way without great difficulty, as they are not acted upon effectually either by vitriolic, nitrous, or marine acid, or even by aqua-regia. The reaſon of this inſolubility is, that the calx, being well dephlogiſticated, is either not taken up at all, or in very ſmall quantity; and beſides, being involved in ſtrong particles, the menſtrua can ſcarce have acceſs to it. The following method is recommended by our author as one by which this proceſs may be nearly effected.

37 Chryſtalline ores of tin.

"To a very ſubtile powder of the cryſtalline tin ore obtained not only by levigation but elutriation, let there be added a quantity of concentrated vitriolic acid, and let this be expoſed to a ſtrong digeſting heat for ſeveral hours: then pour on a ſmall portion of concentrated marine acid; and upon agitating it, a vehement efferveſcence immediately begins, with a conſiderable heat ariſing from the marine acid, which is partly deprived of its water by the vitriolic, and generates a marine acid air. By this method the forces of the two are conjoined: water is to be added in about an hour after, and the clear liquor decanted after the ſediment has fallen. This operation is to be repeated with the reſiduum until the acids can diſſolve no more. What remains finally undiſſolved is nothing more than the ſtony matrice. Let the ſolution precipitated by means of aerated alkali $= a$, and the quantity of regulus will be $\frac{100a}{131}$. The ſubtile atoms of the cryſtalline ore, intimately mixed with any matrice, may, after due pulveriſation, be ſeparated by waſhing from a given portion, as the cryſtals are nearly of ſix times the ſpecific gravity of water; ſo that they not only exceed the gravity of the earthy particles, but that of the ores of other metals, and approach even to the lighter metals themſelves. The cryſtalline particles, after being ſeparated, are expoſed to the trial above deſcribed. The larger diſtinct cryſtals can ſeldom be employed; the moſt common ore contains particles of them very much diſperſed."

The adventitious metals uſually found in tin are copper and iron.

38 Biſmuth.

9. *Ores of Biſmuth.* This ſemimetal, when native, is eaſily taken up by nitrous acid, and may then be precipitated by water; after which any other metals that happen to be mixed with the biſmuth remain in the liquor, and may be ſeparated by the methods already frequently deſcribed. When mineralized by ſulphur, the ore is decompoſed by ſlight boiling in the ſame menſtrum; ſo that the ſulphur may be at laſt obtained; which when waſhed and collected is to be examined as to its purity and quantity. The ſolution of the metallic part precipitated by water leaves a white calx; and ſuppoſing its weight $= a$, that of the correſponding metal will be $\frac{100a}{113}$.

Iron is ſometimes met with in theſe ores, which may eaſily be diſcovered after the ſeparation of the biſmuth.

39 Mineralized.

Biſmuth in form of a calx, whether alone or mineralized by aerial acid, is alſo ſoluble in nitrous acid, and may be precipitated by water, upon which the heterogeneous matters remain in the liquor. The preſence of cobalt is diſcoverable by its communicating a red colour.

40 Nickel, 10. *Ores of Nickel.* This ſubſtance, when found native, may be diſſolved by the nitrous acid; and when precipitated by aerated alkali, yields a calx which almoſt always contains iron, arſenic, and cobalt, in the ſame proportions in which they uſually accompany the regulus obtained in the common way. If ſilver and biſmuth happen to be preſent, which, however, is very ſeldom the caſe, the former is be precipitated by common ſalt before the latter is employed. Sulphur may be ſeparated and collected during ſolution.

41 Mineralized. Nickel, mineralized by vitriolic acid, is ſcarcely ever without iron. A great part of the latter, however, is ſeparated by long and violent boiling in water. Aerated alkali throws down a greeniſh white precipitate; and if we ſuppoſe the weight of this $= a$, that of the reguline nickel is $= \frac{100a}{135}$. The ſame metal mineralized by aerial acid is diſſolved by ſpirit of nitre, and may be precipitated by means of mild alkali.

42 Arſenic, 11. *Ores of Arſenic.* The purity of native arſenic may be examined by diſſolving it in four times its weight of aqua-regia, and the ſolution ſlowly evaporated without any ſeparation of the metal. The arſenic is then to be precipitated by water, and collected upon a ſilter; the heterogeneous metals will be contained in the clear liquor which paſſes through the ſilter. If any ſilver be preſent, it falls to the bottom in conjunction with the marine acid. Iron is hardly ever abſent altogether, and is frequently in ſuch quantity, that the maſs has a poliſhed appearance, moſt commonly cryſtalline, and is commoly known by the name of *miſpickel*.

43 Mineralized by ſulphur. Arſenic mineralized by ſulphur is to be diſſolved in marine acid, with the addition of the nitrous occaſionally, in greater or leſſer quantities, ſo that the ſulphur may be ſeparated free from all metallic matter. The ſulphur collected, waſhed, and weighed, indicates the quantity of the arſenical part. This, however, ought to be precipitated ſeparately by water, and weighed; a ſtep which is always neceſſary where great accuracy is required. Arſenic diſſolved by marine acid may alſo be precipitated in its metallic form by zinc; the ſolution being previouſly weakened by ſpirit of wine. When ſulphur alone is united to the arſenic by its different proportions, it produces different colours, from a dilute yellow to an intenſe red. But if a conſiderable portion of iron alſo enters the compoſition, a white colour is generated, and a very different ſpecies of pyrites formed, which is called the *arſenical pyrites*. This may be analyzed by ſolution in marine acid in the manner already deſcribed.

44 Too much acid of nitre muſt not be uſed. In analyzing arſenical ores in general, we muſt take care not to add too much nitrous acid, as we would thus take away the whole of the phlogiſton, and diſengage the arſenical acid. The ſmalleſt quantity ſufficient for ſolution ought therefore to be employed; otherwiſe water will occaſion no precipitation: and even with all our caution, it is ſcarce poſſible to prevent a ſmall portion of the arſenical acid from being diſengaged, eſpecially if the boiling be long continued. This may be recovered by evaporating to dryneſs, though rarely alone, but united either with the alkaline earths or the metals which are preſent. Some of the arſenic eaſily flies off.

45 Cobalt, 12. *Ores of Cobalt.* This ſemimetal, when native, almoſt always contains iron, arſenic, and frequently nickel; whence no doubt it is, that ſome authors have ſaid that vitriolated cobalt is of a green colour, as well as the other ſalts containing this ſemimetal; but the truth is, that they are of an obſcure red, unleſs the nickel be in large quantity. To ſeparate theſe metals from one another, diſſolve the compound maſs in water, evaporate to dryneſs, and extract the cobalt with vinegar. Let the weight of the precipitate be *a*, and that of the correſponding regulus will be $\frac{100a}{160}$. If the arſenic be abundant in the evaporated ſolution, it may perhaps be precipitated by the effuſion of water. Cobalt united with ſulphur may be treated in the ſame way, as it differs from the native cobalt only in containing a ſmall quantity of ſulphur, which is to be ſeparated and collected.

46 Mineral zed by v triolic ac Cobalt has been diſcovered by Mr Brandt in a ſtate of union with vitriolic acid, along with a large quantity of iron, and without any arſenic. This may be examined by ſolution in aqua regia. The ſolution is yellow, with ſcarce any redneſs, on account of the great quantity of iron. By boiling it aſſumes an obſcure green, and reſumes its former colour; a property by which the exiſtence of cobalt is always known. The ore does not appear to contain any ſulphur; but a few drops of ſolution of terra ponderoſa diſſolved in marine acid immediately diſcovered the vitriolic acid. Scarce any veſtige of arſenic was to be met with. The vitriolic acid, however, though preſent in ſuch abundance, was yet ſo far dephlogiſticated, that it could not unite with the ſemimetal into a vitriolated cobalt, and therefore muſt be conſidered only as an impurity.

47 Trichite an ore o cobalt. The trichetes of the Greeks, which is found in the mines of Herngrund and Idua, adhering to an argillaceous ſtone, is found to contain a real cobalt, beſides the clay and vitriolic acid. It can only be precipitated by the phlogiſticated alkali.

48 A·ſenica cobalt. Cobalt frequently exhibits beautiful red efflorеſcences, ſometimes more dilute, and ſometimes of a deeper colour. Sometimes it appears like a looſe powder, ſometimes concrete, and at times forming moſt beautiful cryſtals radiating from a centre like a ſtar. Theſe ſubſtances always ſhow ſome veſtiges of arſenic; but as this ſubſtance is incapable, either in its reguline or calcined ſtate, of imparting a red colour to arſenic, it is reaſonable to ſuppoſe that it is done by the arſenical acid itſelf, as all acids have the property of communicating a red colour to cobalt. To determine this point, Mr Bergman made the following experiments. 1. Having artificially combined the acid of arſenic with cobalt, he found an exact reſemblance betwixt this compound and the natural cryſtals above mentioned. 2. On account of the ſcarcity of the latter ſubſtance, he extracted the pure acid of arſenic, firſt ſeparating it by vitriolic acid, and then abſorbing the latter by highly rectified ſpirit of wine, which takes up only the ſuperfluous acid, leaving the vitriolated cobalt untouched. Natural arſenicated cobalt is ſcarcely ſoluble in water, unleſs the latter be ſharpened by an acid; and when thus diſſolved it ſhould be precipitated by mild alkali, to diſcover the quantity of ſemimetal. Cobalt artificially combined with arſenical acid, and dried, ſhows the ſame properties with the natural.

The black calx of cobalt is generally found concreted

ted into an hard maſs, known by the name of the *glaſſy ore of cobalt*. This, when pulveriſed, may be diſſolved in the marine acid or aqua-regia, and examined like the former.

49 y ore balt.

50 13. *Ores of Zinc.* If ever this ſemimetal occurs in a native ſtate, its purity may be eaſily determined, as it is readily ſoluble in all the acids; and whatever heterogeneous metal is preſent may be precipitated by zinc.

51 e·ali- y ful and The pſeudo-galena which contains zinc mineralized by ſulphur, together with iron, muſt be carefully treated with nitrous acid, in order to extract the metallic part without decompoſing the ſulphur. If no other metal than iron be preſent, it may be precipitated by zinc; but if others alſo are combined with it, the iron muſt be calcined, by repeatedly abſtracting nitrous acid to dryneſs, and a new ſolution, made by vinegar or any other acid, examined.

52 te vi- l ana- l. To analyſe the combination of vitriolic acid and zinc, diſſolve the ſalt in water, and precipitate the ſolution with mild fixed alkali; when, if the weight of the precipitate be $a$, that of the regulus will be $\frac{100a}{193}$. When iron is preſent, as is uſually the caſe, it ought to be precipitated by a known weight of zinc.

53 c mine- ed by l air. This ſemimetal, mineralized by aerial acid, ought to be diſſolved in ſome of the mineral acids, and then precipitated by phlogiſticated alkali or mild fixed alkali. When the former is employed, the weight of the ſediment muſt be divided by 5, in order to aſcertain that of the metallic part.

54 imony, 14. *Ores of Antimony.* The purity of this ſemimetal, when found native, may be examined by reducing it to a calx with ſtrong nitrous acid: in which caſe, if it has been entirely pure, there will remain only a ſmall part diſſolved in the water, and which will ſeparate on the addition of water. When mineralized by ſulphur, the metallic part is taken up by aqua-regia, and the ſulphur remains pure. The ſolution, by boiling with ſtrong nitrous acid, lets fall a calcined antimony; which being ſeparated, the remaining liquor may be examined by phlogiſticated alkali or otherwiſe at pleaſure.

55 nbined 1 arſe- By the addition of a certain quantity of arſenic, crude antimony grows red, frequently exhibiting beautiful faſciculi of filaments radiating from a centre. The preſence of arſenic may be diſcovered by gently boiling the powder in aqua-regia, until the ſulphur be obtained pure. The arſenic and antimony are contained in the clear ſolution, and may be ſeparated in the following manner. Let concentrated nitrous acid be poured on, and the antimony reduced to a white calx by boiling. Let this be collected on a filter; and the liquor that paſſes through affords arſenic by evaporation, but generally deprived of phlogiſton, or reduced to the ſtate of arſenical acid. As the cauſtic alkali alſo takes up both ſulphur and antimony, it may be advantageouſly employed, eſpecially for the ſeparation of ſilver, or other metals which do not yield to this menſtruum. A hepar ſulphuris is indeed produced; but in this caſe it diſſolves little or nothing.

56 nganeſe 15. *Ores of Manganeſe.* This ſemimetal accompanies moſt of the ores of iron, though it has likewiſe ores of its own in which it predominates, but ſeldom to be met with. It has never been found native or mineralized by ſulphur, but commonly occurs in the form of a calx, generally alone and black, though ſometimes mineralized by the aerial acid. Theſe ores, after being reduced to a ſubtile powder, muſt be immerſed in any acid, particularly one of the mineral kind, together with a ſmall piece of ſugar, in order to ſupply the phlogiſton neceſſary for diſſolving the manganeſe. Freſh acid is to be poured repeatedly on the calx with ſugar, until no more can be extracted by a digeſting heat; after which the ſolution is to be precipitated by mild alkali: and if we ſuppoſe the weight of the ſediment $=a$, that of the correſponding regulus will be $\frac{100a}{180}$. The inſoluble reſiduum at bottom either contains heterogeneous mixtures or belongs to the matrice.

57 Combined with aerial acid. To ſeparate the iron from calx of manganeſe combined with aerial acid, nitrous acid is to be repeatedly abſtracted from the ore, and the heat, after each addition, increaſed to ignition; after which the manganeſe will be obtained pure, or at leaſt contaminated with iron in a much ſmaller degree than before. It may then be ſeparated by ſtrong concentrated vinegar or diluted nitrous acid. Manganeſe, when precipitated from ſuperabundant nitrous acid by phlogiſticated alkali, totally diſſolves in diſtilled water; which property affords likewiſe a method of ſeparating it perfectly from iron.

58 Method of eſſaying ſilver and gold. Beſides the foregoing kind of operations which relate only to the ores of metals, *eſſaying* is uſed in metallurgic operations to ſignify the method of determining how much gold or ſilver is contained in any maſs of metal already ſmelted from its ore.

1. *Eſſay of the Value of Silver*, to examine its purity, or the quantity of alloy mixed with it. The common method of examining the purity of ſilver, is by mixing it with a quantity of lead proportionable to the quantity of imperfect metals with which it is ſuppoſed to be alloyed; by teſting this mixture; and afterwards by weighing the remaining button of ſilver. The loſs of weight which the ſilver ſuffers by cupellation ſhows the quantity of imperfect metals which it contained.

We may hence perceive, that the eſſay of ſilver is nothing elſe than the refining of it by cupellation. The only difference between theſe two operations is, That when ſilver is teſted merely for the purpoſe of refining it, its value is generally known; and it is therefore mixed with the due proportion of lead, and teſted, without any neceſſity of attending to the loſs of weight it ſuſtains during the operation: whereas, in the eſſay, all poſſible methods ought to be employed to aſcertain preciſely this loſs of weight. The firſt of theſe operations, or the mere refining of ſilver, is made in the great, in the ſmelting of ſilver ores, and in mints for making money *. The ſecond operation is never made but in ſmall; becauſe the expences of ſmall operations are leſs than of great, and in the requiſite accuracy is more eaſily attended to. The laſt operation is our preſent object, and is to be performed in the following manner.

* See *Refining.*

We ſuppoſe, firſt, that the maſs or ingot of ſilver of which an eſſay is to be made, conſiſts of 12 parts perfectly equal; and theſe 12 parts are called *pennyweights*. Thus, if the ingot of ſilver be an ounce weight, each of theſe 12 parts will be $\frac{1}{12}$ of an ounce; or if it be a mark, each of theſe will be $\frac{1}{12}$ of a mark,

*Chem. Dict.*

mark, &c. Hence, if the maſs of ſilver be free from all alloy, it is called *ſilver of* 12 *penny-weights*; if it contains $\frac{1}{12}$ of its weight of alloy, it is called *ſilver of* 11 *penny-weights*; if $\frac{2}{12}$ of its weight be alloy, it is colled *ſilver of* 10 *penny-weights*; and theſe 10 penny-weights or parts of pure ſilver are called *fine penny-weights*.

We ought to obſerve here concerning theſe penny-weights, that eſſayers give alſo the name *penny-weight* to a weight equal to 24 real grains: which latter real penny-weight muſt not be confounded with the former, which is only ideal and proportional; and ſuch a confuſion is the more likely to take place, as this ideal penny-weight is alſo, like the former, divided into 24 ideal grains, which are called *fine grains*.

An ingot of fine ſilver, or ſilver of 12 penny-weights, contains then 288 fine grains; if this ingot contains $\frac{1}{288}$ part of alloy, it is ſaid to be *ſilver of* 11 *penny-weight and* 23 *grains*; if it contains $\frac{2}{288}$ of alloy, it is called *ſilver of* 11 *penny-weight and* 22 *grains*; if it contains $\frac{14}{288}$, it is called *ſilver of* 11 *penny-weight and* 10 *grains*; and ſo on. Laſtly, the fine grain has alſo its fractions, as $\frac{1}{2}$, $\frac{1}{4}$ of a grain, &c.

As eſſays to diſcover the value of ſilver are always made in ſmall, eſſayers only take a ſmall portion of an ingot for the trial; and the cuſtom in France is to take 36 real grains for this purpoſe, which is conſequently the largeſt weight they employ, and repreſents 12 fine penny-weights. This weight is ſubdivided into a ſufficient number of other ſmaller weights, which alſo repreſent fractions of fine penny-weights and grains. Thus 18 real grains, which is half of the quantity employed, repreſent ſix fine penny-weights; three real grains repreſent one fine penny-weight, or 24 fine grains; a real grain and a half repreſent 12 fine grains; and $\frac{1}{32}$ part of a real grain repreſents $\frac{1}{4}$ part of a fine grain, which is only $\frac{1}{752}$ part of a maſs of 12 penny-weights.

We may eaſily perceive, that weights ſo ſmall, and eſſay-balances, ought to be exceedingly accurate. Theſe balances are very ſmall, ſuſpended and incloſed in a box the ſides of which are panes of glaſs, that they may be preſerved from duſt, and that their motion may not be affected by agitated air, ſo as to diſorder their action *.

* See (Eſſay) *Balance*

When an eſſay of a maſs or ingot of ſilver is to be made, the cuſtom is to make a double eſſay. For this purpoſe, two fictitious ſemi-marks, each of which may be equal to 36 real grains, are to be cut from the ingot. Theſe two portions of ſilver ought to be weighed very exactly; and they ought alſo to have been taken from oppoſite ſides of the ingot.

Perſons accuſtomed to theſe operations know pretty nearly the value of ſilver merely by the look of the ingot, and ſtill better by rubbing it on a touchſtone. By the judgment they form of the purity of the ingot, they regulate the quantity of lead which is to be added to it, as this quantity muſt be always proportionable to the quantity of imperfect metal mixed with the ſilver.

Nevertheleſs, this proportion of lead to the alloy has not been preciſely determined. Authors who treat of this ſubject differ much. They who direct the largeſt quantity of lead ſay, that thereby the alloy is more certainly deſtroyed; and others who direct a ſmall quantity of lead, pretend, that no more of that metal ought to be uſed than is abſolutely neceſſary, becauſe it carries off with it always ſome portion of ſilver. Every eſſayer uſes his own particular method of proceeding, to which he is attached.

To aſcertain theſe doubtful points, three chemiſts of the Academy of Sciences at Paris, Meſſrs Hellot, Tillet, and Macquer, were appointed by the French government. They were directed to aſcertain every thing concerning the eſſay of gold and ſilver by authenticated experiments, made under the inſpection of a miniſter whoſe ſuperior knowledge is equal to his deſire of public good, and in preſence of the officers of the mint.

The experiments made by theſe chemiſts, and the conſequent regulation, have determined that four parts of lead are requiſite for one part of ſilver of 11 penny-weight and 12 grains, that ſix parts of lead are requiſite for ſilver of 11 penny-weight, eight parts of lead for ſilver of 10 penny-weight, 10 parts of lead for ſilver of nine penny-weight, and ſo on in the ſame progreſſion.

Two cupels of equal ſize and weight are to be choſen. The cuſtom is to uſe cupels of ſuch a ſize that their weight ſhall be equal to that of one half of the lead employed in the eſſay; becauſe ſuch cupels have been found capable of imbibing all the litharge formed during the operation. Theſe cupels are to be placed together under a muffle in an eſſay-furnace. The fire is to be kindled, and the cupels are to be made red-hot, and to be kept ſo during half an hour at leaſt before any metal be put into them. This precaution is neceſſary to dry and calcine them perfectly; becauſe if they contained any moiſture or inflammable matter, an ebullition and effervеſcence would be occaſioned in the eſſay. When the cupels are heated ſo as to become almoſt white, the lead is to be put into them; the fire is to be increaſed, which is done by opening the door of the aſh-hole ſo as to admit air, till the lead becomes red, ſmoking, and is agitated by a motion of its parts called its *circulation*, and till its ſurface becomes ſmooth and clear.

Then the ſilver, previouſly beat into ſmall plates for its eaſier fuſion, is to be put into the cupels; the fire is to be continued, and even increaſed, by putting hot coals at the mouth of the muffle, till the ſilver ſhall have *entered the lead*, that is, till it have melted and mixed with the lead. When the melted matter circulates well, the heat is to be diminiſhed by taking away, partly or entirely, the coals put at the mouth of the muffle, and by cloſing more or leſs the doors of the furnace.

The heat ought to be regulated ſo, that the eſſays in the cupels ſhall have ſurfaces ſenſibly convex, and ſhall appear ardent, while the cupels are leſs red; that the ſmoke ſhall riſe almoſt to the roof of the muffle; that undulations ſhall be made in all directions upon the ſurfaces of the eſſays, which are called *circulations*; that their middles ſhall be ſmooth, and ſurrounded with a ſmall circle of litharge, which is continually imbibed by the cupels.

The eſſays are to be kept in this ſtate till the operation is finiſhed, that is, till the lead and alloy have ſoaked into the cupel; and the ſurfaces of the buttons of ſilver being no longer covered with a pellicle of litharge, become ſuddenly bright and ſhining, and are then

Eſſay of Silver.

then ſaid to *lighten*. If the operation has been well conducted, the two eſſays ought to become bright nearly at the ſame time. When the ſilver has been by this operation well refined, we may ſee, immediately after it has brightened, the ſurface of the ſilver covered with rainbow colours, which quickly undulate and croſs each other, and then the buttons become fixed or ſolid.

The management of the fire is an important article in eſſays. For if the heat be too great, the lead is ſcorified and imbibed by the cupel ſo quickly, that it has not ſufficient time to ſcorify and carry along with it all the alloy; and if the heat be too little, the litharge is gathered upon the ſurface, and does not penetrate the cupel. The eſſayers ſay then, that the eſſay is *choaked* or *drowned*. In this caſe the eſſay does not advance; becauſe the litharge covering the ſurface of the metal defends it from the contact of air, which is abſolutely neceſſary for the calcination of metals.

We have above related the marks of a ſucceſsful eſſay. The heat may be known to be too great, from the convexity of the ſurface of the melted metal; from a too ſtrong circulation; from the too vivid appearance of the cupel, ſo that the colours given to it by the litharge cannot be diſtinguiſhed; and, laſtly, by the ſmoke riſing up to the roof of the muffle, or not being at all viſible from its being ſo ardent and red-hot as not to be diſtinguiſhable. In this caſe, the heat muſt be diminiſhed by ſhutting the door of the aſh-hole: Some eſſayers, for this purpoſe, put round the cupels ſmall, oblong, cold pieces of baked clay, which they call *inſtruments*.

If, on the contrary, the melted metal have a ſurface not very ſpherical, relatively to its extent; if the cupel appear dark-coloured, and the ſmoke of the eſſay do only creep upon the ſurface; if the circulation be too weak, and the ſcoria, which appears like bright drops, have but a dull motion, and be not ſoaked into the cupel; we may be aſſured that the heat is too weak; much more may we be aſſured of it when the metal *fixes*, as the eſſayers call it. In this caſe, the fire ought to be increaſed by opening the door of the aſh-hole, and by placing large burning coals at the mouth of the muffle, or even by laying them acroſs upon the cupels.

As ſoon as the lead is put into the cupels, the fire is to be increaſed, becauſe they are then cooled by the cold metal; and the lead ought to be quickly melted, to prevent its calx from collecting upon its ſurface in too great quantity before it be formed into litharge; which it would do, and be difficultly fuſed, if the heat were too weak.

When the ſilver is added to the lead, the heat muſt be ſtill increaſed; not only becauſe the ſilver cools the maſs, but becauſe it is leſs fuſible than lead. And as all theſe effects ought to be produced as quickly as poſſible, more heat is at length given than ought to be continued; and therefore, when the ſilver has entered the lead, the heat is to be diminiſhed till it becomes of a due intenſity for the operation.

During the operation, the heat ought gradually to be augmented to the end of it, both becauſe the metallic mixture becomes leſs fuſible as the quantity of lead diminiſhes; and alſo becauſe the lead is more difficultly ſcorifiable, as it is united with a larger proportion of ſilver. Hence the eſſays muſt be rendered very hot before they brighten.

Eſſay of Silver.

When the operation is finiſhed, the cupels are left in the ſame heat during ſome ſeconds, to give time to the laſt portions of litharge to be entirely abſorbed; becauſe, if any of it remained under the buttons of ſilver, it would ſtick to them. The fire is then allowed to extinguiſh, and the cupels to cool gradually, till the buttons have entirely fixed, particularly if they be pretty large; becauſe if they cool too quickly, their ſurfaces fix and contract before the internal maſs, which is thereby ſo ſtrongly compreſſed as to burſt through the external ſolid coat and form vegetations, or even to be entirely detached from the reſt of the maſs, and diſſipated. This is called *the vegetation of the button*. It ought to be carefully prevented, becauſe ſmall bits of ſilver are ſometimes thrown out of the cupel.

Laſtly, when the buttons are thoroughly fixed, they are to be diſengaged from the cupels by a ſmall iron utenſil while they are yet hot; otherwiſe they could not be diſengaged clean and free from part of the cupels, which ſtrongly adhere to them when the heat is much diminiſhed.

Nothing then remains to complete the eſſay, but to weigh the buttons. The diminution of weight which they have ſuſtained by cupellation will ſhow the purity or value of the ingot of ſilver.

We ought to obſerve, that as almoſt all lead naturally contains ſilver, and that after cupellation this ſilver is mixed with the ſilver of the ingot in the button of the eſſay; before we employ any lead in this operation, we ought to know how much ſilver it contains, that we may ſubtract this quantity from the weight of the button, when we compute the fineneſs of the ſilver of the ingot eſſayed. For this purpoſe eſſayers generally cupel a certain quantity of their lead ſeparately, and weigh accurately the button of ſilver it yields: or, at the ſame time when they eſſay ſilver, they put into a third cupel, in the muffle, a quantity of lead equal to that employed in both their eſſays; and when the operation is finiſhed, and the buttons are to be weighed, they throw the ſmall button produced from the lead alone into the ſcale which contains the weights; and as this exactly counterpoiſes the ſmall portion of ſilver which the eſſay buttons have received from the lead employed in the cupellation, the weights will ſhow preciſely the quantity of ſilver contained in the ingot, and thus the trouble of calculating is prevented. The ſmall button of ſilver procured from the cupellation of lead alone is called the *witneſs*. But to prevent this trouble, eſſayers generally employ lead which contains no ſilver, ſuch as that from Willach in Carinthia, which is therefore procured by eſſayers.

In the ſecond place, we ſhall obſerve, that a certain quantity of ſilver always paſſes into the cupel, as refiners in the great have long obſerved, and which happens alſo in eſſaying ſmall quantities. The quantity of ſilver thus abſorbed, varies according to the quantity of the lead employed, and the matter and form of the cupels; all which objects will undoubtedly be determined by the above mentioned chemiſts.

The cupellation which we have now deſcribed is exactly the ſame for eſſays by which the produce of a ſilver ore, or of an ore of another metal containing ſilver, is determined. But as theſe ores contain frequently gold, and ſometimes in conſiderable quantity, when theſe eſſays are made, the buttons of ſilver obtained

Eſſay of Silver.

by the eſſays ought to be ſubjected to the operation called *parting*. See Silver, Refining, &c.

M. Tillet has publiſhed a memoir, ſhowing that eſſays of ſilver made in the common method are uncertain and not to be depended upon; and that this uncertainty proceeds from the different quantities of ſilver abſorbed by the cupel in different eſſays, according as the heat and other circumſtances happened to vary. He therefore propoſes, in order to render eſſays accurate, to extract from the cupel the quantity of ſilver it has abſorbed during the operation, and to add this particle of ſilver to the button, as theſe two contain the whole quantity of ſilver in the matter eſſayed.

The variations in the different reſults of different eſſayers, or of the ſame eſſayer at different times, upon the ſame maſs of ſilver, are ſufficient proofs of the uncertainty mentioned by M. Tillet. Theſe variations are occaſioned, according to that author, principally from the following cauſes: 1. From the inaccuracy of the balances and weights employed. 2. From the faulty fuſion of the maſs to be eſſayed; by which means the contained alloy may be unequally diffuſed. 3. From the impurity of the lead, eſpecially from its containing ſilver, which is not always equally diffuſed through its maſs. 4. From the different proportions of lead uſed by different eſſayers. 5. From the difference of the intenſity of heat: for if the heat be not ſufficiently intenſe, the ſilver will ſtill contain a portion of alloy; and if the heat be too intenſe, too much of the ſilver will be imbibed by the cupel. 6. From the want of care in picking the ſmall particles of ſilver, which frequently adhere to the ſides of the cupel ſeparately, from the principal button. 7. From the ſpurting which ſometimes happens unobſerved by the eſſayer; and which may further falſify the eſſays of other pieces included under the ſame muffle, by the falling of the particles thrown out of one cupel into others adjacent. But, with all the attentions to avoid theſe cauſes of error, the author obtained different reſults from different eſſays of the ſame maſs of ſilver. Nor could he, by any method, make his different eſſays conſiſtent with each other, but by adding to each button the particle extracted from the cupel; and this method he found by accurate experiments to be perfectly exact.

M. Tillet obſerved, that the quantity of lead directed in the regulations eſtabliſhed in conſequence of the report made by Meſſrs Macquer, Hellot, and Tillet, is not ſufficient to purify the ſilver perfectly from its alloy. He nevertheleſs approves of the ſaid regulation; and conſiders the weight of the alloy retained by the button, as ſome compenſation for the weight of the ſilver abſorbed by the cupel. And as it is a conſtant fact, that the more lead is uſed, the greater is the loſs by the abſorption of the cupel, he remarks, that a regulation, directing a larger proportion of lead for France than is uſed in other countries, would be diſadvantageous to that kingdom; as thereby the ſilver of the ſame denomination would be required to be finer in that than in other countries where a leſs proportion of lead was employed. He obſerves, that the above mentioned rule, "that the more lead is uſed, the greater is the loſs by the abſorption of the cupel," does not extend to quantities of lead much above double the uſual quantities. Thus 32 parts of lead to one of ſilver, will not occaſion more abſorption than 16 parts of lead. For the refining ſcarcely takes place till the extraordinary quantity of lead be gone, and the ſilver is only or chiefly carried into the cupel along with the copper. Accordingly, he found, that he could render the ſilver finer by uſing four parts of lead at firſt, and afterwards adding two more parts when the iriſes began to appear, than by employing all the ſix parts of the lead at once. By this method of dividing the quantity of lead, the loſs of ſilver by abſorption was greater. M. Tillet did not find, that, by employing biſmuth alone, or mixed with lead, his eſſays were more certain than when lead alone was uſed. He obſerved, however, that the addition of biſmuth made the ſilver purer, but occaſioned a greater abſorption by the cupel.

Eſſay of Gold.

2. *Eſſay of the Value of Gold.* The fictitious weights uſed to determine the purity of gold, and to eſſay this metal, are different from thoſe of ſilver. See the preceding article. A maſs of gold perfectly pure, or which contains no alloy, is ideally divided into 24 parts, called *carats;* this pure gold is therefore called *gold of 24 carats.* If the maſs or ingot contains $\frac{1}{24}$th part of its weight of alloy, the gold is then of 23 carats; and if it contains $\frac{2}{24}$th or $\frac{1}{12}$th of alloy, it is gold of 22 carats, &c. Hence we ſee, that the carat of gold is only a relative and proportional weight, ſo that the real weight of the carat varies according to the total weight of the maſs of gold to be examined. If this maſs of gold weighs a mark, the real weight of the carat will be $\frac{1}{24}$th of eight ounces, which is equal to a mark. If the maſs weigh an ounce, the carat will be $\frac{1}{24}$th part of an ounce, or 24 grains. If it is only a penny-weight or 24 grains, the real weight of a carat will be one grain; and ſo on.

For greater accuracy, the carat of gold is divided into 32 parts, which are relative and proportional weights, as the carat itſelf is. Thus $\frac{1}{32}$d of a carat of gold is $\frac{1}{32}$d of $\frac{1}{24}$th, or the $\frac{1}{768}$th of any maſs of gold: and the gold which contains an alloy equal to the $\frac{1}{768}$th part of the whole maſs is called *gold of* 23 *carats, and* $\frac{31}{32}$; gold which contains $\frac{2}{768}$th of alloy is *gold of* 23 *carats and* $\frac{30}{32}$; and ſo on.

The real weight now generally uſed in the operation for determining the purity of gold is ſix grains. This weight then repreſents 24 carats. The half of this weight, or three real grains, repreſents 12 carats. According to this progreſſion, we ſhall find that $\frac{1}{4}$th of a real grain repreſents one carat, and the $\frac{1}{128}$th part of a grain repreſents the $\frac{1}{32}$d of a carat, or the $\frac{1}{768}$th part of a maſs of gold to be eſſayed.

As theſe weights are exceedingly ſmall, ſome eſſayers employ a weight of 12 grains, which muſt be very convenient.

When a maſs or ingot of gold is to be eſſayed, ſix grains are to be cut off, and exactly weighed: alſo 18 grains of fine ſilver are to be weighed. Theſe two metals are to be cupelled together with about ten times as much lead as the weight of the gold. This cupellation is conducted preciſely like that of the eſſay to determine the purity of the ſilver, excepting that the heat muſt be raiſed a little more towards the end of the operation when the eſſay is going to brighten. Then the gold is freed from all alloy but ſilver. If the quantity of copper or other alloy deſtructible by cupellation be required to be known, the remaining button is accurately weighed. The diminution of weight from the ſum

ſum of the weights of the gold and of the ſilver determines the quantity of this alloy.

The button containing gold and ſilver is then to be flattened upon a poliſhed piece of ſteel, and care muſt be taken to anneal it from time to time, to prevent its ſplitting and cracking. By this method it is reduced to a thin plate, which is to be rolled up, in order to be parted by aquafortis*. The diminution found after the parting from the original weight of the gold eſſayed, ſhows the whole quantity of alloy contained in that gold.

* See *Parting*.

The eſſay for determining the purity of gold is then made by two operations: the firſt, which is cupellation, deprives it of all its imperfect metals; and the ſecond, which is parting, ſeparates all the ſilver from it. By antimony alſo gold may be purified, which is a kind of dry parting. By this ſingle operation, all the imperfect metals, and ſilver with which gold is allayed, are ſeparated. See Purification, Gold, Silver, Refining.

*Essay-Hatch*, is the miners term for a little trench or hole, which they dig to ſearch for ſhoad or ore.

ESSEDARII, a ſort of gladiators, mentioned by Seneca, Suetonius, and Tully, who on ſome occaſions engaged one another out of chariots called *eſſeda*. The *eſſedum* was a ſort of heavy chariot from which the Gauls and Britons engaged the Romans. See Gladiator.

ESSENCE, in metaphyſics, that which conſtitutes the particular nature of each genus or kind, and diſtinguiſhes it from all others: being nothing but that abſtract idea to which this name is affixed, ſo that every thing contained in it is eſſential to that particular kind.

This Mr Locke calls the *nominal eſſence;* in contradiſtinction to the real eſſence, or conſtitution of ſubſtances on which this nominal eſſence depends. Thus the nominal eſſence of gold is that complex idea the word *gold* ſtands for; let it be, for inſtance, a body, yellow, weighty, malleable, fuſible, and fixed: but its real eſſence is the conſtitution of its inſenſible parts, on which theſe qualities and all its other properties depend, which is wholly unknown to us.

ESSENES, or Essenians, in Jewiſh antiquity, one of the three ancient ſects among that people. They allowed a future ſtate, but denied a reſurrection from the dead. Their way of life was very ſingular: they did not marry; but adopted the children of others, whom they bred up in the inſtitutions of their ſect: they deſpiſed riches, and had all things in common, and never changed their cloaths till they were entirely worn out. When initiated, they were ſtrictly bound not to communicate the myſteries of their ſect to others; and if any of their members were found guilty of enormous crimes, they were expelled.

Pliny tells us, that they dwelt on the weſt ſide of the lake of Aſphaltites; and that they were a ſolitary kind of men, living without women or money, and feeding upon the fruit of the palm-tree: he adds, that they were conſtantly recruited by new comers, whom the ſurges of ill fortune had made weary of the world; in which manner the ſect was kept up for ſeveral thouſands of years, without any being born among them. The reaſon why we find no mention made of them in the New Teſtament, may be their recluſe and retired way of life, not leſs than their great ſimplicity and honeſty, whereby they lay open to no cenſure or reproof.

ESSENTIAL, ſomething neceſſarily belonging to a thing, from which it cannot be conceived diſtinct: thus the primary qualities of bodies, as extenſion, figure, number, &c. are eſſential or inſeparable from them in all their changes and alterations.

*Essential Oils* are ſuch as are really contained in a plant, and are drawn from it by diſtillation in an alembic with water: they are thus called, in contradiſtinction to empyreumatic oils, which are raiſed by a naked fire without water.

ESSEX, a county of England, bounded on the north by the Stour, which ſeparates it from Suffolk and Cambridgeſhire; on the eaſt, by the German ſea; on the weſt, by Hertfordſhire and Middleſex; and on the ſouth by the river Thames. It extends 46 miles in length from E. to W. and about 42 in breadth from N. to S. and 200 in circuit. This county is in the dioceſe of London, and gives title of Earl to the family of Capel. It is divided into 19 hundreds, and contains 27 market-towns, 415 pariſhes, 125 vicarages, and 1100 villages, with about 34,800 houſes, and 208,800 inhabitants. It ſends eight members to parliament; namely, two for the county, and two for Colcheſter, Harwich, and Malden. The air in the inland parts is healthy; but in the marſhes near the ſea it produces agues, particularly in the part called the Hundreds. However, the fertility of the unwholeſome part is very great, and even the higher grounds of this county are very fruitful. About Saffron Walden, the earth, after bearing ſaffron three years, it is ſaid, will produce good barley for 18 years ſucceſſively without any manure. Its produce, which is very plentiful, conſiſts of corn, moſt excellent ſaffron, cattle, fowl, fiſh, and particularly oyſters. The chief manufactures of this county are cloth, ſtuffs, and particularly baize. The principal rivers, beſides the Thames, are the Stour, which falls into the German ſea at Harwich; the Lea, its weſtern boundary, falls into the Thames below Stratford; the Blackwater runs thro' the heart of the county, and paſſing by Chelmsford is joined by the Chalmer, and from thence runs into the German ſea; the Coln runs by Halſted to Colcheſter, and ſo into the ſea. The Roding which riſes northwards, near Dunmow, runs into the Thames near Barking. All theſe rivers abound in moſt ſorts of fiſh.

ESTATE, in law, ſignifies the title or intereſt that a perſon has in lands, tenements, or other effects; comprehending the whole in which a perſon hath any property, and will paſs the ſame.

Eſtates are either real or perſonal; otherwiſe diſtinguiſhed into freeholds, which deſcend to heirs; or chattels, that go to executors or adminiſtrators.

A fee-ſimple is the ampleſt eſtate our law admits of. See Fee.

Eſtates are obtained ſeveral ways; as, by deſcent from a father to a ſon; by conveyance or grant from one perſon to another; by gift or purchaſe; or by deed or will. See Descent, Succession, Tenure, &c.

Estates, in a political ſenſe, is uſed either to denote the dominions of ſome prince, or the general claſſes into which the people are divided.

In Britain, the eſtates are the king, lords, and commons;

mons; or rather the lords and commons, who meet the king in parliament, for reforming abuſes, and enacting good and wholeſome laws.

ESTHER, a canonical book of the Old Teſtament; containing the hiſtory of a Jewiſh virgin, dwelling with her uncle Mordecai at Shuſhan, in the reign of Ahaſuerus, one of the kings of Perſia.

The great beauty of this maid raiſed her to the throne of Perſia; whereby ſhe had an opportunity to ſave her countrymen, whoſe deſtruction was plotted by Haman, a favourite of that prince.

The learned are not agreed who this Ahaſuerus was. Archbiſhop Uſher ſuppoſes him to be Darius Hyſtaſpes, and Artyſtona to be Eſther. Scaliger makes him the ſame with Xerxes, and his queen Haneſtris to be Eſther. Joſephus, on the contrary, poſitively aſſerts, that the Ahaſuerus of the ſcriptures, is the Artaxerxes Longimanus of profane ſtory; and the Septuagint, throughout the whole book of Eſther, tranſlate Ahaſuerus by Artaxerxes. Moſt people ſubſcribe to this laſt opinion; and indeed the extraordinary kindneſs ſhowed by Artaxerxes to the Jews, can ſcarce be accounted for otherwiſe than by ſuppoſing that they had ſo powerful an advocate as Eſther to ſolicit for them.

ESTOILE'E, or Cross Estoille'e, in heraldry, a ſtar with only four long rays in form of a croſs; and, accordingly, broad in the centre, and terminating in ſharp points.

ESTONIA, is a province of the Ruſſian empire, and part of Livonia. It is bounded on the eaſt by the Baltic ſea, on the north by the Gulph of Finland, on the weſt by Ingria, and on the ſouth by Lettonia. It is divided into ſix diſtricts: 1. Harrien; 2. Wireland; 3. Aleutakin; 4. Wich; 5. Jerven; and, 6. Odepoa. The principal towns are, Revel, Weiſenberg, Borchholm, Narva, Nyſlot, Habſal, Derpt, St Elin, Pernau, and Roderſwick.

In former times the inhabitants of this country carried on a good trade in corn, which was dried in ſtoves: but wars have much depopulated the country, inſomuch that not a fourth part of it is inhabited, and a great number of gentlemens ſeats lie in ruins.

ESTOPPEL (formed of the French *eſtouper*, *oppilare*, *obſtipare*, "to ſtop, or block up"), in law, an impediment or bar of action, ariſing from a man's own act or deed; againſt which a man is forbidden, by law, to ſpeak, though it be to ſay the truth.

ESTOVERS, in law, is uſed, by Bracton, for that ſuſtenance which a man, committed for felony, is to have out of his lands or goods for himſelf and his family during impriſonment. In ſtat. 6 Edw. I. it is uſed for an allowance in meat or clothes. In ſome manors, the tenants have *common of Eſtovers;* that is, neceſſary botes or allowances out of the lord's wood: in which laſt ſenſe, eſtovers comprehends houſe-bote, hay-bote, and plow-bote; ſo that if a man have in his grant theſe general words, *de rationabili eſtoverio in boſcis*, &c. he may thereby claim all three.

Eſtovers is alſo uſed for alimony, which, if the huſband refuſes to pay, there is, beſides the ordinary proceſs of excommunication, a writ at common law, *de eſtoveriis habendis*, in order to recover it.

ESTRAY, or Stray, ſignifies any tame beaſt, as ſheep, oxen, ſwine, and horſes, or ſwans, found within a lordſhip, and not owned by any man; in which caſe being cried, according to law, in the church, and two market towns adjoining, if it be not claimed by the owner within a year and a day, it becomes the lord's of the ſoil where found. If the owner claims it within the year and day, he muſt pay the charges of finding, keeping, and proclaiming them; and he may ſeize it, without telling the marks or proving his property, which may be done at the trial if conteſted. If the beaſt ſtray within the year to another lordſhip, the firſt lord cannot retake it. An eſtray muſt be fed and kept, uninjured, and without labour, till it is reclaimed or the limited time expires.

ESTREAT, Extractum, in law, is uſed for the true copy or duplicate of ſome original writing, eſpecially of amercements or penalties ſet down in the rolls of a court, to be levied by the bailiff or other officer, on every offender.

ESTREMADURA, a province of Spain, has New Caſtile on the eaſt, Leon on the north, Andaluſia on the ſouth, and Portugal on the weſt. It is 175 miles in length, and 100 in breadth; and its principal towns are, Calatrava, Menda, and Badajoz, on the river Guadiana; Alcantara, on the Tajo; and Cona and Placentia, to the north of this river.

This province enjoys a very pure and healthful air, and its mountains are full of wild and tame animals; they having woods and foreſts for the one ſort, and paſtures for the other. The fields are planted with fruit-trees, which bear all kinds of delicious fruit. The vineyards produce excellent wines of all colours, and the fields yield plenty of corn.

Estremadura, a province of Portugal, near the mouth of the Tagus or Tajo, bounded on the north by Beira, on the eaſt and ſouth by Alentejo, and on the weſt by the Atlantic Ocean. It is about 88 miles in length, and 45 in breadth. This province is divided into ſix comarcas, viz. Litria, Liſbon, Tomar, Santaren, and Alanquar, to the north of the Tagus; and that of Setubal, to the ſouth of this river. Theſe are likewiſe the principal towns. Eſtremadura is equal, if not preferable, to any other province in Spain or Portugal. The diſtrict of Santaren produces ſuch plenty of corn, and feeds ſo many flocks of ſheep, that it may enter into competition with Sicily. The fruits and the wines are all excellent; and it was here that the ſweet oranges brought from China were firſt planted, and of which there are large quantities tranſported to foreign parts, with the wines and other fruits. The fields are covered with flowers almoſt all the year, from which the bees collect large quantities of fine honey. The olive-trees are numerous, from which they have excellent oil. The rivers abound with good fiſh, and the mountains have quarries of ſeveral kinds.

ETCHING, a method of engraving on copper, in which the lines or ſtrokes, inſtead of being cut with a tool or graver, are eaten in with aquafortis. See Engraving.

Etching is of a later invention, though not very modern, than engraving with the tool; of which it was at firſt only an imitation, that was practiſed by painters and other artiſts, who could much ſooner form their hands to, and attain a faculty of, working in this way, than with the graver. But being then nevertheleſs conſidered as a counterfeit kind of engraving, and therefore inferior to the other, it was culti-

vated

vated in a very confined manner; the cloſeneſs of the reſemblance of the work to that performed by the tool, being made the teſt of its merit, and conſequently the principal object of aim in thoſe who purſued it. This ſervile confinement of the art of etching to the imitation of the original kind of engraving, was a great cauſe of retarding its advancement towards perfection, as many of the moſt able maſters cramped their talents with the obſervance of it: which may be ſeen in the inſtances of Sadelers, Swaneberg, Villamena, and particularly Le Boſſe; who, in his treatiſe on engraving, has laid down as a principle, that the perfection of this kind conſiſts in the cloſe ſimilitude of the work with that done by the tool. This abſurd prepoſſeſſion has been ſince worn out: and the method of working with aquafortis has been ſo far improved, that inſtead of being now deemed a ſpurious kind of engraving, it evidently appears the foundation of an excellence in many modern works, that could never have been produced without it: ſince, though the neatneſs and uniformity of the hatches, which attend the uſe of the tool, is more advantageous with reſpect to portraits; yet the liberty and facility of the other manner give a much greater opportunity to exerciſe the force of genius and fancy in hiſtory-engraving; where the effect of the whole, and not the minute exactneſs in finiſhing all the parts, conſtitutes the principal value.

There are two methods practiſed of engraving in this way; the one with a hard varniſh or ground, the other with a ſoft. The firſt was formerly much uſed, being better accommodated to the intention of imitating the engraving with the tool; as the firmneſs of the body of the varniſh gave more opportunity of retouching the lines, or enlarging them with the oval-pointed needles, called by the French *echoppes*, as was practiſed by Le Boſſe and others for that purpoſe. The latter has now almoſt wholly ſuperſeded the uſe of the other, by the free manner of working it admits of; which affords a power of expreſſion incompatible with the greater inflexibility of the hard varniſh, that confines the lines and hatches to ſuch a regularity and ſameneſs, as gives a ſtiffneſs of manner and coldneſs of effect to the work.

The mixture of the uſe of the tool and aquafortis, which are now both employed in many caſes, has, however, given that perfection to engraving which it poſſeſſes at preſent. The truth and ſpirit of the outline that the method of working with aquafortis affords, and the variety of ſhades which the different kinds of black produce in this way, as well as other means of expreſſing the peculiar appearance and character of particular ſubjects, furniſh what was defective in the ſole uſe of the tool; while, on the other hand, the exactneſs and regularity of the lines, which are required for finiſhing many kinds of deſigns, are ſupplied by the graver; and by a judicious application of both, that complete finiſhing is obtained, which either of them alone muſt neceſſarily want.

The manner by which this art is performed, is the covering the ſurface of the plate with a proper varniſh or *ground*, as it is called, which is capable of reſiſting aquafortis; and then ſcoring or ſcratching away, by inſtruments reſembling needles, the parts of this varniſh or ground, in the places where the ſtrokes or hatches of the engraving are intended to be: then, the plate being covered with aquafortis, the parts that are laid naked and expoſed by removing the ground or varniſh, are corroded or eaten away by it; while the reſt, being ſecured and defended, remain untouched.

There are two methods of etching, as hath been already obſerved; the difference of which from each other conſiſts, as well in the difference of the varniſh or ground, as in that of the aquafortis, adapted to each kind; but the general methods of performing them are alike in both. Theſe varniſhes or grounds are diſtinguiſhed by the names of *hard* and *ſoft*: for in their conſiſtence, or the reſiſtance they give to the needles, lies their eſſential variation from each other. The hard varniſh, it is with good reaſon conjectured, was not the firſt in uſe: but ſoon took place of the other; and was, for ſome time, the moſt received in practice, on account of its admitting the work to be made more like that of the graver: the ſoft has, however, ſince, in its turn, prevailed to the excluſion of it in ſome degree, except in the caſe of particular ſubjects; but not ſo entirely as to take away the expedience of ſhowing how it is performed. The manner of etching with the ſoft varniſh is now, however, one of the moſt important objects of the art of engraving; and it is at preſent in univerſal uſe, ſometimes alone, but more frequently intermixed with the work of the tool, and in ſome caſes with great advantage, even where the whole is intended to paſs for being performed by the graver.

*Preparation of the ſoft varniſh; according to Mr Lawrence, an eminent Engliſh engraver at Paris.* "Take of virgin wax and aſphaltum, each two ounces; of black pitch and Burgundy pitch, each half an ounce. Melt the wax and pitch in a new earthen-ware glazed pot; and add to them, by degrees, the aſphaltum finely powdered. Let the whole boil till ſuch time as that, taking a drop upon a plate, it will break when it is cold, on bending it double two or three times betwixt the fingers. The varniſh being then enough boiled, muſt be taken off the fire; and letting it cool a little, muſt be poured into warm water, that it may work the more eaſily with the hands, ſo as to be formed into balls; which muſt be rolled up, and put into a piece of taffety for uſe."

It muſt be obſerved, firſt, that the fire be not too violent, for fear of burning the ingredients; a ſlight ſimmering will be ſufficient: ſecondly, that while the aſphaltum is putting in, and even after it is mixed with them, the ingredients ſhould be ſtirred continually with the ſpatula: and thirdly, that the water, into which this compoſition is thrown, ſhould be nearly of the ſame degree of warmth with it, to prevent a kind of cracking that happens when the water is too cold.

The varniſh ought always to be harder in ſummer than in winter; and it will become ſo if it be ſuffered to boil longer, or if a greater proportion of the aſphaltum or brown reſin be uſed. The experiment abovementioned, of the drop ſuffered to cool, will determine the degree of hardneſs or ſoftneſs that may be ſuitable to the ſeaſon when it is uſed.

*Preparation of the hard varniſh uſed by Callot, commonly called the* Florence varniſh. Take four ounces of fat oil very clear, and made of good linſeed oil, like that uſed by painters: heat it in a clean pot of glazed earthen-ware, and afterwards put to it four ounces of maſtich well powdered; and ſtir the mixture briſkly till the whole be well melted; then paſs the whole maſs through a piece of fine linen into a glaſs bottle with a long neck, that can be ſtopped very ſecurely; and keep it for the uſe that will be below explained.

*Method of applying the ſoft varniſh to the plate, and of blackening it.* The plate being well poliſhed and burniſhed, as alſo cleanſed from all greaſineſs by chalk or Spaniſh white, fix a hand-vice on the edge of the plate where no work is intended to be, to ſerve as a handle for managing it when warm: then put it upon a chafing-diſh, in which there is a moderate fire; obſerving to hold it ſo that it may not burn: keep the plate over the fire till it be ſo hot that the varniſh being brought into contact with it may melt: then cover the whole plate equally with a thin coat of the varniſh; and while the plate is warm, and the varniſh upon it in a fluid ſtate, beat every part of the varniſh gently with a ſmall ball or dauber made of cotton tied up in taffety; which operation ſmooths and diſtributes the varniſh equally over the plate.

When the plate is thus uniformly and thinly covered with the varniſh, it muſt be blackened by a piece of flambeau, or of a large candle which affords a copious ſmoke; ſometimes two, or even four, ſuch candles are uſed together for the ſake of diſpatch, that the varniſh may not grow cold: which if it does during the operation, the plate muſt then be heated again, that it may be in a melted ſtate when that operation is performed: but great care muſt be taken not to burn it; which, when it happens, may be eaſily perceived by the varniſh appearing burnt and loſing its gloſs. The following expedient is made uſe of for the more commodiouſly blackening the varniſh, being particularly neceſſary where the plates are large: Fix a ſtrong hook in the roof of the room, through which paſs four pieces of cord of equal length, at the end of which are fixed four iron rings of about four inches diameter, for ſupporting the corners of the plate. The plate being thus ſuſpended in the air, with the varniſhed ſide downwards, may be blackened with great convenience: but this is not, however, abſolutely requiſite, except in the caſe of large plates that could not, without difficulty, be held up, unleſs this or ſome other ſuch contrivance were made uſe of.

It is proper to be very cautious in keeping the flambeau or candle at a due diſtance from the plate, leſt the wick touch the varniſh, which would both ſully and mark it. If it appear that the ſmoke has not penetrated the varniſh, the plate muſt be again placed for ſome little time over the chafing-diſh; and it will be found, that, in proportion as the plate grows hot, the varniſh will melt and incorporate with the black which lay above it, in ſuch a manner that the whole will be equally pervaded by it.

Above all things, the greateſt caution ſhould be uſed in this operation, to keep all the time a moderate fire; and to move frequently the plate, and change the place of all the parts of it, that the varniſh may be alike melted every where, and kept from burning. Care muſt alſo be taken, that during this time, and even till the varniſh be entirely cold, no filth, ſparks, or duſt, fly on it; for they would then ſtick faſt, and ſpoil the work.

*Method of applying the hard varniſh.* This is preciſely the ſame as for the ſoft; being ſpread equally over the warm plate with the taffety-ball, and ſmoked in the ſame manner: only after it is ſmoked, it muſt be baked, or dried over a gentle fire of charcoal, till the ſmoke from the varniſh begins to decreaſe; taking care not to overheat the plate, which would both ſoften it and burn the varniſh.

The plate being thus prepared, and an exact drawing of the outlines of the deſign made upon thin paper, the other ſide of the paper muſt be well rubbed with chalk or Spaniſh whitening, or, which is better, with red chalk ſcraped to a powder; and the looſe chalk is cleared off with a linen rag: then the ſtained ſide of the paper is laid upon the varniſh, fixing the corners to the plate with wax or wafers, to prevent its ſhuffling; and with a blunted needle or pointer the drawing is ſlightly traced, and communicates to the varniſh an exact outline of the deſign to be etched.

A variety of pointers is neceſſary for the work. Thoſe uſed for the broad large ſtrokes ought to be very blunt, exceeding round, and well poliſhed at the point; the ſoal of a ſhoe anſwers very well for poliſhing the points. The fineſt ought to be as ſharp as a needle. If any ſcratches or falſe ſtrokes happen in the working, they are to be ſtopped up with a hair-pencil dipped in Venetian varniſh, mixed with lamp-black, by which means theſe places will be defended from the action of the aquafortis.

The next operation is that of eating or corroding the plate with aquafortis; in order to which, a border of ſoft wax (being a compoſition of bees-wax melted and tempered with a little Venice turpentine and tallow) muſt be faſtened round the plate about an inch high, in the form of a little wall or rampart, to contain the aquafortis. At one of the corners of this border a gutter is uſually made, which ſerves for pouring commodiouſly the aquafortis off the plate. The plate being thus bordered, take a due quantity of the refiners aquafortis; mix it with half its quantity of common water; and pour it gently on, till it riſe above a finger's breadth above the ſurface of the plate; when, if all things have been rightly conducted, it will be ſeen that the aquafortis will ſoon exert its action in the hatches which have been ſtrongly touched; but thoſe more weakly engraved will appear at firſt clear, and of the colour of the copper. The menſtruum muſt therefore be ſuffered to continue on the plate till its effects become viſible on the more tender parts: then the aquafortis ſhould be poured off, the plate waſhed with clean water, and dried before the fire: then take a ſmall pencil dipped into the Venetian varniſh, and cover with it the lighter parts of the plate. This being done, the aquafortis muſt again be poured on, and ſuffered to continue a longer or ſhorter time, according to the ſtrength of the menſtruum, or the nature of the engraving; when it muſt be again poured off as before, and the plate immediately waſhed with water.

It may not be improper to obſerve, that, when the aquafortis is on the plate, a feather ſhould be uſed to cleanſe away the foulneſs of the verdigris that gathers in the hatches when the aquafortis operates on them, and to give it more room to exert its action; for by moving the aquafortis to and fro on the plate by the feather, and bruſhing away the black ſaline matter where it appears to be formed, the hatches will be cleanſed,

cleanſed, and the aquafortis exert its whole force equally on every part.

The plate being thus ſufficiently corroded by the aquafortis, and well waſhed with water, it muſt be warmed at the fire, and the border of wax removed; after which, it muſt be made hotter till the varniſh melt; then it muſt be well wiped with a linen cloth, and afterwards rubbed heartily with oil of olives; when it will be ready to be retouched and finiſhed by the graver. See the article Engraving.

ETEOCLES (fab. hiſt.), a ſon of Œdipus and Jocaſta. After his father's death, it was agreed between him and his brother Polynices, that they ſhould both ſhare the royalty, and reign alternately each a year. Eteocles by right of ſeniority firſt aſcended the throne; but after the firſt year of his reign was expired he refuſed to give up the crown to his brother, acccording to their mutual agreement. Polynices, reſolved to puniſh ſuch an open violation of a ſolemn engagement, went to implore the aſſiſtance of Adraſtus king of Argos. He received that king's daughter in marriage, and was ſoon after aſſiſted with a ſtrong army headed by ſeven famous generals. Theſe hoſtile preparations were ſeen by Eteocles, who on his part did not remain inactive. He choſe ſeven brave chiefs to oppoſe the ſeven leaders of the Argives, and ſtationed them at the ſeven gates of the city. He placed himſelf againſt his brother Polynices, and he oppoſed Menalippus to Tydeus, Polyphontes to Capaneus, Megareus to Eteoclus, Hyperbius to Parthenopæus, and Laſthenes to Amphiaraus. Much blood was ſhed in light and unavailing ſkirmiſhes, and it was at laſt agreed between the two brothers that the war ſhould be decided by ſingle combat. They both fell in an engagement conducted with the moſt inveterate fury on either ſide; and it is even ſaid that the aſhes of theſe two brothers, who had been ſo inimical one to the other, ſeparated themſelves on the burning pile, as if ſenſible of reſentment, and hoſtile to reconciliation.

ETERNITY, an attribute of God, expreſſing his infinite or endleſs duration. See Logic and Metaphysics.

Eternity, in mythology, a divinity among the Romans, who had neither temples nor altars. They repreſented it under the figure of a woman, who held the ſun in one hand and the moon in the other: her ſymbols were a phœnix, globe, and elephant.

ETESIÆ, or Etesian *winds*, are ſuch as blow at ſtated times of the year, from what part ſoever of the compaſs they come. They are ſo called from the Greek word ἐτος, "year," being yearly or anniverſary winds, ſuch as our ſeamen call *monſoons* and *trade-winds*, which in ſome parts of the world continue conſtantly blowing for certain ſtated ſeaſons of the year. Thus, the north winds, which, during the dog-days, conſtantly blow upon the coaſts of Egypt, and hinder all ſhips from ſailing out of Alexandria for that ſeaſon, are called *eteſiæ* in Cæſar's Commentaries. In other authors, the weſt and eaſt winds are called *eteſiæ*, when they continue blowing for certain ſeaſons of the year.

Cellarius endeavours to prove that thoſe winds are properly eteſian which blow from that part of the horizon which is between the north and weſt about the time of the ſolſtice. In ancient writers, they are repreſented as of a very mild and gentle nature; and were called by mariners *ſomniculoſi* and *delicati*, from their ſleeping or ceaſing to blow in the night.

ETHELBALD,
ETHELBERT,
ETHELRED,
ETHELWOLF, kings of England. See (Hiſtory of) England.

ETHER,
ETHERIAL, See Æther.

ETHERIDGE (Sir George), a celebrated wit and comic genius in the reigns of Charles II. and James II. deſcended from an ancient family in Oxfordſhire, and born in 1636. He travelled in his youth; and, not being able to confine himſelf to the ſtudy of the law, devoted himſelf to the gayer accompliſhments. His firſt dramatic performance, the Comical Revenge, or Love in a Tub, appeared in 1664, and introduced him to the leading wits of the time: in 1668, he produced a comedy called She would if ſhe could; and, in 1676, he publiſhed his laſt comedy, called the Man of Mode, or Sir Fopling Flutter; which is perhaps the moſt elegant comedy, and contains more of the real manners of high life than any one the Engliſh ſtage was ever adorned with. This piece he dedicated to the beautiful ducheſs of York, in whoſe ſervice he then was; and who had ſo high a regard for him, that when, on the acceſſion of James II. ſhe came to be queen, ſhe procured his being ſent ambaſſador firſt to Hamburg, and afterwards to Ratiſbon, where he continued till after his majeſty quitted the kingdom. Our author being addicted to certain gay extravagances, had greatly impaired his fortune; to repair which, he paid his addreſſes to a rich widow: but ſhe, being an ambitious woman, had determined not to condeſcend to a marriage with any man who could not beſtow a title upon her; on which account he was obliged to purchaſe a knighthood. None of the writers have exactly fixed the period of Sir George's death, though all ſeem to place it not long after the Revolution. Some ſay, that on this event he followed his maſter king James into France, and died there; but the authors of the Biographia Britannica mention a report, that he came to an untimely death by an unlucky accident at Ratiſbon; for that after having treated ſome company with a liberal entertainment at his houſe there, where he had taken his glaſs too freely, and being, through his great complaiſance, too forward in waiting on his gueſts at their departure, fluſhed as he was, he tumbled down ſtairs and broke his neck, and ſo fell a martyr to mirth and jollity. As to Sir George's literary character, he certainly was born a poet, and ſeems to have been poſſeſſed of a genius whoſe vivacity needed no cultivation: for we have no proofs of his having been a ſcholar. His works, however, have not eſcaped cenſure on account of that licentiouſneſs which in general runs through them, which renders them dangerous to young unguarded minds; and the more ſo, for the lively and genuine wit with which it is gilded over, and which has therefore juſtly baniſhed them from the purity of the preſent ſtage.

ETHICS, the doctrine of manners, or the ſcience of moral philoſophy. The word is formed from ηθος, ηθη, *mores*, "manners;" by reaſon the ſcope or object thereof is to form the manners. See *Moral Philoſophy*.

ETHIOPIA, a celebrated, though very much un-

1
The name anciently beſtowed on different nations.

known empire of Africa, whoſe boundaries have never been exactly defined either by ancient or modern geographers. By ſome writers of antiquity the title of *Ethiopians* was given to all nations whoſe complexion was black: hence we find the Arabians as well as many other Aſiatics ſometimes falling under this denomination; beſides a number of Africans whoſe country lay at a diſtance from Ethiopia properly ſo called. Thus the Africans in general were by theſe writers divided into the weſtern or Heſperian Ethiopians, and thoſe above Egypt ſituated to the eaſt of the former; the latter being much more generally known than the former, by reaſon of the commerce they carried on with the Egyptians.

2
Different names of Ethiopia.

From this account we may eaſily underſtand why there ſhould be ſuch a ſeeming diſagreement among ancient authors concerning the ſituation of the empire of Ethiopia, and likewiſe why it ſhould paſs under ſuch a variety of names. Sometimes, for example, it was named *India*, and the inhabitants *Indians*; an appellation likewiſe applied to many other diſtant nations. It was alſo denominated *Atlantia* and *Etheria*, and in the moſt remote periods of antiquity *Cephenia*; but more uſually *Abaſene*, a word ſomewhat reſembling *Abaſſia* or *Abyſſinia*, two of its modern names. On the other hand, we find Perſia, Chaldæa, Aſſyria, &c. ſtyled *Ethiopia* by certain writers; and all the countries extending along the coaſts of the Red Sea were promiſcuouſly denominated *India* and *Ethiopia*. By the Jews the empire of Ethiopia was ſtyled *Cuſh* and *Ludim*.

3
Situation of Ethiopia Propria.

Notwithſtanding this diverſity of appellations, and vaſt diffuſion of territory aſcribed to the Ethiopians, there was one country to which the title was thought more properly to belong than to any of the reſt; and which was therefore called *Ethiopia Propria*. This was bounded on the north by Egypt, extending all the way to the leſſer cataract of the Nile, and an iſland named *Elephantine*; on the weſt it had Libya Interior; on the eaſt the Red Sea, and on the ſouth unknown parts of Africa; though theſe boundaries cannot be fixed with any kind of preciſion.

4
Different nations in Ethiopia.

In this country the ancients diſtinguiſhed a great variety of different nations, to whom they gave names either from ſome perſonal property, or from their manner of living. The principal of theſe were, 1. The *Blemmyes*, ſeated near the borders of Egypt; and who, probably from the ſhortneſs of their necks, were ſaid to have no heads, but eyes, mouths, &c. in their breaſts. Their form, ſomehow or other, muſt have been very extraordinary, as we learn from Vopiſcus, who gives an account of ſome of the captives of this nation brought to Rome. 2. The *Nobatæ*, inhabiting the banks of the Nile near the iſland Elephantine already mentioned, ſaid to have been removed thither by Oaſis to repreſs the incurſions of the Blemmyes. 3. The *Troglodytes*, by ſome writers ſaid to belong to Egypt, and deſcribed as little ſuperior to brutes. 4. The *Nubians*, of whom little more is known than their name. 5. The *Pigmies*, by ſome ſuppoſed to be a tribe of Troglodytes; but by the moſt approved writers placed on the African coaſt of the Red Sea. 6. The *Aualitæ* or *Abalitæ*, of which we know nothing more than that they were ſituated near the Abalitic gulf. 7. The *Struthiophagi*, ſo called from their feeding upon oſtriches, were ſituated to the ſouth of the Memnones. 8. The *Acridophagi*; 9. *Chelonophagi*; 10. *Ichthyophagi*; 11. *Cynamolgi*; 12. *Elephantophagi*; 13. *Rhizophagi*; 14. *Spermatophagi*; 15. *Hylophagi*; and, 16. *Ophiophagi*: all of whom had their names from the food they made uſe of, *viz.* locuſts, tortoiſes, fiſh, bitches milk, elephants; roots, fruits, or ſeeds, and ſerpents. 17. The *Hylogones*, neighbours to the Elephantophagi, and who were ſo ſavage that they had no houſes, nor any other places to ſleep in but the tops of trees. 18. The *Pamphagi*, who uſed almoſt every thing indiſcriminately for food. 19. The *Agriophagi*, who lived on the fleſh of wild beaſts. 20. The *Anthropophagi*, or man-eaters, are now ſuppoſed to have been the Caffres, and not any inhabitants of Proper Ethiopia. 21. The *Hippophagi*, or horſe-eaters, who lay to the northward of Libya Incognita. 22. The *Macrobii*, a powerful nation, remarkable for their longevity; ſome of them attaining the age of 120 years. 23. The *Sambri*, ſituated near the city of Tenupſis in Nubia upon the Nile; of whom it is reported that all the quadrupeds they had, not excepting even the elephants, were deſtitute of ears. 24. The *Aſachæ*, a people inhabiting the mountainous parts, and continually employed in hunting elephants. Beſides theſe, there were a number of other nations or tribes, of whom we ſcarce know any thing but the names; as the Gapachi, Ptoemphanes, Catadupi, Pechini, Catadræ, &c.

5
Of the ſettlem of Ethi

In a country inhabited by ſuch a variety of nations, all in a ſtate of extreme barbariſm, it is rather to be wondered that we have any hiſtory at all, than that it is not more diſtinct. It has already been obſerved, that the Jews, from the authority of the ſacred writers no doubt, beſtowed the name of *Cuſh* upon the empire of Ethiopia; and it is generally agreed that Cuſh was the great progenitor of the inhabitants. In ſome paſſages of ſcripture, however, it would ſeem that *Cuſh* was an appellation beſtowed upon the whole peninſula of Arabia, or at leaſt the greater part of it. In others, the word ſeems to denominate the country watered by the Araxes, the ſeat of the ancient Scythians or Cuthites; and ſometimes the country adjacent to Egypt on the coaſt of the Red Sea.

6
People riginal from A bia.

A number of authors are of opinion, that Ethiopia received its firſt inhabitants from the country lying to the eaſt of the Red Sea. According to them, the deſcendants of Cuſh, having ſettled in Arabia, gradually migrated to the ſouth-eaſtern extremity of that country; whence, by an eaſy paſſage acroſs the ſtraits of Babelmandel, they tranſported themſelves to the African ſide, and entered the country properly called *Ethiopia*: a migration which, according to Euſebius, took place during the reſidence of the Iſraelites in Egypt; but, in the opinion of Syncellus, after they had taken poſſeſſion of Canaan, and were governed by judges. Mr Bruce makes mention of a tradition among the Abyſſinians, which, they ſay, has exiſted among them from time immemorial, that very ſoon after the flood, Cuſh the grandſon of Noah, with his family, paſſed through Atbara, then without inhabitants, till they came to the ridge of mountains which ſeparates that country from the high lands of Abyſſinia. Here, ſtill terrified with the thoughts of the deluge, and apprehenſive of a return of the ſame calamity, they choſe to dwell in caves made in the ſides of theſe mountains, rather than truſt themſelves in the plains of Atbara;

bara; and our author is of opinion, that the tropical rains, which they could not fail to meet with in their journey ſouthward, and which would appear like the return of the deluge, might induce them to take up their habitations in theſe high places. Be this as it will, he informs us that it is an undoubted fact, "that here the Cuſhites, with unparalleled induſtry, and with inſtruments utterly unknown to us, formed to themſelves commodious, yet wonderful, habitations in the heart of mountains of granite and marble, which remain entire in great numbers to this day, and promiſe to do ſo till the conſummation of all things."

9
cription
he city
Axum.

The Cuſhites having once eſtabliſhed themſelves among theſe mountains, continued to form habitations of the like kind in all the neighbouring ones; and thus following the different chains (for they never choſe to deſcend into the low country), ſpread the arts and ſciences, which they cultivated, quite acroſs the African continent from the eaſtern to the weſtern ocean. According to the tradition above-mentioned, they built the city of Axum early in the days of Abraham. This, though now an inconſiderable village, was anciently noted for its ſuperb ſtructures, of which ſome remains are ſtill viſible. Among theſe are ſome belonging to a magnificent temple, originally 110 feet in length, and having two wings on each ſide; a double porch; and an aſcent of 12 ſteps. Behind this ſtand ſeveral obeliſks of different ſizes, with the remains of ſeveral others which have been deſtroyed by the Turks. There is alſo a great ſquare ſtone with an inſcription, but ſo much effaced that nothing can be diſcovered excepting ſome Greek and Latin letters, and the word *Baſilius*. Mr Bruce mentions ſome "prodigious fragments of coloſſal ſtatues of the dog-ſtar" ſtill to be ſeen at this place: "and *Seir* (adds he), which, in the language of the Troglodytes, and in that of the low country of Meroe, exactly correſponding to it, ſignifies a *dog*, inſtructs us in the reaſon why this province was called *Sirè*, and the large river which bounds it *Siris*."

11
cription
peſti-
al fly.

Soon after building the city of Axum, the Cuſhites founded that of Meroe, the capital of a large iſland or peninſula formed by the Nile, much mentioned by ancient hiſtorians, and where, according to Herodotus, they purſued the ſtudy of aſtronomy in very early ages with great ſucceſs. Mr Bruce gives two reaſons for their building this city in the low country after having built Axum in the mountainous part of Abyſſinia. 1. They had diſcovered ſome inconveniences in their caves both in *Sirè* and the country below it, ariſing from the tropical rains in which they were now involved, and which prevented them from making the celeſtial obſervations to which they were ſo much addicted. 2. It is probable that they built this city farther from the mountains than they could have wiſhed, in order to avoid the fly with which the ſouthern parts were infeſted. This animal, according to Mr Bruce, who has given a figure of it, is the moſt troubleſome to quadrupeds that can be imagined. He informs us, that it infeſts thoſe places within the tropical rains where the ſoil is black and loamy, and no other place whatever. It is named *Zimb* (by whom we are not informed), and has not been deſcribed by any other naturaliſt. It is of a ſize ſomewhat larger than a bee, thicker in proportion, and having broader wings, placed ſeparate like thoſe of a fly, and quite colourleſs, or without any ſpots. The head is large, with a ſharp upper jaw; at the end of which is a ſtrong pointed hair about a quarter of an inch long; and the lower jaw has two of theſe hairs: all of which together make a reſiſtance to the finger equal to that of a ſtrong hog's briſtle. One or all of theſe hairs are uſed as weapons of offence to the cattle; but what purpoſe they anſwer to the animal itſelf, our author does not ſay. So intolerable, however, are its attacks to the cattle, that they no ſooner hear its buzzing, than they forſake their food, and run about till they fall down with fright, fatigue, and hunger. Even the camel, though defended by a thick and ſtrong ſkin with long hair, cannot reſiſt the punctures of this inſect; which ſeem to be poiſonous, as they produce large putrid ſwellings on the body, head, and legs, which at laſt terminate in death. To avoid this dreadful enemy, the cattle muſt all be removed as quick as poſſible to the ſandy parts of Atbara, where they ſtay as long as the rains laſt, and where this dreadful enemy never ventures to follow them. The elephant and rhinoceros, who, on account of the quantity of food they require, cannot remove to theſe barren places, roll themſelves in the mud, which, when dry, coats them over ſo hard, that they are enabled to reſiſt the punctures of the inſect; though even on theſe ſome tubercles are generally to be met with, which our author attributes to this cauſe. Mr Bruce is of opinion, that this is the fly mentioned by Iſaiah, chap. vii. 18. 19. 'And it ſhall come to paſs, in that day, that the Lord ſhall *hiſs* for the fly that is in the uttermoſt part of the rivers of Egypt; and they ſhall come and ſhall reſt all of them in the deſolate valleys, and in the holes of the rocks, and upon all thorns, and upon all buſhes." 'That is (ſays Mr Bruce), they ſhall cut off from the cattle their uſual retreat to the deſert, by taking poſſeſſion of theſe places, and meeting them there, where ordinarily they never come, and which therefore are the refuge of the cattle.'

Meroe, which lay in N. Lat. 16°, the exact limit of the tropical rains, was without the bounds aſſigned by nature to theſe deſtructive inſects; and conſequently a place of refuge for the cattle. Mr Bruce, on his return through the deſert, ſaw at Gerri, in this latitude, ruins, ſuppoſed to be thoſe of Meroe, and caves in the mountains immediately above them; for he is of opinion, that they did not abandon their caverns immediately after they began to build cities. As a proof of this, he mentions that Thebes, in Upper Egypt, was built by a colony of Ethiopians; and that near the ruins of that city, a vaſt number of caves are to be ſeen even up to the top of a mountain in the neighbourhood; all of which are inhabited at this day. By degrees, however, they began to exchange theſe ſubterranean habitations for the cities they built above ground; and thus became farmers, artificers, &c. though originally their ſole employment had been commerce.

12
Of the magnificence of the ancient Indians and Egyptians.

On this ſubject Mr Bruce has given a very curious diſſertation; though how far the application of it to the Ethiopians may be juſt, we cannot pretend to determine. He begins with obſerving, that the magnificence of the Indians and Egyptians has been celebrated from the moſt remote antiquity, without any account of the ſources from whence all this wealth was derived: and indeed it muſt be owned, that in all hiſtories of theſe people, there is a ſtrange deficiency in this reſpect. The kings, we are to ſuppoſe, derived their ſplendor and magnificence from their ſubjects; but we are quite at a loſs to know whence their ſubjects had it: and this ſeems the more ſtrange, that in no period of their hiſtory are they ever repreſented in a poor or mean ſituation. Nor is this difficulty confined to theſe nations alone. Paleſtine, a country producing neither ſilver nor gold, is repreſented by the ſacred writers as abounding in the early ages with both thoſe metals in a much greater proportion than the moſt powerful European ſtates can boaſt of, notwithſtanding the vaſt ſupplies they derive from the lately diſcovered continent of America. The Aſſyrian empire, in the time of Semiramis, was ſo noted for its wealth, that M. Monteſquieu ſuppoſes it to have been obtained by the conqueſt of ſome more ancient and richer nation; the ſpoils of which enriched the Aſſyrians, as thoſe of the latter afterwards did the Medes. This, however, Mr Bruce very juſtly obſerves, will not remove the difficulty, becauſe we are equally at a loſs to know whence the wealth was derived to that former nation; and it is very unuſual to find an empire or kingdom of any extent enriched by conqueſt. The kingdom of Macedon, for inſtance, though Alexander the Great over-ran and plundered in a very ſhort time the richeſt empire in the world, could never vie with the wealth of Tyre and Sidon. Theſe laſt were commercial cities; and our author juſtly conſiders commerce as the only ſource from whence the wealth of a large kingdom ever was or could be derived. The riches of Semiramis, therefore, were accumulated by the Eaſt India trade centring for ſome time in her capital. While this was ſuffered to remain undiſturbed, the empire flouriſhed: but by an abſurd expedition againſt India itſelf, in order to become miſtreſs at once of all the wealth it contained, ſhe loſt that which ſhe really poſſeſſed; and her empire was ſoon after entirely ruined. To the ſame ſource he attributes the riches of the ancient Egyptians; and is of opinion, that Seſoſtris opened up to Egypt the commerce with India by ſea; though other authors ſpeak of that monarch in very different terms. As the luxuries of India have ſome how or other become the objects of deſire to every nation in the world, this eaſily accounts for the wealth for which Egypt has in all ages been ſo much celebrated, as well as for that with which other countries abounded; while they ſerved as a medium for tranſmitting theſe luxuries to other nations, and eſpecially for the riches of thoſe which naturally produced the Indian commodities ſo much ſought after. This was the caſe particularly with Arabia, ſome of the productions of which were very much coveted by the weſtern nations; and being, beſides, the medium of communication between the Eaſt Indies and weſtern nations, it is eaſy to ſee why the Arabian merchants ſoon became poſſeſſed of immenſe wealth.

Beſides the territories already mentioned, the Cuſhites had extended themſelves along the mountains which run parallel to the Red Sea on the African ſide; which country, according to Mr Bruce, has "in all times been called *Saba*, or *Azabo*, both which ſignify *South*;" an epithet given from its lying to the ſouthward of the Arabian gulf, and which in ancient times was one of the richeſt and moſt important countries in the world. "By that acquiſition (ſays our author), they enjoyed all the perfumes and aromatics in the eaſt; myrrh, and frankincenſe, and caſſia; all which grow ſpontaneouſly in that ſtripe of ground from the Bay of Bilur weſt of Azab to Cape Gardefan, and then ſouthward up in the Indian ocean, to near the coaſt of Melinda, where there is cinnamon, but of an inferior kind." As the Cuſhites or Troglodytes advanced ſtill farther ſouth, they met not only with mountains, in which they might excavate proper habitations, but likewiſe with great quantities of gold and ſilver furniſhed by the mines of Sofala, which, our author ſays, furniſhed "large quantities of both metals in their pure and unmixed ſtate, lying in globules without any alloy or any neceſſity of preparation or ſeparation." In other parts of his work, he labours to prove Sofala to have been the *Ophir* mentioned in ſcripture.

13
The eth
pians at
firſt a ci
lized an
learned
people.

Thus the Ethiopians, for ſome time after their ſettlement, according to Mr Bruce, muſt have been a nation of the firſt importance in the world. The northern colonies from Meroe to Thebes built cities, and made improvements in architecture; cultivated commerce, agriculture, and the arts; not forgetting the ſcience of aſtromomy, for which they had an excellent opportunity by reaſon of the clearneſs of the ſky in the Thebaid. Their brethren farther to the ſouth, or thoſe who inhabited Ethiopia properly ſo called, were confined for ſix months to their caves by reaſon of the tropical rains, whence they were naturally led to purſuits of another kind. "Letters *, at leaſt one kind of them, and arithmetical characters (we are told), were invented by this middle part of the Cuſhites; while trade and aſtronomy, the natural hiſtory of the winds and ſeaſons, were what neceſſarily employed that part of the colony eſtabliſhed at Sofala moſt to the ſouthward."

14
Accoun
the Eth
pian Sh
herds.

While the Cuſhites were thus employed at home in collecting gold, gathering and preparing ſpices, &c. theſe commodities were ſent abroad into other countries by another ſet of people named *Shepherds*, who acted as carriers to them, and who afterwards proved ſo formidable to the Egyptians †. Theſe differed in their appearance from the Ethiopians, having long hair, and the features of Europeans; and were of a very dark complexion, though not at all like the blackmoors or negroes. They lived in the plain country in huts or moveable habitations, attending their cattle, and wandering up and down as various circumſtances required. By acting as carriers to the Cuſhites, they became a great and powerful people, poſſeſſing vaſt numbers of cattle, as well as a very conſiderable extent of territory. They poſſeſſed a ſtripe of land along the Indian ocean; and to the northward of that, another along the Red-Sea: but their principal habitation was the flat part of Africa between the northern tropic and the mountains of Abyſſinia, which country is now called *Beja*. This reaches from Maſuah along the ſea-coaſt to Suakem; then turns weſtward, and continues in that direction, having the Nile on the ſouth, the tropic of Cancer on the north, with the deſerts of Selima and Libya on the weſt. The next diſtrict belonging to theſe people was Meroe, now called *Atbara*, lying between the rivers Nile and Aſtaboras. A third diſtrict, now called *Derkin*, is a ſmall plain lying between the river Mareb on the eaſt and Atbara on the weſt But the moſt noble and warlike of all the Shepherds were thoſe who poſſeſſed the mountains

---

† See *E gypt*, n°

mountains of Habab, reaching from the neighbourhood of Maſuah to Suakem; which diſtrict is ſtill inhabited by them.

15
ferent ſes of n.

Theſe Shepherds, according to our author, were diſtinguiſhed by ſeveral different appellations, which may be ſuppoſed to denote different degrees of rank among them. Thoſe called ſimply *Shepherds*, our author ſuppoſes to have been the common ſort who attended the flocks. Another ſet were called *Hycſos* or *Agſos*, ſignfying "armed ſhepherds," who are ſuppoſed to have been the ſoldiers. A third were named *Agag*, ſuppoſed to be the chiefs or nobles of theſe armed ſhepherds; whence the title of *king of kings*, according to Mr Bruce, is derived; and he ſuppoſes *Agag* killed by Samuel, to have been an Arabian ſhepherd.

16
aſon of enmity ween Shep- ds and yptians.

The building of Carthage augmented the power of the Shepherds to a conſiderable degree, by reaſon of the vaſt quantity of carriage naturally belonging to a place of ſuch extenſive commerce, and which fell into the hands of the Lehabim, Lubim, or Libyan peaſants. An immenſe multitude of camels, in the early ages, anſwered the purpoſe of navigation: and thus we find that commerce was carried on by the Iſhmaelites as early as the days of Joſeph from the ſouthern extremity of the Arabian peninſula. Theſe Shepherds, however, though generally the friends and allies of the Egyptians, who were alſo Cuſhites, ſometimes proved very bitter enemies to them, as is related in the hiſtory of that country. The reaſon of this may be deduced from the great oppoſition betwixt their manners and cuſtoms. The Egyptians worſhipped black cattle, which the Shepherds killed and uſed as food; the latter worſhipped the heavenly bodies, while the Egyptians were the groſſeſt idolaters, and worſhipped idols of all kinds that can be imagined. Hence a mere difference in religion might occaſion many bloody quarrels; though if the above account can be depended upon as authentic, it is natural to imagine that the mutual connection of intereſt ſhould have cemented their friendſhip, whatever difference there might happen to be in opinions of any kind.

17
igin of diffe- t Ethio- n na- ns.

Beſides the Cuſhites and Shepherds, however, we muſt now ſeek for the origin of thoſe different nations which have already been mentiond. Mr Bruce allows that there are various nations inhabiting this country, who are fairer than either the Cuſhites or the Shepherds, and which, though they have each a particular name, are all known by the general title of *Habeſh:* which may be tranſlated by the Latin word *convenæ*, ſignifying a number of diſtinct people meeting accidentally in one place; and which our author maintains againſt Scaliger, Ludolf, and a number of others, to be a very juſt tranſlation, and exceedingly conſonant to the hiſtory of the country.

18
ſt ſettle- nt of E- opia, ac- ding to Abyſ- lian hi- ry.

The moſt authentic ancient hiſtory of this country, according to Mr Bruce, is the chronicle of Axum: the character of which, among the modern Abyſſinians, ſtands next to the ſacred writings themſelves; and conſequently muſt be eſteemed the higheſt Abyſſinian authority we have on the ſubject. According to this book, there was an interval of 5500 years between the creation of the world and the birth of Chriſt; 1808 years before which laſt event the empire of Abyſſinia or Ethiopia received its firſt inhabitants. Two hundred years after its ſettlement, it was ſo deſtroyed by a flood that it received the name of *Ouré Midra*, or a country laid waſte; "or (ſays our author) as it is called in ſcripture itſelf, *a land which the waters or floods had ſpoiled*," (Iſaiah xviii. 2.) The peopling of the country was finiſhed about 1400 years before Chriſt, by the ſettlement of a great number of people, ſpeaking different languages, who ſat down peaceably in the high lands of Tigre, in the neighbourhood of the Shepherds, with whom they were in friendſhip. Theſe people, according to tradition, came from Paleſtine; and our author is inclined to believe the whole of the relation to be true, as the time coincides with the expulſion of the Canaanitiſh nations by Joſhua, which happened about 1490 B. C. ten years before which there had been, according to Pauſanias, a flood in Ethiopia which occaſioned prodigious devaſtation. Ethiopia, he thinks, would afford the moſt ready aſylum for the fugitive Canaanites, as they muſt have long had a commercial intercourſe with that country; and he ſupports the opinion likewiſe from what Procopius mentions of two pillars extant in his time, on the coaſt of Mauritania, with the following inſcription in the Phœnician language: "We are Canaanites, flying from the face of Joſhua, the ſon of Nun, the robber." The authenticity of theſe inſcriptions, however, is much diſputed, and therefore it cannot go a great way in eſtabliſhing any hiſtorical point. The firſt and moſt conſiderable of the colonies above mentioned ſettled in the province of Amhara; the ſecond in Damot, one of the ſouthern provinces; the third in another province called *Laſta*, or *Tcheratz-Agow*, from *Tchera* their principal habitation; and a fourth in the territory of Gafat.

19
The country laid waſte by a deluge.

20
Ethiopia conquered by Moſes.

Our author goes on to prove, that the Ethiopians in ancient times were not only the moſt learned people in the world, but that they ſpoke the original language, and were the inventors of writing. In what manner they came to degenerate from this character, and into their preſent ſtate of barbarity, cannot be known; this being a phenomenon equally unaccountable with the degeneracy of the Egyptians. According to ſome authors, the Ethiopians were conquered by Moſes: of which tranſaction we have the following account. Before the time of that legiſlator, the Ethiopians poſſeſſed the country of Thebais in Egypt: but, not content with this, they made an irruption into the Lower Egypt, and penetrated as far as Memphis; where, having defeated the Egyptians, they threatened the kingdom with total deſtruction. The Egyptians, by the advice of their oracles, put Moſes at the head of their forces; who immediately prepared for invading the enemy's country. The Ethiopians imagined that he would march along the banks of the Nile; but Moſes choſe rather to paſs through ſome of the interior countries, though greatly infeſted with ſerpents, and where conſequently his march muſt be attended with much danger. To preſerve his men, he conſtructed a number of cheſts or panniers of the Egyptian reed papyrus, which he filled with the birds named *Ibis*, celebrated for their antipathy to ſerpents. As ſoon as he approached the tract abounding with theſe reptiles, a ſufficient number of the birds were let out, who preſently cleared the way for the army by deſtroying the ſerpents. Thus the Ethiopians were ſurpriſed in their own country where they had dreaded no invaſion; their forces, being defeated in the field, were at laſt ſhut up in the capital Meroe, a city almoſt impregnable, by being ſurrounded with three rivers, the Nile, Aſtapus, and Aſtaboras. The daughter of the Ethiopian monarch, however, having an opportunity of ſeeing Moſes from the walls, fell in love with him, and offered to deliver up the city, provided he would ſwear to marry her. With this requiſition the Jewiſh legiſlator complied; but treated the inhabitants with great ſeverity, plundering the city, and putting many of the inhabitants to death. After this he ravaged the whole country, diſmantling all the places of ſtrength; and having thus rendered the Ethiopians incapable of attempting any thing againſt other nations for a conſiderable time, he returned in triumph to Egypt, after an abſence of ten years.

21 Of the queen of Sheba.

From the time of Moſes to that of Solomon there is a chaſm in the Ethiopic hiſtory. After this, however, we are furniſhed with ſome kind of regular accounts. The hiſtory commences with the queen of Sheba, who came to viſit the Jewiſh monarch, and whom the Abyſſinians ſuppoſe to have been ſovereign of Ethiopia Propria: but Mr Bruce is of opinion that ſhe was only ſovereign of that territory on the eaſtern coaſt of Africa named *Saba*, which he ſays ought to be her title inſtead of *Sheba*. In favour of this opinion he likewiſe urges, that it was cuſtomary for the Sabeans, or inhabitants of the African diſtrict named *Saba*, to be governed by women; whereas thoſe who inhabited the oppoſite ſide of the Arabian gulf, and who were named *Sabæan Arabs* or *Homerites*, were not only governed by kings, but would not allow their ſovereigns to go abroad any where under pain of being ſtoned to death. The Abyſſinians, as has been already hinted, claim her for their ſovereign; and he informs us, that having received an account from Tamerin, an Ethiopian merchant, of the ſurpriſing wiſdom and wealth of Solomon, ſhe undertook the journey mentioned in Scripture, to aſcertain the truth of the report. In this ſhe was attended by a great many of her nobility, carrying along with her alſo magnificent preſents for the monarch ſhe intended to viſit. According to the Abyſſinian hiſtorians, ſhe was a pagan at the time this journey was undertaken; but being ſtruck with admiration at the ſight of Solomon's grandeur, and the wiſdom he diſplayed, ſhe became a convert to the true religion. Another part of her hiſtory, by no means inconſiſtent with the character of Solomon, is, that ſhe returned in a ſtate of pregnancy; and within a year was delivered of a ſon, named *David* by Solomon; but by his mother *Menilek*, *Menelech*, or *Menelebeck*; that is, *another ſelf*. When he grew up, he was ſent to be educated at the court of his father Solomon; where having ſtaid ſome time, he was accompanied home by many doctors of the law, and other Iſraelites of diſtinction, particularly Azariah the ſon of Zadoc the high-prieſt. By theſe the Jewiſh religion was eſtabliſhed in Abyſſinia, where it continued till the introduction of Chriſtianity. The princeſs we ſpeak of is named *Makeda*, *Balkis*, or *Bulkis*, by the Abyſſinians. By our Saviour, and in the Ethiopic verſion of the Scriptures, ſhe is ſtyled *The Queen of the South*, and is ſaid to have come from the uttermoſt parts of the earth or of the habitable world. Hence the compilers of the Univerſal Hiſtory have inferred, that the princeſs ſtyled *The Queen of Sheba* in Scripture was really ſovereign of Ethiopia. "Ethiopia (ſay they) is more to the ſouth of Judæa than the territory or kingdom of Saba in Arabia Felix; conſequently has a better claim than that country for the dominions of the princeſs whom our Saviour calls *The Queen of the South*. Ethiopia is ſtyled *the remoteſt part of the habitable world* by Herodotus and Strabo; and therefore better agrees with what our Saviour has ſaid of the queen of Sheba, that ſhe came from 'the uttermoſt parts of the earth,' than Arabia. Nor can it be deemed a ſufficient reply to this argument, that Arabia Felix was the uttermoſt part of the earth in reſpect to Judæa, ſince it was bounded by the Red Sea: for that not only Egypt, but even Ethiopia, regions beyond that ſea, were known to, and had a communication with, the Jews, both before and in our Saviour's time, is indiſputably clear. Laſtly, from what has been ſuggeſted, it appears no improbable conjecture, that Judaiſm was not only known, at leaſt in a part of Ethiopia, but nearly related to the eſtabliſhed religion there, at the beginning of the apoſtolic age, if not much earlier. After all, theſe two opinions, ſo contrary in appearance, may be made conſiſtent without great difficulty; ſince it is agreed, that Arabia and Ethiopia have anciently borne the ſame name, been included during certain intervals in one empire, and governed by one prince. Part of the Arabs and Ethiopians had the ſame origin, and very conſiderable numbers of the Abaſeni tranſported themſelves from Arabia Felix into Ethiopia; a circumſtance which ſufficiently proves the intercourſe that formerly ſubſiſted between the Cuſhites or Ethiopians of Aſia and Africa."

The Abyſſinian hiſtorians farther inform us, that the young prince Menilek was anointed and crowned king in the temple of Jeruſalem, before he returned to his own country; that Azarias was conſtituted high-prieſt; that he brought with him an Hebrew tranſcript of the law; and though this book is now loſt, having been burnt along with the church at Axum, the office is ſtill continued in the line of Azarias, whoſe ſucceſſors are ſtyled *Nebrits*, *high-prieſts*, or *keepers of the church*, in that city; both church and ſtate being modelled exactly after that of Jeruſalem. Makeda continued to enjoy the ſovereignty for 40 years; and the laſt act of her reign was to ſettle the ſucceſſion to the throne. By this act the crown was declared hereditary in the family of Solomon for ever; it was alſo determined, that after her no woman ſhould be intitled to wear the crown or act as ſovereign of the country; but that the ſovereignty ſhould deſcend to the moſt diſtant heirs male, rather than to the females, however near; which two articles were to be conſidered as fundamental laws of the empire, not to be aboliſhed. Laſtly, that the male heirs of the royal family ſhould always be ſent priſoners to a high mountain, where they were to be confined till they ſhould be called to the throne, or as long as they lived This cuſtom, according to Mr Bruce, was peculiar to Abyſſinia; the neighbouring Shepherds being accuſtomed to have women for their ſovereigns, which prevailed in the laſt century, and perhaps does ſo at preſent.

Makeda having eſtabliſhed theſe laws in ſuch a manner as not to be revocable, died in the year 986 B. C. The tranſactions of her ſon Menilek after his acceſſion are not pointed out, farther than that he removed his capital to Tigré. His reign can by no means be accounted proſperous; ſince in his time the empire was invaded by Shiſhak or Seſac the king of Egypt, who plundered the temple of Jeruſalem under Rehoboam. The like fate attended a rich temple which had been built at Saba the capital of the Ethiopian empire, and which might very probably occaſion the removal of the imperial ſeat to Tigré, as already mentioned. It is indeed pretty plain from Scripture, that Ethiopia, or great part of it, was ſubject to this monarch; as the Ethiopians or Cuſhites mentioned in his army which invaded Judæa, are joined with the Lubims or Libyans, and muſt therefore be accounted inhabitants of Ethiopia Proper. This is indeed no ſmall confirmation of the opinion of Sir Iſaac Newton, who agrees with Joſephus in ſuppoſing Shiſhak to have been the celebrated Seſoſtris of profane hiſtorians. Thus far we are certain, that in the paſſage of Scripture juſt now alluded to, the ſacred hiſtorian indirectly aſcribes the ſovereignty of Ethiopia to Shiſhak; and we do not find it any where hinted that another Egyptian monarch was poſſeſſed of this ſovereignty. Herodotus alſo plainly tells us, that Seſoſtris was maſter of Ethiopia, and that no other Egyptian but himſelf ever poſſeſſed that empire.

22 thiopia nquered Shiſh. k

23 volu- ns after time of ſhak.

During the reign of Shiſhak we know no particulars concerning the Ethiopians; but after his death, Sir Iſaac Newton is of opinion that they defended Egypt againſt the Libyans, who had taken an opportunity of invading the country during the civil war which took place on the death of that great conqueror. In about ten years afterwards, however, according to the ſame author, they became aggreſſors; drowned the ſucceſſor of Shiſhak in the Nile, and ſeized on the whole kingdom; at which time Libya fell alſo into their hands. In the time of Aſa king of Judah, we find the combined hoſt of the Ethiopians and Lubims or Libyans making an attack on the territories of that prince, to the number of more than a million. This may be reckoned a conſiderable confirmation of the piece of hiſtory juſt mentioned; as it is not eaſy to conceive how the two ſhould combine in ſuch a manner, unleſs Zerah was maſter of both. The total overthrow which the allied army received from Aſa, gave the inhabitants of Lower Egypt an opportunity of revolting; who being ſuſtained by an army of 20,000 auxiliaries from Phœnicia and Paleſtine, obliged Memnon, ſuppoſed to be the ſame with Amenophis, to retire to Memphis. Soon after this he was forced to leave Egypt altogether, and to retire into Ethiopia; but in about 13 years he returned with his ſon Rameſſes at the head of a powerful army, and obliged the Canaanitiſh forces to retire out of the Lower Egypt; a tranſaction denominated by the Egyptian writers the *ſecond expulſion of the Shepherds.*

24 feat of rah by a king Judah.

25 Menes his ſuc- ors.

Sir Iſaac Newton is of opinion, that the Egyptian princes Menes, Memnon, and Amenophis, were the ſame perſon; and that by him Memphis was either originally built or firſt fortified, in order to prevent the Egyptians from entering Ethiopia. He is alſo ſuppoſed to have been the ſon of Zerah, and to have died in a very advanced age about 90 years after the deceaſe of Solomon. Thus, according to Sir Iſaac Newton's chronology, the moſt remarkable tranſactions of antiquity will be brought lower by ages than by the uſually received computations. According to this, the Argonautic expedition happened in the time of Amenophis; though ſome Greek writers inform us, that the ſame prince aſſiſted Priam king of Troy with a body of forces. He was ſucceeded by Rameſſes, already mentioned, who built the northern portico of the temple of Vulcan at Memphis. The next was Mœris; who adorned Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cheops, Caphrenus, and Mycerinus, ſucceeded in order to Mœris; the laſt being ſucceeded by his ſiſter Nitocris. In the reign of Aſychis her ſucceſſor, both Ethiopia and Aſſyria revolted from Egypt; which, being now divided into ſeveral ſmall kingdoms, was quickly ſubdued by Sabacon or So, the emperor of Ethiopia. This monarch, ſoon after his acceſſion to the throne of Egypt, allied himſelf with Hoſhea king of Iſrael; by which means the latter was induced to revolt from the Aſſyrians; and in conſequence of this, an end was put to the kingdom of Iſrael by Shalmaneſer king of Aſſyria, in the 24th year of the era of Nabonaſſar, and 720th before the commencement of the Chriſtian era. According to Herodotus, this monarch voluntarily reſigned the crown of Egypt after he had enjoyed it 50 years; but Africanus relates, that after a reign of eight years, he died in Egypt, in the ninth year of Hezekiah king of Judah. His ſucceſſor Sethon, ſuppoſed to be the Sevechus of Manetho, advanced to Peluſium with a powerful army againſt Sennacherib king of Aſſyria; when the bowſtrings of the Aſſyrians were gnawed in pieces by a great number of rats or mice, and thus they were eaſily defeated with great ſlaughter by the Egyptians. Hence Herodotus informs us, that the ſtatue of Sethon which he ſaw in Egypt had a mouſe in its hand. Sir Iſaac Newton, however, explains the whole in an allegorical manner. As the mouſe among the Egyptians was a ſymbol of deſtruction, he conjectures, that the Aſſyrians were on this occaſion overthrown with great ſlaughter; and that Sethon, in conjunction with Terhakah, either king of the Arabian Cuſhites, or a relation of Sethon and his viceroy in Ethiopia Proper, ſurpriſed and defeated Sennacherib betwixt Libnah and Peluſium, making as great ſlaughter among his troops as if their ſhield-ſtraps and bowſtrings had been deſtroyed by mice.

26 Sennacherib defeated by Sethon.

27 Ethiopia ſubdued by Eſarhaddon.

In the 78th year of the era of Nabonaſſar, the empire of Ethiopia was ſubdued by Eſarhaddon king of Aſſyria; who held it three years, committing enormous cruelties both in that country and in Egypt. After his death the Ethiopians ſhook off the yoke, and maintained their independency till the time of Cyrus the Great the firſt king of Perſia; who, according to the Greek hiſtorian Xenophon, ſeems to have alſo been ſovereign of Ethiopia. After his death they revolted, and his ſon Cambyſes unſucceſsfully attempted to reduce them. Herodotus informs us, that before he undertook this expedition, he ſent ſome of the Ichthyophagi ambaſſadors to the king of the Macrobii or long-lived Ethiopians, under pretence of ſoliciting his friendſhip, but in reality to obſerve the ſtrength of the country. Of this the Ethiopian prince was aware, and told the ambaſſadors that he knew their deſign, reproached Cambyſes with his injuſtice and ambition, and gave them his bow; telling them at the ſame time, that the

28 Unſucceſsful expedition of Cambyſes againſt this country.

Perſians might think of invading Ethiopia when they could eaſily bend it; and in the mean time, that their maſter ought to thank the gods who had never inſpired the Ethiopians with a deſire of extending their territories by conqueſt. Cambyſes had ſent by the ambaſſadors a rich purple robe, gold bracelets, a box of precious ointment, a veſſel full of palm wine, and other things, which he imagined would be acceptable to the Ethiopian monarch. But all theſe, excepting the wine, were deſpiſed. This, he owned, was ſuperior to any liquor produced in Ethiopia; and he did not ſcruple to intimate, that the Perſians, ſhort-lived as they were, owed moſt of their days to the uſe of this excellent liquor. Being informed by the ambaſſadors, that a conſiderable part of the food made uſe of by the Perſians was bread, he ſaid that it was no wonder to find people who lived on *dung* unable to attain the longevity of the Macrobian Ethiopians. In ſhort, the whole of his anſwer was ſo contemptuous and diſguſting, that Cambyſes was filled with the greateſt indignation; in conſequence of which, he inſtantly began his march without taking time to make the neceſſary preparations, or even to procure proviſions of any kind for his army. Thus a famine enſued among them; which at laſt became ſo grievous, that the ſoldiers were obliged to eat one another: and Cambyſes himſelf, finding his life in great danger, was obliged to give orders for marching back again; which was not accompliſhed without the loſs of a great number of men. Another army which he ſent on an expedition againſt Ammonia, in order to deſtroy the celebrated oracle of Jupiter Ammon, periſhed entirely in the deſarts, being overwhelmed with the vaſt clouds of ſand frequently raiſed there by the wind.

29
Ethiopia at this time a powerful empire.

30
Ethiopia ſuppoſed by Sir Iſaac Newton to have been conquered by Cambyſes.

At this time, it is doubtful whether Cambyſes would have accompliſhed his purpoſe even if he had found it practicable to march into the heart of Ethiopia. This empire had but a ſhort time before received a very conſiderable acceſſion of ſtrength by the deſertion of 240,000 Egyptians who had been poſted by Pſammenitus in different places on the frontiers. Theſe not having been relieved for three years, had gone over at once to the emperor of Ethiopia, who placed them in a country diſaffected to him; ordering them to expel the inhabitants, and take poſſeſſion of their lands. Notwithſtanding this, however, Sir Iſaac Newton hints, that Cambyſes conquered Ethiopia about the 223d or 224th year of the era of Nabonaſſar; but his opinion in this reſpect does not appear to be well founded. We are told indeed, that the Perſian monarch, notwithſtanding the misfortunes he met with in the expedition above mentioned, did really make himſelf maſter of ſome of the Ethiopic provinces which bordered on Egypt; and that theſe, together with the Troglodytes, ſent him an annual preſent of two chænixes of unrefined gold, 200 bundles of ebony, five Ethiopian boys, and 20 elephants teeth of the largeſt ſize: but it appears improbable to the laſt degree, that even though Cambyſes had employed the whole of his reign in the attempt, he could have conquered the vaſt regions of Ethiopia Proper, Sennaar, and Abaſſia, which were all included in the Ethiopia of the ancients.

31
Ethiopians employed by Xerxes.

When Xerxes invaded Greece, we find his army, according to Herodotus, was partly compoſed of Ethiopians, of whom Herodotus mentions two diſtinct races of people. One of theſe inhabited the Aſiatic coaſt, and differed from the Indians only in their hair and language. Their arms were the ſame with thoſe of India; they wore helmets made of the ſkins of horſes, the ears and manes of which ſerved them for tufts and plumes of feathers; their ſhields being made of the ſkins of cranes. The hair of the Aſiatic Ethiopians was long, but that of the weſtern tribes was frizzled. The latter were alſo differently armed, having darts lighted at one end and covered with leather. We are not informed particularly from what nations theſe troops were brought, nor whether they were natural ſubjects of the king of Perſia or only auxiliaries: of conſequence we can conclude nothing certain concerning the dominion of the Perſian monarchs at this time over Ethiopia, farther than that they might poſſeſs ſome of the provinces next to Egypt; while the main body of the empire being in a ſtate of independence, and unconnected with other parts of the world, is not taken notice of by the hiſtorians of thoſe times.

32
Ethiopia conquered by Ptolemy Euergetes.

Though Alexander the Great had a deſire to know the ſources of the Nile, he did not ſuffer himſelf to be diverted by this curioſity from purſuing his grand expedition into Perſia. Ptolemy Euergetes, however, appears to have carried this curioſity to ſuch an extremity as to invade Ethiopia for no other purpoſe. It is ſurpriſing that the particulars of this expedition are not recorded by any hiſtorian, as it appears by an inſcription that he penetrated to the fartheſt parts of the empire, and conquered the moſt powerful nations in it. Of this we have the following account, which is looked upon by the beſt hiſtorians to be authentic. It was copied on the ſpot (being the weſtern entrance to Adule, one of the cities of Ethiopia) by Coſmas Egyptius, or, as ſome call him, Coſmas Indicopleuſtes, in the time of the emperor Juſtin I. by order of Eleſbaan king of the Axumites, and of which the following account is given by the perſon who copied it. "Here (ſays he), facing the road to Axuma, ſtood a chair of white marble, conſiſting of a ſquare baſe, a ſmall thin column at each angle of this baſe, with a larger wreathed one in the middle, a ſeat or throne upon theſe, a back and two ſides. Behind this chair there was a large ſtone three cubits high, which had ſuſtained conſiderable injury from time. This ſtone and chair contained an inſcription to the following purpoſe: 'Ptolemy Euergetes penetrated to the fartheſt parts of Ethiopia. He ſubdued Gaza, Agame, Signe, Ava, Tiamo or Tziamo, Gambela, Zingabene, Angabe, Tiama, Athagaos, Calaa, Semene, Laſine, Zaa, Gabala, Atalino, Bega, the Tangaitæ, Anine, Metine, Seſea, Rauſo, Solate, the territory of Rauſo, and ſeveral other kingdoms. Among the nations he reduced, were ſome inhabiting mountains always covered with a deep ſnow; and others ſeated upon ridges of hills, from whence iſſued boiling ſteams and craggy precipices, which therefore ſeemed inacceſſible. Having finally, after all theſe conqueſts, aſſembled his whole army at Adule, he ſacrificed to Mars, Neptune, and Jupiter; for his great ſucceſs, he dedicated this chair or throne to Mars.'

33
Conqueſt of Ethiopia by the Romans.

From the time of this conqueror to that of the emperor Auguſtus, we meet with nothing of any conſequence relating to Ethiopia Proper. The Roman forces having about this time been drawn out of Egypt

gypt in order to invade Arabia, Candace queen of Ethiopia, or perhaps rather of the iſland or peninſula of Meroe, took the opportunity of their abſence to make an irruption, with a numerous army, into the province of Thebais. As there was at that time no force to oppoſe her, ſhe met for ſome time with great ſucceſs; but hearing at laſt that Petronius, governor of Egypt, was in full march to attack her, ſhe retired into her own dominions. Petronius purſued her as far as Pſelcha, where with 10,000 men he gained an eaſy victory over 30,000 undiſciplined Ethiopian ſavages, armed only with poles, hatchets, and other clumſy or inſignificant weapons of a ſimilar nature. This victory was ſoon followed by the reduction of ſeveral fortreſſes; however, as the Roman ſoldiers were exceſſively incommoded by the heat of the climate, Petronius, notwithſtanding his ſucceſs, was obliged at laſt to retire. Soon after, Candace ſent ambaſſadors to Auguſtus himſelf with ſuch magnificent preſents, that the emperor is ſaid to have been thereby induced to grant her a peace on her own terms. From this time the Romans accounted themſelves maſters of Ethiopia: Auguſtus was complimented on the great glory he had acquired; and that he had, by reducing a country till that time unknown even to the Romans, finiſhed the conqueſt of Africa. No material alteration, however, took place in the affairs of Meroe in conſequence of this conqueſt, whether real or pretended. Pliny informs us that it had been governed by queens, who bore the title of Candace, for ſeveral generations before that time; and ſo it continued to be afterwards, as we learn from Scripture, where we are informed that, in the reign of Tiberius, the ſovereign of Ethiopia was ſtill named Candace. Some indeed are of opinion that the Candace mentioned in the Acts of the Apoſtles was the ſame with her who had been conquered by Auguſtus; but this ſeems by no means probable, as the interval of time is by far too long to be allowed for the reign of a ſingle princeſs.

34
ccount of
e Blem-
yes.

From an anecdote of the debauched emperor Heliogabalus, who was accuſtomed to confine his favourites, by way of diverſion, with old Ethiopian women, we may learn that ſome intercourſe took place between the two empires, and probably that the Ethiopians owned ſome kind of ſubjection to the Romans. The Blemmyes, a gang of monſtrous banditti, who inhabited the frontiers of Thebais, were vanquiſhed by the emperor Probus: but, towards the cloſe of the third century, we find them again become ſo powerful, that in conjunction with another nation called *Nobatæ*, who inhabited the banks of the Nile near the Upper Egypt, they committed ſuch depredations in the Roman territories, that Diocleſian was obliged to aſſign lands to the latter, and to pay both of them a conſiderable ſum annually, to deſiſt from their former practices. Theſe expedients did not anſwer the purpoſe; the ſavages continued their depredations till the time of the emperor Juſtinian, who treated them with more ſeverity, and obliged them to remain at peace. We are told by Procopius, that before the time of Diocleſian, the Roman territories extended ſo far into Ethiopia, that their boundaries were not 23 days journey from the capital, ſo that probably the whole empire had been in a ſtate of dependence on them.

35
Ethiopians converted to Chriſtianity by Frumentius.

From the time of this emperor to that of their converſion to Chriſtianity, we find nothing remarkable in the hiſtory of the Ethiopians. Three hundred and twenty-ſeven years are counted from the time of our Saviour to that of Abreha and Atzbeha, or from Abra and Aſba, who enjoyed the kingdom when the goſpel was preached in Ethiopia by Frumentius. This man was a kinſman and companion of a philoſopher named Meropius, a native of Tyre; who having travelled all over India, died on an iſland of the Red Sea. After his death Frumentius, with another named Ædeſius, who had alſo been his companion, were brought before the king of Ethiopia, to whom that iſland was ſubject. He took them into his ſervice; making the one his treaſurer and the other his butler. On the death of this prince, the queen conceived ſuch a favour for them, that ſhe refuſed to allow them to depart out of the kingdom; but committed the management of her affairs entirely to Frumentius, who made uſe of his influence to diffuſe the Chriſtian religion throughout the country, and at laſt was appointed biſhop of Axuma. It is ſaid, however, that the court and principal people, if not the nation in general, relapſed into idolatry, which continued to prevail till the year 521, when they were again converted by their king Adad, or Aidog.

36
The two kings refuſe to admit Arianiſm.

The two princes Abra and Aſba, who reigned jointly in Ethiopia in the time of Frumentius, lived in ſuch harmony together, that their friendſhip became almoſt proverbial. After being converted to Chriſtianity, they adhered ſtrictly to the orthodox doctrine, refuſing to admit an Arian biſhop into their country. In the time of the emperor Conſtantius, however, this hereſy was introduced, and greatly favoured by that monarch; and an attempt was made to depoſe Frumentius on account of his refuſal to embrace it.

37
Account of the war of the elephant.

The reign of theſe princes is remarkable for an expedition into Arabia Felix, called by the Mohammedan writers the war of the elephant, and which was undertaken on the following occaſion: The temple of Mecca, ſituated nearly in the middle of the Arabian peninſula, had been held in the greateſt veneration for near 1400 years; probably from the notion entertained by the people in the neighbourhood, that Adam pitched his tent on that ſpot. Here alſo was a black ſtone ſuppoſed to poſſeſs extraordinary ſanctity, as being that on which Jacob laid his head when he had the viſion of angels. The moſt probable account of the real origin of this temple, according to Mr Bruce, is, that it was built by Seſoſtris, and that he himſelf was worſhipped there under the name of Oſiris.

On account of the veneration in which this tower and idol were held by the Arabians, Mr Bruce ſuppoſes that the thought was firſt ſuggeſted of making it the emporium of the trade between India and Africa; but Abra, in order to divert it into another channel, built a very large temple near the Indian ocean in the country of the Homerites; and, to encourage the reſort of people to this new temple, he beſtowed upon it all the privileges of the former which ſtood in the city of Mecca. The tribe of Arabians named *Koreiſh*, in whoſe country Mecca ſtood, being exceedingly alarmed at the thoughts of having their temple deſerted, entered the new one in the night, burned all that could be conſumed, and beſmeared the remains with human excrements. Abra, provoked at this ſacrilege, 38 Miraculous deſtruction of the Ethiopian army.

crilege, aſſembled a conſiderable army, with which he inveſted Mecca, himſelf appearing on a white elephant, from whence the war took its name already mentioned. The termination of the war, according to the Arabian hiſtorians, was miraculous. A vaſt number of birds named *Ababil* came from the ſea, having faces like lions; each carrying in its claws a ſmall ſtone about the ſize of a pea, which they let fall upon the Ethiopian army in ſuch numbers, that every one of them was deſtroyed. At this time it is ſaid that the ſmall-pox firſt made its appearance; and the more probable account of the deſtruction of the Ethiopian army is, that they periſhed by this diſtemper.

39 Firſt appearance of the ſmall-pox.

40 Reconverſion to Chriſtianity under Eleſbaan.

41 Chriſtians perſecuted in Arabia.

The war of the elephant is ſuppoſed to have terminated in the manner above-mentioned about the year 360; from which time to that of Eleſbaan, named alſo *Caleb*, and probably the ſame with the Adad or Adag already mentioned, we meet with nothing remarkable in the Ethiopic hiſtory. He engaged in a war with the Homerites or Sabæans in Arabia Felix; whom he overthrew in battle, and put an end to their kingdom; after which he embraced the Chriſtian religion in token of gratitude for the ſucceſs he had met with In the time of this prince a violent perſecution of the Chriſtians took place in Arabia. The Jewiſh religion had now ſpread itſelf far into that peninſula; and in many places the profeſſors of it were become abſolute maſters of the country, inſomuch that ſeveral Jewiſh principalities had been erected, the ſovereigns of which commenced a ſevere perſecution againſt the Chriſtians. Among the reſt, one Phineas diſtinguiſhed himſelf by his cruelty, having prepared a great number of furnaces or pits filled with fire, into which he threw thoſe who refuſed to renounce Chriſtianity. The Chriſtians applied for relief to the emperor Juſtin; but he being at that time engaged in a war with the Perſians, could not interfere: however, in the year 522, he ſent an embaſſy to Eleſbaan, who was now alſo a member of the Greek church, intreating him to exert himſelf for the relief of the Chriſtians of Arabia. On this the emperor commanded his general Abreha, governor of the Arabian province Yemen, to march to the aſſiſtance of Aretas, ſon to a prince of the ſame name whom Phineas had burnt; while he himſelf prepared to follow with a more conſiderable force. But before the arrival of the Ethiopian monarch, young Aretas had marched againſt Phineas, and entirely defeated him. In a ſhort time afterwards the emperor himſelf arrived, and gave Phineas a ſecond defeat: but notwithſtanding theſe misfortunes, it does not appear that either the principality of Phineas or any of the other Jewiſh ones, was at this time overturned; though it ſeems to be certain, that at the time we ſpeak of, the Ethiopians poſſeſſed part of the Arabian peninſula. According to the Arabian hiſtorians, the war of the elephant, with the miraculous deſtruction of the Ethiopian army already mentioned, took place in the reign of Eleſbaan.

42 Cruelty of Phineas a Jewiſh prince.

43 He is defeated.

Some hiſtorians mention, that the Ethiopian monarchs embraced the doctrines of Mahomet ſoon after the impoſtor made his appearance; but this ſeems not to be well founded: though it is certain that the *Najaſhi* or Ethiopian governor of Yemen embraced Mahommedaniſm, and that he was related to the royal family. On this occaſion, however, the Ethiopians loſt all the footing they once had in Arabia; the governors being expelled by Mohammed and his ſucceſſors. They fled to the African ſide of the Red Sea with numbers of their ſubjects, where they erected ſeveral ſmall kingdoms, as Adel, Wypo, Hadea, Mara, and others which ſtill continue.

44 Ethiopians driven out of Arabia.

45 Number of Jews in Ethiopia increaſed.

During the conqueſts of the caliphs, the Jews were for ſome time every where driven out of their dominions, or oppreſſed to ſuch a degree that they voluntarily left them. Ethiopia offered them an aſylum: and in this country they became ſo powerful, that a revolution in favour of Judaiſm ſeemed ready to take place. One family had always preſerved an independent ſovereignty on a mountain called Samen, the royal reſidence being on the top of an high rock; and ſeveral other high and rugged mountains were uſed by that people as natural fortreſſes. Becoming by degrees more and more powerful, Judith the daughter of one of their kings formed a deſign of overturning the Ethiopian government, and ſetting aſide the family of Solomon, who had hitherto continued to enjoy the ſovereignty. This deſign was facilitated by ſeveral circumſtances. The empire had been weakened by an unſucceſful war, famine, and plague; the throne was poſſeſſed by an infant; and the abſurd cuſtom of confining the whole royal family on a rock named *Damo*, gave her an opportunity of cutting them all off at once by ſurpriſing that place. Fortunately, however, the king himſelf eſcaped the general cataſtrophe, and was conveyed by ſome of the nobility of Amhara to the province of Xoa or Shoa; by which means the line of Solomon was preſerved, and afterwards reſtored, though not till after a very conſiderable interval.

46 Royal family of Ethiopia maſſacred by Judith.

47 The king eſcapes.

48 Judith uſurps the throne.

Judith having by this maſſacre eſtabliſhed her own power, aſſumed the imperial dignity, though in direct oppoſition to an eſtabliſhed and fundamental law of the empire already mentioned, that no woman ſhould enjoy the ſovereign power. The people, however, ſeemed to have ſubmitted quietly to her government, as ſhe ſat on the throne for 40 years, and afterwards tranſmitted the ſovereignty to her poſterity; five of whom reigned ſucceſſively in this country. We are not furniſhed with any particulars concerning their reigns; farther than that, during them, the people were greatly oppreſſed. By ſome means, of which hiſtorians have not given any account, another revolution took place, and a new ſet of uſurpers, related to the family of Judith, but not their direct lineal deſcendants, ſucceeded to the throne. Theſe were Chriſtians, and governed with much greater lenity than the Jewiſh ſovereigns had done; but ſtill, being uſurpers, none of their tranſactions are recorded in the Abyſſinian annals, excepting thoſe of Lalibala, who was accounted a ſaint. He lived in the end of the 12th or beginning of the 13th century, and proved a great prince. At that time the Chriſtians in Egypt were grievouſly perſecuted by the Saracens, who had a particular abhorrence at maſons, builders, and ſtone-cutters; looking upon them as the chief promoters of idolatry by the ornaments they put upon their works. Theſe were joyfully received by Lalibala; who, by affording them an aſylum in his dominions, ſoon collected a great number. They were employed by him in hewing churches out of the ſolid rock, after the example of the ancient Troglodytic habitations; and many works of this kind

49 A new revolution takes place.

50 Chriſtians perſecuted in Egypt fly to Ethiopia.

51 libala lertakes liminiſh ſtream he Nile.

kind remain in the country to this day. He undertook, however, a ſtill more difficult and arduous taſk; no leſs than that of leſſening the ſtream of the Nile, and thus ſtarving the whole kingdom of Egypt now in the hands of his enemies, and who perſecuted thoſe of his religion. From the account given by Mr Bruce of this project, it appears that there really is a poſſibility in nature of accompliſhing it; not indeed by turning the courſe of the Nile itſelf, but by diverting that of many of its branches, which are the means of conveying into it the water ſupplied by the tropical rains, and by which it overflows its bank annually. We are likewiſe aſſured by the ſame author, that Lalibala ſucceeded in his enterprize ſo far as to divert the courſe of two large rivers from the Nile, and that they have ever ſince flowed into the Indian-ocean. He next proceeded to carry a level towards a lake named *Zacvia*, into which many rivers, whoſe ſtreams contribute to increaſe that of the Nile, empty themſelves; and had this been accompliſhed, there is no doubt that the loſs of ſo much water would have been very ſenſibly felt by the Egyptians. According to moſt hiſtorians, this enterprizing monarch was prevented by death from putting his deſign in execution; though Mr Bruce informs us of a written account at Shoa, in which it was aſſerted, that he was diſſuaded from it by certain monks, who told him, that by ſending down ſuch a quantity of water to the eaſtern and dry parts of Africa, theſe countries would ſoon become ſo fertile and populous that they would rival the empire of Ethiopia, or at leaſt withdraw their allegiance from it entirely. The remains of theſe works were ſeen by the Portugueſe ambaſſador in 1522.

52 eſtoration the line Solomon.

All this time the princes of the line of Solomon had been obliged to content themſelves with the ſovereignty of the province of Xoa or Shoa, without making any attempt to regain their former dignity; but they were unexpectedly reſtored without bloodſhed or diſturbance by Naacueto Laeb the grandſon of Lalibala above mentioned. This prince, being of a gentle and pacific diſpoſition, was perſuaded by a monk named *Tecla Haimanout*, greatly celebrated for his ſanctity, to reſign the crown, to which, though he received it from his father, he could not pretend any abſolute right. In conſequence of the mediation of this monk, therefore, it was agreed that Naacueto ſhould give up the empire to Icon Amlac the lineal deſcendant of Solomon, who then poſſeſſed the ſovereignty of Shoa. In conſequence of this a portion of lands ſhould be irrevocably and irredeemably aſſigned to him and his heirs; and he ſhould likewiſe be allowed ſome marks of ſovereignty as a teſtimony of his former grandeur. In this treaty, however, the good monk did not forget his own intereſt. He had founded a famous monaſtery in Shoa, and was primate of the whole empire under the title of *Abuna*. He now inſiſted that one third of the kingdom of Ethiopia ſhould be abſolutely ceded to himſelf for the maintenance of his own dignity, and the ſupport of the clergy, convents, &c. throughout the country; he alſo inſiſted that no native Abyſſinian ſhould ever enjoy the ſame dignity with himſelf, even though he ſhould have been choſen and ordained at Cairo, as was the cuſtom with the Abyſſinian prelates.

53 Uncertainty of the Abyſſinian hiſtory for a conſiderable time.

Theſe extraordinary terms were complied with, and Icon Amlac raiſed to the throne of Ethiopia. He did not, however, remove the ſeat of government from the province of Shoa; but continued at Tegulat the capital of that province during the whole of his lifetime, which continued 15 years after his acceſſion to the throne of Ethiopia. We are ignorant of the tranſactions of his reign, as well as that of ſeveral of his ſucceſſors; five of whom aſcended the throne in as many years. From this quick ſucceſſion Mr Bruce is of opinion, that a civil war had taken place among the candidates for the throne: but the Abyſſinian annals make no mention of this; neither have we any particular account of the tranſactions of the empire till the time of Amda Sion, who began to reign in 1312. He was the ſon of Wedem Araad, the youngeſt brother of Icon Amlac, and ſucceeded to the throne on the death of his father. He profeſſed the Chriſtian religion; but his practice ſeems to have been very oppoſite to its precepts. He began his reign with living publicly with a concubine of his father's; and quickly after committed inceſt with his two ſiſters. On this he was firſt exhorted to repentance, and then excommunicated, by Honorius, a monk greatly celebrated for his ſanctity, and who has ſince been canonized. The prince, enraged at this indignity, cauſed the ſaint to be ſeverely whipped through every ſtreet of his capital. That night the town was by ſome unknown means ſet on fire and reduced to aſhes: the clergy perſuaded the people, that the blood of Honorius had turned to fire as it dropped on the ground, and thus occaſioned the cataſtrophe; but the king ſuſpecting that the monks themſelves had been the incendiaries, baniſhed or impriſoned them all, ſo that their hopes of exciting an inſurrection were diſappointed; and being diſperſed into thoſe provinces where the inhabitants were moſtly Jews or Pagan, they were now obliged to apply to what was certainly more incumbent upon them, viz. the diffuſion of the knowledge of the goſpel.

54 Reign of Amda Sion.

55 He is excommunicated for inceſt.

56 The monks baniſhed.

While the king was buſied with the monks, one of the factors, who had been entruſted with ſome of his commercial intereſts, was aſſaſſinated by the Moors in the province of Ifat; on which, without making the leaſt complaint or expoſtulation, he aſſembled his troops, and with *ſeven* horſemen (A) fell upon the neareſt Mahometan ſettlements, maſſacring all he met without exception. Putting himſelf then at the head of his army, he proceeded in the moſt rapid career of deſolation, laying waſte the whole country with fire and ſword, and carrying off an immenſe booty.

57 His expedition againſt the Mahometans.

For ſome time the Moors were ſo ſurpriſed that they did not think of making oppoſition; but at laſt they took up arms, and attempted to ſurpriſe the

---

(A) On this Mr Bruce remarks, that "it has been imagined the number ſhould be increaſed to 70; but there would be little difference in the raſhneſs of the action." The word in the byſſinian annals which he tranſlates is *ſeven*; but if we increaſe the number at all, it ought more probably to be to *ſeven hundred* than ſeventy.

58
They attack his camp in the night without ſucceſs.

Abyſſinian monarch in his camp, hearing that he had ſent out moſt of his army in detachments. With this view they approached the camp in the night-time, expecting to have found the king and his few ſoldiers immerſed in ſleep. Unexpectedly, however, he had been joined by a conſiderable part of his army, whom he drew up in battle array to receive his enemies. An engagement enſued, in which the king behaved with great valour; killed the Mooriſh general with his own hand, and gained a complete victory. He then commanded ſuch of his ſoldiers as could not find houſes ready built, to build huts for themſelves, and a large tract of land to be plowed and ſown, as if he meant to ſtay in the country of the enemy during the rainy ſeaſon.

59
They ſubmit, but quickly revolt again.

The Mahometans now perceiving that they were in danger of being totally exterminated, willingly ſubmitted to the terms he pleaſed to impoſe upon them; while the monach conciliated the affections of his people by dividing among them the vaſt plunder he had acquired in this expedition.

The Moors no ſooner found themſelves freed from any apprehenſions of immediate danger, than they prepared for a new revolt. The king having intelligence of their deſigns, ſecretly prepared to ſubdue them before they could have time to bring their matters to a ſufficient bearing. The Moors, however, being better prepared than he expected, began hoſtilities by ſurpriſing and plundering ſome villages belonging to the Chriſtians, and deſtroying their churches. A moſt formidable combination had taken place; and as the conſequence of allowing the confederate rebels to join their forces might have been very dangerous, the king uſed his utmoſt endeavours to prevent it.

60
King of Hadea defeated and taken priſoner.

This deſign was in ſome meaſure facilitated by the ſuperſtition of Amano king of Hadea, one of the principal rebels. This man, by the advice of a conjurer in whom he put great confidence, inſtead of marching his troops to the aſſiſtance of his allies, remained at home with them, where he was defeated and taken priſoner by a detachment of the king's army. The governor of Amhara was next diſpatched againſt Saber-eddin the revolted governor of Fatigar, with orders to lay waſte the country, and uſe every method to force him to a battle, if he ſhould be diſinclined to venture it himſelf.

61
Another rebel chief defeated.

Theſe orders were punctually executed; Saber-eddin was compelled to ſtand an engagement, in which he was defeated; the victors plundered his houſe, and took his wife and children priſoners. But in the mean time intelligence was received of a new revolt among the Falaſha, who had aſſembled a great army, and threatened to become very formidable; their chief keeping a cloſe correſpondence with Saber-eddin, as well as with the king of Adel.

62
The Falaſha defeated.

Theſe, however, ſhared the ſame fate with the reſt, being entirely defeated by Tzaga Chriſtos another Abyſſinian general, who ſoon after joined the king with his whole army. This proved fatal to the rebel cauſe: Saber-eddin, no longer able to ſupport himſelf againſt the royal forces, was obliged to ſurrender at diſcretion, and all the reſt were quickly reduced; ſo that the king was at leiſure to march againſt the kings of Adel and Mara, who having now united their forces, reſolved to give him battle.

63
The king marches againſt Adel, Mara, &c.

At this the Abyſſinian monarch was ſo exaſperated, that he determined to take a moſt ample vengeance on his enemies. In the preſence of his whole army, therefore, and a monk of uncommon ſanctity dreſſed in the ſame habit in which he uſually performed divine ſervice, the king made a long ſpeech againſt the Mahometans.

64
His ſpeec
and oath
preſence
his army.

He recounted the many violences which they had committed; and of which the kings of Adel and Mara had been principal promoters. He enumerated many examples of murder, ſacrilege, &c. of which they had been guilty; ſetting forth alſo that they had carried off great numbers of Chriſtians into ſlavery, and that the view of making ſlaves was now a great motive with them for making war. He diſclaimed every idea of commencing hoſtilities from any avaricious motive; as a proof of which, he denied that he would accept of any part of the plunder for his own uſe; concluding with a declaration, that he was now about to ſwear on the holy euchariſt, that, "though but 20 of his army ſhould join him, he would not turn his back upon Adel or Mara, till he had either forced them to tribute and ſubmiſſion, or entirely extirpated them and annihilated their religion." After this ſpeech, he took the oath in the preſence of the whole army; who not only applauded him with loud ſhouts, but proteſted that they looked upon themſelves to be all bound by the oath he had taken.

65
Enthuſiaſ
of his
troops.

As he had mentioned in his ſpeech that the plunder had been purchaſed by the lives of their Chriſtian brethren, they determined to ſhow their abhorrence at keeping any of it on theſe terms. Taking lighted torches in their hands, therefore, they ſet fire to the whole plunder that had been amaſſed ſince the beginning of the war; and having thus reduced themſelves to a ſtate of poverty, they prepared to ſhow their Chriſtianity by thirſting, not after the wealth, but the blood of their enemies.

66
Exceſſive
ſuperſtitio
of both p
ties.

Notwithſtanding the enthuſiaſm of the whole army on this occaſion, the expedition was attended with great difficulties. Theſe aroſe principally from ſuperſtition; and as, on the one hand, the Abyſſinians were by this principle laid under conſiderable diſadvantages, their adverſaries on the other enjoyed equal advantages from no better cauſe. The Abyſſinians, according to Mr Bruce, are very credulous with reſpect to genii or ſpirits which go about doing miſchief in the dark. Hence they are afraid of travelling, but eſpecially of fighting, in the night-time; becauſe they imagine that the world is then entirely given up to theſe beings, who are put out of humour by the motions of men, or of any other terreſtrial creature. In the night-time therefore an Abyſſinian dares not even throw a little water out of a baſon, leſt it ſhould fall upon ſome ſpirit and provoke it to vengeance. The Moors, on the other hand, though equally fearful, ſecure themſelves againſt theſe inviſible enemies by means no leſs ridiculous than the fears themſelves. A verſe of the Koran, ſewed up in leather, and worn round their neck or arm, is ſufficient to defy the power of the moſt miſchievous genii. Under ſuch powerful protection, therefore, they laugh at the terrors of the Abyſſinians, and are on all occaſions ready to attack them in the night-time, and even chooſe that ſeaſon rather than any other for coming to an engagement. Senſible of this advantage, and encouraged by the little loſs which attended even a defeat in theſe nocturnal encounters, they determined on the preſent occaſion to avoid any pitched battles, and to content themſelves with haraſſing the king's army by continual ſkirmiſhes of

67
The king
troops ha
raſſed by
frequent
encounte

this kind. Thus, though the Abyſſinian monarch had always the advantage, his troops ſoon began to complain; and, on the commencement of the rainy ſeaſon, inſiſted on being allowed to return.—This was by no means agreeable to a prince of ſuch a martial diſpoſition as Amda Sion. He therefore told them, that, if they were afraid of rains, he would conduct them to a country where there were none; meaning Adel, which, though likewiſe within the limits of the tropical rains, has them at another ſeaſon than that in which they fall in Abyſſinia. Thus he perſuaded his army again to ſet forward: but was ſo grievouſly haraſſed by the nocturnal attacks of the Moors, that he was once more in danger of being deſerted; and when by his eloquence he had found means to diſſipate the apprehenſions of the ſoldiers, he was ſeized with ſuch a violent fever as threatened his life.

68
is ſeized
h a dan-
ous fe-

The ſoldiers now expected that they were ſoon to return; but while they indulged themſelves in the careleſſneſs which uſually attends an expectation of this kind, they accidentally received intelligence that the Moors, having aſſembled an army of 40,000 men, were in full march to attack them, and at a very ſmall diſtance. The king was now free from fever, but ſo weak that he fainted on attempting to put himſelf in readineſs for going out to battle. Still, however, his reſolution continued firm and unalterable; having recovered from his faint, waſhed and refreſhed himſelf, he made a ſpeech to his ſoldiers, filled with the moſt enthuſiaſtic expreſſions of confidence in the juſtice and goodneſs of the cauſe in which he was engaged, and in the continuance of the divine favour and protection. "As it never was my opinion (ſaid he), that it was my own ſtrength and valour, or their want of it, which has ſo often been the cauſe of preſerving me from their hands; ſo I do not fear at preſent that my accidental weakneſs will give them any advantage over me, as long as I truſt in God's power as much as I have ever done." By this ſpeech the drooping ſpirits of the Abyſſinians were revived; and they only begged that their monarch would now truſt to the valour of his troops, and not expoſe his perſon to ſuch danger as he had uſually done.

69
troops
earten-

He promiſed to comply with their requeſt; but matters were ſoon thrown into confuſion by a report that the Moors had poiſoned the wells and enchanted all the running water in the front of the army. The poiſoned wells, however, were eaſily avoided; and a prieſt of vaſt ſanctity was diſpatched a day's journey before the army to diſenchant the waters by his bleſſings; which, having the advantage of the good qualities of the element itſelf on their ſide, were doubtleſs more powerful than the ſpells of the infidels. Not content with this, the king cauſed a river to be conſecrated by the name of *Jordan*; but while his men were employed in bathing themſelves in this holy water, the *Fits-Auraris*, an officer who had been diſpatched with a party of men who always go before the Abyſſinian armies, was attacked and driven back on the main body by a detatchment of the enemy, who had along with them a number of women provided with drugs to poiſon and ſpells to enchant the waters.

70
y are
d with
nic, and
ſe to
ge.

On this a dreadful panic ſeized the whole army; who, unmindful of the promiſes made to their king. not only refuſe! to advance, but for the moſt part came to the reſolution of leaving their camp, and returning homewards without delay. The king, ſenſible that all was loſt if this pernicious ſcheme ſhould be adopted, did his utmoſt to encourage and perſuade them to return to their duty; but perceiving that nothing was to be gained by reaſoning with men ſo much terrified, he only requeſted that ſuch as could not be induced to fight, would not leave their places, but ſtand quiet ſpectators of the battle.

71
He begins the fight with a very few attendants.

Even this had very little effect: ſo that, finding the enemy now ready to make an attack, he ordered his maſter of the horſe, with only five others, to attack the left wing of the enemy; while he, with a ſmall party of his ſervants, made an attack on the right. This deſperate action was attended with ſucceſs. The king, notwithſtanding the weakneſs he yet laboured under, killed with his own hand two of the commanding officers of the enemy's right wing; while his ſon diſpatched another of conſiderable rank belonging to the left. This had ſuch an effect upon the whole Mooriſh army, that they began evidently to loſe courage; while the Abyſſinians, aſhamed of their conduct, now ruſhed furiouſly on to reſcue their prince from danger. The battle continued for ſome time with great obſtinacy; but at laſt the centre and left wing of the Moors were entirely defeated.

72
The Moors defeated,

The right wing, compoſed principally of Arabians, retired in a body; but, not knowing the country, they entered a deep valley ſurrounded by perpendicular rocks entirely covered with wood. The Abyſſinians, imagining they had nothing more to do, began to ſtrip and mangle the bodies of the killed and wounded; but the king, perceiving that the Arabians had brought themſelves into a ſituation from whence they never could be extricated, obliged his ſoldiers to deſiſt from this barbarous employment, and even killed two of them who diſobeyed his orders.

73
And almoſt entirely cut off.

The army was then divided into two parts, one of which ſurrounded the devoted Arabians, while the other was ſent a day's journey after the remainder of the Moors. Both parties proved equally ſucceſsful. The king with part of his diviſion attacked the Arabians in front, while the reſt rolled great ſtones down from the tops of the rocks upon them. By this they were thrown into ſuch confuſion, that being neither able to fly nor reſiſt, they were all killed to a man. The fate of the Moors was little better. The other diviſion of the Abyſſinian army found them lying round a large pool of water which they lapped like as many dogs. In this helpleſs ſituation there was nothing requiſite but to order them to be ſlaughtered; and this cruel order was executed with the utmoſt preciſion. The ſoldiers, imagining they ſhould now diſcharge their vow to heaven, wearied themſelves with ſlaughter; till at laſt, being almoſt ſatiated with blood, they made a few priſoners, among whom was Saleh king of Mara with his queen; the former of whom was hanged by order of Amda Sion, and the latter cut in pieces and her body given to the dogs by the ſoldiers.

74
Amda Sion purſues his advantage.

This ſignal victory was gained in the end of July 1316; but as the rains at that ſeaſon ſet in with violence, moſt of the army now again inſiſted on their returning home without delay. The king and principal officers, however, were of opinion, that the advantages ſo dearly purchaſed ought by all means to be purſued till they had either reduced the Mahometans to ſubjection, or at leaſt deprived them of all power to make attacks on the empire with any proſpect of ſucceſs. This opinion being adopted, the king ſent back the baggage, women, and others who could be of no uſe to the army; retaining only the veteran ſoldiers, who were able to encounter more than ſix times the number of ſuch enemies as he could expect to meet with. Advancing farther into the Mahometan territories, he took up his reſidence in a large town called *Zeyla*; from whence he, that very night, ſent out a detachment to ſurpriſe a large village in the neighbourhood named *Taraca*. This was executed with ſucceſs; the men were maſſacred, and the women kept to ſupply the places of thoſe who had been ſent away. Continuing ſtill to advance, he detached parties to lay waſte the countries all round; and in this expedition he had the good fortune to cut off two of the principal authors of the conſpiracy againſt him. He then proceeded to invade Talab and Abalge in the territories of the king of Adel. That monarch, now rendered deſperate by the view of approaching ruin, had aſſembled all the troops he could raiſe, in order to make one laſt effort againſt the enemy; but conducted himſelf with much leſs prudence than he ought to have done when contending with ſuch an experienced and vigilant adverſary. Amda Sion, confident of ſucceſs, took no leſs care how to prevent the enemy from eſcaping than how to gain the victory. For this purpoſe he diſpatched parties of horſe to lie in wait in all thoſe avenues by which he ſuppoſed that the Moors might attempt to make their eſcape; after which, falling furiouſly on the Adelians himſelf, and being well ſupported by his troops, he gained a complete victory; the king of Adel, with great numbers of his men, being killed on the ſpot, and almoſt all the reſt by the parties of horſe whom the Abyſſinian monarch had poſted in ambuſh to intercept them.

75 His further conqueſts.

76 Adel invaded.

77 The king of Adel defeated and killed.

As the loſs of this battle rendered the affairs of the Adelians quite deſperate, the three young princes, ſons to the late king, with their uncle, waited upon Amda Sion with rich preſents, which they laid at his feet in the moſt humble manner, putting their foreheads in the duſt, and intreating his pardon; profeſſing their ſubjection and readineſs to obey his commands, provided that he would ſpare the remainder of their country and property. To this the king made a very unfavourable reply, reproaching them with indignities done to himſelf; but eſpecially with the ſacrilege they had committed in burning churches and murdering prieſts, deſtroying alſo defenceleſs people in villages, merely becauſe they imagined that he would not protect them. To puniſh theſe and other crimes, he ſaid, he was now in the heart of their country; and he was determined never to turn his back upon Adel while he had ten men capable of drawing their ſwords; for which reaſon he commanded them to return and expect the approach of his army.

78 The princes of Adel ſubmit.

By this fierce ſpeech the brother and two eldeſt children of the king of Adel were ſo diſheartened, that they could not ſpeak; but the youngeſt ſon made a very ſpirited ſpeech, in which he attempted to ſoften the king by complimenting his valour, and ſhowing that it was unworthy of his character to puſh the war againſt a people who were already conquered and defenceleſs. All the anſwer he could obtain, however, was, that unleſs the queen with the reſt of the royal family, and the principal people of the nation, would come by to-morrow evening and ſurrender themſelves as the princes had done, he would lay waſte the territory of Adel, from the place where he ſat to the Indian ocean. On this the princes earneſtly requeſted their mother to ſubmit without reſerve to the clemency of the Abyſſinian monarch, and to wait upon him next morning; but ſhe was prevented from this by ſome of the nobility who had formerly adviſed the war, and who juſtly ſuſpected danger to themſelves if they ſhould be obliged to ſubmit unconditionally to the conqueror. They reſolved, therefore, to venture a battle once more; and the better to enſure ſucceſs, they bound themſelves by an oath to ſtand by each other to the laſt extremity. At the ſame time they diſpatched meſſengers to the princes, requeſting them to make their eſcape with all manner of expedition, and to head the army themſelves; all of whom were determined to conquer or die as ſoon as the royal family ſhould be out of the enemy's hands. By this conduct the Abyſſinian monarch was ſo much irritated, that he divided his army into three parts; two of which he commanded to enter the territory of the enemy by different routes, and to exterminate both man and beaſt wherever they came; while he himſelf, with the third, took the ſtraight road to the place where the new Adelian army was encamped. Here he found a number of infantry drawn up and ready to engage him; but, beſides theſe, there was a multitude of old men, women, and even children, all armed with ſuch weapons as they could procure. Surpriſed at this ſight, he ordered a party of horſe to diſperſe them; but this was found impoſſible; ſo that he was obliged to call in the detachments he had ſent out, with orders to fall upon the enemy by the neareſt way they could advance. The engagement was for a long time very doubtful; and in oppoſition to Amda Sion appeared the young king of Wypo, who every where encouraged his troops, and made the moſt obſtinate reſiſtance. The Abyſſinian monarch having obſerved him, ſheathed his ſword, and arming himſelf with a bow, choſe the broadeſt arrow he could find, and took ſo juſt an aim, that he ſhot the young prince through the ſide of the neck, and his head inclining to one ſhoulder he ſoon fell down dead. On this the ſpirit of the Adelians entirely forſook them, and they betook themſelves to flight; but unluckily falling in with two Abyſſinian detachments coming to the king's relief, they were ſo completely deſtroyed, that only three of them are ſaid to have made their eſcape. On the ſide of the Abyſſinians, however, the victory was dearly purchaſed; many of the principal officers being killed, and ſcarcely one of the cavalry eſcaping without a wound.

79 Are unfavourably received.

80 The war continue

81 An obſti nate batt

82 The M ſh arm entirely off.

The remainder of this expedition conſiſted only in the deſtruction and burning of towns and villages, and maſſacres of helpleſs people, on pretence of retaliating the injuries committed by the Mahometans againſt the Chriſtians. At laſt, weary of conqueſt and of carnage, this victorious monarch, who never ſuffered a defeat in any battle, returned in triumph to his capital, where he ended his days after a reign of 30 years. In his time we find that the royal family were not confined, as had been the uſual practice from the time of the queen of Sheba to the maſſacre by Judith; for Saif Araad, the ſon and ſucceſſor of Amda Sion, diſtinguiſhed himſelf in one of the battles in which his father was engaged.

been juſt now obſerved, was by no means deſtitute of military talents, the Abyſſinian empire enjoyed a profound peace during his reign. The only remarkable tranſaction was the relief given by him to the Coptic patriarch, whom the ſultan of Egypt had thrown into priſon. At this time a great trade was carried on through the deſart by caravans between Cairo and Abyſſinia, as well as from Cairo and Suakem on the Red Sea; but the Ethiopic monarch having ſeized the merchants from Cairo, and ſent parties of horſe to interrupt the caravans in their paſſage, the ſultan was ſoon content to releaſe the patriarch, whom he had impriſoned only with a view to extort money.

86
Theod

87
celebra-
as a
nt.

In the reign of Theodorus, who held the crown of Ethiopia from the year 1409 to 1412, we find an infringement made on the treaty between Icon Amlac and the Abuna Tecla-Haimanout formerly mentioned. By that treaty the Abuna was to have a full third of the whole empire for the ſupport of his own dignity and that of the church: but Theodorus, juſtly conſidering this as an unreaſonable acquiſition, reduced it very conſiderably, though he ſtill allowed a very ample revenue out of every province of the empire; and even this has been conſidered by ſeveral of his ſucceſſors as far too large, and has conſequently been frequently abridged by them. The annals of this prince's reign are very defective, and Mr Bruce ſuppoſes that they have been mutilated by the eccleſiaſtics; which, conſidering what we have juſt now related of his reducing their revenues, is by no means improbable. By his ſubjects he was conſidered as ſuch a ſaint, that to this day the people believe he is to riſe again and to reign a thouſand years in Abyſſinia; during which period war is to ceaſe, and happineſs to be univerſally diffuſed.

From the time of Theodorus to that of Zara Jacob, who began his reign in 1434, the Abyſſinian annals furniſh us with little or nothing of any conſequence. The character of this prince is repreſented as by no means inferior to that of Theodorus, or indeed of any monarch that ever ſat on the throne of Ethiopia, or any other kingdom in the world. He is in ſhort ſet forth as another Solomon, and a model of what ſovereigns ought to be; though, from ſome particulars of his reign, this character ſhould ſeem to be rather exaggerated. The firſt remarkable tranſaction of this great monarch was his ſending an embaſſy to the council of Florence. The ambaſſadors were certain prieſts from Jeruſalem, who in that aſſembly adhered to the opinions of the Greek church; and the embaſſy itſelf was judged to be of ſuch conſequence as to be the ſubject of a picture in the Vatican. This prince obtained alſo a convent at Rome from the pope for the uſe of the Abyſſinians; which is ſtill preſerved, though very ſeldom viſited by thoſe for whom it was deſigned. He ſeems to have been very deſirous of keeping up a correſpondence with the Europeans as well as the Aſiatics; and in his time we firſt read of a diſpute in Abyſſinia with the *Frangi* or Franks on the ſubject of religion. This was carried on in preſence of the king between one Abba George and a Venetian painter, Franciſco de Branco Lone, in which the former confuted and even convinced his antagoniſt; but from this time we find a party formed for the church of Rome, and which probably took its riſe from the embaſſy to the council of Florence.

94
Perſecution
ſuppreſſed.

The prince of whom we now treat was the firſt who introduced perſecution on a religious account into his dominions; and for this reaſon moſt probably he is ſo highly commended by the eccleſiaſtics. The ſtate of religion in Abyſſinia was now indeed very corrupt. The Greek profeſſion had been originally eſtabliſhed from the church of Alexandria; but in the low provinces bordering on the coaſt of Adel, the Mahometan ſuperſtition prevailed. Many of that perſuaſion had alſo diſperſed themſelves through the towns and villages in the internal parts of the empire, while in not a few places the groſſeſt idolatry ſtill took place; ſuch as the worſhip of the heavenly bodies, the wind, trees, cows, ſerpents, &c. All this had hitherto paſſed unnoticed; but in the reign of Zara Jacob, ſome families being accuſed of worſhipping the cow and ſerpent, were brought before the king, who pronounced ſentence of death upon them. Their execution was followed by a royal proclamation, that whoever did not carry on his right hand an amulet with theſe words upon it, "I renounce the devil for Chriſt our Lord." ſhould not only forfeit his perſonal eſtate, but be liable to corporal puniſhment. The ſpirit of perſecution thus begun, quickly diffuſed itſelf, and an inquiſitor was appointed to ſearch for criminals. This was one Amda Sion, the king's chief confident, who pretended to all that abſurd and auſtere devotion common to religious hypocrites. In this he was flattered with uncommon parade and attendance, the uſual rewards of people of that ſtamp; as he never appeared abroad but with a great number of ſoldiers, trumpets, drums, and other enſigns of military dignity waiting upon him. He kept alſo a number of ſpies, who brought him intelligence of thoſe who were ſecretly guilty of any idolatrous or treaſonable practices; after which, proceeding with his attendants to the houſe of the delinquent, he cauſed the family firſt ſupply himſelf and his party with refreſhments, and then ordered the unhappy wretches to be all put to death in his preſence. Among thoſe who ſuffered in this barbarous manner were the two ſons-in-law of the king himſelf, who had been accuſed by their wives, the one of adultery, and the other of inceſt; on which ſlight ground they were both put to death in their own houſes in ſuch a manner as deſervedly threw an odium on the king. His conduct was afterwards ſo ſeverely condemned by certain clergymen from Jeruſalem, that a reformation ſeems to have been produced; and no mention is afterwards made of the inquiſitor or perſecution during this reign.

95
Affairs of
the kingdom regulated

96
Churches
repaired.

The attention of the king was now called off from religion to the ſtate of his affairs in the different provinces of the kingdom. As the Mooriſh provinces were very rich, by reaſon of the extenſive trade they carried on, and frequently employed their wealth in exciting rebellions, it became neceſſary that the ſovereign himſelf ſhould examine into the circumſtances and diſpoſitions of the ſeveral governors; which was likewiſe proper on another account, that he might aſſign to each the ſum to be paid. On this occaſion he divided the empire more diſtinctly, and increaſed the number of governments conſiderably; which being done, he ſet about repairing the churches throughout the country, which had fallen into decay, or been deſtroyed in the war with the Mahometans. So zealous was he in this reſpect, that having heard of the deſtruction of the church of the Virgin in Alexandria by fire, he inſtantly built another in Ethiopia, to repair the loſs which Chriſtianity might have ſuffered.

The laſt public tranſaction of this prince's reign was the quaſhing of a rebellion which ſome of his governors had entered into; but whatever glory he might acquire from this or any other exploit, his behaviour with regard to his domeſtic affairs muſt certainly place him in a very diſadvantageous light.

97
The queen put to a cruel death.

In the decline of the king's life, the mother of the heir apparent conceived ſuch an extreme deſire to behold her ſon in poſſeſſion of the throne, that ſhe began to form ſchemes for obliging his father to take him into partnerſhip with him in the government. Theſe being diſcovered, her huſband cruelly cauſed her to be whipped to death: and finding that his ſon afterwards performed certain ſolemnities at her grave in token of regard for her, he cauſed him to be loaded with irons and baniſhed to the top of a mountain; where he would probably have been put to death, had not the monks interfered. Theſe having invented prophecies, dreams, and revelations, that none but the young prince Bæda Mariam was to poſſeſs the throne, the old king ſubmitted to the decrees of heaven, and relaxed in his ſeverity.

98
The royal family again confined.

On the acceſſion of the new king in 1468, the old law for impriſoning all the royal family was revived, and a mountain named *Geſhen* choſen for the purpoſe. Having thus ſecured himſelf from any danger of a rival in caſe he ſhould undertake a foreign expedition, he proclaimed a pardon to all thoſe who had been baniſhed during the former reign, and thus ingratiated himſelf with his people; after which he began to prepare for war.

99
War with the Dobas reſolved on.

At this the neighbouring princes, particularly the king of Adel, being alarmed, ſent ambaſſadors requeſting the continuance of peace. The Abyſſinian monarch told them, that his deſign was to deſtroy the Dobas; a race of Shepherds very wealthy, but extremely barbarous, profeſſing the pagan religion, and greatly reſembling the Gallas. The reaſon of his commencing hoſtilities againſt them was, that they made continual inroads into his country, and committed the greateſt cruelties; on which account he determined not to make war as with a common enemy, but to exterminate and deſtroy them as a nuiſance. The king of Adel was no ſooner poſſeſſed of this piece of intelligence, than he communicated it to the Dobas; deſiring them to ſend their women and children, with their moſt valuable effects, into his country, till the invaſion ſhould be over.

100
They are maſſacred.

This propoſal was readily embraced; but Bæda having got notice of it, ſeized an avenue through which they muſt neceſſarily paſs, and maſſacred every one of the company. After this, entering their country, he committed ſuch devaſtations, that they were glad to ſubmit, and even to renounce their religion in order to free themſelves from ſuch a dreadful enemy. The king then turned his arms againſt Adel, where he was attended with the uſual ſucceſs; a moſt complete victory being gained over the Moors by the Abyſſinian general: but while the king himſelf was advancing towards that country, with a full reſolution to reduce it to the moſt abject ſtate of miſery, he was ſeized with a pain in his bowels, which occaſioned his death.

101
Death of the king.

The diſcovery of the kingdom of Ethiopia or Abyſſinia by the Europeans took place about this time. It has already been obſerved, that ſome intercourſe by means of individuals had been carried on betwixt this country and Italy; but the knowledge conveyed to Europeans in this manner was ſo imperfect and obſcure, that it ſcarce amounted to any thing.

102
Diſcovery of Ethiopia by the Europeans.

Even the ſituation of the country had been forgot; and though ſome confuſed notions were entertained of a diſtant Chriſtian prince who was likewiſe a prieſt, Marco Paulo, the famous Venetian traveller, affirms, that he had met with him in Tartary; and it was univerſally agreed that his name was *Joannes Preſbyter*, *Prete Janni*, or *Preſter John*.

103
Of Preſter John.

When the Portugueſe began to extend their diſcoveries along the coaſt of Africa, more certain intelligence concerning this prince was obtained. Bemoy, one of the kings of the Jaloſſes, a nation on the weſtern coaſt of Africa, had aſſured the Portugueſe navigators of the exiſtence of ſuch a prince ſo ſtrongly, that the king determined to ſend ambaſſadors to him; and the diſcovery was of the greater conſequence, that a paſſage to the Eaſt Indies was now attempted both by land and ſea.

104
Ambaſſadors ſent from the king of Portugal.

The ambaſſadors were named *Peter Covillan* and *Alphonſo de Paiva*. Theſe were ſent to Alexandria in Egypt, from whence they were to ſet out on their journey; the intent of which was, to explore the ſources of the Indian trade, the principal markets for the ſpice, &c. but above all, to diſcover whether it was poſſible to arrive at the Eaſt Indies by ſailing round the continent of Africa.

105
Account of their travels.

In the proſecution of this ſcheme our two travellers went from Alexandria to Cairo; from thence to Suez at the bottom of the Red Sea; from Suez they took their route to Aden, a wealthy and commercial city beyond the ſtraits of Babel Mandel. Covillan now ſet ſail for India, and De Paiva for Suakem. The latter loſt his life without making any diſcovery; but Covillan paſſed over to Calicut and Goa. From thence he returned to the continent of Africa, viſiting the gold mines of Sofala, and paſſing from thence to Aden and Cairo; at which laſt place he was informed of the death of his companion. In this city he was met by two Jews with letters from the king of Abyſſinia. One of theſe Jews was ſent back with letters to the Abyſſinian monarch: but with the other he proceeded to the iſland of Ormus in the Perſian gulf. Here they ſeparated; the Jew returning home, and Covillan repaſſing the ſtraits of Babel Mandel, whence he proceeded to Aden, and afterwards entered the Abyſſinian dominions.

The reigning prince at this time was named *Alexander*; and when Covillan arrived, he was employed in levying contributions upon his rebellious ſubjects. He met with a kind reception; and was conveyed to the capital, where he was promoted to the higheſt poſts of honour, but never allowed to return to Europe again.

106
Important intelligence conveyed to Portugal by Covillan.

The intelligence, however, which he tranſmitted to the court of Portugal proved of much importance. He not only deſcribed all the ports of India he had ſeen, with the ſituation and wealth of Sofala, but adviſed the king to proſecute the diſcovery of the paſſage round Africa with the utmoſt diligence; affirming, that the Cape at the ſouthern extremity of the continent was well known in India; and accompanying the whole with a chart which he had obtained from a Moor, and which ſhowed exactly the ſituation of the Cape and neighbouring countries.

07
n of
ander.

Covillan arrived in Ethiopia about the year 1490; and the prince to whom he addreſſed himſelf was Alexander the ſon of Bæda Mariam. He ſeems to have been endowed with many good qualities, and no leſs verſed in military affairs than any of his predeceſſors.

08
itates
r a-
l Adel.

His reign was diſturbed by plots and rebellions, which at laſt proved fatal to him. From his early years he manifeſted a great deſire to make war on the king of Adel, who ſeems to have been the natural rival of the Ethiopic princes. But the Adelian monarch, having now become ſenſible that he was not able to cope with ſuch powerful adverſaries, took the moſt effectual way of ſecuring himſelf; *viz.* by gaining over a party at the court of Abyſſinia. In this he had now ſucceeded ſo well, that when Alexander was about to invade Adel, Za Saluce the prime miniſter, with many of the principal nobility, were in the intereſt of his adverſary.

a vic-

Not being apprized of this treachery, however, Alexander entruſted this miniſter with the command of a great part of his forces; and with theſe the latter abandoned him in the heat of an engagement. Alexander and the few troops who remained with him, however, were ſo far from being diſheartened by this treachery, that they ſeemed to be inſpired with freſh courage. The king having killed the ſtandard-bearer of the enemy, and thus become maſter of the green enſign of Mahomet, the enemy began to give way; and on his killing the king of Adel's ſon, immediately after they quitted the field altogether. The victory was not by any means complete; neither was Alexander in a ſituation to purſue the advantage he had gained. Having therefore challenged the Moors to a ſecond engagement, which they declined, he returned with a deſign to puniſh his perfidious miniſter Za Saluce, who had endeavoured to excite the governors of all the provinces to revolt as he went along. The traitor, however, had laid his plots too well; ſo that his ſovereign was murdered in two days after his arrival in the capital.

10
ard r
red.

Za Saluce did not enjoy the rewards he expected from his treachery: for having attempted to excite a revolt in the province of Amhara, he was attacked by the nobility there; and his troops deſerting him, he was taken priſoner without any reſiſtance, his eyes were put out, and himſelf expoſed on an aſs, to the curſes and deriſion of the people.

I
1 of
.

Alexander was ſucceeded by an infant ſon, who reigned only ſeven months; after which his younger brother Naod was choſen king by the unanimous voice of the people. He proved a wiſe and virtuous prince; but the late misfortunes, together with the corruption introduced at court by the Mahometans, had ſo unhinged the government, that it became very difficult to know how to manage matters. Judging very properly, however, that one of the moſt effectual methods of quieting the minds of the people would be an offer of a general pardon; he not only proclaimed this, but likewiſe, "That any perſon who ſhould upbraid another with being a party in the misfortunes of paſt times, or ſay that he had been privy to this or that conſpiracy, had received bribes from the Moors, &c. ſhould be put to death without delay."

2
di
es the
nian
ries.

On his entering upon government, he found it neceſſary to prepare againſt an enemy whom we have not heretofore mentioned, *viz.* Maſſudi, prince of a diſtrict named *Arar*, which lay in the neighbourhood of Adel. This chieftain being a man of a very enterpriſing and martial diſpoſition, and a moſt violent enthuſiaſt in the Mahometan cauſe, had made a vow to ſpend 40 days annually in ſome part of the Abyſſinian dominions during the time of Lent. For this purpoſe he kept a ſmall body of veteran troops, with whom he fell ſometimes on one part, and ſometimes on another of the frontiers of Ethiopia, putting to death without mercy ſuch as made reſiſtance, and carrying off for ſlaves thoſe who made none. For 30 years he continued this practice; beginning exactly on the firſt day of Lent, and proceeding gradually up the country as the term advanced. His progreſs was greatly facilitated by the ſuperſtition of the people themſelves, who kept that faſt with ſuch rigour as almoſt entirely to exhauſt their ſtrength; ſo that Maſſudi having never met with any opponent, was always ſure of ſucceſs, and thus came to be reckoned invincible.

113
He is defeated.

On the preſent occaſion, however, he experienced a prodigious reverſe of fortune. Naod having enjoined his ſoldiers to live in the ſame full and free manner during the faſt as at any other time, and having ſet the example himſelf, marched out againſt his enemy; who being ignorant of the precaution he had taken, advanced with his uſual confidence of ſucceſs. The Abyſſinian monarch, ſtill pretending fear, as if on account of the weakneſs of his men, pitched his camp in very ſtrong ground, but left ſome paſſages open to it, that the enemy might make an attack. This was done contrary to the advice of their leader; and the conſequence was, that almoſt every one of them was cut off. On this the king of Adel ſent ambaſſadors to ſolicit a continuance of the peace with himſelf; which was granted, upon condition that he reſtored all the ſlaves whom Maſſudi had carried off in his laſt year's expedition; with which the Mahometan chief thought proper to comply rather than engage in ſuch a dangerous war.

Naod having thus freed his country from the danger of any foreign invaſion, applied himſelf to the cultivation of the arts of peace, and reforming the manners of his ſubjects, in which he ſpent the remainder of his days. He died in 1508, after a reign of 13 years; and was ſucceeded by his ſon David III.

114
David III.

a child of 11 years of age. Though the affairs of the empire were at preſent in ſuch a ſtate as required a very prudent and active adminiſtration, the Empreſs Helena, widow of Bæda Mariam, had intereſt enough to get the crown ſettled on the infant juſt mentioned. This proceeded partly from her deſire of engroſſing all the power into her own hands, and partly from a wiſh to keep peace with Adel her native country. Theſe ends could not be accompliſhed but by keeping a minor on the throne of Abyſſinia; which was therefore her conſtant object as long as ſhe lived. But though this might not have been attended with any very bad conſequence had the two nations been left to decide the quarrel by themſelves, the face of affairs was now quite changed by the interference of the Turks. That people having now conquered almoſt the whole of Arabia to the Indian ocean, being likewiſe on the point of reducing Egypt, and having a great advantage over their adverſaries in uſing fire-arms, now projected the conqueſt of India alſo.

115
Abyſſinia in danger from the Turks.

In this indeed they were always diſappointed by the ſuperior valour of the Portugueſe; but as this conqueſt remained a favourite object with them, they did not abandon their attempts. All along the countries which they had conquered, they exacted ſuch enormous contributions from the merchants, that vaſt numbers of them fled to the African ſide of the Red Sea, and ſettled on the coaſt of Adel. The Turks, ſurpriſed at the increaſe of trade in this country, which they themſelves had occaſioned, reſolved to ſhare in the profits. For this purpoſe they took poſſeſſion of Zeyla, a ſmall iſland in the Red Sea, directly oppoſite to the coaſt of Adel; and erected a cuſtom-houſe in it, where they oppreſſed and ruined the trade as in other places. Thus both Adel and Abyſſinia were threatened with a moſt formidable enemy, which it would have been utterly out of their power to have reſiſted, had not the deſire of poſſeſſing India conſtantly prevented the Turks from directing their ſtrength againſt theſe countries. Helena was ſenſible enough of the dangerous ſituation of the empire, but preferred the gratification of her ambition to the good of her country; however, that ſhe might preſerve herſelf from the attacks of ſuch a formidable enemy, it was now thought proper to enter into an alliance with the Portugueſe. The ambaſſador from Portugal Peter Covillan, was denied the liberty of returning to his own country, as has been already related; and as, for ſome time paſt, it had not been obvious how he could be of much uſe, he had begun to fall into oblivion. The preſent emergency, however, recovered his importance. The empreſs was ſenſible of the neceſſity ſhe lay under of having ſome perſon who underſtood both the Abyſſinian and Portugueſe languages before ſhe could open any correſpondence with that nation, and who might likewiſe inform her of the names of the perſons to whom her letters ought to be addreſſed. By him ſhe was now inſtructed in every thing neceſſary to the ſucceſs of her embaſſy. The meſſage was committed to one Matthew an Armenian merchant, with whom a young Abyſſinian was joined; but the latter died by the way. The letters they carried are by Mr Bruce ſuppoſed to have been partly the work of Covillan and partly of the leſs experienced Abyſſinian confidents of the empreſs. They began with telling the king, that Matthew would give him information of her whole purpoſe, and that he might depend on the truth of what he ſaid; but in the latter part the whole ſecret of the embaſſy was diſcloſed, and a force ſufficient to deſtroy the Turkiſh power was expreſsly ſolicited. Among the other particulars of this embaſſy alſo it is ſaid, that a third part of Abyſſinia was offered in caſe her requiſitions were complied with; but this, as well as the embaſſy itſelf, was always denied by David when he came of age.

116
An embaſſy ſent to Portugal.

117
The ambaſſador ill uſed.

Matthew, tho' raiſed from the rank of merchant to that of an ambaſſador, could not, it ſeems, act according to his new dignity in ſuch a manner as to ſcreen himſelf from the moſt mortifying and dangerous imputations. Having arrived at Dabul in the Eaſt Indies, he was ſeized as a ſpy, but relieved by Albuquerque the viceroy of Goa; and that not out of any regard to his character as ambaſſador, but becauſe he himſelf had a deſign upon Abyſſinia. This viceroy uſed his utmoſt endeavours to induce Matthew to deliver his commiſſions to him; but the ambaſſador conſtantly refuſed to ſhow any letter he had, except to the king of Portugal in perſon, and in his own kingdom. This put him out of favour with the viceroy; while his attendants, diſpleaſed at the mean appearance of the man, inſiſted ſometimes that he was a ſpy from the ſultan, at others that he was a cook, an impoſtor, or a menial ſervant. Matthew, however, perceiving that he was now out of danger, maintained that his perſon was ſacred, and inſiſted on being treated as the repreſentative of a ſovereign. He let the viceroy, biſhop, and clergy know, that he had with him a piece of the wood of the true croſs, ſent as a preſent to the king of Portugal; and he required them, under pain of ſacrilege, to pay reſpect to the bearer of ſuch a precious relic, and to celebrate its arrival as a feſtival. This was inſtantly complied with, and a ſolemn proceſſion inſtituted; but very little regard appears to have been paid to this ambaſſador either in his temporal or ſpiritual character, as he could not obtain leave to depart for Portugal till 1513, which was three years after he arrived in India. In his paſſage he was extremely ill-treated by the ſhipmaſters with whom he ſailed: but of this they ſoon had cauſe to repent; as on their arrival at Liſbon they were all put in irons, and would probably have died in confinement, had not Matthew made interceſſion for them with the king.

118
Maſſudi news his depreda- tions wo than eve

In the mean time, Maſſudi having recovered from the defeat given him by Naod, and formed alliances with the Turks in Arabia, had renewed his depredations on the Abyſſinian territories with more ſucceſs than ever. Such a number of ſlaves had been, by his aſſiduity, ſent to Mecca, that he was honoured with a green ſilk ſtandard (an emblem of the true Mahometan faith), with a tent of black velvet embroidered with gold, and he was likewiſe made Sheykh of Zeyla; ſo that as this iſland was properly the key to the Abyſſinian empire, he could neither be rewarded with greater honour nor profit. This happened when David had attained the age of 16; and in conſequence of ſuch ſurpriſing ſucceſs, the king of Adel, never a hearty friend to Abyſſinia, determined to break the peace with that empire and make an alliance with Maſſudi. Having taken this reſolution, the two princes invaded Abyſſinia with their joint forces, and in one year carried off 19,000 Chriſtian ſlaves, ſo that a general terror was ſpread over the whole empire. David, already impatient of the injuries his people had ſuſtained, determined to raiſe an army, and to head it in perſon as his anceſtors had done, contrary to the advice of the empreſs, who, conſidering only his youth and inexperience in military affairs, wiſhed him to have employed ſome of his veteran officers. A very powerful army was raiſed, and ample ſupplies of all kinds were procured. With one part of his forces the emperor took the road to Auſſa the capital of Adel; ſending the other under the command of an officer named *Betwudet*, to meet the Mooriſh army, who were then ravaging part of Abyſſinia It was natural to be imagined, that the Moors, on hearing that an army was marching to deſtroy the capital of their country, would abandon the thoughts of conqueſt or plunder to preſerve it. In doing this, David knew that they had certain defiles to paſs before they could reach Adel. He ordered Betwudet therefore to allow them to enter theſe defiles; and before they could get through, he himſelf with the main body of the army, marched to attack them

119
David marches gainſt h

them at the other end. Thus the Moors were completely hemmed in by a ſuperior army: but beſides this unfavourable ſituation, they were farther diſpirited by Maſſudi.

120 ffudi ohefies own .h.

That hero came, on the morning of the engagement, to the king of Adel, informing him that his own time was now come; that he had been certainly told by a prophet, long ago, that if this year (1516) he ſhould fight the king of Abyſſinia in perſon, he ſhould loſe his life. He was aſſured that the Abyſſinian monarch was then preſent, having ſeen the ſcarlet tent which was uſed only by the ſovereigns of that country; and therefore adviſed the king of Adel to make the beſt of his way over the leaſt ſteep part of the mountain before the engagement began. The Adelian monarch, who had at any rate no great inclination to fight, was not inſpired with courage by this ſpeech: he therefore followed the advice given him; and, with a few of his friends, paſſed the mountain, leaving his troops to their fate. The Moors, in the mean time, being abandoned by one leader, and having another devoted to deſtruction, ſhowed an uncommon backwardneſs to engage, which was taken notice of by their enemies. Maſſudi, however, as ſoon as he ſuppoſed the king of Adel to be out of danger, ſent a trumpet to the Abyſſinian camp, with a challenge to any man of quality in the army to fight him; on condition that the party of the victorious champion ſhould be accounted conquerors, and that the armies ſhould immediately ſeparate without further bloodſhed. The challenge was inſtantly accepted by a monk named *Gabriel Andreas*; who, in the reign of Bæda Mariam, had been condemned to loſe the tip of his tongue for ſpeaking ſlightly of the king's proclamation of amneſty.

121 ſkilled.

Maſſudi ſhowed no reluctance to preſent himſelf; but received ſuch a ſtroke from his antagoniſt with a two-handed ſword as almoſt cut his body in two, and he immediately fell down dead. Andreas cut off his head; and throwing it at the king's feet, cried out, "There is the Goliath of the infidels." This became the ſignal for a general engagement, notwithſtanding the terms ſtipulated by Maſſudi before the combat.

122 Moors ated de- ed.

The Moors were quickly repulſed by the king's troops, and driven backward through the defile. At the other end they were met by the Betwudet (B), who drove them back to the king's forces; ſo that at laſt being forced to fly to the mountains, they were all ſlaughtered by the peaſants or periſhed with hunger and thirſt.

123 a ta- by the ugueſe.

The ſame day that this victory was gained over the Moors by David, being in the month of July 1516, the iſland of Zeyla in the Red Sea was taken and the town burnt by the Portugueſe fleet under Lopez Suarez de Alberguiera. The Abyſſinian ambaſſador, Matthew, in the mean time, had been received with the greateſt marks of eſteem in Portugal. The utmoſt attention was paid to his embaſſy; he was lodged in the moſt ſplendid manner; and his maintenance was ſuitable to his lodging.

123] aſſy the of ugal.

The king prepared an embaſſy on his part, and ſent home Matthew on board the Indian fleet commanded by Lopez. The ambaſſador ordered for Abyſſinia was one Edward Galvan, a man who had filled many ſtate departments with the utmoſt applauſe; but who by reaſon of his age, being now 86, was certainly very unfit for ſuch a diſtant and perilous voyage. He died accordingly on the iſland of Camaran in the Red Sea, where Suarez had imprudently landed, and paſſed the winter in the utmoſt diſtreſs for want of proviſions of every kind. This admiral was ſucceeded by Lopez de Seguyera; who ſailed firſt to the iſland of Goa in the Eaſt Indies, where he fitted out a ſtrong fleet; after which he returned to the Red Sea, and landed on the iſland of Maſſuah, having along with him Matthew, about the authenticity of whoſe miſſion there had been ſuch diſputes. At his firſt approach the inhabitants fled; but at laſt he was accoſted by a Chriſtian and a Moor from the continent, who informed him that the coaſt oppoſite to Maſſuah was part of the kingdom of Abyſſinia, and that it was governed by an officer named *Baharnagaſh*; that all the inhabitants of the iſland were Chriſtians; that the reaſon of their flying at the ſight of the Portugueſe fleet was that they took them for Turks, who frequently made deſcents, and ravaged the iſland, &c.

124 A Portugueſe fleet arrives on the coaſt of Abyſſinia.

The admiral diſmiſſed them with preſents; and ſoon after had a viſit from the governor of Arkeeko, a town on the continent; who informed him, that about 24 miles up the country there was a monaſtery, ſeven of the members of which were now deputed to wait upon him. Theſe inſtantly knew Matthew, and congratulated him in the warmeſt manner upon his return from ſuch a long voyage. An interview ſoon took place between the Baharnagaſh himſelf and Lopez. The Abyſſinian informed him, that the coming of the Portugueſe had been long expected, in conſequence of certain ancient prophecies; and that he himſelf and all the officers of the emperor were ready to ſerve him. They parted with mutual preſents; and all doubt about Matthew being now removed, he prepared to ſet out for the emperor's court; while Roderigo de Lima was nominated ambaſſador in place of Galvan who died. Along with them were 15 Portugueſe; all men of the moſt determined courage, and who would heſitate at nothing which they thought might contribute to the glory of their king, their own honour, or the advantage of their country.

125 Difficult journey of the ambaſſadors thro' Abyſſinia.

Their preſent journey indeed was much more perilous than their voyage from Portugal to Abyſſinia. The emperor was at this time in the ſouthern part of his dominions, but the Portugueſe had landed on the northern part; ſo that they had almoſt the whole breadth of the empire to paſs before they could meet with him. The very firſt journey they attempted was thro' a wood ſo thick that it could ſcarce afford a paſſage either to man or beaſt, while the interſtices of the trees were ſo interwoven with briers and thorns of various kinds, that their paſſage was rendered almoſt impracticable. This was rendered ſtill more terrible by the vaſt numbers of wild beaſts they ſaw, and which ſeemed only to be prevented from devouring them by the appearance of ſo many men together. The rainy ſeaſon was alſo now begun; ſo that they were expoſed to inceſſant deluges of water deſcending from the clouds, beſides frequent and violent ſtorms of wind, thunder and lightning, &c. To add to their misfortunes, an epidemic fever broke out among them, which

---

(B) This is the title of one of the officers in Abyſſinia, not the proper name of a man.

126
Are very indifferently received by the emperor, and long detained.

which carried off Matthew and one of the ſervants of Don Roderigo. At laſt, after a moſt tedious and toilſome journey, from the 16th of April to the 18th of October 1520, the Portugueſe ambaſſador, with his retinue, came within ſight of the Abyſſinian camp at the diſtance of about three miles. His reception was by no means favourable; for inſtead of being immediately admitted to the preſence of the emperor, he was waited on by one of the officers of ſtate, ſtyled, in token of humility, *Hadug Ras*, or *commander of aſſes*; who cauſed him pitch his tent three miles farther off from the camp: and it was not till five years afterwards that he was enabled to finiſh the buſineſs of his embaſſy, and obtained leave to depart for Portugal.

127
At laſt allowed to depart with an ambaſſador from the emperor.

During all this time not a ſingle word had paſſed relating to the affairs of the two nations; ſo that it is difficult to imagine what might have been the deſign of the Abyſſinian emperor. At laſt, having reſolved to ſend an embaſſy to Portugal, he allowed Roderigo to depart, but detained two of his people, appointing Zaga Zaab, an Abyſſinian monk, his ambaſſador to Portugal.

128
Bad effects of this delay.

This long intercourſe betwixt two ſuch diſtant nations, however, could not but greatly alarm the Mahometan powers, who were natural enemies to both. Selim the Turkiſh ſultan, having been conſtantly defeated by the Portugueſe in the eaſt, and alarmed at the thoughts of having a fleet of that nation in the Red Sea, where they might greatly annoy his ſettlements on the coaſt of Arabia, determined to carry his arms to the African ſide; while the king of Adel, having ſtrengthened himſelf by alliances with the Turkiſh officers in Arabia, was now become a much more formidable enemy than before. This was ſoon experienced in a battle with the Adelians; in which the Abyſſinian monarch was overthrown with the loſs of almoſt all his great officers and principal nobility, beſides a vaſt number of private men. The victory was principally owing to the aſſiſtance given by the Turks; for the army was commanded by Mahomet ſurnamed *Gragné*, i. e. *left-handed*, governor of Zeyla which had now received a Turkiſh garriſon. This man, having the conqueſt of Abyſſinia greatly at heart, reſolved, as ſoon as poſſible, to effect ſomething deciſive; and therefore having ſent to Mecca all the priſoners taken in his late expedition, he obtained in return a conſiderable number of janizaries, with a train of portable artillery. Thus the fortune of the war was entirely decided in favour of the Adelians and Turks; the emperor was defeated in every battle, and frequently hunted from place to place like a wild beaſt. The Moors, finding at laſt no neceſſity for keeping up an army, over ran the whole empire in ſmall parties, every where plundering and burning the towns and villages, and carrying off the people for ſlaves.

129
The emperor defeated by the Moors.

130
The Adelians aſſiſted by the Turks

131
The emperor every where defeated and reduced to great diſtreſs.

This deſtructive war continued till the year 1537; when Gragné ſent a meſſage to the emperor, exhorting him not to fight any longer againſt God, but to make peace while it was in his power, and give him his daughter in marriage: on which condition he would withdraw his army; but otherwiſe he would reduce his empire to ſuch a ſtate that it ſhould be capable of producing nothing but graſs. David, however, ſtill refuſed to ſubmit; replying, that he put his confidence in God, who at preſent only chaſtiſed him and his people for their ſins; but that Gragné himſelf, being an infidel, and enemy to the true religion, could not fail of coming in a ſhort time to a miſerable end. This unſucceſsful negociation was followed by ſeveral encounters, in which the emperor was conſtantly defeated; in one of them his eldeſt ſon was killed, and in another his youngeſt was taken priſoner: ſo that he now ſeemed entirely deſtitute, being obliged to wander on foot, and all alone, hiding himſelf throughout the day among the buſhes on the mountains.

132
Refuſes t
ſubmit.

The invincible conſtancy with which this forlorn monarch bore his misfortunes, proved a matter of ſurpriſe both to friends and enemies. Many of his veteran ſoldiers, compaſſionating the diſtreſſes of their ſovereign, ſought him out in his hiding places; ſo that he once more found himſelf at the head of a ſmall army, with which he gained ſome advantages that ſerved to keep up his own ſpirits and thoſe of his adherents. His greateſt enemy was Ammer, one of Gragné's officers, who headed the rebellious Abyſſinians, and who had formed a ſcheme of aſſaſſinating the king; but, inſtead of accompliſhing his purpoſe, he himſelf was aſſaſſinated in 1538 by a common ſoldier, on what account we are not informed.

By the death of Ammer and the ſmall ſucceſſes which David himſelf had obtained, the affairs of Abyſſinia ſeemed to revive; but ſtill there was no probability of their being ever brought to a fortunate iſſue. An embaſſy to Portugal was therefore thought of in good earneſt, as the miſchievous effects of ſlighting the proffered friendſhip of that power were now ſufficiently apparent. One of the attendants of Roderigo, named John Bermudes, who had been detained in Abyſſinia, was choſen for this purpoſe; and to his temporal character of ambaſſador was added that of Abuna, primate or patriarch. John, who was not a clergyman originally, had received all the inferior eccleſiaſtical orders at once, that the ſupreme one might be thus conferred upon him; but happening to be a great bigot to the popiſh religion, he would not accept of his new dignity but with a proviſo, that his ordination ſhould be approved by the pope. This was indirectly ſubmitting the church of Abyſſinia to that of Rome; to which David would never have agreed, had it not been for the deſperate ſituation of his affairs at that time. John was therefore allowed to do as he thought proper: when paſſing through Arabia and Egypt to Italy, he had his ordination confirmed by the pope; after which he ſet out on the buſineſs of his embaſſy. On his arrival at Liſbon, he was acknowledged by the king as patriarch of Alexandria, Abyſſinia, and of the ſea; for this laſt title had alſo been conferred upon him by his Holineſs. Entering then upon the purpoſe of his embaſſy, he began by putting Zaga Zaab in irons for having waſted ſo much time, and done nothing effectual ſince he had left Abyſſinia. Then he repreſented to the king the diſtreſſes of the Abyſſinians in ſuch a ſtrong light, and inſiſted ſo violently for relief to them, that an order was very ſoon procured for 400 muſketeers to be ſent by Don Garcia de Noronha to their relief. To accelerate the progreſs of the intended ſuccours, John him-

himſelf propoſed to ſail in the ſame fleet with Don Garcia; but his voyage was delayed for a whole year by ſickneſs, occaſioned, as he ſuppoſed, by poiſon given him by Zaga Zaab, the monk whom he had impriſoned, and who had been ſet at liberty by the king. After his recovery, however, he ſet ſail for India, where he arrived in ſafety. The death of Don Garcia, which happened in the mean time, occaſioned another delay; but at laſt it was reſolved that Don Stephen de Gama, who had ſucceeded to Don Garcia, ſhould undertake an expedition to the Red Sea, in order to burn ſome Turkiſh galleys which then lay at Suez. But intelligence having in the mean time been received of the intended voyage, theſe veſſels had withdrawn themſelves. Anchoring then in the port of Maſuah, Don Stephen ſent over to Arkeeko on the continent to procure freſh water and other proviſions; but the Turks and Moors being now entirely maſters of that coaſt, the goods he had ſent in exchange were ſeized without any thing being given in return. A meſſage was brought back, importing, that the king of Adel was now maſter of all Ethiopia, and conſequently that no trade could be carried on without his leave; but if Don Stephen would make peace with him, the goods ſhould be reſtored, a plentiful ſupply of water and all kinds of proviſions granted, and amends likewiſe made for 60 Portugueſe who had been killed at Zeyla. Theſe had run away from the fleet on its firſt arrival in the Red Sea, and landed on the coaſt of Adel, where they could procure no water; of which the barbarians took advantage to decoy them up the country; where, having perſuaded them to lay down their arms, they murdered them all. To this Don Stephen returned a ſmooth anſwer, ſent more goods, obtained proviſions, and promiſed to come aſhore as ſoon as a Mahometan feſtival, which the ſavages were than celebrating, ſhould be over. This treaty was carried on with equal bad faith on both ſides; but Don Stephen had now the advantage by obtaining the proviſions he ſtood in need of. Theſe were no ſooner brought on board, than he ſtrictly forbad all intercourſe with the land; and chooſing out 600 men, he attacked the town of Arkeeko, killed the governor, and ſent his head to the Abyſſinian court; maſſacring at the ſame time all the people in the town he met with.

During this long interval a conſiderable change had taken place in the Abyſſinian affairs. We have already ſeen that David had been reduced to great diſtreſs; but afterwards met with ſome little ſucceſſes, which ſeemed to indicate an approaching change of fortune. In theſe, however, he was ſoon diſappointed. A Mahometan chief called *Vizir Mugdid* made an attack upon the rock Geſhen, where the royal family were kept; and finding it entirely unguarded, aſcended without oppoſition, and put every perſon to the ſword. This laſt diſaſter ſeems to have been too great for the reſolution even of this heroic prince, as he died the ſame year 1540. He was ſucceeded by his ſon Claudius, who, though then but about 18 years of age, was endowed with all the great qualities neceſſary for managing the affairs of the empire in ſuch a dreadful criſis, and had made conſiderable progreſs before the arrival of the Portugueſe.

Powerful league formed againſt the new emperor.

140
The Moors defeated.

On his acceſſion, the Moors deſpiſing his youth, inſtantly formed a league among themſelves to cruſh him at once; but, like almoſt all others too confident of victory, they neglected to take the proper precautions againſt a ſurpriſe. This was not unobſerved by Claudius; who falling upon one party which lay next to him, gave them a total defeat. The king purſued them the whole day of the engagement, the enſuing night, and part of the following day; putting to death without mercy every one who fell into his hands. This exceſſive ardour very much damped the ſpirits of his enemies, and at the ſame time inſpired his own party with the moſt ſanguine hopes of ſucceſs; whence he ſoon appeared at the head of ſuch an army as convinced his enemies that he was by no means to be deſpiſed. They now found it neceſſary to deſiſt from the practice they had ſo long continued of plundering and ravaging the country; to call in their ſcattered parties, unite their troops, and ſpend the rainy ſeaſon in ſuch parts of Abyſſinia as they had conquered, without returning into Adel as had hitherto been uſual with them. They now came to a reſolution to force the king to a general engagement, in which they hoped to prove victorious by dint of numbers. For this purpoſe all the rebel chiefs in Abyſſinia were called in, and a formidable army collected. They waited only for one very experienced chief named *Jonathan*; after whoſe junction they determined to attack the royal army without delay. But Claudius took his poſts at all times with ſuch judgment, that any attempt upon his camp would have been almoſt deſperate; and getting intelligence where Jonathan lay with his forces, he marched out in the night time, came upon him quite unprepared, defeated and killed him, ſending his head to the reſt of the confederacy by a priſoner, the only one he had ſpared out of all thoſe who were taken. By the ſame meſſenger a defiance was ſent to the Moors, and many opprobrious epithets were beſtowed upon them; but though the armies approached one another, and continued for ſeveral days under arms, the Moors were ſo much intimidated that they would by no means venture an engagement.

141
Jonathan, a rebel chief, defeated and killed.

142
Unſucceſsful attempt to aſſaſſinate Claudius.

By this victory the ſpirits of the Abyſſinians were ſo much elevated, that they flocked in from all parts to join their prince; and even many of the Mahometans, having experienced the lenity of the Chriſtian government, choſe rather to ſubmit to Claudius than to the Turks and Adelians. The king, however, was in danger of being aſſaſſinated by one Ammer, a treacherous governor; who knowing that he had retired to ſome diſtance from his army to celebrate the feſtival of Eaſter, attempted to ſurpriſe him when almoſt deſtitute of attendants; but Claudius having timely notice of his deſigns, laid an ambuſh for him with a conſiderable part of his army which he headed in perſon. The rebel, not being equally well informed, fell into the ſnare, was defeated, and almoſt his whole army cut off on the 24th of April 1541.

Matters were in this ſituation when the Portugueſe arrived, as has already been related. The head of the governor of Arkeeko had been received by the queen, who conſidered it as an happy inſtance of the valour of her allies, and as a preſage of future victories. The Portugueſe admiral, Don Stephen de Gama, loſt no time in employing the men allowed by the king to aſſiſt

aſſiſt the Abyſſinians. Theſe were in number 450; but as the officers who commanded them were all noblemen of the firſt rank, the army was conſiderably increaſed by the number of their ſervants. The ſupreme command was given to Don Chriſtopher de Gama the admiral's youngeſt brother. Almoſt every man on board, however, was ambitious to ſhare in the glory of this enterpriſe; whence great complaints were made by thoſe who were not allowed to go: and hence, Mr Bruce informs us, the bay in the iſland of Maſua, where the admiral's galley rode, had the name of *Bahia dos Agravados;* the bay of the *injured*, not of the *ſick*, as has been erroneouſly ſuppoſed.

143 Derivation of the name of a bay in Maſuah.

144 The Portugueſe under Don Chriſtopher de Gama ſet out to meet the emperor.

This gallant army inſtantly ſet forward by the moſt eaſy road through the Abyſſinian territories, in order to join the emperor. Still, however, the way was ſo rugged, that the carriages of their artillery gave way, and they were therefore obliged to conſtruct new ones as they went along, ſplitting the barrels of old muſkets to furniſh them with iron, that commodity being very ſcarce in Abyſſinia. In this journey the general was met by the empreſs, attended by her two ſiſters and a great many others of both ſexes, whom he ſaluted with drums beating and colours flying, accompanied by a general diſcharge of the fire-arms, to their great confuſion and terror. Her majeſty, whoſe perſon was entirely covered, indulged the Portugueſe general with a view of her face; and after a mutual exchange of civilities, the queen returned with 100 muſketeers appointed by him as her guard. After eight days march, through a very rugged country, Don Chriſtopher received a defiance in very inſulting terms from Gragné the Mahometan general, which was returned in the ſame ſtyle. An engagement took place on the 25th of March 1542; in which little was done by either party beſides wounding both the commanders: however, Gragné, though greatly ſuperior in horſe, had already felt ſo much of the Portugueſe valour, that he did not chooſe to venture a ſecond battle.

145 Interview with the empreſs.

146 Battle between the Portugueſe and the Moors.

As the ſeaſon was now far advanced, the Portugueſe put themſelves into winter-quarters; while Gragné remained in their neighbourhood, in hopes of forcing them to a battle before they could be joined by the king, who advanced for the purpoſe as faſt as poſſible. This being the caſe, it was to the laſt degree imprudent in Don Chriſtopher to think of venturing an engagement without previouſly forming a junction with his royal ally; eſpecially as Gragné had now doubled the number of his horſe, increaſed his train of artillery, and otherwiſe received conſiderable reinforcements. Unfortunately, however, the Portugueſe general ſuffered himſelf to be hurried away by the impetuoſity of his own temper; and paying regard to the defiances and reproaches of a barbarian whom he ought to have deſpiſed, was induced, contrary to all advice that could be given, to venture an engagement at a vaſt diſadvantage. Yet when the armies encountered each other, the ſuperiority of the Portugueſe was ſo great, that victory ſeemed likely to be decided in their favour. On this Gragné ordered ſome artillery to be pointed againſt the Abyſſinian allies. Theſe, entirely unaccuſtomed to fire-arms, fled almoſt at the firſt diſcharge. Gragné, well knowing that it was his intereſt to deſtroy the Portugueſe, who were only 400 in number, ordered no purſuit againſt the Abyſſinians, but fell with his whole force upon the Europeans. Even yet his ſucceſs was doubtful, till Don Chriſtopher, expoſing himſelf too much, was ſingled out and ſhot through the arm. This produced ſuch confuſion, that a total defeat, with the loſs of the camp, enſued; when the barbarians, according to cuſtom, put to death all the wounded, and began to abuſe the women, who had all retired into the tent of the general. This being obſerved by a noble Abyſſinian lady married to one of the Portugueſe, ſhe ſet fire to ſome barrels of gunpowder which happened to be in the tent, and thus periſhed along with her raviſhers.

147 Don Chriſtopher raſhly engages at a diſadvantage.

148 Is wounded and defeated.

Don Chriſtopher, who by his raſhneſs had occaſioned this diſaſter, obſtinately refuſed to fly, till he was put into a litter by force, and ſent off along with the queen and patriarch, who happened to be preſent. The two latter had ſet off before the battle; but Don Chriſtopher ſent ſome horſemen in purſuit of them, by whom they were brought back, and reproached by the general for the bad example they had ſhown to the army. Arriving at the approach of night in a wood where there was a cave, Don Chriſtopher entered it to have his wound dreſſed, but obſtinately refuſed to proceed farther. Next day he was taken; betrayed, as is moſt probable, by a woman whom he loved; who is ſaid to have pointed out this cave to him, and promiſed to ſend ſome friends to convey him into a place of ſafety. Inſtead of this, a party of the enemy entered the cave; and on his readily informing them of his name, they inſtantly carried him in triumph to Gragné. Here, after ſeveral inſults had paſſed on both ſides, the barbarian, in a fit of paſſion, cut off his head; which was ſent to Conſtantinople, and his body cut in pieces and diſperſed through Abyſſinia.

149 Takes ſhelter in a cave, is taken and put to death.

This cruelty of Gragné proved more detrimental to his cauſe than a complete victory gained by the other party could have been. On the one hand, the Portugueſe were ſo exaſperated by the loſs of their leader, that they were ready to embark in the moſt deſperate undertakings, in order to revenge his death; on the other, the Turks, on whom he principally depended, were irritated to the laſt degree at the diſappointment of ſharing his ranſom, which they imagined would have been an immenſe ſum; and therefore abandoned their leader to return to their own country. Gragné, thus left to decide the quarrel with his Africans, was quickly defeated by Claudius; and in another engagement which took place on the 10th of February 1543, his troops were defeated and himſelf killed. This laſt misfortune was owing to his boldneſs in advancing before his army which was giving way, ſo that he became known to the Portugueſe. On this he was ſingled out by a Portugueſe named *Peter Lyon*, who had been valet de chambre to Don Chriſtopher. This man, to make his aim more ſure, crept for a conſiderable way along the bank of a river towards the place where Gragné was; and when come ſufficiently near, ſhot him quite through the body. Finding himſelf mortally wounded, he quitted the field of battle; and was followed by Lyon, who in a ſhort time ſaw him fall from his horſe. He then came up to him, and cut off one of his ears, which he put in his pocket, and returned to the battle to do what further ſervice he could. The next day Gragné's body was found by an Abyſſinian officer, who cut off his head and claimed the merit of killing him; but Lyon having pulled

150 Gragné abandoned by his allies, is defeated and killed.

out the ear which he carried in his pocket, vindicated his own right to the reward which was to be given to the other. On this occaſion the Mooriſh army was almoſt entirely deſtroyed; Gragné's wife and ſon were taken priſoners, with Nur the ſon of Mugdid, who deſtroyed the royal family; and it had been happy for Claudius, as we ſhall afterwards ſee, that he had put theſe priſoners to death. Very ſoon after this engagement, the emperor had intelligence that Joram, a rebel chief, who had once reduced his father David to great diſtreſs, was advancing rapidly in hopes of being ſtill able to be preſent at the battle. This was the laſt of his father's enemies on whom Claudius had to revenge himſelf; and this was effectually done by a detachment of his army, who poſted themſelves in his way, fell upon him unexpectedly, and cut him in pieces with all his men.

on.

Claudius being now freed from all apprehenſion of foreign enemies, began to turn his thoughts towards the reparation of the damages occaſioned by ſuch a long war, and the ſettlement of religious affairs. We have already mentioned, that John Bermudes was appointed by the pope, as he ſaid, patriarch of Alexandria, Abyſſinia, and of the ſea. This, however, is ſaid by others to have been a falſehood; that John was originally ordained by the old patriarch of Abyſſinia; and that the pope did no more than give his ſanction to this ordination, without adding any new one of his own. But whether this was ſo or not, certain it is, that John, who was very inſolent in his behaviour, and of a turbulent diſpoſition, now began to inſiſt that Claudius ſhould not only embrace the doctrines of the church of Rome, but eſtabliſh that religion throughout the empire, which he ſaid his father David had engaged to do; and which, conſidering the extreme diſtreſs in which he was involved, it is very probable that he did. Claudius, however, was of a different opinion, and refuſed to alter the religion of the country; upon which a contention began, which was not ended but by the total expulſion of the catholics, and the cutting off all communication with Europeans. At that time the Portugueſe and Abyſſinians intermarried, and attended religious worſhip promiſcuouſly in each others churches: ſo that the two nations might have continued to live in harmony, had it not been for the miſbehaviour of Bermudes. Claudius, perceiving the violence and overbearing diſpoſition of the man, took every opportuninty of ſhowing his attachment to the Alexandrian or Greek church; denying that he had made any promiſe of ſubmitting to the ſee of Rome. On this Bermudes told him that he was accurſed and excommunicated; the king in return called him a Neſtorian heretic; to which Bermudes replied by calling him a liar, and threatened to return to India, and carry all the Portugueſe along with him. To this inſolent ſpeech Claudius anſwered, that he wiſhed indeed that Bermudes would return to India; but that he would not allow the Portugueſe, nor any perſon, to leave his territories without permiſſion.

153

ides.

Thus matters ſeemed likely to come to an open rupture; and there can be no doubt that the worſt extremities would have followed, had not the emperor been reſtrained by the fear of the Portugueſe valour on the one hand if he ſhould attempt any thing againſt them, and the hopes of further advantages ſhould he retain them in his ſervice. For theſe reaſons he bore with patience the inſults of the patriarch; attempting to gain the reſt of the Portugueſe over to his ſide. He ſucceeded perfectly with their commander Arius Dias; who privately renounced the church of Rome, and was baptized into that of Abyſſinia by the name of *Marcus* or *Marco*; in conſequence of which, the emperor, looking upon him as a naturalized ſubject, ſent him a ſtandard with the Abyſſinian arms to be uſed inſtead of thoſe of Portugal. This, however, was not delivered; for a Portugueſe named *James Brito*, meeting the page who carried it, took it from him and killed him with his ſword. The apoſtacy of Arius is ſaid to have been owing to the great honours which had been conferred upon him by the Abyſſinian monarch: for having, in an expedition againſt Adel, defeated and killed the king and taken the queen priſoner, he beſtowed her in marriage on Arius; and that the match might be equal, he raiſed him alſo to the royal dignity, by giving him the kingdoms of Doar and Belwa.

154
The Portugueſe command-er renounces the Romiſh religion.

155
He is inveſted with royal dignity.

The altercation on the ſubject of religion becoming every day more violent, Bermudes was prohibited by the emperor from ſending any farther orders to the Portugueſe, they being now under the command of Marco the Abyſſinian captain-general; meaning Arius Dias, to whom the name of Marco had been lately given. To this the patriarch replied, that being ſubjects of the king of Portugal, they were under no obligation to obey a traitor to his king and religion; and that ſince his majeſty ſtill perſiſted in refuſing to ſubmit to the pope, he was reſolved to leave the empire with his forces. The emperor, however, ſtill inſiſted that he was abſolute in his own dominions; and he expected the Portugueſe to pay obedience to his general, and none elſe. The Portugueſe, enraged at this declaration, reſolved to die ſword in hand rather than ſubmit to ſuch terms; and therefore began to fortify their camp in caſe of any attack. The emperor, on this, thinking a defiance was given him in his own territories, ordered the camp to be inſtantly attacked. The attempt was accordingly made, but with very little ſucceſs; the Portugueſe having ſtrewed the ground with gunpowder, ſet fire to it as the Abyſſinians marched along, which deſtroyed great numbers, and intimidated the reſt to ſuch a degree that they inſtantly fled. Finding it vain to think of reducing them by force, the emperor is then ſaid to have been adviſed by Marco to conſult his own ſafety, and break the power of the Portugueſe by artifice. With this view he ſent for the patriarch, pretended to be very ſorry for his frequent breach of promiſe, and deſirous to make what amends for it he could. Inſtead of complying with the patriarch's demands, however, he firſt ordered his ſubjects to ſupply them with no proviſions: then he ſtopped the mouths of the Portugueſe by a conſiderable quantity of gold, giving the patriarch himſelf a very valuable preſent; adding to all this a large ſupply of proviſions; but at the ſame time taking proper methods to diſperſe their leaders into different parts of the empire, ſo that they ſhould find it impoſſible ever to reunite in a body.

156
Hoſtilities betwixt the Abyſſinians and Portugueſe.

Such is the account given of this tranſaction by the Portugueſe hiſtorians; but that of Mr Bruce, who ſays that he tranſlated his from the Abyſſinian annals, is ſomewhat different. He only informs us, that the quarrel betwixt the Portugueſe and Abyſſinians was inflamed by the "incendiary ſpirit of the brutiſh Bermudes: from

from reproaches they came to blows; and this proceeded ſo far, that one night the Portugueſe aſſaulted the king's tent, where they ſlew ſome and grievouſly wounded others." The event, however, was, that no abſolute quarrel ever took place betwixt this emperor and any of the Portugueſe excepting this patriarch, whom he was on the point of baniſhing to one of the rocks uſed as priſons in Abyſſinia. This was diſpenſed with on the interpoſition of Gaſpar de Suza the new Portugueſe commander (who had ſucceeded Arius Dias), and another named *Kaſmati Robel*, both of whom were in great favour with the emperor; and Bermudes perſuaded to withdraw to India.

157 Bermudes leaves Abyſſinia.

According to Mr Bruce, he repaired to Dobarwa, where he remained two years quite neglected and forlorn, ſaying maſs to no more than ten Portugueſe who had ſettled there after the defeat of Don Chriſtopher. He then went to Maſuah; and the wind ſoon becoming favourable, he embarked in a Portugueſe veſſel, carrying with him the ten perſons to whom he had officiated as prieſt. From Goa he returned to Portugal, and continued there till his death. On the other hand, the Portugueſe writers inform us, that he was narrowly watched by order of the emperor; and that Gaſpar de Suza, the Portugueſe commander, had orders to put him to death if he ſhould attempt to make his eſcape. Bermudes, however, being determined at all events to make his eſcape, pretended to be ill of the gout, and that a change of air was neceſſary for his recovery; for which reaſon he went to the town above mentioned, where there was a monaſtery. On this pretence he was allowed to croſs the kingdom of Tigré, accompanied by eight faithful ſervants, with whom he reached Dobarwa unſuſpected. Here he remained concealed in a monaſtery for two years before he could find an opportunity of getting to the iſland of Maſuah, from whence he proceeded to Goa.

158 A new deputation from the pope.

The emperor was ſcarce freed from this troubleſome prieſt, when he was in danger of being involved in new difficulties by the intruſion of others into his dominions. Ignatius Loyola, founder of the order of the Jeſuits, was at that time at Rome; and ſo much attached to the cauſe of the Pope, that he propoſed to go in perſon to Abyſſinia, in order to make a thorough converſion of both prince and people. His Holineſs, however who, from what he had already ſeen of Ignatius, conceived that he might be of greater uſe to him by ſtaying in Europe, ſent in his ſtead Nugnez Baretto, one of the ſociety of Jeſuits, whom he inveſted with the dignity of patriarch, and honoured with a letter to Claudius. With theſe commiſſions, and a number of prieſts, Baretto ſailed for Goa in the Eaſt Indies; by which, however diſtant, the only paſſage to Abyſſinia was at that time. On his arrival at that place he was informed that the Abyſſinian monarch had ſuch a ſteady averſion to the church of Rome, that there was no probability of his meeting with a favourable reception. For this reaſon it was judged more proper to ſend ſome clergymen of inferior dignity, with proper credentials, as ambaſſadors to the emperor from the governor of India, without running the riſk of having any affront put upon the patriarch. Theſe were Oviedo biſhop of Hierapolis, Carneyro biſhop of Nice, and ſeveral others, who arrived ſafely at Maſuah in the year 1558. Claudius, on hearing of their arrival, was greatly pleaſed, as ſuppoſing that a new ſupply of Portugueſe ſoldiers were arrived. Finding, however, that they were only prieſts, he was very much mortified, but ſtill reſolved to give them a civil reception. But a more important conſideration, and which concerned the welfare of the empire in the higheſt degree, now claimed his attention. This was the appointment of a ſucceſſor to the throne, Claudius himſelf having no ſon.

159 Prince Menas redeemed from captivity.

A project was therefore ſet on foot for ranſoming Prince Menas, the emperor's youngeſt brother, who had been taken priſoner by the Moors in the time of David, and hitherto detained in captivity on a high mountain in Adel. This was not likely to be accompliſhed; for the Moors would not willingly part with one who they knew was their mortal enemy, that he might be raiſed to the ſovereignty of a great empire. By detaining him priſoner alſo, they might reaſonably hope for diſputes concerning the ſucceſſion to the Abyſſinian throne; which would enable them to attack the empire with advantage. In theſe circumſtances, it is probable that Claudius would have found great difficulty in procuring his brother's liberty, had it not been that the ſon of the famous Gragné had been taken in that battle in which his father was killed, and in like manner confined on a mountain in Abyſſinia. A propoſal was then made to his mother, who had eſcaped into Atbara that her ſon ſhould have his liberty, provided the king's brother ſhould be reſtored. This was accepted; and by means of the baſhaw of Maſuah, an exchange was made. Four thouſand ounces of gold were given for the ranſom of Menas, which were divided between the Moors and the baſhaw of Maſuah; while on his part Claudius ſet at liberty Ali Gerad the ſon of Gragné without any farther demand.

According to Bermudes's account of theſe times, the widow of Gragné was taken priſoner at the battle in which her huſband was killed, and was afterwards married to Arius Dias. In this caſe we muſt ſuppoſe her to have been the ſame with the *queen of Adel*, mentioned as his conſort by other hiſtorians: but Mr Bruce treats this account as a mere fable; and informs us, that by means of Nur the ſon of Mugdid, murderer of the royal family as already related, ſhe made her eſcape into Atbara.

160 Nur determines to deſtroy Claudius.

On that occaſion Nur fell in love with her; but ſhe refuſed to marry any man unleſs he brought her the head of Claudius, who had killed her former huſband. To attain his wiſhes therefore, Nur, now governor of Zeyla, undertook the taſk; and when Claudius marched towards Adel, ſent him a challenge to fight; telling him that there was yet a particular inſtrument for ſhedding the blood of the Abyſſinian princes, and deſiring him to be prepared, as he was very ſoon to ſet out to attack him. The emperor did not decline the combat, but is ſaid to have been adviſed againſt this expedition by all his friends. This advice ſeems to have proceeded from a number of prophecies, probably trumped up by the clergy, that he ſhould be unfortunate, and loſe his life in the campaign. Theſe prophecies ought no doubt to have had weight with him, as they moſt certainly indicated a ſpirit of diſaffection among his troops; and the event accordingly evinced that it was ſo.

161 Defeat an death of t emperor.

The Abyſſinians fled almoſt on the firſt fire, leaving the king in the midſt of his enemies, attended only by 18 Portugueſe and 20 horſemen of Abyſſinia, who continued faithful to the laſt.

All theſe were killed after the moſt deſperate reſiſtance; the king himſelf receiving upwards of 20 wounds before he fell. His head was cut off, and brought by Nur to his miſtreſs, who hung it up on a tree before her door. Here it remained for three years, when it was at laſt bought by an Armenian merchant, who buried it at Antioch in the ſepulchre of a ſaint of the ſame name. Nur gained on this occaſion a very complete victory; the king and moſt of the principal nobility being killed, a great number made priſoners, and the camp taken with an immenſe booty. On his return to Adel, he refuſed to accept of any congratulations, or to allow rejoicings to be made for his victory, but paſſed along in the habit of a common ſoldier mounted on an aſs; ſaying, that he owed the victory to the mercy of God alone, who had immediately interpoſed for the deſtruction of the Chriſtian army.

162
eign of
enas.

This fatal engagement took place on the 22d of March 1559; and as the ſucceſſion had been already ſettled, Menas aſcended the throne without any oppoſition. On his acceſſion he found his affairs in great confuſion, and he had ſtill to contend with foreign and domeſtic enemies The firſt of theſe was Radaet the king of the Jews, who had a territory in the empire of Abyſſinia. the capital of which was on a rock named *Samen*. The cauſe of this quarrel is not known, but the event was unfortunate; the king being obliged to abandon the enterpriſe, after having beſtowed a conſiderable time upon it. This was followed by an attempt to aſſaſſinate him, which had very near taken place; and this again by a conſpiracy among his principal nobles headed by Iſaac the Baharnagaſh.

163
ebellion of
ſaac the
aharna
aſh.

He had been a very faithful ſervant of the late emperor Claudius; but ill uſed by Menas, who was of a very haughty and moroſe diſpoſition. In attempting to ſuppreſs this rebellion, the firſt attempts of the emperor were likewiſe ineffectual, his forces being attacked by ſurpriſe and entirely defeated. Soon after this, Iſaac proclaimed Taſcar the nephew of Menas, who was then at liberty, king of Abyſſinia; hoping thereby to ſtrengthen his cauſe, and enable him to cope with the emperor, who was aſſembling a powerful army againſt him.

164
e is de-
eated.

This expedient did not anſwer the purpoſe. His army was entirely defeated by Menas; Taſcar taken priſoner, and thrown headlong from the top of a precipice; and Iſaac himſelf eſcaped with great difficulty to the confines of his own government in the neighbourhood of Maſuah.

165
Allies with
he Turks
nd Portu-
ueſe.

Here he entered into an alliance with the Turkiſh baſhaw of Maſuah; whoſe friendſhip he gained by putting him in poſſeſſion of the town of Dobarwa, with the flat country adjacent, which abounds with the proviſions wanted at Maſuah, and is looked upon as the key to the province of Tigre and the high-lands of Abyſſinia. Beſides this, Iſaac ſtrengthened himſelf alſo by an alliance with the Portugueſe; which, had their numbers been at all conſiderable, muſt have been very formidable. Their inclination to deſert their former protector and ally the emperor, proceeded entirely from the ſhameful behaviour of their prieſts, who never would be ſatisfied without enſlaving the emperor as well as his ſubjects to the tyranny of Rome.

166
eaſon of
heir quar-
el with the
mperor.

We have already ſeen that Bermudes had proceeded ſo far on this ſubject, that he narrowly eſcaped with his life. His ſucceſſor Oviedo (for the patriarch Nugnez died by the way) fared ſtill worſe. On his introduction to the emperor Claudius, he informed him, that the pope and king of Portugal now expected no leſs than an immediate fulfilment of his engagements of ſubmiſſion to the ſee of Rome. This requiſition was made with ſuch an air of inſolence, that the prince could ſcarce conceal his reſentment; but reſtraining his paſſion, he promiſed to conſider of it, and to call meetings of the learned in theſe matters to debate the point. This was a very fruitleſs taſk; and therefore Oviedo thought proper to quit the court towards the end of December 1558; leaving behind him an inſolent letter addreſſed to the Portugueſe and ſuch converts as they had made; in which he exhorted them not to converſe with ſchiſmatics, and the Abyſſinians to forſake their errors. Being now debarred from acceſs to the emperor, he began to entertain the people with ſeditious diſcourſes; which practice he continued during the remaining part of the reign of Claudius and the beginning of that of Menas. The latter, perceiving the pernicious tendency of his diſcourſes, poſitively commanded him to deſiſt; which the patriarch refuſing, the emperor fell upon him with his own hands, beat him ſeverely, tore his clothes and beard. and took his chalice from him that he might thus be diſabled from ſaying maſs; after which he baniſhed him, with Francis Lopez another of his aſſociates, to a barren mountain, where they remained ſeven months in great miſery.

167
Oviedo baniſhed to a
mountain.

Not content with this, he iſſued many ſevere edicts againſt the Portugueſe; prohibited them from intermarrying with the Abyſſinians; and ſuch of the Abyſſinian women as were already married to Portugueſe huſbands, he commanded not to accompany them to their churches. His next ſtep was to call Oviedo again into his preſence, and command him, under pain of death, inſtantly to leave his dominions.

168
Is commanded to
leave the
empire,
but refuſes.

The inſolent and fooliſh prieſt refuſed obedience to this expreſs command; he declared that he would obey God rather than man; and preſenting his bare neck to the emperor, deſired him to ſtrike and put an end to his life at once Menas drew his ſword, but was prevented by the queen and others who ſtood near him from giving the fatal ſtroke. A ſecond beating and baniſhment to the mountain ſucceeded; and in the latter part of the ſentence all the Portugueſe prieſts as well as others were included.

169
Sentence of
baniſhment
paſſed on all
the Portugueſe, who
thereupon
join the
rebels.

The Portugueſe, however, determined not to ſubmit to ſuch an indignity; and therefore, to a man, joined Iſaac; who, in expectation of more auxiliaries from India, profeſſed a great deſire of embracing the Romiſh religion The king was very apprehenſive, and not without reaſon, of the arrival of more Portugueſe; but it appears that Oviedo had not ſufficient intereſt to procure the ſupply he promiſed. An engagement, therefore, took place without them, in which Menas was again victorious; though the battle was not ſo deciſive as to put an end to the rebellion.

170
Iſaac again
defeated.

The emperor died a ſhort time after his victory, and was ſucceeded in 1563 by his ſon Sertza Denghel, then only 12 years of age.

171
Reign of
Sertza
Denghel.

The beginning of his reign was diſturbed by new rebellions; which, however, were happily ſuppreſſed. Iſaac, with his allies the baſhaw and the Portugueſe, ſeem to have remained for ſome time unmoleſted; and in the year 1569, a kind of accommodation took place. It is by no means eaſy to ſay how the Portugueſe were again received into favour after ſuch flagrant treachery and rebellion. Mr Bruce.

Bruce only ſimply tells us that "Oviedo and the Portugueſe did not appear at court." This indeed is not to be wondered at, as they had been ſo lately at open war with the emperor. Other accounts ſay, that after the laſt battle with Iſaac, "their name became ſo odious to all the Abyſſinians, eſpecially to their monarchs, that they would never ſuffer any of them to be in their army from that time." Some of theſe accounts ſay alſo, that Menas was defeated and killed in another battle; others, that he was driven to ſome high mountains, where he wandered about till death put an end to his miſery. Accounts of this kind, however, are by Mr Bruce treated as mere falſehoods, and expreſsly contradictory to the annals of thoſe times. All we can ſay upon the ſubject therefore is, that after the defeat of Iſaac, the Portugueſe, not excepting Oviedo himſelf, remained in Abyſſinia, where they were more favourably dealt with by the new emperor than they had been by his father; though he was no friend to their religion, as ſuppoſing it to be deſtructive of monarchy and all civil government. It is probable alſo, that the various diſturbances which happened, together with his own tender age during the beginning of his reign, would prevent him from paying that attention to them which he would otherwiſe have done. The Galla, a very barbarous nation, and who have at laſt greatly reduced the power of the Ethiopian monarchs, made frequent inroads during this reign; and in the year 1576, a league was formed by Mahomet king of Adel, with Iſaac and the Turkiſh baſhaw, who had either continued their hoſtilities, or renewed them about this time.

172
Iſaac and the Baſhaw league with the king of Adel;

The emperor, however, marched with ſuch expedition, that he did not allow them time to join their forces; and attacking them ſeparately, gained a complete victory over them all.

173
But are entirely defeated.

Almoſt the whole Mooriſh army was deſtroyed; but while the emperor entered Adel with a deſign to make a full end of his enemies on the eaſt, he received information that the Galla had invaded him on the weſt. Traverſing the whole breadth of the empire therefore with the utmoſt expedition, he came up with theſe enemies, who were afraid to encounter him. On this he turned his arms againſt the Falaſha, obliging them to deliver up their king, whom he baniſhed to a mountain.

174
The emperor invades and ravages the country of the Galla and Falaſha.

Then invading the country of the Galla and Falaſha, he ravaged it for four years ſucceſſively, protecting at the ſame time the kingdom of Narea from the inroads of theſe barbarians.

175
Tigré invaded by Cadward Baſhaw.

While Sertza Denghel employed himſelf in repreſſing the incurſions of the Galla, one Cadward Baſha, a Turkiſh officer of great valour and experience, who had been inveſted with the office of baſhaw of Maſuah, began to make inroads into the province of Tigré. The emperor haſtened to oppoſe him; but in his paſſage committed great devaſtations in the country of the Falaſha, in order to provoke them to deſcend from their mountains and come to an engagement. Theſe Falaſha profeſs the Jewiſh religion, and were then governed by a king named *Geſhen*.

176
King of the Falaſha defeated and killed.

This monarch, provoked at the ravages and deſtruction he beheld, deſcended with vaſt numbers of his ſubjects, in order to revenge it; but was killed, and his army utterly defeated by the Abyſſinians, on the 19th of January 1594. The victorious Sertza then haſtened to encounter the baſhaw; who, confident of the ſuperiority of his own troops, not only waited him patiently, but gave him every advantage he could deſire. A very deſperate battle enſued; the event of which was doubtful, till Robel, commander of part of the king's houſehold troops, who were armed with pikes, attacked that part of the Turkiſh horſe where he ſaw the baſhaw, and killed the officer who carried the ſtandard. In doing this he broke his pike; but though then deſtitute of any other weapon than a ſhort crooked knife which the Abyſſinians always carry in their girdles, he inſtantly puſhed up to the baſhaw, and with it wounded him mortally in the throat.

177
The baſhaw defeated and killed.

This unexpected event inſtantly decided the victory; the Turkiſh horſe betook themſelves to flight, and the reſt of the army ſoon followed their example. A dreadful ſlaughter enſued among the Moors, who were purſued to the iſland of Maſuah; and many were driven into the deſarts, where they periſhed with thirſt. After this, marching back to the weſtern part of his territories, the emperor proceeded to Narea, deſtroying the Galla as he went along.

178
Death of the emperor.

His laſt expedition was towards Damot to chaſtiſe ſome rebels there. Before he ſet out, a prieſt of great ſanctity and talent for divination, is ſaid to have warned him not to undertake the war; but his advice was rejected with contempt: on which he requeſted him only not to eat the fiſh taken out of a certain river; but this advice was alſo neglected, and the fiſh being really of a poiſonous nature, the king died in conſequence of eating them.

179
Two ſucceſſors nominated.

On the death of Sertza Denghel a diſpute enſued about the ſucceſſion. In the beginning of his ſickneſs the late king had named for his ſucceſſor his ſon Jacob, a boy of only ſeven years of age; but finding death approaching, he named his nephew Za Denghel, as being come to the years of manhood, and more fit for the government of ſuch a numerous and turbulent people. This laſt reſolution proved highly diſagreeable to the queen and ſome of the principal nobility, who wiſhed for a minority, during which they might engroſs the power into their own hands.

180
Jacob raiſed to the throne.

In conjunction with her two ſons-in-law, Keſla Wahad and Ras Athanaſius, therefore, the empreſs determined to raiſe Jacob to the throne, notwithſtanding the final determination of the late king abovementioned. This was put in execution immediately after the death of Sertza Denghel; Jacob was raiſed to the throne, and Za Denghel confined in an iſland of the lake Dembea or Tzana. An attempt was likewiſe made to ſeize Socinios, natural ſon to Facilidas grandſon of the unfortunate David, who had likewiſe a claim to the throne; for his not being born of a lawful marriage, was no objection in Abyſſinia. Socinios, however, no ſooner ſaw the fate of his couſin Za Denghel, than he withdrew himſelf from the power of his enemies; and Za Denghel himſelf, after being a ſhort time confined in the iſland above mentioned, found means to eſcape, and took refuge among the inacceſſible mountains of Gojam.

Thus diſappointed in their attempts on the princes, the empreſs, with her two ſons-in-law, were obliged to pretend loyalty to Jacob, whom they governed till he was 17 years of age. The young king then perceiving that his tutors were taking ſome ſteps to prolong their dominion over him, took the government into his own hands, and baniſhed one Za Selaſſe, whom they had employed in the execution of their projects, to the kingdom of Narea. The conſpirators, alarmed at this bold exertion of royal prerogative, determined inſtantly to depoſe Jacob, and raiſe Za Denghel, whom they had baniſhed, to the throne.

181 Deng- raiſed to throne.

This, however, was now a matter of ſome difficulty, as he had concealed himſelf ſo effectually among the mountains of Gojam, that he could ſcarce be found out. His retreat being at laſt diſcovered, Ras Athanaſius took an opportunity of inſulting Jacob, even while ſitting on the throne; called him an obſtinate, ſtubborn, and fooliſh boy; declared him degraded from the imperial dignity, and that Za Denghel was coming to ſupplant him. Jacob, perceiving by the inſolence of this ſpeech, that he was entirely in the power of his enemies, left his palace in the night, in order to fly to the mountains of Samen, where his mother's relations were, from whom he expected protection. He got to the borders of that country, but was there diſcovered, ſeized, and brought back to his rival, who was now ſeated on the throne.

182 cob ba- ſhed.

Za Denghel, however, with a clemency not very uſual in Abyſſinia, did not either put him to death, or mutilate him in ſuch a manner as to render him incapable of afterwards enjoying the kingdom; but contented himſelf with baniſhing him for life to Narea.

183 ecline of e Romiſh ligion in byſſinia.

Za Denghel was no ſooner ſettled on the throne, than he unluckily behaved in ſuch a manner as to alienate the affections of his people from him entirely. This was occaſioned by his attachment to the church of Rome. Ever ſince the time that the Portugueſe had joined Iſaac the Baharnagaſh, the entrance into Abyſſinia had been ſhut up by the Turks, ſo that no new miſſionaries could have acceſs; and all thoſe who came with Oviedo being dead, the Romiſh religion had languiſhed for want of preachers to ſupport it. The laſt of theſe died in 1596; and all the reſt having been dead ſome time before, little could be expected from the labours of a ſingle perſon. Next year Melchior Sylvanus, a vicar of the church at Goa, was ſent on a miſſion to Abyſſinia; being ſuppoſed to be a proper perſon for this work, on account of his language and complexion, which might baffle the vigilance of the Turks. He entered without being ſuſpected; but the great defeat given the Turks by Sertza Denghel already mentioned, had reduced their power ſo much, that leſs danger now attended this expedition than formerly, and other miſſionaries quickly followed.

184 eter Paez eſtores it.

The moſt learned, as well as the beſt qualified for the undertaking in every reſpect, was *Peter Paez*, who came to this country in the year 1600; and on his taking upon him the whole charge of the miſſion, Sylvanus returned to India. The new miſſionary did not at firſt affect to intrude himſelf on the emperor; but taking up his reſidence at the convent of Fremona in the province of Tigre, he firſt applied to the ſtudy of the learned language of the Abyſſinians called *Geez*, and in which their books are uſually written. In this he made ſuch progreſs as quickly to ſurpaſs the natives themſelves; after which he ſet up a ſchool, where the children of the Portugueſe and Abyſſinians were taught promiſcuouſly. The progreſs made by his ſcholars was ſo great, that he was ſpoken of at court, and recommended in the warmeſt terms to the emperor Jacob before his depoſition.

185 e arrives t court.

On this he was ſent for, and appeared before the court in 1604; where, to the great diſſatisfaction of the Abyſſinian monks, he received ſuch honours as are uſually beſtowed on men of the firſt quality. Next day, in a diſpute before the king, two of his ſcholars, whom he had brought along with him, fairly vanquiſhed the beſt theologians that could be found to oppoſe them. Maſs was then ſaid in the Roman manner; and this was followed by a ſermon, which in the purity and elegance of its diction (whatever the ſubſtance might be) excelled any thing that had ever been compoſed in the Abyſſinian language.

Though Paez had been called to court by Jacob, yet Za Denghel was on the throne before he arrived, and it was he who witneſſed the diſpute and heard the ſermon.

186 The emperor embraces the Catholic religion.

He was ſo much charmed with the latter, that he inſtantly reſolved to embrace the religion of the church of Rome; which reſolution he ſoon after communicated to ſeveral of his friends, and even to Paez himſelf; but under an oath of ſecrecy. The emperor's own zeal, however, rendered this oath of no uſe; for in a little time he iſſued proclamations forbidding the obſervation of the Jewiſh Sabbath, and wrote letters to Pope Clement VIII. and Philip III. of Spain, deſiring a ſupply of mechanics to inſtruct his people in the uſeful arts, and Jeſuits to teach them religion.

187 His imprudent conduct occaſions a rebellion.

This precipitate conduct had the effect which might have been expected. The Abyſſinians were generally diſaffected to the church of Rome, and no pains had been taken to gain them over: they were alſo turbulent, ſavage, and rebellious; ever ready to revolt; and now had a favourable opportunity of excuſing their treaſons under pretence of zeal for religion. This opportunity was quickly made uſe of by Za Selaſſe, whom, as we have already mentioned, Jacob had baniſhed; but who, on the advancement of Za Denghel, had probably been ſet at liberty.

183 The emperor excommunicated.

This traitor having firſt held many ſeditious meetings in private, prevailed on the Abuna, or Abyſſinian patriarch, to excommunicate the king, and abſolve his ſubjects from their allegiance. He then ſet out for the territory of Gojam, where the people had always been remarkable for their averſion to the church of Rome. In this place, therefore, he found no difficulty in raiſing an army to fight againſt his ſovereign.

189 An army raiſed againſt him.

Za Denghel, who was an expert warrior, did not fail to go in queſt of him with what forces he could raiſe; but ſoon found, by the great deſertion among his troops as he paſſed along, how much the excommunication pronounced by the Abuna had availed. This was ſo alarming, that John Gabriel, an experienced Portugueſe officer, adviſed him to decline an engagement for the preſent, and take ſhelter in ſome fortreſs until his ſubjects ſhould return to a ſenſe of their duty. This ſalutary advice was rejected, from the abſurd notion that it was a diſhonour not to fight a rebel who had defied his ſovereign. In the beginning of the engagement, victory ſeemed to favour the royal cauſe. The Portugueſe carried every thing before them, and routed that wing of the enemy which oppoſed them.

190 He is abandoned by his troops and killed.

In the other wing, however, the cowardly and treacherous Abyſſinians deſerted their king, who was quickly ſurrounded by his enemies, and left in a deſperate ſituation. A body of nobility, with his own officers and domeſtics, attended him and fought deſperately in his defence. Za Denghel himſelf, being an excellent horſeman, and admiſkilled in the uſe of arms, performed aſtoniſhing feats of valour. At laſt he was thrown to the ground, grievouſly wounded in the breaſt by a lance. Notwithſtanding this, he inſtantly recovered himſelf, drew his ſword, and reſiſted his aſſailants ſo violently, that they were fain to keep at a diſtance and annoy him with miſſile weapons. In this ſituation he ſtood till almoſt fainting with fatigue and loſs of blood; when the traitor Za Selaſſe, puſhing up his horſe violently againſt him, threw him to the ground by a blow on the forehead, and a multitude then ruſhing upon him he was diſpatched with many wounds.

191
His death univerſally lamented.

The news of Za Denghel's death were received with ſuch general indignation throughout the Abyſſinian empire, that the rebels durſt not name any ſucceſſor. As it ſeemed natural to think, however, that Jacob would now be re-elected, meſſengers were diſpatched to acquaint him of his good fortune; but during this interval Socinios appeared, not as a candidate, but as already in poſſeſſion of the empire, and ready to ſupport his rights by force of arms. His firſt ſtep was to let Ras Athanaſius know his pretenſions to the throne, and deſire his aſſiſtance with his army, promiſing to reward him as ſoon as it ſhould be in his power. Without waiting for any anſwer, he advanced ſo rapidly, that Athanaſius had ſcarce time to conſider what he ſhould reply, when a ſecond meſſage was ſent, importing that Socinios was in the neighbourhood, and ordering preparations to be made for receiving him as his ſovereign. This expeditious mode of action ſo much confounded Athanaſius, that he complied with the requiſitions, ſaluting him king, and joining his troops to his. Thus ſucceſsful in his firſt attempt, Socinios made a ſimilar one on Za Selaſſe. In this, however, he was diſappointed. Za Selaſſe having firſt ſent an equivocal anſwer, marched againſt him with his whole army; while Socinios, happening to fall ſick, and putting little confidence in Athanaſius, withdrew to the mountains of Amhara. Athanaſius likewiſe, not knowing to whom he ſhould attach himſelf, withdrew his forces, and ſtood neuter.

192
The empire claimed by Socinios.

193
He is obliged to retire.

Za Selaſſe had refuſed to join Socinios, in expectation that Jacob would make his appearance, whom he rather wiſhed to enjoy the crown than Socinios; as under the former he might hope to engroſs all the power to himſelf. For a long time, however, no anſwer was returned to his meſſages; his troops became impatient; ſo that fearing leſt a mutiny or general deſertion ſhould take place, he diſpatched a meſſenger to Socinios, acknowledging him for emperor. But ſcarce was this done, when a meſſenger arrived from Jacob, informing him that he was then in Dembea, and promiſing Za Selaſſe great honours if he would acknowledge him for his ſovereign. With theſe terms the traitor inſtantly complied, and his example was followed by Athanaſius; while Socinios, not as yet able to reſiſt all his enemies, retired again to Amhara. This, however, he was not long of accompliſhing. Jacob was by no means poſſeſſed of equal military ſkill; and though Za Selaſſe was an experienced officer, yet his extreme perfidy, pride, and obſtinacy, rendered it very dangerous to have any concern with him. This appeared remarkably in the preſent caſe. His pride in the firſt place would not allow him to join his forces to thoſe of Jacob, leſt the latter, who was inferior in military ſkill, ſhould have a ſhare in the victory he was to gain. Then, intoxicated with his opinion of himſelf, he neglected to behave with the caution neceſſary in the neghbourhood of ſuch an experienced general as Socinios, which gave the latter an opportunity of cutting off almoſt his whole army. Being now obliged to fly with a few attendants to Jacob's camp, he met with an indifferent reception on account of his defeat; for which reaſon he made propoſals to join Socinios. The latter accepted his offer. though he could put no confidence in one who had been guilty of ſuch complicated treachery; only he thought it would be an advantage to put it out of his power to join his antagoniſt. Jacob, on the other hand, confident in his numbers, which are ſaid to have been almoſt 30 to 1, advanced boldly to give his antagoniſt battle. Socinios declined the engagement till he had drawn him into a ſituation where his numerous forces could not act; ſo that a dreadful carnage enſued, Jacob himſelf periſhing among the multitude, and his body being never found afterwards. In this battle alſo was killed the wicked prieſt Abuna Petros, who was the occaſion of Za Denghel's death, as we have already related. Ras Athanaſius eſcaped by the ſwiftneſs of his horſe, and took refuge in a neighbouring monaſtery. He was afterwards pardoned at the interceſſion of Peter Paez; but his goods and eſtate being confiſcated on various occaſions, falling into univerſal contempt, and being abandoned by his wife, he died at laſt of want. According to the Abyſſinian accounts, Socinios ordered the purſuit to be ſtopped as ſoon as he ſaw the head of Abuna Petros; but the Portugueſe writers inform us, that he kept it up with the utmoſt vigour throughout the whole day and part of the night. They particularly mention, that a number of Portugueſe, who had joined the army of Jacob, loſt their lives on this occaſion, by falling over a precipice which they could not avoid in the dark. One of theſe named *Manuel Gonſalvez* had the good luck to light on a tree, where he ſat till morning in the utmoſt terror, but at laſt made a ſhift to clamber up and eſcape.

194
Jacob ſet up in oppoſition to him.

195
Bad conduct and defeat of Za Selaſſe Jacob's general.

196
Jacob defeated and killed.

By this victory Socinios was fully eſtabliſhed on the throne, though his ſituation might ſtill be accounted precarious by reaſon of the rebellious diſpoſition of many of the provinces. He began with making a general proclamation of pardon, excepting only the murderers of Za Denghel, with whom he had been in terms of intimate friendſhip. Being informed therefore, that one *Mahardin*, a Moor, had given him the firſt wound in that battle in which he was killed, he ordered his head to be inſtantly ſtruck off with an ax before the gate of the palace.

197
Socinios f vours the Portugue

The Portugueſe were much favoured by this prince; and they were become very numerous by continual intermarriages with the Abyſſinians; the male children being always trained to the uſe of fire-arms by their parents, and incorporated as ſoldiers with them; and they were now all united in one body under an experienced officer named *John Gabriel*, whom we have already had occaſion to mention. As their numbers and valour made them objects of conſideration, Socinios determined to attach them to himſelf as much as poſſible; and the beſt means to do this he knew was by favouring their prieſts. Peter Paez was therefore ſent for to court; where a diſpute concerning

198
reſolves
embrace
Catho-
religion.

cerning the ſupremacy of the pope and the two natures of Chriſt (the great ſubjects of debate in Abyſſinia), took place, and a ſermon was preached with as great ſucceſs as that in Za Denghel's time. The king firſt enlarged the territory poſſeſſed by the Jeſuits at Fremona; after which he declared to Paez his reſolution of embracing the Catholic religion; giving him at the ſame time two letters, one to the king of Portugal, the other to the Pope, the purport of which was to requeſt a number of more Portugueſe to deliver Abyſſinia from the incurſions of the Galla, as they had formerly done from the yoke of the Moors.

defeated.

Before any thing of importance could be done in matters of religion, the king was called forth to ſuppreſs a rebellion which had already taken place. An impoſtor had appeared, who called himſelf *Jacob* the late king, and pretended to have eſcaped from the battle; but ſo much wounded in the face that he kept one ſide of it conſtantly covered to conceal the deformity. He made his appearance among the mountains of Habab near Maſuah; and being joined by great numbers of people, Sela Chriſtos, brother to the king, and governor of Tigré, marched againſt him. The impoſtor's troops, though numerous, fled at the firſt onſet; but he eſcaped to the mountains, where it was very difficult to follow him. This, however, was attempted; and a great many of the poſts he had taken were ſtormed like as many forts: but ſtill the impoſtor himſelf, though driven from place to place, found means to make good his retreat to the country lying between the mountains of Habab and the territory of the Baharnagaſh. Thither he was purſued by Selah Chriſtos; but that general, finding the rebellion likely to ſpread through the whole province of Tigré, thought proper now to acquaint his brother Socinios with the ſtate of affairs, and to deſire his aſſiſtance. The king, though at that time he had ſent away moſt of his troops in an expedition againſt the Shangalla and Gongas, who dwell on the northweſt of Abyſſinia, ſet out immediately with ſuch troops as he could collect. Theſe were but few in number; his cavalry particularly, amounting to no more than 530, beſides a ſmall reinforcement brought by his brother Emana Chriſtos, governor of Amhara. As he proceeded, he was informed that a party of Galla were lodged on a hill at no great diſtance from him. Determining to cut them off, he ſurrounded the hill where they were poſted; but having cauſed his cavalry to advance before, and paſs a deep ravine, they were almoſt entirely deſtroyed, while the reſt of the army were ſeized with ſuch a panic that they refuſed to ſtir. In this extreme danger, the Galla paſſed the ravine to attack them; but the king having advanced ſingly, and killed the firſt of them, his troops, aſhamed of their cowardice, ruſhed forward on the enemy, and gained a complete victory, which obliged the ſavages to leave the province they infeſted at that time.

ted.

The misfortune of the cavalry on this occaſion quickly occaſioned a report that the king had been defeated; of which the impoſtor Jacob did not fail to take advantage; and deſcending from his mountains, committed great devaſtations in the low country. But though attended by a great multitude, who likewiſe fought with more obſtinacy than formerly, he was ſtill defeated by Sela Chriſtos with a force greatly inferior. But before any thing effectual could be done for his reduction, the Galla made a dreadful irruption into the ſouthern provinces, murdering all who fell into their hands, and burning and deſtroying towns, churches, and villages, in the moſt dreadful manner. The king bore thoſe exceſſes for ſome time with patience, till at laſt he drew them into ſuch a diſadvantageous ſituation, that being ſurrounded by his forces, and inferior in number as well as in valour, they were all cut off to a man, with the loſs of only 400 on the part of the Abyſſinians. Soon after this victory the king underwent the ceremony of coronation. He then marched againſt the impoſtor Jacob; but the latter was too ſenſible of the ſuperiority of his rival to face him in the field. He therefore retired again to his mountains, while the king left the ſuppreſſion of the rebellion to an experienced officer named Amſala Chriſtos; who employed two young men, that had been outlawed for murder, to aſſaſſinate the impoſtor. This being done, it was found that the pretended Jacob was no other than a herdſman among thoſe mountains to which he ſo conſtantly fled for refuge; and that he had neither wound nor ſcar on his face, but had kept one half of it covered to conceal the little reſemblance he bore to Jacob whom he perſonated.

zo be pro-
claimed
king.

The king being now freed from this rebellion, began again to turn his thoughts towards religion. His firſt ſtep was to make an handſome preſent to the Jeſuits; but he ſoon ſhowed his inexperience in religious matters, by attempting to reconcile the two contending parties in his empire. Before he could ſee the folly of this attempt, however, his attention was called by a moſt dangerous rebellion, which was begun by one Melchizedec, a ſervant of the late Sertza Denghel, but a man of great experience in war. He was firſt oppoſed by Sanuda, a brave officer; but being totally deſtitute of troops, he was obliged to apply to the attendants of the king of Sennaar, who had been depoſed by his ſubjects, and was at that time in Abyſſinia. Theſe readily joined him; and a bloody battle enſued, in which Sanuda was ſo totally defeated, that he alone had the good fortune to eſcape, and that grievouſly wounded, his men being all killed on the ſpot. On this misfortune Socinios ſent his brother Emana Chriſtos with a conſiderable force to reduce the rebels. Melchizedec finding himſelf oppoſed by ſuch an able general, exerted himſelf to the utmoſt, in order to raiſe a force ſufficient to reſiſt him; and in this he ſucceeded ſo well, that his army ſoon ſtruck terror into all the neighbouring country, notwithſtanding the preſence and known valour of the king's brother. A prince of the blood-royal, named *Arzo*, was likewiſe found out and proclaimed king, in order to give ſome ſanction to the rebels; ſoon after which they boldly marched to meet the royal army. The engagement took place on the 9th of March 1611, and was fought with great obſtinacy on both ſides: the advantage even appeared for ſome time on that of the rebels; till Emana Chriſtos, perceiving that all was at ſtake, puſhed deſperately forward to the place where Melchizedec himſelf was. The latter ſeeing no probability of avoiding a ſingle combat, which he did not chooſe to try, inſtantly turned his horſe and fled; and the reſt of the army ſoon followed his example. Melchizedec,

however,

however, did not much avail himſelf of this cowardice; for he was cloſely purſued by the peaſants, taken priſoner, and executed as a traitor, together with ſeveral of his principal officers.

209
Is defeated, taken priſoner, and put to death.

The fate of Prince Arzo, whom, to ſupport their cauſe, the rebels had proclaimed king, is not known.

210
The rebellion continues.

This victory, ſo far from extinguiſhing the ſpirit of rebellion, ſeemed to have inflamed it beyond all bounds: for news were now received that the whole country round the head of the Nile to the province of Tigré had revolted; ſo that there was a neceſſity for the immediate preſence of the emperor himſelf; and even this was inſufficient, as the rebels were diſperſed over ſuch a large tract of territory. His two brothers, Emana and Sela Chriſtos, were therefore both employed againſt different rebel chiefs, while the king marched againſt thoſe who were moſt formidable.

211
Cruel manner of carrying on the war.

The principle on which this war was carried on, ſeems to have been very cruel, viz. that of killing all the men, and carrying off the women and children for ſlaves. This was punctually executed, firſt upon the inhabitants of a mountainous diſtrict named *Guſman* on the Nile; though, at the interceſſion of the miſſionary Peter Paez, the women and children, inſtead of being ſold for ſlaves, were given to the Jeſuits to be educated in the Catholic religion. The Gongas and Agows were next attacked with equal ſucceſs, and ſtill greater cruelty; one of their tribes, named *Zalabaſſa*, being almoſt entirely exterminated: but this, inſtead of having any good effect, ſeemed to multiply the rebels ſtill more. The Agows and Galla invaded the provinces in the neighbourhood;

212
Amdo, another impoſtor, ſupported by the Jews.

and another impoſtor, whoſe true name was *Amdo*, but who pretended to be the unfortunate emperor Jacob, appeared as a competitor for the crown. This laſt rebel proved much more formidable than any of the reſt. He was indeed ſurpriſed before he had time to collect any forces; but Gideon, king of the Jews of Samen, having killed the guards who watched him, ſet the impoſtor at liberty, and ſupported his cauſe. Thus he ſoon collected a very formidable army, with which he defeated and killed an officer named *Abram*, who oppoſed him with a conſiderable force. This brought Socinios himſelf againſt him, who inſtantly attacked the Jewiſh monarch Gideon, as being the principal ſupport of his cauſe.

213
War with Gideon.

As the country of the Jews was naturally ſtrong, and very full of fortified places, the reduction of it was evidently a very difficult taſk. The firſt place attacked was a fortreſs named *Maſſiraba;* which, though very ſtrongly fortified and garriſoned, was ſoon taken by ſtorm, and every one in it put to the ſword without diſtinction. Hotchi and Amba Za Hancaſſe, two other ſtrong fortreſſes, ſhared the ſame fate. A fourth, named *Senganat*, no leſs ſtrong than any of the former, was alſo taken; Gideon himſelf narrowly eſcaping with his life in the attack. Diſcouraged therefore by ſo many misfortunes, and apprehending the total ruin of his country, this prince at laſt was content to ſue for peace; which was granted on condition that Amdo ſhould be delivered up.

214
Amdo delivered up and put to death.

This traitor was condemned to a puniſhment very unuſual among Chriſtians, *viz.* that of being crucified; but in nailing him to the croſs, his cries and groans ſo much affected the king, that he ordered him to be taken down and beheaded.

The war was now reſumed againſt the Gongas and Guba; whom the king annually invaded for the purpoſe of making ſlaves. In this expedition his officers not only executed their commiſſion againſt theſe ſavages, but likewiſe carried off a great number of cattle from the Agows, who were then at peace with the emperor.

215
Other mil tary exp ditions.

This conduct was highly reſented by Socinios, who obliged them to make reſtitution of what they had taken away; and the doing them juſtice in this particular, had more effect in reducing the reſt of theſe people to obedience, than all the cruelties which had been committed ſince the beginning of the war.

In 1616, the emperor ſet out on an expedition againſt the Galla; but this was laid aſide on the death of his eldeſt ſon, for whom he entertained a great affection.

216
The Jews exterminated.

It was ſucceeded by a very cruel order againſt the Jews, whom Socinios now determined to exterminate without any apparent occaſion. His commands, however, were executed with the utmoſt punctuality, ſo that very few eſcaped; and among the reſt periſhed their prince Gideon lately mentioned. He was ſuppoſed to be immenſely rich, and to have concealed his riches, which have been ſought for in vain by the Abyſſinians from that time to the preſent. The children of the murdered Jews were ſold for ſlaves; and ſuch of the profeſſion as were ſcattered through the empire, had orders to renounce their religion and be baptized, under pain of death. Thus almoſt the whole Jewiſh religion was extinguiſhed at once, as moſt of them choſe rather to embrace Chriſtianity than ſuffer death. In token of the ſincerity of their converſion, they were all ordered to plow and harrow on the ſabbath day.

217
Succeſsful expedition againſt th Galla.

This butchery being over, the expedition againſt the Galla was reſumed, and carried on with the uſual cruelty; while the Galla never once appeared to prevent the deſolation of their country. Next year, however, a new aſſociation was made among theſe ſavages, and the empire invaded by them in two different parts at once. One of their armies was cut off to a man before they had time to begin their ravages; while the other fled on the firſt approach of the royal army, leaving their wives, children, and baggage, to the mercy of the enemy. Thus the king was left for a ſhort time at reſt from rebellions or foreign invaſions; and this interval he determined to make uſe of in making war on his neighbour the king of Sennaar, from whom he had formerly received an affront.

218
War wit Sennaar, &c.

In this expedition he was aſſiſted by one Wed Ageeb, a prince of the Arabs, who lived on the frontiers of Abyſſinia. The allies proceeded with their uſual cruelty, killing all the men, and ſelling the women and children for ſlaves. Vaſt numbers of cattle were carried off; and the victorious armies returned with an immenſe booty. The next expedition was againſt Fatima queen of the Shepherds, otherwiſe called *queen of the Greeks*, who reſided on the north-eaſt of Atbara. In this alſo the king proved ſucceſsful, though leſs blood was ſhed than uſual: but it was not long before this extraordinary ſucceſs met with a ſevere check by the entire loſs of an Abyſſinian army; the favourite ſon of the emperor himſelf being killed in the engagement, with ſome of the beſt officers in the empire.

219
Progreſs the Ro religion.

All this time Peter Paez had applied himſelf with the utmoſt aſſiduity to the converſion of the Abyſſinians to the Catholic faith; and in this undertaking he

220
cellent
aracter of
ter Paez.

he had been attended with wonderful ſucceſs. He was indeed of all others the moſt fit for an undertaking of this kind among a rude and barbarous people. Beſides an uncommon ſhare of learning, he poſſeſſed an eminent degree of ſkill in the mechanical arts; by which he was enabled to teach the Abyſſinians how to build houſes of ſtone and lime, which they had never known before. In theſe he was at firſt maſon, carpenter, ſmith, and architect, himſelf; and thus, to the aſtoniſhment of the whole empire, he built ſome churches and a palace for the king. His univerſal genius prepared the people for the reception of his opinions; while the barbarous ignorance and ſavage manners of his antagoniſts tended to prejudice every one againſt their tenets, though ever ſo juſt in themſelves. Sela Chriſtos, the king's brother, is ſaid to have been converted by only reading the Abyſſinian books with attention; in which, it ſeems, the ignorance of the prieſts had been diſplayed in an extraordinary manner. We have already ſeen how well the emperor himſelf was diſpoſed towards the Romiſh church; and his example was followed by many of the principal people of the kingdom. At laſt the Abyſſinian patriarch named *Simon* made a complaint, that irregularities in religion had been committed; and diſputes held on matters of faith without calling him, or permiſſion granted him, to ſupport his clergy in theſe controverſies. As Socinios had no opinion of this prieſt's learning or eloquence, he did not imagine that any harm could enſue to the cauſe from granting what he wanted. A public diſpute was accordingly appointed; in which Simon's inferiority was ſo apparent, that Socinios now publicly declared his belief in the two natures of Chriſt.

221
Letters from the pope and king of Spain.

While the converſion was in this proſperous way, letters arrived from the pope and king of Spain, but without any promiſe of the temporal aſſiſtance, *viz.* the ſoldiers he had ſolicited; though they aſſured him of an ally far ſuperior, the Holy Spirit himſelf, provided the emperor continued firm in his reſolutions of embracing the Catholic faith. Socinios would probably have been as well ſatisfied with an account of a

222
Determines to ſubmit to the pope.

reinforcement of ſoldiers; but as matters ſtood, he was obliged to be content, and reſolved to ſubmit in form to the pope, renouncing for ever his connection with the Greek church. As it was improper, however, to ſend letters on a ſubject of ſuch importance by a common meſſenger, proper perſons were to be appointed who might occaſionally aſſume the character of ambaſſadors, and act accordingly. This being reſolved on, the next thing was to determine the way by which the ambaſſadors were to reach Europe. The uſual track by Maſuah was now ſhut up on account of the rebellion which exiſted in the neighbouring provinces; ſo that the more eligible way ſeemed to be through Narea and the provinces to the ſouthward, by which they might reach Melinda, and from thence embark for Goa.

223
Ambaſſadors ſet out for Europe.

The ambaſſadors were choſen by lot; which falling firſt on Antonio Fernandez, he named Fecur Egzie as his companion; and, all things being ſettled, theſe two ſet out for Gojam in the beginning of March 1613. It ſeems ſurpriſing that the Abyſſinian monarch ſhould have ſent theſe ambaſſadors on ſuch a dangerous expedition without a proper guard through the barbarous countries they had to paſs. This, however, ſeems undoubtedly to have been the caſe; as we hear of no other attendants they had than 10 Portugueſe taken with him by Fecur Egzie, ſix of whom were to go no farther than Narea, but the other four were to proceed to India; forty men armed with ſhields and javelins were alſo granted, but this force was undoubtedly too ſmall to anſwer any uſeful purpoſe. Sela Chriſtos indeed furniſhed them with guides from the barbarous nations in the neighbourhood of Narea, taking hoſtages for the ſecurity of the travellers; but the inſufficiency of theſe precautions ſoon appeared.

224
Account of their journey.

Our travellers had proceeded but two days journey into the country of the Gongas, when they were treated in ſuch an hoſtile manner, that one of the Portugueſe was obliged to return with Fernandez to complain of the behaviour of the ſavages. On this information Sela Chriſtos inſtantly diſpatched three officers, with a proper number of troops to chaſtiſe them; by which means the ambaſſadors got ſafe to Mine, the name of ſome miſerable villages on a ford of the Nile. Here they croſſed the river on ſkins blown up, and next day entered the country of the Pagan Galla; and ſoon after, though not without great difficulty, they reached the kingdom of Narea the moſt ſoutherly province of the Abyſſinian empire, but quite ſurrounded by the Galla. Here they were received with great kindneſs by the commanding officer of the firſt fortified place they came to; but on being introduced to the king himſelf, they met with a very indifferent reception. This was owing to the inſinuations of an Abyſſinian monk, that they were to bring Portugueſe ſoldiers that way into Abyſſinia; which would be deſtructive to his kingdom. On calling a council, it was reſolved to ſend them into the kingdom of Bali; ſo that they would be obliged to paſs through a much more difficult and dangerous road than what was firſt intended. Having thus, as he ſuppoſed, provided againſt the danger which threatened his kingdom, he made them a preſent of 50 pieces of gold, recommending them at the ſame time to the ambaſſador from the ſovereign of Gingiro, thro' which they were next to paſs.

On leaving Narea, they received a convoy of 80 ſoldiers to conduct them ſafely to their next ſtage; after which they paſſed four days through countries totally laid waſte by the Galla, and where they were obliged to hide themſelves for fear of meeting with theſe ſavages. Proceeding ſtill through woods and vaſt chains of mountains, they came to the river Zebee, or more properly *Kibbee*, from its white colour reſembling melted butter, as the word imports.

225
Deſcription of the river Zebee.

Fernandez deſcribes this river as larger than the Nile, and vaſtly more rapid. They paſſed it by a kind of bridge, but certainly a moſt tremendous one The channel of the river is full of rocks; and betwixt every two of theſe a ſingle tree was laid, ſo elaſtic that it would bend with the weight of one perſon; while the vaſt height of the precipice, and the ſight of the roaring current below, was ſufficient to ſtrike the boldeſt with terror. At a ſmall diſtance from this bridge was a ford, through which it was neceſſary that their mules ſhould paſs; which being accompliſhed without any accident, though with difficulty and danger, they entered the territory of Gingiro. Here they were hoſpitably received by the ſovereign. and after a mutual exchange of preſents proceeded to Sangara, the capital of another ſmall kingdom named *Cambat*, which was at this time governed by a Moor named *Amelmal*. During the time of their reſidence here, one Manquer, a ſchiſmatic Abyſſinian, arrived, who inſinuated to the king that the recommendations they had brought along with them were falſe. This reduced them to the neceſſity of ſtaying there till meſſengers could be ſent to Socinios to know whether it was ſo or not; which occaſioned a delay of three months. At laſt orders were brought to ſend them off immediately. This favourable anſwer procured the diſmiſſion of the ambaſſadors with preſents; while the malicious Manquer was detained priſoner. He eſcaped, however, and overtook them in the next kingdom, named *Alaba*, which was governed by a Moor named *Aliko*. Here he accuſed them of a deſign to overturn the Mahometan religion altogether: which ſo exaſperated the barbarian, that he threatened them all with death; and actually put them in priſon, where ſome of the Portugueſe died.

226
They are obliged to return.

At laſt, after holding a council in which Manquer gave his voice for putting them to death, it was reſolved that they ſhould be ſent back to Amelmal; which was accordingly done, and from his dominions they returned to Abyſſinia. Thus ended this memorable embaſſy, by which the Pope was deprived of any authentic documents which might ſhow that any Abyſſinian emperor had ever voluntarily ſubmitted to him; and there can be no doubt that this miſcarriage, more than any thing elſe, prevented the eſtabliſhment of Popery in this country.

227
A number of rebellions on account of religion.

Socinios had now gone ſo far in favour of the Catholic party, that he began to ſhare in ſome meaſure the fate of Za Denghel, numberleſs conſpiracies being formed againſt him; which it was undoubtedly owing only to the altered ſituation of affairs by the preaching and aſſiduity of Peter Paez, that he was able to withſtand. The conſpirators were at this time ſupported, not only by the Abuna, but by Emana Chriſtos himſelf, the king's brother, whom we have frequently had occaſion to mention.

228
The Abuna excommunicates the emperor, but is obliged to withdraw his ſentence.

Their firſt ſtep was the very ſame which had been ſo ſucceſsfully taken by Za Selaſſe in the time of Za Denghel, viz. to pronounce ſentence of excommunication on the emperor. He was at that time abſent on an expedition againſt the Agows; but returned immediately on hearing what was tranſacted in his abſence; informing the Abuna, that if he did not recal the excommunication without delay, his head ſhould pay the forfeit. This ſpirited declaration had ſuch an effect, that the Anathema was annulled, and the conſpiracy diſſolved for that time.

229
Attempts to aſſaſſinate the emperor.

It was next reſolved between Emana Chriſtos the king's brother, Julius his ſon-in law, and Kefla Wahad maſter of the houſehold, to aſſaſſinate the king in his palace. To accompliſh this purpoſe it was concerted that they ſhould deſire an audience; that Julius ſhould enter firſt, and preſent a petition of ſuch a nature as would probably be refuſed: on this he was to begin an altercation; and during the continuance of it the other two aſſaſſins were to come up, and ſtab their ſovereign before he had time to put himſelf in a poſture of defence. Happily for Socinios, however, he was informed of his danger by a page juſt before Julius made his appearance: on which, inſtead of refuſing the petition, he granted it immediately; ſo that there was no room for diſpute. He then got up to walk; which was ſcarce done when Emana Chriſtos alſo came; on which Socinios invited them all to the terrace to walk with him. This prevented their falling upon him at that moment; and as they ſuppoſed they would have ſtill a better opportunity on the terrace, they readily conſented.

230
It miſcarries.

But Socinios having opened a private door, at which he entered firſt, drew it quickly after him; and as this door had a ſpring lock made by Peter Paez, which ſhut it in the inſide but could not be opened from without. the conſpirators were diſappointed. Being alſo ſenſible that their deſign had been diſcovered, they were obliged for ſome time to keep at a diſtance, but did not for that reaſon abandon their wicked projects.

231
The rebellious ſpirit of the conſpirators continues.

Their next ſcheme was to be put in execution when the king was abſent on an expedition againſt Sennaar, who had made a violent irruption into the Abyſſinian territories. The object now was not the aſſaſſination of the emperor, but of his brother Sela Chriſtos; becauſe the emperor had taken the government of Gojam from Emana Chriſtos, who was a ſchiſmatic, to give it to Sela Chriſtos, who was a violent Catholic.

232
Julius the emperor's ſon-in law firſt appears in arms.

The enterpriſe was begun by Julius; who iſſued a proclamation, that all thoſe who believed two natures in Chriſt ſhould leave the province of Tigré, where he was governor; and that ſuch as were true friends to the Alexandrian faith ſhould repair to his ſtandard to fight for it. He then ordered the goods of all the Catholics in Tigré to be confiſcated; and marched without delay into Gojam, in hopes to ſurpriſe Sela Chriſtos. But here the whole ſcheme was baffled by the vigilance and activity of the emperor; for he having received information of what was going forward, returned into that province before the conſpirators had received certain intelligence of his having left it.

233
Is deſerted by his aſſociates.

This ſo much damped the ardour of Emana Chriſtos and Kefla Wahad, that they ſtood aloof without attempting any thing till Julius ſhould try his fortune. That rebel was at firſt very much diſconcerted; but ſoon recovering his courage, advanced to the place where the Nile iſſues out of the lake of Dembea, where he met with the Abuna. Being confirmed by that prieſt in his wicked deſigns, he reſolved, by his advice, to fall upon the king before he could be joined by Sela Chriſtos, Simon himſelf (the Abuna) offering to ſhare his fortune; and to confirm all, a new and ſolemn excommunication was pronounced againſt the king and all his adherents.

234
Socinios excommunicated a ſecond time.

Socinios, alarmed at theſe proceedings, ſent a meſſage to Sela Chriſtos, deſiring him to come to his aſſiſtance as faſt as poſſible. In the mean time he himſelf advanced to meet Julius; but choſe his poſts ſo judiciouſly, that he could not be forced to an engagement without great diſadvantage on the part of the enemy. Notwithſtanding this, Julius pitched his camp cloſe to that of the king, with a deſign to force him to a battle at all events. This raſh action was followed by one ſtill worſe. Simon had perſuaded him, that as ſoon as the royal army ſhould ſee him, they would abandon the ſtandard of the emperor to join his.

235
His raſhneſs and death.

On this, without farther conſideration, he ruſhed into the camp of Socinios with a very few attendants, and reached the emperor's tent. Here he was known by the guards, and inſtantly diſpatched with all his followers; the whole army betaking themſelves to flight after his death, and being purſued with great ſlaughter by the royaliſts. The plunder of the camp

camp was immenſe, Julius having brought all his riches, which he had amaſſed by a long courſe of extortion, into the field along with him; and all of theſe were diſtributed among the ſoldiers. A vaſt number of cattle were likewiſe taken, which Socinios diſtributed among the prieſts, judges, and lay-officers. By this complete victory the whole ſcheme of the conſpirators was overthrown. Emana Chriſtos having no forces capable of coping with his brother, and unwilling, as we have ſaid, to aſſiſt Julius openly, had retired to a high mountain named *Melca Amba*, in the territory of Gojam. Here he was inveſted by Af Chriſtos, an experienced general, whom Sela Chriſtos had left governor when he joined the emperor. Emana, who was likewiſe an expert commander, would have made a vigorous defence; but unfortunately the mountain was ſo deſtitute of water, that in three days he was delivered up by his own men to ſave themſelves from periſhing with thirſt. On being brought to the king, he was tried in a full aſſembly of judges, and condemned to death; but the king pardoned and ſent him to Amhara.

236
mana
hriſtos
ken, but
rdoned.

This terrible conſpiracy had been occaſioned by the diſpute concerning the two natures of our Saviour: another quickly followed on account of the diſpute concerning the Sabbath-day; the Abyſſinian church inſiſting on the obſervance of the ſeventh day of the week as a Sabbath, and the Romiſh church on the obſervance of the firſt day. The author of this rebellion was one Jonael, who had been concerned in the expedition formerly mentioned, in which the Agow's cattle were driven away, and afterwards reſtored by the king. It is more than probable that his reſentment on this account contributed much to increaſe his zeal on the preſent occaſion; but whatever was the real cauſe, religion was the ſole pretence. He began with a moſt inſolent but anonymous letter to the king; in which the arguments of the Alexandrians for the obſervance of the Jewiſh Sabbath were ſtated, and the contrary doctrine condemned with the utmoſt virulence of expreſſion. The king himſelf was reviled in the moſt opprobrious manner, compared to another Diocleſian, the Jeſuits ſaid to be relations of Pontius Pilate, and all of them devoted to hell without redemption. By this ſtupid performance the king was ſo much offended, that he added a clauſe to the former proclamation, commanding that "all out-door work, ſuch as plowing and ſowing, ſhould be publicly followed by the huſbandman on the Saturday, under penalty of paying a web of cotton-cloth for the firſt omiſſion, the value of the cloth to be 5 s.; the ſecond offence to be puniſhed by a confiſcation of moveables, and the offence not to be pardoned for ſeven years." To this Socinios added a ſpeech from the throne in vindication of himſelf, concerning the part he had taken in religious matters; and to ſhow that he was in earneſt, cauſed the tongue of a monk to be cut out for denying the two natures of Chriſt, and one of his generals to be whipt for obſerving the Jewiſh Sabbath.

237
Another re-
ellion by
onael.

In the mean time Jonael having collected what forces he could, openly declared againſt his ſovereign; but not daring to meet him in the field, he retired into the country of the Galla, on hearing that Socinios was approaching him with an army. On this the king entered their territories, and laid them waſte; which created a diſſention among the ſavages themſelves; one party being for affording him protection, the other for delivering him up. This being made known to the king, he ſent a few preſents to the faithleſs barbarians of Jonael's party; who returned his kindneſs by ſending him the head of the rebel, though but a ſhort time before they had fought with their brethren for his reſcue.

238
He is murdered by the Galla.

A more formidable enemy than Jonael, however, ſtill remained. The province of Damot was one of the moſt diſaffected to Socinios in the whole empire; and to this place the greateſt part of the religious fanatics in other provinces had retired. They now muſtered up an army of more than 12,000 men, among whom were 400 monks, all of them armed with ſhields, lances, and ſwords; inſpired, beſides, with ſuch a degree of religious enthuſiaſm, that they expected to be rendered invulnerable by all terreſtrial weapons, and that armies of angels would fight in their cauſe. Againſt theſe Sela Chriſtos was diſpatched with about 7000 excellent ſoldiers; and as the general himſelf was a zealous Roman Catholic as well as moſt of his men, we need not doubt that both parties imagined themſelves ſure of the protection of heaven, and conſequently that the encounter would be very violent. The two armies met on the 16th of October 1620; but Sela Chriſtos was unwilling to deſtroy the infatuated people, who he knew would be unable to reſiſt his veteran troops. He therefore firſt ſhowed them his ſuperiority in ſome ſkirmiſhes; and then ſent a pathetic meſſage, offering a general pardon if they would lay down their arms. The meſſengers, however, were not allowed to approach, ſo that an engagement became unavoidable. The numbers of the rebels, as Sela Chriſtos had foreſeen, availed very little againſt the diſcipline of the veterans he commanded. The 400 monks made a moſt obſtinate reſiſtance; and did not yield till after 180 of them had been killed on the ſpot.

239
Another rebellion.

240
Deſperate enthuſiaſm of the monks.

Socinios, having once more vanquiſhed his enemies, now determined to ſhow his attachment to the church of Rome more openly. Having therefore ſent for Peter Paez, he told him his final reſolution to embrace the Catholic religion in its full extent; after which he renounced the Alexandrian church in the moſt explicit manner. His renunciation was followed by a proclamation vindicating his conduct; in which, beſides the arguments uſed for the Pope's ſupremacy, &c. he inſiſted much on the bad lives of the clergy of the oppoſite party, and for which it appeared that there was in reality too much foundation. This was the laſt work of the excellent miſſionary Peter Paez, who died of a fever immediately after his leaving the king. The example of the ſovereign, however, had very little effect upon his ſubjects. The proclamation was followed by a new rebellion in Amhara. Unluckily the enemies of his brother Sela Chriſtos had perſuaded Socinios to deprive him of his government; and there was no other in the kingdom who could be entruſted with ſuch an important commiſſion; ſo that the king ſoon found himſelf under a neceſſity of replacing and committing to him the charge of the war againſt the rebels. In this he was attended with his uſual ſucceſs: for the rebel chief, finding himſelf unable to contend with his enemy, repaired for aſſiſtance to the

241

242
A new rebellion breaks out.

243 The rebel chief murdered by the Galla.

Galla ; who no ſooner had him in their power than they killed him on the firſt offer of the imperial general, mangling his body in ſuch a manner that ſcarce a bit of it remained to be ſent to his antagoniſt.

244 A new patriarch and miſſionaries arrive in Abyſſinia.

245 Socinios takes an oath of ſubmiſſion to the pope.

246 Violent conduct of Sela Chriſtos,

In the mean time news of the revolution in religious matters which had taken place in Abyſſinia, arrived in Europe. Though the embaſſy to the Pope and king of Spain could not paſs, as has already been related, yet frequent accounts had been otherwiſe tranſmitted ; which produced ſuch an effect, that a new ſet of miſſionaries, with a patriarch (Alphonſo Mendez) at their head, were ſent to Abyſſinia. They arrived at Gorgora, the ſeat of royal reſidence, in the beginning of the year 1626 ; and at the very firſt audience of the emperor, it was agreed that he ſhould take an oath of ſubmiſſion to the Pope. The ceremony was performed with all the ſplendor that could be contrived : the patriarch then preached a ſermon on the Pope's ſupremacy in the Portugueſe language, intermixed with Latin quotations ; which is reported to have greatly confirmed the faith of the emperor and his brother, though neither of them underſtood a word of the languages in which it was preached. An anſwer to this unintelligible diſcourſe was made in the Amharic language, which was equally unintelligible to the patriarch and his attendants ; and to this the patriarch added a few words of a reply equally ill underſtood. At the concluſion of the diſpute, an oath of the Pope's ſupremacy was taken by the emperor himſelf on his knees, then by the princes, and afterwards by all preſent, according to their different ſtations. Sela Chriſtos, not contented with taking the oath, drew his ſword, and in words not eaſily underſtood, denounced vengeance on "thoſe who fell from their duty ;" and he likewiſe added to the oath of ſupremacy another to the emperor and Facilidas the Prince Royal ; but if the latter ſhould fail in the defence of the Catholic faith, he ſwore to be his greateſt enemy : nor would he be ſatisfied without impoſing this clauſe upon all the officers, whether civil or military, then preſent.

247 And of the emperor and patriarch.

This violent conduct of Sela Chriſtos procured him a number of enemies, and at laſt was the occaſion of his deſtruction ; but that of the king and patriarch ſet the whole empire in a flame. An excommunication was firſt pronounced upon all who did not keep the oath : a proclamation was next iſſued, that all prieſts ſhould previouſly embrace the catholic religion under pain of death ; and that every one, under the ſame penalty, ſhould obſerve Lent and Eaſter according to the rules of the Romiſh church. The patriarch proceeded in the ſame ſtyle ; re-ordaining the clergy, conſecrating the churches over again, rebaptizing the people, even ſuch as were full-grown, abrogating circumciſion, polygamy, and divorce (for theſe had been allowed by the Alexandrian church), and reducing the moveable feaſts entirely to the rules of the church of Rome.

Though polygamy and divorce are no doubt inconſiſtent with the pure doctrines of the goſpel, yet it was very improper to meddle with theſe practices at once in ſuch a violent manner. Beſides the confuſion that this would naturally occaſion in private families, theſe practices gave occaſion to many queſtions in law, which it belonged to the civil judges to decide ; but now theſe were all ſubjected to the authority of the patriarch : and from ſome other ſteps taken by this prelate, it appeared that he intended to encroach much farther upon the civil authority. One of theſe related to the church-lands ; which in Ethiopia are granted by the king, and reſumed at his pleaſure ; others being granted in their place, ſo that neither prieſts nor monks have any property in them. On the preſent occaſion, an Abyſſinian nobleman had poſſeſſed ſome lands belonging to a catholic monk ; for which he was called before the patriarch. On his refuſing to ſubmit to this new tribunal, he was inſtantly condemned to reſtore the lands ; but refuſing this alſo, the patriarch took an opportunity, as he was attending the emperor at church, to pronounce ſentence of excommunication againſt him, giving him over at once, ſoul and body, to the devil.—On hearing this terrible ſentence pronounced, the nobleman fainted away, and was with difficulty recovered. On the interceſſion of the emperor, however, the curſe was taken off ; but the incident produced a very diſagreeable effect on the minds of the people, who from that day began to entertain a greater averſion than ever to the Roman Catholics and their prieſts. This averſion was greatly increaſed by the abſurd conduct of the patriarch, in ordering the body of an Abyſſinian ſaint to be taken up, and thrown out of the grave in an ignominious manner, becauſe it had been buried under the altar of a church, which he imagined was thus defiled. In all other reſpects, the patriarch behaved in ſuch an inſolent and overbearing manner, that the effects of his oppreſſion ſoon began to be univerſally felt, and the Catholic religion began very quickly to decline.—The firſt ſtroke given to it was the alteration of the liturgy ; which was done at the deſire of the emperor. Ever ſince the eſtabliſhment of the Catholic religion, the Latin maſs-book, &c. had been made uſe of according to the practice of the church of Rome ; but as it ſeemed very unreaſonable to impoſe this at once upon the Ethiopians, Socinios ordered the patriarch to make ſuch alterations in the old Abyſſinian liturgies as he thought proper, that the people might thus have an opportunity of paying their devotions in a language they underſtood. The patriarch, not being able to aſſign any ſolid reaſon to the contrary, was obliged to comply ; but no ſooner was this done than the people made uſe of their old liturgies entirely, without the leaſt regard to the innovations of the patriarch. In the midſt of the confuſion which daily took place from theſe cauſes, the Galla made a dreadful invaſion, and cut off one of the emperor's generals with his whole army : nor were all the abilities of Sela Chriſtos, who had ſo often diſtinguiſhed himſelf, ſufficient to retrieve matters ; ſo that the ſavages, after having ravaged the country for ſome time at pleaſure, returned home loaded with booty. This misfortune was followed by the revolt of Tecla Georgis the king's ſon-in-law ; who not only made religion the pretence for taking up arms, but inſulted the Catholics in the moſt outrageous manner ; collecting their images and other religious trinkets into an heap, and then publicly ſetting fire to them. After this he called before him his own chaplain, named *Abba Jacob*, who was a Catholic, ſtripped him of his pontificals, and killed him with his own hand. A reconciliation with Socinios was now impoſſible ; ſo that he had no reſource but in arms. In this,

defeated,
en, and
cuted.

this, however, he was equally unſucceſsful with the other rebels in this reign; being defeated, taken priſoner, and put to death along with his ſiſter Abdera, notwithſtanding the interceſſion of a Catholic miſſionary for him, and that of the queen and ladies of the court for his ſiſter.

As the reaſons given by the king for refuſing ſuch powerful interceſſion were purely religious, the people became more and more averſe to a profeſſion ſo extremely oppreſſive and ſanguinary as that of Rome ſeemed to be.

254
volt of
e Agows.
ho ſet up
Melcha
hriſtos.

A revolt of the Agows quickly followed; not that religion had really any ſhare in their determinations, but that they were exaſperated by the ſlavery and oppreſſion to which they ſaw themſelves ſubjected. They now therefore ſet up Melcha Chriſtos, a prince of the royal blood, as a pretender to the crown; and ſoon put on ſuch a formidable appearance, that the king himſelf thought proper to march againſt them with an army of 30,000 fighting men, which with the ſervants and other attendants amounted to more than 80,000. Melca Chriſtos retired with his troops to the craggy mountains of the country; and being imprudently followed by the emperor, rolled down ſuch quantities of ſtones from the precipices, that Socinios was obliged to retreat with great precipitation, after having loſt almoſt one half of his army.

255
he rebels

iam's re-
olt and
eath.

He ſucceeded in giving the rebels a dreadful overthrow, which for ſome time entirely broke their power; but this ſucceſs was quickly followed by the revolt of Læca Mariam, a near relation of the king. He alſo was defeated, and obliged to retire to a mountain ſo ſteep, that though he aſcended it in ſafety, he was daſhed in pieces with many of his followers in attempting to deſcend; the reſt, who eſcaped this danger, being killed by their purſuers.

257
everal
isfortunes
efal the
mperor.

Still, however, the rebel Melca Chriſtos was unſubdued; againſt whom Prince Facilidas, the heir apparent to the throne, was ſent, having under him a nobleman of moſt diſtinguiſhed character named *Keba Chriſtos*. The latter was defeated and killed, without its being in the power of Facilidas to do any thing towards the ſuppreſſion of the rebellion. This misfortune was followed by the death of Fecur Egzie, formerly ambaſſador with Antonio Fernandes to the pope, but now lieutenant-general to Sela Chriſtos. He was cut off with a ſmall body of troops by the Galla; and from many misfortunes befalling the imperial troops, the power of Melca Chriſtos was augmented to ſuch a degree, that he now began to act as a king, and appointed a deputy-governor to one of the provinces.

258
rebel ge-
eral en-
rely de-
ated

His opinion of his own importance, however, had almoſt proved his ruin; for the new governor having appointed a great feſtival on a Saturday, in oppoſition to the royal edict, he was attacked by a party of the king's troops, and entirely routed with the loſs of 4000 of his men.

259
rince Fa-
lidas de
ated.

This defeat was revenged by an overthrow given to Prince Facilidas himſelf; the blame of which was laid upon Sela Chriſtos. The latter, as we have often had occaſion to obſerve, was not only a moſt valiant commander, but a rigid Catholic; and theſe two properties might naturally have been thought to ſecure him in favour with the emperor. His violent conduct in regard to the Catholic religion, however, had raiſed him ſo many enemies, that accuſations were perpetually brought againſt him; and one diſgrace conſtantly followed another, notwithſtanding all his ſervices.

260
Sela Chriſtos univerſally hated.

The preſent accuſation was brought by one Leſana Chriſtos, whom Sela Chriſtos had formerly condemned to death. For this offence he had received a pardon from Socinios; and he now revenged himſelf upon his former judge by accuſing him to his ſovereign. Sela Chriſtos was not unmindful of this conduct; and therefore, as ſoon as he had him in his power, put him to death without regarding the pardon he had received.

261
Deprived of the government of Gojam.

The emperor on this deprived him of the government of Gojam, which he gave to Serca Chriſtos, who was ſuppoſed to be a dependent on Prince Facilidas, and was beſides couſin to the emperor himſelf.

262
Revolt of the new governor.

The new governor, on his entering upon office, promiſed ſolemnly to ſupport the Catholic religion; but no ſooner did he arrive in Gojam, than he ſolicited Prince Facilidas to rebel againſt his father, and re-eſtabliſh the Alexandrian faith. This was not the only inſtance in which he ſhowed his diſobedience. He had received the charge of a caravan which came annually from Narea; but inſtead of acting properly in this reſpect. he employed himſelf in driving off the cattle of the Agows and Damots, who expected no harm, and were conſequently quite unprepared. Such numbers of them were carried off on this occaſion, that 100,000 are ſaid to have been ſent to the Abyſſinian market. Socinios, when informed of ſuch an atrocious robbery, ordered him to reſtore the cattle, and to ſurrender himſelf priſoner; but inſtead of complying with this order, he again ſolicited Facilidas to revolt againſt his father. For this he was ſharply reproved; but now, determining to make the world believe that the prince had entered into his ſchemes, he ſent a public meſſage to him, in which he was deſired to come and take poſſeſſion of the kingdom. Facilidas impriſoned the perſon who brought this treaſonable meſſage, and ſoon after ſent him to Socinios; but Serca Chriſtos ſtill perſiſted in his mad attempts. He now propoſed to aboliſh the Romiſh religion throughout the kingdom; and with that view attacked a convent which Sela Chriſtos had built in Gojam: but the fathers having been furniſhed with ſome fire-arms, made ſo good a defence, that he was obliged to give over the enterprize. He then took the laſt ſtep to complete his folly, by openly revolting againſt the emperor, and ſetting up a prince of the blood-royal in oppoſition to him, whom he had found living in obſcurity among his mother's relations. To cut off all poſſibility of reconciliation with the emperor, he renewed the ſacrilegious practices of Georgis, and put to death a prieſt for refuſing to deny the two natures of Chriſt. Thus he procured a multitude of enthuſiaſts to join him; but when the affair came to a deciſion, and Prince Facilidas with a well diſciplined army was ſent again him, it then became evident how little the fanaticiſm of a tumultuous rabble availed againſt the ſkill of a regular army.

263
He is defeated, taken, and put to death.

The rebels fought, however, with great obſtinacy till moſt of them were killed, their commander being obliged to take refuge on a mountain; from whence being unable to make his eſcape, he at laſt came down and ſurrendered at diſcretion. We need not doubt of his fate; but notwithſtanding the execution of this rebel, another ſtill remained. This was Melca Chriſtos, againſt whom the emperor next prepared to march. He now found, however, the bad conſequences of having acted ſo violently in favour of the Catholic religion. His army was ſo diſaffected, that he could ſcarcely put any confidence in them.

264
The emperor relaxes in his ſeverity concerning religion, which is reſented by the patriarch.

For this reaſon he iſſued a proclamation, that ſuch as choſe to obſerve the Wedneſday as a faſt inſtead of Saturday, had liberty to do ſo. This and ſome other indulgencies being reported to the patriarch, the latter ſharply reproved him as committing an encroachment on the prieſthood; and put him in mind of the puniſhment of leproſy inflicted upon Uzziah for aſſuming the prieſt's office. Thus an altercation commenced; and it was evident, from the behaviour of Socinios, that his extreme favour for the Romiſh religion began to decline. After this he ſet out for the country of Laſta, where Melcha Chriſtos was; and the entrance to which was guarded by very high and rugged mountains. Among theſe the rebels had ſtrongly fortified themſelves; but were driven from four poſts by the king's troops, ſo that the latter imagined a complete victory had been gained. Aſſembling themſelves, however, on the top of another high mountain, the rebels watched their opportunity; and deſcending ſuddenly upon them, cut off great numbers, and obliged the reſt to make a precipitate retreat.

265
The emperor defeated.

Another campaign was therefore neceſſary; but now the army loſt all patience. They were become weary of making war on their countrymen; and, after ſlaughtering them in the field, ſeeing the intervals between the campaigns filled up with numerous executions of thoſe who had eſcaped the ſword.

266
The army require the reſtoration of the Alexandrian faith.

A deputation was therefore ſent from the ſoldiers by Prince Facilidas, who, though he had never declared his ſentiments openly, was ſtrongly ſuſpected of being no friend to the Catholics. The purport of the deputation was, that they did not mean to ſay that the Romiſh profeſſion was a bad one, but it was ſuch as they could not underſtand; and conſequently there could be no merit on their part in profeſſing it. They were ready, however, to lay down their lives for the public good, provided their ancient religion was reſtored; but this was a point they would not give up, and without which they would neither concern themſelves in the quarrel, nor even wiſh ſucceſs to the emperor's arms. With regard to the Romiſh religion, they added this declaration, perhaps the ſtrongeſt poſſible mark of averſion, that they did not *wiſh* to know any thing about it. Socinios, therefore, according to the Abyſſinian accounts, promiſed to reſtore the Alexandrian faith, on condition that he returned victorious from Laſta. The army then readily agreed to follow him wherever he pleaſed; while the rebels, having left their fortreſſes in Laſta, probably from a confidence in their own ſtrength, boldly marched towards the royal army. In the engagement, however, they did not ſhow their uſual alacrity, and were ſoon defeated with the loſs of 8000 men.

267
Melca Chriſtos defeated.

Many of their beſt officers were killed on the ſpot, and Melca Chriſtos himſelf eſcaped only by the ſwiftneſs of his horſe.

By this victory the power of the rebels was broken; but it was not attended with the ſame ſatisfaction to the people with which other victories were wont to be accompanied. On viewing the field of battle along with Facilidas next day, the prince is ſaid to have made a pathetic ſpeech to his father; in which he told him, that the bodies of the men he ſaw dead on the field of battle were neither thoſe of Pagans nor Mohammedans, but of his own Chriſtian ſubjects; and that victories of this kind were like driving a ſword into his own entrails. "* How many men (ſays he) have you ſlaughtered? how many more have you yet to kill? We are become a proverb even to the Pagans and Moors for carrying on this war; and for apoſtatizing, as they ſay, from the faith of our anceſtors."

268
Pathetic ſpeech of prince F
cilidas to his father concernin
the war.

The king did not make any reply at that time; but the effects of the prince's words were ſoon apparent. The patriarch took the firſt opportunity of upbraiding him with his ingratitude to the Catholics, and deſerting the religion whoſe profeſſors had by their prayers obtained ſuch a ſignal victory. To this Socinios replied in general, that he had done every thing in his power to eſtabliſh the Catholic religion; for which he had ſhed the blood of thouſands, and had ſtill as much more to ſhed: but that he ſhould conſider of the matter, and acquaint him with his final reſolution. This was by no means favourable; for next day, in a meſſage to the patriarch, he recounted the many rebellions which had been excited on account of religion; and concluded with telling him, that though the faith of Rome was not a bad one, yet the people of Abyſſinia did not underſtand it.

269
An unive
ſal toleration gran
ed.

For this reaſon he was determined to grant a toleration, by allowing ſuch as profeſſed the Catholic faith to do ſo in peace, and ſuch as rather choſe that of Alexandria to do the ſame.

270
Oppoſed
the patriarch.

The patriarch replied, that he had no objection to grant this indulgence to ſuch as had not yet embraced the Catholic faith; but thoſe who had done ſo could not be permitted to renounce it without a grievous ſin. Thus a new ſyſtem of perſecution would have commenced: but the emperor, underſtanding well the purport of his diſcourſe, replied, that if this was the caſe, he was no longer maſter of his own kingdom; and immediately afterwards iſſued a proclamation, wherein he declared the Alexandrian faith reſtored, with the altars for the ſacrament, liturgy, and every other thing belonging to it; at the ſame time, that being now old and infirm, he himſelf reſigned the crown and empire to Facilidas.

271
The emp
ror reſtor
the Alex
andria
faith, and
reſigns th
kingdom.

This remarkable proclamation was made on the 14th of June 1632; after which Socinios took no farther care of publick affairs, nor did he long ſurvive this tranſaction. He died on the 7th of September this year, and with him fell all the hopes of the Jeſuits.

272
The new
emperor
an enemy
to the Ro
mans.

Facilidas, as had been rightly conjectured, was an inveterate enemy to the Catholic faith. As ſoon therefore as he had obtained the government, even before he took upon himſelf the title of king, the Catholics were every where diſplaced from offices of truſt and honour; but as ſoon as he found himſelf eſtabliſhed on the throne, a letter was ſent to the patriarch, informing him, that as the Alexandrian faith was now reſtored, it was become indiſpenſably neceſſary for him to leave the kingdom, eſpecially as the new Abuna was on the way, and only deferred his journey till the Romiſh prieſts ſhould be out of the country.

273
The patri
arch com
manded t
quit Aby
ſinia.

For this reaſon he commanded the patriarch, with all his brethren, to leave their convents throughout the empire, and retire to Fremona in the kingdom of Tigré, there to wait his further pleaſure. The patriarch attempted to ſoft-

---

* Bruce's Travels, vo
ii. 943. p.

en him by many conceſſions, but in vain; on the 9th of March 1633 he was ordered, with the reſt of the fathers, to proceed immediately for Fremona. This they were obliged to comply with; but the emperor, underſtanding that they were about to eſtabliſh themſelves, and to ſolicit ſuccours from Spain to accompliſh their purpoſes by force, he ſent orders to the patriarch inſtantly to deliver up all the gun-powder they had at that place, and to prepare without delay to ſet out for Maſuah. Still the infatuated and obſtinate prieſt determined not to comply with the emperor's orders. At laſt he thought proper to deliver up the gun-powder; but reſolved to leave his companions behind him, and to diſperſe them as much as poſſible through the empire, in caſe he himſelf ſhould be obliged to embark at Maſuah; which, however, he did not by any means intend.

274
e applies
protec-
n to the
harna-
ſh, then
rebellion.

For this purpoſe he applied to the Baharnagaſh, named *John Akay*, then in rebellion againſt the emperor; who carried them all off from Fremona in the night-time, under a guard of ſoldiers, and lodged them ſafely in a ſtrong fortreſs named *Adicotta*. Here the patriarch imagined that he might remain in ſafety till he ſhould be able to procure ſuccours from India. In this, however, he was deceived. John conveyed them from place to place, through many unwholeſome ſituations, till their ſtrength as well as their patience was exhauſted. At laſt, on receiving a preſent of gold, he allowed them to return to their old habitation Adicotta. Facilidas, then, being determined at all events to get rid of ſuch troubleſome gueſts, endeavoured to prevail upon John by bribes to deliver them into his hands. John was too delicate to comply with this requeſt, which he ſuppoſed would be a violation of hoſpitality; but he conſented, on receiving a proper compenſation, to ſell them to the Turks.

275
he patri-
ch and o-
er miſſio-
aries ſold
the
urks.

Two were left in Abyſſinia, in hopes of ſoon ſharing the crown of martyrdom; and this indeed Facilidas did not delay to put them in poſſeſſion of, both being ordered for execution as ſoon as he got them into his power. Not content with this, and being perpetually apprehenſive of freſh invaſions from Europe, he entered into a treaty with the Turkiſh baſhaws to keep the ports of Maſuah and Suakem ſhut againſt them; by which their entrance into Abyſſinia would be effectually prevented.

During theſe tranſactions, the emperor took the moſt effectual methods otherwiſe to eradicate the Romiſh religion, by cutting off the principal perſons who profeſſed it, or obliging them to renounce their profeſſion.

276
ela Chri-
os put to
ath.

The principal of theſe was his uncle Sela Chriſtos, who had deſerved ſo well of the late emperor Socinios, and of the whole empire in general. His exceſſive bigotry in religious matters proved the cauſe of his deſtruction, as has formerly been hinted. When it was propoſed to him to renounce his faith, he abſolutely refuſed to do ſo, either to avoid the greateſt puniſhment the king could inflict, or to obtain the greateſt gift he had in his power to beſtow. On this he was baniſhed to an unwholeſome diſtrict among the mountains of Samen; but as even here he kept up a correſpondence with the Jeſuits, and wiſhed to facilitate the introduction of more Portugueſe from India, he was ſentenced to be hanged on a cedar-tree.

The expulſion of the preſent race of miſſionaries did not entirely diſcourage the Europeans from attempting to introduce a freſh miſſion into Abyſſinia. The obſtinate, haughty, and rebellious ſpirit of the Jeſuits was univerſally condemned, and looked upon to be the cauſe of the extreme averſion ſhowed by the emperor and the whole empire againſt the doctrines they profeſſed. It was therefore hoped, and not without ſome appearance of reaſon, that the point might ſtill be gained, provided the miſſion were undertaken by others leſs violent and inſidious in their behaviour.

277
A new miſ-
ſion under-
taken by ſix
Franciſcan
Capuchins.

After the execution of thoſe who remained in Abyſſinia, ſix Capuchins, the reformed order of St Francis, were ſent with protections from the Grand Signior to facilitate their paſſage into Abyſſinia, where they hoped to revive the drooping or rather loſt cauſe of the Catholic religion. Nothing, however, could be more unfortunate than the event of this undertaking.

278
Four of
them mur-
dered, and
the other
two return.

The Galla murdered two who attempted to enter Abyſſinia by the way of Magadoxa. Two who arrived ſafely in the country, were ſtoned to death; while the remaining two, hearing at Maſuah of the fate of their companions, returned home with an account of it.

270
Three
others mur-
dered by
order of Fa-
cilidas.

The bad ſucceſs of theſe did not deter three others from making the ſame attempt a ſhort time afterwards; but they having imprudently informed Facilidas of their intention, were murdered by the baſhaw of Maſuah, who had received orders from him to this purpoſe. So particular was the emperor with regard to the execution of this order, that he cauſed the baſhaw to ſend him the ſkin of their faces and heads; that he might know by their faces that they were Europeans, and by their ſhaved heads that they were prieſts.

280
Melca Criſ-
tos ſtill con-
tinues in re-
bellion.

Though the Catholic faith was now totally ſuppreſſed, the ſpirit of rebellion ſtill continued; and Melca Chriſtos continued as much in oppoſition to his ſovereign as when he firſt took up arms on pretence of religion. At firſt he met with extraordinary ſucceſs; totally defeated the royal army, though commanded by Facilidas in perſon: after which, purſuing his good fortune, he made himſelf maſter of the capital, entered the palace, and was formally crowned king. This, however, was the laſt of his good fortune. Facilidas having recruited his army as faſt as poſſible, ſent three able generals to attack his rival, who was now acting the ſovereign in his palace.

281
Is defeated
and killed.

The rebels were ſurrounded before they expected any enemy, and almoſt entirely cut off, Melca Chriſtos himſelf being killed in the engagement.

The victory over Melca Chriſtos was followed by ſeveral ſucceſsful expeditions againſt the Agows and Galla; but in the 6th year of the reign of this emperor, the rebels of Laſta, who ſeemed determined not to yield while there remained a poſſibility of reſiſtance, choſe the ſon of Melca Chriſtos for their king, and again began their depredations on the neighbouring provinces.

282
The rebels
chooſe his
ſon for their
leader.

283
The empe-
ror's army
periſhes
with cold.

Facilidas marched againſt them with his uſual activity; but had the misfortune to loſe the greateſt part of his army by cold among the mountains of Laſta, though it was then the time of the equinox, and conſequently the ſun was only 12° from being vertical, the latitude of Laſta being no more than 12°, and the ſun 12 hours in the day above the horizon.—Before this rebellion could be ſuppreſſed, another was begun, at the head of which was Claudius the king's brother. He had not the ſame good fortune with the rebels of Laſta; but was quickly defeated, taken priſoner,

ſoner, and baniſhed to a mountain called *Wechne*; which ſerved from that time for the impriſonment of the princes of the blood-royal. The ſuppreſſion of one rebellion, however, ſeemed to have no other effect than that of giving riſe to another. A new expedition was to be undertaken againſt the Agows and Shangalla; but they had poſted themſelves ſo advantageouſly, that the royal army was entirely defeated without being able to make any impreſſion on their enemies. Facilidas, however, knowing that this defeat could be attended with no other bad conſequence than the loſs of the men, which had already happened, marched directly againſt the rebels of Laſta without attempting to revenge the defeat he had ſuſtained. The rebel general, weary of contention, in which he probably ſaw that he would be finally unſucceſsful, choſe to ſubmit unconditionally to the emperor; who, though he at firſt affected to treat him with ſeverity, ſoon after releaſed him from priſon, beſtowing upon him large poſſeſſions in Begemder, with his daughter Theoclea in marriage.

284
Princes of the blood again impriſoned on a mountain.

285
Facilidas defeated by the Agows and Shangalla.

286
The rebels of Laſta ſubmit.

287
Reign of Hannes.

Facilidas died in the month of October 1665, and was ſucceeded by his ſon Hannes. This prince was ſuch an enthuſiaſt for Chriſtianity, that in the very beginning of his reign he iſſued a proclamation forbidding the Mahometans to eat any fleſh but what was killed by Chriſtians; but ſo far was he from any inclination to favour the Catholics, that he ordered all their books which could be found in the empire, to be collected in a heap and burnt. Much of his time was ſpent in regulations of church-matters, and in contentions and trifling diſputes with the clergy; which conduct ſo diſguſted his ſon Yaſous, that he fled twice from the capital, but was purſued and brought back. The laſt time was in the year 1680, when he found his father ill of the diſtemper of which he died. Hannes expired on the 19th of July that year, having lived at peace during the whole of his reign, excepting ſome trifling expeditions againſt the Shangalla and rebels of Laſta.

288
Reign of Yaſous.

Yaſous, who ſucceeded to the throne with the approbation of the whole kingdom, was of a very different diſpoſition from his father; being generous, active, and brave to a great degree; he was alſo much leſs bigoted, and differed from him conſiderably in religious principles. Having ſettled church-matters as he thought proper, his next ſtep, and the moſt glorious action of his whole reign, was to pay a viſit to thoſe of the royal family who were confined on the mountain of Wachne. He found them in the moſt miſerable condition; all in tatters, and many almoſt naked; their revenue having been ill-paid by his father, who was of a ſordid diſpoſition, and the little they received having been embezzled by their keepers. Yaſous being greatly moved at this ſpectacle, ordered a large ſum of money to be divided among them for their preſent neceſſities, clothed them according to their rank, and ſettled matters ſo that no part of their revenue could ever afterwards be applied to improper purpoſes. To the governor of the mountain he aſſigned a large tract of territory, to make amends for the profit he had been accuſtomed to derive from the revenue of the princes; and finally, he left all the priſoners at the foot of the mountain, at perfect liberty either to take up their reſidence again on it or any where elſe. By theſe extraordinary inſtances of royal munificence the emperor ſo effectually gained the affection of his relations, that they unanimouſly determined to return to their former ſtate of confinement; and during the whole time of his reign no competitor for the crown ever made his appearance from among thoſe who reſided there.

289
His generoſity to the baniſhed princes.

Though Yaſous is ſaid to have poſſeſſed all the qualities which conſtitute a great and good monarch, the natural turbulence of his ſubjects, and the peſtilent diſpoſition of the monks, ſoon began to ſhow themſelves by new ſeditions. Theſe were preceded by a violent irruption of the Galla, who were overthrown, as uſual, with great ſlaughter; but ſoon after, being ſolicited by ſome monks who had drawn over a party of the Agows to their ſide, the diſturbances were renewed. A grandſon of Socinios, who had fled to the Galla when Facilidas firſt baniſhed the princes to Wechne, was proclaimed king. A multitude of ſavages immediately flocked to his ſtandard, ſo that he was ſoon at the head of a very formidable army, while the Agows and other malcontents were ready to join him as ſoon as he ſhould repaſs the Nile. The king, however, entirely diſconcerted the ſcheme by his activity; for, advancing with the utmoſt celerity, he reached the banks of the Nile before the Galla on the other ſide were ready to join their allies on this ſide of it. The Agows were ſo confounded at his preſence, that they allowed him to paſs the river unmoleſted. The Galla were equally ſurpriſed at ſeeing the war transferred into their own country; and, with their uſual fickleneſs, deſerted the prince whoſe cauſe they had pretended to eſpouſe. A few remained faithful, but were utterly defeated by the forces of Yaſous; the unhappy prince himſelf, whoſe name was *Iſaac*, being taken priſoner, and put to death in the preſence of his rival. After this many great exploits were performed againſt the rebellious Agows, Galla, and other ſavages: but which, as they produced no other conſequence than that of eſtabliſhing the emperor's character for valour and ſkill in military affairs, we ſhall here paſs over; only remarking, that, in the opinion of his ſubjects, one of his campaigns was the moſt glorious ever recorded in the annals of Abyſſinia. The moſt memorable events in the preſent reign regarded religion, and a renewal of the correſpondence betwixt Europe and Abyſſinia; of which we have a particular account from Mr Bruce to the following purpoſe. About the end of the 17th century a number of Franciſcans from Italy ſettled at Cairo in Egypt, and were maintained at the expence of the fathers in Paleſtine, though pretending to be independent of their ſuperior the guardian of Jeruſalem. The latter, diſpleaſed at this method of proceeding, offered to ſupply the miſſion to Egypt entirely at the expence of Paleſtine, and likewiſe to furniſh from thence miſſionaries capable of inſtructing the people in the Chriſtian religion. This offer meeting with a favourable reception at Rome, a new ſet of miſſionaries from Jeruſalem, called by our author *Capuchins*, appeared at Cairo; from whence the Franciſcans were baniſhed, only two of them being allowed to remain in that city. The others returned to Rome; where, finding that they could not re-eſtabliſh themſelves by fair means, they had recourſe to artifice and fiction. It was now pretended, that, on the expulſion of the Jeſuits from Abyſſinia, a great number of Catholic Chriſtians had fled into the neighbouring

bouring countries of Nubia and Sennaar, where they found themſelves ſo grievouſly oppreſſed by the Mahometans, that, without ſome ſpiritual aſſiſtance, they would be under the neceſſity of renouncing their religion. This ſtory being confirmed by the two Franciſcans who remained at Cairo, the cauſe of theſe ſuppoſed Chriſtians was eagerly eſpouſed by the religious in Italy, and a new miſſion ſet on foot at the expence of the pope for their relief, which continues to this day under the title of the *Ethiopic miſſion*. The miſſionaries had it alſo in charge to penetrate if poſſible into Abyſſinia; and to keep up, as far as was in their power, the Catholic faith, until a better opportunity ſhould offer of making an attempt to convert the whole empire. For this purpoſe a convent was procured for them at Achmim in Upper Egypt; and permiſſion was granted, notwithſtanding their former baniſhment, to ſettle two of their order at Cairo independent of the fathers of Paleſtine.

While theſe tranſactions paſſed in Italy and Egypt, Louis XIV. of France was in the height of his glory. He had attempted to rival the ancient Greeks and Romans in the magnificence of his works; but his conduct with regard to religion, his perſecution of the Proteſtants, and revocation of the edict of Nantz, had ſtigmatized him throughout the greateſt part of Europe as a bloody and mercileſs tyrant. To wipe off this ſtain, the Jeſuits, his great ſpiritual directors, formed a ſcheme of inducing the emperor of Abyſſinia to ſend an embaſſy to France; after which they hoped that they might get themſelves replaced in the Ethiopic miſſion, to the excluſion of the Franciſcans. The king, whoſe pride was very much flattered by the propoſal, readily came into it; but the Pope's conſent was ſtill neceſſary. His Holineſs was by no means pleaſed with this intruſion of a temporal prince into ſpiritual affairs: nevertheleſs, he did not chooſe to enter into any conteſt; but that he might undo with one hand what he did with the other, he appointed ſix Jeſuits, of whom Verſeau, the ambaſſador of Louis to himſelf, was one, to be miſſionaries to Abyſſinia, but the ſuperior of the Franciſcans to be his legate *à latere* at that court; providing him with ſuitable preſents for the emperor and principal nobility.

The Jeſuits now finding themſelves in danger of being ſupplanted by the Franciſcans, applied to the Pope to know which of the two orders ſhould make the firſt attempt to enter Abyſſinia; but received no other anſwer than that thoſe who were moſt expert ſhould do ſo. Verſeau, probably diſpleaſed at this conduct of the Pope, went to a convent in Syria of which he was ſuperior, without making any attempt to enter Ethiopia: therefore the miſſion remained in the hands of two perſons of oppoſite profeſſions, a Jeſuit and Franciſcan; the name of the latter being *Paſchal*, an Italian; and of the former *Brevedent*, a Frenchman. The latter was accounted a man of learning and probity, zealous in the cauſe of his religion, but by no means imprudent or raſh in his attempts to promote it.

293
Yaſous falls ſick, and ſends for an European phyſician.

In the mean time an unforeſeen accident procured admittance to the miſſionaries into Abyſſinia more readily than could have been expected in the preſent ſituation of affairs. Yaſous and his ſon had both been attacked by a ſcorbutic diſorder which threatened to turn to a leproſy; on which one Hagi Ali, a Mahometan factor at Cairo, received orders to bring with him an European phyſician on his return to Abyſſinia. It happened that this man had formerly been acquainted with Friar Paſchal, who had adminiſtered ſome medicines to him. He now propoſed that Paſchal ſhould accompany him to Abyſſinia in the character of a phyſician; and that Friar Anthony, another of his own order, ſhould go with him as his companion. But this ſcheme was fruſtrated by Maillet the French conſul, who had the charge of the whole from Louis XIV. and wiſhed that the Jeſuits alone ſhould have the conduct of the miſſion. For this purpoſe he repreſented to Hagi Ali, that friar Paſchal underſtood nothing of medicine; but he promiſed to furniſh him with another, whoſe ſkill he extolled above all thoſe of ancient or modern times. Hagi Ali, who knew nothing of the matter, readily agreed to Maillet's propoſal; and Charles Poncet a Frenchman, who had been bred a chemiſt and apothecary, was appointed to the office of phyſician, with Father Brevedent to attend him as his ſervant. Thus the ſcheme of the Franciſcans was for the preſent overthrown: but unluckily Maillet employed one Ibrahim Hanna, a Syrian, to write letters to the Abyſſinian monarch and ſome of his principal nobility, which he deſired him to ſubmit to the inſpection of one Francis a capuchin or monk of the Holy Land, and conſequently an enemy to the Franciſcans. Ibrahim, not being acquainted with the monk he mentioned, and thinking any other would anſwer as well, carried the letters to one of the ſame name, but of the Franciſcan order. Thus the whole ſecret was divulged at once; and the Franciſcans, with the malevolence eſſential to ſuch religious miſcreants, reſolved on the deſtruction of Poncet and his attendants. At preſent, however, their ſanguinary intentions were defeated; Poncet ſet out immediately after he had received his commiſſion, and arrived ſafe at Gondar the capital of Abyſſinia, with his attendant Father Brevedent, on the 21ſt of July 1699. Brevedent died on the 9th of Auguſt; but Poncet lived to execute his commiſſion, by making a full cure of his royal patient. On the 2d of May 1700, he ſet out on his return for Europe, and arrived at Maſuah without any bad accident.

294
Friar Paſcal and another Franciſcan undertake the office.

295
Diſappointed by M. Maillet.

296
Poncet and Brevedent appointed.

297
The Franciſcans reſolve the deſtruction of the miſſionaries.

298
Poncet ſets out on his return after curing Yaſous.

It has already been obſerved, that the main end of this undertaking was to procure an embaſſy from Abyſſinia to the French monarch; and this end alſo was gained. An ambaſſador was procured, but unluckily not ſuch a one as M. Maillet the chief manager of the whole project deſired. This man, intoxicated with abſurd notions of nobility and diſtinctions of rank, could not make allowance for the difference between the appearance of an ambaſſador from a barbarous monarch, however powerful, and one from the ſovereign of a civilized and polite nation. The ambaſſador ſent by Yaſous, therefore, having been originally no other than a cook, could not be agreeable to a man of ſuch a diſpoſition. The preſents ſent by the Abyſſinian monarch indeed, had they arrived, would have probably conciliated matters. Theſe were, an elephant, ſome Abyſſinian young women, &c. but unluckily the elephant died, and the ambaſſador was robbed of all the reſt by a Turkiſh baſhaw. Maillet, therefore, naturally proud, imperious, and covetous, thought pro-

300 He is not allowed to proceed to France.

per to call in queſtion the authenticity of Morat the ambaſſador's miſſion, to call Poncet himſelf a liar, and not to allow the former to proceed to France. The tranſactions on this occaſion are ſet forth at length by Mr Bruce, greatly to the diſgrace of Maillet; but as details of this kind would ſwell the preſent article beyond due bounds, we muſt refer the curious reader to the work juſt mentioned.

301 M. de Roule ſent ambaſſador from France.

302 He is murdered.

Thus the ſcheme of procuring an embaſſy from Abyſſinia having proved abortive, the next project of the Jeſuits was to get an embaſſy ſent from France, whoſe object was to be the cementing a perpetual peace betwixt the two nations, and to eſtabliſh a laſting and commercial intercourſe; though, whatever friendſhip or good-will might take place, it was evident that there was not a ſingle article that could be exchanged between them, nor was there any ready communication betwixt the two countries either by ſea or land. The perſon pitched upon as ambaſſador was M. de Roule, vice-conſul at Damietta. He is characteriſed by Mr Bruce as "a young man of ſome merit, who had a conſiderable degree of ambition, and a moderate ſkill of the common languages ſpoken in the eaſt; but abſolutely ignorant of that of the country to which he was going, and, what was worſe, of the cuſtoms and prejudices of the nations through which he was to paſs. Like moſt of his countrymen, he had a violent predilection for the dreſs, carriage, and manners of France, and a hearty contempt for thoſe of all other nations: this he had not addreſs enough to diſguiſe; and this endangered his life." Beſides theſe diſadvantages, he had the miſfortune to be under the diſpleaſure of all thoſe of his own nation who reſided at Cairo: ſo that the merchants were very much averſe to his embaſſy; and, as the Franciſcans and Capuchins were his mortal enemies, he had not a ſingle friend in the world except Maillet and the Jeſuits. Unluckily the conſul miſled him in one of the moſt material articles, and which was undoubtedly of the utmoſt conſequence to him in the accompliſhment of his purpoſe, viz. the preſents neceſſary to be taken with him for the barbarous people through whoſe country he was to paſs. Brocades, ſattins, and trinkets of various kinds, according to Mr Bruce, were the proper wares; but, inſtead of this, he had taken along with him mirrors of various kinds, with the pictures of the king and queen of France, wearing crowns upon their heads. The former of theſe ſubjected him to the imputation of being a magician; while the latter, if ſhown to a Mahometan, would bring upon him the charge of idolatry. The worſt misfortune of all was the malice and treachery of the Franciſcans, who had already prejudiced againſt him the people of the caravan with whom he was to go, the governors of the provinces through which his road lay, and the brutal and barbarous inhabitants of Sennaar, who lie in the way betwixt Egypt and Abyſſinia. The conſequence of all this was, that he was murdered at the laſt mentioned place with all his retinue. The Franciſcan friars, who had preceded him to Sennaar, left it before his arrival, and returned immediately after. There cannot therefore be the leaſt doubt that they were the authors of his murder; though the bigotted diſpoſition of Louis XIV. prevented all enquiry into the matter; ſo that the particular ſteps they took to accompliſh their deſigns were never publiſhed to the world.

303 Yaſous aſſaſſinated.

304 The new emperor intends to revenge his death;

305 But is himſelf murdered.

The aſſaſſination of de Roule was preceded by that of Yaſous emperor of Abyſſinia, who fell by a conſpiracy of his wife and ſon, occaſioned by a fit of jealouſy in the former. He was ſucceeded by his ſon Tecla Haimanout, who had conſpired againſt him. Before his death, he had diſpatched a meſſage to the king of Sennaar, requiring him to afford M. de Roule protection at his court, and a ſafe conduct from it; but when the meſſenger was within three days journey of the capital of that kingdom, he received news of the aſſaſſination of Yaſous. On this he returned in great haſte to Gondar, in order to have the letters of protection renewed by Tecla Haimanout the reigning prince. This was readily done: but before the meſſenger could reach Sennaar, he was informed that de Roule was already aſſaſſinated; on which he returned with ſtill greater haſte than before. The Abyſſinian monarch, provoked at ſuch a ſcandalous violation of the law of nations, declared his intention of commencing hoſtilities againſt the king of Sennaar; and for this purpoſe aſſembled his army. But this was ſcarce done, before he was informed that a rival, named Amda Sion, had been ſet up againſt him by the friends of his father Yaſous, and had been for ſome time privately collecting troops to ſurpriſe him before he could be ready to make any oppoſition. It was therefore neceſſary to employ the army deſtined againſt Sennaar to reduce this rebel to obedience; and ſcarce was this done, when the emperor himſelf was aſſaſſinated; ſo that all thoughts of revenging the death of M. Roule were laid aſide.

306 Reign of Theophilus.

307 Execution of the queen and other regicides.

308 Tigi revolts but is defeated, taken and put to death.

Tecla Haimanout periſhed in 1706, and was ſucceeded by his uncle Tiffilis, or Theophilus; whoſe firſt care was to apprehend all thoſe ſuſpected to have been concerned in the death of his predeceſſor. Thus the murderers of Yaſous, whom Tecla Haimanout had inſtigated, imagined themſelves ſecure, and came to court without any fear of danger: but no ſooner did Theophilus get them into his power, than he cauſed them all to be put to death without exception; the queen herſelf being publicly hanged on a tree. Not ſatisfied with avenging the death of Yaſous by the execution of his murderers, he did the ſame with thoſe of Tecla Haimanout; putting to death all who were immediately in his own power, and commanding the governors of the provinces to do the ſame with thoſe whom they could find within their juriſdiction. One of theſe named Tigi, who had been formerly betwudet, having eſcaped into the country of the Galla, raiſed a very conſiderable army, with which he invaded Abyſſinia, where he committed the moſt dreadful cruelties. Theophilus engaged him on the 28th of March 1709; when, with a force greatly inferior, he gained a complete victory. A number of the Galla fled to a church, hoping to be protected by the ſanctity of the place; but the emperor telling his ſoldiers that it was defiled by thoſe who were in it, commanded it to be ſet on fire, ſo that every one periſhed. Tigi, with his two ſons, were taken priſoners, and put to death. The king himſelf did not long ſurvive his victory; falling ſick of a fever, of which he died in September 1709.

309
ine of So
mon ſet
ide.

After the death of Theophilus, the line of Solomon by the queen of Sheba was ſuperſeded a ſecond time, and a ſtranger of the name of *Ouſtas* ſeated on the Abyſſinian throne. The extreme ſeverity of Theophilus in puniſhing the murderers of both Yaſous and Tecla Haimanout gave occaſion to this; for as both princes had been aſſaſſinated in conſequence of conſpiracies formed by the principal people of the nation, the number of conſpirators was ſo great, that the parties concerned had intereſt ſufficient to influence the election of the new monarch even in this moſt capital reſpect, of his not being a deſcendant of Solomon. Excepting this ſingle defect, he was in every reſpect worthy of the kingdom, and was already the higheſt ſubject in it. Scarce was he ſeated on the throne, however, when a dangerous conſpiracy was formed againſt him by the very perſons by whom he had been placed upon it. Ouſtas baffled their deſigns, by ſeizing the principal conſpirators before they had time to bring their ſchemes to a bearing; and ſeveral people of the firſt rank were condemned to loſe their noſes, or to be put to death. After this the emperor undertook an expedition againſt the Shangalla, according to the barbarous cuſtom of the Abyſſinian monarchs, who hunt theſe poor people merely for the ſake of making ſlaves; ſlaughtering the men without mercy as well as many of the women, and carrying off only the boys and girls into captivity. In this he met with perfect ſucceſs; and was about to attempt the conqueſt of the whole country, when he was called back by the news that his prime miniſter Tafa Chriſtos was dead.

310
he empe-
or falls
k.

While the emperor remained in his capital at Gondar, he was taken ſuddenly ill; which he at firſt imputed to witchcraft, and therefore uſed ſome antidotes; among which the ſmoking of the palace with gun-powder was one. But this was done ſo careleſsly by the ſervants, that the whole building was conſumed; an accident looked upon by the people in general as a very bad omen, eſpecially as the king's complaint increaſed every day. At laſt the principal officers came to pay him a viſit of condolence, as they pretended; but in reality to obſerve the nature of his diſtemper, and to conſult whether or not it was likely to continue till they could fall upon means to deprive him of the government. Ouſtas underſtood their intentions, and therefore ſummoned all his ſtrength to put on for a moment the appearance of health; ſo that the officers found him attending buſineſs as uſual. Being thus diſconcerted, it became neceſſary to make ſome apology for a viſit ſo extraordinary and formal; for which they were at firſt ſomewhat at a loſs: on recollection, however, they told him, that, hearing he had been ſick, which they happily found was not the caſe, they had come to make a propoſal concerning the ſucceſſion; profeſſing a deſire that he would quiet the minds of his own family, and of the people in general, by appointing his ſon Faſil ſucceſſor to the throne after his deceaſe.

311
uſtas de-
oſed, and
avi . pro-
laimed
m eror.

Ouſtas gave them an equivocal anſwer; but the diſcourſe concerning Faſil happening to be overheard by the ſoldiers, a violent mutiny enſued, and all the officers who had come to viſit Ouſtas were killed. Part of the town was ſet on fire in the confuſion; and at laſt a proclamation was made, that David ſon of Yaſous was king of Abyſſinia. The prince was then ſent for from the mountain, and arriving at Gondar was crowned on the 30th of January 1714. The diſtemper of Ouſtas in the mean time continuing to increaſe, he died on the 10th of February the ſame year.

312
Death of
Ouſtas.

313
Reign of
David.

The new emperor was a rigid Alexandrian in principle; but Ouſtas had been ſo far favourable to the Catholics, as to entertain ſome of their prieſts, though in a private manner. As it was the cuſtom, however, to call a convocation of the clergy on the acceſſion of every new emperor, the monks and others inſiſted upon one being called on the preſent occaſion; the more eſpecially that a new abuna was come from Egypt, and the lenity ſhown to the Catholics by Ouſtas had excited the jealouſy of the Abyſſinian clergy in the higheſt degree. This aſſembly proved fatal to three Romiſh prieſts, whom Ouſtas had protected and ſupported for ſome time. They were brought before the king and Abyſſinian clergy; who ſhortly aſked them, whether they believed that the council of Chalcedon was to be accepted as a rule of faith, and that Pope Leo lawfully preſided in it? To both theſe queſtions they anſwered in the affirmative: on which, without more trial, they were condemned to be ſtoned; and the ſentence was inſtantly put in execution by the furious and ignorant multitude, only one perſon in the whole aſſembly exclaiming againſt it as unjuſt. The prieſts being thus gratified in one inſtance, inſiſted that Abba Gregorius, who had acted as an interpreter to the three juſt mentioned, ſhould alſo be put to death; but this was prevented by David, who found, upon inquiry, that he had only done ſo in obedience to the expreſs commands of Ouſtas his ſovereign.

314
Three Romiſh prieſts
executed.

Here we muſt take notice, that though the faith of Abyſſinia is always ſaid to be the ſame with that of Alexandria, it is not for that reaſon to be imagined that the clergy are all of the ſame mind. On the contrary, many different parties exiſt among them, who hate one another no leſs than all of them do the church of Rome. The principal of theſe in the time we ſpeak of were the monks of Debra Libanos and thoſe of St Euſtathius, to which laſt the emperor himſelf belonged. On the arrival of a new abuna, it is cuſtomary to interrogate him before the emperor and aſſembly of the clergy, which of the two opinions he adheres to. The emperor at preſent, not thinking his preſence neceſſary, ſent the betwudet with the principal perſons of both parties to hear the profeſſion of the new abuna, which was afterwards to be proclaimed to the people. The latter, probably not willing to contend with either party, gave an equivocal anſwer. But with this the king himſelf was diſſatisfied; and therefore, without conſulting the abuna farther, he cauſed it to be proclaimed, that the new abuna's profeſſion was the ſame with that of the monks of St Euſtathius. This was highly reſented by the monks of Debra Libanos, who inſtantly ran to the abuna, and from him received a profeſſion directly contrary to what had been proclaimed by the king's order.

315
Diſſenſions
among the
Abyſſinian
clergy.

Not ſatisfied with this, they continued their tumult, diſregarding the imminent danger they were in of falling under the king's diſpleaſure. One of their number was ſo infatuated as to cry out, that he ſaw a cherub with a flaming ſword guarding the door of the houſe where they were. Unluckily, however, they continued their aſſembly ſo long, and behaved in ſuch a ſeditious manner, that the emperor ſent againſt them a body of pagan Galla; who falling upon them ſword in hand, killed upwards of 100 of the ringleaders, and then ſallying out into the ſtreet deſtroyed indiſcriminately every one they met.

316 Great maſſacre of the clergy and others.

The maſſacre continued till the next day at noon, when a ſtop was put to it by the king's proclamation. The vaſt quantity of blood ſo wantonly ſhed, however, could not but occaſion great diſcontent throughout the capital, and the bad effects of it ſoon appeared.

317 The king poiſoned.

The king was univerſally hated, and numberleſs conſpiracies were talked of; but before any pretender to the crown appeared, David himſelf fell ſick, the cauſe of which was found to be poiſon. The perpetrators of this crime being known, were inſtantly put to death; but nothing could ſave the life of the emperor, who died the 9th of March 1719 in great agony.

318 Reign of Bacuffa.

David was ſucceeded by his brother Bacuffa; who in the beginning of his reign proved very ſevere and cruel, cutting off almoſt all the nobility who could be ſuppoſed to have had any ſhare in the conſpiracies and ſeditions of former reigns. In the latter part of it he became much more mild, and was beloved by his ſubjects.

319 Of Yaſous II.

He was ſucceeded in 1729 by his ſon Yaſous II. who continued long under the regency of his mother; and as ſoon as he took the management of affairs upon himſelf, was diſturbed with continual ſeditions and rebellions. In one of theſe the city of Gondar was made a field of battle, and was ſo frequently ſet on fire, as to be almoſt entirely reduced to ruins.

320 Applies himſelf to the arts of peace.

Having at laſt ſucceeded in reducing all his enemies to obedience, he applied himſelf to the arts of peace, repairing and ornamenting his palaces, in which he employed ſome Greek artiſts.

321 Is ridiculed by his ſubjects, and undertakes an expedition againſt Sennaar.

For this he renounced the diverſion of hunting, and the barbarous expeditions againſt the Shangalla; but this way of life proved ſo diſagreeable to his turbulent ſubjects, that a ſevere ſatire was publiſhed againſt him under the title of "The expeditions of Yaſous the Little." Nettled at this reproach, he determined on an expedition againſt the kingdom of Sennaar; and having made the neceſſary preparations, invaded it with a formidable army, without the leaſt pretence of provocation, or making any declaration of war. As he proceeded into the country of the enemy, he allowed his ſoldiers every where to exerciſe the greateſt cruelties, to deſtroy every living creature with the ſword, and every thing combuſtible with fire. Some of the Arabs joined him as he went along; many more fled from his preſence; and a body of them tried to oppoſe him. Theſe laſt were utterly defeated; and Yaſous without delay prepared to march to Sennaar the capital of the kingdom.

322 A diviſion of his army cut off.

As he ſtill went on, the king Baady being aſſiſted by Hamis prince of a territory named *Dar Fowr*, ſurpriſed one diviſion of his army ſo effectually, that they were all cut off to the number of 18,000. Yaſous, however, ſtill continued his deſtructive progreſs; though he gave over all thoughts of reducing the capital, or ſubduing the kingdom. He returned triumphant to Gondar, making a great ſhow of the plunder he had acquired; though the dejected countenances of many of his army ſhowed that they were by no means pleaſed with expeditions of this kind. The king himſelf was ſuppoſed to behold the diſtreſs of his ſubjects on this occaſion with a malicious pleaſure, on account of their impatience and turbulence in times of peace, and their forcing him into a war when he had no inclination for it. In a ſhort time, however, the people were perfectly comforted for the loſs of their brethren.

323 Religious utenſils redeemed at an extravagant rate.

In the late unfortunate action they had loſt all thoſe holy utenſils, which it is uſual in Abyſſinia to carry into the field of battle in order to enſure victory. Among theſe was a true picture of the crown of thorns which was put upon our Saviour's head; ſome pieces of the croſs upon which he ſuffered; a crucifix which had ſpoken on many occaſions; with many other ſacred relics of equal value. Soon after the battle all theſe were redeemed by the prieſts at an extravagant rate; no leſs than 8000 ounces of gold having been given for the ſpeaking crucifix; and for the reſt, we are to ſuppoſe a proportional price had been paid. On the arrival of this trumpery at Gondar, the greateſt rejoicings were made, and Yaſous was aſtoniſhed at the people having ſo ſoon forgot the loſs of their countrymen and relations.

324 The meſſengers ſen for the ne Abuna inſulted and robbed.

Soon after theſe tranſactions the abuna died; but though it was cuſtomary for the Abyſſinian monarchs to advance the money neceſſary to bring a new one from Alexandria, Yaſous found himſelf obliged to lay a tax upon the churches for defraying it at this time, having ſpent all his ready money in repairing and ornamenting his palaces. Three prieſts, conſigned to the care of as many Mahometan factors, were ſent to Egypt for the new patriarch; but they were detained for ſome time by the naybe or prince of Maſuah, who extorted from them one half of the money given by the emperor for bringing the abuna from Cairo. Yaſous no ſooner heard that they were detained at Maſuah, than he ſent orders to Suhul Michael governor of Tigré to refuſe proviſions to the inhabitants of Maſuah, which would ſoon reduce the naybe to obedience: but as Michael intended ſoon to quarrel with the king himſelf, he was not in any haſte to obey the orders he received. The travellers were therefore detained ſo long, that on their arrival at Jidda, they found they had loſt the monſoon; and, what was worſe, the ſcherif of Mecca would not allow them to paſs without a freſh extortion. Their money was now exhauſted; but the rapacious ſcherif put one of their number in priſon, where he continued for a twelvemonth till the money arrived:

325 A ſtated tribute for the paſſage of the Abuna.

and from this time theſe extortions were changed into a ſtated tribute; 75 ounces of gold (about L. 186 ſterling) being granted for leave of paſſage to Cairo for the abuna; 90 ounces to the ſcherif, and as many to the naybe, for allowing the abuna to paſs from Cairo; an agreement which ſubſiſts to this day. Several other inſults of this kind being received from the naybe, Yaſous at laſt diſcovered that there was a ſtrict alliance betwixt him, the governor of Tigré, and the Baharnagaſh; any one of whom, had he thought proper, could have cruſhed this pitiful prince with the ſmalleſt effort

326 The emperor determines to puniſh the Naybe of Maſuah, but is prevented.

On this the emperor determined to march againſt him in perſon; but was prevented by a rebellion which had been purpoſely excited in the country of Azab and that of the Dobas. The rebels were eaſily overthrown: but thus the expedition againſt the Naybe was delayed for a year; during which interval the emperor ſent for Michael to Gondar.

327 War with Michael governor o Tigré.

This order was poſitively refuſed, and a war enſued. Michael, unable to contend with the emperor in the open field, took to a high mountain, the uſual refuge of

Abyſſinian rebels. Here alſo his bad fortune purſued him; all his poſts were taken by ſtorm excepting one, which, it was evident, would likewiſe have been carried, though not without a very great expence of men. Here Michael requeſted a capitulation; and to enſure favourable terms, he deſired to put into the hands of Yaſous a great quantity of treaſure, which would otherwiſe be diſſipated among the common ſoldiers. This being done, Michael deſcended with a ſtone upon his head, as confeſſing himſelf guilty of a capital crime, with a deſign to make ſubmiſſion to the emperor. This was prevented for one day by a violent ſtorm of wind and rain; from which moment the Abyſſinians believe he began to converſe with the devil: but Mr Bruce informs us, that he has often heard him ſay it was Michael the archangel who was his correſpondent.

Yaſous was firmly determined to put this rebel to death, notwithſtanding the quantity of gold he had received; nevertheleſs a promiſe was extorted from him that he would grant him his life. As ſoon as Michael came into his preſence, the emperor was filled with indignation, retracted his promiſe, and ordered him to be carried out and put to death before his tent-door. The execution of the ſentence, however, was prevented by the interceſſion of all the officers of any conſideration in the court or army. Such univerſal ſolicitation could not be withſtood: Michael was pardoned; but with theſe remarkable words, that the emperor waſhed his hands of all the innocent blood which Michael ſhould ſhed before he brought about the deſtruction of his country, which he knew he had been long meditating.

onours.

Michael continued for ſome time in priſon; but was afterwards ſet at liberty, and even reſtored to his government of Tigré. No ſooner was he reinſtated in this dignity, than collecting an army, he attacked Kaſmati Woldo governor of Amhara, defeated him in two battles, and forced him to take refuge among the Galla, whom he ſoon after bribed to murder him. In other reſpects he behaved as a moſt dutiful ſubject, gave the king the beſt intelligence, and ſupplied him with ſoldiers better accoutred than he had ever before beheld. He was alſo more humble than before his misfortune; nor did an increaſe of his favour and influence make him deviate from the line he had preſcribed. Having begun to gain friends by bribery, he continued to add one bribe to another to ſecure the old, and to gain new ones by the ſame means, pretending all the while to no kind of dignity or honour, not even to ſuch as was juſtly due to his own rank. Thus he became ſuch a favourite with the emperor, that he beſtowed upon him the governments of Enderta and Sire, in addition to that of Tigré; ſo that he was now maſter of almoſt one half of Abyſſinia. During the reign of Yaſous, however, he attempted nothing. The foundations of the diſturbances which ſucceeded were laid by the queen-mother, towards the end of the reign of Yaſous. This emperor had been married when very young to a lady of Amhara, by whom he had two ſons named Adigo and Aylo; but as his wife pretended to interfere in matters of ſtate, he was perſuaded by his mother to baniſh both her and her children to Wechne. After this his mother choſe a wife for him from among the Galla; a people of all others the moſt obnoxious to the Abyſſinians, both on account of the horrid barbarity of their manners, and the continual wars which from time immemorial had taken place between the two nations. The new queen was the daughter of one Amitzo, a prince who had once hoſpitably entertained Bacuſſa before he became emperor; and his people were eſteemed the leaſt barbarous of the whole. A prejudice againſt her, however, againſt her offspring, and the emperor himſelf, never to be effaced, now took place among the Abyſſinians; but this did not ſhow itſelf during the reign of Yaſous. The emperor died on the 21ſt of June 1753, being the 24th year of his reign, not without ſuſpicion of being poiſoned by his mother's relations, who were now attempting to engroſs the whole power of the empire into their hands.

332
Death of
Yaſous.

333
Reign of
Ioas.

On the death of Yaſous, his ſon Ioas by the Galla princeſs juſt mentioned ſucceeded to the throne without any oppoſition. The diſcontent which had taken place in the former reign about the power aſſumed by the relations of the old queen, now began to ſhow itſelf more openly; and it was complained that a relationſhip to her was the only way to preferment, by which means the old families, whoſe merit had often ſaved the ſtate, were totally excluded from every ſhare of favour. On the acceſſion of the young king, a party of Galla horſe, ſaid to be about 1200 in number, were ſent as the portion of his mother; and theſe were quickly followed by a number of private perſons from motives of curioſity, or hopes of preferment, who were embodied to the number of 600 into a troop of infantry, the command of which was given to Wooſheka. The great favour in which theſe people were at court ſoon induced many others to make their appearance. Two of the king's uncles were ſent for by his expreſs deſire; and they brought along with them a troop of 1000 horſe. By the time they arrived the queen was dead; but her two brothers, named *Brulhe* and *Lubo*, finding that the king put an entire confidence in them, determined to make a party at court. This was eaſily effected; every thing was governed by Gallas; even the king himſelf affected to ſpeak their language; while the Abyſſinians were to the laſt degree mortified at ſeeing their inveterate enemies thus eſtabliſhing a dominion over them in the heart of their own country. At laſt the king thought proper to appoint his uncle Lubo to the government of Amhara; but this produced ſuch exceſſive diſcontent, that he was fain to retract his nomination, leſt a civil war ſhould have enſued. While the empire was thus divided into two parties, Suhul Michael came to Gondar in a very ſplendid manner, on an application from the exiled prince of Sennaar to be reſtored to his kingdom. When conducted into the preſence of the emperor, he proſtrated himſelf before him, owned himſelf his vaſſal, and was put in poſſeſſion of the government of Ras-el-Feel upon the frontiers, with a large revenue, where he was adviſed to ſtay till the diſputes which ſubſiſted at that time ſhould ſubſide. This ſalutary advice, however, he had not prudence to comply with; but ſuffering himſelf to be decoyed from his aſylum into Atbara, was taken priſoner and murdered.

King of
Sennaar
murdered.

In the mean time, the Abyſſinian prime miniſter, Welled de l'Oul, died. He had hitherto moderated the fury of the oppoſite parties by his wiſe and prudent conduct; but no ſooner was he taken out of the way, than a moſt dreadful ſcene of confuſion and civil war took place, which raged with the utmoſt violence while Mr Bruce was in Abyſſinia, and ſeemed not likely to come to any termination when he left it.

338
State of the different parties.

The whole empire was divided into two great factions: at the head of the one was the old queen-mother of Yaſous; and at the head of the other, Ioas himſelf the emperor, with his Galla relations. Matters were firſt brought to a criſis by the imprudence of the emperor himſelf in beſtowing the government of Begemder upon Brulhe one of his Galla uncles. The government of this province had been lately reſigned into the hands of the queen by an old officer named *Ayo;* and it was ſuppoſed that his ſon named *Mariam Barea*, univerſally allowed to be one of the moſt accompliſhed noblemen of the kingdom, was to ſucceed him in this government. This opinion was farther confirmed by the marriage of Mariam himſelf with Ozoro Eſther, a daughter of the old queen by her ſecond huſband. Unfortunately a quarrel had happened between Kaſmati Ayo, the old governor of Begemder, and Suhul Michael, a little before the reſignation of the former, and continued undecided till Mariam took the office upon him. The occaſion was quite trifling; nevertheleſs, as Mariam had refuſed to ſubmit to the deciſion of the judges, whom he ſtigmatized as partial and unjuſt, inſiſting that the king ſhould either decide the affair in perſon, or that it ſhould be referred to the deciſion of the ſword, he thus fell under the imputation of being a diſobedient and rebellious ſubject.

339
Brulhe made governor of Begemder.

In conſequence of this, Ioas looked upon him ever afterwards with an evil eye; and now deprived him, by proclamation, of the government of Begemder, giving it to his own Galla uncle Brulhe, of whom we have already made ſo much mention.

340
An univerſal ferment enſues.

This unexpected promotion threw the whole empire into a ferment. As Begemder was a frontier province bordering on the country of the Galla, there was not the leaſt doubt, that, immediately on the acceſſion of Brulhe to his new office, it would be over-run by that race of barbarians, remarkable for their ſavage manners almoſt beyond all the other nations in Africa. This was the more dangerous as there was not above a day's journey betwixt the frontiers of Begemder and Gondar, the capital of the whole empire. Mariam Barea himſelf, who had a high ſenſe of honour, was particularly hurt at the manner in which he was deprived of his dignity, and condemned with his family to be ſubject to a race of Pagans, whom he had often defeated in battle, and obliged to acknowledge him as their ſuperior. All remonſtrance, however, was vain. Brulhe, under the ſanction of the imperial command, advanced with an army to take poſſeſſion of his new dignity: but ſo exceedingly averſe were the Abyſſinians to follow him in this expedition, that the army diſbanded itſelf ſeveral times after it had been collected; and it took up almoſt a year before he could proceed from the place where his camp was, at the lake Tzana or Dembea, to the frontiers of Begemder, though ſcarce half a day's journey diſtant.

341
Is oppoſed by Mariam Barea.

Mariam Barea beheld his operations with great contempt, employing his time in the diſpatch of ordinary buſineſs, and endeavouring to reconcile himſelf to the king, but without ſucceſs. As his laſt effort, he ſent a remonſtrance to the emperor; in which, after many proteſtations of duty and obedience, he reminded him, that, at his inveſtiture into the office of governor of Begemder, he had ſworn not to allow any of the Galla to enter his province: that, ſhould he deviate from the obſervance of this oath, the ſafety of the princes in Wackne would be endangered; they would conſtantly be liable to the invaſions of the Pagans, and probably be extirpated, as had already happened at two different times: and he begged of the emperor, if he was determined to deprive him of his government, to beſtow it rather upon ſome Abyſſinian nobleman; in which caſe he promiſed to retire, and live in private with his old father. He had, however, formed a reſolution, which he thought it his duty to ſubmit to the emperor, that if his majeſty ſhould think proper to come, at the head of a Galla army, to invade his province, he would retire to the fartheſt extremity of it, till he was ſtopped by the country of the Galla themſelves; and, ſo far from moleſting the royal army, he might be aſſured, that though his own men might be ſtraitened, every kind of proviſion ſhould be left for his majeſty. But if an army of Galla, commanded by one of that nation, ſhould enter the province, he would fight them at the well of Fernay, on the frontiers, before one of them ſhould drink there, or advance the length of a pike into the province.

This remonſtrance had no effect upon the emperor.

342
Farther promotio of Micha

He returned a ſcoffing anſwer, announcing the ſpeedy arrival of Brulhe, whom he thought ſure of victory: but, at the ſame time, to ſhow that he did not put his confidence entirely in his proweſs, he created Suhul Michael governor of Samen, which lay next to Tigré in the way to Samen, ſo that no obſtruction might lie in the way of that officer's march to Gondar, in caſe there ſhould be any occaſion for him. Mariam, provoked at the manner in which he was undervalued in the king's meſſage, gave an ironical reply, in which he alluded to the name of *Brulhe*, in the Abyſſinian language ſignifying a kind of *bottle;* this he told him would be broken on the rocks of Begemder, if ſent into that country.

343
Brulhe d feated an killed.

On receiving this laſt meſſage from Mariam, the king inſtantly ordered the army to be put in motion; but the Abyſſinians had unanimouſly determined not to act offenſively againſt their countrymen. Brulhe therefore was left to decide the affair with his Galla. Mariam kept exactly to his word in the declaration he had made to the king, not ſtirring out of his province, nor allowing the leaſt attempt to be made to haraſs his enemy, till they were drawn up at the well above mentioned, where he met them with his army. The Galla, unſupported by the Abyſſinian troops, were utterly unable to bear the ſhock of Mariam's army, and therefore ſoon betook themſelves to flight; but a part of them, who were ſurrounded by the cavalry, fought valiantly till they were all cut to pieces. Mariam had given the moſt expreſs orders to take Brulhe alive; or, if that could not be done, to allow him to make his eſcape. One of his ſervants, however, obſerving him in the field, puſhed up through the enemy to the place where he was, and running him twice through with a lance, left him dead on the ſpot.

Mariam Barea was no ſooner informed of the death of his rival, than he cried out in great emotion, that

Suhul Michael, with the whole army from Tigré, would attack him before autumn. In this he was not deceived. Ioas inſtantly diſpatched an expreſs for Michael, ordering his attendance, and inveſting him with the dignity of Ras, by which he became poſſeſſed of unlimited power both civil and military.

344
chael
atedRas.

Michael himſelf had for a long time ſeen that matters would come to this criſis at laſt, and had provided for it accordingly. He now ſet out with an army of 26,000 men, all of them the beſt ſoldiers in the empire, and 10,000 of them armed with muſkets.

345
mmits
eat de-
ſtations.

As he paſſed along, his troops deſolated the country wherever they came, but he encumbered his army by nothing uſeleſs; allowing his men to carry along with them neither women, tents, beaſts of burden, nor even proviſions. The ſubſiſtence of his troops was abundantly provided for by the miſerable inhabitants of the provinces thro' which he paſſed; and, not ſatisfied with this, he inſiſted on a contribution in money from all the diſtricts within a day's march of thoſe places where he was; the leaſt delay was followed by the ſlaughter of the inhabitants and deſtruction of their houſes. Towns, villages, and buildings of every kind, were ſet on fire as he paſſed along; the people fled from all quarters to the capital for refuge, as from the face of the moſt inveterate enemy; and Ioas himſelf was now ſenſible of his having been in the wrong to inveſt him with ſuch unlimited power.

346
rives at
ondar.

On his arrival at the capital, Michael took poſſeſſion of all the avenues, as if he meant to beſiege it; ſo that an univerſal conſternation enſued. Inſtead of offering any hoſtility, however, he waited with the utmoſt reſpect on the emperor, proceeding immediately from the royal preſence to his own houſe, where he ſat in judgment, as the nature of his office required him to do.

347
xecutes
ſtice im-
partially.

No ſooner had he taken upon him this new office, however, than he executed juſtice in ſuch a rigorous and impartial manner as made the boldeſt offenders tremble. Some parties of his own ſoldiers, preſuming upon the licence that had hitherto been granted them, entered Gondar and began to plunder as they had done in other places; but, on the very firſt complaint, their commander cauſed 12 of them to be apprehended and hanged. Their execution was followed by 50 others in different quarters of the city; after which he gave the charge of the capital to three officers who were to preſide over three quarters, himſelf taking care of the fourth. Two civil judges were appointed to aſſiſt each officer in a diſtrict, two were left in the king's houſe, and four of them held a court of judicature in his own. Thus the inhabitants, finding, that inſtead of bloodſhed and maſſacre, they were to expect nothing but ſtrict equity and moderation, became reconciled to Michael the day after his arrival, and lamented only that he had not come ſooner to relieve them from the anarchy and confuſion in which they had been held ſo long. To ſo great a degree of perfection indeed did he bring his legiſlation, that a very ſhort time after he entered the city, a loaf of bread, a bottle of water, and an ounce of gold, were expoſed in the market-place on the head of a drum night and day for ſome time, without any one offering to take them away. This was the more remarkable as there was then a ſcarcity of proviſions, and Michael himſelf would allow but a very ſcanty ſupply of water to be carried into the city; thereby giving the inhabitants to underſtand, that if he ſhould ſet fire to it as he had done to other places, it would not be in their power to quench the flames.

348
Marches
againſt Mariam Barea.

The capital being thus ſecured in perfect obedience, Michael next prepared to ſet out on his expedition againſt Mariam Barea. Senſible, however, that the deſtruction of this worthy nobleman would be attended with a great degree of odium, he was reſolved that none of it, or at leaſt as little as poſſible, ſhould fall upon himſelf. For this purpoſe, he inſiſted that the emperor ſhould march in perſon from Gondar, and carry all his ſoldiers along with him. Thus he had an opportunity of throwing the whole blame upon Ioas, and repreſenting himſelf as no more than a paſſive inſtrument in the affair. He alſo took every occaſion of praiſing his antagoniſt for his virtues, and cenſuring the emperor for attempting to cut off ſuch an excellent officer.

In the mean time Mariam Barea keeping exactly to the terms of the laſt remonſtrance he had ſent to Ioas, retired before him to the extremity of the province. Ioas and Michael advanced furiouſly, burning and deſtroying every thing as they went along. An engagement at laſt took place at a place called *Nefas Muſa*, on the extreme borders of Begemder, when Mariam could not retreat without going out of the province. As the royal army was more than twice the number of the other, and commanded by an officer of ſuperior ſkill, victory was not long of being decided in its favour.

349
Mariam defeated.

Mariam, with 12 of his officers, took refuge in the country of the Galla; but were immediately delivered up by that faithleſs people.

350
Betrayed
by the Galla, and
cruelly
murdered.

He was put to death by Lubo the brother of Brulhe, who is ſaid with his own hands to have cut his throat as a ſheep is commonly killed in this country, and afterwards to have disfigured the body in a ſhocking manner. The head was cut off, and carried to Michael's tent, who would not allow it to be uncovered in his preſence. It was afterwards ſent to the family of Brulhe in the country of the Galla, to ſhow them what attention had been given to revenge his death; and this diſpleaſed the Abyſſinians even more than any thing that had yet happened ſince the beginning of the conteſt.

351
Some of his
officers protected by
Michael.

The 12 officers, who were taken along with him, ſought protection in the tent of Ras Michael, to which they were ſuffered to eſcape by Wooſheka their keeper. Lubo, however, intended likewiſe to have ſacrificed them as he had done Mariam, and therefore ſent Wooſheka to demand them: but no ſooner had he unfolded his errand, than Michael in a rage, called to his attendants to cut him in pieces before the tent-door; which would certainly have been done, had he not fled with the utmoſt precipitation.

352
Diſagreement between the
king and
Michael.

The ſcandalous aſcendency which the Galla always manifeſted over the king, had greatly diſpleaſed Michael; who expreſſed himſelf ſo freely on the ſubject, that a coolneſs took place between them. Another officer named *Waragna Faſil*, a Galla by birth, had inſinuated himſelf into the king's favour, and greatly diſtinguiſhed himſelf at the battle of Nefas Muſa. It was no wonder, therefore, that he ſoon became a rival to Michael; and this rivalſhip was greatly augmented by the following circumſtance. Near the field of battle at Nefas Muſa was a houſe of Mariam Barea, where Ozoro Eſther his widow now was. Being ſurrounded by pleaſant and verdant meadows, Faſil encamped there for the ſake of his cavalry. No other deſign was at that time apparent; however, his preſence greatly alarmed the princeſs. She had along with her at that time a nobleman named *Ayto Aylo*, who had been at the battle of Sennaar; but had there been terrified to ſuch a degree, that he reſolved to renounce the world ever after and turn monk. In this character he was now with Ozoro Eſther; and though he refuſed to be concerned in any military affairs, he was ſtill conſulted by both parties as a kind of oracle. In the preſent emergency, therefore, he told the princeſs that there was only one way by which ſhe could ſecure herſelf from the cruelty of the Galla, and becoming a prey to one or other of the murderers of her huſband; and that was by immediately eſpouſing Ras Michael. Ozoro was perfectly ſenſible of the propriety of the advice, and therefore ſet out next morning in company with Aylo to Michael's tent. Here ſhe threw herſelf at his feet on the ground; and refuſing to riſe, Aylo explained her errand, informing the Ras that ſhe intended to beſtow herſelf upon him in marriage, as being the only perſon not guilty of her former huſband's death capable of affording her protection in her preſent ſituation.

353
Michael marries the princeſs Ozoro Eſther.

Michael ſaw clearly the advantages attending ſuch a match; and therefore having cauſed the army to be drawn up in order of battle, as if for a review, he ſent for a prieſt, and was married to the princeſs in the ſight of all his men. The ceremony was followed by the loud acclamations of the whole army; and Ioas was ſoon informed of the reaſon. He expreſſed his diſpleaſure at the match, however, in ſuch unequivocal terms, that a mutual hatred commenced from that moment. This was ſoon made public by a very trifling accident. One day while the army was marching, Michael being much incommoded by the ſun which affected his eyes, threw a white handkerchief over his head to keep off the heat. This was inſtantly told the king, who took it as an affront offered to himſelf; for in Abyſſinia it is unlawful to cover the head on any occaſion whatever in preſence of the emperor, or even within ſight of the palace where he lodges. Ioas was no ſooner informed of the ſuppoſed affront, than he ſent to the Ras to know upon what account he preſumed to cover his head in his preſence; but though the covering was inſtantly taken off, it was thought that no atonement could ever be made for ſuch a grievous offence. Soon after this a quarrel happening between Faſil and a perſon named *Guſho*, likewiſe a man of great conſequence, complaint was made to the Ras, who, as civil judge, ſummoned both parties before him. Faſil abſolutely refuſed to obey any ſuch juriſdiction; and the affair being laid before the other judges, it was given in favour of Michael, and Faſil declared to be in rebellion.

354
Final quarrel betwixt Michael and Faſil

This was followed by a proclamation depriving him of his government of Damot, and every other public office he held. Faſil, however, had no mind to ſubmit to this diſgrace; and therefore, after holding a long conference with the king, departed with his army, encamping on the high road betwixt Damot and Gondar, where he intercepted the proviſions coming from the ſouthward to the capital.

355
A ſhot fired at Michael from the palace window.

This was followed by an attempt to aſſaſſinate the Ras. A ſhot was fired from one of the windows of the palace into the houſe where he ſat in judgment; the diſtance being ſo ſmall, that he could eaſily be ſeen from the palace while thus employed. The ball, however, miſſed Michael, but killed a dwarf who was ſtanding before him fanning the flies from his face. As it was evident that this ſhot muſt have been fired with the knowledge of the king, it was rightly judged to be the commencement of hoſtilities. Ioas inſtantly removed to a diſtance, but ſent Wooſheka with orders to the Ras to return to Tigré without ſeeing his face; declaring, at the ſame time, his own uncle Lubo governor of Begemder and Amhara. Michael could ſcarcely be prevailed upon to ſee Wooſheka, and told him that he ſhould certainly be put to death the next time he appeared in his preſence. Next day Ioas ſent a meſſage to the Ras by four judges, commanding him to return to Tigré without the leaſt delay, under pain of his higheſt diſpleaſure. Michael returned a formal anſwer, concluding, that he expected the king himſelf to be ready to march againſt Faſil to morrow. To this an abſolute refuſal was given; on which Michael iſſued a proclamation, commanding all the Galla to leave the capital next day under pain of death: in caſe of diſobedience they were declared outlaws, and liable to be killed by the firſt that met them if they were found 24 hours after the proclamation in the capital, or to the ſame penalty if they were found in the kingdom after ten days.

356
Faſil defea ed by Michael.

An engagement took place a ſhort time after, in which Faſil was totally defeated, and obliged to retire into Damot. In this engagement ſome of the king's black horſe were taken. Theſe are all ſlaves, and ſubject to no other commands but thoſe of his majeſty himſelf. The appearance of them therefore ſhowed that they muſt have been ſent by the king to fight againſt the Ras. All of them were therefore brought before the latter, and interrogated by whoſe orders they had come to the battle. Two refuſed to give any anſwer, and had their throats cut in preſence of their companions. A third plainly told him that they had been ſent by the king; who had likewiſe ordered an Armenian to fire out of the palace window at Ras Michael.

357
Ioas aſſaſſinated.

On this the priſoners were diſmiſſed; but aſſaſſins inſtantly diſpatched to put an end to the king's life; which they accompliſhed, and buried him in a church dedicated to St Raphael.

358.
Hannes ſe up by Michael, and ſoon after poiſoned.

On the death of Ioas, Michael, now abſolute maſter of Abyſſinia, ſet up for emperor Hannes, brother to the late king Bacuffa, an old man who had reſided almoſt all his lifetime on the mountain of Wechne, and being entirely unacquainted with the affairs of the world was on this account probably ſuppoſed by Michael to be the more proper for his purpoſes. Hannes had been maimed by the loſs of his hand, on purpoſe to incapacitate him for the throne; but this objection was laughed at by the Ras. He found him, however, poſſeſſed of a quality much more inimical to his own purpoſes; and that was, an abſolute averſion at meddling with the affairs of government: ſo that he could not by any means be induced to take the field againſt Faſil. Michael therefore was obliged to ſet out by himſelf; but thinking it improper to leave a king of any kind behind him in the capital, he had the old man poiſoned before his departure; putting his ſon Tecla Haimanout in his place.

The young emperor, according to Mr Bruce's account, 359 g of cla Hai- nout.

360 il defeat

count, was of a fair complexion, leſs tawny than a Neapolitan or Portugueſe, owing to his having been born in the mountain. He was endowed with many princely accompliſhments; and ſo much attached to Michael Ras, that he called him *Father* from the time of his acceſſion, waiting upon him when indiſpoſed with the affection of a ſon. There being now no objection therefore, Michael marched againſt Faſil without delay, and entirely defeated him on the 3d of December 1769. On this occaſion Wooſheka was taken priſoner, and afterwards flead alive, notwithſtanding the interceſſion of ſome of Michael's officers for him; his ſkin being afterwards formed into a bottle. This piece of cruelty was attributed to Ozoro Eſther; whom Mr Bruce repreſents as the moſt humane and merciful of women; though he is obliged to allow, that on the preſent occaſion, as well as on every other which regarded her former huſband, ſhe entirely forgot her character. The night on which this miſerable victim was deſtroyed, ſhe appeared in the king's tent dreſſed like a bride; and in a little time returned in triumph to Gondar.

361 Ir Bruce's rival and dventures a byſ- nia.

Soon after theſe tranſactions, Mr Bruce entered Abyſſinia. He arrived at Maſuah when there was only a report of Hannes's being ill, and Mr Bruce was ſuppoſed to be his phyſician, though in truth that emperor was already dead. Here he was ill-treated by the naybe, with a deſign to extort money, and afterwards probably to put him to death, as was his cuſtom with other ſtrangers. He eſcaped the danger, however, by the protection of Achmet, nephew and heir apparent to the naybe; and by his own prudent and reſolute behaviour, threatening his adverſaries with the arrival of a Britiſh man of war in caſe of any injury; ſhowing the Grand Signior's protection; making uſe of the name of Ras Michael, now ſo formidable, and to whom he had obtained a recommendation, &c. After many vexations and delays, he was at laſt allowed to depart; and a guide, by name *Saloome*, was ſent along with him. This man was brother-in-law to the naybe, and a profeſſed Chriſtian; but a traitor in his heart, and who wiſhed to do every thing in his power to hurt our traveller. He was furniſhed with another guide, however, by his friend Achmet, to inform him where to pitch his tent, and other neceſſary particulars.

362 Sets out from Arkeeko.

363 Account of the country through which he paſſed.

364 Sudden ſwell of a torrent.

On the 15th of November 1769 Mr Bruce left Arkeeko on the eaſtern coaſt of Africa, and proceeded ſouthward for Gondar the capital of Abyſſinia. After an hour's journey, he pitched his tent near a pit full of rain-water, where he remained all day; and in the evening a meſſenger arrived from the naybe, who took away the guide *Saloomé*. Next day the latter returned in company with Achmet the naybe's nephew, already mentioned. The latter cauſed him depoſit in his hands Saloome's full hire, as though he had gone the whole length he had promiſed. Four of the men were commanded to go back to Arkeeko, and others put in their place: after which Achmet told Mr Bruce, that he was not to take the road through Dobarwa, though near, becauſe it belonged to the naybe; but that Saloome knew another by a place called *Dixan*, which belonged to himſelf, and where he could enſure him of a good reception. In this journey he told him, that he would be obliged to croſs the mountain of Taranta, the higheſt in Abyſſinia; but the fatigue of this would be more than recompenſed by the aſſurance of ſafety and the curioſity of the place. Taking leave of Achmet in a very friendly manner, therefore, Mr Bruce with his company finally ſet out on their journey the evening of the 16th. For the ſhort ſpace they had travelled, the ground was covered with graſs broader in the leaf than ours; but in a little time the ſoil became hard, dry, gravelly, and full of acacia or Egyptian thorn. Next day (17th) they changed their courſe from ſouth to weſt; and ſoon arrived at a range of mountains ſtanding ſo cloſe to one another, that there was no paſſage between them excepting what was worn by torrents of water; the bed of one of which conſequently now became their road. In the evening they pitched their tent at ſome diſtance from this torrent, which had ſcarcely any water in it when they left it; but all the afternoon there had been an appearance of rain, with much thunder and lightning, at a diſtance. On a ſudden they heard a noiſe among the mountains louder than thunder; and inſtantly ſaw the torrent, ſwelled immenſely by the diſtant rains, now running like a rapid river, and the foremoſt part of it advancing in its bed in a body of water about the height of a man. Having run for ſome time in this violent manner, the current, no longer ſupplied by the rains, began to diminiſh, and by the next morning was quite gone. Among theſe mountains the nights are cold even in ſummer.

365 Notes of the African birds different from thoſe of Europe.

On the 18th the journey was reſumed in the bed of the torrent, which now ſcarcely had any water; though the ſtones were rendered very ſlippery by the quantity of rain which had fallen. Leaving this diſagreeable road, they came to a fine rivulet; which being the firſt clear water they had ſeen from the time Mr Bruce left Syria, was exceedingly agreeable. They proceeded along the banks of this river for ſome time; and ſoon after leaving it, they came to another of the ſame kind: but next day were obliged to reſume their courſe in the bed of a torrent. The mountains in this part of the world are exceſſively rugged and full of precipices, entirely deſtitute of ſoil, and covered with looſe ſtones of a black colour. On the ſide of the torrent in which they marched, however, there grew very large ſycamore trees, ſome of them little leſs than 7½ feet in diameter. Their branches afforded ſhelter to an infinite number of birds; many of them without ſong; but others having notes very different from the European kinds, and peculiar to the continent of Africa. Moſt of thoſe which had very beautiful colours were of the jay or magpie kind. The trees were loaded with figs; but they come to nothing, by reaſon of the ignorance of the ſavages, who know not the proceſs of caprification. The ſtreams of water themſelves, which at this ſeaſon were found ſo delightful, run only after October: they appear on the eaſt ſide of the mountains when the ſummer rains in Abyſſinia are ceaſing; at other times, no water is to be met with, excepting what is contained in ſtagnant pools.

366 Account of the mountain Taranta.

On the 20th of November they began to aſcend the high mountain of Taranta. Their road was now exceſſively rugged and uneven, interſected with monſtrous gullies and holes made by the torrents, as well as by huge fragments of rocks tumbled down by the torrents. It was with the utmoſt difficulty that they could

could carry the aſtronomical inſtruments up this hill; in which work Mr Bruce himſelf, and one of his attendants named *Yaſine*, a Moor, bore a principal ſhare. The only misfortune they met with was, that their aſſes being unloaded, and committed to the care of a ſingle perſon, refuſed to aſcend this barren mountain; and in ſpite of all that their driver could do, ſet off at a briſk trot for the fertile plains below. Luckily, however, they were afterwards recovered by four Moors ſent after them, and the journey reſumed without any material interruption. The beaſts were now become much more tractable, having been ſeen and purſued by the hyænas with which that mountain abounds.

367 Of the village Halai, and inhabitants of the mountains.

368 Beautiful cattle, &c.

Taranta is ſo deſtitute of earth, that there was no poſſibility of pitching a tent upon it; ſo that our travellers were obliged to take up their lodging in one of the caves with which it abounds. The under part of the mountain produces in great plenty the tree called *Kolquall*, which was here obſerved in greater perfection than in any other place throughout the whole journey. The middle part produced olives which carried no fruit; and the upper part was covered with the oxycedras or Virginia cedar, called *arze* in the language of the country. On the top is a ſmall village named *Halai*, inhabited by poor ſhepherds, who keep the flocks of the rich people of the town of Dixan below. They are of a dark complexion, inclining to yellow; their hair black, and curled artificially by means of a ſtick, and which our author ſuppoſes to be the ſame with the *criſping-pin* mentioned Iſa. iii. 22. The men have a girdle of coarſe cotton-cloth, ſwathed ſix times round their middle; and they carry along with them two lances, and a ſhield made of bulls hides. Beſides theſe weapons, they have in their girdles a crooked knife with a blade about 16 inches in length, and three in breadth at the lower part. There is here great plenty of cattle of all kinds; the cows generally of a milk white, with dew-laps hanging down to their knees; their horns wide like thoſe of the Lincolnſhire cattle; and their hair like ſilk. The ſheep are all black both here and throughout the province of Tigré; having hair upon them inſtead of wool, like the reſt of the ſheep within the tropics; but remarkable for its luſtre and ſoftneſs, without any briſtly quality. On the top of the mountain is a plain, which, at the time our author was there, they had ſown with wheat. The air ſeemed exceſſively cold, though the barometer was not below 59° in the evening. On the weſt ſide the cedars, which on other parts are very beautiful, degenerate into ſmall ſhrubs and buſhes.

369 Town of Dixan deſcribed.

The road down this mountain was for ſome time nothing inferior in ruggedneſs to what they had met with in aſcending it; but as they approached Dixan, it became conſiderably better. This is the firſt town on the Abyſſinian ſide of Taranta. It is ſeated on the top of an hill of a form exactly conical, ſurrounded by a deep valley like a ditch; and no acceſs to it but by a path which winds round the hill. The inhabitants were formerly exterminated by Michael Ras; and the ſucceeding race, in Mr Bruce's time, were of a very indifferent character, being, as he ſays, compoſed of the worſt people from the territories of the Baharnagaſh and the province of Tigré, on both of which it borders. Here he was in danger from the treachery of Saloome, who wiſhed to have decoyed him into the power of ſome aſſaſſins. Finding that this could not be done, he ſurrounded Mr Bruce and his retinue with a body of armed men; but they were diſperſed by the authority of Hagi Abdelcader, the friend of Achmet, who had received orders to provide for the ſafety of the travellers. The only trade carried on here is that of buying and ſelling ſlaves; who are ſtolen from Abyſſinia, chiefly by the prieſts, and ſent into Arabia and India.

370 Journey t Adowa, th capital of Tigré.

371 His treacherous guide obliged to return.

The next ſtage was from Dixan to Adowa, capital of the province of Tigré. Leaving Dixan on the 25th of November, they pitched their tent the firſt night under a large ſpreading tree called *Daroo*, which Mr Bruce ſays was one of the fineſt he ſaw in Abyſſinia, being about 7½ feet in diameter. They had been joined by ſome Moors driving 20 loaded aſſes and two bulls, which in that country are likewiſe uſed as beaſts of burden. Here, our author ſays, he recovered a tranquillity of mind which he had not enjoyed ſince his arrival at Maſuah; but they were now entirely without the dominions of the naybe, and entered into thoſe of the emperor. Saloome attended them for ſome way, and ſeemed diſpoſed to proceed; but one of the company, who belonged to the Abyſſinian monarch, having made a mark in the ground with his knife, told him, that if he proceeded one ſtep beyond that, he would bind him hand and foot, and leave him to be devoured by wild beaſts.

372 The country becomes mo fertile as l paſſes along.

Being now in a great meaſure delivered from their fears and embarraſſments, the company proceeded on their journey with pleaſure, through a much better country than they had hitherto paſſed. In ſome places it was covered with wild oats, wood, high bent-graſs, &c. but, in not a few places, rocky and uneven. Great flocks of a bird as large as a turkey, called, in the Amharic language, *Erkoom*, were ſeen in ſome places. A large animal of the goat kind, called *Agazan*, was found dead and newly killed by a lion. It was about the ſize of a large aſs, and afforded a plentiful repaſt. Numbers of kolquall trees were alſo ſeen; and the ſides of the river Habeſh were adorned with a beautiful tree of the ſame name with the ſtream. There were in this place alſo many flowers of various kinds, particularly jeſſamine. The mountains of Adowa, which they came in ſight of on the 5th of December, are totally unlike any thing to be met with in Europe; their ſides being all perpendicular rocks, like ſteeples or obeliſks of many different forms.

373 Adowa d ſcribed.

Adowa, though the capital of an extenſive province or kingdom, does not contain above 300 houſes; but occupies nevertheleſs a large ſpace, by reaſon of the incloſures of a tree called *Wanzey*, which ſurrounds each of the houſes. It ſtands on the declivity of a hill, ſituated on the weſt ſide of a ſmall plain ſurrounded by mountains. It is watered by three rivulets which never become dry even in the greateſt heats. A manufacture is carried on here of a kind of coarſe cotton cloth, which paſſes for money throughout all Abyſſinia. The houſes are built of rough ſtone cemented with mud; lime being only uſed in the conſtruction of thoſe at Gondar, and even there it is very bad.

Our traveller was very hoſpitably entertained at A-

374 ſits the ns of um.

dowa by one Janni, with whom he reſided during his ſtay there. Leaving it on the 17th of December, he viſited the ruins of Axum, once the capital of the empire. Here are 40 obeliſks, but without any hieroglyphics. A large one ſtill remains, but the two largeſt are fallen. There is alſo a curious obeliſk, of which he gives a figure, with other antiquities which our limits will not allow us to enlarge upon. The town has at preſent about 600 houſes, and carries on manufactures of the coarſe cotton-cloth already mentioned. It is watered by a ſmall ſtream which flows all the year, and is received into a fine baſon 150 feet ſquare, where it is collected for the uſe of the neighbouring gardens. Its latitude was found by Mr Bruce to be 14° 6′ 36″ north.

375 rous arbarity of f the A-yſſinians.

On the 20th of January 1770, our traveller ſet out from Axum. The road was at firſt ſmooth and pleaſant, but afterwards very difficult; being compoſed of ſtones raiſed one above another, the remains of a magnificent cauſeway, as he conjectures. As they paſſed farther on, however, the air was every where perfumed by a vaſt number of flowers of different kinds, particularly jeſſamine. One ſpecies of this, named *Agam*, was found in ſuch plenty, that almoſt all the adjacent hills were covered by it; the whole country had the moſt beautiful appearance; the weather was exquiſitely fine, and the temperature of the air agreeable. In this fine country, however, Mr Bruce had the firſt opportunity of beholding the horrible barbarity of the Abyſſinians in cutting off pieces of fleſh from the bodies of living animals, and devouring them raw; but notwithſtanding this extreme cruelty, they have the utmoſt horror and religious averſion at pork of every kind; inſomuch that Mr Bruce durſt not venture to taſte the fleſh of a wild boar, juſt after having aſſiſted in the deſtruction of five or ſix.

During the remaining part of the journey from Adowa to Sirè, the country continued equally beautiful, and the variety of flowers and trees greatly augmented; but as a report was propagated that Ras Michael had been defeated by Faſil, they now met with ſome inſults. Theſe, however, were but trifling; and on the 22d in the evening they arrived ſafely at Sirè, ſituated in N. Lat. 14° 4′ 35″.

376 irè deſcribed.

This town is ſtill larger than Axum: but the houſes are built of no better materials than clay, and covered with thatch; the roofs being in the form of cones, which indeed is the ſhape of all thoſe in Abyſſinia. It ſtands on the brink of a very ſteep and narrow valley, through which the road is almoſt impaſſable. It is famous for a manufacture of cotton-cloth, which, as we have already obſerved, paſſes for money throughout the whole empire. At ſome times, however, beads, needles, antimony, and incenſe, will paſs in the ſame way. The country in the neighbourhood is extremely fine; but the inhabitants ſubject, by reaſon of the low ſituation, to putrid fevers. On leaving it on the 24th, our travellers paſſed through a vaſt plain, where they could diſcern no hills as far as the eye could reach, excepting ſome few detached ones ſtanding on the plain, covered with high graſs, which the inhabitants were then burning. The country to the northward is flat and open. In the way to Gondar, however, lie that ridge of mountains called *Samen*; of which one named *Lamalmon* is the moſt remarkable, and by ſome ſuppoſed to be the higheſt in Abyſſinia. Betwixt Sirè and theſe mountains the river Tacazze runs, which, next to the Nile, is the largeſt in Abyſſinia. Mr Bruce informs us that it carries near one third of the water which falls on the whole empire; and when paſſing it, he ſaw the marks of its ſtream, the preceding year, 18 feet perpendicular above the bottom; nor could it be aſcertained whether this was the higheſt point to which it had reached. It has its ſource in the diſtrict of Angot, riſing from three ſources like the Nile, in a flat country, about 200 miles to the S. E. of Gondar. It is extremely pleaſant; being ſhaded with fine lofty trees, the water extremely clear, and the banks adorned with the moſt fragrant flowers. At the ford where they croſſed, this river was fully 200 yards broad, and about three feet deep; running very ſwiftly over a bottom of pebbles. At the very edge of the water the banks were covered with tamariſks, behind which grew tall and ſtately trees, that never loſe their leaves. It abounds with fiſh, and is inhabited by crocodiles and hippopotami; the former of which frequently carry off people who attempt to croſs the river upon blown up ſkins. The neighbouring woods are full of lions and hyænas. The Tacazze is marked by Mr Bruce in his map as a branch of the Aſtaboras, which falls into the Nile. The latitude of the ford was found to be 13° 42′ 45″.

377 Tacazze river deſcribed.

378 Mountainous country of Samen deſcribed.

This river was paſſed on the 26th of January; after which our travellers entered into the country of Samen; the governor of which, Ayto Teſfos, had never acknowledged the authority of Ras Michael, nor any of the emperors ſet up by him ſince the death of Joas. The country therefore was hoſtile; but the uncertainty of the event of the war, and the well-known ſeverity of Michael's diſpoſition, preſerved our traveller and his company from any inſult, excepting a feeble and unſucceſsful attempt to extort money. Here Mr Bruce obſerves that the people were more flat-noſed than any he had hitherto ſeen in Abyſſinia. The path among the mountains was for the moſt part exceedingly dangerous, having a precipice of vaſt height cloſe by it which way ſoever you turn. The mountains appeared of very extraordinary ſhapes; ſome being like cones; others high and pointed like columns, pyramids, or obeliſks. In one place a village was obſerved in ſuch a dangerous ſituation, that ſcarce the diſtance of a yard intervened between the houſes and a dreadful precipice. Below it is a plain of about a mile ſquare, covered with citron and lemon trees. A river named *Mai-Lumi* riſes above this village, and falls into the wood, where it divides in two; one branch ſurrounding the north and the other the ſouth part of the plains; then falling down a rock on each ſide, they unite; and having run about a quarter of a mile farther, the ſtream is precipitated in a cataract 150 feet high. The lions and hyænas were very numerous among theſe mountains, and devoured one of the beſt mules our travellers had. The hyænas were ſo bold, that they ſtalked about as familiarly as dogs, and were not intimidated by the diſcharge of fire-arms. Their voracity was ſuch, that they eat the bodies of thoſe of their own ſpecies which our travellers had killed in their own defence.

379 Extreme voracity of the hyænas.

380 Lamalmon mountain deſcribed.

On the 7th of February they began to aſcend Lamalmon by a winding path ſcarcely two feet broad, on the brink of a dreadful precipice, and frequently interſected by the beds of torrents, which produced vaſt irregular chaſms in it. After an aſcent of two hours, attended with incredible toil, up this narrow path, they came to a ſmall plain named *Kedus* or *St Michael*. from a church of that name ſituated there. This plain is ſituated at the foot of a ſteep cliff, terminating the weſtern ſide of the mountain, which is as perpendicular as a wall, with a few trees on the top. Two ſtreams of water fall down this cliff into a wood at the bottom; and as they continue all the year round, the plain is thus preſerved in continual verdure. The air is extremely wholeſome and pleaſant. On aſcending to the very top of the mountain, where they arrived on the 9th of February, our travellers were ſurpriſed to find, that though from below it had the appearance of being ſharp-pointed, it was in reality a large plain, full of ſprings, which are the ſources of moſt rivers in this part of Abyſſinia. Theſe ſprings boil out of the earth, ſending forth ſuch quantities of water as are ſufficient to turn a mill. A perpetual verdure prevails; and it is entirely owing to indolence in the huſbandman if he has not three harveſts annually. The Lamalmon ſtands on the north-weſt part of the mountains of Samen; but though higher than the mountains of Tigré, our author is of opinion that it is conſiderably inferior to thoſe which are ſituated on the ſouth-eaſt. The plain on the top is altogether impregnable to an army, both by reaſon of its ſituation and the plenty of proviſions it affords for the maintenance of its inhabitants; even the ſtreams on the top are full of fiſh. Here the mercury in the barometer ſtood at 20$\frac{7}{8}$ inches.

381
Journey to Gondar.

During the time our travellers remained at Lamalmon, a ſervant of Ras Michael arrived to conduct them ſafely to the capital, bringing a certain account of the victory over Faſil; ſo that now the difficulties and dangers of their journey were over. The country appeared better cultivated as they approached the capital; and they ſaw ſeveral plantations of ſugar-canes, which there grow from the ſeed. In ſome places, however, particularly in Woggora, great damage is done by ſwarms of ants, rats, and mice, which deſtroy the fruits of the earth. Mr Bruce had already experienced the miſchief ariſing from a ſmall ſpecies of ant, whoſe bite was not only more painful than the ſting of a ſcorpion, but iſſued out of the ground in ſuch numbers as to cut in pieces the carpets and every thing made of ſoft materials to which they could have acceſs.

382
Miſchief done by ants.

383
Arrival at Gondar.

When Mr Bruce approached the capital, he was dreſſed like a Moor: and this dreſs he was adviſed to keep until he ſhould receive ſome protection from government; his greateſt, indeed his only, danger ariſing from the prieſts, who were alarmed at hearing of the approach of a Frank to the capital. This was the more neceſſary, as the emperor and Michael Ras were both out of town. For this reaſon alſo he took up his reſidence in the Mooriſh town at Gondar; which is very large, containing not fewer than 3000 houſes. The only inconvenience he underwent here was the not being allowed to eat any fleſh: for we have already taken notice of a law made by one of the emperors, that none of his ſubjects ſhould eat fleſh but ſuch as had been killed by Chriſtians; and a deviation from this would have been accounted equal to a renunciation of Chriſtianity itſelf. Here he remained till the 15th of February; when Ayto Aylo waited upon him, and addreſſed him in the character of phyſician, which he had aſſumed. By this nobleman he was carried to the palace of Koſcam, and introduced to the old queen. His advice was required for one of the royal family who was ill of the ſmall-pox; but a ſaint had already undertaken his cure. The event, however, proved unfortunate; the patient died, and the ſaint loſt his reputation. Our limits will not allow us to give any particular account of the ſteps by which Mr Bruce arrived at the high degree of reputation which he enjoyed in Abyſſinia. In general his ſucceſs in the practice of medicine, his ſkill in horſemanſhip, and the uſe of firearms, which by his own account muſt be very extraordinary; his prudence in evading religious diſputes; as well as his perſonal intrepidity and preſence of mind, which never once failed him, even in the greateſt emergencies; all conſpired to render him agreeable to people of every denomination. By the king he was promoted to the government of Ras-el-Feel, was his conſtant attendant on all occaſions, and was with him in ſeveral military expeditions; but never met with any opportunity of diſtinguiſhing his perſonal valour, though he had the command of a body of horſe at one of the battles fought at a place named *Serbruxos*. Thus honoured and employed, he had an ample opportunity of exploring the ſources and cataracts of the Nile, as well as the geography and natural products of the whole country; obtaining alſo leave at laſt to return home. We cannot, however, praiſe the benevolence of his ſpirit at his departure. It has already been obſerved, that he was in ſome danger from the prieſts on his firſt arrival, on account of their ſuſpecting him to be a Jeſuit; for that is the meaning which they affix to the word *Frank* or *European*. As he conſtantly attended the eſtabliſhed worſhip of the country, however, and carefully avoided all diſputes on the ſubject of religion, he became at laſt not only unſuſpected, but very intimate with many of the principal eccleſiaſtics. From one of theſe, named *Tenſa Chriſtos*, he aſked a benediction immediately before he departed; which piece of unexpected humility ſo affected the prieſt, that it brought tears in his eyes. The benediction was conveyed in the ſimple form, "God bleſs you." A troop of inferior prieſts who attended would needs bleſs him alſo; and probably were pleaſed at having it in their power to beſtow a benediction publicly on a man of ſuch conſequence: but to the bleſſings of theſe poor monks Mr Bruce replied *in Engliſh*, "Lord ſend you all a halter, as he did Abba Salama!" This Abba Salama had been an eccleſiaſtic of great conſequence; but of a very diſſolute life, and at laſt hanged for his crimes. The monks imagined he had been recommending them to their patriarch Abba Salama, and with great devotion anſwered "Amen."

384
Mr Bruce introduced to the queen.

385
Is promoted and held in great eſtimation.

386
His departure from the country.

387
Event of the war b fore he le the country.

The hiſtory of the war after Mr Bruce's arrival is related at great length in his work. The king Tecla Haimanout ſtill kept his ground, and was at laſt acknowledged by almoſt the whole empire, though ſucceſs did not always attend his arms. An uſurper, named *Socinios*, was reduced and made a ſervant in the king's kitchen; but was afterwards hanged for theft. Ras Michael, notwithſtanding all his ſkill in military affairs, was not able to get the better of Faſil; and his exceſſive cruelty, avarice, and ambition, diſguſted every one. An attempt was even made to aſſaſſinate him; and his ſpiritual friend (Michael the archangel,

archangel, according to his own report, or the devil, according to that of the Abyſſinians) at laſt forſook him; ſo that he was carried off priſoner by a party of the rebels. After this misfortune he was much dejected, imputing it to the want of the ſpiritual aſſiſtance juſt mentioned, and which it ſeems had withdrawn itſelf ſome time before. His wife Ozoro Eſter, whom Mr Bruce characteriſes as the handſomeſt woman he ever ſaw, was in great favour with the king at the time our traveller left Abyſſinia. As the king himſelf was a handſome young man, there is no improbability in ſuppoſing with Mr Bruce, that "they were not inſenſible to each other's merits;" and as ſhe was ſometimes honoured with a *private audience*, where Michael himſelf "bore no part in the converſation," we ſhall conclude our hiſtory of this ſingular empire by a conjecture, that ſoon after Mr Bruce's departure, Michael either died by courſe of nature, he being then very old, or was cut off by his enemies; on which Tecla Haimanout, having fully ſettled the affairs of his empire, became poſſeſſed of the beautiful Ozoro Eſter, and commenced his reign with great glory.

388 eography ancient hiopia.

With regard to the geographical deſcription of ancient Ethiopia, little can be ſaid; as not even the boundaries of the empire itſelf, much leſs thoſe of the particular diſtricts which compoſed it, were known. The ancient writers, however, agreed that it was very mountainous: but they mention no mountains of any conſequence excepting Garbata and Elephas, whoſe ſituation is not well aſcertained, tho' it is generally ſuppoſed that they anſwer to the mountains of Tigré. The moſt noted cities were Axum, Napata, Premis or Premnis, Melis, Mondus, Abalis, Moſylon, Caloe, Opone, &c.

389 uſtoms of he inhabi- ants.

The nations which inhabited ancient Ethiopia have already been enumerated; and it is not to be ſuppoſed that all, or indeed any two of them, would agree in many reſpects. The ancient hiſtorians, however, give the following information. They had many laws which were very different from thoſe of other nations; eſpecially their laws relating to the election of kings. The prieſts choſe the moſt reputable men of their body, and drew a large circle around them, which they were not to paſs. A prieſt entered the circle, running and jumping like an *Ægipan* or a ſatyr. He of thoſe that were incloſed in the circle who firſt catched hold of the prieſt, was immediately declared king; and all the people paid him homage, as a perſon entruſted with the government of the nation by Divine Providence. The new-elected king immediately began to live in the manner which was preſcribed to him by the laws. In all things he exactly followed the cuſtoms of the country; he paid a moſt rigid attention to the rules eſtabliſhed from the origin of the nation, in diſpenſing rewards and puniſhments. The king could not order a ſubject to be put to death, though he had been capitally convicted in a court of juſtice; but he ſent an officer to him, who ſhowed him the ſignal of death. The criminal then ſhut himſelf up in his houſe, and was his own executioner. It was not permitted him to fly to a neighbouring country, and ſubſtitute baniſhment for death; a relaxation of the rigour of the law, with which criminals were indulged in Greece.

*Diod. Sic.* .101, 102.

We have the following extraordinary information with regard to the death of many of their kings: The prieſts of Meroè, who had acquired great power there, when they thought proper, diſpatched a courier to the king to order him to die. The courier was commiſſioned to tell him, that it was the will of the gods, and that it would be the moſt heinous of crimes to oppoſe an order which came from *them*. Their firſt kings obeyed theſe groundleſs deſpotical ſentences, though they were only conſtrained to ſuch obedience by their own ſuperſtition. Ergamenes, who reigned in the time of Ptolemy the ſecond, and who was inſtructed in the philoſophy of the Greeks, was the firſt who had the courage to ſhake off this iniquitous and ſacerdotal yoke. He led an army againſt Meroè, where, in more ancient times, was the Ethiopian temple of gold; where he put all the prieſts to the ſword, and inſtituted a new worſhip.

The friends of the king had impoſed on themſelves a very ſingular law, which was in force in the time of Diodorus Siculus. When their ſovereign had loſt the uſe of any part of his body, by malady, or by any other accident, they inflicted the ſame infirmity on themſelves; deeming it, for inſtance, ſhameful to walk ſtraight after a lame king. They thought it abſurd not to ſhare with him corporal inconveniences; ſince we are bound by the ties of mere friendſhip to participate the misfortunes and proſperity of our friends. It was even cuſtomary among them to die with their kings, which they thought a glorious teſtimony of their conſtant loyalty. Hence the ſubjects of an Ethiopian king were very attentive to *his* and their common preſervation; and therefore it was extremely difficult and dangerous to form a conſpiracy againſt him.

The Ethiopians had very particular ceremonies in their funerals. According to Cteſias, after having ſalted the bodies, they put them into a hollow ſtatue of gold which reſembled the deceaſed; and that ſtatue was placed in a niche on a pillar which they ſet up for that purpoſe. But it was only the remains of the richeſt Ethiopians that were thus honoured. The bodies of the next claſs were contained in ſilver ſtatues; the poor were enſhrined in ſtatues of earthen ware.

Herodotus* informs us, that the neareſt relations of the dead kept the body a year in their houſes, and offered ſacrifices and firſt-fruits during that time to their deceaſed friend; and at the end of the year, they fixed the niche in a place ſet apart for the purpoſe near their town.

The Ethiopians made uſe of bows and arrows, darts, lances, and ſeveral other weapons, in their wars, which they managed with great ſtrength and dexterity. Circumciſion was a rite obſerved amongſt them, as well as among the Egyptians, from very early antiquity; though which of theſe nations firſt received it, cannot certainly be known. The Ethiopian ſoldiers tied their arrows round their heads, the feathered part of which touched their foreheads, temples, &c. and the other projected out like ſo many rays, which formed a kind of crown. Theſe arrows were extremely ſhort, pointed with ſharp ſtones inſtead of iron, and dipped in the *virus* of ſerpents, or ſome other lethiferous poiſon, inſomuch that all the wounds given by them were attended with immediate death. The bows from which they ſhot theſe arrows were four cubits long; and required ſo much ſtrength to manage them, that no other nation could make uſe of them. The Ethiopians retreated fighting, in the ſame manner as the Parthians; diſcharging vollies of arrows with ſuch dexterity and addreſs whilſt they were retiring full-ſpeed, that they terribly galled the enemy. Their lances or darts were

---

* *Lib* iii. 24.

of an immenſe ſize, which may be deemed a farther proof of their vaſt bodily ſtrength.

Thus far chiefly with regard to the Ethiopians who lived in the capital, and who inhabited the iſland of Meroë and that part of Ethiopia which was adjacent to Egypt.

There were many other Ethiopian nations, ſome of which cultivated the tracts on each ſide of the Nile, and the iſlands in the middle of it; others inhabited the provinces bordering on Arabia; and others lived more towards the centre of Africa. All theſe people, and among the reſt thoſe who were born on the banks of the river, had flat noſes, black ſkins, and woolly hair. They had a very ſavage and ferocious appearance; they were more brutal in their cuſtoms than in their nature. They were of a dry aduſt temperament; their nails in length reſembled claws: they were ignorant of the arts which poliſh the mind: their language was hardly articulate; their voices were ſhrill and piercing. As they did not endeavour to render life more commodious and agreeable, their manners and cuſtoms were very different from thoſe of other nations. When they went to battle, ſome were armed with bucklers of ox's hide, with little javelins in their hands; others carried crooked darts; others uſed the bow; and others fought with clubs. They took their wives with them to war, whom they obliged to enter upon military ſervice at a certain age. The women wore rings of copper at their lips.

*Diod. Sic.* p. 102.

Some of theſe people went without clothing. Sometimes they threw about them what they happened to find, to ſhelter themſelves from the burning rays of the ſun. With regard to their food, ſome lived upon a certain fruit, which grew ſpontaneouſly in marſhy places: ſome ate the tendereſt ſhoots of trees, which were defended by the large branches from the heat of the ſun; and others ſowed Indian corn and lotos. Some of them lived only on the roots of reeds. Many ſpent a great part of their time in ſhooting birds; and as they were excellent archers, their bow ſupplied them with plenty. But the greater part of this people were ſuſtained by the fleſh of their flocks.

The people who inhabited the country above Meroë made remarkable diſtinctions among their gods. Some, they ſaid, were of an eternal and incorruptible nature, as the ſun, the moon, and the univerſe; others having been born among men, had acquired divine honours by their virtue, and by the good which they had done to mankind. They worſhipped Iſis, Pan, and particularly Jupiter and Hercules, from whom they ſuppoſed they had received moſt benefits. But ſome Ethiopians believed that there were no gods; and when the ſun roſe, they fled into their marſhes, execrating him as their cruelleſt enemy.

Theſe Ethiopians differed likewiſe from other nations in the honours which they paid to their dead. Some threw their bodies into the river, thinking that the moſt honourable ſepulchre. Others kept them in their houſes in niches: thinking that their children would be ſtimulated to virtuous deeds by the ſight of their anceſtors; and that grown people, by the ſame objects, would retain their parents in their memory. Others put their dead bodies into coffins of earthen ware, and buried them near their temples. To ſwear with the hand laid upon a corpſe, was their moſt ſacred and inviolable oath.

The ſavage Ethiopians of ſome diſtricts gave their crown to him who of all their nation was beſt made. Their reaſon for that preference was, that the two firſt gifts of heaven were monarchy and a fine perſon. In other territories, they conferred the ſovereignty on the moſt vigilant ſhepherd; for he, they alleged, would be the moſt careful guardian of his ſubjects. Others choſe the richeſt man for their king; for he, they thought, would have it moſt in his power to do good to his ſubjects. Others, again, choſe the ſtrongeſt; eſteeming thoſe moſt worthy of the firſt dignity who were ableſt to defend them in battle.

390 Account of the miſſionaries.

The Jeſuit miſſionaries were the firſt who gave any information to the Europeans concerning this country; and indeed, excepting them and the late accounts by Mr Bruce, we have no other ſource of information concerning it. The miſſionaries confirm what is ſaid by the ancients, that Ethiopia is a very mountainous country. The provinces of Begemder, Gojam, Waleka, Shoa, &c. according to them, are only one continued chain of mountains. Many of them were ſaid to be of ſuch enormous height, that the Alps and Pyrenees are but mole-hills in compariſon of them. Thoſe called *Aorni* were ſaid to be of this kind; but Mr Bruce informs us, that theſe accounts are greatly exaggerated. Amongſt thoſe mountains, and even frequently in the plains, there are many ſteep and craggy rocks to be met with of various and whimſical ſhapes; ſome of them ſo ſmooth, that men and oxen are craned up to the top by means of engines: but what is moſt ſurpriſing, the tops of theſe rocks are covered with woods and meadows, full of ſprings and ſtreams of water; of the truth of which we have an atteſtation by Mr Bruce in his deſcription of Lamalmon. The moſt remarkable of theſe, according to the authors we are now ſpeaking of, is that called *Amba Geſhen*, mentioned in the courſe of this article as one of the mountains uſed for a priſon to the princes of the blood. Its top is deſcribed as only half a league in breadth, tho' it is ſaid that it would require near half a day to go round it. Kircher mentions alſo a rock which reſembles a mirror at a diſtance; though this is probably not to be depended upon.

391 Climate, &c.

The climate of Ethiopia varies, as may naturally be ſuppoſed, according to the ſituation and elevation of the ground. On the coaſt of the Red Sea, as well as the open flat parts of the country in general, the heat is intenſe, inſomuch that at Suakem, an iſland in the Red Sea, Gregory the Abyſſine relates that it was ſo great, as to excoriate any part of the body expoſed to the ſolar rays, melt hard ſealing-wax, and ſear a garment like red hot iron. In ſeveral diſtricts, however, the heat is milder that in Portugal, and in Samen the air is rather cold than otherwiſe. In ſome other provinces the winter is very ſevere, though ſnow is ſeldom ſeen. Hail indeed ſometimes falls, which reſembles ſnow at a diſtance. and Mr Bruce mentions an account of ſnow having once fallen which laſted three days, and was looked upon to be a kind of prodigy. There are frequent and violent thunders, with exceſſive deluges of rain during one part of the year, and there are likewiſe violent ſtorms of wind. The miſſionaries mention a kind of wind named *Sendo*, which, according to Gregory, may be ſeen like a ſerpent of vaſt magnitude with its head on the ground, and the body twiſted in vaſt curls up to the ſkies. This, in all pro-

392 Violent whirl-winds.

probability, is no other than that violent ſpecies of whirlwind named *Typhon*, frequent in America and other warm countries; and its being viſible is owing to the duſt which it takes up in its paſſage.

393
Bruce's
ount of
divi-
us.

Modern Ethiopia, or *Abyſſinia*, as it is now called, is divided, according to Mr Bruce, into two parts, named *Tigré* and *Amhara*; though this rather denotes a difference in the language than the territory of the people. The moſt eaſterly province properly ſo called is Maſuah. It is of conſiderable length, but no great breadth; running parallel to the Indian Ocean and Red Sea, in a zone of about 40 miles broad, as far as the iſland MASSUAH. The territories of the Baharnagaſh include this province as well as the diſtricts of Azab and Habab. In the former are mines of foſſile ſalt, which in Abyſſinia paſſes current inſtead of money. For this purpoſe the mineral is cut into ſquare ſolid pieces about a foot in length. Here alſo is a kind of mint from which great profits are derived. The Habab is likewiſe called the land of the *Agaazi* or Shepherds; who ſpeak the language called *Geez*, and have had the uſe of letters from the moſt early ages. This province was formerly taken by the Turks, when the rebellious Baharnagaſh Iſaac called them to his aſſiſtance againſt the emperor Menas. From that time the office fell into diſrepute, and the Baharnagaſh at preſent has much leſs power than formerly. The province of Maſuah is now governed by a Mahometan prince or officer called a *naybe*.

Tigré is bounded on the eaſt by the territories of the Baharnagaſh, of which the river Mareb is the boundary on the eaſt, and the Tacazze on the weſt. It is about 200 miles long from north to ſouth, and 120 broad from weſt to eaſt. All the merchandiſe ſent acroſs the Red Sea to Abyſſinia, or from Abyſſinia acroſs the Red Sea, muſt paſs through this province, ſo that the governor has his choice of it as it goes along. Thus the province itſelf is very wealthy; and as the Abyſſinian fire-arms are brought from Arabia, the governors of Tigré, by purchaſing quantities of them, may eaſily render themſelves very powerful. No arms of this kind can be ſent to any perſon without his permiſſion; nor can any one buy till the governor has firſt had an offer.

Siré was ſome time ago united to Tigré, on account of the miſbehaviour of its governor; but was disjoined from it at the time Mr Bruce was in Abyſſinia, with the conſent of Ras Michael, who beſtowed the government of it upon his ſon. It is about 25 miles long, and as much in breadth. Its weſtern boundary is the Tacazze.

Samen is a very mountainous province lying to the weſtward of the river Tacazze, about 80 miles long, and in ſome places 30 broad, though in moſt it is much narrower. It is moſtly inhabited by Jews.

Begemder lies to the north-eaſt of Tigré. It is about 180 miles long and 60 broad; bounded by the river Nile on the weſt. It comprehends the mountainous country of Laſta; and there are now ſeveral ſmall governments diſmembered from it. The inhabitants are fierce and barbarous, but reckoned the beſt ſoldiers in Abyſſinia; and it is ſaid that this province with Laſta can furniſh 45,000 horſemen. It abounds with iron mines, which in Abyſſinia would be very valuable if properly managed. It is alſo well ſtored with beautiful cattle. Near the ſouth end it is cut into vaſt gullies, ſeemingly by floods, of which we have no account. This province is reckoned the great barrier againſt the incurſions of the Galla; and though they have often endeavoured to make a ſettlement in it, they have never yet found it practicable. Several of their tribes have been cut off in the attempt.

Next to Begemder is the province of Amhara, in length about 120 miles, and ſomewhat more than 40 in breadth. It is very mountainous; and the men are reckoned the handſomeſt in all Abyſſinia. In this province is the mountain or rock Geſhen, formerly the reſidence of the royal family. This province is parallel to Begemder on the ſouth; being ſeparated from it by the river Baſhilo. On the weſt it is bounded by the Nile. The river Geſhen is another boundary.

Walaka lies between the rivers Geſhen and Samba. It is a low unwholeſome province, having upper Shoa to the ſouthward. It was in this province that the only ſurviving prince of the family of Solomon was preſerved after the maſſacre by Judith, formerly mentioned; and on this account great privileges were conferred upon the inhabitants, which in ſome degree continue to this day. The governor is conſidered as an ally, rather than a ſubject, of the emperor of Abyſſinia; and to preſerve his independency, he has allowed the Galla to ſurround his province entirely, yielding them up the territory of Walaka above mentioned. Truſting to the valour of his own people, he is under no apprehenſion of his barbarous neighbours the Galla. This province is alſo remarkable for the monaſtery of Debra Libanos, where the famous Saint Tecla Haimanout, the founder of the power of the clergy, was bred.

Gojam is remarkable for having in it the ſources of the Nile. It is bounded on the north by the high mountains of Amid Amid, on the ſouth by the river Nile, on the weſt by another river named *Gult*, and on the eaſt by the river Temci; on the north-eaſt it has the kingdom of Damot. It is about 40 miles long from north to ſouth, and ſomewhat more than 20 in breadth from eaſt to weſt. It is very populous, but the men are accounted the worſt ſoldiers in Abyſſinia. There is great plenty of very beautiful cattle.

Beyond the mountains of Amid on the eaſt lies the country of the Agows; on the weſt it has Buré, Umbarma, and the country of the Gongas; on the ſouth, thoſe of Damot and Gafat; and Dingleber on the north.

Dembea occupies all the ſpace along the lake of the ſame name from Dingleber below the mountains bounding Gueſque and Kuara. Mr Bruce is of opinion, that the lake has formerly overflowed the whole of it; and the decreaſe of this lake he brings as an inſtance of the decreaſe of large pools throughout the world.

To the ſouth of Dembea is the country of Kuara, bordering on that of the Shangalla, the Macrobii of the ancients. The neighbouring countries, inhabited by the pagan ſavages, produce gold, which is introduced in plenty into this province. None is produced in the province itſelf, nor indeed does Mr Bruce mention any part of Abyſſinia where gold is naturally found. In the lower part of this country is a colony of pagan blacks named *Ganjar*; derived, according to our author, from the black ſlaves who came into the country with the Arabs after the invaſion of Mahomet. Theſe deſerting their maſters, formed the colony we ſpeak of; but it is now more increaſed by vagabonds from other parts than by the multiplication of the inhabitants themſelves.

The governor of this country is one of the great officers of ſtate: he has kettle-drums of ſilver, which he is allowed to beat through the ſtreets of Gondar; a privilege allowed to none but himſelf. This privilege was conferred upon the firſt governor by David II. who conquered the country.

The frontier countries of Nara, Ras-el-Feel, Tchelga, &c. are wholly inhabited by Mahometans, and the government of them is uſually given to ſtrangers. The country is very hot, unwholeſome, and covered with thick woods. The people are fugitives from all nations; but excellent horſemen, making uſe of no other weapon but the broad ſword; with which, however inadequate we might ſuppoſe the weapon to be, they will attack the elephant or rhinoceros.

The moſt diſtinct idea of the ſituation of the Abyſſinian provinces is to be had from the map which Mr Bruce has given of it in his 5th volume. According to this, the empire is bounded on the ſouth by a vaſt chain of mountains, extending with very little interruption from 34° to 44° E. Long. and between 8° and 9° N. Lat. In the more proſperous times it extended beyond theſe ſouthward, particularly into the kingdom of Adel; but the mountains juſt mentioned are undoubtedly to be reckoned its natural boundaries on this ſide. On the eaſt and north-eaſt it has the Red Sea, and on the ſouth-eaſt the kingdom of Adel. On the weſt and north its boundaries are leſs diſtinctly marked; having on both theſe quarters the barbarous kingdom of Sennaar, whoſe limits will no doubt frequently vary according to the fortune of war betwixt the two princes. From Arkecko, ſituated near the foot of the Baſaltes mountains, in about 15° 30′ N. Lat. it extends to near 7° N. Lat. where the mountains of Caffa, the moſt ſoutherly province of Abyſſinia, terminate. Along the coaſt of the Red Sea lie the territories inhabited by the Hazorta-Shiho, the diſtrict of Engana Shiho, and the kingdom of Dancali, including the territory of Azab and the ſalt-pits already mentioned. To the weſtward of theſe are the province or kingdom of Tigré, including the country of the Dobas, part of the kingdom of Bali, and that of Dawaro. Still farther weſt are thoſe of Sirè, Laſta, Amhara, the greateſt part of Bali, and part of Fatigar, which laſt reaches beyond the mountains. Proceeding ſtill in the ſame direction, we come to Tcherkin, Tchelga, Abargale, Salao, Begemder, Shoa, and Ifat; reckoning always from north to ſouth; Tcherkin, for inſtance, being to the northward of Tchelga, &c. Shoa extends a conſiderable way to the weſtward; ſo that, beſides Ifat, it has to the ſouth of it alſo the kingdoms of Hade and Cambut; the latter extending beyond the ſouthern ridge of mountains. To the weſtward are Ras-el-Feel, Dembea, Gojam, and Damot; and beyond theſe are the kingdoms of Dembea, Bizamo, Gooderoo, and Guraque; thoſe of Nare or Enarea and Caffa occupying the ſouth-weſt corner of the empire.

394 Climate. With regard to the climate of Abyſſinia, Mr Bruce does not mention any thing materially different from what has been already ſaid; only he gives a very particular deſcription of the rains which produce the inundation of the NILE; and of which the ſubſtance ſhall be given under that article. We ſhall therefore cloſe our account of this country with an enumeration of its products, and ſome detail of the manners and cuſtoms of the preſent inhabitants.

395 Soil and vegetable productions. The great difference of climate, owing to the vaſt extent and variety of elevation in different parts of this empire, is very perceptible in its ſoil and productions. The mountains in many places are not only barren, but altogether inacceſſible, except by thoſe who make it their conſtant practice to climb amongſt them; and even by them they cannot be aſcended without great difficulty and danger. The ſhapes of theſe mountains, as we have already had occaſion to obſerve, are very ſtrange and fantaſtical; exceedingly different from thoſe of Europe; ſome reſembling towers and ſteeples, while others are like a board or ſlate ſet up on end; the baſe being ſo narrow, and the whole mountain ſo high and thin, that it ſeems wonderful how it can ſtand. In the valleys, however, and flat parts of the country, the ſoil is exceſſively fruitful, though in the warmeſt places grain cannot be brought to perfection. Wine is alſo made only in one or two places; but the greateſt profuſion of fruits of all kinds is to be met with every where, as well as many vegetables not to be found in other countries. There is a vaſt variety of flowers, which adorn the banks of the rivers in ſuch a manner as to make them reſemble fine gardens. Among theſe a ſpecies of roſes is met with, which grows upon trees, and is much ſuperior in fragrance to thoſe which grow on buſhes. Sena, cardamom, ginger, and cotton, are likewiſe produced here in great quantities. Among the variety of rare plants to be met with in Abyſſinia, Mr Bruce particularly deſcribes the following.

396 Plants deſcribed by Mr Bruce. 1. The papyrus, the ancient material for paper; which our author ſuppoſes to have been a native of Ethiopia, and not of Egypt as has been ſuppoſed. 2. Baleſſan, balm, or balſam plant; a tree growing to the height of 14 or 15 feet, and uſed for fuel along with other trees in the country. It grows on the coaſt of the Red Sea, among the myrrh trees behind Azab, all the way to Babelmandel. This is the tree producing the balm of Gilead mentioned in Scripture. 3. The ſaſſa, myrrh, and opocalpaſum trees. Theſe grow likewiſe along the coaſt of the Red Sea. The ſaſſa or opocalpaſum is uſed in manufactures; and, according to our author, reſembles gum *adragant*, probably tragacanth. The tree which produces it grows to a great ſize, and has a beautiful flower, ſcarce admitting of deſcription without a drawing. 4. The ergett, a ſpecies of the mimoſa, is of two kinds; one called *ergete y'dimmo*, or the bloody ergett, from the pink colour of its filaments; the other *ergett el krone*, or the horned ergett, with a flower reſembling the acacia vera or Egyptian thorn. Theſe were both found on the banks of a river named *Amo*, near the great lake Dembea. 5. Enſete, an herbaceous plant, growing in Narea, in ſwampy places; but it is ſuppoſed to grow equally well in any other part of the empire where there is heat and moiſture ſufficient. It forms a great part of the vegetable food of the Abyſſinians. It produces a kind of figs, but theſe are not eatable. When uſed for food, it is to be cut immediately above the ſmall detached roots, or perhaps a foot or two higher, according to the age of the plant. The green is to be ſtripped from the upper part till it becomes white; and when ſoft, it affords an excellent food when eaten with milk or butter. 6. Kolquall, a kind of tree, only the lower part of which is woody, the upper part being herbaceous and ſucculent. The flowers are of a beautiful golden colour, and the fruit turns to a deep crimſon; ſo that the trees

make a very beautiful appearance. The whole plant is full of a very acrid and cauſtic milk. 7. Rack is a large tree, growing not only in Abyſſinia but in many places of Arabia Felix. Its wood is ſo hard and bitter, that no worm will touch it; for which reaſon it is uſed by the Arabs for conſtructing their boats. It grows, like the mangrove, among the ſalt-water of the ſea, or about ſalt ſprings. 8. Gir-gir, or geſhe-el-aube; a kind of graſs found about Ras-el-Feel, growing to the height of about three feet four inches. 9. The kantuffa, a very noxious ſpecies of thorn, much more troubleſome than any with which we are acquainted, and growing to the height of eight or more feet. The flowers have a ſtrong ſmell like the flower mignionet. 10. The gaguedi, is a ſhort tree only about nine feet high, a native of Lamalmon. The flowers, which are yellow and very beautiful, turn towards the ſun like thoſe of the helianthus. 11. The wanſey, a tree common throughout all Abyſſinia; flowers exactly on the firſt day the rains ceaſe. It grows to the height of 18 or 20 feet; having a thick bark and cloſe heavy wood; the firſt part of which is white, but the reſt of a dark colour. The flowers are of a beautiful white colour; but it does not appear to poſſeſs any other remarkable property, though it is held in great eſtimation by the Abyſſinians, and is even worſhipped by the Galla. 12. The farek, or Bauhinia acuminata, grows in the country immediately adjacent to the ſources of the Nile; being found by Mr Bruce ſcarce 400 yards diſtant from the fountain. 13. Kuara, is a beautiful tree, growing in the ſouth and ſouth-weſt parts of Abyſſinia. It has a fruit like a bean, of a red colour, which in the early ages was made uſe of as a weight for gold and diamonds; and hence Mr Bruce is of opinion that the name of the imaginary weight *carat* is derived. 14. The walkuffa, grows in the hotteſt parts of Ethiopia. It is a flowering tree, with beautiful white bloſſoms, which do not appear till towards the middle of January. The flowers have no ſmell, and are accounted pernicious to bees. The wood is very heavy. 15. The wooginoos, or Brucea antidyſenterica, is common throughout the whole empire, but principally on the ſides of the valleys. It is a ſovereign remedy againſt the dyſentery, a very common and fatal diſeaſe in hot countries. Mr Bruce had experimental proof of its antidyſenteric virtues. 16. Cuſſo, or Bankſia anthelmintica, is a very beautiful and uſeful tree, being a ſtrong anthelmintic, and uſed as ſuch by the Abyſſinians. Every perſon there, whether male or female, is troubled with that kind of worm called *aſcarides;* a great number of which are evacuated every month, and the evacuation is promoted by an infuſion of this plant. While taking this medicine, the patients ſequeſtrate themſelves from all their acquaintance, and keep cloſe at home. It is ſaid, that the want of this medicine in other countries is the reaſon why the Abyſſinians do not go out of their own country; or, if they do, that they are ſhort-lived. 17. Teff, is a kind of grain ſown generally throughout Abyſſinia; and conſtituting the bread commonly made uſe of by the inhabitants. They have indeed plenty of wheat, and are as ſkilful in forming it into bread as the Europeans; but this is only made uſe of by people of the firſt rank: however, the teff is ſometimes of ſuch an excellent quality, that the bread made from it is held in equal eſtimation with the fineſt wheat. From the bread made of this grain a ſouriſh liquor called *louza* is prepared, which is uſed for common drink like our ſmall beer. A liquor of the ſame kind, but of inferior quality, is made from barley cakes. Some have been of opinion, that the uſe of teff occaſions the worms above mentioned; but this is controverted by Mr Bruce. Nook, a plant not to be diſtinguiſhed from our marigold either in ſhape, ſize, or foliage, is alſo ſown very generally over the country, and furniſhes all Abyſſinia with oil for the kitchen and other uſes.

397 Quadrupeds. Abyſſinia abounds with a vaſt variety of quadrupeds both wild and tame. Immenſe numbers of cattle every where preſent themſelves, ſome of them the moſt beautiful in the world. Some have monſtrous horns, ſaid to be capable of holding 10 quarts each; but this, as our author informs us, is a diſeaſe which proves fatal to them. Buffalos are here met with in great numbers, and are very fierce and untractable; but there are no ſuch animals as carnivorous bulls, which have been ſaid to exiſt in this and other internal parts of Africa. Antelopes and other wild animals are met with in great numbers in the uncultivated parts; feeding chiefly on the leaves of trees. They abound moſt of all, however, in thoſe parts which have been once cultivated, but ſince deſolated by the calamities of war; and where wild oats abound in ſuch quantities as to hide them from purſuit. Hyænas, lions, foxes, jackals, wild boars, &c. are alſo found, as well as the elephant, rhinoceros, cameleopard, and others of the larger and more uncommon kinds. Great havock is made in the cultivated fields by multitudes of baboons, apes, rats, and mice. There is plenty of hares; but theſe being reckoned unclean, as well as wild boars, are not uſed as food. The rivers abound with crocodiles and hippopotami, at leaſt the Nile, and thoſe large ſtreams which flow into it: but a great number have water in them only during the rainy ſeaſon, and theſe have neither fiſh nor any animal that feeds upon them.

398 Birds. The number of birds in this country is immenſe; nor are thoſe of the carnivorous kind at all deficient. Great numbers of eagles, vultures, hawks, and others of that kind, are met with, and come punctually every year after the tropical rains have ceaſed. They feed at firſt upon the ſhell-fiſh which are met with in great quantities on the edges of the deſerts, where they had lived in the ſalt ſprings; but, being forced from their natural habitations when theſe ſprings were ſwelled by the rains, are afterwards left to periſh on dry land. When theſe fail, their next reſource is from the carcaſes of the large animals, ſuch as the elephant and rhinoceros, which are killed in the flat country by the hunters. Their next ſupply is the multitude of rats and field-mice which infeſt the country after harveſt. The vaſt ſlaughter of cattle made by the Abyſſinian armies, the multitude of perſons killed whoſe bodies are allowed to rot on the field of battle, &c. furniſh them alſo with another reſource. Theſe ſupplies, however, all fail at the beginning of the rainy ſeaſon, when the hunters and armies return home, and the vaſt quantity of water which continually overflows the ground renders it impoſſible for them to find any other food.

There are other birds which feed upon inſects, and multitudes which live on grain or ſeeds of various kinds; all of which are amply ſupplied by the immenſe quantity of fruits and berries which grow in Abyſſinia, and are ripe at all ſeaſons of the year. A very remarkable

markable particular concerning this is, that the trees which bear fruit all the year round do not carry it always in the ſame place. The weſt ſide is that which bloſſoms firſt, and where of conſequence the fruit firſt comes to perfection; the ſouth ſide ſucceeds, and goes through the ſame proceſs; after which, the north bloſſoms in like manner; and laſt of all is the eaſt ſide, which produces flowers and fruit towards the beginning of the rainy ſeaſon. All the trees of Abyſſinia are ever-green; and their leaves are of a thick leathery conſiſtence, and highly varniſhed to enable them to reſiſt the violent rains which fall during a certain ſeaſon. The granivorous birds have likewiſe this advantage, that the rains do not fall at the ſame time all over the country. It is interſected by a chain of mountains that divide the ſeaſons alſo; ſo that they have but a ſhort way to fly in order to become birds of paſſage, and ſupply themſelves with ſuch food as is neceſſary for them beyond the mountains. All the pigeons, of which there are many ſpecies, are birds of paſſage, excepting one kind. The owls are extremely large and beautiful, but few in number. There is a great variety of ſwallows, ſeveral kinds of which are unknown in Europe; but, ſays our author, "thoſe that are common in Europe appear in paſſage at the very ſeaſon when they take their flight from thence. We ſaw the greateſt part of them in the iſland of Maſuah, where they lighted and tarried two days, and then proceeded with moon-light nights to the ſouth-weſt." The large birds which reſide conſtantly among the mountains of Samen and Taranta have all their feathers tubular, the hollow part being filled with a kind of yellow duſt which iſſues out in great abundance on hunting them. This was particularly obſerved by Mr Bruce in a ſpecies of eagle which he calls the *golden eagle;* and the duſt being viewed through a microſcope with a very ſtrong magnifying power, appeared like fine feathers. The crows are ſpotted white and black, almoſt in equal proportions. The raven has his feathers intermixed with brown; the tip of his beak white, and a figure like a cup or chalice of white feathers upon his head. Our author ſaw no ſparrows, magpies, nor bats; neither are there many water fowl, eſpecially of the web-footed kind; but there are vaſt numbers of ſtorks, which cover the plains in May, when the rains become conſtant. There are no geeſe, excepting one ſpecies called the *golden gooſe* or *gooſe of the Nile*, which is common all over Africa; but there are ſnipes in all the marſhes.

399
Fiſhes.

Our author deſcribes very few fiſhes; though he ſays that an account of theſe, and other marine productions of the Red Sea, which he has painted and collected, would occupy many large volumes, and the engraving coſt a ſum which he could not by any means afford. He mentions one named *binny*, which is good food, and grows to a pretty large ſize; that from which he took the drawing being about 32 pounds weight. Its whole body is covered with beautiful ſcales reſembling ſilver ſpangles.

400
Reptiles.

401
Few ſerpents in Abyſſinia.

Of the reptiles in Abyſſinia Mr Bruce deſcribes the fly already mentioned as deſtructive to cattle, and which in his 5th volume he calls *tlatſalva*. He gives a particular deſcription of a kind of lizard, and of the ceraſtes or horned ſerpent; but denies that ſerpents are numerous in Abyſſinia, as almoſt all authors have ſuppoſed, and as we ſhould be led naturally to ſuſpect. He vouches alſo for the power that ſome perſons have of inchanting ſerpents and ſcorpions, which in ſome is natural, in others communicated artificially by certain medicines. He prevailed upon thoſe who knew the ſecret to prepare him by theſe means as they had done others; but, notwithſtanding this aſſiſtance, he acknowledges, that when it came to the trial his heart always failed him.

402
Manners, &c. of the Abyſſinians.

403
Method o ſettling th ſucceſſion to the crown de trimental to the em pire.

404
Exceſſive deſtructio by the A byſſinian armies.

*Bruce's Travels*, vol. v. p. 16

405
Immenſe number o birds whi follow them.

Mr Bruce gives an ample deſcription of the manners of the Abyſſinians, who in ſome reſpects are barbarous beyond meaſure. The continual ſtate of warfare in which they are engaged, muſt no doubt contribute to confirm them in their barbarity. That, again, according to Mr Bruce, ariſes from an error in the regulations concerning the ſucceſſion. The crown is indeed hereditary in the line of Solomon, but it depends on the miniſter to chooſe the particular perſon who is to enjoy it; and as it is always his inclination to have the government in his own hands, he never fails to chooſe an infant, who is ſeldom ſuffered to live after he comes to the years of maturity. Thus perpetual wars and commotions take place, inſomuch that the ravenous birds, as has been obſerved, find one great ſupply of food in the ſlaughters made by the Abyſſinians of one another. All authors indeed agree that the devaſtations committed by the armies of this country are exceſſive; inſomuch, that after a long encampment is removed, nothing is to be ſeen all around the place where it was but bare earth. When an army marches through the country, ſays Mr Bruce, "an inconceivable number of birds and beaſts of prey, eſpecially the former, follow it from the firſt day of its march to its return; increaſing always in proportion the more it advances into the country. An army there leaves nothing living behind, not the veſtige of an habitation; but the fire and the ſword reduce every thing to a wilderneſs and ſolitude. The beaſts and birds unmoleſted have the country to themſelves, and increaſe beyond all poſſible conception. The ſlovenly manner of this ſavage people, who, after a battle, bury neither friends nor enemies; the quantity of beaſts of burthen that die perpetually under the load of baggage, and variety of miſmanagement; the quantity of offal, and half-eaten carcaſes of cows, goats, and ſheep, which they conſume in their march for ſuſtenance; all furniſh a ſtock of carrion ſufficient to occaſion contagious diſtempers, were there not ſuch a prodigious number of voracious attendants who conſume them almoſt before putrefaction. There is no giving the reader any idea of their number, unleſs by comparing them to the ſand of the ſea. While the army is in motion, they are a black canopy which extends over it for leagues. When encamped, the ground is diſcoloured with them beyond the ſight of the eye; and all the trees are loaded with them."

406
Curious method o keeping the hyæ from the king's pa lace.

The prodigious number of criminals executed for high treaſon, whoſe bodies are cut in pieces and thrown about the ſtreets, invite the hyænas to the capital, in the ſame manner that the carrion of the camp invites the birds of prey to follow it. The method of keeping off theſe voracious animals is certainly very curious. "An officer (ſays Mr Bruce) called *Serach Maſſery*, with a long whip, begins cracking and making a noiſe worſe than 20 French poſtilions at the door of the palace before the dawn of day. This chaſes away the hyænas and other wild beaſts: this too is the ſignal for the king's riſing, who ſits in judgment every morning

ing faſting; and after that, about 8 o'clock, he goes to breakfaſt."

107 hod of nting crown- the g.

From theſe and other circumſtances we ſhould be apt to imagine that the Abyſſinians, inſtead of becoming more civilized, were daily improving in barbarity. The king is anointed at his election with plain oil of olives; "which (ſays Mr Bruce) being poured upon the crown of his head, he rubs into his long hair indecently enough with both his hands, pretty much as his ſoldiers do with theirs when they get acceſs to plenty of butter." In former times, however, matters ſeem to have been conducted with more decency. Socinios, the greateſt monarch that ever ſat on the Abyſſinian throne, was crowned, after having gained a great victory over the Galla, in a very different manner, and with the ceremonies which we are told were in uſe among the ancient kings of Tigré. At that time he had with him an army of about 30,000 men; and was beſides attended by all the great officers dreſſed in the gayeſt manner, as well as by the ladies of the firſt quality in the empire. The king himſelf, dreſſed in crimſon damaſk, with a great chain of gold about his neck, his head bare, and mounted on a horſe richly capariſoned, advanced at the head of his nobility, paſſed the outer court, and came to the paved way before the church. Here he was met by a number of young girls, daughters of the *Umbares* or ſupreme judges, together with many noble virgins ſtanding on the right and left of the court. Two of the nobleſt of theſe held in their hands a crimſon cord of ſilk, ſomewhat thicker than common whip-cord, ſtretched acroſs from one company to another, as if to ſhut up the road by which the king was approaching the church. When this cord was prepared and drawn tight about breaſt-high by the girls, the king entered; advancing moderately quick, and ſhowing his ſkill in horſemanſhip as he went along. Being ſtopped by the tenſion of the ſtring, the damſels aſked, Who he was? To this he anſwered, "I am your king, the king of Ethiopia." But they replied, "You ſhall not paſs; you are not our king." He then retired ſome paces, and again preſented himſelf. The queſtion was again put, "Who he was?" To which he anſwered, "I am your king, the king of Iſrael." But the ſame reply was ſtill given by the girls. The third time, on being aſked, "Who he was?" he anſwered, "I am your king, the king of Sion:" and drawing his ſword, he cut the cord aſunder. The damſels then cried out, "It is a truth, you are our king; truly you are the king of Sion." On this they began to ſing Hallelujah, and were joined by the whole army and the reſt of the king's attendants. Amidſt theſe acclamations the king advanced to the foot of the ſtair of the church, diſmounted, and ſat-down upon a ſtone; which, in Mr Bruce's opinion, was plainly an altar of Anubis or the Dog-ſtar. After the king, came a number of prieſts in proper order. The king was firſt anointed, then crowned, and accompanied half up the ſteps by the ſinging prieſts. He ſtopped at a hole made on purpoſe in one of the ſteps, where he was fumigated with myrrh, aloes, and caſſia: after which divine ſervice was celebrated; and he returned to the camp, where 14 days were ſpent in feaſting and rejoicing.

Ceremonies of this kind are now given over on account of the expence. Our author was informed by Tecla Haimanout, that when he was obliged to retire into Tigré from his enemies, Ras Michael had ſome thoughts of having him crowned in contempt of his enemies; but by the moſt moderate calculation that could be made, it would have coſt 20,000 ounces of gold, about 80,000 l. ſterling; on which all thoughts of it were laid aſide.

408 Manners of the Abyſſinians.

With regard to the manners of the Abyſſinians, they are repreſented by Mr Bruce as highly barbarous. Their continual warfare inures them to blood from their infancy; ſo that even children would not have the leaſt ſcruple at killing one another or grown up perſons if they were able. Many ſhocking inſtances of hardneſs of heart are related by our author in Tecla Haimanout himſelf, though otherwiſe an accompliſhed prince. Their cruelty diſplays itſelf abundantly in the puniſhments inflicted upon criminals, one of which is flaeing alive, as has been already related of Wooſheka. Cutting in pieces with a ſabre is another; and this is performed, not by executioners, whoſe employment is reckoned diſgraceful as in this country, but by officers and people of quality. So little is this thought of indeed in Gondar, the capital of the empire, that Mr Bruce happening to paſs by an officer employed in this work, who had three men to diſpatch, the officer called to him to ſtop till he had killed them all, as he wanted to ſpeak to him upon a matter of conſequence. Stoning to death is a capital puniſhment likewiſe common in this country; and uſually inflicted on Roman Catholics if they happen to be found, or upon other heretics in religion.

409 Their horrid manner of feeding.

It is not to be ſuppoſed that people who regard the lives of one another ſo little, will ſhow much compaſſion to the brute creation. In this reſpect, however, the Abyſſinians are cruel and ſavage beyond all people on the face of the earth. There are many inſtances of people eating raw fiſh or fleſh, and we call them barbarous that do ſo; but what name ſhall we give to thoſe who cut off pieces of fleſh from animals while ſtill living, and eat it not only raw but ſtill quivering with life! Mr Bruce labours much to prove, that the way of eating not raw, but *living* fleſh, was cuſtomary among the nations of antiquity: but whatever be in this, he is the only author who mentions it directly; and it is on his ſingle teſtimony that the fact is eſtabliſhed. The Jeſuits mentioned in their books, that the Abyſſinians eat raw fleſh, but not a word of of eating it in this manner; and indeed there are ſome circumſtances which he himſelf relates ſeemingly very difficult to be reconciled with known and indubitable facts. He informs us, for inſtance, that when at no great diſtance from Axum, the capital of Tigré, he fell in with three ſoldiers "driving a cow. They halted at a brook, threw down the beaſt, and one of them cut a pretty large collop of fleſh from its buttock; after which they drove the cow gently on as before." In another place he tells us, that the fleſh was taken from the upper part of the buttock; that the ſkin was flapped over the wound, faſtened with a ſkewer, and a cataplaſm of clay put over all. Now it is known to anatomiſts, that no piece of fleſh can be cut off without deſtroying a muſcle; and that the muſcles of the buttocks are ſubſervient to the motion of the legs. The Abyſſinians therefore muſt have been expert anatomiſts to know how to cut off ſuch muſcles as would allow the creature ſtill to go on; and if their repaſt had been two or three times repeated, it is plainly impoſſible that the cow could at any rate have ſtirred a ſtep. In his deſcription of their feaſts there is more conſiſtency; for there the animal is tied ſo that it cannot move: after ſtripping off the ſkin, the fleſh of the buttocks is cut off in ſolid ſquare pieces, without bones or much effuſion of blood; and the prodigious noiſe the animal makes is a ſignal for the company to ſit down to table. Every man ſits between two women, having a long knife in his hand. With this he cuts the fleſh, while the motion of its fibres is yet viſible, into pieces like dice. Theſe are laid upon pieces of bread made of the grain called *teff*, already mentioned, after being ſtrongly powdered with Cayenne pepper and foſſile ſalt. They are then rolled up like as many cartridges; the men open their mouths, ſtooping and gaping like idiots, while the women cram them ſo full of theſe cartridges, that they ſeem every moment in danger of being choked; and in proportion to the quantity their mouths can hold, and the noiſe they make in chewing, they are held in eſtimation by the company. All this time the animal bleeds but little: but when the large arteries are cut and it expires, the fleſh becomes tough; and the wretches who have the reſt to eat, gnaw it from the bones like dogs!
