It may be observed farther, that " to live under an Exercises habitual sense of the *Deity* and his great administration, of piety is to be conversant with unsdam order and becaute in improving is to be conversant with wisdom, order, and beauty, in to virtue. the highest subjects, and to receive the delightful reflexions and henign feelings which these excite while they irradiate upon him from every scene of nature and providence." How improving must such views be to the mind, in dilating and exalting it above those pany interests and competitions which agitate and inflame the bulk of mankind against each other !

### CHAP. IV. Motive to VIRTUE from the IMMORTA-LITY of the Soul, &c.

The other motive mentioned was the *immortality* of Metaphythe sonl, with future rewards and punishments. The ments for metaphysical proofs of the soul's immortality are com-its immormonly drawn from-its simple, uncompounded, and indi-tality. visible nature ; from whence it is concluded, that it cannot be corrupted or extinguished by a dissolution or destruction of its parts :- from its having a beginning of motion within itself; whence it is inferred, that it cannot discontinue and lose its motion :---from the different properties of matter and mind, the sluggishness and inactivity of the one, and the immense activity of the other; its prodigious flight of thought and imagination ; its penetration, memory, foresight, and anticipations of futurity; from whence it is concluded, that a being of so divinc a nature cannot be extinguished. But as these metaphysical proofs depend on intricate reasonings concerning the nature, properties, and distinctions of body and mind, with which we are not very well acquainted, they are not obvious to ordinary understandings, and are seldom so convincing even to those of higher reach, as not to leave some doubts behind them. Therefore perhaps it is not so safe to rest the proof of such an important article on what many may call the subtilities of school learning. Those proofs which are brought from analogy, from the moral constitution and phenomena of the human mind, the moral attributes of God, and the present course of things, and which therefore are called the moral arguments, are the plainest and generally the most satisfying, We shall select only one or two from the rest.

In tracing the nature and destination of any being, Moral we form the surest judgment from his powers of action, prost from and the scope and limits of these, compared with his analogy.

MORAL PHILOSOPHY. Motives to state, or with that field in which they are exercised. If this being passes through different states, or fields of action, and we find a succession of powers adapted to the different periods of his progress, we conclude that he was destined for those successive states, and reekon

his nature progressive. If, besides the immediate set of powers which fit him for action in his present state, we observe another set which appear superfluous if he were to be confined to it, and which point to another or higher one, we naturally conclude, that he is not designed to remain in his present state, but to advance to that for which those supernumerary powers are adapted. Thus we argue, that the insect, which has wings forming or formed, and all the apparatus proper for flight, is not destined always to creep on the ground, or to continue in the torpid state of adhering to a wall, hut is designed in its season to take its flight in air. Without this farther destination, the admirable mechanism of wings and the other apparatus would be useless and absurd. The same kind of reasoning may be applied to man, while he lives only a sort of vegetative life in the womb. He is furnished even there with a beautiful apparatus of organs, eyes, cars, and other delieate senses, which receive nourishment indeed, but are in a manner folded np, and have no proper exercise or use in their present confine-\* Vide Lu- ment \*. Let ns suppose some intelligent spectator, who never had any connexion with man, nor the least tion. acquaintance with human affairs, to see this odd phenomenon, a creature formed after such a manner, and vita Uteri, placed in a situation apparently unsuitable to such various machinery: must he not be strangely puzzled about the use of his complicated structure, and reckon such a profusion of art and admirable workmanship lost on the subject; or reason by way of anticipation, that a creature endued with sneh various yet unexerted capacities, was destined for a more enlarged sphere of action, in which those latent capacities shall have full play ? the vast variety and yet beautiful symmetry and proportions of the several parts and organs with which the creature is endued, and their apt cohesion with, and dependence on, the eurious receptacle of their life and nourishment, would forbid his concluding the whole to be the birth of chance, or the bungling effort of an unskilful artist; at least would make him demur a while at so harsh a sentence. But if, while he is in this state of uncertainty, we suppose him to sec the babe, after a few successful struggles, throwing off his fetters, breaking loose from his little dark prison, and emerging into open day, then unfolding his reeluse and dormant powers, breathing in air, gazing at light, admiring colours, sounds, and all the fair variety of nature, immediately his doubts clear up, the propriety and excellency of the workmanship dawn upon him with full lustre, and the whole mystery of the first period is unravelled by the opening of this new scene. Though in this second period the creature lives chiefly a kind of animal life, i. e. of sense and appetite, yet by various trials and observations he gains experience, and by

the gradual evolution of the powers of imagination he

ripens apace for a higher life, for exercising the arts of

design and imitation, and of those in which strength or

dexterity are more requisite than acuteness or reach of

judgment. In the succeeding rational or intellectual

period, his understanding, which formerly crept in a

3

lower, mounts into a higher sphere, canvasses the na- From the tures, judges of the relations of things, forms schemes, Immorta deduces consequences from what is past, and from pre- ty of the sent as well as past collects future events. By this suecession of states, and of correspondent culture, he grows up at length into a moral, a social, and a political ereature. This is the last period at which we perceive him to arrive in this his mortal career. Each period is introductory to the next succeeding one; each life is a field of exercise and improvement for the next higher one; the life of the factus for that of the infant, the life of the infant for that of the child, and all the lower for see the highest and best § .- But is this the last period of B tier's nature's progression ? Is this the utmost extent of her plot, where she winds up the drama, and dismisses the Part I. actor into eternal oblivion ? Or does he appear to be invested with supernumerary powers, which have not full exercise and scope even in the last scene, and reach not that maturity or perfection of which they are capable; and therefore point to some higher scene, where he is to sustain another and more important character than he has yet sustained? If any such there are, may we not conclude by analogy, or in the same way of anticipation as before, that he is destined for that after pa t, and is to be produced upon a more august and solemn stage, where his sublimer powers shall have proportioned action, and his nature attain its comple-

Part II

If we attend to that curiosity, or prodigions thirst of Powers knowledge, which is natural to the mind in every pe-man wi riod of its progress, and consider withal the endless point to round of business and care, and the various hardships to which the bulk of mankind are chained down; it is Intellecevident, that in this present state it is impossible to ex-tual. peet the gratification of an appetite at once so insatiable and so noble. Our senses, the ordinary organs by which knowledge is let into the mind, are always imperfect, and often fallacious; the advantages of assisting or correcting them are possessed by few ; the difficulties of finding out truth amidst the various and contradictory opinions, interests, and passions of mankind, are many; and the wants of the creature, and of those with whom he is connected, numerous and urgent : so that it may be said of most men, that their intellectual organs are as much shut up and secluded from proper nourishment and exercise in that little circle to which they are confined, as the bodily organs are in the womb. Nay, those who to an aspiring genius have added all the assistances of art, leisure, and the most liberal education, what narrow prospects can even they take of this unbourded seenc of things from that little cminence on which they stand ? and how eagerly do they still grasp at new discoveries, without any satisfaction or limit to their ambition?

But should it be said, that man is made for action, Moral and not for speculation, or fruitless searches after know-powers. ledge, we ask, For what kind of action ? Is it only for bodily exercises, or for moral, political, and religious ones? Of all these hc is capable; yet, by the unavoidahle circumstances of his lot, he is tied down to the former, and has hardly any leisure to think of the latter, or, if he has, wants the proper instruments of exerting them. The love of virtue, of one's friends and country, the generous sympathy with mankind, and heroic zeal of doing good, which are all so natural to great and good

ntives to good minds, and some traces of which are found in the lowest, are seldom united with proportioned means or Virtue. opportunities of exercising them : so that the moral spring, the noble energies and impulses of the mind, can hardly find proper scope even in the most fortunate condition; but are much depressed in some, and almost entirely restrained in the generality, by the numerous elogs of an indigent, sickly, or embarrassed life. Were such mighty powers, such godlike affections, planted in the human breast to be folded up in the narrow womb of our present existence, never to be produced into a more perfect life, nor to expatiate in the ample career immortality?

236 satisfied sires of d happi

Htal.

Let it be considered, at the same time, that no possession, no enjoyment, within the round of mortal things, is commensurate to the desires, or adequate to the capacities of the mind. The most exalted condition has its abatements ; the happiest conjuncture of fortune leaves many wishes behind; and after the highest gratifications, the mind is carried forward in pursuit of new ones without end. Add to all, the fond desire of immortality, the secret dread of non-existence, and the high unremitting pulse of the soul beating for perfection, joined to the improbability or the impossibility of attaining it here; and then judge whether this elaborate structure, this magnificent apparatus of inward powers and organs, does not plainly point out an hereafter, and intimate eternity to man? Does nature give the finishing touches to the lesser and ignoble instances of her skill, and raise every other creature to the maturity and perfection of his being; and shall she leave her principal workmanship unfinished? Does she carry the vegetative and animal life in man to their full vigour and highest destination ; and shall she suffer his intellectual, his moral, his divine life, to fade away, and be for ever extinguished? Would such abortions in the moral world be congruous to that perfection of wisdom and goodness which upholds and adorns the natural?

We must therefore conclude from this detail, that the present state, even at its best, is only the WOMB of man's being, in which the noblest principles of his nature are in a manner fettered, or secluded from a correspondent sphere of action; and therefore destined for a future and unbounded state, where they shall emancipate themselves, and exert the fulness of their strength. The most accomplished mortal, in this low and dark apartment of nature, is only the rudiments of what he shall be when he takes his ethereal flight, and puts on immortality. Without a reference to that state, man were a mere abortion, a rude unfinished embryo, a monster in nature. But this being once supposed, he still maintains his rank of the masterpiece of the ereation; his latent powers arc all suitable to the harmony and progression of nature ; his noble aspirations, and the pains of his dissolution, are his cfforts towards a second birth, the pangs of his delivery into light, liberty, and perfection; and death, his discharge from gaol, his separation from his fellow prisoners, and introduction into the assembly of those heroic spirits who are gone before him, and of their great eternal Parent. The fetters of his mortal eoil being loosened, and his prison walls broke down, he will be bare and open on every side to the admission of truth and virtue, and their fair attendant happiness; every vital and intellectual spring will evolve itself with

+

not then peep at the universe and its glorious Author Immortalithrough a dark grate or a gross medium, nor receive ty of the the reflections of his glory through the strait openings of sensible organs : but will be all cye, all ear, all ethcreal and divine feeling \*. Let one part, however, of \* Fide Rethe analogy be attended to : That as in the womb we ligion of receive our original constitution, form, and the essen-Nature, tial stamina of our being, which we earry along with 9. us into the light, and which greatly affect the succeeding periods of our life ; so cur temper and condition in the future life will depend on the conduct we have observed, and the character we have formed, in the present life. We are here in miniature what we shall be at full length hereafter. The first rude sketch or outlines of reason and virtue must be drawn at present, to be afterwards enlarged to the stature and beauty of angels. 238

This, if duly attended to, must prove not only a Immortaliguard, but an admirable incentive to virtue. For he ty a guard who faithfully and ardently follows the light of know- tive to virledge, and pants after higher improvements in virtue, tae. will be wonderfully animated and inflamed in that pursuit by a full conviction that the scene does not close with life-that his struggles, arising from the weakness of nature and the strength of habit, will be turned into triumphs-that his career in the track of wisdom and goodness will be both swifter and smoother-and those generons ardours with which he glows towards heaven, i. e. the perfection and immortality of virtue, will find their adequate object and exercise in a sphere proportionably enlarged, incorruptible, immortal. On the other hand, what an inexpressible damp must it be to the good man, to dread the total extinction of that light and virtue, without which life, nay, immortality itself, were not worth a single wish?

Many writers draw their proofs of the immortality proof from of the soul, and of a future state of rewards and pu- the inequanishments, from the unequal distribution of these here. lity of pre-It cannot be dissembled that wicked men often escape sent distri-the outward punishment due to their erimes, and de butions. not feel the inward in that measure their demerit seems to require, partly from the callousness induced upon their nature by the habits of vice, and partly from the dissipation of their minds abroad by pleasure or business-and sometimes good men do not reap all the natural and genuine fruits of their virtue, through the many unforeseen or unavoidable calamities in which they are involved. To the smallest reflection, however, it is obvious that the natural tendency of virtue is to produce happiness; that if it were universally practised, it would, in fact, produce the greatest sum of happiness of which human nature is capable; and that this tendency is defeated only by numerous individuals, who, forsaking the laws of virtue, injure and oppress those who steadily adhere to them. But the natural tendency of virtue is the result of that constitution of things which was established by God at the creation of the world. This being the case, we must either conclude, that there will be a future state, in which all the moral obliquities of the present shall be made straight; or else admit, that the designs of infinite wisdom, goodness, and power, can be finally defeated by the perverse conduct of human weakness .----But this last supposition is so extravagantly absurd, 3 E that

Vol. XIV. Part IL.

Motives to that the reality of a future state, the only other possible alternative, may be pronounced to have the evi-Virtue. Lawy dence of perfect demostration.

240 Belief of ty, &cc. a great support amidst trials.

Virtue has present rewards, and vice present punishimmortali- ments annexed to it; such rewards and punishments as make virtue, in most cases that happen, far more eligible than vice : but, in the infinite variety of human contingencies, it may sometimes fall out, that the inflexible practice of virtue shall deprive a man of considerable advantages to himself, his family, or friends, which he might gain by a well-timed piece of roguery; suppose by betraying his trust, voting against his conscience, selling his country, or any other crime where the security against discovery shall heighten the temptation. Or, it may happen, that a strict adherence to his honour, to his religion, to the cause of liberty and virtue, shall expose him, or his family, to the loss of every thing, nay, to poverty, slavery, death itself, or to torments far more intolerable. Now what shall secure a man's virtue in circumstances of such trial? What shall enforce the obligations of conscience against the allurcments of so many interests, the dread of so many and so terrible cvils, and the almost unsurmountable aversion of human nature to excessive pain ! The conflict is the greater, when the circumstances of the crime are such as easily admit a variety of alleviations from necessity, natural affection, love to one's family or friends, perhaps in indigence : these will give it even the air of virtue. Add to all, that the crime may be thought to have few bad consequences, -may be easily concealed, or imagined possible to be retrieved in a good measure by future good conduct. It is obvious to which side most men will lean in such a case ; and how much need there is of a balance in the opposite scale, from the consideration of a God, of a Providence, and of an immortal state of retribution, to keep the mind firm and uncorrupted in those or like instances of singular trial or distress.

24I In the geof life.

But without supposing such peculiar instances, a neral course sense of a governing Mind, and a persuasion that virtue is not only befriended by him here, but will be crowned by him hereafter with rewards suitable to its nature, vast in themselves, and immortal in their duration, must be not only a mighty support and incentive to the practice of virtue, but a strong barrier against vice. The thoughts of an Almighty Judge, and of an impartial future reckoning, are often alarming, inexpressibly so, even to the stoutest offenders. On the other hand, how supporting must it be to the good man, to think that he acts under the eye of his

friend, as well as judge ! How improving, to consider From the the present state as connected with a future one, and Immortali every relation in which he stands as a school of disci- ty of the Soul pline for his affections; every trial as the exercise of some virtue; and the virtuous deeds which result from both, as introductory to higher scenes of action and enjoyment ! Finally, How transporting is it to view death as his discharge from the warfare of mortality, and a triumphant entry into a state of freedom, security, and perfection, in which knowledge and wisdom shall break upon him from every quarter; where each faculty shall have its proper object : and his virtue, which was often damped or defeated here, shall be enthroned in undisturbed and eternal empire ?

On reviewing this short system of morals, and the Advantamotives which support and enforce it, and comparing Christian both with the CHRISTIAN scheme, what light and vigour scheme, do they borrow from thence! How clearly and fully and its com do CHRISTIANITY lay open the connexions of our na-nexion wi do CHRISTIANITY hay open the connection of our well natural re ture, both material and immaterial, and future as well ligion or as present ! what an ample and beautiful detail docs it morality. present of the duties we owe to God, to society, and ourselves, promulgated in the most simple, intelligible, and popular manner; divested of every partiality of sect or nation; and adapted to the general state of mankind ! With what bright and alluring example does it illustrate and recommend the practice of those duties : and with what mighty sanctions does it enforce that practice ! How strongly docs it describe the corruptions of our nature; the deviations of our life from the rule of duty, and the eauses of both ! How marvellous and benevolent a plan of redemption does it unfold, by which those corruptions may be remedied, and our nature restored from its deviations to transcendent heights of virtue and picty! Finally, What a fair and comprehensive prospect does it give us of the administration of God, of which it represents the present state only as a small period, and a period of warfare and trial ! How solemn and unbounded are the scenes which it opens beyond it ! the resurrection of the dead, the general judgment, the equal distribution of rewards and punishments to the good and the bad ; and the full completion of divine wisdom and goodness in the final establishment of order, perfection, and happiness! How glorious then is that SCHEME of RELIGION, and how worthy of affection as well as of admiration, which, by making such discoveries, and affording such assistances, has disclosed the unfading fruits and triumphs of VIR-TUE, and secured its interests beyond the power of TIME and CHANCE.

MORAT, or MURTEN, a considerable town of Switzerland,

Morat.

Morata.

ee His-

y of

Switzerland, capital of a bailiwick of the same name, belonging to the eantons of Bern and Friburg. It is seated on the lake Morat, on the road from Avenche to Bern, 10 miles west of Bern and 10 miles north-east of Friburg. The lake is about six miles long and two broad, and the country about it pleasant and well cultivated. The lakes of Morat and Neufchatel are parallel to each other, but the latter is more elevated, discharging itself by means of the river Broye into the lake of Neufchatel. According to M. de Luc, the former is 15 French feet above the level of Neufchatel lake; and both these lakes, as well as that of Bienne, seem formerly to have extended considerably beyond their present limits, and from the position of the country appear to have been once united. Formerly the large fish named silurus glanis, or the saluth, frequented these lakes, but has not been caught in them for a long time past. The environs of this town and lake were carefully examined by Mr Coxe, during his residence in Switzerland, who made several exeursions across the lake to a ridge of hills situated betwixt it and Neufchatel. Here are many delightful prospects; particularly one from the top of Mount Vuilly, which, he says, is perhaps the only central spot from which the eye can at once comprehend the vast amphitheatre formed on one side by the Jura stretching from the environs of Geneva as far as Basle, and, on the other, by that stupendous chain of snowy Alps which extend from the frontiers of Italy to the confines of Germany, and is lost at each extremity in the horizon. Morat is eelebrated for the obstinate defence it made against Charles the Bold, duke of Burgundy, and for the battle which afterwards followed on the 22d of June 1476, where the duke was defeated, and his army almost entirely destroyed \*. Not far from the town, and adjoining to the high road, there still remains a monument of this victory. It is a square building, filled with the bones of Burgundian soldiers who were slain at the siege and in the battle; the number of which appears to have been very considerable. There are several inscriptions in the Latin and German languages commemorating the victory. MORATA, OLYMPIA FULVIA, an Italian lady,

distinguished for her learning, was born at Ferrara, in 1526. Her father, after teaching the belles lettres in several cities of Italy, was made preceptor to the two young princes of Ferrara, the sons of Alphonsus I. The uncommon abilities he discovered in his daughter determined him to give her all the advantages of edueation. Meanwhile the princess of Ferrara studying polite literature, it was judged expedient that she should have a companion in the same pursuit; and Morata being ealled, she was heard by the astonished courtiers to declaim in Latin, to speak Greek, and to explain the paradoxes of Cicero. Her father dying, she was obliged to return home to take upon her the management of family affairs, and the education of her brother and three sisters; both which she executed with the greatest diligence and success. In the mean time Andrew Grunthler, a young German physician, had married her, and with him she went to Germany, taking her brother along with her, whom she instructed in the Latin and Greek tongues; and after staying a short time at Augsburg, went to Schweinfort in Franconia, where her husband was born : but they had not

becu there long before that town was unhappily besicged Morata. and burnt; however, escaping the flames, they fled in Moravia. the utmost distress to Hammelburg. This place they were also obliged to quit, and were reduced to the last extremities, when the elector Palatine invited Grunthler to be professor of physic at Heidelberg. He entcred on his new office in 1554; but they no sooner began to taste the sweets of repose, than a disease, oceasioned by the distresses and hardships they had suffered, seized upon Morata, who died in 1555, in the 29th year of her age; and her husband and brother did not long survive her. She composed several works, great part of which were burnt with the town of Schweinfort; the remainder, which consist of orations, dialogues, letters, and translations, were collected and published under the title of Ohympiæ Fulviæ Moratæ, fæminæ doctissimæ, et plane divinæ, opera omnia quæ hactenus inveniri potucrint ; quibus Calii secundi curicnis epistolæ ac orationes accesserunt.

MORAVIA, a river of Turkey in Europe, which rises in Bulgaria, runs north through Servia by Nissa, and falls into the Danube at Scmendria, to the castward of Belgrade.

MORAVIA, a marquisate of Germany, derives the name of Mahern, as it is called by the Germans, and of Morawa, as it is called by the natives, from the river of that name, which rises in the mountains of the county of Glatz, and passes through the middle of it. It is bounded to the south by Austria, to the north by Silesia, to the west by Boliemia, and to the east by Silesia and Hungary; being about 120 miles in length and 100 in breadth. Its surface is about 89,000 square miles. In 1775 its population, according to official returns, was 1,134,674, of whom 23,382 were Jews; but in 1801 has been computed to be 1,400,000 (Mentelle et Malte Brun). Olmutz, formerly the chief town, contains 11,000 inhabitants; Brunn, now the seat of government, contains 14,000; and there are several other considerable towns.

A great part of this country is overrun with woods and mountains, where the air is very cold, but much wholesomer than in the low grounds, which are full of bogs and lakes. The mountains, in general, are barren; but the more champaign parts tolerably fertile, yielding corn, with plenty of hemp and flax, good safiron, and pasture. Nor is it altogether destitute of wine, red and white, fruits, and garden stuff. Moravia also abounds in horses, black cattle, sheep, and goats. In the woods and about the lakes there is plenty of wild fowl, game, venison, bces, honcy, hares, foxes, wolves, beavers, &c. This country affords marble, alum, iron, sulphur, saltpetre, and vitriol, with mineral waters, and warm springs; but salt is imported. Its rivers, of which the March, Morawa, or Morau, are the chief, abound with trout, crayfish, barbels, eels, perch, and many other sorts of fish.

The language of the inhabitants is a dialect of the Sclavonic, differing little from the Bohemian; but the nobility and eitizens speak German and French.

Moravia was anciently inhabited by the Quadi, who were driven out by the Sclavi. Its kings, who were once powerful and independent, afterwards became dependent on, and tributary to, the German emperors and kings. At last, in the year 908, the Moravian kingdom was parcelled out among the Germans, Poles, and

3 E 2

F

Morbus.

Moravia and Hungarians. In 1086, that part of it properly called Moravia was declared a marquisate by the German king Henry IV. and united with Bohemia, to whose dukes and kings it hath ever since been subject. The states of the country consist of the elergy, lords, knights, and burgesses ; and the diets, when summoned by the regency, are held at Brunn. The marquisate is still governed by its own peculiar constitutions, under the directorium in publicis et cameralibus, and the supreme judicatory at Vienna. It is divided into six circles, each of which has its captain, and contributes to its sovercign about one-third of what is exacted of Bohemia. Towards the expenses of the military establishment of the whole Austrian hereditary countries, its yearly quota is 1,856,490 florins. Seven regiments of foot, one of euirassiers, and one of dragoons, are usually quatered in it.

Christianity was introduced into this country in the 9th century; and the inhabitants continued attached to the church of Rome till the 15th, when they espoused the doetrine of John Huss, and threw off Popery : but after the defeat of the elector Palatine, whom they had chosen king, as well as the Bohemians, the emperor Ferdinand II. re-established Popery; though there are still some Protestants in Moravia. The bishop of Olmutz, who stands immediately under the pope, is at the head of the ecclesiasties in this country. The supreme eeclesiastical jurisdiction, under the bishop, is vested in a consistory.

The commerce of this country is inconsiderable. Of what they have, Brunn enjoys the principal part. At Iglau and Trebitx are manufactures of cloth, paper, gunpowder, &e. There are also some iron works and glass houses in the country.

The inhabitants of Moravia in general are openhearted, not easy to be provoked or pacified, obedient to their masters, and true to their promises; but credulous of old propheeies, and much addicted to drinking, though neither such sots or bigots as they are represented by some geographers. The boors, indeed, upon the river Hank, are said to be a thievish, unpolished, brutal race. The sciences now begin to lift up their heads a little among the Moravians, the university of Olmutz having been put on a better footing; and a riding academy, with a learned society, has been lately established there.

MORAVIAN BRETHREN. See HERNHUTTERS, and UNITAS Fratrum.

MORAW, or MORAVA, a large river of Germany, which has its source on the confines of Bohemia and Silesia. It traverses the whole of Moravia, waters Olmutz and Hradiseh, and receiving the Taya from the confines of Lower Hungary and Upper Austria, separates these two countries as far as the Danube, into which it falls.

MORBID, among physicians, signifies " diseased or corrupt ;" a term applied either to an unsound constitation, or to those parts or humours that are affected by a disease.

MORBUS COMITIALIS, a name given to the epilepsy; because if on any day when the people were assembled in comitia upon public business, any person suddenly seized with this disorder should fall down, the assembly was dissolved, and the business of the comitia, however important, was suspended. See COMITIA.

MORBUS Regius, the same with the JAUNDICE. See Morbus MEDICINE Index. More.

MORBUS, or Disease, in Botany. See VARIETAS. MORDAUNT, CHARLES, earl of Peterborough, a celebrated commander both by sea and land, was the son of John Lord Mordaunt Viscount Avalon, and was born about the year 1658. In 1675 he succeeded his father in his honours and estate. While young he served under the admirals Torrington and Narborough in the Mediterranean against the Algerines; and in 1680 embarked for Africa with the earl of Plymouth, and distinguished himself at Tangier when it was besieged by the Moors. In the reign of James 11. he voted against the repeal of the test act; and disliking the measures of the court, obtained leave to go to Holland to accept the command of a Dutch squadron in the West Indies. He afterwards accompanied the prince of Orange into this kingdom; and upon his advancement to the throne, was sworn of the privycouncil, made one of the lords of the bedehamber to his majesty, also first commissioner of the treasury, and advanced to the dignity of earl of Monmouth. But in November 1690 he was dismissed from his post in the treasury. On the death of his uncle Henry earl of Peterborough in 1697, he succeeded to that title; and, upon the accession of Queen Anne, was invested with the commission of captain-general and governor of Jamaica. In 1705 he was sworn of the privycouncil; and the same year declared general and commander in chief of the forces sent to Spain, and joint admiral of the flect with Sir Cloudesley Shovel, of which the year following he had the sole command. His taking Barcelona with a handful of men, and afterwards relieving it when greatly distressed by the enemy; his driving out of Spain the duke of Anjou, and the French army, which consisted of 25,000 men, though his own troops never amounted to 10,000; his gaining possession of Catalonia, of the kingdoms of Valencia, Arragon, and the isle of Majorea, with part of Murcia and Castile, and thereby giving the earl of Galway an opportunity of advancing to Madrid without a blow; are astonishing instances of his bravery and conduct. For these important services his lordship was declared general in Spain by Charles III. afterwards emperor of Germany; and on his return to England he received the thanks of the house of lords. His lordship was afterwards employed in several embassies to foreign courts, installed knight of the Garter, and made governor of Minorea. In the reign of George I. he was general of all the marine forces in Great Britain, in which post he was continued by King George II. He died in his passage to Lisbon, where he was going for the recovery of his health, in 1735. His lordship was distinguished by various shining qualities: for, to the greatest personal courage and resolution, he added all the arts and address of a general; a lively and penetrating genius; and a great extent of knowledge upon almost every subject of importance within the compass of ancient and modern literature.

MORDELLA, a genus of inseets of the coleoptera order. See ENTOMOLOGY Index.

MORE, SIR THOMAS, lord high chancellor of England, the son of Sir John More, knight, one of the judges of the King's Bench, was born in the year 1480, in More.

More.

in Milk-street London. He was first sent to a school at St Anthony's in Threadneedle street; and afterward introduced into the family of Cardinal Moreton, who in 1407 sent him to Canterbury college in Oxford. During his residence at the university he constantly attended the lectures of Linaere and Groeinus, on the Greek and Latin languages. Having in the space of about two years made considerable proficiency in academical learning, he came to New Inn in London, in order to study the law; whenee, after some time, he removed to Lincoln's Inn, of which his father was a member. Notwithstanding his application to the law, however, being now about 20 years old, he was so bigotted to monkish discipline, that he wore a hair shirt next his skin, frequently fasted, and often slept on a bare plank. In the year 1503, being then a burgess in parliament, he distinguished himself in the house, in opposition to the motion for granting a subsidy and three fifteenths for the marriage of Henry VII.'s eldest daughter, Margaret, to the king of Seotland. The motion was rejected; and the king was so highly offended at this opposition from a beardless boy, that he revenged himself on Mr More's father, by sending him, on a frivolous pretcnee, to the Tower, and obliging him to pay 1001. for his liberty. Being now called to the bar, he was appointed law reader at Furnival's inn, which place he held about three years ; but about this time he also read a public lecture in the church of St Lawrence, Old Jewry, upon St Austin's treatise De Civitate Dei, with great applause. He had indeed formed a design of becoming a Franciscan friar, but was dissuaded from it; and, by the advice of Dr Colet, married Jane, the eldest daughter of John Colt, Esq. of Newhall in Essex. In 1508 he was appointed judge of the sheriff's court in the city of London, was made a justice of the peace, and became very eminent at the bar. In 1516 he went to Flanders in the retinue of Bishop Tonstal and Dr Knight, who were sent by King Henry VIII. to renew the alliance with the archdnke of Austria, afterwards Charles V. On his return, Cardinal Wolsey would have engaged Mr More in the service of the crown, and offered him a pension, which he refused. Nevertheless, it was not long before he accepted the place of master of the requests, was created a knight, admitted of the privy council, and in 1520 made treasurer of the exchequer. About this time he built a house on the bank of the Thames, at Chelsea, and married a second wife. This wife, whose name was Middleton, and a widow, was old, ill tempered, and covetous ; nevertheless Erasmus says, he was as fond of her as if she were a young maid.

In the 14th year of Henry VIII. Sir Thomas More was made speaker of the house of commons; in which capacity he had the resolution to oppose the then powerful minister, Wolsey, in his demand of an oppressive subsidy; notwithstanding which, it was not long before he was made chancellor of the duchy of Lancaster, and was treated by the king with singular familiarity. The king having once dined with Sir Thomas at Chelsea, walked with him near an hour in the garden, with his arm round his neck. After he was gone, Mr Roper, Sir Thomas's son-in-law, observed how happy he was to be so familiarly treated by the king: to which Sir Thomas replied, "I thank our lord, son Roper, I find his grace my very good lord indeed, and believe he doth as singularly favour me as any subject within this realm : howbeit, I must tell thee, I have no cause to be proud thereof; for if my head would win him a castle in France, it would not fail to go off." From this anecdote it appears, that Sir Thomas knew his grace to be a villain.

In 1526 he was sent with Cardinal Wolsey and others, on a joint embassy to France, and in 1529 with Bishop Tonstal to Cambray. The king, it seems, was so well satisfied with his services on these occasions, that in the following year, Wolsey being disgraced, he made him chancellor; which scens the more extraordinary, when we are told that Sir Thomas had repeatedly declared his disapprobation of the king's divorce, on which the great defensor fidei was so positively bent. Having executed the office of chancellor about three years, with equal wisdom and integrity, he resigned the seals in 1533, probably to avoid the danger of his refusing to confirm the king's divorce. He now retired to his house at Chelsea; dismissed many of his servants; sent his children with their respective families to their own houses (for hitherto, he had, it seems, maintained all his children. with their families, in his own house, in the true style of an aneient patriarch; and spent his time in study and devotion : but the capricious tyrant would not suffer him to enjoy his tranquillity. Though now reduced to a private station, and even to indigence, his opinion of the legality of the king's marriage with Anne Boleyn was deemed of so much importance, that various means were tried to procure his approbation ; but all persuasion proving ineffectual, he was, with some others, attainted in the house of lords of misprision of treason, for encouraging Elizabeth Barton, the nun of Kent, in her treasonable practices. His innocenee in this affair appeared so clearly, that they were obliged to strike his name out of the bill. He was then accused of other crimes, but with the same effect; till, refusing to take the oath enjoined by the act of supremacy, he was committed to the Tower, and, after 15 months imprisonment, was tried at the bar of the king's bench for high treason, in denying the king's snpremaey. The proof rested on the sole evidence of Rich the solicitor general, whom Sir Thomas, in his defence, sufficiently discredited ; nevertheless the jury brought him in guilty, and he was con-demned to suffer as a traitor. The merciful Harry, however, indulged him with simple decollation; and he was accordingly beheaded on Tower hill, on the 5th of July 1535. His body, which was first interred in the Tower, was begged by his daughter Margaret, and deposited in the chancel of the church at Chelsea, where a monument, with an inscription written by himself, had been some time before erected. This monument with the inscription is still to be seen in that church. The same daughter, Margaret, also procured his head after it had remained 14 days upon London bridge, and placed it in a vault belonging to the Roper family, under a chapel adjoining to St Dunstan's church in Canterbury. Sir Thomas More was a man of some learning, and an upright judge; a very priest in religion, yet cheerful, and even affectedly witty;

MOR

Morel

witty (A). He wanted not sagacity, where religion was out of the question ; but in that his faculties were so enveloped, as to render him a weak and credulous enthusiast. He left one son and three daughters ; of whom Margaret, the eldest, was very remarkable for her knowledge of the Greek and Latin languages. She married a Mr Roper of Wellhall in Kent, whose life of Sir Thomas More was published by Mr Hearne at Oxford in 1716. Mrs Roper died in 1544; and was buried in the vault of St Dunstan's in Canterbury, with her father's head in her arms.

Sir Thomas was the author of various works, though his Utopia is the only performance that has survived in the esteem of the world ; owing to the rest being chiefly of a polemic nature : his answer to Luther has only gained him the eredit of having the best knack of any man in Europe, at calling bad names in good Latin. His English works were collected and published by order of Queen Mary, in 1557; his Latin, at Basil, in 1563, and at Louvain, in 1566,

MOREA, formerly called the Peloponnesus, is a peninsula to the south of Greece, to which it is joined hy the isthmus of Corinth. Its form resembles a mulberry leaf, and its name is derived from the great number of mulberry trees which it produces. It is about 140 miles in length, and 110 in breadth. The air is temperate, and the land fertile, except in the middle, where it is full of mountains, and is watered by a great number of rivers. It is divided into three provinces; Scania, Belvedera, and Brazzo-di-Maina. It was taken from the Turks by the Venetians in 1687; but they lost it again in 1715. The population of the Morea is estimated by Dr Clarke at 300,000. See GREECE and PELOPONNESUS.

MOREL, the name of several celebrated printers to the kings of France, who, like the Stephens, were also men of great learning.

Frederic MOREL, who was interpreter in the Greek and Latin tongues, as well as printer to the king, was heir to Vascosan, whose daughter he had married .---He was born in Champagne, and he died in an advanced age at Paris, 1583. His sons and grandsons trode in his steps; they distinguished themselves in literature, and maintained also the reputation which he had acquired by printing. The edition of St Gregory of Nyssa, by his son Claude Morel, is held in great estimation by the learned.

MOREL, Frederic, son of the preceding, and still more celebrated than his father, was professor and interpreter to the king, and printer in ordinary for the Hebrew, Greek, Latin, and French languages. He was so devoted to study, that when he was told his wife was at the point of death, he would not stir till he had finished the sentence which he had begun. Bcfore it was finished, he was informed that she was ac-

tually dead; I am sorry for it, (replied he coldly), she was an excellent woman. This printer acquired great reputation from the works which he published, which Morgagi were very numerous and beautifully executed. From the manuscripts in the king's library, he published several treatises of St Basil, Theodoret, St Cyrille; and he accompanied them with a translation. His edition of the works of Œeumenius and Aretas, in 2 vols. folio, is much estecmed. In short, after distinguishing himself by his knowledge in the languages, he died June 27. 1630, at the age of 78. His sons and grandsons followed the same profession.

MOREL, William, regius professor of Greek, and director of the king's printing house at Paris, died 1564. He composed a Dictionnaire Grec-Latin Francois, which was published in quarto in 1622, and some other works which indicate very extensive learning. His editions of the Greek authors are exceed-This great scholar, who was of a ingly beautiful. different family from the preceding, had a brother named, John, who died in prison (where he had been confined for heresy) at the age of 20, and whose body was dug out of the grave, and burnt, Feb. 27. 1559. They were of the parish of Tilleul, in the county of Mortein in Normandy.

MORENA, in Ancient Geography, a district or division of Mysia, in the Hither Asia. A part of which was occupied by Cleon, formerly at the head of a band of robbers, but afterwards priest of Jupiter Abrettenus, and enriched with possessions, first by Antony, and then by Cæsar.

MOREŠQUE, MORESK, or Morisko, a kind of painting, earving, &c. done after the manner of the Moors ; consisting of several grotesque picces and compartments promiscuously intermingled, not containing any perfect figure of a man, or other animal, but a wild resemblance of birds, beasts, trees, &c. These are also called arabesques, and are particularly used in embroideries, damask work, &e.

MORESQUE Dances, vulgarly ealled Morrice dances, are those altogether in imitation of the Moors, as sarabands, chaeons, &e. and are usually performed with eastanets, tambours, &c.

There are few country places in England where the morrice dance is not known. It was probably introduced about, or a little before, the reign of Henry VIII. and is a dance of young men in their shirts, with bells at their feet, and ribbands of various colours tied round their arms and flung across their shoulders.

MORGAGNA. See FATA.

MORGAGNI, JOHN BAPTIST, doetor of medicine, first professor of anatomy in the university of Padua, and member of several of the most eminent societies of learned men in Europe, was born in the year 1682, at Forli, a town in the district of La Romagna in Italy. His

(A) This last disposition, we are told, he could not restrain even at his execution. The day being come, he ascended the scaffold, which seemed so weak that it was ready to fall; whereupon, " I pray (said he) see me safe up, and for my coming down let me shift for myself." His prayers being ended, he turned to the executioner, and with a cheerful countenance said, " Pluck up thy spirits, man, and be not afraid to do thy office ; my neck is very short, take heed therefore thou strike not awry for saving thy honesty." Then laying his head upon the block, he bade him stay until he had put aside his beard, saying, "That had never committed any treason."

More, Morel. L

argagni. His parents, who were in easy circumstances, allowed him to follow that course in life his genius dictated. He began his studies at the place of his nativity; but soon after removed to Bologna, where he obtained the degree of Doctor of Medicine, when he had but just reached the 16th year of his age. Here his peculiar taste for anatomy found an able preceptor in Valsalva, who bestowed on him the utmost attention; and such was the progress he made under this excellent master, that at the age of 20 he himself taught anatomy with high reputation. Soon, however, the fame of his prelections, and the number of his pupils, excited the jealousy of the public professors, and gave rise to invidious persecutions. But his abilities and prudence gained him a complete triumph over his enemies; and all opposition to him was finally terminated from his being appointed by the senate of Bologna to fill a medical chair, which soon became vacant. But the duties of this office, although important, neither occupied the whole of his time, nor satisfied his anxious desire to afford instruction. He still continued to labour in secret on his favourite subject, and soon after communicated the fruits of these labours to the public in his Adversaria Anatomica, the first of which was published in the year 1706, the second and third in 1717, and the three others in 1719. The publication of this excellent work spread the fame of Morgagni far bcyond the limits of the state of Bologna. Such was his reputation, that the wisc republic of Venicc had no hesitation in making him an offer of the second chair of the theory of medicine in the university of Padua; then vacant by the death of M. Molinetti; and, to ensure his acceptance, they doubled the emoluments of that appointment. While he was in this department, he published his treatise, entitled Nova Institutionum medicarum idea, which first appeared at Padua in the year 1712. From this work his former reputation suffered no diminution. And soon after he rose, by different steps, to be first professor of anatomy in that celebrated university. Although Morgagni was thus finally settled at Padua, yet he gave evident proofs of his gratitude and attachment to Bologna, which he considered as his native country with respect to the sciences. He exerted his utmost efforts in establishing the academy of Bologna, of which he was one of the first associates ; and he enriched their publications with several valuable and curious papers. Soon after this, the Royal Societies of London and Paris received him among their number. Not long after the publication of his Adversaria Anatomica, he began, much upon the same plan, his Epistolæ Anatomicæ, the first of which is dated at Padua in the beginning of April 1726. The works of Morgagni which have already been mentioned, are to be considered, in a great measure, as strictly anatomical : but he was not more eminent as an anatomist, than as a learned and successful physician. In the year 1760, when he was not far distant from the 80th year of his age, he published his large and valuable work De causis et sedibus morborum per anatomen indagatis. This last and most important of all his productions will afford convincing evidence of his industry and abilities to latest postcrity. Besides these works, he published, at different periods of his life, several miscellaneous pieces, which were afterwards collected into one volume, and printed under his

own eye at Padua, in the year 1765. It does not ap- Morgagni pear that he had in view any future publications; but he intended to have favoured the world with a com- Morison. plete edition of all his works, which would probably have been augmented with many new observations. In. this he was engaged when, on the 5th of December. 1771, after he had nearly arrived at the 90th year of his age, death put a period to his long and glorious career in the learned world.

MORGANA, or MORGAGNA, Fata. See FATA. MORGES, a town of Swisserland in the canton of Berne, a place of some trade, and situated on the lake of Geneva, five miles from Lausanne. E. Long. 6. 42. N. Lat. 46. 29.

MORGO, anciently Amorgos, an island in the Archipelago, which produces wine, oil, and corn. It is well cultivated, and the inhabitants are affable, and generally of the Greek church. The best parts belong, to a monastery. The greatest inconvenience in this island is the want of wood. It is 30 miles in circumference. E. Long. 26. 15. N. Lat. 36. 30.

MORIAH, one of the eminences of Jerusalem; on which Abraham went to offer his son, and David wanted to build the temple, which was afterwards exe-cuted by Solomon : The threshing floor of Araunah; originally narrow, so as scarce to contain the temple, but enlarged by means of ramparts; and surrounded. with a triple wall, so as to add great strength to the. temple, (Josephus). It may be considered as a part. of Mount Sion, to which it was joined by a bridge and gallery, (Id.).

MORILLES, a kind of mushroom, about the size of a walnut, pierced with holes like a honey-comb, and said to be good for creating an appetite. It is often used in sauces and ragouts.

MORINA, a genus of plants belonging to the diandria class; and in the natural method ranking under the 48th order, Aggregata. Sec BOTANY Index.

MORINORUM CASTELLUM, in Ancient Geography, simply Castellum (Antonine); situated on an eminence, with a spring of water on its top, in the territory of the Morini. Now Mont Cassel, in Flanders.

MORINDA, a genus of plants belonging to the. pentandria class, and in the natural method ranking under the 48th order, Aggregate. See BOTANY Indar.

MORISON, ROBERT, physician and professor of. botany at Oxford, was born at Aberdeen in 1620, bred at the university there, and taught philosophy for some time in it; but having a strong inclination to botany, made great progress in that science. The civil wars obliged him to leave his country; which, however, he did not do till he had first signalized his zcal for the interest of the king, and his courage, in a battle fought between the inhabitants of Aberdeen and the Presbyterian troops on the bridge of Aberdeen, in which he received a dangerous wound on the head. As soon as he was cured of it, he went into France; and fixing at Paris, he applied assiduously to botany and anatomy. He was introduced to the duke of Orleans, who gave him the direction of the royal gardens at Blois. He exercised the office till the death of that prince, and afterwards went over to England in 1660. Charles II. to whom the duke of Orleans had presented him at Blois, sent for him to London, and gave him the title

Merison of his physician, and that of professor royal of botany, with a pension of 2001 per annum. The Præludium Morlachia. Botanicum, which he published in 1669, procured him so much reputation, that the university of Oxford invited him to the professorship of botany in 1669; which he accepted, and aequitted himself in it with great ability. He died at London in 1683, aged 63. He published a second and third part of his History of Plants, in 2 vols. folio; with this title, Plantarum Historia Oxoniensis Universalis. The first part of this excellent work has not been printed; and it is not

known what has become of it. MORISONIA, a genus of plants belonging to the monadelphia class, and in the natural method ranking under the 25th order, *Putamineæ*. See BOTANY *Index*.

MORLACHIA, a mountainous country of Dalmatia. The inhabitants are called Morlacks or Morlacchi ; they inhabit the pleasant valleys of Koter, along the rivers Kerha, Cettina, Narenta, and among the inland mountains of Dalmatia. The inhabitants are by some said to be of Walachian extraction, as is indicated hy their name; Morlachia being a contraction of Mauro Walachia, that is, Black Walachia : and the Walachians arc said to be descendants of the ancient Roman colonies planted in these countries. This, however, is denied by the Abbé Fortis, who published a volume of travels into that country. He informs as that the origin of the Morlacchi is involved in the darkness of barbarous ages, together with that of many other nations, resembling them so much in customs and language, that they may be taken for one people, dispersed in the vast tracts from the Adriatic sea to the Frozen ocean.

With regard to the ctymology of the name, the Abbé observes, that the Morlacchi generally call themselves, in their own language, *Vlassi*; a national term, of which no vestige is found in the records of Dalmatia till the 13th century. It signifies *powerful men*, or *men of authority*; and the denomination of *Moro Vlassi*, corruptly *Morlacchi*, as they are now called, may perhaps point out the original of the nation. This word may possibly signify the *conquerors that came from the sea*; *moor*, in all the dialects of the Sclavonian language, signifying the *sea*.

With regard to the character of these people, we are informed that they are much injured by their maritime neighbours. The inhabitants of the sea coast of Dalmatia tell many frightful stories of their avarice and cruelty: but these, in our author's opinion, are all either of an ancient date, or if any have happened in latter times, they ought rather to be ascribed to the corruption of a few individuals, than to the bad disposition of the nation in general; and though thievish tricks are frequent among them, he informs us, that a stranger may travel securely through their country, where he is faithfully escorted, and hospitably treated.

As to the Morlacchi themselves, they are represented as open and sincere to such a degree, that they would be taken for simpletons in any other country; and by means of this quality they have been so often duped by the Italians, that *the faith of an Italian* and *the faith of a deg*, are synonymous among the Morlaechi. They are very hospitable to strangers; and their hos-

pitality is equally conspicuous among the rich and poor. Moriach The rich preparcs a roasted lamb or sheep, and the poor with equal cordiality offers whatever he has; nor is this generosity confined to strangers, but generally extends itself to all who are in want. When a Morlack is on a journey, and comes to lodge at a friend's house, the eldest daughter of the family, or the new married bride, if there happen to be one, receives and kisses him when he alights from his horse or at the door of the house : but a foreigner is rarely favoured with these female civilities; on the contrary the women, if they are young, hide themselves, and keep out of his way.

The Morlacchi in general have little notion of domestic economy, and readily consume in a week as much as would be sufficient for several months, whenever any occasion of merriment presents itself. A marriage, the holiday of the saint protector of the family, the arrival of relations or friends, or any other joyful incident, consumes of course all that there is to eat and to drink in the house. Yet the Morlack is a great economist in the use of his wearing apparel; for rather than spoil his new cap, he takes it off, let it rain ever so hard, and goes bareheaded in the storm. In the same manner he treats his shoes, if the road is dirty and they arc not very old. Nothing but an absolute impossibility hinders a Morlack from being punctual; and if he cannot repay the money he borrowed at the appointed time, he carries a small present to his creditor, and requests a longer term.

Friendship is lasting among the Morlacchi. They have even made it a kind of religious point, and tie the sacred bond at the foot of the altar. The Sclavonian ritual contains a particular benediction for the solemn union of two male or two female friends in the presence of the congregation. The male friends thus united are called Pobratimi, and the female Posestreme, which means half-brothers and half-sisters. From those consecrated friendships among the Morlacchi and other nations of the same origin, it should seem that the sworn brothers arose ; a denomination frequent enough among the common people of Italy and in many parts of Europe. The difference between these and the Pobratimi of Morlachia consists not only in the want of the ritual ceremony, but in the design of the union itself. For, among the Morlaechi, the sole view is reciprocal service and advantage; but such a brotherhood among the Italians is generally commenced by bad men, to enable them the more to hurt and disturb society.

But as the friendships of the Morlacchi are strong and sacred, so their quarrels are commonly unextinguishable. They pass from father to son; and the mothers fail not to put their children in mind of their duty to revenge their father if he has had the misfortune to be killed, and to show them often the bloody shirt and arms of the dead. And so deeply is revenge rooted in the minds of this nation, that all the missionaries in the world would not be able to eradicate it. A Morlack is naturally inclined to do good to his fellow creatures, and is full of gratitude for the smallest benefit, but implacable if injured or insulted.

A Morlack who has killed another of a powerful family, is commonly obliged to save himself by flight, 1

Vorlacchi and to keep out of the way for several years. If during that time he has been fortunate enough to escape the search of his pursuers, and has got a small sum of money, he endeavours to obtain pardon and peace; and, that he may treat about the conditions in person, he asks and obtains a safe conduct, which is faithfully maintained, though only verbally granted. Then he finds mediators : and, on the appointed day, the relations of the two hostile families are assembled, and the criminal is introduced, dragging himself along on his hands and feet, the musket, pistol, or eutlass, with which he committed the murder, hung about his ncck ; and while he continues in that humble posture, one or more of the relations recites a panegyric on the dead, which sometimes rekindles the flames of revenge, and puts the poor prostrate in no small danger.

The Morlacks, whether they happen to be of the Roman or of the Greek church, have very singular ideas about religion : and the ignorance of their teachers daily augments this monstrous evil. They are as firmly persuaded of the reality of witches, fairies, enchantments, nocturnal apparitions, and sortileges, as if they had seen a thousand examples of them. Nor do they make the least doubt about the existence of vampires : and attribute to them, as in Transylvania, the sucking the blood of infants. Therefore, when a man dies suspected of becoming a vampire, or vukodlak, as they call it, they cut his hams, and prick his whole body with pins; pretending, that after this operation he cannot walk about. There arc even instances of Morlacchi, who, imagining that they may possibly thirst for children's blood after death, entreat their heirs, and sometimes oblige them to promise, to treat them as vampires when they die.

A most perfect discord reigns in Morlacchia, as it generally does in other parts, between the Latin and Greek communion, which their respective priests fail not to foment, and tell a thousand little scandalous stories of each other. The churches of the Latins are poor, but not very dirty; those of the Greeks are equally poor, and shamefully ill kept. Our author has seen the curate of a Morlack village sitting on the ground in the churchyard, to hear the confession of women on their knees by his side : a strange posture indeed ! but a proof of the innocent manners of those good people, who have the most profound veneration for their spiritual pastors, and a total dependence upon them; who, on their part, frequently make use of a discipline rather military, and correct the bodies of their offending flock with the cudgel.

Innocence, and the natural liberty of pastoral ages, are still preserved among the Morlacchi, or at least many traces of them remain in the places farthest distant from our settlements. Pure cordiality of sentiment is not there restrained by other regards, and displays itself without any distinction of circumstances. A young handsome Morlack girl, who meets a man of her district on the road, kisses him affectionately, without the least imputation of impropriety; and M. Fortis has seen all the women and girls, all the young men and old, kissing one another as they came into the churchyard on a holiday; so that they looked as if they all belonged to one family. He often observed the same thing on the road, and at the fairs in the ma-Vol. XIV. Part II.

#### M 0 R

ritime towns, where the Morlaechi came to sell their Morlacchi, commodities.

The dress of the unmarried women is the most complex and whimsical, in respect to the ornaments of the head; for when married they are not allowed to wear any thing else but a handkerchief, either white or coloured tied about it. The girls use a scarlet cap, to which they commonly hang a veil falling down on the shoulders, as a mark of their virginity. The better sort adorn their caps with strings of silver coins, among which are frequently seen very ancient and valuable ones; they have moreover ear rings of very eurious work, and small silver chains with the figures of half moons fastened to the ends of them. But the poor are forced to content themselves with plain caps; or if they have any ornaments, they consist only of small exotic shells, round glass beads, or bits of tin. The principal merit of these eaps, which constitute the good taste as well as vanity of the Morlack young ladics, is to attract and fix the eyes of all who are near to them by the multitude of ornaments, and the noise they make on the least motion of their heads.

Both old and young women wear about their necks large strings of round glass beads, of various size and colour; and many rings of brass, tin, or silver, on their fingers. Their bracelets are of leather covered with wronght tin or silver; and they embroider their stomachers, or adorn them with beads or shells. But the use of stays is unknown, nor do they put whalebone or iron in the stomacher. A broad woollen girdle surrounds their petticoat, which is commonly decked with shells, and of blue colour, and therefore called modrina. Their gown as well as petticoat, is of a kind of serge; and both reach near to the ancle: the gown is bordered with scarlet, and called sadak. They use no modrina in summer, and only wear the sadak without sleeves over a linen petticoat or shift .---The girls always wear red stockings ; and their shoes are like those of the men, called opanke. The sole is of undressed ox hide, and the upper part of sheep's skin thongs knotted, which they call apute; and these they fasten above the ancles, something like the ancient cothurnus. The unmarried women, even of the richest families, are not permitted to wear any other sort of shoes; though after marriage, they may, if they will, lay aside the opanke, and use the Turkish slippers. The girls keep their hair tressed under their caps, but when married they let it fall dishevelled on the breast; sometimes they tic it under the chin; and always have medals, beads, or bored coins, in the Tartar or American mode twisted amongst it.

Nothing is more common among the Morlacchi than marriages concluded between the old people of the respective families, cspecially when the parties live at a great distance, and neither see nor know each other; and the ordinary motive of these alliances is the ambition of being related to a numerous and powerful family, famous for having produced valiant men. A denial in such cases is very rare; nor does the father of the maid inquire much into the eircumstances of the family that asks her. Sometimes a daughter of the master is given in marriage to the servant or tenant, as was usual in patriarchal times; so little are the women regarded in this country. But on these occasions, the Morlaechi girls enjoy the privilege of refusal. For he 3 F who

Morlacchi. who acts by proxy, having obtained his suit, is obliged to go and bring the bridegroom : and, if on seeing each other, the young people are reciprocally content, the marriage is concluded, but not otherwise. In some parts it is the custom for the bride to go to see the house and family of the proposed husband, before she gives a definitive answer; and if the place or persons are disagreeable to her, she is at liberty to annul the contract.

The bride is conducted to a ehurch, veiled, and surrounded by the friends of the bridegroom, or svati, as they are called, on horseback; and the sacred ceremony is performed amidst the noise of muskets, pistols, barbaric shouts and acclamations, which continue till she return to her father's house or to that of her husband, if not far off. The first day's entertainment is sometimes made at the bride's house, but generally at the bridegroom's, whither the svati hasten immediately after the nuptial benediction ; and at the same time three or four men run on foot to tell the good news; the first who gets to the house has a kind of a towel embroidered at the ends, as a premium. The domachin, or head of the house, comes out to meet his daughter-in-law; and a child is handed to her, before she alights, to caress it; and if there happen to be none in the house, the child is borrowed from one of the neighbours. When she alights, she kneels down, and kisses the threshold .--Then the mother-in-law, or in her place some other female relation, presents a corn sieve, full of different kinds of grain, nuts, almonds, and other small fruit, which the bride scatters upon the svati, by handfuls, behind her back. The bride does not sit at the great table the first day, but has one apart for herself, the two diveri, and the stacheo. The bridegroom sits at table with the svati; but in all that day, consecrated to the matrimonial union, he must neither unloosen nor cut any thing whatever. The knum carves his meat, and cuts his bread. It is the domachin's business to give the toasts; and the stari-svat is the first who pledges him. Generally the bukkara, a very large wooden cup, goes round, first to the saint protector of the family; next to the prosperity of the holy faith; and sometimes to a name the most sublime and venerable. The most extravagant abundance reigns at these feasts; and each of the svati contributes, by sending a share of provisions. The dinner begins with fruit and cheese; and the soup comes last, just contrary to our custom. All sorts of domestie fowls, kid, lamb, and sometimes venison, are heaped in prodigal quantities upon their tables.

These nuptial feasts, called sdrave by the ancient Huns, arc by the Morlacchi called sdravize, from whence the Italian word stravizzo is undoubtedly derived. They continue three, six, eight, or more days, according to the ability or prodigal disposition of the family where they are held. The new married wife gets no inconsiderable profit in these days of joy : and it usually amounts to much more than all the portion she brings with her, which often consists of nothing but her own clothes and perhaps a cow; nay, it happens sometimes that the parents, instead, of giving money with their daughter, get something from the bridegroom by way of price. The bride carries water every morning, to wash the hands of her guests as long as the feasting lasts ; and each of them throws a small

piece of money into the bason after performing that Morlacci function, which is a very rare one among them, except- Mornay ing on such occasions.

The Morlacehi pass their youth in the woods, attending their flocks and herds ; and in that life of quiet and leisure they often become dexterous in carving with a simple knife : they make wooden cups, and whistles adorned with fanciful bas reliefs, which are not void of merit, and at least show the genius of the people.

MORNAY, PHILIPPE DE, seigneur du Plessis Marly, was born at Buhy or Bishuy in Upper Normandy in France, in 1549, and was educated at Paris. What was then thought a prodigy in a gentleman, he made a rapid progress in the belles lettres, in the learned languages, and in theology. He was at first destined for the ehurch; but the principles of Calvinism, which he had imbibed from his mother, effectually excluded him from the eeclesiastical preferments to which he was entitled by his interest, abilitics, and birth. After the horrible massacre of St Bartholomew, Philippe de Mornay made the tour of Italy, Germany, England, and the Low Countries ; and he was equally improved and delighted by his travels. Mornay afterwards joined the king of Navarre, at that time leader of the Protestant party, and so well known since by the name of Henry IV. This prince sent Mornay, who employed his whole abilities, both as a soldier and a writer, in defence of the Protestant cause, to conduct a negociation with Elizabeth queen of England; and left him wholly to his own discretion in the management of that business. He was successful in almost every negociation, because he conducted it like an able politician, and not with a spirit of intrigue. He tenderly loved Henry IV. and spoke to him on all occasions as to a friend. When he was wounded at Annale, he wrote to him in these words : "Sire, You have long enough acted the part of Alexander, it is now time you should act that of Cæsar. It is our duty to die for your majesty, &c. It is glorious for you, Sire, that I dare venture to tell you it is your duty to live for us." This faithful subject did every thing in his power to raise Henry to the throne. But when he deserted the Protestant faith, he reproached him in the bitterest manner, and retired from court. Henry still loved him; and was extremely affected with an insult which he received in 1597 from one Saint Phal, who beat him with a cudgel, and left him for dead. Mornay demanded justice from the king, who gave him the following answer, a proof as well of his spirit as of his goodness of heart. " Monsieur Duplessis, I am. exceedingly offended at the insult you have received; and I sympathize with you both as your sovereign and your friend. In the former calacity, I shall do justice to you and to myself; and had I sustained only the character of your friend, there are few perhaps who would have drawn their sword or sacrificed their life more cheerfully in your cause. Be satisfied, then, that I will act the part of a king, a master, and a friend," &c. Mornay's knowledge, probity, and valour, made him the soul of the Protestant party, and procured him the contemptuous appellation of the Pope of the Huguenots. He defended their doctrines both by speech and writing. One of his books on the Iniquity of the Mass, having stirred up all the Catholic divines, he refused to

Mornay

Moroc

R M 0

> Moroe Moreeco

to make any reply to their censures and criticisms except in a public conference. This was accordingly appointed to be held A. D. 1600, at Fountainbleau, where the court then was. The two champions were, Du Perron bishop of Evreux, and Mornay. After a great many arguments and replies on both sides, the victory was adjudged to Du Perron. He had boasted that he would point out to the satisfaction of every one five hundred errors in his adversary's book, and he partly kept his word. The Calvinists did not fail to claim the victory on this occasion, and they still continue to do so. This conference, instead of putting an end to the differences, was productive of new quarrels among the controversialists, and of much profane wit among the libertines. A Huguenot minister, who was present at the conference, observed with great concern to a captain of the same party,-"" The bishop of Evrcux has already driven Mornay from several strong holds." " No matter (replied the soldier), provided he does not drive him from Saumur." This was an important place on the river Loire, of which Duplessis was governor. Hither he retired, his attention being constantly occupied in defending the Huguenots, and in making himself formidable to the Catholics. When Louis XIII. was making preparations against the Protestants, Duplessis wrote him a letter, dissuading him from such a measure. After employing the most plausible arguments, he concludes in the following manner : " To make war on the subject, is an indication of weakness in the government. Authority consists in the quiet submission of the people, and is established by the prudence and justice of the governor. Force of arms ought never to be employed except in repelling a foreign enemy. The late king would have sent the new ministers of state to learn the first elements of politics, who like unskilful surgeons would apply violent remedies to every disease, and advise a man to cut off an arm when his finger aches." These remonstrances produced no other effect than the loss of the government of Saumur, of which he was deprived by Louis XIII. in 1621. He died two years after, November 11. 1623, aged 74, in his barony de la Foret-sur-Seure in Poitou. The Protestant cause never had an abler supporter, or one who did it more credit by his virtues and abilities.

#### Censeur des courtisans, mais à la cour aimé; Fier ennemi de Rome, et de Rome estimé.-HENRIADE.

The following is a list of his works: 1. Un Traité de l'Euchariste, 1604, in folio. 2. Un Traité de la verité de la Religion Chretienne, 8vo. 3. A book entitled La Mystere d'Iniquité, 4to. 4. Un discours sur le droit pretendu par ceux de la maison de Guise, 8vo. 5. Curious and interesting Memoirs from the year 1572 to 1629, 4 vols. 4to. valuable. 6. Letters; which are written with great spirit and good sense. David dcs Liques has given us his life in quarto; a book more interesting for the matter than the manner.

MORNE-GAROU, a very remarkable volcanic mountain on the island of St Vincent's in the West Indies. It was visited by Mr James Anderson surgeon in the

year 1764. See ST VINCENTS. MOROC, or MAROC, a beautiful bird of Abyssinia, described by Mr Bruce, who thinks its name is derived from mar, " honey," though he says that he never heard it was further concerned in the honey than destroying bees. It seems to pursue those insects out of ennity or diversion as well as for food, leaving great numbers dead on the ground, besides those which it devours for food.

The moroc resembles the cuckoo in size and shape, but differs in other respects. Its mouth is very wide, the opcning reaching almost to its eyes; the inside of the mouth and throat yellow, the tongue sharp-pointcd, and capable of being drawn almost half its length out of the mouth beyond the point of its beak, and is very flexible. The head and neck are brown, without any mixture of other colours : there are likewise a number of very small and scarcely visible hairs at the root of the beak.

This seems to be the bird mentioned by Sparman under the name of *cuculus indicator*, which (he says) has the singular property of discovering the nests of wild bees, and leading travellers by a certain cry to the place where the treasure is deposited. According to Sparman's account, it makes known these discoveries by the same cry to foxes as well as to the human species; but Jcrome Lobo, who mentions the Abyssinian bird, takes no notice of the foxes, though he mentions its singing melodiously when it arrives at the place where the honey is deposited. Both these accounts are severely criticised by Mr Bruce, who says, that honcy is so abundant on every hillock and every tree, that a bird possessing this faculty could be of no use to man or to any other animal in that country, and that having never heard of such a bird in Abyssinia, he considers the account of it as a fiction.

MORNING, the beginning of the day, or the time of the sun rising. The astronomers reckon morning, mane, from the time of midnight to that of mid-day. Thus an eclipse is said to begin at II o'clock in the morning, &c.

MORNING star, is the planet Vcnus, when a little to the westward of the sun; that is, when she rises a little before. In this situation she is called by the Greeks Phosphorus ; by the Latins Lucifer, &c.

MOROCCO, an empire of Africa, comprehending Situation a considerable part of the ancient Mauritania, is bound- and bouned on the west by the Atlantic ocean; on the east by daries. the river Mulvya, which separates it from Algiers; on the north by the Mediterranean; and on the south by Mount Atlas, or rather by the river Sus, which divides it from the kingdom of Tafilet. Its greatest length is from the north-cast to the south-west, amounting to above 590 miles; its breadth is not above 260 where broadcst, and in the narrowest places it is not above half that breadth.

The ancient history of Morocco has been already History. given under the article MAURITANIA. It continued under the dominion of the Romans upwards of 400 years. On the decline of that empire it fell under the Goths, who held it till about the year 600, when the Goths were driven out by the Vandals, the Vandals by the Greeks, and they in their turn by the Saracens, who conquered not only this empire, but we may say the whole continent of Africa; at least their religion, one way or other, is to be found in all parts of it. The Saracen empire did not continue long united under one head, and many princes set up for themselves in Africa as well as elsewhere, through whose dissensions the Almoravides were at length 3 F 2 raised

Morocco. raised to the sovereignty, as related under the article ALGIERS, N° 2. Yusef, or Joseph, the second monarch of that line, built the city of Morocco, conquered the kingdom of Fez, and the Moorish dominions in Spain; all which were lost by his grandson Abbu Halli, who was defeated and killed by the Spaniards. On this prince's death the crown passed to the Mohedians, or Almohedes, with whom it had not continued above three generations, when Mohammed the son of Al Mansur lost the famous battle of Sierra Morena, in which 200,000 Meors were slain, and in consequence of which Alphonso X. retook a great many of the Moorish conquests immediately after.

Mohammed died soon after this disgrace, and left several sons, between whom a eivil war ensued, during which the vieeroys of Fez, Tunis, and Tremesen, found means to establish themselves as independent princes. At length one of the princes of the royal blood of Tremesen having defeated the Almohedes, made himself master of the kingdoms of Moroeco and Fez, and entailed them on his own family. In a short time, however, this family was expelled by the Merini, the Merini by the Oatazes, and these by the Sharifs of Hascen, who have kept the government ever since.

Nothing can be conceived more unjust and despotic than the government of Morocco, and nothing more degenerate than the character of the people. The emperor is allowed to have not only an uncontrollable power over the lives and fortunes of his subjects, but in a great measure over their consciences, in as much as he is the only person who, as the successor of the prophet, has a right to interpret the Koran; and appoints all the judges under him, of whom those of Morocco and Fez are the ehief, whose business it is to explain and dispense all matters relating to their religion; and who, being his ereatures and dependents, dare not steer otherwise than as he directs. Whenever therefore the laws are enacted by him, and proclaimed by his governors in all the provinces, as is commonly done, that none may plead ignorance, they are everywhere received with an implicit and religious submission. On the other hand, the subjects are bred up with a notion, that those who die in the execution of his command are entitled to an immediate admittanee into paradise, and those who have the honour to die by his hand to a still greater degree of happiness in it. After this we need not wonder at finding so much eruclty, oppression, and tyranny on the one side, and so much submission, passiveness and misery on the other.

4 Account of the black troops.

This latter, however, extends no farther than the Moors: for as to the mountaineers, the subjection and tribute they pay to those tyrants was always involuntary; and as for the negroes, their zeal and attachment is owing nerely to the great sway and power which they have gained in the government, on various aecounts. They were first introduced, or rather their importation increased, by the policy of Muley Ishmael, a late emperor, at a period when there was a great decrease of population in the empire, oecasioned in some degree by the enormous cruelties exercised by its former sovereigns, who have been known not unfrequently, through a slight disgust, to abandon a whole town or province to the sword. In the eharaeter of Muley Ishmael were found the most singular inconsistencies; for it is certain, that although a tyrant, yet in other re-

spects, as if to repair the mischief which he committed, Morocco. he left nothing undone for the encouragement of population .- He introduced large colonies of negroes from Guinea; built towns for them, many of which are still remaining, assigned them portions of land, and encouraged their increase by every possible means. He soon initiated them in the Mahometan faith ; and had his plan been followed, the country by this time would have been populous, and probably flourishing. As the negroes are of a more lively, active and enterprising disposition than the Moors, they might scon have been taught the arts of agriculture ; and their singular ingenuity might have been directed to other useful purposes. It is true, Muley Ishmael, when he adopted this plan, had more objects in view than that of merely peopling his dominions. He saw plainly that his own subjects were of too eapricious a disposition to form soldiers calculated for his tyrannical purposes. They had uniformly manifested an inclination to change their sovereigns, though more from the love of variety than to reform the government, or restrain the abuses of tyranny. Muley Ishmael had discernment enough to see, that by forming an army of slaves, whose sole dependence should rest upon their master, he could easily train them in such a manner as to act in the strictest conformity to his wishes. He soon learnt that the great object with the negroes was plenty of money and liberty of plunder; in these he liberally indulged them, and the plan fully answered his expectations. Though, however, Muley Ishmael had no great merit in introducing subjects for the purposes of tyranny, yet the good effects of this new colonization were very generally experienced. By intermarrying among themselves, and intermixing among the Moors (for the Moors will keep negro women as concubines, though they seldom marry them), a new race of people started up, who became as useful subjects as the native inhabitants, and brought the empire into a much more flourishing state than it had ever been in since their great revolution.

Sidi Mahomet, his grandson and successor, had diffcrent views, and was actuated by different motives. From his inordinate avarice, he ceased to act towards his black troops in the generous manner which had distinguished his predecessor Muley Ishmael; and they soon showed themselves discontented with his conduct. They offered to place his cldest son Muley Ali, on the throne; but this prince, not unmindful of the duty which he owed his father and sovereign, declined their offer. They next applied to Muley Yazid, who at first accepted of the assistance they tendered, but in a short time relinquished the plan. Sidi Mahomet, disgusted with this conduct of the negroes, determined to curb their growing power, by disbanding a considerable part of these troops, and banishing them to distant parts of the empire.

A most flagrant species of despotism, which renders Desputs the emperors more formidable to their subjects, is their of the enmaking themselves their sole heirs, and, in virtue of that, perors. seizing upon all their effects, and making only such provision for their families as they think proper; and often, on some frivolous pretence, leaving them destitute of any, according to the liking or dislike they bear to the deceased; so that, upon the whole, they are the only makers, judges, and interpreters, and in many instances likewise the executioners, of their own laws, which have

Government. mini-

ation of

ice.

proceo no other limits than their own arbitrary will. The titles which the emperors of Morocco assume, are those of Most glorious, mighty, and noble emperor of Afric ; king of Fez and Morocco, Tafilet, Suz, Dorha, and all the Algarbe, and its territories in Afric; grand Sharif (or, as others write it, Xarif, that is, successor, or vicegerent), of the great Prophet Mohammed, &c.

The judges or magistrates who act immediately under the emperor are either spiritual or temporal, or rather ecclesiastical and military. The mufti and the cadis are judges of all religious and civil affairs; and the bashaws, governors, alcaides, and other military officers, of those that concern the state or the army : all of them the most obsequious creatures and slaves of their prince, and no less the rapacious tyrants of his subjects, and from whom neither justice nor favour can be obtained but by mere dint of moncy and extortionate bribery, from the highest to the lowest. Neither can it indeed be otherwise in such an arbitrary government, where the highest posts must not only be bought of the prince at a most extravagant price, and kept only by as exorbitant a tribute, which is yearly paid to him, but where no one is sure to continue longer than he can bribe some of the courtiers to insinuate to the monarch that he pays to the utmost of his power and much beyond what was expected from him. There are instances of the sultan elevating at once a common soldier to the rank of a bashaw, or making him a confidential friend; the following day he would perhaps imprison him, or reduce him again to the station of private soldier. Yet such is the disposition of these people, that they have an unbounded thirst for rank and power with all their uncertainties; and what is more extraordinary, when they have obtained a high station, they seldom fail to afford their sovereign a plea for ill treating them, by abusing in some way or other their trust.

I al reve-From what has been said, it may be reasonably concluded that the revenue arising to the emperor from the last mentioned source, that of bribery, extortion, and confiscation, must be very considerable, though there is no possibility to make any other conjecture of its real amount than that it must be an immense one. Another considerable branch is the piratical trade, which brings the greater income into his treasury, as he is not at any expence either for fitting out of corsair vessels, or maintaining their men; and yet has the tenth of all the cargo and of all the captives; besides which, he appropriates to himself all the rest of them, by paying the captors 50 crowns per head, by which means he engrosses all the slaves to his own service and advantage. This article is indeed a very considerable addition to his revenue, not only as he sells their ransom at a very high rate, but likewise as he has the profit of all their labour, without allowing them any other maintenance than a little bread and oil, or any other assistance when sick, than what medicines a Spanish convent, which he tolerarates there, gives them gratis ; and which, nevertheless is forced to pay him an annual present for that toleration, besides furnishing the court with medicines, and the slaves with lodging and diet when they are not able to work. Another branch of his revenue consists in the tenth part of all cattle, corn, fruits, honcy, wax, hides, rice, and other products of the earth, which is exacted of the Arabs and Brebes, as well as of the natives; and these are levied, or rather farmed, by the bashaws, go-

413 1

vernors, alcaides, &c. with all possible severity. The Morocco. Jews and Christians likewise pay an income or capitation, the former of six crowns per head on all males from 15 years and upwards, besides other arbitrary imposts, fines, &c. That on the Christians, for the liberty of trading in his dominions, rises and falls according to their number, and the commerce they drive ; but which, whatever it may bring yearly into his coffers, is yet detrimental to trade in general, seeing it discourages great numbers from settling there, notwithstanding the artful invitations which the emperors and their ministers make use of to invite them to it; for, besides those arbitrary exactions, there is still another great hardship attending them, viz. that they cannot leave the country without forfeiting all their debts and effects to the crown. The duties on all imports and exports is another branch of his income, the amount of which, it is said, does not exceed 165,000l. per annum.

The climate of the empire of Morocco is in general climate of sufficiently temperate, healthy, and not so hot as its situ-Morocco. ation might lead us to suppose. The chain of mountains which form Atlas, on the eastern side, defends it from the east winds, that would scorch up the earth were they frequent. The summit of these mountains is always covered with snow; and their abundant descending streams spread verdure through the neighbourhood, make the winter more cold, and temper the heats of summer. The sea on the west side, which extends along the coast from north to south, also refreshes the land with regular breezes, that seldom vary according to their seasons. At a distance from the sea, within land, the heat is so great, that the rivulets become dry in summer; but as in hot countries dews are plentiful, the nights arc there always cool. The rains are tolerably regular in winter; and are even abundant, though the atmosphere is not loaded with clouds as in northern latitudes. Those rains which fall by intervals are favourable to the earth, and increase its fecundity. In January the country is covered with verdure, and cnamelled with flowers. Barley is cut in March, but the wheat harvest is in June. All fruits are early in this climate; and in forward years the vintage is over in the beginning of September. Though in general there is more uniformity and less variation in hot than in northcrn climates, the first are nevertheless exposed to the intemperance of weather: too heavy rains often impede the harvest; and drought has still greater inconvenienccs, for it ensures the propagation of locusts.

The soil of Morocco is exceedingly fertile. It is Soil, and most so in the inland provinces. On the western coast it is in general light and stony, and is better adapted to the vine and olive than the culture of wheat. They annually burn, before the September rains, the stubble, which is left rather long; and this and the dung of cattle, every day turned to pasture, form the sole ma-nure the land receives. The soil requires but little labour and the ploughing is so light that the furrows are scarcely six inches deep; for which reason, in some provinces, wooden ploughshares are used for cheapness.

The empire of Morocco might supply itself with all producnecessaries, as well from the abundance and nature of tions. its products, as from the few natural or artificial wants of the Moors occasioned by climate or education. Its wealth consists in the fruitfulness of its soil; its corn, fruits.

MOR

Morocco. fruits, flocks, flax, salt, gums, and wax, would not only supply its nccessities, but yield a superflux, which might become an object of immense trade and barter with other nations. Such numerous exports might return an inexhaustible treasure, were its government fixed and secure, and did subjects enjoy the fruits of their labour and their property in safety. The increase of corn in Morocco is often as sixty to one, and thirty is held to be but an indifferent harvest.

The Moors, naturally indolent, take little care of the culture of their fruits. Oranges, lemons, and thick skinned fruits, the trees of which require little nurture, grow in the open fields; and there arc very large plantations of them found, which they take the trouble to water in order to increase their product. Their vines, which yield excellent grapes, are planted as far as the 33d degree, as in the southern provinces of France, and are equally vigorous. But at Morocco, where they yield a large and delicious grape, they are supported by vine poles five and six feet above ground; and as they are obliged to be watered, the little wine made there is seldom preserved. Figs arc very good in some parts of the empire, but toward the south they are scarcely ripe before they are full of worms; the heats and night dews may, perhaps, contribute to this speedy decay. Melons, for the same reason, are rarely eatable ; they have but a moment of maturity ; which passes so rapidly that it is with difficulty seized. Water melons are everywhere reared, and in some provinces are excellent. Apricots, apples, and pears, are in tolerable plenty in the neighbourhood of Fez and Mequinez, where water is less scarce and the climate more temperate. But in the plain, which extends along the western coast, these delicate fruits are very indifferent, have less juice or taste, and the peaches there do not ripen. The tree called the prickly pear, or the Barhary fig, is plentifully found in the empire of Morocco; and is planted round vineyards and gardens, because its thick and thorny leaves, which are wonderfully prolific, form impenetrable hedges. From these leaves a fruit is produced, covered with a thorny skin, that must be taken off with care. This fruit is mild, and full of very hard, small kernels. The olive is everywhere found along the coast, but particularly to the south.

In the province of Suz, between the 25th and 30th degrees, the inhabitants have an almond harvest, which varies little because of the mildness of the climate; but the fruit is small, for which reason they take little care of the trees, and they degenerate with time. The palmtree is common in the southern provinces of Morocco; but dates ripen there with difficulty, and few are good except in the province of Suz and toward Tafilet. On the coast of Sallee and Mamora there are forests of oak, which produce acorns near two inches long. They taste like chesnuts, and are eaten raw and roasted. Salt abounds in the empire, and in some places on the coast requires only the trouble of gathering. Independent of the salt pits formed by the evaporation of the soft water, there are pits and lakes in the country whence great quantities are obtained. It is carried even as far as Tombut, whence it passes to the interior parts of Africa.

The Moors cultivate their lands only in proportion to their wants; hence two-thirds of the empire at least lie waste. Here the *doum*, that is, the fan or wild palm

tree, grows in abundance: and from which those people, Moroce when necessity renders them industrious, find great advantage. The shepherds, mule drivers, camel-drivers, and travellers, gather the leaves, of which they make mats, fringes, baskets, hats, *shoaris* or large wallets to carry corn, twine, ropes, girths, and covers for their pack saddles. This plant, with which also they heat their ovens, produces a mild and resinous fruit that ripens in September and October. It is in form like the raisin, contains a kernel, and is astringent and very proper to temper and counteract the effects of the watery and laxative fruits, of which these people in summer make an immoderate use.

Unacquainted with the sources of wealth of which Mines. their ancestors were possessed, the Moors pretend there are gold and silver mines in the empire, which the emperors will not permit to be worked, lest their subjects should thus find means to shake off their yoke. It is not improbable but that the mountains of Atlas may contain unexplored riches; but there is no good proof that they have ever yielded gold and silver. There are known iron mines in the south ; hut the working of them has been found so expensive, that the natives would rather use imported iron, notwithstanding the heavy duty it pays, by which its price is doubled. There are copper mines in the neighbourhood of Santa Cruz, which are not only sufficient for the small consumption of the empire, where copper is little used, but are also an object of exportation, and would become much more so were the duties less immoderate.

Neither the elephant nor the rhinoceros is to be found Animals either in this or the other states of Barbary ; but the deserts abound with lions, tigers, leopards, hyænas, and monstrous serpents. The Barbary horses were formerly very valuable, and thought equal to the Arabian. Though the breed is now said to be decayed, yet some very fine ones are occasionally imported into England. Camels and dromedaries, asses, mules, and kumrahs (a most serviceable creature, begot by an ass upon a cow), are their beasts of burden. Their cows are but small, and barren of milk. Their sheep yield but indifferent fleeces, but are very large, as are their goats. Bears, porcupines, foxes, apes, hares, rabbits, ferrets, weasels, moles, chameleons, and all kinds of reptiles, are found here. Partridges and quails, cagles, hawks, and all kinds of wild fowl, arc frequent on the coast.

The principal mountains form the chain which goes Mountain under the name of *Mount Atlas*, and runs the whole &c. length of Barbary from east to west, passing through Morocco, and abutting upon that ocean which separates the eastern from the western continent, and is from this mountain called the *Atlantic Ocean*. See ATLAS. The principal rivers, besides the Malva or Mulvya above mentioned, which rises in the deserts, and running from south to north divides Morocco from the kingdom of Algiers, are the Suz, Ommirabih, Rabbata, Larache, Darodt, Sebon, Gueron, and Tensift, which rise in Mount Atlas, and fall into the Atlantic ocean.

The traffic of the empire by land is either with Ara-Inland bia or Negroland : to Mecca, they send caravans, con-traffic. sisting of several thousand camele, horses, and mules, twice every ycar, partly for traffic, and partly on a religious account; for numbers of pilgrims take that opportunity of paying their devotions to their great prophet. The goods they carry to the east are woollen manufactures,

flic.

16

reign

17 1 d

E es.

manufactures, leather, indigo, cochineal, and ostrich forocco. feathers; and they bring back from thence, silk, muslins, and drugs. By their earavans to Negroland, they send salt, silk, and woollen manufactures, and bring back gold and ivory in return, but chiefly negroes.

The caravans always go strong enough to defend themselves against the wild Arabs in the deserts of Africa and Asia ; though, notwithstanding all their vigilance, some of the stragglers and baggage often fall into their hands: they are also forced to load one-half of their camels with water, to prevent their perishing with drought and thirst in those inhospitable deserts. And there is still a more dangerous enemy, which is the sand itself: when the winds rise, the caravan is perfectly blinded with dust; and there have been instances both in Africa and Asia, where whole caravans, and even armies, have been buried alive in the sands.

The natives have hardly any trading vessels, but are umerce. seldom without some corsairs. These, and European merchant ships, bring them whatever they want from abroad ; as linen and woollen cloth, stuffs, iron wrought and unwrought, arms, gunpowder, lead and the like : for which they take in return, copper, wax, hides, Morocco leather, wool (which is very fine), gums, soap, dates, almonds and other fruits. The duties paid by the English in the ports of Morocco are but half those paid by other Europeans. It is a general observation, that no nation is fond of trading with these states, not only on account of their capricious despotism, but the villany of their individuals, both natives and Jews, many of whom take all opportunities of cheating, and when detected are seldom punished.

The land forces of the emperor of Morocco consist principally of black troops, and some few white ; amounting altogether to an army of about 36,000 men upon the establishment, two-thirds of which are cavalry. This establishment, however, upon occasion, admits of a considerable increase, as every man is supposed to be a soldier, and when called upon is obliged to act in that capacity. About 6000 of the standing forces form the emperor's body guard, and are always kept near his person; the remainder arc quartered in the different towns of the empire, and are under the charge of the bashaws of the provinces. They are all clothed by the emperor, and receive a trifling pay; but their chief dependence is on plunder, which they have frequent opportunities of acquiring.

The black troops are naturally of a very fiery disposition, capable of enduring great fatigue, hunger, thirst, and every difficulty to which a military life is exposed. They appear well calculated for skirmishing parties, or for the purpose of harassing an enemy; but were they obliged to undergo a regular attack, from their total want of discipline they would soon be routed. In all their manœuvres they have no notion whatever of order and regularity, but have altogether more the appearance of a rabble than of an army.

The emperor's navy consists of about 15 small frigates, a few xebecks, and between 20 and 30 row-galleys. The whole is commanded by one admiral ; but. as these vessels are principally used for the purposes of piracy, they seldom unite in a fleet. The number of the seamen in service is computed at 6000.

The coins of this empire are a fluce, a blanquil, and Morocco. ducat. The fluce is a small copper coin, 20 whereof make a blanquil, of the value of twopence sterling. The blanquil is of silver, and the ducat of gold, not Coins. unlike that of Hungary, and worth about nine shillings. Both these pieces are so liable to be elipped and filed by the Jews, that the Moors always carry scales in their pockets to weigh them ; and when they are found to be much diminished in their weight, they are recoined by the Jews, who are masters of the mint, by which they gain a considerable profit; as they do also by exchanging the light pieces for those that are full weight. Merchants accounts are kept in ounces, 10 of which make a ducat; but in payments to the government, it is said they reckon 17 one-half for a ducat.

With respect to religion, the inhabitants of Moroeco Religion are Mohammedans, of the sect of Ali; and have a and mufti or high-priest, who is also the supreme civil magistrate, and the last resort in all causes ecclesiastical and eivil. They have a great veneration for their hermits, and for idiots and madmen ; as well as for those who by their tricks have got the reputation of wizzards : all whom they look upon as inspired persons, and not only honour as saints while they live, but build tombs and chapels over them when dead ; which places are not only religiously visited by their devotces far and near, but are esteemed inviolable sanctuaries for all sorts of criminals except in cases of treason.

Notwithstanding the natives are zealous Mohammedans, they allow foreigners the free and open profession of their religion, and their very slaves have their priests and chapels in the capital city; though it must be owned that the Christian slaves are here treated with the utmost cruelty. Here, as in all other Mo- Laws. hammedan countries, the Alcoran and their comments upon it are their only written laws; and though in some instances their cadis and other civil magistrates are controlled by the arbitrary determinations of their princes, bashaws, generals, and military officers, yet the latter have generally a very great deference and regard for their laws. Murder, theft, and adultery, are commonly punished with death : and their punishments for other crimes, particularly those against the state, are very cruel; as impaling, dragging the prisoner through the streets at a mule's heels till all his flesh is torn off, throwing him from a high tower upon iron hooks.

The inhabitants of the empire of Morocco, known Inhabitants by the name of Moors, are a mixture of Arabian and of the em-African nations formed into tribes; with the origin rocco. of whom we are but imperfectly acquainted. These tribes, each strangers to the other, and ever divided by traditional hatred or prejudice, seldom mingle. It seems probable that most of the casts who occupy the provinees of Morocco have been repulsed from the eastern to the western Africa, during those different revolutions by which this part of the world has been agitated ; that they have followed the standard of their chiefs, whose names they have preserved; and that by these they, as well as the countries they inhabit, are distinguished. At present these tribes are called cafiles or cabiles, from the Arabie word kobeila; and they are so numerous, that it is impossible to have a knowledge of them all.

The

MOR

Morocco. 20 23

The Brebes. or Mountaineers.

The native subjects of the empire of Morocco may be divided into two principal classes; the Brebes and the Moors.

416

The etymology of the name, and the origin of the people, of the first class, are equally unknown. Like the Moors, at the time of the invasion by the Arabs, they may have adopted the Mahometan religion, which is consonant to their manners and principal usages; but they are an ignorant people, and observe none of the precepts of that religion, but the aversion it enjoins against other modes of worship.

Confined to the mountains, the Brebes preserve great animosity against the Moors, whom they confound with the Arabs, and consider as usurpers .- They thus contract in their retreats a ferocity of mind, and a strength of body, which makes them more fit for war and every kind of labour than the Moors of the plain in general are. The independence they boast of gives even a greater degree of expression to their countenance. The prejudices of their religion make them submit to the authority of the emperors of Moroceo; but they throw off the yoke at their pleasure, and retire into the mountains, where it is difficult to attack or overcome them. The Brebes have a language of their own, and never marry but among each other. They have tribes or eafiles among them who are exceedingly powerful both by their number and courage.

The Moors of the plains may be distinguished into those who lead a pastoral life, and those who inhabit the eities.

The former live in tents; and that they may allow of the coun- their ground a year's rest, they annually change the place of their encampments, and go in search of fresh pasturage; but they cannot take this step without acquainting their governor. Like the ancient Arabs, they are entirely devoted to a pastoral life : their encampments, which they call douchars, are composed of several tents, and form a erescent; or they are ranged in two parallel lines, and their flocks, when they return from pasture, occupy the centre.

The tents of the Moors, viewed in front, are of a conical figure; they are from 8 to 10 feet high, and from 20 to 25 feet long; like those of high antiquity, they resemble a boat reversed. They are made of cloth composed of goats and eamel's hair, and the leaves of the wild palm, by which they are rendered impervious to water ; but at a distance their black colour gives them a very disagreeable look.

25 Their simlife.

The Moors, when encamped, live in the greatest ple way of simplicity, and exhibit a faithful picture of the inhabitants of the earth in the first ages of the world. The nature of their education, the temperature of the climate, and the rigour of the government, diminish the wants of the people, who find in their plains, in the milk and wool of their floeks, every thing necessary for food and elothing. Polygamy is allowed among them ; a luxury so far from being injurious to a people who have few wants, that it is a great convenience in the economy of those societies, because the women are intrusted with the whole care of the domestic management. In their half-elosed tents, they are employed in tions of the milking the cows for daily use; and when the milk abounds, in making butter, in picking their corn, their barley, and pulse, and grinding their meal, which they do daily in a mill composed of two stones about 18 T

R MO

inches in diameter, the uppermost having a handle, and Moror turning on an axis fixed in the under one : they make bread likewise every day, which they bake between two earthen plates, and often upon the ground after it has been heated by fire. Their ordinary food is the eooseoosoo; which is a paste made with their meal in the form of small grains like Italian paste. This cooscoosoo is dressed in the vapour of boiling soup, in a hollow dish perforated with many small holes in the bottom, and the dish is enclosed in a kettle where meat is boiled; the cooscoosoo, which is in the hollow dish, grows gradually soft by the vapour of the broth, with which it is from time to time moistened. This simple food is very nourishing, and even agreeable when one has got the better of the prejudices which every nation entertains for its own customs. The common people eat it with milk or butter indifferently; but those of higher rank, such as the governors of provinces and lieutenants, who live in the centre of the encampments, add to it some succulent broth, made with a mixture of mutton, poultry, pigeons, or hedgehogs, and then pour on it a sufficient quantity of fresh butter.

The women in their tents spin wool, and weave it into cloth on looms suspended the whole length of the tent. Each piece is about five ells long, and one and a half broad; it is neither dressed nor dyed, and it has no seam ; they wash it when it is dirty ; and as it is the only habit of the Moors, they wear it night and day. It is called haick, and is the true model of the ancient draperies.

The Moors of the plain wear nothing but their Dress, woollen stuff; they have neither shirts nor drawers. Linen among these people is a luxury known only to those of the court or the city. The whole wardrobe of a country Moor in easy circumstances consists in a haick for winter, another for summer, a red cap, a hood, and a pair of slippers. The common people both in the country and in towns wear a kind of tunie of woollen eloth, white, gray, or striped, which reaches to the middle of the leg, with great sleeves and a hood ; it resembles the habit of the Carthusians.

The women's dress in the country is likewise confined to a haick, which covers the neck and the shoulders, and is fastened with a silver elasp. The ornaments they are fondest of are ear rings, which are either in the form of rings or ereseents, made of silver, bracelets, and rings for the small of the leg; they wear these triukets at their most ordinary occupations ; less out of vanity than because they are unaequainted with the use of easkets or cabinets for keeping them. They also wear necklaces made of coloured glass beads or cloves strung on a cord of silk.

The Moors consider their wives less in the light of companions than in that of slaves destined to labour. Except in the business of tillage, they are employed in every servile operation ; nay, in some of the poorer quarters a woman is often seen yoked in a plough along with a mule, an ass, or some other animal. When the Moors remove their douchars, all the men seat themselves in a circle on the ground; and with their elbows resting on their knees, pass the time in conversation, while the women strike the tents, fold them up into bundles, and place them on the backs of their camels or oxen. The old women are then each loaded with a parcel, and the young carry the children on their shoulders

124 The Moors try.

Jorocco. shoulders suspended in a cloth girt round their bodies. In the more southern parts the women are likewisc employed in the care of the horses : the husband, who in these climates is always a despot, issues his orders, and seems only made to be obeyed. hrriages,

The marriage ceremonies of the Moors that live in tents pretty much resemble those of the same people that live in the cities. In the douchars they are generally most brilliant and gay; the strangers that pass along are invited, and made to contribute to the feast; but this is done more from politeness than from any mercenary motive.

The tribes of the plain generally avoid mixing by marriage with one another : the prejudices that divide these people are commonly perpetuated; or, if they are partially healed, they never fail to revive upon triffing occasions, such as a strayed camel, or the preference of a pasture or a well. Marriages have sometimes taken place among them, that, so far from cementing their differences, have occasioned the most tragical scenes. Husbands have been known to murder their wives, and women their husbands, to revenge national quarrels.

Parents are not encumbered with their children, however numerous they may be, for they are very early employed in domestic affairs; they tend the flocks, they gather wood, and they assist in ploughing and reaping. In the evening, when they return from the field, all the children of the douchar assemble in a common tent, where the iman, who himself can hardly spell, makes them read a few sentences from the Koran written on boards, and instructs them in their religion by the light of a fire, made of straw, of bushes, and cow dung dried in the sun. As the heat is very great in the inland parts of the country, children of both sexes go quite naked till the age of nine or ten.

The douchars dispersed over the plains are always in the neighbourhood of some rivulet or spring, and they are a kind of inns for the reception of travellers. There is generally a tent erected for their use, if they have not brought one along with them, where they are accommodated with ponltry, milk, and eggs, and with whatever is necessary for their horses. Instead of wood for fuel, they have the cow dung, which, when mixed with charcoal, makes a very brisk fire. A guard is always set on the tcuts of travellers, especially if they are Europeans, because the opinion of their wealth might tempt the avidity of the Moors, who are naturally inclined to thieving.

With respect to the roads, a very judicious policy is established, which is adapted to the character of the Moors, and to their manner of life. The douchars are responsible for robberies committed in their neighbourhood and in sight of their tents : they are not only obliged to make restitution, but it gives the sovereign a pretence for exacting a contribution proportioned to the abilities of the douchar. In order to temper the rigour of this law, they are made responsible only for such robheries as are committed during the day; those that happen after sunset are not imputed to them, as they could neither see nor prevent them : on this account, people here travel only from suurising to sunsetting.

To facilitate the exchange of necessaries, there is in the fields every day, except Friday, which is a day of . Vol. XIV. Part II.

MO R

prayer, a public market in the different quarters of Moroeco. each province. The Moors of the neighbourhood assemble to sell and buy cattle, corn, pulse, dried fruits, carpets, haicks, and in short all the productions of the country. This market, which is called Soc, resembles our fairs. The bustle of the people who go and come, gives a better idea of the manner of life of the Moors than can be had in the cities. The alcaides, who command in the neighbourhood, always attend these markets with soldiers to keep the peace; as it frequently happens that the grudges which these tribes harbour against one another break out upon such occasions into open violence.

The Moors who inhabit the cities differ from the Of the others only in having a little more urbanity and a Moors who more easy department. Though they have the same dwell in cimore easy deportment. Though they have the same ties. origin with those of the plains, they affect to decline all intercourse with them. Some writers, without any foundation, have given the name of Arabs to the inhabitants of the towns, and that of Moors to those of the plains. But the greater part of the cities of this empire are more ancient than the invasion of the Arabs, who themselves lived in tents.

The houses in most of the towns in this empire ap-Their pear at a little distance like vaulted tombs in a church-houses and yard; and the entrance into the best of them has but a mean appearance. The rooms are generally on the ground floor, and whitened on the outside. As the roofs are quite flat, they serve as verandas, where the Moorish women commonly sit for the benefit of the air; and in some places it is possible to pass nearly over the whole town without having occasion to descend into the street.

As the best apartments are all backwards, a stable, or perhaps something worse, is the place to which visitors are first introduced. Upon entering the house; the stranger is either detained in this place, or in the street, till all the women are despatched out of the way ; he is then allowed to enter a square court, into which four narrow and long rooms open by means of large folding doors, which, as they have no windows, serve likewise to introduce light into the apartments. The court has generally in its centre a fountain; and if it is the house of a Moor of property, it is floored with blue and white chequered tiling. None of the chambers have fire places; and their victuals are always dressed in the court-yard in an earthen stove heated with charcoal. When the visitor enters the room, where he is received by the master of the house, he finds him sitting cross-legged and barefooted on a mattress, covered with fine white linen, and placed on the floor or else on a common mat. This, with a narrow piece of carpeting, is in general the only furniture he will meet with in Moorish houses, though they are not destitute of other ornaments.

The wardrobe of the inhabitants of cities is but little Dress of the different from that of those who live in tents .- Like the men. latter, they have a haick, and a hood more or less fine, and have also a hood of coarse European cloth of dark blue for the winter. What farther distinguishes them from the country Moors is, that they wear a shirt and linen drawers, and an upper garment of cotton in summer, and of cloth in winter, which they call a caftan. The white or blue hood, the purpose of which seems to be to guard against bad weather, and which is called 3 G bernus,

furniture.

Morocco. bernus, is likewise a ceremonial part of dress; without which, together with sabre and canjer (or dagger) worn in a bandelier, persons of condition never appear before the emperor.

34 Un Dress of the Ladies. of

The Moorish women who live in cities are, as in other nations, more addicted to show and finery in dress than those of the country; but as they generally leave the house only one day in the week, they seldom dress themselves. Not allowed to receive male visitors, they remain in their houses employed in their families, and so totally in deshabile that they often wear only a shift, and another coarser shift over the first, tied round their waist, with their hair plaited, and sometimes with, though often without, a cap. When dressed, they wear an ample and fine linen shift, the bosom embroidered in gold; a rich caftan of cloth, stuff, or velvet, worked in gold; and one or two folds of gauze, streaked with gold and silk, round the head, and tied behind so as that the fringes, intermingled with their tresses, descend as low as the waist ; to which some add a ribband of about two inches broad, worked in gold or pearls, that encircles the forehead in form of a diadem. Their caftan is bound round their waist by a crimson velvet girdle, embroidered in gold, with a buckle of gold or silver, or clsc a girdle of tamboured stuff, manufactured at Fez.

The women have yellow slippers, and a custom of wearing a kind of stocking of fine cloth somewhat large, which is tied below the knee and at the ankle, over which it falls in folds. This stocking is less calculated to show what we call a handsome leg, than to make it appear thick; for to be fat is one of the rules of beauty among the Moorish women. To obtain this quality, they take infinite pains, feed when they become thin on a diet somewhat like forced meat balls, a certain quantity of which is given them daily; and in finc, the same care is taken among the Moors to fatten young women as is in Europe to fatten fowls.

35 Negroes.

30

Renega-

does.

The Negroes, who constitute a large proportion of the emperor's subjects, are better formed than the Moors; and as they are more lively, daring, and active, they are intrusted with an important share in the executive part of government. They constitute in fact the most considerable part of the emperor's army, and are generally appointed to the command of provinces and towns. This circumstance naturally creates a jealousy between them and the Moors, the latter considering the negroes as usurpers of a power which they have no right to assume. Besides those negroes which form the emperor's army, there are a great many others in the country, who either are or have been slaves to private Moors : every Moor of consequence, indeed, has his proportion of them in his service. To the disgrace of Europe, the Moors treat their slaves with humanity, employing them in looking after their gardens, and in the domestic duties of their houses. They allow them to marry among themselves; and after a certain number of years, spontaneously present them with the in-valuable boon of liberty. They soon are initiated in the Mahometan persuasion, though they sometimes intermix with it a few of their original superstitious customs. In every other respect they copy the dress and manners of the Moors.

Among the inhabitants of Morocco there is another class, of whom we must not omit to make men-

tion. These are the Renegadoes, or foreigners, who Morocco have renounced their religion for the faith of Mahomet. Of these there are a great number who have been originally Jews: they are held in little estimation by the Moors; and would be held in ahhorrence by the Jews, if they durst freely express their aversion. The families of these apostates are called Toornadis: not having at any time married with the Moors, they still prescrve their ancient characteristics, and are known almost at sight to be the progeny of those who formerly embraced the Mahometan religion. The Christian renegadoes are but few; and generally are fugitive peculators of Spain, or men fallen from power, who because of their misconduct, or in despair, quit one unfortunate situation for another much more deplorable.

The Jews were formerly vcry numerous in this em-Jews. pire. After being proscribed in Spain and Portugal, multitudes of them passed over to Morocco, and spread themselves through the towns and over the country. By the relations they themselves give, and by the extent of the places assigned them to dwell in, it would appear there were more than 30,000 families, of whom at present there is scarcely a residue of one-twelfth ; the remainder either having changed their religion, sunk under their sufferings, or fled from the vexations they endured, and the arbitrary taxes and tolls imposed upon The Jews possess neither lands nor gardens, nor them. can they enjoy their fruits in tranquillity : they must wear only black ; and are obliged, when they pass near mosques, or through streets in which there are sanctuaries, to walk barefoot. The lowest among the Moors imagines he has a right to ill-treat a Jew; nor dares the latter defend himself, because the Koran and the judge are always in favour of the Mahometan .- Notwithstanding this state of oppression, the Jews have many advantages over the Moors : they better understand the spirit of trade; they act as agents and brokers, and profit by their own cunning and the ignorance of the Moors.

The Moots, who derive their language and religion State of from the Arabs, seem not in any manner to have par-knowled ticipated of their knowledge. United and confoundamong ed as those of Morocco have been with the Moors of Spain, the latter of whom cultivated the arts and gave birth to Averroes, and many other great men, the Moors of this empire have preserved no traccs of the genius of their ancestors. They have no conception of the speculative sciences. Education consists merely in learning to read and write; and as the revenues of the learned are derived from these talents, the priests and talbes among them are the sole depositorics of thus much knowledge : the children of the Moors are taught in their schools to read and repeat some sixty lessons, selected from the Koran, which for the sake of economy are written upon small boards.

The Moors who formerly inhabited Spain gave great application to physic and astronomy; and they have left manuscripts behind them which still remain momments of their genius. The modern Moors are infinitely degenerate; they have not the least inclination to the study of science; they know the properties of some simples; but as they do not proceed upon principle, and are ignorant of the causes and effects of diseases, they generally make a wrong application of their remedies. Their most useful physicians are their talbes, their fakirs, Jorocco. kirs, and their saints, in whom they place a superstitious confidence.

Notwithstanding the Moors have occupied themselves little in the study of astronomy, they have been eager after astrology. This imaginary science, which made so rapid a progress at Rome in spite of the edicts of the emperors, may be conceived to make still greater advances among a people wholly stupid and ignorant, and ever agitated by the dread of present evils, or the hope of a more happy futurity. Magic, the companion of astrology, has here also found its followers, and is particularly studied by the talbes in the southern parts, who successfully use it in imposing upon Moorish credulity with strange dreams and ambiguous forebodings and prophecies.

The Moorish manufactures are-The haick, which anufaces and as was before observed, is a long garment composed of white wool and cotton, or cotton and silk woven together, and is used by the Moors for the purpose of covering their under aress when they go abroad, which they do by totally wrapping themselves in it in a careless but easy manner; silk handkerchiefs of a particular kind, prepared only at Fez; silks checquered with cotton; carpeting, little inferior to that of Turkey; bcautiful matting, made of the palmetto or wild palm trec; paper of a coarse kind; cordovan, commonly called Morocco leather; gunpowder of an inferior nature; and long-barrelled muskets, made of Biscay iron. The Moors are unacquainted with the mode of casting cannon : and therefore those few which are now in the country are obtained from Europeans .--The manufacture of glass is likewise unknown to them; as indeed they make great use of earthcn ware. and have few or no windows to their houses, this commodity may be of less importance to them than many others. They make butter, by putting the milk into a goat skin, with its outward coat turned inwards, and shaking it till the butter collects on the sides, when it is taken out for use. From this operation it proves always full of hairs, and has an insipid flavour. Their cheese consists merely of curds hardened and dried, and has uniformly a disagreeable taste. The bread in some of the principal towns, particularly at Tangier and Sallee, is remarkably good, but in many other places it is coarse, black, and heavy.

des.

Their looms, forges, ploughs, carpenters tools, &c. are much upon the same construction with the unimproved instruments of the same kind which are used at this time in some parts of Europe, only still more clumsily finished. In their work, they attend more to strength than neatness or convenience; and, like all ether ignorant people, they have no idea that what they do is capable of improvement. It is probable, indeed, that the Moors have undergone no very material change since the revolution in their arts and sciences, which took place soon after their expulsion from Spain. Previous to that period, it is well known they were an enlightened people, at a time when the greater part of Europe was involved in ignorance and barbarism; but owing to the weakness and tyranny of their princes, they gradually sunk into the very opposite extreme, and may now be considered as but a few degrees removed from a savage state.

Their mosques or places of public worship are usually large square buildings, composed of the same materials

as the houses. The building consists of broad and Morocco. lofty piazzas, opening into a square court, in a manner in some degree similar to the Royal Exchange of Lon- 40 don. In the centre of the court is a large fountain ; ceremonics. and a small stream surrounds the piazzas, where the Moors perform the ceremony of ablution. The court and piazzas are floored with blue and white chequered tiling; and the latter are covered with matting, upon which the Moors kneel while repeating their prayers. In the most conspicuous part of the mosque fronting the east, stands a kind of pulpit, where the talbe or priest occasionally preaches. The Moors always enter this place of worship barefooted, leaving their slippers at the door. On the top of the mosque, is a square steeple with a flag staff, whither at stated hours the talbe ascends, hoists a white flag, and calls the people to prayers, for they have no bells. From this high situation the voice is heard at a considerable distance; and the talbes have a monotonous mode of enunciation, the voice sinking at the end of every short sentence, which in some measure resembles the sound of a bell. The moment the flag is displayed, every person forsakes his employment, and goes to prayers. If they are near a mosque, they perform their devotions within it, otherwise immediately on the spot where they happen to be, and always with their faces towards the east, in honour of their prophet Mahomet, who it is well known was buried at Medina.

Their Sabbath is on our Friday, and commences from six o'clock the preceding evening. On this day they use a blue flag instead of the white one. As it has been prophesied that they are to be conquered by the Christians on the Sabbath day, the gates of all the towns and of the emperor's palaces are shut when at divine service on that day, in order to avoid being sur-prised during that period. Their talbes are not distinguished by any particular dress.

The Moors have three solemn devotional periods in the course of the year. The first, which is named Aid de Cabier, is held in commemoration of the birth of Mahomet. It continues seven days; during which period, every person who can afford the expence kills a sheep as a sacrifice, and divides it among his friends. The second is the Ramadam. This is held at the season when Mahomet disappeared in his flight from Mccca to Medina. Every man is obliged at that period to fast (that is, to abstain from animal food from sunrise to sunset each day) for 30 days; at the expiration of which time a feast takes place, and continues a week. The third is named Llashore, and is a day set apart by Mahomet for every person to compute the value of his property, in order for the payment of zakat, that is, one-tenth of their income to the poor, and other pious uses. Although this feast only lasts a single day, yet it is celebrated with far greater magnificence than either of the others.

The Moors compute time by lunar months, and count the days of the week by the first, second, third, &c. beginning from our Sunday. They use a common reed for writing, and begin their manuscripts from right to left.

The Moors of the empire of Morocco, as well as Language those to the northern limits of Africa, speak Arabic; of the but this language is corrupted in proportion as we re- Moors. tire farther from Asia, where it first took birth; the 3 G 2 intermixture

Morocco, intermixture which has happened among the African - nations, and the frequent transmigrations of the Moors, during a succession of ages, have occasioned them to lose the purity of the Arabic language; its pronunciation has been vitiated, the use of many words lost, and other foreign words have been introduced without thereby rendering it more copious; the pronunciation of the Africans, however, is softer to the ear and less guttural than that of the Egyptians. The language, when written, is in effect much the same at Morocco as at Cairo, except that there are letters and expressions among the Moors which differ from those of the Oriental Arabs, who, however, understand the Moors in con-

420

42 Their temper and

43 Mode of living, manners, &cc.

versation, notwithstanding their vitiated manner of pronouncing. They mutually read each others writings with some difficulty. The Moors are naturally of a grave and pensive disposition, fervid in professions of friendship, but very disposition. insincere in their attachments. They have no curiosity, no ambition of knowledge; an indolent habit, united to the want of mental cultivation, renders them perhaps even more callous than other unenlightened people to every delicate sensation; and they require more than ordinary excitement to render them sensible of pleasure or of pain. This languor of sentiment is, however, unaccompanied with the smallest spark of courage or fortitude. When in adversity, they manifest the most abject submission to their superiors; and in prosperity their tyranny and pride are insupportable. Personal cleanliness has been considered as one of those circumstances which serve to mark and determine the civilization of a people. It was in vain that Mahomet enjoined the frequency of ablution as a religious duty to the Moors. Their dress, which should be white, is but seldom washed; and their whole appearance evinces that they perform this branch of their religious ceremonies in but a slovenly manner. With

this degree of negligence as to their persons, we may be justly surprised to find united a most scrupulous nicety in their habitations and apartments. They enter their chambers barefooted, and cannot bear the slightest dcgree of contamination near the place where they are seated. This delicacy again is much confined to the insides of their houses. The streets receive the whole of their rubbish and filth; and by these means the ground is so raised in most parts of the city of Morocco, that the new buildings always stand considerably higher

than the old. With respect to the hours for eating, the people of this country are remarkably regular. Very soon after daybreak they take their breakfast, which is generally a composition of flour and water boiled thin, together with an herb which gives it a yellow tinge. The male part of the family eat in one apartment and the female in another. The children are not permitted to eat with their parents, but take their meals afterwards with the servants; indeed in most other respects they are treated exactly as servants or slaves by their parents. The mess is put into an earthen bowl, and brought in upon a round wooden tray. It is placed in the centre of the guests, who sit cross-legged either on a mat or on the floor, and who form a circle for the Having previously washed themselves, a purpose. ceremony always performed before and after mcals, each person with his spoon attacks vigorously the

#### MOR

bowl, while they diversify the entertainment by eating Morour with it fruit or bread. At twelve o'clock they dine, performing the same ceremonies as at breakfast. For dinner, from the emperor down to the peasant, their dish is universally cooscoosoo, the mode of preparing which has been already described. The dish is brought in upon a round tray and placed on the floor, round which the family sit as at breakfast, and with their fingers commit a violent assault on its contents : they are at the same time, however, attended by a slave or domestic, who presents them with water and a towel occasionally to wash their hands. From the want of the simple and convenient invention of knives and forks, it is not uncommon in this country to see three or four people pulling to pieces the same piece of meat, and afterwards with their fingers stirring up the paste or cooscoosoo, of which they often take a whole handful at once into their mouth. At sunset they sup upon the same dish; and indeed supper is their principal meal.

But the common people must content themselves with a little bread and fruit instead of animal food, and sleep in the open streets. This kind of existence seems ill calculated to endure even in an inactive state; far more severe must it therefore be to those who exercise the laborious employment of couriers in this country, who travel on foot a journey of three hundred or four hundred miles, at the rate of between thirty or forty miles a-day, without taking any other nourishment than a little bread, a few figs, and some water, and who have no better shelter at night than a tree. It is wonderful with what alacrity and perseverance these people perform the most fatiguing journeys at all seasons of the year. There is a regular company of them in every town, who are ready to be dispatched at a moment's warning to any part of the country their employers may have occasion to send them.

As the Moors are not fond of admitting men into their houses, except upon particular occasions, if the weather be fine they place a mat, and sometimes a carpet, on the ground before the door, seat themselves upon it cross-legged, and receive their friends, who form a circle, sitting in the same manner, with their attendants on the ontside of the groupe. Upon these occasions they either drink tea or smoke and converse. The streets are sometimes crowded with parties of this kind; some engaged in playing at an inferior kind of chess or draughts, at which they are very expert ; but the majority in conversation. The people of this country, indeed, are so decidedly averse to standing up, or walking about, that if only two or three people meet, they squat themselves down in the first clean place they can find, if the conversation is to hold but a for a few minutes.

The Moors have in general but few anusements ; Their athe sedentary life they lead in cities is little variegated musemen except by the care they take of their gardens, which are rather kept for profit than pleasure. Most of these gardens are planted with the orange, the lemon tree, and the cedar, in rows, and in such great quantities, that the appearance is rather that of a forest than that of a garden. The Moors sometimes, though rarely, have music in these retreats : a state of slavery but ill agrees with the love of pleasure; the people of Fez alone, either from a difference in education, or because their organs and sensibility are more delicate, make

arecco.

I e of

make music a part of their amusements. There are not in Morocco, as in Turkey, public coffee-houses, where people meet to inquire the news of the day; but instead of these, the Moors go to the barbers shops, which in all countries seem to be the rendezvous of newsmongers. These shops are surrounded by benches; on which the customer, the inquisitive, and the idle, seat themselves, and when there are no more places vacant, they crouch on the ground like monkeys.

A common diversion in the towns where there are soldiers, as well as in the country, is what the Moors call the game of gunpowder; a kind of military exercise, that is the more pleasing to these people, inasmuch as, by the nature of their government, they all are, or are liable to become, soldiers, therefore all have arms and horses. By explosions of powder, too, they manifest their festivity on their holidays. Their game of gunpowder consists in two bodies of horse, each at a distance from the other, galloping in successive parties of four and four, and firing their pieces charged with powder. Their chief art is in galloping up to the opposite detachment, suddenly stopping, firing their muskets, facing about, charging, and returning to the attack ; all which manœuvres are imitated by their opponents. The Moors take great pleasure in this amusement, which is only an imitation of their military evolutions.

The common topics for conversation among the Moors, are the occurrences of the place, religion, their women, but above all their horses. This last topic, indeed, appears to occupy by far the greatest portion of their attention. These animals are seldom kept in stables in Morocco. They are watered and fed only once a-day, the former at one o'clock at noon, and the latter at sunset : and the only one mode which they use to clean them is by washing them all over in a river two or three times a-week, and suffering them to dry themselves.

Like all barbarous nations, the Moors are passionately fond of music, and some few have a taste for poetry. Their slow airs, for want of that variety which is introduced when the science has attained a degree of perfection, have a very melancholy sameness; but some of their quick tunes are beautiful and simple, and partake in some degree of the characteristic melody of the Scotch airs. The poetry of their songs, the constant subject of which is love, though there are few nations perhaps who are less sensible of that passion, has certainly less merit than the music.

Their instruments are a kind of hautboy, which differs from ours only in having no keys; the mandoline, which they have learnt to play upon from their neighbours the Spaniards; another instrument, bearing some resemblance to a violin, and played upon in a similar manner, but with only two strings; the large drum, the common pipe, and the tahor. These united, and accompanied with a certain number of voices, upon many occasions form a band, though solo music is more common in this unsocial country.

The Moors marry very young, many of their females not being more than 12 years of age at their muptials. As Mahometans, it is well known that their religion admits of polygamy to the extent of four wives, and as many concubines as they please; but if we except the very opulent, the people seldom avail themselves of this indulgence, since it entails on them Morocco a vast additional expense in house-keeping, and in providing for a large family. In contracting marriage, the parents of both parties are the only agents; and the intended bride and bridegroom never see eath other 47 till the ceremony is performed. The marriage settle-Marriage ments are made before the cadi; and then the friends ceremoof the bride produce her portion, or if not, the hushand agrees to settle a certain sum upon her in case he should die, or divorce her on account of barrenness, or any other cause. The children of the wives have all an equal claim to the effects of the father and mother, but those of the concubines can each only claim half a share.

When the marriage is finally agreed upon, the bride is kept at home eight days, to receive her female friends, who pay congratulatory visits every day. At the same time a talbe attends upon her, to converse with her relative to the solemn engagement on which she is about to enter : on these occasions he commonly accompanies his admonitions with singing a pious hymn, which is adapted to the solemnity. The bridegroom, on the other hand, receives visits from his male friends in the morning, and in the evening rides through the town accompanied by them, some playing on hautboys and drums, while others are employed in firing volleys of musketry. In all their festivals the discharge of musketry indeed forms a principal part of the entertainment. Contrary to the European mode, which particularly aims at firing with exactness, the Moors discharge their pieces as irregularly as possible, so as to have a continual succession of reports for a few minutes.

On the day of the marriage, the bride in the evening is put into a square or octagonal cage about twelve feet in circumference, which is covered with fine white linen, and sometimes with gauses and silks of various colours. In this vehicle, which is placed on a mule, she is paraded round the streets, accompanied by her relations and friends, some carrying lighted torches, others playing on the hautboys, and a third party again firing volleys of musketry. In this manner she is carried to the house of her intended husband, who returns about the same time from performing similar ceremonies. On her arrival, she is placed in an apartment by herself, and her husband is introduced to her alone for the first time, who finds her sitting on a silk. or velvet cushion (supposing her to be a person of consequence), with a small table before her, upon which are two wax candles lighted. Her shift, or more properly shirt, hangs down like a train behind her, and over it is a silk or velvet robe with close sleeves, which at the breast and wrists is embroidcred with gold ; this dress reaches something lower than the calf of the leg. Round her head is tied a black silk searf, which hangs behind as low as the ground. Thus attired, the bride sits with her hands over her eyes, when her husband appears, and receives her as his wife without any further ceremony : for the agreement made by the friends before the cadi is the only specific contract which is thought necessary.

If the hushand should have any reason to suspect that his wife has not been strictly virtuous, he is at liberty to divorce her and take another. For some time after marriage, the family and the friends are engaged in much

Morocco. much feasting, and a variety of amusements, which last - a longer or shorter time according to the circumstances of the parties. It is usually customary for the man to remain at home eight days and the woman eight mouths after they are first married ; and the woman is at liberty to divorce herself from her husband, if she can prove that he does not provide her with a proper subsistence.

Women suffer but little inconvenience in this country from child-bearing; they are frequently up the next day, and go through all the duties of the house with the infant upon their backs. In celebrating the rite of circumcision, the child is dressed very sumptuously, and carried on a mule, or, if the parents are in poor circumstances, on an ass, accompanied with flags flying and musicians playing on hautboys and beating drums. In this manner they proceed to the mosque, 49 drums. In this manner they prove the Children, as soon Education where the coremony is performed. Children, as soon ef children. as they can be made in the least degree useful, are put to the various kinds of labour adapted to their age and strength. Others, whose parents are in better circumstances, are sometimes sent to school; and those who are intended for the church, usually continue their studies till they have nearly learnt the Koran by rote. In that case they are enrolled among the talbes, or learned men of the law; and upon leaving school are paraded round the streets on a horse, accompanied by music and a large concourse of people.

When any person dies, a certain number of women are hired for the purpose of lamentation; in the performance of which, nothing can be more grating to the ear, or more unpleasant, than their frightful moans, or rather howlings : at the same time, these mercenary mourners beat their heads and breasts, and tear their cheeks with their nails. The bodies are usually buried a few hours after death. Previous to interment, the corpsc is washed very clean, and sewed up in a shroud, with the right hand under the head, which is pointed towards Mecca : it is carried on a bier supported upon men's shoulders, to the hurying place, which is always, with great propriety, on the outside of the town, for they never bury their dead in the mosques, or within the bounds of an inhabited place.

MOROCCO, a city of the kingdom of Morocco in Barbary, lying about 120 miles to the north of Tarudant, 90 to the east of Mogodore, and 350 to the south of Tangier. It is situated in a beautiful valley, formed by a chain of mountains on the northern side, and those of Atlas, from which it is distant about 20 miles, on the south and east. The country which immediately surrounds it is a fertile plain, beautifully diversified with clumps of palm trees and shrubs, and watered by small and numerous streams which descend from Mount Atlas. The emperor's out gardens, which are situated at the distance of about five miles to the south of the city, and are large plantations of olives walled in, add considerably to the beauty of the scenc.

Morocco, though one of the capitals of the empire (for there are three, Morocco, Mequinez, and Fez), has nothing to recommend it but its great extent and the royal palace. It is enclosed by remarkably strong walls built of tabby, the circumference of which is about eight miles. On these walls there are no guns mounted; but they are flanked with square towers, and surrounded by a wide and deep ditch. The city

has a number of entrances, consisting of large double Moroce porches of tabby in the Gothic style, the gates of which are regularly shut every night at certain hours. As polygamy is allowed by the Mahometan religion. and is supposed in some degree to affect population, it would be difficult to form any computation near the truth with respect to the number of inhabitants which this city may contain. The mosques, which are the only public buildings except the palace worth noticing at Morocco, arc more numerous than magnificent; one of them is ornamented with a very high and square tower, built of cut stone, which is visible at a considerable distance from the city. The streets are very parrow, dirty, and irregular, and many of the houses are uninhabited and falling to ruin. Those which are decent and respectable in their appearance are built of tabby, and enclosed in gardens. That of the effendi or prime minister (according to Mr Lempriere, from whose Tour\* this account is transcribed), was among \* Public the best in Morocco. This house, which consisted of in 1792 two stories, had elegant apartments both above and below, furnished in a style far superior to any thing our author ever saw in that country. The court, into which the lower apartments opened, was very neatly paved with glazed blue and white tiling, and had in its centre a beautiful fountain. The upper apartments were connected together by a broad gallery, the ballusters of which were painted of different colours. The hot and cold baths were very large, and had every convenience which art could afford. Into the garden, which was laid out in a tolcrably neat style, opened a room adjoining to the house, which had a broad arched entrance but no door, beautifully ornamented with chequered tiling; and at both ends of the apartment the walls were entirely covered with looking glass. The flooring of all the rooms was covered with beautiful carpeting, the walls ornamented with large and valuable looking glasses, intermixed with watches and clocks in glass cases. The ceiling was carved woodwork, painted of different colours ; and the whole was in a superior style of Moorish grandeur. This and a few others are the only decent habitations in Morocco. The generality of them scrve only to impress the traveller with the idea of a miserable and deserted city.

The Elcaisseria is a particular part of the town where stuffs and other valuable articles are exposed to sale. It consists of a number of small shops, formed in the walls of the houses, about a yard from the ground, of such a height within as just to admit a man to sit in one of them cross-legged. The goods and drawers are so arranged round him, that when he serves his-customers, who are standing all the time out in the street, he can reach down any article he wants without being under the necessity of moving. These shops, which are found in all the other towns of the empire, are sufficient to afford a striking example of the indolence of the Moors. There are three daily markets in different parts of the town of Morocco where provisions are sold, and two weekly fairs or markets for the disposal of cattle. The city is supplied with water by means of wooden pipes connected with the neighbouring streams, which empty themselves into reservoirs placed for the purpose in the suburbs, and some few in the centre of the town.

The castle is a large and ruinous building, the outer walls

48 Circumcision.

50 Funeral rites.

procee.

walls of which enclose a space of ground about three miles in circumference. It has a mosque, on the top of which are three large balls, formed, as the Moors allege, of solid gold. The castle is almost a town of itself; it contains a number of inhabitants, who in some department or other are in the service of the emperor, and all under the direction of a particular alcaide, who is quite independent of the governor of the town. On the outside of the castle, between the Moorish town and the Jewdry, arc several small distinct pavilions, enclosed in gardens of orange trees, which are intended as occasional places of residence for such of the cmperor's sons or brothers as happen to be at Morocco. As they are covered with coloured tiling, they have at a small distance rather a neat appearance; but upon approaching or entering them, that effect in a great measure ceases.

The Jews, who are at this place pretty numerous, have a separate town to themselves, walled in, and under the charge of an alcaide, appointed by the emperor. It has two large gates, which are regularly shut every evening about nine o'clock; after which time no person whatever is permitted to enter or go out of the Jewdry till they are opened again the following morning. The Jews have a market of their own; and when they enter the Moorish town, castle, or palace, they are always compelled to be barcfooted.

The palace is an ancient building, surrounded by a square wall, the height of which nearly excludes from the view of the spectator the other buildings. principal gates are constructed with Gothic arches, composed of cut stone, which conduct to several open and spacious courts; through these it is necessary to pass before we reach any of the buildings. These open courts were used by the late emperor for the purposes of transacting public business and exercising his troops. The habitable part consists of several irregular square pavilions, built of tabby, and whitened over; some of which communicate with each other, others are distinct, and most of them receive their names from the different towns of the empire. The principal pavilion is named by the Moors the Douhar, and is more properly the palace or scraglio than any of the others. It consists of the emperor's place of residence and the harem, forming altogether a building of considerable extent. The other pavilions are merely for the purposes of pleasure or business, and are quite distinct from the douhar. The Mogodore pavilion, so named from the late emperor's partiality to that town, has by far the fairest claim to grandeur and magnificence. This apartment was the work of Sidi Mahomet, and is lofty and square. It is built of cut stone, handsomely ornamented with windows, and covered with varnished tiles of various colours; and its clegance and neatness, contrasted altogether with the simplicity and irregularity of the other buildings, produce a most striking effect. In the inside, besides several other apartments, we find in the pavilion a spacious room floored with blue and white chequered tiling, its ceiling covered with curiously carved and painted wood, and its stuccoed walls variously ornamented with looking glasses and watches, rc-gularly disposed in glass cases. To this pavilion the late emperor manifested an exclusive preference, frequently retiring to it both for the purpose of business

and of recreation. The apartments of the emperor Morocco have in general a much smaller complement of furniture than those of the Moors in the inferior walks of life. Morpheus. Handsome carpeting, a mattress on the ground covered with fine linen, a couch, and a couple of European bcdsteads, are the principal articles they contain. The gardens within the walls of the palace, of which he has several, are very neat; they contain orange and olive trees, variously disposed and arranged, and intersected with streams of water, fountains, and reservoirs. Those on the outside are nothing more than large tracts of ground, irregularly planted with olives; having four square walks, and surrounded by walls.

MOROCCO, or Marroquin, the skin of a goat, or some other animal resembling it, dressed in sumach or galls, and coloured at pleasure; much used in bookbinding, &c. The name is commonly derived from the kingdom of Morocco, whence it is supposed the manner of preparing these skins was first borrowed. We have Morocco skins brought from the Levant, Barbary, Spain, Flanders, and France; red. black, yellow, blue, &c. For the manner of preparing them see LEATHER.

MORON, a town of Spain, in Andalusia, seated in a fertile plain about 30 miles south-east of Seville. W. Long. 5. 20. N. Lat. 37. 0.

MORPETH, a handsome town of Northumberland, 14 miles from Newcastle, 286 miles from London, is an ancient borough by prescription, with a bridge over the Wansbeck. It had once an abbey and a castle, now in ruins, situated about a quarter of a mile south of the town and river Wansbeck, on an . eminence which overlooks both. The market-place is conveniently situated near the centre of the town; and a an elegant townhouse was built by the Carlisle family in 1714, in which the quarter-sessions is held for the county. It is built of hewn stone, with a piazza. The church being a quarter of a mile distant from the town. a tower containing a good ring of bells stands near the market place. Near the bridge is the county gaol, a modern structure. Here are a free grammar school, a chapel near the river, on the site of a chantry that was granted for the support of the foundation of the school, which was part of the old structure, and an hospital for infirm people. In 1215, the townsmen themselves burnt their town, out of pure hatred to King John, that he might find no shelter there. Here is a good market on Saturday for corn, cattle, and all necessary provisions; and there is another on Wednesday, the greatest in England except Smithfield, for live cattle. This is a post town and a thoroughfare, with many good inns, and plenty of fish; and here arc several mills .---The earl of Carlisle's steward holds a court here twice a-year, one of them the Monday after Michaelmas, when four persons are chosen by the free burgesses, who are about 107, and presented to the steward, who names two of them to the bailiffs, who, with seven aldermen, are its governors for the year ensuing. In 1811 the inhabitants amounted to nearly 3244. It has several fairs, and sends two members to parliament. W. Long. 1. 24. N. Lat. 55. 12. MORPHEUS, in fabulous history, the god of

sleep, or, according to others, one of the ministers of Somnus. He caused sleepiness, and represented the forms

deities; and he is usually described in a recumbent po-Mortality. sture, and crowned with poppies. MORRERI, LEWIS, author of the Historical Dictionary, was born at Barge-mont in Provence, in 1643.

He learned rhetoric and philosophy at Aix, and divinity at Lyons. At 18 years of age he wrote a small piece, entitled Le Pays d'Amour, and a collection of the finest French poems entitled Doux plaisirs de la Poesie. He learned Spanish and Italian ; and translated out of Spanish into French the book entitled La Perfection Chretienne de Rodriguez. He then refined the Saints Lives to the purity of the French tongue. Being ordained priest, he preached at Lyons, and undertook, when he was but 30 years of age, a new Historical Dictionary, printed at Lyons in one vol. folio, 1673. But his continual labour impaired his health; so that he died in 1680, aged 37. His second volume was published after his death ; and four more volumes have since been added. He left some other works behind him.

MORRHINA or MURRHINA VASA, were a sort of cups or vases made use of by the ancients for drinking out of, and other purposes. Authors are not agreed as to the substance of which they were made. Some say it was a stone; some assert that it was a fluid condensed by being buried under ground. All that we know concerning it is, that it was known by the name of murrha, and that Heliogabalus's chamber pot was made of The word is sometimes written myrrhina.

it. The word is somethies white some Dances. MORRISE-DANCES. See Moresque-Dances.

MORS, DEATH, one of the infernal deities, born of Night without a father. She was worshipped by the ancients with great solemnity. She was not represented as an actually existing power, but as an imaginary being. Euripides introduces her in one of his tragedies on the stage. The moderns represent her as a skeleton armed with a scythe and a scimeter.

MORSE. Sce TRICHECUS, MAMMALIA Index.

MORTALITY, a term frequently used to signify a contagious disease, which destroys great numbers of either men or beasts.

Bills of MORTALITY, are accounts or registers specifying the numbers born, married, and buried in any parish, town, or district. In general they contain only these numbers; and, even when thus limited, are of great use, by showing the degrees of healthiness and prolifickness, and the progress of population in the places where they are kept. It is therefore much to be wished, that such accounts had been always correctly kept in every kingdom, and regularly published at the end of every year. We should then have had under our inspection the comparative strength of every kingdom, as far as it depends on the number of inhabitants, and its increase or decrease at different periods. But such accounts are rendered more useful, when they include the ages of the dead, and the distempers of which they have died. In this case they convey some of the most important instructions, by furnishing us with the means of ascertaining the law which governs the waste of human life, the values of annuities dependent on the continuance of any lives, or any survivorships between them, and the favourableness and unfavourableness of different situations to the duration of buman life. There are but few registers of this kind;

nor has this subject, though so interesting to mankind, Mortain ever engaged much attention till lately. The first bills containing the ages of the dead were those for the town of Breslaw in Silesia. It is well known what use has been made of these by Dr Halley, and after him by De Moivre. A table of the probabilities of the duration of human life at every age, deduced from them by Dr Halley, has been published in the Philosophical Transactions, (see the Abridgement, vol. iii. p. 699.) and is the first table of that sort that has been ever published. Since the publication of this table similar bills have been established in a few towns of this kingdom; and particularly in London, in the year 1728, and at Northampton in 1735.

Two improvements of these registers have been proposed : the first is, That the sexes of all that die in every period of life should be specified in them, under the denomination of boys, married men, widowers, and bachelors; and of girls, married women, widows, and virgins. The second is, That they should specify the number of both sexes dying of every distemper in every month, and at every age. See the end of the 4th essay in Dr Price's Treatise on Reversionary Payments. Registers of mortality thus improved, when compared with records of the seasons, and with the circumstances that discriminate different situations, might contribute greatly to the increase of medical knowledge; and they would afford the necessary data for determining the difference between the duration of human life among males and females; for such a difference there certainly is much in favour of females, as will appear from the following facts.

At Northampton, though more males are born than females: and nearly the same number die; yet the number of living females appeared, by an account taken in 1746, to be greater than the number of males, in the proportion of 2301 to 1770, or 39 to 30.

At Berlin it appeared, from an accurate account which was taken of the inhabitants in 1747, that the number of female citizens exceeded the number of male citizens in the proportion of 459 to 391. And yet out of this smaller number of males, more had died for 20 years preceding 1751, in the proportion of 19 to 17.

At Edinburgh, in 1743, the number of females was to the number of males as 4 to 3. (See Maitland's History of Edinburgh, p. 220). But the females that died annually from 1749 to 1758, were to the males in no higher proportion than 3<sup>1</sup>/<sub>3</sub> to 3.

He that will take the pains to examine the accounts in Phil. Trans. Abr. vol. vii. part iv. p. 46, &c. will find, that though in the towns there enumerated, the proportion of males and females born is no higher than 19 to 18, yet the proportion of boys and girls that die is 8 to 7; and that, in particular, the still-born and chrysom males are to the still-born and chrysom females as 3 to 2.

In 39 parishes of the district of Vaud in Switzerland, the number of males that died during ten years before 1766 was 8170; of females 8167; of whom the numbers that died under one year of age were 1817 males and 1305 females; and under ten years of age, 3099 males and 2598 females. In the beginning of life, therefore, and before any emigrations can take place, the rate of mortality among males appears to

I
tality, he greater than among females. And this is rendered yet more certain by the following accounts. At Vevey, in the district of Vaud just mentioned, there died in the course of 20 years, ending at 1764, in the first month after birth, of males 135 to 89 females; and in the first year 225 to 162. To the same effect it appears from a table given by Susmilch, in his Gottliche Ordnung, vol. ii. p. 317, that in Berlin 203 males die in the first month, and but 168 females; and in the first year, 489 to 395; and also, from a table of Struyek's, that in Holland 396 males die in the first year to 306 females.

The authorities for the facts here mentioned, and much more on this subject, may be found in the 4th essay in Dr Price's Treatise on Reversionary Payments, and in the supplement at the end of that treatise.

We shall here only add the following table, taken from a memoir of Mr Wargentin's, published in the collection of the Memoirs of the Royal Academy of Sciences at Stoekholm, printed at Paris in 1772.

In all Sweden for nine years, ending in 1763, the proportion of females to males that died out of a given number living, was

| Under the age of | one year,   | tcoc                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | to tooo      |

Registers of mortality on the improved plan before mentioned, were established in 1772 at Chester, and also in 1773 at Warrington in Laneashire ; and they are so comprehensive and correct, that there is reason to expect they will afford much instruction on the subject of human mortality, and the values of lives.

But the country most distinguished in this respect is Sweden: for in that kingdom exact accounts are taken of the births, marriages, and burials, and of the numbers of both sexes that die at all ages in every town and district, and also at the end of every period of five years, of the numbers living at every age: and at Stockholm a society is established, whose business it is to superintend and regulate the enumerations, and to collect from the different parts of the kingdom the registers, in order to digest them into tables of observation. These regulations were begun in Sweden in 1755; and tables, containing the result of them from 1755 to 1763, have been published in Mr Wargentin's memoir just referred to; and the most

Vol. XIV. Part II.

material parts of them may be found in an essay by Mortality. Dr Price on the Difference between the Duration of -Human Life in Towns and in Country Parishes, printed in the 65th volume of the Philosoph. Trans. Part II.

In the fourth essay in Dr Price's Treatise on Reversionary Payments and Life Annuities, the following account is given of the principles on which tables of observation are formed from registers of mortality; and of the proper method of forming them, so as to render them just representations of the number of inhabitants, and the probabilities of the duration of human life in a town or country.

In every place which just supports itself in the number of its inhabitants, without any recruits from other places; or where, for a course of years, there has been no increase or decrease; the number of persons dying every year at any particular age, and above it, must be equal to the number of the living at that age. The number, for example, dying every year at all ages from the beginning to the utmost extremity of life, must, in such a situation, be just equal to the whole number born every year. And for the same reason, the number dying every year at one year of age and upwards, at two years of age and upwards, at three and upwards, and so on, must be equal to the numbers that attain to those ages every year; or, which is the same, to the numbers of the living at those ages. It is obvious, that unless this happens, the number of inhabitants cannot remain the same. If the former number is greater than the latter, the inhabitants must decrease; if less, they must increase. From this observation it follows, that in a town or country where there is no increase or decrease, bills of mortality which give the ages at which all die, will show the exact number of inhabitants, and also the exact law according to which human life wastes in that town or country.

In order to find the number of inhabitants, the mean numbers dying annually at every particular age and upwards must be taken as given by the bills, and placed under one another in the order of the second column of the following tables. These numbers will, it has appeared, be the numbers of the living at 1, 2, 3, &c. years of age; and consequently the sum diminished by half the number born annually will be the whole number of inhabitants.

This subtraction is necessary, for the following reason. In a table formed in the manner here directed, it is supposed that the numbers in the second column are all living together at the beginning of every year. Thus the number in the second column opposite to o in the first column, the table supposes to he all just horn together on the first day of the year. The number, likewise, opposite to I, it supposes to attain to one year of age just at the same time that the former number is born. And the like is true of every number in the second column. During the course of the year, as many will die at all ages as were born at the beginning of the year, and consequently, there will be an excess of the number alive at the beginning of the year above the number alive at the end of the year, equal to the whole number of the annual births ; and the true number constantly alive together, is the arithmetical mean between these two numbers; or agreeably

3 H

Mortality. greeably to the rule here given, the sum of the numbers in the second column of the table lessened by half the number of annual births.

In such a series of numbers, the excess of each number above that which immediately follows it will be the number dying every year out of the particular number alive at the beginning of the year; and these excesses set down regularly as in the third column of the table to which we have referred, will show the different rates at which human life wastes through all its different periods, and the different probabilitics of life at all particular ages.

It must be remembered, that what has been now said goes on the supposition, that the place whose bills of mortality are given, supports itself, by procreation only, in the number of its inhabitants. In towns this very seldom happens, on account of the luxury and debauchery which generally prevail in them. They are, therefore, commonly kept up by a constant accession of strangers, who remove to them from country parishes and villages. In these circumstances, in order to find the true number of inhabitants, and probabilities of life, from bills of mortality containing an account of the ages at which all die, it is necessary that the proportion of the annual births to the annual settlers should be known, and also the period of life at which the latter remove. Both these particulars may be discovered in the following method.

If for a course of years there have been no sensible increase or decrease in a place, the number of annual settlers will be equal to the excess of the annual burials above the annual births. If there be an increase, it will be greater than this excess. If there be a deercase, it will be less.

The period of life at which these settlers remove, will appear in the bills by an increase in the number of deaths at that period and beyond it. Thus in the London bills the number of deaths between 20 and 30 is generally above double, and between 30 and 40 near triple the number of deaths between 10 and 20; and the true account of this is, that from the age of 18 or 20 to 35 or 40, there is an afflux of people every year to London from the country, which occasions a great increase in the number of inhabitants at these ages; and consequently raises the deaths for all ages above 20 considerably above their due proportion when compared with the number of deaths before 20. This is observable in all the bills of mortality for towns with which we are acquainted, not even excepting the Breslaw bills. Dr Halley takes notice, that these bills gave the number of deaths between 10 and 20 too small. This he considered as an irregularity in them owing to chance; and, therefore, in forming his table of observations, he took the liberty so far to correct it, as to render the proportion of those who die to the living in this division of life nearly the same with the proportion which, he says, he had been informed die annually of the young lads in Christ Church hospital. But the truth is, that this irregularity in the bills was derived from the cause we have just assigned. During the five years for which the Breslaw bills are given by Dr Halley, the births did indeed a little exceed the burials; but it appears that this was the effect of some peculiar causes that happened to operate just at that time; for during a complete century, from 1633 to

1734, the annual medium of births was 1089, and of Mortali burials 1256. This town, therefore, must have been all along kept up by a number of yearly recruits from other places, equal to about a seventh part of the yearly births.

It appears from the account in the Philosophical Transactions (Abridgement, vol. vii. Nº 332, p. 46, &c.), that from 1717 to 1725, the annual medium of births at Breslaw was 1252, of burials 1507; and also that much the greatest part of the births died under 10 years of age. From a table in Susmilch's works, vol. i. p. 38, it appears that in reality the greater part of all that die in this town are children under five ycars of age.

What has been now observed concerning the period of life at which people remove from the country to settle in towns, would appear sufficiently probable were there no such evidence for it as has been mentioned; for it might well be reckoned that these people in general must be single persons in the beginning of mature life, who not having yet obtained settlements in the places where they were born, migrate to towns in quest of employments.

Having premised these observations, it will be proper next to endeavour to explain distinctly the effect which these accessions to towns must have on tables of observation formed from their bills of mortality. This is a subject proper to be insisted on, because mistakes have been committed about it; and because also the discussion of it is necessary to show how near to truth the value of lives comes as deduced from such tables.

The following general rule may be given on this subject. If a place has for a course of years been maintained in a state nearly stationary, as to number of inhabitants, by recruits coming in every year, to prevent the decrease that would arise from the excess of burials above the births, a table formed on the principle, " that the number dying annually after. every particular age, is equal to the number living at that age," will give the number of inhabitants, and the probabilities of life, too great, for all ages, preceding that at which the recruits cease : and after this it will give them right. If the accessions are so great as to cause an increase in the place, such a table, will give the number of inhabitants and the probabilities of life too little after the age at which the accessions cease; and too great if there is a decrease. Before that age it will in both cases give them too great; but most considerably so in the former case, or when there is an increase.

Agreeably to these observations, if a place increases not in consequence of accessions from other places, but of a constant excess of the births above the deaths, a table constructed on the principle that has been mentioned will give the probabilities of life too low through the whole extent of life; because in such eircumstances the number of deaths in the first stages of life must be too great in comparison of the number of deaths in the latter stages; and more or less so as the increase is more or less rapid. The contrary in all respects takes place where there is a decrease arising from the excess of the deaths above the births.

For example: Let us suppose that 244 of those born in a town attain annually to 20 years of age,

4

MOR

show likewise at what parts of life the errors in such Mortality tables are most considerable, and how they may be in a great measure corrected.

All this shall be exemplified in the particular case of Loudon.

The number of deaths between the ages of 10 and 20 is always so small in the London bills, that it seems certain few recruits come to London under 20, or at least not so many as before this age are sent out for education to schools and universities. After 20 great numbers come in till 30, and some perhaps till 40 or 50: but at every age after 50, it is probable that more retire from London than come to it. The London tables of observation, therefore, being formed on the principle already mentioned, cannot give the probabilities of life right till 40. Between 30 and 40 they must be a little too high; but more so between 20 and 30, and most of all so before 20. It follows also that these tables must give the number of inhabitants in London much too great.

The first of the following tables is formed in the manner here explained, from the London bills for 10 years, from 1759 to 1768, and adapted to 1000 born. as a radix. The sum of the numbers in the second column, diminished by half the number born, is 25.757. According to this table, then, for every 1000 deaths in London there are 253 as many inhabitants; or, in other words, the expectation of a child just born is  $25\frac{3}{4}$ ; and the inhabitants are to the annual burials as  $25\frac{3}{4}$  to 1. But it has appeared, that the numbers in the second column, being given on the supposition that all those who die in London were born there, must be too great; and we have from hence a demonstration. that the probabilities of life are given in the common tables of London observations too high for at least the first 30 years of life; and also, that the number of inhabitants in London must be less that 25<sup>3</sup>/<sub>4</sub> multiplied by the annual burials. The common tables, therefore, of London observations undoubtedly need correction, as Mr Simpson suggested, and in some measure performed; though too imperfectly, and without going upon any fixed principles, or showing particularly how tables of observation ought to be formed, and how far in differcut circumstances, and in different ages, they are to be depended on. The way of doing this, and in general the right method of forming genuine tables of observation for towns, may be learned from the following rule :

"From the sum of all that die annually, after any given age, subtract the number of annual settlers after that age; and the remainder will be the number of the living at the given time."

This rule can want no explication or proof after what has been already said.

If, therefore, the number of annual settlers in a town at every age could be ascertained, a perfect table of observations might be formed for that town from bills of mortality, containing an account of the ages at which all die in it. But no more can be learned in this instance from any bills, than the whole number of annual settlers, and the general division of life in which they enter. This, however, may be sufficient to enable us to form tables that shall be tolerably exact. For instance: Suppose the annual deaths in a town which has not increased or decreased, to have

3H2

stality. and that 250 more, all likewise 20 years of age, come into it annually from other places, in consequence of which it has for a course of years been just maintained in the number of its inhabitants, without any sensible increase or decrease : in these circumstances, the number of the living in the town of the age of 20 will be always 244 natives, and 250 settlers, or 494 in all; and since these arc supposed all to dic in the town, and no more recruits are supposed to come in, 494 will be likewise the number dying annually at 20 and upwards. In the same manner it will appear, on these suppositions, that the number of the living at every age subsequent to 20 will be equal to the number dying annually at that age and above it; and consequently that the number of inhabitants and the decrements of life, for every such age, will be given exactly by the table. But for all ages before 20, they will be given much too great. For let 280 of all born in the town reach 10; in this case, 280 will be the true number of the living in the town at the age of 10; and the recruits not coming in til! 20, the number given by the bills as dying between 10 and 20 will be the true number dying annually of the living in this division of life. Let this number be 36; and it will follow that the table ought to make the numbers of the living at the ages between 10 and 20, a series of decreasing means between 280 and (280 diminished by 36, or) 244. But in forming the table on the principle just mentioned, 250 (the number above 20 dying annually in the town who were not born in it) will be added to each number in this series; and therefore the table will give the numbers of the living, and the probabilities of life in this division of life, almost twice as great as they really are. This observation, it is manifest, may be applied to all the ages under 20.

It is necessary to add, that such a table will give the number of inhabitants and the probabilities of life equally wrong before 20, whether the recruits all come in at 20, agreeably to the supposition just made, or only begin then to come in. In this last case, the table will give the number of inhabitants and probabilities of life too great throughout the whole extent of life, if the recruits come in at all ages above 20. But if they cease at any particular age, it will give them right only from that age; and before, it will err all along on the side of excess; but less considerably between 20 and that age than before 20. For example : if, of the 250 supposed to come in at 20, only 150 then come in, and the rest at 30; the number of the living will be given 100 too high at every age between 20 and 30; but, as just shown, they will be given 250 too high at every age before 20. In general, therefore, the number of the living at any particular age must be given by the supposed table as many too great as there are annual settlers after that age; and if these settlers come in at all ages indiscriminately, during any certain interval of life, the number of inhabitants and the probabilities of life will be continually growing less and less wrong, the nearer any age is to the end of that interval. These observations prove, that tables of observation formed in the common way, from bills of mortality for places where there is an excess of the burials above the births, must be erroneous for a great part of the duration of life, in proportion to the degree of that excess. They

Mortality, been for many years in the proportion of 4 to 3 to - the annual births. It will hence follow, that  $\frac{1}{4}$  of the persons who die in such a town are settlers, or emigrants from other places, and not natives; and the sudden increase in the deaths after 20 will also show, agreeably to what was before observed, that they enter after this age. In forming, therefore, a table for such a town, a quarter of all that die at all ages throughout the whole extent of life must be deducted from the sum of all that die after every given age before 20; and the remainder will be the true number living at that given age. And if at 20, and every age above it, the deduction is omitted, or the number of the living at every such age is taken the same with the sum of all that die after it, the result will be (supposing most of the settlers to come in before 30, and all before 40) a table exact till 20; too high between 20 and 30; but nearly right for some years before 40; and after 40 exact again. Such a table, it is evident, will be the same with the table last described at all ages above 20, and different from it only under 20. It is evident also, that on account of its giving the probabilities of life too great for some years after 20, the number of inhabitants deduced from it may be depended on as somewhat greater than the truth; and more or less so, as the annual recruits enter in general later or sooner after 20.

Let us now consider what the result of these remarks will be, when applied particularly to the London bills.

It must be here first observed, that at least one quarter of all that die in London are supplies or settlers from the country, and not natives. The medium of annual burials for 10 years, from 1759 to 1768, was 22,956; of births 15,710. The excess is 7246, or near a third of the burials. The same excess during 10 years before 1750 was 10,500, or near half the burials. London was then decreasing. For the last 12 or 15 years it has been increasing. This excess, therefore, agreeably to the foregoing observations, was then greater than the number of annual settlers, and it is now less. It is however here supposed, that the number of annual settlers is now no more than a quarter of the annual burials, in order to allow for more omissions in the births than the burials; and also, in order to be more sure of obtaining results that shall not exceed the truth.

Of every 1000 then who die in London only 750 are natives, and 250 are recruits who come to it after 18 or 20 years of age; and, consequently, in order to obtain from the bills a more correct table than the first of the following tables, 250 must be subtracted from every one of the numbers in the second column till 20; and the numbers in the third column must be kept the sause, the bills always giving these right. After 20, the table is to be continued unaltered; and the result will be, a table which will give the numbers of the living at all ages in London much nearer the truth but still somewhat too high. Such is the second of the following tables. The sum of all the numbers in the second column of this table, diminished by 500, is 20,750. For every 1000 deaths, therefore, in London, there are, according to this table, 20,7 to living persons in it; or for every single death 203 inhabitants. It

was before shown, that the number of inhabitants in Mortality London could not be so great as 253 times the deaths. It now appears (since the numbers in the second column of this table are too high) that the number of inhabitants of London cannot be so great as even 201 times the deaths. And this is a conclusion which every one, who will bestow due attention on what has been said, will find himself forced to receive. It will not be amiss, however, to confirm it by the following fact, the knowledge of which is derived from the particular inquiry and information of Mr Harris, the late ingenious master of the royal mathematical school in Christ-Church hospital. The average of lads in this school has, for 30 years past, been 831. They are admitted at all ages between 7 and 11; and few stay beyond 16 : they are, therefore, in general, lads between the age of 8 and 16. They have better accommodations than it can be supposed children commonly have; and about 300 of them have the particular advantage of being educated in the country. In such circumstances it may be well reckoned, that the proportion of children aying annually must be less than the general proportion of children dying annually at the same ages in London. The fact is, that for the last 30 years 114 have died annually, or one in  $70\frac{2}{5}$ .

According to Table II. one in 73 dies between 10 and 20, and one in 70 between 8 and 16. That table, therefore, probably gives the decrements of life in London at these ages, too little, and the numbers of the living too great : and if this is true of these ages, it must be true of all other ages under 20; and it follows demonstrably, in conformity to what was before shown, that more people settle in London after 20 than the fourth above supposed ; and that from 20 to at least 30 or 35, the numbers of the living are given too great, in proportion to the decrements of life.

In this table the numbers in the second column are doubled at 20, agreeably to what really happens in London; and the sum of the numbers in this column, diminished by half the whole number of deaths, gives the expectation of life, not of a child just born, as in other tables, but of all the inhabitants of London at the time they enter it, whether that be at birth or at 20 years of age. The expectations, therefore, and the values of London lives under 20, cannot be calculated from this table. But it may be very easily fitted for this purpose, by finding the number of births which, according to the given decrements of life, will leave 494 alive at 20; and then adapting the intermediate numbers in such a manner to this radix, as to preserve all along the number of the living in the same proportion to the numbers of the dead. This is done in the third of the following tables; and this table may be recommended as better adapted to the present state of London than any other table. The values of lives, however, deduced from it, ane in general nearly the same with those deduced by Mr Simpson from the London bills as they stood forty years ago; the main difference is, that after 52, and in old age, this table gives them somewhat lower than Mr Simpson's table. The fourth and fifth of the following tables, compared with the two last, will give a distinct and full view of the difference between the rate of human mortality in great towns and in country parishes and villages.

All the bills, from which the following tables are formed, give the numbers dying under 1 as well as under 2 years; and in the numbers dying under 1 are included, in the country parish in Brandenburg and at Berlin, all the stillborns. All the bills also give the numbers dying in every period of five years.

For the probabilities of life at Carlisle, see ANNUI-

## Mortality.

## TABLE IV.

Showing the Probabilities of Life in the District of Vaud, Switzerland, formed from the Registers of 43 Parishes, given by Mr Muret, in the First Part of the Bern Memoirs for the Year 1766.

| Age              | Living                  | Decr            | Age                  | Living.           | Decr           | Age            | Living            | Decr.          |

BRIEF of MORTANCESTRY, in Scots Law; anciently the ground of an action at the instance of an heir, in the special case where he had been excluded from the possession of his ancestor's estate by the superior, or other person pretending right.

MORTAR, a preparation of lime and sand mixed with water, which serves as a cement, and is used by masons and bricklayers in building walls of stone and brick. See LIME, CHEMISTRY Index.

MORTAR, a chemical utensil, very useful for the division of bodies, partly by percussion and partly by grinding. Mortars have the form of an inverted bell. The matter intended to be pounded is to be put intothem, and there it is to be struck and bruised by a long instrument called a *pestle*. The motion given to the pestle ought to vary according to the nature of the substances to be pounded. Those which are easily broken, or which are apt to fly out of the mortar, or which are hardened by the stroke of the pestle, require that this instrument should be moved circularly, rather by grinding or bruising than by striking. Those substances which are softened by the heat occasioned by. rubbing

Mortar. rubbing and percussion, require to be pounded very slowly. Lastly, Those which are very hard, and which are not capable of being softened, are easily pounded by repeated strokes of the pestle. They require no bruising but when they are brought to a certain degree of fineness. But these things are better learned by habit and practice than by any directions.

As mortars are instruments which are constantly ' used in chemistry, they ought to be kept of all sizes and materials; as of marble, copper, glass, iron, gritstone, and agate. The nature of the substance to be pounded determines the choice of the kind of mortar. The hardness and dissolving power of that substance are particularly to be attended to. As copper is a metal, which is soluble by almost all menstrua, and hurtful to health, this metal is rarely or never employed for the purpose of making mortars.

One of the principal inconveniences of pulverization in a mortar proceeds from the fine powder which rises abundantly from some substances during the operation. If these substances be precious, the loss will be considerable; and if they be injurious to health, they may hurt the operator. These inconveniences may be remedied, either by covering the mortar with a skin, in the middle of which is a hole, through which the pestle passes; or by moistening the matter with a little water when this addition does not injure it; or, lastly, by covering the mouth and nose of the operator with a fine cloth, to exclude this powder. Some sub-

stances, as corrosive sublimate, arsenic, calces of lead, Mortan cantharides, cuphorbium, &c. are so noxious, that all these precautions ought to be used, particularly when a large quantity is pounded.

Large mortars ought to be fixed upon a block of wood, so high, that the mortar shall be level with the middle of the operator. When the pestle is large and heavy, it ought to be suspended by a cord or chain fixed to a movcable pole placed horizontally above the mortar: this pole considerably relieves the operator, because its elasticity assists the raising of the pestle.

MORTAR-Piece, in the military art, a short piece of ordnance, thick and wide, proper for throwing bombs, careases, shells, stones, bags filled with grapeshot, &c. See GUNNERY, Nº 50.

Land MORTARS, are those used in sieges, and of late in battles, mounted on beds made of solid timber, consisting generally of four pieces, those of the royal and cohorn excepted, which are but one single block ; and both mortar and bed are transported on blockcarriages. There is likewise a kind of land mortars, mounted on travelling carriages, invented by Count Buckeburg, which may be elevated to any degree; whereas ours are fixed to an angle of 45 degrees, and firmly lashed with ropes. The following table shows the weight of land mortars and shells; together with the quantity of powder the chambers hold when full the weight of the shells, and powder for loading them.;

Sea MORTARS, are those which are fixed in bomb vessels for bombarding places by sea : and as they are generally fired at a much greater distance than that which is required by land, they are made somewhat

longer and much heavier than the land mortars. The following table exhibits the weight of the sea mortare and shells, and also of their full charges.

| Nature of the mortar.                                   | Powder con-<br>tained in the<br>chamber<br>when full. | Weight of<br>the mortar.                  | Weight of<br>the shell<br>when fixed. | Weight of<br>power con<br>tained in<br>the shell. |

To Charge or Load a MORTAR, the proper quantity of gunpowder is put into the chamber, and if there be any vacant space they fill it up with hay; some choose a wooden plug: over this they lay a turf, some a wooden tompion fitted to the bore of the piece; and lastly the bomb; taking care that the fuse be in the axis thereof, and the orifice be turned from the muzzle of the piece : what space remains is to be filled up with hay, straw, turf, &c. so as the load may not be exploded without the utmost violence.

The

ortar.

MO R

The quantity of gunpowder to be used is found by dividing the weight of the bomb by 30; though this rule is not always to be strictly observed.

When the proper quantity of powder necessary to charge a sea mortar is put into the chamber, it is covered with a wad well beat down with the rammer. After this the fixed shell is placed upon the wad, as near the middle of the mortar as possible, with the fuse hole uppermost, and another wad pressed down close upon it, so as to keep the shell firm in its position. The officer then points the mortar according to the proposed inclination .-- When the mortar is thus fixed, the fuse is opened; the priming iron is also thrust into the touch-hole of the mortar to clear it, after which it is primed with the finest powder. This done, two of the matrosses or sailors, taking each one of the matches, the first lights the fuse, and the other fires the mortar. The bomb, thrown out by the explosion of the powder, is carried to the place intended : and the fuse, which ought to be exhausted at the instant of the shell's falling, inflames the powder contained in it, and bursts the shell in splinters; which, flying off circularly, oceasion incredible mischief wheresoever they reach.

If the service of mortars should render it necessary to use pound shots, 200 of them with a wooden bottom are to be put into the 13 inch mortar, and a quantity of powder not exceeding 5 pounds; and 100 of the above shot with 2<sup>1</sup>/<sub>2</sub> pounds of powder, for the 10 inch mortar, or three pounds at most.

To Elevate the MORTAR so as its axis may make any given angle with the horizon, they apply the artillery level or gunner's quadrant. An elevation of 70 or 80 degrees is what is commonly chosen for rendering mortars most serviceable in casting shells into towns, forts, &e. though the greatest range he at 45 degrees.

All the English mortars are fixed to an angle of 45 degrees, and lashed strongly with ropes at that elevation. Although in a siege there is only one case in which shells should be thrown with an angle of 45 degrees; that is, when the battery is so far off that they cannot otherwise reach the works; for when shells are thrown out of the trenches into the works of a fortification, or from the town into the trenches, they should have as little elevation as possible, in order to roll along, and not bury themselves; whereby the damage they do, and the terror they oceasion, are much greater than if they sink into the ground. On the contrary, when shells are thrown upon magazines or any other buildings, with an intention to destroy them, the mortars should be elevated as high as possible, that the shells may acquire a greater force in their fall, and consequently do greater execution.

If all mortar pieces were, as they ought to be, exactly similar, and their requisites of powder as the cubes of the diameters of their several bores, and if their shells, bombs, carcasses, &c. were also similar; then, comparing like with like, their ranges on the plane of the horizon, under the same degree of elevation, would be equal; and consequently one piece being well proved, i. e. the range of the grenado, homb, carcass, &e. being found to any degree of elevation, the whole work of the mortar piece would become very easy and exact.

But since mortars are not thus similar, it is required, Vol. XIV. Part II.

that the range of the piece, at some known degree of Mortan. elevation, be accurately found by measuring; and from hence all the other ranges may be determined.

Thus, to find the range of the piece at any other elevation required; say, As the sine of double the angle under which the experiment was made, is to the sine of double the angle proposed, so is the range known to the range required.

Suppose, for instance, it be found, that the range of a piece, elevated to 30°, is 2000 yards: to find the range of the same piece with the same charge when elevated to  $45^{\circ}$ ; take the sine of  $60^{\circ}$ , the double of  $30^{\circ}$ , and make it the first term of the rule of three; the second term must be the sine of 90°, the double of 45°, and the third the given range 2000; the fourth term will be 2310, the range of the piece at 45°. If the elevation be greater than 45°, instead of doubling it, take the sine of double its complement to 90°. As suppose the elevation of a piece be 50°, take the sine of 80°, the double of 40°. Again, If a determinate distance to which a shot is to be cast, be given, and the angle of elevation to produce that effect be required ; the range known must be the first term in the rule of three, which suppose 2000 yards; the range proposed, which we suppose 1600 yards, the second term; and the sine of 60 double of the elevation for the range of 2000 yards, the third term. The fourth term will be found the sine of 43° 52', whose half 21° 56' is the angle of elevation the piece must have to produce the desired effect. And if 21° 56' be taken from 90°, you will have 68° 4' for the other elevation of the piece, with which the same effect will likewise be produced.

Note, To avoid the trouble of finding sines of double the angles of the proposed elevations, Galileo and Torricelli give us the following table, wherein the sines of the angles sought are had by inspection.

| Degrees.                                                                               | Degrees                                                                     | Ranges.                                                                                                    | Degrees.                                                                             | Degrees                                                                              | Ranges.                                                                                                      |

4.34

Mortan,

The use of the table is obvious. Suppose, for in-Mortgage stance, it be known by experiment, that a mortar elevated 15°, charged with three pounds of powder, will throw a bomb to the distance of 350 fathoms; and it be required, with the same charge, to throw a bomb 100 fathoms farther; seek in the table the number answering to 15 degrees, and you will find it 5000. Then as 350 is to 450, so is 5000 to a fourth number, which is 6428. Find this number, or the nearcst to it, in the table, and against it you will find 20° or 70°; the proper angles of clevation.

MORTGAGE, in Law, (mortuum vadium, or dead pledge), is where a man borrows of another a specific sum (e. g. 2001.), and grants him an estate in fee, on condition that if he, the mortgager, shall pay the mortgagee the said sum of 2001. on a certain day mentioned in the deed, that then the mortgager may re-enter on the estate so granted in pledge; or, as is now the more usual way, that the mortgagec shall re-convey the estate to the mortgager : in this case the land which is so put in pledge, is by law, in case of nonpayment, at the time limited, for ever dead and gone from the mortgager; and the mortgagee's estate in the lands, is then no longer conditional, but absolute. But so long as it continues conditional, that is, between the time of lending the money and the time allotted for payment, the mortgagee is called tenant in mortgage. But as it was formerly a doubt, whether, by taking such estate in fee, it did not become liable to the wife's dower, and other encumbrances of the mortgage (though that doubt has been long ago overruled by our courts of equity), it therefore became usual to grant only a long term of years, by way of mortgage; with condition to be void on repayment of the mortgage money : which course has been since continued, principally because on the death of the mortgagee such term becomes vested in his personal representatives, who only are entitled in equity to receive the money lent, of whatever nature. the mortgage may happen to be.

As soon as the estate is created, the mortgagee may. immediately enter on the lands; but is liable to be dispossessed, upon performance of the condition by payment of the mortgage money at the day limited. And therefore the usual way is to agree that the mortgager shall hold the land till the day assigned for payment : when, in case of failure, whereby the estate becomes absolute, the mortgagee may enter upon it, and take possession, without any possibility at law of being afterwards evicted by the mortgager, to whom the land is now for ever dead. But here again the courts of equity interpose; and though a mortgage be thus forfeited, and the estate absolutely vested in the mortgagee at the common law, yet they will consider the real value of the tenements compared with the sum borrowed. And if the estate bc of greater value than the, sum lent thereon, they will allow the mortgager at any reat sonable time to recall or redeem his estate : paying to the mortgagee his principal, interest, and expendes : for otherwise, in strictness of law, an estate worth 1000l. might be forfeited for non-payment of 1001. or a less This reasonable advantage, allowed to mortgasum. gers, is called the equity of redemption ; and this cnables a mortgager to call on the mortgagee, who has possession of his estate, to deliver it back, and account for the rents and profits received on payment of his

whole debt and interest, thereby turning the mortuum Mortgage into a kind of vivum vadium; (see VADIUM). But, on the other hand, the mortgagee may either compel Morimain the sale of the estate, in order to get the whole of his money immediately; or else call upon the mortgager to redeem his estate presently, or, in default thereof, to be for ever foreclosed from redeeming the same; that is, to lose his equity of redemption without possibility of recal. And also, in some cases of fraudulent mortgages, the fraudulent mortgager forfeits all equity of redemption whatsoever. It is not, however, usual for mortgagces to take possession of the mortgaged estate, unless where the security is precarious, or small; or where the mortgager neglects even the payment of interest : when the mortgagee is frequently obliged to bring an ejectment, and take the land into his own hands, in the nature of a pledge, or the pignus of the Roman law : whereas, while it remains in the hands of the mortgager, it more resembles their hypotheca, which was where the possession of the thing pledged remained with the debtor. But by statute 7. Geo. II. c. 20. after payment or tender by the mortgager, of principal, interest, and costs, the mortgagee can maintain no ejectment; but may be compelled to re-assign his securities. In Glanvil's time, when the universal method of conveyance was by livery of seisin or corporal tradition of the lands, no gage or pledge of lands. was good unless possession was also delivered to the creditor; si non sequatur ipsius vadii traditio, curia domini regis hujusmodi privatas conventiones tueri non solet : for which the reason given is, to prevent subsequent and fraudulent pledges of the same land; cum in tali casu possit eadem res pluribus aliis creditoribus tum prius tum posterius invadiari. And the frauds which have arisen, since the exchange of these public and notorious conveyances for more private and secret bargains, have well evinced the wisdom of our ancient law.

MORTIER, an ensign of dignity, which was borne by the chancellor and grand presidents of the parlia-ment of France. That borne by the chancellor was a piece of cloth of gold, edged and turned up with ermine; and that of the first president was a piece of black velvet edged with a double row of gold lace.

MORTIFICATION, or GANGRENE. See ME-DICINE and SURGERY Index.

MORTIFICATION, in religion, any severe penance

observed on a religious account. See FAST. MORTISE, or MORTOISE, in carpentry, &c. a. kind of joint wherein a hole of a certain depth is made in a piece of timber, which is to receive another piece. called a tenon.

MORTMAIN, or ALIENATION in Mortmain (in mortug manu), is an alienation of lands or tenements to any corporation, sole or aggregate, ecclesiastical or tem- , See poral \*: but these purchases having been chiefly made by religious houses, in consequence whereof the lands became perpetually inherent in one dead hand, this hath occasioned the general appellation of mortmain to be applied to such alienations, and the religious houses themselves to be principally considered in forming the statutes of mortmain : in deducing the history of which statutes, it will be matter of curiosity to observe the great address and subtle contrivance of the ecclesiastics, in eluding from time to time the laws in being, and the zeal with which successive parliaments have pursued them

5

ckst.

( ment.

By the common law any man might dispose of his lands to any other private man at his own discretion, especially when the feodal restraints of alienation were worn away. Yet in consequence of these it was always, and is still necessary, for corporations to have a license of mortmain from the erown, to enable them to purchase lands : for as the king is the ultimate lord of every fee, he ought not, unless by his own consent, to lose his privilege of escheats and other feodal profits, by the vesting of lands in tenants that can never be attainted or die. And such licenses of mortmain seem to have been necessary among the Saxons above 60 years before the Norman conquest. But, besides this general license from the king as lord paramount of the kingdom, it was also requisite, whenever there was a mesne or intermediate lord between the king and the alienor, to obtain his license also (upon the same feodal principles) for the alienation of the specific land. And if no such lieense was obtained, the king or other lord might respectively enter on the land so alienated in mortmain, as a forfeiture. The necessity of this licence from the crown was acknowledged by the Constitutions of Clarendon, in respect of advowsons, which the monks always greatly coveted, as being the groundwork of subsequent appropriations. Yet such were the influence and ingenuity of the clergy, that (notwithstanding this fundamental principle) we find that the largest and most considerable donations of religious houses happened within less than two centuries after the Conquest. And (when a license could not be obtained) their contrivance seems to have been this: That as the forfeiture for such alienations accrued in the first place to the immediate lord of the fce, the tenant who meant to alienate first conveyed his lands to the religious house. and instantly took them back again to hold as tenant to the monastery : which kind of instantaneous seisin was probably held not to occasion any forfeiture : and then, by pretext of some other forfeiture, surrender, or escheat the society entered into those lands in right of such their newly acquired signiory, as immediate lords of the fee. But when these donations began to grow numerous, it was observed that the feodal services, ordained for the defence of the kingdom, were every day visibly withdrawn; that the circulation of landed property from man to man hegan to stagnate : and that the lords were curtailed of the fruits of their signories, their escheats, wardships, reliefs, and the like : and therefore, in order to prevent this, it was ordained by the second of King Henry III.'s great charters, and afterwards by that printed in our common statute books, that all such attempts should be void, and the land forfeited to the lord of the fee.

But as this prohibition extended only to religious houses, bishops and other sole cornorations were not included therein; and the aggregate ecclesiastical bodies (who, Sir Edward Coke observes, in this were to be commended, that they ever had of their counsel the best learned men that they could get) found many means to creep out of this statute, by buying in lands that were bona fide holden of themselves as lords of the fee, and thereby evading the forfeiture ; or by taking long

leases for years, which first introduced those extensive Mortmain. terms, for a thousand or more years, which are now so frequent in conveyances. This produced the statute de religiosis, 7 Edw. I.; which provided, that no person, religious or other whatsoever, should buy, or sell, or receive under pretence of a gift, or term of years, or any other title whatsoever, nor should by any art or ingenuity appropriate to himself, any lands or tenements in mortmain; upon pain that the immediate lord of the fce, or, on his default for one year, the lords paramount, and in default of all of them, the king, might enter thereon as a forfeiture.

This seemed to be a sufficient security against all alienations in mortmain : but as these statutes extended only to gifts and conveyances between the parties, the religious houses now began to set up a fictitions title to the land, which it was intended they should have, and to bring an action to recover it against the tenant; who, hy fraud and collusion, made no defence, and thereby judgment was given for the religious house, which then recovered the land by a sentence of law upon a supposed prior title. And thus they had the honour of inventing those fictitions adjudications of right, which are since become the great assurance of the kingdom, under the name of common RECOVERIES. But upon this the statute of Westminster the second, 13 Edw. I. c. 32. enacted, that in such eases a jury shall try the true right of the demandants or plaintiffs to the land; and if the religious house or corporation be found to have it, they shall still recover seisin; otherwise it shall be forfeited to the immediate lord of the fee, or else to the next lord, and finally to the king, upon the immediate or other lord's default. And the like provision was made by the succeeding chapter, in case the tenants set up crosses upon their lands (the badges of knights templars and hospitallers) in order to protect them from the feudal demands of their lords, by virtue of the privileges of those religious and military orders. And so careful was this provident prince to prevent any future evasions, that when the statute of quia emptores, 18 Edw. I. abolished all sub infeudations, and gave liberty for all men to alienate their lands to be holden of their next immediate lord, a proviso was inserted that this should not extend to authorize any kind of alienation in mortmain. And when afterwards the method of obtaining the king's license by writ of ad guod dammum was marked out by the statute 27 Edw. I. st. 2. it was farther provided by statute 34 Edw. I. st. 3. that no such license should be effectual without the consent of the mesne or intermediate lords.

Yet still it was found difficult to set bounds to ecclesiastical ingenuity : for when they were driven out of all their former holds, they devised a new method of conveyance, by which the lands were granted, not to themselves directly, but to nominal feoffees to the use of the religious houses; thus distinguishing between the possession and the use, and receiving the actual profits, while the seisin of the land remained in the nominal fcoffice; who was held by the courts of equity (then under the direction of the clergy) to be bound in conscience to account to his cestuy que use for the rents and emoluments of the estate. And it is to these inventions that our practisers are indebted for the introduction of uses and trusts, the founda-312 tion

Mertmain, tion of modern conveyancing. But unfortunately for the inventors themselves, they did not long enjoy the advantage of their new device ; for the statute 1 5 Richard II. c. 5. enacts, that the lands which had been so purchased to uses should be admortised by license from the crown, or elsc be sold to private persons; and that, for the future, uses shall be subject to the statutes of mortmain, and forfeitable like the lands themselves. And whereas the statutes had been eluded by purchasing large tracts of land adjoining to churches, and consecrating them by the name of churchyards, such subtile imagination is also declared to be within the compass of the statutes of mortmain. And civil or lay corporations, as well as ecclesiastical, are also declared to be within the mischief, and of course within the remedy provided by those salutary laws. And lastly, As during the times of popery lands were frequently given to superstitious uses, though not to any corporate bodics; or were made liable in the hands of heirs and devisees to the charge of obits, chantries, and the like, which were equally pernicious in a well-governed state as actual alienations in mortmain; therefore at the dawn of the Reformation, the statute 23 Hen. VIII. c. 10. declares, that all future grants of lands for any of the purposes aforesaid, if granted for any longer term than

20 years, shall be void. But, during all this time, it was in the power of the crown, by granting a license of mortmain, to remit the forfciture, so far as related to its own rights; and to enable any spiritual or other corporation to purchase and hold any lands or tenements in perpetuity: which prerogative is declared and confirmed by the statute 18 Edw. III. st. 3. c. 3. But as doubts were conceived at the time of the Revolution how far such license was valid, since the king had no power to dispense with the statutes of mortmain by a clause of non obstante, which was the usual course, though it seems to have been unnecessary; and as, by the gradual declension of mesne signiorics through the long operation of the statute of quia emptores, the rights of intermediate lords were reduced to a very small compass; it was therefore pro-vided by the statute 7 & 8 W. III. c. 37. that the crown for the future at its own discrction may grant licenses to alienate or take in mortmain, of whomsocver the tenements may be holden.

After the dissolution of monasteries under Hen. VIII. though the policy of the next popish successor affected to grant a security to the possessors of abbey lands, yet, in order to regain so much of them as cither the zeal or timidity of their owners might induce them to part with, the statutes of mortmain were suspended for 20 years by the statute 1 & 2 P. & M. c. 8. and during that time any lands or tenements were allowed to be granted to any spiritual corporation without any license whatsoever. And long afterwards, for a much better purpose, the augmentation of poor livings, it was enacted by the statute 17 Car. II. c. 3. that appropriators may annex the great tithes to the vicarages, and that all benefices under 1001. per annum may be augmented by the purchase of lands, without license of mortman in either case; and the like provision hath been since made in favour of the governors of Queen Anne' bounty. It hath also been held, that the statute 13 Hen. VIII. before-mentioned, did not extend to any thing but superstitious uses; and that therefore

#### O B M

a man may give lands for the maintenance of a school, Mortmail an hospital, or any other charitable uses. But as it Mortuan was apprehended from recent experience, that persons on their deathbeds might make large and improvident dispositions even for these good purposes, and defeat the political ends of the statutes of mortmain; it is therefore enacted by the statute 9 Gco. 11. c. 36. that no lands or tenements, or money to be laid out thereon, shall be given for or charged with any charitable uses whatsoever, unless by deed indented, executed in the presence of two witnesses 12 kalender months before the death of the donor, and enrolled in the court of chancery within six months after its execution (except stocks in the public funds, which may be transferred within six months previous to the donor's death), and unless such gift be made to take effect immediately, and be without power of revocation ; and that all other gifts shall be void. The two universities, their colleges, and their scholars upon the foundation of the colleges of Eton, Winchester, and Westminster, are excepted out of this act : but such exemption was granted with this proviso, that no college shall be at liberty to purchase more advowsons than are equal in number to one moiety of the fellows or students upon the respective foundations.

MORTUARY, in Law, is a sort of ecclesiastical heriot\*, being a customary gift claimed by and due to \* See the minister in very many parishes on the death of his Heriot. parishioners. They seem originally to have been only a voluntary bequest to the church; being intended, as Lyndewode informs us from a constitution of Archbishop Langham, as a kind of expiation and amends to the clergy for the personal tithes, and other ccclesiastical duties, which the laity in their life time might have neglected or forgotten to pay. For this purpose, after the lord's heriot or best good was taken out, the second best chattel was reserved to the church as a mortuary. And therefore in the laws of King Canute, this mortuary is called soul-scot or symbolum animæ. And, in pursuance of the same principle, by the laws of Venicc, where no personal tithes have been paid during the life of the party, they are paid at his death out of his merchandise, jewels, and other moveables. So also, by a similar policy in France, every man that died without bequeathing a part of his estate to the church, which was called dying without confession, was formerly deprived of Christian burial; or, if he died intestate, the relations of the deceased, jointly with the bishop, named proper arbitrators to determine what he ought to have given to the church, in case he had made a will. But the parliament, in 1409, redressed this grievance.

It was anciently usual in England to bring the mortuary to church along with the corpse when it came to be buried; and thence it is sometimes called a corpsepresent: a term which bespeaks it to have been once a voluntary donation However, in Bracton's time, so early as Henry III. we find it rivetted into an established custom; in so much that the bequests of heriots and mortuarics were held to be necessary ingredients in every testament of chattels. Imprimis autem debct quilibet, qui testamentum fecerit, dominum suum de meliori re quam habucrit recognoscere ; et postea ecclesiam de alia meliore : the lord must have the best good left him as a heriot; and the church the second best as a mortuary.

for any one of full age, that is not a housekeeper; nor Mortuary tuary shall be paid in the parish to which he belongs. Mosaic Law.

tuary. tuary. But yet this custom was different in different places : in quibusdam locis habet ecclesia melius animal de consuetudine ; in quibusdam secundum, vel tertium melius ; et in quibusdam nihil : et ideo consideranda est consuetudo loci. This custom still varies in different places, not only as to the mortuary to be paid, but the person to whom it is payable. In Wales a mortuary or corse present was due upon the death of every clergyman to the bishop of the diocese; till abolished, upon a recompense given to the bishop, by the statute, 12 Ann. st. 2. c. 6. And in the archdeaeonry of Chester a custom also prevailed, that the bishop, who is also archdeacon, should have, at the death of every clergyman dying therein, his best horse or mare, bridle, saddle, and spurs; his best gown or cloak, hat, upper garment under his gown, and tippet, and also his best signet or ring. But by statute 28 Geo. II. e. 6. this mortuary is directed to cease, and the act has settled upon the bishop an equivalent in its room. The king's claim to many goods, on the death of all prelates in England, seems to be of the same nature; though Sir Edward Coke apprchends, that this is a duty upon death, and not a mortuary : a distinction which seems to be without a difference. For not only the king's ecclesiastical character, as supreme ordinary, but also the species of the good claimed, which bear so near a resemblance to those in the archdeaconry of Chester, which was an acknowledged mortuary, puts the matter out of dispute. The king, according to the record vouched by Sir Edward Coke, is entitled to six things; the bishop's best horse or palfrey, with his furniture; his cloak or gown, and tippet; his cup and cover; his bason and ewer; his gold ring; and lastly, his muta canum, his mew or kennel of hounds.

This variety of eustoms with regard to mortuaries, giving frequently a handle to exactions on the one side, and frauds or expensive litigations on the other, it was thought proper by statute 21 Henry VIII. e. 6. to reduce them to some kind of certainty. For this purpose it is enacted, that all mortuaries, or corsepresents to parsons of any parish, shall be taken in the following manner, unless where by custom less or none at all is due; viz. for every person who does not leave goods to the value of ten marks, nothing; for every person who leaves goods to the value of ten marks and under 30 pounds, 3s. 4d.; if above 30 pounds, and 'under 40 pounds, 6s. 8d.; if above 40 pounds, of what value soever they may be, 10s. and no more. And no mortuary shall throughout the kingdom be paid for the death of any fenie-covert; nor for any child; nor

And upon this statute stands the law of mortuaries to this day MORUS, the MULBERRY TREE, a genus of plants belonging to the monœcia class, and in the natural method ranking under the 53d order, Scabridæ. See Bo-

TANY Index. MOSA, in Ancient Geography, a river of Belgica, rising in Mount Vogesus on the borders of the Lingones, and which, after receiving a part of the Rhine called Vahalis, forms the island of the Batavi, and passes off into the sea, at the distance of 80 miles. Now called the Maese, or Mcuse; rising in Champagne, on the borders of the eounty of Burgundy, or Franche Compté, at a village called Meuse, whence the appellation; and running north through Lorrain and Champagne into the Netherlands: it afterwards directs its eourse north-east and then west; and joining the Waal, runs to Dort, and falls into the German sea, a little below the Briel.

MOSÆ Pons, in Ancient Geography, supposed to be Maestricht, situated on the Maese. E. Long. 5. 40. N. Lat. 50. 55.

MOSAIC LAW, or the Law of Moses, is the most Wilson's. ancient that we know of in the world, and is of three *Archaol*. kinds; the moral law, the eeremonial law, and the judicial law. The different manner in which each of these was delivered, may perhaps suggest to us a right idea of their different natures. The moral law, or ten commandments, for instance, was delivered on the top of the mountain, in the face of the whole world, as being of universal influence, and obligatory on all mankind. The ceremonial was received by Moses in private in the tabernacle, as being of peculiar concern, belonging to the Jews only, and destined to cease when the tabernacle was down, and the vail of the temple rent. As to the judicial law, it was neither so publicly nor so audibly given as the moral law, nor vet so privately as the ceremonial; this kind of law being of an indifferent nature, to be observed or not observed, as its rites suit with the place and government under which we live. The five books of Moses called the Pentateuch, are frequently styled, by way of emphasis the Law. This was held by the Jews in such veneration, that they would not allow it to be laid upon the bed of any sick person, lest it should be polluted by touching the dead.

## A TABLE or HARMONY of the MOSAIC LAW, digested into proper HEADS, with REFERENCES to the several Parts of the PENTATEUCH where the respective Laws occur.

Losaic.

it from mosaicum, a corruption of musaicum, as that is of musivum, as it was called among the Romans. Scaliger derives it from the Greek preva, and imagines the name was given to this sort of works as being very fine and ingenious. Nebricensis is of opinion it was so ealled, because ex illis picturis ornabantur musca.

1. Method of performing mosaic work of glass is this: They provide little pieces of glass, of as many different colours and sizes as possible.

Now, in order to apply these several pieces, and out of them to form a picture, they in the first place procure a cartoon, or design to be drawn; this is transferred to the ground or plaster by chalking as in painting in fresco. See FRESCO.

As this plaster is to be laid thick on the wall, and therefore will continue fresh and soft a considerable time, so there may be enough prepared at once to serve for as much work as will take up three or four days.

This plaster is composed of lime made of hard stone, with briek dust very fine, gum tragacanth, and whites of eggs; when this plaster has been thus prepared and laid on the wall, and made the design of what is to be represented, they take out the little pieces of glass with a pair of plyers, and range them one after another, still keeping strictly to the light, shadow, diffcrent teints and colours represented in the design before; prossing or flatting them down with a ruler, which serves both to sink them within the ground and to render the surface even.

Thus, in a long time, and with a great deal of labour, they finish the work, which is still the more beautiful, as the pieces of glass are more uniform and ranged at an even height.

Some of these pieces of mosaic work are performed with that exactness, that they appear as smooth as a table of marble, and as finished and masterly as a painting in freseo; with this advantage, that they have a fine lustre, and will last ages.

The finest works of this kind that have remained till our time, and those by whom the moderns have retrieved the art, which was in a manner lost, are those in the church of St Agnes, formerly the temple of Baechus, at Rome ; and some at Pisa, Florence, and other cities of Italy. The most esteemed among the works of the moderns are those of Joseph Pine and the Chcvalier Lanfranc, in the church of St Peter at Rome : there are also very good ones at Venice.

2. The method of performing mosaic work of marble is this: The ground of mosaic works, wholly marble, is usually a massive marble either white or black. On this ground the design is cut with a chisel, after it has been first chalked. After it has been eut of a considerable depth, i. c. an inch or more, the eavities are filled up with marble of a proper colour, first fashioned according to the design, and reduced to the thickness of the indentures with various instruments. To make the piece thus inserted into the indentures eleave fast, whose several colours are to imitate those of the design, they use a stuceo, composed of lime and marble dust; or a kind of mastich, which is prepared by each workman, after a different manner peculiar to himself. The figures being marked out, the painter or sculptor himself draws with a pencil the colours of the figures not determined by the ground, and in the same manner makes strokes or hatchings in the place where shadows Vol. XIV. Part II.

1

are to be : and after he has engraven with the chisel Mesaic. all the strokes thus drawn, he fills them up with a black mastich, composed partly of Burgundy pitch poured on hot; taking off afterwards what is superfluous with a piece of soft stone or brick, which, together with water and beaten cement, takes away the mastich, polishes the marble, and renders the whole so even that one would imagine it only consisted of one piece. This is the kind of mosaie work that is seen in the church of the Invalids at Paris, and the fine chapel at Versailles, with which some entire apartments of that palace are incrustated.

3. As for mosaic work of precious stones, other and finer instruments are required than those used in marble; as drills, wheels, &c. used by lapidaries and engravers on stone. As none but the richest marbles and stones enter this work, to make them go the farther, they are sawn into the thinnest leaves imaginable, scarcely exceeding half a line in thickness; the block to be sawn is fastened firmly with eords on the bench, and only raised a little on a piece of wood, one or two inches high. Two iron pins, which are on one side the block, and which serve to fasten it, are put into a vice contrived for the purpose; and with a kind of saw or bow, made of a fine brass wire, bent on a piece of spongy wood, together with emery steeped in water, the leaf is gradually fashioned by following the stroke of the design made on paper, and glued on the piece. When there are pieces enough fastened to form an entire flower, or some other part of the design, they are applied to the ground.

The ground which supports this mosaic work is usually of freestone. The matter with which the stones are joined together is a mastich, or kind of stucco, laid very thin on the leaves as they are fashioned ; and this being done, the leaves are applied with plyers.

If any contour, or side of a leaf, be not either squared or rounded sufficiently, so as to fit the place exactly into which it is to be inserted, when it is too large, it is to be bronght down with a brass file or rasp; and if it he too little, it is managed with a drill and other instruments used by lapidaries.

Mosaie work of marble is used in large works, as in pavements of churches and palaces; and in the incrustation and vencering of the walls of the same edifices.

As for that of precious stones, it is only used in small works, as ornaments for altar pieces, tables for rich cabinets, precious stones being so very dear.

4. Manner of performing mosaic work of gypsum. Of this stone calcined in a kiln, beaten in a mortar and sifted, the French workmen make a sort of artificial marbles, imitating precious stones; and of these they compose a kind of mosaic work, which does not come far short either of the durableness or the vivacity of the natural stones; and which besides has this advantage that it admits of continued pieces or paintings of entire compartments without any visible joining.

Some make the ground of plaster of Paris, others of freestone. If it be of plaster of Paris, they spread it in a wooden frame, of the length and breadth of the work intended, and in thickness about an inch and a half. This frame is so contrived, that the tenons being only joined to the mortises by single pins, they may be taken asunder, and the frame be dismounted when the plaster is dry. The frame is covered on one side with a strong linen cloth, nailed all round; which being 3 K placed

Mosaic. placed horizontally with the linen at the bottom, is filled with plaster passed through a wide sieve. When the plaster is half dry, the frame is set up perpendieularly, and left till it is quite dry; then it is taken out, by taking the frame to pieces.

In this mosaie, the ground is the most important part. Now in order to the preparation of this sifted gypsum, which is to be applied on this ground, it is dissolved and boiled in the best English glue, and mixed with the colour that it is to be of; then the whole is worked up into the usual eonsistence of plaster, and then taken and spread on the ground five or six inches thick. If the work be such, as that mouldings are required, they are formed with gouges and other instruments.

It is on this plaster, thus eoloured like marble or precious stone, and which is to serve as a ground to a work, either of lapis, agate, alabaster, or the like, that the design to be represented is drawn : having been first pounced or chalked. To hollow or impress the design, they use the same instruments that seulptors do; the ground whereon they are to work not being much less hard than the marble itself. The eavities being thus made in the ground, are filled with the same gypsum boiled in glue, only differently coloured, and thus are the different colours of the original represented. In order that the necessary colours and teints may be ready at hand, the quantities of the gypsum are tempered with the several colours in pots. After the design has been thus filled and rendered visible, by half polishing it with brick and soft stone, they go over it again, eutting such plates as are either to be weaker or more shadowed, and filling them with gypsum; which work they repeat till all the colours being added one after the other, represent the original to the life. When the work is finished, they scour it with soft stone, sand, and water; after that with a pumiee stone; and in the last place polish it with a wooden mullet and emery. Lastly, they give it a lustre, by smearing it over with oil, and rubbing it a long time with the palm of the hand, which gives it a lustre nowise inferior to that of natural marble.

5. In Clavigero's history of Mexico is described a curious kind of mosaie work, made by the aneient Mexicans of the most delicate and beautiful feathers of birds. They raised for this purpose various species of hirds of fine plumage with which that country abounds, not only in the palaees of the king, where there were all sorts of animals, but likewise in private houses; and at certain seasons they carried off their feathers to make use of them on this kind of work, or to sell them at market. They set a high value on the feathers of those wonderful little birds which they call Heitzitzilin, and the Spaniards Picaflores, on account of the smallness, the fineness, and the various colours of them. In these and other beautiful birds, nature supplied them with all the colours which art can produce, and also some which art eannot imitate. At the undertaking of every mosaie work several artists assembled : After having agreed upon a design, and taken their measures and proportions, each artist charged himself with the execution of a certain part of the image, and exerted himself so diligently in it, with such patience and application, that he frequently spent a whole day in adjusting a feather; first trying one, then another, viewing it sometimes one way, then

another, until he found one which gave his part that Mosaic ideal perfection proposed to be attained. When the Mosam part which each artist undertook was done, they as- bique. sembled again to form the entire image from them .-If any part was accidentally the least deranged, it was wrought again until it was perfectly finished. They laid hold of the feathers with small pinehers, that they might not do them the least injury, and pasted them on the cloth with tzauhtli, or some other glutinous matter; then they united all the parts upon a little table, or a plate of copper, and flattened them softly until they left the surface of the image so equal and smooth that it appeared to be the work of a pencil.

These were the images so much eelehrated by the Spaniards and other European nations. Whoever beheld them was at a loss whether he ought to have praised most the life and beauty of the natural colours, or the dexterity of the artist and the ingenious disposition of art. " These images (says Aeosta) are deservedly admired; for it is wonderful how it was possible, with the feathers of birds, to exceute works so fine and so equal, that they appear the performance of the peneil; and, what neither the peneil nor the colours in painting ean effect, they have, when viewed from a side, an appearance so beautiful, so lively, and animated, that they give delight to the sight. Some Indians, who are able artists, eopy whatever is painted with a peneil so perfectly with plumage, that they rival the best painters of Spain." These works of feathers were even so highly esteemed by the Mexicans as to be valued more than gold. Cortes, Bernal Diaz, Gomara, Torquemada, and all the other historians who saw them, wcre at a loss for expressions sufficient to praise their perfection. Several works of this kind, our author says, are still preserved in the museums of Europe, and many in Mexico; but few, he apprehends, belong to the 16th century, and still fewer, if any, are of those made before the conquest. The mosaic works also which the Mexicans made of broken shells were extremely eurious: this art is still practised in Guatimala.

MOSAMBIQUE, a kingdom of Africa, lying south of Quiloa, and taking its name from the chief. town, which is situated on an island, at the mouth of a river of the same name, in 15 deg. S. Lat. The island is 30 miles in eircumference, and very populous. Though the air is said to be very hot, and the soil in general dry, sandy, and barren; yet they have most of the tropical fruits, with black eattle, hogs, and sheep. There is a kind of fowl here, both the feathers and flesh of which are black, insomuch that, when they are boiled, the broth looks like ink; and yet their flesh is very delicate and good food. The town of Mosambique is regularly fortified, and has a good harbour, defended by a eitadel, with several churches and monasteries. The Portuguese shipping to and from India touch here for refreshments. As the island abounds in eattle, the Portuguese slanghter and salt up a great deal of beef, which they afterwards send to the Brazils, or sell to the European shipping. They also barter European goods with the natives for gold, elephants teeth, and slaves. There is another town, ealled Mongala, situated also on an island, and garrisoned by the Portuguese, being their chief magazine for European goods. The gold they receive from the natives is found near the surface of the earth, or in the sands

Loscow.

sands of rivers ; no gold mines, or at least very few, beafosaniing at present wrought in Africa. bique

MOSCHION, the name of four different writers, whose compositions, character, and native place, are unknown. Some fragments of their writings remain, some few verses, and a treatise De mulierum affectibus.

MOSCHUS, a Grecian poet of antiquity, usually coupled with Bion; and they were both of them cotemporaries with Theocritus. In the time of the latter Grecians, all the ancient idylliums were collected and attributed to Theocritus; but the claims of Moschus and Bion have been admitted to some few little pieces; and this is sufficient to make us inquisitive about their characters and story; yet all that can be known about them must be collected from their own remains. Moschus, by composing his delicate elegy on Bion, has given the best memorials of Bion's life. See BION. Moschus and Theocritus have by some critics been supposed the same person; but there are irrefragable cvidences against it : others will have him as well as Bion to have lived later than Theocritus, upon the authority of Suidas : while others again suppose him to have been the scholar of Bion, and probably his successor in governing the poetic school; which, from the elegy of Moschus, does not seem unlikely. Their remains are to be found in all the editions of the Poetæ Minores.

Moschus, a genus of quadrapeds, of the order of pecora, having no horns. Sec MAMMALIA Index.

MOSCOW, the chief province of the empire of Russia, deriving its name from the river Muscova, or Moskva, on which the capital is situated. It was from this duchy that the czars of old took the title of dukes of Muscovy. The province is bounded on the north by the duchies of Twere, Rostow, Susdal, and Wolodimer; on the south by Rezan, from which it is separated by the river Occa; on the east by the principality of Cachine, and the same river Occa parting it from Nisi-Novogorod; and on the west by the duchies of Rzeva, Bielar and Smolensko. It extends about 150 miles in length, by 100 in breadth, and contains 1,139,000 inhabitants on a surface of 10,000 square miles. It is watered by the Moskva, Occa, and Clesma, which fall into the Wolga: neverthcless, the soil is not very fertile. The air, though sharp, is salubrious; and this consideration, with the advantage of its being situated in the midst of the best provinces in the empire, induced the czars to make it their chief residence. In the western part of Moscow is a large forest, from whence flows the celebrated river Dnieper, or Borysthenes, which, traversing the duchy of Smolensko, winds in a serpentine course to Ukraine, Lithuania, and Poland.

Moscow, the capital of the above province, and till the beginning of the last century the metropolis of all Russia, is situated in a spacious plain on the banks of the river Moskva. E. Long. 37. 31. N. Lat. 55. 45. The Russian antiquaries differ considerably in their opinions concerning the first foundation of Moscow; the following relation, Mr Coxe says, is generally estecmed by the best authors the most probable account.

Kiof was the metropolis, when George son of Vladimir Monomaka ascended in 1154 the Russian throne. That monarch, being insulted in a progress through his dominions by a rich and powerful nobleman named Stephen Kutchko, put him to death, and confiscated

his domains, which consisted of the lands now occu- Moscow. pied by the city of Moscow and the adjacent territory. Pleased with the situation of the ground lying at the conflux of the Moskva and Neglina, he laid the foundation of a new town, which he called Moskva from the river of that name. Upon the demise of George, the new town was not neglected by his son Andrew, who transferred the scat of empire from Kiof to Vladimir; but it fell into such decay under his immediate successors, that when Daniel, son of Alexander Nevski, received, in the division of the cmpire, the duchy of Muscovy as his portion, and fixed his residence upon the conflux of the Moskva and Neglina, he may be said to have new founded the town. The spot now occupied by the Kremlin was at that time overspread with a thick wood and a morass, in the midst whereof was a small island containing a single wooden hut. Upon this part Daniel constructed churches and monasteries, and various buildings, and enclosed it with wooden fortifications : he first assumed the title of duke of Moscow; and was so attached to this situation, that when in 1304 he succeeded his brother Andrew Alexandrovich in the great duchy of Vladimir, he did not remove his court to Vladimir, but continued his residence at Moscow, which then became the capital of the Russian dominions. His successors followed his example; among whom his son Ivan considerably enlarged the new metropolis, and in 1367 his grandson Demetrius Ivanovitch Donski surrounded the Kremlin with a brick wall. These new fortifications, however, were not strong enough to prevent Tamerlane in 1382, from taking the town after a short sicge. Bcing soon evacuated by that desultory conqueror, it again came into the possession of the Russians; but was frequently invaded and occupied by the Tartars, who in the 14th and 15th centuries overran the greatest part of Russia, and who even maintained a garrison in Moscow until they were finally expelled by Ivan Vassilicvitch I. To him Moscow is indebted for its principal splendour, and under him it became the principal and most considerable city of the Russian empire.

Moscow continued the metropolis of Russia until the beginning of the 18th century, when, to the great dissatisfaction of the nobility, but with great advantage probably to the state, the seat of empire was transferred to Pctersburgh.

Notwithstanding the predilection which Peter conceived for Petersburgh, in which all the succeeding sovereigns excepting Peter the II. have fixed their residence, Moscow, according to Mr Coxe, is still the most populous city of the Russian empire. Here the chief nobles who do not belong to the court reside : they here support a large number of retainers; they love to gratify their taste for a ruder and more expensive magnificence in the ancient style of fendal grandeur; and are not, as at Petersburgh, eclipsed by the superior splendour of the court.

Moscow, before its destruction in 1812, was represented as the largest town in Europe; its circumference within the rampart, which encloses the suburbs, being exactly 39 versts or 26 miles; but it was built in so straggling and disjointed a manner, that its population in no degree corresponded to its extent. According to a computation, which Mr Coxe says may be depended 3K 2 upon,

Moscow. upon, Moscow contains within the ramparts 250,000 sonls, and in the adjacent villages 50,000. The ground is about 1730 feet above the level of the sea, which renders the atmosphere rather cold. The streets of Moscow are in general exceedingly long and broad; some of them are paved; others, particularly those in the suburbs, are formed with trunks of trees, or are boarded with planks like the floor of a room ; wretched hovels are blended with large palaces; cottages of one story stand next to the most superb and stately mansions. Many brick structures are covered with wooden tops; some of the wooden houses are painted; others have iron doors and roofs. Numerous churches present themselves in every quarter, built in a peculiar style of architecture ; some with domes of copper, others of tin, gilt or painted green, and many roofed with wood. In a word, some parts of this vast city have the look of a sequestered desert, other quarters of a populous town; some of a contemptible village, others of a great capital.

Moscow may be considered as a town built upon the Asiatic model, but gradually becoming more and more European, and exhibiting in its present state a motley mixture of discordant architecture. It is distributed into the following divisions. I. The Kremlin. This stands in the central and highest part of the city ; is of a triangular form, and about two miles in circumference: and is surrounded by high walls of stone and brick ; which were constructed in the year 1491, under the reign of Ivan Vassilievitch I. It contains the ancient palace of the czars, several churches, two convents, the patriarchal palace, the arsenal now in ruins, and one private house, which belonged to Boris Godunof before he was raised to the throne. 2. Khitaigorod, or the Chinese town, is enclosed on one side by that wall of the Kremlin which runs from the Moskva to the Neglina; and on the other side by a brick wall of inferior height. It is much larger than the Kremlin, and contains the university, the printinghouse and many other public buildings, and all the tradesmen's shops. The edifices are mostly stuccoed or white-washed, and it has the only street in Moscow in which the houses stand close to one another without any intervals between them. 3. The Bielgorod, or White Town, which runs quite round the two preceding divisions, is supposed to derive its name from a white wall with which it was formerly enclosed, and of which some remains are still to be seen. 4. Semlainogorod, which environs all the three other quarters, takes its denomination from a circular rampart of earth with which it is encompassed. These two last mentioned divisions exhibit a grotesque groupe of churches, convents, palaces, brick and wooden houses, and mean hovels, in no degree superior to peasants cottages. 5. The Sloboda, or suburbs, form a vast exterior circle round all the parts already described, and are invested with a low rampart and ditch. These suburbs contain, beside buildings of all kinds and denominations, corn fields, much open pasture, and some small lakes, which give rise to the Neglina. The river Moskva, from which the city takes its name, flows through it in a winding channel; but excepting in spring is only navigable for rafts. It receives the Yausa in the Semlainogorod, and the Neglina at the western extremity of the Kremlin; the beds of both these last-mentioned rivulets are in summer little better than dry channels.

The places of divine worship at Moscow are exceed. Moscow ingly numerous; including chapels, they amount to above -1000: there are 484 public churches, of which 100 are of brick ; and the others of wood ; the former are commonly stuccoed or white-washed, the latter painted of a red colour. The most ancient churches of Moscow are generally square buildings, with a cupola and four small domes, some whereof are of copper or iron gilt; others of tin, cither plain or painted green. These cupolas and domes are for the most part ornamented with crosses entwined with thin chains or wires. The church of the Holy Trinity, sometimes called the church of Jerusalem, which stands in the Khitaigorod, close to the gate leading into the Kremlin, has a kind of high steeple and nine or ten domes : it was built in the reign of Ivan Vassilievitch II. The inside of the churches is mostly composed of three parts : that called by the Greeks wdormos. by the Russians trapeza; the body; and the sanctuary or shrine. Over the door of each church is the portrait of the saint to whom it is dedicated, to which the common people pay their homage as they pass along, by taking off their hats, crossing themselves, and occasionally touching the ground with their heads. The bells, which form no inconsiderable part of public worship in this country, as the length or shortness of their peals ascertains the greater or lesser sanctity of the day, are hung in belfrys detached from the church : they do not swing like our bells; but are fixed immoveably to the beams, and are rung by a rope tied to the clapper and pulled sidewise. Some of these bells are of a stupendous size ; one in the tower of St Ivan's church weighs 3551 Russian poods, or 127,836 English pounds. It has always been esteemed a meritorious act of religion to present a church with bells; and the piety of the donor has been measured by their magnitude. According to this mode of estimation, Boris Godunof, who gave a bell of 288,000 pounds to the cathedral of Moscow, was the most pious sovereign of Russia, until he was surpassed by the empress Anne, at whose expence a bell was cast weighing 432,000 pounds, and which exceeded in bigness every bell in the known world. The height of this enormous bell is 19 feet, its circumference at the bottom 21 yards 11 inches; its greatest thickness 23 inches. The beam to which this vast machine was fastened being accidentally burnt, the bell fell down, and a fragment was broken off towards the bottom, which left an aperture large enough to admit two persons abreast without stooping.

The palace, inhabited by the ancient czars, stands at the extremity of the Kremlin. Part of this palace is old, and remains in the same state in which it was built under Ivan Vassilievitch I. The remainder has been successively added at different intervals, without any plan, and in various styles of architecture, which has produced a motley pile of building, remarkable for nothing but the incongruity of the several structures. The top is thickly set with numerous little gilded spires and globes; and a large portion of the front is decorated with the arms of all the provinces which compose the Russian empire. The apartments are in general exceedingly small, excepting one single room called the council chamber, in which the ancient czars used to give audience to foreign ambassadors, and which has been repeatedly described by several English travellers who visited Moscow before the imperial residence was transferred to Petersburgh. The room is large and vaulted, and has in the centre an enormous

scow. enormous pillar of stone which supports the ceiling. In this palace Peter the Great eame into the world, in the year 1672. In that part called the treasury are deposited the erown, jewels, and royal robes, used at the coronation of the sovereign, besides several curiosities relative to the history of the country. Of the great number of churches contained in this eity, two in particular, namely, that of St Michael and that of the Assumption of the Virgin Mary, are remarkable ; the one for being the place where the sovereigns of Russia were formerly interred, and the other where they are crowned. These edifices, which are situated in the Kremlin, are both in the same style of architecture ; and their exterior form, though modelled according to the ancient style of the country, is not absolutely inelegant. In the eathedral of St Michael, which contains the tombs of the Russian sovereigns, the bodies are not, as with us deposited in vaults, or beneath the pavement, but are entombed in raised sepulehres, mostly of brick, in the shape of a eoffin, and about two feet in height.

The cathedral of the Assumption of the Virgin Mary, which has long been appropriated to the coronation of the Russian sovereigns, is the most splendid and magnificent in Moscow. The screen is in many parts covered with plates of solid silver and gold riehly worked. From the centre of the roof hangs an enormous chandelier of massy silver, weighing 2940 pounds : it was made in England, and was a present from Morosof, prime minister and favourite of Alexey Miehaelovitch. The sacred utensils and episcopal vestments are extraordinarily rich, but the taste of the workmanship is in general rude, and by no means equal to the materials. Many of the paintings which cover the inside walls are of a colossal size: some are very ancient, and were executed so early as in the latter end of the 15th century. It contains, amongst the rest a head of the Virgin, supposed to have been delineated by St Luke, and greatly eelebrated in this eountry for its sanctity and the power of working miraeles.

The place in the Khitaigorod, where the public archives are deposited, is a strong brick building, containing several vaulted apartments with iron floors. These archives, consisting of a numerous collection of state papers, were crowded into boxes and thrown aside like common lumber, until the empress Catharine ordered them to be revised and arranged. In conformity to this mandatc, Mr Muller has disposed them in ehronological order with such perfect regularity, that any single document may be inspected with little trouble.

The university of Moseow, all situated in the Khitaigorod, was founded, at the instance of Count Shuvalof. by the empress Elizabeth, for 600 students; who are elothed, boarded, and instructed, at the expence of the erown. Besides this institution, there are two gymnasia or seminaries for the education of youth, endowed also by Elizabeth; in which are taught, by twenty-three professors, divinity, elassies, philosophy, the Greek, Latin, Russian, German, French, Italian, and Tartar languages; history, geography, mathematics, architeeture, fortification, artillery, algebra, draw ing and painting, musie, fencing, daneing, reading and writing.

Moscow is the centre of the inland commerce of Russia, and particularly eonneets the trade between Europe and Siberia. The only navigation to this city is formed by the Moskva, which falling into the Ocea

near Columna, communicates by means of that river Moscow. with the Volga. But as the Moskva is only navigable in spring upon the melting of the snows, the principal merchandise is conveyed to and from Moscow upon sledges in winter. The whole of the retail trade is carried on in the Khitaigorod; where according to a eustom common in Russia, as well as in most kingdoms of the East, all the shops are collected together in one spot. The place is like a kind of fair, consisting of many rows of low briek buildings; the intervals between them resembling alleys. These shops or booths occupy a considerable space; they do not, as with us, make part of the houses inhabited by the tradesmen, but are quite detached from their dwellings, which for the most part are at some distance in another quarter of the town. The tradesman comes to his shop in the morning, remains there all day, and returns home to his family, in the afternoon. Every trade has its separate department; and they who sell the same goods have booths adjoining to each other. Furs and skins form the most considerable article of commerce in Moseow ; and the shops which vend those commodities occupy several streets. Amongst the curiosities of Moscow, the market for

the sale of houses is not the least remarkable. It is held in a large open space in one of the suburbs; and exhibits a great variety of ready-made houses, thickly strewed upon the ground. The purchaser who wants a dwelling, repairs to this spot, mentions the number of rooms he requires, examines the different timbers, which are regularly numbered, and bargains for that which suits him. The house is sometimes paid for on the spot, and taken away by the purchaser; or sometimes the vender contracts to transport and erect it upon the place where it is designed to stand. It may appear ineredible to assert, that a dwelling may be thus bought, removed, raised and inhabited, within the space of a week; but we shall conceive it practicable by considering that these ready-made houses are in general merely collections of trunks of trees tenoned and mortised at each extremity into one another, so that nothing more is required than the labour of transporting and adjusting them. But this summary mode of building is not always peculiar to the meaner hovels; as wooden structures of very large dimensions and handsome appearanee are occasionally formed in Russia with an expedition almost inconceivable to the inhabitants of other countries. A remarkable instance of this dispatch was displayed the last time the empress came to Moscow. Her majesty proposed to reside in the mansion of Prince Galitzin, which is esteemed the completest edifice in this city; but as it was not sufficiently spacious for her reecption, a temporary addition of wood, larger than the original house, and containing a magnificent suite of apartments, was begun and finished within the space of six weeks. This meteor-like fabric was so handsome and commodious, that the materials which were taken down at her majesty's departure, were to be re-constructed as a kind of imperial villa upon an eminenee near the eity. Mr Coxe mentions an admirable police in this eity for preventing riots, or for stopping the eoneourse of people in case of fires, which are very frequent and violent in those parts, where the houses are mostly of wood, and the streets are laid with timber. At the entrance of each street there is a chevaux-de-frize gate, one end whereof turns upon a pivot, and the other rolls upon a wheel;

Moscow. wheel; near it is a centry box in which a man is occasionally stationed. In times of riot or fire the centinel shuts the gate, and all passage is immediately stopped.

Among the public institutions of Moscow, the most remarkable is the Foundling Hospital, endowed in 1764 by the empress Catharine, and supported by voluntary contributions and legacies, and other charitable gifts. In order to encourage donations, her majesty granted to all benefactors some valuable privileges, and a certain degree of rank in proportion to the extent of their liberality. Among the principal contributors must be mentioned a private merchant named Dimidof, a person of great wealth. who has expended in favour of this charity above 100,000l. The hospital, which is situated in a very airy part of the town upon a gentle ascent near the river Moskva, is an immense pile of building of a quadrangular shape, part of which was only finished when Mr Coxc (whose account we are transcribing) was at Moscow. It contained, at that time, three thousand foundlings; and, when the whole is completed, will receive eight thousand. The children are brought to the porter's lodge, and admitted without any recommendation. The rooms are lofty and large ; the dormitories, which are separate from the work rooms, are very airy, and the beds are not crowded : each foundling, even each infant, has a separate bed. The children remain two years in the nursery, when they are admitted into the lowest class; the boys and girls continue together until they are seven years of age, at which time they are separated. They all learn to read, write, and cast accounts. The boys are taught to knit; they occasionally card hemp, flax, and wool, and work in the different manufactures. The girls learn to knit, net, and all kinds of needle work; they spin and weave lace; they are employed in cookery, baking, and house work of all sorts. At the age of fourteen the foundlings enter into the first class, when they have liberty of choosing any particular brauch of trade; and for this purpose there are different species of manufactures cstablished in the hospital, of which the principal are embroidery, silk stockings, ribbands, lace, gloves, buttons, and cabinet work. A separate room is appropriated to each trade. Some boys and girls are instructed in the French and German languages, and a few boys in the Latin tongue; others learn music, drawing, and dancing.

Such was Moscow previous to 1812. The battle of Borodino, on the 7th September, which was gained by the French, though hardly contested, opened their way to this ancient capital of the empire. They entered it on the 15th September; but the governor Rostopchin had previously taken measures for its destruction; and the French had hardly got possession, when they discovered that the city was in flames in many different quarters. The greater part of the inhabitants had withdrawn with the governor. From the love of pillage, the French soldiers, at first, rather aided the progress of the fire; and when they afterwards endeavoured to stop its course, their cfforts were of little avail. The conflagration began on the night of the 14th, and raged with unceasing fury till the 19th; about three-fourths of the city were destroyed. Great and unprecedented as this sacrifice was, it was justified by the happy result it produced. It defeated Bonaparte's purpose of remaining there through the winter, compelled him to make a disastrous retreat, which so completely broke

his strength as to lead to the final overthrow of his Mopower. Large sums were collected in Britain and elsewhere in behalf of the suffering inhabitants; and, Meaccording to late accounts, the city is rising rapidly from its ruins. Moscow was evacuated by the French on the 23d October, after they had destroyed some parts of the town which had escaped the fire. Their attempts to blow up the Kremlin were prevented by the sudden arrival of a large Russian force.

MOSELLE, a river of Germany, which rises in the mountains of Vosges in Lorraine, and falls into the Rhine at Coblentz.

MOSELLE is also the name of a department of France, which includes part of the late province of Lorrain. Its population in 1800 was 353,788 upon a surface of 2525 square miles.

MOSES, the son of Amram and Jochebed, was born in the year 1571 before Christ. Pharaoh king of Egypt, perceiving that the Hebrews were become a formidable nation, issued forth an edict commanding all the male children to be put to death. To avoid this cruel edict, Jochebed, the mother of Moses, having concealed her son for three months, at length made an ark or basket of bulrnshes, daubed it with pitch, laid the child in it, and exposed him on the banks of the Nilc. Thermuthis the king's daughter, who happened to be walking by the river's side, perceived the floating cradle, commanded it to be brought to her, and struck with the beauty of the child, determined to preserve his life. In three years afterwards the princess adopted him for her own son, called his name Moses, and caused him be diligently instructed in all the learning of the Egyptians. But his father and mother, to whom he was restored by a fortunate accident, were at still greater pains to teach him the history and religion of his fathers. Many things are related by historians concerning the first period of Moses's life, which are not to be found in the Old Testament. According to Josephus and Eusebius, he made war on the Ethiopians, and completely defeated them. They add, that the city Saba, in which the enemy had been forced to take refuge, was betrayed into his hands by the king's daughter, who became deeply enamoured of him, when she beheld from the top of the walls his valorous exploits at the head of the Egyptian army. But as the truth of this expedition is more than doubtful, we shall therefore confine ourselves to the narrative of sacred writ, which commences at the fortieth year of Mose's life. He then left the court of Pharaoh, and went to visit his countrymen the Hebrews, who groaned under the ill usage and oppression of their unfeeling masters. Having perceived an Egyptian smiting a Hebrew, he slew the Egyptian, and buried him in the sand. But he was obliged, in consequence of this murder, to fly into the land of Midian, where he married Zipporah, daughter of the priest Jethro, by whom he had two sons, Gershom and Eliezar. Here he lived 40 years; during which time his employment was to tend the flocks of his father-in-law. Having one day led his flock towards Mount Horeb, God appeared to him in the midst of a bush which burned with fire but was not consumed, and commanded him to go and deliver his brethren from their bondage. Moses at first refused to go; but was at length prevailed on by two miracles

2

oses. racles which the Almighty wrought for his conviction. Upon his return to Egypt, he, together with his brother Aaron, went to the court of Pharoah, and told him that God commanded him to let the He. brews go to offer sacrifices in the desert of Arabia. But the impious monarch disregarded this command, and caused the lahour of the Israelites to be doubled. The messengers of the Almighty again returned to the king, and wrought a miracle in his sight, that they might move his heart, and induce him to let the people depart. Aaron having cast down his miraculous rod, it was immediately converted into a serpent : but the same thing being performed by the magicians, the king's heart was hardened more and more; and his obstinacy at last drew down the judgments of the Almighty on his kingdom, which was afflicted with ten dreadful plagues. The first was the changing of the waters of the Nile and of all the rivers into blood, so that the Egyptians died of thirst. In consequence of the second plague, the land was covered with innumerable swarms of frogs, which entered even into Pharach's palace. By the third plague, the dust was converted into lice, which cruelly tormented both man and beast. The fourth plague was a multitude of destructive flies which spread throughout Egypt, and infested the whole country. The fifth was a sudden pcstilence, which destroyed all the cattle of the Egyptians, without injuring those of the Israclites. The sixth produced numberless ulcers and fiery boils upon man and upon beast. The seventh was a dreadful storm of hail, accompanied with thunder and lightning, which destroyed every thing that was in the field, whether man or beast, and spared only the land of Goshen, where the children of Israel dwelt. By the eighth plague swarms of locusts were brought into the country, which devoured evcry green herb, the fruit of the trees and the produce of the harvest. By the ninth plague thick darkness covered all the land of Egypt, except the dwellings of the children of Israel. The tenth and last plague was the death of the firstborn in Egypt, who were all in one night cut off by the destroying angel, from the firstborn of the king to the firstborn of the slaves and of the cattle. This dreadful calamity moved the heart of the hardened Pharaoh, and he at length consented to allow the people of Israel to depart from his kingdom.

Profane authors who have spoken of Moses, seem to have been in part acquainted with these mighty wonders. That he performed miracles, must have been allowed by many, by whom he was considered as a famous magician; and he could scarcely appear in any other light to men who did not acknowledge him for the messenger of the Almighty. Both Diodorus and Herodotus mention the distressed state to which Egypt was reduced by these terrible calamities. The Hebrews, amounting to the number of 600,000 men, without rcckoning women and children, left Egypt on the 15th day of the month Nisan, which, in memory of this deliverance, was thenceforth reekoned the first month of their year. Scarcely had they reached the shore of the Red sea when Pharaoh with a powerful army set out in pursuit of them. On this occasion Moses stretched forth his rod upon the sea; and the waters thereof being divided, remained suspended on both sides till the Hebrews passed through dry-footed .- The Egyptians

determined to follow the same course; but God caused Moses. a violent wind to blow, which brought back the waters to their bed, and the whole army of Pharaoh perished in the waves.

After the miraculous passage of the Red sea, the army proceeded towards Mount Sinai, and arrived at Marah, where the waters were bitter; but Moses, by casting a tree into them, rendered them fit for drinking. Their tenth cncampment was at Rephidim, where Moses drew water from the rock in Horeb, by smiting it with his rod. Here likewise Amalek attacked Israel, While Joshua fought against the Amalekites, Moses stood on the top of a hill, and lifted up his hands; in consequence of which the Israclites prevailed, and cut their enemies in pieces. They at length arrived at the foot of Mount Sinai on the third day of the ninth month after their departure from Egypt. Moscs having ascended several times into the mount, received the law from the hand of God himself in the midst of thunders and lightnings, and eoneluded the famous covenant betwixt the Lord and the children of Israel. When he descended from Sinai, he found that the people had fallen into the idolatrous worship of the golden calf. The messenger of God, shocked at such ingratitude, broke in pieces the tables of the law which he carried in his hands, and put 23,000 of the transgressors to the sword. He afterwards reascended into the mountain, and there obtained new tables of stone on which the law was inscribed. When Moses descended, his face shone so that the Israelites dared not to come nigh unto him, and he was obliged to cover it with a veil. The Israelites were here employed in constructing the tabernacle according to a pattern shown them by-God. It was erected and consecrated at the foot of the Mount Sinai on the first day of the first month of the second year after their departure from Egypt; and it served the Israelites instead of a temple till the time of Solomon, who built a house for the God of his fathers after a model shown him by David.

Moses having dedicated the tabernacle, he consecrated Aaron and his sons to be its ministers, and appointed the Levites to its service. He likewise gave various commandments concerning the worship of God and the political government of the Jews. This was a theocracy in the full extent of the word. God himself governed them immediately by means of his servant Moses, whom he had chosen to be the interpreter of his will to the people; and he required all the honours belonging to their king to be paid unto himself. He dwelt in his tabernacle, which was situated in the middle of the camp, like a monarch in his palace. He gave answers to those who consulted him, and himself denounced punishment against the transgressors of his laws. This properly was the time of the theocracy, taken in its full extent; for God was not only considered as the divinity who was the object of their religious worship, but as the sovereign to whom the honours of supreme majesty were paid. The case was nearly the same under Joshua; who, being filled with the spirit of Moses, undertook nothing without consulting God. Every measure, both of the leader and of the people. was regulated by the direction of the Almighty, who rewarded their fidelity and obedience by a series of. miracles, victories, and successes. After Moses had regulated every thing regarding the civil administration,

Mases.

tion, and the marching of the troops, he led the Israel-Mosheim ites to the confines of Canaan, to the foot of Mount Nebo. Here the Lord commanded him to ascend into the mountain; whence he showed him the promised land, whereinto he was not permitted to enter. He immediately after yielded up the ghost, without sickness or pain, in the 120th year of his age, and 1451 years before Jesus Christ.

1

Moses is incontestably the author of the first five books of the Old Testament, which go by the name of the Pentateuch; and which are acknowledged to be inspired, by the Jews and by Christians of every persuasion. Some, however, have denied that Moses was the author of these books; and have founded their opinion on this, that he always speaks of himself in the But this manner of writing is by no third nerson. means peculiar to Moses; it occurs also in several ancient historians; such as Xenophon, Cæsar, Josephus, & c. who possessed of more modesty or good sense than some modern historians, whose egotism is altogether disgusting, have not like them left to posterity a spectacle of ridiculous vanity and self-conceit. After all, it is proper to observe, that profane authors have related many falsehoods and absurdities concerning Moses, and concerning the origin and the religion of the Jews, with which they were but little acquainted. Plutarch, in his book concerning Isis and Osiris, says, that Judæus and Hierosolymus were brothers, and descended from Typhon; and that the former gave his name to the country and its inhabitants, and the latter to the capital city. Others say that they came from Mount Ida in Phrygia. Strabo is the only author who speaks any thing like reason and truth concerning them; though he too says that they were descended from the Egyptians, and considers Moses their legislator as an Egyptian priest. He acknowledges, however, that they were a people strictly just and sincerely religious. Other authors by whom they are mentioned, seem not to have had the smallest acquaintance either with their laws or their worship. They frequently confound them with the Christians, as is the case with Juvenal, Tacitus, and Quintilian.

MOSHEIM, JOHN LAURENCE, an illustrious German divine, was born in 1695, of a noble family, which might seem to open to his ambition a fair path to civil promotion ; but his zeal for the interests of religion, his thirst after knowledge, and particularly his taste for sacred literature, induced him to consecrate his talents to the service of the church. The German universities loaded him with literary honours; the king of Denmark invited him to settle at Copenhagen ; the duke of Brunswick called him thence to Helmstadt, where he filled the academical chair of divinity; was honoured with the character of ecclesiastical counsellor to the court ; and presided over the seminaries of learning in the duchy of Wolfenbuttle and the principality of Blackenburgh. When a design was formed of giving an uncommon degree of lustre to the universities of Gottingen, by filling it with men of the first rank in letters, Dr Mosheim was deemed worthy to appear at the head of it, in quality of chancellor; and here he died, in 1755, universally lamented. In depth of judgment, in extent of learning, in purity of taste, in the powers of eloquence, and in a laborious application to all the various branches of erudition and philosophy, he had certainly very few superiors. His Latin translation of

Cudworth's Intellectual System, enriched with large Moshe annotations, discovered a profound acquaintance with ancient learning and philosophy. His illustrations of Mosq the Scriptures, his labours in defence of Christianity, and the light he cast upon religion and philosophy, appear in many volumes of sacred and profane literature ; and the Ecclesiastical History, from the birth of Christ to the beginning of the 18th century, is unquestionably the best that is extant. This work, written in Latin, has been translated into English, and accompanied with notes and chronological tables by Archibald Maclaine, D. D. and from this translator's preface to the second edition, 1758, in 5 vols 8vo, this short account is taken.

MOSKITO, or Mosquito country, is situated in North America, between 85 and 88 degrees of west longitude, and between 13 and 15 degrees of north latitude; having the North sea on the north and east, Nicargua on the south, and Honduras on the west; and indeed the Spaniards esteem it a part of the principality of Honduras, though they have no colonies in the Moskito country. When the Spaniards first invaded this part of Mexico, they massacred the greatest part of the natives, which gave those that escaped into the inaccessible part of the country an insuperable aversion to them ; and they have always appeared ready to join any Europeans that come upon their coasts against the Spaniards, and particularly the English, who frequently come hither ; and the Moskito men being excellent marksmen, the English employ them in striking the manati fish, &c. and many of the Moskito Indians come to Jamaica, and sail with the English in their voyages.

These people are so situated between morasses and inaccessible mountains, and a coast full of rocks and shoals, that no attempts against them by the Spaniards, whom they mortally hate, could ever succeed. Nevertheless, they are a mild inoffensive people, of great morality and virtue, and will never trust a man who has once deceived them. They have so great a veneration towards the English, that they have spontaneously put themselves and their lands under the protection and dominion of the crown of England. This was first done when the duke of Albermarle was governor of Jamaica, and the king of the Moskitos received a commission from his grace, under the seal of that island ; and since this time they have been steady in their alliance with the English. But in the year 1786, this country was ceded to Spain, and consequently became a Spanish province.

MOSQUE, a temple or place of religious worship among the Mahometans.

All mosques are square buildings, generally constructed of stone. Before the chief gate there is a square court paved with white marble; and low galleries round it, whose roof is supported by marble pillars. In these gallerics the Turks wash themselves before they go into the mosque. In each mosque there is a great number of lamps; and between these hang many crystal rings, ostrich eggs, and other curiosities, which, when the lamps are lighted, make a fine show. As it it is not lawful to enter the mosque with stockings or shoes on, the pavements are covered with pieces of stuff sewed together, each being wide enough to hold a row of men knceling, sitting, or prostrate. The women are not

MOS

iloss. not allowed to enter the mosque, but stay in the porches without. About every mosque there are six high towers, called minarets, each of which has three little open galleries, one above another : these towers, as well as the mosques, are covered with lead, and adorned with gilding and other ornaments; and from thence. instead of a bell, the people are called to prayers by certain officers appointed for that purpose. Most of the mosques have a kind of hospital belonging to them, in which travellers of what religion soever, are entertained three days. Each mosque has also a place called tarbe. which is the burying-place of its founders; within which is a tomb six or seven feet long, covered with green velvet or satin; at the ends of which are two tapers, and round it several seats for those who read the Koran and pray for the sonls of the deceased.

MOSS or Mosses. See Musci, BOTANY Index.

Moss on Trees, in gardening. The growth of large quantities of moss on any kind of tree is a distemper of very bad consequence to its increase, and much damages the fruit of the trees of our orchards.

The present remedy is the scraping it off from the body and large branches by means of a kind of wooden knife that will not hurt the bark, or with a piece of rough hair cloth, which does very well after a soaking rain. But the most effectual cure is the taking away the cause. This is to be done by draining off all the superfluous moisture from about the roots of the trees, and may be greatly guarded against in the first planting of the trees, by not setting them too deep.

If trees stand too thick in a cold ground, they will always be covered with moss; and the best way to remedy the fault is to thin them. When the young branches of trees are covered with a long and shaggy moss, it will utterly ruin them; and there is no way to prevent it but to cut off the branches near the trunk, and even to take off the head of the tree if necessary; for it will sprout again; and if the cause be in the mean time removed by thinning the plantation, or draining the land and stirring the ground well, the young shoots will continue clear after this.

If the trees be covered with moss in consequence of the ground's being too dry, as this will happen from either extreme in the soil, then the proper remedy is the laying mud from the bottom of a pond or river pretty thick about the root, opening the ground to some distance and depth to let it in; this will not only cool it, and prevent its giving growth to any great quantity of moss, but it will also prevent the other great mischief which fruit-trees are liable to in dry grounds, which is the falling off of the fruit too early.

The mosses which cover the trunks of trees, as they always are freshest and most vigorous on the side which points to the north, if only produced on that, serve to preserve the trunk of the tree from the severity of the north winds, and direct the traveller in his way, by always plainly pointing out that part of the compass.

Moss is also a name given to boggy ground in many parts of England, otherwise called a *fen* and *bog*.

In many of these grounds, as well in England and Ireland as in other parts of the world, there are found vast numbers of trees standing with their stumps erect, and their roots piercing the ground in a natural po-Vol. XIV. Part II. sture as when growing. Many of those trees are broken or cut off near the roots, and lie along, and this usually in a north-east direction. People who have been willing to account for this, have usually resolved it into the effect of the deluge in the days of Noah; but this is a very wild conjecture, and is proved false by many unanswerable arguments. The waters of this deluge might indeed have washed together a great number of trees, and buried them under loads of earth; but then they would have lain irregnlarly and at random; whereas they all lie lengthwise from southwest to north-east, and the roots all stand in their natural perpendicular posture, as close as the roots of trees in a forest.

Besides, these trees are not all in their natural state, but many of them have the evident marks of human workmanship upon them, some being cut down with an axe, some split, and the wedges still remaining in them; some burnt in different parts, and some bored through with holes. These things are also proved to be of a later date than the deluge, by other matters found among them, such as utensils of ancient people, and coins of the Roman emperors.

It appears from the whole, that all the trees which we find in this fossil state, originally grew in the very places where we now find them, and have only been thrown down and buried there, not brought from elsewhere. It may appear indeed an objection to this opinion, that most of these fossil trees are of the fir kind ; and that Cæsar says expressly, that no firs grew in Britain in his time; but this is easily answered, by observing, that these trees, though of the fir kind, yet are not the species usually called the fir, but pitch-tree; and Cæsar has no where said that pitch-trees did not grow in England. Norway and Sweden yet abound with these trees; and there are at this time whole forests of them in many parts of Scotland, and a large number of them wild upon a hill at Wareton in Staffordshire to this day.

In Hatfield marsh, where such vast numbers of the fossil trees are now found, there has evidently once been a whole forest of them growing. The last of these was found alive, and growing in that place within 70 years last past, and cut down for some common use.

It is also objected by some to the system of the firs growing where they are found fossil, that these countrics are all bogs and moors, whereas these sorts of trees grow only in mountainous places. But this is founded on an error; for though in Norway and Sweden, and some other cold countries, the fir kinds all grow upon barren and dry rocky mountains, yet in warmer places they are found to thrive as well on wet plains. Such are found plentifully in Pomerania, Livonia, and Courland, &c. and in the west parts of New England there are vast numbers of fine stately trees of them in low grounds. The whole truth seems to be, that these trees love a sandy soil; and such as is found at the bottoms of all the mosses where these trees are found fossil. The roots of the fir kind are always found fixed in these; and those of oaks, where they arc found fossil in this manner, are usually found fixed in elay; so that each kind of tree is always found rooted in the places where they stand in their proper soil; and there is no doubt to be made but that they ori-3 1 ginally

Moss.

ginally grew there. When we have thus found that all the fossil trees we meet with once grew in the places where they are now buried, it is plain that in these places there were once noble forests, which have been destroyed at some time; and the question only remains how and by whom they were destroyed. This we have reason to believe, by the Roman coins found among them, was done by the people of that empire, and that at the time when they were established or establishing themselves here.

Their own historians tell us, that when their armies pursued the wild Britons, these people always sheltered themselves in the miry woods and low watery forests. Cæsar expressly says this; and observes, that Cassibelanus and his Britons, after their defeat, passed the Thames, and fled into such low morasses and woods, that there was no pursuing them : and we find that the Silures secured themselves in the same manner when attacked by Ostorius and Agricola. The same thing is recorded of Venutius king of the Brigantes, who fled to secure himself into the boggy forests of the midland part of this kingdom : and Herodian expressly says, that in the time of the Romans pushing their conquests in these islands, it was the custom of the Britons to secure themselves in the thick forests which grew in their boggy and wet places, and when opportunity offered, to issue out thenee and fall upon the Romans. The consequence of all this was the destroying all these forests; the Romans finding themselves so plagued with parties of the natives issuing out upon them at times from these forests, that they gave orders for the cutting down and destroying all the forests in Britain which grew on boggy and wet These orders were punctually executed; grounds. and to this it is owing that at this day we can hardly be brought to believe that such forests ever grew with us as are now found buried.

The Roman historians all agree, that when Suetonius Paulinus conquered Anglesea, he ordered all the woods to be cut down there, in the manner of the Roman generals in England: and Galen tells us, that the Romans, after their conquest in Britain, kept their soldiers constantly employed in cutting down forests, draining of marshes, and paving of bogs. Not only the Roman soldiers were employed in this manner, but all the native Britons made captives in the wars were obliged to assist in it : and Dion Cassius tells us, that the emperor Severus lost no less than 50,000 men in a few years time in cutting down the woods and draining the bogs of this island. It is not to be wondered at, that such numbers executed the immense destruction which we find in these buried forests. One of the greatest subterranean treasures of wood is that near Hatfield; and it is easy to prove, that these people, to whom this havock is thus attributed, were upon the spot where these trees now lie buried. The common road of the Romans out of the south into the north, was formerly from Lindum (Lincoln), to Segelochum (Little Burrow upon Trent), and from thence to Danum (Doncaster), where they kept a standing garrison of Crispinian horse. A little off on the east, and north-east of their road, between the two last-named towns, lay the borders of the greatest forest, which swarmed with wild Britons, who were continually making their sallies out, and their retreats into it again, in-

tcrcepting their provisions, taking and destroying their carriages, killing their allies and passengers, and disturbing their garrisons. This at length so exasperated the Romans, that they were determined to destroy it; and to do this safely and effectually, they marched against it with a great army, and encamped on a great moor not far from Finningly; this is evident from their fortifications yet remaining.

There is a small town in the neighbourhood called Osterfield; and as the termination field seems to have been given only in remembrance of battles fought near the towns whose names ended with it, it is not improbable that a battle was fought here between all the Britons who inhabited this forest and the Roman troops under Ostorius. The Romaus slew many of the Britons, and drove the rest back into this forest, which at that time overspread all this low country. On this the conquerors taking advantage of a strong south-west wind, set fire to the pitch-trees, of which this forest was principally composed; and when the greater part of the trees were thus destroyed, the Roman soldiers and captive Britons cut down the remainder, except a few large ones which they left standing as remembrances of the destruction of the rest. These single trees, however, could not stand long against the winds, and these falling into the rivers which run through the country, interrupted their currents; and the water then overspreading the level country, made one great lake, and gave origin to the mosses or moory bogs, which were afterwards formed there, by the workings of the waters, the precipitation of earthy matter from them, and the putrefaction of rotten houghs and branches of trees, and the vast increase of water-moss and other such plants which grow in prodigious abundance in all these sorts of places. Thus were these burnt and felled trees buried under a new-formed spongy and watery earth, and afterwards found on the draining and digging through this earth again.

Hence it is not strange that Roman weapons and Roman coins are found among these buried trees; and hence it is that among the buried trees some arc found burnt, some chopped and hewn; and hence it is that the bodies of the trees all lic by their proper roots, and with their tops lying north-east, that is, in that direction in whick a south-west wind would have blown them down : hence also it is, that some of the trees arc found with their roots lying flat, these being not cut or burned down, but blown up hy the roots afterwards when left single; and it is not wonderful, that such trees as these should have continued to grow even after their fall, and shoot up branches from their sides which might easily grow into high trees. Phil. Trans. N° 275.

By this system it is also easily explained why the moor soil in the country is in some places two or three yards thicker than in others, or higher than it was formerly, since the growing up of peat-earth or bogground is well known, and the soil added by overflowing of waters is not a little.

As the Romans were the destroyers of this great and noble forest, so they were probably also of the sevcral other ancient forests; the ruins of which furnish us with the bog-wood of Staffordshire, Lancashire, Yorkshire, and other counties. But as the Romans were not much in Wales, in the Isle of Man, or in

3

1880

in Ireland, it is not to be supposed that forests cut down by these people gave origin to the fossil wood found there; but though they did not cut down these forests, others did; and the origin of the bog-wood is the same with them and with us. Holingshed informs us, that Edward I. being not able to get at the Welsh because of their hiding themselves in boggy woods, gave orders at length that they should all be destroyed by fire and by the axe; and doubtless the roots and bodies of trees found in Pembrokeshire under ground, are the remains of the execution of this order. The fossil wood in the bogs of the island of Man is doubtless of the same origin, though we have not any account extant of the time or occasion of the forests there being destroyed; but as to the fossil trees of the bogs of Ireland, we are expressly told that Henry II. when he conquered that country, ordered all the woods to be cut down that grew in the low parts of it, to secure his conquests, by cutting away the places of resort of rebels. For a fuller detail of the natural history of mosscs, see Essays on this subject by the Rev. Mr Rennie of Kilsyth.

MOVING-MOSS. We have an account in the Philosophical Transactions of a moving moss near Churchtown in Lancashire, which greatly alarmed the neighbourhood as miraculous. The moss was observed to rise to a surprising height, and soon after sunk as much below the level, and moved slowly towards the south.

A very surprising instance of a moving moss is that of Solway in Scotland, which happened in the year 1771, after severe rains which had produced terrible inundations of the rivers in many places. For the better understanding of this event, we shall give the following description of the spot of ground where it happened. Along the side of the river Esk there is a vale, about a mile broad, less or more in different places. It is bounded on the south-east by the river Esk, and on the north-west by a steep bank 30 feet in height above the level of the vale. From the top of the bank the ground rises in an casy ascent for about a quarter of a mile, where it is terminated by the moss ; which extends about two miles north and south, and about a mile and a half east and west, and is bounded on the north west by the river Sark. It is probable that the solid ground from the top of the bank above the vale was continued in the same direction under the moss, before its eruption, for a considerable space; for the moss at the place where the eruption happened, was inclined towards the sloping ground. From the edge of the moss there was a gully or hollow; called by the country people the gap, and said to be 30 yards deep where it entered the vale; down which ran a small rill of water, which was often dry in summer, having no supply but what filtered from the moss. The eruption happened at the head of this gap, on Saturday November 16. 1771, about ten or eleven at night, when all the neighbouring rivers and brooks were prodigiously swelled by the rains. A large body of the moss was forced, partly by the great fall of rain, and partly by some springs below it, into a small beek or burn, which runs within a few yards of its border to the south east. By the united pressure of the water behind it, and of this beck, which was then very high, it was carried down a narrow glen between two

banks about 300 feet high, into a wide and spacious plain, over part of which it spread with great rapidity. The moss continued for some time to send off considerable quantities; which being borne along by the torrent on the back of the first great body, kept it for many hours in perpetual motion, and drove it still farther on. This night at least 400 acres of fine arable land were covered with moss from 3 to 12 or 15 feet dcep. Several houses were destroyed, a good deal of corn lost, &c. but all the inhabitants escaped. When the waters subsided, the moss also ceased to flow; but two pretty considerable streams continued to run from the heart of it, and carried off some pieces of mossy matter to the place where it burst. There they joined the beck already mentioned ; which, with this addition, resumed its former channel; and, with a little assistance from the people of the neighbourhood, made its way to the Esk, through the midst of that great body of moss which obstructed its course. Thus, in a great measure drained, the new moss fell several feet, when the fair weather came in the end of November, and settled in a firmer and more solid body on the lands it had overrun. By this inundation about 800 acres of arable ground were overflowed before the moss stopped, and the habitations of 27 families destroyed. Tradition has preserved the memory of a similar inundation in Monteith in Scotland. A moss there altered its course in one night, and covered a great extent of ground.

Moss Troopers, a rebellious sort of people in the north of England, who lived by robbery and rapine, not unlike the tories in Ireland, the bucaniers in Jamaica, or banditti of Italy. The counties of Northumberland and Cumberland were formerly charged with a yearly sum, and a command of men, to be appointed by justices of the peace, to apprehend and suppress them.

MOSTRA, in the Italian music, a mark at the end of a line or space, to show that the first note of the next line is in that place : and if this note be accompanied with a sharp or flat, it is proper to place these characters along with the mostra.

MOSUL, or MOUSUL. See MOUSUL.

MOTACILLA, the WAGTAIL and WARBLER; a genus of birds of the order of passeres. See ORNI-THOLOGY Index.

MOTE, in law books, signifies court or convention; as ward mote, burgh mote, swain mote, &c.

MOTE was also used for a fortress or castle; as mota de Windsor, &c.

MOTE also denoted a standing water to keep fish in ; and sometimes a large ditch encompassing a castle or dwelling house.

Mote-Bell, or Mot-bell, the bell so called, which was used by the English Saxons to call people together to the court. See FOLKMOTE.

MOTH. See PHALÆNA, ENTOMOLOGY Index.

MOTHER, a term of relation, denoting a woman who hath born a child.

Mother-of-Pearl. See MYTILUS, CONCHOLOGY Index.

MOTION is now generally considered as incapable Motion. of definition, being a simple idea or notion received by the senses. The ancients, however, thought differently. Some of them defined it to be a passage out of one state into another; which conveys no idea to him 3 L 2 who

Moss Motion.

Motion. who is ignorant of the nature of motion .- The Peripatetie definition has been mentioned elsewhere and shown to be wholly unintelligible, as well as their celebrated division of motion into four classes, belonging to the 2 three categories, quality, quantity, and where; (see Several de-METAPHYSICS, Nº 188, 189, 190). The Cartesians, finitious of. too, among the moderns, pretend to define motion, by calling it a passage or removal of one part of matter, ont of the ucighbourhood of those parts to which it is immediately contiguous, into the neighbourhood of others. Borelli defines motion to be the successive passage of a body from place to place. Others say that it is the application of a body to different parts of infinite and immoveable space; and a late writer \* of uncommon acuteness has given as a definition of mothe Powers tion-change of place.

We have elsewhere offered our opinion of every pos-Nature, by sible attempt to define motion : but as the author of the last quoted definition has endeavoured to obviate such objections as ours, candour requires that he be heard for himself. " It is said (he observes) by some, that change implies motion, and therefore cannot be a part of its definition, being the very thing defined. To this I answer, We are speaking of the sensible idea of motion, as it appears to our sight; now changes do appear to our view, and to all our senses, which give us no idea of motion. Changes in heat or cold; in colour, flavour, smell. sound, hardness, softness, pain, pleasure; in these, and many other ideas, changes do not produce ideas like that produced by a ball rolling or a stone falling. We may perhaps ultimately trace them to motion, but to insensible motions; to motions which arise only in reflection, and constitute no part of the actual idea of change. We can therefore conceive of change, without conceiving at the same time of motion .- Change is a generic idea, including many species ; motion, as a sensible idea, is a species of that genus. Change is therefore a necessary part of the definition of motion; it marks the genus of the thing defined. Motion is a change; but as there are many species of change, which of those species is motion? The answer is, It is a change of place. This marks the species; and distinguishes it from change of colour, of temperament and figure."

This is the ablest defence of an attempt to define motion that we have ever seen ; and at first view the definition itself appears to be perfect. Aristotle, the prince of definers, " considers a definition + as a speech declaring what a thing is. Every thing essential to the thing defined, and nothing more, must be contained in the definition. Now the essence of a thing consists of these two parts: first, what is common to it with other things of the same kind; and secondly, what distinguishes it from other things of the same kind. The first is called the genus of the thing; the second, its specific difference. The definition, therefore, consists of these two parts."

Shown not to declare what the thing is; and therefore to be no defininon.

In obedience to this rule, the definition under consideration seems to consist of the genus, signified by the word change ; and of the specific difference, denoted by the words of place. But does the speech change of place really declare what motion is ? We cannot admit that it docs; as, in our apprehension, a change of place is the effect of motion, and not motion itself. Suppose a lover of dialectic undertaking to define the stroke by

T 0 M

which he saw his neighbour wounded with a bludgeon; Motion what should we think of his art were he to call it a contusion on the head ? He might say that contusion is a general term, as contusions may be produced on the arms, on the legs, and on various parts of the body; and as there arc many species of contusion, if he were asked which of those species was the stroke to be dcfined, he might answer, " a contusion on the head." Here would be apparently the genus and specific difference; the former denoted by contusion, and the latter by the words on the head. But would this be a definition of a stroke ? No, surely : a contusion on the head may be the effect of a stroke; but it can no more be the stroke itself, than a blow can be a bludgeon, or a flesh wound the point of a sword. Equally evident it is, that a change of place cannot be motion; because every body must have been actually moved before we can discern, or even conceive, a change of its place.

The act of changing the place would perhaps come nearer to a definition of motion; but so far would it be from "a speech declaring what motion is," that we are confident a man who had never by any of his senses perceived a body in actual motion, would acquire no ideas whatever from the words " act of changing place." He might have experienced changes in heat, cold, smell, and sound; but he could not possibly combine the ideas of such changes with the signification of the word place, were he even capable of understanding that word, which to us appears to be more than doubtful. (See METAPHYSICS, Nº 40, 41.).

The distinctions of motion into different kinds have The dis been no less various, and no less insignificant, than the tinction several definitions of it. The moderns who reject the different Peripatetic division of motion into four classes, yet con-kinds in sider it themselves as either absolute or relative. Thus nificant we are told, that " absolute motion is the change of absolute place, and that its celerity must be measured by the quantity of absolute space which the moving body runs through in a given time." " Relative motion, on the other hand, is a mutation of the relative or vulgar place of the moving body, and has its celerity estimated, by the quantity of relative space run through."

Now it is obvious, that this distinction conveys no. ideas without a farther explanation of the terms by which it is expressed; but that explanation is impossible to be given. Thus, before we can understand what absolute motion is, we must understand what is meant by absolute place. But absolute place is a contradiction; for all place is relative, and consists in the positions of different bodies with regard to one another. Were a globe in the regions of empty space to be put in motion by Almighty Power, and all the rest of the corporeal world to be soon afterwards annihilated, the motion would undoubtedly continue unchanged; and yet, according to this distinction, it would be at first relative, and afterwards absolute. That the beginning of such a motion would be perceptible, and the remainder of it imperceptible, is readily granted; but on this ac- The opi count to consider it as of two kinds, is as absurd as to nions of suppose the motion of the minute hand of a clock to be the Carl siens an affected by onr looking at it.

Leaving therefore these unintelligible distinctions, of New we now come to consider a question still of a very abstruse nature, but much agitated among philosophers, of motion viz.

ion. viz. What is the original source of motion in the creation: Is it natural to matter? or are we to ascribe it to the immediate and continual agency of some immaterial being? The former has been strenuously argued by the Cartesians, and the latter by the Newtonians. The arguments of the former, founded upon the chimerical hypothesis of vortices and the original construction of matter, were evidently inconclusive; and the hypothesis of Sir Isaac Newton, who asserted that it was naturally incapable of motion, appeared more probable. To account for the quantity of motion in the universe, therefore, it became necessary to have recourse either to the Deity, or to some subordinate spiritual agent; and this became the more necessary, as the doctrine of an absolute vacuum in the celestial spaces, that is, throughout the incomparably greatest part of the creation, was one of the fundamental maxims of the system. As it was absolutely denied that matter existed in these spaces, and it was plain that the celestial bodies affected one another at immense distances, the powers of attraction and repulsion were naturally called in as the sources of motion by their impulse upon inert and sluggish matter. These being admitted, a speculution ensued concerning their nature. Spiritual, it was confessed, they were; but whether they were to be accounted the immediate action of the divine Spirit himself, or that of some subordinate and inferior spirit, was a matter of no little dispute. Sir Isaac Newton, towards the latter part of his life, began to relax somewhat of the rigidity of his former doctrine; and allowed that a very subtle medium, which he called æther, might be the cause of attraction and repulsion, and thus of the whole phenomena of nature. Since his time the multitude of discoveries in electricity, the similarity of that fluid to fire and light, with the vast influence it has on every part of the creation with which we are acquainted, have rendered it very probable that the æther mentioned by Sir Isaac is no other than the element of fire, " the most subtle + and elastic of all bodies, which seems to pervade and expand itself throughout the whole universe. Electrical experiments show that this mighty agent is everywhere present, ready to break forth into action, if not restrained and governed with the greatest wisdom. Being always restless and in motion, it actuates and enlivens the whole visible mass; is equally fitted to produce and to destroy; distinguishes the various stages of nature, and keeps up the perpetual round of generations and corruptions, pregnant with forms which it constantly sends forth and resorbs. So quick in its motions, so subtle and penetrating in its nature, so extensive in its effects, it seemeth no other than the vegetative soul or vital spirit of the world.

ttra on

nd inl.

"The animal spirit in man is the instrument both of sense and motion. To suppose sense in the corporeal world would be gross and unwarranted ; but locomotive faculties are evident in all its parts. The Pythagoreans, Platonists, and Stoics, held the world to be an animal; though some of them have chosen to consider it as a vegetable. However, the phenomena do plainly show, that there is a spirit that moves, and a mind or providence that presides. This providence, Plutarch saith, was thought to be in regard to the world what the soul is in regard to man. The order and course of things, and the experiments we daily

make, show that there is a mind which governs and Motion. actuates this mundane system as the proper and real agent and cause; and that the inferior instrumental cause is pure æther, fire, or the substance of light, which is applied and determined by an infinite mind in the macrocosm or universe, with unlimited power, and according to stated rules, as it is in the microcosm with limited power and skill by the human mind. We have no proof either from experiment or reason of any other agent or efficient cause than the mind or spirit. When, therefore, we speak of corporeal agents or corporeal causes, this is to be understood in a different, subordinate, and improper sense; and such an agent we know light or elementary fire to be."

That this elementary fire, absorbed and fixed in all Experi-bodies, may be the cause of the universal principle of ving that gravity, is made sufficiently evident by numberless ex-a suble periments. Homberg having calcined in the focus of æther may a burning glass some regulus of antimony, found that be the imit had gained one-tenth in weight, though the regu-eause of lus, during the whole time of the operation, sent up the planea thick smoke, and thereby lost a considerable part of tary moits own substance. It is vain to allege that any he-tions, &c. terogeneous matter floating in the air, or that the air itself, may have been hurried into the mass by the action of the fire, and that by this additional matter the weight was increased; for it is known experimentally, that if a quantity of metal be even hermetically securcd within a vessel of glass to keep off the air and all foreign matter, and the vessel be placed for some time in a strong hre, it will exhibit the same effect. " I have seen the operation performed (says Mr Jones +) on two + Essay on ounces of pewter filings, hermetically sealed up in a the First Florence flask, which in two hours gained 55 grains, of Natural that is nearly one 17th. Had it remained longer in Philosophy. the fire, it might probably have gained something more; as, in one of Mr Boyle's experiments, steel filings were found to have gained a fourth.

" Of accounting for these effects there are but two possible ways : 1. If the quantity of matter be the same, or, in the case of calcination, be somewhat less, after being exposed to the action of the fire, while the gravity of the whole is become greater; then does it follow, that gravity is not according to the quantity of matter, and of course is not one of its properties. 2. If there be an increase of the mass, it can be imputed to nothing but the matter of light or fire entangled in its passage through the substance, and so fixed in its pores, or combined with its solid parts, as to gravitate together with it. Yet it is certain, from the phenomenon of light darting from the sun, that this elementary fire does not gravitate till it is fixed in metal, or some other solid substance .- Here then we have a fluid which gravitates, if it gravitate at all, in some cases and not in others. So that which way soever the experiment be interpreted, we are forced to conclude that elementary or solar fire may be the cause of the law of gravitation."

That it is likewise in many cases the cause of repulsion, is known to every one who has seen it fuse metals, and convert water and mercury into elastic vapour. But there is a fact recorded by Mr Jones, which seems . to evince that the same fluid, which as it issues from the sun exhibits itself in the form of light and heat, is in other circumstances converted into a very fine air,

MTD.

T M 0

Motion.

or cold æther, which rushes very forcibly towards the body of that luminary. " As a sequel to what has been observed (says he) concerning the impregnation of solid substances with the particles of fire, give me leave to subjoin an experiment of M. de Stair. Hc tells us, that upon heating red lead in a glass whence the air was exhausted by the rays of the sun collected in a burning glass, the vessel in which the said red lead was contained burst in pieces with a great noise. Now, as all explosions in general must be ascribed either to an admission of the air into a rarefied space, or to what is called the generation of it; and as air was not admitted upon this oceasion, it must have been generated from the calx within the vessel; and certainly was so, because Dr Hales has made it appear that this substance, like crude tartar and many others, will yield a considerable quantity of air in distillation. What went into the metal therefore as fire, came out of it again as air; which in a manner forces upon us conclusions of inestimable value in natural philosophy, and such as may earry us very far into the most sublime part of it."

454

One of the conclusions which the ingenious author thinks thus foreed upon us, is, that the motion of the planets round the sun, as well as round their own axes, is to be attributed to the continual agency of this fluid, under its two forms of elementary fire and pure air. As fire and light, we know that it rushes with inconecivable rapidity from the body of the sun, and penetrates every corporeal substance, exerting itself sometimes with such foree as nothing with which we are acquainted is able to resist. If it be indeed a fact, that this elementary fire, or principle of light and heat, afterwards cools, and becomes pure air, there cannot be a doubt, but that under such a form it will return with great force, though surely in a somewhat different direction, towards the sun, forming a vortex, in which the planets are included, and by which they must of eourse be carried round the eentrc. Mr Jones does not suppose that the air into which the principle of light and heat is converted, is of so gross a nature as our atmosphere. He rather considers it as cool æther, just as he represents light to be æther heated : but he maintains, that this æther, in its aërial form, though not fit for human respiration, is a better pabulum of fire than the air which we breathe.

This theory is exceedingly plausible; and the author supports it by many experiments. He has not, indeed, convinced us that the solar light is converted or convertible into pure air; but he has, by just reasoning from undoubted facts, proved that the whole expanse of heaven, as far as eomets wander, is filled not only with light, which is indeed obvious to the senses, but also with a fluid, which, whatever it may be called, supplies the place of the air in feeding the fire of these ignited bodies.

The existan æther. however, does not solve the phenomena.

That the motion of the heavenly bodies should reence of such sult from the perpetual agency of such a medium, appears to us a much more rational hypothesis, than that which makes them act upon each other at immense dicompletely stances through empty space, But the hypothesis is by no means so complete a solution of the phenomena as some of its fond admirers pretend to think it. This fluid, whether called æther, heat, light, or air, is still

T M O

material; and the question returns upon him who Motion imagines that it is sufficient to account for gravitation, repulsion, magnetism, and cohesion, &c. " What moves the fluid itself, and makes the parts of which it is composed cohere together ?" However widely it may be extended, it is ineapable of positive infinity; and therefore may be divided into parts separated from each other; so that it must be held together by a foreign force, as well as a ball of lead, or a piece of wax. As matter is not essentially active, the motion of this æther, under both its forms, must likewise be considered as an effect, for which we do not think that any propelling power in the body of the sun can be admitted as a sufficient eause. For how comes the sun to possess that power, and what makes the fluid return to the sun? We have no notion of power, in the proper sense of the word, but as intelligence and volition; and, by the pious and excellent author of the Essay on the First Principles of Natural Philosophy, we are certain that the sun was never supposed to be intelligent.

Bishop Berkeley, who admits of light or æther as It is the the instrumental cause of all corporeal motion, gets rid fore by of this difficulty, by supposing, with the ancients, that some supposed to this powerful agent is animated. " According to the animate Pythagoreans and Platonists (says his Lordship \*), \* Siris, there is a life infused throughout all things; the mug No 277 voreon, mug mexnixon, an intellectual and artificial fire, an inward principle, animal spirit, or natural life, producing and forming within, as art doth without ; regulating, moderating, and reconciling the various motions, qualities, and parts of the mundane system. By virtue of this life, the great masses are held together in their ordinary courses, as well as the minutest particles governed in their natural motions, according to the several laws of attraction, gravity, electricity, magnetism, and the rest. It is this gives instincts, teaches the spider her web, and the bee her honey. This it is that directs the roots of plants to draw forth juices from the earth, and the leaves and cortical vessels to separate and attract such particles of air and elementary fire as suit their respective natures."

This life or animal spirit seems to be the same thing which Cudworth ealls plastic nature, and which has been considered elsewhere. (See METAPHYSICS, Nº 200, and *PLASTIC Nature*). We shall therefore dismiss it at present, with just admitting the truth of the bishop's position, " that if nature be supposed the life of the world, animated by one soul, compacted into one frame, and directed or governed in all its parts by one supreme and distinct intelligence, this system cannot be accused of atheism, though perhaps it may of mistake or impropriety."

A theory of motion somewhat similar to that of A new t Berkeley, though in several respects different from it, tion, was not many years ago stated with great clearness, and supported with much ingenuity, in An Essay on the Powers and Mechanism of Nature, intended to improve, and more firmly establish, the grand superstructure of the Newtonian system. Mr Young, the author of the essay, admits with most other philosophers of the present age, that body is composed of atoms which are impenetrable to each other, and may be denominated solid. These atoms, however, he does not consider as primary and simple elements, incapable of resolution into principles;

by ppos-

nu trse.

Protof

the wist-

455

tion ciples; but thinks that they are formed by certain motions of the parts of a substance immaterial and essentially active.

As this notion is uncommon, and the offspring of in hat a a vigorous mind, we shall consider it more attentively summer under the article  $P_{LASTIC}$  Nature. It is mentioned at ec e per- present as a necessary introduction to the author's theory ra, the of motion, of which he attributes both the origin and the continuance to the agency of this elementary substanec pervading the most solid atoms of the densest bodies. Of every body and every atom he holds the constituent principles to be essentially active : but those principles act in such a manner as to conterbalance each other; so that the atom or body considered as a whole is inert, unless in so far as it resists the compression or separation of its parts. No body or atom can of itself begin to move, or continue in motion for a single instant : but being pervious to the active substance, and coalescing with it, that substance, when it enters any body, it carries it along with it, till, meeting some other body in the way, either the whole of the active substance lodged in the former body passes into the obstaele, in which case the impelling body instantly ceases to move : or else part of that substance passes into the obstacle, and part remains in the impelling body; and in this case both bodies are moved with a velocity in proportion to the quantity of matter which cach contains, combined with the quantity of active substance by which they are respectively penetrated.

In order to pave the way for his proof of the existence of one uniform active substance, he observes, that " change being an essentially constituent part of mosub-tion, and change implying action, it follows that all motion implies action, and depends on an active cause. Every motion (he continues) has a beginning, a mid-dle, and an end. The beginning is a change from rest to motion; the middle is a continuance in motion; the end is a change from motion to rest." He then proceeds to show, that the beginning of motion is by an action begun; the continuance of motion by an action continued; and the end of motion by a cessation of action.

" The first of these positions is admitted by every body. That the continuance of motion is by an action continued, will be proved, if it shall be shown that the continuance of a motion is nothing different from its beginning, in regard to any point of time assumed in the continued motion. Now the beginning of motion (he says) consists in the beginning of change of place. But if any given portions of time and of space are assumed, a body beginning to move in the commencement of that time, and in the first portion of the space assumed, then and there begins that particular motion : and whether before the body began to move in that space it was moving in other spaces and times, has no relation to the motion in question; for this being in a space and time altogether distinct, is a distinct motion from any which might have preceded it immediately, as much as from a motion which preceded it a thousand years before. It is therefore a new motion begun; and so it may be said of every assumable point in the continued motion. The term continued serves only to connect any two distinct motions, the end of one with the beginning of the other; but does not destroy their distinctness."

He then proceeds to combat, which he does very Motion. successfully, the arguments by which the more rigid -Newtonians endeavour to prove that a body in motion will continue to be moved by its own inertia, till stopt by some opposite force. Having done this, he establishes the contrary conclusion by the following syllogisms :

- " I. Whatever requires an active force to stop its motion, is disposed to move.
  - Every body in motion requires an active force to stop its motion :
  - Therefore every body in motion is disposed to move.
- " II. Whatever is disposed to motion is possessed of action.
  - But a body in motion is disposed to continuc in motion :
  - Therefore a body in motion is possessed of action.

Thus it appears, that the middle part of any motion is action equally with the beginning.

"The last part of motion is its termination. It is admitted that all motion is terminated by an action contrary to the direction of the motion. It is admitted, too, that the moving body acts at the time its motion is destroyed. Thus the beginning and the end of any uniform motion arc confessed to be actions; but all the intermediate continuation which connects the beginning with the end is denied to be action. What can be more unaccountable than this denial? Is it not more consonant to reason and analogy, to ascribe to the whole continued motion one uninterrupted action? Such a conclusion true philosophy, we think, requires us to make.

"To move or act, is an attribute which cannot be conceived to exist without a substance. The action of a body in motion is indeed the attribute of the body, and the body relatively to its own motion is truly a substance, having the attribute or quality of motion. But the body being a name signifying a combination of certain ideas, which ideas are found to arise from action (see PLASTIC Nature), that action which is productive of those ideas whose combination we denominate body, is of the nature of an attribute so long as it is considered as constituted of action .- To this attribute we must necessarily assign its substance. The actions which constitute body must be actions of something, or there must be something which aets. When then is this ACTIVE SOMETHING, from whose agency we get the idea of body, or whose actions constitute body? Is it not sufficient that it is something active ? A name might be surely given it, but a name would not render the idea more clear. Its description may be found in every sensation ; it is colour to the eyc, flavour to the palate, odonr to the nose, sound to the ear, and feeling to the touch ; for all our sensations are but so many ways in which this ACTIVE SOMETHING is manifested to us. A substratum of solidity philosophers have imagined to exist, and have in vain sought to find. Our ACTIVE SUBSTANCE is the substratum so long sought for, and with so little success. We give it a quality by which it may be perceived; it ACTS. One modification of action produces MATTER, another generates MOTION. These modifications of action are modes of the active substance, whose presence is action : matter and motion constitute

14 Which is unintelligent,

Motion. constitute the whole of nature. THERE IS THEREFORE THROUGHOUT NATURE AN ACTIVE SUBSTANCE, THE CONSTITUENT ESSENCE OF MATTER, AND IMMEDIATE NATURAL AGENT IN ALL EFFECTS."

By an argument which we do not think very conclusive, our author determines this active substance to be unintelligent. " In our sensations individually, not discovering (says he) the traces, not seeing the characters of intelligence, but finding only action present and neccssary, our inferences go no farther than our observations warrant us to do; and we conclude in all these things an action only, and that action unintelligent." Having given our opinion of real agency elsewhere (see METAPHYSICS, Nº 118), we shall not here stop to examine this reasoning .- We may however ask, Whether all our sensations individually be not excited for a certain end? If they be, according to our author's mode of arguing in another place, the exciting agent should be an intelligent being. By this we are far from meaning to deny the reality of a secondary or instrumental cause of sensation which is destitute of intelligence. We are strongly inclined to think that there is such a cause, though our persuasion results not from this argument of our author's. In our opinion, he reasons better when he says, " that a subordinate agent constructed as the matter of creation, invested with perpetual laws, and producing agreeably to those laws all the forms of being, through the varieties of which inferior intelligences can, by progressive steps, arrive ultimately at the supreme contriver, is more agreeable to our ideas of dignity, and tends to impress us with more exalted sentiments, than viewing the Diety directly in all the individual impressions we receive, divided in the infinity of particular events, and unawful, by his continual presence in operations to our view insignificant and mean."

This active substance, or secondary cause, our auther matter thor concludes to be neither matter nor mind. " Matter (says he) is a being, as a whole quiescent and innor mind. active, but constituted of active parts, which resist separation, or cohere, giving what is usually denominated solidity to the mass. Mind is a substance which thinks. A being which should answer to neither of these definitions, would be neither matter nor mind; but an immaterial, and, if I may so say, an immental substance." Such is the active substance of Mr Young, which, considered as the cause of motion, seems not to differ greatly from the plastic nature, hylarchical principle, or vis genitrix, of others. The manner in which it operates is indeed much more minutely detailed by our author than by any other philosopher, ancient or modern, with whose writings we have any acquaint-

" Every thing (he says) must be in its own nature either disposed to rest or motion ; consequently the ACTIVE SUBSTANCE must be considered as a being naturally either quiescent or motive. But it cannot be naturally quiescent; for then it could not be active, because activity, which is a tendency to motion, cannot The man- originate in a tendency to rest. Therefore the ACTIVE SUBSTANCE is by nature motive, that is, tending to mowhich it is supposed to tion. The ACTIVE SUBSTANCE is not solid, and does not resist penetration. It is, therefore, incapable of impelling or of sustaining impulse. Whence it follows,

that as it tends to move, and is incapable of having its Motion motion impeded by impulse, it must actually and continually move: in other words, MOTION IS ESSENTIAL TO THE ACTIVE SUBSTANCE.

" In order that this substance may act, some other thing upon which it may produce a change is necessary; for whatever suffers an action, receives some change. The active substance, in acting on some other thing, must impart and unite itself thereto; for its action is communicating its activity. But it cannot communicate its activity without imparting its substance : because it is the substance alone which possesses activity, and the quality cannot be separated from the substance. THEREFORE THE ACTIVE SUBSTANCE ACTS BY UNI-TING ITSELF WITH THE SUBSTANCE ON WHICH IT ACTS. The union of this substance with bodies, is not to be conceived of as a junction of small parts intimately blended together and attached at their surfaces; but as an entire diffusion and incorporation of one substance with another in perfect coalescence. As bodies are not naturally active, whenever they become so, as they always do in motion, it must be by the accession of some part of the active substance. The active substance being imparted to a body, penetrates the most solid or resisting parts, and does not reside in the pores without, and at the surfaces of the solid parts. For the activity is imparted to the body itself; and not to its pores, which are no parts of the body : therefore if the active substance remained within the pores, the cause would not be present with its effect; hut the cause would be in one place and the effect in another, which is impossible.

" Bodies by their impulse on others lose their activity in proportion to the impulse. This is matter of observation. Bodies which suffer impulse acquire activity in proportion to the impulse. This also is matter of observation. In impulse, therefore, the active substance passes out of the impelling body into the body impelled. For since bodies in motion are active, and activity consists in the presence of the active substance, and by impulse bodies lose their activity, therefore they lose their active substance, and the loss is proportional to the impulse. Bodies impelled acquire activity; therefore acquire active substance, and the acquisition is proportioned to the impulse. But the active substance lost by the impelling body ought to be concluded to be that found in the other; because there is no other receptacle than the impelled body to which the substance parted from can be traced, nor any other source than the active body whence that which is found can be derived. Thcrefore, in impulse, the active substance ought to be concluded to pass from the impelling body to the body impelled. The flowing of such a substance is a sufficient cause of the communication of activity, and no other rational cause can be assigned.

" The continued motion of a body depends not upon its inertia, but upon the continuance of the active substance within the body. The motion of a body is produced by the motion of the active substance in union with the body. It being evident, that since the active substance itself does always move, whatever it is united to will be moved along with it, if no obstacle prevent. In mere motion, the body moved the patient, and the active substance the agent. In impulse,

ner in operate.

16

and nei-

istion.

princes

implse,

ven loo-

impulse, the body in motion may be considered as an agent, as it is made active by its active substance .---While the active substance is flowing out of the active body into the obstacle or impelled body, the active body will press or impel the obstacle. For while the active substance is yet within the body, although flowing through it, it does not cease to impart to the body its own nature, nor can the body cease to be active because not yet deprived of the active substance. Therefore during its passing out of the body, such portion of the active substance as is yet within, is urging and disposing the body to move, in like manner as if the active substance were continuing in the body; and the body being thus urged to move, but impeded from moving, presses or impels the obstacle.

"We see here (says our author) an obvious explanation of impulse ; it consists in the flowing of the motive substance from a source into a receptacle ;" and he thinks, that although the existence of such a substance had not been established on any previous grounds, the communication of motion by impulse does alone afford a sufficient proof of its reality.

He employs the agency of the same substance to account for many other apparent activities in bodies, such as those of fire, electricity, attraction, repulsion, elasticity, &c. All the apparent origins of corporeal activity serve, he says, to impart the active substance to bodies ; " and where activity is without any manifest origin, the active substance is derived from an invisible source."

Our limits will not permit us to attend him in his solution of all the apparent activities in bodies ; but the orbicular motions of the planets have been accounted for in so many different ways by philosophers ancient and modern, and each account has been so little satisfactory to him who can think, and wishes to trace effects from adequate causes, that we consider it as our duty to furnish our readers with the account of this phenomenon which is given by Mr Young.

The question which has been so long agitated, and Luses the ption "Whence is the origin of motion ?" our author conof thea-siders as implying an absurdity. "It supposes (says he) that rest was the primitive state of matter, and that motion was produced by a subsequent act. But this supposition must ever be rejected, as it is giving precedency to the inferior, and inverting the order of nature." The substance which he holds to be the basis of matter is essentially active; and its action is motion. This motion, however, in the original element, was *power* without direction, agency without order, activity to no end. To this power it was necessary that a LAW should be superadded; that its agency should be guided to some regular purpose, and its motion conspire to the production of some uniform effects. Our author shows, or endcavours to show, by a process of reasoning which shall be examined elscwhere, that the primary atoms of matter are produced by the circular motion of the parts of this substance round a centre; and that a similar motion of a number of these atoms around another centre common to them all, produces what in common language is called a solid body; a cannon ball, for instance, the terrestrial globc, and the body of the sun, &c. In a word, he labours to prove, and with no small success, that a prin-Vol. XIV. Part II. +

ciple of union is implied in the revolving or circulating Motion. movements of the active substance.

" But we may also assume (he says) à priori, that a principle of union is a general law of nature ; because we see in fact all the component parts of the universe are united systems, which successively combine into larger unions, and ultimately form one whole." Let us then suppose the sun with all his planets, primary and secondary, to be already formed for the purpose of making one system, and the orbits of all of them, as well as these great bodies themselves, to be pervaded by the active substance, which necessarily exists in a state of motion, and is the cause of the motion of every thing corporcal. " If to this motion a principle of union be added, the effect of such a principle would be a determination of all the parts of the active substance, and of course all the bodics to which it is united, towards a common centre, which would be at rest, and void of any tendency in any direction. But this determination of all the parts of the system towards a common centre, tends to the destruction both of the motion of the active substance and of the system; for should all the parts continually approximate from a circumference towards a centre, the snn and planets would at last meet, and form one solid and quiescent mass. But to preserve existence, and consequently motion, is the first law of the active substance, as of all being; and it cannot be doubted, that to preserve distinct the scveral parts of the solar system, is the first law given to the substance actuating that system. The union of the system is a subsequent law.

" When the *direct* tendency of any inferior law is obviated by a higher law, the inferior law will operate indirectly in the manner the nearest to its direct tendency that the superior law will permit. If a body in motion be obliquely obstructed, it will move on in a direction oblique to its first motion. Now the law of union, which pervades the solar system, being continually obstructed by the law of self-preservation, the motion of the active substance, and of the bodies to which it is united, can be no other than a revolving motion about the common centre of approach, towards which all the parts have a determination. But when this revolution has actually taken place, it gives birth to a new tendency, which supersedes the operation of the law of self-preservation. It has been shown, that the motion essential to the active substance, required to be governed by some law to give being to an orderly state of things. Now, there are motions simple and motions complex ; the more simple is in all things first in order, and out of the more simple the more complex arises in order posterior. The most simple motion is rectilincal; therefore a rectilineal motion is to be considered as that which is the original and natural state of things, and consequently that to which all things tend. It will follow from hence, that when any portion of active substance in which the law of union operates, has in the manner above explained been compelled to assume a revolving motion, that is, a motion in some curve; a tendency to a rectilineal motion will continually exist in every part of the revolving portion, and in every point of the curve which it describes during its revolution. And this rectilineal tendency will be a tendency to recede from the centre in every 3 M point

4.58

Motion. point of the revolving orbit, and to proceed in a tangent to the orbit at each point. These two tendencies, if not originally equal, must necessarily in all cases arrive at an equality. For the tendency towards the centre, ealled the centripetal tendency, that is, the law of union, operating first, if we suppose the motion approaches the centre, the tendency to recede from it, called the centrifugal tendency, will have its proportion to the centripetal continually increased as the orbit of revolution grows less, so as ultimately to equal the centripetal tendency, and restrain the motion from its central course, at which point it will no longer seck the centre but revolve round it."

As our author holds that every atom of matter is formed by the motion of parts of the active substance, and every body formed by the motion of atoms; so he maintains, not only that the sun, moon, earth, planets, and stars, are penetrated by the same substance, but that each is the centre of a vortex of that substance, and that of these vortices some are included within others. " The subtle revolving fluid, the centre of whose vortex the earth occupies, not only surrounds but pervades the earth, and other vortices their earths, to their centres; and the earth and planets are by its revolutions earried around on their own axes. The earth is an active mass, and all its component masses are severally as well as collectively inactive; but the earth and all its parts have various collective and separate movements, imparted from the fluid which surrounds, pervades, and constitutes it. Being immersed together with its proper surrounding sphere or vortex in the larger sphere or vortex of the sun, it is earried thereby in a larger orbit about the sun, at the same time that by the revolution of its proper sphere it rotates on its own axis."

Objections to this theory.

Such is the most complete view which our limits will permit us to give of Mr Young's theory of motion. To the philosopher who considers experiment as the only test of truth, and who in all his inquiries employs his hands more than his head, we are fully aware that it will appear in no better light than as " the baseless fabric of a vision." Even to the intellectual philosopher who is not frightened at the word metaphysics, we are afraid that such an active substance as the author contends for, will appear as inadequate to the production of the phenomena of gravitation and repulsion as the material æther of Mr Jones and his followers. A being void of intelligence, whether it be material or immaterial, quiescent or motive, cannot be the subject of law, in the proper sense of the word. The laws of which Mr Young speaks as necessary to regulate the motions of the active substance, must be mere forces, applied by some extrinsic and superior power. And since " motion, as it is essential to the active substance, is power without direction, agency without order, activity to no end; since it is of such a nature, that from its unguided agitations there could result neither connection, order, nor harmony ;" it follows that those extrinsic forces must be perpetually applied, because what is essential to any substance can never be destroyed or changed so long as the substance itself remains.

Forces producing order out of confusion, can be applied only by a being possessed of intelligence; and if the immediate and perpetual agency of an intelligent

being be necessary to regulate the motions of the ac- Motion tive substance, that substance itself may be thought superfluous, and its very existence be denied. Entia non sunt multiplicanda absque necessitate, is a rule of philosophizing which every man of science acknowledges to be just. And it will hardly be denied that the immediate and perpetual agency of an intelligent being upon Mr Jones's etherial fluid, or even upon the matter of solid bodies themselves, would be capable of producing every kind of motion without the instrumentality of a substance which is neither mind nor matter.

Such, we conceive, are the objections which our metaphysical readers may make to this theory. Part of their force, however, will perhaps be removed by the ingenious manner in which our author analyzes matter into an immaterial principle. But so much of it remains, that the writer of this article is inclined to believe that no mechanical account can be given of the motions of the heavenly hodies, the growth of plants, and various other phenomena which are usually solved by attraction and repulsion. In the present age, phi-Otherth by attraction and repuision. In the present age, print rics mon losophers in general are strangely averse from admitting ancient on any occasion the agency of mind ; yet as every cf-and ratio fect must have a cause, it is surely not irrational to at-al. tribute such effects as mechanism cannot produce to the operation either of intelligence or instinct. To suppose the Deity the immediate agent in the great motions of the universe, has been deemed impicus; and it must be confessed that very impious conclusions have been deduced from that principle. But there is surcly no impiety in supposing, with the excellent bishop of Cloyne, that the fluid which is known to pervade the solar system, and to operate with resistless force, may be animated by a powerful mind, which acts instinctively for ends of which itself knows nothing. For the existence of such a mind, no other evidence, indeed, can be brought than what is afforded by a very ancient and very general tradition, and by the impossibility of accounting for the phenomena upon principles of mere mechanism. Perhaps some of our more pious readers may be inclined to think that the Supreme Being has committed the immediate government of the various planetary systems to powerful intelligences, or ANGELS, who, as his ministers, direct their motions with wisdom and foresight. Such an opinion is certainly not absurd in itself; and it seems to he countenanced by an ancient writer \*, who, though \* Psal. not known by the name of a philosopher, knew as much of the matter as any founder of the most celebrated school.

To object to either of these hypotheses, as has been sometimes done, that it represents the government of the world as a perpetual miracle, betrays the grossest ignorance; for we might as well call the movements of the bodies of men and brutes, which are certainly produced by minds, miraeulous. We do not affirm that either hypothesis is certainly true; but they are both as probable and as satisfactory as the hypothesis which attributes agency to attraction and repulsion, to a subtle ather, or to a substance which is neither mind nor matter. Were the immediate agency of intellect to be admitted, there would be no room for many of those disputes which have been agitated among philosophers, about the increase or diminution of motion
ntion.

in the universe; because an intelligent agent, which could begin motion as well as carry it on, might increase or diminish it as he should judge proper. If instinctive agency, or something similar to it, be adoptcd, there is the same room for investigation as upon the principles of mechanism; because instinct works blindly, according to steady laws imposed by a superior mind, which may be discovered by observation of their effects. As we consider this as by much the most probable hypothesis of the two, we find ourselves involved in the following question : " If a certain quantity of ques-Whe- motion was originally communicated to the matter of the universe, how comes it to pass that the original quantity of quantity still remains?" Considering the many opposite and contradictory motions which since the creation have taken place in the universe, and which have regins un. undoubtedly destroyed a great part of the original quantity, by what means has that quantity been restored ?

If this question can be solved by natural means, it must be upon the principles of Newton; for, " in every case\* where quantities and relations of quantities are required, it is the province of mathematics to supply the information sought; " and all philosophers agree that Sir Isaac's doctrine of the composition and resolution of motion, though in what respects the heavenly bodies it may have no physical reality, is so mathematically just, as to be the only principle from which the quantity of motion, or the force of powers, can in any case be computed. If we choose to answer the question, by saying that the motion left is restored by the interposition of the Deity, then we might as well have had recourse to him at first, and say that he alone is the true principle of motion throughout the creation.

The Carte-Before we are reduced to this dilemma, however, sial and it is necessary, in the first place, to inquire whether there is or can be any real diminution of the quantity of motion throughout the universe? In this question the Cartesians take the negative side; and maintain, that the Creator at the beginning impressed a certain quantity of motion on bodies, and that under such laws as that no part of it should be lost, but the same portion of motion should be constantly preserved in matter: and hence they conclude, that if any moving body strike on any other body, the former loses no more of its motion than it communicates to the latter. Sir Isaac Newton takes the contrary side, and argues by ston in the following manner: " From the various compositions of two motions, it is manifest there is not always the same quantity of motion in the world; for if two balls, joined together by a slender wire, revolve with an uniform motion about their common centre of gravity, and at the same time that centre be carried uniformly in a right line drawn in the plane of their circular motion, the sum of the motions of the two balls, as often as they are in a right line, drawn from their common centre of gravity, will be greater than the sum of their motions when they are in a line perpendicular to that other. Whence it appears, that motion may be both generated and lost. But by reason of the tenacity of fluid bodies, and the friction of their parts, with the weakness of the elastic power in solid bodies, nature seems to incline much rather to the destruction than the production of motion; and

in reality, motion becomes continually less and less .- Motion. For bodies which are either so perfectly hard or so soft as to have no elastic power, will not rebound from each other; their impenetrability will only stop their motion. And if two such bodies equal to one another be carried with equal but opposite motions, so as to meet in a void space, by the laws of motion they must stop in the very place of concourse, lose all their motion, and be at rest for ever, nuless they have an clastic power to give them a new motion. If they have elasticity enough to make them rebound with one-fourth, one-half, or three-fourths, of the force they meet with, they will lose three fourths, one-half, or one-fourth, of their motion. And this is confirmed by experiments : for if two equal pendulums be let fall from equal heights, so as to strike full upon each other; if those pendulums be of lead or soft clay, they will lose all, or almost all, their motion ; and if they be of any elastic matter, they will only retain so much motion as they receive from their elastic power."

Motion, therefore, being thus, in the opinion of our celebrated anthor, lost, or absolutely destroyed, it is necessary to find some cause by which it may be renewed. Such renovation Sir Isaac attributes to active principles ; for instance, " the cause of gravity, whereby the planets and comets preserve their motions in their orbits, and all bodies acquire a great degree of motion in falling; and the cause of fermentation, whereby the heart and blood of animals preserve a perpetual warmth and motion, the inner parts of the carth are kept perpctually warmed; many bodies burn and shine, and the sun himself burns and shines, and with his light warms and cheers all things."

Elasticity is another cause of the renovation of motion mentioned by Sir Isaac. "We find but little motion in the world (says he), except what plainly flows either from these active principles, or from the command of the willer."

With regard to the destruction or positive loss of No power motion, however, we must observe, that notwithstand of motion ing the authority of Sir Isaac Newton, it is altogether ever lost or impossible that any such thing can have a All more destroyed. impossible that any such thing can happen. All moving bodies which come under the cognizance of our senses are merely passive, and acted upon by something which we call powers or fluids, and which are to us totally invisible. Motion, therefore, cannot be lost without a destruction or diminution of one of these powers, which we have no reason to think can ever happen. When two pendulums rush against each other, the motion is the mere effect of the action of gravity; and that action, which in this case is the power, continues to be the very same whether the pendulum moves or moves not. Could motion, therefore, be exhausted in this case, we must suppose, that by separating two pendulums to the same distance from each other, and then letting them come together for a great number of times, they would at last meet with less force than before. But there is certainly not the least foundation for this supposition ; and no rational person will take it into his head, that supposing the whole human race had employed themselves in nothing else from the creation to the present day, but separating pendulums and letting them stop each other's motion, they would now come together with less force than they did at first. Power, therefore, which is the cause

3 M 2

Motion. of motion, is absolutely indestructible. Powers may indeed counteract one another, or they may be made to counteract themselves; but the moment that the obstacle is removed, they show themselves in their pristine vigour, without the least symptom of abatement or decay.

Whether, therefore, we reckon the ultimate source of motion to be spiritual or material, it is plain that it must be to our conceptions infinite; neither will the phenomena of nature allow us to give any other explanation than we have done: for no power whatever can lose more than its own quantity ; and it seems absurd to think that the Deity would create the world in such a manner that it would ultimately become immoveable, and then have recourse to unknown principles to remedy the supposed defect. On the principle we have now just laid down, however, the mat-ter becomes exceedingly plain and obvious. The Creator at first formed two opposite powers, the action of which is varied according to the circumstances of the bodies upon which they act; and these circumstances arc again varied by the action of the powers themselves in innumerable ways upon one another, and the approach of one body to another, or their receding to a greater distance. Where these powers happen to oppose each other directly, the body on which they act is at rest; when they act obliquely, it moves in the diagonal; or if the force acting upon one side is by any means lessened, the body certainly must move towards that side, as is evident from the case of the atmosphere, the pressure of which, when removed from one side of a body, will make it move very violently towards that side; and if we could continually keep off the pressure in this manner, the motion would assuredly be perpetual. We must not imagine that motion is destroyed because it is counteracted; for it is impossible to destroy motion by any means but removing the cause; counteracting the effect is only a temporary obstacle, and must ccase whenever the obstacle is removed. Nature, therefore, having in itself an infinite quantity of motion, produces greater or lesser motions, according to the various action of the moving powers upon different bodics or upon one another, without a possibility of the general stock being either augmented or diminished, unless one of the moving powers was to be withdrawn by the Creator; in which case, the other would destroy the whole system in an The nature instant. As to the nature of these great original of the mov-powers, we must confess ourselves totally ignorant; ing powers nor do we perceive any data from which the nature of them can be investigated. The clements of light, air, &c. are the agents; but in what manner they act, or in what manner they received their action, can be known only to the Creator.

Perpetual Motion, in Mechanics, a motion which is supplied and renewed from itself, without the intervention of any external cause; or it is an uninterrupted communication of the same degree of motion from one part of matter to another, in a circle or other curve rcturning into itself, so that the same momentum still returns undiminished upon the first mover.

The celebrated problem of a perpetual motion consists in the inventing a machine, which has the prin-ciple of its motion within itself. M. de la Hire has de-

monstrated the impossibility of any such machine, and Motion. finds that it amounts to this, viz. to find a body which is both heavier and lighter at the same time, or to find a body which is heavier than itself.

Animal Morrow, that which is performed by animals at the command of the mind or will.

Though all the motions of animals, whether voluntary or involuntary, are performed by means of the muscles and nerves, yet neither these nor the subtile fluid which resides in them are to be accounted the ultimate sources of animal motion. They depend entirely upon the mind for those motions which are properly to be accounted animal. All the involuntary motions, such as those of the blood, the heart, muscles, organs subservient to respiration and digestion, &c. are to be classed with those of vegetables; for though no vegetables have them in such perfection as animals, there are yet traces of them to be found evidently among vegetables, and that so remarkable, that some have imagined the animal and vegetable kingdoms to approach each other so nearly that they could scarce be distinguished by a philosophic eye. See MUSCLE.

Though the motions of animals, however, depend on the action of the mind or of the will, external objects seem originally to have the command of the mind itself ; for unless an animal perceive something, it will not be inclined to act. By means of the ideas once received, indeed, and retained in the memory, it acquires a selfmoving power, independent of any object present at the time, which is not the case with vegetables; for however they may act from a present impulse, their motions never appear to be derived from any source which may not be accounted strictly mechanical.

According to some, motion is the cause of sensation itself; and indeed it seems very probable that the motions of that subtle fluid, called light or electricity, in our bodies always accompany our sensations; but whether these be the cause, or only the medium, of sense, cannot be discovered.

Though all animals are endowed with a power of voluntary motion, yet there is a very great variety in the degrees of that power; to determine which no certain rules can assigned; neither can we, from the situation and manner of life of animals, derive any probable reason why the motion of one should differ so very much from that of another. This difference does not arise from their size, their ferocity, their timidity, nor any other property that we can imagine. The elephant, though the strongest land animal, is by no means the slowest in its motions; the horse is much swifter than the bull, though there is not much difference in their size; a greyhound is much swifter than a cat, though the former be much larger, and though both live in the same manner, viz. by hunting. Among insects the same unaccountable diversity is observable. The louse and flea are both vermine, are both nearly of the same size, and both feed on the bodies of animals; yet there is no comparison between the swiftness of their motions: while the bug, which is much larger than either, seems to have a kind of medium swiftness between both .--This very remarkable circumstance seems not even to depend on the range which animals are obliged to take in order to procure food for themselves : the motion of a snail is slower than that of an earth worm ; while that

unknown.

23

rion.

that of many caterpillars is much quicker than either; though we can searce determine which of the three has the greatest or the least extensive range for its food.

Of all animals the shell fish move the slowest, insomuch that some have supposed them to be entirely destitute of locomotive powers; and muscles particularly are denied to have any faculty of this kind. Every one knows that these animals can open and shut their shells at pleasure; and it cannot escape observation, that in every muscle there is a fleshy protuberance of a much redder colour than the rest. This has been thought to be a tongue or proboscis, by which the animal takes in its food ; but is in reality the instrument of its motion from place to place. This protuberance is divided into two lobes, which perform the office of feet. When the river muscle is inclined to remove from its station, it opens its shells, thrusts out this protuberance, and digs a furrow in the sand ; and into this furrow, by the action of the same protuberance, the shell is made to fall in a vertical position. It is recovered out of this into the former horizontal onc, by pushing back the sand with the same tentacula, lengthening the furrow, and thus the animal continues its journey by a continual turning topsy-turvy .- Marine muscles perform their motions in the same manner, and by similar instruments. In general they are firmly attached to rocks or small stones by threads about two inches long, which are spun from a glutinous substance in the protuberances already mentioned.

Other animals which inhabit bivalved shells, perform their motions by a kind of leg or foot; which, however, they can alter into almost any figure they please. By means of this leg they can not only sink into the mud, or rise out of it at pleasure, but can even leap from the place where they are; and this can be done by the limpit, which people are apt to imagine one of the most sluggish animals in nature .- When this creature is about to make a spring, it sets its shell on edge, as if to diminish friction; then, stretching out the leg as far as possible, it makes it embrace a portion of the shell, and by a sudden movement, similar to that of a spring let loose, it strikes the earth with its leg, and actually lcaps to a considerable distance.

The spout, or razor-fish, is said to be incapable of moving forward horizontally on the surface; but it digs a hole sometimes two feet deep in the sand, in which it can ascend or descend at pleasure. The lcg, by which it performs all its movements, is fleshy, cylindrical, and pretty long ; and the animal can at plcasure make it assume the form of a ball. When lying on the surface of the sand, and about to sink into it, the log is extended from the inferior end of the shell, and makes the extremity of it take on the form of a shovel, sharp on each side, and terminating in a point. With this instrument the animal makes a hole in the sand; after which it advances the leg still farther into it, makes it assume the form of a hook, and with this, as a fulerum, it obliges the shell to descend into the hole. This operation is continued until the whole shell be covered; and when the animal wishes to rcgain the surface, it makes the extremity of the leg to assume the form of a ball, and makes an effort to extend it. The ball, however, prevents any farther descent, and the reaction of the muscular effort raises up

the whole shell, which operation is continued until it Motions reaches the surface; and it is surprising with what facility these motions are accomplished by an animal seemingly so little qualified to move at all. Another particularity in this fish is, that though it lives among salt water, it abhors salt so much, that when a little is thrown into its hole it instantly leaves it. But it is still more remarkable, that if you once take hold of the spout-fish, and then allow it to retire into its hole, it cannot then be driven out by salt; though unless it be taken hold of by the hand, the application of salt will make it come to the surface as often as you please.

All other shell fish, even those apparently the most sluggish and destitute of any apparatus for motion, are found to be furnished with such instruments as enable them to perform all those movements for which they have any oceasion. Thus the scallop, a well-known animal inhabiting a bivalved shell, can both swim upon the surface of water and move upon land. When it happens to be deserted by the tide, it opens its shell to the full extent, and shutting it again with a sudden jerk, the reaction of the ground gives such an impulse to the whole, that it sometimes springs five or six inches from the ground; and by a continued repctition of this action, it gradually tumbles forward until it regains the water. Its method of sailing is still more curious. Having attained the surface of the water by means unknown to us, it opens the shell, and puts one-half above water, the other with the body of the animal in it remaining below. Great numbers of them are thus frequently seen sailing in company with their shells sticking up above water when the weather is fine, and the wind acting upon them as sails ; but on the least alarm they instantly shut their shells, and all sink to the bottom together.

The oyster has generally been supposed one of the most sluggish animals in nature, and totally incapable of voluntary motion; but from the researches of the Abbé Dicquemarre, this opinion seems to be erroneous. The oyster, like many other bivalved shell-fish, has a power of squirting water out from its body; and this property may easily be observed by putting some of them into a plate with as much sea water as will cover them. The water is ejected with so much force, as not only to repel the approach of ordinary enemies, but to move the whole animal backwards or sidewise, in a direction contrary to that in which the water was ejected. It has been also supposed, that oysters are destitute of sensation ; but M. Dicquemarie has shown, that they not only possess sensation, but that they are capable of deriving knowledge from experience. When removed from such places as are entirely covered with the sea, when destitute of experience, they open their shells and die in a few days; but if they happen to escape this danger, and the water covers them again, they will not open their shells again, but keep them shut, as if warned by experience to avoid a danger similar to what they formerly underwent.

The motions of the sea-urchin are perhaps more curious and complicated than those of any other animal. It inhabits a beautiful multivalved shell, divided into triangular compartments, and covered with great numbers of prickles; from which last circumstance it rcceives the name of sca urchin or sca hedgehog. The triangles

462

Motion. triangles are separated from one another by regular belts, and perforated by a great number of holes, from every one of which issues a fleshy horn similar to that of a snail, and capable of moving in a similar manner. The principal use of these horns seems to be to fix the animal to rocks or stones, though it likewise makes use of them in its progressive motion. By means of these horns and prickles, it is enabled to walk either on its back or its belly; but it most commonly makes use of those which are near the mouth. Occasionally it has a progressive motion by turning round like a wheel.

The animals called sea-nettles or medusæ, though extremely slow in their motions, are nevertheless evidently capable of moving at pleasure from place to place. The variety of their figure is such, that it is difficult to assign them any determinate figure whatever. In general, however, they resemble a truncated cone, the base of which is applied to the rock to which they adhere. Their colours are various, whitish, brown, red or greenish : the mouth is very large ; and when opened appears surrounded with filaments resembling the horns of snails, which being disposed in three rows around it, give the animal the appearance of a flower; and through every one of these the animal has the power of squirting the sea water. The structure of these animals is extremely singular; they consisting all of one organ, viz. a stomach. When searching for food, they extend their filaments, and quickly entangle any small animals that come within their reach. The prey is instantly swallowed, and the mouth shut close upon it like a purse ; in which state it remains for many days before the nutritive parts are extracted. The animal, though scarcely an inch or an inch and a half in diameter, is nevertheless so dilatable, that it can swallow large whelks and muscles, the shells of which are thrown out by the mouth after the nutritive parts have been exhausted. Sometimes the shell is too large to be voided this way; in which case the body of the animal splits, and the shell is voided through the opening, which in a short time heals up again. The progressive motion of this creature is so slow, that it resembles that of the hour hand of a clock, and is performed by means of innumerable muscles placed on the outside of the body. All these are tubular, and filled with a fluid, which makes them project like prickles. On occasion it can likewise loosen the base of the cone from the rock, and inverting its body, move by means of the filaments already mentioned, which surround the mouth ; but even the motion performed in this manner is almost as slow as the other.

Some animals are capable of moving backwards, apparently with the same facility that they do forwards, and that by means of the same instruments which move them forward. The common house fly exhibits an instance of this, and frequently employs this retrograde motion in its ordinary courses; though we cannot know the reason of its employing such an extraordinary method. Another remarkable instance is given by Mr Smellie in the *mason-bce*. This is one of the solitary species, and has its name from the mode of constructing its nest with mud or mortar. Externally this nest has no regular appearance, but at first sight is taken for a quantity of dirt adhering to the wall; though the internal part be furnished with cells in the same regular

manner with the nests of other insects of the bee kind. Motion When this bee leaves its nest, another frequently takes possession of it ; in which case a battle never fails to ensue on the return of the real proprietor. The dispute is decided in the air ; and each party endeavours to get above the other, as birds of prey are wont to do in order to give a downward blow. The undermost one, to avoid the stroke, instead of flying forward or laterally, always flies backward. The encounter is so violent, that when they strike, both parties fall to the ground.

Vegetable Morios. Though vegetables have not the power of moving from one place to another like animals, they are nevertheless capable of moving their different parts in such a manner as would lead us to suspect that they are actuated by a sort of instinct. Hence many have been induced to suppose, that the animal and vegetable kingdoms are in a manner indistinguishable from one another; and that the highest degree of vegetable life can hardly be known from the lowest degree of animal life. The essential and insuperable distinction however between the two, is the faculty of sensation, and loco-motion in consequence of it. Were it not, indeed, for the manifestation of sense by moving from one place to another, we should not be able to tell whether vegetables were possessed of scusation or not ; but whatever motions they may be possessed of, it is certain that no vegetable has the faculty of moving from one place to another. Some have endeavoured to distinguish the two kingdoms by the digestion of food ; alleging that plants have no proper organs, such as a stomach, &c. for taking in and digesting their aliment. But to this it has been replied, that the whole body of a vegetable is a stomach, and absorbs its food at every pore. This, however, seems not to be a sufficient answer. All animals take in their food at intervals, and there is not a single instance of one which eats perpetually. The food is also taken into the body of the animal, and application of the parts made by means of the internal organization of the viscus; but in vegetables, their whole bodies are immersed in their food, and absorb it by the surface, as animal bodies will sometimes absorb liquids when put into them. The roots of a tree indeed will change their direction when they meet with a stone, and will turn from barren into fertile ground; but this is evidently mere mechanism, without any proof of will or sensation; for the nourishment of the root comes not from the stone, but from the earth around it; and the increase in size is not owing to any expansion of the matter which the root already contains, but to the apposition of new matter ; whence the increase of size must always take place in the direction from whence the nourishment proceeds. On this principle also we may explain the reason why the roots of a tree, after having arrived at the edge of a ditch, instead of shooting out into the air, will creep down the one side, along the bottom, and up the other.

In their other movements the vegetables discover nothing like sensation or design. They will indeed uniformly bend towards light, or towards water; but in the one case we must attribute the phenomenon to the action of the elements of light and air upon them; and in the latter, the property seems to be the same; with what in other cases we call attraction. Thus, if

2

463

tion. a root be uncovered, and a wet sponge placed near it in a direction different from that in which the root was proceeding, it will soon alter its position, and turn towards the sponge; and thus we may vary the direction of the root as often as we please. The efforts of a plant to turn from darkness or shade into sunshine are very remarkable; as in order to accomplish this, not only the leaves will be inclined, but even the stems and branches twisted. When a wot sponge is held under the leaves of a tree, they bend down in order to touch it. If a vessel of water be put within six inches of a growing cucumher, in less than 24 hours the latter will alter its direction ; the branches will bend towards the water, and never alter their course until they come in contact with it. The most remarkable instance of this kind of motion, however, is, that when a pole is brought near a vine, the latter will turn towards it, and never cease extending its branches till it lays hold of the support.

The motions of the sensitive plant, and others of the same kind, have been considered as very wonderful; but it is doubtful if any of them be really more so than that of the vine just mentioned. None of these show any kind of propensity to move without an actual touch. A very slight one, indeed, makes the sensitive plant contract, and the whole branch, together with the leaves, bend down towards the earth .---These phenomena are by some ascribed to electricity. Even the motions of the hedysarum gyrans, which at first sight seem so much more surprising than those of the sensitive plant, may, it is supposed, admit of explanation upon the same principle. The American plant ealled dionæa muscipula, or Venus's fly-trap, is another example of very wonderful mechanism in vegetables, though even this does not argue any degree of sensation in this plant more than in others. The leaves of the dionzea are jointed, and furnished with two rows of prickles. A number of small glands upon the surface secrete a sweet juice which entices flies to come and settle upon it; but the moment these inseets touch the fatal spot, the leaves fold up, and squeeze them to death between the priekles. The leaves fold up in the same manner when the plant is touched with a straw or pin. The drosera rotundifolia and longifolia, round and long-leafed sundew, plants of our own country, not uncommon in boggy ground, possess a similar stracture, and perform similar functions.

The folding up of the leaves of certain plants in the absence of the sun's light, ealled their sleep, affords another very eurious instance of vegetable motion .---Almost all vegetables, indeed, undergo such a remarkable change in the night, that it is difficult to know exactly how many kinds do really sleep. They fold up their leaves in many different ways; but all agree in disposing of them in such a manner as to afford the best. protection to the young stems, flower buds or fruit. The leaves of the tamarind tree contract round the young fruit in order to protect it from nocturnal cold; and those of senna, glycina, and many other papilionaceons plants, dispose of their leaves in the same manner. The leaves of the chickweed, asclepias atriplex, &c. are disposed in opposite pairs. In the night time they rise perpendicularly, and join so close at the top that the flowers are concealed by them. In like manner do the leaves protect the flowers of the fida or althæa theophrasti, cenothera, solanum, and the Egyp- Motion. tian veteh. All these are creeted during the night; but

those of the white lupine, in time of sleep, hang down. The flowers of plants also have motions peculiar to themselves. Many of them during the night are enclosed in their ealyxes. Some, particularly those of the German spurge, geranium striatum, and eommon whitlow grass, when asleep, bend towards the earth; by which means the noxious effects of rain or dew are prevented. All these motions have been commonly aseribed to the sun's rays; and Mr Smellie informs us that in some of the examples above mentioned the effeets were evidently to be ascribed to heat : but plants kept in a hot-house, where the temperature of the day and night are alike, contract their leaves, and sleep in the same manner as if they were exposed to the open air ; " whenee it appears (says he), that the sleep of plants, is owing rather to a peculiar law, than to a quicker or slower motion of the juices." He suspects, therefore, that as the sleep of plants is not owing to the mere absence of heat, it may be oceasioned by the want of light; and to ascertain this he proposes an experiment of throwing upon them a strong artificial light. "If notwithstanding this light (says he), the plants are not roused, but continue to sleep as usual, then it may be presumed that their organs, like those of animals, are not only irritable, but require the reparation of some invigorating influence which they have lost while awake, by the agitations of the air and of the sun's rays, by the act of growing, or by some other latent cause." On this, however, we must remark, that the throwing of artificial light upon plants cannot be attended with the same consequences as that of the light of the sun, unless the former were as strong as the latter, which is impossible; and even granting that we could procure an artificial light as strong as that of the sun, a difference might be occasioned by the different directions of the rays, those of the sun being very nearly parallel, while the rays of all artificial light diverge very greatly. If, therefore, we are to make an experiment of this kind, the rays should be rendered parallel by means of a burning mirror. Here again we would be involved in a difficulty; for the rays of the sun proceed all in one direction, but as of necessity we must employ different mirrors in our experiment, the light must fall upon the plant in different directions, so that we could not reasonably expect the same result as when the plants are directly exposed to the rays of the sun.

The motion of plants, not being deducible from sensation, as in animals, must be ascribed to that property called irritability ; and this property is possessed insensibly by the parts of animals in a greater degree than even by the most irritable vegetable. The muscular fibres will contract on the application of any stimulating substance, even after they are detached from the body to which they belonged. The heart of a frog will continue to beat when pricked with a pin for several hours after it is taken out of the body. The heart of a viper, or of a turtle, beats distinctly from 20 to 30 hours after the death of these animals. When the intestines of a dog, or any other quadruped, are suddenly eut into different portions, all of them erawl about like worms, and contract upon the slightest touch. The heart, intestines, and diaphragm, are the most irritable

irritable parts of animal bodies; and to discover whe-Motion . ther this quality resides in all plants, experiments should be made chiefly on lcaves, flowers, buds, and the tender fibres of the roots.

~~

The motions of plants are universally ascribed by our author to irritability, to which also we have ascribed them under the article ANIMAL. The term, however, requires an explanation ; and to give this in an intelligible manner requires some attention. The most obvious comparison is that of an clectrified thread; which ou the approach of any unelectrified substance, shows a variety of motions, equally surprising with those of the parts of plants or the muscular fibres cut out of the body. Could we suppose that the electricity of a thread might be preserved after it was cut off from the electrifying substance, it would show as much irritability as even the muscular fibres, or portions of the intestines of animals. We know, from the history of the torpedo, electrical eel, &c. that there are animals in which the electric fluid acts in such a manner as to produce a much more powerful effect than that of giving motion to the leaves of plants. The readiness, therefore, with which this fluid is thrown into agitations when any substance in which it acts is touched, is without doubt the irritability in question ; but we have from thence no more reason to ascribe sensation to these irritable bodies, than to an electrified bottle when it discharges itself, or makes a cork ball play round it.

In a paper read before the Academy of Sciences at Paris, by M. Broussonet, the author inclines to confound irritability and sensibility together. The diffcrent parts of plants (says he) enjoy the faculty of motion; but the motions of a vegetable are very different in their nature from those of an animal : the most sensible, those that are produced with most rapidity in plants, are always influenced by some stimulating cause. Irritability, which is nothing but sensibility made manifest by motion, is a general law to which nature has subjected all living beings; and it is this that continually watches over their preservation. Being more powerful in animals than in plants, it may be often confounded in these last with phenomena that depend on a quite different cause. In the vegetable it is only the organ which is exposed to the action of the stimulating power that moves. Irritation in particular places never produces that prompt combination of sensations which we observe in animals; in consequence of which certain parts are put in motion without being directly affected, and which otherwise might have been passive.

". The more perfect the organization in the different parts of animals is, the more apparent are the signs of irritability. The parts that come nearest to those of vegetables, and in which of consequence the organization is most imperfect, are the least irritable. The same law holds with regard to plants; but the result is opposite : the signs of irritability are most sensible in proportion to the analogy of the parts with those of animals; and they are imperceptible in those that are dissimilar. This assertion is proved by what we observe in the organs destined in vegetables to perpetuate the species. Those parts alonc secm sensible to stimuli; the bark, leaves, stalks, and roots showing no signs of irritability.

" The motions essentially vital, which have in plants

the greatest affinity with those of animals, are the course Motion. of the sap, the passage of the air in the trachea, the different positions which the flowers of certain plants take at certain hours of the day, &c. But if we attend to the manner in which all these motions in plants are performed, we shall find that they present a greater number of modifications than the analogous motions that take place in animals. The temperature of the atmosphere, its agitation, light, &c. have great influence on the motions of plauts, by accelerating or retarding the course of their fluids; and, as they eannot change their place, these variations produce in them changes more obvious and more uniform than in animals."

Our author now proceeds to inform us, that some of the motions of plants are occasioned by the rarity of the juices in plants, and others by their abundance. Of the former kind are those by which the capsules of some plants suddenly burst with a spring, and throw their seeds to some distance. Of the other kind are the action of the stamina in the parietaria, the inflection of the peduncles of flowers, and of the pistilla. " Those motions (says he) which are particularly observed in the organs destined to the reproduction of the individual, not appearing except in circumstances that render them absolutely necessary, seem in some measure to be the effect of a particular combination: they are, however, merely mechanical; for they are always produced in the same way and in the same circumstances. Thus the rose of Jericho, and the dry fruit of several species of mescmbryanthemum, do not open but when their vessels are full of water.

"The sudden disengagement of fluids produces a kind of motion. To this cause we must attribute a great number of phenomena observable in the leaves of several plants, and which do not depend on irritability. The small glands in each leaf of the dionæa are no sooner punctured by an insect, that it instantly folds up and seizes the animal : the puncture seems to operate a discngagement of the fluid which kept the leaf expanded by filling its vessels. This explanation is the more probable, that in the early state of the vegetation of this plant, when the small glands are hardly evolved, and when probably the juices do not run in sufficient abundance, the leaves are folded up exactly as they appear when punctured by an insect at a more advanced period. We observe a phenomenon similar to this in both species of the drosera (sun-dew), mentioned above. The mechanism here is very easily observable : the leaves are at first folded up ; the juices are not yet propelled into the fine hairs with which they are covered; but after they are expanded, the presence of the fluid is manifest by a drop seen at the extremity of each hair: it is by absorbing this fluid that an insect empties the vessels of the leaf, which then folds up, and resumes its first state : the promptitude of the action is proportioned to the number of hairs touched by the insect. This motion in some degree resembles that which takes place in the limb of an animal kept in a state of flexion by a tumor in the joint; when the matter which obstructed the motion is discharged, the limb instantly resumes its former position. The phenomena that depend on the abundance of fluids are particularly evident in plants which grow in wet soils; the drosera and dionaa are of this kind: and it is known by

ation

coualis.

by the experiments of Mess. Du Fay and Du Hamel, that sensitive plants are particularly sensible when the sun is obscured by clouds and the air warm and moist. The influence of external causes sometimes so modifies the vital motions in plants, that we would be tempted to ascribe them to volition, like those that depend entirely on that faculty in animals. If we set a pole in the ground near a twining plant, it always lays hold of the pole for support, in whatever place we put it. The same thing occurs in the tendrils of the vine; which always attach themselves to the support presented them, on whatever side it may be placed, provided they can reach it: but these motions are entirely vital: the twining plants and the tendrils direct themselves to every quarter, and consequently cannot fail of meeting with the bodies within their reach. These motions are performed as long as the parts continue to grow; but when they ccase to elongate, if they have not been able to reach any body on which they can fix, they bend back upon themselves. This and other ohservations show how far the vital motions in plants may be modified by external causes, and how essentially they differ from those that are the effect of volition in animals.

" Some plants appear endowed with no sort of motion: some have leaves that can move in different directions: their motions are generally modified by different causes; but none appear so eminently possessed of this quality as the hedysarum gyrans of Linnæus.-No part of this plant shows any signs of irritability upon application of stimuli: and the motion of its foliola ceases when the leafets are agitated by the wind -When the sun is warm, the little leaves of the hedysarum are also immoveable; but when the weather is warm and moist, or when it rains, they move very freely. This motion seems indispensably necessary to the plant; for it begins as soon as the first leaves unfold, and continues even during the night; but in time it grows weaker. In our stoves it is most considerable during the first year; in the second, it is not very sensible : in its native place all the leaves have a motion never observed here. The moving leafets are most agitated while the plants are in full flower, and the process of fructification goes on. The oscillatory motion is so natural to it, that it not only remains for three or four days in the leafets of a branch that has been cut off and put in water, but is even continued though the branch be exposed to the air. The leaves seem to perform the office of the heart in vegetables. When a plant is stripped of its leaves, the progress of vegetation is arrested; and such vegetables resemble those animals which have a periodical sleep, induced by a diminution of the action of the heart. Many plants hardly show any signs of motion; many seem also wholly cataleptic; which is rarely if ever found in animals. The footstalks of the flowers of dracocephalum, a Virginian plant, preserve themselves in whatever position they are placed.

Muscular Morion. See Muscle.

MOTIVE, is sometimes applied to that faculty of the human mind, by which we pursue good and avoid evil. Thus Hobbes distinguishes the faculties of the mind into two sorts, the cognitive and motive.

MOTOUALIS, a small nation of Syria, inhabiting to the east of the country of the DRUSES, in the valley Vol. XIV. Part II. which separates their mountains from those of Damas- Motoualts, cus; of which the following account is given by Vol-

The characteristic distinction between them and the other inhahitants of Syria (says our author) is, that they, like the Persians, are of the sect of Ali, while all the Turks follow that of Omar or Moaouia. This distinction, occasioned by the schism which in the 36th year of the Hegira arose among the Arabs, respecting the successors of Mahomet, is the cause of an irreconcilable hatred between the two parties. The sectaries of Omar, who consider themselves as the only orthodox, assume the title of Sonnites, which has that signification, and term their adversaries Shiites, that is "sectaries of Ali." The word Motouali has the same meaning in the dialect of Syria. The followers of Ali, dissatisfied with this name, substitute that of Adlia, which means "assertors of justice," literally "Justiciarians :" a denomination which they have assumed in consequence of a doctrinal point they advance in opposition to the Sonnite faith. A small Arabic treatise, entitled Theological Fragments concerning the Sects and Religions of the World, has the following passage :

"These sectaries who pretend that God acts only on principles of justice, conformable to human reason, are called Adlia or Justiciarians. God cannot (say they) command an impracticable worship, nor ordain impossible actions, nor enjoin men to perform what is beyond their ability; but wherever he requires obedience, will bestow the power to obey. He removes the cause of evil, he allows us to reason, aud imposes only what is easy, not what is difficult; he makes no man responsible for the actions of another, nor punishes him for that in which he has no part; he imputes not as a crime what himself has created in man; nor does he require him to avoid what destiny has decreed .-This would be injustice and tyranny, of which God is incapable, from the perfection of his being." To this doctrine, which diametrically opposes the system of the Sonnites, the Motonalis add certain ceremonies which increase their mutual aversion. They curse Omar and Moaouia as rebels and usurpers; and celebrate Ali and Hosain as saints and martyrs. They begin their ablutions at the elbow, instead of the end of the finger, as is customary with the Turks; they think thenisclyes defiled by the touch of strangers; and, contrary to the general practice of the East, neither eat nor drink out of a vessel which has been used by a person not of their sect, nor will they even sit with such at the same table.

These doctrines and customs, by separating the Motoualis from their neighbours, have rendered them a distinct society. It is said they have long existed as a nation in this country, though their name has never been mentioned by any European writer before the 18th century; it is not even to be found in the maps of D'Anville : La Roque, who left their country not a hundred years ago, gives them the name of Amcdiens. Be this as it may, in the later times their wars, robberies, successes, and various changes of fortune, have rendered them of consequence in Syria. Till about the middle of this century, they only possessed Balbec their capital, and a few places in the valley, and Anti-Lebanon, which seems to have been their original 3N country.

T

MOVEABLE, in general, denotes any thing capable of being moved.

MOVEABLE Feasts, are such as are not always held on the same day of the year or month ; though they be on the same day of the week. See FEASTS.

Thus, Easter is a moveable feast, being always held on the Sunday which falls upon or next after the first full moon following the 21st of March.

All the other moveable feasts follow Easter, i. e. they keep their distance from it; so that they are fixed with respect thereto.

Such are Septuagesima, Sexagesima, Ash Wednesday, Ascension day, Pentecost, Trinity Sunday, &c. which see under their proper articles, SEPTUAGESIMA, &c.

MOVEABLE Subject, in Law, any thing that moves itself, or can be moved; in contradistinction to immoveable or heritable subjects, as lands, houses, &c.

MOVEMENT, MOTION, a term frequently used in the same sense with automaton.

The most usual movements for keeping time are watches and clocks: the first are such as show the parts of time, and are portable in the pocket; the second, such as publish it by sounds, and are fixed as furniture. See HOROLOGY.

MOVEMENT, in its popular use uniong us, signifies all the inner works of a watch, clock, or other engine, which move, and by that motion carry on the design of the instrument.

The movement of a clock or watch is the inside, or that part which measures the time, strikes, &c. exclusive of the frame, ease, dial plate, &e.

The parts common to both of these movements are, the main-spring, with its appurtenances; lying in the spring box, and in the middle thereof lapping about the spring-arbor, to which one end of it is fastened. A-top of the spring-arbor is the endless screw and its wheel; but in spring-clocks, this is a ratchet-wheel with its click, that stops it. That which the main-spring draws, and round which the chain or string is wrapped, is called the fusy; this is ordinarily taper; in large works, going with weights, it is cylindrical, and called the *barrel*. The small teeth at the bottom of the fusy or barrel, which stop it in winding up, is called the ratchet; and that which stops it when wound up, and is for that end driven up by the spring, the garde-gut. The wheels are various: the parts of a wheel are, the hoop or rim, the teeth, the eross and the collet or piece of brass soldered on the arbor or spindle whereon the wheel is rivetted. The little wheels playing in the teeth of the larger are called pinions; and their teeth, which are 4, 5, 6, 8, &c. are ealled leves; the ends of the spindle are ealled pivots; and the guttered wheel, with iron spikes at bottom, wherein the line of ordinary clocks runs, the pulley. We need not say any thing of the hand, screws, wedges, stops, &c. Sce WHEEL, FUSY, &c.

Perpetual MOVEMENT. See Perpetual Motion.

MOUFET, THOMAS, a celebrated English physician, was born at London, and practised medicine with great reputation. Towards the latter end of his life

Motto.

Motoualis, country. At that period we find them under a like government with the Druzes, that is to say, under a number of Shaiks, with one principal chief of the family of Harfoush. After the year 1750 they established themselves among the heights of Bekaa, and got footing in Lebanon, where they obtained lands belonging to the Maronites, almost as far as Besharrai. They even incommoded them so much by their ravages, as to oblige the emir Yousef to attack them with open force and expel them; but on the other side, they advanced along the river even to the neighbourhood of Sour (Tyre). In this situation, Shaik Daher had the address, in 1760, to attach them to his party .---The pachas of Saide and Damaseus elaimed tributes, which they had neglected paying, and complained of several robheries committed on their subjects by the Motoualis; they were desirous of chastising them; but this vengeance was neither certain nor easy. Daher interposed; and by becoming security for the tribute, and promising to prevent any depredations, acquired allies who were able, as it is said, to arm 10,000 horsemen, all resolute and formidable troops. Shortly after they took possession of Sour, and made this village their principal sea port. In 1771 they were of great service to Ali Bey and Daher against the Ottomans. But Emir Yousef having in their absence armed the Druzes, ravaged their country. He was besieging the castle of Djezin, when the Motoualis, returning from Damascus, received intelligence of this invasion. At the relation of the barbarities committed by the Druzes, an advanced corps, of only 500 men, were so enraged, that they immediately rushed forward against the enemy, determined to perish in taking vengeance. But the surprise and confusion they occasioned, and the discord which reigned between the two factions of Mansour and Yousef, so much favoured this desperate attack, that the whole army, consisting of 25,000 men, was completely overthrown.

In the following year, the affairs of Daher taking a favourable turn, the zeal of the Motoualis cooled towards him, and they finally abandoned him in the catastrophe in which he lost his life. But they have suffered for their imprudence under the administration of the pacha who succeeded him. Since the year 1777, Djezzar, master of Aere and Saide, has incessantly laboured to destroy them. His persecution forced them in 1784 to a reconciliation with the Druzes, and to enter into an alliance with the emir Yousef. Though reduced to less than 700 armed men, they did more in that campaign than 15,000 or 20,000 Druzes and Maronites assembled at Dair-el-Kamar. They alone took the strong fortress of Mar-Djebaa, and put to the sword 50 or 60 Epirots who defended it. But the misunderstanding which prevailed among the chiefs of the Druzes having rendered abortive all their operations, the pacha has obtained possession of the whole valley, and the city of Balbec itself. At this period not more than 500 families of the Motoualis remained, who took refuge in Anti-Lebanon, and the Lebanon of the Maronites; and, driven as they now are from their native soil, it is probable they will he totally annihilated, and even their very name become extinet.

MOTTO, in armoury, a short sentence or phrase,

Ionfet life he retired to the country, and died about the year 1600. This physician is known by a work which was begun by Edward Wotton, and printed at London in 1634, folio, with the title of Theatrum Insectorum. A translation of it into English was published at London in 1658 folio. Martin Lister gives a very unfavourable opinion of this book : "As Moufet (says he) made use of Wotton, Gesner, &c. an excellent work might have been expected from him; and yet his Theatrum is full of confusion, and he has made a very bad use of the materials with which these authors have furnished him. He is ignorant of the subject of which he treats, and his manner of expression is altogether harbarous. Besides this, he is extremely arrogant, to say no worse ; for though he has copied Aldrovandus in innumerable places, he never once mentions his name." But Lay thinks that Lister, by expressing himself in this manner, has not done justice to Moufet; and he maintains that the latter has rendered an essential service to the republic of letters.

MOUG-DEN, or CHEN-YANG; a city of Chinese Tartary, and capital of the country of the Mantchews or Eastern Tartars. These people have been at great pains to ornament it with several public edifices, and to provide it with magazines of arms and storehouses. They consider it as the principal place of their nation ; and since China has been under their dominion, they have established the same tribunals here as at Peking, excepting that called Lii-pou : these tribunals are composed of Tartars only; their determination is final; and in all their acts they use the Tartar characters and language. The city is built on an eminence ; a numher of rivers add much to the fertility of the surrounding country. It may be considered as a double city, of which one is enclosed within the other: the interior contains the emperor's palace, hotels of the principal mandarins, sovereign courts, and the different tribunals; the exterior is inhabited by the common people, tradesmen, and all those who by their employments or professions are not obliged to lodge in the interior. The latter is almost a league in circumference ; and the walls which enclose both are more than three leagues round : these walls were entirely rebuilt in 1631, and repaired several times under the reign of Kang-hi.

MOULD, or MOLD, in the mechanic arts, &c. a cavity artificially cut, with a design to give its form or impression to some softer matter applied therein. Moulds are implements of great use in sculpture, foundery, &c. The workmen employed in melting the mineral or metallic ore dug out of mines, have their several moulds to receive the melted metal as it comes out of the furnace; but these are different according to the diversity of metals and works. In gold mines, they have moulds for ingots; in silver mines, for bars; in copper and lead mines, for pigs or salmons; in tin mines, for pigs and ingots; and in iron mines, for sows, chimney backs, anvils, caldrons, pots, and other large utensils and merchandises of iron ; which are here cast, as it were, at first hand.

MOULDS of founders of large works, as statues, bells, guns, and other brazen works, are of wax, supported within-side by what we call a core, and covered withoutside with a cape or case. It is in the space which the wax took up, which is afterwards melted away to leave it free, that the liquid metal runs, and the work

is formed ; being carried thither through a great num- Moulds. ber of little canals, which cover the whole mould. See -FOUNDERY.

MOULDS of moneyers are frames full of sand, wherein the plates of metal are cast that are to serve for the striking of species of gold and silver. See COINING.

A sort of concave moulds made of clay, having within them the figures and inscriptions of ancient Roman coins, are found in many parts of England, and supposed to have been used for the casting of money. Mr Baker having been favoured with a sight of some of these moulds found in Shropshire, bearing the same types and inscriptions with some of the Roman coins, gave an account of them to the Royal Society. They were found in digging of sand, at a place called Ryton in Shropshire, about a mile from the great Watlingstreet road. They are all of the size of the Roman denarius, and of little more than the thickness of our halfpenny. They are made of a smooth pot or brick clay, which seems to have been first well cleansed from dirt and sand, and well beaten or kneaded, to render it fit for taking a fair impression. There were a great many of them found together, and there are of them not unfrequently found in Yorkshire; but they do not seem to have been met with in any other kingdom, except that some have been said to be once found at Lyons. They have been sometimes found in great numbers joined together side by side, on one flat piece of clay, as if intended for the casting of a great number of coins at once; and both these, and all the others that have been found, seem to have been of the emperor Severus. They are sometimes found impressed on both sides, and some have the head of Severus on one side and some well known reverse of his on the other. They seem plainly to have been intended for the coinage of money, though it is not easy to say in what manner they can have been employed for that purpose, especially those which have impressions on both sides, unless it may be supposed that they coined two pieces at the same time by the help of three moulds, of which this was to be the middle one. If by disposing these into some sort of iron frame or case, as our letterfounders do the brass moulds for casting their types, the melted metal could be easily poured into them, it would certainly be a very casy method of coining, as such moulds require little time or expence to make, and therefore might be supplied with new ones as often as they happen to break.

These moulds seem to have been burnt or baked sufficiently to make them hard; but not so as to render them porous like our bricks, whereby they would have lost their smooth and even surface, which in these is plainly so close, that whatever metal should be formed in them would have no appearance like the sandholes by which counterfeit coins and metals are usually detected.

MOULDS of founders of small works are like the frames of coiners: it is in these frames, which are likewise filled with sand, that their several works are fashioned; into which, when the two frames of which the mould is composed, are rejoined, the melted brass is run.

MOULDS of letter-founders are parly of steel and partly of wood. The wood, properly speaking, serves only to cover the real mould which is within, and to prevent

3 N 2

Moulds.

prevent the workman, who holds it in his hand, from being incommoded by the heat of the melted metal. Only one letter or type can be formed at once in each mould. See LETTER FOUNDERY.

MOULDS, in the manufacture of paper, are little frames composed of several brass or iron wires, fastened together by another wire still finer. Each mould is of the bigness of the sheet of paper to be made, and has a rim or ledge of wood to which the wires are fastened. These moulds are more usually called frames or forms. See PAPER-Making.

MOULDS, with furnace and crucible makers, are made of wood, of the same form with the crucibles; that is, in form of a truncated cone : they have handles of wood to hold and turn them with, when being covered with the earth, the workman has a mind to round or flatten his vessel.

MOULDS for leaden bullets are little iron pincers, each of whose branches terminates in a hemispherical concave, which when shut from an entire sphere. In the lips or sides where the branches meet is a little jet or hole, through which the melted lead is conveyed.

Laboratory Moulds are made of wood, for filling and driving all sorts of rockets and cartridges, &c.

Glaziers Moulds. The glaziers have two kinds of moulds, both serving to cast their lead : in the one they cast the lead into long rods or canes fit to be drawn through the vice, and the grooves formed therein ; this they sometimes call ingot-mould. In the other, they mould those little pieces of lead a line thick and two lines broad, fastened to the iron bars. These may be also cast in the vice.

Goldsmiths MOULDS. The goldsmiths use the bones of the cuttle fish to make moulds for their small works ; which they do by pressing the pattern between two bones, and leaving a jet or hole to convey the metal through, after the pattern has been taken out.

MOULD, among masons, is a piece of hard wood or iron hollowed within side, answerable to the contours of the mouldings or cornices, &c. to be formed. This is otherwise caliber.

MOULDS, among plumbers, are the tables on which they cast sheets of lead. These they sometimes call simply tables. Besides which they have other real moulds, wherewith they cast pipes without soldering. See each described under PLUMBERY.

MOULDS, among the glass grinders, are wooden frames, whereon they make the tubes wherewith they fit their perspectives, telescopes, and other optic machines. These moulds are cylinders, of a length and diameter according to the use they are to be applied to, but always thicker at one end than the other, to facilitate the sliding. The tubes made on these moulds are of two kinds; the one simply of pasteboard and paper; the other of thin leaves of wood joined to the pasteboard. To make these tubes to draw out, only the last or innermost is formed on the mould; each tube made afterwards serving as a mould to that which is to go over it, but without taking out the mould from the first. See GRINDING.

MOULDS used in basket-making are very simple, consisting ordinarily of a willow or osier turned or bent into an oval, circle, square, or other figure, according to the baskets, panniers, hampers, and other utensils intended. On these moulds they make, or more properly

#### OU M

measure all their work; and accordingly they have Mouris them of all sizes, shapes, &c.

MOULD, in ship-building, a thin flexible piece of Maulinet timber, used by shipwrights as a pattern whereby to form the different curves of the timbers, and other compassing pieces in a ship's frame. There are two sorts of these, viz. the bend mould and hollow mould; the former of these determines the convexity of the timbers, and the latter their concavity on the outside, where they approach the heel, particularly towards the extremities of the vessel. The figure given to the timbers by this pattern is called their bevelling.

MOULDS, among tallow chandlers, are of two kinds : the first for the common dipped candles, being the vessel wherein the melted tallow is disposed, and the wick dipped. This is of wood, of a triangular form, and supported on one of its angles : so that it has an opening of near a foot a-top: the other, used in the fabric of mould candles, is of brass, pewter, or tin .- Here each candle has its several mould. See CANDLE.

MOULD, among gold-beaters, a certain number of leaves of vellum or pieces of gut, cut square of a certain size, and laid over one another, between which they put the leaves of gold and silver which they beat on the marble with the hammer. See GOLD LEAF.

They have four kinds of moulds ; two whereof are of vellum and two of gut; the smallest of those of vellum consists of 40 or 50 leaves; the largest contains" 100: for the others, each contains 500 leaves. The moulds have all their several cases, consisting of two pieces of parchment, serving to keep the leaves of the mould in their place, and prevent their being disordered in beating.

MOULD, in Agriculture, a general name for the soft earthy substance with which the dry land is generally covered, and in which all kinds of vegetables take root and grow. It is far from being an homogeneous substance; being composed of decayed animal and vegetable matters, along with calcareous, argillaceous, and siliccous earths, mixed together in various proportions, and with the different degrees of moisture, constituting every variety of SOIL.

MOULDINESS, is a white down or lanugo, which is produced on the surface of animal or vegetable matters in a state of putrefaction; and which viewed through a microscope appears like a kind of meadow, out of which arise herbs and flowers. See MUCOR, BOTANY Index.

MOULDING, any thing cast in a mould, or that seems to have been so, though in reality it were cut with a chisel or the axe.

MOULDINGS, in Architecture, projectures beyond the naked wall, column, wainscot, &c. the assemblage of which forms corniches, door cases, and other decorations of ARCHITECTURE. See that article.

MOULINET is used in Mechanics, to signify a roller, which being crossed with two levers, is usually applied to cranes, capstans, and other sorts of engines of the like nature to draw ropes, heave up stones, &c.

MOULINET is also a kind of turnstile or wooden cross, which turns horizontally upon a stake fixed in the ground; usually placed in passages to keep out horses, and to oblige passengers to go and come one hy one. These moulinets are often set near the outworks of

utinet of fortified places at the sides of the barriers, through which people pass on foot.

MOULINS, a town of France, in the department of Allier, and containing about 13,200 inhabitants in 1800. The houses of the Chartreux, and that of the Visitation, are magnificent. It has a considerable trade in cutlery ware, and is seated on the river Allier, in a pleasant fertile plain, almost in the middle of France, 30 miles south of Nevers, and 55 north of Clermont. E. Long. 3. 25. N. Lat. 46. 34.

MOULTON, NORTH, a town of Devonshire, on the river Moul.

MOULTON, South, on the same stream, 182 miles from London. This, as well as the former, was anciently royal demesue. It sent members to parliament in the reign of Edward I. consists of a mayor, 18 capital burgesses, a recorder, town clerk, and 2 serjeants at mace. Its chief manufactures are serges, shalloons, and felts; and a considerable market for wool.

MOULTING, or MOLTING, the falling off or change of hair, feathers, skins, horns, or other parts of animals, happening in some annually, in others only at certain stages of life.

The generality of animals moult in the spring. The moulting of a hawk is called *mewing*. The moulting of a deer is the quitting of his horns in February or March. The moulting of a serpent is the putting off his skin. See EXUVIÆ.

MOUND, a term used for a bank or rampart, or other fence, particularly that of earth.

MOUND, in *Heraldry*, a ball or globe with a cross upon it, such as our kings are usually drawn with, holding it in their left hand, as they do the sceptre in the right.

MÖUNT, an elevation of earth, called also mountain. See MOUNTAIN.

Mount Edgecumbe, a prodigious high peak, at the entrance of Cook's strait, in New Zealand, on the west side. Its height is supposed not to be much inferior to that of the Peak of Teneriffe.

Mount Sorrel, a town in Leicestershire, so named from a high mount or solid rock adjoining to the town, of a dusky red or sorrel-coloured stone, extremely hard. Of rough stones hown out of this rock the town is built. It was noted formerly for its castle, and is seated on the river Stour, over which there is a bridge. It is 20 miles south-east by south of Derby, and 105 north-west by north of London. It contained 1502 inhabitants in 1811. W. Long. 1.9. N. Lat. 52. 45.

Mounts of Piety, certain funds or establishments in Italy, where money is lent out on some small security. There were also mounts of piety in England, raised by contribution for the benefit of people ruined by the extortions of the Jews.

MOUNTAIN (*Mons*), a considerable eminence of land, elevated above the surrounding country: It is commonly full of inequalities, cavities more or less exposed, and strata uncovered. For the natural history of mountains, see MOUNTAIN, GEOLOGY Index.

Attraction of MOUNTAINS. This is a late discovery, Mountain. and a very considerable confirmation of Sir Isaac Newton's theory of universal gravity. According to the Newtonian system, an attractive power is not only exerted between those large masses of matter which constitute the sun and planets, but likewise between all comparatively smaller bodies, and even between the smallest particles of which they are composed. Agreeably to this hypothesis, a heavy body, which ought to gravitate or tend toward the centre of the earth, in a direction perpendicular to its surface, supposing the said surface to be perfectly even and spherical, ought likewise, though in a less degree, to be attracted and tend towards a mountain placed on the earth's surface; so that a plumb line, for instance, of a quadrant, hanging in the neighbourhood of such a mountain, ought to be drawn from a perpendicular situation, in consequence of the attractive power of the quantity of matter of which it is composed aeting in a direction different from that exerted by the whole mass of matter in the earth, and with a proportionably inferior degree of force.

Though Sir Isaac Newton had long ago hinted at an experiment of this kind, and had remarked, that "a mountain of an hemispherical figure, three miles high and six broad, would not, by its attraction, draw the plumb line two minutes out of the perpendicular (E) :" yet no attempt to ascertain this matter by actual experiment was made till about the year 1738; when the French academicians, particularly Messrs Bouguer and Condamine, who were sent to Peru to measure a degree under the equator, attempted to discover the attractive power of Chimboraço, a mountain in the province of Quito. According to their observations, which were however made under circumstances by no means favourable to an accurate solution of so nice and difficult a problem, the mountain Chimboraço exerted an attraction equal to eight seconds. Though this experiment was not perhaps sufficient to prove satisfactorily even the reality of an attraction, much less the precise quantity of it; yet it does not appear that any steps had been since taken to repeat it.

Through the munificence of his Britannic majesty, the Royal Society were enabled to undertake the execution of this delicate and important experiment; the astronomer royal was chosen to conduct it. After various inquiries, the mountain Schehallien, situated nearly in the centre of Scotland, was pitched upon as the most proper for the purpose that could be found in this island. The observations were made by taking the meridian zenith distances of different fixed stars, near the zenith, by means of a zenith sector of ten feet radius; first on the south, and afterwards on the north side of the hill, the greatest length of which extended in an east and west direction.

It is evident, that if the mass of matter in the hill exerted any sensible attraction, it would cause the plumb-line of the sector, through which an observer viewed a star in the meridian, to deviate from its perpendicular situation, and would attract it contrariwise at the

(E) By a very easy calculation it is found that such a mountain would attract the plumb line 1' 18" from the perpendicular.

Mountains, the two stations, thereby doubling the effect. On the

South side the plummet would be drawn to the northward by the attractive power of the hill placed to the northward of it : and on the north side, a contrary and equal deflection of the plumb line would take place in consequence of the attraction of the hill, now to the southward of it. The apparent zenith distances of the stars would be affected contrariwise; those heing increased at the one station which were diminished at the other : and the correspondent quantities of the deflection of the plumh line would give the observer the sum of the contrary attractions of the hill, acting on the plummet at the two stations; the half of which will of course indicate the attractive power of the hill.

470

The various operations requisite for this experiment lasted about four months; and from them it appears that the sum of the two contrary attractions of the mountain Schehallien, in the two temporary observations which were successively fixed half way up the hill (where the effect of its attraction would he greatest), was equal to 11".6 .- From a rough computation, founded on the known law of gravitation, and on an assumption that the density of the hill is equal to the mean density of the earth, it appears that the attraction of the hill should amount to about the double of this quantity. From thence it was inferred that the density of the hill is only about half the mean density of the earth. It does not appear, however, that the mountain Schehallien has ever been a volcano, or is hollow; as it is extremely solid and dense, and seemingly composed of an entire rock.

The inferences drawn from these experiments may be reduced to the following :

" I. It appears, that the mountain Schehallien exerts a sensible attraction; therefore, from the rules of philosophizing, we are to conclude, that every mountain, and indeed every particle of the earth, is endued with the same property, in proportion to its quantity of matter.

" 2. The law of the variation of this force, in the inverse ratio of the squares of the distances, as laid down by Sir Isaac Newton, is also confirmed by this experiment. For if the force of attraction of the hill had been only to that of the earth, as the matter in the hill to that of the earth, and had not been greatly increased by the near approach to its centre, the attraction thereof must have been wholly insensible. But now, by only supposing the mean density of the earth to be double to that of the hill, which seems very probable from other considerations, the attraction of the hill will be reconciled to the general law of the variation of attraction in the inverse duplicate ratio of the distances, as deduced by Sir Isaac Newton from the comparison of the motion of the heavenly bodies with the force of gravity at the surface of the earth; and the analogy of nature will be preserved.

"3. We may now, therefore, be allowed to admit this law, and to acknowledge, that the mean density of the earth is at least double of that at the surface; and consequently that the density of the internal parts of the earth is much greater than near the surface. Hence also, the whole quantity of matter in the earth will be at least as great again, as if it had been all composed of matter of the same density with that at the surface; or will be about four or five times as great as MOU

if it were all composed of water.—This conclusion, Mr Monnta Maskelyne adds, is totally contrary to the hypothesis of some naturalists, 'who suppose the earth to be only a great hollow shell of matter; supporting itself from the property of an arch, with an immense vacuity in the midst of it.' But were that the case, the attraction of mountains, and even smaller inequalities in the earth's surface would be very great, contrary to experiment, and would affect the measures of the degrees of the meridian much more than we find they do; and the variation of gravity, in different latitudes, in going from the equator to the poles, as found by pendulums, would not be near so regular as it has been found by experiment to be.

"4. As monntains are by these experiments found capable of producing sensible deflections of the plumb lines of astronomical instruments; it becomes a matter of great importance, in the mensuration of degrees in the meridian, either to choose places where the irregular attraction of the elevated parts may be small; or where, by their situation, they may compensate or counteract the effects of each other." See MOUNTAINS, SUP-PLEMENT.

For measuring the heights of mountains, see BARO-METER.

Burning MOUNTAINS. See ÆTNA, HECLA, VESU-VIUS; see also VOLCANO, GEOLOGY Index.

Marble MOUNTAINS. Of these there are great numbers in Egypt, from which, though immense quantities have been carried off for the multitude of great works erected by the ancient Egyptians; yet in the opinion of Mr Bruce, who passed by them in his journey to Abyssinia, there is still a sufficient supply to build Rome, Athens, Corinth, Syracuse, Memphis, Alexandria, and half a dozen more of such cities.

The first mountain of this kind mentioned by Mr Bruce is one opposite to Terfowey, consisting partly of green marble, partly of granite, with a red blush upon a gray ground, and square oblong spots. Here he saw a monstrous obclisk of marble very nearly square, broken at the end, and nearly 30 feet long and 19 feet in the face. Throughout the plain there were scattered small pieces of jasper, with green, white, and red spots, called in Italy *diaspro sanguineo*; and all the mountains upon that side seemed to consist of the same materials. From Mr Bruce's description of these mountains, it would appear that they are composed of scrpentine, and not of calcarcous marble.

Written MOUNTAIN, Mountain of Inscriptions, or Jibel-al-Mokatteb, a supposed mountain or chain of mountains, in the wilderness of Sinai; on which, for a great extent of space, the marble of which the mountain consists is inscribed with innumerable characters, reaching from the ground sometimes to the height of 12 or 14 feet. These were mentioned by a Greek author in the third century, and some of them have been copied by Pococke and other late travellers ; but, after all, there is still a very great uncertainty even of the existence of such mountain or mountains. The vast number of these inscriptions, the desert place in which they are found, and the length of time requisite for executing the task, have induced a notion hy no means unnatural, that they are the work of the Israelites during their forty years wandering in the wilderness. Others are of opinion that they contain nothing of any importance,

2

his tains, importance, but consist merely of the names of travel-

M. Niebuhr, who visited this country during his travels in the east, made every attempt in his power, though without success, to obtain a sight of this celebrated mountain. On applying to some Greeks at Suez, they all declared that they knew nothing of the written mountain : they, however, directed him to an Arabian sheik, who had passed all his lifetime in travelling between Suez and Mount Sinai ; but he knew no more of it than the former. Understanding, however, that a considerable reward would be given to any person who would conduct them thither, this Arab directed them to another; who pretended not only to know that mountain, but all others upon which there were any inscriptions throughout the desert. On inquiring particularly, however, our travellers found that he was not to be depended upon; so that they were obliged to have recourse to a fourth sheik, who by his conversation convinced them that he had seen mountains with inscriptions in unknown characters upon them. It docs not appear, however, that this person was very eapable, more than the rest, of leading them to the place they so much wished for; though he conducted them to some rocks upon which there were inscriptions in unknown characters. They are most numerous in a narrow pass between two mountains named Om-er-ridstein: and, says M. Niebuhr, " the pretended Jibel-el-Mokatteb may possibly be in its neighbourhood." Some of these inscriptions were copied by our author; but he does not look upon them to be of any consequence. " They seem (says he) to have been executed at idle hours by travellers, who were satisfied with cutting the unpolished rock with any pointed ipstrument, adding to their names and the date of their journeys some rude figures, which bespeak the hand of a people but little skilled in the arts. When such inscriptions are executed with the design of transmitting to postcrity the memory of such events as might afford instructive lessons, greater eare is generally taken in the preparation of the stones, and the inscriptions are engraven with more regularity."

When M. Niebuhr arrived at last at the mountain to which the sheik had promised to conduct him, he did not find any inscriptions; but on elimhing up to the top, he found out an Egyptian cemetery, the stones of which were covered with hieroglyphics. The tomh stones are from five to seven feet in length, some standing on end and others lying flat; and " the more carefully they are examined (says he), the more certainly do they appear to be sepulchral stones, having epitaphs inscribed on them. In the middle of the stones is a building, of which only the walls now remain ; and within it are likewise a great many of the sepulchral stones. At one end of the building seems to have been a small chamber, of which the roof still remains. It is supported upon square pillars ; and these, as well as the walls of the chamber, are eovered with hieroglyphic inscriptions. Through the whole building are various busts executed in the manner of the aneient Egyptians. The sepulchral stones and the busts are of hard and fine grained sand stone." M. Nicbuhr is of opinion that this cometery was not the work of the Egyptians themselves, but of some colony which came from Egypt, and had adopted the manners and customs

of the people. He supposes that it might have been Mountains. built by the Arabs, who had conquered Egypt under the shepherd kings, and adopted the Egyptian manners during their residence there. As it must have helonged to an opulent city, however, he owns that there is a great difficulty in accounting for the existence of such a city in the midst of a desert.

The translator of Volney's travels ascribes these inscriptions to the pilgrims who visit Mount Sinai. But to this, as well as to every other conjecture, there is this objection, that whether the inscriptions be well executed or not, whether they contain matters of importance or not, they ought to have been written in a language which somebody could understand; but from the copies that have been taken of them by Dr Pococke and others, it does not appear that they could be explained either by him or any other person.

When Dr Clayton, bishop of Clogher, visited this part of the world about the year 1723, he expressed the greatest desire to have the matter concerning this written mountain or mountains ascertained, and even made an offer of 500l. sterling to any literary person who would undertake the journey and endeavour to decypher the inscriptions; but no such person has appeared, and the existence of the mountains is testified only by the superior of a convent at Cairo, who gave that mentioned in the beginning of this article. Until that part of the world, therefore, become more accessible to travellers, there is but little hope that we can come to any certainty in the matter. M. Niebuhr plainly, from his own accounts, had not influence enough with the Arabs to show him almost any thing, as they refused to conduct him even to the summit of Mount Sinai.

## White MOUNTAINS. See New HAMPSHIRE.

MOUNTAINS of the Moon, a chain of mountains in Africa, extending hetween Abyssinia and Monomotapa, and so called from their great height.

MOUNTAINS of the Lions, also in Africa, divide Nigritia from Guinea, and extend as far as Ethiopia. They were styled by the ancients the mountains of God, on account of their being greatly subject to thunder and lightning.

MOUNTAIN of Forty Days; a mountain of Judea, sitnated in the plain of Jerieho, to the north of that city. According to the abbé Mariti's description, the summit of it is covered neither with shrubs, turf, nor earth; it eonsists of a solid mass of white marble, the surface of which is become yellow by the injuries of the air. " The path by which you ascend to it (says our author) fills one with terror, as it rises with a winding course between two abysses, which the eye dares scarcely bchold. This path is at first pretty broad, but it at length becomes so confined, that one can with difficulty place both feet upon it at the same time. When we had ascended a little higher, we found an Arab stretched out on the path, who made us pay a certain toll for our passage. Here the traveller requires courage. One of the parapets of the path being broke, we elung to the part which remained until we had reached a small grotto, situated very commodiously, as it gave us an opportunity of recovering our breath. When we had rested ourselves a little, we pursued our course, which hecame still more dangerous. Suspended almost from the reck, and having before our eyes all the horror of

the

Mountain, the precipiee, we could advance only by dragging one Mourning. foot after the other ; so that had the smallest fragments given way under us, we should have been hurried to the bottom of this frightful abyss.

"This mountain is one of the highest in the province, and one of its most sacred places. It takes its name from the rigorous fast which Christ observed here after having triumphed over the vanities of the world and the power of hell. In remembrance of this miraele, a chapel was formerly constructed on the summit of the mountain. It may be seen from the plain, but we could not approach it, as the path was almost entirely destroyed. It, however, may be accessible on the other side of the mountain, which we did not visit. A great many scattered grottos are seen here ; in one of which, according to Quaresmius, were deposited the bodies of several anchorets, which are still entire. 1 have heard the same thing asserted in the country, but I could never meet with any person who had seen them. Here we enjoyed the most beautiful prospect imaginable. This part of the mountain of Forty Days overlooks the mountains of Arabia, the country of Gilead, the country of the Ammonites, the plains of Moab, the plain of Jericho, the river Jordan, and the whole extent of the Dead sea. It was here that the devil said to the Son of God, 'All these kingdoms will I give thee, if thou wilt fall down and worship mc."

MOURNING, a particular dress or habit worn to signify grief on some melancholy occasion, particularly the death of friends or of great public characters .--The modes of mourning are various in various countries; as also are the colours that obtain for that end. In Europe, the ordinary colour for mourning is black ; in China, it is white; in Turkey, blue or violet; in Egypt, yellow; in Ethiopia, brown. White obtained formerly in Castile on the death of their princes. Herrera observes, that the last time it was used was in 1498, at the death of Prince John. Each people pretend to have their reasons for the particular colour of their mourning; white is supposed to denote purity; yellow, that death is the end of human hopes, in regard that leaves when they fall, and flowers when they fade, become yellow: brown denotes the earth, whither the dead return; black, the privation of life, as being the privation of light : blue expresses the happiness which it is hoped the deceased does enjoy ; and purple or violent, sorrow on the one side, and hope on the other, as being a mixture of black and blue.

MOURNING, among the ancients, was expressed various ways.

Amongst the Jews, on the death of their relations or intimate friends, grief or mourning was signified by weeping, tearing their clothes, smiting their breasts, or tearing them with their nails, pulling or cutting off their hair and beards, walking softly, i. e. barefoot, lying upon the ground, fasting, or eating upon the ground. They kept themselves close shut up in their houses, covered their faces, and abstained from all work, even reading the law, and saying their usual prayers. They neither dressed themselves, nor made the beds, nor shaved themselves, nor cut their nails, nor went into the bath, nor saluted any body : so that sulkiness seems to have been an indication of sorrow, and dirtiness of distress. The time of mourning among the Jews was generally seven days : though this

was lengthened or shortened according to circumstan- Mourning ces; but 30 days were thought sufficient upon the severest occasions. The different periods of the time of mourning required different degrees of grief, and different tokens of it.

The Greeks, on the death of friends, showed their sorrow by seeluding themselves from all gaiety, entertainments, games, public solemnities, the enjoyment of wine, and the delights of music. They sat in gloomy and solitary places, stripped themselves of all external ornaments, put on a coarse black stuff by way of mourning, tore their hair, shaved their heads, rolled themselves in the dust and mire, sprinkled ashes on their heads, smote their breasts with their palms, tore their faces, and frequently cried out with a lamentable voice and drawling tone, reiterating the interjection s, s, s, s; hence funeral lamentations were called Exerce. If they appeared in public during the time of mourning, they had a veil thrown over their faces and heads. During the funeral procession, certain persons called exactor Senvor, marched before, and sung melaneholy strains called oyoquepos Ianspes, Airos, and Ashevos. These vocal mourners sung thrice during the procession round the pile and round the grave. Flutes were also used to heighten the solemnity. At the funerals of soldiers, their fellow soldiers who attended, as a testimony of their affliction, held their shields, their spears, and the rest of their armour, inverted.

The tokens of private grief among the Romans were the same as those already observed as customary among the Greeks. Black or dark brown were the colours of the mourning habits worn by the men; they were also common to the women. The mourning of the emperors at first was black. In the time of Augustus, the women wore white veils, and the rest of their dress black. From the time of Domitian they wore nothing but white habits, without any ornaments of gold, jewels, or pearls. The men let their hair and beards grow, and wore no wreaths of flowers on their heads while the days of mourning continued. The longest time of mourning was ten months: this was Numa's cstablishment, and took in his whole year. For a widow to marry during this time was infamous. Mourning was not used for children who died under three years of age. From this age to ten they mourned as many months as the child was years old. A remarkable victory, or other happy event, oecasioned the shortening of the time of mourning: The birth of a child, or the attainment of any remarkable honour in the family, certain feasts in honour of the gods, or the consecration of a temple, had the same effect. After the battle of Cannæ, the commonwealth decreed that mourning should not be worn for more than 30 days, that the loss might be forgotten as soon as possible. When public magistrates died, or persons of great note, also when any remarkable calamity happened, all public moetings were intermitted, the schools of exercise, baths, shops, temples, and all places of concourse were shut up, and the whole city put on a face of sorrow; the senators laid aside the laticlave, and the consuls sat in a lower seat than ordinary. This was the custom of Athens also, and was observed upon the death of Socrates not long after he had been sentenced to death by their judges.

Prafica, or mourning women, (by the Greeks called Senvar Exerci, went about the streets: this was customary

1

purning mary among the Jews as well as the Greeks and Romans, (Jerem. ix. 17.) musul.

MOUSE. See Mus, MAMMALIA Index. Mouse-Ear. See HIERACIUM, BOTANY Index. Dor-Mouse. See MYOXUS, MAMMALIA Index. Shrew-Mouse. See Sorex, France Lation trees

MOUSELLE, the name of an East Indian tree, with white tubular flowers, which fall off every day in great plenty. They are of a sweet agreeable smell, and the Gentoos are very fond of wearing them, stringing and hanging them about their necks and arms. The fruit is a pale red cherry, of the shape and size of our white heart cherry, but the footstalk is not quite so long. This fruit has a stone in it, containing a bitter oily kernel. The Indians rub with this oil any part stung hy a scorpion or bitten by a centipede, which it soon cures. The crows are very fond of the fruit.

MOUSUL, or MOSUL, a large city of Turkey in Asia, and capital of a beglerbegate, stands on the west bank of the Tigris, in the latitude, according to Mr Ives's observation, of 36° 30' north. It is surrounded with stone walls, but has many of its streets lying waste. Tavernier speaks of it as a ruined place, with only two blind markets and a sorry castle; yet, he says, that it is much frequented by merchants, and that its basha commands 3000 men. There is a bridge of boats over the Tigris; and the eity is a thoroughfare from Persia to Syria, which makes it a place of trade, and which is more augmented by a constant traffic from this place to Bagdad. The country on this side the river is sandy and barren; but on the opposite side it is exceedingly fruitful, yielding good crops of corn and fruit in abundance. Mr Ives says it was the best built eity he had seen in Turkey; but had nothing in it to attract the notice of an European. It was besieged for near six months by Nadir Shah without success. Breaches were frequently made in the walls, and assaults continued for three days successively; but the assailants-were constantly repulsed, and the breaches made in the day time repaired during the night. The besieged had unanimously resolved to die rather than to submit. The Turks declared, that should the place be forced to surrender, they were determined to put to death all their wives and daughters first, that they might not fall into the vile hands of the abhorred Persians. The place was therefore defended with uncommon bravery; even the women and children exerted themselves with the greatest alacrity. The Christians behaved in such a manner as to gain the esteem and admiration of the other inhabitants; and some of their ehurehes being demolished, they were afterwards repaired at the expence of government.

In this city there are a great many mosques, the largest and most stately of which is ornamented on the top with green tiles. At the doors of these houses there are usually inscriptions in gilt letters, deelaring the awfulness of the building, as being the house of God. One of them has a minaret which bends like those of Bagdad. Some of the most bigotted Turks say, that Mahomet saluted this minaret as he passed ; on which it bent its head in reverence to the prophet, and ever after continued in that situation. The ma-VOL. XIV. Part II.

nufacture of this city is mussolen (muslin), which is made very strong and pretty fine. In the year 1757, this city and the country adjacent were visited by a dreadful famine, owing to the preceding hard winter, and innumerable multitudes of locusts, by which the fruits of the earth were destroyed. When Mr Ives was there in 1758, the country was comparatively depopulated. Almost all the brute creation had been destroyed for the subsistence of man. During the famine, the people had eaten dogs, and every kind of animal which is held in abhorrence at any other time, not sparing even their own children; and the dead bodies lay in the streets for want of people to bury them. Their fruit trees were also destroyed by the frost ; so that when our author was there searcely any fruit could be had. The neighbouring mountains afford silver mines; and they would yield much quicksilver if the Turks had either the skill or inclination to work them to advantage. Lanza says, that some time ago an Englishman who travelled through this country got two or three bottles of it, which he presented to the basha as a specimen of what might be done in that way : but no farther attempt was made. Here also are some lead mines, which supply as much of that metal as furnishes them with bullets and some necessary utensils.

MOU-TAN or PEONY SHRUB of China : also called hoa-ouang, or "the king of flowers," and peleangkin, " an hundred ounces of gold," in allusion to the excessive price given formerly by some of the virtuosi for certain species of this plant. The mou-tan seems to claim pre-eminence, not only on account of the splendour and number of its flowers, and of the sweet odour which they diffuse around, but also on account of the multitude of leaves which compose them, and of the beautiful golden spots with which they are interspersed. This plant, which is of a shrubby nature, shoots forth a number of branches, which form a top almost as large as those of the finest orange trees.

MOUTH, in Anatomy, a part of the face, consisting of the lips, the gums, the insides of the cheeks, the palate, the salival glands, the os hyoides, the uvula, and the tonsils; which see under the article ANA-TOMY.

Mr Derham observes, that the mouth in the several species of animals is nicely adapted to the uses of such a part, and well sized and shaped for the formation of speech, the gathering and receiving of food, the eatching of prey, &c. In some ereatures it is wide and large, in others little and narrow : in some it is formed with a deep incisnre into the head, for the better catching and holding of prey, and more easy comminution of hard, large, and troublesome food; and in others with a shorter ineisure, for the gathering and holding of herbaceous food. In birds it is neatly shaped for piercing the air; hard and korny, to supply the want of teeth; hooked, in the rapacious kind, to catch and hold their prey; long and slender in those that have their food to grope for in moorish places ; and broad and long in those that search for it in the mud. Nor is the mouth less remarkable in insects; in some it is forcipated, to catch, hold, and tear the prey; in others aculeated, to pierce and wound animals, and suck their blood ; in others, strongly rigid, with jaws and teeth, to gnaw and scrape 30 011

N'ohsu! Mouth. Mouth Muffle.

out their food, carry burdens, perforate the earth, nay the hardest wood, and even stones themselves, for houses and nests for their young.

MOWEE, one of the Sandwich islands, discovered by Captain Cook, is 162 miles in circumference. A low isthmus divides it into two circular peninsulas, of which the eastern is double the size of the western. The mountains in both rise to a great height, and may be seen at the distance of more than 30 leagues. The northern shores, like those of Owhyhee, afford no soundings, and the country presents the same appearance of verdure and fertility. The number of inhabitants is computed at about 65,000. W. Long. 175. 56. N. Lat. 20. 53

MOXA, or MUGWORT of China, is a soft lanuginous substance, prepared in Japan from the young leaves. of a species of ARTEMISIA, by beating them together when thoroughly dried, and rubbing them betwixt the hands till only the fine fibres are left. The down on the leaves of mullein, cotton, hemp, &c. answers the same purpose.

In the Eastern countries it is used by burning it on the skin : a little cone of the moxa is laid upon the part, previously moistened, and set on fire at the top; it burns down with a temperate glowing heat, and produces a dark coloured spot, the exulceration of which is promoted by applying a little garlic; the ulcer is left to discharge, or is soon healed, according to the intention in using the moxa.

MOYRA. See MOIRA.

MUCILAGE, in Pharmacy, is in general any viscid or glutinous liquor.

MUCILAGE also imports the liquor which principally serves to moisten the ligaments and cartilages of the articulations, and is supplied by the mucilaginous glands.

MUCOR, in Botany, a genus of the order of fungi, belonging to the cryptogamia class of plants. See Bo-TANY Index.

MUCUS, a mucilaginous liquor secreted by certain glands, and serving to lubricate many of the internal cavities of the body. In its natural state it is generally limpid and colourless ; but, from certain causes, assumes a thick consistence and a whitish colour like pus. For the distinguishing characters between pus and mucus, see CHEMISTRY, Nº 2769.

MUCK, or RUNNING A MUCK, is a practice that has prevailed time immemorial in Batavia. To run a muck, in the original sense of the word, is to get moxicated with opium, and then rush into the street with a drawn weapon, and kill any one that comes in the way, till the party is himself either killed or taken prisoner. If the officer take one of these amocks or mohawks (as they have been called by an easy corruption) alive, he has a considerable reward; and the unhappy wretch is always broken alive on the wheel: but such is the fury of their desperation, that three out of four are necessarily destroyed in attempting to secure them.

See MURÆNA, ICHTHYOLOGY MUD-IGUANA. Index.

MUFFLE, in Chemistry, a vessel employed in some metallurgic operations. In figure it represents an oblong arch or vault, the hinder part of which is closed by a semicircular plane, and the lower part or floor of

which is a rectangular plane. It is a little oven that is Muffle placed horizontally in assay and enamelling furnaces, so that its open side corresponds with the door of the fire- Mulberry place of the furnace. Under this arched oven small. cupels or crucibles are placed; and the substances contained are thus exposed to intense heat without contact of fuel, smoke, or ashes.

MUFTI, the chief of the ccclesiastical order, or primate of the Mussulman religion. The authority of the mufti is very great in the Ottoman empire; for even the sultan himself, if he would preserve any appearance of religion, cannot, without hearing his opinion, put any person to death, or so much as inflict any corporal punishment. In all actions, especially, criminal ones, his opinion is required, by giving him a writing in which the case is stated under feigned names ; which he subscribes with the words, He shall, or shall not, be punished. Such outward honour is paid to the mufti, that the grand signior himself rises up to him, and advances seven steps to meet him when he comes into his presence. He alone has the honour of kissing the sultan's left shoulder, whilst the prime vizier kisses only the hem of his garment. When the grand signior addresses any writing to the mufti, he gives him the following titles : To the Esad, the wisest of the wise, instructed in all knowledge, the most excellent of excellents, abstaining from things unlawful, the spring of virtue and of true science, heir of the prophetic doctrines, resolver of the problems of faith, revealer of the orthodox articles, key of the treasures of truth, the light to the doubtful allegories, strengthened with the grace of the supreme Legislator of mankind, may the Most High God perpetuate thy virtues ! The election of the multi is solely in the grand signior, who presents him with a vest of rich sables, &c. If he is convicted of treason or any great crime, he is put into a mortar kept for that purpose in the Seven Towers at Constantinople, and pounded to death.

MUGGLETONIANS, a religious sect which arose in England about the year 1657; so denominated from their leader Lodowick Muggleton, a journeyman taylor, who, with his associate Reeves, set up for great prophets, pretending, as it is said, to have an absolute power of saving and damning whom they pleased; and giving out that they were the two last witnesses of God that should appear before the end of the world.

MUGIL, the MULLET, a genus of fishes belonging to the order of abdominales. Sec ICHTHYOLOGY Index.

MUGWORT, a species of ARTEMISIA ; which sec, BOTANY Index.

MUID, a large measure in use among the French, for things dry. The muid is no real vessel used as a measure, but an estimation of several other measures; as the septier, mine, minot, bushel, &c.

MUID, is also one of the nine casks, or regular vessels used in France, to put wine and other liquors in. The muid of wine is divided into two demi-muids, four quarter-muids, and eight half-quarter muids, containing 36 septiers.

MULATTO, a name given in the Indies to those who are begotten by a negro man on an Indian or white woman, or by an Indian or white man on a negro woman. MULBERRY. See Morus, BOTANY Index.

MULBERRY-Cyder, a name given by the people of Devonshire, and some other parts of England, to a sort

a berry

sort of eyder rendered very palatable by an admixture of mulberry juice in the making; they choose for this lier. purpose the ripest and blackest mulberries, and pressing out their juice, and mixing it with a full bodied cyder at the time of the grinding and pressing, give just so much of it as adds a perceptible flavour. It is very worthy the attention of people who live in other countries, where strong and good eyder is made, that this renders it a sort of wine much more agreeable than any other English liquor, and might be brought into general use, to the great advantage of the dealer. The colour of this liquor resembles that of the brightest red wine, and the flavour of the mulberry never goes off. Phil. Trans. Nº 133.

MULCT, a fine of money laid upon a man who has committed some fault or misdemeanour.

MULE, a mongrel kind of quadruped, usually generated between an ass and a marc, and sometimes between a horse and a she ass ; but the signification of the word is commonly extended to every kind of animal produced by a mixture of two different species. See MAMMALIA Index.

MULES, among gardeners, denote a sort of vegetable monsters produced by putting the farina fœcundans of one species of plant into the pistil or utricle of another.

The earnation and sweet-william being somewhat alike in their parts, particularly their flowers, the farina of the one will impregnate the other, and the seed so enlivened will produce a plant differing from either. An instance of this we first had in Mr Fairchild's garden at Hoxton; where a plant is seen neither sweetwilliam nor earnation, but resembling both equally : this was raised from the seed of a carnation that had been impregnated by the farina of the sweet-william. These couplings being not unlike those of the mare with the ass, which produce the mule, the same name is given them; and they are, like the others, ineapable of multiplying their species.

This furnishes a hint for altering the property and taste of any fruit, by impregnating one tree with the farina of another of the same class ; e. gr. a codlin with a pear-main, which will occasion the codlin so impregnated to last a longer time than usual, and to be of a sharper taste.

MULHAUSEN, an imperial and Hanseatic town of Germany, in Upper Saxony, and in Thuringia, under the protection of the elector of Saxony; seated in a fertile country, on the river Unstrutht, 15 miles northeast of Eisenach, and 45 east by south of Cassel. E. Long. 10. 49. N. Lat. 51. 13.

MULHAUSEN, a considerable town in Alsace, formerly eapital of a republic in alliance with the Swiss. It is populous, and well built, seated in a pleasant fertile country, on an island formed by the river Ill, 15 miles north-west of Basle. It was united to France in 1798, and belongs to the department of the Upper Rhine. E. Long. 7. 24. N. Lat. 47. 48.

MULIER, in Law, signifies the lawful issue born in wedlock, though begotten before. The mulier is preferred to an older brother born out of matrimony; as for instance, if a man has a son by a woman before marriage, which issue is a bastard, and afterwards marrics the mother of the bastard, and they have another son, this second son is mulier and lawful, and shall be

M U L

heir of the father; but the other can be heir to no Mulier person\*. By the civil law, where a man has issue by a woman, if after that he marries her, the issue is Mullingar mulier.

MULL, one of the Western islands of Seotland, about article 25 miles long, and as much in breadth. It is in ge- Bastard. neral rocky and barren, not producing a sufficient quantity of eorn for the inhabitants; but a great number of eattle arc annually exported, which with the fishings and a considerable quantity of kelp are the only articles of commerce. It is deeply indented with bays and creeks, forming in several parts good natural harbours. There are no villages except Tobermorey, near the northern point of the island, where a fishing station has been fixed. The island was originally part of the dominions of the Lords of the Isles; but in after times it became a part of the possessions of the ancient family of Maeleans, who still retain a considerable part. The duke of Argyll is also a considerable proprietor. The ruins of several ancient castles are seen on this island. The population of Mull, in 1795, amounted to about Sooo persons.

MULL of Cantyre. See CANTYRE. MULL of Galloway. See GALLOWAY. MULLEIN. See VERBASCUM, BOTANY Index.

MULLER, or REGIOMONTANUS, JOHN, a celebrated astronomer of the 15th century, was born at Koningshoven in Franconia in 1436, and acquired great reputation by publishing an abridgement of Ptolemy's Almagest, which had been begun by Purback. He went to Rome to perfect himself in the Greek tongue, and to see the Cardinal Bassarion ; but finding some faults in the Latin translation of George de Trebizond, that translator's son assassinated him in a second journey he made to Rome in 1476, where Pope Sixtus IV. had provided for him the arehbishoprie of Ratishon, and had sent for him to reform the ealendar. Others say that he died of the plague.

MULLER, or Mullar, denotes a stone flat and even at bottom, but round a-top ; used for grinding of matters on a marble .- The apothecaries use mullers to prepare many of their testaceous powders ; and painters for their colours, either dry or in oil.

MULLER is an instrument used by the glass-grinders; being a piece of wood, to one end whereof is cemented the glass to be ground, whether eonvex in a bason, or concave in a sphere or bowl .- The muller is ordinarily abent six inches long, turned round : the cement used is composed of ashes and pitch. See GRINDING.

MULLERAS, a town of Germany, in the eirele of Upper Saxony, and marquisate of Brandenburg, seated 38 miles south of Berlin, npon a canal which joins the Oder and the Spree. This eanal is 15 miles in length, 10 yards in breadth, and seven feet in depth. It was eight years in making; and since that time the eities of Hamburg and Breslaw have carried on great trade by water. E. Long. 14. 50. N. Lat. 52. 21.

'MULLET. See MUGIL, ICHTHYOLOGY Index.

MULLET, or Mollet, in Heraldry, a bearing in form of the rowel of a spur, which it originally represented.

MULLINGAR, the county town of Westmeath, and province of Leinster, in Ireland, 38 miles from 302 Dublin.

Mum

two handfuls or more; seeds of cardamon bruised, 30 ounces; barberries bruised, one ounce: when the liquor has worked a while, put the herbs and seeds into Mummy, the vessel; and, after they are added, let it work over as little as possible; then fill it up: lastly, when it is stopped, put into the hogshead ten new-laid eggs unbroken; stop it up close, and use it at two years end. The English brewers, instead of the inner rind of fir. use cardamom, ginger, and sassafras; and also add elecampane, madder, and red sanders.

MUMMIUS, L. a Roman consul sent against the Achæans, whom he conquered B. C. 147. He destroyed Corinth, Thebes, and Chalcis, by order of the senate, and obtained the surname of Achaicus from his victories. He did not enrich himself with the spoils of the enemy, but returned home without any increase of fortune. He was so little acquainted with the value of the paintings and works of the most celebrated artists of Greece which were found in the plunder of Corinth, that he said to those who conveyed them to Rome, that if they lost or injured them, they should makes others in their stead.

MUMMY, a body embalmed or dried, in the manner used by the ancient Egyptians; or the composition with which it is embalmed. There are two kinds of bodies denominated mummies. The first are only careases dried by the heat of the sun, and by that means kept from putrefaction: these are frequently found in the sands of Libya. Some imagine, that these are the bodies of deccased people buried there on purpose to keep them entire without embalming; others think they are the carcases of travellers who have been overwhelmed by the clouds of sand raised by the hurricanes frequent in those deserts. The second kind of mummies are bodies taken out of the catacombs near Cairo, in which the Egyptians deposited their dead after embalming. See EMBALMING.

We have two different substances preserved for medicinal use under the name of mummy, though both in some degree of the same origin. The one is the dried and preserved flesh of human bodics, embalmed with myrrh and spices; the other is the liquor running from such mummies, when newly prepared, or when affected by great heat or damps. The latter is sometimes in a liquid, sometimes of a solid form, as it is preserved in vials well stopped, or suffered to dry and harden in the air. The first kind of munimy is brought to us in large pieces, of a lax and friable texture, light and spongy, of a blackish brown colour, and often damp and clammy on the surface : it is of a strong but disagreeable smell. The second kind of mummy, in its liquid state, is a thick, opaque, and viscous fluid, of a blackish colour, but not disagreeable smcll. In its indurated state, it is a dry solid substance, or a fine shining black colour, and close texture, easily broken, and of a good smell; very inflammable, and vielding a scent of myrrh and aromatic ingredients while burning. This, if we cannot be content without medicines from our own bodies, ought to be the mummy used in the shops ;, but it is very scarce and dear; while the other is so eheap, that it will always be most in use.

All these kinds of mummies are brought from E-But we are not to imagine, that any body gypt. breaks up the real Egyptian mummies, to sell them in pieces.

Mullingar Dublin. N. Lat. 53. 30. W. Long. 7. 50. Within a few miles of it are the ruins of the church, and also those of a castle. It is situated on the river Feyle. It holds a great wool fair, and is a place of good trade. In 1227, the priory of St Mary, formerly known by the name of The House of God of Mullingar, was founded here by Ralph de Petyt bishop of Meath, for regular canons of the order of St Augustin. A Dominican friary was also founded here in 1237 by the family of Nugent; some ruins of which still remain. In 1622. the friars of Multifarnham began to erect a house there for friars of the order of St Francis, but it was never completed.

MULLUS, the SURMULLET, a genus of fishes belonging to the order of thoracici. See ICHTHYOLOGY Index.

MULTIPLE, in Arithmetic, a number which comprchends some other several times; thus 6 is a multiple of 2, and 12 is a multiple of 6, 4, and 3; comprehending the first twice, the second thrice, &e.

ACTION of MULTIPLEPOINDING, in Scots Law. See LAW, Nº elxxxiii. 24.

MULTIPLICAND, in Arithmetic, the number to be multiplied by another. See ARITHMETIC.

MULTIPLICATION, in general, the act of increasing the number of any thing.

MULTIPLICATION, in Arithmetic, is a rule by which any given number may be speedily increased, according to any proposed number of times. See ARITH-METIC.

MULTIPLICATION, in Algebra. See ALGEBRA.

MULTIPLICATOR, or MULTIPLIER, in Arithmetic, the number by which any other is multiplied, or the number of times it is supposed to be taken.

MULTIPLICATUS FLOS, a luxuriant flower, whose petals are multiplied so as to exclude a part or the whole of the stamina.

MULTIPLYING GLASS, in Optics, a glass wherewith objects appear increased in number. See OPTICS.

MULTURE in Scots Law, a certain stipulated quantity of meal given as payment to the proprietor or tacksman of a mill for grinding the corn : and all corn ground on farms thirled to the mill is obliged to pay multure whether the corn be ground at that mill or elsewhere.

MULVIA, a river of Barbary in Africa, which rises in the mountains of Atlas, and divides the empire of Morocco from that of Algiers, and then falls iuto the Mediterranean, to the westward of Marsalquiver.

MUM, a kind of malt liquor much drunk in Germany, and chiefly brought from Brunswick, which is the place of most note for making it. The process of brewing mum, as recorded in the townhouse of that city, is as follows: Take 63 gallons of water that has been boiled till one third part is consumed, and brew it with seven bushels of wheaten malt, one bushel of oat meal, and one bushel of ground beans. When it is tunned, the hogshead must not be filled too full at first : as soon as it begins to work, put into it three pounds of the inner rind of fir, one pound of the tops of fir and beech, three handfuls of carduus benedictus, a handful or two of the flower of rosa solis : add burpet, betony, marjoram, avens, pennyroyal, and wild thyme, of each a handful and a half; of elder flowers,

5

Mum.

pieces to the druggists, as they make a much better market of them in Europe whole, when they can contrive to get them. What our druggists are supplied with, is the flesh of executed criminals, or of any other bodies the Jews can get, who fill them with the common bitumen, so plentiful in that part of the world; and adding a little aloes, and two or three other cheap ingredients, send them to be baked in an oven, till the jnices are exhaled, and the embalming matter has penetrated so thoroughly that the flesh will keep and bear transporting into Europe. Mummy has been esteemed resolvent and balsamic : but whatever virtues have been attributed to it, seem to be such as depend more upon the ingredients used in preparing the flesh than in the flesh itself; and it would surely be better to give those ingredients without so shocking an addition.

There are found in Poland a kind of natural mummies, or human bodies preserved without the assistance of art. These lie in considerable numbers in some of the vast caverns in that country. They are dried with the flesh and skin shrunk up almost close to the bones, and are of a blackish colour. In the wars which several ages ago laid waste that country, it was common for parties of the weaker side to retire into these caves, where their enemies, if they found them out, suffocated them by burning straw, &c. at the mouth of the cavern, and then left the bodies ; which, being out of the way of injuries from common accidents, have lain there ever since.

MUMMY, among gardeners, a kind of wax used in grafting and planting the roots of trees, made in the following manner: Take one pound of black pitch, and a quarter of a pound of turpentine; put them together into an earthen pot, and set them on firc in the open air, holding something in your hand to cover and quench the mixture in time, which is to be alternately lighted and quenched till all the nitrous and volatile parts be evaporated. To this a little common wax is to be added; and the composition is then to be set by for use.

## MUMPS. See MEDICINE Index.

MUNDA, an ancient town of Spain, in the kingdom of Granada, scated on the declivity of a hill, at the bottom of which runs a river. W. Long. 4. 13. N. Lat. 48. 15.

This city was anciently famous for a victory gained by Cæsar over the two sons of Pompey, who had collected an army in Spain after the defeat of their father at Pharsalia. See (History of) ROME.

The Pompeys posted their army advantageously on a rising ground, whereof one side was defended by the city of Munda, and the other by a small river which watered the plain, and by a marsh : so that the enemy could not attack them but in front. Cæsar likewise drew up his troops with great art, and having advanced a little way from his camp, ordered them to halt, expecting the enemy would abandon their advantageous post, and come to meet him. But as they did not stir, Cæsar made as if he intended to fortify himself in that post ; which induced the young general, who looked upon this as a sign of fear, to advance into the plain, and attack the enemy before they could secure themselves with any works. Pompey's army was by far, the most numerous : for it consisted of 13 legions,

6000 horse, and an incredible number of auxiliaries, Munda. among whom were all the forces of Bocchus king of ' Mauritania, commanded by his two sons, both youths of great valour and bravery. Cæsar had 80 cohorts, three legions, to wit, the third, the fifth, and the tenth. and a body of 8000 horse. As the enemy drew near, Cæsar betrayed a great deal of uneasiness and concern. as if he were doubtful of the success, knowing he was to engage men no way inferior in valour and experience to his own, and commanded by officers who had on many occasions given signal proofs of their bravery and conduct. Cneius, the elder of the two brothers, was generally looked upon as an able commander ; and Labienus, who had revolted, esteemed scarce inferior to himself.

However, the dictator, desirous to put an end to the civil war, either hy his own death, or that of his rivals, gave the signal for the battle, and fell upon the enemy with his usual vigour and resolution. At the first onset, which was dreadful, the auxiliaries on both sides betook themselves to flight, leaving the Romans to decide their quarrel by themselves. Then the legionaries engaged with a fury hardly to be expressed ; Cæsar's men being encouraged by the hopes of putting an end to all their labours by this battle; and those of Pompey exerting themselves out of necessity and despair, since most of them expected no quarter, as having been formerly pardoned. Never was victory more obstinately disputed. Cæsar's men, who had been always used to conquer, found themselves so vigorously charged by the enemy's legionaries, that they began to give ground; and though they did not turn their backs, yet it was manifest that shame alone kept them in their posts. All authors agree, that Cæsar had never been in so great danger; and he himself, when he came back to his camp, told his friends, that he had often fought for victory, but this was the first time he had ever fought for life. Thinking himself abandoned by fortune, which had hitherto favoured him, he had some thoughts of stabbing himself with his own sword, and by a voluntary death preventing the disgrace of a defeat: but returning soon to himself, and concluding it would be more to his reputation to fall by the enemy's hand at the head of his troops, than, in a fit of despair, by his own, he dismounted from his horse, and snatching a buckler from one of his legionaries, he threw himself like a man in despair into the midst of the enemy; crying out to his men, Are you not ashamed to deliver your general into the hands of boys? At these words, the soldiers of the tenth legion, animated by the example of their general, fell upon the enemy with fresh vigour, and made a dreadful havock of them. But in spite of their utmost efforts, Pompey's men still kept their ground, and, though greatly fatigued, return-ed to the charge with equal vigour. Then the Cæsarcans began to despair of vietory ; and the dictator, . running through the ranks of his disheartened legionaries, had much ado to keep them together. battle had already lasted from the rising to the setting of the sun, without any considerable advantage on either . side.

At length a mere accident decided the dispute in favour of the dictator. Bogud, a petty king of Mauritania, had joined Cæsar soon after his arrival in Spain, with some squadrons of Numidian horse; but in the very

Munda || Munich.

very beginning of the battle, being terrified at the shouting of the soldiers, intermingled with groans, and the clashing of their arms, he had abandoned his post, and retired with the auxiliaries under his command to a rising ground at a small distance from the enemy's There he continued the whole day an idle camp. spectator of the battle that was fought in the plain. But towards the evening, partly out of shame and partly ont of compassion for his friend Cæsar, he resolved to fall upon Pompey's camp; and accordingly flew thither with all the forces he had with him. Labienus, apprised of his design, hastened after him to the defence of the camp ; which Cæsar observing, cried to his legionaries, Courage, fellow soldiers ! the victory at length is ours ; Labienus flies. This artifice had the desired effect : Casar's men, believing that Labienus was truly fled, made a last effort, and charged the wing he commanded so briskly, that after a most obstinate dispute they put them to flight.

478

1

Though the enemy's left wing was thus entirely defeated, the right wing, where the elder Pompey commanded, still kept their ground for some time. Pompey dismounting from his horse, fought on foot like a private man in the first line, till most of his legionarics being killed, he was forced to save himself by flight from falling into the enemy's hands. Part of his troops fled back to their camp, and part took shelter in the city of Munda. The camp was immediately attacked, and taken sword in hand; and as for the city, Cæsar, without loss of time, drew a line of circumvallation round it. This victory was gained on the 16th of the kalends of April, i. e. according to our way of counting, on the 17th day of March, when the Dionysian festival, or the Liberalia, were celebrated at Rome; the very day, as Plutarch observes, in which Pompey the Great, four years before, had set out for the war. In this action Pompey lost 30,000 men; among whom were the famous Labienus, Attius Varus, and 3000 Roman knights. Seventeen officers of distinction were taken, and all the enemy's eagles and ensigns, together with Pompey's fasces, which he had assumed as governor of Spain. On Cæsar's side, only 1000 men were killed and 500 wounded.

MUNDIC, or MARCASITE, an old name for pyrites of copper or iron. See Ores of Copper and Iron, MINERALOGY Index.

MUNDINGOES, the name of a people who live on the sides of the river Gambia in Africa, and who are of a jet black colour, strong, and well made. They have a priest sent over every year from one of the Cape de Verd islands to christen and marry.

MUNDUS PATENS, the open world, in Roman antiquity, a solemnity performed in a small temple, of a round form like the world, dedicated to *Dis* and the rest of the infernal gods. This temple was opened but three times in the year, viz. the 24th of Augnst, the 4th of October, and the 7th of November. During these days, the Romans believed hell was open; on these days therefore they never offered battle, listed soldiers, put to sea, or married.

MUNICH, a town of Germany, capital of the duchy, now the kingdom, of Bavaria. It stands on the Iser, 70 miles south of Ratisbon and 214 west of Vienna, being one of the most pleasant and populous cities of Germany for its bigness. The number of

the inhabitants in 1781 was 48,000. Having been Municipal built at first on a spot of ground belonging to a con- Municip vent, it had from thence in German the name of Munchen, i. e. Monk's town, and a monk for its arms. The elector's palace here is a very grand structure, consisting of several courts, furnished and adorned in the most magnificent manner, with tapcstry, gilding, sculpture, statues, and paintings. It contains an amazing collection of jewels, antiquities, and curiosities. The great hall is 118 feet long and 52 broad; and the staircase leading to it, from top to bottom of marble and gold. In the hall of antiquities are 354 busts and statues of jasper and porphyry, brass and marble. In this palace is a library, containing a vast collection of books, and many valuable manuscripts, in most languages ancient and modern; and a chamber of rarities, among which is the picture of a bravo or assassin, who is said to have committed 345 murders with his own hand, and to have been accomplice in, or privy to, 400 more. The treasury in the chapel contains also a vast number of pictures, precious stones, medals, vessels of gold and silver, &c. Among other curiosities, here is a cherry stone with 140 heads dis-tinctly engraved upon it, The gardens of the palace are also very fine, and it is said a secret passage leads from it to all the churches and convents in the town. There is a great number of other fine buildings in this city, public and private, particularly the riding house, town house, opera room, the Jesuits college, the large edifice for tournaments, the churches, convents, fountains, &c. Its manufactures are those of silk, particularly velvet, woollen cloths, and tapestry; and it has two annual fairs, at which great quantities of salt, wine, &c. are sold. The streets are broad and regular; and most of the houses well built, and painted on the outside. The market place is extremely beautiful. Not far from Munich are four other palaces, with fine gardens, belonging to the elector, viz. those of Sleisheim, Nymphenburg, Dauchau, and Starenberg. The first and last are about three leagues from the capital; the second about half a league; and the third about two leagues. It was unsuccessfully attacked by the French in 1796. Sce BAVARIA, SUPPLEMENT.

MUNICH, Count de, was the favourite of the czarina Ann, and was concerned in all the events of her reign. Being appointed general of her armies, he gained great advantages over the Crim Tartars, beat the Turks, A. D. 1739, in an engagement near Choczim, and took that city together with Jassi the capital of Moldavia. He was afterwards prime minister to the czar Iwan VI. but in a short time after he was accused of employing the power which his office conferred on him to gratify his own ambition and pri-The empress Elizabeth brought vate resentment. him to trial, and he was condemned to lose his life, A. D. 1742. This sentence was mitigated to banishment into Siberia, whither many of the victims of his power had been exiled. He was recalled by Peter III. A. D. 1762, and declared field marshal. Upon the death of this prince, the empress Catharine II. appointed him director general of the ports of the Baltic. He died on the 8th of October 1767, at the age of 84.

MUNICIPAL, in the Roman civil law, an epithet which signifies invested with the rights and privileges of Roman citizens. See MUNICIPIUM.

MUNICIPAL,

479 

MUNICIPAL, among us, is applied to the laws that Micipal obtain in any particular city or province. And those ster. are called municipal officers who are elected to defend the interests of cities, to maintain their rights and privileges, and to preserve order and harmony among the eitizens; such as mayors, sheriffs, consuls, &c.

MUNICIPES, an appellation given by the Romans to the inhabitants of the municipia or municipal cities. See MUNICIPIUM.

MUNICIPIUM, in Roman antiquity, a corporation borough, or enfranchised eity or town, where the inhabitants enjoyed their own laws and customs, and at the same time were honoured with the privileges of Roman citizens; but then this privilege generally reached no further than the bare title. Some indeed, by particular merit, obtained the liberty of votes, which occasioned that distinction of muncipium sine suffragio, and municipium cum suffragio .- The inhabitants of the municipium sine suffragio were called barely Romani, but those of the municipium cum suffragio were called cives Romani.

The difference between proper citizens of Rome and the inhabitants of the municipium may be thus expressed. The proper citizens of Rome were, 1. Registered in the census; 2. Had the right of suffrage and of bearing honours; 3. Were assessed in the poll-tax; 4. Served in the legions; 5. Used the Roman laws and religion; 6. Were called Quirites and populus Romanus : Whereas the municipes enjoyed the three first of these privileges, but were denied the three last.

MUNITION, the provisions with which a place is furnished in order for defence; or that which follows a camp for its subsistence.

MUNITION Ships, are those that have stores on board in order to supply a fleet of men of war at sea. In an engagement, all the munition ships and victuallers attending the fleet take their station in the rear of all the rest; they are not to engage in the fight, but to attend to such directions as are sent to them by the admiral.

MUNSTER, in Latin Monomia, and in Irish Moun, the most southerly province of Ireland; bounded on the north by Leinster and Connaught, and on the east, west, and south, by the ocean. It contains the counties of Cork, Clare, Kerry, Limerick, Tipperary, and Waterford ; and 3,289,932 Irish plantation acres, 740 parishes, 63 baronies, and 26 boroughs. It is about 125 miles long and 120 broad ; and its principal town is Cork. Its ancient name was Mumhan; and in latter ages it was divided into Desmond or South Munster, Ormond or East Munster, and Thomond or North Munster. It lies between 51.15. and 53.0. N. Lat. and 7. 10. and 10. 40. W. Long.

MUNSTER, a bishopric of Germany in the circle of Westphalia, and territories of Prussia; bounded on the north by Embden and Oldenburg, on the south by the county of Mark and duehy of Westphalia, on the west by the county of Bentheim and the United Provinces, and on the east by the bishoprics of Osnaburgh and Paderborn together with the county of Ravensberg. It is the largest of all the Westphalian bishoprics, being in length about 80 miles, and in breadth from 20 to 60, and contains 350,000 inhabitants. It is divided into 13 bailiwicks : and though in general but, a bar-

ren country, has some fruitful plains, with woods, and Munster quarries of stone. The inhabitants, excepting a few of the nobility and gentry, are all Roman Catholics; Murana. though Lutheranism had once a considerable footing here. The bishop, who was generally also elector of Cologne, has a revenue of about 70,000 pounds, and can maintain 8000 men. By an unjust custom, unknown in the rest of the empire, he is heir to all strangers who die in the country without children. In the matricula he is rated at 30 foot and 118 horse; or 832 florins monthly in lieu of them. His chapter consists of 40 canous, who are all noble.

MUNSTER, a city of Germany, capital of a bishopric of the same name, and of all Westphalia, stands at the conflux of the river Aa with the Ems, in E. Long. 7. 49. N. Lat. 52. O. It is of a circular form, large, and had strong fortifications which have been thrown down. The citadel, called the Brille, has been converted into a residence for the bishop. The dean and elapter now elect the bishop; but till the beginning of the 13th century he was nominated by the emperor. This city has been rendered famous by three remarkable transactions. 1. By the peace concluded here in 1648, which put an end to the war of 30 years; occasioned by the persecuting spirit of bigotted Papists, who chose rather to plunge their country into all the calamities of war than allow liberty of conscience to the Protestants. By this peace, however, they consented, much against their inclinations, to grant them a toleration. 2. By the disorders and disturbances occasioned here in 1553, by a parcel of enthusiasts, headed by a taylor, called *John of Leyden* from the place of his birth, who turned out the magistrates, and took possession of the city, where they perpetrated the most horrid villanies and cruelties. 3. For the noble, though unsuccessful, efforts it made in defence of its liberties against the tyranny and oppression of the above mentioned turbulent and bloody-minded bishop, Bernard van Galen. In this city are a great number of convents and other religious houses, many of them stately piles, and surrounded with beautiful gardens.

MUNYCHIA, or Munichius Portus, in Ancient Geography, a village and port of Athens, nearer to the city, fortified in the same manner as the Piræus, to the east of which it lay, or between it and the promontory Sunium, at the mouth of the Ilissus. Strabo says it was an eminence in form of a peninsula, at the foot of which stood three harbours, anciently encompassed with a wall, taking within its extent the Piræus and other harbours full of docks, with the temple of Diana Munychia; taking its name from Mynichus, the founder of the temple.

MUNYCHIA, an anniversary solemnity observed at Athens, in honour of Diana, on the 16th of the month Munychion. Cakes were offered on the occasion, called apepipavres.

MUNYCHION, the tenth month of the Athenian year, containing 29 days, and answering to the latter part of our March and the beginning of April. It was so called from the festival Munychia, which was observed in this month. See MONTH and MUNY-CHIA.

MUPHTI. See MUFTI.

MURÆNA, or EEL; a genus of fishes, belonging to the order of apodes. See ICHTHYOLOGY Index, MURAL,

Afural MURAL, scmething belonging to a wall, which the Latins call murus. Mureia.

V

MURAL Crown, among the ancient Romans. See CROWN.

MURAL Arch, is a wall, or walled arch, placed exactly in the plane of the meridian, i. e. upon the meridian line, for the fixing of a large quadrant, sextant, or other instrument, to observe the meridian altitudes, &c. of the heavenly bodies.

Tycho Brahe was the first who used a mural arch in his observations; after him Hevelius, Mr Flamstead, De la Hire, &ze. used the same means. See ASTRONOMY.

MURANUM, in Ancient Geography, a town of the confines of Lucania. Now Morano; a citadel in Calabria Citra, at the springs of the Sybaris, midway between the Sinus Tarentinus to the east, and the Tuscan sea to the west. Supposed to have riscn from the ruins of Syphæum, a town of the Bruttii mentioned by Livy.

MURATORI, LEWIS, ANTHONY, a learned and celebrated Italian writer, born at Vignoles, iu the territory of Bologna, in 1672. He early discovered an extreme fondness for the learned languages and sciences; and this was seconded by an excellent education. After having completed his first studies, he embraced the state of an ecclesiastic; and applied himself to polite literature, philosophy, theology, civil law, antiquitics, and other sciences; by which means he became in a manner universally learned. He was scarcely 22 years of age when he was made librarian of the Ambrosian library at Milan. It 1700 the duke of Modena, his sovereign, recalled him, and made him his librarian, and keeper of the archives of his duchy. Muratori discharged this double employment during the rest of his life, and had no other benefice than the provostship of Santa Maria del Pomposa. The principal of his works are,-I. Anecdota, or a collection of pieces taken from the Ambrosian library, 2 vols 4to, with learned notes and dissertations. 2. A treatise on the perfection of the Italian poetry, 2 vols 4to. 3. Anecdota Græca, 3 vols 4to. 4. A genealogical history of the house of Modena, 2 vols folio. 5. An excellent collection of the writers of the Italian history, 27 vols folio, with learned notes. 6. Another collection, under the title of Antiquitates Italica. 7. A collection of ancient inscriptions, under the title of Novus Thesaurus, 6 vols folio. 8. The annals of Italy, 12 vols 4to, in Italian, &c. 9. Letters, dissertations, Italian poems, &c.

MURCIA, the Pagan goddess of idleness. The name is taken from murcus or murcidus, an obsolete "word, signifying a dull, slothful, or lazy person .---The statues of this goddess were always covered with dust and moss, to express her idleness and negligence. She had a temple at Rome, at the foot of the Aventine mount.

MURCIA, a kingdom in Spain, bounded on the north by New Castile, on the east by the kingdom of Valencia, on the west by Andalusia and Granada, and on the south by the Mediterranean sea. It is about 62 miles in length, and 58 in breadth ; and its prin-cipal river is the Segura. The soil is dry, because it scldom rains, and therefore it produces little corn or wine; but there is plenty of oranges, citrons, lemons,

olives, almonds, mulberries, rice, pulse, and sugar. It Murei has also a great deal of silk. It was taken from the Murd Moors in 1265. The air is very healthful.

MURCIA, a large, handsome, and populous town of Spain, capital of a kingdom of the same name. It is a bishop's see, and contains six parishes. The cathedral is a most superb edifice, with the stairs of the steeple so contrived that a man may ride up to the top, either on horseback or in a coach. It is situated in a pleasant plain, which abounds in fine gardens about the city, and in which are the best fruits in Spain. It is seated on the river Segura, in W. Long. 8. 36. N.

Lat. 37. 48. MURDER, or MURTHER, the act of killing another with violence and injustice. The word, comes from the Saxon morth, " death ;" which some will have to signify a violent death ; whence the barbarous Latin murdrum and modrum.

Among the number of popular errors, is the notion which has obtained, that the dead body would bleed in the presence or upon the touch of the murderer.

The crime of murder is punished with death in almost all nations.

MURDER, or Murther, in Law, is thus defined, or rather described, by Sir Edward Coke : "When a person, of sound memory and discretion, unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied." The best way of examining the nature of this crime will be by considering the several branches of this definition.

1. It must be committed by a person of sound memory and discretion : for lunatics or infants are ineapable of committing any crime; unless in such cases where they show a consciousness of doing wrong, and of course a discretion or discernment between good and evil.

2. Next, it happens when a person of such sound discretion unlawfully killeth. The unlawfulness arises from the killing without warrant or excuse : and there must also be an actual killing to constitute murder; for a bare assault, with intent to kill, is only a great misdemeanour, though formerly it was held to be murder. The killing may be by poisoning, striking, starving, drowning, and a thousand other forms of death, by which human nature may be overcome. Of these the most detestable of all is poison; because it can of all others be the least prevented, either by manhood or forethought. And therefore, by the stat. 22 Hen. VIII. c. '9. it was made treason, and a more grievous and lingering kind of death was inflicted on it than the common law allowed ; namely, boiling to death : but this act did not live long, being repealed by I Edw. VI. c. 12. There was also, by the ancient common law, one species of killing held to be murder, which may be dubious at this day, as there hath not been an instance wherein it has been held to be murder for many ages past, viz. bearing false witness against another, with an express premeditated design to take away his life, so as the innocent person be condemned and executed. The Gothic laws punished in this case both the judge, the witnesses, and the prosecutor; and, among the Romans, the lex Cornelia de sicariis, punished the false witnesses with death, as being guilty of a species of assassination. And there is no doubt but this is equally murder in foro conscientia

urder.

conscientiæ as killing with a sword ; though the modern law (to avoid the danger of deterring witnesses from giving evidence upon capital prosecutions, if it must be at the peril of their own lives) has not yet punished it as such. If a man, however, do such an act, of which the probable consequence may be, and eventually is, death; such killing may be murder, although no stroke be struck by himself, and no killing may be primarily intended : as was the case of the unnatural son who exposed his sick father to the air against his will, by reason whereof he died; and of the harlot, who laid her child under leaves in an orchard, where a kite strnck and killed it. So too, if a man have a beast that is used to do mischief; and he, knowing it, suffers it to go abroad, and it kills a man; even this is manslaughter in the owner; but if he have purposely turned it loose, though barely to frighten people, and make what is called sport, it is with us (as in the Jewish law) as much murder as if he had incited a bear or dog to worry them. If a physician or surgeon give his patient a potion or plaster to cure him, which, contrary to expectation, kills him, this is neither murder nor manslaughter, but misadventure ; and he shall not be punished criminally, however liable he might formerly have been to a civil action for neglect or ignorance; but it hath been holden, that if it be not a regular physician or surgeon who administers the medicine, or performs the operation, it is manslaughter at the least. Yet Sir Matthew Hale very justly questions the law of this determination ; since physic and salves were in use before licensed physicians and surgeons : wherefore hc treats this doctrine as apocryphal, and fitted only to gratify and flatter licenciates and doctors in physic ; though it may be of use to make people cautious and wary how they meddle too much in so dangerous an employment. In order also to make the killing murder, it is requisite that the party die within a year and a day after the stroke received, or cause of death administered; in the computation of which the whole day upon which the hurt was done shall be reckoned the first.

3. Farther: The person killed must be " a reasonable creature in being, and under the king's peace," at the time of the killing. Therefore to kill an alien, a Jew, or an outlaw, who arc all under the king's peace or protection, is as much murder as to kill the most regular-born Englishman ; except he be an alien-enemy, in the time of war. To kill a child in its mother's womb, is now no murder, but a great misprision; but if the child be born alive, and dieth by reason of the potion or bruises it received in the womb, it seems, by the better opinion, to be murder in such as administered or gave them. As to the murder of bastard children, see BASTARD.

4. Lastly, The killing must be committed " with malice aforethought," to make it the crime of murder. This is the grand criterion which now distinguishes murder from other killing : and this malice prepense, malitia præcogitata, is not so properly spite or malevolence to the deceased in particular, as any evil design in general; the dictate of a wicked, depraved, and malignant heart ; un disposition à faire une mal chose : and it may be either express, or implied, in law. Express malice is when one, with a sedate deliberate mind and formed design, doth kill another, which formed de-

Vol. XIV. Part II.

## MUR

sign is evidenced by external circumstances discovering Murder. that inward intention; as lying in wait, antecedent menaces, former grudges, and concerted schemes to do him some bodily harm. This takes in the case of deliberate duelling, where both parties meet avowedly with an intent to murder : thinking it their duty, as gentlemen, and claiming it as their right, to wanton with their own lives and those of their fellow creatures; without any warrant or authority from any power either divine or human, but in direct contradiction to the laws of both God and man; and therefore the law has justly fixed the crime and punishment of murder on them, and on their seconds also. Yet it requires such a degree of passive valour to combat the dread of even undeserved contempt, arising from the false notions of honour too generally received in Europe, that the strongest prohibitions and penalties of the law will never be entircly effectual to eradicate this unhappy custom, till a method be found out of compelling the original aggressor to make some other satisfaction to the affronted party, which the world shall esteem equally reputable as that which is now given at the hazard of the life and fortune, as well of the person insulted, as of him who has given the insult. Also, if even upon a sudden provocation one beats another, in a cruel and unusual manner, so that he dies, though he did not intend his death, yet he is guilty of murder by express malice ; i. e. by an express evil design, the genuine sense of malitia : As when a park-keeper tied a boy that was stealing wood to a horse's tail, and dragged him along the park : when a master corrected his servant with an iron bar, and a schoolmaster stamped on his scholar's belly, so that each of the sufferers died; these were justly held to be murders, because the correction being excessive, and such as could not proceed but from a bad heart, it was equivalent to a deliberate act of slaughter. Neither shall he be guilty of a less crime who kills another in consequence of such a wilful act as shows him to be an enemy to all mankind in general; as going deliberately, and with an intent to do mischief, upon a horse used to strike, or coolly discharging a gun among a multitude of people. So if a man resolves to kill the next man he meets, and does kill him, it is murder, although he knew him not; for this is universal malice. And if two or more come together to do an unlawful act against the king's peace, of which the probable consequence might he bloodshed; as to beat a man, to commit a riot, or to rob a park, and one of them kills a man; it is murder in them all, because of the unlawful act, the malitia præcogitata, or evil intended beforehand.

Also in many cases where no malice is expressed, the law will imply it : as, where a man wilfully poisons another, in such a deliberate act the law presumes malice, though no particular enmity can be proved. And if a man kills another suddenly, without any, or without a considerable provocation, the law implies malice; for no person, unless of an abandoned heart, would be guilty of such an act upon a slight or no apparent cause. No affront, by words or gestures only, is a sufficient provocation, so as excuse or extennate such acts of violence as manifestly endanger the life of another. But if the person so provoked had unfortunately killed the other, by beating kim in such a manner as showed 3 P only

-

Murder, only an intent to chastise and not to kill him, the law so far considers the provocation of contumelious behaviour, as to adjudge it only manslaughter, and not murder. In like manner, if one kills an officer of justice, either civil or criminal, in the execution of his duty, or any of his assistants endeavouring to conserve the peace, or any private person endeavouring to suppress an affray or apprehend a felon, knowing his authority or the intention with which he interposes, the law will imply malice, and the killer shall be guilty of murder. And if one intends to do another felony, and undesignedly kills a man, this is also murder. Thus if one shoots at A, and misses him, but kills B, this is murder; because of the previous felonious intent, which the law transfers from one to the other. The same is the case, where one lays poison for A, and B, against whom the prisoner had no malicious intent, takes it, and it kills him, this is likewise murder. So also, if one give a woman with child a medicine to procure abortion, and it operates so violently as to kill the woman, this is murder in the person who gave it. It were endless to go through all the cases of homicide, which have been adjudged, either expressly or impliedly, malicious : these therefore may suffice as a specimen; and we may take it for a general rule, that all homicide is malicious, and of course amounts to murder, unless where justified by the command or permission of the law; excused on a principle of accident or self-preservation; or alleviated into manslaughter, by being either the involuntary consequence of some act, not strictly lawful, or (if voluntary) occasioned by some sudden and sufficiently violent provocation. And all these circumstances of justification, excuse, or alleviation, it is incumbent upon the prisoner to make out, to the satisfaction of the court and jury, the latter of whom are to decide whether the circumstances alleged are proved to have actually cxisted; the former, how far they extend to take away or mitigate the guilt. For all homicide is presumed to be malicious, until the contrary appeareth upon evi-

dence. The punishment of murder, and that of man-slaughter, were formerly one and the same; both having the benefit of clergy; so that none but unlearned persons, who least knew the guilt of it, were put to death for this enormous crime. But now, by several statutes, the benefit of clergy is taken away from murderers through malice propense, their abettors, procurers, and counsellors. In atrocious cases it was frequently usual for the court to direct the murderer, after execution, to be hung upon a gibbet in chains near the place where the fact was committed ; but this was no part of the legal judgment; and the like is still sometimes practised in the case of notorious thieves. This, being quite contrary to the express command of the Mosaical law, seems to have been borrowed from the civil law; which, besides the terror of the example, gives also another reason for this practice, viz. that it is a comfortable sight to the relations and friends of the deceased. But now, in England, it is enacted by statute 25 Geo. II. c. 37. that the judges, before whom any person is found guilty of wilful murder, shall pronounce sentence immediately after conviction, unless he sees cause to postpone it; and shall in passing sentence direct him to be executed on the next day but one (unless the same shall be Sunday, and

then on the Monday following), and that his body Murd, be delivered to the surgeons to be dissected and anatomized; and that the judge may direct his body to be afterwards hung in chains, but in nowise to be buried without dissection. And, during the short but awful interval between sentence and execution, the prisoner shall be kept alone, and sustained with only bread and water. But a power is allowed to the judge, upon good and sufficient cause, to respite the execution, and relax the other restraints of this act. See farther, PAR-RICIDE, and PETIT Treason.

MURDERERS, or *Murdering Pieces*, in a ship, are small pieces of ordnance, either of brass or iron, which have chambers put in at their breeches. They are used at the bulk-heads of the fore-castle, half-deck, or steerage, in order to clear the deck, on the ship's being boarded by an enemy.

MURENA. See MURÆNA, ICHTHYOLOGY Index.

MURENGERS, two officers of great antiquity in the city of Chester, annually chosen out of the aldermen, to see the walls kept in repair, and to receive a certain toll for that purpose.

MUREX, a genus of animals belonging to the order of vermes testacea. Sec CONCHOLOGY *Index*.

MUREX, a caltrap or iron instrument, with sharp points projecting in every direction, used by the Romans as a defence against the enemy's horse; so called, probably from some resemblance to the spines on the shell of the murex.

MURGI, or MURGIS, in Ancient Geography, the last town of Bætica, next the Tarraconensis; the Urce of Ptolemy. Now Muxara, a port-town of Granada, on the Mediterranean. W. Long. 1° 50'. N. Lat. 37° 6'.

MURIA, the Latin name of common salt. See So-DA, Muriate of, CHEMISTRY Index. MURIATIC ACID. Sec CHEMISTRY Index. This

MURIATIC ACID. See CHEMISTRY Index. This acid, according to the views of Sir H. Davy, is composed of chlorine (the oxymuriatic acid of all chemists formerly, and of some still) and hydrogen.

MURINA, or MURINES, a delicions sweet wine, medicated with spices, and the usual drink of the ladies of antiquity.

MURRAIN, or GARGLE, a contagious disease among cattle. Sec FARRIERY Index.

MURRAY, or MORAY, the name of a district in. the north of Scotland, which, in a former division of the kingdom, was denominated a province. This district includes the counties of Banff, Elgin and Nairn. The county of Elgin, the middle division of this district, is still known by the name of Morayshirc.

MURRHINE, MURRHINUS, Mogenos, in antiquity, an appellation given to a delicate sort of ware brought from the east, whercof cups and vases were made, which, added not a little to the splendour of the Roman banquets. Critics are divided concerning the matter of the pocula or vasa murrhina, murrina, or murrea. Some will have them to have been the same with our porcelain or china ware. The generality held them to have been made of some precious kind of stone, which was found chiefly, as Pliny tells us, in Parthia, but more especially in Carmania. Arrian tells us, that there was a great quantity of them made at Diospolis in Egypt. This he calls another sort of murrhina work ; and it is evident, from all accounts, that the murrhina of Diospolis was a sort of Menus.

mine of glass ware, made in imitation of the porcelain or murrha of India. There is some difference in the accounts given by Pliny and Martial of the murrhina vasa. The first author says, that they would not bear hot liquors, but that only cold ones were drank out of them. The latter, on the other hand, tells us, that they bore hot liquors very well. If we credit Pliny's account, their porcelain was much inferior to our's in this particular. Some conjecture them to have been of agate, others onyx, others of coral. Baronius, doubtless, was farthest out of the way, when he took them to be made of myrrh, congealed and hardened. Some have supposed these vessels to be made of crystal, but this is contrary to the account of all the ancients. The Grecks had the words revsurros, for crystal, and ouvern for myrrh, vcry common among them; and therefore if these vessels had been made of either of these substances, they would in some places have called them smyrna or crystalline. On the contrary, the most correct among them call them murrhina or morrina. The cups made of crystal, which were also in use at those times were called crystallina, and these murrhina or murrhæa, by way of keeping up the distinction; and Martial tells us that the stone they were made of was spotted or variegated, calling them pocula maculosæ murræ. And Statius mentions the crystalline and murrhine cups in the same sentence, but as different things, not the same. Arrian mentions also the Aidos proggia; which his interpretors censure as an error of the copies, and would alter into myrrha, the name of the gum myrrh.

Pompey is recorded as the first who brought these murrhine vessels out of the east, which he exhibited in his triumph, and dedicated to Jupiter Capitolinus. But private persons were not long without them. So fond in effect did the Roman gentry grow of them, that a cup which held three sextarics was sold for 70 talents. T. Petronius, before his death, to spite Nero (or as Pliny expresses it, ut mensam ejus exhæredaret, to disinherit his table), broke a bason, trulla murrhina, valued at 300 talents, on which that emperor had set his heart.

MUS, a genus of quadrupeds belonging to the order of Glires. See MAMMALIA Index.

MUSA, the PLANTAIN-TREE ; a genus of plants belonging to the polyandria class, and in the natural method ranking under the eighth order, Scitamincæ. Sec BOTANY Index.

MUSÆUS, an ancient Greek poet, was, according to Plato and Diodorus Siculus, an Athenian, the son of Orpheus, and chief of the Eleusinian mysteries instituted at Athens in honour of Ceres: or, according to others, he was only the disciple of Orpheus; but from the great resemblance which there was between his character and talents and those of his master, by giving a stronger outline to the figure he was called his son, as those were styled the children of Apollo who cultivated the arts of which he was the tutelar god.

Musæus is allowed to have been one of the first poets who versified the oracles. He is placed in the Arundelian marbles, cpoch 15. 1426 B. C. at which time his hymns are there said to have been received in the celebration of the Eleusinian mysteries. Laertius tells us, that Musæus not only composed a theogony, but formed a sphere for the use of his companions; yet as this honour is generally given to Chiron, it is more natural to supposo, with Sir Isaac Newton, that he enlar- Musacus ged it with the addition of several constellations after the conquest of the golden fleece. The sphere itself Muschen shows that it was delineated after the Argonautic expe- broeck. dition, which is described in the asterisms, together Burney's with several other more ancient histories of the Greeks, History of and without any thing later; for the ship Argo was the Music. first long vessel which they had built : hitherto they had used round ships of burden, and kept within sight of the shore; but now, by the dictates of the oracle, and consent of the princes of Greece, the flower of that country sail rapidly through the deep, and guide their ship hy the stars.

Musæus is celebrated by Virgil in the character of hierophant, or priest of Ceres, at the head of the most illustrious mortals who have merited a place in Elysium. Here he is made the conductor of Æneas to the recess where he meets the shade of his father Anchises.

A hill near the citadel of Athens was called Musæum, according to Pausanias, from Musæus, who used to retire thither to meditate and compose his religious hymns; at which place he was afterwards buried. The works which went under his name, like those of Orpheus, were by many attributed to Onomacritus. Nothing remains of this poet now, nor were any of his writings extant in the time of Pausanias, except a hymn to Ceres, which he made for the Lycomides. And as these hymns were likewise set to music, and sung in the mysteries by Musæus himself in the character of pricst, he thence perhaps acquired from future times the title of musician, as well as of poet; the performance of sacred music being probably at first confined to the priesthood in these celebrations, as it had been before in Egypt, whence they originated. However, he is not enumerated among ancient musicians by Plutarch; nor does it appear that he mcrited the title of son and successor to Orpheus for his musical abilities, so much as for his poetry, piety, and profound knowledge in religious mysteries.

MUSCA, the FLY; a genus of insects belonging to the order of diptera. See ENTOMOLOGY Index.

Musca, a name given to such persons among the Romans as officiously thrust themselves into the company of their superiors and those who despised them, by finding means of getting admittance to entertainments without invitation, and without a welcome : So that muscæ were the same as parasites, who were frequently by the Greeks termed Mulai. See PARASITE.

MUSCADINE, a rich wine, of the growth of Provence, Languedoc, Cividad, &c.-The word is supposed to be derived from musk; the wine being supposed to have a little of the smell of that perfume; others from musca, "a fly," because the flies are extremely fond of its grapes; as the Latins had their vinum apianum, so called ab apibus, from the bees which fed on it.

The process for making muscadine at Frontignac, is the following: The muscadine grapes arc allowed to be half dried on the vine : and as soon as they are gathered, they are trode and pressed, and the liquor is tunned, without letting it stand to ferment in the fat; the lee which remains is supposed to produce the peculiar flavour of this wine.

MUSCHENBROECK, PETER DE, a very distinguished natural philosopher and mathematician, was 3 P 2 born

Muschen- born at Utrecht a little before 1700. He was first professor in his own university, and afterwards invited to the chair at Leyden, where he died full of reputation and honours in 1761. He was a member of several academies; particularly the Academy of Sciences at Paris. He was the author of several works in Latin, which are frequently referred to, and all of which discover great penctration and exactness of the subjects of which he treats. He was also consummate in the knowledge of law.

MUSCI, MOSSES, one of the orders of the class cryptogamia; which see, BOTANY Index .- The ancients took the moss of trees to be the effect of a disorder or discomposure of the texture of the bark; or at most a kind of little filaments arising from the bark : but the moderns find, by more accurate observation, that mosses are real distinct plants, whose seed, being extremely small, is enclosed in little capsules; which bursting of themselves, the seed is carried off by the winds; till, falling into the inequalities of the bark of trees, it is there stopped, takes root, and feeds at the expence of the tree, as mouldiness does on bread, &c.

See MYTULUS, CONCHO-MUSCLE, or MUSSEL. LOGY Index.

MUSCOVY. See Russia.

MUSCOVY Glass, or GLIMMER, See MICA, MINE-RALOGY Index.

MUSCULUS, a military machine, made use of by the Romans to cover and protect the soldiers while they approached and undermined the walls of besieged places, or filled the ditches. It seems to have resembled the testudo in form, but was smaller in size. See TESTUDO.

MUSEIA, were Grecian festivals in honour of the. Muses, celebrated with games every fifth year, partilarly by the Thespians. The Macedonians also observed a festival of the same name in honour of Jupiter and the Muses, which lasted for nine days, and was celebrated with stage plays, songs, and poetical, compositions.

MUSES, certain fabulous dcities among the Pagans, supposed to preside over the arts and sciences: for this reason it is usual for the poets, at the beginning of a poem, to invoke these goddesses to their aid.

The Muses were originally only singers and musicians in the service of Osiris, or the great Egyptian Bacchus, under the instruction and guidance of his son Orus; but in succeeding times they were called the daughters of Jupiter and Mnemosyne or Memory.

These are the only pagan divinities whose worship has been continued through all succeeding changes in the religion and sentiments of mankind. Professors of every liberal art in all the countries of Europe still revere them; particularly the poets, who seldom undertake the slightest work without invoking their aid.

Sir Isaac Newton tells us, that the singing women of Osiris were celebrated in Thrace by the name of the Muses; and that the daughters of Pierius, a Thra-,

#### M U S

cian, imitating them, were celebrated by the same Muses name.

Diodorus Siculus informs us, that Aleman of Messenc, a lyric poet who flourished in the 27th Olympiad, 670 years B. C. makes them the daughters of Uranus and Terra. It has been asserted by some ancient writcrs, that at first they were only three in number : but Homer, Hesiod, and other profound mythologists, admit of nine (A).

In his hymn to Apollo, Homer says,

### -By turns the nine delight to sing.

And Hesiod, in his Theogony, names them all .- They are, said severally to preside over some art or science, as music, poetry, dancing, astronomy. By some they are called virgins, because the virtues of education appear unalterable : they are called muses from a Greek word Burney which signifies to explain mysteries, because they have Hist taught things the most curious and important to know, Music and which are above the comprehension of vulgar minds. Each of their names is said to include some particular allegory; Clio, for instance, has been thus called, because those who are praised in verse acquire, immortal fame; Euterpe, on account of the pleasure accruing to those who hear learned noetry ; Thalia, implies for ever flourishing; Melpomene, that her melody insimuates itself into the inmost recesses of the soul; Terpsichore marks the pleasure which those receive who are versed in the liberal arts; Erato secms to indicate, that the learned command the esteem and friendship of all mankind; Polyhymnia, that many poets are become immortal by the number of hymns which they have addressed to the gods; Urania, that those whom she instructs elevate their contemplations and celebrity to the heavens and the stars; and lastly, the exquisite voice of Calliope has acquired her that appellation, as the inventress and guardian of eloquence and rhetoric.

An epigram of Callimachus gives the attributes of the Muses in as many lines.

Calliope the deeds of heroes sings; Great Clio sweeps to history the strings; Euterpe teaches mimes their silent show; Melpomene presides o'er scenes of wo; Terpsichore the flute's soft pow'r displays; And Erato gives hymns the gods to praise ; Polymnia's skill inspires melodious strains; Urania wise, the starry course explains ; And gay Thalia's glass points out where folly reigns.

This epigram does not, however, exactly correspond. with the ideas of other poets, or of the ancient painters, in characterizing the attributes of the Muses. The ancients had numberless ingenious and fanciful ideas concerning the muses, which we have not room to recite. -" It seems (says the abbé Barthelemi +) as if the first + Travels poets, enchanted with the beauties of nature, occasion- of Anaally were led to invoke the nymphs of the woods, hills, charsis, and fountains; and that yielding to the prevailing taste  $p_{201}$ , for allegory, they gave them names relative to the influence

(A) It has been said, that when the citizens of Sicyon directed three skilful statuaries to make each of them statues of the three Muses, they were all so well executed, that they did not know which to choose, but erected all the nine, and that Hesiod and Homer only gave them names.

broeck Muses.

fluence they might be supposed to have over the productions of the mind. At first three Muses only were admitted, Mclete, Mneme, and Acede : that is to say, the meditation or reflection necessary to study ; memory, which records illustrious deeds; and song, which accompanies their recital. In proportion as improvement was made in the art of versification, its characters and effects were personified, the number of the Muses increased, and the names they now received referred to the charms of poetry, its celestial origin, the beauty of its language, the pleasure and gaiety it inspires, the song and dance which add to it new charms, and the glory with which it is crowned. Afterwards were associated with them the Graces, whose employment it is to embellish poetry, and Love who is so frequently its object. These ideas took birth in a barbarous country, in Thrace, where Orphcus, Linus, and their disciples, suddenly appeared in the midst of ignorance. The Muses were honoured there on the Pierian mount; and extending their dominion, successively took their stations on Pindus, Parnassus, Helicon, and all those solitary places where the painters of nature, surrounded . by the most pleasing images, experience the divine glow of inspiration."

Pythagoras, and afterwards Plato, make the Muses the soul of the planets in our system; from whence the imaginary music of the spheres.

MUSEUM, a name which originally signified a part of the palace of Alexandria, which took up at least one-fourth of the city. This quarter was called the *museum*, on account of its being set apart for the Muses and the study of the sciences. Here were lodged and entertained the men of learning; who were divided into many companies or colleges, according to Museum, the sciences of which they were the professors; and to Muserom. cach of these houses or colleges was allotted a handsome revenue. The foundation of this establishment is attributed to Ptolemy Philadelphns, who here placed his library. Hence the word *museum* is now applied to any place set apart as a repository for things that have an immediate relation to the arts.

The museum at Oxford, called the Ashmolean museum, is a noble pile of building, crected at the expence of the university, at the west end of the theatre, at which side it has a magnificent portal, sustained by pillars of the Corinthian order. The front, which is to the street, extends about 60 feet, where there is this inscription over the entrance in gilt characters, Museum Ashmoleanum, schola naturalis historia, officina chymi. ca. It was begun in 1679, and finished in 1683, when a valuable collection of curiosities was presented to the university by Elias Ashmole, Esq. which were the same day reposited there : several accessions have been since made to the muscum ; among which are hieroglyphics, and other Egyptian antiquities, an entire mummy, Roman antiquities, altars, medals, lamps, &c. and a variety of natural curiosities.

For an account of the British museum, see LONDON,  $N^{\circ}$  146.

MUSHROOM. See FUNGI, BOTANY Index.

To try the quality of mushrooms: — Take an onion, and strip the outer skin, and boil it with your mushrooms: if the onion become blue or black, there are certainly dangerous ones amongst them; if it remain\_ white, they are good.

# MUSIC;

"HE art of combining sounds in a manner agree-)eillion. able to the ear This combination may be either simultancous or successive : in the first case, it constitutes harmony; in the last, melody. But though the same sounds, or intervals of sound, which give pleasure when heard in succession, will not always produce the same effect in harmony; yet the principles which constitute the simpler and more perfect kinds of harmony, are almost, if not entirely, the same with those of melody. By perfect harmony, we do not here mean that plenitude, those complex modifications of harmonic sound, which are admired in practice ; but that harmony which is called *perfect* by theoricians and artists; that harmony which results from the coalescence of simultaneous sounds produced by vibrations in the proportions of thirds, fifths, and octaves, or their duplicates.

The principles upon which these various combinations of sound are founded, and by which they are regulated, constitute a science, which is not only extensive but profound, when we would investigate the principles from whence these happy modifications of sound result, and by which they are determined; or when we would explore the sensations, whether mental or corporeal, with which they affect us. The ancient definitions of music are not proportioned in their extent

to our present ideas of that art; but M. Rouseau be- Definition. trays a temerity highly inconsistent with the philosophical character, when from thence he infers, that their ideas were vague and undetermined. Every sonl susceptible of refinement and delicacy in taste or sentiment, must be conscious that there is a music in action as well as in sound; and that the ideas of beauty and decorum, of harmony and symmetry, are, if we may use the expression, equally constituent of visible as of audible music. Those illustrious minds, whose comprehensive prospects in every science where taste and propriety prevail took in nature at a single glance, would behold with contempt and ridicule those narrow and microscopic views of which alone their successors in philosophy have discovered themselves capacious. With these definitions, however, we are less concerned. as they bear no proportion to the ideas which are now entertained of music. Nor can we follow M. Rousseau, from whatever venerable sources his authority may be derived, in adopting his Egyptian ctymology for the word music. The established derivation from Musa could only be questioned by a paradoxical genius. That music had been practised in Egypt before it was known as an art in Greece, is indeed a fact which cannot be questioned; but it does not thence follow that the Greeks had borrowed the name as well as the art from

from Egypt. If the art of music be so natural to man that vocal melody is practised wherever articulate sounds are used, there can be little reason for deducing the idea of music from the whistling of winds through the reeds that grew on the river Nile. And indeed, when we reflect with how easy a transition we may pass from the accents of speaking to diatonic sounds; when we observe how early children adapt the language of their amusements to measure and melody, however rude; when we consider how early and universally these practices take place-there is no avoiding the conclusion, that the idea of music is connatural to man, and implied in the original principles of his constitution. We have already said, that the principles on which it is founded, and the rules by which it is conducted, constitute a science. The same maxims when applied to practice form an art : hence its first and most capital division is into speculative and practical music.

Speculative music is, if we may be permitted to usc the expression, the knowledge of the nature and use of those materials which compose it, or, in other words, of all the different relations between the high and low, between the harsh and the sweet, between the swift and the slow, between the strong and the weak, of which sounds are susceptible : relations which, comprehending all the possible combinations of music and sounds. seem likewise to comprehend all the causes of the impressions which their succession can make upon the ear and upon the soul.

Practical music is the art of applying and reducing to practice those principles which result from the theory of agreeable sounds, whether simultaneous or successive ; or, in other words, to conduct and arrange sounds according to the proportions resulting from consonance. from duration and succession, in such a manner as to produce upon the ear the effect which the composer \* See Com-intends. This is the art which we call composition \*. With respect to the actual production of sounds by voices or instruments, which is called execution, this

department is merely mechanical and operative : which, only presupposing the powers of sounding the intervals true, of exactly proportioning their degrees of duration, of elevating or depressing sounds according to those gradations which are prescribed by the tone, and to the value required by the time, demands no other knowledge but a familiar acquaintance with the characters used in music, and a habit of expressing them with promptitude and facility.

Speculative music is likewise divided into two departments; viz. the knowledge of the proportions of sounds or their intervals, and that of their relative durations; that is to say, of measure and of time.

The first is what among the ancients seems to have been called harmonical music. It shows in what the nature of air or melody consists; and discovers what is consonant or discordant, agreeable or disagreeable, in the modulation. It discovers, in a word, the effects which sounds produce on the ear by their nature, by their force, and by their intervals; which is equally applicable to their consonance and their succession.

The second has been called rhythmical, because it treats of sounds with regard to their time and quantity. It contains the explication of their continuance, of their proportions, of their measures, whether long or short, quick or slow, of the different modes of time and the

parts into which they are divided, that to these the succession of sounds may be conformed.

Practical music is likewise divided into two departments, which correspond to the two preceding.

That which answers to harmonical music, and which the ancients called melopée, teaches the rules for combining and varying the intervals, whether consonant or dissonant, in an agreeable and harmonious manner.

The second, which answers to the *rhythmical* music, and which they called rhythmopée, contains the rules for applying the different modes of time, for understanding the feet by which verses were scanned, and the diversities of measure; in a word, for the practice of the rhythmus.

Music is at present divided more simply into melody and harmony; for, since the introduction of harmony, the proportion between the length and shortness of sounds, or even that between the distance of returning cadences, are of less consequence amongst us. For it often happens in modern languages, that the verses assume their measures from the musical air, and almost entirely lose the small share of proportion and quantity which in themselves they possess.

By melody the successions of sound are regulated in such a manner as to produce pleasing airs. See ME-LODY.

Harmony consists in uniting to each of the sounds, in a regular succession, two or more different sounds, which simultaneously striking the ear soothe it by their concurrence. See HARMONY.

Music, according to Rousseau, may be, and perhaps likewise ought to be, divided into the physical and the imitative. The first is limited to the mere mechanism of sounds, and reaches no farther than the external senses, without carrying its impressions to the heart, and can produce nothing but corporeal sensations more or less agreeable. Such is the music of songs, of hymns, of all the airs which only consist in combinations of melodious sounds, and in general all music which is merely harmonious.

It may, however, be questioned, whether every sound, even to the most simple, is not either by nature or by early and confirmed association, imitative. If we may trust our own feelings, there is no such thing in nature as music which gives mechanical pleasure alone. For if so, it must give such pleasure as we receive from tastes, from odours, or from other grateful titillations; but we absolutely deny that there are any musical sensations or pleasures in the smallest degree analogous to these. Let any piece of music be resolved into its elementary parts and their proportions, it will then easily appear from this analysis, that sense is no more than the vehicle of such perceptions, and that mind alone can be susceptible of them. It may indeed happen, from the number of the performers and the complication of the harmony, that meaning and sentiment may be lost in the multiplicity of sounds; but this, though it may be harmony, loscs the name of music.

The second department of this division, by lively and accentuated inflections, and by sounds which may be said to speak, expresses all the passions, paints every possible picture, reflects every object, subjects the whole of nature to its skilful imitations, and impresses even on the heart and soul of man sentiments proper to affect them in the most sensible manner. This, continues

position.

3

nues he, which is the genuine lyric and theatrical music, was what gave double charms and energy to ancient poetry; this is what, in our days, we exert ourselves in applying to the drama, and what our singers execute on the stage. It is in this music alone, and not in harmonics or the resonance of nature, that we must expect to find accounts of those prodigious effects which it formerly produced.

But, with M. Rousseau's permission, all music which is not in some degree characterised by these pathetic and imitative powers, deserves no better name than that of a musical jargon, and can only be effectuated by such a complication and intricacy of harmony, as may confound, but cannot entertain the audience. This character, therefore, ought to be added as essential to the definition of music; and it must be attributed to our neglect of this alone, whilst our whole attention is bestowed on harmony and execution, that the best performances of our artists and composers are heard with listless indifference and oscitation, nor ever can conciliate any admirers, but such as are induced, by pedantry and affectation, to pretend what they do not feel. Still may the curse of indifference and inattention pursue and harrow up the souls of every composer or performer, who pretends to regale our ears with this musical legerdomain, till the grin of scorn, or the hiss of infamy, teach them to correct this depravity of taste, and entertain us with the voice of nature !

Whilst moral effects are sought in the natural effects of sound alone, the scrutiny will be vain, and disputes will be maintained without being understood: but sounds as representatives of objects, whether by nature or association, introduce new scenes to the fancy and new feelings to the heart; not from their mechanical powers, but from the connection cstablished by the Author of our frame between sounds and the object which either by natural resemblance or unavoidable association they are made to represent.

It would seem that music was one of those arts which were first discovered : and that vocal was prior to instrumental music, if in the earliest ages there was any music which could be said to be purely instrumental. For it is more than probable, that music was originally formed to be the vehicle of poetry; and of consequence, though the voice might he supported and accompanied by instruments, yet music was never intended for instruments alone.

We are told by ancient authors, that all the laws, whether human or divine, exhortations to virtue, the knowledge of the characters and actions of gods and heroes, the lives and atchievements of illustrious men, were written in verse, and sung publicly by a quire to the sound of instruments; and it appears from the Scriptures, that such from the earliest times was the custom among the Israelites. Nor was it possible to find means more efficacious for impressing on the mind of man the principles of morals, and inspiring the lave of virtue. Perhaps, however, this was not the result of a premeditated plan; but inspired by sublime sentiments and elevation of thought, which in accents that were suited and proportioned to their celestial nature endeavoured to find a language worthy of themselves and expressive of their grandeur.

It merits attention, that the ancients were duly sensible of the value and importance of this divine art,

not only as a symbol of that universal order and symmetry which prevails through the whole frame of material and intelligent nature, but as productive of the most momentous effects both in moral and political life. Plato and Aristotle, who disagreed almost in every other maxim of politics, are unanimous in their approbation of music, as an efficacious instrument in the formation of the public character and in conducting the state; and it was the general opinion, that whilst the gymnastic exercises rendered the constitution robust and hardy, music humanised the character, and softened those habits of roughness and ferocity by which men might otherwise have degenerated into savages. The gradations by which voices were exerted and tuned, by which the invention of one instrument succeeded to another, or by which the principles of music were collected and methodised in such a manner as to give it the form of an art and the dignity of a science, are topics so fruitful of conjecture and so void. of certainty, that we must leave them to employ minds more speculative and inventions more prolific than ours, or transfer them to the History of music as a more proper place for such disquisitions. For the amuscment of the curious, Rousseau in his Musical Dictionary, Plates C and N, has transcribed some fragments of Grecian, Persian, American, Chincse, and Swiss music, with which performers may entertain themselves at leisure. When they have tried the pieces, it is imagined they will be less sanguinely fond than that author of ascribing the power of music to its affinity with the national accents where it is composed. This may doubtless have its influence ; but there are other causes more permanent and less arbitrary to which it owes its most. powerful and universal charms.

The music now most generally celebrated and practised is that of the Italians, or their successful imitators. The English, from the invasion of the Saxons, to that more late though lucid era in which they imbibed the art and copied the manner of the Italians, had a music which neither pleased the soul nor charmed the car. The primitive music of the French deserves no higher panegvric. Of all the barbarous nations, the Scots and Irish seem to have possessed the most affecting original music. The first consists of a melody characterised by tenderness : It melts the soul to a pleasing pensive langnor. The other is the native expression of grief and melancholy. Tassoni informs us, that in his time a prince from Scotland had imported into Italy a lamentable kind of music from his own country; and that he himself had composed pieces in the same spirit. From this expressive though. laconic description, we learn that the character of our national music was even then established; yet so gross is our ignorance and credulity, that we ascribe the best and most impassioned airs which are extant among us to David Rizzio; as if an Italian lutanist who had lived so short a time in Scotland, could, at once, as. it were by inspiration, have imbibed a spirit and composed in a manner so different from his own. It is yet more surprising that Geminiani should have entertained and published the same prejudice, upon the miscrable authority of popular tradition alonc; for the fact is authenticated by no better credentials. The primitive music of the Scots may be divided into the martial, the pastoral, and the festive. The first consists either.

either in marches, which were played before the chieftains, in imitation of the battles which they fought, or in lamentations for the catastrophes of war and the extinction of families. These wild effusions of natural melody preserve several of the rules prescribed for composition. The strains, though rude and untutored, are frequently terrible or mournful in a very high degree. The port or march is sometimes in common, sometimes in treble time; regular in its measures, and exact in the distance between its returning cadences ; most frequently, though not always, loud and brisk. The pibroch, or imitation of battles, is wild and abrupt in its transitions from interval to interval and from key to key; various and desultory in its movements; frequently irregular in the return of its cadences; and in short, through the whole, seems inspired with such fury and enthusiasm, that the hearer is irresistibly infected with all the rage of precipitate courage, notwithstanding the rudeness of the accents by which it is kindled. To this the pastoral forms a striking contrast. Its accents are plaintive, yet soothing; its harmony generally flat; its modulations natural and agreeable; its rhythmus simple and regular; its returning cadences at equal distance; its transitions from one concinnous interval to another, at least for the most part; its movements slow, and may be either in common or treble time. It scarcely admits of any other harmony than that of a simple bass. A greater number of parts would cover the air, and destroy the melody. To this we shall add what has been said upon the same subject by Dr Franklin. Writing to Lord K------, he proceeds thus:

"Give me leave, on this occasion, to extend a little the sense of your position, ' That melody and harmony are separately agreeable, and in union delightful;' and to give as my opinion, that the reason why the Scotch tunes have lived so long, and will probably live for ever (if they escape being stifled in modern affected ornament), is merely this, that they are really compositions of melody and harmony united, or rather that their melody is harmony. I mean, the simple tunes sung by a single voice. As this will appear paradoxical, I must explain my meaning. In common acceptation, indeed, only an agreeable succession of sounds is called melody; and only the coexistence of agreeable sounds harmony. But since the memory is capable of retaining for some moments a perfect idea of the pitch of a past sound, so as to compare it with the pitch of a succeeding sound, and judge truly of their agreement or diagreement, there may and docs arise from thence a sense of harmony between the present and past sounds, equally pleasing with that between two present sounds. Now the construction of the old Scotch tunes is this, that almost every succeeding emphatical note is a third, a fifth, an octave, or in short some note that is in concord with the preceding note. Thirds are chiefly used, which are very pleasing concords. I use the word emphatical, to distinguish those notes which have a stress laid on them in singing the tune, from the lighter connecting notes that serve merely, like grammar-articles in common speech, to tack the whole together.

"That we have a most perfect idea of a sound just past, I might appeal to all acquainted with music, who know how casy it is to repeat a sound in the same

pitch with one just heard. In tuning an instrument, a good car can as easily determine that two strings are in unison by sounding them separately, as by sounding them together; their disagreement is also as easily, I believe I may say more easily and better distinguished when sounded separately; for when sounded together, though you know by the beating that one is higher than the other, you cannot tell which it is. I have ascribed to memory the ability of comparing the pitch of a present tone with that of one past. But if there should be, as possibly there may be, something in the ear similar to what we find in the eye, that ability would not be entirely owing to memory. Possibly the vibrations given to the auditory nerves by a particular sound may actually continue for some time after the cause of these vibrations is past, and the agreement or disagreement of a subsequent sound become by comparison with them more discernible. For the impression made on the visual nerves by a luminous object will continue for 20 or 30 seconds."

After some experiments to prove the permanency of visible impressions, he continues thus :

" Farther, when we consider by whom these ancient tunes were composed, and how they were first performed, we shall see that such harmonical succession of sounds was natural, and even necessary in their construction. They were composed by the minstrels of those days, to be played on the harp accompanied by the voice. The harp was strung with wire, which gives a sound of long continuance; and had no contrivance like that of the modern harpsichord, by which the sound of the preceding note can be stopt the moment a succeeding note begins. To avoid actual discord, it was therefore necessary that the succeeding emphatic note should be a chord with the preceding, as their sounds must exist at the same time. Hence arose that beauty in those tunes that has so long pleased, and will please for ever, though men scarce know why. That they were originally composed for the harp, and of the most simple kind, I mean a harp without any half notes but those in the natural scale, and with no more than two octaves of strings, from C to C, I conjecture from another circumstance; which is, that not one of these tunes really ancient, has a single artificial half-note in it; and that in tunes where it is most convenient for the voice to use the middle notes of the harp, and place the key in F, there the B, which if used should be a B flat, is always omitted, by passing over it with a third. The connoisseurs in modern music will say I have no taste; but I cannot help adding, that I believe our ancestors, in having a good song, distinctly articulated, sung to one of those tunes, and accompanied by the harp, felt more real pleasure than is communicated by the generality of modern operas, exclusive of that arising from the scenery and dancing. Most tunes of late composition, not having this natural harmony united with their melody, have recourse to the artificial harmony of a bass, and other accompanying parts. This support, in my opinion, the old tunes do not need, and are rather confused than aided by it. Whoever has heard James Oswald play them on his violincello, will be less inclined to dispute this with me. I have more than once seen tears of pleasure in the eyes of his auditors : and yet I think, even his playing those tunes would would please more if he gave them less modern ornament."

As these observations arc for the most part true, and always ingenious, we need no other apology for quoting them at length. It is only proper to remark, that the transition in Scots music by consonant intervals, does not seem, as Dr Franklin imagines, to arise from the nature of the instruments upon which they played. It is more than probable, that the ancient British harp was not strung with wire, but with the same materials as the Welsh harps at present. These strings have not the same permanency of tone as metal; so that the sound of a preceding emphatic note must have expired before the subsequent accented note could be introduced. Besides, they who are acquainted with the manœuvre of the Irish harp, know well that there is a method of discontinuing sounds no less easy and effectual than upon the harpsichord. When the performer

finds it proper to interrupt a note, he has no more to do but return his finger gently upon the string immediately struck, which effectually stops its vibration.

That species of Scots music which we have distinguished by the name of *festive* seems now limited to reels and country-dances. These may be either in common or treble time. They most frequently consist of two strains: each of these contains eight or twelve bars. They are truly rhythmical; but the mirth which they excite seems rather to be inspired by the vivacity of the movement, than either by the force or variety of the melody. They possess a manœuvre and expression peculiar to themselves, which it is impossible to describe, and which can only be exhibited by good performers.

Having thus far pursued the general idea of music, we shall, after the history, give a more particular detail of the science.

## HISTORY OF MUSIC.

Vilceura accents of tate of mie in

Mu not

one in.

Egy an

MUSIC is capable of so infinite a variety, so greatly does the most simple differ from the most complex, and so multiplied are the degrees between these two extremes, that in no age could the incidents respecting in arlier that fascinating art have been few or uninteresting. ag of the But, that accounts of these incidents should have been handed down to us, scanty and imperfect, is no matter of surprise, when we recollect that the history of music is the history only of sounds, of which writing is a very inadequate medium; and that men would long employ themselves in the pleasing exercise of cultivating music before they possessed either the ability or the inclination to record their excrtions.

No accurate traces, therefore, of the actual state of music, in the earlier ages of the world, can be discerned. Our ideas on the subject have no foundation firmer than conjecture and analogy.

It is probable, that among all barbarous nations some degree of similarity is discernible in the style of their music. Neither will much difference appear during the first dawnings of civilization. But in the more advanced periods of society, when the powers of the human mind are permitted without obstacle to excrt their native activity and tendency to invention, and are at the same time affected by the infinite variety of circumstances and situations which before had no existence, and which in one case accelerate, and in another retard ; then that similarity, once so distinguishable, gives place to the endless diversity of which the subject is capable.

The practice of music being universal in all ages and the on- all nations, it would be absurd to attribute the invention of the art to any one man. It must have suffered a regular progression, through infancy, childhood, and youth, before it could arrive at maturity. The first attempts must have been rude and artless. Perhaps the first flute was a reed of the lake.

No nation has been able to produce proofs of antiquity so indisputable as the Egyptians. It would be vain, therefore, to attempt tracing music higher than the history of Egypt.

By comparing the accounts of Diodorus Siculus Vol. XIV. Part. II.

and of Plato, there is reason to suppose, that in very ancient times the study of music in Egypt was confined to the priesthood, who used it only on religious and solemn occasions; that, as well as sculpture, it was circumscribed by law; that it was esteemed sacred, and forbidden to be employed on light or common occasions; and that innovation in it was prohibited: But what the style or relative excellence of this very ancient music was, there are no traces by which we can form an accurate judgment. After the reigns of the Pharaohs, the Egyptians fell by turns under the dominion of the Ethiopians, the Persians, the Greeks, and the Romans. By such revolutions, the manners and amusements of the people, as well as their form of government, must have been changed. In the age of the Ptolemies, the musical games and contests instituted by those monarchs were of Greek origin, and the musicians who performed were chiefly Greck.

The most ancient monuments of human art and industry, at present extant at Rome, are the obelisks brought thither from Egypt, two of which are said to have been erected by Sesostris at Heliopolis, about 400 years before the siege of Troy. These were by the order of Augustus brought to Rome after the conquest of Egypt. One of them, called guglia rotta, or the broken pillar, which during the sacking of the city in 1527 was thrown down and broken, still lies in the Campus Martius. On it is seen the figure of a musi-An Egypcal instrument of two strings, and with a neck. It re-tian musical sembles much the calascione still used in the kingdom instrument. of Naples.

This curious relick of antiquity is mentioned, because it affords better evidence than, on the subject of ancient music, is usually to be met with, that the Egyptians, at so very carly a period of their history, had advanced to a considerable degree of excellence in the cultivation of the arts. By means of its neck, this instrument was capable, with only two strings, of producing a great number of notes. These two strings, if tuned fourths to each other, would furnish that series of sounds called by the ancients heptachord, which

3 Q

4.89

which consists of a conjunct tetrachord as B, C, D, E; E, F, G, A; if tuned fifths, they would produce an octave, or two disjunct tetrachords. The calascione is tuned in this last manner. The annals of no nation other than Egypt, for many ages after the period of the obelisk at Heliopolis, exhibit the vestige of any contrivance to shorten strings during performance by a neck or finger-board. Father Montfancon observes, that after examining 500 aneient lyres, harps, and citharas, he could discover no such thing.

Egypt indeed seems to have been the source of human intelligence, and the favourite residence of genius and invention. From that eelebrated country did the Greeks derive their knowledge of the first elements of those arts and sciences in which they afterwards so eminently excelled. From Greece again did the Romans borrow their attainments in the same pursuits. And from the records of those different nations have the moderns been enabled to accomplish so wonderful an improvement in literature.

The Hermes or Mereury of the Egyptians, sirnamed Trismegistus, or thrice illustrious, who was, according to Sir Isaac Newton, the secretary of Osiris, is celebrated as the inventor of music. It has already been observed, that no one person ought strictly to be called the inventor of an art which seems to be natural to. and coeval with, the human species; but the Egyptian Mercury is without doubt entitled to the praise of having made striking improvements in music, as well as of having advanced in various respects the civilization of the people, whose government was chiefly committed to his charge. The account given by Apollodorus of the manner in which he accidentally invented the lyre, is at once entertaining and probable. " The Nile (says Apollodorus), after having overflowed the whole country of Egypt, when it returned within its natural bounds, left on the shore a great number of dead animals of various kinds, and among the rest a tortoise; the flesh of which being dried and wasted by the sun, nothing remained within the shell but nerves and cartilages, and these being braced and contracted by the drying heat became sonorous. Mercury walking along the banks of the Nile, happened to strike his foot against this shell; and was so pleased with the sound produced, that the idea of a lyre started into his imagination. He constructed the instrument in the form of a tortoise, and strung it with the dried sinews of dead animals."

How beautiful to conceive the energetic powers of the human mind in the early ages of the world, exploring the yet undiscovered capabilities of nature, and directed to the inexhaustible store by the finger of God in the form of accident!

The monaulos, or single flute, called by the Egypfute of the tians photinx, was probably one of the most ancient instruments used either by them or any other nation. From various remains of ancient sculpture, it appears to have been shaped like a bull's horn, and was at first, it may be supposed, no other than the horn itself .--Before the invention of flutes, as no other instrument except those of percussion were known, music must have been little more than metrical. When the art of refining and lengthening sounds was first discovered, the power of music over mankind, from the agreeable surprise oceasioned by soft and extended notes, was

probably irresistible. At a time when all the rest of the world was involved in savage ignorance, the Egyptians were possessed of musical instruments capable of much variety and expression .- Of this the astonishing remains of the city Thebes still subsisting afford ample evidence. In a letter from Mr Bruce, ingrossed in Dr Burney's history of Music, there is given a particular description of the Theban harp, an instrument of ex- The Thetensive compass, and exquisite elegance of form. It is ban harp of accompanied with a drawing taken from the ruins of an Egypt. ancient scpulchre at Thebes, supposed by Mr Bruce to be that of the father of Sesostris.

On the subject of this harp, Mr Bruce makes the following striking observation. It overturns all the accounts of the earliest state of ancient music and instruments in Egypt, and is altogether, in its form, ornaments, and compass, an incontestable proof, stronger than a thousand Greck quotations, that geometry, drawing, mechanics, and music, were at the greatest perfection when this harp was made; and that what we think in Egypt was the invention of arts was only the beginning of the zera of their restoration."

Indeed, when the beauty and powers of this harp, along with the very great antiquity of the painting which represents it, are considered, such an opinion as that which Mr Bruce hints at, does not seem to be devoid of probability.

It cannot be doubted that during the reigns of the Ptolemies, who were voluptuous princes, music must have been much cultivated and encouraged. The father of Cleopatra, who was the last of that race of kings, derived his title of auletes, or flute-player, from his excessive attachment to the flute. Like Nero, he used to array himself in the dress of a tibicen, and exhibit his performance in the public musical contests.

Some authors, particularly Am. Marcellinus and M. Pau, refuse to the Egyptians, at any period of their history, any musical genius, or any excellence in the art ; but the arguments used to support this opinion scem to be inconclusive, and the evidences of the opposite decision appear to be incontestable.

The sacred Scriptures afford almost the only mate-Hebrew rials from which any knowledge of Hebrew music ean Music. be drawn. In the rapid sketch, therefore, of ancient music which we mean to exhibit, a very few observations are all which ean properly be given to that department of our subject.

Moses, who led the Israelites out of Egypt, was educated by Pharaoh's daughter in all the literature and elegant arts cultivated in that country. It is probable, therefore, that the taste and style of Egyptian music would be infused in some degree into that of the Music appcars to have been interwoven Hebrews. through the whole tissue of religious ceremony in Palestine. The priesthood seem to have been musicians hereditary and by office. The prophets appear to have accompanied their inspired effusions with music; and every prophet, like the present improvisatori of Italy, seems to have been accompanied by a musical instrument.

Music, vocal and instrumental, constituted a great part of the funeral ceremonies of the Jews. The pomp and expence used on these occasions advanced by degrees to an excessive extent. The number of finteplayers in the processions amounted sometimes to several hundreds,

The Egyptian Hermes the inventor of the lyre.

The single

Egyptians.

the days of Pindar.

hundreds, and the attendance of the guests continued Josephus, frequently for 30 days \*. iii. c. 9.

The Hebrew language abounds with consonants, and has so few vowels, that in the original alphahet they had no characters. It must, therefore, have been harsh and unfavourable to music. Their instruments of music were chiefly those of percussion; so that, both on account of the language and the instruments, arse and the music must have been coarse and noisy. The vast numbers of performers too, whom it was the taste of the Hebrews to collect together, could with such a language and such instruments produce nothing but clamour and jargon. According to Josephus, there were 200,000 musicians at the dedication of Solomon's temple. Such are the circumstances from which only an idea of Hebrew music can be formed; for the Jews, neither ancient nor modern, have ever had any characters peculiar to music; and the melodies used in their religious ceremonies have at all times been entirely traditional.

Cadmus, with the Phœnician colony which he led into Greece, imported at the same time various arts into that country. By the assistance of his Phœnician artificers, that chief discovered gold in Thrace and copper at Thebes. At Thebes that metal is still termed cadmia. Of these materials, and of iron, they formed to themselves armour and instruments of war. These they struck against each other during their dances at sacrifices, by which they first obtained the idea of music. Such is the account given of the origin of that species of music in Greecc produced by instruments of percussion. The invention of wind in-struments in Greece is attributed to Minerva; and to the Grecian Mcrcury is assigned, by the poets and historians of that country, the honour of many discoveries probably due to the Egyptian Hermes, particularly the invention of stringed instruments. The lyre of the Egyptian Mercury had only three strings; that of the Grecian seven : The last was perhaps no more than an improvement on the other. When the Greeks deified a prince or hero of their own country, they usually assigned him an Egyptian name, and with the name bestowed on their new divinity all the actions, attributes, and rites of the original.

The Greeian lyre, although said to have been invented by Mercury, was cultivated principally by Apollo, who first played upon it with method, and accompanied it with the voice. The celebrated contest between him and Marsyas is mentioned by various authors; in which, by conjoining the voice with his lyre (a combination never before attempted), his music was declared superior to the flute of Marsyas. The Projess of progress of the lyre, according to Diodorus Siculus, is the following. "The muses added to the Grecian lyre the string called mese; Linus that of lichanos; and Orpheus and Thamyras those strings which are named hypate and parhypate." It has been already mentioned, that the lyre invented by the Egyptian Mercury had but three strings. By putting these cir-

cumstances together, we may perhaps acquire some knowledge of the progress of music, or at least of the extension of its scale in the highest antiquity. Mese, in the Greek music, is the fourth sound of the second tetrachord of the great system, and first tetrachord invented by the ancients, answering to our A, on the fifth line in the base. If this sound then was added to the former three, it proves that the most ancient tetrachord was that from E in the base to A; and that the three original strings in the Mercurian and Apollonian lyre were tuned E, F, G, which the Greeks call hypate meson, parhyate meson, and meson diatonos : The addition, therefore, of mese to these, completed the first and most ancient tetrachord E, F, G, A. The string lichanos again being added to these, and answering to our D on the third line in the base, extended the compass downwards, and gave the ancient lyre a regular series of five sounds. The two strings hypate and parhypate, corresponding with our B and C in the base, completed the heptachord or seven sounds b, c, d, e, f, g, a; a compass which received no addition till after

It might perhaps be expected, that in a history of Greek music something ought to he said concerning the muses, Apollo, Bacchus, and the other gods and demi-gods, who in the mythology of that country appear to have promoted and improved the art. But such a discussion would be too diffusive, and involve too much foreign matter for the plan we have chosen to adopt. We cannot avoid, however, making a few observations on the poems of Homer, in so far as connected with our subject. It has been imagined, with much appearance of probability, that the occupation Occupation of the first poets and musicians of Greece resembled of the first of the first poets and musicians of Greece resempted that of the Celtic and German hards and the scalds musicians of Iceland and Scandinavia. They sung their poems in Greece. in the streets of the eities and in the palaces of princes. They were treated with high respect, and regarded as inspired persons. Such was the employment of Homer. His poems, so justly celebrated, exhibit the most authentic picture that can be found in the annals of antiquity, although perhaps somewhat highly coloured, of the times of which he wrote and in which he lived. Music is always named throughout the Iliad and Odyssey with rapture ; but as in these poems no mention is made of instrumental music unaccompanied with poetry and singing, a considerable share no doubt of the poet's praises is to be attributed to the poetry. The instruments most frequently named are the lyre, the flute, and the syrinx. The trumpet appears not to have been known at the siege of Troy, although it had come to be in use in the days of Homer himself. From the time of Homer till that of Sappho, there is almost a total blank in literature. Only a few fragments remain of the works of those poets and musicians whose names are preserved as having flourished between those periods (A). During the century which elapsed between the days of Sappho and those of Anacreon, no literary productions are preserved entire .---

(A) Hesiod lived so near to Homer, that it has been disputed which of them is the most ancient. It is now, we believe, universally admitted, that the palm of antiquity is due to Homer; but we consider them as having both flourished in the same era.

isy.

theian

From Anacreon to Pindar there is another chasm of ncar a century. Subsequent to this time, the works still extant of the three great tragic poets, Æschylus, Sophocles, and Euripides, together with those of Plato, Aristotle, Aristoxenus, Euclid, Theocritus, Callimachus, Polybius, and many others, produced all within a space less than 300 years, distinguish this illustrious and uncommon period as that in which the whole powers of genius seem to have been exerted to illuminate and instruct mankind in future ages. Then it was that eloquence, poetry, music, architecture, history, painting, sculpture, like the spontaneous blossoms of nature, flourished without the appearance of labour or of art.

The poets, as well epic as lyric and elegiac, were all likewise musicians; so strictly connected were music and poetry for many ages. It would afford amusement to collect the biographical anecdotes of these favourites of genius, and to assign to each the respective improvements made by him in music and poetry; but our limits do not admit of so extensive a disquisition; for which, therefore, reference must be made to the editors and commentators of these authors, and to the voluminous historics of music lately published.

The invensical characters.

The invention of notation and musical characters tion of mu- marked a distinguished æra in the progress of music. There are a diversity of accounts respecting the person to whom the honour of that invention is due; but the evidences seem to preponderate in favour of Terpander, a celebrated poet and musician, to whose genius music is much indebted. He flourished about the 27th Olympiad, or 671 years before Christ.

Before that valuable discovery, music being entirely traditional, must have depended much on the memory and taste of the performer.

There is an incident mentioned in the accounts handed down to us of the Olympic games, which may serve in some degree to mark the character of music at the time in which it happened. Lucian relates that a young flute-player named Harmonides, at his first public appearance in these games, began a solo with so violent a blast, on purpose to surprise and elevate the audience, that he breathed his last breath into his flute, Vociferous and died on the spot. When to this anecdote, wonderful to us, and almost incredible, is added that cirthe Greeks cumstance, that the trumpet-players at these public exhibitions expressed an excess of joy when they found their exertions had neither rent their cheeks nor burst their blood-vessels, some idea may be formed of the noisy and vociferous style of music which then pleased; and from such facts only can any opinion be obtained

of the actual state of ancient music. In whatever manner the flute was played on, there is no doubt that it was long in Grecce an instrument of high favour, and that the flute-players were held in much estimation. The flute used by Ismenias, a celebrated Theban musician, cost at Corinth three talents, or 5811. 5s. If, says Xenophon, a bad fluteplayer would pass for a good onc, he must, like the great flute-players, expend large sums on rich furniture, and appear in public with a great retinue of servants.

The ancients, it appears, were not less extravagant Extrapain gratifying the ministers of their pleasures than our-gance of selves. Amœbieus, a harper, was paid an Attic talent, theancient or 1931. 15s. per day for his performance (B).

1931. 15s. per day for ms performance (B). It is proper to add, that the celebrated musicians of music. Greece who performed in public were of both sexes ; and that the beautiful Lamia, who was taken captive by Demetrius, in the sea engagement in which he vanquished Ptolemy Soter, and who herself captivated her conqueror, was a public performer, as well as were many other elevated female spirits, who are recorded by ancient authors in terms of admiration, and of whom, did our limits here admit of biography, we would treat with pleasure. The philosophers of Greece, whose capacious minds grasped every other object of human intelligence, were not inattentive to the theory of music, or the philosophy of sound. This department of science became the source of various sects, and of much diversity of opinion .- The founders of the most distinguished sects were Pythagoras and Aristoxenus.

Like every other people, the Romans, from their Roman first origin as a nation, were possessed of a species of music. music which might be distinguished as their own. It appears to have been rude and coarse, and probably was a variation of the music in use among the Etruscans and other tribes around them in Italy; but as soon as they began to open a communication with Greece, from that country, with their arts and philosophy, they borrowed also their music and musical instruments. No account, therefore, of Roman music. is to be expected that would not be a repetition of what has been said on the subject of the music of Greece.

The excessive vanity of Nero with respect to music, Vanity of displayed in his public contentions for superiority with Nero with the most celebrated professors of the art in Greece music. and Rome, is known to every one conversant in the history of Rome. The solicitude with which that detestable tyrant attended to his voice is curious, and will throw some light on the practices of singers in ancient times. He was in use to lie on his back, with a thin plate of lead on his stomach. He took frequent emetics and cathartics, abstained from all kinds of fruits and such meats as were held to be prejudicial to singing. Apprehensive of injuring his voice, he at length desisted from haranguing the soldiery and the senate; and after his return from Greece established an officer (Phonascus) to regulate his tones in speaking.

Most nations have consented in introducing music Sacred into their religious ceremonies. That art was early music admitted into the rites of the Egyptians and Hebrews; and that it constituted a considerable part of the Grecian and Roman religious service, appears from the writings of many ancient authors. The same pleasing art soon obtained an introduction into the Christian church, as the Acts of the Apostles discover in many passages. There remain no specimens of the music employed in the worship of the primitive Christians; but probably it was at first the same with that used in the Pagan rites of the Greeks and Romans. The practice

(B) Roscius gained 500 sestertia, or 40361. 9s. 2d. sterling.

music of

practice of chanting the psalms was introduced into the western churches by St Ambrose, about 350 years after Christ. In the year 600, the method of chanting was improved by St Gregory the Great. The Ambrosian chant contained four modes. In the Gregorian the number was doubled. So early as the age of Constantine the Great, prior to either of the periods last mentioned, when the Christian religion first obtained the countenance of power, instrumental music came to be introduced into the service of the church. In England, according to Bishop Stillingfleet, music was employed in the church service, first by St Augustine, and afterwards much improved by St Dunstan, who was himself an eminent musician, and who is said to have first furnished the English churches and convents with the organ. The organ, the most majestic of all instruments, seems to have been an improvement of the hydraulican or water organ of the Greeks .--The first organ seen in France was sent from Constantinople in 757, as a present to King Pepin from the emperor Constantine Copronymus VI. In Italy, Germany, and England, that instrument became frequent during the 10th century.

During the dark ages no work of genius or taste in any department of science seems to have been produced in any part of Europe; and except in Italy, where the cultivation of music was rather more the object of attention, that art was neglected equally with all others. There has always been observed a correspondence in every country between the progress of music and the cultivation of other arts and sciences. In the middle ages, therefore, when the most fertile provinces of Europe were occupied by the Goths, Huns, Vandals, and other barbarous tribes, whose language was as harsh as their manners were savage, little perfection and no improvement of music is to be looked for. Literature, arts, and refinements, were encouraged more early at the courts of the Roman pontiffs than in any other country; and owing to that circumstance it is, that the scale, the counterer igin point, the best melodies, the dramas religious and secular, the chief graces and elegancies of modern music, have derived their origin from Italy. In modern times, Italy has been to the rest of Europe what ancient Greece was to Rome. The Italians have aided the civilization of their conquerors, and enlightened the minds of those whose superior prowess had enslaved them.

Having mentioned counterpoint, it would be improper not to make one or two observations on an invention which is supposed to have been the source of great innovation in the practice of music. Counterpoint, or music in parts, seem to be an invention purely modern. The term harmony meant in the language of antiquity what is now understood by melody. Guido, a monk of Arezzo in Tuscany, is, in the general opinion, supposed to have entertained the first idea of counterpoint about the year 1022: an art which, since his time, has experienced gradual and imperceptible improvements, far exceeding the powers or comprehension of any one individual. The term counterpoint, or contra punctum, denotes its own etymology and import, Musical notation was at one time performed by small points; and the present mode is

only an improvement of that practice. Counterpoint; therefore, denotes the notation of harmony or music in parts, by points opposite to each other. The improvements of this important acquisition to the art of music kept pace at first with those of the organ ; an instrument admirably adapted to harmony : And both the one and the other were till the 13th century employed chiefly in sacred music. It was at this period that sacred music began to be cultivated.

Before the invention of characters for time, music in parts must have consisted entirely of simple counterpoint, or note against note, as is still practised in psalmody. But the happy discovery of a time-table extended infinitely the powers of combined sounds. The ancients had no other resource to denote time and movement in music except two characters (--), equivalent to a long and a short syllable. But time is of such importance in music, that it can impart meaning and energy to the repetition of the same sound. Without it variety of tones has no effect with respect to gravity and acuteness. The invention of The inventhe time-table is attributed by almost all the writers tion of the on music of the last and present century to John de time-table. Muris, who flourished about the year 1330. But in a manuscript of John de Muris himself, bequeathed to the Vatican library by the Queen of Sweden, that honour seems to be yielded to Magister Franco, who appears to have been alive as late at least as 1083. John de Muris, however, who there is some cause to believe was an Englishman, though not the inventor of the cantus mensurabilis, did certainly by his numerous writings greatly improve it. His tract on the Art of Counterpoint is the most clear and useful essay on the subject of which those times can boast.

In the 11th century, during the first crusade, Europe began to emerge from the barbarous stupidity and ignorance which had long overwhelmed it. While its inhabitants were exercising in Asia every species of rapine and pious cruelty, art, ingenuity, and reason, insensibly civilized and softened their minds. Then it was that the pocts and songsters, known by the name of Troubadours, who first appeared in Provence, insti-Troubatuted a new profession ; which obtained the patronage dours. of the count of Poictou, and many other princes and barons, who had themselves cultivated music and poetry with success. At the courts of their munificent patrons the troubadonrs were treated with respect. The ladies, whose charms they celebrated, gave them the most generous and flattering reception. The success of some inspired others with hopes, and excited exertions in the exercise of their art; impelling them towards perfection with a rapidity which the united force alone of emulation and emolument could occasion. These founders of modern versification, constructing their songs on plans of their own, classical authority, either through ignorance or design, was entirely disregarded. It does not appear, however, du-ring the cultivation and favour of Provençal literature, that any one troubadour so far outstripped the rest as to become a model of imitation. The progress of taste must ever be impeded by the ignorance and caprice of those who cultivate an art without science or principles.

During almost two centuries after the arrangement

C.

of the scale attributed to Guido, and the invention of the time-table ascribed to Franco, no remains of secular music can be discovered, except those of the tronbadours or Provençal poets. In the simple-tunes of these bards no time indeed is marked, and but little variety of notation appears : It is not difficult, howover, to discover in them the germs of the future melodies, as well as the poetry of France and Italy. Had the poetry and music of the troubadours been treated of in an agreeable manner by the writers who have chosen that subject, it would have been discovered to be worthy of attention ; the poetry, as interesting to literature; the melody to which it was sung, as curious to the musical historian.

Almost every species of Italian poetry is derived from the Provençals. Air, the most captivating part of secular vocal music, seems to have had the same origin. The most ancient strains that have been spared by time, are such as were set to the songs of the trouba-The Provençal language began to be in favour dours. with poets about the end of the 10th century. In the 1 2th it became the general vehicle, not only of poetry, but of prose, to all who were ignorant of Latin. And these were not the laity only. At this period violars, or performers on the vielle or viol, juglars, or fluteplayers, musars or players on other instruments, and comics or comedians, abounded all over Europe. This swarm of poet-musicians, who were formerly compre-. hended in France-under the general title of jongleurs, travelled from province to province, singing their verses at the courts of princes. They were rewarded with clothes, horses, arms, and money. Jongleurs or musicians were employed often to sing the verses of troubadours, who themselves happened to be deficient in voice or ignorant of music. The term troubadour, therefore, implies poetry as well as music. The jongleurs, menetriers, strollers, or minstrels, were frequently musicians, without any pretensions to poetry. These last have been common at all times; but the troubadour or bard has distinguished a particular profession, either in ancient or modern times, only during the early dawnings of literature.

In the 13th century the songs were on various subjects; moral, merry, amorous: and at that time melody seems to have been little more than plain song or chanting. The notes were square, and written on four lines only like those of the Romish church in the cliff C, and without any marks for time. The movement and embellishments of the air depended on the abilities of the singer. Since that time, by the cultivation of the voice modern music has been much extended, for it was not till towards the end of St Lewis's reign that the fifth line began to be added to the stave. The singer always accompanied himself with an instrument in unison.

The harp ite instrument of the Troubadours.

As the lyre is the favourite instrument in Grecian the favour- poetry, so the harp held the same place in the estimation of the poets who flourished in the period of which we at present speak. A poet of the 14th century, Machau, wrote a poem on the subject of the harp alone; in which he assigns to each of its 25 strings an allegorical name; calling one liberality, another wealth, Sec.

The viol er violin.

The instrument which frequently accompanied, and indeed disputed the pre-eminence with the harp, was

Till the 16th century this instrument was the viol. furnished with frets; after that period it was reduced to four strings: and still under the denomination of violin holds the first place among the treble instruments. The viol was played with a bow, and differed entirely from the vielle, the tones of which were produced by the friction of a wheel: The wheel performed the part of a bow.

British harpers were famous long before the conquest. The bounty of William of Normandy to his *joculator* or bard is recorded in the Doomsday book. The harp scems to have been the favourite instrument in Britain for many ages, under the British, Saxon, Danish, and Norman kings. The fiddle, however, is mentioned so early as 1200 in the legendary life of St Christopher. The ancient privileges of the minstrels at the fairs of Chester are well known in the history of -England.

The extirpation of the bards of Wales by Edward I. is likewise too familiar an incident to be particularly mentioned here. His persecuting spirit, however, seems to have been limited to that principality; for we learn, that at the ceremony of knighting his son, a multitude of minstrels attended.

In 1315, during the reign of Edward II. such extensive privileges were claimed by the minstrels, and so many dissolute persons assumed that character, that it became necessary to restrain them by express laws.

The father of our genuine poetry, who in the 14th ecntury enlarged our vocabulary, polished our numbers, and with acquisitions from France and Italy augmented our store of knowledge (Chaucer), entitles one of his poems. The History of St Cecilia; and the ce-St Ceci lebrated patroness of music must no doubt be mentioned in a history of the art. Neither in Chaucer, however, nor in any of the histories or legendary accounts of this saint, does any thing appear to authorize the religious veneration paid to her by the votaries of music; nor is it easy to discover whence it has ariscn.

As an ineident relative to the period of which we -speak, it may be mentioned, that, according to Spelman, the appellation of Doctor was not among the de- Origin grees granted to graduates in England sooner than the the reign of King John, about 1207; although, in of Mus Wood's history of Oxford, that degree is said to have been conferred, even in music, in the reign of Henry II. It is known that the title was created on the continent in the 12th century; and as, during the middle ages, music was always ranked among the seven liberal arts, it is likely that the degree was extended to it.

After the invention of printing, an art which has tended to disseminate knowledge with wonderful rapidity among mankind, music, and particularly coun-terpoint, became an object of high importance. The names of the most eminent composers who flourished in England, from that time to the Reformation, were, Fairfax, William of Newark, Sheryngham, Turges, Banister, Tudor, Taverner, Tye, Johnson, Parsons; to whom may be added John Marbeck, who set the whole English eathedral service to music.

Before this period Scottish music had advanced to Scottish a high degree of perfection. James I. was a great music. composer of airs to his own verses ; and may be considered
dered as the father of that plaintive mclody which in Scotch tunes is so pleasing to a taste not vitiated by modern affectation. Besides the testimony of Fordun and Major, who may be suspected of being under the influence of national prejudice, we have that of Alessandro Tessani, to the musical skill of that accomplished prince. " Among us moderns (says this foreigner) we may reckon James king of Scotland, who not only composed many sacred pieces of vocal music, but also of himself invented a new kind of music, plaintive and melancholy, different from all others ; in which he has been imitated by Carlo Gesueldo prince of Venosa, who in our age has improved music with new and admirable inventions."

Under such a genius in poetry and music as King James I. it cannot be doubted that the national music must have been greatly improved. We have seen that he composed several anthems, or vocal pieces of sacred music, which shows that his knowledge of the science must have been very considerable. It is likewise known, that organs were by him introduced into the cathedrals and abbeys of Scotland, and choir-service brought to such a degree of perfection, as to fall little. short of that established in any country of Europe .--s Tyt-By an able and ingenious antiquary \* the great eropis- era of music, as of poetry, in Scotland, is supposed to have been from the beginning of the reign of James I. Scol Mu-down to the end of the reign of James V. During , i of that period flourished Gavin Douglas bishop of Dunhe ans- keld, Ballenden archdeacon of Murray, Dunbar, Henhe viety of ryson, Scott, Montgomery, Sir David Lindsey, and many he viety others, whose fine poems have been preserved in Baies jcot-natyne's Collection, and of which several have been published by Allan Ramsay in his Evergreen.

Before the Reformation, as there was but one religion, there was but one kind of sacred music in Europe, plain chant, and the descant built upon it .--That music likewise was applied to one language only, the Latin. On that account, the compositions of Italy, France, Spain, Germany, Flanders, and England, kept pace in a great degree with each other in style and excellence. All the arts seem to have been the companions, if not the produce, of successful commerce: they appeared first in Italy, then in the Hanseatic towns, next in the Netherlands; and during the 16th century, when commerce became general in every part of Europe.

In the 16th century music was an indispensable part of politc education : All the princes of Europe were instructed in that art. There is a collection preserved in manuscript called Queen Elizabeth's Virginal Book, If her majesty was able to exccute any of the pieces in that book, she must have been a great player; a month's practice would not be sufficient for any master now in Europe to enable him to play one of them to the end. Tallis, singularly profound in musical composition, and Bird his admirable scholar, were two of the authors of this famous collection.

During the reign of Elizabeth, the genius and learning of the British musicians were not inferior to any on the continent; an observation scarcely applicable at any other period of the history of this country. Sacred music was the principal object to study all over Europe.

The most eminent musical theorists of Italy, who

flourished in the 16th century, were, Franchinus Ga-Eminent fierius, or Gafforio of Lodc, Pietro Aaron of Flo-musicians rence, Lodovico Fogliano, Giov. Spatro, Giov. Ma-in Italy ria da Terentio Lanfranco, Steffano Uanneo, Anton. during the Francisco Dana Luici Dontico Nicela Vi Francisco Done, Luigi Dentice, Nicolo Vicentino, tury. and Gioseffo Zarlino, the most general, voluminous, and celebrated theorist of that period, Vincentio Galilei, a Florentine nobleman, and father of the great Galileo Galilei, Maria Artuse of Bologna, Oraseo Tegrini, Pietro Pontio, and Lodovico Zacconi.

The principal Roman authors were, Giovanni Anmuecia, Giovanni Pierluigi da Palestrina, justly celebrated, Ruggiero Giovanelli, Luca Marenzio, who brought to perfection madrigals, the most cheerful species of secular music.

Of the Venetians, Adrian Willaeri is allowed to be at the head.

At the head of the Neapolitans is deservedly placed. Rocco Rodio.

At Naples, too, the illustrious dilettante, Don Carlo Gesualdo prince of Venosa, is highly celebrated. He. seems, however, to have owed much of his fame to his high rank.

Lombardy might also furnish an ample list of eminent musicians during the 16th century, of whom, however, our limits will not admit of a particular cnumeration :---The chief of them were, Constanzo Porta, Gastoldi, Bissi, Cima, Vocchi, and Monteverde.

At Bologna, besides Artusi already mentioned, Andrea Rota of the same city appears to have been an admirable contrapunctist.

Francisco Corteccia, a celebrated organist and composer, and Alessandro Strigglio, a lutanist and voluminous composer, were the most eminent Florentines.

The inhabitants of the extensive empire of Germany In German's have long made music a part of general education .--- ny. They hold the place, next to Italy, among the most successful cultivators of the art. During the 16th century, their most eminent composers of music and writers on the subject were, Geo. Reischius, Michael Roswick, Andreas Ornithorparchus, Paul Hofhaimer, Luspeinius, Henry Loris or Lorit, Faber, Fink, Hosman, and many others whom it would be tedious to mention; and for a particular account of whose treatises and compositions we must refer to more voluminous histories of music.

In France, during the 16th century, no art except in Frances the art of war made much progress in improvement.-Ronsard, Baif, Goudimel, Claud le Jeune, Caurroy, and Maudit, are the chief French musicians of that period.

In Spain, music was early received into the circle of Spain. sciences in the universities. The musical professorship at Salamanca was founded and endowed by Alfonzo the Wise, king of Castile.

One of the most celebrated of the Spanish musicians was Francis Salinas, who had been blind from his infancy. · He was a native of Burgos.

D. Cristofero Morales, and Tomaso Lodovico da Vittorio, deserve likewise to be mentioned; and to mention them is all we can attempt; the purpose of which is, to excite more minute inquiry by those who may choose to investigate the subject particularly.

The Netherlands, likewise, during the period of which, The Newe have been speaking, produced eminent composers; therlands.

of

of whom we may mention Verletot, Gembert, Arkadelt, Berchem, Richefort or Ricciafort, Crequilon Le Cock or Le Coq, Canis, Jacob Clemens Non Papa, Pierre Manchicourt, Baston, Kerl, Rore, Orlandi di Lasso, and his sons Ferdinand and Rodolph.

during the 17th century.

In the 17th century, the musical writers and comcomposers posers who acquired fame in England, were, Dr Nathanael Giles, Thomas Tomkins, and his son of the same name ; Elway Bevin, Orlando Gibbons, Dr William Child, Adrian Batten, Martin Pierson, William Lawes, Henry Lawes, Dr John Wilson, John Hilton, John Playford, Captain Henry Cook, Pelham Humphrey, John Blow, William Turner, Dr Christopher Gibbons, Benjamin Rogers, and Henry Purcell. Of these, Orlando Gibbons, Pelham Humphrey, and Henry Purcell, far excelled the rest.

About the end of the reign of James I. a music-lecture or professorship was founded in the university of Oxford by Dr William Hychin.

In the reign of Charles I. a charter was granted to the musicians of Westminster, incorporating them, as the king's musicians, into a body politic, with powers to prosecute and fine all who, except themselves, should " attempt to make any bencht or advantage of music in England or Wales;" powers which in the subsequent reign were put in execution.

About the end of the reign of Charles II. a passion seems to have been excited in England for the violin, and for pieces expressly composed for it, in the Italian manner (B). Prior to 1600, there was little other music except masses and madrigals, the two principal divisions of sacred and secular music ; but from that time to the present, dramatic music becomes the chief object of attention. The music of the church and of the chamber continued indeed to be cultivated in Italy with diligence, and in a learned and elaborate style, till near the middle of the century; yet a revolution in favour of melody and expression was preparing, even in sacred music, by the success of dramatic composition, consisting of recitation and melodies for a single voice. Such melodics began now to be preferred to music of many parts ; in which canons, fugues, and full harmony, had been the productions which chiefly employed the master's study and the hearer's attention.

Mean state in the beginning of the 18th century.

So late as the beginning of the 18th century, acof the opera cording to Riccoboni, the performers in the operas of Germany, particularly at Hamburg, " were all tradesmen or handicrafts. Your shoemaker (says he) was often the first performer on the stage; and you might have bought fruit and sweetmeats of the same girls, whom the night before you had seen in the characters of Armida or Semiramis. Soon, however, the German opera arose to a more respectable situation, and even during the 17th century many eminent composers flourished in that country."

State of music in France in the 17th century.

The list of great musicians which France produced during the early part of the same century is not nu-

I

merous. Music seems to have been but little cultivated in that country, till the operas of Lulli, under the powerful patronage of Louis XIV. excited public attention.

The favonrite singing-master and composer of France, about the middle of the 17th century, was Michael Lambert. John Baptist Lulli, soon after this time, rose from the rank of a menial servant to fame, opulence, and nobility, by his skill in musical compositions. The celebrated singer La Rochois was taught singing and acting hy Lulli.

La Maupin the successor of La Rochois, on ac-Curicount of her extraordinary character and romantic ad-anece ventures, deserves to be mentioned. She eloped from of a her husband with a fencing master, of whom she lcarnt singe the small sword. She became an excellent fencer. At Marseilles she entertained a strange attachment to a voung lady, who was seized with a whimsical fondness in return, on account of which the latter was confined in a convent. La Maupin obtained admission into the same conventas a novice. She set fire to the building, and in the confusion carried off her favourite. At Paris when she appeared on the stage in 1695, Dumeni a singer having affronted her, she put on mon's clothes, and insisted on his drawing his sword and fighting her. When he refused, she caned him, and took from him his watch and snuff-box as trophies of her victory. At a ball given by Monsieur brother of Louis XIV. she again put on men's clothes; and having behaved impertinently to a lady, three of the lady's friends, supposing La Manpin to be a man, called her out. She killed them all; and returning coolly to the ball, told the story to Monsieur, who obtained her pardon. She became afterwards mistress to the elector of Bavaria. This prince quitting her for the countess of Arcos, sent her by the count, husband of that lady, a purse of 40,000 livres. She threw it at the count's head, telling him, it was a recompense worthy of such meanness as he displayed. At last, seized with a fit of devotion, she recalled her husband, and spent the remainder of her life in piety. She died in 1707 at the age only of

34. The English musician whom we last mentioned was Chief the celebrated Purcell. After his time the chief com-pose posers for the church were Clarke, Dr Holden, Dr in Er Creyghton, Tucker, Aldrich, Golwin, Weldon, Dr Crofts, Dr Greene, Boyce, and Nares; to whom may be added John Stanley, who attained high proficiency in music, although from two years old totally deprived of sight.

The annals of modern music have hitherto furnished no event so important to the progress of the art as the invention of recitative or dramatic melody ; a style of music which resembles the manner of the ancient rhapsodists.

The Orfeo of Politian was the first attempt at mu-First sical drama. It was afterwards perfected by Metasta-cald No musical dramas similar to those afterwards \$10. known

(B) The most celebrated violin players of Italy, from the 16th century to the present time, have been Farma, M. Angelo Rossi, Bassani the violin-master of Corelli, the admirable Angelico Corelli himself, Torelli, Alberti, Albenoni, Tessarini, Vivaldi, Geminiani, one of the most distinguished of Corelli's scholars, Tartini, Veracini, Barbella, Locatelli, Ferrari, Martini, Boccherini, and Giardini.

known by the names of opera and oratorio, had existence in Italy before the beginning of the 17th century. It was about the 1600, or a little before that time, that eunnehs were first employed for singing in Italy.

There seem to have been no singing eunuclis in anst singcient times, unless the galli or archigalli, priests of Cybele, were such. Castration has, however, at all times been practised in eastern countries, for the purpose of furnishing to tyrannic jealousy guards of female chastity; but never, so far as modern writers on the subject have discovered, merely to preserve the voice, till about the end of the 16th century.

At Rome, the first public theatre opened for the exhibition of musical dramas, in modern times, was il Torre de Nona, where in 1671 Giasone was performed. In 1679, the opera of Dou è Amorc, set by the famous organist Bernardo Pasquini, was represented at Nilla Sala de Signori Capranica ; a theatre which still subsists. In the year 1680, L'Onesta negl' Amore was exhibited; the first dramatic composition of the clegant, profound, and original Alessandro Searlatti.

The inhabitants of Venice have cultivated and encouraged the musical drama with more zeal and diligence than the rest of Italy, during the end of the last and beginning of the present century; yet the opera was not established in Venice before the year 1637. In that year the first regular drama was performed. It was Andromeda.

In 1680 the opera of Berenice was exhibited at Binice. Padua with such astonishing splendour as to merit notice. There were choruses of 100 virgins, 100 soldiers, 100 horsemen in iron armour, 40 cornets of horse, 6 trumpeters on horseback, 6 drummers, 6 ensigns, 6 sackbuts, 6 great flutes, 6 minstrels playing on Turkish instruments, 6 others on octave flutes, 6 pages, 3 sergeants, 6 cymbalists. There were 12 huntsmen, 12 grooms, 6 coachmen for the triumph; 6 others for the procession ; 2 lions led by two Turks, 2 elephants by two others, Berenice's triumphal car drawn by 4 horses, 6 other ears with prisoners and spoils drawn by 12 horses, 6 coaches. Among the scenes and representations in the first act were, a vast plain with two triumphal arches, another plain with pavilions and tents, and a forest for the chase. In act third, the royal dressing room completely furnished, stables with 100 live horses, portico adorned with tapestry, and a stupendous palace in perspective. At the end of the first act were representations of every kind of chase, wild boar, stag, deer, bears. At the end of the third act, an enormous globe, descending as from the sky, divided itself into other globes suspended in the air, and ornamented with emblematical figures of time, fame, honour, &c.

Early in the last century, machinery and decoration usurped the importance due to poetry and music in such exhibitions.

Few instances occur of musical dramas at Naples till the beginning of the present century. Before the time of the elder Searlatti, it seems as if Naples had been less fertile in great contrapuntists, and less diligent in the enltivation of dramatic music, than any other state of Italy. Since that time all the rest of Europe has been furnished with composers and performers from that city.

VOL. XIV. Part II.

The word opera seems to have been familiar to French English poets from the beginning of the last century, and Eng-Stilo recitative, a recent innovation even in Italy, is lish opera. Stilo recitativo, a recent innovation even in Italy, is mentioned by Ben Johnson so early as 1617. From this time it was used in masques, occasionally in plays, and in cantatas, before a regular drama wholly set to music was attempted. By the united abilities of Qui-. nault and Lulli, the opera in France had risen to high favour. This circumstance afforded encouragement to several attempts at dramatic music in' England by Sir William D'Avenant and others, before the music, language, or performers of Italy were employed on our stage. Pieces, styled dramatic operas, preceded the Italian opera on the stage of England. These were written in English, and exhibited with a profuse decoration of scenery and habits, and with the best singers and dancers that could be procured : Psyche and Circe are entertainments of this kind : The Tempest and Macbeth were acted with the same accompaniments.

During the 17th century, whatever attempts were made in musical drama, the language sung was always English. About the end of that century, however, Italian singing began to be encouraged, and vocal as well as instrumental musicians from that country began to appear in London.

The first musical drama, performed wholly after the Italian manner in recitative for the dialogue or narrative parts, and measured melody for the airs, was Arsince Queen of Cyprus, translated from an Italian opera of the same name, written by Stanzani of Bologna. The English version of this opera was set to music by Thomas Clayton, one of the royal band, in the reign of William and Mary. The singers were all English, Messrs Hughes, Leveredge, and Cook ; Mrs Tofts, Mrs Cross, and Mrs Lyndsey. The translation of Arsinoé, and the music to which it is set, are excerable ; yet such is the charm of novelty, that this miserable performance, deserving neither the name of a drama by its poetry, nor of an opera by its music, sustained 24 representations, and the second year 11.

Operas, notwithstanding their deficiencies in poetry, music and performance (no foreign composer or eminent singer having yet arrived), became so formidable to our actors at the theatres, that it appears from the Daily Courant, 14th January 1707, a subscription was opened " for the encouragement of the comedians acting in the Haymarket, and to enable them to keep the diversion of plays under a separate interest from operas."

Mr Addison's opera of Rosamond appeared about this time; but the music set by Clayton is so contemptible, that the merit of the poetry, however great, could not of itself long support the piece. The choice of so mean a composer as Clayton, and Mr Addison's partiality to his abilities, betray a want of musical taste in that elegant author.

The first truly great singer who appeared on the stage of Britain was Cavalier Nicolino Grimaldi, commonly known by the name of Nicolini. He was a Neapolitan; and though a beautiful singer indeed, was still more eminent as an actor. In the Tatler, \*See also Nº 115. the elegance and propriety of his action are Spectator, particularly described \*. Recently before his appear- vol. 1, No. ance, Valentini Urbani, and a female singer called The 13.

3 R

Baroness.

Baroness, arrived. Margarita de l'Epini, who afterwards married Dr Pepusch, had been in this country some time before.

The first opera performed wholly in Italian, and by Italian singers, was Almahide. As at present so at that time, operas were generally performed twice a week.

The year 1710 is distinguished in the annals of music by the arrival in Britain of George Frederic Handel. Handel had been in the service of the elector of Hanover, and came first to England on a visit of cu-riosity. The fame of this great musician had penetrated into this country before he himself arrived in it; and Aaron Hill, then in the direction of the Haymarket theatre, instantly applied to him to compose an opera. It was Rinaldo; the admirable music of which he produced entirely in a fortnight. Soon after this period appeared, for the first time as an opera singer, the celebrated Mrs Anastasia Robinson. Mrs Robinson, who was the daughter of a portrait painter, made her first public exhibitions in the concerts at Yorkbuildings; and acquired so much the public favour, that her father was encouraged to take a house in Golden Square, for the purpose of establishing weekly concerts and assemblies, in the manner of Conversazioni, which became the resort of the most polite audiences.

Soon after Mrs Robinson accepted an engagement at the Opera, where her salary is said to have been 1000l. and her other emoluments equal to that sum. She quitted the stage in consequence of her marriage with the gallant earl of Peterborough, the friend of Pope and Swift. The eminent virtues and accomplishments of this lady, who died at the age of 88, entitled her to be mentioned even in a compend too short for biography.

The conducting the opera having been found to be more expensive than profitable, it was entirely suspended from 1717 till 1720, when a fund of 50,000l. for supporting and carrying it on was subscribed by the Progress of first personages of the kingdom. The subscribers, of whom King George I. was one for 1000l. were formed into a society, and named The Royal Academy of Music. Handel was commissioned to engage the performers: For that purpose he went to Dresden, where Italian operas were at that time performed in the most splendid manner at the court of Augustus elector of Saxony, then king of Poland. Here Handel engaged Senesino-Berenstadt, Boschi, and the Duranstanti.

In the 1723, the celebrated Francesca Cuzzoni appeared as a first rate singer; and two years afterwards arrived her distinguished rival Signora Faustina Bordoni.

In a cantabile air, though the notes Cuzzoni added were few, she never lost an opportunity of enriching the cantilena with the most beautiful embellishments. Her shake was perfect. She possessed a creative faney; and she enjoyed the power of occasionally aceclerating and retarding the measure in the most artificial and able manner, by what is in Italy called tempo rubato. Her high notes were unrivalled in clearness and sweetness. Her intonations were so just and so fixed, that it seemed as if she had not the power to sing out of tune.

Faustina Bordoni, wife of the celebrated Saxon composer Hasse, invented a new kind of singing, by running divisions, with a neatness and velocity which astonished all who heard her. By taking her breath imperceptibly, she had the art of sustaining a note apparently longer than any other singer. Her beats and trills were strong and rapid; her intonation perfect. Her professional perfections were enhanced by a beautiful face, fine symmetry of figure, and a countenance and gesture on the stage which indicated an entire intelligence and possession of the several parts allotted to her.

These two angelic performers excited so signally the attention of the public, that a party spirit between the abettors of the one and of the other was formed, as violent and as inveterate almost as any of those that had ever occurred relative to matters either theological or political; yet so distinct were their styles of singing, so different their talents, that the praise of the one was no reproach to the other.

In less than seven years, the whole 50,000l. subseribed by the Royal Academy, besides the produce of admission to non-subscribers, was expended, and the governor and directors of the society relinquished the idea of continuing their engagements; consequently, at the close of the season 1727, the whole band of singers dispersed. The next year we find Senesino, Faustina, Balde, Cuzzoni, Nicolini, Farinelli, and Bosehe, at Veniee.

Handel, however, at his own risk, after a suspension of about a twelvemonth, determined to recommence the Opera; and accordingly engaged a band of performers entirely new. These were Signior Bernaechi, Signora Merighi, Signora Strada, Signior Anibale Pio Fabri, his wife, Signora Bertoldi, and John Godfrid Reimschneider.

The sacred musical drama, or oratorio, was invent-Invention ed early in the 14th century. Every nation in Europe of the or seems first to have had recourse to religious subjects for its introdramatic exhibitions. The oratorios had been common duction i in Italy during the last century. They had never been to Englat publicly introduced in England, till Handel, stimulated by the rivalship of other adventurers, exhibited in 1732 his oratorios of Esther, and of Acis and Galatea, the last of which he had composed twelve years before for the duke of Chandos's chapel at Cannons. The most formidable opposition which Handel met with in his conduct of the Italian opera was a new theatre for exhibiting these operas, opened by subscription in Lincoln's-inn Fields, under the conduct of Nicola Porpora, a respectable composer. A difference having occurred between Handel and Senesino; Senesino had for some time deserted the Haymarket, where Handel managed, and was now engaged at the rival theatre of Lincoln'sinn Fields. To supply the place of Senesino, Handel brought over Giovanni Carestini, a singer of the most extensive powers. His voice was at first a powerful and clear soprano: Afterwards it changed into the fullest, finest, deepest counter-tenor that has perhaps ever been heard. Carestini's person was tall, beautiful, and majestic. He rendered every thing he sung interesting by energy, taste, and judicious embellishment. In the execution of difficult divisions from the chest, his manner was articulate and admirable. It was the opinion of Hasse, as well as other eminent professors, that

Arrival of

Handel in

England.

the opera

under his

manage-

ment.

levi I.

that whoever had not heard Carestini, was unacquainted with the most perfect style of singing. The opera under the direction of Porpora was removed to the Haymarket, which Handel had left. Handel occupied the theatre of Lincoln's-inn Fields ; but his rivals now acquired a vast advantage of attraction, by the accession of Carlo Broschi detto Farinelli to their part, who at this time arrived. This renowned singer seems to have transcended the limit of all antcrior vocal excellence. No vocal performer of the present ceutury has been so unanimously allowed to possess an uncommon power, sweetness, extent, and agility of voice, as Farinelli. Nicolini, Senesino, and Carestini, gratified the eye as much by the dignity, grace, and propriety of their action and deportment, as the ear, by the judicious use of a few notes within the limits of a small compass of voice ; but Farinelli, without the assistance of significant gestures or graceful attitudes, enchanted and astonished his hearers, by the force, extent, and mellifluous tones of the mere organ, when he had nothing to execute, articulate, or express. Though during the time of singing he was as motionless as a statue, his voice was so active that no intervals were too close, too wide, or too rapid, for his exeeution.

Handel having lost a great part of his fortune by the opera, was under the necessity of trying the public gratitude in a benefit, which was not disgraced by the event. The theatre, for the honour of the nation, was so crowded, that he is said to have cleared 800l.

After a fruitless attempt by Heidegger, the coadjutor of Handel in the conduct of the opera, and patentee of the King's Theatre in Haymarket, to procure a subscription for continuing it, it was found necessary to give up the undertaking.

It was about this time that the statue of Handel was erected in Vauxhall, at the expence of Mr Tyers, proprietor of those gardens.

The next year (1739) Handel carried on oratorios at the Haymarket, as the opera there was suspended. The earl of Middlesex now undertook the troublesome office of impresario of the Italian opera. He engaged the King's theatre, with a band of singers from the continent almost entirely new. Calluppi was his composer. Handel, almost ruined, retired at this time to Ireland, where he remained a considerable time. In 1744 he again attempted oratorios at the King's theatre, which was then, and till 1746, unoccupied by the opera, on account of the rebellion.

The arrival of Giardini in London this year forms a memorable æra in the history of instrumental music of England. His powers on the violin were unequalled. The same year Dr Croza, then manager of the opera, eloped, leaving the performers, and innumerable trades people, his creditors. This incident put an end to operas of all kinds for some time.

This year a comic opera, called Il Filosofo di Campagna, composed by Calluppi, was exhibited, which surpassed in musical merit all the comic operas performed in England till the Bicona Figlinla. Signora Paganini acquired such fame by the airs allotted to her in that piece, that the crowds at her benchit were beyond example. Caps were lost, gowns torn in pieces, and ladies in full dress, without servants or carriages,

were obliged to walk home, amidst the merriment of

the spectators on the streets. At this period the arrival of Giovanni Manzoli mark- 1764 and ed a splendid era in the annals of musical drama, by 1765, conferring on serions opera a degree of importance to Manzoli. which it had soldom yet arisen since its establishment in England. Manzoli's voice was the most powerful and voluminous soprano that had been heard since the time of Farinelli : His manner of singing was grand, and full of taste and dignity.

At this time Tenducci, who had been in England Tenducci. some time before, and was now returned much improved, performed in the station of second man to Manzoli.

Gaetano Guadagni made a great figure at this time. 1769, He had been in this country early in life (1748), as Guadagui. serious man in a hurletta troop of singers. His voice was then a full and well-toned counter tenor; but he sung wildly and carelessly. The excellence of his voice, however, attracted the notice of Handel, who assigned him the parts in his oratorios, the Messiah and Samson, which had been originally composed for Mrs Cibber. He quitted London for the first time about 1753. The highest expectations of his abilities were raised by fame before his second arrival, at the time of which we treat. As an actor he seems to have had no equal on any stage in Europe. His figure was uncommonly elegant and noble ; his countenance replete with beauty, intelligence, and dignity; his attitudes were full of grace and propriety. Those who remembered his voice when formerly in England were now disappointed : It was comparatively thin and feeble : He had now changed it to a soprano, and extended its compass from six or seven notes to fourteen or fifteen. The music he sung was the most simple imaginable; a few notes with frequent pauses, and opportunities of being liberated from the composer and the band, were all he required. In these effusions, seemingly extemporaneous, he displayed the native power of melody nnaided by harmony or even by unisonous accompaniment : The pleasure he communicated proceeded principally from his artful manner of diminishing the tones of his voice, like the dying notes of the Æolian harp. Most other singers affect a swell, or messa de voce; but Guadagni, after beginning a note with force, attenuated it so delicately that it possessed all the effect of extreme distance. During the season 1770 and 1771, Tenducci was the immediate successor of Guadagni. This performer, who appeared in England first only as a singer of the second or third class, was during his residence in Scotland and Ireland so much improved as to be well received as first man, not only on the stage of London, but in all the great theatres of Italy.

It was during this period that dancing seemed first to gain the ascendant over music by the superior talents of Mademoiselle Heinel, whose grace and execution were so perfect as to eclipse all other excellence.

In the first opera performed this season (Lucco Vcro) appeared Miss Cecilia Davies, known in Italy by the Miss Daname of L'Inglesina. Miss Davies had the honour of vies. being the first English woman who had ever been thought worthy of singing on any stage in Italy. She even performed with eclat the principal female characters on many of the great theatres of that country. 3 R 2 Gabrielli

Gabrielli only on the Continent was said to surpass her. Her voice, though not of great volume, was clear and perfectly in tune; her shake was open and distinct, without the sluggishness of the French cadence. The flexihility of her throat rendered her execution equal to the most rapid divisions.

Next season introduced Venanzio Ravygini, a beautiful and animated young man; a composer as well as a singer.—His voice was sweet, clear, flexible; in compass more than two octaves.

The season 1775 and 1776 was rendered memorable by the arrival of the eelebrated Caterina Gabrielli, styled early in life La Cnochetina, being the daughter of a cardinal's cook at Rome. She had, however, in her countenance and deportment no indications of low birth. Her manner and appearance depicted dignity and grace. So great was her reputation before her arrival in England for singing and for caprice, that the public, expecting perhaps in both too much, were unwilling to allow her due praise for her performance, and were apt to ascribe every thing she did to pride and insolence. Her voice, though exquisite, was not very powerful. Her chief excellence having been the neatness and rapidity of her execution, the surprise of the public must have been much diminished on hearing her after Miss Davies, who sung many of the same songs in the same style, and with a neatness so nearly equal, that common hearers could distinguish no difference. The discriminating eritie, however, might have discovered a superior sweetness in the natural tone of Gabrielli's voice, an elegance in the finishing of her musical periods or passages, an accent and precision in her divisions, superior not only to Miss Davies, but to every other singer of her time. In slow movements her pathetic powers, like those in general of performers most renowned for agility, were not exquisitely touching.

Agujari at the Pantheon. About the time of which we have been treating, the proprietors of the Pantheon ventured to engage Agujari at the enormous salary of 1001. per night, for singing two songs only: Lucrezia Agujari was a truly wonderful performer. The lower part of her voice was full, round, and of excellent quality; its compass amazing. She had two octaves of fair natural voice, from A on the fifth line in the base to A on the sixth line in the treble, and beyond that *in alt* she had in early youth more than another octave. She has been heard to aseend to B h *in altissimo*. Her shake was open and perfect: her intonation true; her exceutien marked and rapid; the style of her singing, in the natural compass of her voice, grand and majestie.

In 1776 arrived Anna Pozzi, as successor to Gabrielli. She possessed a voice clear, sweet, and powerful; but her inexperience, both as an actress and as a singer, produced a contrast very unfavourable to her when compared with so celebrated a performer as Gabrielli. After that time, however, Pozzi, with more study and knowledge, became one of the best and most admired female singers in Italy.

After the departure of Ajugari for the second and last time, the managers of the Pantheon engaged *Georgi* as her successor. Her voice was exquisitely fine, but totally uncultivated. She was thereafter employed as the first woman in the operas of the principal cities of Italy.

During the seasons 1777 and 1778 the principal Roncag singers at the opera in London were Francesco Ron- and Da caglia and Francesca Danze, afterwards Madame Le Brun.

Roneaglia possessed a sweet toned voice; but of the three great requisites of a complete stage singer, pathos, grace, and execution, which the Italians call cantabile, graziosa, and bravura, he could lay claim only to the second. His voice, a voce de camera, when confined to the graziosa in a room, left nothing to wish for.

Danze had a voice well in tune, a good shake, great execution, prodigious compass, with great knowledge of music; yet the pleasure her performance imparted was not equal to these accomplishments. But her object was not so much pathos and grace, as to surprise by the imitation of the tone and difficulties of instruments.

This year Gasparo Pacchierotti appeared in London, Pacchi whither his high reputation had penetrated long before.<sup>rotti.</sup> The natural tone of his voice was interesting, sweet, and pathetic. His compass downwards was great, with an ascent up to B b, and sometimes to C in alt. He possessed an unbounded fancy, and the power not only of executing the most difficult and refined passages, but of inventing embellishment entirely new. Ferdinando Bertoni, a well known composer, came along with Pacehierotti to Britain.

About this time dancing became an important branch Danci of the amusements of the opera house. Mademoiselle gains Heinel, M. Vestris le Jeune, Mademoiselle Baccelli, had, ascend during some years, delighted the audience at the opera; at the but on the arrival of M. Vestris l'Ainè, pleasure was rahou exchanged for cestasy. In the year 1781, Pacchicrotti had by this time been so frequently heard, that his singing was no impediment to conversation; but while the elder Vestris was on the stage, not a breathing was to be heard. Those lovers of music who talked the loudest while Paechierotti sung, were in agonies of terror lest the graceful movements of Vestris, le dien de la danse, should be disturbed by audible approbation. After that time, the most mute and respectful attention was paid to the manly grace of Le Pieq, and the light fantastic toe of the younger Vestris; to the Rossis, the Theodores, the Coulons, the Hillingsburgs ; while the slighted singers were disturbed, not by the violence of applause, but the clamour of inattention.

The year 1784 was rendered a memorable era in the Comm annals of music by the splendid and magnificent man-morat ner in which the birth and genius of Handel were Hand celebrated in Westminster Abbey and the Pantheon, by sterA five performances of pieces selected from his own works, and executed by a band of more than 500 voices and instruments, in the presence and under the immediate auspices of their majesties and the first personages of the kingdom. The commemoration of Handel has been since established as an annual musical festival for charitable purposes; in which the number of performers and the perfection of the performances have continued to increase. In 1785 the band, vocal and instrumental, amounted to 616: in 1786 to 741; in 1787 to 806; and in subsequent years to still greater numbers.

Dr Burncy published An Account of the Musical Performances in Commemoration of Handel, for the benefit

benefit of the Musical Fund. The members and guardians of that fund are now incorporated under the title of Royal Society of Musicians. See HANDEL.

This year Pacchicrotti and his friend Bertoni left England. About the same time our country was dcprived of the emiment composer Sacchini, and Giardini the greatest performer on the violin now in Europe.

1 ellence As a compensation for these losses, this memorable o ladame year is distinguished by the arrival of Madamc Mara, whose performance in the commemoration of Handel in Westminster Abbey inspired an audience of 3000 of the first people of the kingdom, not only with pleasure but with eestacy and rapture.

> In 1786 arrived Giovanni Rubinelli. His voice was a true and full contr'alto from C in the middle of the scale to the octave above. His style was grand; his execution neat and distinct; his taste and embellishments new, select, and masterly.

> In 1788 a new dance, composed by the celebrated M. Noverre, called Cupid and Psyche, was exhibited along with the opera La Locandiera, which produced an effect so uncommon as to deserve notice. So great was the pleasure it afforded to the spectators, that Noverre was unanimously brought on the stage and crowned with laurel by the principal performers. This, though common in France, was a new mark of approbation in England.

> This year arrived Signior Luige Marchesi, a singer whose talents have been the subject of praise and admiration on every great theatre of Europe. Marchesi's style of singing was not only elegant and refined in an uncommon degree, but often grand and full of dignity, particularly in his recitative and occasional low notes. His variety of embellishment and facility of running extempore divisions were wonderful. Many of his graces were elegant and of his own invention.

The three greatest Italian singers of these times were certainly Pacchierotti, Rubinelli, and Marchesi. In discriminating the several excellencies of these great performers, a very respectable judge, Dr Burney, has ro Rubiparticularly praised the swcet and touching voice of Pacchierotti; his fine shake, his exquisite taste, his great fancy, and his divine expression in pathetic songs: Of Rubinelli's voice, the fulness, steadiness, and majesty, the accuracy of his intonations, his judicious graces : Of Marchesi's voice, the elegance and flexibility, his grandeur in recitative, and his boundless fancy and embellishments .- Having mentioned Dr Burney, we are in justice bound to acknowledge the aid we have derived from his history; a work which we greatly prefer to every other modern production on the subject.

During the latter part of the 18th century many eminent composers flourished on the continent ; such as Jomelli, the family of the Bachs, Gluck, Haydn, and many others, whose different styles and excellencies would well deserve to be particularized, would our li-Sofeign mits permit. With the same regard to brevity, we can piles di- do no more than just mention the late king of Prussia, the late elector of Bavaria, and Prince Lobkowitz, as eminent dilettanti of modern times.

Sil rs on Besides the opera singers whom we have mentioned, the es our theatres and public gardens have exhibited singers and pub-ic dans of considerable merit. In 1730 Miss Rafter, afterlic dens. wards the celebrated Mrs Clive, first appeared on the

stage at Drury-lane as a singer. The same year introduced Miss Cecilia Young, afterwards the wife of Dr Arne. Her style of singing was infinitely superior to that of any other English woman of her time.

Our favourite musicians at this time were, Dubourg, Favourite Clegg, Clarke, and Festing, on the violin; Kytch musicians. on the hautboy; Jack Festing on the German flute; Baston on the common flute; Karba on the bassoon; Valentine Snow on the trumpet: and on the organ, Roseingrave, Green, Robinson, Magnus, Jack James, and the blind Stanley, who seems to have been preferred. The favourite playhouse singer was Salway ; and at concerts Mountier of Chichester.

As composers for our national theatre, Pepusch and Galliard seem to have been unrivalled till 1732; when two competitors appeared, who were long in possession of the public favour : We allude to John Frederick Lampe and Thomas Augustus Arne.

In 1736 Mrs Cibber, who had captivated every. hearer of sensibility by her nativo sweetness of voice and powers of expression as a singer, made her first attempt as a tragic actress. The same year Beard became a favourite singer at Covent-garden. At this time Miss Young, afterwards Mrs Arne, and her two sisters Isabella and Esther, were the favourite English female singers.

In 1738 was instituted the fund for the support of Fund for decayed decayed musicians and their families.

It was in 1745 that Mr Tyers, proprietor of Vaux-musicians. hall gardens, first added vocal music to the other entertainments of that place. A short time before Ranclagh had become a place of public amusement.

In 1749 arrived Giardini, whose great taste, hand, Arrival of and style in playing on the violin, procured him uni-Giardini. versal admiration. A few years after his arrival he formed a morning academia or concert at his house, composed chiefly of his scholars.

About this time San Martini and Charles Avison were eminent composers.

Of near 150 musical picces brought on our national theatres within 40 years, 38 of them at least were set by Arne. The style of this composer, if ana-Style of lyzed, would perhaps appear to be neither Italian Arne. nor English; but an agreeable mixture of both and of Scotch.

The late earl of Kelly, who died some years ago, The earl of deserves particular notice, as possessed of a very emi-Kelly. nent degree of musical science, far superior to other dilettanti, and perhaps not inferior to any professor of his time. There was no part of theoretical or practical music in which he was not thoroughly versed : He possessed a strength of hand on the violin, and a genius for composition, with which few professors are gifted.

Charles Frederick Abel was an admirable musician : Abel. His nerformance on the viol da gamba was in every particular complete and perfect. He had a hand which no difficulties could embarrass; a taste the most refined and delicate; a judgment so correct and certain as never to permit a single note to escape him without meaning. His compositions were easy and ele-gantly simple. In writing and playing an adagio he was superior to all praise ; the most pleasing yet learned modulation, the richest harmony, the most elegant and polished melody, were all expressed with the most exquisite feeling, taste, and science. His manner of playing

lington.

playing an adagio soon became the model of imitation for all our young performers on howed instruments. Bartholemon Cervetto, Cramer, and Crosdil, were in this respect to be ranked as of his school. All lovers of music must have lamented that Abel in youth had not attached himself to an instrument more worthy of his genius, taste, and learning, than the viol da gamba, that remnant of the old chest of viols which during the 17th century was a necessary appendage of a nobleman's or gentleman's family throughout Europe, previous to the admission of violins, tenors, and basses, in private houses or public concerts. Since the death of the late elector of Bavaria, who was next to Abel the best performer on the viol da gamba in Europe), the instrument seems quite laid aside. It was used longer in Germany than elsewhere; but the place of gambist seems now as much suppressed in the chapels of German princes as that of lutanist. The celebrated performer on the violin, Lolle, came to England in 1785. Such was his caprice, that he was seldom heard ; and so eccentric was his style and composition, that by many he was regarded as a madman. He was, however, during his lucid intervals a very great and expressive performer in the serious style.

Mrs Billington, after distinguishing herself in childhood as a neat and expressive performer on the pianoforte, appeared all at once in 1786 as a sweet and captivating singer. In emulation of Mara and other great bravura singers, she at first too frequently attempted passages of difficulty; afterward, however, so greatly was she improved, that no song seemed too high or too rapid for her execution. Now, at the distance of 20 years, she retains her high reputation. The natural tone of her voice is so exquisitely sweet, her knowledge of music so considerable, her shake so true, her closes and embellishments so various, her expressions so grateful, that envy only or apathy could hear her without delight.

The present composers, and performers of the first class, are so well known to the lovers of the art, that it would be needless and improper to mention them particularly.

The Catch-club at the Thatched House, instituted The catchin 1762 by the earl of Eglinton, the duke of Queensthe concert berry, and others; and the concert of ancient music, of ancient suggested by the earl of Sandwich in 1776, have had a beneficial effect in improving the art.

> Two female performers have lately appeared of distinguished eminence.

Madame Grassini had exhibited her vocal powers in Paris with extraordinary applause, and arrived in London in 1805, where she excited uncommon admiration. She appeared in Zaira, where the display of her powers not only pleased, but she astonished, when it was considered that the compass of her voice did not exceed eight or ten notes.

The year following Madame Catalani divided the public attention with Grassini .- This eminent performer is a native of Sinigaglia in Italy, where her father was a singer of the comic order.

She was educated in a convent. The virtuous im-

pressions she there received, have continued ever since invariably to influence her conduct.

Her father soon discovered the excellence and the value of her vocal powers, which were first exhibited on the provincial theatres of Italy .- He soon carried her to Spain, where she attained very high celebrity. It was there her husband, M. de Valabregue, first paid his addresses to her; and it was not till after a perseverance of seven months that he at last obtained her consent to unite her fortunes with his. Her hesitation proceeded from the reluctance of her father, at once to be deprived of his daughter, and of the very great emolument which she brought him. M. de Valabregue had been an officer in the French army under General Moreau.

From Spain Madame Catalani (for she has retained her father's name), proceeded to Portugal, where she accepted an engagement to come to London. She travelled through France, and at Paris appeared at an occasional concert, where her fame was so great, that the usual price of admission was trebled. She particularly attracted the attention of the singular man who now holds the imperial sceptre of the continent of Europe. He ordered her a pension (its value is about 30l. per annum); and it was with much difficulty, and only through the interference of the British ambassador (the earl of Lauderdale) then at Paris, that she was permitted to leave that capital, and proceed on her journey.

In the dramatic music of the opera, this singer is far superior to any performer ever heard in this country. Her merit in Semiramide, in particular, presents almost the idea of perfection. Her voice is equal to the most difficult execution, while her countenance is interesting, her gestures graceful, and her person elegant. It has been reported that she does not sing in tune; but it is an undeniable fact, vouched by the first musicians, that she possesses a most accurate ear. Every vocal performer occasionally emits a false sound in consequence of some temporary organic cause.

Catalani's easy and clear articulation are particularly striking, her tones are full and liquid. Her cadences are appropriate and masterly. She has a practice of rapidly descending in half notes, which has excited admiration chiefly by its entire novelty. The clearness and rapidity displayed by her in chromatic passages excite astonishment; and she combines mellowness with distinctness, a high qualification, which Mara first taught us to appreciate. In the course of summer 1807, Madame Catalani visited the provincial theatres of England, and appeared likewise in Dublin, Edinburgh, and Glasgow. Her total receipts for that year are said to have exceeded 1 5.000l.

We have been somewhat particular in our account of musical affairs in our own country during the 18th century, as what would be most interesting to general readers, and of which a well-informed gentleman would not wish to be ignorant. The professor and connoisseur will have recourse to disquisitions much more minute than those of which our limits can be supposed to admit.

## MUSIC.

# ELEMENTS OF MUSIC,

THEORETICAL AND PRACTICAL (C).

#### PRELIMINARY DISCOURSE.

MUSIC may be considered, either as an art, which usic conlered in has for its object one of the greatest pleasures of which our senses (D) are susceptible; or as a science, by which that art is reduced to principles. This is the double

view in which we mean to treat of music in this work. It has been the case with music as with all the other arts invented by man ; some facts were at first discovere that of ed by aecident; soon afterwards reflection and observation investigated others : and from these facts, properly disposed and united, philosophers were not slow in forming a body of science, which afterwards increased by degrees.

The first theories of music were perhaps as ancient as the earliest age which we know to have been distinguished by philosophy, even as the age of Pythagoras; nor does history leave us any room to doubt, that from the period when that philosopher taught, the ancients cultivated music, both as an art and as a science, with great assiduity. But there remains to us much uncertainty concerning the degree of perfection to which they brought it. Almost every question which has been proposed with respect to the music of the ancients has divided the learned; and probably may still continue to divide them, for want of monuments sufficient in their number, and incontestable in their nature, from whence we might be enabled to exhibit testimonies and discoveries instead of suppositions and conjectures. In

the preceding history we have stated a few facts respecting the nature of ancient music, and the inventors of the several musical instruments; but it were to be wished, that, in order to elucidate, as much as possible, a point so momentous in the history of the sciences, some person of learning, equally skilled in the Greek language and in music, should exert himself to unite and The hisdiscuss in the same work the most probable opinions tory of established or proposed by the learned, upon a subject music a de-sideratum so difficult and curious. This philosophical history of in literaancient music is a work which might highly embellish ture. the literature of our times.

In the mean time, till an author can be found sufficiently instructed in the arts and in history to undertake such a labour with success, we shall content ourselves with considering the present state of music, and limit our endeavours to the explication of those accessions which have accrued to the theory of music in these latter times.

There arc two departments in music, melody \* and \* See Meharmony t. Melody is the art of arranging several + See Harsounds in succession one to another in a manner agree- mony. able to the ear; harmony is the art of pleasing that organ by the union of several sounds which are heard at one and the same time. Melody has been known and felt throught all ages : perhaps the same cannot be affirmed of harmony (E); we know not whether the ancients made any use of it or not, nor at what period it began to be practised.

Not but that the ancients certainly employed in their music

(c) To deliver the elementary principles of music, theoretical and practical, in a manner which may prove at once entertaining and instructive, without protracting this article much beyond the limits prescribed in our plan, appears to us no easy task. We therefore hestitated for some time whether to try our own strength, or to follow some eminent author on the same subject. Of these the last seemed preferable. Amongst these authors, none appeared to us to have written any thing so fit for our purpose as M. d'Alembert, whose treatise on music is the most methodical, perspicuous, concise, and elegant dissertation on that subject with which we are acquainted. As it was unknown to most English readers before a former edition of this work, it ought to have all the merit of an original. We have given a translation of it; and in the notes, we have added, from the works of succeeding authors, and from our own observations, such explanations as appeared necessary, to adapt the work to the present day.

(D) In this passage, and in the definitions of melody and harmony, our author seems to have adopted the vulgar error, that the pleasures of music terminate in corporeal sense. He would have pronounced it absurd to assert the same thing of painting. Yet if the former bc no more than a mere pleasure of corporeal sense, the latter must likewise be ranked in the same predicament. We acknowledge that corporeal sense is the vehicle of sound; but it is plain from our immediate feelings, that the results of sound arranged according to the principles of melody, or combined and disposed according to the laws of harmony, are the objects of a reflex or internal sense.

For a more satisfactory discussion of this matter, the reader may consult that elegant and judicious treatise on Musical Expression by Mr Avison. In the mean time it may be necessary to add, that, in order to shun the appearance of affectation, we shall use the ordinary terms by which musical sensations, or the mediums by which they are conveyed, are generally denominated.

(E) Though no certainty can be obtained what the ancients understood of harmony, nor in what manner and in what period they practised it; yet it is not without probability, that, both in speculation and practice, they were in possession of what we denominate counterpoint. Without supposing this, there are some passages in the Greek authors which can admit of no satisfactory interpretation. See the Origin and Progress of Language, vol. ii. Besides.

dual.

music those chords which were most perfect and simple; such as the octave, the fifth, and the third; but it seems doubtful whether they knew any of the other consonances or not, or even whether in practice they could deduce the same advantages from the simple chords which were known to them, that have afterwards accrued from experience and combinations.

If that harmony which we now practise owes its origin to the experience and reflection of the moderns, there is the highest probability that the first essays of this art, as of all the others, were feeble, and the progress of its efforts almost imperceptible : and that, in the course of time, improving by small gradations the successive labours of several geniuses have elevated it to that degree of perfection in which at present we find it.

The first inventor of harmony escapes our investiga-The origin tion, from the same causes which leave us ignorant of dental, and those who first invented each particular science; because the original inventors could only advance one step, a succeeding discoverer afterwards made a more sensible improvement, and the first imperfect essays in every kind were lost in the more extensive and striking views to which they led. Thus the arts which we now enjoy, are for the most part far from being due to any particular man, or to any nation exclusively : they are produced by the united and successive endeavours of mankind ; they are the results of such continued and united reflections, as have been formed by all men at all periods and in all nations.

It might, however, be wished, that after having ascertained, with as much accuracy as possible, the state of ancient music by the small number of Greek authors which remain to us, the same application were immediately directed to investigate the first incontestable traces of harmony which appear in the succeeding ages, and to pursue those traces from period to period. The products of these researches would doubtless be very imperfect, because the books and monuments of the middle ages are by far too few to enlighten that gloomy and barbarous era; yet these discoveries would still be precious to a philosopher, who delights to observe the human mind in the gradual evolution of its powers, and the progress of its attainments.

Delincations of the laws of harmony recent and imperfect.

The first compositions upon the laws of harmony which we know, are of no higher antiquity than two ages prior to our own; and they were followed by many others. But none of these essays was capable of satisfying the mind concerning the principles of harmony : they confined themselves almost entirely to the single occupation of collecting rules, without endeavouring to account for them; neither had their analogies one with another, nor their common source, been perceived; a blind and unenlightened experience was the only compass by which the artist could direct and regulate his course.

M. Rameau was the first who began to transfuse light Prelimiand order through this chaos. In the different tones produced by the same sure sonorous body, he found the Discourse most probable original harmony, and the cause of that Its precent pleasure which we receive from it. His principle he not deduunfolded, and showed how the different phenomena of ced from music were produced by it : he reduced all the conso- any prinmusic were produced by it. he reduced all the const ciple till nances to a small number of simple and fundamental M. Rachords, of which the others are only combinations or mean various arrangements. He has, in short, been able to discover, and render sensible to others, the mutual dependence between melody and harmony.

Though these different topics may be contained in the The auwritings of this celebrated artist, and in these writings thor's mo may be understood by philosophers who are likewise tives for adepts in the art of music; still, however, such musicians these ele as were not philosophers, and such philosophers as were ments. not musicians, have long desired to see these objects brought more within the reach of their capacity. Such is the intention of the present treatise; in which we claim no other merit than that of having developed, elucidated, and perhaps in some respects improved, the ideas of another (F).

The first edition of this essay, published in 1752, Improvehaving been favourably received, we have endeavoured ments of to render this more perfect. The detail which is meant this edito be given of my labour, will present the reader with Account a general idea of the principle of M. Rameau, of the the work consequences deduced from it, of the manner in which general, I have disposed this principle and its consequences; in short, of what is still wanting, and might be advantageous to the theory of this delightful art; of what still remains for the learned to contribute towards the perfection of this theory; of the rocks and quieksands which they ought to avoid in this research, and which could serve no other purpose than to retard their progress.

Every sonorous body, besides its principal sound, Rameau likewise exhibits to the car the 12th and 17th major origin of of that sound. This multiplicity of different yet con-harmony. cordant sounds, known for a considerable time, constitutes the basis of the whole theory of M. Rameau, and the foundation upon which he builds the whole superstructure of a musical system\*. In these our clements \* See Sy may be seen, how from this experiment one may de-tem. duce, by an easy operation of reason, the chief points + See of melody and harmony; the perfect + chord, as well Chord, Sce Te major as minor; the two ‡ tetrachords employed in an trachord cient music; the formation of our diatonic || scale; the See Die different values § which the same sound may have in tonic. that scale, according to the turn which is given to the "See Fa-bass I: the alterations \* which we have bass ¶; the alterations \* which we observe in that SeeBas scale, and the reason why they are totally impercepti- \* See All ble to the ear; the rules peculiar to the mode † major; ration the difficulty in ‡ intonation of forming three tones || in Sec.More succession ; the reason why two perfect cherele are line Sec.Im succession; the reason why two perfect chords are pro- nation. scribed || Sec To

Besides, we can discover some vestiges of harmony, however rude and imperfect, in the history of the Gothic ages, and amongst the most barbarous people. This they could not have derived from more cultivated countries, because it appears to be incorporated with their national music. The most rational account, therefore, which can he given, seems to be, that it was conveyed in a mechanical or traditionary manner through the Roman provinces from a more remote period of antiquity.

(F) See M. Ramcau's letter upon this subject, Mere. de Mai, 1752.

elimi-

nary

scribed in immediate succession in the diatonic order; the origin of the minor mode, its subordination to the secourse, mode major, and its variations; the use of discord §; the causes of such effects as arc produced by different me Diskinds of music, whether diatonic, chromatic \*, or ense Chro harmonic +; the principles and laws of temperament 1. In this discourse we can only point out those different ee En- objects, the subsequent essay being designed to explain e Tem- them with the minuteness and precision which they rement. quire.

One end which we have proposed in this treatise, was not only to elucidate, but to simplify the dicoveries of M. Rameau .- For instance, besides the fundamental experiment mentioned above, that celebrated musician, to facilitate the explication of certain phenomena, had recourse to another experiment; that which shows that a sonorous body struck and put in vibration, forces its 12th and 17th major in descending to divide themselves and produce a tremulous sound. The chief use which M. Rameau made of this second experiment was to investigate the origin of the minor mode, and to account for some other rules established in harmony; but we have found means to deduce from the first experiment alone the formation of the minor mode, and, besides, to disengage that formation from all questions foreign to it.

In some other points also; (as, the origin of the \* le Sub- chord of the sub-dominant \*, and the explication of the delinant. seventh in certain cases) it is imagined that we have simplified, and perhaps in some measure extended the principles of the cclebrated artist.

We have likewise banished every consideration of geometrical, arithmetical, and harmonical proportions and progressions, which have been sought in the mixture and protraction of tones produced by a sonorous body ; persuaded as we are, that M. Rameau was under no necessity of paying the least regard to these proportions, which we believe to be not only useless, but even, if we may venture to say so, fallacious when applied to the theory of music. In short, though the relations produced by the octave, the fifth, and the third, &c. were quite different from what they are; though in these chords we should neither remark any progression nor any law; though they should be incommensurable one with another; the protracted tone of the sonorous body, and the multiplied sounds which result from it, are a sufficient foundation for the whole harmonic system.

But though this work is intended to explain the Thretical. milians theory of music, and to reduce it to a system more ca bned complete and more luminous than has hitherto been wiregard done, we ought to caution our readers against misapmilon of prehension either of the nature of our subject or of the miemati-purpose of our endcavours. ca me-

We must not here look for that striking evidence which is peculiar to geometrical discoveries alone, and which can be so rarely obtained in these mixed disquisitions, where natural philosophy is likewise concerned. Into the theory of musical phenomena there must always enter a particular kind of metaphysics, which these phcnomena implicitly take for granted, and which brings along with it its natural obscurity. In this subject, therefore, it would be in vain to expect what is called demonstration : it is much to have reduced the principal facts to a consistent and connected system; to have de-

VOL. XIV. Part II.

tasical

proples an Asic.

duced them from one simple experiment; and to have prelimiestablished upon this foundation the most common and essential rules of the musical art. But if the intimate Discourse. and unalterable conviction which can only be produced by the strongest evidence is not here to be required, we must also doubt whether a clearer elucidation of our subject be possible.

After this declaration, it will not excite surprise, that, amongst the facts deduced from our fundamental experiment, some should immediately appear to depend upon that experiment, and others to result from it in a way more remote and less direct. In disquisitions of natural philosophy, where we are scarcely allowed to use any other arguments than those which arise from analogy or congruity, it is natural that the analogy should be sometimes more and sometimes less sensible ; and we will venture to pronounce that mind very unphilosophical, which cannot recognise and distinguish this gradation and the different circumstances on which it proceeds. It is not even surprising, that, in a subject where analogy alone can take place, this conductress should desert us all at once in our attempts to account for certain phenomena. This likewise happens in the subject which we now treat; nor do we conceal the fact, however mortifying, that there are certain points (though their number be but small) which appear still in some degree unaccountable from our principle. Such, for instance, is the procedure of the diatonic scale of the minor mode in descending, the formation of the chord commonly termed the sixth redundant + or superfluous, and some other facts of less + See Rea importance, for which as yet we can scarcely offer any dundant. satisfactory account except from experience alone.

Thus, though the greatest number of the phenomena of music appear to be deducible in a simple and easy manner from the protracted tone of sonorous bodies, it ought not perhaps with too much temerity to be affirmed as yet that this mixed and protracted tone is demonstratively the only original principle of harmony. But in the mean time it would not be less nnjust Rameau's. to reject this principle, because certain phenomena ap-primary pear to be deduced from it with less success than others. experiment It is only necessary to conclude from this, either that has not as yet acby future scrutinies means may be found for reducing counted for these phenomena to this principle; or that harmony all the phohas perhaps some other unknown principle, more ge-nomena of neral than that which results from the protracted and music. Perhaps compounded tone of sonorous bodies, and of which this some other is only a branch; or, lastly, that we ought not perhaps may be nee to attempt the reduction of the whole science of music cessary. to one and the same principle; which, however, is the natural effect of an impatience so frequent even among philosophers themselves, which induces them to take a part for the whole, and to judge of objects in their full extent by the greatest number of their appearances.

In those sciences which are called physico-mathematical (and amongst this number perhaps the science of sounds may be placed), there are some phenomena which depend only upon one single principle and one single experiment: there are others which necessarily suppose a greater number both of experiments and principles, whose combination is indispensable in forming an exact and complete system; and music perhaps is in this last case. It is for this reason, that whilst 35 SVe

Dary

Preliminary

506

we bestow on M. Rameau all due praise, we should not at the same time neglect to stimulate the learned Discourse in their endeavours to carry them still to higher degrees of perfection, by adding, if it is possible, such improvements as may be wanting to consummate the science.

Whatever the result of their efforts may be, the reputation of this intelligent artist has nothing to fear : he will still have the advantage of being the first who rendered music a science worthy of philosophical attention; of having made the practice of it more simple and easy; and of having taught musicians to employ in this subject the light of reason and analogy.

We would the more willingly persuade those who are skilled in theory and eminent in practice to extend and improve the views of him who before them pursued and pointed out the earcer, bceause many amongst them have already made landable attempts, and have even been in some measure sueecssful in diffusing new light through the theory of this enchanting art. It was with this view that the eclebrated Tartini has presented us in 1754 with a treatise of harmony, founded on a principle different from that of M. Rameau. This principle is the result of a most beautiful experiment (G). If at onee two different sounds are produced from two instruments of the same kind, these two

sounds generate \* a third different from both the Prelimi. We have inserted in the Encyclopédie, under nary others. the article Fundamental, a detail of this experiment ac- Discourse eording to M. Martini; and we owe to the public an \* See Gene information, of which in composing this article we were rate. ignorant : M. Romieu, a member of the Royal Socie-Its discoty at Montpelier, had presented to that society in the very orig year 1753, before the work of M. Tartini had appear- nally due ed, a memorial printed the same year, and where may be found the same experiment displayed at full length. In relating this fact, which it was necessary for us to do, it is by no means our intention to detraet in any degree from the reputation of M. Tartini; we are persuaded that he owes this discovery to his own researches alone: but we think ourselves obliged in honour to give public testimony in favour of him who was the first in exhibiting this discovery.

But whatever be the ease, it is in this experiment that M. Tartini attempts to find the origin of harmony : his book, however, is written in a manner so obseure, that it is impossible for us to form any judgement of it; and we are told that others distinguished for their knowledge of the science are of the same opinion. It were to be wished that the author would engage some man of letters, equally practised in music and skilled in the art of writing, to unfold these ideas which

(G) Had the utility of the preliminary discourse in which we are now engaged been less important and obvious than it really is, we should not have given onrselves the trouble of translating, or our readers that of perusing it. But it must be evident to every one, that the cautions here given, and the advices offered, are no less applicable to students than to authors. The first question here decided is, Whether pure mathematics can be successfully applied to the theory of music? The author is justly of a contrary opinion. It may certainly be doubted with great justice, whether the solid contents of sonorous bodies, and their degrees of eohesion or elasticity, can be ascertained with sufficient accuracy to render them the subjects of musical speculation, and to determine their effects with such precision as may render the conclusions deduced from them geometrically true. It is admitted, that sound is a secondary quality of matter, and that secondary qualities have no obvious connexion which we can trace with the sensations produced by them. Experience, therefore, and not speculation, is the grand eviterion of musical phenomena. For the effects of geometry in illustrating the theory of music (if any will still be so eredulous as to pay them much attention), the English reader may consult Smith's Harmonies, Maleolm's Dissertation on Music, and Pleydel's Treatise on the same subject inserted in a former edition of this work. Our author next treats of the famous discovery made by Signor Tartini, of which the reader may accept the following compendious account.

If two sounds be produced at the same time properly tuned and with due force, from their conjunction a third sound is generated, so much more distinctly to be perceived by delieate ears as the relation between the generating sounds is more simple; yet from this rule we must except the unison and octave. From the fifth is produced a sound unison with its lowest generator; from the fourth, one which is an octave lower than the highest of its generators; from the third major, one which is an octave lower than its lowest; and from the sixth minor (whose highest note forms an oetave with the lowest in the third formerly mentioned) will be preduced a sound lower by a double octave than the highest of the lesser sixth; from the third minor, one which is double the distance of a greater third from its lowest; but from the sixth major (whose highest note makes an octave to the lowest in the third minor) will be produced a sound only lower by double the quantity of a greater third than the highest; from the second major, a sound lower by a double octave than the lowest; from a second minor, a sound lower by triple the quantity of a third major than the highest; from the interval of a diatonic or greater semitone, a sound lower by a triple octave than the highest; from that of a minor or chromatic semitone, a sound lower by the quantity of a fifth four times multiplied than the lowest, & e. & c. But that these musical phenomena may be tried by experiments proper to ascertain them, two hautboys tuned with scrupulous exactness must be procured, whilst the musicians are placed at the distance of some paces one from the other, and the hearers in the middle. The violin will likewise give the same chords, but they will be less distinctly perceived, and the experiment more fallacious, because the vibrations of other strings may be supposed to enter into it.

If our English reader should be eurious to examine these experiments and the deductions made from them in the theory of music, he will find them clearly explained and illustrated in a treatise called Principles and Power of Harmony, printed at London in the year 1771.

Tartini's experiments.

aj eti-

evity, and from whence the art might perhaps derive scourse considerable advantage if they were placed in a proper light. Of this we are so much the more persuaded, that even though this experiment should not be regarded by others in the same view with M. Tartini as the foundation of the musical art, it is nevertheless extremely probable that one might use it with the greatest advantage to enlighten and facilitate the practice of harmony.

In exhorting philosophers and artists to make new attempts for the advancement of the theory of music, we ought at the same time to eaution them against mistaking the real end of their researches. Experience is the only foundation upon which they can proceed; it is alone by the observation of facts, by bringing them together in one view, by showing their dependency upon one, if possible, or at least upon a very small number of primary faets, that they ean reach the end to which they so ardently aspire, the important end of establishing a theory of music, at once great, complete and luminous. The enlightened philosopher will not attempt the explanation of facts, because he knows how little such explanations are to be relied on. To estimate them according to their proper value, it is only necessary to consider the attempts of natural philosophers stion of who have discovered the greatest skill in their science, to explain, for instance, the multiplicity of tones produced by sonorous bodies. Some having remarked (what is by no means difficult to conclude) that the universal vibration of a musical string is a mixture of several partial vibrations, infer that a sonorous body ought to produce a multiplicity of toncs, as it really does. But why should this multiplied sound only appear to contain three, and why these three preferable to others? Others pretend that there are particles in the air, which, by their different degrees of tension, being naturally susceptible of different oscillations, produce the multiplicity of sound in question. But what do we know of all this? And though it should even be granted, that there is such a diversity of tension in these aerial particles, how should this diversity prevent them from being all of them confounded in their vibrations by the motions of a sonorous body? What then should be the result when the vibrations arrive.at our ears, but a confused and inappretiable \* noise, where one could not distinguish any particular sound?

If philosophical musicians ought not to lose their Prelimitime in searching for mechanical explications of the nary phenomena in music, explications which will always be Discourse. fond vague and unsatisfactory ; much less is it their Metaphysiprovince to exhaust their powers in vain attempts to cal conclurise above their sphere into a region still more remote sions less from the prospect of their faculties, and to lose them-adequate. selves in a labyrinth of metaphysical speculations upon the causes of that pleasure which we feel from harmony. In vain would they accumulate hypothesis on hypothesis, to find a reason why some chords should please us more than others. The futility of these supposititious accounts must be obvious to every one who has the least penetration. Let us judge of the rest by the most probable which has till now been invented for that purpose. Some ascribe the different degrees of. pleasure which we feel from chords, to the more or less frequent eoincidence of vibrations; others to the relations which these vibrations have among themselves as they are more or less simple. But why should this coincidence of vibrations, that is to say, their simultaneous impulse on the same organs of sensation, and the accident of beginning frequently at the same time, prove so great a source of pleasure? Upon what is this gratuitous supposition founded? And though it should be granted, would it not follow, that the same chord should successively and rapidly affect us with contrary sensations, since the vibrations are alternately coincident and discrepant? On the other hand, how should the ear be so sensible to the simplicity of relations, whilst for the most part these relations are entirely unknown to him whose organs are notwithstanding sensibly affected with the charms of agreeable music? We may conceive without difficulty how the eye judges of relations ; but how does the ear form similar judgments? Besides, why should certain chords which are extremely pleasing in themselves, such as the fifth, lose almost nothing of the pleasure which they give us, when they are altered, and of consequence when the simplicity of their relations are destroyed; whilst other chords, which are likewise extremely agreeable, such as the third, become harsh almost hy the smallest alteration; nay, whilst the most perfect and the most agreeable of all chords, the octave, eannot suffer the most inconsiderable change ? Let us in sineerity confess our ignorance concerning the genuine causes of these effects (H). The meta-

3 S 2

physical

(H) We have as great an aversion as our anthor to the explication of musical phenomena from mechanical principles ; yet we fear the following observations, deduced from irresistible and universal experience, evidently show that the latter necessarily depend on the former. It is, for instance, universally allowed, that dissonances grate, and concords please a musical ear: It is likewise no less unanimously agreed, that in proportion as a chord is perfect, the pleasure is increased; now the perfection of a chord consists in the regularity and frequeney of coincident oscillations between two sonorous bodies impelled to vibrate : thus the third is a chord less perfect than the fifth, and the fifth than the octave. Of all these consonances, therefore, the octave is most pleasing to the ear; the fifth next, and the third last. In absolute discords, the vibrations are never coincident, and of consequence a perpetual pulsation or jarring is recognised between the protracted sounds, which exceedingly hurts the ear; but in proportion as the vibrations coincide, those pulsations are superseded, and a kindred formed betwixt the two continued sounds, which delights even the corporeal sense : that relation, therefore, without recognizing the aptitudes which produce it, must be the obvious cause of the pleasure which chords give to the ear. What we mean by coincident vibrations is, that while one sonorous body performs a given number of vibrations, another performs a different number in the same time : so that the vibrations of the quickest must sometimes be simultaneous with those of the slowest, as will plainly appear from the following

physical conjectures concerning the acoustic organs Prelimiare probably in the same predicament with those Discourse which are formed concerning the organs of vision, if one may speak so, in which philosophers have even till now made such inconsiderable progress, and in all likelihood will not be surpassed by their suc-

cessors. Since the theory of music, even to those who confine themselves within its limits, implies questions from which every wise musician will abstain; with much greater reason should they avoid idle excursions beyond the boundaries of that theory, and endcavours to investigate between music and the other sciences chimerical relations which have no foundation in nature. The singular opinions advanced upon this subject by some even of the most eelebrated musicians, deserve not to be rescued from oblivion, nor refuted; and ought only to be regarded as a new proof how far men of genius may err, when they engage in subjects of which they are ignorant.

The rules which we have attempted to establish concerning the track to be followed in the theory of the musical art, may suffice to show our readers the end which we have proposed, and which we have endeavoured to attain in this Work. We have here (we repeat it), nothing to do with the mechanical principles of protracted and harmonic tones produced by sonorous bodies; principles which have hitherto been and perhaps.may yet be long explored in vain : we have less to do with the metaphysical causes of the sensations impressed on the mind by harmony; eauses which are still less discovered, and which, according to all appearances, will remain latent in perpetual obscurity. We are alone concerned to show how the principal laws of har-

mony may be deduced from one single experiment; Prelini, for which, if we may speak so, preceding artists have nary Discours been under the necessity of groping in the dark.

With an intention to render this work as generally useful as possible, we have endeavoured to adapt it to the capacity even of those who are absolutely uninstructed in musie. To accomplish this design, it appeared necessary to pursue the following plan.

To begin with a short introduction, in which are Plan of the defined the technical terms most frequently used in this treatise. art ; such as chord, harmony, key, third, fifth, octave, &c.

Afterwards to enter into the theory of harmony, which is explained according to M. Ramean, with all possible perspicuity. This is the subject of the First Part ; which, as well as the introduction, presupposes no other knowledge of music than that of the names of the notes, C, D, E, F, G, A, B, which all the world knows (1).

The theory of harmony requires some arithmetical calculations, necessary for comparing sounds one with another. These calculations arc short, simple, and may be comprehended by every one; they demand no operation but what is explained, and which every school-boy may perform. Yet, that even the trouble of this may be spared to such as are not disposed to take it, these calculations are not inserted in the text, but in the notes, which the reader may omit, if he can take for granted the propositions contained in the text which will be found proved in the notes.

These calculations we have not endeavoured to multiply; we could even have wished to suppress them, if it had been possible : so much did it appear to us to be apprehended that our readers might be misled upon this subject, and might either believe, or suspect us of believing,

following deduction: Between the extremes of a third, the vibrations of the highest are as 5 to 4 of the lowest; those of the fifth as 3 to 2; those of the octave as 2 to 1. Thus it is obvious, that in proportion to the frequent coincidence of periodical vibrations, the compound sensation is more agreeable to the ear. Now, to inquire why that organ should be rather pleased with these than with the pulsation and tremulous motion of encountering vibrations which can never ecalesce, would be to ask why the touch is rather pleased with polished than rough surfaces; or why the eye is rather pleased with the waving line of Hogarth than with sharp angles and abrupt or irregular prominences ? No alteration of which any chord is susceptible will hurt the ear unless it should violate or destroy the regular and periodical coincidence of vibrations. When alterations can be made without this disagreeable effect, they form a pleasing diversity; but still this fact correhorates our argument, that in proportion as any chord is perfect, it is impatient of the smallest alteration; for this reason, even in temperament, the octave endures no alteration at all, and the fifth as little as possible.

(1.) In our former editions, the French syllabic names of the notes ut, re, mi, fa, sol, la, si, were retained, as being thought to convey the idea of the relative sounds more distinctly than the seven letters used in Britain. It is no doubt true, that by constantly using the syllables, and considering each as representing one certain sound in the scale, a singer will in time associate the idea of each sound with its proper syllable, so that he will habitually give ut the sound of the first or fundamental note, re that of a second, mi of a third, &c. but this requires a long time, and much application : and is, besides, useless in modulation or changes of the key, and in all instrumental music. Teachers of sol-fa'ing as it is called, or singing by the syllables, in Britain, have long discarded, (if they ever used), the syllables ut, re, and si: and the prevalent, and we think, the sounder opinion is now, that a scholar will, by attending to the sounds themselves rather than to their names, soon learn their distinct characters and relations to the key, and to each other, and be able of course to assign to each its proper degree in the scale which he employs for the time, by whatever name the note representing that degree may be generally known. See Holden's Essay towards a Rational System of Music, Part I. chap. i. § 32, 33.

We have therefore, in our present edition, preferred to the French syllables the British nomenclature by the letters C, D, E, F, G, A, B, as being more simple, more familiar to British musiciana, and equally applicable. to instrumental as to vocal music.

Elements

nary

Nchema-

si ob-

poilon.

limi- believing, all this arithmetic necessary to form an artist. Calculations may indeed facilitate the understanding of course. certain points in the theory, as of the relations between the different notes in the gammut and of the temperament; but the calculations necessary for treating of these points are so simple, and of so little importance, that nothing can require a less ostentatious display. Let us not imitate those musicians, who believing themselves geometers, or those geometers who, believing themselves musicians, fill their writings with figures upon figures; imagining, perhaps, that this apparatus is necessary to the art. The propensity of adorning their works with a false air of science, can only impose upon ignorance, and render their treatises more obscure and less instructive.

This abuse of geometry in music may be condemned closs not with so much more reason, that in this subject the foundations of those calculations are in some manner al to sen-hypothetical, and can never arise to a degree of certainty above hypothesis. The relation of the octave as ie with- I to 2, that of the fifth as 2 to 3, that of the third on aution. major as 4 to 5, &c. are not perhaps the genuine relations established in nature; but only relations which approach them, and such as experience can discover. For are the results of experience any thing more but mere approaches to truth ?

> But happily these approximated relations are sufficient, though they should not be exactly agreeable to truth, for giving a satisfactory account of those phenomena which depend on the relations of sound; as in the difference between the notes in the gammut, of the alterations necessary in the fifth and third, of the different manner in which instruments are tuncd, and other facts of the same kind. If the relations of the octave, of the fifth and of the third, are not exactly such as we have supposed them, at least no experiments can prove that they are not so; and since these relations are signified by a simple expression, since they are besides sufficient for all the purposes of theory, it would be useless, and contrary to sound philosophy, to invent other relations in order to form the basis of any system of music less easy and simple than that which we have delineated in this treatise.

The second part contains the most essential rules of Com-composition\*, or in other words the practice of harmony. These rules are founded on the principles laid down in the first part ; yet those who wish to understand no more than is necessary for practice, without exploring the reasons why such practical rules are necessary, may limit the objects of their study to the introduction. and the second part. They who have read the first part, will find at every rule contained in the second, a reference to that passage in the first where the reasons for establishing that rule are given.

That we may not present at once too great a num-

ber of objects and precepts, we have transferred to the Preliminotes in the second part several rules and observations narv which are less frequently put in practice, which perhaps Discourse. it may be proper to omit till the treatise is read a se- Some rules, cond time, when the reader is well acquainted with the on account essential and fundamental rules explained in it. of their

This second part presupposes, no more than the first, intricacy; any habit of singing, nor even any knowledge of music; transferred it only requires that one should know, not even the intonation, but merely the position of the notes in the cleff F on the fourth line, and that of G upon the second : and even this knowledge may be acquired from the work itself; for in the beginning of the second part we explain the position of the cleffs and of the notes. Nothing is necessary but to render it a little familiar, and any difficulty in it will disappear.

It would be wrong to expect here all the rules of All the composition, and especially those which direct therules of composition of music in several parts, and which, being composiless severe and indispensable, may be chiefly acquired be expected by practice, by studying the most approved models, in an eleby the assistance of a proper master, but above all hymentary the cultivation of the ear and of the taste. This trea-essay. tise is properly nothing else, if the expression may be allowed, but the rudiments of music, intended for explaining to beginners the fundamental principles, not the practical detail of composition. Those who wish to enter more deeply into this detail, will either find it in M. Rameau's treatise of harmony, or in the code of music which he published more lately (K), or lastly in the explication of the theory and practice of music by M. Bethizi (L); this last book appears to us clear and methodical (M).

Is it necessary to add, that in order to compose Nature the music in a proper-taste, it is by no means enough to essential have familiarized with much application the principles mistress of explained in this treatise ? Here can only be learned musical the mechanism of the art; it is the province of nature tion. alone to accomplish the rest. Without her assistance, it is no more possible to compose agreeable music by having read these elements, than to write verses in a proper manner with the Dictionary of Richelet. In onc word, it is the elements of music alone, and not the principles of genius, that the reader may expect to find in this treatise.

#### DEFINITIONS.

#### I. What is meant by Melody, by Chord, by Harmony, by Interval.

1. Melody is a series of sounds which succeed one to Melody, another in a manner agreeable to the ear. what.

2. A Chord is a combination of several sounds heard Chord and ? together; and Harmony is properly a series of chords harmony, of which the succession pleases the ear. A single chord what.

(K) From my general recommendation of this code, I except the reflections on the principle of sound which . are at the end, and which I should not advise any one to read.

(L) Printed at Paris by Lambert in the year 1754.

(M) In addition to the works mentioned in the text, we recommend to our readers, Holden's Essay, Glasgow 1770, Edin. 1805; Kollmann's Essay on Musical Harmony, 1796; his Essay on Musical Composition, fol. 1799; Shield's Introduction, 1800; and Dr Callcott's Musical Grammar, 1806.

Definitions is likewise sometimes called harmony, to signify the coa-

- lescence of the sounds which form the chord, and the sensation produced in the car by that coalescence. We shall occasionally use the word harmony in this last sense, but in such a manner as never to leave our meaning ambiguous.

3. An Interval, in melody and harmony, is the di-See Interstance, or difference in pitch, between one sound, and another higher or lower than it.

4. That we may learn to distinguish the intervals, and the manner of perceiving them, let us take the ordinary scale C, D, E, F, G, A, B, c, which every person whose ear or voice is not extremely false naturally modulates. The following observations will occur to us in singing this scale.

The sound D is higher or sharper than the sound C, the sound E higher than the sound D, the sound F higher than the sound E, &c. and so through the whole octave; so that the interval, or the distance from the sound C to the sound D, is less than the interval or distance between the sound C and the sound E, the interval from C to F is less than that between C and F, &c. and in short that the interval from the first to the second C is the greatest of all .--

To distinguish the first from the second C, we have Definition marked the last with a small letter (N).

5. In general, the interval between two sounds is The di-5. In general, the interval between the sounds is high-stinetion proportionably greater, as one of these sounds is high-between er or lower with relation to the other : but it is neces-strong an sary to observe, that two sounds may be equally high faint or or low, though unequal in their force. The string of acute and a violin touched with a bow preduces always a sound grave. equally high, whether strongly or faintly struck ; the sound will only have a greater or lesser degree of strength. It is the same with vocal modulation; let any one form a sound by gradually swelling the voice, the sound may be perceived to increase in force, whilst it continues always equally low or equally high.

6. We must likewise observe concerning the scale, Between that the intervals between C and D, between D and tonic and E, between F and G, between G and A, between A semitoni and B, are equal, or at least nearly equal; and that interval the intervals between E and F, and between B and C, are likewise equal among themselves, but consist almost only of half the former. This fact is known and recognised by every one : the reason for it shall be given in the sequel; in the mean time every one may ascertain its reality by the assistance of an experiment (0.) 7. It

(N) We shall afterwards find that three different series of the seven letters are used, which we have distinguished by capitals, small Roman, and Italic characters. When the notes represented hy small Roman characters occur in this treatise we shall, mercly to distinguish them from the typography of the text, place them in inverted commas, thus 'c', 'd', &c.

(0) This experiment may be casily tried. Let any one sing the scale C, D, E, F, G, A, B 'c', it will be immediately observed without difficulty, that the last four notes of the octave G, A, B, 'c', are quite similar to the first C, D, E, F; insomuch, that if, after having sung this scale, one would choose to repeat it, beginning with C in the same tone which was occupied by G in the former scale, the note D of the last scale would have the same sound with the note A in the first, the E with the B, and the F with the 'c'.

Whence it follows, that the interval between C and D, is the same as between G and A; between D and F, as between A and B, and E and F, as between B and 'c'.

From D to E, from F to G, there is the same interval as from C to D. To be convinced of this, we need only sing the scale once more ; then sing it again, beginning with C, in this last scale, in the same tone which was given to D in the first ; and it will be perceived, that the D in the second scale will have the same sound, at least as far as the car can discover, with the E in the former scale ; whence it follows, that the difference between D and E is, at least as far as the car can perceive, equal to that between C and D. It will also be found, that the interval between F and G is, so far as our sense can determine, the same with that between C and D.

This experiment may perhaps be tried with some difficulty by those who are not inured to form the notes and change the key; but such may very easily perform it by the assistance of a harpsichord, by means of which the performer will be saved the trouble of retaining the sounds in one intonation whilst he performs another. In touching upon this harpsichord the keys G, A, B, 'f', and in performing with the voice at the same time C, D, E, F, in such a manner that the same sound may be given to C in the voice with that of the key G in the harpsichord, it will be found that D in the vocal intonation shall be the same with A upon the harpsichord, &c.

It will be found likewise by the same harpsichord, that if one should sing the scale beginning with C in the same tone with E on the instrument, the D, which ought to have followed C, will be higher by an extremely perceptible degree than the F which follows E: thus it may be concluded, that the interval between E and F is less than between C and D; and if one would rise from F to another sound which is at the same distance from F, as F from E, he would find, in the same manner, that the interval from E to this new sound is almost the same as that between C and D. The interval then from E to F is nearly half of that between C and D.

Since then, in the scale thus divided, G, A B, 'c',

the first division is perfectly like the last; and since the intervals between C and D, between D and E, and between F and G, arc equal; it follows, that the intervals between G and A, and between A and B, are likewise equal to every one of the three intervals between C and D, between D and E, and between F and G; and that the intervals between E and F and between B and 'c' are also equal, but that they only constitute one half of the others.

#### 510

finitions. 7. It is for this reason that they have called the in-- terval from E to F, and from B to C, a semitone; whereas those between C and D, D and E, F and G, G and A, and A and B, are tones.

The tone is likewise called a second major \*, and the Jate CLIV. semitone a second minor t. Ι.

8. To descend or rise diatonically, is to descend or ee Interrise from one sound to another by the interval of a tone or of a semitone, or in general by seconds, whether major or minor; as from D to C, or from C to D, from F to E, or from E to F.

#### II. The terms by which the different Intervals of the Scale arc denominated.

- o. An interval composed of a tone and a semitone, 7 rd mi-1 what as from E to G, from A to C, or from D to F, is called a third minor.
- I'rd ma-An interval composed of two full tones, as from C je what. to E, and from F to A, or from G to B, is called a third major.
- I rth, An interval composed of two tones and a semitone, as from C to F, or from G to C, is called a fourth.

An interval consisting of three full tones, as from F 7 lone,

to B, is called a *tritone* or *fourth redundant*. An interval consisting of three tones and a semitone, as from C to G, from F to C, from D to  $\Lambda$ , or from Fh, what. E to B, &c. is called a *fifth*.

Sh mi-An interval composed of three tones and two semia what tones, as from E to C, is called a sixth minor.

Shma-An interval composed of four tones and a semitone, jewhat.

as from C to A, is called a sixth major.

An interval consisting of four toncs and two semitones, as from D to C, is called a seventh minor

An interval composed of five tones and a semitone, as from C to B, is called a seventh major.

And in short, an interval consisting of five tones and two semitones, as from C to 'c' is called an octavc.

Several of the intervals now mentioned, are distinguished by other names, as may be seen in the beginning of the second part; but those now given are the most common, and the only terms which our present purpose demands.

10. Two sounds equally high, or equally low, how-

ever unequal in their force, are said to be in unison one Definitions. with the other.

#### 11. If two sounds form between them any interval, whatever it be, we say, that the highest when ascending is in that interval with relation to the lowest; and when descending, we pronounce the lowest in the same interval with relation to the highest. Thus in the third minor, E, G, where E is the lowest and G the highest sound, G is a third minor from E ascending, and E is a third minor from G in descending.

12. In the same manner, if, speaking of two sonorous bodies, we should say, that the one is a fifth above the other in ascending ; this infers that the sound given by the one is at the distance of a fifth ascending from the sound given by the other.

# III. Of Intervals greater than the Octave.

13. If, after having sung the scale C, D, E, F, G, Fig. 2. A, B, c, one would carry this scale still farther in ascent, it would be discovered without difficulty that a new scale would be formed, 'c, d, e, f', &c. entirely similar to the former, and of which the sounds will be an octave ascending, each to its correspondent note in ... the former scale ; thus 'd', the second note of the second scale, will be an octave in ascent to the D of the first scale; in the same manner 'e' shall be the octave to E, &c. and so of the rest.

14: As there are ninc notes from the first C to the Ninth, second 'd', the interval between these two sounds is what. called a ninth, and this ninth is composed of six full tones and two searitones. For the same reason, the interval from C to 'f' is called an eleventh, and the interval between C and.'g' a twelfth, &c.

It is plain that the ninth is the octave of the second, Eleventh the eleventh of the fourth, and the twelfth of the fifth, what, and twelfth &c.

The octave above the octave of any sound is called a double octave \* ; the octave of the double octave is call- \* See Ined a triple octave, and so of the rest. terval and

The double octave is likewise called a fifteenth : and Double for the same reason the double octave of the third is Octave. called a seventeenth, the double octave of the fifth a nineteenth, &c. (P).

IV.

(P) Let us suppose two vocal strings formed of the same matter, of the same thickness, and equal in their tension, but unequal in their length ; it will be found by experience,

1st, That if the shortest is equal to half the longest, the sound which it will produce must be an octave above the sound produced by the longest.

2dly, That if the shortest constitutes a third part of the longest, the sound which it produces must be a twelfth above the sound produced by the longest.

3dly, That if it constitutes the fifth part, its sound will be a seventeenth above.

Besides, it is a truth demonstrated and generally admitted, that in proportion as one musical string is less than another, the vibrations of the least will be more frequent (that is to say, its departures and returns through the same space) in the same time; for instance, in an hour, a minute, a second, &c. in such a manner that one. string which constitutes a third part of another, forms three vibrations, whilst the largest has only accomplished one. In the same manner, a string which is one half less than another, performs two vibrations, while the other only completes one; and a string which is only the fifth part of another, will perform five vibrations in the same time which is occupied by the other in one.

From thence it follows, that the sound of a string is proportionally higher or lower, as the number of its vibrations is greater or smaller in a given time; for instance, in a second.

It is for that reason, that if we represent any sound whatever by I, one may represent the octave above by 2, that is to say, by the number of vibrations formed by the string which produces the octave, whilst the longest string only vibrates once; in the same manuer we may represent the twelfth above the sound I by 3, the seven-

teenth

# Definitions.

Sharps and See Interval.

# 1V. What is meant by Sharps and Flats.

15. It is plain that one may imagine the five tones Rats, what which enter into the scale, as divided each into two semitones; thus one may advance from C to D, forming in his progress an intermediate sound, which shall be higher by a semitone than C, and lower in the same degree than D. A sound in the scale is called sharp, when it is raised by a semitone; and it is marked with this character % : thus C % signifies C sharp, that is to say, C raised by a semitone above its pitch in the natural scale. A sound in the scale depressed by a semitone is called flat, and is marked thus, b : thus A b signifies A flat, or A depressed by a semitonc.

# V. What is meant by Consonances and Dissonances.

16. A chord composed of sounds whose union or Consocoalescence pleases the ear is called consonance; and nance, See Chord. the sounds which form this chord are said to be conso-

nant one with relation to the other. The reason of this Definitions denomination is that a chord is found more perfect, as the sounds which form it coalesce more closely among themselves.

17. The octave of a sound is the most perfect of consonances of which that sound is susceptible; then the fifth, afterwards the third, &c. This is a fact founded on experiment.

18. A number of sounds simultaneously produced Dissowhose union is displeasing to the car is called a disso-nance, nance, and the sounds which form it are said to be dis- what. sonant one with relation to the other. The second, the tritone, and the seventh of a sound, are dissonants with relation to it. Thus the sounds C D, C B, or F B, &c. simultaneously heard, form a dissonance. See Dis. The reason which renders dissonance disagreeable, is, cord. that the sounds which compose it, seem by no means coalescent to the car, and are heard each of them by itself as distinct sounds, though produced at the same time.

#### THEORY OF HARMONY. PART I.

#### CHAP. I. Preliminary and Fundamental Experiments.

#### EXPERIMENT I.

19. WHEN a sonorous body is struck till it gives a sound, the ear, besides the principal sound and its octave, perceives two other sounds very high, of which one is the twelfth above the principal sound, that is to

say, the octave to the fifth of that sound ; and the other is the seventeenth major above the same sound, that is to say, the double octave of its third major.

20. This experiment is peculiarly sensible upon the thick strings of the violoncello, of which the sound being extremely low, gives to an ear, though not very much practised, an opportunity of distinguishing with sufficient ease and clearness the twelfth and scventeenth now in question (Q).

21.

teenth major above 5, &c. But it is very necessary to remark, that by these numerical expressions we do not pretend to compare sounds as such; for sounds in themselves are nothing but mere sensations, and it cannot be said of any sensation that it is double or triple to another : thus the expressions 1, 2, 3, &c. employed to denominate a sound, its octave above, its twelfth above, &c. signify only, that if a string performs a certain number of vibrations, for instance, in a second, the string which is in the octave above shall double the number in the same time, the string which is in the twelfth above shall triple it, &c.

Thus to compare sounds among themselves is nothing else to than compare among themselves the number of vibrations which are formed in a given time by the strings that produce these sounds.

(a) Since the octave above the sound 1 is 2, the octave below the same sound shall be  $\frac{\pi}{2}$ ; that is to say, that the string which produces this octave shall have performed half its vibration, whilst the string which produces the sound I shall have completed one. To obtain therefore the octave above any sound, the operator must multiply the quantity which expresses the sound by 2; and to obtain the octave below, he must on the contrary divide the ame quantity by 2.

| 510 | the determined as a 1                                                                                          |
|-----|----------------------------------------------------------------------------------------------------------------|
|     | It is for that reason that if any sound whatever, for instance C, is denominated                               |
|     | Its octave above will be                                                                                       |
|     | Its double octave above - 8                                                                                    |
|     | Its triple octave above                                                                                        |
|     | In the same manner its octave below will be                                                                    |
|     | Its double octave below                                                                                        |
|     | Its triple octave below                                                                                        |
|     | And so of the rest.                                                                                            |
|     | Its twelfth above                                                                                              |
|     | Its twelfth below                                                                                              |
|     | Its 17th major above                                                                                           |
|     | Its 17th major below                                                                                           |
|     | The fifth then above the sound I being the octave beneath the twelfth, shall be, as we have immediately        |
|     | active and a second |

3

Elements

21. The principal sound is called the generator \*; eory of armony. and the two other sounds which it produces, and with which it is accompanied, arc, inclusive of its octave, Miee Gecalled its harmonics t. s ator.

#### EXPERIMENT II.

22. There is no person insensible of the resemblance which subsists between any sound and its octave, whether above or below. These two sounds, when heard together, almost entirely coalesce in the organ of sensation. We may besides be convinced (by two facts which are extremely simple) of the facility with which one of these sounds may be taken for the other.

Let it be supposed that any person has an inclination to sing a tune, and having at first begun this air VOL. XIV. Part II.

upon a pitch too high or too low for his voice, so that Theory of he is obliged, lest he should strain himself too much, Harmony to sing the tune in question on a key higher or lower than the first ; he will naturally, without being initiated in the art of music, take his new key in the octave below or the octave above the first; and in order to take this key in any other interval except the octave, he will find it necessary to exert a sensible degree of attention. This is a fact of which we may easily be persuaded by experience.

Another fact. Let any person sing a tunc in our presence, and let it be sung in a tone too high or too low for our voice; if we wish to join in singing this air, we naturally take the octave below or above, and frequently, in taking this octave, we imagine it to be the unison (Q\*). 1

3 T

CHAP II.

served, 3; which signifies that this string performs 3 vibrations; that is to say, one vibration and a half during a single vibration of the string which gives the sound 1.

To obtain the fourth above the sound I, we must take the twelfth below that sound, and the double octave above that twelfth. In effect, the twelfth below C, for instance, is F, of which the double octave f is the fourth above that twenth. In check, the check above  $G_1$  is  $\frac{1}{3}$ , it follows that the double octave above this twelfth, that is to say, the fourth from the sound I in ascending, will be  $\frac{1}{3}$  multiplied by 4, or  $\frac{4}{3}$ .

In short, the third major being nothing else but the double octave beneath the seventeenth, it follows, that the third major above the sound 1 will be 5 divided by 4, or in other words  $\frac{5}{4}$ .

The third major of a sound, for instance the third major E, from the sound C, and its fifth G, form between them a third minor E, G; now E is  $\frac{5}{4}$ , and G  $\frac{3}{2}$ , by what has been immediately demonstrated : from whence it follows, that the third minor, or the interval between E and G, shall be expressed by the relation of the fraction  $\frac{5}{4}$  to the fraction  $\frac{3}{2}$ .

To determine this relation, it is necessary to remark, that  $\frac{5}{4}$  are the same thing with  $\frac{12}{3}$ , and that  $\frac{3}{2}$  are the same thing with  $\frac{10}{8}$ : so that  $\frac{5}{4}$  shall he to  $\frac{3}{2}$  in the same relation as  $\frac{10}{8}$  to  $\frac{12}{8}$ ; that is to say, in the same relation as 10 to 12, or as 5 to 6. If, then, two sounds form between themselves a third minor, and that the first is represented by 5, the second shall be expressed by 6; or, what is the same thing, if the first is represented by 1, the second shall be expressed by 5.

Thus the third minor, an harmonic sound which is even found in the protracted and coalescent tones of a sonorous body between the sound E and G, an harmonic of the principal sound, may be expressed by the fraction 5

N. B. One may see by this example, that in order to compare two sounds one with another which are expressed by fractions, it is necessary first to multiply the numerator of the fraction which expresses the first by the denominator of the fraction which expresses the second, which will give a primary number; as here the numerator 5 of the fraction \$, multiplied by 2 of the fraction \$, has given 10. Afterwards may be multiplied the numerator of the second fraction by the denominator of the first, which will give a secondary number, as here 12 is the product of 4 multiplied by 3; and the relation between these two numbers (which in the preceding example are 10 and 12), will express the relation between these sounds, or, what is the same thing, the interval which there is between the one and the other; in such a manner, that the farther the relation between these sounds departs from unity, the greater the interval will be.

Such is the manner in which we may compare two sounds one with another whose numerical value is known. We shall now show the manner how the numerical expression of a sound may be obtained, when the relation which it ought to have with another sound is known whose numerical expression is given.

Let us suppose, for example, that the third major of the fifth 1 is sought. That third major ought to be, by what has been shown above, the  $\frac{5}{4}$  of the fifth; for the third major of any sound whatever is the  $\frac{5}{4}$  of that sound. We must then look for a fraction which expresses the  $\frac{5}{4}$  of  $\frac{1}{2}$ ; which is done by multiplying the numerators and denominators of both fractions one by the other, from whence results the new fraction  $\frac{1}{8}$ . It will likewise be found that the fifth of the fifth is  $\frac{2}{4}$ , because the fifth of the fifth is the  $\frac{3}{2}$  of  $\frac{3}{2}$ .

Thus far we have only treated of fifths, fourths, thirds major and minor, in ascending ; now it is extremely casy to find by the same rules the fifths, fourths, thirds major and minor in descending. For suppose C equal to 1, we have seen that its fifth, its fourth, its third, its major and minor in ascending, are 1, 4, 5, 5. To find its fifth, its fourth, its third, its major and minor in descending, nothing more is necessary than to reverse these fractions, which will give  $\frac{1}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}$ .

(Q\*) It is not then imagined that we change the value of a sound in multiplying or dividing it by 2, by 4, or by 8, &c. the number which expresses these sounds, since by these operations we do nothing but take the simple double, or triple octave, &c. of the sound in question, and that a sound coalesces with its octave.

#### Harmony. CHAP. II. The Origin of the Modes Major and Minor; of the most natural Modulation, and the ~ most perfect Harmony.

Fundawhat.

Harmony

chords,

octaves.

val.

23. To render our ideas still more precise and permental and manent, we shall call the tone produced by the sonoharmonics, rous body C ; it is evident, by the first experiment, that this sound is always attended by its 12th and 17th major; that is so say, with the octave of G, and the double octave of E.

24. This octave of G then, and this double octave of E, produce the most perfect chord which can be joined with C, since that chord is the work and choice of nature (R).

25. For the same reason, the modulation formed by with the octave of G, and the double octave of E, reduced to C sung one after the other, would likewise be the most simple and natural of all modulations which do not defifths, and scend or ascend directly in the diatonic order, if our voices had sufficient compass to form intervals so great without difficulty : but the ease and freedom with which we can substitute its octave to any sound, when it is more convenient for the voice, afford us the means of representing this modulation.

26. It is on this account that, after having snng the Mode matone C, we naturally modulate the third E, and the fifth jor, what. G, instead of the double octave of E, and the octave of G; from whence we form, by joining the octave of the sound G, this modulation, C, E, G, 'c', which in effect is the simplest and easiest of them all; and which likewise has its origin even in the protracted and compounded tones produced by a sonorous body.

27. The modulation C, E, G, 'c', in which the chord See Mode. C, E, is a third major, constitutes that kind of harmony See like or melody which we call the mode major; from whence wise Interit follows, that this mode results from the immediate operation of nature.

28. In the modulation C, E, G, of which we have Mode minor, what. now been treating, the sounds E and G are so propor-

tioned one to the other, that the principal sound C Theory of (art. 19.) causes both of them to resound ; but the se- Harmony coud tone E does not cause G to resound, which only forms the interval of a third minor.

29. Let us then imagine, that, instead of this sound E, one should substitute between the sounds C and G, another note which (as well as the sound C) has the power of causing G to resound, and which is, however, different from the sound C; the sound which we explore ought to be such, by art. 19. that it may have for its 17th major G, or one of the octaves of G; of consequence the sound which we seek ought to be a 17th major below G, or, what is the same thing, a third major below the same G. Now the sound E being a third minor beneath G, and the third major being (art. 9.) greater by a semitone than the third minor, it follows, that the sound of which we are in search shall be a semitone bencath the natural E, and of consequence E b.

30. This new arrangement, C, E b, G, in which the sounds C and E b have both the power of causing G to resound, though C does not cause E b to resound, is not indeed equally perfect with the first arrangement C, E, G; because in this the two sounds E and G are both the one and the other generated by the principal sound C; whereas, in the other, the sound E b, is not generated by the sound C; but this arrangement C, E b, G, is likewise dictated by nature (art. 19.), though less immediately than the former; and accordingly experience evinces that the ear accommodates itself almost as well to the latter as to the former.

31. In this modulation or chord C, E b, G, C, Origin of it is evident that the third from C to E b is minor; nor. and such is the origin of that mode which we call See Mod See also minor (s).

32. The most perfect chords then are, I. All chords Interval. related one to another, as C, E, G, 'c', consisting of Perfect any sound, of its third major, of its fifth, and of its chords, octave. 2. All chords related one to another, as C, what E b, G, 'c', consisting of any sound, of its third minor,

(R) The chord formed with the twelfth and scventeenth major united with the principal sound, being exactly conformed to that which is produced by nature, is likewise for that reason the most agreeable of all; especially when the composer can proportion the voices and instruments together in a proper manner to give this chord its full effect. M. Rameau has executed this with the greatest success in the opera of Pygmalion, page 34. where Pygmalion sings with the chorus L'amour triomphe, &c.: in this passage of the chorus, the two parts of the vocal and instrumental basses give the principal sound and its octave ; the first part above, or treble, and that of the counter-tenor, produce the seventeenth major, and its octave, in descending; and the second part, or tenor above, gives the twelfth.

See fig. 3.

(s) The origin which we have here given of the mode minor, is the most simple and natural that can possibly be given. M. Rameau deduces it, more artificially, from the following experiment :- If you put in vibration a musical string HI, and if there are at the same time contiguous to this two other strings KN, RW, of which the first shall be a twelfth, and the second a seventcenth major below the string HI, the strings KN, RW will vibrate without being struck as soon as the string HI shall give a sound, and divide themselves by a kind of undulation, the first into three, the last into five equal parts ; in such a manner, that, in the vibration of the string KN, you may easily distinguish two points at rest LM, and in the tremulous motion of the string RW, four quiescent points S, T, U, V, all placed at equal distances from each other, and dividing the strings into three or five equal parts. In this experiment, says M. Rameau, if we represent by the note C the tone of the string HI, the two other strings will represent the sounds F and A b ; and from thence M. Rameau deduces the modulation F, A b, C, and of consequence the mode minor. The origin which we have assigned to the minor mode, appears more direct and more simple, because it presupposes no other experiment than that of art. 19. and because also the fundamental sound C is still retained in both the modes, without being obliged, as M. Rameau found himself, to change it into F.

Part I

mory of minor, of its fifth, and of its octave. In effect, these remony. two kinds of chords are exhibited by nature; but the first more immediately than the second. The first are called perfect chords major, the second perfect chords minor.

#### CHAP. III. Of the Succession by Fifths, and of the Laws which it observes.

33. SINCE the sound C causes the sound G to be Filamenheard, and is itself heard in the sound F, which sounds G and F arc its two twelfths, we may imagine a modulation composed of that sound C and its two twelfths. or, which is the same thing (art. 22.) of its two fifths, F and G, the one below, the other above ; which gives the modulation or series of fifths F, C, G, which we call the fundamental bass of C by fifths.

> We shall find in the sequel (Chap. XVIII.), that there may be some fundamental bass by thirds, deduced from the two seventeenths, of which the one is an attendant of the principal sound, and of which the other includes that sound. But we must advance step by step, and satisfy ourselves at present to consider immediately the fundamental bases by fifths.

> 34. Thus, from the sound C, one may make a transition indifferently to the sound G, or to the sound F.

> 35. One may, for the same reason, continue this kind of fifths in ascending, and in descending, from C, in this manner:

Eb, Bb, F, C, G, D, A, &c.

And from this series of fifths one may pass to any sound which immediately precedes or follows it.

36. But it is not allowed in the same manner to pass to rule, from one sound to another which is not immediately contiguous to it; for instance, from C to D, or from D to C: for this very simple reason, that the sound D is not contained in the sound C, nor the sound C in that of D; and thus these sounds have not any alliance the one with the other, which may authorise the transition from one to the other.

> 37. And as these sounds C and D, by the first experiment, naturally hring along with them the perfect chords consisting of greater intervals C, E, G, 'e', and D, F%, A, 'd'; hence may be deduced this rule, That two perfect chords, especially if they are major (T), cannot succeed one another diatonically in a fundamental bass; we mean, that in a fundamental bass two sounds cannot be diatonically placed in succession, each of which, with its harmonies, forms a perfect chord, cspecially if this perfect chord be major in both.

#### CHAP. IV. Of Modes in General.

38. A MODE, in music, is, the order of sounds prescribed, as well in harmony as melody, by the series of

Thus the three sounds, F, C, G, and the har- Theory of fifths. monics of each of these three sounds, that is to say, Harmony. their thirds major and their fifths, compose all the major modes which are proper to C.

39. The series of fifths then, or the fundamental bass Modes, F, C, G, of which C holds the middle space, may be how repre-regarded as representing the mode of C. One may the series likewise take the series of fifths, or fundamental bass, of fifths. C, G, D, as representing the mode of G; in the same manner Bb, F, C, will represent the mode of F.

Thus the mode of G, or rather the fundamental bass of that mode, has two sounds in common with the fundamental bass of the mode of C. It is the same with the fundamental bass of the mode F.

40. The mode of C (F, C, G) is called the principal Principal mode with respect to the modes of these two fifths, which mode, and are called its two adjuncts. adjuncts,

41. It is then, in some measure, indifferent to the See Adcar whether a transition be made to the one or to the junct. other of these adjuncts, since each of them has equally Modes retwo sounds in common with the principal mode. Yet lished in the mode of G seems a little more eligible : for G is proportion as their heard amongst the harmonics of C, and of consequence sounds are is implied and signified by C; whereas C does not common. cause F to be heard, though C is included in the same sound F. It is hence that the ear, affected by the mode of C, is a little more prepossessed for the mode of G than for that of F. Nothing likewise is more frequent, nor more natural, than to pass from the mode of C to that of G.

42. It is for this reason, as well as to distinguish Dominant the two fifths one from the other, that we call G the and sub-dofifth above the generator the dominant sound, and the minant, fifth F, below the generator, the subdominant. See Domi-

43. As in the series of fifths, we may indifferently nant. pass from one sound to that which is contiguous : so Transition having passed from the mode of C to that of G, one to contigu-may from thence proceed to the mode of D. And on how to be the other hand, having passed from the mode of C to managed. that of F we may then pass to the mode of Bb. But it is necessary, however, to observe, that the ear, which has been immediately affected with the principal mode. feels always a strong propensity to return to it. Thus the further the mode to which we make a transition is removed from the principal mode, the less time we ought to dwell upon it; or rather, to speak in the terms of the art, the less ought the phrase (v) of that mode to be protracted.

#### CHAP. V. Of the Formation of the Diatonic Scale as used by the Greeks.

44. FROM this rule, that two sounds which are contiguous may be placed in immediate succession in the series of fifths, F, C, G, it follows, that one may 3T2 ferm

<sup>(</sup>T) We say especially if they are major; for in the major chord D, F\*, A, 'd', hesides that the sounds C and D have no common harmonical relation, and are even dissonant between themselves (art 13.) it will likewise be found, that F% forms a dissonance with C. The minor chord D, F, A, 'd', would be more tolerable, because the natural F, which occurs in this chord carries along with it its fifth C, or rather the octave of that fifth : It has likewise been sometimes the practice of composers, though rather by a licence indulged them than strictly agreeable to their art, to place a minor in diatonic succession to a major chord.

of the

bass.

Harmony. fifths, See fig. 4. Formation

Theory of form this modulation, or this fundamental bass, by G, C, G, C, F, C, F.

45. Each of the sounds which forms this modulation brings necessarily along with itself its third major, its fifth, and its octave; insomuch that he who, for Greek dia-instance, sings the note G, may be reckoned to sing at tonic scale the same time the notes G, B, 'd, g': in the same by the fun- manner the sound C in the fundamental bass brings along with it this modulation, C, E, G, C: and, in damental. short, the sound F brings along with it F, A, C, 'f'. This modulation then, or this fundamental bass,

G, C, G, C, F, C, F,

gives the following diatonic series,

### B, 'c, d, e, f, g, a';

See fig. 4.

which is precisely the diatonic scale of the Greeks. We are ignorant upon what principles they had formed this scale; but it may be sensibly perceived, that that series arises from the bass G, C, G, C, F, C, F; and that of consequence this hass is justly called fundamental, as being the real primitive modulation, that which conducts the ear, and which it feels to be implied in the diatonic modulation, B, 'c, d, e, f, g, a' (x).

46. We shall be still more convinced of this truth by the following remarks.

Part F

In the modulation B, 'c, d, e, f, g, a', the sounds 'd' Theory of and 'f' form between themselves a third minor, which Harmony, is not so perfectly true as that between 'e' and 'g' (Y). Nevertheless, this alteration in the third minor between 'd' and 'f' gives the car no pain, because that 'd' and that 'f' which do not form between themselves a true third minor, form, each in particular, consonances perfectly just with the sounds in the fundamental bass which correspond with them : for 'd' in the scale is the true fifth of G, which answers to it in the fundamental bass; and 'f' in the scale is the true octave of F, which answers to it in the same bass.

47. If, therefore, these sounds in the scale form con-Altered r sonances perfectly true with the notes which correspond tervals, and to them in the fundamental bass, the ear gives itself objection little trouble to investigate the alterations which there may be in the intervals which these sounds in the scale form between themselves. This is a new proof that the fundamental bass is the genuine guide of the ear, and the true origin of the diatonic scale.

48. Moreover, this diatonic scale includes only seven Reasons sounds, and goes no higher than 'b', which would why this be the octave of the first : a new singularity, for which chudes on a reason may be given by the principles above establish-seven cd. sounds.

the use of the word phrase when transferred from language to that art, we have thought proper to insert the definition of Rousseau.

A phrase, according to him, is in melody a series of modulations, or in harmony a succession of chords, which form without interruption a sense more or less complete, and which terminates in a repose by a cadence more or less perfect.

(x). Nothing is easier than to find in this scale the value or proportions of each sound with relation to the sound C, which we call 1; for the two sounds G and F in the bass are  $\frac{3}{2}$  and  $\frac{2}{3}$ ; from whence it follows,

1. That 'c' in the scale is the octave of C in the bass; that is to say, 2.

2. That 'b' is the third major of G; that is to say  $\frac{5}{4}$  of  $\frac{3}{2}$  (note a), and of consequence  $\frac{15}{8}$ .

3. That 'd' is the fifth of  $G_{i}$ ; that is to say  $\frac{3}{2}$  of  $\frac{3}{2}$ , and of consequence  $\frac{9}{4}$ . 4. That 'e' is the third major of the octave of C, and of consequence the double of  $\frac{5}{4}$ ; that is to say,  $\frac{5}{2}$ .

5. That 'f' is the double octave of F of the bass, and consequently 3.

6. That 'g' of the scale is the octave of G of the bass, and consequently 3.

7. That 'a' in the scale is the third major of 'f' of the scale; that is to say,  $\frac{5}{4}$  of  $\frac{8}{3}$ , or  $\frac{10}{3}$ .

Hence then will result the following table, in which each sound has its numerical value above or below it.

| Diatonic    |    | 2  | 94 | 5 2 | 8  | 3  | 10 |
|-------------|----|----|----|-----|----|----|----|
| Scale.      | B, | с, | d, | е,  | f, | g, | a. |
| Fundamental | G, | С, | G, | С,  | F, | С, | F. |
| Race 7      | 3  | τ. | 3  | T   | 2  | I  | 2  |

And if, for the conveniency of calculation, we choose to call the sound C of the scale I; in this case we have only to divide each of the numbers by 2, which represent the diatonic scale, and we shall have

$$\frac{15}{16} I \frac{9}{3} \frac{4}{4} \frac{4}{3} \frac{2}{2} \frac{5}{3} B, c, d, e, f, g, a.$$

(Y) In order to compare 'd' with 'f', we need only compare 2 with 4; the relation between these fractions will be, (note c) that of 9 times 3 to 8 times 4; that is to say, of 27 to 32: the third minor, then, from 'd' to 'f', is not true; because the proportion of 27 to 32 is not the same with that of 5 to 6, these two proportions being between themselves as 27 times 6 is to 32 times 5, that is to say, as 162 to 160, or as the halves of these two numbers, that is to say, as 81 to 80.

M. Rameau, when he published, in 1726, his New theoretical and practical System of Music, had not as yet found the true reason of the alteration in the consonance which is between 'd' and 'f', and of the little attention which the car pays to it. For he pretends, in the work now quoted, that there are two thirds minor, one in the proportion of 5 to 6, the other in the proportion of 27 to 32. But the opinion which he has afterwards adopted, seems much preferable. In reality, the genuine third minor, is that which is produced by nature between 'e' and 'g', in the continued tone of those sonorous bodies of which 'e' and 'g' are the two harmonics: and that third minor, which is in the proportion of 5 to 6, is likewise that which takes place in the minor mode, and not that third minor which is false and different, being in the proportion of 27 to 32.

eory of ed. In reality, in order that the sound 'b' may succeed mony immediately in the scale to the sound 'a', it is necessary that the note 'g', which is the only one from whence 'b' as a harmonic may be deduced, should immediately succeed to the sound 'f', in the fundamental bass, which is the only one from whence 'a' can be harmonically deduced. Now, the diatonic succession from F to G cannot be admitted in the fundamental bass, according to what we have remarked (art. 36.). The sounds 'a' and 'b', then, caunot immediately succeed one another in the seale : we shall see in the sequel why this is not the case in the series 'e, d, e, f, g, a, b', c, which begins upon C; whereas the scale in question here begins upon B.

49. The Greeks likewise, to form an entire octave, n of the added below the first B the note A, which they distinguished and separated from the rest of the scale, which for that reason they called prostambanomene, that is to say, a string or note subadded to the scale, and put before B to form the entire octave.

50. The diatonic scale B, 'c, d, e, f, g, a', is composed of two tetrachords, that is to say, of two diatonic scales, wo simi-each consisting of four sounds, B, 'c, d, e', and 'e, f, I conjuncg, a'. These two tetrachords are exactly similar; for i : tetrafrom 'e' to 'f' there is the same interval as from B to 'c', from 'f' to 'g' the same as from 'c' to 'd', from 'g' to 'a' the same as from 'd' to 'e' (z): this is the reason why the Greeks distinguished these two tetrachords; yet they joined them by the note 'a' which is common to both, and which gave them the name of conjunctive tetrachords.

51. Moreover, the intervals between any two sounds, Ibrvals in 1 a tetrataken in each tetrachord in particular, are precisely ords true: thus, in the first tetrachord, the intervals of C 'e', and B 'd', are thirds, the one major and the other minor, exactly true, as well as the fourth B 'e' (AA); it is the same thing with the tetrachord 'e, f, g, a', since this tctrachord is exactly like the former.

52. But the ease is not the same when we compare Irvals blyeen two sounds taken each from a different tetrachord; for t notes of we have already seen, that the note 'd' in the first tetrad rent tachords chord forms with the note 'f' in the second a third mid milar, nor, which is not true. In like manner it will be

found, that the fifth from 'd' to 'a' is not exactly true, Theory of which is evident; for the third major from 'f' to 'a' is Harmony. true, and the third minor from 'd' to 'f' is not so: now, in order to form a true fifth, a third major and a third minor, which are both exactly true, are necessary.

53. From thence it follows, that every consonance Another 53. From thence it follows, that every consumation is absolutely perfect in each tetrachord taken by it-reason for distinguishself; but that there is some alteration in passing from ing the one tetrachord to the other. This is a new rea-scale into son for distinguishing the scale into these two tetra- two tetrachords. chords.

54. It may be ascertained by calculation, that in the The source tetrachord B, 'c', d, e', the interval, or the tone from of tones major and 'd' to 'e', is a little less than the interval or tone from minor in-'c' to 'd' (BB). In the same manner, in the second te-vestigated. trachord 'e, f, g, a', which is, as we have proved, perfectly similar to the first, the note from 'g' to 'a' is a little less than the note from 'f' to 'g'. It is for this reason that they distinguish two kinds of tones; the greater tone \*, as from 'c' to 'd', from 'f' to 'g', &c; Greater tone. \* See and the lesser +, from 'd' to 'e', from 'g' to 'a', &c.

See Scale.

the Moderns, or the ordinary Gammut. 55. WE have just shown in the preceding chapter, The mo-

how the scale of the Greeks is formed, B, 'c, d, e, g, a' dern scale, by means of a fundamental bass composed of three ed. sounds only, F, C, G; but to form the scale 'c, d, e. f, g, a, b,' c, which we use at present, we must necessarily add to the fundamental bass the note D, and form, with these four sounds F, C, G, D, the following fundamental bass :

C, G, C, F, C, G, D, G, C;

from whence we deduce the modulation or scale 'c, d, e, f, g, a, b,' c.

In effect (cc), 'c' in the scale belongs to the harmony of C which corresponds with it in the bass ; 'd', which. is the second note in the gammut, is included in the harmony of G, the second note of the bass ; 'e' the third note of the gammut, is a natural harmonic of C. which is the third sound in the bass, &c.

56. Hence

(z) The proportion of B to 'c' is as  $\frac{1}{5}$  to 1, that is to say as 15 to 16; that between 'e' and 'f' is as  $\frac{5}{4}$  to  $\frac{4}{7}$ , that is to say (note a), as 5 times 3 to 4 times 4, or as 15 to 16: these two proportions then are equal. In the same manner, the proportion of 'c' to 'd' is as I to 2, or as 8 to 9; that between 'f' and 'g' is as 4 to 2; that is to say (note Q), as 8 to 9. The proportion of 'e' to 'c' is as 3 to 1, or as 5 to 4; that between 'f' and 'a' is as  $\frac{5}{3}$  to  $\frac{4}{3}$ , or as 5 to 4: the proportions here then are likewise equal.

(AA) The proportion of 'e' to 'c' is as 5 to 1, or as 5 to 4, which is a true third major; that from 'd' to 'b' is as  $\frac{9}{8}$  to  $\frac{7.5}{16}$ ; that is to say, as 9 times 16 to 15 times 8, or as 9 times 2 to 15, or as 6 to 5. In like manner we shall find, that the proportion of 'c' to 'b' is as 5 to 15; that is to say, as 5 times 16 to 15 times 4, or as 4 to 3, which is a true fourth.

(BB) The proportion of 'd' to 'c' is as \$ to I, or as 9 to 8; that of 'e' to 'd' is as \$ to \$, that is to say, as 40 to 36, or as 10 to 9: now 10 is less removed from unity than 8; the interval then from 'd' to 'e' is a little less than that from 'c' to 'd'.

If any one would wish to know the proportion which  $\frac{x \circ}{9}$  bear to  $\frac{9}{8}$ , he will find (note Q) that it is as 8 times 10 to 9 times 9, that is to say, as 80 to 81. Thus the proportion of a lesser to a greater tone is as 80 to 81; this difference between the greater and lesser tone is what the Greeks called a comma.

We may remark, that this difference of a comma is found between the third minor when true and harmonical. and the same chord when it suffers alteration 'd', 'f', of which we have taken notice in the scale (note Y); for we have seen, that this third minor thus altered is in the proportion of 80 to 81 with the true third minor.

(cc) The values or estimates of the notes shall be the same in this as in the former scale, excepting only the

tone

Theory of Harmony. The Greek diatonie scale simpler than ours, and why.

g twice

nic rela-

tal bass.

The mo-

modes.

518

56. Hence it follows, that the diatonic scale of the Grecks is, at least in some respects, more simple than ours; since the scale of the Greeks (chap. v.) may be formed alone from the mode proper to C; whereas ours is originally and primitively formed, not only from the mode of C (F, C, G), but likewise from the mode of G, (C, G, D).

It will likewise appear, that this last scale consists of two parts; of which the one, 'c, d, e, f, g' is in the mode of C; and the other, 'g, a, b,' c in that of G.

57. For this reason the note 'g' is twice repeated in The note immediate succession in this scale ; once as the fifth of repeated in C, which corresponds with it in the fundamental bass ; the diatonic and again as the octave of G, which immediately follows G in the same bass. These two consecutive 'g's' scale from its harmoare otherwise in perfect unison. For this reason we tions to the sing only one of them when we modulate the scale 'c, d, e, f, g, a, b,' c; but this does not prevent us from fundamenemploying a pause or repose, expressed or understood, after the sound 'f'. There is no person who does not perceive this whilst he himself sings the scale.

58. The seale of the moderns, then, may be considered as consisting of two tetrachords, disjunctive indern scale composed deed, but perfectly similar one to the other, 'c, d, e, f', junctive te- and 'g, a, b, c,' one in the mode of C, the other in that of G. We shall see in the sequel, by what artifice one trachords. of different may cause the scale 'c, d, e, f, g, a, b, c,' to be regarded as belonging to the mode of C alone. For this pur-

The mode of G inthe fundamental bass productive of conveniences.

pose it is necessary to make some changes in the fundamental bass, which we have already assigned : but this shall be explained at large in chap. xiii. 59. The introduction of the mode proper to G in the fundamental bass has this happy effect, that the troduced in notes 'f, g, a, b,' may immediately succeed cach other in ascending the scale, which cannot take place (art. 48.)

in the diatonic series of the Greeks, because that series is formed from the mode of C alone. Whence it follows :

1. That we change the mode at every time when Theory of we modulate three whole tones in succession.

2. That if these three tunes are sung in succession in the seale 'c, d, e, f, g, a, b,' c, this cannot be done but by the assistance of a pause expressed or understood after the note 'f'; insomuch, that the three tones 'fg,' 'ga', 'a b', are supposed to belong to two different tetrachords.

60. It ought not then any longer to surprise us, Change of that we feel some difficulty whilst we ascend the scale mode the in singing three tones in succession, because this is difficulty in impracticable without changing the mode; and if onc sincine pauses in the same mode, the fourth sound above the three confirst note will never be higher than a semitone above secutive that which immediately precedes it; as may be seen by cending. 'c, d, e, f,' and by 'g, a, b,' c, where there is no more than a semitone between 'e and f', and between 'b' and c.

61. We may likewise observe in the seale 'c, d, e, f', Intervals, that the third minor from 'd' to 'f', is not true, for the though alreasons which have been already given (art. 49.). It themselves is the same ease with the third minor from 'a' to c, and form true with the third major from 'f' to 'a'; but each of these consonansounds forms otherwise consonances perfectly true, ces with the funda with their corresponding sounds in the fundamental mental bass. bass.

52. The thirds 'a', c, 'f a', which were true in the former scale, are false in this; bccause in the former scale 'a' was the third of 'f', and here it is the fifth of D, which corresponds with it in the fundamental bass.

63. Thus it appears, that the scale of the Greeks Feweralcontains fewer consonances that are altered than ours tered com (DD); and this likewise happens from the introduc-sonances tion of the mode of G into the fundamental bas Greek scale than (EE)

We see likewise that the value of 'a' in the diatomic in ours. seale, a value which authors have been divided in ascertaining, solely depends upon the fundamental bass, and that

tone 'a'; for 'd' being represented by  $\frac{6}{8}$ , its fifth will be expressed by  $\frac{2}{76}$ ; so that the seale will be numerically signified thus:

I  $\frac{9}{8} \frac{5}{4} \frac{4}{3} \frac{3}{2} \frac{27}{16} \frac{7}{8} \frac{5}{2}$ c, d, c, f, g, a, b, c, Where you may see, that the note 'a' of this scale is different from that in the scale of the Greeks; and that the 'a' in the modern scrics stands in proportion to that of the Greeks as  $\frac{2}{76}$  to  $\frac{5}{3}$ , that is to say, as 81 to 80; these two 'a's' then will likewise differ by a comma.

(DD) In the scale of the Greeks, the note 'a' being a third from 'f', there is an altered fifth between 'a' and 'd' : but in ours, 'a' being a fifth to 'd', produces two altered thirds, 'f a' and 'a' c; and likewise a fifth altered, 'a' e as we shall see in the following chapter. Thus there are in our scale two intervals more than in the scale of the Grecks which suffer alteration.

(EE) But here it may be with some colour objected : The scale of the Greeks, it may be said, has a fundamental bass more simple than ours; and, besides, in it there are fewer chords which will not be found exactly true: why then, notwithstanding this, does ours appear more easy to be sung than that of the Greeks ? The Grecian scale begins with a semitone, whereas the intonation prompted by nature sccms to impel us to rise by a full tone at once. This objection may be thus answered. The scale of the Greeks is indeed better disposed than ours for the simplicity of the bass, but the arrangement of ours is more suitable to natural intonation. Our seale commences by the fundamental sound c, and it is in reality from that sound that we ought to begin ; it is from this that all the others naturally arise, and upon this that they depend; nay, if we speak so, in this they are included: on the contrary, neither the scale of the Greeks, nor its fundamental bass, commences with C; but it is from this C that we must depart, in order to regulate our intonation, whether in rising or descending; now, in ascending from 'c', the intonation, even of the Greek scale, gives the series 'c, d, e, f, g, a': and so true is it that the fundamental sound C is here the genuine guide of the ear, that if, before we modulate the sound 'e', we should

cory of that it must be different according as the note 'a' has rmony. 'f' or 'd' for its bass. See the note (cc).

#### CHAP. VII. Of Temperament.

<sup>[Imperarut, why</sup> <sup>Imperarut, why <sup>Impessary.</sup> 64. THE alterations which we have observed in the intervals between particular sounds of the diatonic scale, naturally lead us to speak of temperament. To give a clear idea of this, and to render the necessity of it palpahle, let us suppose that we have before us an instrument with keys, a harpsicord, for instance, consisting of several octaves or scales, of which cach includes its twelve semitones.</sup>

Let us choose in that harpsicord one of the strings which will sound the note C, and let us tunc the string G to a perfect fifth with C in ascending; let us afterwards tune to a perfect fifth with this G the 'd' which is above it; we shall evidently perceive that this 'd' will be in the scale above that from which we set out: but it is also evident that this 'd' must have in the scale a D which corresponds with it, and which must be tuned a true octave helow 'd'; and between 'd' and G there 519

scale to a just fifth with this last D; then the note 'e' in the highest scale to a true fifth with this new A, and in consequence the E in the first scale to a true fourth beneath this same A: Having finished this operation, it will be found that the last E, thus tuned, will by no means form a just third major from the sound C (FF): that is to say, that it is impossible for E to constitute at the same time the third major of C and the true fifth of A; or, what is the same thing, the true fourth of A in descending.

65. If, after having successively and alternately tuned the strings C, G, 'd', A, F, in perfect fifths and fourths one from the other, we continue to tune successively by true fifths and fourths the strings E, B, F $\times$ , C $\times$ , G $\times$ , 'd $\times$ ', E $\times$ , B $\times$ ; we shall find, that, though B $\times$ , being a semitone higl.\*r than the natural note, should be equivalent to 'c' natural, it will by no means form a just octave to the first C in the scale, but be considerably higher (GG); yet this B $\times$  upon the harpsichord ought not

should attempt to rise to it by that note in the scale which is most immediately contiguous, we cannot reach it but by the note B, and by the semitone from B to 'c'. Now to make a transition from B to 'c', by this semitone, the ear must of necessity be predisposed for that modulation, and consequently preoccupied with the mode of C: if this were not the case, we should naturally rise from B to 'c%', and by this operation pass into another mode.

(FF) The A considered as the fifth of D is  $\frac{2}{7}\frac{7}{6}$ , and the fourth beneath this A will constitute  $\frac{3}{4}$  of  $\frac{7}{16}$ , that is to say,  $\frac{8}{54}$ ;  $\frac{8}{74}$ ;  $\frac{8}{54}$  then shall be the value of E, considered as a true fourth from A in descending: now E, considered as the third major of the sound C, is  $\frac{4}{7}$ , or  $\frac{8}{54}$ : these two E's then are between themselves in the proportion of 81 to 80; thus it is impossible that E should be at the same time a perfect third major from C, and a true fourth beneath B.

(GG) In effect, if you thus alternately tune the fifth above and the fourth below, in the same octave, you may here see what will be the process of your operation.

C, G, a fifth; D a fourth; A a fifth; É a fourth; B a fifth; F a fourth; C a fifth; G a fourth: 'd a fifth; A a fifth; B a fourth; B a fourth; C a fifth; G a fourth: 'd a fifth; B a fourth: now it will be found, by a very easy computation, that the first C being represented by I, G shall be  $\frac{3}{2}$ , D  $\frac{9}{2}$ , A  $\frac{2}{76}$ , E  $\frac{81}{54}$ , &c. and so of the rest till you arrive at B a which will be found  $\frac{53}{212}\frac{144}{121}$ . This fraction is evidently greater than the number 2, which expresses the perfect octave c to its correspondent C: and the octave below B would be one half of the same fraction, that is to say  $\frac{53}{212}\frac{144}{138}$ , which is evidently greater than C represented by unity. This last fraction  $\frac{53}{324}\frac{144}{48}$  is composed of two numbers; the numerator of the fraction is nothing clse but the number 3 multiplied II times in succession by itself, and the denominator is the number 2 multiplied I8 times in succession by itself. Now it is evidently are of B a fifth; is not equal to the unity which expresses the value of the sound C, though upon the harpsichord, B and C are identical. This fraction rises above unity by  $\frac{72}{242}\frac{15}{8}$ , that is say, by about  $\frac{x}{73}$ ; and this difference was called the comma of Pythagoras. It is palpable that this comma is much more considerable than that which we have already mentioned (note BB), and which is only  $\frac{x}{50}$ .

only  $\frac{\pi}{50}$ . We have already proved that the series of fifths produces a 'c' different from B%, the series of thirds major gives another still more different. For, let us suppose this series of thirds, C, E, G%, B%, we shall have E equal to  $\frac{5}{4}$ , G% to  $\frac{\pi}{50}$ , and B to  $\frac{r_2 5}{5\pi}$ , whose octave below is  $\frac{125}{728}$ ; from whence it appears, that this last B is less than unity (that is to say than C), by  $\frac{1}{728}$ , or by  $\frac{\pi}{42}$ , or near it : A new comma, much greater than the preceding, and which the Greeks have called *apotome major*.

It may be observed, that this B<sup>\*</sup>, deduced from the series of thirds, is to the B<sup>\*</sup> deduced from the series of fifths, as  $\frac{12}{5}\frac{2}{5}$  is to  $\frac{5}{5}\frac{1}{2}\frac{4}{4}\frac{4}{5}\frac{8}{5}$ : that is to say, in multiplying by 524288, as 125 multiplied by 4096 is to 531441, or as 51200 to 531441, that is to say, nearly as 26 is to 27: from whence it may be seen, that these two B's<sup>\*</sup> are very considerably different one from the other, and even sufficiently different to make the ear sensible of it; because the difference consists almost of a minor semitone, whose value, as will afterwards be seen (art. 139.), is  $\frac{2}{5}\frac{4}{2}$ .

Moreover, if, after having found the G% equal to  $\frac{2}{5}\frac{6}{5}$ , we then tune by fifths and by fourths, G%, 'd%', A%, C%, B%, as we have done with respect to the first series of fifths, we find that the B% must be  $\frac{2}{5}\frac{2}{5}\frac{2}{5}\frac{1}{5}$ ; its differrence, then, from unity, or, in other words, from C, is  $\frac{1}{2}\frac{2}{3}\frac{4}{8}$ , that is to say, about  $\frac{7}{85}$ ; a comma still less than any of the preceding, and which the Greeks have called *apotome minor*.

Theory of not to be different from the octave above C: for every Harmony. Bx and every 'c' is the same sound, since the octave or the scale only consists of twelve semitones.

Reasons and rules for temperament.

66. From thence it necessarily follows, 1. That it is impossible that all the octaves and all the fifths should be just at the same time, particularly in instruments which have keys, where no intervals less than a semitone are admitted. 2. That, of consequence, if the fifths are justly tuned, some alteration must be made in the octaves; now the sympathy or sound which subsists between any note and its octave, does not permit us to make such an alteration : this perfect coalescence of sound is the cause why the octave should serve as limits to the other intervals, and that all the notes which rise above or fall below the ordinary scale, are no more than replications, i. c. repetitions, of all that have gone before them. For this reason, if the octave were altered, there could be no longer any fixed point either in harmony or melody. It is then absolutely necessary to tune the 'c' or B\* in a just octave with the first ; from whence it follows, that, in the progression of fifths, or, what is the same thing, in the alternate series of fifths and fourths, C, G, D, A, E, B, F\*, C\*, G\*, 'd\*', A\*, 'e\*', B\*, it is necessary that all the fifths should he altered, or at least some of them. Now, since there is no reason why one should rather be altered than another, it follows, that we ought to alter them all equally. By these means, as the alteration is made to influence all the fifths, it will be in each of them almost

imperceptible; and thus the fifth, which, after the oc- Theory of tave, is the most perfect of all consonances, and which Harmony, we are under the necessity of altering, must only be altered in the least degree possible.

67. It is true, that the thirds will be a little harsh: but as the interval of sounds which constitutes the third, produces a less perfect coalescence than that of the fifth, it is necessary, says M. Rameau, to sacrifice the justice of that chord to the perfection of the fifth ; for the more perfect a chord is in its own nature, the more displeasing to the car is any alteration which can be made in it. In the octave the least alteration is insupportable.

68. This change in the intervals of instruments Its definiwhich have, or even which have not, keys, is that which tion. we call temperament.

69. It results then from all that we have now said, Principle that the theory of temperament may be reduced to whence in this question .- The alternate succession of fifths and theory ma fourths having been given, (art. 66.), in which Bx be deduce or C is not the true octave of the first C; it is proposed to alter all the fifths equally, in such a manner that the two C's may be in a perfect octave the one to the other.

70. For a solution of this question, we must begin Practical with tuning the two C's in a perfect octave the one to directions the other; in consequence of which, we will render all for temper the semitones which compose the octave as equal as possible. By this means (HH) the alteration made in each

In a word, if, after having found E equal to 5 in the progression of thirds, we then tune by fifths and fourths E, B, F\*, C\*, &c. we shall arrive at a new B\*, which shall be 32805, and which will not differ from unity but by about  $\frac{7}{885}$ , which is the last and smallest of all the commas; but it must be observed, that, in this case, the thirds major from E to G%, from G% to B%, or C, &c. are extremely false, and greatly altered.

(nn) All the semitones being equal in the temperament proposed by M. Rameau, it follows, that the twelve semitones C, C\*, D, D\*, E, E\*, &c. shall form a continued geometrical progression ; that is to say, a series in which C shall be to C% in the same proportion as C% to D, as D to D%, &c. and so of the rest.

These twelves semitones are formed by a series of thirteen sounds, of which C and its octave 'c' are the first and last. Thus to find by computation the value of each sound in the temperament, which is the present object of our speculations, our serutiny is limited to the investigation of eleven other numbers between 1 and 2 which may form with the I and the 2 a continued geometrical progression.

However little any one is practised in calculation, he will easily find each of these numbers, or at least a number approaching to its value. These are the characters by which they may be expressed, which mathematicians will easily understand, and which others may neglect.

| C | C×        | D                       | D×              | E    | F    | F×   | G    | GX<br>12     |

It is obvious, that in this temperament all the fifths are equally altered. One may likewise prove, that the alteration of each in particular is very inconsiderable; for it will be found, for instance, that the fifth from C to G, which should be  $\frac{3}{2}$ , ought to be diminished by about  $\frac{1}{22}$  of  $\frac{1}{73}$ ; that is to say, by  $\frac{1}{376}$ , a quantity almost inconceivably small.

It is true, that the thirds major will be a little more altered; for the third major from C to E, for instance, shall be increased in its interval by about  $\frac{t}{100}$ : but it is better, according to M. Rameau, that the alteration should fall upon the third than upon the fifth, which after the octave is the most perfect chord, and from the perfection of which we ought never to degenerate but as little as possible.

Besides, it has appeared from the series of thirds major C, E, G%, B%, that this last B% is very different from 'c' (note GG); from whence it follows, that if we would tune this BX in unison with the octave of C, and alter at the same time each of the thirds major by a degree as small as possible, they must all be equally altered. This is what occurred in the temperament which we propose; and if in it the third be more altered than the fifth, it is a consequence of the difference which we find between the degrees of perfection in these intervals; a difference with which, if we may speak so, the temperament proposed conforms itself. Thus this diversity of alteration is rather advantageous than inconvenient. 4

Tory of each fifth will be very considerable, but equal in all of mony. them.

71. In this, then, the theory of temperament consists: but as it would be difficult in practice to tune a harpsichord or organ by thus rendering all the semitones equal, M. Rameau, in his *Generation Harmonique*, has furnished us with the following method, to alter all the fifths as equally as possible.

72. Take any key of the harpsichord which you please; but let it be towards the middle of the instrument; for instance, C: then tune the note G a fifth above it, at first with as much accuracy as possible; this you may imperceptibly diminish: tune afterwards the fifth to this with equal accuracy, and diminish it in the same manner; and thus proceed from one fifth to another in ascent: and as the ear does not appreciate so exactly sounds that are extremely sharp, it is necessary, when by fifths you have risen to notes extremely high, that you should tune in the most perfect manner the octave below the last fifth which you had immediately

met pro-

prod.

formed; then you may continue always in the same Theory of manner; till in this process you arrive at the last fifth Harmony. from E% to B%, which should of themselves be in

tune; that is to say, they ought to be in such a state, that B\*, the highest note of the two which compose the fifth, may be identical with the sound C, with which you began, or at least the octave of that sound perfectly just : it will be necessary then to try if this C, or its octave, forms a just fifth with the last sound EX or F, which has been already tuned. If this be the case, we may be certain that the harpsichord is properly tuned. But if this last fifth be not true, in this case it will be too sharp, and it is an indication that the other fifths have been too much diminished, or at least some of them ; or it will be too flat, and consequently discover that they have not been sufficiently diminished. We must then begin and proceed as formerly, till we find the last fifth in tune of itself, and without our immediate interposition (II).

, en 19

By

(11) We have only to acknowledge, with M. Rameau, that this temperament is far remote from that which is now in practice: it may here be seen in what this last temperament consists as applied to the organ or harpsichord. They begin with C in the middle of the keys, and they flatten the four first fifths G, D, A, E, till they form a true third major from E to C; afterwards, setting out from this E, they tune the fifths B, F%, C%, G%, but flattening them still less than the former, so that G% may almost form a true third major with E. When they have arrived at G%, they stop; they resume the first C, and tune to it the fifth F in descending, then the fifth Bb, &c. and they heighten a little all the fifths till they have arrived at Ab, which ought to be the same with the G% already tuned.

If, in the temperament commonly practised, some thirds are found to be less altered than in that prescribed by M. Rameau, in return, the fifths in the first temperament are much more false, and many thirds are likewise so; insomuch, that upon a harpsichord tuned according to the temperament in common use, there are five or six modes which the ear cannot endure, and in which it is impossible to execute any thing. On the contrary, in the temperament suggested by M. Rameau, all the modes are equally perfect; which is a new argument in its favour, since the temperament is peculiarly necessary in passing from one mode to another, without shocking the ear; for instance, from the mode of C to that of G, from the mode of G to that of D, &c. It is true, that this uniformity of modulation will to the greatest number of musicians appear a defect: for they imagine, that, by tuning the semitones of the scale unequal, they give each of the modes a peculiar character; so that, according to them, the scale of C,

#### C, D, E, F, G, A, B, C,

is not perfectly similar to the gammut or diatonic scale of the mode of E,

#### E, F%, G%, A%, B, c%, d%, e,

which in their judgment, renders the modes of C and E proper for different manners of expression. But after all that we have said in this treatise on the formation of diatonic intervals, every one should be convinced, that, according to the intention of nature, the diatonic scale ought to be perfectly the same in all its modes : The contrary opinion, says M. Rameau, is a mere prejudice of musicians. The character of an air arises chiefly from the intermixture of the modes; from the greater or lesser degrees of vivacity in the movement; from the tones, more or less grave, or more or less acute, which are assigned to the generator of the mode; and from the chords more or less beautiful, as they are more or less deep, more or less flat, more or less sharp, which are found in it.

In short, the last advantage of this temperament is, that it will be found conformed with, or at least very little different from that which is practised upon instruments without keys; as the bass-viol, the violin, in which true fifths and fourths are preferred to thirds and sixths tuned with equal accuracy; a temperament which appears incompatible with that commonly used in tuning the harpsiehord.

Yet M. Rameau, in his New System of Music, printed in 1726, adopted the ordinary temperament. In that work, (as may be seen chap. xxiv.), he pretends that the alteration of the fifths is much more supportable than that of the thirds major; and that this last interval can hardly suffer a greater alteration than the octave, which, as we know, cannot suffer the slightest alteration. He says, that if three strings are tuned, one by an octave, the other by a fifth, and the next by a third major to a fourth string, and if a sound be produced from the last, the strings tuned by a fifth will vibrate, though a little less true than it ought to have been; but that the octave and the third major, if altered in the least degree, will not vibrate: and he adds, that the temperament which is now practised, is founded upon that principle. M. Rameau goes still farther; and as, in the ordinary

temperament,

By this method all the twelve sounds which compose Theory of Harmony. one of the scales shall be tuned : nothing is necessary

Alterations by either method hardly disagreeable.

but to tune with the greatest possible exactness their octaves in the other scales, and the harpsichord shall be well tuned.

We have given this rule for temperament from M. Rameau; and it belongs only to disinterested artists to judge of it. However this question be determined, and whatever kind of temperament may be received, the alteration which it produces in harmony will be but very small, or not perceptible to the ear, whose attention is entirely engrossed in attuning itself with the fundamental bass, and which suffers, without uneasincss, these alterations, or rather takes no notice of them, because it supplies from itself what may be wanting to the truth and perfection of the intervals.

Simple and daily experiments confirm what we now advance. Listen to a voice which is accompanied, in singing, by different instruments ; though the temperament of the voice, and the temperament of each of the instruments, are all different one from another, yet you will not be in the least affected with the kind of cacophony which ought to result from these diversities, because the ear supposes these intervals true, of which it does not appreciate differences.

We may give another experiment. Let the three keys E, G, B be struck upon an organ, and the minor perfect chord only will be heard ; though E, by the construction of that instrument, must cause G \* likewise to be heard; though G should have the same effect upon D, and B upon F \*; insomuch that the ear is at once affected with all these sounds, D, E, F \*, G, G &, B: how many dissonances perceived at the same time, and what a jarring multitude of discordant sensations, would result from thence to the car, if the perfect chord with which it is preoccupied had not power entirely to abstract its attention from such sound as might offend !

#### CHAP. VIII. Of Reposes or Cadences (KK).

73. In a fundamental bass whose procedure is by perfect an fifths, there always is, or always may be, a repose, or imperfect crisis, in which the mind acquiesces in its transition what and from one sound to another: but a repose may be more why. or less distinctly signified, and of consequence more or See Reput less perfect. If one should rise by fifths; if, for in- or Cadena stance, we pass from C to G; it is the generator which passes to one of these fifths, and this fifth was already pre-existent in its generator : but the generator exists no longer in this fifth ; and the ear, as this generator is the principle of all harmony and of all melody, feels a desire to return to it. Thus the transition from a sound to its fifth in ascent, is termed an imperfect repose, or imperfect cadence ; but the transition from any sound to its fifth in descent, is denominated a perfect cadence, or an absolute repose : it is the offspring which returns to its generator, and as it were recovers its existence once more in that generator itself, with which when sounding it resounds (chap. i.).

74. Amongst absolute reposes, there are some, if Perfect of we may be allowed the expression, more absolute, that dences is to say, more perfect, than others. Thus in the fun-less perfect and why. damental bass

C, G, C, F, C, G, D, G, C, which forms, as we have seen, the diatonic scale of the moderns, there is an absolute repose from D to G, as from G to C; yet this last absolute repose is more perfect than the preceding, because the ear, prepossessed with the mode of C by the multiplied impression of the sound C which it has already heard thrice before, feels a desire to return to the generator C; and it accordingly does so by the absolute repose G C.

75. We may still add, that what is commonly called Cadence cadence in melody, ought not to be confounded with melody ferent fre what we name cadence in harmony. what it i In in har-

mony.

temperament, there is a necessity for altering the last thirds major, and to make them a little more sharp, that they may naturally return to the octave of the principal sound, he pretends that this alteration is tolerable, not only because it is almost insensible, but because it is found in modulations not much in use, unless the composer should choose it on purpose to render the expression stronger. "For it is proper to remark (says he), that we receive different impressions from the intervals in proportion to their different alterations : for instance, the third major, which naturally elevates us to joy, in proportion as we feel it, heightens our feelings even to a kind of fury, when it is tuned too sharp ; and the third minor, which naturally inspires us with tenderness and serenity, depresses us to melancholy when it is too flat." All this is very different from what this celebrated musician afterwards exhibited in his Generation Harmonique, and in the performances which followed it. From this we can only conclude, that the reasons which, after him, we have urged for the new temperament, must without doubt have appeared to him very strong, because in his mind they had superseded those which he had formerly adduced in favour of the ordinary temperament.

We do not pretend to give any decision for either the one or the other of these methods of temperament, each of which appears to us to have its particular advantages. We shall only remark, that the choice of the one or the other must be left absolutely to the taste and inclination of the reader; without, however, admitting this choice to have any influence upon the principles of the system of music, which we have followed even till this period, and which must always subsist, whatever temperament we adopt.

(KK) That the reader may have a clear idea of the term before he enters upon the subject of this chapter, it may be necessary to caution him against a mistake into which he may be too easily led by the ordinary signification of the word repose. In music, therefore, it is far from being synonymous with the word rest. It is, on the contrary, the termination of a musical phrase which ends in a cadence more or less emphatic, as the sentiment implied in the phrase is more or less complete. Thus a repose in music answers the same purpose as punctuation in language. See REPOSE, in Rousseau's Musical Dictionary.

#### In the first case, the word only signifies an agreewory of mony, able and rapid alteration between two contiguous sounds, ealled likewise a trill or shake; in the second, it signifies a repose or close. It is however true, that this shake implies, or at least frequently enough presages, a repose, either present or impending, in the fundamental bass (LL).

76. Since there is a repose in passing from one sound in he funto another in the fundamental bass, there is also a repose in passing from one note to another in the diabil necestonie scale, which is formed from it, and which this sen in the bass represents: and as the absolute repose G C is of all others the most perfect in the fundamental bass. the repose from B to 'c', which answers to it in the scale, and which is likewise terminated by the generator, is for that reason the most perfect of all others in the diatonic scale ascending.

77. It is then a law dictated by nature itself that if you would ascend diatonically to the generator of a mode, you can only do this by means of the third major, from the fifth of that very generator. This third major, which with the generator forms a semitone, has Se Sensi- for that reason been called the sensible note or leading note, as introducing the generator, and preparing us for the most perfect repose.

We have already proved, that the fundamental bass We shall besides make it is the principle of melody. appear in the sequel, that the effect of a repose in melody arises solely from the fundamental bass.

#### CHAP. IX. Of the Minor Mode and its Diatonic Series.

78. In the second chapter, we have explained (art. ni ries of 20. 30. 31. and 32.) by what means, and upon what the inor principle, the minor chord C, Eb, G, 'c' may be formed, which is the characteristical ehord of the minor mode. Now what we have there said, taking C for the principal and fundamental sound, we might likewise have said of any other note in the scale, assumed in the same manner as the principal and fundamental sound : but as in the minor chord, C, Eb, G, 'c' there occurs an Eb which is not found in the ordinary diatonic scale, we shall immediately substitute, for greater ease and conveniency, another chord, which is likewise minor and exactly similar to the former, of which all the notes are found in the scale.

> 79. The scale affords us three chords of this kind, viz. D, F, A, 'd'; A, 'c, e, a'; and E, G, B, 'e'. Among these three we shall choose A, 'c, e, a'; because this chord, without including any sharp or flat, has two sounds in common with the major chord C, E, G, 'c'; and besides, one of these two sounds is the very same 'c': so that this chord appears to have the most immediate, and at the same time the most simple, relation with the chord C, E, G, 'c.' Concerning this we need only add, that this preference of the chord A, 'c, e, a', to every other minor chord, is by no means in itself necessary for what we have to say in this chapter upon the dia-

tonic scale of the minor mode. We might in the same Theory of manner have chosen any other minor chord ; and it is Harmony, only, as we have said, for greater case and conveniency that we fix upon this.

80. In every mode, whether major or minor, the Tonic or principal sound which implies the perfect chord, whe-key in harther major or minor, is called the tonic note or key; thus what. C is the key in its proper mode, A in the mode of A, See Princi-&c. Having laid down this principle, 81. We have shown how the three sounds, F, C, See Tonic. G, which constitute (art. 38.) the mode of C, of which The forma-tion of the the first, F, and the last, G, are the two fifths of C, one scale purdescending, the other rising, produce the scale, B, 'c, d, sued. e, f, g, a', of the major mode, by means of the fun-See fig. 4. damental bass G, C, G, C, F, C, F; let us in the same manner take the three sounds D, A, E, which constitute the mode of A, for the same reason that the sounds F, C, G, constitute the mode of C; and of them let us form this fundamental bass, perfectly like the preeeding E, A, F, A, D, A, D; let us afterwards place See fig. 7. below each of these sounds one of their harmonics, as we have done (chap. v.), for the first scale of the major mode ; with this difference, that we must suppose D, and A as implying their thirds minor in the fundamental bass to characterize the minor mode; and we shall have the diatonic scale of that mode,

#### G\*, A, B, 'c, d, c, f'.

82. The GX, which corresponds with E in the fundamental bass, forms a third major with that E, though the mode be minor; for the same reason that a third from the fifth of the fundamental sound ought to be major (art. 77.) when the third riscs to the fundamental sound A.

83. It is true, that, in causing E to imply its third See Imply minor G, one might also rise to A by a diatonic pro- or Carry. gress. But that manner of rising to A would be less perfect than the preceding; for this reason (art. 76.), that the absolute repose or perfect eadence E, A, in the fundamental bass, ought to be represented in the most perfect manner in the two notes of the diatonic scale which answer to it, especially when one of these two notes is A, the key itself upon which the repose is made. From whence it follows, that the preceding note G ought rather to be sharp than natural; because G\*, being included in E (art. 19.), much more perfectly represents the note E in the bass, than the natural G could do, which is not included in E.

84. We may remark this first difference between Diversities the scale in the scales of the ma-

and the scale which corresponds with it in the major jor and mi-nor mode. G\*, A, B, 'e, d, c, f', mode

#### B, 'c, d, e, f, g, a',

that from 'e' to 'f' which are the two last notes of the former scale, there is only a semitone ; whereas from 'g' to 'a', which are the two last sounds of the latter series, there is the interval of a complete tone; but this not the only discrimination which may be found between the scales of the two modes.

3U2

85. To

(LL) M. Rousseau, in his letter on French music, has called this alternate undulation of different sounds a trill, from the Italian word trillo, which signifies the same thing ; and some French musicians already appear to have adopted this expression.

which produces

524

Theory of Investigation of these differences and their reasons See fig. 5.

85. To investigate these differences, and to discover Harmony the reason for which they happen, we shall begin by forming a new diatonic scale of the minor mode, similar to the second scale of the major mode,

# 'c, d, e, f, g, g, a, b', c.

That last series, as we have seen, was formed by means of the fundamental bass F, C, G, D, disposed in this manner,

C, G, C, F, C, G, D, G, C.

Let us take in the same manner the fundamental bass D, A, E, B, and arrange it in the following order,

A, E, A, D, A, E, B, E, A,

See fig. 8. and it will produce the scale immediately subjoined,

A, B, 'c, d, e, e, f\*, g\*, a', in which 'c' forms a third minor with A, which in the fundamental bass corresponds with it, which denominates the minor mode ; and, on the contrary, 'g \* forms a third major with E in the fundamental bass, because 'g\*' ises towards 'a' (art. 82. 83.).

86. We see besides an 'f X', which does not occur in the former,

G\*, A, B, 'c, d, e, f',

where 'f' is natural. It is because, in the first scale, 'f' is a third minor from D in the bass ; and in the second, 'f X' is the fifth from B in the bass (MM).

Difference between the two scales of the minor major.

minor

why.

The case

and why.

minor

87. Thus the two scales of the minor mode are still in this respect more different one from the other than the two scales of the major mode; for we do not rcmark this difference of a semitone between the two modegreat-scales of the major mode. We have only observed er than (art. 63.) some difference in the value of A as it stands those of the in each of these scales, but this amounts to much less than a semitone.

88. From thence it may be seen why 'f' and 'g' are 'f' and 'g' sharp in the sharp when ascending in the minor mode; besides the 'f' is only natural in the first scale GX, A, B, 'c, d, c, 'f', because this 'f' cannot rise to 'g\*', (art. 48.). mode, and

89. It is not the same case in descending. For E, different in the fifth of the generator, ought not to imply the third descending, major 'g X', but in the case when that E descends to the generator A to form a perfect repose (art. 77. and 83.); and in this case the third major 'g\*' rises to the generator 'a': but the fundamental bass AE may, in descending, give the scale 'a, g', natural, provided 'g' does not rise again to 'a'.

90. It is much more difficult to explain how the 'f' Explication of the which ought to follow this 'g' in descending, is natural descending and not sharp; for the fundamental bass scale in the A E B E A D A E A

A, E, B, E, A, D, A, E, A,

mode from produces in descending,

a funda 'a, g, f %, e, e, d, c', B, A. mental bass And it is plain that the 'f' cannot be otherwise than difficult.

sharp, since 'f \* ' is the fifth of the note B of the fun- Theory of damental bass. Experience, however, evinces that the Harmony 'f' is natural in descending in the diatonic scale of the major mode of A, especially when the preceding 'g' is natural: and it must be acknowledged, that here the fundamental bass appears defective.

M. Rameau has attempted the following solution of Ramean' this difficulty. In the diatonic scale of the minor mode solution, though the in descending, ('a, g, f, e, d, c', B, A,) 'g' may be re-only one, garded simply as a note of passage, merely added to give yet unsat sweetness to the modulation, and as a diatonic gradation factory. by which we may descend to 'f' natural. This is easily perceived, according to M. Rameau, by the fundamental bass,

'a, f, e, d, c', B, A;

which may be regarded, as he says, as the real scale of the minor mode in descending ; to which is added 'g' natural between 'a' and 'f', to preserve the diatonic order.

This appears the only possible answer to the difficulty above proposed : but we know not whether it will fully satisfy the reader; whether he will not see with regret, that the fundamental bass does not produce, to speak properly, the diatonic scale of the minor mode in descent, when at the same time this same bass so happily produces the diatonic scale of that identical mode in ascending, and the diatonic scale of the major mode whether in rising or descending (NN).

#### CHAP. X. Of Relative Modes.

91. Two modes of such a nature that we can pass from the one to the other, are called relative modes. Modes re Thus the major mode of C is relative to the major lative, mode of F and to that of G. It has also been seen what how many intimate connexions there are between the See Mode major mode of C, and the minor mode of A. For, 1. The perfect chords, one major, C, E, G, 'c', the other minor, A, 'c, c, a', which characterize each of those two \* See Me kinds of modulation \* or harmony, have two sounds in dulation. common, 'c' and 'e'. 2. The scale of the minor mode of A in descent, absolutely contains the same sounds with the scale of the major made of C.

Hence the transition is so natural and easy from the major mode of C to the minor mode of A, or from the minor mode of A to the major mode of C, as experience proves.

92. In the minor mode of E, the minor perfect chord E, G, B, 'e', which characterizes it, has likewise two sounds, E, G, in common with the perfect chord major C, E, G, 'c', which characterizes the major mode of

(MM) Besides, without appealing to the proof of the fundamental bass, 'f X' obviously presents itself as the sixth note of this scale; because the seventh note being necessarily 'g\*' (art. 77.) if the sixth were not 'f\*', but 'f\$', there would be an interval of three semitones between the sixth and the seventh, consequently the scale would not be diatonic, (art. 8.).

(NN) When 'g' is said to be natural in descending the diatonic scale of the minor mode of A, it is only meant that this 'g' is not necessarily sharp in descending as it is in rising; for it may be sharp, as may be proved by numberless examples, of which all musical compositions are full. It is true, that, when 'g' is found sharp in descending to the minor mode of A, we are not sure that the mode is minor till the 'f' or 'c' natural is found ; both of which impress a peculiar character on the minor mode, viz. 'c' natural, in rising and in descending, and the 'f' natural in descending.

Part 1

seory of of C. But the minor mode of E is not so closely remony. lated nor allied to the major mode of C as the minor mode of A; because the diatonic scale of the minor mode of E in descent, has not, like the series of the minor mode of A, all these sounds in common with the scale of C. In reality, this scale is 'e, d, c', B, A, G, F\*, E, where there occurs an 'f' sharp which is not in the scale of C. Though the minor mode of E is thus less relative to the major mode of C than that of  $\Lambda$ ; yet the artist does not hesitate sometimes to pass immediately from the one to the other.

When we pass from one mode to another by the interval of a third, whether in descending or rising, as from C to A, or from A to C, from C to E, or from E to C, the major mode becomes minor, or the minor mode becomes major.

93. There is still another minor mode, into which an immediate transition may be made in issuing from the major mode of C. It is the minor mode of C itself in which the perfect minor chord C, Eb, G, 'c', has two sounds, C and G, in common with the perfect major chord C, E, G, 'c'. Nor is there any thing more common than a transition from the major mode of C to the minor mode, or from the minor to the major (00).

#### CHAF. XI. Of Dissonance.

94. WE have already observed, that the mode of C. with the (F, C, G,) has two sounds in common with the mode mode of G (C, G, D); and two sounds in common with the mode of F (Bb, F, C); of consequence, this procedure of the bass C G may belong to the mode of C, or to she mode of G, as the procedure of the bass F C, or C F, may belong to the mode of C or the mode of F. When one therefore passes from C to F or to G in a fundamental bass, he is still ignorant what mode he is in. It would be, however, advantageous to know it. and to be able by some means to distinguish the generator from its fifths.

95. This advantage may be obtained by uniting at manyesthe same time the sounds G and F in the same harmony, that is to say, by joining to the harmony G, B, 'd' of the fifth G, the other fifth F in this manner, G, B, 'd, f'; this 'f' which is added, forms a dissonance with G (art. 18.). Hence the chord G, B, 'd, f', is fift and meds decalled a dissonant chord, or a chord of the seventh. It ter ae the serves to distinguish the fifth G from the generator C, which always implies, without mixture or alteration,

the perfect chord C, E, G, 'c' resulting from nature it- Theory of self (art. 32.). By this we may see, that when we pass Harmony. from C to G, one passes at the same time from C to F, because 'f' is found to be comprehended in the chord of G; and the mode of C by these means plainly appears to be determined, because there is none but that mode to which the sounds F and G at once belong.

96. Let us now see what may be added to the har-Manner ofmony F, A, C, of the fifth F below the generator, to treating distinguish this harmony from that of the generator, dissonances It seems probable at first, that we should add to it the It seems probable at first, that we should add to it the other fifth G, so that the generator C, in passing to F, may at the same time pass to G, and that by this the mode should be determined : but this introduction of G, in the chord F, A, C, would produce two se-conds in succession, F G, G A, that is to say, two dissonances whose union would prove extremely harsh to the ear; an inconvenience to be avoided. For if, to distinguish the mode, we should alter the harmony of the fifth F in the fundamental bass, it must only be altered in the least degree possible.

97. For this reason, instead of G, we shall take its Chord of fifth 'd', the sound that approaches it the nearest, and the great we shall have, instead of the fifth F, the chord F, A, sixth. 'c, d', which is called a chord of the great sixth.

One may here remark the analogy there is observed between the harmony of the fifth G and that of the fifth F.

98. The fifth G, in rising above the generator, gives The subject a chord entirely consisting of thirds ascending from G, of dissonan-C, B, 'd, f'; now the fifth F being below the genera-ces contitor G in descending, we shall find, as we go lower by thirds from 'c' towards E, the same sounds 'c', A, F. D, which form the chord F, A, 'c, d', given to the fifth F.

99. It appears besides, that the alteration of the harmony in the two fifths consists only in the third minor D, F, which was reciprocally added to the harmony of these two fifths.

#### CHAP. XII. Of the Double Use or Employment of Dissonance.

100. IT is evident by the resemblance of sounds to Account ef their octaves, that the chord F, A, 'c, d', is in effect the double the same as the chord D, F, A, 'c', taken inversely +, employ-that the inverse of the chord C, A, F, D, has been + See Infound (art. 98.) in descending by thirds, from the ge-verted. nerator C (PP).

101. The

(00) There are likewise other minor modes, into which we may pass in our egress from the mode major of C; as that of F minor, in which the perfect minor chord F, Ab, 'c', includes the sound 'c', and whose scale in ascent F, G, Ab, Bb, 'c, d, c, f', only includes the two sounds Ab, Bb, which do not occur in the scale of C. This transition, however, is not frequent.

The minor mode of D has only in its scale ascending D, E, F, G, A, B, 'c X, d', one 'c' sharp which is not found in the scale of C. For this reason a transition may likewise be made, without grating the ear, from the mode of C major to the mode of D minor ; but this passage is less immediate than the former, because the chords C, E, G, 'c', and D, F, A, 'd', not having a single sound in common, one cannot (art. 37.) pass immediately from the one to the other.

(PP) M. Rameau, in several passages of his works (for instance; in p. 110, 111, 112, and 113. of the Generation Harmonique), appears to consider the chord D, F, A, C, as the primary chord and generator of the chord E, A, 'c, d', which is that chord reversed ; in other passages (particularly in p. 116. of the same performance), he seems to consider the first of these chords as nothing else but the reverse of the second. It would seem that

Theory of Harmony. Difference hetween dominant and tonic dominant.

526

101. The chord D, F, A, 'c', is a chord of the seventh like the chord G, B, 'd, f'; with this only difference, that the latter in the third G, B, is major: whereas in the former, the third D, F, is minor. If the F were sharp, the chord D, FX, A, 'c', would be a genuine chord of the dominant, like the chord G, B, D, 'f'; and as the dominant G may descend to C in the fundamental bass, the dominant D implying or carrying with it the third major FX might in the same manner descend to G-

102. Now if the F% should be changed into F natural, D, the fundamental tone of this chord D, F, A, 'c', might still descend to G; for the change from FX to F natural will have no other effect, than to preserve the impression of the mode of C, instead of that of the mode of G, which the FX would have here introduced. The note D will, however, prescrve its character as a dominant, on account of the mode of C, which forms a seventh. Thus in the chord of which we treat (D, F, A, 'c'), D may be considered as an imperfect dominant : we call it imperfect, because it carries with it the third minor F, instead of the third major FX. It is for this reason that in the sequel we shall call it simply the dominant, to distinguish it from the dominant G, which shall be named the tonic dominant +.

103. Thus the sounds F and G, which cannot succeed each other (art. 36.) in a diatonic bass, when they only carry with them the perfect chords F A C, G B 'd', may succeed one another, if 'd' bc added to the harmony of the first, and 'f' to the harmony of the second; and if the first chord be inverted, that is to say, if the two chords take this form, D, F, A, C, G, B, 'd, a'.

104. Besides, the chord F, A, 'c, d', being allowed to succeed the perfect chord C, E, G, 'c', it follows for tions recon- the same reasons, that the chord C, E, G, C may be succeeded by D, F, A, 'c'; which is not contradictory to what we have above said (art. 37.), that the sounds C and D cannot succeed one another in the fundamental bass : for in the passage quoted, we had supposed that both C and D carried with them a perfect chord major ; whereas, in the present case, D carries the third minor E, and likewise the sound 'c', by which the chord DFA 'c' is connected with that which precedes it CEG 'c'; and in which the sound 'c' is found. Besides, this chord, D F A 'c', is properly nothing else but the chord F A 'c d' inverted, and if we may speak so, disguised.

105. This manner of presenting the chord of the

subdominant under two different forms, and of employ- Theory of ing it under these two different forms has been called Harmony, by M. Ramcau its double office or employment +. This Double emis the source of one of the finest varieties in harmony ; ployment, and we shall see in the following chapter the advantages what, and why so which result from it.

We may add, that as this double employment is a called. kind of license, it ought not to be practised without ble Emsome precaution. We have lately seen that the chords D ployment. F A 'c', considered as the inverse of F A 'c d,' may succeed to C E G 'c', but this liberty is not reciprocal: and though the chord F A 'c d' may be followed by the chord C E G 'c', we have no right to conclude from thence that the chord D F A 'c', considered as the inverse of F A 'c d', may be followed by the chord C E G 'c'. For this the reason shall be given in chap. xvi.

#### CHAP. XIII. Concerning the Use of this Double Employment, and its Rules.

106. WE have shown (chap. xvi.) how the diatonic By the scale, or ordinary gammut, may be formed from the double use fundamental bass F, C, G, D, by twice repeating the of the note G in that series; so that this gammut is primitive-above.men ly composed of two similar tetrachords, one in the chord, the mode of C, the other in that of G. Now it is possible, impression by means of this double employment, to preserve the of the mod impression of the mode of C through the whole extent may be of the scale, without twice repeating the note C, or preserved. even without supposing this repetition. For this effect we form the following fundamental bass,

C, G, C, F, C, D, G, C:

in which C is understood to carry with it the perfect chord C E G 'c'; G, the chord G B 'd f'; F the chord F A 'c d'; and D, the chord D F A 'c'. It is plain from what has been said in the preceding chapter, that in this case C may ascend to D in the fundamental bass, and D descend to G, and that the impression of the mode of C is preserved by the 'f' natural, which forms the third minor 'd f', instead of the third major which D ought naturally to imply.

107. This fundamental bass will give, as it is evident, the ordinary diatonic scale,

'c, d, e, f, g, a, b', c, which of consequence will be in the mode of C alone; and if one should choose to have the second tetrachord in the mode of G, it will be necessary to substitute 'f\*' instead of 'fp', in the harmony of D (QQ).

108. Thus the generator C may be followed according

this great artist has neither expressed himself upon this subject with so much uniformity nor with so much precision as is required. We think that there is some foundation for considering the chord F, A, 'c, d', as primitive : 1. Because in this chord, the fundamental and principal note is the subdominant F, which ought in effect to be the fundamental and principal sound in the chord of the sub-dominant. 2. Because that without having recourse, with M. Rameau, to harmonical and arithmetical progressions, of which the consideration appears to us quite foreign to the question, we have found a probable and even a satisfactory reason for adding the note 'd' to the harmony of the fifth F (art. 96. and 97.). The origin thus assigned for the chord of the sub-dominant appcars to us the most natural, though M. Rameau does not appear to have felt its full value; for scarcely has it been slightly insinuated by him.

(QQ) It is obvious that this fundamental bass C, G, C, F, C, D, G, C, which formed the ascending scale \*c, d, e, f, g, a, b', c, cannot by inverting it, and taking it inversely in this manner, C, G, D, C, F, C, G, C, form the diatonic scale c, 'b, a, g, f, e, d, c', in descent. In reality, from the chord G, B, 'd, f', we cannot pass to the chord D, F, A, 'c', nor from thence to C, E, G, 'c'. For this reason, in order to have the fundamental

+ See Dominant.

Sceming contradicciled.

Part I.

neory of ing to pleasure in ascending diatonically either by a armony, tonic dominant (D F% A C), or by a simple dominant (D F A C).

109. In the minor mode of A, the tonic dominant E ought always to imply its third major E GX, when this dominant E descends to the generator A (art. 83.); and the chord of this dominant shall be E G & B 'd', entirely similar to G B 'd f'. With respect to the sub-dominant D, it will immediately imply the third minor F, to denominate the minor mode; and we may add B above its chord D F A, in this manner D F A B, a chord similar to that of F A 'c d'; and as we have deduced from the chord FA 'c d' that of DFA 'c', we may in the same manner deduce from the chord DFA B'a' a new chord of the seventh B 'd f a', which will exhibit the double employment of dissonances in the minor mode.

110. One may employ this chord B 'd f a', to preserve the impression of the mode of A in the diatonic scale of the minor mode, and to prevent the necessity of twice repeating the sound E; but in this case, the F must be rendered sharp, and the chord changed to B 'd f% a', the fifth of B being 'f' %, as we have seen above. This chord is then the inverse of D F\* A B, the subdominant implying the third major, which ought not to surprise us; for in the minor mode of A, the second tetrachord E FX GX A is exactly the same as it would be in the major mode of A : Now, in the major mode of A the subdominant D ought to imply the third major F%.

**L**ersities 111. Hence the minor mode is susceptible of a much ir ne migreater number of varieties than the major : the major mode is found in nature alone; whereas the minor is in some measure the product of art. But, in return, th in the the major mode has received from nature, to which it owes its immediate formation, a force and energy which the minor cannot boast.

# CHAP. XIV. Of the different Kinds of Chords of the Seventh.

112. THE dissonance added to the chord of the dominant and of the sub-dominant, though in some measure suggested by nature (chap. xi.), is nevertheless a work of art; but as it produces great beauties in harmony by the variety which it introduces into it, let us

discover whether, in consequence of this first advance, Theory of art may not still be carried farther. Harmony.

113. We have already three different kinds of chords of the seventh, viz.

1. The chord G B 'd f', composed of a third major followed by two thirds minor.

2. The chord D F A 'c', or B 'd f a', a third major between two minors.

3. The chord B 'd.f a', two thirds minor followed by a major.

114. There are still two other kinds of chords of the seventh which are employed in harmony; one is composed of a third minor between two thirds major, CEG B, or FA 'ce'; the other is wholly composed of thirds minor G & B 'd f'. These two chords, which at first appear as if they ought not to enter into harmony if we rigorously keep to the preceding rules, are nevertheless frequently practised with success in the fundamental bass. The reason is this:

115. According to what has been said above, if we The chords would add a seventh to the chord C E G, to make last describa dominant of C, one can add nothing but Bb; and ed admissiin this case  $C \to G \to B$  would be the chord of the tonic ble, and dominant in the mode of F. as  $G \to df'$  is the chord why. dominant in the mode of F, as GB'df' is the chord of the tonic dominant in the mode of C; but if we would preserve the impression of the mode of C in the harmony, we change this Bb into B natural, and the chord CEGBb becomes CEGB. It is the same case with the chord FA 'ce', which is nothing else but the chord F A 'c eb'; in which one may substitute for 'cb'. 'e' natural, to preserve the impression of the mode of C, or that of F.

Besides, in such chords as CEGB, FA'c e', the founds B and 'e', though they form a dissonance with C in the first case, and with F in the second, are nevertheless supportable to the ear, because these sounds B and 'e' (art. 19.) are already contained and understood, the first in the note E of the chord C E G B, as likewise in the note G of the same chord; the second in the note A of the chord FA 'c e', as likewise in the note 'c' of the same chord. All together then seem to allow the artist to introduce the note B and 'e' into these two chords (RR).

116. With respect to the chord of the seventh G% Chords of B 'd f', wholly composed of thirds minor, it may be re- the seventh garded as formed from the union of the two chords of continued the and ex-

bass of the scale, c, 'b, a, g, f, c, d, c', in descent, we must either determine to invert the fundamental bass mentioned in art. 55. in this manner, C, G, D, G, C, F, C, G, C, in which the second G and the second C answer to the G alone in the scale; or otherwise we must form the fundamental bass C, G, D, G, C, G, C, in which all the notes imply perfect chords major, except the second G, which implies the chord of the seventh G, B, 'd, f', and which answers to the two notes of the scale G, F, both comprehended in the chord G, B, 'd, f'.

Whichever of these two basses we shall choose, it is obvious that neither the one nor the other shall be wholly in the mode of C, but in the mode of C and in that of G. Whence it follows, that the double employment which gives to the scale a fundamental bass all in the same mode when ascending, cannot do the same in descending; and that the fundamental bass of the scale in descending will be necessarily in two different modes.

(RR) On the contrary, a chord such as C Eb G B, in which E would be flat, could not be admitted in harmony, because in this chord the B is not included and understood in Eb. It is the same case with several other chords, such as BDFA\*, BD\*FA, &c. It is true, that in the last of these chords, A is included in F, but it is not contained in DX; and this DX likewise forms with F and with A a double dissonance, which, joined with the dissonance BF, would necessarily render this chord not very pleasing to the ear; we shall yet, however, see in the second part, that this chord is sometimes used.

Theory of the dominant and of the sub-dominant in the minor Harmony. mode. In effect, in the minor mode of  $\Lambda$ , for instance, these two chords are E G & B, 'd', and D E A B, whose union produces E G & B, 'd, f, a'. Now, if we should suffer this chord to remain thus, it would be disagreeable to the ear, by its multiplicity of dissonances, D.E. E F, F G\*, A B, D G\*, (art. 18.); so that, to avoid this inconveniency, the generator  $\Lambda$  is immediately expunged, which, (art. 19.) is as it were understood in D, and the fifth or dominant E, whose place the sensible note D% is supposed to hold : thus there remains only the chord G B'df', wholly composed of thirds minor, and in which the dominant E is considered as understood: in such a manner that the chord G &B 'd f' represents the chord of the tonic dominant E G & B 'd', to which we have joined the chord of the sub-dominant D F A B, but in which the dominant E is always reckoned the principal note (ss).

117. Since, then, from the chord E G & B 'd', we may pass to the perfect A C 'e a', and vice versa, we may in like manner pass from the chord G% B 'd f' to the chord A C 'e a', and from this last to the chord G & B 'd f': this remark will be very useful to us in the sequel.

# CHAP. XV. Of the Preparation of Discords.

118. In every chord of the seventh, the highest Dissonance, note, that is to say, the seventh above the fundamental, is called a dissonance or discord ; thus 'f' is the dissonance of the chord G B 'd f'; 'c' in the chord D

FA'c', &c. 119. When the chord GB'df' follows the chord Manner of C E G 'c', as often happens, it is obvious that we do not dissonances find the dissonance 'f' in the preceding chord C E G'c'. investigat- Nor ought it indeed to be found in that chord; for this dissonance is nothing else but the sub-dominant added to the harmony of the dominant to determine the mode: now, the sub-dominant is not found in the harmony of the generator.

120. For the same reason, when the chord of the subdominant F-A 'c d' follows the chord CEG 'c', the note 'd', which forms a dissonance with 'c', is not found in the preceding chord.

It is not so when the chord D F A 'c' follows the chord C E G 'c'; for 'c' which forms a dissonance in the second chord, stands as a consonance in the preceding.

Dissonance -121. In general, dissonance being the production of is only to- art (chap. xi.), especially in such chords as are not of lerable to the tonic dominant nor sub-dominant, the only means when found to prevent its displeasing the ear by appearing too betethe ear in preced. rogeneous to the chord, is, that it may be, if we may ing chords. speak so, announced to the ear by being found in the

preceding chord, and by that means connect the two Theory chords. Hence follows this rule :

122. In every chord of the seventh, which is not Freparatio the chord of the tonic dominant, that is to say, (art. of dissonant 102.) which is not composed of a third major followed ces how by two thirds minor, the dissonance which this chord performed. forms ought to stand as a consonance in the chord which precedes it.

This is what we call a prepared dissonance.

See Pre-123. Hence, in order to prepare a dissonance, the paration. fundamental bass must necessarily ascend by the interval of a second, as

FA 'c';

or descend by a third, as CEG'c', ACEG;

or descend by a fifth, as

#### CEG'c', FACE:

in every other case the dissonance cannot be prepared. This may be easily ascertained. If, for instance, the fundamental bass rises by a third, as CEG'c', EGB'd', the dissonance 'd' is not found in the chord C E G 'c'. The same might be said of CEG 'c', GB 'df', and CEG'e', BD'fa', in which the fundamental bass rises by a fifth or descends by a second.

124. When a tonic, that is to say, a note which carries with it a perfect churd, is followed by a dominant in the interval of a fifth or third, this succession may be regarded as a process from that same tonic to another, which has been rendered a dominant by the addition of the dissonance.

Moreover, we have seen (art. 119. and 120.) that a dissonance does not require preparation in the chords of the tonic dominant and of the sub-dominant : whence it follows, that every tonic carrying with it a perfect chord, may be changed into a tonic dominant (if the perfect chord be major), or into a sub-dominant (whether the chord be major or minor) by adding the dissonance all at once.

### CHAP. XVI. Of the Rules for resolving Dissonances.

125. WE have seen (chap. v. and vi.) how the Dissonan diatonic scale, so natural to the voice, is formed by the ccs to be harmonies of fundamental sounds; from whence it fol-resolved, lows, that the most natural succession of harmonical must be sounds is to be diatonic. To give a dissonance then, and made in some measure, as much the character of an harmo- to appear nic sound as may be possible, it is necessary that this in the ch dissonance, in that part of the modulation where it is racter of found, should descend or rise diatonically upon another harmonic note, which may be one of the consonances of the subsequent chord.

126. Now in the chord of the tonic dominant it In the

ought chord of the tonic dominant the disso-

(ss) We have seen (art. 109.) that the chord B 'd fa', in the minor mode of A, may be regarded as the in-nance verse of the chord DFAB; it would likewise seem, that, in certain cases, this chord B'd fa' may be considered should ra as composed of the two chords F B 'd f', F A 'c d' of the dominant and of the sub-dominant of the major mode of ther rise C; which chords may be joined together after having excluded from them, 1. The dominant of the major mode of than de-its third major B, which is presumed to retain its place. 2. The note C which is understood in F, which will why. form this chord B'dfa'. The chord B'dfa', considered in this point of view, may be understood as belonging to the major mode of C upon certain occasions.

2

peory of ought rather to descend than to rise; for this reason. armony. Let us take, for instance, the chord G B 'd f' followed by the chord C E G 'c'; the part which formed the dis-

sonance 'f' ought to descend to 'e' rather than rise to 'g', though both the sounds E and G are found in the subsequent chord CEG 'c'; because it is more natural and more conformed to the connexion which eight to be found in every part of the music, that G should be found in the same part where G has already been sounded, whilst the other part was sounding 'f', as may be here seen (Parts First and Fourth).

| First part, |         |   | - | "f" "e" |  |
|-------------|---------|---|---|---------|--|
| Second,     | -       | - | - | ·d'7    |  |
| Third,      | -       | - | - | B ( 'c' |  |
| Fourth,     | -       |   | - | GG      |  |
| Fundamenta  | l bass, | - | - | GC      |  |

127. So, in the chord of the simple dominant DFA i isequenof the 'c', followed by G B 'd f', the dissonance 'c' ought raf ner ther to descend to B than rise to 'd'.

128. And, for the same reason, in the chord of the sub-dominant FA 'c d', the dissonance 'd' ought to rise to 'e' of the following chord CEG 'c, rather than descend to 'c'; whence may be deduced the following rules. Lis de-

129. 1°, In every chord of the dominant, whether ed from tonic or simple, the note which constitutes the seventh, tiformer that is to say the dissonance, ought diatonically to deseend upon one of the notes which form a consonance in the subsequent chord.

> 2°, In every chord of the snh-dominant, the dissonance ought to rise diatonically upon the third of the subsequent chord.

Monance 130. A dissonance which descends or rises diatonirelved, cally according to these two rules, is called a dissonance S Resolu- resolved.

From these rules it is a necessary result, that the chord of the seventh DFA 'c', though it should even be considered as the inverse of FA 'cd', cannot be succeeded by the chord CEG 'c', since there is not in this last chord the note B, upon which the dissonance 'c' of the chord DFA 'c' can descend.

One may hesides find another reason for this rule, in examining the nature of the double employment of dissonances. In effect, in order to pass from DFA 'c', to CEG 'c', it is necessary that DFA 'c' should in this case be understood as the inverse of FA 'cd.' Now the chord DFA 'c' can only be conceived as the inverse of FA 'c d', when this chord DFA 'c' precedes or immediately follows the CEG 'c'; in every other case the chord DFA 'c' is a primitive chord, formed from the perfect minor chord DFA, to which the dissonance 'c' was added, to take from D the character of a tonic. Thus the chord DFA 'c', could not be followed by the chord CEG 'c', but after having been preceded by the same chord. Now, in this case, the double employment would be entirely a futile expedient, without producing any agrecable effect : because, instead of this succession of chords, CEG 'c', DFA 'c', CEG 'c', it would be muchmore easy and natural to substitute this other, which furnishes this natural succession CEG 'c', FA 'cd', CEG'c'. The proper use of the double employment is, that, by means of inverting the chord of the sub-domimant, it may be able to pass from that chord thus inverted VOL. XIV. Part II.

to any other chord except that of the tonic, to which it Theory of naturally leads. Harmony.

#### CHAP. XVII. Of the Broken or Interrupted Cadence.

131. IN a fundamental bass which moves by fifths, The test of there is always, as we have formerly observed (chap. perfection viii.), a repose more or less perfect from one sound to to be found another; and of consequence there must likewise be a in the funrepose more or less perfect from one sound to another damental in the diatonic scale, which results from that bass. bass. It may be demonstrated by a very simple experiment, that the cause of a repose in melody is solely in the fundamental bass expressed or understood. Let any person sing these three notes 'cdg', performing on the 'd' a shake, which is commonly called a cadence; the modulation will appear to him to be finished after the second 'c', in such a manner that the ear will neither expect or wish any thing to follow. The case will be the same if we accompany this modulation with its natural fundamental bass CGC: but if, instead of this bass, we should give it the following, CGA: in this case the modulation 'c d c' would not appear to be finished, and the ear would still expect and desire something more. This experiment may easily be made.

132. This passage GA, when the dominant G diato- Broken canically ascends upon the note A instead of descending dences, by a fifth upon the generator C, as it ought naturally to what what, and do, is called a broken cadence; because the perfect ca- See Cadence GC, which the ear expected after the dominant dence. G, is, if we may speak so, broken and suspended by the transition from G to A.

133. Hence it follows, that if the modulation 'c d c' appeared finished when we supposed no bass to it at all, it is because its natural fundamental bass C G C is implied ; for the car desires something to follow this modulation, as soon as it is reduced to the necessity of hearing another bass.

134. The broken cadence may be considered as ha- Origin of ving its origin in the double employment of dissonances; broken since this cadence like the double employment only cadence since this cadence, like the double employment, only the double consists in a diatonic procedure of the bass ascending employ-(chap. xii.). In effect, nothing hinders us to descend ment of from the chord GB 'df' to the chord CEGA by con-dissonanverting the tonic C into a sub-dominant, that is to say, ces. by passing all at once from the mode of C to the mode of G: now to descend from GB 'df' to CEGA is the same thing as to rise from the chord GB 'df' to the chord A 'ceg', in changing the chord of the sub-dominant CEGA for the imperfect chord of the dominant, according to the laws of the double employment.

135. In this kind of cadence, the dissonance of the Manner of first chord is resolved by descending diatonically upon performing the fifth of the subsequent chord. For instance, in this cathe broken cadence G B 'd f', A'c eg', the dissonance 'f' is resolved by descending diatonically upon the fifth 'e'.

136. There is another kind of cadence, called an in-Interrupted terrupted cadence, where the dominant descends hy a cadence, third to another dominant, instead of descending by a See Cafifth upon the tonic, as in this succession of the bass dence.

Tone.

Theory of G B 'd f', E G B 'd'; in the case of an interrupted ca-Harmony. dence, the dissonance of the former chord is resolved by descending diatonically upon the octave of the fundamental note of the subsequent chord, as may be here seen, where 'f' is resolved upon the octave of E.

137. This kind of interrupted cadence has likewise this kind of its origin in the double employment of dissonances. For let us suppose these two chords in succession, G B 'd f', G B 'd e' where G is successively a tonie dominant and likewlse in sub-dominant: that is to say, in which we pass from the double the mode of C to the mode of D; if we should change the second of these chords into the chord of the dominant, according to the laws of the double employment, we shall have the interrupted cadence G B 'd f', E G B 'd.'

# CHAP. XVIII. Of the Chromatic Species.

138. THE series or fundamental bass by fifths pro-Fundamenduces the diatonic species in common use (chap. vi.); now the third major being one of the harmonics of a fundamental sound as well as the fifth, it follows, that we may form fundamental basses by thirds major, as we have already formed fundamental basses by fifths.

139. If then we should form this base C, E, G%, tic interval the two first sounds earrying each along with it their thirds major and fifths, it is evident that C will give G, and that E will give G : now the semitone which See fig. 10, is between this G and this G% is an interval much less than the semitone which is found in the diatonic scale between E and F, or between B and 'c'. This may be ascertained by calculation (TT): and for this reason the semitone from E to F is called major, and the other minor (UU).

140. If the fundamental bass should proceed by thirds minor in this manner, C, Eb, a succession which is allowed when we have investigated the origin of the minor mode (chap. ix.), we shall find this mo-

dulation G, Gb, which would likewise give a minor Theory of semitone (XX.)

141. The minor semitone is hit by young practi-An intonationers in intonation with more difficulty than the se-tion minor mitone major. For which this reason may be assign-semitone ed : The semitone major which is found in the diato-difficultto nie scale, as from E to F, results from a fundamen-be hit, and tal bass by fifths CF, that is to say, by a succession why. which is most natural, and for this reason the easiest to the car. On the contrary, the minor semitone arises from a succession by thirds, which is still less natural than the former. Hence, that scholars may truly hit the minor semitone, the following artifice is employ-Let us suppose, for instance, that they intend to ed. rise from G to GX; they rise at first from G to A, then descend from A to G% by the interval of a semitone major : for this G sharp, which is a semitone major below A, proves a semitone minor above G. [See the notes (TT) and (UU).]

142. Fivery procedure of the fundamental bass by Minor sethirds, whether major or minor, rising or descending, mitone to gives the minor semitone. This we have already seen every profrom the succession of thirds in ascending. The series cedure of of thirds minor in descending, C A, gives, C, C & the funda-(YY); and the series of thirds major in descending, C, mental Ab, gives C, Cb, (zz). thirds.

143. The minor semitone constitutes the species, The minor called chromatic ; and with the species which moves by semitone, diatonic intervals, resulting from the succession of when prefifths (chap. v. and vi.), it comprehends the whole of valent, chromatic melody. music.

# CHAP. XIX. Of the Enharmonic Species.

144. THE two extremes, or highest and lowest notes, Diesis or C G%, of the fundamental bass by thirds major CEG%, nic inter-give this modulation 'c' B%; and these two sounds 'c' val, what, B\*, differ between themselves by a small interval which and how is called the diesis, or cnharmonic fourth\* of a tone (3A). formed. which \* See Fourth of

(TT) In reality, C being supposed 1, as we have always supposed it, E is  $\frac{4}{3}$  and  $\frac{3}{75}$ : now G being  $\frac{1}{2}$ , G then shall be to G as  $\frac{25}{76}$  to  $\frac{3}{2}$ ; that is to say, as 25 times 2 to 3 times 16: the proportion then of GX to G is as 25 to 24, an interval much less than that of 16 to 15, which constitutes the semitone from 'c' to B, or from F to E (note z).

(UU) A minor joined to a major semitone will form a minor tone; that is to say, if one rises, for instance, from E to F, by the interval of a semitone major, and afterwards from F to F% by the interval of a minor semitone, the interval from E to F% will be a minor tone. For let us suppose E to be I, F will be 3, and F% will be 24 of  $\frac{16}{75}$ ; that is to say, 25 times 16 divided by 24 times 15, or  $\frac{10}{9}$ ; E then is to F as one is to  $\frac{10}{9}$ , the interval which constitutes the minor tone (note BB).

With respect to the tone major, it cannot be exactly formed by two semitones; for, 1. Two major semitones in immediate succession would produce more than a tone major. In effect,  $\frac{1}{7}\frac{6}{5}$ , multiplied by  $\frac{1}{75}$  gives  $\frac{255}{257}$ , which is greater than 3, the interval which constitutes (note BB) the major tone. 2. A semitone minor and a semitone major would give less than a major tone, since they amount only to a true minor. 3. And, à fortiori, two minor semitones would still give lcss.

(xx) In effect, Eb being  $\frac{\sigma}{3}$ , Gb will be  $\frac{\sigma}{3}$  of  $\frac{\sigma}{5}$ ; that is to say, (note a)  $\frac{3\sigma}{23}$ : now the proportion of  $\frac{1}{2}$  to  $\frac{3\sigma}{23}$ (note a) is that of 3 times 25 to 2 times 36; that is to say, as 25 to 24.

 $(\Upsilon \Upsilon)$  A being  $\frac{5}{6}$  C is  $\frac{5}{4}$  of  $\frac{5}{6}$ ; that is to say,  $\frac{25}{24}$ , and C is I: the proportion then between C and C is that of I to  $\frac{15}{24}$ , or of 24 to 25.

(zz) Ab being the third major below C, will be  $\frac{4}{3}$  (note Q): Cb, then, is  $\frac{7}{3}$  of  $\frac{4}{3}$ ; that is to say  $\frac{24}{33}$ . The proportion, then, between C and Cb, is as 25 to 24.

(3 A) G% being  $\frac{15}{16}$  and B% being  $\frac{5}{4}$  of  $\frac{15}{76}$ , we shall have B% equal (note Q) to  $\frac{125}{64}$ , and its octave below shall be  $\frac{125}{18}$ ; an interval less than unity by about  $\frac{1}{268}$  or  $\frac{4}{43}$ . It is plain then, from this fraction, that the B% in question must be considerably lower than C. 5

formed by thirds major.

tal bass

A-chromaor minor semitone.
upon

des.

heory of which is the difference between a semitone major and a armony semitone minor (3 B). This quarter tone is inappretiable by the car, and impracticable upon several of our instruments. Yet have means been found to put it in practice in the following manner, or rather to perform what will have the same effect upon the ear.

145. We have explained (art. 116.) in what mananner of mingly ner the chord G & B 'd f' may be introduced into the roducing minor mode, entirely consisting of thirds minor perfects interly true, or at least supposed such. This chord supplytruments ing the place of the chord of the dominant (art. 116.) from thence we may pass to that of the tonic or generator A (art. 117.). But we must remark,

1. That this chord GX B 'd f', entirely consisting of thirds minor, may be inverted or modified according to the three following arrangements, B 'd f g %', D F G & B, F G & B 'd'; and that in all these three different states, it will still remain composed of thirds minor; or at least there will only be wanting the enharmonic fourth of a tone to render the third minor between F and G% entirely just; for a true third minor, as that from E to G in the diatonie scale, is composed of a semitone and a tone both major. Now from F to G there is a tone major, and from G to GX there is only a minor semitone. There is then wanting (art. 144.) the enharmonic fourth of a tone, to render the third F GX exactly true.

2. But as this division of a tone cannot be found in the gradations of any scale practicable upon most of our instruments, hor be appretiated by the car, the car Theory of takes the different chords. Harmony

| B   | ٠d' | 6f? | 'gx' |
|-----|-----|-----|------|
| D   | F   | G*  | B    |
| F   | GX  | B   | ٠d?, |
| 4 1 |     |     | C '  |

which are absolutely the same, for chords composed every one of thirds minor are exactly just.

Now the chord G & B 'd f', belonging to the minor mode of A, where G\* is the sensible note; the chord B 'd f g %', or B 'd f ab', will, for the same reason, belong to the minor mode of C, where B is the sensible note. In like manner, the chord D F GX B, or DF Ab 'cb', will belong to the minor mode of Eb, and the chord F G B 'd', or F Ab 'ch ebb', to the minor mode of Gb.

After having passed then by the mode of A to the ehord  $G \otimes B$  d f' (art. 117.), one may by means of this last chord, and by merely satisfying ourselves to invert it, afterwards pass all at once to the modes of C minor, of Eb minor, or of Gb minor; that is to say, into the modes which have nothing, or almost nothing, in common with the minor mode of A, and which are entirely foreign to it (3 c).

146. It must, however, he acknowledged, that a The alteratransition so abrupt, and so little expected, cannot de-tion, howceive nor elude the ear; it is struck with a sensation ever, by so unlooked for, without being able to account for the effectuated passage to itself. And this account has its foundation abrupt and in the enharmonie fourth of a tone; which is overlook-sensible. 3 X 2 'ed

This interval has been called the fourth of a tone, and this denomination is founded on reason. In effect, we may distinguish in music four kinds of quarter tones.

1. The fourth of a tone major : now, a tone major being ?, and its difference from unity being I, the difference of this quarter tone from unity will be almost the fourth of  $\frac{1}{5}$ ; that is to say,  $\frac{1}{32}$ .

2. The fourth of a tone minor; and as a tone minor, which is y, differs from unity by 5, the fourth of a minor tone will differ from unity about 16.

3. One half of a semitone major; and as this semitone differs from unity by  $\frac{1}{15}$ , one half of it will differ from unity about To.

4. Finally, one half of a semitone minor, which differs from unity by 1/24 : its half then will be 45.

The interval, then, which forms the enharmonic fourth of a tone, as it does not differ from unity but by Tro may justly be called the fourth of a tone, since it is less different from unity than the largest interval of a quarter tone, and more than the least.

We shall add, that since the enharmonic fourth of a tone is the difference between a semitone major, and a semitone minor; and since the tone minor is formed (note UU) of two semitones, one major and the other minor; it follows, that two semitones major in succession form an interval larger than that of a tone by the enharmonic fourth of a tone; and that two minor semitones in succession form an interval less than a tone by the same fourth of a tone.

(3 B) That is to say, that if you rise from E to F, for instance, by the interval of a semitone major, and afterwards, returning to E, you should rise by the interval of a semitone minor to another sound which is not in the scale, and which I shall mark thus, F+, the two sounds F+ and F will form the enharmonie fourth of a tone : for E being 1, F will be  $\frac{1}{25}$ ; and  $F + \frac{3}{25}$ ; the proportion then between F + and F is that of  $\frac{2}{25}$  to  $\frac{1}{15}$  (note Q); that is to say, as 25 times 15 to 16 times 24; or otherwise, as 25 times 5 to 16 times 8, or as 125 to 128. Now this proportion is the same which is found, in the beginning of the preceding note, to express the enharmonic fourth of a tone.

(3 c) As this method for obtaining or supplying enharmonic gradations cannot be practised on every oceasion when the composer or practitioner would wish to find them, especially upon instruments where the scale is fixed and invariable, except by a total alteration of their economy, and re-tuning the strings, Dr Smith in his Harmonics has proposed an expedient for redressing or qualifying this defect, by the addition of a greater number of keys or strings, which may divide the tone or semitone into as many appretiable or sensible intervals as may be necessary. For this, as well as for the other advantageous improvements which he proposes in the structure of instrus ments, we cannot with too much warmth recommend the perusal of his learned and ingenious book to such of our readers as aspire to the character of genuine adepts in the theory of music.

532

Theory of ed as nothing, because it is inappretiable by the ear; Harmony. but of which, though its value is not ascertained, the whole harshness is sensibly perceived. The instant of surprise, however, immediately vanishes ; and that astonishment is turned into admiration, when one feels himself transported as it were all at once, and almost imperceptibly, from one mode to another, which is by no means relative to it, and to which he never could have immediately passed by the ordinary series of fundamental notes.

## CHAP. XX. Of the Diatonic Enharmonic Species.

147. IF we form a fundamental bass, which rises alternately by fifths and thirds, as F, C, E, B, this bass See fig. 12. will give the following modulation 'f, e, e, dX'; in

which the semitones from 'f' to 'e', and from 'e' to 'd X', are equal and major (3 D).

This species of modulation or of harmony, in which See Enhar-all the semitones are major, is called the cnharmonic diatonic species. The major semitones peculiar to this

species give it the name of diatonic, because major semitones belong to the diatonic species; and the tones which are greater than major by the excess of a fourth, resulting from a succession of major semitones, give it the name of enharmonic (note 3 A).

## CHAP. XXI. Of the Chromatic Enharmonic Species.

148. IF we pass alternately from a third minor in Chromatic descending to a third major in rising, as C, C, A, C\*, enharmo-C%, we shall form this modulation 'eb, e, e, e e ex', in nic intervals, how which all the semitones are minor (3 E).

This species is called the chromatic enharmonic spe-See fig. 13. cics: the minor semitones peculiar to this kind give it From this species, the the name of chromatic, bceause minor semitones belong effects of to the chromatic species; and the semitones which are harmony and melo- lesser by the diminution of a fourth resulting from a succession of minor semitones, give it the name of endy appear to he in the harmonic (note 3 F). fundamen-

149. These new species confirm what we have all along said, that the whole effects of harmony and melody reside in the fundamental bass.

1 50. The diatonic species is the most agreeable, be-Diatonic species cause the fundamental bass which produces it is formed from a succession of fifths alone, which is the most able, and natural of all others. The chro-

151. The chromatic being formed from a succession matic vext. of thirds, is the most natural after the preceding.

152. Finally, the enharmonic is the least agreeable Lastly, the of all, because the fundamental bass which gives it is

not immediately indicated by nature. The fourth of Theory of a tone which constitutes this species, and which is it- Harmony, self inappretiable to the ear, neither produces nor can produce its effect, but in proportion as imagination suggests the fundamental bass from whence it results; a bass whose procedure is not agreeable to nature, since it is formed of two sounds which are not contiguous oneto the other in the series of thirds (art. 144.).

### CHAP. XXII. Showing that Melody is the Offspring of Harmony.

153. ALL that we have hither to said, as it seems to of melody me, is more than sufficient to convince us, that melody to be inve has its original principle in harmony; and that it is intigated in harmony, expressed or understood, that we ought to harmony look for the effects of melody. or under-

154. If this should still appear doubtful, nothing more stood, is necessary than to pay due attention to the first experiment (art. 19.), where it may be seen that the prineipal sound is always the lowest, and that the sharper sounds which it generates are with relation to it what the treble of an air is to its bass.

155. Yet more, we have proved, in treating of the broken cadence (ehap. xvii.), that the diversification of basses produces effects totally different in a modulation which, in other respects, remains the same.

156. Can it be still necessary to adduce more convincing proofs ? We have but to examine the different basses which may be given to this very simple modulation GC. It will be found susceptible of many, and each will give a different character to the modulation GC, though in itself it remains always the same. We may thus change the whole nature and effects of a modulation, without any other alteration than that of its fundamental bass.

M. Rameau has shown, in his New System of Music, printed at Paris 1726, p. 44. that this modulation G, C, is susceptible of 20 different fundamental basses. Now the same fundamental bass, as may be seen in our sceond part, will afford several continued or thorough basses. How many means, of consequence, may be practised to vary the expression of the same modulation ?.

157. From these different observations it may be Conseque concluded, 1. That an agreeable melody, naturally im- ces dedu plies a bass extremely sweet and adapted for singing; ble from and that reciprocally, as musicians express it, a bass of this printhis kind generally prognosticates an agreeable me-ciple.

lody (3 F). 2. That the character of a just harmony is only to form in some measure one system with the modulation,

(3 D) It is obvious, that if F in the bass be supposed I, 'f' of the scale will be 2, C of the bass  $\frac{3}{2}$  and 'e' of the scale  $\frac{5}{4}$  of  $\frac{3}{2}$ , that is  $\frac{1}{5}$ ; the proportion of 'f' to 'e' is as 2 to  $\frac{1}{5}$ , or as I to  $\frac{1}{5}$ . Now E of the bass being fikewise  $\frac{5}{4}$  of  $\frac{1}{2}$ , or  $\frac{1}{5}$ ; B of the bass is  $\frac{3}{2}$  of  $\frac{1}{5}$ , and its third major D $\overset{\times}{\underline{5}}$  of  $\frac{1}{2}$  of  $\frac{1}{5}$ , or  $\frac{1}{5}$  of  $\frac{1}{5}$ ; this third major, approximated as much as possible to 'e' in the scale by means of octaves, will be  $\frac{1}{5}$  of  $\frac{1}{5}$ : 'e' then of the scale will be to 'd' which follows it, as  $\frac{1}{5}$  is to  $\frac{1}{5}$  of  $\frac{1}{5}$ , that is to say, as I to  $\frac{1}{5}$ . The semitones then from the scale by the value of the scale by the 'f' to 'e', and from 'e' to 'd' , are both major.

(3 E) It is evident that 'e'b is  $\frac{6}{3}$  (note Q), and that 'e' is  $\frac{5}{4}$ : these two 'c's, then, are between themselves as  $\frac{6}{3}$ to  $\frac{5}{4}$ , that is to say, as 6 times 4 to 5 times 5, or as 24 to 25, the interval which constitutes the minor semitone. Moreover, the A of the bass is  $\frac{5}{6}$ , and C  $\times \frac{5}{4}$  of  $\frac{5}{6}$ , or  $\frac{25}{24}$ : 'e' then is  $\frac{5}{4}$  of  $\frac{25}{24}$ , the 'e' in the scale is likewise to the 'e' which follows it, as 24 to 25. All the semitones therefore in this seale are minor.

(3 F) Many composers begin with determining and writing the bass; a method, however, which appears in general

monic.

puciples so that from the whole taken together, the ear may ono mposi-ly receive, if we may speak so, one simple and indivisible impression. non.

3. That the character of the same modulation may be diversified, according to the character of the bass which is joined with it.

But notwithstanding the dependency of melody upon harmony, and the sensible influence which the latter may exert upon the former; we must not however conclude, with some eelebrated musicians, that the effects of harmony are preferable to those of melody. Experience proves the contrary. [See, on this account, what is written on the license of music, printed in tom. iv. of D'Alembert's Melanges de Literature, p. 448.7.

#### GENERAL REMARK.

Principles of Composition.

The diatonie seale or gammut being composed of twelve semitones, it is clear that each of these semitones taken by itself may be the generator of a mode; and that thus there must be twenty-four modes in all, twelve major and twelve minor. We have assumed the major mode of C, to represent all the major modes in general, and the minor mode of A to represent the modes minor, to avoid the difficulties arising from sharps and flats, of which we must have encountered either a greater or lesser number in the other modes. But the rules we have given for each mode are general, whatever note of the gammut be taken for the generator of a mode.

## PART II. PRINCIPLES AND RULES OF COMPOSITION.

158. COMPOSITION, ealled also counterpoint, is ticin harnot only the art of composing an agreeable air, but also that of composing several airs in such a manner that when Se lompo-heard at the same time, they may unite in producing an effect agreeable and delightful to the ear; this is what we eall composing music in several parts.

> The highest of these parts is called the treble, the lowest is termed the bass; the other parts, when there are any, are termed middle parts; and each in particular is signified by a different name.

#### CHAP. I. Of the Different Names given to the same Interval.

159. In the introduction (art. 9.), we have seen a Pa cular int rals detail of the most common names given to the different sig ied by intervals. But particular intervals have obtained difna's, and ferent names, according to circumstances ; which it is proper to explain.

160. An interval composed of a tone and a semi-Se id rede ant, tone, which is commonly ealled a third minor, is likewise sometimes called a second redundant; such is the interval from C to DX in ascending, or that of A to. Gb deseending.

> This interval is so termed, because one of the sounds. which form it is always either sharp or flat, and that, if that sharp or flat be taken away, the interval will be that of a second (3 G).

Fa fifth, 161. An interval composed of two tones and two semitones, as that from B to 'f', is ealled a false fifth. This interval is the same with the tritone (art. 9.), since two tones and two semitones are equivalent to threetones. There are, however, reasons for distinguishing them, as will appear below.

162. As the interval from C to DX in ascending Fifth rehas been called a second redundant, we likewise call dundant, the interval from C to G% in ascending, a fifth redun. what, dant, or from B to Eb in descending, each of which intervals is composed of four tones (3 H).

This interval is, in the main, the same with that of Distinthe sixth minor (art. 6): but in the fifth redundant guished there is always a sharp or flat; insomuch, that if this from the sharp or flat were removed the interval would have sixth misharp or flat were semoved, the interval would become nor. a true fifth.

163. For the same reason, an interval composed of Seventh dithree tones and three semitones, as from G% to 'f' in minished, ascending, is called a seventh diminished; because, if what. we remove the sharp from G, the interval from G to 'f' will become that of an ordinary seventh. The interval of a seventh diminished is in other respects the same with that of the sixth major (art. 9.) (3 1).

164. The major seventh is likewise sometimes called Seventh a seventh redundant (3 K). major and

redundant coincident.

#### CHAP. II. Comparison of the Different Intervals.

165. IF we sing 'c' B in descending by a second, Notes in and afterwards C B in ascending by a seventh, these different two B's shall be octaves one to the other; or, as we octaves or commonly express it, they will be *replications* one of scales repli-cations the other. each of the

166. On account then of the resemblance between other, every

general more proper to produce a learned and harmonious music, than a strain prompted by genius and animated by enthusiasm.

(3 G) For the same reason, this interval is frequently termed by English musicians an extreme sharp second.

(3 H) This interval is usually termed by English theorists a sharp fifth.

(3 1) The material difference between the diminished seventh and the major sixth is, that the former always implies a division of the interval into three minor thirds, whereas a division into a fourth and third major, or into a second and major and minor third, is usually supposed in the latter.

(3 K) The chief use of these different denominations is therefore to distinguish chords: for instance, the chord of the redundant fifth and that of the diminished seventh are different from the chord of the sixth; the chord of the seventh redundant, from that of the seventh major. This will be explained in the following. chapters. 3

Principles every sound and its octave (art. 22.), it follows, that of Composi- to rise by a seventh, or descend by a second, amount to tion.

, the same thing. 167. In like manner, it is evident that the sixth desdescend to cending is nothing but a replication of the third ascendone rep'ica-ing, nor the fourth descending but a replication of the fifth ascending.

168. The following expressions either are or ought to be regarded as synonymous.

To rise by a second .- To descend by a seventh. To descend by a second .- To rise by a seventh. To rise by a third .- To descend by a sixth. To descend by a third .- To rise by a sixth. To rise by a fourth .- To descend by a fifth. To descend by a fourth .- To rise by a fifth.

169. Thus, therefore, we shall employ them indiffer- Principles ently the one for the other ; so that when we say, for of Composition instance, to rise by a third, it may be said with equal, tion. propriety to descend by a sixth, &c.

## CHAP. III. Of the Cleffs ; of the Value or Quantity ; of the Rhythm ; and of Syncopation.

170. THERE are three cleffs + in music ; the F cleff + See Cleff Cleffs, D:; the C cliff | ; and the G cleff 6. what,

The F cleff is placed on the fourth line (3 L) or on and how the third ; and the line on which this cleff is placed gives placed. the name of F to all the notes on that line.

The C cleff is placed on the fourth, the third, the Fig. 7.1. second, or the first line : and in these different positions Fig. 7.2.

all

(3 L) Our author has treated this part of his subject with somewhat less perspicuity than usual. He has neither described the staffs or systems of lines on which the cleffs are placed, nor explained their relation to each other. We have therefore attempted to supply the deficiency.

Musical sounds, like language, are represented by written characters, by which their graveness or acuteness, their duration, and the other qualities intended to be assigned to them, are accurately distinguished.

The characters which denote the graveness or acuteness, or, as it is termed, the pitch of sounds, are intended to represent the ordinary limits of the human voice, in the exercise of which, or the employment of instruments

of nearly the same compass with it, all practical music consists. From the lowest distinct note, without straining, of the masculine voice, to the highest note generally produced by the female voice, there is an interval of three octaves, or twenty-two diatonic notes.

These notes are represented by characters described alternately on eleven parallel lines, and the spaces between

them, forming what we shall here term the general system. The characters representing the notes are differently formed according to their duration, but with this we have

at present no concern. We shall employ the simplest, a small circle or ellipse. The whole extent of the human voice, then, if described upon the general system, would be represented as at

The masculine voice, rising from the lowest note of the general system, will, generally speaking, reach the Plate CCCLV. fig. 1. note on the central line ; and an ordinary female voice will reach the same note, descending from the highest. Male voices more acute, and female voices graver than usual, will consequently execute this note with greater

This central note, then, being producible by every species of voice, has been assumed as a fundamental or key facility. note, by which all the others are regulated (art. 4.). And to it is assigned the name of C, by which, in the theory of harmony, (as we have seen), the fundamental sound of the diatonic scale is distinguished.

The other notes take their denominations accordingly. The note below it is B, that above it 'd', &c. ; and to distinguish this central C from its octaves, it is called the middle or tenor C.

As no human voice can execute the whole twenty-two notes, the general system is divided into portions of five lincs, each portion representing the compass of an ordinary voice; and different portions are made use of, according to the graveness or acuteness of different voices.

The five lines in this state form what is called a staff. Each staff is subdivided into lines and spaces. On the lines, and in the spaces, the heads of the notes are placed. The lines and spaces are counted upwards, from the lowest to the highest ; the lowest line is termed the first line ; the space between it and the second line is denominated the first space, and so on. Both lines and spaces have the common name of degrees ; the staff thus contains nine degrees, viz. five lines and four spaces.

To ascertain what part of the general system is formed by a staff; one of the cleff's mentioned in the text is placed at the beginning of the staff, on one or other of the lines of it.

The C or tenor cleff always denotes the line on which it is placed to be that which carries the tenor C. The G or treble cleff distinguishes the line carrying 'g', the perfect fifth *above* the tenor C. And the F or bass cleff ascertains the line which represents F the perfect fifth *below* the tenor C.

The figures of the cleffs, (which are characters gradually corrupted from the Gothie C, G, and F), and their places in the general system, appear on Plate CCCLV. fig. 2.

By this disposition of the cleffs, we see that the staff, which includes the line bearing the treble cleff, is formed by the five highest lines of the general system ; and that the staff which comprehends the bass cleff consists of the five lowest.

The central line, which carries the tenor C, belongs neither to the treble nor the bass staves. But as that note frequently occurs in composition written on these staves, a small portion of the tenor line is occasionally introduced below the treble cleff and above that of the bass (fig. 3.).

tion, and rise to another, has the same effect. Detail of replications. Examples +of this.

principles all the notes on the same line with the cleff take the Composi-name of C.

tion. The G cleff is placed on the second or first line; and all the notes on the line of the cleff take the name of G.

iames of 171. As the notes are placed on the lines, and in he notes to the spaces between the lines, the name of any note may e investibe discovered from the position of the cleff. Thus, in ated from the F cleff, the note on the lowest line is G; the note on of the space between the two first lines A; the note on second line B, &c.

tarks and 172. A note before which there is a sharp (marked wer of thus \*) must be raised by a semitone; and if there be urps, flats, a flat (marked b) before it, it must be depressed by a d natu-semitone.

The natural (marked thus \$) restores to its natural Principles value a note which had been raised or depressed by a of Composisemitone.

173. When a sharp or a flat is placed at the cleff, Fig 8. all the notes upon the line or space on which this sharp or flat is marked, are sharp or flat. For instance, if in the eleff of G a sharp be placed on the highest line, which is the place of f', all the notes on that hine will be  $f \otimes f'$ —to restore them to the original value of f' natural, a  $\natural$  must be placed before them.

In the same manner, if a flat be marked at the cleff, Fig. 9. all the notes on the same line or space with the flat will be flat; to restore them to their natural state, a h must be placed before them (3 M).

174. Every piece of music is divided into different Bars and equal Times, what,

As notes still more remote from the staff in use are sometimes introduced, small portions of the lines to which these lines belong are employed in the same manner. Thus, if in writing in the bass staff we want the note properly placed on the lowest line of the treble staff, we draw two short lines above the bass staff, one representing the tenor line, and the other the lowest line of the treble staff, and on this last short line we place the note in question, (fig. 4.).

On the other hand, if, in writing on the treble staff, we would employ a note properly belonging to the bass staff, we place it below the treble staff, and insert the requisite short lines, representing the corresponding lines of the general system (fig. 5.).

The occasional short lines thus employed are termed leger lines.

The same expedient is used to represent notes beyond the limits of the general system. Thus, we write the F which is one degree lower than the lowest G of the bass staff, on the space below that G; the E immediately lower, or on a leger line below the bass staff, and so on. Notes in this position are termed *double*; thus, the F just mentioned is double F, or FF; the E, or double E, EE, &c.

just mentioned is double F, or FF; the E, or double E, EE, &c. Again, the 'a' above the highest 'g' of the treble staff is placed on a leger line above that staff. The 'b' is placed on the space above the leger line : The next note 'c' is set on a second leger line, and so on. These high notes are, in compositions for some instruments, carried more than an octave above the general system. Those in the first octave are said to be *in alt*; those beyond it, to be *in altissimo*.

The tenor or C cleff is employed to form different intermediate staves between the treble and bass, according to the compass of the voice or instrument for which the staff is wanted.

Compositions for the gravest masculine voices and instruments are written on the bass cleff, and those for fe male voices and instruments highest in tone, on the treble staff \*.

For masculine voices next in depth to the bass, and for the higher octave of the violoncello and bassoon, a staff, called the *tenor staff*, is formed by adding to the tenor line the three highest lines of the bass staff and, the lowest line of the treble (fig. 6. 1.).

For the highest masculine voices, which are called *counter tenor*, and for the tenor violin, a staff is formed by the tenor line, the two highest lines of the bass, and the two lowest of the treble staff (fig. 6. 2.).

For the gravest female voices, which are called mezzo soprano, the tenor line and four lowest lines of the treble form a staff (fig. 6. 3.)

The relation of all the staves to the general system, and to each other, will appear from fig. 6.

The bass cleff on the third line, the tenor cleff on the second, and the treble cleff on the first, rarely occur, except in old French music.

The tenor cleff, and the staves distinguished by it, are now less frequently used than the treble and bass cleffs. Those who cultivate music only as an annusement find it irksome to learn so many modes of notation. The tenor staves are accordingly banished from compositions for keyed instruments. Secular compositions for voices are likewise now written in the treble and bass staves only; although in this there is some inaccuracy, as the tenor parts now written in the treble staff, must often be sung an octave below that in which they appear. The chief use of the tenor cleff is in choral music and compositions for the bassoon and tenor violin; and its principal advantage, the facility of reading ancient music, which is almost exclusively written in this cleff, has seldom been deemed an insufficient recompense for the labour of acquiring it.

(3 M) The disposition of sharps or flats at the cleff, which is termed the signature, depends upon the mode, or tone assumed in the composition as a fundamental or key note, and will be afterwards explained.

The sharps or flats of the signature affect not only the notes placed on the same degree with themselves, as mentioned in the text, but also all the notes of the same letter, in every octave throughout the movement.

The sharps or flats of the signature determine the seale in which the movement is composed, and are therefore said to be essential; those which occur in the course of the picce on an occasional change of the scale, are termed accidental.

\* Compositions for French horns are written in the treble staff, although the tone of the instrument be very grave; but this is he-

Principles equal times, called measures; and each measure is likeof Composi-wise divided into different times.

tion. See Time.

There are properly two kinds of measures or modes of time; the measure of two times, or common time, marked by the figure 2 at the beginning of the time (fig. 10.); and the measure of three times, or triple time, marked

by the figure 3 placed in the same manner (fig. 11.).

The different measures are distinguished by perpendicular lines (3 N), called bars.

In a measure, we distinguish between the strong and the weak time : the strong time is that which is beat; the weak, that in which the hand or foot is raised. A measure consisting of four times ought to be considered as compounded of two measures, each consisting of two times: thus there are in this measure two strong and two wcak times. In general by the words strong

and weak even the parts of the same time are distin- Principle guished ; thus, the first note of each time is considered of Compe as strong and the others as weak.

175. The longest of all notes is a semibreve. A mi-The value nim is half its value; that is to say, two minims are to of notes be performed in the time occupied by one semibreve duration. A minim in the same manner is equivalent to two Fig. 12. crotchets, the crotchet to two quavers (3 0).

176. A note which is divided into two parts by a Syncopa bar, that is, which begins at the end of a measure, and tion, wh terminates in the measure following, is called a synco- See Syn pated note (3 P).

177. A note followed by a point or dot is increased value ci balf its value. Thus a dotted semibreve is equivalent a pointer to a semibreve and a minim, a dotted minim, to a mi-note. nim and a crotchet, &c. (Fig. 17.) (3 a).

CHAP.

(3 N) All the notes, therefore, contained between two bars constitute one measure ; although in common lan. guage the word bar is improperly used for measure.

(3 0) The notes, in their figure, consist of a *head* and a *stem*, except the semibreve, which has a *head* only. The place of the note in the staff is determined by the *head*, which must be placed on the line, or in the space,

assigned to the note. The stem may be turned either up or down.

The quaver is equivalent to two semiquavers, and the semiquaver to two demi-semiquavers. In modern music the demi-semiquaver is also subdivided.

The quaver and the notes of shorter duration may be grouped together, by two, three, or four, &c. and joined by as many black lines across the ends of the stem as there are hooks in the single note (fig. 12). This arrangement is convenient in writing, and assists the eye in performance.

When quavers, or the shorter notes, are to be repeated in the same degree for a time equal to the duration of a longer note, the iterations are, by a sort of musical short-hand, represented by writing the long note only, and placing over or under it, as many short lines as the short note has hooks (fig. 13.) And the repetition of a series of short notes is represented by merely writing for each repetition as many short lines as there are hooks to the short notes of which the series is composed (fig. 14.).

(3 P) A note in the middle of a measure is also said to be syncopated when it begins on a strong, and ends on a weak part of the measure, (see fig. 15.) where D, C, and B are each of them syncopated.

A note which of itself occupies one, two, or more measures, is not said to be syncopated, but continued or protracted. See fig. 16.

(3 2) Notes have sometimes in modern music a double dot after them, which makes them longer by threefourths. Thus a minim twice dotted is equal to three crotchets and a half, or seven quavers, &c.

Our author, in this chapter, has omitted the explanation of rests, and of the particular modifications of time. Rests are characters indicating the temporary suspension of musical sounds. There are as many different rests as there are notes. Thus the semibreve rest indicates a pause of the duration of a semibreve; the minim rest, of

a minim, &c. (fig. 18.). The semibreve rest also denotes the silence of one entire measure, in triple as well as common time. The silence of several measures is marked as in fig. 18.; but where the silence exceeds three bars, the number is usually marked over the rests.

Common time is either of a semibreve, or of a minim to the measure.

Common time of a semibreve is indicated by the letter C at the cleff, fig. 1. of Plate CCCLVI. When it is meant to be somewhat quicker than usual, a perpendicular line is drawn through the C, (fig. 2.).

Common time of a minim to the measure, which is called half time, is indicated by the fraction  $\frac{2}{4}$ , that is, twofourths of a semibreve, or two crotchets equal to a minim, (fig. 3.).

In triple time the measure consists of three minims, three crotchets or three quavers, six crotchets or six quavers, nine quavers or twelve quavers.

Triple time of three minims is marked at the cleff  $\frac{1}{2}$ , that is, three halves of a semibreve, (fig. 4.)

Triple time of three crotchets is indicated by the fraction  $\frac{3}{4}$ , (three-fourths of a semibrevc) (fig. 5.) and that of three quavers by  $\frac{3}{8}$  (three-eighths of a semibreve), (fig. 6.)

In the last three examples the measure is divided into three times, of which the first is strong, and the two others weak.

The measure of six crotchets is marked  $\frac{6}{4}$ , (fig. 7.); and that of six quavers  $\frac{6}{8}$ , (fig. 8.). In both there are two times, of which the first is strong, and the second weak.

The measure of nine quavers is marked 2, (fig. 9.); and is divided into one strong and two weak times. That of twelve quavers is marked ". (fig. 10.); and is accented as if it were two measures of six quavers.

The measures of  $\frac{9}{4}$  and  $\frac{9}{16}$  rarely occur. Three notes are often performed in the time of two of the same name, and are then termed triplets, (fig. 11.)

# CHAP. IV. Definition of the principal Chords.

178. (3R) THE chord composed of a third, a fifth, and an octave, as C, E, G, C, is called a perfect chord (art. 32.).

If the third be major, as in C, E, G, C, the perfect chord is denominated major : if the third be minor, as in A, C, E, A, the perfect chord is minor. The perfect chord major constitutes the major mode; and the perfect chord minor, the minor mode (art. 31.).

179. A chord composed of a third, a fifth, and a seventh, as G, B, D, F, or D, F, A, C, &e. is called a chord of the seventh. Such a chord is wholly comhat, and posed of thirds in ascending.

All chords of the seventh are practised in harmony, save that which might carry the third minor and the seventh major, as C Eb G B; and that which might earry a false fifth and a seventh major, B D F A\*, (ehap. xiv. Part I.).

180. As thirds are either major or minor, and as they may be differently arranged, it is clear that there are different kinds of chords of the seventh; there is even one, B D F A, which is composed of a third, a false fifth, and a seventh.

181. A chord composed of a third, a fifth, and a sixth, as FACD, DFAB, is called a chord of the greater sixth.

182. Every note which earries a perfect chord is ealled a tonic; and a perfect chord is marked by an 8, by a 3, or by a 5, which is written above the note; but frequently these numbers are suppressed. Thus in the example 1. the two C's equally carry a perfect (LVII chord.

183. Every note which earries a chord of the seventh y t, and is called a dominant (art. 102.); and this chord is hords. marked by a 7 written above the note. Thus in the figurexample 11. D carries the chord D F A C, and G the ehord G B D F. Il inant,

It is necessary to remark, that among the chords Vol. XIV. Part II.

of the seventh we do not reekon the chord of the Principles seventh diminished, which is only improperly ealled a of Composichord of the seventh ; and of which we shall say more tion. below.

184. Every note which carries the chord of the great Sub-domisixth, is ealled a subdominant, (art. 97. and 42.) and naut what, is marked with a 6. Thus in the example III. Fand how earries the chord of FACD. The sixth should al-figured. ways be major, (art. 97. and 109.).

185. In every chord, whether perfect, or a chord Fundamen-of the seventh, or of the great sixth, the note which tal note, earries this chord, and which is the flattest or lowest, what. is called the fundamental note. Thus C in the ex-See Funample I. D and C in the example II. and F in the ex- damental. ample III. are fundamental notes.

186. In every chord of the seventh, and of the great Dissonance sixth, the note which forms the seventh or sixth above of a chord, the fundamental, that is to say, the highest note of the what. chord, is called a *dissonance*. Thus in the chords of the seventh G B D F, D F A C, F and C are the dissonance is E with what. dissonances, viz. F with relation to G in the first chord, and C with relation to D in the second. In the chord of the great sixth F A C D, D is the dissonance (art. 120.); but that D is only, properly speaking, a dissonance with relation to C from which it is a second, and not with respect to F from which it is a sixth major (art. 17. and 18.).

187. When a chord of the seventh is composed of Tonic and a third major followed by two thirds minor, the fun-simple do-damental note of this chord is called the toniant, damental note of this chord is called the tonic domi-what, nant. In every other chord of the seventh the fundamental is called the simple dominant (art. 102.). Thus in the chord G B D F, the fundamental G is the tonic dominant; hut in the other chords of the seventh, as C E G B, D F A C, &e. the fundamentals C and D arc simple dominants.

188. In every chord, whether perfect, or of the Major seventh, or of the sixth, if it is meant that the third how renabove the fundamental note should be major though dered miit be naturally minor, a sharp must be placed above the nor, and +3 Y fundamental vice versa.

where the groups of quavers in the second measure are triplets, and each triplet occupies the time of two quavers only. Triplets also occur in triple time, fig. 12.

Certain other characters will be with propriety explained here.

The Pause signifies that the regular time is to be delayed, and the note marked with the pause protracted. See fig. 13. where the pause is on the last note of the second measure.

The Repeat, a character resembling an S, denotes, that the following part of the movement must be repeated. See fig. 14.

The Direct (fig. 15.) is placed at the end of the staff, to shew upon what degree the first note of the following staff is placed.

When the inner sides of two bars arc dotted, the measures between them are to be repeated (fig. 16.). The word bis is sometimes placed over such passages.

The double bar distinguishes the end of a movement or strain, (fig. 17.). If the double bar be dotted on one or both sides, the strain is to be repeated, (fig. 18.). The double bar does not affect the time; so that when the strain terminates before the end of a measure, as is often the case, the double bar only marks the conclusion of the strain, but the time is kept exactly as if it were not inserted. See fig. 19.

The graces of exertion and expression, such as the appogiature, the shake, the slur, the crescendo, the diminuendo, &c. are not necessary to the consideration of the theory of music or principles of composition, but belong to the performer only. See SHAKE, &c.

(3 R) In this part of our subject, we shall, in mentioning the harmonies of the chords, make use of the capital letters only, as the general names of the notes, without distinguishing octaves by minuscular or Italic letters. The harmonics may be arranged in different octaves. Their different positions will be most easily seen and best understood from the examples in the plates.

Principles fundamental note. For example, if we would mark the of Composi-perfect major chord D F% A D, as the third F above D is naturally minor, we place above D a sharp, as in Example IV. In the same manner, the chord of the seventh D F X A C, and the chord of the great sixth D F% A B, is marked with a % above D, and above the % a 7 or a 6 (see v. and v1.).

On the contrary, when the third is naturally major, and if we would render it minor, we place above the fundamental note a b. Thus the example VII. VIII. IX. shew the chords G Bb D G G Bb D F, G Bb D E (3 s).

## CHAP. V. Of the Fundamental Bass.

Fundamental bass how formed.

bass.

189. LET a modulation be invented at pleasure ; and under this modulation let there be set a bass composed of different notes, of which some may carry a perfect chord, others that of the seventh, and others that of the great sixth, in such a manner that each note of the modulation which answers to each of the bass, may be one of those which enters into the chord of that note in the bass; this bass being composed according to the rules which shall be immediately given, will be the fundamental bass of the modulation proposed. See Part I. where the nature and principles of the fundamental bass are explained.

Thus (Exam. xvi.) it will be found that this modu-See Fundalation, C D E F G A B C, has or may admit for its mental fundamental bass, C G C F C D G C.

In reality, the first note C in the upper part is found in the chord of the first note C in the bass, which chord is G E G C; the second note D in the treble is found in the chord G B D G; which is the chord of the second note in the bass, &c. and the bass is composed only of notes which carry a perfect chord,

or that of the seventh, or that of the great sixth. Principle Moreover it is formed according to the rules which we of Compos tion. are now about to give.

## CHAP. VI. Rules for the Fundamental Bass.

100. ALL the notes of the fundamental bass being Rules for only capable of carrying a perfect ehord, or the chord the form of the seventh, or that of the great sixth, are either tion of the tonics, or dominants, or sub-dominants; and the dominants may be either simple or tonic.

The fundamental bass ought always to begin with a tonic, as much as it is practicable. And now follow the rules for all the succeeding chords; rules which are evidently derived from the principles established in the First Part of this treatise. To be convinced of this we shall find it only necessary to review the articles 34, 91, 122, 124, 126, 127.

#### RULE I.

191. In every chord of the tonic, or of the tonic dominant, it is necessary that at least one of the notes which form that chord should be found in the chord that precedes it.

#### RULE II.

192. In every chord of the simple dominant, it is necessary that the note which constitutes the seventh, or dissonance, should likewise be found in the preceding chord.

#### RULE III.

193. In every chord of the sub-dominant, at least one of its consonances must be found in the preceding chord. Thus, in the chord of the sub-dominant F A C D, it is necessary that F, A, or C, which are the consonances

(3 s) We may only add, that there is no occasion for marking these sharps or flats when they are originally placed at the cleff. For instance, if the sharp be upon F which indicates the key of G (see Exam. x.) it is sufficient to write D, without a sharp, to mark the perfect chord major of D, D F & A D. In the same manner, in the Example XI. where the flat is at the cleff upon B, which denotes the key of F, it is sufficient to write G, to mark the perfect chord minor of G Bb D G.

But where there is a sharp or a flat at the cleff, if we would render the chord minor which is major, or vice versa, we must place above the fundamental note a \$ or natural. Thus the Example XII. marks the minor chord D F A D, and Example XIII. the major chord G B D G.—Sometimes, in lieu of a natural, a flat is used to signify the minor chord, and a sharp to signify the major. Thus Example XIV. in the key of G, marks the minor chord D F A D, and Example xv. in F, the major chord G B D G.

When in a chord of the great sixth, the dissonance, that is to say, the sixth, ought to be sharp, and when the sharp is not found at the cleff, we write before or after the 6 a \*; and if this sixth should be flat according to the cleff, we write a \$.

In the same manner, if in a chord of the seventh of the tonic dominant, the dissonance, that is to say, the scventh, ought to be flat or natural, we write by the side of the seventh a b or a b. Many musicians, when a seventh from the simple dominant ought to be altered by a sharp or a natural, have likewise written by the side of the seventh a % or a \$; but M. Rameau suppresses these characters. The reason shall be given below, when we speak of chords by supposition.

If there be one sharp at the cleff, and if we would mark the chord G B D F\$ or the chord A C E F\$, we ought to place before the seventh or the sixth a \$ or a \$.

In the same manner, if there be one flat at the cleff, and if we would mark the chord C E G Ba, we ought to place before the seventh a  $\otimes$  or a  $\natural$ ; and so of the rest.

All these intrieate comhinations of figuring shew the superior convenience of the modern method of writing the notes themselves instead of the figures, which has the farther advantage of exhibiting the proper arrangement of the chord, see Example II.

rinciples consonances of the chord, should be found in the chord Composi-preceding. The dissonance D may either be found in tion. it or not.

#### RULE IV.

194. Every simple or tonic dominant ought to descend by a fifth. In the first case, that is to say, when the dominant is simple, the note which follows can only be a dominant; in the second it may be any one; or, in other words, it may either be a tonic, a tonic dominant, a simple dominant, or a sub-dominant. It is necessary, however, that the conditions prescribed in the second rule should be observed, if it be a simple dominant.

This last reflection is neccessary, as will presently be seen. For, let us assume the succession of the two chords  $A C \cong E G$ , D F A C (see Exam. XVII.), this succession is by no means legitimate, though in it the first dominant descends by a fifth; because the C which forms the dissonance in the second chord, and which belongs to a simple dominant, is not in the preceding chord. But the succession will be admissible, if, without meddling with the second chord, we take away the sharp carried by the C in the first; or if, without meddling with the first chord, we render C and F sharp in the second (3 T); or, if we simply render the D of the second chord a tonic dominant, in causing it to carry F $\cong$  instead of F (119. and 122.).

It is likewise by the same rule that we ought to reject the succession of the two following chords,

DFAC, GBDFX; (see Exam. XVIII.).

#### RULE V.

195. Every sub-dominant ought to rise by a fifth; and the note which follows it may, at pleasure, be either a tonic, a tonic dominant, or a sub-dominant.

#### REMARK.

errules Of the five fundamental rules which have now been tituted given, instead of the three first, one may substitute the three following, which are consequences from them.

#### RULE I.

If a note of the fundamental bass be a tonic, and rise by a fifth or a third to another note, that second

note may be either a tonic (34. & 91.), see Examples Principles XIX. and XX. (3 U); a tonic dominant (124.), see of Composi-XXI. and XXII.; or a sub-dominant (124.), see XXIII. tion.

and XXIV; or, to express the rule more simply, that second note may be any one, except a simple dominant.

#### RULE II.

If a note of the fundamental bass be a tonic, and descend by a fifth or a third upon another note, this second note may be either a tonic (34. & 91.) see Exam. XXV. and XXVI.; or a tonic dominant, or a simple dominant, yet in such a manner that the rule of art. 192. may be observed (124.), see XXVII. XXVIII. XXIX. and XXX.; or a sub-dominant (124.), see XXXI. and XXXII.

The succession of the bass C Eb G C, F A C E, is excluded by art. 192.

#### RULE III.

If a note in the fundamental bass be a tonic, and rise by a second to another note, that note ought to be a tonic dominant, or a simple dominant (101. & 102.). See XXXIV. and XXXV. (3 X).

We must here advertise our readers, that the examples XXXVI. XXXVII. XXXVII. XXXIX. belong to the fourth rule above, art. 194.; and the examples XL. XLI. XLII. to the fifth rule above, art. 195. See the articles 34, 35, 121, 123, 124.

#### REMARK I.

196. The transition from a tonic dominant to a Perfect and tonic is called an *absolute repose*, or a *perfect cadence* imperfect (73.); and the transition from a sub-dominant to a cadences, touic is called an *imperfect* or *irregular cadence* (73.); how emthe tonic falls upon the accented part of the bar. See ployed. XLIII. XLIV. XLV. XLVI.

#### REMARK II.

3 Y 2

197. We must avoid, as much as we can, syncopa-Syncopations in the fundamental bass; that the ear may accu-tion only rately distinguish the primarily accented part of a mea- admissible sure, by means of a harmony different from that which damental it had before perceived in the last unaccented part of the bass by preceding measure. Nevertheless syncopation may be license. sometimes admitted in the fundamental bass, but it is by a license (3 y).

#### Снар.

(3 T) In this chord it is necessary that the C and F should be sharp at the same time; for the chord D F A C \*, in which C would be sharp without the F, is excluded by art. 179.

(3 U) When the bass rises or descends from one tonic to another by the interval of a third, the mode is commonly changed; that is to say, from a major it becomes a minor. For instance, if we ascend from the tonic C to the tonic E, the major mode of C, C E G C, will be changed into the minor mode of E, E G B E. We must never ascend from one tonic to another, when there is no sound common to both their modes: for example, we cannot rise from the mode of C, C E G C, to the minor mode of Eb, Eb Gb Bb Eb (91.).

(3 x) Thus all the intervals, viz. the third, the fifth, and second, may be admitted in the fundamental bass, except that of a second in descending. The rules now given for the fundamental bass, are not, however, without exception, as approved compositions in music will certainly discover; but these exceptions being in reality licences, and for the most part in opposition to the great principle of connection, which prescribes that there should be at least one note in common between a preceding and a subsequent chord, it does not seem necessary to enter into a minute detail of these licences in an elementary work, where the first and most essential rules of the art alone ought to be expected.

(3 x) There are notes which may be found several times in the fundamental bass in succession with a different of Composi- CHAP. VII. Of the Rules which ought to be observed in the Treble with relation to the Fundamental Bass. tion.

Definition of treble.

198. THE treble is nothing else but a modulation above the fundamental bass, and whose notes are found in the ebords of that bass which corresponds with it (189.). Thus in Ex. XVI. the seale C D E F G A B C, is a treble with respect to the fundamental bass C G C

FCDGC. 199. We are about to give the rules for the treble ; One note but first we think it necessary to make the two followin the treble or bass may answering remarks.

to its correspondent parts, and why.

1. It is obvious, that many notes of the treble may answer to one and the same note in the fundamental bass, when these notes belong to the chord of the same note in the fundamental bass. For example, this modulation C E G E C, may have for its fundamental bass the note C alone, because the chord of that note comprchends the sounds C, E, G, which are found in the treble.

2. In like manner, a single note in the treble may, for the same reason, answer to several notes in the bass. For instance, G alone may answer to these three notes in the bass, C G C (3 z).

### RULE I. For the TREBLE.

200. If the note which forms the seventh in a chord

of the simple dominant, is found in the treble, the note Principa which precedes it must be the very same. This is what of Company we call a discord prepared (122). For instance, let us suppose that the note of the fundamental bass shall be D, bearing the chord of the simple dominant D FAC; and that this C, which (art. 18. and 118.) is the dis-sonance, should be found in the treble; it is necessary that the note which goes before it in the treble should likewise be a C.

201. According to the rules which we have given for the fundamental bass, C will always be found in the chord of that note in the fundamental bass which precedes the simple dominant D. See XLVIII. XLIX. L. In the first example the dissonance is C, in the second G, and in the third E : and these notes are already in the preceding chord (4 A).

#### RULE II.

202. If a note of the fundamental bass be a tonic dominant, or a simple dominant, and if the dissonance be found in the treble, this dissonance in the same treble ought to descend diatonically. But if the note of the bass be a sub-dominant, it ought to rise diatonically. This dissonance, which rises or descends diatonically, is what we have ealled a dissonance saved or resolved (129, 130.). See LII. LIII. LIV.

203. According to the rules for the fundamental bass which we have given, the note upon which the dissonance

ferent harmony. For instance, the tonic C, after having carried the chord C E G C, may be followed by another C which carries the chord of the seventh, provided that this chord be the chord of the tonic dominant C E G Bb. In the same manner, the tonic C may be followed by the same tonic C, which may be rendered a subdominant, by causing it to carry the chord C E G A.

A dominant, whether tonic or simple, sometimes descends or rises to another by the interval of a tritone or false fifth. For example, the dominant F carrying the chord F A C E, may be followed by another dominant B earrying the chord B D F A. This is a licence in which the musician indulges himself, that he may not be obliged to depart from the scale in which he is; for instance, from the scale of C to which F and B belong. If one should descend from F to Bb by the interval of a just fifth, he would then depart from that seale, because Bb is no part of it.

(3 z) There are often in the treble several notes which may, if we choose, carry no chord, and be regarded merely as notes of passage, serving only to connect between themselves the notes that do earry chords, and to form a more agreeable modulation. These notes of passage are commonly quavers. See Example XLVII. (Plate CCCLVIII). in which this modulation C D E F G, may be regarded as equivalent to this other, C E G, as D and F are no more than notes of passage. So that the bass of this modulation may be simply C G.

When the notes are of equal duration, and arranged in a diatonic order, the notes which are accented ought each of them to carry chords. Those which are unaccented, are mere notes of passage. Sometimes, however, the unaccented note may be made to carry harmony; but the duration of this note is then commonly increased by a point placed after it, which proportionably diminishes the continuance of the accented note, and makes it pass more swiftly.

When the notes do not move diatonically, they ought generally all of them to enter into the chord which is placed in the lower part correspondent with these notes.

(4 A) There is, however, one case in which the seventh of a simple dominant may be found in a modulation without being prepared. It is when, having already employed that dominant in the fundamental bass, its seventh is afterwards heard in the modulation, while the dominant is still retained. For instance, let us imagine this modulation,  $\begin{array}{c|c|c} C & D & C & B & C & D; \\ C & D & G & C & G; \end{array}$ 

| hand  | this  | fund | amental    | hass. | ( |
|-------|-------|------|------------|-------|---|
| 11111 | LILIO | Lunu | THI CHICK! | 00000 | - |

(see example LI.); the D of the fundamental bass answers to the two notes D C of the treble. The dissonance C

has no need of preparation, because the note D of the fundamental bass having already been employed for the D which precedes C, the dissonance C is afterwards presented, below which the chord D may be preserved, or DFAC.

principles ance ought to descend or rise will always be found in of Composi- the subsequent chord (4 B). tion.

## CHAP. VIII. Of the Continued Bass and its Rules.

204. THE continued ‡ bass is a fundamental bass Continued whose chords are inverted. We invert a chord when bass, what we change the order of the notes which compose it.

For example, if, instead of the chord G B D F, we should say BDFG or DFGB, &c. the chord is inverted.

The ways in which a PERFECT CHORD may be IN-VERTED.

205. The perfect chord CEGC may be inverted in two different ways.

1. EGCE, which we call a chord of the sixth, composed of a third, a sixth, and an octave; and in this case the bass note E is marked with a 6. (See LVI.)

2. GCEG, which we call a chord of the sixth and fourth, composed of a fourth, a sixth, and an octave ; and it is marked with a 4. See LVII.

The perfect minor chord is inverted in the same manner.

#### The ways in which the CHORD of the SEVENTH may be INVERTED.

206. In the chord of the tonic dominant, as G B D F, the third major B above the fundamental note G is called a sensible note (77.); and the inverted chord B DFG composed of a third, a false fifth and a sixth, is called the chord of the false fifth, and is marked as in examples LVIII. and LIX.

The chord D F G B, composed of a third, a fourth, and a sixth, is called the chord of the sensible sixth, and marked as in Example LX. (4 c). In this chord, the third is minor, and the sixth major.

The chord F G B D, composed of a second, a tritone,

and a sixth, is called the chord of the tritone, and is Principles marked as in Example LXI. (4 D). of Composi-

207. In the chord of the simple dominant D F A C, we find.

1. FACD, a chord of the great sixth, which is composed of a third, a fifth, and a sixth, and which is figured with a §. See LXII. (4 E). 2. ACDF, a chord of the lesser sixth, which is fi-

gured with a 6. See LXIII. (4 F).

3. CDFA, a chord of the second, composed of a second, a fourth, and a sixth, and which is marked with a 2. See LXIV. (4 G).

### The ways in which the CHORD of the sub-DOMINANT may be Inverted.

208. The chord of the sub-dominant, as F A C D, may be inverted in three different manners; but the method of inverting it which is most in practice is the chord of the lesser sixth A C D F (LXIII.), and the chord of the seventh DFAC. See LXV.

## RULES for the CONTINUED BASS.

209. The continued bass is a fundamental bass, whose chords are only inverted in order to render it more in the tastc of singing, and suitable to the voice. See LXVI. in which the fundamental bass which in itself is monotonic and little suited for singing, CGCGC G C, produces, by inverting its chords, this continued bass highly proper to be sung, CBCDEFE, &c. (4H).

The continued bass then is properly a treble with respect to the fundamental bass. Its rules immediately follow, which are properly those already given for the treble.

#### RULE I.

210. Every note which carries the chord of the false fifth,

(4 B) When the treble syncopates in descending diatonically, it is common enough to make the second part of the syncope carry a discord, and the first a concord. See Example LV. where the first part of the syncopated note G, is in concord with the notes CEGC, which answers to it in the fundamental bass, and where the second part is a dissonance in the subsequent chord ACEG. In the same manner, the first part of the syncopated note F is in concord with the notes D F A C, which answer to it; and the second part is a dissonance in the subsequent chord G B D F, which answers to it, &c.

(4c) This chord is called, by English musicians, the chord of the third and fourth, and generally figured<sup>4</sup>. (4 D) This chord is in England called the chord of the second and fourth, and is figured 2

(4 E) We are obliged to mark likewise, in the continued bass, the chord of the sub-dominant with a \$, which in the fundamental bass is figured with a 6 alone; and this to distinguish it from the chords of the sixth and of the lesser sixth. (See examples LVI. and LXIII.). The chord of the great sixth in the fundamental bass carries always the sixth major, whereas in the continued bass it may carry the sixth minor. For instance, the chord of the seventh C E G B, gives the chord of the great sixth E G B C, thus improperly called, since the sixth from E to C is minor.

(4 F) M. Rameau has justly observed, that we ought rather to figure this lesser sixth with a 3, to distinguish it from the sensible sixth which arises from the chord of the tonic dominant, and from the sixth which arises from the perfect chord. In the mean time he figures in his works with a 6 alone, the lesser sixths which do not arise from the tonic dominant; that is to say, he figures them as those which arise from the perfect chord; and we have followed him in that notation, though we thought with him, that it would be better to mark this chord by a particular figure.

(4 G) The chord of the seventh BDFA gives, when inverted, the chord FABD, composed of a third, a tritone, and a sixth. The chord is commonly marked with a 6, as if the tritone were a just fourth. It is his business who performs the accompaniment, to know whether the fourth above F be a tritone or a fourth redundant. One may figure this chord thus, 4\*.

(4 H) The continued bass is proportionably adapted to singing, as the sounds which form it more scrupulously

observe

Chord inverted, how.

ed.

Principles fifth, and which of consequence must be what we have of Composi-called a sensible note, ought (77.) to rise diatonically

tion

upon the note which follows it. Thus in example LXIV. the note B, carrying the chord of the false fifth, rises diatonically upon C (4 1).

#### RULE II.

211. Every note carrying the chord of the tritone should descend diatonically upon the subsequent note. Thus in the same example LXVI. F, which carries the chord of the tritone figured with a 4+, descends diatonically upon E (art. 202.).

#### RULE III.

212. The chord of the second is commonly put in practice upon notes which are syncopated in descend-

1

ing, because these notes are dissonances which ought to Principles be prepared and resolved (200. 302.). See the exam- of Conposi ple LXVII. where the second C, which is syncopated, and which descends afterwards upon B, carries the chord of the second (4 K).

#### CHAP IX. Of some Licenses assumed in the Fundamental Bass.

## § 1. Of BROKEN and INTERRUPTED CADENCES.

213. THE broken cadence is executed by means of a Broken ca dominant which rises diatonically upon another, or upon dence, how a tonic by a license. See, in the example LXXIV. GA, excented. (132. and 134.)

214. The interrupted cadence is formed by a do-Interrupted minant, cadence, bow form.

observe the diatonic order, because this order is the most agreeable of all. We must therefore endeavour to preserve it as much as possible. It is for this reason that the continued bass in Example LXV. is much more in the taste of singing, and more agreeable, than the fundamental bass which answers to it.

(4 1) The continued bass being a kind of trehle with relation to the fundamental bass, it ought to observe the same rules with respect to that bass as the treble. Thus a note, for instance D, carrying a chord of the seventh DFAC, to which the chord of the sub-dominant FACD corresponds in the fundamental bass, ought to rise diatonically upon E, (art. 129. Nº 1. and art. 202.).

(4K) When there is a repose in the treble, the note of the continued bass ought to be the same with that of the fundamental bass, (see Example LXVIII.). In the closes which are found in the treble at D and C (measures second and fourth), the notes in the fundamental and continued bass are the same, viz. G for the first cadence, and C for the second. This rule ought above all to be observed in cadences which terminate a piece or a modulation.

It is necessary, as much as possible, to prevent coincidences of the same notes in the treble and continued bass, unless the motion of the continued bass should be contrary to that of the treble. For example, in the first note of the second measure in Example LXIX. D is found at the same time in the continued bass and in the treble; but the treble rises from C to D, and from D to E, whilst the bass descends from E to D, and from D to C.

Two octaves, or two fifths, in succession, must likewise be avoided. For instance, in the treble sounds G E, the bass must be prevented from sounding G E, C A, or D B; because in the first case there are two octaves in succession, E against E, and G against G; and because in the second case there are two fifths in succession, C against E, and A against G, or D against G, and B against E. This rule, as well as the preceding, is founded upon this principle, that the continued bass ought not to be a copy of the treble, but to form a different melody.

Every time that several notes of the continued bass answer to one note alone of the fundamental, the composer satisfies himself with figuring the first of them. Nay he does not even figure it if it be a tonic; and he draws above the others a line, continued from the note upon which the chord is formed. See Example LXX. (Plate CCCLIX.) where the fundamental bass C gives the continued bass C E G E; the two E's ought in this bass to carry the chord 6, and G the chord 4: but as these chords are comprehended in the perfect chord C E G C, which is the first of the continued bass, we place nothing above C, only we draw a line over C E G E.

In like manner, in the second measure of the same example, the notes F and D of the continued bass, arising from the note G alone of the fundamental bass which carries the chord G B D F, we think it sufficient to figure F only, and to draw a line above F and D because the same harmony is used with both.

It should be remarked, that this F ought naturally to descend to E; but this note is considered as subsisting so long as the chord subsists; and when the chord changes, we ought necessarily to find the E, as may be seen by that example.

In general, whilst the same chord subsists in passing through different notes, the chord is reckoned the same as if the first note of the chord had subsisted; in such a manner, that, if the first note of the chord is, for instance, the sensible note, we ought to find the tonic when the chord changes. See Example LXXI. where this continued bass, C B D B G C, is reckoned the same with this, C, B C. (Example LXXII.).

If a single note of the continued bass answers to several notes of the fundamental bass, it is figured with the different chords which agree to it. For example, the note G in a continued bass may answer to this fundamental bass C G C, (see example LXXIII.); in this case we may regard the note G as divided into three parts, of which the first carries the chord 2, the second the chord 7, and the third the chord 2.

We shall repeat here, with respect to the rales of the continued bass, what we have formerly said concerning the rules of the fundamental bass in the note upon the third rule, art. 193. The rules of the continued bass have exceptions, which practice and the perusal of good authors will teach. There are likewise several other rules which might require a considerable detail, and which will be found in the Treatise of Harmony, by M. Rameau, and

rinciples minant which descends by a third upon another (136.). Composi- See, in the example LXXV. G E (4 L). tion.

These cadences ought to be permitted but rarely and ~ with precaution.

#### 2. Of SUPPOSITION.

215. When a dominant is preceded by a tonic in ord by sposition, the fundamental bass, we add sometimes, in the con-1at. tinued bass to the chord of that dominant, a new note which is a third or a fifth below; and the chord which results from it in this continued bass is called a chord by supposition.

Suppo-

art II.

For example, let us suppose, that in the fundamental bass we have a dominant G carrying the chord of the seventh G B D F; let us add to this chord the note C, which is a fifth below this dominant, and we shall have the total chord CGBDF, or CDFG, which is called a chord by supposition (4 M).

Principles of Composition.

216. Chords by supposition are of different kinds. For instance, the chord of the tonic dominant G B D F

gives, I. By adding the fifth C, the chord C G B D F, These diffecalled a chord of the seventh redundant, and composed rent chords of a fifth, seventh, ninth, and eleventh. It is figured what, and with a %7: see LXXVI (4N) This shard is not much how figurwith a %7; see LXXVI. (4 N). This chord is not prac-ed. tised but upon the tonic. They sometimes leave out the sensible note, for reasons which we shall give in the note (4 0), upon the art. 219; it is then reduced to C F G D, and marked with 5 or 5.

2. By adding the third E, we shall have the chord E G B D F, called a chord of the ninth, and composed of a third, fifth, seventh, and ninth. And it is figured with a 9. This third may be added to every third of the dominant. See LXXVII.

3. If

and elsewhere. These rules, which are proper for a complete dissertation, did not appear indispensably necessary in an elementary essay on music, such as the present. The books which we have quoted at the end of our preliminary discourse will more particularly instruct the reader concerning this practical detail.

(4 L) One may sometimes, but very rarely, cause several tonics in succession to follow one another in ascending or descending diatonically, as CEGC, DFAD, Bb DFBb; but, besides that this succession is harsh, it is necessary, in order to render it practicable, that the fifth below the first tonic should be found in the chord of the tonic following, as here F, a fifth below the first tonic C, is found in the chord D F A D, and in the chord Bb D F Bb (37. and note T).

(4 M) Though supposition be a kind of license, yet it is in some measure founded on the experiment related in the note (s), where you may see that every principal or fundamental sound causes its twelfth and seventeenth major in descending to vibrate, whilst the twelfth and the seventeenth major ascending resound : which seems to authorize us in certain cases to join with the fundamental harmony this twelfth and seventeenth in descending ; or, which is the same thing, the fifth or the third beneath the fundamental sound.

Even without having recourse to this experiment, we may remark, that the note added beneath the fundamental sound, causes that very fundamental sound be heard. For instance, C added beneath G, causes G to resound. Thus G is found in some measure to be implied at C.

If the third added beneath the fundamental sound be minor, for example, if to the chord GBDF, we add the third E, the supposition is then no longer founded on the experiment, which only gives the seventeenth major, or what is the same thing, the third major beneath the fundamental sound. In this case the addition of the third minor must be considered as an extension of the rule, which in reality has no foundation in the chords cmitted by a sonorous body, but is authorized by the sanction of the ear and by practical experiment.

(4 N) Many musicians figure this chord with a \*2 : M. Rameau suppresses this 2, and merely marks it to be the seventh redundant by a 7% or \$7. But it may be said, how shall we distinguish this chord from the seventh major, which, as it would seem, ought to be marked with a 7%? M. Rameau answers, that there is no danger or mistake, because in the seventh major, as the seventh ought to be prepared, it is found in the preceding chord ; and thus the sharp subsisting already in the preceding chord, it would be useless to repeat it.

Thus DG, according to M. Rameau, would indicate DF%AC, GBDF%. If we would change F% of the

second chord into F\$, it would then be necessary to write D G. In notes such as C, whose natural seventh is major, the figure 7 preceded or followed by a sharp will sufficiently serve to distinguish the chord of the seventh redundant CGBDF, from the simple chord of the seventh CEGB, which is marked with a 7 alone. All this appears just and well founded.

(4 0) Supposition introduces into a chord dissonances which were not in it before. For instance, if to the chord É G B D, we should add the note of supposition C descending by a third, it is plain that, besides the dissonance between E and D which was in the original chord, we have two new dissonances, C B, and C D; that is to say, the seventh and the ninth. These dissonances, like the others, ought to be prepared and resolved. They are prepared by being syncopated, and resolved by descending diatonically upon one of the consonances of the subsequent chord. The sensible note alone can be resolved in ascending ; but it is even necessary that this sensible note should be in the chord of the tonic dominant. As to the dissonances which are found in the primitive chord, they should always follow the common rules. (See art. 202.).

544

Principles of Composi- we should add the fifth G, we would have the chord G

tion.

## figured with a <sup>9</sup>/<sub>4</sub> or <sup>4</sup>/<sub>9</sub>. (See LXXVIII.). OBSERVE.

3. If to a chord of the simple dominant, as DFAC,

Occasions when retrenchments of chords are proper.

Chord of

dundant

how figu-

red.

217. When the dominant is not a tonie dominant, we often take away some notes from the chord. For example, let us suppose that there is in the fundamental bass this simple dominant E, carrying the chord E GBD: if there should be added the third C bencath, we shall have this chord of the continued bass CEG BD; but we suppress the seventh B, for reasons which shall be explained in the note upon art. 210. In this state the chord is simply composed of a third, fifth, and ninth, and is marked with a 9. See LXXIX. (4 P).

218. In the chord of the simple dominant, as D F A C, when the fifth G is added, we frequently obliterate the sounds F and A, that too great a number of dissonances may be avoided, which reduces the chord to GCD. This last is composed only of the fourth and the fifth. It is called a chord of the fourth, and it is figured with a 4 (49) (see LXXX.).

219. Sometimes we only remove the note A, and then the chord ought to be figured with  $\frac{7}{4}$  or  $\frac{4}{7}$  (4R).

220. Finally, in the minor mode, for example, in the fifth re- that of A, where the chord of the tonic dominant (109), is E G & B D ; if we add to this chord the third C bewhat, and low, we shall have E G & B D, called the chord of the fifth redundant, and composed of a third, a fifth redundant, a seventh and a ninth. It is figured as in LXXXI. (4s).

## § 3. Of the CHORD of the DIMINISHED SEVENTH.

221. In the minor mode, for instance, in that of A, Chord of the flat se- E a fifth from A is the tonic dominant (109), and venthwhat, carries the chord E G & B D, in which G is the sensible and how figured.

note. For this chord we sometimes substitute GB\*DF, Principles (116), all composed of minor thirds; and which has of Composition for its fundamental sound the sensible note G\*. This, tion. chord is called a chord of the flat or diminished scventh, and is figured with a # in the fundamental bass, (see LXXXIV.); but it is always considered as representing the chord of the tonic dominant.

222. This chord by inversion produces in the conti- Chords preducedinth nued bass the following chords:

I. The chord BDFG%, composed of a third, false bass by this fifth, and sixth major. They call it the chord of the what, and sixth sensible and false fifth; and it is figured as in how figur-Exam. LXXXV. (Plate CCCLX.). ed.

2. The chord D F G & B, composed of a third, a tritone, and a sixth. It is called the chord of the tritone and third minor; and marked as in LXXXVI.

3. The chord F G & B D, composed of a second redundant, a tritone, and a sixth. It is called the chord of the second redundant, and figured as in LXXXVII. (4T).

223. Besides, since the chord G & B D F represents Alteration the chord E G & B D, it follows, that if we operate by by supposisupposition upon the first of these chords, it must be per- which they formed as one would perform it upon E G & B D; that produce, is to say, that it will be necessary to add to the chord what, and G & B D F, the notes C or A, which are the third or how figurfifth below E, and which will produce,

1. By adding C, the chord C G & B D F, composed of a fifth redundant, a seventh, a ninth, and eleventh, which is the octave of the fourth. It is called a chord of the fifth redundant and fourth, and marked as in LXXXVIII.

2. By adding A, we shall have the chord AG% B DF, composed of a seventh redundant, a ninth, an cleventh, and a thirteenth minor, which is the octave of the sixth minor. It is called the chord of the seventh redundant and sixth minor, and marked as in LXXXIX. It is of all chords the most harsh, and the most rarely practised (4 U).

CHAP.

(4P) Several musicians call this last chord the chord of the ninth; and that which, with M. Ramcau, we have simply called a chord of the ninth, they term a chord of the ninth and seventh. This last chord they mark with a ?; but the denomination and figure used by M. Rameau are more simple and can lead to no error; because the chord of the ninth always includes the seventh, except in the cases of which we have already spoken.

(4 9) In England it is figured 4.

(4 R) We often remove some dissonances from chords of supposition, cither to soften the harshness of the chord, or to remove discords which can neither be prepared nor resolved. For instance, let us suppose, that in the continued bass the note C is preceded by the sensible note B carrying the chord of the false fifth, and that we should choose to form upon this note C the chord CEGBD, we must obliterate the seventh B, because in retaining it we should destroy the effect of the sensible note B, which ought to rise to C.

In the same manner, if to the harmony of a tonic dominant GBDF, one should add the note by supposition C, it is usual to retrench from this chord the sensible note B; because, as the D ought to descend diatonically to C, and the B to rise to it, the effect of the one would destroy that of the other. This above all takes place in the suspension, concerning which we shall presently treat.

(4s) Supposition produces what we call suspension; and which is almost the same thing. Suspension consists in retaining as many as possible of the sounds in a preceding chord, that they may be heard in the chord which succeeds. For instance, in Example LXXXII. the C bearing \$7 is a supposition; but in Example LXXXIII. it is a suspension, because it suspends or retards the perfect chord CEGC which the ear expects after the tonic dominant G B D F.

(4T) The chord of the diminished seventh, and the three derived from it, are termed chords of substitution They are in general harsh, and proper for imitating melancholy objects.

(4u) As the chord of the diminished seventh G & BDF, and the chord of the tonic dominant EG & BD, only

## Composi- CHAP. X. Of some licenses used in the Treble and Continued Bass.

~ beenserst.

224. SOMETIMES in a treble, the dissonance which ought to have been resolved by descending diatonically upon the succeeding note, instead of descending, on the contrary rises diatonically : but in that case, the note

upon which it ought to have descended must be found in some of the other parts. This license ought to be rarely practised.

In like manner, in a continued bass, the dissonance in a chord of the sub-dominant inverted, as A in the chord A C E G, inverted from C E G A, may sometimes descend diatonically instead of rising as it ought to do, art. 129. Nº 2.; but in that ease the note ought to be repeated in another part, that the dissonance may be there resolved in ascending.

Llense 2d. 225. Sometimes likewise, to render a continued bass more agreeable by causing it to proceed diatonically, we place between two sounds of that bass a note which belongs to the chord of neither. See Example xc11. in which the fundamental bass G C produces the continued bass GABGC, where A is added on account of the diatonic modulation. This A has a line drawn above it, to show its resolution by passing under the ehord G B D F.

In the same manner, (see xciii.) this fundamental bass C F may produce the continued bass C D E C F, Vol. XIV. Part II.

where the note D, which is added, passes under the Principles chord C E G C. of Composi-

tion.

CHAP. XI. Containing the Method of finding the How to find Fundamental Bass when the continued Bass is the fundafigured. mental

226. As the continued bass alone appears in practi-tinued is fical compositions, it becomes necessary to know how to gured. find the fundamental bass when the continued bass is figured. This problem may be easily solved by the following rules.

227. 1. Every note which has no figure in the continued bass, ought to be the same, and without a figure in the fundamental bass; it is either a tonie, or reckoned such (4 x).

2. Every note which in the continued bass carries a 6, ought in the fundamental bass to give its third below not figured \*, or its fifth below marked with a 7. \* Sec Fi We shall distinguish these two cases below. See I.VI. gured. and the note (4 Y).

3. Every note earrying & gives in the fundamental bass its fifth below not figured. See LVII.

4. Every note figured with a 7, or a #, is the same in both basses, and with the same figure (4 x).

5. Every note figured with a 2 gives in the fundamental bass the diatonic note above figured with a 7. See LXIV. (4 Z).

6. Every note marked with a 4 gives in the funda-32 mental

differ one from the other by the notes E and F; one may form a diatonic modulation of these two notes, and then the fundamental bass does nothing but pass from the tonie dominant to the sensible note, and from that note to the tonic dominant, till it arrives at the tonic. (See xc.).

For the same reason, as the chord of the diminished seventh GX B D F, and the chord B D F A, which carries the fifth B of the tonic dominant E, only differs by the sensible note GX, and the tonie A; one may sometimes, while the treble modulates G\* A G\* A G\* A, ascend in the fundamental bass, from the bass note to the third above, provided one descend at last from thence to the tonic dominant, and from thence to the tonic; (see xc1). This and the preceding examples are licenses.

(4 x) We say a tonie, or reckoned such, because it may perhaps be a dominant from which the dissonance has been removed. But in that case one may know that it is a real dominant by the note which precedes it. For instance, if the note G, earrying a perfect chord, is preceded by D a simple dominant, carrying the chord D F A C, that note G is not a real tonic ; because, in order to this, it would have been necessary that D should have been a tonic dominant, and should have carried the chord D F\* A C; and that a simple dominant, as D, earrying the chord D F A C, should only naturally descend to a dominant, (art. 194.).

(4 r) Sometimes a note which carries a 7 in the continued bass, gives in the fundamental bass its third above

figured with a. 6. For example, this continued bass A B C gives this fundament bass C G C; but in this case it is necessary that the note figured with a 6 should rise by a fifth, as we see here C rise to G.

(4 z) A note figured with a 2, gives likewise sometimes in the fundamental bass its fourth above, figured with a 6; but it is necessary in that case that the note figured with a 6, may even here rise to a fifth. (See

These variations in the fundamental bass, as well in the chord concerning which we now treat, as in the chord figured with a 7, and in two others which shall afterwards be mentioned (art. 228. and 229.), are caused by a deficiency in the signs proper for the chord of the sub-dominant, and for the different arrangements by which it

M. l'Abbé Roussier, to redress this deficiency, had invented a new manner of figuring the continued bass. His method is most simple for those who know the fundamental bass. It consists in expressing each chord by only signifying the fundamental sound with that letter of the seale by which it is denominated, to which is joined a 7 or 7, or a 6, in order to mark all the discords. Thus the fundamental chord of the seventh DFAC is expressed by a D; and the same chord, when it is inverted from that of the sub-dominant F A C D, is characterized by F; the chord of the second C D F A, inverted from the dominant D F A C, is likewise represented by D; and the same chord CDFA, inverted from that of the sub-dominant FACD, is signified by F; the case is

the

Principles mental bass the diatonic note above, figured with a 7.

of Composi- (See LXI.) 7. Every note figured with a g gives its third below tion. figured with a 7. (See LVIII.).

8. Every note marked with a & gives the fifth below marked with a 7; (see LX.) and it is plain by art. 187. that in the chord of the seventh, of which we treat in these three last articles, the third ought to be major, and the seventh minor, this chord of the seventh being the chord of the tonic dominant. (See art. 102.) 9. Every note marked with a 9 gives its third above

figured with a 7. (See LXXVII. and LXXIX.).

10. Every note marked with a 2 gives the fifth above figured with a 7. (See LXXVIII.)

11. Every note marked with a \$\$, or with a + 5,

gives the third above figured with a \*. (See LXXXI.). 12. Every note marked with a %7 gives a fifth above

figured with a 7, or with a %. (See LXXVI.). It is the same case with the notes marked  $\frac{7}{4}, \frac{5}{2}$ , or  $\frac{5}{2}$ : which shows a retrenchment, either in the complete chord of the eleventh, or in that of the seventh redundant.

13. Every note marked with a 4 gives a fifth above

figured with a 7, or a \*. (See LXXX.)

14. Every note marked with a \$6 gives the third minor below, figured with a 7. (See LXXXV.).

15. Every note marked with a b gives the tritone above figured with a #. (See LXXXVI.).

16. Every note marked with a \$2 gives the second redundant above, figured with a 7. (See LXXXVII.).

17. Every note marked with a \*\* gives the fifth redundant above, figured with a #. (See LXXXVIII.).

18. Every note marked with a  $\frac{\%7}{b6}$  gives the seventh redundant above, figured with a # (See I.XXXIX.).

#### ·REMARK.

228. We have omitted two cases, which may cause some uncertainty.

A difficulty in finding the fundamental bass.

(5 A).

The first is that where the note of the continued bass Principle is figured with a 6. We now present the reason of the of Compos tion. difficulty.

Suppose we should have the dominant D in the fundamental bass, the note which answers to it in the continued bass may be A carrying the figure 6 (see LXIV.); that is to say, the chord A C D F: now

if we should have the subdominant  $\ddot{\mathbf{F}}$  in the fundamental bass, the subdominant might produce in the continued bass, the same note A figured with a 6. When therefore we find in the continued bass a note marked with a 6, it appears at first uncertain whether we should place in the fundamental bass the fifth below marked with a 7, or the third below marked with a 6.

229. The second case is that in which the conti-Another nued bass is figured with a  $\frac{\sigma}{5}$ . For instance, if there

should be found F in the continued bass, we may be ignorant whether we ought to insert in the fundamental bass F marked with a 6, or D figured with a 7.

230. This difficulty may be removed by leaving for Solution. an instant this uncertain note in suspense, and in examining the succeeding note of the fundamental bass; for if that note be in the present case a fifth above F, that is to say, if it be C in this case, and in this alone,

we may place F in the fundamental bass. It is a consequence of this rule, that in the furdamental bass every sub-dominant ought to rise by a fifth (195.).

### CHAP. XII. What is meant by being in a Mode or Tone.

231. In the first part of this treatise (chap. vi.) we Method have explained, how by the means of the note C, and determined of its two-fifths G and F, one in ascending, which is ing the of its two-filths G and F, one in ascending, which is mode in called a tonic dominant, the other in descending which is which w called a sub-dominant, the scale C D E F A B C may arc. be found: the different sounds which form this scale compose

the same when the chords are differently inverted. By this means it would be impossible to mistake either with respect to the fundamental bass of a chord, or with respect to the note which forms its dissonance, or with respect to the nature and species of that discord.

(5 A) We may only add, that here, and in the preceding articles of the text, we suppose, that the continued bass is figured in the manner of M. Rameau. For it is proper to observe, that there are not, perhaps, two musicians who characterize their chords with the same figures ; which produce a great inconveniency to the person who plays the accompaniments: but here we do not treat of accompaniments. We prefer the continued basses of M. Rameau to all the others, as by them the fundamental bass will be most easily discovered.

M. Rameau only marks the lesser sixth by a 6 without a line, when this lesser sixth does not result from the thord of the tonic dominant; in such a manner that the 6 renders it uncertain whether in the fundamental bass we ought to choose the third or the fifth below ; but it will be easy to see whether the third or the fifth is signified by that figure. This may be distinguished, 1. In observing which of the two notes is excluded by the rules of the fundamental bass. 2. If the two notes may with equal propriety be placed in the fundamental bass, the preference must be determined by the tone or mode of the treble in that particular passage. In the following chapter we shall give rules for determining the mode (note 3 z).

There is a chord of which we have not spoken in this enumeration, and which is called the chord of the sixth redundant. This chord is composed of a note, of its third major, of its redundant fourth or tritone, and its redundant sixth, as F A B DX. It is marked with a 6%. It appears difficult to find a fundamental bass for this chord; nor is it indeed much in use amongst us. (See the note upon the art. 115.)

This chord is called in England the chord of the extreme sharp sixth. When accompanied by the third only, it is called the Italian sixth. When the fifth is substituted for the tritone, it has been called the German sixth-

meiples compose the major mode of C, because the third E omposi-above C is major. If therefore we would have a moion. dulation in the major mode of C, no other sounds must enter into it than those which compose this scale; in such a manner that if, for instance, we should find F% in this modulation, this F% discovers to us that we are not in the mode of C, or at least that, if we have been in it, we are no longer so.

232. In the same manner, if we form this scale in ascending A B C $\otimes$  D E F $\otimes$  G $\otimes$  A, which is exactly similar to the scale C D E F G A B C of the major mode of C, this scale, in which the third from A to C $\otimes$  is major, shall be in the major mode of A; and if we incline to be in the minor mode of A, we have only to substitute for C sharp C natural; so that the major third A C $\otimes$  may become minor A C: we shall have then

#### A B C D E F & G & A,

which is (85.) the scale of the minor mode of A in ascending; and the scale of the minor mode of A in descending shall be (90.),

AGFECDBA,

in which the G and F are no longer sharp. For it is a singularity peculiar to the minor mode, that its scale is not the same in rising as in descending (89.).

He it 233. This is the reason why, when we wish to beapus gin a piece in the major mode of A, we place three mains sharps at the cleff upon F, C, and G; and on the conshat be trary, in the minor mode of A, we place none, because plied at the minor mode of A, in descending, has neither sharps nor flats.

in the construction of the second sec

(5 B) The major mode of F%, of C%, and of G%, are not much practised.

When a piece begins upon C<sup>\*</sup>, there ought to be seven sharps placed at the cleff: but it is more convenient only to place five flats, and to suppose the key Db, which is almost the same thing with C<sup>\*</sup>. For this reason we substitute here the mode of Db, for that of C<sup>\*</sup>.

It is still much more necessary to substitute the mode of Ab for that of G%; for the scale of the major mode of G% is, G%, A%, B%, C%, d%, e%, g, g%,

in which it appears that there are at the same time both a 'gh' and a 'g%': it would then be necessary, even at the same time, that upon G there should and should not be a sharp at the cleff; which is inconsistent. It is true that this inconvenience may be avoided by placing a sharp upon G at the cleff, and by marking the note G with a natural through the course of the music wherever it ought to be natural; but this would become troublesome, above all if there should be occasion to transpose. In the article 236. we shall give an account of transposition. We might likewise in this series, instead of G natural, which is the note immediately before the last, substitute F%%, that is to say, F twice sharp: which, however, is not absolutely the same sound with G natural, especially upon instruments whose scales are fixed, or whose intervals are invariable. But in that case two sharps must be placed at the cleff upon F, which would produce another inconvenience. But by substituting Ab for G\%, the trouble is eluded.

The double sharp, however, is incidentally used, when in a composition in the key of F $\otimes$  there is an occasional modulation into the dominant of that key, and it is distinguished by the character  $\times$  or  $\otimes$ .

235. These then are all the modes, as well major as with sharps minor. Those which are crowded with sharps and flats are little practised, as being extremely difficult in and flats little prac- execution. tised.

236. Hence it follows,

Principles 1. That when there are neither sharps nor flats at of Composithe eleff, the piece begins in the major mode of C, or tion. in the minor mode of A.

2. That when there is one sharp, it will always be Results. placed upon F, and that the piece begins in the major mode of G, or in the minor of E, in such a manner that it may be sung as if there were no sharp, by singing B instead of F%, and in singing the tunc as if it had been in another eleff. For instance, let there be a sharp up on F in the cleff of G upon the first line; one may then sing the tunc as if there were no sharp; and as if, instead of the cleff of G upon the first line, it were the. cleff of C; for the F\*, when changed into B, will re-quire that the cleff of G should be changed to the cleff of C, as may be easily seen. This is what we call transposition (5 D).

237. It is evident, that when F% is changed into See Trans B, position.

(5 c) We have already seen, that in each mode, the principal note is called a tonic; that the fifth above that note is called a tonic dominant, or the dominant of the mode, or simply a dominant; that the fifth below the tonic, or, what is the same thing, the fourth above that tonic, is called a sub-dominant; and in short, that the note which forms a semitone below the tonie, and which is a third major from the dominant, is called a sensible note. The other notes have likewise in every mode particular names which it is advantageous to know. Thus a note which is a tone immediately above the tonic, as D in the mode of C, and B in that of A is termed a super-tonic ; the following note, which is a third major or minor from the tonic, according as the chord is major or minor, such as E in the major mode of C, and C in the minor mode of A, is called a mediant; and the note which is a tone above the dominant, such as A, in the mode of C, and FX in that of A, is called a superdominant.

(5 D). Though our author's account of this delicate operation in music will be found extremely just and compendious; though it proceeds upon simple principles, and comprehends every possible contingency; yet as the manner of thinking upon which it depends may be less familiar to English readers, if not profoundly skilled in music, it has been thought proper to give a more familiar, though less comprehensive, explanation of the manner in which transposition may be executed.

It will easily occur to every reader, that if each of the intervals through the whole diatonic series were equal, in a mathematical sense, it would be absolutely indifferent upon what note any air were begun, if within the compass of the gammut ; because the same equal intervals must always have the same effects. But since, besides the natural semitones, there is another distinction of diatonic intervals into greater and lesser tones; and since these vary their positions in the series of an octave, according as the note from whence you begin is placed, that note is consequently the hest key for any tune whose natural series is most exactly correspondent with the intervals which that melody or harmony requires. But in instruments whose scales are fixed, notwithstanding the temperament and other expedients of the same kind, such a series is far from being easily found, and is indeed in common practice almost totally neglected. All that can frequently be done is, to take care that the car may not be sensibly shocked. This, however, would be the ease, if, in transposing any tune, the situation of the semitones, whether natural or artificial, were not exactly correspondent in the series to which your air must be transposed, with their positions in the seale from which you transpose it. Suppose, for instance, your air should begin upon C, requiring the natural diatonic series through the whole gammut, in which the distance between E and E, as also that between B and C, is only a semitone. Again, suppose it necessary for your voice, or the instrument on which you play, that the same air should be transposed to G, a fifth above its former key ; then because in the first series the intervals between the third and the fourth, seventh and eighth notes, are no more than semitones, the same intervals must take the same place in the octave to which you transpose. Now, from G, the note with which you propose to begin, the three tones immediately succeeding are full; but the fourth C is only a semitone; it may therefore be kept in its place. But from F, the seventh note above, to G, the eighth, the interval is a full tone, which must consequently be redressed by raising the F a semitonc higher. Thus the situations of the semitonic intervals in both octaves will be correspondent; and thus, by conforming the positions of the semitones in the octave to which you transpose, with those in the octave in which the original key of the tune is contained, you will perform your operation with as much success as the nature of fixed scales can admit.

The order to be observed in these alterations of the intervals, is deduced from the relation which the fifth ascending and descending bear to the fundamental (art. 34, 35.); and therefore the farther we depart from the natural fundamental C by a series of fifths ascending or descending, the alterations, and consequently the number sharps or flats indicating them, will be the greater.

Thus if G, which is the perfect fifth ascending from , therefore the note most nearly allied to C (art. 39, 40.),

art II.

minor

1-

inciples B, G must be changed into C, and E into A. Thus, nomposi-by transposition, the air has the same melody as if it tion. were in the major mode of C, or in the minor mode of A. The major mode then of G, and the minor of E, the

are by transposition reduced to those of C major, and des reof A minor. It is the same case with all the other cible to major modes (5 E). C and

#### CHAP. XIII. To find the Fundamental Bass of a of Composi-Principles given Modulation. tion.

238. As we have reduced to a very small number Method of the rules of the fundamental bass, and those which in finding a the treble ought to be observed with relation to this fundamenbass, a given air

not difficult, and

be taken for a fundamental, F, which is the seventh of the scale of G, must be made sharp, that it may be a why. whole tone from the sixth E, and only a semitone from the key note G, according to the laws of the diatonic scale (art. 77.). See Ex. XCIV. 1. 2. Again, if D, the perfect fifth ascending from G, and the second in the series of progressive fifths ascending

from C, be used as a fundamental, C, which is the seventh of the scale of D, must, to render it the sensible or leading note (art. 77.) be made sharp in addition to F; so that in the scale of D, there are two sharps, F and C. See Ex. XCIV. (3.)

If A, the perfect fifth above D, and the third in the series of fifths ascending from C, be the fundamental, the seventh G must, in addition to F and C, be made sharp, for the same reason (4.); and so on, on the scale of E, which is next in order, F, C G, and D, must be sharp (5.): in that of B, the sharps must be F, C, G, D, and A (6.).

The perfect fifth above B is F\*, and in that scale F, C, G, D, A, and E, must be sharp (7.). And in the next scale C% all the notes of the system are sharp (8.).

This, for the reasons mentioned in the note (5 B), is the last scale to which we can properly go by the progressions of fifths ascending.

Returning to the natural scale of C, if instead of assuming G, the perfect fifth above, for a fundamental, we take F, the perfect fifth below; B, which is the fourth note above F, and forms a tritone or sharp fourth to it, must, to become a perfect fourth, according to the laws of the diatonic scale, (art. 60.) be made flat 12.).

Proceeding with the series of fifths descending, if Bb, which is the perfect fifth below F, be taken for a fundamental; E, which, in its natural state, is the tritone or sharp fourth to Bb, must, to become the diatonic fourth (art. 60.), also be rendered flat (11.).

If Eb, which is the perfect fifth below Bb, and the third in the series of fifths descending from C, be made the fundamental, A, the sharp fourth, must, to become the diatonic fourth, be made flat, and the flats marked at the cleff are B, E, and A (10.).

To form the next scale in the series of fifths descending, which is that of A flat, D must be flattened; and B, E, A, and D, are marked flat at the cleff (9.).

The next scale, that of D flat, is formed by flattening G, and adding its flat to the others at the cleff (8.). This is the scale recommended to be used rather than that of C%. (See note 5 B).

We do not proceed farther with the series of fifths descending, since the next scale, that of Gb, would just or very nearly exhibit the sounds already represented by the scale of F% (7.). This scale is, however, sometimes written in the key of G flat, and we even meet with the scale of its fifth below, C flat, and, with an occasional modulation from that key into its fifth below, F flat, where B being necessarily twice flattened, is distinguished by

this character  $\frac{b}{b}$ , or bb, called a double flat.

We have thus seen, 1st, That each of the notes of the diatonic scale of C, and each of the semitones into which the whole tones of that scale are divided, may be taken for the fundamental note of a diatonic scale, called the scale of that note. 2dly, That the notes of the natural scale are more or less altered, as the note assumed for a fundamental is more or less distant from C, in a progression of fifths ascending or descending. 3dly, That in the progression by fifths ascending, the notes are altered by sharps, and in the progression by fifths descending, the alterations are by flats. 4thly, That in the alteration by sharps, the last sharp is always on the seventh or sensible note of the scale; and where there are more than one, is always on the fifth above the sharp inimediately preceding; and in the alteration by flats, the last flat is always on the fourth of the scale; and where there are more than one, is always on the fifth below the flat immediately preceding.

The signatures of sharps and flats at the cleffs, belonging to the twelve major scales, are also used for their relative minor scales. The occasional elevation and depression of the sixths and sevenths of the minor scales, are denoted by occasional sharps and flats placed before these notes.

(5 E) Many musicians, and amongst others the ancient musicians of France, as Lulli, Campra, &c. place one flat less in the minor mode : so that in the minor mode of D, they place neither sharp nor flat at the cleff ; in the minor mode of G, one flat only; in the minor mode of C, two flats, &cc.

This practice in itself is sufficiently indifferent, and scarcely merits the trouble of a dispute. Yet the methodwhich we have here described, according to M. Rameau, has the advantage of reducing all the modes to two; and besides it is founded upon this simple and very general rule, That in the major mode, we must place as many sharps or flats at the cleff, as are contained in the diatonic scale of that mode in ascending; and in the minor mode, as many as are contained in that same scale in descending.

Principles bass, it should no longer be difficult to find the fundaof Composi-mental bass of a given modulation, nay, frequently to find several; for every fundamental bass will be legitimate, when it is formed according to the rules which we have given (chap. vi.); and that, besides this, the dissonances which the modulation may form with this bass, will both be prepared, if it is necessary that they should be so, and always resolved (5 F).

239. It is of the greatest utility in searching for the Difficulty of fundamental bass, to know what is the tone or mode of the melody to which that bass should correspond .---But it is difficult in this matter to assign general rules, and such as are absolutely without exception, in which nothing may be left that appears indifferent or discretionary; because sometimes we seem to have the free choice of referring a particular melody either to one whose funmode or another. For example, this melody G C may belong to all the modes, as well major as minor, in which G and C are found together ; and each of these two sounds may even be considered as belonging to a different mode.

240. We may sometimes, as it should seem, operate without the knowledge of the mode, for two reasons; 1. Because, since the same sounds belong to several different modes, the mode is sometimes considerably cced withundetermined; above all, in the middle of a piece, and during the time of one or two bars. 2. Without giving knowledge ourselves much trouble about the mode, it is often sufmode, and ficient to preserve us from deviating in composition, if we observe in the simplest manner the rules above prescribed (chap. vi.) for the procedure of the fundamental from devibass.

241. In the mean time, it is above all things necessary to know in what mode we operate at the be-Knowledge ginning of the piece, because it is indispensable that of the mode the fundamental bass should begin in the same mode, ning a piece and that the treble and bass should likewise end in it; nay, that they should even terminate in its fundamental note, which in the mode of C is C, and A in that of sable, and A, &c. Besides, in those passages of the modulation where there is a cadence, it is generally necessary that the mode of the fundamental bass should be the same with that of the part to which it corresponds.

242. To know upon what mode or in what key a piece commences, our inquiry may be entirely reduced to distinguish the major mode of C from the minor of A. For we have already seen (art. 236. and 237.), that all the modes may be reduced to these two, at least in the

2

See.

beginning of the piece. We shall now therefore give a Principles detail of the different means by which these two modes of Composimay be distinguished.

I. From the principal and characteristical sounds of Means by the mode, which are C E G in the one, and A C E in which the the other; so that if a piece should, for instance, begin modes may thus, A C E A, it may be almost constantly concluded, be deterthat the tone or mode is in A minor, although the notes mined. A C E belong to the mode of C.

2. From the sensible note, which is B in the one, and G% in the other; so that if G% appears in the first bars of a piece, we may be certain that we are in the mode A.

3. From the adjuncts of the mode, that is to say, the modes of its two-fifths, which for C are F and G, and D and E for A. For example, if after having begun a melody by some of the notes which are common to the modes of C and of A (as E D E F E D C B C), we should afterwards find the mode of G, which we ascertain by the FX, or that of F which we ascertain by the Bb or Cb, we may conclude that we have begun in the mode of C; but if we find the mode of D, or that of E, which we ascertain by Bb, C\*, or D\*, &c. we conclude from thence that we have begun in the mode of A.

4. A mode is not usually changed, especially in the beginning of a piece, unless in order to pass into one or other of the modes most relative to it, which are the mode of its fifth above, and that of its third below, if the original mode be major, or of its third above if it be minor. Thus, for instance, the modes which are most intimately relative to the major mode of C, are the major mode of G, and that of A minor. From the mode of C we commonly pass either into the one or the other of these modes ; so that we may sometimes judge of the principal mode in which we arc, by the relative mode which follows it, or which goes before it, when these relative modes are decisively marked. Besides these two relative modes, there are likewise two others into which the principal mode may pass, but less frequently, viz. the mode of its fifth below, and that of its third above, as F and E for the mode of C (5 G).

5. The modes may still be likewise distinguished by the cadences of the melody. These cadences ought to occur at the end of every two, or at most of every four bars, as in the fundamental bass: now the note of the fundamental bass which is most suitable to these closes,

(5 F) We often say, that we are upon a particular key or scale, instead of saying that we are in a particular mode. The following expressions therefore are synonymous; such a piece is in C major, or in the mode of C major, or in the key of C major, or in the scale of C major.

(5 G) It is certain that the minor mode of E has an extremely natural connection with the mode of C, as has been proven (art. 92.) both by arguments and by examples. It has likewise appeared in the note upon the art. 93. that the minor mode of D may be joined to the major mode of C : and thus in a particular sense, this mode may be considered as relative to the mode of C, but it is still less so than the major modes of G and F, or than those of A and E minor; because we cannot immediately, and without licence, pass in a fundamental bass from the perfect minor chord of C to the perfect minor chord of D; and if you pass immediately from the major mode of C to the minor mode of D in a fundamental bass, it is by passing, for instance, from the tonic C, or from E G C, to the tonic dominant of D, carrying the chord A C E G, in which there are two sounds, E G, which are found in the preceding chord of the control dominant of D. found in the preceding chord, (Ex. xcv.) or otherwise from C E G C to G Bb D E, a chord of the sub-dominant in the minor mode of D, which chord has likewise two sounds, G and E, in common with that which went immediately before it. See Ex. xcvi.

tion of the mode cone tinued.

slt.

When the mode is ascertained, by the different ence. laving as-means which we have pointed out, the fundamental bass ertained will cost little pains. For in each mode there are three he mode, fundamental sounds. he funda-

1. The tonic of the mode, or its principal sound, iental bass which carries always the perfect chord major or minor, ot diffiaccording as the mode itself is major or minor.

Major mode of C, CEG'c'.

ACEA. Minor mode of A,

2. The tonic dominant, which is a fifth above the tonic, and which, whether in the major or minor mode, always carries a chord of the seventh, composed of a third major followed by two thirds minor.

#### Tonic dominant.

#### Major mode of C, GBD 'f'.

#### Tonic dominant.

#### Minor mode of A, EG%B'd'.

3. The sub-dominant, which is a fifth below the tonic, and which carries a chord composed of a third, fifth, and sixth major, the third being either greater or lesser, according as the mode is major or minor.

#### Sub-dominant.

Major mode of C, FAC'd'. Minor mode of A, DFAB.

These three sounds, the tonic, the tonic dominant, and the sub-dominant, contain in their chords all the notes which enter into the scale of the mode; so that when a melody is given, it may almost always be found which of these three sounds should be placed in the fundamental bass, under any particular note of the upper part. Yet it sometimes happens that not one of these notes can be used. For example, let it be supposed that we arc in the mode of C, and that we find in the melody these two notes A B in succession; if we confine ourselves to place in the fundamental bass one of the three sounds C G F, we shall find nothing for the sounds A and B but this fundamental bass FG; now such a succession as F to G is prohibited by the fifth rule for the fundamental bass, according to which every sub-dominant, as F, shall rise by a

551

To remedy this, the chord of the sub-dominant F A C 'd' must be inverted into a fundamental chord of the seventh, in this manner, D F A 'c', which has been called the double employment (art. 105.) because it is a secondary manner of employing the chord of the subdominant. By these means we give to the modulation

A B this fundamental bass DG; which procedure is agrecable to rules. See Ex. xcvii.

Here then are four chords, C E G 'c', G B D 'f', FAC'd', DFA'c', which may be employed in the major mode of C. We shall find in like manner, for the minor mode of A, four chords.

And in this mode we sometimes change the last of these chords into B D 'f% a', substituting the 'f%' for 'fh'. For instance, if we have this melody in the minor mode of A, E F\* G\* A, we would cause the first note E to carry the perfect chord A C E A; the second note F% to carry the chord of the seventh B D F% A; the third note GX, the chord of the tonic dominant E G\* B D, and the last the perfect chord A C E A .-See Ex. xcviii.

On the contrary, if this melody is given always in the minor mode, A A G X A, the second A being syncopated, it might have the same bass as the modulation E FX GX A, with this difference alone, that Fy might be substituted for F% in the chord B D F% A, the better to mark out the minor mode. See Exam. XCIX.

Besides these chords which we have just mentioned, and which may be regarded as the principal chords of the mode, there are still a great many others; for example, the series of dominants,

#### CÁDĞĆF BEADGC,

which are terminated equally in the tonic C, either entirely belong, or at least may be reckoned as belonging (51) to the mode of C; because none of these dominants are tonic dominants, except G, which is the tonic dominant of the mode of C; and besides, because the chord of each of these dominants forms no other

(5 I) I have said, that they may be reckoned as belonging to this mode, for two reasons : I. Because, properly speaking, there are only three chords which essentially and primitively belong to the mode of C, viz. C carrying the perfect chord, F carrying that of the sub-dominant, and G that of the tonic dominant, to which we may join the chord of the seventh, D F A C (art. 105.): but we here regard as extended the series of dominants in question, as belonging to the mode of C, because it preserves in the ear the impression of that mode. 2. In a series of dominants, there are a great many of them which likewise belong to other modes; for instance, the simple dominant A belongs naturally to the mode of G, the simple dominant B to that of A, &c. Thus it is only improperly, and by way of extension, as I have already said, that we regard here these dominants as belonging to the mode of C.

<sup>(5</sup> H) All these different manners of distinguishing the modes ought, if we may speak so, to give mutual light and assistance one to the other. But it often happens, that one of these signs alone is not sufficient to determine the mode, and may even lead to error. For example, if a piece of music begins with these three notes, E C G, we must not with too much precipitation conclude from thence that we are in the major mode of C, although these three sounds, E C G, be the principal and characteristical sounds in the major mode of C: we may be in the minor mode of E, cspecially if the note E should be long.

Principles other sounds than such as belong to the scale of C. See of Compo- Ex. c.

But if we were to form this fundamental bass,

## CADGC,

considering the last C as a tonic dominant in this manner, CEGB; the mode would then be changed at the second C, and we should enter into the mode of F, because the chord C E G Bb indicates the tonic dominant of the mode of F; besides, it is evident that the mode is changed, because Bb does not belong to the scale of C. See Ex. CI.

In the same manner, were we to form this fundamental bass

considering the last C as a sub-dominant in this manner, C E G A; this last C would indicate the mode of G, of which C is the sub-dominant. See Ex. CII.

In like manner, still, if in the first series of domiuants, we caused the first D to carry the third major, in this manner, DFX A ' c'; this D having become a tonic dominant, would signify to us the major mode of G,

and the G which should follow, it, carrying the chord B D ff, would relapse into the mode of C, from whence we had departed. See Ex. CIII.

Finally, in the same manner, if in this series of dominants, we should cause B to carry FX in this manner, B D F & A, this F would show that we had departed from the mode C, to enter into that of G. See Ex. CIV.

Hence it is easy to form this rule for discovering the changes of mode in the fundamental; bass.

1. When we find a tonic in the fundamental bass, A rule for discoverwe are in the mode of that tonic; and the mode is major or minor, according as the perfect chord is major or changes of minor.

2. When we find a sub-dominant, we are in the Principles mode of the fifth above that sub-dominant; and the of Compomode is major or minor, according as the third in the sition. chord of the sub-dominant is major or minor.

3. When we find a tonic dominant, we are in the mode of the fifth below that tonic dominant. As the tonic dominant catries always the third major, it cannot be ascertained from this dominant alone, whether the mode be major or minor : but it is only necessary to examine the following note, which must be the tonic of the mode in which he is; by the third of this tonic it will be discovered whether the mode be major or minor.

243. Every change of the mode supposes a cadence ; and when the mode changes in the fundamental bass, it is almost always either after the tonic of the mode in which we have been, or after the tonic dominant of that mode, considered then as a tonic by favour of a close which ought necessarily to be found in that place : Whence it happens that cadences in a melody for the most part presage a change of mode which ought to follow them.

244. All these rules, joined with the table of modes which we have given (art. 234.), will serve to discover in what mode we are in the middle of a piece, especially in the most essential passages, as cadences (5 K).

### CHAP. XIV. Of the Chromatic and Enharmonic.

245. WE call that melody chromatic which is com- Chromatic. posed of several notes in succession, whether rising or what. descending by semitones. See cv. and cv1.

246. When an air is chromatic in descending, the To an air most natural and ordinary fundamental bass is a con-descending catenated series of tonic dominants; all of which fol- matic inlow one another in descending by a fifth, or, which tervals. is the same thing, in rising by a fourth. See Ex. cv. fundamental bass, (5L). 247. what.

(5K) Two modes are so much more intimately relative, as they contain a greater number of sounds common to both; for example, the minor mode of C and the major of G, or the major mode of C and the minor of A: on the contrary, two modes are less intimately relative as the number of sounds which they contain as common to both is smaller; for instance, the major mode of C and the minor of B, &c.

When the composer, led away by the current of the modulation, that is to say, by the manner in which the fundamental bass is constituted, into a mode remote from that in which the piece was begun, he ought to continue in it but for a short time, because the ear is always impatient to return to the former mode.

(5 L) We may likewise give to a chromatic melody in descending, a fundamental bass, into which may enter chords of the seventh and of the diminished seventh, which may succeed one another by the intervals of a false fifth and a fifth redundant : thus in the Example CVII. where the continued bass descends chromatically, it may easily be seen that the fundamental bass carries successively the chords of the seventh and of the seventh diminished, and that in this bass there is a false fifth from D to GX, and a fifth redundant from GX to C.

The reason of this licence is, as it appears to us, because the chord of the diminished seventh may be considered as representing (art. 221.) the chord of the tonic dominant; in such a manner that this fundamental bass

(see Example cviii.) may be considered as representing (art. 116.) that which is written below,

# 7 \* 7 7 7 × A D E C F\* B E A.

Now this last fundamental bass is formed according to the common rules, unless that there is a broken ca-

dence from D to E, and an interrupted cadence from E to C, which are licenses (art. 213, and 214.)

247. When the air is chromatic in ascending, one Principles of Compo- may form a fundamental bass by a series of tonics and sition of tonic dominants, which succeed one another alternately by the interval of a third in descending, and of Ascending, a fourth in ascending, (see Ex. CVI.). There are many what. other ways of forming a chromatic air, whether in rising or descending ; but these details in an elementary essay are by no means necessary.

248. The enharmonic is very rarely put in practice; Enharmo nic little and we have explained its formation in the first book, practised. to which we refer our readers.

### CHAP. XV. Of Design, Imitation, and Fugue. See Design.

Design, what.

249. In music, the name of design, or subject, is generally given to a particular air or melody, which the composer intends should prevail through the piece; whether it is intended to express the meaning of words to which it may be set, or merely inspired by the impulse of taste and fancy. In this last ease, design is distinguished into imitation and fugue.

tation. Imitation. what.

Fugue.

See Imi-

250. Imitation consists in causing to be repeated the melody of one or several measures in one single part, or in the whole harmony, and in any of the various made modes that may be chosen. When all the parts abso-\* See Air, lutely repeat the same air \* or melody, and beginning one after the other, this is called a canon (5M).

Fugue consists in alternately repeating that air in treble, and in the bass, or even in all the parts, if there are more than two.

VOL. XIV. Part II.

251. Imitation and fugue are sometimes conducted Principles by rules merely deducible from taste, which may be of Composeen in the 332d and following pages of M. Rameau's sition. Treatise on Harmony ; where will likewise be found a Principal detail of the rules for composition in several parts. rules for The chief rules for composition in several parts are, composing that the discords should be found, as much as possible, in several prepared and resolved in the same part; that a dis-parts. eord should not be heard at the same time in several parts, because its harshness would disgust the ear; and that in no particular part there should be found two octaves or two fifths in succession (5N) with respeet to the bass. Musicians, however, do not hesitate sometimes to violate this precept, when taste or occasion require. In music, as in all the other fine arts, it is the business of the artist to assign and to observe rules; and the province of men of taste and genius to find exceptions.

### APPENDIX.

THE treatise of D'Alembert is well entitled to the merit of accuracy; but perhaps a person who has not partienlarly studied the subject, may find difficulty in following the scientific deductions of that author .- We subjoin, therefore, a few general observations on the philosophy of musical sound, commonly called harmonics, which may perhaps convey the full portion of knowledge of the theory of music, with which one in 4 A search

(5 M) Compositions in strict canon, where one part begins with a certain subject, and the other parts are bound to repeat the very same subject, or the reply, as it is called, in the unison, fifth, fourth, or cetave, depend on the following rules, which are nothing more than a summary of the system explained by our author.

1. The chords to be employed are the tonic, and its two adjuncts; the subdominant, susceptible of an added sixth, and the dominant, susceptible of an added seventh.

2. The subject must begin in the harmony of the tonic, and as the fundamental progression from the dominant to the subdominant is not permitted (art. 33, 36.), the subdominant must follow the tonic, and the dominant

C, F, G, C, F, G, C, &c. 3. As the diatonic scale consists of two tetrachords, of which the first is also the second tetrachord of the mode of the sub-dominant, and the second the first tetrachord of the dominant; so, in canon, when the reply is meant to be in the mode of the dominant, the subject must be in the first tetrachord of the tonie, by which means the corresponding first tetrachord of the dominant being the second tetrachord of the tonic, the whole piece is truly in that mode. On the other hand, if the reply is to be in the mode of the sub-dominant, the subject must be in the second tetrachord of the tonic, the corresponding tetrachord of the sub-dominant being the first tetrachord of the tonic, and the mode of the tonic being thus preserved.

4. For the same reason, where the reply is in the dominant, the subject is only allowed to modulate into the mode of the sub-dominant, and the reply of course into that of the tonie. And where the reply is in the dominant, the subject is to modulate only into the mode of the sub-dominant, the reply following of course into that of the tonie. Were the contrary modulation permitted, the reply would depart too far from the mode of the tonic.

Lastly, When the reply is to be in the mode of the dominant, it must commence in the measure bearing that harmony; and in the same way, the reply in the sub-dominant must begin in the measure which bears the harmony of the sub-dominant.

If these rules be observed, and due attention puid to the preparation and resolution of dissonances, composition in strict canon, in any number of parts, will be found to be by no means difficult. See Ex. cix. and cx.

(5 N) Yet there may be two fifths in succession, provided the parts move in contrary directions, or, in other words, if the progress of ouc part he ascending, and the other descending; but in this case they are not properly two fifths, they are a fifth and a twelfth : for example, if one of the parts in descending should sound F D, and the other 'c a' in rising, C is the fifth of F, and 'a' the twelfth of D.

Observa-Harmonics, satisfied.

General search only of general information, and not a professed student of this particular science, would choose to rest

### The theory of musical sound, which only in the beginning of the present century was ultimately established by mathematical demonstration, is no other than that which distinguished the ancient musical sect who followed the opinions of Pythagoras on that subject.

No part of natural philosophy has been more fruitful of hypothesis than that of which musical sound is the object. The musical speculators of Greece arranged themselves into a great number of sects, the chief of whom were the Pythagoreans and the Aristoxenians.

Pythagoras supposed the air to be the vehicle of sound; and the agitation of that element, occasioned by a similar agitation in the parts of the sounding body, to be the cause of it. The vibrations of a string or other sonorous body, being communicated to the air, affected the auditory nerves with the sensation of sound ; and this sound, he argued, was acute or grave in proportion as the vibrations were quick or slow .- He discovered by experiment, that of two strings equal in every thing but length, the shorter made the quicker vibrations, and emitted the acuter sound : in other words, that the number of vibrations made in the same time by two strings of different lengths, was inversely as those lengths; that is, the greater the length the smaller the number of vibrations in any given time. Thus sound, considered in the vibrations that cause it, and the dimensions of the vibrating body, came to be reduced to quantity, and as such was the subject of calculation, and expressible by numbers .- For instance, the two sounds that form an octave could be expressed by the numbers 1 and 2, which would represent cither the number of vibrations in a given time, or the length of the strings; and would mean that the acuter sound vibrates twice, while the graver vibrates once ; or that the string producing the lower sound is twice the length of that which gives the higher. If the vibra-tions were considered, the higher sound was as 2, the lower as I; the reverse, if the length was alluded to. In the same manner, in the same sense, the 5th would be expressed by the ratio of 2 to 3, and the 4th by that of 3 to 4.

Aristoxenes, in opposition to the calculations of Pythagoras, held the ear to be the sole standard of musical proportions. That sense he accounted sufficiently accurate for musical, though not for mathematical purposes; and it was in his opinion absurd to aim at an artificial accuracy in gratifying the ear beyond its own power of distinction. Hc, therefore, rejected the velo-

## Glass-Music. See HARMONICA.

Music.

Musimon.

MUSIMON, in Natural History, the name of an animal esteemed a species of sheep, described by the ancients as common in Corsica, Sardinia, Barbary, and the north-east parts of Asia. It has been doubted whether the animal described under this name is now any where to be found in the world; and whether it was not probably a spurious breed between two animals of different species, perhaps the sheep and goat,

cities, vibrations, and proportions of Pythagoras, as General foreign to the subject, in so far as they substituted Observaabstract causes in the room of experience, and made tions on Harmonics music the object of intellect rather than of sense.

Of late, however, as has been already mentioned, the opinions of Pythagoras have been confirmed by absolute demonstration ; and the following propositions, in relation to musical sound, have passed from conjecture to certainty.

Sound is generated by the vibrations of elastic bodies, which communicate the like vibrations to the air, and these again the like to our organs of hearing. This is evident, because sounding bodies communicate tremors to other bodies at a distance from them. The vibrating motion, for instance, of a musical string, excites motion in others, whose tension and quantity of matter dispose their vibrations to keep time with the undulations of air propagated from it (the string first set in motion).

If the vibrations be isochronous, and the sound musical, continuing at the same pitch, it is said to be acuter, sharper, or higher, than any other sound whose vibrations are slower; and graver, flatter, or lower, than any other whose vibrations are quicker .- For while a musical string vibrates, its vibrations become quicker by increasing its tension or diminishing its length; its sound at the same time will be more acute : and, on the contrary, by diminishing its tension or increasing its length, the vibrations will become slower and the sound graver. The like alteration of the pitch of the sound will follow, by applying, by means of a weight, an equal degree of tension to a thicker or heavier and to a smaller or lighter string, both of the same length, as in the smaller string the mass of matter to be moved by the same force is less.

If several strings, however, different in length, density, and tension, vibrate altogether in equal times, their sounds will have all one and the same pitch, however they may differ in loudness or other qualities .- They are called unisons. The vibrations of unisons are isochronous.

The vibrations of a musical string, whether wider or narrower, are nearly isochronous. Otherwise, while the vibrations decrease in breadth till they cease, the pitch of the sound could not continue the same (which we perceive by experience it does), unless where the first vibrations are made very violently; in which case, the sound is a little acuter at the beginning than afterwards.

Lastly, The word vibration is understood to mean the time which passes between the departure of the vibrating body from any assigned place and its return to the same.

### U S M

which, like the mulc, not being able to propagate its Musimon species, the production of them may have been discontinued.

Buffon supposes it to be the sheep in a wild state; and it is described as such by Mr Pennant. These animals live in the mountains, and run with great swiftness among the rocks. Those of Kamtschatka are so strong, that 10 men can scarce hold one; and the horns are so large as sometimes to weigh 30 pounds, and

L

Musimon and so capacious that young foxes often shelter themselves in the hollow of such as by accident fall off in Jussulman. the deserts.

MUSIVUM AURUM. See CHEMISTRY, Nº 1806.

MUSK, a very strong scented substance, found in a bag under the belly of a species of moschus. Sce Moschus, MAMMALIA Index. And for an account of the nature and properties of musk, see MATERIA MEDICA Index.

EDICA Index. MUSK Animal. See Moschus, MAMMALIA Index. MUSK Rat. See CASTOR,

MUSKET, or MUSQUET, properly a fire-arm borne on the shoulder, and used in war; to be fired by the application of a lighted match.

The length of the barrel is fixed to three fect eight inches from the muzzle to the touch-pan, and its bore is to be such as may receive a bullet of 14 in a pound, and its diameter differs not above one 50th part from that of the bullet.

Muskets were anciently borne in the field by the infantry, and were used in England so lately as the beginning of the civil wars. At present they are little used, except in the defence of places; fusees or firelocks having taken their place and name.

MUSKETOON, a kind of short thick musket, whose bore is the 38th part of its length; it carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder. This is the shortest kind of blunderbusses.

MUSLIN, a fine sort of cotton cloth, which bears a downy knot on its surface. There are several sorts of muslins brought from the East Indies, and more particularly from Bengal; such as doreas, betelles, mulmuls, tanjecbs, &c. Muslin is now manufactured in Britain, and brought to very great perfection. MUSQUETOE. See CULEX, ENTOMOLOGY Index.

MUSSULMAN, or MUSYLMAN, a title by which the Mahometans distinguish themselves; signifying, in the Turkish language, " true believer, or orthodox." See MAHOMETANISM.

In Arabic, the word is written Moslem, Mosleman, or Mosolman. The appellation was first given to the Saracens, as is observed by Leunclavius.-There are two kinds of Mussulmans, very averse to each other; the one called Sonnites, and the other Shiites .- The Sonnites follow the interpretation of the Alcoran given by Omar; the Shiites are the followers of Ali. The subjects of the king of Persia are Shiites; and those of the grand signior, Sonnites. See SONNA, and ALCORAN.

According to some authors the word Mussulman signifies saved, that is, predestinated : and hence the Mahometans give themselves the appellation, as believing they are all predestinated to salvation .- Martinins is more particular as to the origin of the name; which he derives from the Arabic act musalem, "saved, snatched out of danger:" the Mahometans, he observes, establishing their religion by fire and sword, massacred all those who would not embrace it, and granted life to all that did, calling them Mussulmans, q. d. erepti è periculo; whence the word, in course of time, became the distinguishing title of all those of that sect, who have affixed to it the signification of true believers.

MUST, MUSTUM, sweet wine newly pressed from Mussulman the grape; or the new liquor pressed from the fruit be-Mutilation. fore it is formented. Sce WINE.

MUSTARD. See SINAPI, BOTANY Index.

MUSTARD Seed. For an account of its medical qualities, see MATERIA MEDICA Index.

MUS'TELA, the OTTER and WEASEL; a genus of quadrupeds of the order of feræ. Sec MAMMALIA Index.

MUSTER, in a military sense, a review of troops under arms, to see if they be complete and in good order; to take an account of their numbers, the condition they are in, viewing their arms and accoutrements, &c.

MUSTER-Master-general, or Commissary-general of the MUSTERS; one who takes account of every regiment, their number, horses, arms, &c. reviews them, secs the horses be well mounted, and all the men well armed and accoutred, &c.

MUSTER-Rolls, lists of soldiers in each company, troop, or regiment, by which they are paid, and the strength of the army is known. MUTABILITY is opposed to immutability. See

IMMUTABILITY.

MUTATION, the act of changing, or sometimes the change itself.

MUTATION, in the ancient music, is applied to the changes or alterations that happen in the order of the sounds which compose the melody.

MUTATIONES, among the Romans, post stages or places where the public couriers were supplied with fresh horses .- The mutationes were wholly designed for the use of these couriers, or messengers of state ; in which respect they differ from mansiones.

MUTCHKIN, a liquid measure used in Scotland; it contains four gills, and is the fourth part of a Scotch pint.

MUTE, in a general sense, signifies a person that cannot speak, or has not the use of speech.

MUTE, in Law, a person that stands dumb or speechless when he ought to answer, or to plead. See AR-RAIGNMENT.

MUTE, in Grammar, a letter which yields no sound without the addition of a vowel. The simple consonants are distinguished into mutes and liquids, or semivowels. Sec the articles CONSONANT, LIQUID, &c.

The nutes in the Greek alphabet arc nine, three of which, viz. m, x, r, are termed tennes; three B, y, d, termed media; and three  $\varphi$ ,  $\chi$ ,  $\vartheta$ , termed aspirata. See the article ASPIRATE, &c.

The mutes of the Latin alphabet are also nine, viz. B, C, D, G, I, K, P, Q, T, MUTILATION, the retrenching or cutting away

any member of the body.

This word is also extended to statucs and buildings, where any part is wanting, or the projecture of any member, as a cornice or an impost, is broken off. is sometimes also used in a more immediate manner for castration : (See CASTRATION and EUNUCH). The practice of this sort of mutilation is of various kinds: the Hottentots are said to cut away one testicle from their children upon supposition that they are thereby made lighter and more active for running. In other countries, poor people completely mutilate their boys,

4 A 2

to

Mutina.

Mutilation to prevent the misery and want which would attend their offspring. Those who have nothing in view but , the improvement of a vain talent, or the formation of a voice which disfigures nature, as was the case formerly in Italy, are contented with eutting away the testicles. But in some countries of Asia, especially among the Turks, and in a part of Africa, those whom jealousy inspires with distrust would not think their wives safe in the custody of such eunuchs : They employ no slaves in their seraglios who have not been deprived of all the external parts of generation.

Amputation is not the ouly means of accomplishing this end. Formerly, the growth of the testicles was prevented, and their organization destroyed by simple rubbing, while the child was put into a warm bath made of a decoction of plants. Some pretend that by this species of eastration the life is in no danger. Amputation of the testicles is not attended with much danger; but complete amputation of the external parts of generation is often fatal. This operation can only be performed on children from seven to ten years of age. Eunuchs of this kind, owing to the danger attending the operation, cost in Turkey five or six times more than others. Chardin relates, that this operation is so painful and dangerous after 15 years of age, that hardly a fourth part of those by whom it is undergone escape with life. Pietro della Valle, on the contrary, informs us, that in Persia those who suffer this cruel and dangerous operation as a punishment for rapes and other crimes of this kind, are easily cured though far advanced in life; and that nothing but ashes is applied to the wound.

There are eunuchs at Constantinople, throughout all Turkey, and in Persia, of a gray complexion : they come for the most part from the kingdom of Golconda, the peninsula on this side the Ganges, the kingdoms of Assan, Aracan, Pegu, and Malabar. Those There from the gulf of Bengal are of an olive colour. are some white eunuchs who come from Georgia and Circassia, but their number is small. The black eunuchs come from Africa, and especially from Ethiopia. These, in proportion to their horrible appearance, are the more esteemed and cost dearer. It appears that a very considerable trade is carried on in this species of men; for Tavernier informs us, that when he was in the kingdom of Golconda, in the year 1657, 22,000 eunuchs were made it it. In that country they are sold at the fairs.

The object of improving the voice by means of this species of mutilation, it is said, often fails; for of 2000 victims to the luxury and extravagant caprices of the art, hardly three are found who unite good talents with good organs. The other languishing and inactive wretches are, in some measure, outcasts from both sexes, and paralytic members in the community. But let us pay the tribute which is due to that virtuous pontiff Pope Clement VIII. who, listening to the voice of modesty and humanity, proscribed and abolished this detestable and infamous practice. Mutilation, he declared was the most abominable and disgraceful of crimes.

MUTILLA, a genus of inseets belonging to the order of hymenoptera. See ENTOMOLOGY Index.

MUTINA, in Ancient Geography, a noble city of the Cispadana, made a Roman colony in the same year with

Parma, situated between the rivers Gabellus and Scultenna, on the Via Æmilia. Here D. Brutus being besieged by Antony, was relieved by the consuls Hirtius Mutius. and Pansa. The Greeks called it Mutine; except Polybius, in whom it is Motine ; and in Ptolemy Mutina, after the Roman manner .- Now Modena, a city of Lombardy, and capital of a cognominal duchy. E. Long. 11. 20. N. Lat. 44 45.

MUTINY, in a military sense, to rise against authority .-... " Any officer or soldier who shall presume to use traiterous or disrespectful words against the sacred person of his majesty, or of the royal family, is guilty of mutiny.

" Any officer or soldier who shall behave himself with contempt or disrespect towards the general or other commander in chief of our forces, or shall speak words tending to their hurt or dishonour, is guilty of mutiny.

" Any officer or soldier who shall begin, excite, cause, or join in, any mutiny or sedition, in the troop, company, or regiment, to which he belongs, or in any other troop or company in our service, or in any party, post, detachment, or guard, on any pretence whatsoever, is guilty of mutiny.

" Any officer or soldier who, being present at any mutiny or sedition, does not use his utmost endeavours to suppress the same, or coming to the knowledge of any mutiny, or intended mutiny, does not without delay give information to his commanding officer, is guilty of mutiny.

" Any officer or soldier, who shall strike his superior officer, or draw, or offer to draw, or shall lift up any weapon, or offer any violence against him, being in the execution of his office, on any pretence whatsoever, or shall disobey any lawful command of his superior officer, is guilty of mutiny."

MUTINY Act. See MILITARY State.

MUTIUS, CAIUS, surnamed Codrus, and afterwards Scavola, was one of the illustrious Roman family of the Mutii, and rendered his name famous in the war between Porsenna king of Tuscany and the Romans. That prince resolving to restore the family of Tarquin the Proud, went to besiege Rome 507 B. C. Mutius resolved to sacrifice himself for the saftey of his country; and boldly entering the enemy's camp, killed Porsenna's secretary, whom he took for Porsenna himself. Being seized and brought before Porsenna, he told him boldly, that 300 young men like himself had sworn to murder him ; but since this hand has missed thee, continued he, it must be punished; then putting his right hand on the burning coals, he let it burn with such constancy as astonished the beholders. The king, amazed at the intrepidity of this young Roman, ordered that he should have his freedom and return to Rome, and soon after concluded a peace with the Romans. From this action Mutius obtained the surname of Scævola, " or left-handed," which was enjoyed by his family.

MUTIUS Seævola, Q. surnamed the Augur, was an excellent civilian, and instructed Cicero in the laws. He was made prætor in Asia; was afterwards consul, and performed very important services for the republic.

He ought not to be confounded with Quintus Mutius Scævola, another excellent eivilian, who was præIutius

ycenæ.

tor in Asia, tribune of the people, and at length consul, 95 B. C. He governed Asia with such prudence and equity, that his example was proposed to the governors who were sent into the provinces. Cicero says, " that he was the most eloquent orator of all the civilians, and the most able civilian of all the orators." He was assassinated in the temple of Vesta, during the wars of Marius and Sylla, 82 B. C.

MUTTON, the common name of the flesh of a sheep after the animal has been killed. Mutton has heen commonly preferred to all the fleshes of quadrupeds. And indeed, besides its heing more perfect, it has the advantage over them of being more generally suited to different climates : whereas beef, e. g. rcquires a very nice intermediate state, which it seems to enjoy chiefly in England; for although Scotland supplies what are reckoned the best cattle, it is in the rich English pastures that they are brought to perfection. Now the sheep can be brought almost to the same perfection in this bleak northern region as in the southern countrics.

MUTUAL, a relative term, denoting something that is reciprocal between two or more persons.

Thus we say, mutual assistance, mutual aversion, &c. There are mutual or reciprocal duties, offices, &c. between superiors and inferiors ; as the king and his subjects, the master and his servants, &c.

Vaugelas makes a distinction between mutual and reciprocal : mutual, according to him, is understood of what is between two only; and reciprocal, of what is between more than two: but this distinction is little rcgarded in common use.

MUTULE, in Architecture, a kind of square modillion set under the cornice of the Doric order.

MUTUNUS, or MUTINUS, in Fabulous History, a deity among the Romans, similar to the Priapus of the Greeks.

MUZZLE of a GUN or MORTAR, the extremity at which the powder and ball is put in; and hence the muzzle ring is the metalline circle or moulding that surrounds the month of the piece.

MYA, the GAPER; a genus of shell fish. Sce CON-CHOLOGY Index.

MYAGRUM, GOLD OF PLEASURE, a genus of plants, belonging to the tetradynamia class; and in the natural method ranking under the 39th order, Siliquosæ. See BOTANY Index.

MYCALE, a city and mountain of Caria; also a promontory of Asia opposite Samos, celebrated for a battle which was fought there between the Greeks and Persians about the year of Rome 275. The Persians were about 100,000 men, who had just returned from the unsuccessful expedition of Xerxes in Greece .---They had drawn their ships to the shore, and fortified themselves strongly, as if determined to support a siege. They suffered the Greeks to disembark from their fleet without the least molestation, and were soon obliged to give way before the cool and resolute intrepidity of an inferior number of men. The Greeks obtained complete victory, slaughtered some thousands of the enemy, burned their camp, and sailed back to Samos with an immense booty, in which were 70 chests of money.

MYCENÆ, in Ancient Geography, a town of Argolis, in Peloponnesus. The kingdom of the Argives was divided into two portions by Acrisius and his bro-

ther Proetus. Argos and Mycenæ were their capitals. Mycenæ -These, as belonging to the same family, and distant only about 50 stadia or six miles and a quarter from Myginda. cach other, had one tutelary deity, Juno, and were jointly proprietors of her temple, the Heræum, which was near Mycenæ. It was here that Agamemnon reigned. He enlarged his dominions by his valour and good fortune, and possessed, besides Mycenæ, the region about Corinth and Sicyon, and that called afterwords Achaa. On his return from Troy, he was slain with his companions at a banquet. Mycenæ then declined : and under the Heraclidæ was made subject to Argos. (See Angos and Argeia.) The Mycenzans sending 80 men, partook with the Lacedæmomans in the glory acquired at Thermopylæ. The jealousy of the Argives produced the destruction of their city, which was abandoned after a siege, and laid waste in the first year of the 78th Olympiad, or 466 years before Christ. Some part of the wall remained in the second century, with a gate on which were lions, a fountain, the subterraneous edifices where Atreus and his sons had deposited their treasures, and, among other sepulchral monuments, one of Agamemnon, and onc of his fellow soldiers and sufferers.

MYCONE, an island of the Archipelago, situated in E. Long. 25. 51. N. Lat. 37. 28. It is about 36 miles in circuit, and has a town of the same name, containing about 3000 inhabitants. The people of this island are said to be the best sailors in the Archipelago, and have about 150 vessels of different sizes. The island yields a sufficient quantity of barley for the inhabitants, and produces abundance of figs, and some olives; but there is a scarcity of water, especially in summer, there being but one well in the island .--There are a great number of churches and chapels, with some monasteries.

MYCONUS, in Ancient Geography, one of the islands called Cyclades, near Delos, under which the last of the Centaurs slain by Hercules are feigned to lie buried. Hence the proverb, Omnia sub unam Myconum congerere, applied to an injudicious or unnatural farrago. Myconii, the people, noted for baldness. Hence Myconius, a bald person. According to Strabo, the inhabitants became hald at the age of 20 or 25; and Pliny says that the children were always born without hair. The island was poor, and the inhabitants very avaricious; whence Archilochus reproached a certain Pericles, that he came to a feast like a Myconian; that is without previous invitation. Now called Mycone, which see.

MYCTERIA, the JABIRU, a genus of birds belonging to the order of grallæ. See ORNITHOLOGY Index.

MYGDONIA, in Ancient Geography, a district of Macedonia, to the north of the Sinus Thermaicus, and east of the river Axius, which separates it from Bottæis, and west of the river Strymon (Pliny). Also a district of Mesopotamia, which took its name from that of Macedonia, running along the Euphrates, from Zeugma down to Thapsacus, extending a great way east, hecause Nisibis was reckoned to it.

MYGINDA, a genus of plants belonging to the tetrandria class; and in the natural method ranking with those of which the order is doubtful. See BOTANY Index.

Myiagrus

Mylasa.

MYO

MYIAGRUS DEUS, in the heathen mythology, a name given sometimes to Jupiter, and sometimes to Hercules, on occasion of their being sacrificed to for the driving away the vast numbers of flies which infested the sacrifices on certain public occasions. The word is usually spelt Myagrus; but this must be an error, as this word does not express the fly-destroyer, but the mouse-destroyer; and we have it sufficiently testified by the ancients, that flics were the only erea-tures against whom this deity was invoked. Pliny calls this deity also Myjodes ; and tells us that the flies which used to poster the Olympic rites went away in whole clouds on the sacrificing a bull to this god. We find in Athenacus also, that this sacrificing to the god of flies at the Olympic games was a constant custom. Some distinguish these two doities, and tell us that the latter or Myiodes, used to visit the nations in vengeance, with a vast multitude of flies : and that, on paying him the due honours of a sacrifice, they all went away again; and this seems to agree with what Pliny tells us in some places.

At the time of the Olympic games, Jupiter was worshipped under the name of Apomyos or Myiagrus Deus, to supplicate the destruction of those troublesome creatures. This happened only once in many years, when the sacrifices were performed there; but the Elians worshipped him continually under this name, to deprecate the vengeance of heaven, which usually sent, as they expressed it, an army of flies and other insects, toward the latter end of the summer, that infested the whole country with sickness and pestilence.

MYIODES DEUS, in the heathen mythology, a name sometimes given to Hercules, but more frequently to Jupiter, to whom a bull was sacrificed, in order to make him propitious in driving away the flies that infested the Olympic games.

MYLÆ, in Ancient Geography, a Greek eity situated on an isthmus of a cognominal peninsula, on the north-east side of the island. Mylaci, or Mylenses, the people. A town built by those of Zanele (Strabo). Mylæus, the epithet, as Mylæus Campus, mentioned by Polybius. Now ealled Milazzo, a port town of Sicily, in the Val di Demona. E. Long. 15. 5. N. Lat. 38. 36.

MYLASA, or MYLASSA, in Ancient Geography, a noble city of Caria in Asia Minor, situated about three leagues from the Sinus Ceramicus. It was the capital of Hecatomnus king of Caria, and father of Mausolus. Pliny speaks of Menander king of Caria, and says that the Rhodians preserved with the greatest carc his portrait painted by Apelles: but it was not in honour of this Menander that a Corinthian pillar was crected at Mylasa, which still exists, and on which is to be seen the following inscription : "The people erected this pillar in honour of Menander, the son of Uliades, and grandson of Euthydemus, the benefactor of his country, and whose ancestors rendered it great services also." Euthydemus, the grandfather of this Menander, lived in the time of Julius Cæsar and Augustus. Caria was taken by Mithridates, and afterwards by Labienus, whose father had been one of Cæsar's generals. Hybrias, whose eloquence and valour deservedly entitled him to a distinguished rank among his countrymen, in vain encouraged them to make a most obstinate defence

2

while it was besieged by the latter. He bimself was Mylasa obliged to yield to necessity, and to take refuge at Rhodes : but scarcely had the conqueror quitted the Myomand city, when Hybrias returned, and restored liberty to his country .- Not content with rendering it this service, he also destroyed the power of a dangerous eitizen, whose riches and talents rendered him a necessary evil. Euthydemus, often banished, and as often recalled, always too powerful in a state the independence of which be threatened, saw his ambition enccked by the zeal and activity of Hybrias. The Romans left to Mylasa that liberty of which it rendered itself so worthy, by the great efforts it made to preserve it. Pliny calls it Mylasa libera. Strabo informs us, that it was one of the most magnificent cities of antiquity, and one of those, the temples, porticoes, and other public monuments of which were highly admired. A quarry of white marble in the neighbourhood furnished it with abundance of materials for erecting these edifices .---The Mylasians had two temples dedicated to Jupiter, one situated in the eity, which was named Osogo, and another built on a mountain, at the distance of 60 leagues. The latter was dedicated to Jupiter Stratius, Jupiter the Warrior. His state, which was very ancient, inspired great veneration; people came from all quarters to implore his protection; and for the greater accommodation of his votaries a paved way was constructed which reached from Mylasa to this venerable fabric. This eity is now called Mclasso, and, according to Dr Chandler, is still a large place .- The houses are numerous, hut chiefly of plaster, and mean, with trees interspersed. The air is accounted bad; and scorpions abound as anciently, entering often at the doors and windows, and lurking in the rooms. The plain is surrounded by lofty mountains, and cultivated. Round the towns are ranges of broken columns, the remnants of porticoes, now with rubbish bounding the vineyards. A large portion of the plain is covered with scattered fragments, and with piers of ordinary aqueduets ; besides inscriptions, mostly mincd and illegible. Some altars dedicated to Hecatomnus have been discovered. Of all the ancient temples which formerly ornamented this eity, one only escaped the power of time, the blind zcal of the early Christians, and the barbarous super-stition of the Mahometans. This monument was dedicatcd to Augustus and the divinity of Rome. When Pocoeke visited Melasso, it was perfect and entire; but at present no traces of it remain, except a few fragments, which have been employed to construct a Turkish mosque.

MYLOGLOSSUM, in Anatomy. See ANATOMY, Table of the Muscles.

MYLOHYOIDÆUS. Ibid.

MYOLOGY, (formed of  $\mu\nu\nu_s$ ,  $\mu\nu\nu_s$ , " a muscle," and  $\lambda \circ \gamma \circ s$ , "discourse"), in anatomy, a description of the muscles; or the knowledge of what relates to the muscles of the human body. *Ibid.* 

MYOMANCY, a kind of divination, or method of foretelling future events by means of mice.

Some authors hold myomaney to be one of the most ancient kinds of divination; and think it is on this account that Isaiah, lxvi. 17. reckons mice among the abominable things of the Idolaters. But, heside that, it is not certain that the Hebrew word vised by the smancy the prophet signifies a mouse, it is cvident it is not the divination by that animal, be it what it will, that is ristical spoken of, but the eating it.

MYOPIA, SHORT-SIGHTEDNESS; a species of vision wherein objects are seen only at small distances. See MEDICINE, Nº 361.

MYOSOTIS, SCORPION-GRASS; a genus of plants belonging to the pentandria class, and in the natural method ranking under the 41st order, *Asperifoliæ*. See BOTANY *Index*.

MYOSORUS, a genus of plants belonging to the pentandria class, and in the natural method ranking under the 26th order, *Multisiliquæ*. See BOTANY *Index*.

MYOXUS, the DORMOUSE, a genus of quadrupeds belonging to the order of glires. See MAMMALIA Index.

MYRIAD, a term sometimes used to denote ten thousand.

MYRICA, GALE, or SWEET-WILLOW, a genus of plants belonging to the diœcia class, and in the natural method ranking under the 5th order, Amentaceæ. See BOTANY Index.

MYRIOPHYLLUM, a genus of plants belonging to the monœcia class, and in the natural method ranking under the 15th order, *Inundatæ*. See BOTANY *Index*.

MYRISTICA, the NUTMEG-TREE, in Botany, a genus of plants belonging to the class diccia, and order syngenesia, and of the natural order, Lauri. The description of this genus having been omitted in its proper place under BOTANY, we shall here introduce a short account of it .- The male calyx is monophyllous, strong, and parted into three laciniæ of an oval shape, and ending in a point: it has no corolla. In the middle of the receptacle rises a column of the height of the calyx, to the upper part of which the antheræ are attached. They vary in number from three to twelve or thirteen .- The female calyx and corolla as in the male, on a distinct tree. The germen of an oval shape; the style short, with a bifid stigma, the lacinii of which are oval and spreading .- The fruit is of that sort called drupa. It is fleshy, roundish, sometimes unilocular, sometimes bivalved, and bursts when ripe at the side. The seed is enveloped with a fleshy and fatty membranous substance which divides into filaments (this, in one of the species, is the mace of the shops). The seed or nutmeg is round or oval shaped, unilocular, and contains a small kernel, variegated on the surface by the fibres running in the form of a screw.

Species.—There are five species of this genus according to some authors; but several of these being only varieties, may be reduced into three, viz.

2. The myristica sebifera, (*Virola Sebifera* Aublet, page 904. tab. 345.) a tree frequent in Guiana, rising to 40 or even to 60 feet high; on wounding the trunk of which, a thick, acrid, red juice runs out. Aublet says nothing of the nutmegs being aromatic; he only observes, that a yellow fat is obtained from them, which Myristica. serves many economical and medical purposes, and that the natives make candles of it.

3. The myristica moschata, or nutmeg, rises to the height of 30 feet, producing numerous branches; the bark of the trunk is of a reddish brown, but that of the young branches is of a bright green colour: the leaves are nearly elliptical, pointed, undulated, ohliquely nerved, on the upper side of a bright green, on the under whitish, and stand alternately upon footstalks: the flowers are small, and hang upon slender peduncles, proceeding from the axillæ of the leaves: they are both male and female upon separate trees.

M. Schwartz, who has carefully examined this as well as the two first species, preserved in spirits, places them among the monadelphia.

The nutmeg has been supposed to be the comacum of Theophrastus, but there seems little foundation for this opinion; nor can it with more probability be thought to be the chrysobalanos of Galen. Our first knowledge of it was evidently derived from the Arabians; by Avicenna it was called jiausiban, or jiausiband, which signifies nut of Banda. Rumphius both figured and described this tree; but the figure given by him is so imperfect, and the description so confused, that Linnæus, who gave it the generic name myristica, was unable to assign its proper characters. M. Lamarck informs us, that he received several branches of the myristica, both in flower and fruit, from the isle of France, where a nutmeg-tree, which was introduced by Monsieur Poivre in 1770, is now very large, and continually producing flowers and fruit. From these branches, which were sent from Mons. Cere, director of the king's garden in that island, Lamarck has been enabled to describe and figure this and other species of the myristica. See Plate CXXIV. BOTANY."

The seeds or kernels called *nutmegs* are well known, as they have been long used both for culinary and mcdical purposes. Distilled with water, they yield a large quantity of essential oil, resembling in flavour the spice itself; after the distillation an insipid sebaecous matter is found swimming on the water; the decoction inspissated, gives an extract of an unctuous, very lightly bitterish taste, and with little or no astringency. Rectified spirit extracts the whole virtue of nutmegs by infusion, and elevates very little of it in distillation; hence the spirituous extract possesses the flavour of the spice in an eminent degree.

Nutmegs, when heated, yield to the press a considerable quantity of limpid yellow oil, which on cooling concretes into a sebaceous consistence. In the shops we meet with three sorts of unctuous substances, called oil of mace, though really expressed from the nutmeg. The best is brought from the East Indies in stone jars; this is of a thick consistence, of the colour of mace. Myristica. mace, and has an agreeable fragrant smell; the second sort, which is paler coloured, and much inferior in quality, comes from Holland in solid masses, generally flat, and of a square figure : the third, which is the worst of all, and usually called common oil of mace, is an artificial composition of sevum, palm oil, and the like, flavoured with a little genuine oil of nutmeg.

Method of gathering and preparing Nutmeg .- When the fruit is ripe the natives ascend the trees, and gather it by pulling the branches to them with long hooks. Some are employed in opening them immediately, and in taking off the green shell or first rind, which is laid together in a heap in the woods, where in time it putrefies. As soon as the putrefaction has taken place, there spring up a kind of mushrooms called boleti moscharyni, of a blackish colour, and much valued by the natives, who consider them as delicate cating. When the nuts are stripped of their first rind, they are carried home, and the mace is carefully taken off with a small knife. The mace, which is of a beautiful red, but afterwards assumes a darkish or reddish colour, is laid to dry in the sun for the space of a day, and is then rcmoved to a place less exposed to his rays, where it remains for eight days, that it may soften a little. They afterwards moisten it with sea water, to prevent it from drying too much, or from losing its oil. They are careful, however, not to employ too much water, lest it should become putrid, and be devoured by the worms. It is last of all put into small bags, and squcezed very close.

The nuts which are still covered with their ligneous shell, are for three days exposed to the sun, and afterwards dried before a firc till they emit a sound when they are shaken; they then beat them with small sticks in order to remove their shell, which flies off in pieces. These nuts are distributed into three parcels, the first of which contains the largest and most bcautiful, which are destined to be brought to Europe; the second contains such as are reserved for the use of the inhabitants; and the third contains the smallest, which are irregular or unripe. These are burnt; and part of the rest is employed for procuring oil by pressure. A pound of them commonly gives three ounces of oil, which has the consistence of tallow, and has entirely the taste of nutnieg. Both the nut and mace, when distilled, afford an essential, transparent, and volatile oil, of an excellent flavour.

The nutmegs which have been thus selected would soon corrupt if they were not watered, or rather pickled, with lime-water made from calcined shell fish, which they dilute with salt water till it attain the consistence of fluid pap. Into this mixture they plunge the nutmegs, contained in small baskets, two or three times, till they are completely covered over with the liquor. They are afterwards laid in a heap, where they heat, and lose their superfluous moisture by evaporation. When they have sweated sufficiently, they are then properly prepared, and fit for a sea voyage.

In the island of Banda, the fruit of the nutmeg tree is preserved entire in the following manner : When it is almost ripe, but previous to its opening, it is boiled in water and pierced with a needle. They next lay it in water to soak for ten days, till it has lost its sour

and sharp taste. They then boil it gently in a syrup Myristic of sugar, to which, if they wish it to be hard, a little lime is added. This operation is repeated for eight days, and each time the syrup is renewed. The fruit when thus preserved is put for the last time into a pretty thick syrup, and is kept in earthen pots closely shut.

These nuts are likewise pickled with brine or with vinegar; and when they intend to eat them, they first steep them in fresh water, and afterwards boil them in syrup of sugar, &c.

Uses .-- Nutmegs prescrved entire are presented as desserts, and the inhabitants of India sometimes eat them when they drink tea. Some of them use nothing but the pulp ; others likewise chew the mace ; but they generally throw away the kernel, which is really the nutmeg. Many who perform sea voyages to the north chew this fruit every morning.

The medicinal qualities of nutmeg are supposed to be aromatic, anodyne, stomachic, and restringent ; and with a view to the last-mentioned effects, it has been much used in diarrhœas and dysenteries.

Remarks on the trade of Nutmegs .- Nutmeg trees grow in several islands in the castern ocean. The wood pigeon of the Moluecas is unintentionally a great planter of these trees, and disseminates them in places where a nation, powerful by its commerce, thinks it for its interest that they should be rooted out and destroyed. The Dutch, whose unwearied patience can surmount the greatest obstacles, formerly appropriated to themselves the crop of nutmeg, as well as that of cloves and ciunamon, growing in the islands of Ternate, Ccylon, &c. either by right of conquest or by paying subsidies to the islanders, who find these much more profitable than the former produce of their trees. It is nevertheless true, that they have prevailed upon or compelled the inhabitants of the Moluccas to cut down and root out all the clove trees, which they have preserved only in the islands of Amboyna and Ternate, which are in a great measure subject to them. We know for certain, that the Dutch pay 18,000 rixdollars yearly to the king of Ternate by way of tribute or gift, in order to recompense him for the loss of his clove trees in the other Molucca islands ; and that they are moreover bound by treaty to take at 3<sup>3</sup>/<sub>4</sub>d. a pound, all the cloves brought by the natives of Amboyna to their magazines.

The Dutch had formerly immense and very rich magazines of these precious aromatics, both in India and Europe. It is said, that they had actually by them the produce of 16 years, and never supplied their neighbours with the last, but always with the oldest crop: in 1760 they sold what was laid up in 1744; and when they had too great a quantity of cloves, nutmeg, &c. in their magazines, they threw them into the sea, or destroyed them by burning. On the 10th of June 1760, M. Bomare saw at Amsterdam, near the Admiralty, a fire, the fuel of which was valued at 8,000,000 of livres; and as much was to be burned on the day following. The feet of the spectators were bathed in the essential oil of these substances ; but no person was allowed to gather any of it, much less to take any of the spices which were in the fire. Some years before, upon a similar occasion, and at the same place, a poor man

Myristica man who had taken up some nutmegs which had rolled out of the fire, was, as M. Bomare was informed, seized Myrch. Both and condemned to immediate execution.

But after all, although the spice trade is less exclusively limited to the Dutch of late years, it does not appear that the price of East Indian spiceries is in any degree reduced to the consumer.

MYRMECOPHAGA, or ANT-BEAR, a genus of quadrupeds; belonging to the order of bruta. See MAM-MALIA Index.

MYRMELEON, or ANT-LION, a genus of insects of the neuroptera order. See ENTOMOLOGY Index.

MYRMIDONS, MYRMIDONES, in antiquity; a people in the southern borders of Thessaly, who ac-companied Achilles to the Trojan war. They received their name from Myrmidon, a son of Jupiter and Eurymedusa, who married one of the daughters of Æolus, son of Helen. His son Actor married Ægina, the daughter of Æsopus. He gave his name to his subjects, who dwelt near the river Peneus in Thessaly. According to some, the Myrmidons received their name from their having arisen from ants or pismires, upon a prayer put up for that purpose by King Æacus to Jupiter, after his kingdom had been dispeopled by a severe pestilence. According to Strabo, they received it from their industry, because they imitated the diligence of the ants, and like them were indefatigable, and were continually employed in cultivating the earth.

MYRMILLONES were gladiators of a certain kind at Rome, who fought against the Retiarii. Their arms were a sword, head piece, and shield. On the top of the head-piece they wore a fish embossed, called Moguoges, whence their name is by some supposed to be derived. The Retiarii, in their engagements, made use of a nct, in which they endeavoured to entangle their adversaries; and sung during the fight, "Non te peto, piscem peto; quid me fugis, Galle?" "I aim not at thee, but I aim at thy fish; why dost thou shun me, O Gaul!" The Myrmillones were called Galli, because they wore Gallic armour. They were also named Secutores. This kind of gladiators was suppressed by Caligula. See GLADIATORS, RETIARII, &c.

MYROBALANS, a kind of medicinal fruit brought from the Indies, of which there are five kinds. 1. The citrine of a yellowish red colour, hard, oblong, and the size of an olive. 2. The black or Indian myrobalan, of the bigness of an acorn, wrinkled and without a stone. 3. Chebulic myrobalans, which are of the size of a date, pointed at the end, and of a yellowish brown. 4. Emblic, which are round, rough, the size of gall, and of a dark brown. 5. Balleric, which are hard, round, of the size of an ordinary prune, less angular than the rest, and yellow. They are all slightly purgative and astringent. The word comes from the Greek μυζον, "ointment," and βαλαres, "acorn," as being in the form of acorns, and used in medicine.

MYRON, an excellent Grecian statuary, flourished 442 B. C. The cow he represented in hrass was an admirable piece of workmanship, and was the occasion of many fine epigrams in Greek.

MYROXYLON, a genus of plants belonging to the decandria class. See BOTANY Index.

MYRRH, a gummy-resinous concrete juice, which Vol. XIV. Part II. † is brought from the East Indies or from Abyssinia. See MATERIA MEDICA Index.

It is affirmed hy some, that the myrrh we have at present is not equal in quality to that of the ancients, and has not that exquisite smell which all authors ascribe to the latter. They aromatized their most delicious wines with it; and it was presented as a very valuable perfume to our Lord while he lay in the manger.

It was this gum also which was mingled with the wine given him to drink at his passion, to deaden his pains, and produce a stupor. (See Mark xv. 32.). The gall mentioned on the same occasion by St Matthew is prohably the same with myrrh; for any thing bitter was usually distinguished by the name of gall. The Hebrews were accustomed to give those that were exe-cuted some stupefying draught. The difficulty which arises from the seeming difference betwixt the two evangelists, by some is solved by saying, that St Matthew, writing in Syriac, made use of the word marra, which signifies "myrrh, bitterness, or gall ;" but the Greek translator has taken it for gall, and St Mark for myrrh. Others think that our Saviour's drink was mingled with myrrh as a stupefying drug: but suppose that the soldiers out of wanton cruelty and inhumanity, infused gall; which was the reason, say they, why, when he had tasted, he refused to drink.

MYRRHINE, or MURRINE. See MURRINE.

MYRSINE, a genus of plants belonging to the pentandria class, and in the natural method ranking under the 18th order, *Bicornes*. See BOTANY Index.

MYRTIFORM, in Anatomy, an appellation given to several parts, from their resembling myrtle berries.

MYRTLE. See MYRTUS, BOTANY Index.

MYRTOUM MARE, a part of the Ægean sea, lying between Eubœa, Peloponnesus and Attica. It receives this name from Myrto a woman, or from Myrtos a small island in the neighbourhood, or from Myrtilus the son of Mercury who was drowned there, &c.

MYRTUS, in Ancient Geography; a small island near Carystus in Eubœa, which gave name to the mare Myrtoum. Others, according to Pausanias, derive the appellation from Myrto, the name of a woman. Strabo extends this sea between Crete, Argia, and Attica. Pausanias beginning it at Eubœa, joins it at Helena, a desert island, with the Ægean sea. Ptolemy carries it to the coast of Caria. Pliny says, that the Cyclades and Sporades are bounded on the west by the Myrtoan coast of Attica.

MYRTUS, the Myrtle, a genus of plants belonging to the icosandria class; and in the natural method ranking under the 19th order, Hesperideæ. See BOTANY Index.

MYSIA, a country of Asia Minor, generally divided into Major and Minor. Mysia Minor was bounded on the north and west by the Propontis and Bithynia, and Phrygia on the southern and eastern borders. Mysia Major had Æolia on the south, the Ægean sea on the west, and Phrygia on the north and east. Its chief cities were Cyzicum, Lampsacus, &c. The inhabitants were once very warlike; but they greatly degenerated, and the words *Mysorum ultimus* were emphatically used to signify a person of no merit. The aneients generally hired them to attend their funerals as 4 B mourners, Myrrh || Mysia.

MYSORE, or Mysorean Dominions, a kingdom

of Asia, in the East Indies, including the territorics

usurped or subdued by Hyder Ali, and transmitted to

his son Tippoo Saib, but now subject to the British go-

vernment. For an account of the conquest of which,

The gradual introduction of mysteries into religion.

Mysia,

Myson.

R ELIGION, in its original form, was simple and intelligible. It was intended for the instruction and education of all ranks of men; and of consequence its doctrines were on a level with vulgar capacities. The Jewish dispensation was openly practised : nothing was performed in secret ; every article was plain, open, and accessible. The divine Author of the Christian economy commanded his disciples to preach his doctrine in the most public manner : " What ye have heard in secret (says he) preach openly; and what I have taught you in private teach ye publicly, and proclaim it on the house tops." Such are the charms of truth, and such the character of that religion which came down from heaven, that they, as it were, " delight, and lift up their voice in the streets, and cry in the chief places of concourse."

But such is the depravity of the nature of man, that the noblest institutions degenerate in his hands. Religion itself, originally pure, simple, and amiable, under his management has often been transformed into pollution, perplexity, and deformity. The ministers of religion, whose province it was to guard the sacred dcposite, and to secure it from foreign and spurious intermixtures, have generally been the first innovators, and the first and most industrious agents in corrupting its integrity and tarnishing its beauty. Avarice and ambition prompted that class of men to deviate from the original plainness and simplicity of religious institutions, and to introduce articles, rites, and usages, which might furnish them with opportunities of gratifying these unhallowed and insatiable passions. Hence distinctions unknown to pure and undefiled religion were fabricated; and that heavenly institution, heretoforc, one, simple, indivisible, was divided into two partitions : the one popular and public ; the other dark, secret, and mysterious. The latter of these we intend as the subject of this article.

2 Etymology and import of the term.

The English word mystery is derived from the Greek moornguer; and in its modern acceptation imports something above human intelligence, something awfally obsure and enigmatical ; any thing artfully made difficult; the secret of any business or profession. The word is often used by the founder of the Christian religion, and more frequently by his apostles, especially St Paul. In these cases, it generally signifies those doctrines of Christianity which the Jews, prior to the advent of the Messiah, either did not or could not understand. The Trinity in Unity, and the Unity in Tranty; the incarnation of the Son of God; the union of two natures in one and the same person, &c. we generally

call mysteries, because they are infinitely above human comprehension. All these significations arc out of the question at present. Our intention in this article is Object of to lay before our readers the fullest and fairest account this article we have been able to collect, of those anogenta, or secret rites, of the Pagan superstition, which were carefully concealed from the knowledge of the vulgar, and which are universally known under the denomination of mysteries.

The word purgeon is evidently deduced from purge; but the origin of this last term is not altogether so obvious. The etymologies of it exhibited by the learned are various; some of them absurd and inconsistent, others foolish and futile. Instead of fatiguing our readers with a detail of these, which would be equally unentertaining and uninteresting, we shall only produce one, which to us appears to come nearest the truth. The mysteries under consideration at present were certainly imported into Greecc from the east. In those regions, then, we ought of course to look for the etymology of the word. Mistor or mistur, in Hehrew, signifies " any place or thing hidden or concealed." As this word implies a kind of definition of the nature of the thing intended, and as it is one of the excellencies of original languages to apply vocables with this propriety, we find ourselves strongly inclined to assign the word mistur as the root of the term pusne, myster.

We have already observed, that the avarice and am-Motives bition of the Pagan priesthood probably gave birth to the introthe institution of the mysteries. To this observation duction of we may now add, that the ministers of that superstition might possibly imagine, that some articles of their ritual were too profound to be comprehended by the vulgar; others, too sacred to be communicated to a description of men, whom the institutions of civil society had placed in a situation not only subordinate but even contemptible. It was imagined, that things saered and venerable would have contracted a taint and pollution by an intercourse with sordid and untutored souls. These appear to us the most probable motives for making that odious and pernicious distinction between the popular religion and that contained in the sacred and mysterious ritual.

The learned Bishop Warhurton is positive, that the mysteries of the Pagan religion were the invention of legislators\* and other great personages, whom fortune \* Divin or their ewn merit had praced at the head of the e civil Leg. societies which were formed in the earliest ages in different parts of the world. It is with reluctance, and indeed

indeed with diffidence, that we presume to differ in our sentiments from such respectable authority. What-Varburton ever hypothesis this prelate had once adopted, so extenfounded sive was his reading, and so exuberant his intellectual

resources, that he found little difficulty in defending it by an appearance of plausibility, if not of rational argumentation. The large quotations he has adduced from Plato and Cicero, do indeed prove that the sages and legislators of antiquity sometimes availed themselves of the influence derived from the doctrines of the mysteries, and from the authority they acquired by the opinion of their having been initiated in them; but that those men were the inventors and fabricators of them is a position for which his quotations do not furnish the most slender presumption. At the same time, we think it not altogether certain, that the doctrine of a divine Providence, and a future state of rewards and punishments, were revealed in the mysteries with all the clearness and cogency which is pretended by his lordship.

But granting that the fabric was raised by the hands of sages and legislators, we imagine it would be rather difficult to discover what emolument that description of men could propose to derive from the enterprise .---The institution was evidently, and indeed confessedly, devised to conceal from the million those very doctrines and maxims, which had they known and embraced them, would have contributed most effectually to dispose them to submit to those wise regulations which their governors and legislators wished most ardently to establish. Experience has taught, that nothing has a more commanding influence on the minds of the vulgar, than those very dogmas, which, according to the Bishop, were communicated to the initiated. A conviction of the unity of the Deity, of his wisdom, power, goodness, omnipresence, &c. the steady belief of the immortality of the human soul, and of a future state of rewards and punishments, have in all ages, and in all countries, proved the firmest supports of legal authority. The very same doctrines, in the dawn of Christianity, contributed, of all other methods, the most effectually to tame and civilize the savage (A) inhabitants of the northern regions of Eurepe. Supposing those principles to have been inculcated by the mysterics, the most prudent plan legislators could have adopted, would have been to publish them to all mankind. They ought to have sent forth apostles to preach them to the savages whom they had undertaken to civilize. According to the learned prelate, they pursued the opposite course, and deprived themselves of those very arms by which they might have encountered and overthrown all the armies of savagism.

Of all the legislators of antiquity, the Cretan alone was prudent enough to foresee and adopt this rational plan. Diodorus the Sicilian informs us t, that the mysteries of Eleusis, Samothracia, &c. which were elsewhere buried in profound darkness, were among the Cretans taught publicly, and communicated to all

the world. Minos, however, was a successful legislator; and his intercourse with Jupiter Idaus extended his influence and established his authority. He was not under the necessity of calling in the mysteries to his assistance: on the contrary, it is highly probable that the universal knowledge of the doctrines of the mysteries among his countrymen contributed in a considerable degree to facilitate his labour, and ensure his success.

The divine Author of the Christian economy, viewed in the light of a human legislator, saw the propriety of this procedure. Nothing was concealed in his institutions; nothing was veiled with mystery, or buried in darkness. The success was answerable to the wisdom of the plan. The million flocked to the evangelical standard : the gospel was preached to the poor, to the illiterate and the vulgar; and the meanest of mankind eagerly embraced its maxims. Wherever it prevailed, it produced civilization, morality, sobriety, loyalty, and every other private and social virtue .- Upon the supposition that the mysteries had contained and inculcated the principles and practices which the prelate supposes they did, the civilizers of mankind, legislators, magistrates, and princes, ought to have combined to make them public for the sake of their own tranquillity, and the more effectual support of their authority and influence.

Upon the whole, we are inclined to believe that the Mysteries mysteries were the offspring of Egyptian priestcraft the off-They were instituted with a view to aggrandize that spring of order of men, to extend their influence and enhance Egyptian order of men, to extend their influence, and enlarge priestcraft; their revenues. To accomplish those selfish projects, but they applied every engine towards besotting the multitude with superstition and enthusiasm. They taught them to believe, that themselves were the distinguished favourites of heaven; and that celestial doctrines had been revealed to them, too holy to be communicated to the profane rabble, and too sublime to be comprehended by vulgar capacities. It is, we confess, exceedingly probable, that after the mysteries were instituted, and had acquired an exalted reputation in the world, legislators, magistrates, judges, and potentates, joined in the imposture, with the same views and from the same principles. Princes and legislators, who adopted by found their advantage in overawing and humbling the legislators, multitude, readily adopted a plan which they found so &c. artfully fabricated to answer these very purposes. They had interest enough with the sacerdotal (B) mystagogues, to induce them to allow them to participate in those venerable rites which had already established the authority of that description of men in whose hands they were deposited. The views of both parties were exactly congenial. The respect, the admiration, and dependance on the million, were the ultimate objects of their ambition respectively .- Priests and princes were actuated by the very same spirit. The combination was advantageous, and of consequence harmonious. For these reasons we have taken the liberty of differing from his Lordship of Gloucester with respect 4 B 2 tö

(A) The Germans, Russians, and Scandinavians, who were never thoroughly civilized till the gospel was preached among them.

(B) The mystagogues were the ministers who acted the chief part in celebrating the mysteries.

to the persons who first instituted the secret mysterics of the Pagan religion.

9 Hypothesis of Mosheim

564

10 singular and indefensible.

Another writer of considerable reputation in the republic of letters, is of opinion, that the mysteries were entirely commemorative ; that they were instituted with a view to preserve the remembrance of heroes and great men, who had been deified in consideration of their martial exploits, useful inventions, public virtues, and especially in consequence of the benefits by them conferred on their contemporaries .- According to him, the (c) mysterics of Mithras were established for this very purpose. It would be no difficult matter to prove that the Persian deity of that name was the sun, and that his name and insignia jointly ascertain the truth of this assertion. The same writer extends this observation to the mysteries of the Egyptians, Phœnicians, Greeks, Hctruscans; and in a word, to all the institutions of that species throughout the world. In opposition to this singular opinion, it may be argued, we think with some show of reason, that the method of preserving the memory of great and illustrious men generally adopted, was the cstablishing festivals, cclebrating games, offering sacrifices, singing bymns, dances, &c. We can recollect no secret mysteries instituted for that purpose at least in their original intention. If any usage of the commemorative kind was admitted, it was superinduced at some period posterior to the primary institution. At the same time, upon the supposition that the orgia of Bacchus were the same with those of the Egyptian Osiris, and that the mysteries of Ceres exhibited at Eleusis were copied from those of the Egyptian Isis, and allowing that the former was the sun, and the latter the moon; it will be difficult to find out the human persons whose exploits, adventures, inventions, &c. wcre intended to be immortalized by those institutions. Upon the whole, the mysteries were performed in secret; they were intended to be communicated only to a few; of course had they been instituted with a view to immortalize the memory of heroes and great men, the authors would have acted the most foolish and inconsistent part imaginable .- Instead of transmitting the fame of their heroes with eclat to posterity, they would by this procedure have consigned it to eternal oblivion.

TE Our first position supported by the chaof Egypt. \* Diodor.

We must then recur to our first position. The mysteries were the offspring of bigotry and priestcraft; they originated in Egypt, the native land of idolatry. In that country the priesthood ruled predomithe priests nant. The kings were engrafted into their body before they could ascend the throne. They were posscssed of a third part\* of all the land of Egypt. The Sicul. lib. i. sacerdotal function was confined to one tribe, and was transmitted unalienably from father to son. All the orientals, but more especially the Egyptians, delighted in mysterious and allegorical doctrines. Every maxim of morality, every tenet of theology, every

dogma of philosophy, was wrapt up in a veil of allc-gory and mysticism. This propensity, no doubt, conspired with avarice and ambition to dispose them to a dark and mysterious system of religion. Besides, the Egyptians were a gloomy + race of men ; they delighted + Plutares in darkness and solitude. Their sacred rites were generally celebrated with melancholy airs, weeping, and lamentation. This gloomy and unsocial bias of mind must have stimulated them to a congenial mode of worship. In Egypt then we are to search for the origin of the mysteries. Both the nature of the institution and the genius of the people confirm this position ; and historians, both ancient and modern, are agreed in admitting the certainty of the fact.

The Osiris of Egypt, every body knows, was the The Osiris original Bacchus; as the Isis of the same country was and Isis the Ceres of the Greeks. The rites of Osiris were Egypt the performed with loud shricks and lamentations when Bacchus he was put into the coffin; and with the most extra of Greece vagant mirth, when he was in a manner raised from the dead, or supposed to be found again. Their hymns were upon the whole always composed in melancholy affecting strains; and consisted of lamentations for the loss of Osiris, the mystic flight of Bacchus, the wanderings of Isis, and the sufferings ‡ of the gods. The t Plut. Is Canaanites, who were a kindred tribe of the Mizraim et Osir. or Egyptians, imitated them in their sacred rites. At & Ezek. Byblus, Berytus, Sidon, and afterwards at Tyre, they chap. viii. used particularly mournful dirges for the death of Ado- and Nonmi nis or Tammuz §, who was the same with the Egypti- Dionys. an Osiris, i. e. the sun.

The Egyptians, then, naturally inclined to gloom Death of and secrecy, instituted a mode of worship congenial Osiris and with their natural disposition of mind. The recess of wandering the sun towards the southern hemisphere, was the of Isis. \* Macrob death \* of Osiris; the wanderings of Isis in search of Saturn. hcr husband and brother, allegorically imported the longing of the earth + for the return of the fructifying + Plut. Is et Osir. influence of the solar heat.

When that luminary returned towards the summer solstice, and grain, trees, fruits, herbs, and flowers adorned the face of nature, another festival was celebrated of a very different complexion from that of the former. In this season all Egypt was dissolved in the most extravagant mirth and jollity. During the celebration of those festivals, the priests formed allegorical representations of the sun and the carth (D). They personified the one and the other, and allegorized their motions, aspects, relations, sympathies, accesses, recesses, &c. into real adventures, peregrinations, sufferings, contests, battles, victories, dcfeats, and so forth. These, in process of time, were held up to the vulgar as real occurrences; and these in a few ages became the most essential articles of the popular creed. From this source were derived the conquests of Dionysus or Bacchus, so beautifully exhibited by Nonnus in his Dionysiacs;

<sup>(</sup>c) Principio hoc ego quidem controversia vacare, arbitror, mysteria quæ vocantur, ritus fuisse idcirco institutos ne memoria periret veterum beneticiorum, inventorum, fatorum rerum gestarum quibus primi populorum conditores, aut alii præelari homines, decus nomen, et famam, inter suos sibi comparaverant. Neque hæc cuiquam sententia mirabilis videri poterit. Cud. Syst. Intellect. ed. Moshemii, p 329.

<sup>(</sup>D) Isis, among the Egyptians, sometimes signifies the moon, and sometimes the earth.

Dionysiacs; the wanderings of Io, wonderfully adorned by Æschylus; and the labours of Hercules, afterwards usurped by the Greeks.

Whether the Egyptians deified mortal men in the earliest ages has been much controverted. Jablonkski + 1 depart has taken much pains to prove the negative. Diodorus ‡ assures us, that they paid their monarchs a kind of divine adoration, even in their lifetime. Plutarch tells us plainly  $\S$ , that some were of opinion that Isis, Osiris, Horus, Anubis, Typhon, were once mortal persons, who were exalted into demons after their death. The Sicilian, in his history of Isis and Osiris, Pan, Hermes, &c. plainly represents them as human personages; and informs us, that the Egyptians imagined, that after their decease they transmigrated into particular stars. From these authorities, we are inclined to believe that the Egyptians, as well as the other Pagans, did actually deify persons who had distinguished themselves in their days of nature by prowess, wisdom, useful arts, and inventions. This was a constant practice among the Greeks, who probably learned it from the people in question.

The exploits of these herces had been disguised by allegorical traditions and hieroglyphical representations. They had been magnified beyond all dimensions, in orrealed in der to astonish and intimidate the valgar. They had 1 myste- been interlarded with the most extravagant fables, in order to gratify their propensity towards the marvel4 lous. All these secrets were developed in the mysteries. The catechumens (E) were informed of every particular relating to the birth, the life, the exploits, the adventures, the misfortunes, and decease of those heroic personages, and when, and by what means, they had attained to the high rank of divinities. At the same time we think it highly probable, that those demi-gods were represented in their state of exaltation and heavenly splendour. The magicians of Egypt were abundantly qualified for exhibiting angels in machines. The souls of virtuous men, who had not been eminent enough to merit the honour of deification, were shown in all the perfection of Elysian felicity; and perhaps the souls of tyrants, and of the children of (F) Typhon, were shown in Tartarus, suffering all the extremes of infernal punishment. From these exhibitions the mystagogues might naturally enough take occasion to read their pupils suitable lectures on the happy tendency of a virtuous conduct, and the dishonour and misery consequent upon a contrary course. They might set before them immortal renown, deification, and Elysium, on the one hand, and eternal infamy and misery on the other. This will probably be deemed the chief advantage accruing from this institution.

Besides the communications above mentioned, the catechumens were taught many secrets of physiology, or the nature of the phenomena of the world. This Nat. Pharnutus \* every where affirms, especially in his last book towards the end. Plutarch too informs us, that

many of the Greek philosophers were of opinion, that most of the Egyptian fables were allegorical details of physical operations. Eusebius acquaints us +, that + Prop. the physiology, not only of the Greeks, but likewise Evangel. of the barbarians, was nothing clse but a kind of science of nature, a concealed and dark theology, involved in fable and fiction, whose hidden mytseries were so veiled over with enigmas and allegories, that the ignorant million were as hittle capable of comprehending what was said as what was suppressed in silence. This, says he, is apparent from the poems of Orphens and the fable of the Phrygians and Egyptians. Dionysius of Halicarnassus likewise observes 1, † Antig. that the fables of the Greeks detail the operations of Rom. nature by allegories. Proclus § makes the same ob-§ In Tim. servation concerning the people in question. The Egyptians, says he, taught the latent operations of nature by fables.

These physiological secrets were no doubt expounded Physiologito the initiated; and that the Egyptian priests were cal secrets deeply skilled in physiological science, can scarce be expounded questioned if we believe that I are a line by the science of the scarce be in the myquestioned, if we believe that Jannes and Jambres ri-steries of valled Moscs with their enchantments. The preceding Egypt. detail comprehends all that was revealed to the Epoptæ in the original Egyptian mysteries. What articles might have been introduced afterwards we cannot pretend to determine.

Be that as it may, one thing is certain, namely, that the vulgar were excluded from all those choice secrets, which were carefully reserved for the nobility and sacerdotal tribes. To them it was given to know the mysteries of the kingdom of darkness; but to those who were without, all was mystery and parable. While the laity fed on husks, the clergy and the quality feasted on royal dainties. The priests who had devised these allegories understood their original import, and bequeathed it as an inestimable legacy to their children. Here then we have the primary object of the mysteries, namely, to develope to the initiated the original and rational import of those allegorical and mystical doctrines which were tendered to the uninitiated, wrapt up in impenetrable allegory and obscurity. To the former, these were communicated and explained: The latter were obliged to stand at an awful distance, and retire as the Procul, O procul este profani, thundered in their ears.

These allegorical traditions originated in Egypt, (see MYTHYOLOGY.) It was the general bias of the oriental genius. The Egyptians, however, according to the most authentic accounts (G), were the greatest profi-cients in that science. The original subject of these institutions were, we imagine, the articles we have spccified above : but in process of time, according to the natural course of things, numerous improvements were made, and many new rites, ccremonies, usages, and even doctrines, were superinduced, which were utterly unknown to the original hicrophants, (H). Simplicity is, for

(E) Catechuniens were pupils who were learning the elements of any science.

(F) Typhon was the evil genius, or devil, of the Egyptians.

(G) As early as the age of Joseph, the Egyptians were skilled in the interpretations of dreams, divinations, &c. and in the age of Moses they were become wise men, magicians, &c.

(H) Hierophant imports a priest employed in explaining the doctrines, rites, &c. communicated to the initiated.

for the most part, one of the distinguishing characters of a new institution; but succeeding architects generally imagine that something is still wanting to complete the beauty, the regularity, the uniformity, the magnificence, and perhaps the conveniency of the structure. Hence, at length, it comes to be so overloaded with adventitious drapery, that its primary elegance and symmetry are altogether defaced. This was the case with the earliest Egyptian mysteries. Their subject was at first simple and easy to be comprehended; in time it became complex, intricate, and unintelligible.

Temples where the mysteries were celebrated.

TS

566

The Grecian infernal regions copied from the Egyptian mysteries.

10

In order to celebrate those mysteries with the greater secrecy, their temples were so constructed as to favour the artifice of the priests. The fanes, in which they used to execute their sacred functions, and to perform the rites and ccremonies of their religion, were subterraneous apartments, constructed with such wonderfull skill and dexterity, that every thing that appeared in them hreathed an air of solemn secrecy. Their walls were covered with hieroglyphic paintings and sculpture, and the altar was situated in the centre of \* Norden, the apartment. Modern ‡ travellers have of late years Shaw, Po- discovered some vestiges of them, and bear witness to cocke, &c. the above description of those dark abodes (1). In those subterrancous mansions, which the priests of that ingenious nation had planned with the most consummate skill, the kings, princes, and great men of the state, encountered the dangers and hardships contrived to prove their prudence, fortitude, patience, abstinence, &c. These were appointed to try their merit ; and by these the hierophants were enabled to decide whether or not they were duly qualified for receiving that benefit. Upon these occasions we may believe, abundance of those magical tricks were exhibited, for which the magicians of Egypt were so much celebrated among the ancients. The strange and astonishing sights, the alternate successions of light and darkness, the hideous spectres exposed to view, the frightful howlings reechoed hy these infernal domes, the scenes of Tartarus and Elysium, exhibited alternately and in quick succession, must have made a deep and lasting impression on the mind of the affrighted votary (K). These scenes we shall describe more fully in the sequel.

From the scenes exhibited in celebrating the Egyptian mysteries, especially those of Isis and Osiris, the Grecks seem to have copied their ideas of the infernal regions, and the subterraneous mansions of departed souls. Many colonies of Egyptians settled in Greece. From these the acidos (L), or most early bards of Greece, learned them imperfectly. Of course, we find Homer's account of the infernal regions, and of the state of departed souls, lame and incoherent. Succeeding bards obtained more full and more distinct in-

formation. Euripides and Aristophanes seem to have paved the way for the prince of Roman poets. Plato + + Phada and some of the other philosophers have shown by their descriptions or allusions, that the whole apparatus of Tartarus and Elysium had become a hackneyed topic some centuries before Virgil was born. This incomparable poet borrowed his ideas from Homer, Aristophanes, Euripides, Plato, &c. These, under his plastic hand, in the sixth Æneid, grew into a system beautiful, regular, uniform, and consistent. The materials he has employed were created to his hand; he had only to collect, polish, arrange, and connect them .--The sentiments collected from the Platonic philosophy, and the inimitable episode copied from, the annals of Rome, by the masterly skill which he has displayed in the application of them, form the chief excellencies of the piece. For the rest, he could well dispense with going to Eleusis (M): every old woman in Athens and Rome could repeat them.

Egypt was then the native land of mysteries as well Mysterie as of idolatry. Every god and goddess respectively brought had their mysteries; but as those of Isis and Osiris into Pen were the most celebrated, they of course became prin- and Gree cipal objects of pursuit as well as of imitation to the neighbouring nations. These, as is generally believed, were carried into Persia by Zoroastres, or Zerdusht, by whom they were consecrated to Mithras. On these we shall make some observations in the sequel .-- Orpheus imported them into Thrace; Cadmus brought them into Bœotia, where they were sacred to Bacchus. Inachus established them at Argos in honour of Juno, the same with Isis (N); Cyniras in Cyprus, where they were dedicated to Venus. In Phrygia they were sacred to Cybele, the mother of the gods.

Our learned readers, who will probably reflect that the Egyptians were in ancient times inhospitable to strangers, will perhaps be surprised that this fastidious and jealous people were so ready to communicate the arcana of their religion to foreigners .- But they will please recollect, that a great part of Greece was planted with colonies from Egypt, Phœnicia, Palestine, &c. This we could easily prove, did the bounds prescribed us admit such a degression. Orpheus, if not an Egyptian, was at least of oriental extraction. Inachus, Cadmus, and Melampus, are universally allowed to have been Egyptians. Erechtheus, in whose reign the Eleusinian mysteries were established, was an Egyptian by birth, or at least sprung from Egyptian ancestors. The Egyptians, then, in those early ages, did not view the Greeks in the light of aliens, but as a people nearly related either to themselves or the Phœnicians, who were their brethren. Upon this connexion we imagine it was, that in later times most of the sages of Grecce,

<sup>(1)</sup> See an excellent description of these subterraneous abodes, and of the process of probation carried on there, in a French romance, entitled the Life of Sethos.

<sup>(</sup>K) Persons who had descended into Trophonius's vault were said to have been so terrified with shocking sights, that they never laughed during the remainder of their lives.

<sup>(</sup>L) These were strolling poets like our minstrels, who frequented the houses of the great men of Greece, and entertained the company upon public occasions with singing and tales of other times.

<sup>(</sup>M) Bishop Warburton has, with much ingennity, and a vast profusion of reading, endeavoured to prove that Virgil borrowed the whole scenery of the sixth Æneid from the sources mentioned in the text.

<sup>(</sup>N) Isis was the moon, and the original Juno was the same planet.

Greece, especially of Athens, found so hospitable a reception among that people. They probably viewed them in the light of propagandi; apostles able and willing to disseminate their idolatrous rites. This ohservation, which might be supported by numberless authorities, did the nature of the present inquiry permit, will, we think, go a great way towards obviating the objection.

Although, as has been observed, every particular deity had his own peculiar mysterious sacred rites, yet of all others those of Mithras, Bacehus (0), and Ceres, Ceres, were deemed the most august, and were most universally and most religiously celebrated. To these, therefore, we shall in a good measure confine ourselves, upon this occasion. If our readers shall become intimately acquainted with these, they may readily dispense with the knowledge of the rest, which are, indeed, no more than streams and emanations from these sources. We shall then, in the first place, present to our readers a brief sketch of the mysteries of Mithras.

MITHRAS, or, according to the Persian, Mihr, was one of the great gods of the Asiatics. His worship was for many ages confined to Persia. Afterwards, however, it was propagated so far and wide, that some have imagined they had discovered vestiges of it even in Gaul. Mihr, according to Dr Hyde \*, signifies Persa-love, and likewise the sun. If we might presume to differ from so a respectable an authority, we should conjecture that it is a cognate of the Hebrew word muthir. " excellentia, præstantia." That there was an analogy between the Hebrew and old Persian, is generally admitted by the learned. Be that as it may, Mithras was the sun (P) among the Persians; and in honour of that luminary this institution was established. Mithras, according to Plutarch (Q), was the middle god nof Mi- between Oramaz and Ariman, the two supreme divinities of Persia. But the fact is, the solar planet was the visible emblem of Oramaz, the good genius of the Persian tribes, and the same with the Osiris of the Egyptians. From these people, some have imagined that Zoroastres (R), or Zerdnsht, horrowed his my-steries of Mithras. To this opinion we eannot give our assent, because the probationary trials to be undergone by the eandidates among the former were much more savage and sanguinary than among the latter .---Both, however, were instituted in honour of the same deity; and probably the scenes exhibited, and the information communicated in both, were analogous; a eircumstance which perhaps gave birth to the opinion above mentioned.

The grand festival of Mithras was celebrated six days, in the middle of the month Mihr (s). Upon these days, it was lawful for the kings of Persia to get drunk and dance. On this festival, we imagine, the eandidates for initiation, having duly proved their vocation, were solemnly admitted to the participation of the mysteries.

Zorcastres (T) worshipped Mithras, or the Sun, in a. certain natural cave, which he formed into a temple, and fitted up in a manner exactly mathematical. There Mithras was represented as presiding over the lower world with all the pomp of royal magnificence. In it too were seen the symbols of Mithras and of the world, philosophically and mathematically exhibited, to be contemplated and worshipped. This deity was sometimes represented as mounted on a bull, which he is breaking, and which he kills with a sword. On: some bas reliefs still existing, he appears as a young man with his tiara turned upward, after the manner of the Persian kings. He is elothed with a short tunie and breeches, after the Persian fashion. Sometimes he wears a small cloak. By his sides are seen other human figures, with tiaras of the same fashion on their heads, but without cleaks. One of these figures commonly holds in his one hand a toreh lifted up; in the other, one turned downward. Sometimes over the eave are seen the ehariots of the sun and moon, and divers constellations, such as cancer, scorpio, &c.

In one of those eaves the eeremonies of initiation probationwere performed; but before the candidate could be ary exeradmitted, he was forced to undergo a course of pro-cises prebationary exercises, so numerous and so rigorous, that vious to very few had courage and fortitude enough to go through initiation. them. He was obliged to live a life of virtue and abstinence for the space of seven years previous to the period of his initiation. Some months before it, he was obliged to submit to a long and anstere fast, which continued fifty days. He was to retire several days to a deep and dark dungeon, where he was successively exposed to all the extremes of heat and cold. Meantime he frequently underwent the bastinado, which the priests applied without merey. Some say this fustigation continued two whole days, and was repeated no less than 15 times. In the course of these probationary exercises, the candidate was generally reduced to a skeleton : and we are told, that there have been several instances of persons who have perished in the attempt.

Upon the eve of the initiation, the aspirant was \* Jul. Firobliged to\* brace on his armour, in order to encoun-micus. ter

(0) Bacehus was the Osiris of the Egyptians, and Ceres was Isis of the same people.

(P) Mosheim, in his note on Cudworth's Intellectual System, p. 330. has taken much pains to prove that Mithras was a deified mortal; but we cannot agree with that learned man in this point.

(Q) Isis and Osiris, p. 369. 1. 20. from the bottom. This philosopher makes Zoroaster, according to some, 5000 years prior to the Trojan war. This date is certainly extravagant. We cannot, however, agree, with some moderns, who make him contemporary with Darius Hystaspes, the immediate successor of Cambyses, because it contradiets all antiquity.

(R) M. Silohwette, Disser, v. p. 17. asserts that Zoroastes was initiated among the Egyptians.

(S) The month Mchr began September 30. and ended October 30.

(T) See Dr Hyde de Rel. vet. Pers. pages 16, 17. Mr Bryant's Anal. vol. i. p. 232. Porphyr. de Antro Nymph. p. 254. This philosopher often mentions the cave of Mithras, and always attributes the institution of . his rites to Zoroaster.

ter giants and savage monsters. In those spacious subterraneous mansions a mock hunting was exhibited. The priests and all the subordinate officers of the temple, transformed into lions, tygers, leopards, boars, wolves, and other savage creatures, assailed him with loud howlings, roaring, and yelling, and every instance of ferine fury. In those mock combats, the hero was often in danger of being really worried, and always came off with bruises and wounds. Lampridius informs us, that when the emperor Commodus was initiated, he actually carried the joke too far, and butchered one of the priests who attacked him in the figure of a wild beast. The Persians worshipped Mithras or the Sun by a perpctual fire ; hence the votary was obliged to undergo a fiery trial; that is, to pass seven times through the sacred fire, and each time to plunge himself into cold water. Some have made these probationary penances amount to 80: others have thought that they were in all only 8. As we find no good authority for either of these numbers, we think ourselves at liberty to hazard the following eonjecture : The number seven was deemed sacred over all the east. The Mithriac penances we imagine were either seven, or if they exceeded it, were regulated by seven repetitions of that number. The candidate having undergone all these torturing trials with becoming patience and fortitude, was deelared a proper subject for initiation. But before his admission he was obliged to bind himself by the most solemn oath, with horrible imprecations annexed, never to divulge any single article of all that should be communicated to him in the course of his initiation.

24 Oath of secrecy.

25

Revela-

Mithras.

What a mogenia or ineffable secrets were imparted to tions in the the initiated, it is impossible at this distance of time to mysteries of discover with any tolerable degree of certainty. We may, however, rest assured, that the most authentic tradition concerning the origin of the universe; the nature, attributes, perfections, and operations, of Oromasd; the baleful influences of Ariman; and the benign effects of the government of Mithras, were unfolded and inculcated. The secret phenomena of nature, as far as they had been discovered by the Magi, were likewise exhibited; and the application of their effects, to astonish and delude the vulgar, were taught both in theory and practice. The exercise of public and private virtues was warmly recommended; and vice represented in the most odious and frightful colours. Both these injunctions were, we may suppose, enforced by a display of the pleasures of Elysium and the pains of Tartarus, as has been observed above in describing the mysteries of the Egyptians.

Those initiations are mentioned by Lampridius in Dial. cum the life of Commodus, and likewise by Justin + and Tryphone. Tertullian 1, who both flourished in the second centu-

The last of these two speaks of a kind of baptism. rv. which washed from the souls of the initiated all the stains which they had contracted during the course of their lives prior to their initiation. He at the same time mentions a particular mark which was imprinted upon them (U), of an offering of bread, and an emblem of the resurrection; which particulars, however, he does not describe in detail. In that offering, which was accompanied with a certain form of prayer, a vessel of water was offered up with the bread. The same father elsewhere informs us, that there was presented to the initiated a erown suspended on the point of a sword; but that they were taught to say, Mithras is my crown. By this answer was intimated, that they looked upon the service of that deity as their ehief honour and ornament.

After that the Teletæ (x) were finished, the pupil was brought out of the eave or temple, and with great solemnity proelaimed a lion of Mithras (Y); a title which imported strength and intrepid eourage in the service of the deity. They were now conscerated to the god, and were supposed to be under his immediate protection; an idea which of eourse animated them to the most daring and dangerous enterprises.

The worship of Mithras was introduced into the Roman empire towards the end of the republic, where it made very rapid progress. When Christianity hegan to make a figure in the empire, the champions for Paganism thought of proposing to men the worship of this power of benevolence, in order to eounterbalance or annihilate that worship which the Christians paid to Jesus Christ the true Sun of righteousness. But this mode was soon abolished, together with the other rites of Paganism. The Persian grandees often affected names compounded with Mithras; hence Mithridates, Mithrobarzanes, &c. Hence, too, the precious stone called Mithridat +, which by the reflection of the sun + Solinus, sparkled with a variety of eolours. There is likewise cap. 10. a certain pearl of many different eolours, which they eall Mithras. It is found among the mountains near the Red sea; and when exposed to the sun, it sparkles with a variety of dyes. We find likewise a king of Egypt of that name, who reigned at Heliopolis ; who being commanded in a dream to erect an obelisk to the solar deity, reared a most prodigious one in the neighbourhood of that eity.

The votaries of Mithras pretended that he was sprung Mithras from a rock, and that therefore the place where the said to ba mysterious ceremonies were communicated to the ini-sprung fro tiated was always a cave Many different reasons have a rock. been assigned for the origin of this rock-born deity, most of which appear to us unsatisfactory. If our readers will be obliging enough to accept of a simple and obvious conjecture, they may take the following :

‡ De præ-script adver. Hæret.

(U) In allusion to this practice of imprinting a sacred mark, probably on the forehead of the initiated, we find the injunction to the angel, Ezek. chap. ix. ver. 4. and the Revelation passim.

(x) The mysteries were ealled Teletæ, which imports, " the rites which confer perfection."

(Y) Tertull. adv. Marc. p. 55. The priests of Mithras were called the lions of Mithras, and his priestesses lionesses; some say hyanas. The other inferior ministers were called eagles, hawks, ravens, &e. and on their festivals they wore masks corresponding to their titles, after the Egyptian manner, where the priests appeared at the ceremonies with masks resembling the heads of lions, apes, dogs, &c. a circumstance which furnishes a presumption that the mysteries of Mithras were of Egyptian original.

A rock is the symbol of strength and stability (z); the dominion of Mithras, in the opinion of his votaries, was firm as a rock, and stable as the overlasting hills. If our readers should not admit the prohability of this conjecture, we would heg leave to remit them to the learned Mr Bryant's Analysis of Mythology, where they will find this point discussed with deep research and wonderful ingenuity. Whatever may have been the origin of this opinion with relation to the birth of Mithras, it is certain that some reverence to rocks and caves was kept up a long time even after the establishment of Christianity. Hence the prohibition given to some of the proselytes to that religion, that they should no more presume to offer up their prayers ad petras, at the rocks (A).

We shall conclude our account of the mysteries of Mithras, with a passage from M. Auquetil, to whom we are so much indebted for what knowledge we have of the Persian theology, and in which the functions of that deity are briefly and comprehensively delineated. " The peculiar functions of Mithras are to fight continually against Ahriman and the impure army of evil genii, whose constant employment is to scatter terror and desolation over the universe; to protect the frame of nature from the demons and their productions. For this purpose he is furnished with a thousand ears and a thousand eyes, and traverses the space between heaven and earth : his hands armed with a club or macc. Mithras gives to the earth light and sun: he traces a course for the waters : he gives to men corn, pastures, and children; to the world virtuous kings and warriors ; maintains harmony upon earth, watches over the law," &c. As the history of Mithras, and the nature of his mysteries, are not generally known, we imagined it would be agreeable to many of our readers to have the most important articles relating to that subject laid before them as it were in detail.

Mkeries We now proceed to the orgia or mysteries of Baca acchus. chus, which we shall introduce with a brief history of that deity. The original Dionysus or Bacchus was the Osiris of the Egyptians, which last was the Sun (B). Whether there was an Egyptian monarch of that name, as Diodorus Siculus affirms\*, has no manner of connexion with the present disquisition. The Greek name of that deity is plainly oriental, being compounded of di, "hright," and nasta or nasa, in the Æolic thame dialect nusa, "a prince." This name was imported w Osiris. from the cast hy Orpheus, Cadmus, or by whoever else communicated the worship of Osiris to the Greeks. That the Dionysus of the Greeks was the same with the Osiris of the Egyptians, is universally allowed. Herodotus tells us expressly +, that Osiris is Dionysus in the Greek language : Martianus Capellus, quoted above, expresses the very same idea ‡. The original Osiris was then the sun ; but the Dionysus or Bacchus VOL. XIV. Part II.

of the Greeks was the same with the Osiris of the Egyptians; therefore the Bacchus or Dionysus of the Greeks was likewise the same luminary.

The name Osiris has much embarrassed critics and etymologists. The learned Jablonski §, instead of de-§ Panth. lineating the character, attributes, operations, adven- Egyp. tures, exploits, and peculiar department assigned this deity by his votaries, has spent much of his pains on trying to investigate the etymology of his name. If it be granted, which is highly probable, that the Hebrew and Egyptian tongues are cognate dialects, we should imagine that it is actually the Chosher or Oshir of the former language, which imports, " to make rich, to become rich." Indeed the words Osiris and Isis were not the vulgar names of the sun and moon among the Egyptians, but only cpithets importing their qualities. The name of the sun among that people was Phri or Phry, and that of the moon Ioh, whenec the Greek Io. The term Osiris was applied both to the sun and to the river Nile; both which by their influence contributed respectively to enrich and fertilize the land of Egypt.

It was a general custom among the orientals to denominate their princes and great men from their gods, demigods, heroes, &c. When the former were advanced to divine honours, they were in process of time confounded with their archetypes. The original divinities were forgotten, and these upstart deities usurped their place and prerogatives. In the earliest periods of the Egyptian monarchy, there appeared two illustrious personages, Osiris and Isis. These were the children of Cronus; and being brother and sister, they were joined in matrimony, according to the custom of the Egyptians. As the brother and husband had assumed the name of the Sun, so the sister and consort took that of Isis, that is, " the woman ||," a name which Horapello, the Egyptians applied both to the moon and to the cap. 3. earth, in consequence of the similarity of their nature, their mutual sympathy, and congenial fecundity. Osiris having left his consort Isis regent of the king- 29 Exploits of dom, with Hermes as her prime minister, and Hercu-Osnis. les as general of her armies, quitted Egypt with a numerous body of troops, attended by companies of fauns (c), satyrs, singing women, musicians, &c. and traversed all Asia to the eastern ocean. He then returned homeward through the Upper Asia, Thrace, Pontus, Asia Minor, Syria, and Palestine. Wherever he marched he conferred numberless benefits on the savage inhabitants. He taught the art of cultivating the ground, preserving the fruits of the earth, and distinguishing the wholesome and nutritive from the unwholesome and poisonous. He instructed them in the culture of the vine; and where vincs could not be produced, he communicated to them the method of producing a fermented liquor from barley, very little inferior to wine itself. He built many cities in different 4 C parts

(z) Our Saviour probably alludes to this emblem, when he talks of building his church on a rock; and adds, that the gates of hell should not prevail against it.

(A) The Caledonian druids seem to have regarded certain stones with a superstitious veneration, in which the Catholics imitated them. There are in several places of Scotland large stones, which the vulgar call lecre stones, i. e. we imagine, lecture.

(B) See Macrob. lib. i. cap. 21. p. 247. bottom. Diogenes Laert. in procensio, par. 10. Martian. Capel. lib. ii. Jablonski, vol. i. lib. ii. 415. par. 3. Plut. Isis et Osir. passim.

parts of the globe, planted numerous colonies (D), and wherever he directed his course instituted just and wholesome laws, and established the rites and ccremonies of religion, and left priests and catechists of his train to teach and inculcate the observance of them. In short, he left everywhere lasting monuments of his progress, and at the same time of his generosity and beneficence. Where he found the people docile and submissive, he treated them with kindness and humanity: if any showed themselves obstinate, he compellcd them to submit to his institutions by force of arms.

570

Wanderings of Isis

At the end of three years, he returned to Egypt, where his brother Typhon, a wicked unnatural monster, had been forming a conspiracy against his life. His death. This traiterons design he soon after accomplished in the following manner: He invited Osiris, with some other persons whom he had gained over, to an entertainment. When the repast was finished, he produced a beautiful coffer, highly finished, and adorned with studs of gold; promising to bestow it on the person whom it should fit best. Osiris was tempted to make the experiment. The conspirators nailed down the cover upon him, and threw the coffer into the river. This coffer, which was now become the coffin of Osiris, was, they tell us, wafted by the winds and waves to the neighbourhood of Byblus, a city of Phœnicia, where it was cast on shore, and left by the waves at the foot of a tamarind tree.

Isis in the mean time, disconsolate and forlorn, attended by Anubis, was ransacking every quarter in of his body. search of her beloved Osiris. At length being informed by her faithful attendant and guardian, that his body was lodged somewhere in the neighbourhood of Byblus, she repaired to that city. There, they say, she was introduced to the queen, and after (E) a variety of adventures she recovered the corpse of her husband, which, of course, she carried back with her to Egypt : but the mischievous Typhon, ever on the watch, found her on the banks of the Nile; and having robbed her of her charge, cut the body into 14 parts, and scatter-ed them up and down. Now, once more, according to the fable, Isis set out in quest of those parts, all of which, only one excepted, she found, and interred in the place where she found them; and hence the many tombs of Osiris in that country. These tombs were denominated tuposins by the natives. Many other fabulous adventures were ascribed to those two personages, which it is not our province to enumerate at present. If our readers should wish to be more minutely informed on this subject, they may have recourse to the authors mentioned in the last-quoted author, or to the learned Mr Bryant's Analysis of Ancient Mythology,

and M. Cour de Gebelin, where they will find matter enough to gratify their curiosity.

To commemorate those adventures, the mysteries of The myste-Isis and Osiris were instituted; and from them both and Osiris those of Bacchus and Ceres, among the Greeks, were instituted derived. Of the Egyptian solemnity, we have an ex-in commeact epitome in one of the fathers of the church, to the moration of following purpose : " Here follows (says he) an epi-ventures. tome of the mysteries of Isis and Osiris. They deplore annually, with deep lamentations and shaved heads, the catastrophc of Osiris over a buried statue of that monarch. They beat their breasts, mangle their arms, tear open the scars of their former wounds; that by annual lamentations the catastrophe of his miserable and fatal death may be revived in their minds. When they have practised these things a certain number of days, then they pretend that they have found the remains of his mangled body; and having found them, their sorrows are lulled asleep, and they break out into immoderate joy." What maxims of morality, secrets of phvsiology, or phenomena of astronomy, were couched under this allegorical process, is not our business to investigate in this place. We shall only observe, that, in all probability, Osiris and Isis were sovereigns of Egypt at a very early period; that they had conferred many signal benefits on their subjects, who, influenced by a sense of gratitude, paid them divine honours after their decease; that in process of time they were confounded with the sun and the moon ; and that their adventures were at length magnified beyond all credibility, interlarded with fables and allegories, and employed in the mysteries as channels to convey a variety of instructions to the initiated.

Be that as it may, it is certain that the very same Transfermode of worship was established at Byblus, and in af-red to Bytor ages transferred to Tyre. The Mizraim and Cha-blus and Tyre, naanim were nearly connected by blood, and their re-where Osiligious ceremonies were derived from the very sameris was source. By what medium the worship of Osiris at called Ado-Abydus and Tyre was connected, we shall leave to nis and Bacchus. others to explain ; we shall only observe, that among the Phœnicians this deity obtained the names Adonis and Bacchus. The former is rather an (F) epithet than a name: the latter is evidently an allusion to the weeping and lamentation (G) with which the rites were performed. We find another name of that divinity mentioned in Scripture (H); but that term is plainly of Egyptian original : we shall now proceed to the mysteries of Osiris as they were celebrated among the Greeks and Thracians, under the name of the Or-+ Diod. Sigia of Dionysus or Bacchus +.

Orpheus, the celebrated Thracian philosopher, had cul. Vosius travelled into Egypt in quest of knowledge; and from de Idol. that

(D) Many have thought this expedition fabulous; but the numberless monuments of Egyptian architecture, sculpture, and statuary, lately discovered in the east, confirm it.

(E) For the conquests and adventures of Osiris and Isis, we must send our learned readers to Diod. Sic. Bibl. l. i. and Plut. Isis et Osiris, p. 256. et seq. which we have been obliged to abridge, in consequence of the narrow limits prescribed us.

(F) Adonis is evidently the Hebrew Adoni, " my lord," and imports the sovereignty of the deity.

(G) Bacchus is derived from the Phœnician word bahah, " to weep." This was the name embraced by the Romans.

(H) Ezek. chap. viii. ver. 14. Tammuz is the name of one of the months of the Egyptian year.

that country, according to the most authentic accounts. he imported the Bacchanalian rites and institutions. Some have affirmed that this same Orpheus being intimately acquainted with the family of Cadmus, communicated these rites to them, and endeavoured to transfer them to the grandson of that hero, which grandson became afterwards the Grecian Bacchus. It is, however, we think much more probable, that those rites were d thence imported from Egypt or Phœnicia, by (1) Cadmus himself, who was a native of the former country, and Cadmus is thought to have spent some time in the latter, before he emigrated in quest of a settlement in Bœotia. It is said that Semele, the daughter of Cadmus, and the mother of the Grecian Bacchus, was struck with lightning at the very instant of his birth. The child was,. in all probability, denominated Bacchus (K), from the sorrow and lamentation this melancholy accident had occasioned in the family. Cadmus, in order to conecal the dishononr of his daughter, might, we imagine, convey away his infant grandson to some of his relations in Phœnicia or Egypt. There he was educated and instructed in all the mysteries of Isis and Osiris, and at the same time initiated in all the magical or juggling tricks of the Egyptian priests and hierophants. Thus accomplished, when he arrived at manhood, he returned to Thebes with the traditional retinue of the original deity of the same name; and claimed divine honours accordingly. This claim, however, was not admitted without much opposition; Pentheus, another grandson of Cadmus, was torn to pieces by the frantic Bacchanalians upon Mount Citheron, because he attempted to interrupt them in celebrating the orgia. Some have thought that Cadmus lost his kingdom for the same reason; but this we think is by no means probable: we should rather imagine that the old prince was privy to the whole process, and that it was originally planned by him, with a view to attract the veneration of his new subjects, by making them believe that there was a divinity in his family.

cia Bac-

Thetions Be that as it may, the vain-glorious Greeks attributed all the actions of the Egyptian hero to their new Bacchus; and according to their laudable practice, engaged him in numberless adventures in which his prototype had no share. Most of those are futile and unentertaining (L). The Greeks commonly adopted some oriental personage as the hero of their mythological

rhapsodies. Him they naturalized and adopted into some Grecian family, and so he became their own. To him they ascribed all the adventures and exploits of the oriental archetype from whom he was copied. Conscquently in the orgia (M), every thing was collected that had been imported from the east relating to Osiris; and to that farrago was joined all that the Grecian rhapsodists had thought fit to invent, in order to amuse the credulous multitude. This, however, was not the whole of the misfortune : The adventures of Osiris were described by the Egyptian hierophants, veiled with allegorical and hieroglyphical mysteries. These the persons who imported them into Greece did not thoroughly comprehend, or, if they did, they were not inclined to communicate them sound and unsophisticated. Besides, many oriental terms were retained, the import of which was in process of time lost or distorted. Hence the religious ceremonies of the Greeks became a medley of inconsistencies. The mysteries of Bacchus, in particular, were deeply tinctured with this meretricious colouring; the adventures of the Theban pretender were grafted upon those of the Egyptian archetype, and out of this combination was formed a tissue of adventures disgraceful to human nature, absurd, and in-consistent. Indeed the younger or Theban Bacchus seems to have been a monster of debauchery; whereas the Egyptian is represented as a person of an opposite character. Of course the mysteries of the former were attended with the most shocking abomina-

These mysteries, as has been observed above, were Mysteries first celebrated at Thebes the capital of Bœotia, under of Bacchus the auspices of the family of Cadmus. From this spread intercountry they gradually found their way into Greece, and all the neighbouring parts of Europe. They were celebrated once every three years (N), because at the end of three years Osiris returned from his Indian expedition. As the Greeks had impudently transferred the actions of the Egyptian hero to their upstart divinity, the same period of time was observed for the cclebration of those rites in Greece that had been ordained for the same purpose in Egypt.

When the day appointed for the celebration of the Process of orgia (0) approached, the priests issued a proclama-their celetion, enjoining all the initiated to equip themselves bration. according to the ritual, and attend the procession on

the

(1) Cadmus and Melampus, who were both Egyptians, introduced the Bacchanalia into Greece. The Egyptian or oriental name of Bacchus was Dinusi, that is, " the prince of light." Cadmus had learned the name Bacchus from the Phœnicians.

tions.

(K) We have omitted the immense farrage of fable relating to the connexion between Jupiter and Semele as of little importance to our readers.

(L) Nonnus, an Egyptian of Pentapolis, has collected all the fabulous adventures of Bacchus, and exhibited them in a heautiful but irregular poem : To this we must refer our learned readers. Of the Dionysiacs we have a most judicious sketch, Gebelin. Calend. p. 553. et seq.

(M) The orgia belonged to all the Mydones, but to those of Baechus in a peculiar manner.

(N) Hence these orgia were called Triteria.

(0) According to Clem. Alexand. Cohort. page 12. Pott. the word orgia is derived from orge, which signifies " anger," and originated from the resentment of Ceres against Jupiter, in consequence of a most outrageous insolt he had offered her with success. We should rather imagine it derived from the Hebrew word argoz, signifying a "chest or coffer," alloding to the casket which contained the sacred symbols of the god .--The Egyptians or Phœnicians might write and pronounce, argoz, orgoz, or in some manner nearly resembling orgia.

the day appointed. The votaries were to dress themselves in coats of deer-skins, to loose the fillets of their hair, to cover their legs with the same stuff with their coats, and to arm themselves with thyrsi, which were a kind of spears wholly of wood entwined with leaves and twigs of the vine or ivy. It is said that the Bac-chanalians, especially the Thracians, used often to quarrel and commit murder in their drunken revels; and that in order to prevent those unlucky accidents, a law was enacted, that the votaries, instead of real spears, should arm themselves with those sham weapons which were comparatively inoffensive. The statue of the deity, which was always covered with vine or ivy leaves was now taken down from its pedestal, and elevated on the shoulders of the priests. The cavalcade then proceeded nearly in the following manner:

First of all, hymns were chanted in honour of Bacchus, who was called the *Power of dances, smiles, and jests*; while at the same time he was deemed equally qualified for the exploits of war and heroism. Horace, in some of his dithyrambic odes, has concisely pointed out the subjects of those Bacehanalian songs. In the collection of hymns fahulously attributed to Orpheus, we find several addressed to this deity (P), each under a different title, derived from the different appellations of the god. All these names are of oriental original, and might easily be explained, did the bounds preseribed us admit of etymological disquisitions.

The hymn being finished, the first division of the votaries proceeded, earrying a pitcher of wine, with a bunch of the vine. Then followed the he-goat; an animal odious to Bacchus, because he ravages the vines. The chanting the hymns, the sacrificing the he-goat, and the revels, games, and diversions, with which the celebration of those rites was attended, gave birth to the dramatic poetry of the Greeks; as the persons habited in the dress of Fauns, Sylvans, and Satyrs (Q), furnished the name of another species of poetry of a coarser and more forbidding aspect.

Then appeared the mysterious coffer or basket, containing the secret symbols of the deity. These were the h phallus (R), some grains of sesama, heads of poppies, pomegranates, dry stems, cakes baked of the meal of different kinds of corn, salt, carded wool, rolls of ho-

ney, and cheese ; a child, a serpent (s), and a van (T). Such was the furniture of the sacred coffer carried in the solemn Baechanalian procession. The inventory given by some of the fathers + of the church is somewhat + Clem. different. They mention the dye, the ball, the top, Alexand. the wheel, the apples, the looking-glass, and the fleece. The articles first mentioned seem to have been of Egyptian original; the last were certainly superinduced by the Greeks, in allusion to his being murdered and torn in pieces when he was a child by the machinations of Juno, who prevailed with the Titans to commit the horrid deed. These last seem to have been memorials of his boyish playthings; for, says Maternus, " the Cretans 1, in celebrating the rites of the child Bacehus, t De Erreacted every thing that the dying boy either said, or did, re Prof. or suffered. They likewise (says he) tore a live bull Gent. in pieces with their teeth, in order to commemorate the dismembering of the boy." For our part, we think, that if such a beastly rite was practised, it was done in commemoration of the savage manner of life which had prevailed among men prior to the more humane diet invented and introduced by Isis and Osiris. Be that as Human sait may, we learn from Porphyry §, that in the island of crifices. Chios they used to sacrifice a man to Bacchus, and that & De Abstithey used to mangle and tear him limb from limb. nentia. This was no doubt practised in commemoration of the eatastrophe mentioned above.

The orgia of this Pagan god were originally simple enough; but this unsophisticated mode was of no long continuance, for riches soon introduced luxury, which quickly infected even the ceremonies of religion. On the day set apart for this solemnity, men and women erowned with ivy, their hair disheveiled, and their bodies almost naked, ran about the streets, roaring aloud Evohe (U) Baeche. In this rout were to be seen people intoxicated at once with wine and enthusiasm, dressed like Satyrs, Fauns, and Sileni, in such scandalous postures and attitudes, with so little regard to mo- Total condesty and even common decency, that we are persuaded tempt of our renders will readily enough forgive our omitting to decency. describe them. Next followed a company mounted upon asses, attended by Fauns, Baechanals, Thyades, Mimallonides, Naiads, Tityri, &c. who made the adjacent places echo to their frantic shrieks and howlings. Aften this tumultuous herd were carried the statues of Victory

(P) These stand between the 41 and 52; one to Lenzus, or the presser; one to Libnites, or the winnower; one to Bessareus, or the vintager; one to Sabazius the god of rest; to Myses, or the Mediator, &c.

(Q) Dacier, Casaubon, and other French critics, have puzzled and perplexed themselves to little purpose about the origin of this word, without considering that it was coeval to dramatic poetry.

(T) Servius in Georg. I. Virg. ver. 166. Mystica vannus Iacehi. The van, says he, is an emblem of that purifying influence of the mysteries, by which the initiated were cleansed from all their former pollutions, and qualified for commencing a holy course of life.

(U) Clem. Alexand. Cohort. page 11. Pott. derives this word from *Cheveh*, the mother of mankind, who, first opened the gate to that and every other error; but we are rather inclined to believe that it comes from the oriental word *Hevé*, which signifies a "serpent;" which among the Egyptians was sacred to the sun, and was likewise the emblem of life and immortality. It then imported a prayer to Bacchus for life, vigour, health, and every other blessing.

<sup>(</sup>R) The phallus was highly respected by the Egyptians, and was used as the emblem of the focundity of the human race.

<sup>(</sup>s) That reptile was in high veneration among the Egyptians. See Euseb. Præp. Evang. lib. i. page 26. Steph. where we have a minute detail of the symbolical properties of that creature, according to Taautos the great legislator of that people.

Victory and altars in form of vine-sets, crowned with ivy, smoking with incense and other aromatics. Then appeared several chariots loaded with thyrsi, arms, garlands, casks, pitchers, and other vases, tripods, and vans. The chariots were followed by young virgins of quality, who carried the baskets and little boxes, which in general contained the mysterious articles above enumcrated. These, from their office, were called cistophoræ. The phallophori (x) followed them, with a chorus of itophallophori habited like Fauns, counter-feiting drunk persons, singing in honour of Bacchus songs and catches suited to the occasion. The procession was closed by a troop of Bacchanalians crowned with ivy, interwoven with branches of yew and with serpents \*. Upon some occasions, at those scandalous festivals, naked women whipped themselves, and tore their skin in a most barbarous manner. The procession terminated on Mount Citheron, when it set out from Thebes; and in other places, in some distant unfrequented desert, where the votaries practised every spccies of debauchery with secrecy and impunity. Orphens saw the degeneracy of those ceremonics; and in endeavouring to reform them he probably lost his life. Pentheus suffered in the like attempt, being torn in pieces by the Bacchanalians on Mount Citheron, among whom were his own mother and his aunts. The Greeks, who were an airy jovial people, seem to have paid little regard to the plaintive part of the orgia; or rather, we believe, they acted with howling and frantic exclamations, often enhanced by a combination of drunkenness, ecstacy, and enthusiastic fury.

What secrets, religious, moral, political, or physical, were communicated to the votaries, it is impossible to determine with any degree of certainty .--One thing we may admit, namely, that the doctrines discovered and inculcated in the orgia, were originally the very same which the apostles of the sect had im. bibed in Egypt and Phœnicia; and of which we have given a brief account near the beginning of this article. It is, however, probable, that the spurious or Theban Bacchus had superadded a great deal of his own invention, which, we may believe, was not altogether so sound and salubrious as the original doctrine. However that may be, the initiated were made to believe that they were to erive wonderful advantages from the participation of those rites, both in this life and that which is to come. Of this, however, we shall talk more at length by and bye, in our account of the Eleusinian mysteries.

Durines

inneated

in le or-

To detail the etymology of the names of this Pagan deity, the fables relating to his birth, his education, his transformations, his wars, peregrinations, adventures, the various and multiform rices with which he was worshipped, would swell this article to a most immoderate size. If any of our readers should wish to be more minutely and more accurately acquainted with this subject, we must beg leave to remit them to Diod. Sic. Apollod. Bibl. Euripid. Bacchæ, Aristophanis Ranæ, Nonn. Dionys.; and among the moderns, to Ban. Mythol. Voss. de Orig. Idol. Mons. Fourmont, Reflexions sur l'origine des anciens peuples, Mr Bryant's Analys. and especially to Mons. Cour de Gebelin, Calendrics ou Almanach. That prince of etymologists, in his account of the festival of Bacchus, has given a most acute and ingenious explication of the names and epithets of that deity. For our part, we have endeavoured to collect and exhibit such as we judged mostimportant, most entertaining, and most instructive, to the less enlightened classes of our readers.

We now proceed to the Eleusinian mysteries, which, Eleusinian among the ancient Greeks and Romans, were treated mysteries with a superior degree of awe and veneration. These instituted in honour of were instituted in honour of Ceres, the goddess of Ceres. corn; who, according to the most authentic accounts, was the Isis of the Egyptians. The mysteries of Osiris and Isis have been hinted at in the preceding part of this article. They were originally instituted in honour of the sun and moon, and afterwards consecrated. to an Egyptian prince and princess; who, in consequence of their merits, had been deified by that people. We know of no more exact and brilliant description of the ceremonics of that goddess, in the most polished ages of the Egyptian superstition, than what we meet with in the witty and florid Apuleius t, to which we must take + Lib. ix. the liberty to refer our more curious readers. Our business at present shall be to try to investigate by what means, and upon what occasion, those mysteries were introduced into Attica, and established at Eleusis. A passage from Diodorns Siculus 6, which we shall here 6 Lib. i. translate, will, we think, throw no inconsiderable light. on that abstruse part of the subject.

" In like manner with him (Cecrops), says that judicious historian, they tell us, that Erechtheus, a prince of Egyptian extraction, once reigned at Athens. Of on what this fact they produce the following evidence: A scorch- occasion ing drought, during the reign of this prince, prevailed introduced over almost all the habitable world, except Egypt; into Attica. which, in consequence of the humidity of its soil, was not affected by that calamity. The fruits of the earth were burnt up; and at the same time multitudes of people perished by famine. Erechtheus, upon this occasion, as he was connected with Egypt, imported a vast quantity of grain from that country to Athens. The people, who had been relieved by his munificence, unanimously elected him king. Being invested with the government, he taught his subjects the mysteries of Ceres at Eleusis, and the mode of celebrating the sacred ceremonies, having transferred from Egypt the ritual for that purpose. In those times the goddess is said to have made her appearance at Athens three several times; bccause, according to tradition, the fruits of the earthwhich bear her name were then imported into Attica. On this account the seeds and fruits of the earth were said to be the invention of that deity. Now the Athenians themselves acknowledge, that, in the reign of Erechtheus, the fruits of the earth having perished for want of rain, the arrival of Ceres in their country did actually happen, and that along with her the blessing of COLI

(x) The phallus was the symbol of the fructifying power of Nature. The itophallus was the type of that power in act.

corn was restored to the earth. They tell us at the same time, that the teletæ and the mysteries of that goddess were then received and instituted at Eleusis."

Here then we have the whole mystery of the arrival of Ceres in Attica, and the institution of her mysteries at Eleusis, unveiled. The whole is evidently an oriental allegory. The fruits of the earth had been destroyed by a long course of drought : Egypt, by its peculiar situation, had been preserved from that dreadful calamity. Erechtheus, in consequence of his relation to the Egyptians, imported from their country a quantity of grain, not only sufficient for the consumption of his own subjects, but also a great overplus to export to other parts of Greece, Sieily, Italy, Spain, &c. Triptolemus, another Egyptian, was appointed by Erechtheusto export this superfluous store. That hero, according to Pherecydes, was the son of Oceanus and Tellus, that is, of the sea and the earth ; because his parents were not known, and because he eame to Eleusis by sea. The ship in which he sailed, when he distributed his corn to the western parts of the world, was deeorated with the figure of a winged dragon : therefore, in the allegorical style of his country, he was said to be wafted through the air in a chariot drawn by dragons. Those creatures, every body knows, were held saered by the Egyptians.

Wherever Triptolemus disposed of his corn, thither were extended the wanderings of Ceres. In order to elucidate this point, we must observe, that along with the grain imported from Egypt, Erechtheus, or Triptolemus, or both, transported into Attiea a cargo of priests and priestesses from the temples of Busiris, a eity which lay in the \* centre of the Delta, where the goddess Isis had a number of chapels erceted for her worship. The presidents of these ceremonies, like all other bigots, gladly laid hold on this opportunity of propagating their religious rites, and disseminating the worship of the deities of their country. That the Egyptian priests were zealous in propagating the dogmas of their superstition, is abundantly evident from the extensive spreading of their rites and ceremonies over almost all Asia and a considerable part of Europe. The Greek and Roman idolatry is known to have originated from them ; and numberless monuments of their impious worship are still extant in Persia ‡, India, Ja-Researches, pan, Tartary, &e. Our inference then is, that the worship of Isis was introduced into every country where Triptolemus sold or disposed of his commodities .--Hence the wanderings of Ceres in search of her daughter Proserpine who is generally ealled Core. The

famine oceasioned by the drought destroying the fruits of the ground, imports the loss of Proserpine. The restoration of the corn in various parts of the earth, by fresh supplies from Egypt from time to time, imports the wanderings of Ceres in quest of Proserpine. The whole process is an oriental allegory. The disappearing of the fruits of the earth, of which Proserpine, or Persephone t, or Peresephone (Y), is the emblem, is Plutared the allegorical rape of that goddess. She was seized and carried off by Pluto, sovereign of the infernal regions. The seed committed to the earth in that dry season appeared no more, and was, consequently, said to dwell under ground with Pluto. It was then that Ceres, that is, eorn imported from Egypt, set out in quest of her daughter. Again, when the earth recovered her pristine fertility, the Core, or maid, was found by her mother Ceres, that is, the earth ; for Isis, among the Egyptians, frequently signified the earth. The wanderings of Isis in search of Osiris furnished the model for the peregrinations of Ceres.

44 Ceres, the Roman name of the goddess of corn, was Different unknown to the modern Greeks. They always deno-names of minated her Damater (z), which is rather an epithet Ceres. than a proper name. The Greeks, who always affected to pass for originals, we think, suppressed the Egyptian name on purpose, to conceal the country of that deity. As a proof of the probability of this conjecture, it may be observed, that they metamorphosed the wanderings of Isis in search of Osiris into the peregrinations of Ceres in quest of Proscrpine. The Romans who were less ambitious of the character of originality, retained one of her oriental names (AA.) Ceres, says Diodorus, appeared thrice in Attica during the reign of Erechtheus ; which seems to import, that fleets loaded with corn had thrice arrived in that country from Egypt during that period.

Cecrops, the first king of Attica, had established the worship of the Saitie Athena or Minerva in that region, and consecrated his capital to that deity. Erechtheus, in his turn, introduced the warship of Isis, or Damater, who in all appearance was the tutelar deity of Busiris his native city. The subjects of Cecrops were a colony Contenof Saites, and readily embraced the worship of Miner-tons at Athens taned to a monitor of that district being accus-respecting tomed to a maritime, perhaps to a piratical course of Minerva life, were more inclined to consecrate their city to and Nep-Neptune the god of the sea, and to constitute him their tune, the guardian and protector. Cecrops by a stratagem se-cause of cured the preference to Minerva his favourite divinity.fixing the Erechtheus, in order to give equal importance to his mysteries patroness, at Eleusis.

(Y) This word seems to be formed of two Hebrew terms, pheri " fruit," and tzaphon, or tzephon, " abscondit, recondidit."

\* Herod. lib. i.

† Asiatic vol. i. and

<sup>(</sup>z) Damater is compounded of the Chaldaic particle da, " the," and mater, " mother." As Isis often signified the carth, the Greeks naturally adopted that title ; because, according to them, that element is the mother of all living. In the very same manner they discarded the word Juno, an original title of the moon, and substituted Hera, which intimates " mistress or lady."

<sup>(</sup>AA) According to some of the Latin etymologists, Ceres, or rather Geres, is derived from gero, " to bear, to carry," because the carth bears all things ; or because that element is the general fruit-bearer. But as this term came to Italy immediately from the cast, and not by the medium of Greece, we would rather incline to adopt an oriental etymology. The Hebrew word cheres fignifies arare, "to plough ;" a name naturally applicable to the goddess of husbandry.

patroness, had the address to institute the Eleusinian mysteries; and to accomplish his design laid hold on the opportunity above mentioned.

This appears to us the most probable account of the origin and institution of the Eleusinian mysteries; for which the Sicilian historian has indeed furnished the clue. We shall now proceed to detail some other circumstances which attended the original institution of these far-famed cercmonies.

\* ollod.

B lib.

Cim-

Cerennal

Backis,

whomey

The archpriestess who personated the newly imported deity was entertained by one Celcus\*, who was either viceroy of that petty district of which Eleusis in p. 13. was the capital, or some considerable personage in that city or its neighbourhood. Upon her immediate arstres at- rival, according to the fabulous relations of the Greeks, the a farce was acted not altogether suitable to the chaimppear-racter of a goddess whose mysteries were one day to anof Ce- be deemed so sacred and austere. These coarse receprest At- tions and other indecencies attending the first appearance of the goddess, that is, the Egyptian dame who assumed her character, were copied from the like unhallowed modes of behaviour practised on oceasion of the solemn processions of her native country. These scommata, or coarse jokes, had an allegorical signification in Egypt; and among the most ancient Greeks the very same spirit was universally diffused by the oriental colonists who from time to time arrived and settled among them. In process of time they abandoned the figurative and allegorical style, in consequence of their acquaintance with philosophy and abstract reasoning. In the ceremonies of religion, however, the same allegorical and typical representations which had been imported from the east were retained; but the Grecian hierophants in a short time lost every idea of their latent import, and religious, moral, or physical interpretation. Accordingly, this shameful rencounter between Ceres and Banho (BB), or Jambe, was retained in the mysteries, though we think it was copied from Egypt, as was said above, where even that obscene action was probably an allegorical representation of something very different from what appeared to the Greeks.

At the same time that Cercs arrived in Attica, Bacehus likewise made his appearance in that country. He was entertained by onc Icarus; whom, as a reward for his hospitality, he instructed in the art of cultivating the vine, and the method of manufacturing wine. Thus it appears that both agriculture and the art of managing the vintage were introduced into Athens much about the same time. Ceres was no other than a priestess of Isis; Baechus was no doubt a priest of Osiris. The arrival of those two personages from Egypt, with a number of inferior priests in their train, produced a memorable revolution in Athens, both with respect to life, manners, and religion. The sacred rites of Isis, afterwards so famous under the name of the Eleusinian mysteries, date their institution from this period.

When this company of propagandi arrived at Eleusis, they were entertained by some of the most respectable persons who then inhabited that district. Their names, according to Clem. Alexand. were Banbo, Dysaulis, Triptolemus, Eumolpus, and Eubulus. From Eumolpus were descended a race of priests called Eumolpidæ, who figured at Athens many ages after. Triptolemus was an ox herd, Eumolpus a shepherd, and Eubulus a swine herd. These were the first apostles of the Eleusinian mysterics. They were instructed by the Egyptian missionaries; and they, in their turn, in-structed their successors. Erechtheus, or, as some say, Pandion, countenanced the seminary, and built a small temple for its accommodation in Elcusis, a city of Attica, a few miles west from Athens, and originally one of the twelve districts into which that territory was divided. Here then we have arrived at the scene of those renowned mysterics, which for the space of near 2000 years were the pride of Athens and the wonder of the world.

The mysteries were divided into the greater and les- Eleusinian The latter were celebrated at Agræ, a small town mysteries ser. on the river Ilyssus: the former were celebrated in the divided inmonth which the Athenians called Boedromion (cc); the to greater latter in the month Anthesterion (DD). The lesser mysteries, according to the fabulous legends of the Greeks, were instituted in favour of the celebrated Hercules. That hero being commanded by Eurystheus to bring up Cerberus from the infernal regions, was desirous of being initiated in the Eleusinian mysteries before he engaged in that perilous undertaking. He addressed himself to Eumolpus the hicrophant for that purpose. There was a law among the Eleusinians prohibiting the initiation of foreigners. The priest not daring to refuse the benefit to Hercules, who was both a friend and benefactor to the Athenians, advised the hero to get himself adopted by a native of the place, and so to elude the force of the law. He was accordingly adopted by one Pyolius, and so was initiated in the lesser mysteries, which were instituted for the first time upon that occasion. This account has all the air of a fable. The lesser mysteries were instituted by way of preparation for the greater.

The person who was to be initiated in the lesser Austerities mysteries, as well as in the greater, was obliged to and rites practise the virtue of chastity a considerable time be-previous to fore his admission. Besides, he was to bind himself by initiation. the most solemn vows not to divulge any part of the mysteries. At the same time, he was, according to the original institution, to be a person of unblemished moral character. These were preliminaries indispensably necessary in order to his admission. A bull was sacrificed to Jupiter, and the hide of that animal, called by a peculiar name ( $\Delta \iota o_5 \ K \omega \delta i o_7$ ) was carefully pre-served and carried to Eleusis, where it was spread un-der the feet of the initiated. The candidate was then purified by bathing in the river Ilyssus, by aspersions with salt water or salt, with laurel, barley, and passing through

(BB) Apollod. Bib. ubi supra. Clem. Alexand. Cohort. page 17. where the story is told with very little reserve.

<sup>(</sup>cc) The third month of the Athenian year, answering to onr September.

<sup>(</sup>DD) The eighth month, answering to our February ; but Meursius makes it November;

through the fire; all which rites were attended with incantations and other usages equally insignificant and ridiculous. Last of all, a young sow was sacrificed to Ceres; and this animal, according to the ritual, bohoved to be with pigs: and before it was killed it was to be washed in Cantharus, one of the three harbours which formed the Piræus.

All these ceremonies duly performed, the candidate was carried into the hall appointed for the purpose of initiation. There he was taught the first elements of those arcana which were afterwards to be more fully and more clearly revealed in the more august mysteries of Eleusis. The pupils at Agræ were called Mystæ, which may intimate probationers; whereas those of Eleusis were denominated Epoptæ, importing that they saw as they were seen.

The lesser mysteries were divided into several stages, and candidates were admitted to them according to stages, with their quality and capacity respectively. Those who were initiated in the lowest were obliged to wait five years before they were admitted to the greater. Those who had partaken of the second kind underwent a noviciate of three years; those who had been admitted to the third, one of two years; and these who had goue through the fourth were admitted to the greater at the end of one year ; which was the shortest period of probation a candidate for that honour could legally undergo. Such was the process generally observed in administering the lesser mysteries.

With respect to the greater mysteries, it is probable natives of that originally none but the natives of Attica were ad-Athens ori- mitted to partake of them. In process of time, howginally ad-wer, the pale was extended so far and wide as to comthe greater prehend all who spoke the Greek language. All foanysteries. reigners were debarred from those sacred rites. They tell us, however, that Hercules, Bacchus, Castor and Pollux, Æsculapins, and Hippocrates, were initiated in an extraordinary manner, from a regard to their high character and heroic exploits. All barbarians, too, were excluded ; yet Anacharsis the Scythian was indulged that privilege, in consequence of his reputation for science and philosophy. All persons guilty of manslaughter, though even accidentally or involuntarily, all magicians, enchanters; in a word, all impious and profane persons, were expressly prohibited the benefit of this Pagan sacrament. At last, however, the gate became wider, and crowds of people, of all nations, kindreds, and languages, provided their character was fair and irreproachable, rushed in by it. In process of time the Athenians initiated even their infants; but this, we imagine, must have been a kind of lustration or purification, from which it was supposed that they derived a kind of moral ablution from vice, and were thought to be under the peculiar protection of the goddess.

Celebration days; but

The celebration of the mysteries began on the 15th lasted nine day of the month Boedromion; and, according to most ancient authors, lasted nine days. Meursius has enumerated the transactions of each day, which are much too numerous to fall within the compass of this article ; we must therefore refer our curious reader to the author just mentioned. Some days before the commencement of the festival, the præcones, or public criers, invited all the initiated, and all the pretenders to that honour, to attend the festival, with clean

5

hands and a pure heart, and the knowledge of the Greek lai.guage.

On the evening of the 15th day of the month call-was per-On the evening of the 15th day of the month carl formed on ed Boedromion the initiations commenced. Our read-formed on ly during ers will observe, that all the most sacred and solemn the night rites of the Pagan superstition were performed during the night : they were indeed generally works of darkness. On this day there was a solemn cavalcade of Athenian matrons from Athens to Eleusis, in carriages drawn by oxen. In this procession the ladies used to rally one another in pretty loose terms, in imitation, we suppose, of the Isiac procession described by Herodotus, which has been mentioned above. The most The Mun remarkable object in this procession was the Mundus dus Cerer Cereris, contained in a small coffer or basket. This was carried by a select company of Athenian matrons, who, from their office, were styled Camphoræ. In this coffer were lodged the comb of Ceres, her mirror, a serpentine figure, some wheat and barley, the pudenda of the two sexes, and perhaps some other articles which we have not been able to discover. The procession ended at the temple, where this sacred charge was deposited with the greatest solemnity.

We have no description of the temple of Eleusis Pausanias intended to have described upon record. it; but says he was diverted from his design by a dream \*. Strabo informs us that the mystic sanctua-\* Lib. iz ry was as large as a theatre, and that it was built by + See El Ictinus +. In the porch, or outer part of this temple, sis, the candidates were crowned with garlands of flowers," which they called himera, or "the desirable." They Dress of were at the same time dressed in new garments, which the cand they continued to wear till they were quite worn out. dates. They then washed their hands in a laver filled with holy water ; a ceremony which intimated the purity of their hearts and hands. Before the doors were locked, Care to one of the officers of the temple proclaimed with a keep the loud voice a stern mandate, enjoining all the unini-uninitiat tiated to keep at a distance from the temple, and de-tance. nouncing the most terrible menaces if any should dare to disturb or pry into the holy mysteries. Nor were these menaces without effect : for if any person was found to have crowded into the sanctuary even through ignorance, he was put to death without mercy. Every precaution having been taken to secure secrecy, the initiatory ceremonies now began. But before we describe these, we must lay before our readers a brief account of the ministers and retainers of these secrets of paganism.

The chief minister of these far-famed mysteries The hie was the hierophant. He was styled King, and enjoy-phant. ed that dignity during life, and was always by birth an Athenian. He presided in the solemnity, as is evident from his title. This personage, as we learn from Eus bius, represented the Demiurgus, or Creator of the world. " Now in the mysteries of Eleusis (says that father) the hierophant is dressed out in the figure of the demiurgus." What this demiurgus was, we learn from the same writer. As this whole insti-tution was copied from the Egyptians, we may rest assured that the figure of the Eleusinian Demiurgus was borrowed from the same quarter. " As for the symbols of the Egyptians (says he, quoting from Porphyry ‡), they are of the following complexion. The Prop. Demiurgus, whom the Egyptians call Gneph, is figured Evan

576

into the lesser my steries; of which

there were several Jong intervals between them.

52

None but

SI

as a man of an azure colour, shaded with black, holding in his right hand a sceptre and in his left a girdle, and having on his head a royal wing or feather wreathed round." Such, we imagine, was the equipment of the Eleusinian hierophant. This person was likewise styled Prophet. He was to be of the family of the Eumolpidæ; was obliged to make a vow of perpetual ehastity; and even his voice, hair, and attitude, were adjusted to the ritual.

The next minister was the daduehus, or torchbearer; who, according to the father above quoted, was attired like the sun. This minister resembled the sun, because that luminary was deemed the visible type of the supreme Demiurgus, and his vicegerent in governing and arranging the affairs of this lower world.

Tibriests. The third was the person who officiated at the altar. He was habited like the moon. His office was to implore the favour of the gods for all the initiated. We should rather imagine, that the person at the altar, as he resembled the moon, was intended to represent the goddess herself: for the Egyptian Isis, who was the archetype of Ceres, was sometimes the moon and sometimes the earth.

Thlerald The sacred herald was another principal actor in this solemn exhibition. His province was to recite every thing, that, according to the ritual, was to be communicated to the novices; and he probably represented Thyoth or Thoth, that is Hermes or Mercury, the interpreter of the gods.

Besides these, there were five epimeletæ or curators, of whom the king was one, who jointly directed the whole ceremonial. Lastly, There were ten priests to offer the sacrifices. There were no doubt many officers of inferior note employed upon these occasions; but these were only insignificant appendages, whose departments have not been transmitted to posterity.

After this detail of the ministers of this solemn service, we return to the mysta, or candidates for initiation. Some of the fathers of the church + mention a hymn composed by the celebrated Orpheus, which was Clerifler, sung by the mystagogue or king upon that occasion. This hymn appears to us one of those spurious compositions which abounded in the first ages of Christianity, and which the pious apologists often adopted without sufficient examination. That some saered hymn was chanted upon that oceasion, we think highly probable; but that the one in question was either composed by Orpheus, or used at the opening of these ceremonics, to us appears somewhat problematical.

Before the eeremony opened, a book was produced, which contained every thing relating to the teletæ. This was read over in the ears of the mystæ; who were ordered to write out a copy of it for themselves. This was book kept at Eleusis in a sacred repository, formed by two stones exactly fitted to each other, and The ro- of a very large size. This repository was called *petroma*. At the annual celebration of the greater mysteries, these stones were taken asunder, and the hook taken out ; which, after being read to the mystæ, was replaced in the same casement.

The initiations began with a representation of the Menovent wanderings of Ceres, and her bitter and loud lamentations for the loss of her beloved daughter. Upon this occasion, no doubt, a figure of that deity was Vol. XIV. Part II.

displayed to the mystæ, while loud lamentations echoed from every corner of the sanctuary. One of the company having kindled a firebrand at the altar, and sprung to a certain place in the temple, waving the toreh with the utmost fury, a second snatched it from him, roaring and waving it in the same frantic manner; and a third, fourth, &e. in the most rapid succession. This was done to imitate Ceres, who was said to have perlustrated the globe of the earth with a flaming pine in her hand, which she had lighted at Mount Etna.

When the pageant of the goddess was supposed to Questions arrive at Eleusis, a solemn pause ensued, and a few put to the trifling questions were put to the mystæ : What these myste. questions were, is evident from the answers. " I have fasted; I have drunk the liquor; I have taken the contents out of the coffer; and having performed the ceremony; have put them into the hamper : I have taken them out of the hamper, and put them again in the coffer." The meaning of these answers, we conjecture, was this : " I have fasted, as Ceres fasted while in search of her daughter; I have drunk off the wort as she drank when given her by Banbo ; I have performed what Ceres taught her first disciples to perform, when she committed to them the sacred hamper and coffer." After these interrogatories, and the suitable responses, the mundus Cereris was displayed before the eyes of the mystæ, and the mystagogue or hierophant, or perhaps the sacred herald by his command, read a lecture on the allegorical import of those sacred symbols. This was heard with the most profound attention; and a solenin silence prevailed throughout the fane. Such was the first aet of this religious farce, which perhaps consisted originally of nothing more.

After the exposition of the mundus Cereris, and the Traditions import of her wanderings, many traditions were com-respecting municated to the mystæ concerning the origin of the the origin universe and the nature of things. The doctrines deli- of the univered in the greater mysteries, says Clem. Alex, "re-verse, &c. late to the nature of the universe. Here all instruction, ends. Things are seen as they are ; and nature, and the things of nature, are given to be comprehended." To the same purpose Cicero : "Which points being explained and reduced to the standard of reason, the nature of things, rather than that of the gods, is diseovered." The father of the universe, or the supreme demiurgus, was represented as forming the ehaotie mass into the four elements, and producing animals, vegetables, and all kinds of organized beings, out of those materials. They say that they were informed of the secrets of the anomalies of the moon, and the eclipses of the sun and moon ; and, according to Virgil,

### Unde hominum genus, et pecudes, unde imber et ignes.

What system of eosmogony those hierophants adopted, is evident from the passage above quoted from Eusebius; and from the account immediately preceding, it was that of the most ancient Egyptians, and of the orientals in general. This cosmogony is beautifully and energe-tically exhibited in Plato's Timæus, and in the genuine spirit of poetry by Ovid in the beginning of his Metamorphoses.

577

The next scene exhibited upon the stage, on this Exploits of solemn occasion, consisted of the exploits and adventures the gods, of the gods, demigods, and heroes, who had from time and 4 D

to

to time, being advanced to divine honours. These were displayed as passing before the mystæ in pageants fabricated for that important purpose. This was the original mode among the Egyptians, and was no doubt followed by their Eleusinian pupils. These adventures were probably demonstrated to have been allegorical, symbolical, hieroglyphical, &c. at least they were exhibited in such a favourable point of view as to dispel those absurdities and inconsistencies with which they were sophisticated by the poets and the vulgar.

their origin.

With respect to the origin of those factitious deities, it was discovered that they had been originally men who had been exalted to the rank of divinity, in consequence of their heroic exploits, their useful inventions, their beneficent actions, &c. This is so clear from the two passages quoted from Cicero, by Bishop Warbur-Div. Leg. ton +, that the the fact cannot be contradicted. But that

prelate has not informed us so precisely, whether the mystagogues represented them as nothing more than dead men, in their present state, or as beings who were actually existing in a deified state, and executing the functions assigned them in the rubric of Paganism. Another query naturally occurs ; that is, to what purpose did the mystagogues apply this communication ? That the hierophants did actually represent those deified mortals in the latter predicament, is obvious from another passage quoted from Ciccro by the same prelate, which we shall transcribe as translated by him: "What think you of those who assert that valiant, or famous, or powerful men, have obtained divine honours after death; and that these are the very gods now become the objects of our worship, our prayers, and adoration ? Enhemerus tells us, when these gods died, and where they lie buried. I forbear to speak of the sacred and august rites of Eleusis. I pass by Samothraee and the mysteries of Lennos, whose hidden rites are celebrated in darkness, and amidst the thick shades of groves and forests." If, then, those deified moreals were become the objects of worship and prayers, there can be no doubt of the belief of their deified existence. The allusion to the Eleusinian and other Pagan mysteries towards the close of the quotation, places the question beyond the reach of controversy. But though, according to this account, " there were gods many and lords many ;" yet it is evident from the passage quoted from Eusebius in the preceding part of this article, that the unity of the Supreme Being was maintained, exhibited, and inculcated. This was the original doctrine of the hierophants of Egypt: It was maintained by Thales and all the retainers of the Ionian school. It was the doctrine of Pythagoras, who probably gleaned it up in the country just mentioned, in connexion with many other dogmas which he had the assurance to claim as his own. But however the unity, and perhaps some of the most

Unity of the supreme Being maintained in the mys-

gods.

69

obvious attributes, of the Supreme Author of nature, might be illustrated and inculeated, the tribute of homage and veneration due to the subordinate divinities was by no means neglected. The initiated were taught to look to the dii majorum gentium with a superior degree of awe and vereration, as beings endowed with an ineffable measure of power, wisdom, purity, goodness, 90 Offices of &c. These were, if we may use the expression, the prime favourites of the Monarch of the universe, who the other were admitted into his immediate presence, and who

received his behests from his own mouth, and communieated them to his subordinate officers, prefects, lieutenants, &c. These they were exhorted to adore ; to them they were to offer sacrifices, prayers, and every other act of devotion, both on account of the excellency of their nature and the high rank they bore at the court of heaven. They were instructed to look up to hero gods and demigods, as being exalted to the high rank of governors of different parts of nature, as the immediate guardians and protectors of the human race ; in short, as gods near at hand, as prompters to a virtuous course, and assistants in it ; as ready upon all oceasions to confer blessings upon the virtuous and deserving. Such were the doctrines taught in the teletæ with respect to the nature of the Pagan divinities, and the worship and devotion enjoined to be offered them by the mysteries.

As the two principal ends proposed by these ini-Exceller As the two principal ends proposed by these interplan for tiations were the exercise of heroic virtues in men, complis and the practice of sincere and uniform piety by the ing the candidates for immortal happiness, the hierophants ends pr had adopted a plan of operations excellently accom-posed in modated to both these purposes. The virtuous con-mysteric duct and heroic exploits of the great men and demigods of carly antiquity, were magnified by the most pompous eulogiums, enforced with suitable exhortations to animate the votaries to imitate so noble and alluring an example. But this was not all: the heroes and demigods themselves were displayed in pageants, or vehicles of celestial light. Their honours, offices, habitations, attendants, and other appendages, in the capacity of demons, were exhibited with all the pomp and splendour that the sacerdotal college were able to advise. The sudden glare of mimic light, the melting music stealing upon the ear, the artificial thunders reverberated from the roof and walls of the temple, the appearance of fire and ethereal radiance, the vehicles of flame, the effigics of heroes and demons adorned with crowns of laurel emitting rays from every sprig, the fragrant odours and aromatic gales which breathed from every quarter, all dexterously counterfeited by sacerdotal mechanism, must have filled the imagination of the astonished votaries with pictures at once tremendous and transporting: Add to this, that every thing was transacted in the dead of night amidst a dismal gloom; whence the most bright effulgence instantaneously burst upon the sight. By this arrangement the aspirants to initiation were wonderfully animated to the practice of virtue while they lived, and inspired with the hope of a blessed immortality when they died. At the same time, their awe and veneration for the gods of their country were wonderfully enhanced by reflecting on the appearances above described. Accordingly Strabo very judiciously observes, " that the mystical secrecy of the sacred rites preserves the majesty of the Deity, imitating its nature, which escapes our apprehension. For these reasons, in celebrating the teletæ, the demons were introduced in their deified or glorified state.

But as all the candidates for initiation might not aspire to the rank of heroes and demigods, a more easy and a more attainable mode of conduct, in order to arrive at the palace of happiness, behaved to be opened. Private virtues were inculcated, and these 100

578

too were to meet a condign reward. But alas! this vate vir-present life is too often a chequered scene, where virsineuled in the tue is depressed and trodden under foot, and vice lifts steries, up its head and rides triumphant. It is a dictate of the doc- common sense, that virtue should sooner or later emerge, ne of a and vice sink into contempt and misery. Here then urestate the conductors of the mysteries, properly and naturally, adopted the doctrine of a future state of rewards and punishments. The dogma of the immortality of the human soul was elucidated, and carefully and pathetically inculcated. This doctrine was likewise im-Lib. ii. ported from Egypt; for Herodotus \* informs us, " that the Egyptians were the first people who maintained the immortality of the human soul." The Egyptian immortality, however, according to him, was only the metempsychosis or transmigration of souls. This was not the system of the ancient Egyptians, nor indeed of the teletæ. In these, a metempsychosis was admitted; but that was carried forward to a very distant period, to wit, to the grand Egyptian period of 36,000 years.

73 blems of As the mystagogues well knew that the human mind is more powerfully affected by objects presented to the Farta eyes than by the most engaging instructions conveyed by the ear, they made the emblems of Elysium and Tartarus pass in review before the eyes of their novices. There the Elysian scenes, so nobly described by the Roman poet, appeared in mimic splendour; and, on the other hand, the gloom of Tartarus, Charon's boat, the dog of hell, the Furies with tresses of snakes, the tribunal of Minos and Rhadamanthus, &c. were displayed in all their terrific state. Tantalus, Ixion, Sisyphus, the daughters of Danaus, &c. were represented in pageants before their eyes. These exhibitions were accompanied with most horrible cries and howlings, thunders, lightning, and other objects of terror which we shall mention in their proper place.

sium

Thhree

labf

No contrivance could be better accommodated to animate the pupils to the practice of virtue on the one hand, or to deter them from indulging vicious passions on the other. It resembled opening heaven and hell to a hardened sinner. The practices inculcated in celebrating the mysteries are too numerous to be detailed in this imperfect sketch. The worship of the gods was strictly enjoined, as has been shown above. The three laws generally ascribed to Triptolemus were inculcated, 1. To honour their parents; 2. To honour the gods with the first fruits of the carth; 3. Not to treat brute animals with cruelty. These laws were imported from Egypt, and were communicated to the Eleusinians by the original missionaries. Cicero makes the civilization of mankind one of the most beneficial effects of the Eleusinian institutions : " Nullum milii, cum multo eximia divinaque videntur Athenæ tuæ peperisse; tum nihil melius illis mysteriis, quibus ex agresti immanique vita, exculti ad humanitatem, et mitigati sumus ; initiaque, ut appellantur, ita revera principia vitæ cognovimus; neque solum eum lectitia vivendi rationem accepimus, sed ctiam cum spe meliore moriendi." Hence it is evident that the precepts of humanity and morality were warmly recommended in these institutions. The virtue of humanity was extended, one may say, even to the brute creation, as appears from the last of Triptolemns's laws above quoted. Some articles were enjoined in the teletæ

which may appear to us of less importance, which, however, in the symbolical style of the Egyptians, were abundantly significant. The initiated were " commanded to abstain from the flesh of certain birds and fishes; from beans, from pomegranates and apples, which were deemed equally polluting. It was taught, that to touch the plant of asparagus was as dangerous as the most deadly poison. Now, says Porphyry, whoever is versed in the history of the visions, knows for what reason they were commanded to abstain from the flesh of birds."

The initiated then bound themselves by dreadful oaths The initiato observe most conscientiously and to practise every ted bound precept tendered to them in the course of the teletæ; by oaths to and at the same time never to divulge one article of observe the all that had been heard or seen by them upon that oc-precepts of casion. In this they were so exceedingly jealous, that the myste-Æschylus the tragedian was in danger of eapital pu-ries. nishment, for having only alluded to one of the Eleusinian arcana in a tragedy of his; and one of the articles of indictment against Diagoras the Mclian was, his having spoken disrespectfully of the mysteries, and dissuaded people from partaking of them. It must then be allowed, that the institution of the mysteries was of infinite advantage to the Pagan world. They were indeed a kind of sacraments, by which the initiated bound themselves by a solemn vow to practise piety towards the gods, justice and humanity towards (heir fellow men, and gentleness and tenderness towards the inoffensive part of the brute creation. The Pagans themselves were so thoroughly convinced of this fact, that in their disputes with the apologists for Christianity, they often appealed to the teletæ, and contrasted their maxims with the most sublime doctrines of that heavenly institution.

In order to impress these maxims the more deeply upon the minds of the novices, and to fix their attention more stedfastly upon the lectures which were delivered them by the mystagogue or the sacred herald, a mechanical operation was played off at proper intervals during the course of the celebration. "Towards the end of the celebration (says Stobæus), the whole seene is terrible; all is trembling, shuddering, sweat, and astonishment. Many horrible spectres are seen, Horrible and strange cries and howlings uttered. Light suc-spectres ceeds darkness; and again the blackest darkness the and pleasmost glaring light. Now appear open plains, flowery alternatemeads, and waving groves; where are seen dances and ly exhibitchoruses; and various holy phantasies enchant the sight. cd. Melodious notes are heard from far, with all the sublime symphony of the sacred hymns. The pupil now is completely perfect, is initiated, becomes free, released, and walks about with a crown on his head, and is admitted to bear a part in the sacred rites." Aristides de Myst. Eleus. calls Eleusis " a kind of temple of the whole earth, and of all that man beholds done in the most dreadful and the most exhilarating manner. In what other place have the records of fable sung of things more marvellous? or in what region upon earth have the objects presented to the eye borne a more exact resemblance to the sounds which strike the ear? What object of sight have the numberless generations of men and women beheld comparable to these exhibited in the ineffable mysteries ?" To the same purpose, Pletho, in the oracles of Zoroastres, informs us, " that 4 D 2

579

" that frightful and shocking apparitions, in a variety of forms, used to be displayed to the mystæ in the course of their initiation." And a little after, he adds, " that thunder and lightning and fire, and every thing terrible which might be held symbolical of the divine presence, were introduced." Claudian, in his poem De Rapta Proserpina, gives an elegant, though brief, description of this phenomenon, which throws some light on the passages above quoted.

> Jam mihi cernuntur trepidis delubra moveri Sedibus et clarum dis pergere culmina lucem, Adventum testata Dea, jam magnus ab imis Auditur fremitus terris, templumque remugit Cecropidum.

The sight of those appearances was called the Antopsia, or " the real presence :" hence those rites werc sometimes called Epoptica. The Epoptæ were actually initiated, and were admitted into the Sanctum Sanctorum, and bore a part in the ceremonial : whereas the mysta, who had only been initiated in the lesser mysteries at Agræ, were obliged to take their station in the porch of the temple. The candidates for initiation bathed themselves in holy water, and put on new clothes, all ablution in of linen, which they continued to wear till they were the myste- quite torn, and then they were consecrated to Ceres and Proserpine. From the ceremony of bathing they were denominated Hydrani; and this again was a kind of baptismal ablution. Whether the phrases of washing away sin, putting on the Lord Jesus Christ, putting off the old man with his deeds, putting on a robe of rightconsness, being buried in baptism, the words mystery, perfect, perfection, which occur so frequently in the New Testament, especially in the writings of the apostle St Paul, are borrowed from the Pagan mysteries, or from usages current among the Jews, we leave to our more learned readers to determine.

The Epoptæ having sustained all those fiery trials, heard and seen every thing requisite, taken upon them the vows and engagements above narrated, and, in a word, having shown themselves good soldiers of Ceres and Proserpine, were now declared perfect men. They might, like Cebes's virtuous man, travel wherever they ated deela- chose; those wild beasts (the human passions) which tyrannise over the rest of mankind, and often destroy them, had no longer dominion over them. They were now not only *perfect* but *regenerated* men. They were now crowned with laurel, as was said above, and dismissed with two barbarous words, Korz ouraz, Konx ompax, of which perhaps the hierophants themselves did not comprehend the import. They had been introduced by the first Egyptian missionaries, and retained in the sacra after their signification was lost. This was a common practice among the Greeks. In the administration of their religious ceremonies, they rctained many names of persons, places, things, customs, &c. which had been introduced by the Phœnicians and Egyptians, from whom they borrowed their system of idolatry. These terms constituted the language of the gods, so often mentioned by the prince

of poets. To us the words in question appear to be Syriac, and to signify, Be vigilant, be innocent.

Numerous and important were the advantages supposcd to redound to the initiated, from their being admitted to partake of the mysteries, both in this life and that which is to come. First, They were highly honoured, and even revered by their contemporaries. Indeed, they were looked up to as a kind of sacred persons : they were, in reality, consecrated to Ceres and Proserpine. Secondly, They were obliged by their oath to practise every virtue, religious, moral, political, public, and private. Thirdly, They imagined, that sound advice and happy measures of conduct were suggested to the initiated by the Eleusinian goddesses. Accordingly, says Pericles the celebrated Athenian statesman, "I am convinced, that the deities of Eleusis inspired mc with this sentiment, and that this stratagem was suggested by the principle of the mystic rites." There is a beautiful passage in Aristophanes's + comedy of the + Acti. Ranæ to the very same purpose, of which we shall subjoin the following periphrasis. It is sung by the chorus of the initiated.

Let us to flow'ry meads repair,

With deathless roses blooming, Whose balmy sweets impregn the air, Both hills and dales perfuming. Since fate benign our choir has join'd, We'll trip in mystic measure ;

In sweetcst harmony combin'd

We'll quaff full draughts of pleasure. For us alone the pow'r of day.

A milder light dispenses ;

And sheds benign a mellow'd ray To cheer our ravish'd senses :

For we beheld the mystic show,

And brav'd Eleusis' dangers. We do and know the deeds we owe

To neighbours, friends, and strangers.

Euripides, in his Bacchæ (E), introduces the chorus extolling the happiness of those who had been acquainted with God, by participating in the holy mysteries, and whose minds had been enlightened by the mystical rites. They boast, " that they had led a holy and unblemished life, from the time that they had been initiated in the sacred rites of Jupiter Idæus, and from the time that they had relinquished celebrating the nocturnal rites of Bacchus, and the banquets of raw flesh torn off living animals." To this sanctity of life they had no doubt engaged themselves, when they were initiated in the mysteries of that god. The Eleusinian Epoptæ derived the same advantages from their sacramental engagements. Fourthly, The initiated were imagined to be the peculiar wards of the Elensinian goddesses. These deities were supposed to watch over them, and often to avert impending danger, and to rescue them when beset with troubles .--Our readers will not imagine that the initiated reaped much benefit from the protection of his Eleusinian tutclary dcitics; but it was sufficient that they believ-

A kind of baptismal ries.

> The initired perfect men.

ed the fact, and actually depended upon their interposition. Fifthly, The happy influences of the teletæ, were supposed to administer consolation to the Epoptæ in the hour of dissolution; for, says Isocrates, " Ceres bestowed upon the Athenians two gifts of the greatest importance; the fruits of the earth, which were the cause of our no longer leading a savage course of life; and the tcletæ, for they who partake of these entertain more pleasant hopes both at the end of life, and eterni-Aristides, ty afterwards." Another author \* tells us, " that the initiated were not only often rescued from many hardships in their lifetime, but at death entertained hopes that they should be raised to a more happy condition." Sixthly, After death, in the Elysian fields, they were to enjoy superior degrees of felicity, and were to bask in eternal sunshine, to quaff nectar, and feast upon ambrosia, &c.

The priests were not altogether disinterested in this salutary process. They made their disciples believe, that the souls of the uninitiated, when they arrived in the infernal regions, should roll in mire and dirt, and with very great difficulty arrive at their destined mansion. Hence Plato introduces Socrates + observing, " that the sages who introduced the teletæ had positively affirmed, that whatever soul should arrive in the infernal mansions unhousell'd and unanneal'd, should lie there immersed in mire and filth." And as to a future state (says Aristides), "the initiated shall not roll in

mire and grope in darkness; a fate which awaits the unholy and uninitiated." It is not hard to conceive with what a commanding influence such doctrines as these must have operated on the generality of mankind. marks of

When the Athenians advised Diogenes to get himogenes self initiated, and enforced their arguments with the Antisabove considerations, "It will be pretty enough (replied the philosopher) to see Agesilaus and Epaminondas wallowing in the mire, while the most contemptible rascals who have been initiated are strutting in the islands of bliss."

When Antisthenes was to be initiated in the Orphic mysteries, and the priest was boasting of the many astonishing benefits which the initiated should enjoy in a future state ‡, "Why, forsooth, (says Antisthenes), 'tis wonder your reverence don't e'en hang yourself in order to come at them the sooner."

When such benefits were expected to be derived from the mysteries, no wonder if all the world erowded to the Eleusinian standard. After the Macedonian conquests, the hierophants abated much of their original strictness. By the age of Cicero, Eleusis was a temple whither all nations resorted to partake of the benefits of that institution. We find that almost all the great men of Rome were initiated. The hierophants, however, would not admit Nero on account of the profligacy of his character. Few others were refused that honour; even the children of the Athenians were admitted. But this, we think, was rather a lustration or consecration, than an initiation. Perhaps it paved the way for the more august eeremony, as the Christian baptism does among us for the other sacrament.

] genera-That this institution gradually degenerated, ean hardly be questioned; but how much, and in what points, we have not been able to investigate. The fa-

thers of the church, from whom that charge is chiefly to be collected, are not always to be trusted, especially when they set themselves to arraign the institutions of Paganism, There were indeed several ancient authors, such as Melanthius, Menander, Sotades, &c. who wrote purposely on the subject in question; but their works are long since irrecoverably lost. For this reason, modern writers, who have professedly handled it, have not always been successful in their researches. The two who have lahoured most indefatigably, and perhaps most successfully, in this field, are Meursius and Warburton. The former, in his Liber Singularis, has collected every thing that can be gleaned from antiquity relating to the ceremonial of these institutions, without, however, pointing out their original, or elucidating the end and import of their establishment. The latter has drawn them into the vortex of a system which has in many instances led him to aseribe to them a higher degree of merit than we think they deserve. These instances we would willingly have noticed in our progress, had the limits prescribed us admitted such a discussion.

If we may believe Diodorus the Sicilian, these mysteries, which were celebrated with such wonderful secrecy at Elcusis, were communicated to all mankind among the Cretans. This, however, we think, is ra-ther problematical. We imagine that excellent historian has confounded the mysteries of Cybele with those of the Eleusinian Ceres. These two deities were undoubtedly one and the same, that is, the moon or the earth. Hence it is probable, that there was a striking resemblance between the sacred mysteries of the Cretans and Eleusinians.

This institution continued in high reputation to the age of St Jerome, as appears from the following passage : " Hierophantæ quoque Atheniensium legant usque hodie cieutæ sorbitione eastrari." The emperor Valentinianus intended to have supressed them; but Zozimus \* informs us, that he was diverted from \* Advers. his design by the proconsul of Greece. At length Jovin. Theodosius the elder, by an imperial edict, prohibited <sup>83</sup> Abolished the celebration of these as well as of all the other sa-by the emcra of Paganism. These mysteries, instituted in the peror Theoreign of Erechtheus, maintained their ground to the dosius. period just mentioned, that is, near 2000 years; during which space, the celebration of them never had been interrupted but once. When Alexander the Great massacred the Thebans and razed their city. the Athenians were so much affected with this melancholy event, that they neglected the celebration of that festival.

There were almost numberless other mysterious in- Other mystitutions among the ancient Pagans, of which these steries asketched above were the most celebrated. The Sa-mong the mothraeian mysteries, instituted in honour of the Ca-Pagans of less celebribiri, were likewise of considerable celebrity, and were ty. supposed to confer much the same blessings with the Eleusinian, but were not of equal celebrity. The Cabiri were Phœnician and likewise Egyptian + dei- + Sanchonities. The learned Bochart has explained their ori-athon and gin, number, names, and some part of their worship. Herodotus. The Orphic mysteries were likewise famous among the Thracians. Orpheus learned them in Egypt, and they were nearly the same with the sacra Baschanalia of the Greeks. There were likewise the mysteries of

of Jupiter Idæus in great request among the Cretans, those of the Magna Mater or Cybele, cclebrated in Phrygia. To cnumerate and detail all these would require a complete volume. We hope our readers will be fully satisfied with the specimen exhibited above. We are convinced many things have been omitted which

### MYS

Mystical, Mystics.

MYSTICAL, something mysterious or allegorical. Some of the commentators on the sacred writings, hesides a literal find also a mystical meaning. The sense of Scripture, say they, is either that immediately signified by the words and expressions in the common use of language; or it is mediate, sublime, typical, and mystical. The literal sense they again divide into proper literal, which is contained in the words taken simply and properly; and metaphorical literal, where the words are to be taken in a figurative and metaphorical sense. The mystical sense of scripture they divide into three kinds : the first corresponding to faith, and called allegorical; the second to hope, called anagogical; and the third to charity, called the tropological sense. And sometimes they take the same word in Scripture in all the four senses ; thus the word Jerusalem literally signifies the capital of Judea : allegorically, the church militant : tropologically, a believer : and anagogically, heaven. So, that passage in Genesis, let there be light, and there was light, literally significs corporeal light; by an allegory, the Messiah; in the tropological sense, grace; and anagogically, beatitude, or the light of glory.

MYSTICS, mystici, a kind of religious sect, distingnished by their professing pure, sublime, and perfect devotion, with an entire disinterested love of God, free from all selfish considerations.

The mystics, to excuse their fanatic ecstasies and amorous extravagancies, allege that passage of St Paul, The Spirit prays in us by sighs and groans that are unutterable. Now, if the spirit, say they, pray in us, we must resign ourselves to its motions, and be swayed and guided by its impulse, by remaining in a state of mere inaction.

Passive contemplation is that state of perfection to which the mystics all aspire.

The authors of this mystic science which, sprung up towards the close of the third century, are not known; but the principles from which it was formed are manifest. Its first promotors proceeded from the known doctrinc of the Platonic school, which was also adopted by Origen and his disciples, that the divine nature was infused through all human souls, "or that the faculty of reason, from which proceed the health and vigour of the mind, was an emanation from God into the human soul, and comprehended in it the principles and elements of all truth, human and divine. They denied that men could by labour or study excite this celestial flame in their breasts; and therefore they disapproved highly of the attempts of those, who by definitions, abstract theorems, and profound speculations, endeavoured to form distinct notions of truth, and to discover its hidden nature. On the contrary, they maintained that silence, tranquillity, repose, and solitude, accompanied with such acts as might tend to

might have been inserted, but we have collected the most curious and the most important.—Every one of the positions might have been authenticated by quotations from authors of the most undoubted credibility, but that process would have swelled the article beyond all proportion.

### MYT

extenuate and exhaust the body, were the means by Mystice which the hidden and internal word was excited to produce its latent virtues, and to instruct men in the knowledge of divine bings. For thus they reasoned; those who behold with a noble contempt all human affairs, who turn away their eyes from terrestrial vanities, and shut all the avenues of the outward senses against the contagious influences of a material world, must necessarily return to God, when the spirit is thus disengaged from the impediments that prevented that happy union. And in this blessed frame they not only enjoy inexpressible raptures from their communion with the Supreme Being, but also are invested with the inestimable privilege of contemplating truth undisguised and uncorrupted in its native purity, while others behold it in a vitiated and delusive form.

The number of the mystics increased in the fourth century, under the influence of the Grecian fanatic, who gave himself out for Dionysius the Areopagite, disciple of St Paul, and probably lived about this period; and by pretending to higher degrees of perfection than other Christians, and practising greater austerity, their cause gained ground, especially in the eastern provinces, in the fifth century. A copy of the pretended works of Dionysius was sent by Balbus to Lewis the Meek, in the year 824, which kindled the holy flame of mysticism in the western provinces, and filled the Latins with the most enthusiastic admiration of this new religion.

In the twelfth century, these mystics took the lead in their method of expounding Scripture; and by searching for mysteries and hidden meaning in the plainest expressions, forced the word of God into a conformity with their visionary doctrines, their enthusiastic feelings, and the system of discipline which they had drawn from the excursions of their irregular fancies. In the thirteenth century, they were the most formidable antagonists of the schoolmen ; and towards the close of the fourteenth, many of them resided and propagated their tcnets almost in every part of Europe. They had, in the fifteenth century, many persons of distinguished merit in their number: and in the sixtcenth century, previous to the Reformation, if any sparks of real piety subsisted under the despotic empire of superstition, they were only to be found among the mystics.

The principles of this sect were adopted by those called *Quietists* in the seventeenth century, and, under different modifications, by the Quakers and Methodists.

MYSTRUM, a liquid measure among the ancients, containing the fourth part of the cyathus, and weighing two drachms and a half of oil, or two drachms two scruples of water or wine. It nearly answers to our spoonful.

MYTELENE. See METYLENE.

MYTHOLOGY.

## MYTHOLOGY

befinition.

igin of

ble.

IS a term compounded of two Greek words, and in its original import it significs any kind of fabulous doctrine: In its more appropriated sense, it means those fabulous details concerning the objects of worship which were invented and propagated by men who lived in the early ages of the world, and by them transmitted to succeeding generations, either by written records or by oral tradition.

As the theology and mythology of the ancients are almost inseparably connected, it will be impossible for us to develope the latter, without often introducing some observations relating to the former. We must therefore entreat the indulgence of our readers, if upon many occasions we would hazard a few strictures on the names, characters, adventurcs, and functions of such Pagan divinities as may have furnished materials for those fabulous narrations which the nature of the subject may lead us to discnss.

With respect to fable, it may be observed in general, that it is a creature of the human imagination, and derives its birth from that love of the marvelious which is in a manner congenial to the soul of man .----The appearances of nature which every day occur, objects, actions, and events, which succeed each other by a kind of routine, are too familiar, too obvious, and uninteresting, either to gratify curiosity or to excite admiration. On the other hand, when the most common phenomena in nature or life are new-modelled by the plastic power of a warm imagination; when they are diversified, compounded, embellished; or even arranged and moulded into forms which seldom or perhaps never occur in the ordinary course of things ;novelty generates admiration, a passion always attended with delightful sensations. Here then we imagine we have discovered the very source of fiction and fable .--They originated from that powerful propensity in our nature towards the new and surprising, animated by the delight with which the contemplation of them is generally attended.

Many circumstances contributed to extend and establish the empire of fable. The legislator laid hold on this bias of human nature, and of course employed *fable* and *fiction* as the most effectual means to civilize a rude, unpolished world. The philosopher, the theologist, the poet, the musician, each in his turn, made use of this vehicle to convey his maxims and instructions to the savage tribes. They knew that *truth*, simple and unadorned, is not possessed of charms powerful enough to captivate the heart of man in his present corrupt and degenerate state. This consideration, which did indeed result from the character of their audience, naturally led them to employ fiction and allegory. From this was derived the allegorical taste of the east.

Though almost every nation on the face of the globe, however remote from the centre of population, how-B<sup>thess</sup> of ever savage and averse from cultivation, has fabricated thrients and adopted its own system of mythology; the O-Mology rientals, however, have distinguished themselves in a

peculiar manner, by the boldness, the inconsistency, and the extravagance of their mythology. The genial warmth of those happy climes, the fertility of the soil, which afforded every necessary, every conveniency, and often every luxury of life, without depressing their spirits by laborious exertions; the face of nature perpetually blooming around them, the skies smiling with uninterrupted serenity; all contributed to inspire the Orientals with a glow of fancy and a vigour of imagination rarely to be met with in less happy regions. Hence every object was swelled beyond its natural dimensions. Nothing was great or little in moderation, but every sentiment was heightened with incredible hyperbote. The magnificent, the sublime, the vast, the enormous, the murvellous, first sprung up, and were brought to maturity, in those native regions of fable and fairy land. As nature, in the ordinary course of her operations, exhibited neither objects nor effects adequate to the extent of their romantic imaginations, they naturally deviated into the fields of fiction and fable. Of consequence, the custom of detailing fabulous adventures originated in the east, and was from thence transplanted into the western countries.

As the allegorical taste of the eastern nations had sprung from their propensity to fable, and as that propensity had in its turn originated from the love of the marvellous; so did allegory in process of time contribute its influence towards multiplying fables and fiction almost *in infinitum*. The latent import of the allegorical doctrines being in a few ages lost and oblitenated, what was originally a moral or theological tenet, assumed the air and habit of a personal adventure.

The propensity towards personification, almost uni- Propensity versal among the orientals, was another fruitful source to personiof fable and allegory. That the people of the east fication a were strongly inclined to personify inanimate objects eastern myand abstract ideas, we imagine will be readily granted, thology. when it is considered, that in the formation of language they have generally annexed the affection of sex to those objects. Hence the distinction of grammatical genders, which is known to have originated in the eastern parts of the world. The practice of personifying virtues, vices, religions and moral affections, was necessary to support that allegorical style which universally prevailed in those countries. This mode of writing was in high reputation even in Europe some centuries ago; and to it we are indebted for some of the most noble poetical compositions now extant in our own. language. Those productions, however, are but faint imitations of the original mode of writing still current among the eastern nations. The Europeans derived this species of composition from the Moorish inhabitants of Spain, who imported it from Arabia, their original country.

The general use of hieroglyphics in the east, must The effects have contributed largely towards extending the em-of hieroglypire of mythology. As the import of the figures phic wiemployed in this method of delineating the signs of ting on myideas was in a great measure arbitrary, mistakes must

3

have

have been frequently committed in ascertaining the notions which they were at the first intended to represent. When the developement of these arbitrary signs happened to be attended with uncommon difficulty, the expounders were obliged to have recourse to conjecture. Those conjectural expositions were for the most part tinctured with that bias towards the marvellous which universally prevailed among the primitive men. This we find is the case even at this day, when moderns attempt to develope the purport of emblematical figures, preserved on ancient medals, entaglions, &c.

The wise men of the cast delighted in obscure enigmatical sentences. They seem to have disdained every sentiment obvious to vulgar apprchension. The words of the wise, and their dark sayings, often occur in the most ancient records both sacred and profane. The sages of antiquity used to vie with each other for the prize of superior wisdom, by propounding riddles, and dark and mysterious questions, as subjects of investigation. The contest between Solomon and Hiram, and that hetween Amasis king of Egypt and Polycrates tyrant of Samos, are universally known .--As the import of those enigmatical propositions was often absolutely lost, in ages when the art of writing was little known, and still less practised, nothing remained but fancy and conjecture, which always verged towards the regions of fable. This then, we think, was another source of mythology.

Mythology reduced to a kind of system in Egypt.

6

The Pagan priests, especially in Egypt, were probably the first who reduced mythology to a kind of system. The sacerdotal tribe, among that people, were the grand depositories of learning as well as of religion. That order of men monopolized all the arts and sciences. They seem to have formed a conspiracy among themselves, to preclude the laity from all the avenues of intellectual improvement. This plan was adopted with a view to keep the laity in subjection, and to enhance their own importance. To accomplish this end, they contrived to perform all the ministrations of their religion in an unknown tongue, and to cover them with a thick veil of fable and allegory. The language of Ethiopia became their sacred dialect, and hieroglyphics their sacred character .--Egypt, of course, became a kind of fairy land, where all was jugglery, magic, and enchantment. The initiated alone were admitted to the knowledge of the occult mystical exhibitions, which, in their hands, constituted the essence of their religion. From these the vulgar and profane were prohibited by the most rigorous penalties (sec MYSTERIES). The Egyptians, and indeed all the ancients without exception, deemed the mysteries of religion too sacred and solemn to be comnunnicated to the herd of mankind, naked and unreserved; a mode by which they imagined those sacred and sublime oracles would have been defiled and degraded. " Procul, ô procul este profani-Odi profanum vulgus et arceo." Egypt was the land of graven images; allegory and mythology were the veil which concealed religion from the eyes of the vulgar; fahle was the groundwork of that impenetrable covering.

In the earistence.

In the earliest and most unpolished stage of society liest ages of we cannot suppose fable to have existed among men. mythology Fables are always tales of other times, but at this period had no ex- other times did not reach far enough backward to af-

ford those fruits of the imagination sufficient time to arrive at maturity. Fable requires a considerable space of time to acquire credibility, and to risc into reputation. Accordingly, we find that both the Chinese and Egyptians, the two most ancient nations whose annals have reached our times, were altogether unacquainted with fabulous details in the most early and least improved periods of their respective monarchies. It has been shown almost to a demonstration, by a variety of learned men, that both the one and the other people, during some centuries after the general deluge, retained and practised the primitive Noachic religion, in which fable and fancy could find no place; all was genuine unsophisticated truth.

As soon as the authentic tradition concerning the origin of the universe was cither in a good measure lost, or at least adulterated by the invention of men, fable and fiction began to prevail. The Egyptian Thoth or Thyoth, or Mercury Trismegistus, and Mos-Fabulous chus the Phœnician, undertook to account for the for-cosmogomation and arrangement of the universe, upon prin-ny, the ciples purely mechanical. Here fable began to usurp logical dethe place of genuine historical truth. Accordingly, tails. we find that all the historians of antiquity, who have undertaken to give a general detail of the affairs of the world, have ushered in their parration with a fabulous cosmogony. Here imagination ranged unconfined over the boundless extent of the primary chaos. To be convinced of the truth of this assertion, we need only look into Sanchoniathon's Cosmogony, Euseb. Præp. Evang. l. 1. sub init. and Diodorus Sic. l. 1. From this we suppose it will follow, that the first race of fables owed their birth to the erroncous opinions of the formation of the universe.

Having now endeavoured to point out the origin of mythology, or fabulous traditions, we shall proceed to lay before our readers a brief detail of the mythology of the most respectable nations of antiquity, following the natural order of their situation.

The Chinese, if any credit be due to their own an-Chinese nals, or to the missionaries of the church of Rome, who mythology pretend to have copied from them, were the first of the nations. Their fabulous records reach npwards many myriads of years before the Mosaic era of the creation. The events during that period of time, if any had been recorded, must have been fabulous as the period itself. These, however, are buried in cternal oblivion. The missionaries, who are the only sources of our information with relation to the earliest periods of the Chinese history, represent those people as having retained the religion of Noah many centuries after the foundation of their empire. Upon this supposition, their cosmogony must have been sound and genuine, without the least tincture of those fabulous ingredients which have both disguised and disgraced the cosmogonics of most other nations.

According to the most authentic accounts, Fohe Birth and or Fohi laid the foundation of that empire about inventions 4000 years ago. This emperor, according to the Chi-of Fohinese, was conceived in a miraculous manner. His mother, say they, one day as she was walking in a desert place, was surrounded by a rainbow; and, being impregnated by this metcor, was in due time delivered of that cclebrated legislator. This personage, like the Athenian Cecrops, was half a man and half a serpent. His

4
His intellectual powers were truly hyperbolical. In one day he discovered 50 different species of poisonous herbs. He taught his countrymen the whole art of agriculture in the space of a very few years. He instructed them how to sow five different sorts of grain. He invented boats, and nets for fishing, the art of fabricating porcelain, the management of silk worms, the manufacturing of silk, &c. In a word, that wonderful personage was inspired by Heaven with knowledge, which qualified him for composing that incomparable bady of laws which are even at this day the wonder of the world. Our readers will admit, that this whole detail is fabulous and chimerical. The most learned part of them will readily observe, that the Chinese in ascribing the invention of all the useful arts to their Fohi, are perfectly agreed with almost all the other nations of antiquity. The Indians ascribe every invention to Budha, or Vishnou, or Foe; the Persians to Zerdusht, or Zoroaster ; the Chaldeans to their man of the sea, whom they call Oannes; the Egyptians to Thoth or Thyoth; the Phœnicians to Melicerta; the Greeks to the family of the Titans; and the Scandinavians to Odin, &c.

trines.

his his

In Auc-

these-

About 551 years before the Christian era, appeared the famous Chinese philosopher Con-fu-tse or Confucius. Concerning the birth of this prince of philosophers, the Chinese have propagated the following legendary tale. His mother, walking in a solitary place, was impregnated by the vivifying influence of the heavens. The babe, thus produced, spake and reasoned as soon as it was born. Confucius, however, wrought no miracles, performed no romantic exploits, but lived an austere ascetic life, taught and inculcated the doctrines of pure morality, and died, remarkable only for superior wisdom, religious, moral, and political.

About the year of Christ 601, flourished the scctary Lao-kiun. His mother carried him 30 years in her womb, and was at last delivered of him under a plum-tree. This philosopher was the Epicurus of the Chinese. His disciples, who were denominated Fao-ssc, i. c. heavenly doctors, were the first who corrupted the religion of the Chinese. They were addicted to magic, and introduced the worship of good and bad demons. Their doctrine was embraced by a long succession of emperors. One of these princes, called You-ti, had been deprived by death of a favouritc mistress, whom he loved with the most extravagant passion. The emperor, by the magical skill of one of these doctors, obtained an interview with his deccased mistress, a circumstance which rivetted the whole order in the affection and esteem of the deluded prince. Here our readers will observe the exact counterpart of the fable of Eurydice, so famous in the mythology of the Greeks and Romans. That such a system of religious principles must have abounded with mythological adventures is highly probable; but as the missionaries, to whom we are chiefly indebted for our information relating to the religion of the Chinese, to f the have not taken the pains to record them, we find it ip of impossible to gratify the curiosity of our readers on Fond of that head.

The worship of the idol Fo, or Foe, was transthe bit the planted from India into China about the 56th year of the planted from India into China about the Jean. Onc the into the Christian cra, upon the following occasion. Onc of the doctors of the Fao-sse had promised a prince of Vol. XIV. Part. II.

the family of Tchou, and brother of the emperor Ming-ti, to make him enter into communion with the spirits. At his solicitation an ambassador was despatched into India, in order to inquire where the true religion was to be found. There had been a tradition, say the missionaries, ever since the age of Confucius, that the true religion was to be found in the west .---The ambassador stopt short in India; and finding that the god Foe was in high reputation in that country, he collected several images of that deity painted on chintz, and with it 42 chapters of the canonical books of the Hindoos, which, together with the images, he laid on a white elephant, and transported into his native country. At the same time he imported from the same quarter the doctrine of the transmigration of souls, which is firmly believed in China to this day. The doctrine and worship of Foe, thus introduced, made a most rapid progress all over China, Japan, Siam, &c. The priests of Foe are called among the Siamese Talapoins; by the Tartars, Lamas; by the Chinese, Ha-chang; and by the people of Japan, Bonzes. By this last appellation they are generally known in Europe.

An infinitude of fables was invented and propagated The worby the disciples of Foe, concerning the life and adven-shippers of tures of their master. If the earlier ages of the Chi-Foe great nese history are barren of mythological incidents, the gists. later periods, after the introduction of the worship of Foc, furnish an inexhaustible store of miracles, monsters, fables, intrigue, exploits, and adventures, of the most villanous complexion. Indeed, most of them are so absurd, so ridiculous, and at the same time so impious and profane, that we are convinced our readers will easily dispense with a detail from which they could reap neither entertainment nor instruction. Such as may find themselves disposed to rake into this abominable puddle, we must refer to the reverend fathers Du Halde, Couplet, Amiot, Kircher, and other members of the propaganda, in whose writings they will find wherewithal to satisfy, and even to surfcit, their appetite.

The Hindoos, like the other nations of the east, for Hindoomya long time retained the worship of the true God. At thology. length, however, idolatry broke in, and, like an impetuous torrent, overwhelmed the country. First of all, the genuine history of the origin of the universe was either utterly lost, or disguised under a variety of fictions and allegories. We are told that Brimha, the supreme divinity of the Hindoos, after three several efforts, at last succeeded in creating four persons, whom he appointed to rule over all the inferior creatures .----Afterwards Brimha joined his efficient power with Bishon and Rulder; and by their united exertions they produced ten men, whose general appellation is Munies, that is, the inspired. The same being, according to another mythology, produced four other persons, as imaginary as the former ; one from his breast, one from his back, one from his lip, and one from his heart. These children were denominated Bangs; the import of which word we cannot pretend to determine. According to another tradition, Brimha produced the Bramins from his mouth, to pray, to read, to instruct; the Chiltern from his arms, to draw the bow, to fight, to govern ; the Bice from his belly or thighs, to nourish, to provide the necessaries of life by agriculture and commerce; the Soder from his feet, for 4 Esubjection.

585

subjection, to serve, to labour, to travel. The reader will see at once, in these allegorical persons, the four casts or septs into which the Hindoo nations have, time immemorial, been divided. These are some of their most celebrated mythological traditions with relation to the origin of the universe.

The Hindoos have likewise some mythological opinions which seem to relate to the general deluge. They tell us, that desiring the preservation of herds and of brahmans, of genii and of virtuous men, of vedas of law, and of precious things, the Lord of the universe assumes many bodily shapes ; but though he pervades, like the air, a variety of beings, yet he is himself unvaried, since he has no quality in him subject to change. At the close of the last calpa, there was a general destruction, occasioned by the sleep of Brahme, whence his creatures in different worlds were drowned in a vast ocean. Brahme being inclined to slumber after a lapse of so many ages, the strong demon Hyagri-va, came near him, and stole the vedas which had flowed from his lips. When Heri, the preserver of the universe, discovered this deed of the prince of Dainavas, he took the shape of a minute fish called Sap-hari. After various transformations, and an enormous increase of size in each of them, the Lord of the universe loving the righteous man (A), who had still adhered to him under all these various shapes, and intending to preserve him from the sea of destruction caused by the depravity of the age, thus told him how he was to act: " In seven days from the present time, O thou tamer of enemies! the three worlds will be plunged in an ocean of death ; but in the midst of the destroying waves a large vessel sent by me for thy use shall stand before thee." The remaining part of the mythology so nearly resembles the Mosaic history of Noah and the general deluge, that the former may be a strong confirmation of the truth of the latter. To dry up the waters of the deluge, the power of the Deity descends in the form of a boar, the symbol of strength, to draw up and support on his tusks the whole earth, which had been sunk beneath the ocean. Again, The same power is represented as a tortoise sustaining the globe, which had been convulsed by the violent assaults of demons, while the gods charmed the sea with the mountain Mandar, and forced it to disgorge the sacred things and animals, together with the water of life which it had swallowed. All these stories, we think, relate to the same event, shadowed by a moral, a metaphysical, and an astronomical allegory; and all three seem connected with the hieroglyphical sculptures of the old Egyptians.

The Hindoos divide the duration of the world into four *yugs* or *jugs*, or *jogues*, each consisting of a prodigious number of years. In each of those periods, the age and stature of the human race have been gradually diminished; and in each of them mankind has gradually declined in virtue and piety, as well as in age and stature. The present period they call the *Colla*, i. e. the corrupt jogue, which they say is to last 400,000 years, of which near 5000 years are already past. In the

last part of the preceding jogue, which they call the dwa paar, the age of man was contracted into 1000 years, as in the present it is confined to 100. From this proportional diminution of the length of the human life, our readers will probably infer, that the two last jogues bear a pretty near resemblance to the Mosaic history of the age of the antediluvian and postdiluvian patriarchs; and that the two first are imaginary periods prior to the creation of the world, like those of the Chimese, Chaldeans, and Egyptians.

According to the mythology of the Hindcos, the The world system of the world is subject to various dissolutions subject to and resuscitations. At the conclusion of the Collæ solutions jogue, say they, a grand revolution will take place, and resuse. when the solar system will be consumed by fire, and tations. all the elements reduced to their original constituent atoms. Upon the back of these revolutions, Brimha, the supreme deity of the Hindoos, is sometimes represented as a new born infant, with his toe in his mouth, floating on a camala or water flower, sometimes only on a leaf of that plant, on the surface of the vast abyss. At other times he is figured as coming forth of a winding shell: and again as blowing up the mundane foam with a pipe at his mouth. Some of these emblematical figures and attitudes, our learned readers will probably observe, nearly resemble those of the ancient Egyptians.

But the vulgar religion of the ancient Hindoos was of a very different complexion, and opens a large field of mythological adventures. We have observed above, that the Fo or Foc of the Chinese was imported from India; and now we shall give a brief detail of the mythological origin of that divinity. We have no certain Birth, &c. account of the birth-place of this imaginary deity .- of the god His followers relate, that he was born in one of the Fo. kingdoms of India near the line, and that his father was one of that country. His mother brought him into the world by the left side, and expired soon after her delivery. At the time of her conception, she dreamed that she had swallowed a white elephant; a circumstance which is supposed to have given birth to the veneration which the kings of India have always shown for a white animal of that species. As soon as he was born, he had strength enough to stand erect without assistance. He walked abroad at seven, and, pointing with one hand to the heavens, and with the other to the earth, he cried out, " In the heavens, and on the earth, there is no one but me who deserves to be honoured." At the age of 30, he felt himself all on a sudden filled with the divinity ; and now he was metamorphosed into Fo or Pagod, according to the expression of the Hindoos. He had no sooner declared himself a divinity, than he thought of propagating his doctrine, and proving his divine mission by miracles. The number of his disciples was immense; and they soon spread his dogmas over all India, and even to the higher extremities of Asia.

One of the principal doctrines which Fo and his Doctrines disciples propagated, was the metempsychosis or trans-of Foder nigration of souls. This doctrine, some imagine, has ed from given

(A) He was Sovereign of the world. His name was Mana, or Statgavrata, his patronymic name was Vaisvata, or Child of the Sun.

traditions

relating to

the deluge

given rise to the multitude of idols reverenced in every country where the worship of Fo is established. Quadrupeds, birds, reptiles, and the vilest animals, had temples creeted for them; because, say they, the soul of the god, in his numerous transmigrations, may have at one time or other inhabited their bodies.

Both the doctrine of transmigration and of the worship of animals seems, however, to have been imported from Egypt into India. If the intercourse between these two countries was begun at so early a period as some very late writers have endeavoured to prove, such a supposition is by no means improbable. The doctrine of the transmigration of souls was carly established among the Egyptians. It was, indeed, the only idea they formed of the soul's immortality. The worship of animals among them seems to have been still more ancient. If such an interconrse did actually exist, we may naturally suppose that colonies of Egyptian priests found their way into India, as they did afterwards into Asia Minor, Italy, and Greece. That colonies of Egyptians did actually penetrate finto that country, and settle there, many centuries before the Nativity, is a fact that cannot be called in question, for reasons which the bounds prescribed us in this article will not allow us to enumerate. We shall only observe, that from the hieroglyphical representations of the Egyptian deitics seem to have originated those monstrous idols which from time immemorial have been worshipped in India, China, Japan, Siam, and even in the remotest parts of Asiatie Tartary.

Foe is often called Budha or Budda, and sometimes Vishnou ; perhaps, indeed, he may be distinguished by many other names, according to the variety of dialects of the different nations among which his worship was established. An infinitude of fables was propagated by his disciples concerning him after his death. They pretended that their master was still alive ; that he had been already born 8000 times, and that he had successively appeared under the figure of an ape, a lion, a dragon, an elephant, a boar, &c. These were called the incarnations of Vishnou. At length he was confounded with the supreme God; and all the titles, attributes, operations, perfections, and ensigns of the Most High were ascribed to him. Sometimes he is called Amida, and represented with the head of a dog, and worshipped as the guardian of mankind. He sometimes appears as a princely personage, issuing from the mouth of a fish. At other times, he wears a lunette on his head, in which arc seen cities, mountains, towers, trees, in short, all that the world contains. These transformations are evidently the children of allegorical or hieroglyphical emblems, and form an exact counterpart to the symbolical worship of the Egyptians

20 he incar-

tions of

shnou.

The enormous mass of mythological traditions which have in a manner deluged the vast continent of India, would fill many volumes: We have selected the preceding articles as a specimen only, by which our readers may be qualified to judge of the rest. If they find themselves disposed to indulge their curiosity at greater length, we must remit them to Thevenot's and Hamilton's Travels, to Mons. Anquetil in his Zond Avesta, Halhed's Introduction to his Translation of the Code of Gentoo Laws, Col. Dow's History of Hindostan.

# Grose's Voyage to the East Indies, Asiatic Researches, vol. i. and ii.

The mythology of the Persians is, if possible, still Persian more extravagant than that of the Hindoos. It sup-mythology, poses the world to have been repeatedly destroyed, and repeopled by creatures of different formation, who were successively annihilated or banished for their disobedience to the supreme Being. The monstrous griffin Sinergh tells the hero Caherman that she had already lived to see the earth seven times filled with ereatures, and seven times a perfect void : that beforc the creation of Adam, this globe was inhabited by a race of beings called *Peri* and *Dives*, whose cha-Peri and ractors formed a perfect contrast. The Peri are dc-Dives. seribed as beautiful and benevolent; the Dives as deformed, malevelent, and mischievous, differing from infernal demons only in this, that they are not as yet confined to the pit of hell. They are for ever ranging over the world, to scatter discord and misery among the sons of men. The Peri nearly resemble the fairies of Europe: and perhaps the Dives gave birth to the giants and magicians of the middle ages. The Peri and Dives wage incessant wars; and when the Dives make any of the Peri prisoners, they shut them up in iron cages, and hang them on the highest trees, to expose them to public view, and to the fury of every chilling blast.

When the Peri are in danger of being overpowered by their foes, they solicit the assistance of some mortal hero; which produces a series of mythological adventures highly ornamental to the strains of the Persian bards, and which, at the same time, furnishes an inexhaustible fund of the most diversified machinery.

One of the most celebrated adventurers in the mythology of Persia is *Tahmuras*, one of their most ancient monarchs. This prince performs a variety of exploits, while he endeavours to recover the fairy Merjan. He attacks the Dive Demrush in his own cave; where having vanquished the giant or demon, he finds vast piles of hoarded wealth; these he carries off with the fair captive. The battles, labours, and adventures of Rostan, another Persian worthy, who lived many ages after the former, are celebrated by the Persian bards with the same extravagance of hyperbole with which the labours of Hereules have been sung by the poets of Greece and Rome.

The adventures of the Persian heroes breathe all Persia the the wildness of achievement recorded of the knights of chivalry of Gothic romance. The doctrine of euchantments, and rotransformations, &c. exhibited in both, is a characte-mance. In ristic symptom of one common original. Persia is the genuine classic ground of eastern mythology, and the source of the ideas of chivalry and romance; from which they were propagated to the regions of Seandinavia, and indeed to the remotest corners of Europe towards the west.

Perhaps our readers may be of our opinion, when we offer it as a conjecture, that the tales of the war of the Peri and Dives originated from a vague tradition concerning good and bad angels : nor is it, in our opinion, improbable, that the fable of the wars between the gods and giants, so famous in the mythology of Greece and Italy, was imported into the former of these countries from the same quarter. For a more particular account of the Persian mythology, cur readers may consult Dr 4 E 2 Hyde Hyde Relig. vet. Pers. Medor. &c. D'Herbelot's Bibl. Orient. and Mr Richardson's introduction to his Persian and Arabic Dictionary.

The mythology of the Chaldcans, like that of the mythology. other nations of the east, commences at a period myriads of years prior to the era of the Mosaic creation. Their cosmogony, exhibited by Berosus, who was a priest of Belus, and dceply versed in the antiquities of his country, is a piece of mythology of the most extravagant nature. It has been copied by Eusebius (Chron. lib. i. p. 5.); it is likewise to be found in Syncellus, copied from Alexander Polyhistor. According to this historian, there were at Babylon written records prescrved with the greatest care, comprehending a period of fifteen myriads of years. Those writings likewise contained a history of the heavens and the sea, of the earth, and of the origin of mankind. " In the beginning (says Berosus, copying from Oannes, of whom we shall give a brief account below) there was nothing but darkness and an abyss of water, wherein resided most lideous beings produced from a twofold principle. Men appeared with two wings; some with two and some with four faces. They had one body, but two heads ; the one of a man, the other of a woman. Other human figures were to be seen, furnished with the legs and horns of goats. Some had the feet of horses behind, but before were fashioned like men, resembling hippocentaurs." The remaining part of this mythology is much of the same complexion; indeed so extravagant, that we imagine our readers will readily enough dispense with our translating the sequel. " Of all these (says the author) were preserved delineations in the temple of Belus at Babylon. The person who was supposed to preside over them was called Omorca. This word, in the Chaldean language, is Thalath, which the Greeks call Oadaooa, but it more properly imports the moon. Matters being in this situation, their god (says Eusebius), the god (says Syncellus) came and cut the woman asunder; and out of one half of her he formed the earth, and out of the other he made the heavens; and, at the same time, he destroyed the monsters of the abyss." This whole mythology is an allegorical history copied from hieroglyphical representations, the real purport of which could not be decyphered by the author. Such, in general, were the consequences of the hieroglyphical style of writing.

Oannes the the Chal-. deans.

25

Oannes, the great civilizer and legislator of the Challegislator of deans, according to Apollodorus, who copied from Berosus, was an amphibious animal of a heterogeneous appearance. He was endowed with reason and a very uncommon acuteness of parts. His whole body resembled a fish. Under the head of a fish he had also another head, and feet below similar to those of a man, which were subjoined to the tail of the fish. His voice and language were articulate and perfectly intelligible. and there was a figure of him still extant in the days of Berosus. He made his appearance in the Erythrean or Red sea, where it borders upon Babylonia. This monstrous being conversed with men by day; but at night he plunged into the sea, and remained concealed in the water till next morning. He taught the Baby-

lonians the use of letters, and the knowledge of all the arts and sciences. He instructed them in the method of building houses, constructing temples, and all other edifices. He taught them to compile laws and religious ceremonics, and explained to them the principles of mathematics, geometry, and astronomy. In a word he communicated to them every thing necessary, useful, and ornamental : and so universal were his instructions, that not one single article had ever been added to them since the time they were first communicated. Helladius is of opinion that this strange personage, whoever he was, came to be represented under the figure of a fish, not because he was actually believed to be such, but because he was clothed with the skin of a seal. By this account our readers will see that the Babylonian Oannes is the exact counterpart of the Fohi of the Chinesc, and the Thyoth or the Mercury Trismegistus of the Egyptians. It is likewise apparent that the idea of the monster compounded of the man and the fish has originated from some hieroglyphic of that form grafted upon the appearance of man. Some modern mythologists have been of opinion, that Oannes was actually Noah the great preacher of righteousness; who, as some think, settled in Shinar or Chaldea after the deluge, and who, in consequence of his connexion with that event, might be properly represented under the emblem of the Man of the Sea.

The nativity of Venus, the goddess of beauty and The natilove, is another piece of mythology famous among the vity of the Babylonians and Assyrians. An egg, say they, of a beauty and prodigious size, dropt from heaven into the river Eu-love. phrates. Some doves settled upon this cgg, after that the fishes had rolled it to the bank. In a short time this egg produced Venus, who was afterwards called Dea Syria, the Syrian goddess. In consequence o this tradition (says Hyginus), pigeons and fishes became sacred to this goddess among the Syrians, who always abstained from eating the one or the other. Of this imaginary being we have a very exact and entertaining history in the treatise De Dea Syria, generally ascribed to Lucian.

In this mythological tradition our readers will probably discover an allusion to the celebrated Mundane egg; and at the same time the story of the fishes will lead them to anticipate the connexion between the sea and the moon. This same deity was the Atargatis of Ascalon, described by Diodorus the Sicilian ; the one half of her body a woman and the other a fish. This was no doubt a hieroglyphic figure of the moon, importing the influence of that planct upon the sea and the sex. The oriental name of this deity evidently points to the moon ; for it is compounded of two Hebrew words (B), which import " the queen of the host of heaven."

The fable of Semiramis is nearly connected with The sable the preceding one. Diodorus Siculus has preserved of Semira the mythological history of this deity, which he and mis. all the writers of antiquity have confounded with the Babylonian princess of the same name. That historian informs us, that the word Semiramis, in the Syrian dialect, signifies "a wild pigeon;" but we apprehend that this term was a name or epithet of the moon,

Chaldean

(B) Adar or Hadar, " magnificus ;" and Gad, " exercitus turmi."

moon, as it is compounded of two words (c) of an import naturally applicable to the lunar planet. It was a general practice among the Orientals to denominote their sacred animals from that deity to which they were consecrated. Hence the moon being called Semiramis, and the pigeon being sacred to her divinity, the latter was called by the name of the former.

As the bounds prescribed this article render it impossible for us to do justice to this interesting piece of mythology, we must beg leave to refer our readers for farther information to Diod. Sic. lib. ii. Hyginus Poet. Astron. Fab. 197. Pharnutus de Nat. Deor. Ovid. Metam. lib. iv. Athen. in Apol. Izetzes, Chil. ix. cap. 275. Seld. de Diis Syr. Syrit. ii. p. 183.

We should now proceed to the mythology of the Arabians, the far greatest part of which is, however, buried in the abyss of ages; though, when we reflect on thology. the genius and character of that people, we must be convinced that they too, as well as the other nations of the east abounded in fabulous relations and romantic compositions. The natives of that country have always been enthusiastically addicted to poetry, of which fable is the essence. Wherever the Muses have erected their throne, fables and miracles have always appeared in their train. In the Koran we meet with frequent allusions to wellknown traditionary fables. These had been transmitted from generation to generation by the bards and rhapsodists for the entertainment of the vulgar. In Arabia, from the earliest ages, it has always been one of the favourite entertainments of the common people, to assemble in the serene evenings around their tents, or on the platforms with which their houses are generally covered, or in large halls erected for the purpose, in order to amuse themselves with traditional narrations of the most distinguished actions of their most remote ancestors. Oriental imagery always embellished their romantic details. The glow of fancy, the love of the marvellous, the propensity towards the hyperbolical and the vast, which constitute the essence of oriental description, must ever have drawn the relation aside into the devious regions of fiction and fairy land. The religion of Mahomet beat down the original fabric of idolatry and mythology together. The Arabian fables current in modern times are borrowed or imitated from Persian compositions; Persia being still the grand nursery of romance in the east.

In Egypt we find idolatry, theology, and mythology, almost inseparably blended together. The inhabitants of this region, to, as well as of others in the vicinity of the centre of population, adhered for several centuries to the worship of the true God. At last, however, conscious of their own ignorance, impurity, imperfection, and total unfitness to approach an infinitely perfect Being, distant, as they imagined, and invisible, they began to cast about for some beings more exalted, and more perfect than themselves, by whose mediation they might prefer their prayers to the supreme Majesty of heaven. The luminaries of heaven, which they imagined were animated bodies, naturally presented themselves. These were splendid and glorious beings. They were thought to partake

of the divine nature : they were revered as the satraps, prefects, and representatives of the supreme Lord of the universe. They were visible, they were beneficent; they dwelt nearer to the gods, they were near at hand and always accessible. These were, of course, employed as mediators and intercessors between the supreme Divinity and his humble subjects of this lower world. Thus employed, they might claim a subordinate share of worship, which was accordingly assigned them. In process of time, however, that worship, which was originally addressed to the supreme Creator by the mediation of the heavenly bodies, was in a great measure forgotten, and the adoration of mankind ultimately terminated on those illustrious creatures. To this circumstance, we think, we may ascribe the origin of that species of idolatry called Zabiism, Origin of or the worship of the host of heaven, which overspread Zabiism. the world early and almost universally. In Egypt this mode of worship was adopted in all its most absurd and most enthusiastic forms : and at the same time the most heterogeneous mythology appeared in its train. The mythology of the ancient Egyptianswas so various and multiform, so complicated and so mysterious, that it would require many volumes even to give a superficial account of its origin and progress, not only in its mother country, but even in many other parts of the eastern and western world. Besides, the idolatry and niythology of that wonderful country are so closely connected and so inseparably blended together, that it is impossible to describe the latter without at the same time developing the former. We hope, therefore, our readers will not be disappointed, if, in a work of this nature, we touch only upon some of the leading or most interesting articles of this complicated subject.

The Egyptians confounded the revolutions of the Reign of heavenly bodies with the reigns of their most early gods and monarchs. Hence the incredible number of years in-demigods, cluded in the reign of their eight superior gods, who, &c. in E--according to them; filled the Egyptian throne successively in the most early periods of time. To these, according to their system, succeeded twelve demigods, who likewise reigned an amazing number of years. These imaginary reigns were no other than the periodical revolutions of the heavenly bodies preserved in their almanacks, which might be carried back; and actually were carried back, at pleasure. Hence the fabulous antiquity of that kingdom. The imaginary exploits and adventures of these gods and demigods furnished an inexhaustible fund of mythological romances. To the demigods succeeded the kings of the cynic cycle, personages equally chimerical with the former. The import of this epithet has greatly perplexed critics and etymologists. We apprehend it is an oriental word importing royal dignity; elevation , of rank. This appellation intimated, that the monarchs of that cycle, admitting that they actually existed, were more powerful and more highly revered i than their successors. After the princes of the cynic cycle comes another race, denominated Nekyes, a title likewise, implying royal, splendid, glorious. These cycles

cycles figure high in the mythological annals of the Egyptians, and have furnished materials for a variety of learned and ingenious disquisitions. The wars and ploits, and adventures of Osiris, Oris, Typhon, and other alle-transforma-gorical personages who figure in the Egyptian rubric; the wandcrings of Isis, the sister and wife of Osiris; the transformation of the gods into divers kinds of animals; their birth, education, peregrinations, and exploits ;-- compose a body of mythological fictions so various, so complicated, so ridiculous, and often so apparently absurd, that all attempts to develope and explain them have hitherto proved unsuccessful. All, or the greatest part, of those extravagant fables, are the offspring of hieroglyphical or allegorical emblems devised by the priests and sages of that nation, with a view to conceal the mysteries of their religion from that class of men whom they stigmatized with the name of

33 U Worship of brute animals, &c.

the uninitiated rabble. The worship of brute animals and of certain vegetables, universal among the Egyptians, was another exuberant source of mythological adventures. The Egyptian priests, many of whom were likewise profound philosophers, observed, or pretended to observe, a kind of analogy hetween the qualities of certain animals and vegetables, and those of some of their subordinate divinitics Such animals and vegetables they adopted, and consecrated to the deities to whom they were supposed to bear this analogical resemblance; and in process of time they considered them as the visible emblems of those divinities to which they were consecrated. By these the vulgar addressed their archetypes: in the same manner, as in other countries, pictures and statues were employed for the very same purpose. The moh, in process of time, forgetting the emblematical character of those brutes and vegetables, addressed their devotion immediately to them; and of course these became the ultimate objects of vulgar adoration.

After that these objects, animate or inanimate, were consecrated as the visible symbols of the deities, it soon became fashionable to make use of their figures to represent those deities to which they were consecrated. This practice was the natural consequence of the hieroglyphical style which universally prevailed among the ancient Egyptians. Hence Jupiter Ammon was represented under the figure of a ram, Apis, under that of a cow, Osiris of a bull, Pan of a goat, Thoth or Mercury of an ibis, Bubastis or Diana of a cat, &c. It was likewise a common practice among those deluded neople to dignify these objects, by giving them the names of those deities which they represented. By this mode of dignifying these sacred emblems, the veneration of the rabble was considerably enhanced, and the ardour of their devotion inflamed in proportion. From these two sources, we think, are derived the fabulous transformation of the gods, so generally celebrated in the Egyptian mythology, and from it imported into Greece and Italy. In consequence of this practice, their mythological system was rendered at once enormous and unintelligible.

34 Mercury Egyptian

Their Thoth, or Mercury Trismegistus, was, in our Trismegis- opinion, the inventor of this unhappy system. This tus the au- personage, according to the Egyptians, was the original author of letters, geometry, astronomy, music, armythology. chitecture; in a word, of all the elegant and useful arts, and of all the branches of science and philosophy.

He it was who first discovered the analogy between the divine affections, influences, appearances, operations, and the corresponding properties, qualities, and instincts of certain animals, and the propriety of dedicating particular kinds of vegetables to the service of particular deities.

The priests, whose province it was to expound the mysteries of that allegorical hieroglyphical religion, (see MYSTERIES), gradually lost all knowledge of the primary import of the symbolical characters. To supply this defect, and at the same time to voil their own ignorance, the sacerdotal instructors had recourse to fable and fiction. They heaped fable upon fable, till their religion became an accumulated chaos of mythological absundities.

Two of the most learned and most acute of the ancient philosophers have attempted a rational explication of the lacent import of the Egyptian mythology; but both have failed in the attempt; nor have the moderns, who have laboured in the same department, performed their part with much better success. Instead, therefore, of prosecuting this inexplicable subject, which would swell this article beyond all proportion, we must beg leave to refer those who are desirous of further information to the following authors, where they will find enough to gratify their curiosity, if not to inform their judgment : Herodotus, lib. ii. Diodorus Siculus, lib. i. Plut. Isis et Osiris ; Jamblichus de Myst. Egypt. Horapollo Hieroglyph. Egypt. Macrob. Sat. cap. 23. among the ancients; and among the moderns, Kircher's Oedip. Voss. de Orig. et Prog. Idol. Mr Bryant's Analysis of Auc. Mythol. Mons. Gebelin Monde Prim. ; and above all, to the learned Jablonski's Panth. Egyptiorum.

The elements of Phœnician mythology have been Phœnici preserved by Eusebius, Præp. Evang. sub. init. In mytholog the large extract which that learned father had copied from Philo Biblius's translation of Sanchoniathon's History of Phœnicia, we are furnished with several'articles of mythology. Some of these throw considerable light on several passages of the sacred history; and all of them are strictly connected with the mythology of the Greeks and Romans. There we have preserved a brief but entertaining detail of the fabulous adventures of Uranus, Cronus, Dagon, Thyoth or Mercury, probably the same with the Egyptian hero of that name. Herc we find Muth or Pluto, Æphcestus or Vulcan, Æsculapius, Nereus, Poseedon or Neptune, &c. Astarte, or Venus Urania, makes a conspicuous figure in the catalogue of Phœnician worthies; Pallas or Minerva is planted on the territory of Attica ; in a word, all the branches of the family of the 'Titans, who in after ages figured in the rubric of the Greeks, are brought upon the stage, and their exploits and adventures briefly detailed.

By comparing this fragment with the mythology of Greeian the Atlantidæ and that of the Cretans preserved by mytholog The Atlantidize and that of the Cretans preserved by derived Diodorus the Sicilian, lib. v. we think there is good from Eg reason to conclude, that the family of the Titans, the and Phot several branches of which seem to have been both the nicia: authors and objects of a great part of the Grecian idolatry, originally emigrated from Phœnicia. This conjecture will receive additional strength, when it is considered, that almost all their names recorded in the fabulous records of Greece, may be easily traced up to a Phœnician

32 Birth, ex-

tion of the

gods.

Phœnician original. We agree with Herodotus, that a considerable part of the idolatry of Greece may have been borrowed from the Egyptians; at the same time, we imagine it highly probable, that the idolatry of the Egyptians and Phœnieians was, in its original constitution, nearly the same. Both systems were Sabiism, or the worship of the host of heaven. The Pelasgi, according to Herodotus, learned the names of the gods from the Egyptians; but in this conjecture he is ccrtainly warped by his partiality for that people. Had those names been imported from Egypt, they would no doubt have bewrayed their Egyptian original; whereas, every etymologist will be convinced that every one is of Phœnieian extraction.

The adventures of Jupiter, Juno, Mereury, Apollo, Diana, Mars, Minerva or Pallas, Venus, Bacehus, Ceres, Proserpine, Pluto, Neptune, and the other deseendants and coadjutors of the amhitious family of the Titans, furnish by far the greatest part of the mythology of Greece. They left Phoenicia, we think, about the age of Moses; they settled in Crete, a large and fertile island; from this region they made their way into Greece, which, according to the most authentic accounts, was at that time inhabited by a race of savages. The arts and inventions which they communicated to the natives; the mysteries of religion which they ineulcated; the laws, customs, polity, and good order, which they established ; in short, the blessings of humanity and civilization, which they everywhere disseminated, in process of time inspired the unpolished inhabitants with a kind of divine admiration. Those ambitious mortals improved this admiration into divine homage and adoration. The greater part of that worship, which had been formerly addressed to the luminaries of heaven, was now transferred to those illustrious personages. They claimed and obtained divine honours from the deluded rabble of enthusiastic Greeks. Hence sprung an inexhaustible fund of the most ineonsistent and irreconcilable fictions.

He the The foibles and frailties of the deified mortals were transmitted to posterity, incorporated as it were with the pompous attributes of supreme divinity. Hence til of the the heterogeneous mixture of the mighty and the mean which chequers the characters of the heroes of the Iliad and Odyssey. The Greeks adopted the oriental fables, the import of which they did not understand. These they accommodated to heroes and illustrions personages, who had figured in their own country in the earliest periods. The labours of Hercules originated in Egypt, and evidently relate to the annual progress of the sun in the zodiac, though the vain-glorious Grecks accommodated them to a hero of their own, the reputed son of Jupiter and Alemena. The expedition of Osiris they borrowed from the Egyptians, and transferred to their Bacchus, the son of Jupiter and Semele the daughter of Cadmus. The transformation and wanderings of Io are evidently transcribed from the Egyptian romance of the travels of Isis in quest of the body of Osiris, or of the Phœnician Astarte, drawn from Sanchoniathon. Io or Ioh is in reality the Egyptian name of the moon, and Astarte was the name of the same planet among the Phœnieians. Both these fables are allegorical representations of the anomalies of the lunar planet, or perhaps of the progress of the worship of that planet in different parts

in usis-

**Pdi** 

of the world. The fable of the conflagration oceasioned by Phaeton is clearly of oriental extraction, and alludes to an excessive drought which in the early periods of time seorched Ethiopia and the adjacent countries. The fabulous adventures of Perseus are said to have happened in the same regions, and are allegorieal representations of the influence of the solar luminary; for the original Perseus was the sun. The rape of Proserpine and the wanderings of Ceres; the Elensinian mysteries; the orgia or sacred rites of Bacehus; the rites and worship of the Cabiri-were imported from Egypt and Phœnieia; but strangely garbled and disfigured by the hierophants of Greece. The gigantomachia, or war between the gods and the giants, and all the fabulous events and varieties of that war, form an exact counterpart to the battles of the Peri and Dives, eelebrated in the romantie annals of Persia.

A considerable part of the mythology of the Greeks The Greeks sprung from their ignorance of the oriental languages, ignorant of They disdained to apply themselves to the study of oriental languages spoken by people whom, in the pride of languages. their heart, they stigmatized with the epithet of barbarians. This aversion to every foreign dialect was highly detrimental to their progress in the sciences. The same neglect or aversion has, we imagine, proved an irreparable injury to the republic of letters in all succeeding ages. The aoids, or strolling bards, laid hold on those oriental legends, which they sophistieated with their own additions and improvements, in order to accommodate them to the popular taste. These wonderful tales figured in their rhapsodieal compositions, and were greedily swallowed down by the credulous vulgar. Those fictions, as they rolled down, were constantly augmented with fresh materials, till in process of time their original import was either forgotten or buried in impenetrable darkness. A multitude of these Hesiod has collected in his Theogonia, or Generation of the Gods, which unhappily became the religious ereed of the illiterate part of the Greeks. Indeed fable was so elosely interwoven with the religion of that airy volatile people, that it seems to have contaminated not only their religious and moral, but even their political tenets.

The far-famed oracle of Dodona was copied from Oracle of that of Ammon at Thebes in Egypt: The oracle of Dodona. Apollo at Delphos was an emanation from the same source : The eelebrated Apollo Pythius of the Greeks was no other than Ob or Aub of the Egyptians, who denominated the basilisk or royal snake Ov Cai, bccause it was held sacred to the sun. Ob or Aub is still retained in the Coptie dialect, and is one of the many names or epithets of that luminary. In short, the ground-work of the Grecian mythology is to be traced in the east. Only small part of it was fabricated in the country; and what was imported pure and genuine was miserably sophisticated by the hands through which it passed, in order to give it a Greeian air, and to accommodate its style to the Grecian taste. To enlarge upon this topic would be altogether superfinous, as our learned readers must be well aequainted with 40 it already, and the unlearned may without much trouble Roman or expense furnish themselves with books upon that mythology borrowed subject.

The Roman mythology was borrowed from the Greece.

Greeks. That people had addicted themselves for many centuries to the arts of war and civil polity. Science and philosophy were either neglected or unknown. At last they conquered Greece, the native land of science, and then "Græcia capta ferum victorem cepit arte et intulit agresti Latio." This being the case, their mythology was, upon the whole, a transcript from that of Greece. They had indeed gleaned a few fables from the Pelasgi and Hetruscans, which, however, are of so little consequence, that they are scarce worth the trouble of transcribing.

The mythology of the Celtic nations is in a good measure lost. There may possibly still remain some vestiges of the Druidical superstition in the remotest parts of the highlands and islands of Scotland; and perhaps in the uncivilized places of Ireland. These, we presume, would afford our readers but little entertainment, and still less instruction. Instead therefore of giving a detail of those uninteresting articles, we shall beg leave to refer our readers to Ossian's Poems, and Col. Valency's Collections of Irish Antiquities, for satisfaction on that subject.

The mythology of the northern nations, i. e. of the

Norwegians, Danes, Swedes, Icelanders, &c. is un-

commonly curious and entertaining. The Edda and

Voluspa contain a complete collection of fables which

have not the smallest affinity with those of the Greeks

and Romans. They are wholly of an oriental com-

plexion, and seem almost congenial with the tales of

the Persians above described. The Edda was com-

piled in Iceland in the 13th century. It is a kind of

system of the Scandinavian mythology : and has been

reckoned, and we believe justly, a commentary on the

Voluspa, which was the Bible of the northern nations.

Odin or Othin, or Woden or Waden, was the supreme

divinity of those people. His exploits and adventures

furnish the far greater part of their mythological creed.

That hero is supposed to have emigrated from the east ;

but from what country or at what period is not cer-

tainly known. His achievements are magnified be-

yond all credibility. He is represented as the god of

battles, and as slaughtering thousands at a blow. His palace is called Valhal: it is situated in the city of

Midgard, where, according to the fable, the souls of

heroes who had bravely fallen in battle enjoy supreme

matches, or imaginary combats. At night they assemble in the palace of Valhalla, where they feast on

the most delicious viands, dressed and served up by the

Valkyriæ, virgins adorned with celestial charms, and flushed with the bloom of everlasting youth. They

solace themselves with drinking mead out of the skulls

of enemies whom they killed in their days of nature.

Mead, it seems, was the nectar of the Scandinavian

Sleepner, the horse of Odin, is celebrated along

with his master. Hela, the hell of the Scandinavi-

ans, affords a variety of fables equally shocking and

heterogeneous. Loke, the evil genius or devil of the

northern people, nearly resembles the Typhon of the

Egyptians. Signa or Sinna is the consort of Loke;

from this name the English word sin is derived. The

giants Weymur, Ferbanter, Belupher, and Hellunda,

perform a variety of exploits, and are exhibited in the

most frightful attitudes. One would be tempted to

felicity.

heroes.

imagine, that they perform the exact counterpart of the giants of the Greek and Roman mythologists. Instead of glancing at these ridiculons and miniteresting fables, which is all that the limits prescribed us would permit, we shall take the liberty to lay before our readers a brief account of the contents of the Voluspa, which is indeed the text of the Scandinavian mythology.

logy. The word Voluspa imports, "the prophecy of Vola The <sup>44</sup> or Fola." This was, perhaps, a general name for the pa. prophetic ladies of the north, as Sibyl was appropriated to women endowed with the like faculty in the south. Certain it is, that the ancients generally connected madness with the prophetic faculty. Of this we have two celebrated examples : the one in Lycophron's Alexandra, and the other in the Sibyl of the Reman poet. The word vola signifies " mad or foolish;" whence the English words fool, foolish, folly. Spa, the latter part of the composition, signifies " to prophecy," and is still current among the common people in Scotland, in the word Spac, which has nearly the same signification.

The Voluspa consists of between 200 and 300 lines. The prophetess having imposed silence on all intelligent beings, declares that she is about to reveal the works of the Father of nature, the actions and operations of the gods, which no mortal ever knew before herself. She then begins with a description of the chaos; and then proceeds to the formation of the world, the creation of the different species of its inhabitants, giants, men, and dwarfs. She then explains the employments of the fairies or destinies, whom the northern people call nornies; the functions of the deities, their most memorable adventures, their disputes with Loke, and the vengeance that ensued. She at last concludes with a long and indeed animated description of the final state of the universe, and its dissolution by a general conflagration.

In this catastrophe, Ödin and all the rabble of the Pagan divinities, are to be confounded in the general ruin, no more to appear on the stage of the universe. Out of the ruins of the former world, according to the Voluspa, a new one shall spring up, arrayed in all the bloom of celestial beauty.

Such is the doctrine exhibited in the fabulous Voluspa. So congenial are some of the details therein delivered, especially those relating to the final dissolution of the present system, and the succession of a new heaven and a new earth, that we find ourselves strongly inclined to suspect, that the original fabricator of the work was a semipagan writer, much of the same complexion with the authors of the Sibylline oracles, and of some other apocryphal pieces which appeared in the world during the first ages of Christianity.

In America, the only mythological countries must Mythological countries must Mythological countries must Mythological countries must Mythological continent were originally inhabited by savages, most and Per of them as remote from religion as from civilization. The two vast empires of Mexico and Peru had existed about 400 years only before the Spanish invasion. In neither of them was the use of letters understood; and of course the ancient opinions of the natives relating to the origin of the universe, the changes which succeeded, and every other monument of antiquity, were obliterated and lost. Clavigero has indeed enumerated a vast canaille of sanguinary gods worshipped by the Mexicans;

.5

Mexicans; but produces nothing either entertaining or interesting with respect to their mythology. The information to be derived from any other quarter is little to be depended upon. It passes through the hands of bigotted missionaries or other ecclesiasties, who were so deeply tinctured with fanaticism, that they viewed every action, every sentiment, every custom, every religious opinion and ceremony of those half-eivilized people, through a false medium. They often imagined they discovered resemblances and analogies betwen the rites of those savages and the dogmas of Christianity, which nowhere existed but in their own heated imagination.

The only remarkable piece of mythology in the annals of the Peruvians, is the pretended extraction of Manco Capec the first Inca of Peru, and of Mama Ocolla his consort. These two illustrious personages appeared first on the banks of the lake Titiaca. They were persons of a majestic stature, and elothed in decent garments. They declared themselves to be the children of the Sun, sent by their beneficent parent, who beheld with pity the miseries of the human race,

## MYU

MYTILUS, the MUSSEL, a genus of animals, belonging to the order of vermes testacea. See CONCHO-LOGY Index.

Ayus.

MYTTOTON, a coarse kind of food, used by the labouring people among the Greeks, and sometimes among the Romans. It was made of garlic, onions, eggs, cheese, oil, and vinegar, and reckoned very wholesome.

MYUS, in Ancient Geography, one of the twelve towns of Ionia; seated on the Meander, at the distance of 30 stadia from the sea. In Strabo's time it was in-

in the second of Kings, xx, +2, lather

to instruct and to reclaim them. Thus we find these two legislators availed themselves of a pretence which had often been employed in more civilized regions to the very same purposes. The idolatry of Peru was gentle and beneficent, that of Mexico gloomy and sanguinary. Hence we may see, that every mode of superstition, where a divine revelation is not concerned, borrows its complexion from the characters of its professors.

1

In the course of this article, our readers will observe, that we have not much enlarged upon the mythology of the Greeks and Romans; that subject we. imagine to be so universally known by the learned, and so little valued by the vulgar, that a minute discussion of it would be altogether superfluous. Besides, we hope it will be remembered, that the narrowness of the limits prescribed us would scaree admit of a more copious detail. We would flatter ourselves, that in the course of our disquisition, we have thrown out a few reflections and observations, which may perhaps prove more acceptable to both descriptions of readers.

## MYX

corporated with the Milesians, on account of the paueity of inhabitants, from its being formerly overwhelmed with water: for which reason the Ionians consigned its suffrage and religious eeremonies to the people of Miletus. Artaxerxes allotted this town to Themistoeles, in order to furnish his table with meat: Magnesia was to support him in bread, and Lampsacus in winc. The town now lies in ruins.

MYXINE, the HAG; a genus of animals belonging to the order of vermes intestina. See HELMIN-THOLOGY *Index*.

# N.

N, A liquid consonant, and the 13th letter of the Greek, Latin, English, &c. alphabets.

The *n* is a nasal consonant: its sound is that of a d, passed through the nose; so that when the nose is stopped by a cold, or the like, it is usual to pronounce dfor *n*. M. Abbe de Dangeau observes, that in the French, the *n* is frequently a mere nasal vowel, without any thing of the consonant in it. He calls it the Selavonie vowel. The Hebrews call their *n nun*, which signifies child, as being supposed the offspring of *m*; partly on account of the resemblance of sound, and partly on that of the figure. Thus from the *m*, by omitting the last column, is formed *n*; and thus from the capital N, by omitting the first column, is

Vol. XIV. Part II.

formed the Greek minuscle v. Hence from biennies, &c. the Latins frequently use bimus, &c. and the same people convert the Greek v, at the end of a word, into an m, as  $\varphi \alpha e \mu \alpha x \circ v$ , pharmacum, &e. See M.

N before p, b, and m, the Latins change into m, and frequently into l and r; as in *in-ludo*, *illudo*; *inrigo*, *irrigo*, &c.: in which they agree with the Hebrews, who, in lieu of *nun*, frequently double the following consonants: and the Greeks do the same; as when for *Manlius*, they write Mallow, &c. The Greeks also, before x,  $\gamma$ ,  $\chi$ , r, changed the r into  $\gamma$ : in which they were followed by the ancient Romans: who, for *Angulus*, wrote *Aggulus*; for *anceps*, *agceps*, &c.

The Latins retrench the *n* from Greek nouns cud-4 F ing Myus

Nabis.

F

ing in wy; as Aewy, Leo; Deanwy, Draco; on the contrary, the Greeks add it to the Latin ones ending in 0; as Katar, Negar, Cato, Nero.

B

N, among the ancients, was a numeral letter, signifying 900; according to the verse in Baronius,

## N, quoque nongentos numero designat habendos.

And when a line was struck over it, N, nine thousand. Among the ancient lawyers, N. L. stood for non liquet, i. e. the cause is not clear enough to pass sentence upon. N, or Nº, in commerce, &c. is used as an abbreviation of numero, number.

NAARDA, NEARDA, Neerda, or Nehardea, in Ancient Geography, a town situated on the confines of Mcsopotamia and Babylonia; populous, and with a rich and extensive territory, not easily to be attacked by an enemy, being surrounded on all sides by the Euphrates and strong walls (Josephus). In the lower age the Jews had a celebrated school there.

NAAS, a borough town of Ircland, in the county of Kildare and province of Leinster. It is the shire town of that county, and alternately with Athy the assizes town. It is distant above 15 miles south-west from Dublin, in N. Lat. 53. 10. W. Long. 6. 50. It gives title of viscount to the family of Burke. This place was anciently the residence of the kings of Leinster : the name signifies " the place of elders," for here the states of that province assembled during the 6th, 7th, and 8th centuries, after the Naasteighan of Carmen had been anathematized by the Christian clergy. On the arrival of the English it was fortified ; many eastles were erected, the ruins of which are partly visible; and parliaments were held there. At the foot of the mount or rath are the ruins of a house founded in 1484, for cremites of the order of St Augustin. In the 12th century the baron of Naas founded a priory dedicated to St John the Baptist, for Augustinian regular eanons. In the centre of this town the family of Eustace erected a monastery for Dominican friars, dedicated to St Eustachius; and it appears that their possessions in Naas were granted them in the year 1355. This place was a strong hold during the civil wars.

NABATENE, or REGIO NABATÆORUM, according to Jerome, comprised all the country lying between the Euphrates and the Red. sea, and thus contained Arabia Deserta, with a part of the Petræa: 90 called from Nabaioth, the first born of Ismael. According to Diodorus, it was situated between Syria and Egypt. The people Nahatæi (1 Maccahees, Diodorus Siculus): inhabiting a desert and barren country: they lived by plundering their neighbours, according to Diodorus. Nabathæus the epithet.

NABIS, tyrant of Sparta, reigned about 204 B.C.; and is reported to have exceeded all other tyrants so far that, upon comparison, he left the epithets of gracious and merciful to Dionysius and Phalaris. He is said to have contrived an instrument of torture in the form of a statue of a beautiful woman, whose rich dress concealed a number of iron spikes in her bosom and arms. When any one therefore opposed his demands, he would say, " If I have not talents enough to prevail with you, perhaps my woman Apega may persuade you." The statue then appeared; which Nabis taking by the hand, led up to the person, who,

B N A

being embraced by it, was thus tortured into com- Nabis

pliance. To render his tyranny less unpopular, Nabis made an alliance with Flaminius the Roman general, Nabuchad and pursued with the most inveterate enmity the war, which he had undertaken against the Achæans. He besieged Gythium, and defeated Philopæmen in a naval battle. His triumph was short, the general of the Achæans soon repaired his losses, and Nahis was defeated in an engagement, and killed as he attempted to save his life by flight, about 194 years before the Christian era.

NABLOUS, a province of Syria, anciently celebrated under the name of the kingdom of Samaria. Its capital, likewise called Nablous, is situated near to Sichem on the ruins of the Niepolis of the Greeks, and is the residence of a sheik, who is subordinate to the pacha of Damaseus, from whom he farms the tribute of the province.

NABLUM, in Hebrew, Nebel, was an instrument of music among the Jews. It had strings like the harp, and was played upon by both hands. Its form was that of a Greek A. In the Septuagint and Vulgate, it is called noblum, psalterion, lyra ; and sometimes cithara.

NABO, or NEBO, in Mythology, a deity of the Babylonians, who possessed the next rank to Bel. It is mentioned by Isaiah, chap. xlviii. Vossius apprehends that Nabo was the moon, and Bel the sun : but Grotius supposes that Nabo was some celebrated prophet of the country ; which opinion is confirmed by the etymology of the name, signifying, according to Jerome, " one that presides over prophecy."

NABOB, properly NAVAB, the plural of Naib, a deputy. As used in Bengal, it is the same as NAZIM. It is a title also given to the wives and daughters of princes, as well as to the princes themselves.

NABONASSAR, first king of the Chaldeans or Babyloniaus; memorable for the Jewish cra which bears his name, which is generally fixed in 3257, beginning on Wednesday, February 26th, in the 3967th. of the Julian period, 747 years before Christ. The Babylonians revolting from the Medes, who had overthrown the Assyrian monarchy, did, under Nabonassar, found a dominion, which was much increased under Nebuchadnezzar. It is probable, that this Nabonassar is that Baladan in the second of Kings, xx. 12. father. of Merodach, who sent ambassadors to Hezekish. See 2 Chron. xxxii.

NABOPOLASSAR, king of Babylon : he joined; with Astyages the Mede, to destroy the empire of Assyria; which having accomplished, they founded the two empires of the Medes under Astyages, and the

Chaldeans under Nabopolassar, 627 B. C. NABUCHADNEZZAR, or NABUCHODONOSOR II. king of Assyria, son of Nabopolassar, and styled the Great, was associated by his father in the empire, 607 B. C. and the following year he took Jehoiakim king of Judah prisoner, and proposed to carry himand his subjects in eaptivity into Babylon; but nponhis submission, and promising to hold his kingdom under Nabuchodonosor, he was permitted to remain at Jerusalem In 603 B. C. Jehoiakim attempted to shake off the Assyrian yoke, but without success; and this revolt brought on the general captivity. Nabuchadnezzar having subdued the Ethiopians, Arabians, Idumacans, Philistines, Syrians, Persians, Medes, Assyrians,

nezzar

Nævus

Nævus Nail.

Tabuchad. syrians, and almost all Asia; being puffed up with pride, caused a golden statue to be set up, and commanded all to worship it; which Daniel's companions refusing to do, they were cast into the fiery furnace. But as he was admiring his own magnificence, by divinc sentence he was driven from men, and in the Scripture style is said to have eaten grassas oxen : i. e. he was seized with the disease called by the Greeks lyconthropy, which is a kind of madness that causes persons to run into the fields and streets in the night, and sometimes to suppose themselves to have the heads of oxen, or to be made of glass. At the end of seven years his reason returned to him, and he was restored to his throne and glory. He died 562 B. C. in the 43d year of his reign; in the 5th of which happened that eclipse of the sun mentioned by Ptolemy, which is the surest foundation of the chronology of his reign.

NADIR, in Astronomy, that point of the heavens which is diametrically opposite to the zenith or point directly over our heads.

NÆNIA, the goddess of funerals at Rome. Her temple was without the gates of the city. The songs which were sung at funcrals were also called næma. They were generally filled with the praises of the deceased; but sometimes they were so unmeaning and improper, that the word became proverbial to signify nonscnse.

NAERDEN, a strong town of Holland, seated at the head of the canals of the province. The foundations of it were laid by William of Bavaria, in 1350. It was taken by the Spaniards in 1572, and by the French in 1672; but it was retaken by the prince of Orange the next year. It stands at the south end of the Zuyder Zee, in E. Long. 5. 3. N. Lat. 51. 22.

NÆVIUS, CNEIUS, a famous poet of Campania, was bred a soldier ; but quitted the profession of arms, in order to apply himself to poetry, which he prosecuted with great diligence. He composed a history in verse, and a great number of comedies : but it is said that his first performance of this last kind so displeased Metcllus on account of the satirical strokes it contained, that he procured his being banished from the city: on which he retired to Utica in Africa, where he at length died, 202 B. C. We have only some tragments left of his works.

There was another NÆVIUS, a famous augur in the reign of Tarquin, who, to convince the king and the Romans of his preternatural power, cut a flint with a razor, and turned the ridicule of the populace to admiration. Tarquin rewarded his merit by erecting him a statue in the comitium, which was still in being in the age of Augustus. The razor and flint were buried near it under an altar, and it was usual among the Romans to make witnesses in civil causes swear near it. This miraculous event of cutting a flint with a razor, though believed by some writers, is treated as fabulous and improbable by Cicero, who himself had been augur.

NÆVUŠ, a mole on the skin, generally called a mother's mark ; also the tumour known by the name of a wen.

All preternatural tumours on the skin, in the form of a wart or tubercle, are called excrescences; by the Greeks they are called acrothymia ; and when they are

born with a person, they are called nævi materni, or marks from the mother. See TUMOURS, SURGERY Inder.

NAGERA, or NAGARA, a town of Spain, in Old Castile, and the territory of Rioja, with the title of a duchy and fortress; famous for a battle fought in its neighbourhood in 1369. It is situated in a fertile country, on a brook called Nascrilla. W. Long. 2. 20.

N. Lat. 42. 45. NAGRACUT, a town of India, the eapital of a kingdom of the same name in the dominions of the Great Mogul, with a rich temple to which the Indians go in pilgrimage. It is seated on the river Ravi. E. Long. 78. 10. N. Lat. 33. 12. NAHUM, or the Prophecy of NAHUM, a canonical

book of the Old Testament.

NAHUM, the seventh of the 12 lesser prophets, was a native of Elkoshai, a little village of Galilee. The subject of his prophecy is the destruction of Nineveh, which he describes in the most lively and pathetic manner; his style is bold and figurative, and eannot be exceeded by the most perfect masters of oratory. This prophecy was verified at the siege of that city by Astyages, in the year of the world 3378, 622 years before Christ.

NAIADES, in fabulous history, certain inferior deities who presided over rivers, springs, wells, and fountains. The Naiades generally inhabited the country, and resorted to the woods or meadows near the stream over which they presided. They are represented as young and beautiful virgins, often leaning upon an urn, from which flows a stream of water. was the fairest of the Naiades, according to Virgil. Their name seems to be derived from vativ, "to flow." They were held in great veneration among the ancients ; and often sacrifiecs of goats and lambs were offered to them, with libations of wine, honey, and oil. Sometimes they received only offerings of milk, fruit, and flowers.

NAIANT, in Heraldry, a term used in blazoning fishes, when borne in a horizontal posture, as if swimming

NAIAS, a genus of plants belonging to the diæcia class; and in the natural method ranking with those of which the order is doubtful. See BOTANY Index.

NAID, the interior of the great desert of Arabia, inhabited by a few seattered tribes of feeble and wretched Arabs. See ARABIA.

NAIL, UNGUIS, in Anatomy, which see.

NAILS, in building, &c. small spikes of iron, brass, &c. which being driven into wood, serve to bind several pieces together, or to fasten something upon them.

Nails were made use of by the ancient Hebrews for cancelling bonds; and the ceremony was performed by striking them through the writing. This seems to be alluded to in Scripture, where God is said by our cru-cified Saviour to have "blotted out the hand-writing of ordinances that was against us, and to have taken it out of the way, nailing it to his cross," Col. ii. 14. For the cause and ceremony of driving the annual nail, or clavus annalis, among the Romans, see ANNALIS Clavus.

NAIL, is also a measure of length, containing the 16th part of a yard

NAILING

Nairn.

NAILING of Cannon. When circumstances make it Cannon necessary to abandon cannon, or when the enemy's artillery are seized, and it is not however possible to take them away, it is proper to nail them up, in order to render them useless; which is done by driving a large nail or iron spike into the vent of a piece of artillery, to render it unserviceable. There are various contrivances to force the nail out, as also sundry machines invented for that purpose, but they have never been found of general use; so that the best method is to drill a new vent.

One Gasper Vimercalus was the first who invented the nailing of cannon. He was a native of Bremen, and made use of his invention first in nailing up the artillery of Sigismund Malatesta.

NAIN, LEWIS SEBASTIAN DE, a French critic and historian, was the son of a master of the requests, and was born at Paris in 1637. At ten years old he went to school at Port Royal, and became one of the best writers of that institution. Sacy, his intimate friend and counsellor, prevailed with him in 1676 to receive the pricsthood; which it seems, his great humility would not before suffer him to aspire to. This virtue he seems to have possessed in the extreme; so that Bossuct, seeing one of his letters to Father Dami, with whom he had some little dispute, besought him merrily " not to be always upon his knees before his adversary, but raise himself up now and then." He was solicited to push himself forward in the church, and Buzanval, bishop of Beauvois, wished to have him for his successor; but Nain, regardless of dignities, wished for nothing but retirement, so that he might indulge in the mortifications of a religious life and the indefatigable cultivation of letters. He died in 1698, aged 61. His principal works are, 1. Memoirs on the ecclesiastical history of the six first ages of the church, 16 vols. 4to. 2. The history of the emperors, 6 vols. .4to. These works are deduced from original sources, and composed with the utmost fidelity and accuracy.

NAIN, or NAIM, situated at the bottom of Mount Hermon on the north side, was anciently a city of the tribe of Issachar, in the province of Galilce. It was near the gates of this city that our Saviour restored to life the only son of a widow, and where he inspired Mary Magdalen to come and mourn for her sins at his feet. These circumstances alone make this place worthy of notice; for at present Nain is only a hamlet inhabited by Christians, Mahometans, and Hebrews, where there is not a single monument to attract the curigsity of the traveller.

NAIRES, NAHERS, or NAYERS, in modern history, ra name which is given by the Malabarians to the military of their country, who form a very numerous class or tribe, out of which the sovereigns of Malabar choose their body guard.

NAIRN, a county of Scotland, comprehending the western part of the province of Murray. It is bounded on the north by the Murray frith, on the west and south by Inverness, and on the east by Elgin. The length is about 18 miles, and the breadth about 14. The air is temperate and salubrious, and the winters arc remarkably mild. The face of the country is rough and mountainous : yet there are some fruitful valleys which produce good crops of oats and barley; but in general the country is much better adapted for pastuN

rage. Here are also large woods of fir, and other trees, that afford shelter to the game, of which there is great plenty. The most remarkable straths or valleys in this county, are Strathnairn, on the river of that name, in the south-west part of the shire; and on the south-east side, Strathrin, on both sides of Findhorn river. Nairn is well watered with streams, rivulets, and lakes abounding with fish. In the southern part there is a small lake, called Moy. The greater part of the shire is peopled by the Frazers, a warlike Highland clan, whose chief, the lord Lovat, lost his life on the scaffold for having been concerned in the rebellion of 1745. Here are a great number of villages; but no towns of note except Nairn, supposed to be the Tuæsis of Ptolemy, situated at the mouth of the river which bears the same name; a royal borough, which gave the title of lord to an ancient family, forfeited in the rebellion of 1715. The harbour, which opened in the Murray frith, is now choked up with sand; and the commerce of the town is too inconsiderable to deserve notice. About four miles from Nairn stands the castle of Calder on the river of that name, belonging to a branch of the family of Campbell; and six miles to the north-west of Nairn stands Fort George.

The following is the population of the parishes of this county, according to the Statistical History of Seotland.

| in town of Palland, scal | Population  | Population in  |
|--------------------------|-------------|----------------|
| Parishes.                | in 1755.    | 1790-1798.     |
| Ardclach                 | 1163        | 1186           |

In the returns for 1811 the population of Nairn is stated to be 8251. Sce NAIRN, SUPPLEMENT.

NAISSANT, in Heraldry, is applied to any animal issuing out of the midst of some ordinary, and showing only his head, shoulders, fore feet, and legs, with the tip of his tail; the rest of his body being hid in the shield, or some charge upon it : in which it differs from issuant, which denotes a living creature arising out of the bottom of any ordinary or charge.

NAISSUS, in Ancient Geography, a town of Dardania, a district of Mœsia Superior, said to be the birthplace of Constantine the Great, which seems probable from his often residing at that place. Naisitani,

Nairn Naissus.

## NAM

the people (Coin). Now called Nissa, a city of Ser-Naissus via. E. Long. 23. N. Lat. 43. Names.

NAKED SEEDS, in Botany, those that are not enelosed in any pod or case.

NAKIB, in the oriental dignities, the name of an officer who is a deputy to the cadiliskier, or, as he may be called, the lord high chancellor of Egypt, appointed by the grand signior. His office is to carry the standard of Mahomet.

NAKOUS, an Egyptian musical instrument, made like two plates of brass, and of all sizes, from two inches to a foot in diameter; they hold them by strings fastened to their middles, and strike them together so as to beat time. They are used in the Coptic churches and in the Mahometan processions.

NAMA, a genus of plants belonging to the pentandria class, and order digynia; and, in the natural method, ranking under the 13th order, Succulenta. See BOTANY Index.

NAME, denotes a word whereby men have agreed to express some idea ; or which serves to denote or signify a thing or subject spoken of. See WORD.

This the grammarians usually call a noun, nomen, though their noun is not of quite so much extent as our name. See NOUN.

Seneca, lib. ii. de Beneficiis, observes, that there are a great number of things which have no name; and which, therefore, we are forced to call by other borrowed names. Ingens est (says he) rerum copia sine nomine, quas cum propriis appellationibus signare non possumus, alienis accommodatis utimur : which may show why, in the course of this dictionary, we frequently give divers senses to the same word.

Names are distinguished into proper and appellative. Proper NAMES, are those which represent some individual thing or person, so as to distinguish it from all other things of the same species; as, Socrates, which represents a certain philosopher.

Appcllative or General NAMES, are those which signify common ideas; or which are common to several individuals of the same species; as, horse, animal, man, oak, &c.

Proper names are cither called Christian, as being given at baptism; or surnames : The first imposed for distinction of persons, answering to the Roman prænomen; the second, for the distinction of families, answering to the nomen of the Romans, and the patronymicum of the Greeks.

Originally every person had but one name; as among the Jews, Adam, &c. among the Egyptians, Busiris; among the Chaldees, Ninus; the Medes, Astijages; the Greeks, Diomedes; the Romans, Romulus; the Gauls, Divitiacus; the Germans, Ariovistus; the Britons, Cassibelan; the English, Hengist, &c. And thus of other nations, except the savages of Mount Atlas, whom Pliny and Marcellinus represent as anonymi, " nameless."

The Jews gave the name at the circumcision, viz. eight days after the birth : the Romans, to females the same day, to males the ninth ; at which time they held a feast, called nominalia.

Since Christianity has obtained, most nations have followed the Jews, baptizing and giving the name on the eighth day after the birth; except our English ancestors, who, till of late, baptized and gave the name Names. on the birth day. The first imposition of names was founded on differ-

ent views, among different people; the most common was to mark the good wishes of the parents, or to entitle the children to the good fortune a happy name seemed to promise. Hence, Victor, Castor, Faustus, Statorius, Probus, &c.

Accordingly, we find such names, by Cicero called bona nomina, and by Tacitus fausta nomina, were first enrolled and ranged in the Roman musters; first called to serve at the sacrifices, in the foundation of colonies, &c .- And, on the contrary, Livy calls Atrius Umber, abominandi omnis nomen : and Plantus, on occasion of a person named Lyco, i.e. " greedy wolf;" says;

Vosmet nunc facite conjecturam cæterum Quid id sit hominis, cui Lyco nomen fiet.

Hence, Plato recommends it to men to be careful in giving happy names ; and the Pythagoreans taught expressly, that the minds, actions, and successes of men, were according to their names, genius, and fate. Thus Panormitan, ex bono nomine oritur bona præsumptio; and the common proverb, Bonum nomen bonum omen ; and hence the foundation of the onomomantia. See ONOMOMANTIA.

It is an observation deserving attention, says the abbé Barthelemi, that the greater part of names found in Homer are marks of distinction. They were given in honour of the qualities most esteemed in the heroic ages. From the word polemos, which signifies war, have been formed Tlepolemus and Archepolemus, the names of two heroes mentioned in the Iliad. The former name signifies able to support, and the latter, able to direct, the labours of war. By adding to the word mache, or battle, certain prepositions and different parts. of speech, which modify the sense in a manner always honourable, are composed the names Amphimachus, Antimachus, Promachus, Telemachus. Proceeding in the same way, with the word honorca, "strength or intrepidity," they formed the names Agapenor, "he who esteems valour;" Agenor, "he who directs it." From thoes, "swift," are derived, Alcathocs, Panthoes, Perithoes, &c. From nous, "mind or intelligence," come Astynocs, Arsinoes, Autenoes, &c. From medes, " counsel," Agamedes, Eumedes, Lycomedes, Thrasy-medes; and from clios, "glory," Amphicles, Agacles, Iphicles, Patroclus, Cleobulus, with many others.

Hence Camden takes it for granted, that the names, in all nations and languages, are significative, and not simple sounds for mere distinction's sake. This holds not only among the Jews, Greeks, Latins, &c. but even the Turks ; among whom, Abdala signifies God's servant; Soliman, peaceable; Mahomet, glorified, &c. And the savages of Hispaniola, and throughout America, who, in their languages, name their children, Glistering Light, Sun, Bright, Fine Gold, &c.; and they of Congo, by the names of precious stones, flowers, &c.

To suppose names given without any meaning, however by the alteration of language their signification may be lost, that learned author thinks is to reproach our ancestors; and that contrary to the sense

of

N AM

Names

Name. of all ancient writers. Porphyry notes, that the barbarous names, as he ealls them, were very emphatical, and very eoncise : and accordingly it was esteemed a duty to be Preuvous, or sui nominis homines : as Severus, Probus, and Aurelius, are called sui nominis imperatores.

It was the usual way of giving names, to wish the Thus when children might discharge their names. Gunthram king of France named Clotharius at the font, he said, Crescat puer, et hujus sit nominis execu-

The ancient Britons, Camden says, generally took their names from colours, because they painted themselves ; which names are now lost, or remain hid among the Welsh. When they were subdued by the Romans, they took Roman names, some of which still remain corrupted; though the greatest part became extinct upon the admission of the English Saxons, who introduced the German names, as Cridda, Penda, Oswald, Edward, &c .- The Danes, too, brought with them their names ; as Sugyne, Harold, Knute, &c. The Normans, at the Conquest, brought in other German names, as originally using the German tongue; such as Robert, William, Richard, Henry, Hugh, &c. after the same manner as the Greek names Aspasius, Boethius, Symmachus, &c. were introduced into Italy upon the division of the empire. After the Conquest, our nation, which had ever been averse to foreign names, as deeming them unlueky, began to take Hebrew names : as Matthew, David, Samson, &c. The various names anciently or at present obtaining among us, from what language or people soever borrowed, are explained by Camden in his Remains. As to the period when names began to be multiplied, and surnames introduced, &c. see SURNAME.

Of late years it has obtained among us to give surnames for Christian names; which some dislike, on account of the confusion it may introduce. Camden relates it as an opinion, that the practice first began in the reign of Edward VI. by such as would be godfathers, when they were more than half fathers. Upon which some were persuaded to change their names at confirmation; which, it seems, is usual in other countries. -Thus, two sons of Henry II. of France, ehristened Alexander and Hercules, changed them at confirmation into Henry and Francis. In monasteries, the religious assume new names at their admittance, to show they are about to lead a new life, and have renounced the world, their family, and even their name : v. g. sister Mary of the Incarnation, brother Henry of the Holy Sacrament, &c. The popes also changed their names at their exaltation to the pontificate; a custom first introduced by Pope Sergius, whose name till then, as Platina informs us, was Swine's-snout. But Onuphrius refers it to John XII. or XIII. and at the same time adds a different reason for it from that of Platina, viz. that it was done in imitation of St Peter and St Paul, who were first called Simon and Saul.

Among the ancients, those deified by the Heathen consecrations had new names given them; as Romulus was called Quirinus; Melicertes, Portunus or Portumnus, &c.

New names were also given in adoptions, and sometimes by testament? thus L. Æmilius, adopted by Scipio, took the name of Scipio Africanus; and thus

Augustus, who was at first called C. Octavius Thurinus. being adopted by the testament of Julius Cæsar into his name and family, took the name of Caius Julius Casar Namur. Octávianus.

Names were also changed at enfranchisements into new cities. Thus Lucumo, at his first being made free of Rome, took the name Lucius Tarquinius Priscus, &c.; and slaves when made free, usually assumed their masters names. Those called to the equestrian order, if they had base names, were always new named, nomini ingenuorum veteramques Romanorum. And among the primitive Christians, it was the practice to change the names of the catechumens: Thus the renegado Lucianus, till his baptism, was called Lucius.

Towards the middle of the 15th century, it was the fancy of the wits and learned men of the age, particularly in Italy, to change their baptismal names for elassical As Sannazarius, for instance, who altered his ones. own plain name Jucopo to Actius Syncerus. Numbers did the same, and among the rest Platina the historian at Rome, who, not without a solenin eeremonial, took the name of Callimachus instead of Philip. Pope Paul II. who reigned about that time, unluckily chanced to be suspicious, illiterate, and heavy of comprehension, He had no idea that persons could wish to alter their names unless they had some bad design, and aetually serupled not to employ imprisonment and other violent methods to discover the fancied mystery. Platina was most cruelly tortured on this frivolous account : he had nothing to confess : so the pope, after endeavouring in vain to convict him of heresy, sedition, &c. released him after a long imprisonment.

NAMPTWICH, or NANTWICH, a town of Cheshire in England, situated on the river Weever, 14 miles S. E. from Chester, and 162 miles from London. It lies in the Vale Royal, and is one of the largest and best built towns in the county, the streets being very regular, and adorned with many gentlemen's houses. The inhabitants amounting in 1811 to 3999, trade in corn, cattle, cheese, fine white salt, and shocs. It is governed by a constable, &c. who are guardians of the salt springs. It is divided into two equal parts by the Weever, which is navigable to Winsford bridge. The Chester canal, terminates in a large bason near this place. In this town were several religious foundations, now no more. The church is a handsome pile of building in the form of a cross, with an octangular tower in the middle.

NAMUR, a province in the kingdom of the Netherlands, lying between the rivers Sambre and Maese; bounded on the north by Brabant, on the east and south by Liege, and on the west by Hainault. It is pretty fertile; has several forests, marble quarries, and mines of iron, lead, and pit coal; and is about 30 miles long and 20 broad. Namur is the capital town.

NAMUR, a large, rich, and very strong town of the Netherlands, capital of the county of Namur, with a strong castle, several forts, and a bishop's see. It contains 15,400 inhabitants. The most considerable forts are, Fort William, Fort Maese, Fort Coquelet, and Fort Espinor. The castle is built in the middle of the town, on a craggy rock. It was besieged by King William in 1695, who took it in the sight of an army of 100,000 French, though there were 16,000 men in the garrison. It was ceded to the house of Austria in

3

Namur

in circumference.

in 1713, but taken by the French in 1746; and and restored by the treaty of Aix-la-Chapelle. It was an-king again taken by the French in 1794, and remained in their possession till 1814, when it was ceded to the king of the Netherlands. It is situated at the confluence of the rivers Maese and Sambre, in E. Long. 4. 57. N. Lat, 50. 25.

NAN-TCHANG-FOU, the capital of Kiang-si, a prowince of China. This city has no trade but that of porcelain, which is made in the neighbourhood of Jaotcheou. It is the residence of a viceroy, and comprehends in its district cight cities ; seven of which are of the third class, and only one of the second. So much of the country is cultivated, that the pastures left are scarcely sufficient for the flocks.

NANCI, a town of France, in the department of Meurthe, situated near the river Meurthe, and containing 29,740 inhabitants in 1800. It is divided into the Old and New Towns. The first is irregularly built, and contains the ducal palace : the streets of the New Town are as straight as a line, adorned with handsome buildings, and a very fine square. The primatial church is a magnificent structure, and in that of the Cordelicrs are the tombs of the ancient dukes. The manufactures are cloths, woollen stuffs, silks, hats, iron ware, &c. The town was very well fortified, but the king of France demolished the fortifications. It has been taken and retaken several times; but has belonged to France ever since 1736. E. Long. 6. 17. N. Lat. 48. 41.

NANCOWRY, or SowRy, one of the Nicobar islands, lying at the entranec of the bay of Bengal. See NICOBAR.

NANI, JOHN BAPTIST, was born in 1616. His father was procurator of St Mark, and ambassador from Venice to Rome. He was educated with attention, and make considerable improvement. Urban VIII. a just valuer of merit, soon perceived that of young Nani. He was admitted into the college of senators in 1641, and was shortly after nominated ambassador in France, where he signalized himself by his compliant manners. He procured considerable succours for the war of Candia against the Turks; and became, after his return to Venice, superintendant of the war office and of finances. He was afterwards ambassador to the empire : where he rendered those services to his country which, as a zealous and intelligent citizen, he was well qualified to discharge. He was again sent into France in 1660 to solicit fresh succours for Candia; and on his return was appointed procurator of St Mark. He died November 5. 1768, at the age of 63, much regretted by his countrymen. The senate had appointed him to write the History of the Republic ; which he executed to the satisfaction of the Venetians, although the work was less admired by foreigners, who were not proper judges of the accuracy with which he stated the facts, of the purity of his diction, nor of the simplicity of his style; although it must be acknowledged that his narrative is much interrupted by too frequent parentheses. In writing his history of Venice he has given an universal history of his times, especially with respect to the affairs of the French in Italy. This history, which is continued from 1613 to 1671, was printed at Venice in 2 vols 4to, in the years 1662 and 1679.

NAN-KING, a city of China, and capital of the pro-

vince of Kiang-nan, is said to have been formerly one Nan-kingof the most beautiful and flourishing cities in the world. When the Chinese speak of its extent, they say, if two horsemen should go out by the same gate, and ride round it on full speed, taking different direetions, they would not meet before night. This account is evidently exaggerated; but it is certain, that Nanking surpasses in extent all the other cities of China. Wc are assured that its walls are five leagues and a half

This city is situated at the distance of a league from the river Yang-tse-kiang: it is of an irregular figure; the mountains which are within its circumference having prevented its being built on a regular plan. It was formerly the imperial city; for this reason it was called Nan-King, which signifies, the Southern Court ;" but since the six grand tribunals have been transferred. from hence to Peking, it is called Kiang-ning in all the public acts.

Nan-king has lost much of its ancient splendour : it had formerly a magnificent palace, no vestige of which is now to be seen; an observatory at present neglected, temples, tombs of the emperors, and other superb monuments, of which nothing remains but the remembrance. A third of the city is deserted, but the rest is well inhabited. Some quarters of it are extremely populous and full of business; particularly the manufacture of a species of cotton cloth, of which great quantities are imported into Europe under the name of Nankin. The streets are not so broad as those of Peking, they arc, however, very beautiful, well paved, and bordered with rich shops.

In this city resides one of those great mandarins called Tsong-gtou, who takes cognizance of all important affairs, not only of both the governments of the province, but also of those of the province of Kiang-si. The Tartars have a numerous garrison here, commanded by a general of their own nation; and they occupy a quarter of the city, separated from the rest by a plain wall.

The palaces of the mandarins, whether Chinese or Tartars, are in this city neither larger nor better built than those in the capital cities of other provinces. Here are no public edifices corresponding to the reputation of so celebrated a city, excepting its gates, which are very beautiful, and some temples, among which is the famous porcelain tower. It is 200 feet high, and divided into nine stories by plain boards within, and without by cornices and small projections covered with green varnished tiles. There is an ascent of 40 steps to the first story; between each of the others there. are 21.

The breadth and depth of the river Yang-tse-kiang formerly rendered the port of Nan-king very commodious; but at present large barks, or rather Chinese junks, never enter it: whether it be that it is shut up . by sand banks, or that the entrance of it has been forbid, in order that navigators may insensibly lose all knowledge of it.

In the months of April and May a great number of excellent fish are caught in this river near the city, which are sent to court; they are covered with ice, and transported in that manner by barks kept entirely on purpose. Although this city is more than 200 leagues from Peking, these boats make such expedition, that

Nan-king that they arrive there in eight or nine days. This city, though the capital of the province, has under its particular jurisdiction only eight cities of the third class. The number of its inhabitants is said to be 1,000,000.

without comprehending the garrison of 40,000 men. E. Long. 119. 24. N. Lat. 32. 46.

NANSIO, an island of the Archipelago, a little to the north of the island of Santorino, 16 miles in circumference; but has no harbour. The mountains are nothing but bare rocks, and there are not springs suffieient to water the fields. There is a vast number of partridges, whose eggs they destroy every year to preserve the corn, and yet vast numbers of them are always produced. The ruins of the temple of Apollo are yet to be seen, and consist chiefly of marble columns. E. Long. 26. 20. N. Lat. 36. 15.

NANTES, an ancient, rich, and very considerable town of France, in the department of Lower Loire, containing 73,879 inhabitants in 1800. It is situated on the north side of the Loire, about 40 miles from its mouth, at the confluence of the Erdre. It is the chief place of the department, the see of a bishop, and the seat of several tribunals. The atmosphere is pure, and the surrounding country is rich and beautiful. Nantes is a town of extensive trade. Vessels under 100 tons ascend to the city; those above that size discharge their cargoes at Paimboeuf, 25 miles below, and have them conveyed up in boats. The manufactures are cordage, canvas, linen, ealico, leather, refined sugar, bottle-glass, &c. By the Loire, this town has an extensive communication with the interior of France; and supplies Orleans and other towns with foreign commodities. The Spaniards trade here in wine, fine wool, iron, silk, oil, oranges, and lemons; and they carry back cloth, stuffs, corn, and hard ware. The Dutch send salt fish, and all sorts of spices; and in return have wine and brandy. The Swedes bring copper; and the English, lead, tin, &c. It was in this place that Henry IV. promulgated the famous edict in 1598, called the Edict of Nantes, and which was revoked in 1685. Nantes was anciently, like almost every considerable city in Europe, very strongly fortified. Peter de Dreux, one of the dukes of Bretagne, surrounded it with walls, which have only been demolished within these few years. The bridge is an object of curiosity. It is near a mile and a half in length, being continued across all the little islands in the Loire, from north to south. W. Long. 1. 45. N. Lat. 47. 13. NANTWICH. See NAMPTWICH.

NAPÆA, a genus of plants belonging to the polyadclphia class; and in the natural method ranking under the 37th order, Columniferæ. See BOTANY Index.

NAPHTHA, an inflammable substance of the bituminous kind. See CHEMISTRY and MINERALOGY.

NAPHTHALI, or NEPHTHALI (Josh. xix.), one of the tribes of Isracl; having Zabulon on the south, Asher on the west, the Jordan on the east, and on the north Antilibanus.

NAPIER, JOHN, baron of Merchiston in Seotland, inventor of the logarithms, was the eldest son of Sir Archibald Napier of Merehiston, and born in the year 1550. Having given early discoveries of great natural parts, his father was eareful to have them cultivated by a liberal education. After going through

A P N

the ordinary courses of philosophy at the university of Napier. St Andrew's, he made the tour of France, Italy, and Germany. Upon his return to his native country, his literature and other fine accomplishments soon rendered him conspicuous, and might have raised him to the highest offices of the state : but declining all civil employments, and the bustle of the court, hc retired from the world to pursue literary researches, in which he made an uncommon progress, so as to have favoured mankind with sundry useful discoveries. He ap. plied himself chiefly to the study of mathematics ; but at the same time did not neglect that of the Holy Scriptures. In both these he hath discovered the most extensive knowledge and profound penetration. His essay upon the book of the Apocalypse, indicates the most acute investigation, and an uncommon strength of judgment; though time hath discovered, that his calculations concerning particular events hath proceeded upon fallacious data. This work has been printed abroad in several languages; particularly in French at Rochelle in the year 1 593, 8vo, announced in the title, as revised by himself. Nothing, says Lord Buehan, could be more agreeable to the Rochellers or to the Huguenots of France at this time, than the author's annunciation of the pope as' antichrist, which in this book he has endeavoured to set forth with much zeal. and erudition. But what has principally rendered his name famous, was his great and fortunate discovery of logarithms in trigonometry, by which the ease and expedition in calculation have so wonderfully assisted the seience of astronomy and the arts of practical geometry and navigation. That he had begun about the year 1593 the train of inquiry which led him to that great achievement in arithmetic, appears from a letter to Crugerus from Kepler in the year 1624; wherein, mentioning the Canon Mirificus, he writes thus ; " Nihil autem supra Neperianam rationem esse puto: etsi Seotus quidem literis ad Tychonem, anno 1564, scriptis jam spem fecit Canonis illius mirifici ;" which allusion agrees with the idle story mentioned by Wood in his Athenæ Oxon. and explains it in a way perfectly consonant to the rights of Napier as the inventor.

When Napier had communicated to Mr Henry Briggs, mathematical professor in Gresham college, his wonderful canon for the logarithms, that learned professor set himself to apply the rnles in his Imitatio Nepeirea; and in a letter to Archbishop Usher in the ycar 1615, he writes thus : " Napier, baron of Mcrchiston, hath set my head and hands at work with his new and admirable logarithms. I hope to see him this summer, if it please God; for I never saw a book which pleased me better, and made me more wonder." The following passage from the life of Lilly the astrologer is quoted by Lord Buchan, as giving a picturesque view of the meeting betwixt Briggs and the inventor of the logarithms at Merchiston near Edinburgh. " I will acquaint you (says Lilly) with one memorable story related unto me by John Marr, an excellent mathematieian and geometrician, whom I conceive you remember. He was servant to King James I. and Charles I. When Merchiston first published his logarithms, Mr Briggs, then reader of the astronomy lectures at Gresham college in Londou, was so much surprised with admiration of them, that he could have no quietness in himself until he had seen that noble person whose

Napier.

П

whose only invention they were: he acquaints John Marr therewith, who went into Seotland before Mr Briggs, purposely to be there when these two so learned persons should meet. Mr Briggs appoints a certain day when to meet at Edinburgh ; but failing thereof, Merchiston was fearful he would not come. It happened one day as John Marr and the baron Napier were speaking of Mr Briggs ; ' Ah, John (said Merchiston), Mr Briggs will not come.' At the very instant one knocks at the gate: John Marr hasted down, and it proved to be Mr Briggs to his great contentment. He brings Mr Briggs up to the baron's chamber, where almost one quarter of an hour was spent, each beholding the other with admiration before one word was spoken. At last Mr Briggs began ; ' Sir, I have undertaken this long journey purposely to see your person, and to know hy what engine of wit or ingenuity you came first to think of this most excellent help into astronomy, viz. the logarithms; but, Sir, being by you found out, I wonder nobody else found it out before, when now being known it appears so easy.' He was nobly entertained by Baron Napier ; and every summer after that, during the laird's being alive, this venerable man, Mr Briggs, went purposely to Scotland to visit "arl of him \*."

1 han's ount of 1. Writ i and o ertom.

Rapier.

There is a passage in the life of Tycho Brahe by Gassendi, which may mislead an attentive reader to suppose that Napier's method had been explored by Antions Herwart at Hoenburg: It is in Gassendi's Observa-e apier tions on a Letter from Tycho to Herwart of the last day of August 1599. " Dixit Hervartus nihil morari se solvendi cujusquam trianguli difficultatem; solere se enim multiplicationum, ac divisionum vice additiones solum, subtractiones 93 usurpare (quod ut fieri posset, docuit postmodum suo logarithmorum Canone Neperus)." But Herwart here alludes to this work afterwards published in the year 1610, which solves triangles by prostaphæresis; a mode totally different from that of the logarithms.

Kepler dedicated his Ephemerides, to Napier, which were published in the year 1617; and it appears from many passages in his letter about this time, that he held Napier to be the greatest man of his age in the particular department to which he applied his ahilities. " And indeed (says our noble biographer), if we consider that Napier's discovery was not like those of Kepler or of Newton, connected with any analogies or coincidences which might have led him to it, but the fruit of unassisted reason and science, we shall be vindicated in placing him in one of the highest niches in the temple of Fame. Kepler had made many unsuccessful attempts to discover his canon for the periodic motions of the planets, and hit upon it at last, as he himself candidly owns, on the 15th of May 1618; and Newton applied the palpable tendency of heavy bodies to the earth to the system of the universe in general; but Napier sought out his admirable rules by a slow scientific progress, arising from the gradual evolution of truth."

The last literary exertion of this eminent person was the publication of his Rabdology and Promptuary in the year 1617, which he dedicated to the Chancellor Seton; and soon after died at Merchiston on the 3d of April O. S. of the same year, in the 68th year of his VOL. XIV. Part II.

age and 23d of his happy invention .- The particular Napier. titles of his works published are : r. A plain discovery of the Revelation of St John. 2. Mirifici ipsius canonis constructio et logarithmorum, ad naturales ipsorum numeros habitudines. 3. Appendix de alia atque præstantiore logarithmorum specie constituenda, in qua scilicet unitas logarithmus est. 4. Rhabdologiæ, seu numerationis per virgulas, libri duo. 5, Propositiones quædam eminentissimæ, ad triungula sphærica mira facultate resolvenda. To which may be added, 6. His Letter to Anthony Bacon (the original of which is in the archbishop's library at Lambeth), entitled, "Secret inventions, profitable and necessary in these days for the defence of this island, and withstanding strangers enemies to God's truth and religion;" which the earl of Buchan has caused to be printed in the Appendix to his Account of Napier's Writings. This letter is dated June 2. 1 596, about which time it appears the author had set himself to explore his logarithmic canon.

This eminent person was twice married. By his first wife, who was a daughter of Sir James Stirling of Keir, he had only one son named Archibald, who succeeded to the estate. By his second wife, a daughter of Sir James Chisholm of Cronilix, he had a numerous issue .- Archibald Napier, the only son of the first marriage, was a person of fine parts and learning. Having more a turn to public business than his father had, he was raised to be a privy counsellor by James VI. under whose reign he also held the offices of treasurer-depute, justice-clerk, and senator of the college of justice. By Charles I. he was raised to the peerage by the title of Lord Napier.

NAPIER'S Rods, or Bones, an instrument invented by Baron Napier, whereby the multiplication and division of large numbers is much facilitated.

As to the Construction of Napier's Rods : Suppose the common table of multiplication to be made upon a plate of metal, ivory, or pasteboard, and then conceive the several columns (standing downwards from the digits on the head) to be eut asunder: and these are what we call Napier's rods of multiplication. But then there must be a good number of each; for as many times as any figure is in the multiplicand, so many rods of that species (i. e. with that figure on the top of it) must we have ; though six rods of each species will be sufficient for any example in common affairs : there must be also as many rods of o's.

But before we explain the way of using these rods, there is another thing to be known, viz. that the figures on every rod are written in an order different from that in the table. Thus the little square space or division in which the several products of every column are written, is divided into two parts by a line across from the upper angle on the right to the lower on the left; and if the product is a digit, it is set in the lower division ; if it has two places, the first is set in the lower, and the second in the upper division; but the spaces on the top are not divided ; also there is a rod of digits, not divided, which is called the index rod, and of this we need hut one single rod. See the figure of all the different rods, and the index, separate from one another, in Plate CCCLXIX. fig. 1.

Multiplication by Napier's Rods. First lay down the index rod; then on the right of it set a rod, whose 4 G ton

N A 602

N

Napier. top is the figure in the highest place of the multiplicand ; next to this again, set the rod whose top is the next figure of the multiplicand; and so on in order to the first figure. Then is your multiplicand tabulated for all the nine digits ; for in the same line of squares standing against every figure of the index rod, you have the product of that figure ; and therefore you have no more to do but to transfer the products and sum them. But in taking out these products from the rods, the order in which the figures stand obliges you to a very casy and small addition ; thus, begin to take out the figure in the lower part, or units place, of the square of the first rod on the right ; add the figure on the upper part of this rod to that in the lower part of the next, and so on; which may be done as fast as you can look on them. To make this practice as clear as possible, take the following example.

P

| Example : To multiply 4768 by       | 385. Ha      | ving set  |
|-------------------------------------|--------------|-----------|
| the rods together for the number 47 | 68 (fig. 2.) | ) against |
| 5 in the index, I find this number  | by adding    | accord-   |
| ing to the rule, -                  | *            | 23040     |
| Against 8, this number -            | -            | 3.0144    |
| Against 3, this number -            | -            | 4304      |
| 18                                  |              | 0 (0      |

1835680 'Total product To make the use of the rods yet more regular and easy, they are kept in a flat square box, whose breadth is that of ten rods, and the length that of one rod, as thick as to hold six (or as many as you please), the capacity of the box being divided into ten cells, for the different species of rods. When the rods are put up in the box (each species in its own cell distinguished by the first figure of the rod sct before it on the face of the box near the top), as much of every rod stands without the box as shows the first figure of that rod : also, upon one of the flat sides without and near the edge, upon the left hand, the index rod is fixed ; and along the foot there is a small ledge ; so that the rods when applied are laid upon this side, and supported by the ledge, which makes the practice very easy; but in case the multiplicand should have more than nine places, that upper face of the box may be made broader. Some make the rods with four different faces, and figures on each for different purposes.

Division by Napier's Rods. First tabulate your divisor; then you have it multiplied by all the digits, out of which you may choose such convenient divisors as will be next less to the figures in the dividend, and write the index answering in the quotient, and so continually till the work is done. Thus 2179788, divided by 6123, gives in the quotient 356.

Having tabulated the divisor 6123, you see that 6123 cannot be had in 2179; therefore take five places, and on the rods find a number that is equal or next less to 21797, which is 18369; that is, 3 times the divisor; wherefore set 3 in the quotient, and subtract 18369 from the figures above, and there will remain 3428; to which add. 8, the next figure of the dividend, and seek again on the rods for it, or the next less, which you will find to be five times ; therefore set 5 in the quotient, and subtract 30615 from 34288, and there will remain 3673; to which add 8, the last figure in the dividend, and finding it to be just six times the divisor, set six in the quotient.

NAPLES, a kingdom of Italy, comprehending the ancient countries of Samnium, Campania, Apulia, and Magna Gracia. It is bounded on all sides by the Mediterranean and Adriatic, except on the north east, where it terminates on the Ecclesiastical state. Its greatest length from south-cast to north-west is about 280 English miles ; and its breadth from north-east to south-west, from 96 to 120.

36738

O.

The ancient history of this country falls under the articles ROME and ITALY; the present state of it, as well as of the rest of Italy, is owing to the conquests of Charlemagne. When that monarch put an end to the kingdom of the Lombards, he obliged the dukes of Friuli, Spoletto, and Benevento, to acknowledge him as king of Italy; but allowed them to exercise the same power and authority which they had enjoyed bcfore his conquest. Of these three dukedoms Benevento was by far the most powerful and extensive, as it com- Extent o prehended almost all the present kingdom of Naples ; the duch that part of Farther Calabria beyond the rivers Savuto of Beneand Peto, a few maritime cities in Hither Calabria, vento. with the city of Acripoli, and the promontory in its neighbourhood called Capo di Licosa; and lastly, the dukedoms of Gaeta, Naples, and Amalfi, which were very inconsiderable, and extended along the shore only about 100 miles, and were interrupted by the Gastaldate or county of Capua.

This flourishing and extensive dukedom was at this Arechis time governed by Arechis, who had married one of duke of I the daughters of the last king of the Lombards, and nevento had submitted, and taken the oath of allegiance to the Charleemperor Charles. However, a few year's after, he mague. renounced his allegiance to the Franks, declared himself an independent sovereign, and was acknowledged as such by all the inhabitants of his duchy. To strengthen himself against Pepin king of Italy, who resided at Ravenna, he enlarged and fortified the city of Benevento, and likewise built Salerno on the sea coast, surrounding it with a very strong and high wall. He engaged in several wars with the Greeks, whom he sometimes obliged to give him hostages; but having invaded the territories of the pope, whom Pepin could not assist, Charlemagne was prevailed on to return to Italy. Arechis, unable to oppose such a formidable enemy, sent his eldest son, Romuald, to Rome, with an offer of submission : but, at the instigation of the pope, Charles refused the offer, and detained his son prisoner; after which he ravaged the country, and made himself master of Capua. Other deputies, however, proved more successful; and, in the year 787, a peace was concluded on these conditions: That Arechis and the Beneventans should renew their allegiance to the Franks; that he should pay a yearly tribute to Pepin ; deliver up all his treasure; and give

gave his son Grimoald and his daughter Adelgisa, with twelve others, as hostages for his fidelity : however, after many entreaties, Adelgisa was restored to her father.

Charles had no sconer left Italy, than Arechis forgot all his engagements, and began to negociate with Irene, empress of Constantinople, and her son Constantine, for expelling the Franks out of Italy. For himself, he desired the honour of the patriciate, and the dukedom of Naples with all its dependencies; and, in return, promised to acknowledge the Greek emperor as his sovereign, and to live after the manner of the Greeks. He required, however, to be supported by a Greek army, and that his brother-in-law Adalgisus, son to Desiderius the last king of the Lombards, should be sent over into Italy, to raise a party among his countrymen. These conditions were readily accepted, on condition that Prince Romuald should be sent as an hostage; ambassadors were sent to Naples with the ensigns of the Patrician order, namely the mantle of cloth of gold, the sword, the comb, and the sandals : but before the ceremony could be performed, Prince Romuald died, and soon after him his father; whose death was supposed to have been hastened by that of his son.

After the death of Arcchis, the Beneventans sent a most submissive embassy to Charlemagne, entreating him to send them Grimoald, the late king's son, and only lawful heir to his crown ; threatening at the same time to revolt if their prince was denied them. Charles readily granted their request, and allowed Grimoald to depart, after he had agreed to the following conditions, viz. That he should oblige the Lombards to shave their beards; that, in writings, and on money. the name of the king should be put before that of the prince ; and that he should cause the walls of Salerno, Acerenza, and Consia, to be entirely abolished. The new king was received by his subjects with the utmost joy : and for some time continued faithful to his engagements, excepting only the last article, which he either neglected or eluded. So far, however, was he from assisting the Greeks, that he gave notice of their machinations to Pepin king of Italy; raised an army to oppose his uncle Adalgisus; and being joined by Hildebrand duke of Spoletto, and Vinigise the general of Pepin, he attacked the Greeks in Calabria soon after they had landed, entirely defeated and took his uncle prisoner, and, as is said, put him to a cruch death. Yet in a short time Grimoald contracted an alliance with the Greek emperor by marrying his niece Wanzia; and in the fifth year of his reign a war broke out between him and Pepin, which continued for twelve years; at the end of which time a truce was concluded. Grimoald survived this pacification only three years, and was succeeded by his treasurer Grimoald II. who submitted to Charlemagne after the death of Pepin; and from this time the Beneventans were looked upon as tributaries of the western emperors. As yet, however, the city of Naples did not own allcgiance to the dukes of Benevento, but was held by the castern emperors; and frequent wars took place be-tween the Beneventans and Neapolitans. This happened to be the ease when Grimoald II. ascended the throne. He concluded a peace with them; which, however, was of no long continuance; for Theodore, governor of Naples, having granted protections to

Dauferius à noble Beneventan, who had been concerned Naples. in a conspiracy against his prince, Grimoald marched against the city of Naples, and invested it by sea and land. Theodore still refused to deliver up the traitor, and a general engagement both by land and sea was the consequence; in which the Neapolitans were defeated with so great slaughter, that the sca was stained with their blood for more than seven days. Theodore then consented to deliver up Danferius, with 8000 crowns for the expence of the war; and Grimoald not only pardoned Dauferius, but received him into favour: The traitor, however, reflecting on the heinousness of his crime, was seized with remorse; and went a pilgrimage to the holy land, carrying a large stone in his mouth, by way of penance, which he never took out but at his meals.

In the year 821, Grimoald was murdered by Ra-Is murder. delchis count of Consia, and Sico Gastald of Acerenza, ed, and sucthe latter of whom succeeded to the dukedom of Sico. ceeded Ly Benevento. Radelchis being soon after seized with remorse, became a monk ; while Sito associated his son Sicardo with him in the government; and both, being of an ambitious and restless disposition, sought a pretence for attacking the Neapolitans. This was Naples besoon found, and the city was invested by sea and land. sieged by The walls were furiously battered; and part of them Sico; being beat down, Sico prepared for a general assault. Stephen, at that time duke of Naples, pretended to submit; but, that he might prevent the city from being pillaged, entreated Sico to put off his entry till the morning, and in the mean time sent out his mother and his two children as hostages. Sico consented to his request; but next morning found the breach built up, and the Neapolitans prepared for their defence. Exasperated at their perfidy, he renewed his attacks with vigour, but without any success; the besieged defending themselves with the utmost obstinacy. At last, perceiving that they should not be able to hold out much longer, they consented to a peace on the following conditions, viz. That the Neapolitans should pay an annual tribute to the princes of Benevento, and consent of the transporting of the body of St Januarius from his church without the walls of Naples to Benevento. These conditions being ratified, Sico returned with great honour to Benevento; but soon after renewed the war, under pretence that the Neapolitans had neglected to pay the stipulated sum; and hostilities continued till his death, which happened in 833.

Sico was succeeded in the government of Benevento and by his by his son Sicardo, who had married the daughter of uccessor Dauferius ; and being influenced by the cyll country of Sicardo. Dauferius; and being influenced by the evil counsels of Roffrid his wife's brother, oppressed his subjects to such a degree that they conspired against his life. He besieged Naples with a powerful army, and took possession of Acerra and Atella, both of which he fortified. But Bonus, the Neapolitan duke, defended himself so vigorously, that the Beneventans were obliged to retire, and even to abandon Accrra and Atella, the fortifications of which were immediately demolished. At last Sicardo agreed to a peace for five years, on the intercession of Lothaire, emperor and king of Italy; but his chief motive was thought to have been the fear of the Saracens, whom the duke of Naples had ealled over from Africa to his assistance; for no sooner were 4. G 2 they

in by the duke of Naples.

Naples. they sent back than Sicardo attempted to delay the conclusion of the treaty; but the emperor interposing his authority, a peace was concluded in the year 836, rne Sara-cens called after the war had continued, with very little intermis-

sion, for 16 years. Soon after the conclusion of this peace, the Saracens landed at Brindisi; and having made themselves masters of the place, ravaged all the neighbouring country. Sieardo marched against them with a numerous army; but the Saraceus having dug a great number of ditches which they slightly covered over, found means to draw the Beneventans in among them, whereby they were repulsed with great loss. However, Sicardo, having reinforced his army, marched again to attack them; but the Saracens, despairing of success, pillaged and burnt Brindisi, and then retired with their booty, and a great many captives to Sicily. Sicardo, then, without any apparent provocation, attacked the city of Amalfi, levelled its walls with the ground, carried off all its wealth, and the body of its tutelar saint Triphomen. A great many of the inhabitants were transported to Salerno; and by promoting alliances between the inhabitants of both places, he endcavoured to unite Amalfi to his own principality as firmly as possible.

During all these transactions, Sicardo had tyrannized over his subjects in such a manner, that at last he became intolerable. Among other acts of injustice, he imprisoned his own brother Siconolphus; compelled him to turn pricst; and afterwards sent him bound to Tarento, where he caused him to be shut up in an old tower that had been built for a cistern. By such acts of tyranny his nobles were provoked to conspire against him; and in the year 839 he was murchis, which dered in his tent.

On the death of Sicardo, Radelchis, his secretary a eivil war. or treasurer, was unanimously elected prince of Benevento; but Siconolphus, the last king's brother, having regained his liberty, formed a great party against the new prince. Radelchis did not fail to oppose him with a formidable army; and a most ruinous civil war ensued. Both parties by turns called in the Saracens; and these treacherous allies acted sometimes against one, and sometimes against the other; or, turned their arms against both, as seemed most suitable to their own interest. Thus the war continued with the utmost animosity for 12 years, during which time the principality was almost entirely ruined; till at last the emperor Lewis interposed, and obliged the competitors to agree to a partition of the principality. By this treaty, Radelchis promised to acknowledge Siconolphus and his successors as lawful princes of the principality of Salerno, which was deelared to contain Tarento, Latiano, Cassano, Cossenzo, Laino, Lucadia, Consia, Montella, Rota, Salerno, Sarno, Ciraterium, Furculo, Capua, Feano. Sora, and the half of the Gastaldate of Acerenza, where it joins Latiano and Consia. The houndary betwixt Benevento and Capua was fixed at St Angelo ad Cerros; Alli Peregrini was made the boundary betwixt Benevento and Salerno, and Staffilo betwixt Benevento and Consia. The monasteries of Monte Cassino and St Vincent were declared to be immediately under the protection of the emperor : both princes stipulated that no hostilitics should be committed by either against the sub-

jects of each other; and promised to join their forces Naples in order to drive out the Saraeens. Soon after this pacification, however, both Radelchis and Siconolphus died; the former appointing his son Radelgarius, or Radelcar, to succeed him; and the latter leaving an infant son, Sico, to the care of his godfather, Peter.

The war with the Saracens proved very unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsuccess-Unsucces ful : neither the united efforts of the princes, nor the ful war assistance of the emperor Lewis himself, being able to with the expel the infidels; and in 854, Adelgise the second Saracen son of Radelchis, who had now succeeded, on the death of his brother Radclear, to the principality of Benevento, was obliged to pay them an annual subsidy. Two years after, Lando, count of Capua, revolted from the prince of Salerno, and could not be reduced. In the mean time, Sico, the lawful prince of Salerno, had been poisoned by Count Lando, and the principality usurped by Ademarius, the son of Peter above mentioned; but in 861, Ademarius himself was seized and imprisoned by Gauferius, the son of Dauferius formerly mentioned. This was occasioned by his cruelty and rapaciousness, which entirely alienated the hearts of his subjects from him, and encouraged Gauferius to become the head of the conspirators. The Saracens in the mean time committed terrible ravages throughout the Beneventan territories; which at last obliged Adelgise to enter into an alliance with Gauferius, and both together sent a most humble cmbassy to the emperor Lewis, requesting him to take them under his protection. About the same time an embassy arrived from Constantinople, proposing a junetion of the forces of the eastern and western empires against the infidels; upon which Lewis gave orders for assembling a formidable army. But in the mean time Adelgise fell off from his alliance, and made peace with the Saracens; nay, according to some, he encouraged them in their incursions, and it was at his desire that they invaded the duchy of Capua, and after-wards that of Naples, which they ravaged in a most barbarous manner. The Neapolitans, in conjunction with the duke of Spoletto and the count of Marsi, endeavoured to oppose them; but being defeated, the Saracens continued their ravages with redoubled fury, and retired to Bari, which was their capital city, with an immense booty.

In 866, Lewis arrived at Sora with his army : and having marched to Capua, was there joined by Landulph, the bishop and count, with a body of Capuans : but Landulph soon after persuading his countrymen to desert, Lewis marched against that city, which he took. after a siege of three months, and almost totally destroyed. In the end of the year he was joined by Gauferius with his quota of troops, having ordered the cyes of Ardemarius to be put out in his absence. Lewis confirmed him in the principality, and marched with his army to Benevento, where Adelgise received him with great respect. Having reduced some inconsiderable places belonging to the Saracens, Lewis soon after invested Bari; but as the Saracens received continual supplies from their countrymen settled in Sicily, and besides were protected by the Neapolitans, he could not reduce the place till the year 871, though he had received considerable assistance from his brother Lotharius, and the Greek emperor had sent him a fleet of 200

200 sail. The expulsion of the Saracens was completed the same year by the taking of Tarento; after which the emperor returned with great glory to Benevento, resolving next to carry his arms into Sicily, and expel the infidels from thenee also. But his future schemes of conquest were frustrated by a quarrel between him and Adelgise. The latter, pretending to have been insulted by the empress, and oppressed by the French, seized the emperor himself, and kept him prisoner for 40 days. His imprisonment would probably have been of much longer continuance, had not a body of Saracens arrived from Africa, who, being joined by such of their countrymen as had concealed themselves in Italy, laid siege to Salerno with an army of 30,000 mcn, ravaging the neighbouring country at the same time with the utmost barbarity. By this new invasion Adelgise was so much alarmed, that he set the emperor at liberty, but first obliged him to swear that he would not revenge the insult that had been offered him, and that he would never return to Benevento. Lewis having then joined his forces to those of the prince of Salerno, soon obliged the Saracens to raise the siege of Salcrno; but though they, were prevented from taking that city, they entirely destroyed the inhabitants of Calabria, leaving it, according to the expression of one of the historians of that time, " as desolate as it was at the flood."

In the year 873, Lewis being absolved from his oath by the pope, went to Benevento, and was reconciled to Adelgise; but soon after this reconciliation he died, and the Saracens continued their ravages to such a degree that the inhabitants of Bari were constrained to deliver up their city to the Greeks. At the same time the Salcrnitans, Neapolitans, Cajetans, and Amalfitans, having made peace with the Saracens, were compelled to agree to their proposal of invading the territories of the Roman pontiff. His holiness exerted himself to the utmost, both with spiritual and temporal weapons, in order to defend his right; but was at last reduced to the necessity of becoming a tributary to the infidels, and promising to pay them a large sum annually.

In the mean time, all Italy was thrown into the greatest confusion by the death of Charles the Bald, who died of poison at Pavia, as he was coming to the pope's assistance. Sergius duke of Naples continued a firm friend to the infidels; nor could he be detached from their interests even by the thunder of a papal excommunication : but unluckily happening to fall into the hands of his brother Athanasius bishop of Naples, the zeal of that prelate prompted him to put out his eyes, and send him a close prisoner to Rome; for which the highest encomiums were bestowed on him by the boly father.

In 876, Adelgise was murdered by two of his nephews; one of whom, by name Gaideris, seized the principality. About the same time Landulph bishop of Capua dying, a civil war ensued among his children, though their father's dominions had been divided among them according to his will. The princes of Salerno and Benevento, the duke of Spoletto, and Gregory the Greek governor of Bari and Otranto, took different sides in the quarrel, as they thought most proper; and to complete the confusion, the new bishop was expelled, and his brother, though a layman, cho-

sen to that office, and even consecrated by the pope, Nuples. who wrote to Gauferius, forbidding him to attack Capua under pain of excommunication. But though Gauferius was, in general, obedient to the pope's commands, he proved refractory in this particular, and laid siege to Capua for two years successively.

Thus the Capuan territories were reduced to the most miserable situation ; being obliged to maintain at the same time the armics of the prince of Benevento and the duke of Spoletto. The Saracens, in the mean time, took the opportunity of strengthening themselves in Italy; and Athanasius, notwithstanding the great commendations he had received from the pope for putting out his brother's eyes, consented to enter into an alliance with them, in conjunction with whom he ravaged the territories of the pope, as well as those of Benevento and Spoletto, plundering all the churches, monasteries, towns, and villages, through which they passed. At the same time the prince of Salerno was obliged to grant them a settlement in the neighbourhood of his capital; the duke of Gaeta invited them to his assistance, being oppressed by the count of Capua; and even the pope himself was obliged to make peace with them, and to grant them a settlement on the north side of the Carigliano, where they fortified themselves, and continued for more than 40 years.

To put a stop to the confusion which reigned in Italy, the pope now thought proper to restore the bishop of Capua, who had been expelled, but allowed his brother to reside in the city, and govern one half of the diocese; but notwithstanding this partition, the civil dissensions continued with the utmost violence, the nearest relations murdering or banishing each other, according as the fortune of the one or the other prevailed. Athanasius, notwithstanding all the pope's remonstrances, continued his alliance with the Saracens; in conjunction with whom he ravaged the territory of Benevento, and fomented the divisions in Capua, in hopes of being able to make a conquest of it. At last his holiness thought proper to issue a sentence of excommunication against him: but this attached him to the Saracens more than ever : insomuch that he sent to Suchaim, king of the Saracens in Sicily, desiring him to come over and command a great body of his countrymen who had settled at the foot of Mount Vesuvius. Suchaim accepted the invitation, and immediately turned his arms against Athanasius; allowing his troops to live at discretion in the territory of Naples, where they ravished the women, and plundered the inhabitants. These calamities were, by the superstitious Neapolitans, imagined to be a consequence of the sentence of excommunication; and therefore they used their atmost endeavours to persuade the prelate to conclude a league with some Christian prince, and renounce all connexion with the infidels. In this they at last proved successful, and Athanasius concluded an alliance with Guaimarius prince of Salerno; in consequence of which the Saracens were obliged to quit the Neapolitan territories, and retire to Agropoli. Athanasius then directed his force against Capua, of which he made himself master in the year 882. The Saracens, however, still continued their incursions, and ravaged several provinces in such a manner, that they became entirely desolate.

These confusions continued for a long time; during which

#### N P A

which the Greeks found an opportunity of making themselves masters of Benevento, and well nigh became masters also of Salerno; but in this they failed through the treachery of the bishop, and in the year 896 they were totally expelled by the bishop, four years after they had become masters of it. In 915 the Saracens The Sara- received such an overthrow at Carigliano, that scarce cens almost one of them remained. However, a new body soon arentirely cut rived from Africa, and infested the sea coasts for some time longer. A war also ensued between Landulph and the Greeks; which concluded disadvantageously for the former, who was obliged to submit to the emperor of Constantinople in 943. In 961, Otho the Great, king of Germany, invaded Italy with a powerful army against Berengarius III. and, marching to Rome, received the imperial crown from the hands of the pope. In 964, he crected Capua into a principality, received homage from the other princes of Lombardy, and formed a design of recovering Puglia and Calabria from the Greeks. But in this last scheme he failed; and after various hostilities a treaty was concluded, and the young princess Theophania married to Otho's son, afterwards em-

The Normans first known in Italy.

peror.

All this time the Saracens continued their incursions; and the Greeks had gained ground so much, that they were now in possession of two-thirds of the present kingdom of Naples; but in the year 1002 or 1003, the Normans first began to be remarkable in Italy. They had, about a century before, embraced Christianity, and become very zealous in all the superstitions which were then practised. They were particularly zealous in visiting sacred places, especially Rome, and the holy sepulchre at Jerusalem; and being naturally of a very martial disposition, they forced through great bodies of Greeks and Saracens who opposed their passage. About this time 40, or, as others write, 100, of these Normans, returning from Jerusalem by sea, landed at Salerno in the habit of pilgrims, where they were honourably received by Guaimarins. During their residence at Salerno, a great body of Saracens landed, and invested the city. Guaimarius, not being in a condition to oppose the invaders by force, was preparing to pay them a large sum of money, which they demanded when the Normans proposed to attack them; and, having got arms and horses from the prince, they engaged the infidels with such fury and bravery, that they entirely defeated them, and obliged them to fly to their ships. By this complete victory Guaimarius was filled with such admiration of the valour of these strangers, that he entreated them to remain in his country; offering them lands, and the most honourable employments : but not being able to prevail with them to stay in Italy, or even accept of his presents; at their departure he sent some ambassadors with them to Normandy, in vessels loaded with exquisite fruits, rich furniture for horses, &c. in order to allure the valiant Normans to leave their own country. This kind invitation encouraged a Norman chief, named Osmond Drengot, to settle in Italy about the year IOI5; having killed another lord in a duel, which obliged him to leave his own country, in order to avoid the resentment of his sovereign, Robert duke of Normandy. In the mean time, the city of Bari had revolted from the Greeks, and chosen one Mello for their leader, whose wife and

children happened soon after to fall into the hands of Naples. their enemics, and were sent prisoners to Constantinople. -No sooner, therefore, did Mello hear of the arrival of 18 They rethese adventurers, than he engaged them to assist him; They reand having drawn together a considerable army, defeat-defeat the ed the Greeks with great slaughter, and obliged them Greeks, to abandon their camp. In this engagement the Normans distinguished themselves by their bravery; and the news of their success soon brought from Normandy an innumerable multitude of their countrymen, with their wives and children. By this reinforcement, Mello gained two other victories, took a great many towns, and obliged the Greeks to abandon a large territory; but, in 1019, they were utterly defeated, and every thing recovered by the Greeks. The Greek but are at general, Bajanus, continued to go on with such sur-last defeet prising success, that he almost entirely re-established ed by them the affairs of his countrymen in Italy, and made a distinct province of the western part of Puglia, which he called Capatanata, and which to this day retains the name of Capitanata. His great progress at last alarmed the emperors of Germany ; and, in 1027, Pandulphus prince of Capua made himself master of Naples ; but was obliged, three years afterwards, to leave it, by the Normans, who built the city of Aversa, which was now erected into a county. In consequence of this piece of good fortune, great numbers of Norman adventurers migrated into Italy; among whom were William, Drogo, and Umbert, three of the sons of Tancred dukc of Hautville; from whose posterity those princes were descended, who first conquered the island of Sicily from the Saracens, and formed the present kingdom of Naples.

In 1040, the Greek emperor Michael Palcologue, in order to secure the affection of his fickle subjects, undertook the conquest of Italy from the Saracens, and for that purpose sent a general named Michael Maniacus into Sicily. This commander, hearing of the great reputation of the Normans, sent to Guaimarius, prince of Salerno, entrcating him to grant him some of those warriors. His request was most willingly hearkened to by the prince of Salerno, who, to encourage the Normans to engage in the expedition, promised them some additional rewards besides the emperor's pay. William, Drogo, and Umbert, accordingly marched from Salerno with 300 of their countrymen; and, pas- The Norsing over into Sicily, distinguished themselves most re- mans pass over ints markably in the conquest of that island. Maniacus ac- Sicily. knowledged, that the recovery of Messina was chiefly owing to their valour; and William with his Normans gained a complete victory over the Saracens before Syracuse, where he killed the governor of the city in single combat. Maniacus made himself master of Syracuse, and almost entirely reduced the whole island; but, being accused of treason, was next year carried prisoner to Constantinople. His successor Doceanus, being a man of no abilities, quickly lost the whole island except Messina, and treated his Norman auxiliaries with the utmost contempt. He would not allow them any share of the booty; and even caused one Ardoin, a noble Lombard, and associate and interpreter of the Normans, to be whipped round the camp, because he refused to part with the horse of a Saracen whom he had slain in single combat. The consequences of this tyrannical behaviour were very fatal to the Greeks.

Greeks. Ardoin soon after obtained leave to return about the most important affairs of the nation. Argyrus Naples. alone was neglected in this division; but he, having gained the favour of the emperor by expelling the rebel Maniacus from Italy, was by him created duke of Bari, on purpose to check the power of the Normans, with the title of prince and duke of Puglia. The Normans, however, were too powerful to be much awed by Argyrus, and behaved with great insolence to the neighbouring princes; but as they could not be expelled by force, and were confirmed in their conquests by Henry II. emperor of Germany in 1047, the Greek emperor attempted to get rid of them, by sending Argyrus with large sums of money to bribe them to enter into his service against the Persians. But they, perceiving the snare, replied that they were resolved not to leave Italy unless they were expelled by force : upon which Argyrus made use of the same money in bribing the Puglians to assassinate these invaders. This brought Great numon a massacre, in which greater numbers of Normans there of nerished than had fallen in all the late wars perished than had fallen in all the late wars. Argyrus sacred. attempted to take advantage of the confusion produced by this massacre, but was defeated; after which he had recourse to Pope Leo, beseeching him to deliver Italy from these cruel tyrants : but this scheme proved still more unsuccessful than the others had been ; for the pope himself was defeated and taken prisoner; and, in The consequence of the respect showed him by the Normans, They are granted them, as a fief of the holy see, all the con- confirmed quests they had made or should make in Calabria and by the Pope Sicily. Soon after this, the Norman power became extremely formidable; the famous Robert Guiscard ascended the throne in 1056. He made great progress in the

conquest of Calabria, and reduced most of the cities. which held out for the Greeks in these parts. About. the same time the counts of Capua were expelled from their territory ; and the abbot Desiderius mentions his having seen the children of Landulphus V, the last count, going about as vagabonds, and begging for their support. The pope alarmed by these conquests, excommunicated the Normans in wholesale, pretending; that they had seized some of the territories belonging to the church; but by the pretcuded submission of Robert, he not only was persuaded to take off the scntence of excommunication, but to invest him with the provinces of Apulia, Calabria, and Sicily. After. this, he continued the war against the Greeks with great success. In 1071, in conjunction with his bro- Sicily conther Roger, he conquered the island of Sicily, and quered bygave the investiture of the whole island to him with the Robert title of count, reserving to himself only the half of Pa-Guiscards lermo, Messina, and the valley of Demona. The like success attended his arms against Salerno in 1074; but after this, having unadvisedly taken some places from the pope, he again fell under the sentence of excommunication ; yet he was reconciled to him in 1080, and received a second time the investiture of all his dominions. The next year he undertook an expedition against the Greeks; and though the emperor was assisted by a Venetian fleet, Robert made himself master of the island of Corfu, reduced Durazzo, and great part of Romania; insomuch that by the success of his, arms, and his near approach to Constantinople, he. struck an universal terror among the Greeks. But, while Robert was thus extending his conquests, he was. alarmed:

in all their.

conquests.

to Italy under a pretence of a vow, and all the Normans embarked at night along with him ; but instead of going to Rome, Ardoin went immediately to Aversa, where he persuaded Count Rainulphus, sovereign of that province, to join with him in the design he had formed of attacking the Greek provinces in Italy, which he showed him would be an easy conquest, as the inhabitants submitted with great reluctance to the Greeks, and the provinces were at that time almost entirely defenceless. Rainulphus approved of the scheme, and raised 300 soldiers, whom he sent under 12 officers to join the other Normans under the sons of Tancred; and made an agreement with Ardoin, that the conquests should be equally divided among the chief leaders. Their first enterprise was the reduction of Melfis, one of the strongest cities in Puglia, which presently surrendered; and they increased its fortifications so much, that it thenceforth became impregnable. Soon after this they made themselves masters of Venosa, Ascoli, and Lavello, with very little opposition. Doceanus, alarmed with the rapidity of their conquests, immediately left Sicily, and marched with his army into Puglia, where he attacked the invaders near the river Olivicnto; but after a fierce engagement, he was obliged to retire with considerable loss. Greeks were soon after defeated a second time at Cannæ; and in a third engagement, which happened near the river Ofanto, the army of Doceanus was entirely routed, and he himself obliged to fly to Bari. On this bad success Doceanus was ordered to return to his command in Sicily, and another general was sentwith an army into Puglia. This new commander, however, had no better success than his predecessor; for his army was entirely defeated in an engagement with the Normans, and he himself taken prisoner. Atenulphus, brother to one of the princes of Benevento on whom the Normans had conferred the chief command, set at liberty the captive general without consulting them, on receiving from him a considerable sum of money. With this the Normans were so much displcased that they deprived Atenulphus of his command, and bestowed it on Argyrus son to the late Mello, who had escaped from Constantinople, and now assumed the title of duke and prince of Italy. Before this time also Maniacus, whom we have formerly mentioned, had returned to Italy; and to strike the greater terror into the revolted cities, had executed a number of people of all ages and sexes with great inhumanity. Soon after this Maniacus openly rebelled against the Greek emperor Constantinus, and prevailed uponhis own army to proclaim him emperor, beginning hostilities immediately against the Greek cities. Argyrus at the same time took Giovenazzo and besieged. Trani, and soon after besieged Maniacus himself in Tarento; but he, being afraid of falling into the hands of the Normans, fled to Otranto, and from thence to Bulgaria, where being entirely defeated by one of the emperor's generals, he was taken prisoner, and had his head struck off.

The Normans having now conquered the greatest part of Puglia, proceeded to make a division of their conquest, in which, after each commander had got his proper share, the city of Melfis was left common to all, and appropriated as a place for assembling to consult. Naples. alarmed by the news of a formidable rebellion in Italy, and that the emperor Henry had taken the city of Rome, and closely shut up the pope in the eastle of St Angelo. Robert, therefore, leaving the command of the army to his son Boemund, returned to Italy, where he immediately dispersed the rebels, and released the pope, while his son gained a considerable victory over the Greeks. After this Robert made great preparations for another expedition into Greece, in order to second his son Boemund. Alexius Comnenns, who was about this time declared emperor by the Greek army, being assisted by the Venetian fleet, endeavoured to oppose his passage; but was entirely defeated, with the loss of a great many galleys. But a final stop was now put to his enterprises by his death, which happened in the island of Corfu in 1085.

Though the power of the Normans was thus thoroughly established in Italy and Sieily, and though the prince of Benevento was in 1130 invested by the pope with the title of king of Sicily, yet by reason of the civil dissensions which took place among themselves, and the general confusion which reigned in Italy in those ages, they were obliged, notwithstanding all And by the their valour, to submit to the emperor in 1195. By emperor of him the Sicilians were treated with so great cruelty, that the empress Constantia was induced to conspire against him in 1197, took him prisoner, and released him only on condition of his sending off his army immediately for the Holy Land. This was complied with ; but the emperor did not long survive the reconciliation, being poisoned, as was supposed, by order of the empress.

In 1254 the pope claimed the kingdom as a fief devolved on the church in consequence of a sentence of deposition pronounced against King Frederick at the council of Lyons; and, in 1263, the kingdom was, in consequence of this right, conferred on Charles count of Anjou. After much contention and bloodshed, the French thus became masters of Sieily and Naples. The French Their government was insupportably tyrannical; and at the same time the haughtiness of their king so provoked the pope, that he resolved to humble him .--Charles had resolved on an expedition against Constantinople-; and for this purpose had fitted out a fleet of 100 galleys, 30 large ships, 200 transports, besides many other smaller vessels, on board of which he intended to embark 10,000 horse, and a numerous army of foot. This formidable armament greatly alarmed the emperor Michael Paleologus ; for which reason he entered into a negotiation with John di Procida, a noble Salernitan, lord of the isle of Procida in the bay of Naples, who had formed a scheme for a general rcvolt in the island of Sicily. John, though a nobleman, was also a physician, and had been counsellor to two former princes, and even to King Charles himself; but being stripped of his estate by the king under pretence of treason, and his wife being debauched by the French, he retired to Constantia queen of Arragon, where he was created a baron of the kingdom of Valencia, by her husband King Peter, and lord of Luxen, Benizzano, and Palma. As he was greatly exasperated against the French, he employed many spies both in Puglia and Sieily; and being informed that the Sicilians were totally disaffected to the French, he came to the island in disguise, and concerted a plan with the

3

most powerful of the malecontents for a revolution in Napley. favour of Constantia, though she derived her right only as being the daughter of a former usurper named Manfred. Procida then set out for Constantinople, where in some private conferences with the emperor, he persuaded him, that the most probable means of defeating Charles's scheme was by assisting the Spaniards and Sicilian malecontcuts. Paleologus accordingly grantcd him a large sum of money, and on his departure sent one of his secretaries along with him, who, landing in Sicily, had a conference with the chief conspirators. John, having received letters from them, disguised himself in the habit of a Franciscan, and went to Suriano in the neighbourhood of Rome. As he well knew the cnmity which subsisted between the pope and King Charles, he disclosed his design to his holiness; who readily entered into his measures, wrote to Peter to hasten his armament, promising him the investiture of the island as soon as he had taken possession of it; and, by refusing the assistance he had promised to Charles, obliged him for the present to delay his ex-pedition. In the beginning of the year 1280, Procida returned to Arragon, and by showing the letters from the pope and Sicilian barons, prevailed on Peter to embark in his design, by assuring him of the assistance of Paleologus. This king of Arragon accordingly prepared a formidable fleet under pretence of invading Africa, and is even said to have received 20,000 ducats from Charles, in order to assist him in his preparations.

But while John went on thus successfully with his scheme, all his measures were in danger of being broke by the death of Pope Nicholas. The new pope, Martin IV. was entirely in the interest of Charles, on whom, in 1281, he conferred the senatorial dignity of Rome. Procida, however, still resolved to prosecute his scheme; and, leaving Italy, had another conference with the conspirators in Sicily; after which, he again went to Constantinople, and obtained from Paleologus 30,000 ounces of gold, with which he immediately returned to Arragon. The death of Nicholas had damped the ardour of Peter; but, being urged with great earnestness by John, he again renewed his preparations; which alarmed the pope and the king of France. In consequence of this they sent a message to him, desiring to know against what Saracens he designed to employ his armament. In this particular Peter refused to satisfy them; upon which they earnestly counselled Charles to guard against an invasion : but he neglected their advice, being wholly intent on his eastern expedition, and encouraged by a revolt which had happened in Greece; and to facilitate his expedition, he prevailed on the pope to excommunicate the Greeks, on prctence that they had broken some of the articles of union concluded at the council of Lyons a few years before. Peter in the mean time continued his preparations with great diligence, intending to put to sea the following summer. Procida had returned to They are Palermo, to wait for a favourable opportunity of put-massacred ting his design in execution, which was soon afforded him by the French. On Easter Monday, March 30. 1282, the chief conspirators had assembled at Palermo; and, after dinner, both the Palermitans and French went in a grand procession to the church of Monreale, about three miles without the city. While they were sporting

Germany.

26 become masters of Sicily and Naples.

sporting in the fields, a bride happened to pass by with her train, who being observed by one Drochettus, a Frenchman, he ran to her, and began to use her in a rude manner, under pretence of searching for concealed arms. A young Sieilian, exasperated at this affront stabbed him with his own sword; and a tumult ensuing, 200 French were immediately murdered. The enraged populace then ran to the city, crying out, " Let the French die, Let the French die ;" and, without distinction of age or sex, slaughtered all of that nation they could find, even such as had fled to the churches. The conspirators then left Palermo, and excited the inhabitants to murder the French all over the island, excepting in Messina, which eity at first refused to be concerned in the revolt. But, being invited by the Palermitans to throw off the French yoke, a few weeks after, the citizens in a tumultous manner destroyed some of the French ; and pulling down the arms of King Charles, and erecting those of the eity, chose one Baldwin for their governor, who saved the remaining French from the fury of the populace, and allowed them to transport themselves, with their wives and children to Italy. Eight thousand persons are said to have been murdered on this oceasion.

Immediately after this massaere, the Sicilians offered their allegiance to the king of Arragon; who accepted of the invitation, and landed with his forces at Trapani. From thence he went to Palermo, where he was crowned king of Sieily with great solemnity, and Charles left the island with precipitation. The day after he landed his army in Italy, the Arragonian fleet arrived, took 29 of his galleys, and the next day burnt 80 transports in presence of his army. Soon after this Charles sent an embassy to Peter, accusing him of perfidy, in invading his dominions in time of peace ; and, according to some, ehallenged him at the same time to decide the matter by single combat. Others say that the challenge was given by Peter. Certain it is, however, that a challenge was given, and to appearance accepted : but Peter determined to employ much more effectual means in support of his pretensions than trusting to a duel; and therefore pushed on his operations most vigorously, while his adversary trifled away his time : and thus he at last became master of the contested kingdom ; which, however, he did not long enjoy, dying about the end of the year 1285.

By his will, Peter left the kingdom of Ariagon to his eldest son Alphonsus, and Sicily to Don James his other son, who was also to succeed to the kingdom of Arragon in case Alphonsus should die without male issue. Accordingly, Don James was solemnly crowned at Palermo the 2d of February 1286. In 1295, however, he deserted them, and tamely resigned up his right to Charles, son to him above mentioned, in a manner perhaps unparalleled. On his resignation the Sieilians conferred the crown upon his brother Don Frederic : after which the war continued with great violence till the year 1303, when a peace was concluded, and the kingdoms of Naples and Sicily formally dis-Thing- joined; Frederic being allowed to keep the latter, under the name of Trinacria; and Charles being confirmed Ness and in the possession of the former, which he quietly enjoyed till his death in 1309.

Naples continued to be governed by its own kings Vol. XIV. Part II.

till the beginning of the 16th century, when the kings Naples, of France and Spain contended for the sovereignty of this country. Frederic, at that time king of Naples, resigned the sovereignty to Louis XII. on being created duke of Anjou, and receiving an annual pension of 30,000 dueats. But, in 1 504, the French were entire- The Spaly defeated by the Spaniards, and obliged to evacuate niards bethe kingdom; and the following year Louis renoun-sters of ced all pretensions to the crown, which from this time Naples. hath remained almost constantly in the hands of the Spaniards.

The government of the Spaniards proved no less oppressive to the Neapolitans than that of others had been. The kings of Spain set no bounds to their exactions, and of eonsequence the people were loaded with all manner of taxes ; even the most indispensable necessaries of life not being exempted. In 1647, a new tax was laid on fruit; which the people looked upon as the most gricvous oppression, the chief part of their subsistence, during the summer months, being fruit, which in the kiugdom of Naples is very plentiful and delicions. The edict for collecting the new duty was no sooner published, than the people began to murmur A general in a tumultuous manner; and when the viceroy came revolt. abroad, they surrounded his coach, bawling out to have their grievances redressed. They were encouraged in their sedition, by the news that the eitizens of Palermo had actually revolted on account of the imposition of new dutics. The viceroy, therefore, apprehensive of greater disorders, began to think of taking off the tax ; but those who farmed the tax having bribed some of his favourites, he was by their means per-suaded not to abolish it. The indignation of the people, who had suspected his intention, was now greatly inercased, especially as they were privately excited by several malecontents. The farmers of the revenue, and all those concerned in raising the taxes had incurred the hatred and detestation of the people, particularly of 31 Tommaso Aniello, commonly called Massaniello of Account of Amalfi, a fisherman, whose wife, having been discover. Massaniel-ed in smuggling a small quantity of meal, was imprisoned, and condemned to pay a fine of 100 ducats.

Massaniello, a few years before had come to Naples from Amalfi, where his father had been a fisherman. At this time he was about 24 years of age, and the father of four children. He was of a middle stature, and an agreeable aspect ; was distinguished for his boldness, activity, and integrity; and had a great influence with his companions, by whom he was beloved and esteemed. As he was obliged even to sell his furniture to pay the heavy fine, he had conceived an implacable hatred against the farmers of the taxes, and was also moved with compassion for the miserable state of the city and kingdom. He therefore formed a design, with some of his companions, to raise a tumult in the market place on the festival-day of the Carmelites, usually celebrated about the middle of July, when hetween 500 and 600 youths entertain the people by a moek fight; one half of them, in the character of Turks, defending a wooden eastle, which is attacked and stormed by the other half in the character of Christians. Massaniello being appointed eaptain of one of these parties, and one Pione, who was privy to his design, commanding the other, for several weeks 4 Hbefore

Naples.

dor of

N P A

Naples. before the festival they were very diligent in reviewing and training their followers, who were armed with sticks and recds; but a small and unforescen accident tempted them to begin their enterprise without waiting for the festival.

On the 7th of July a dispute happening in the market-place betwixt the tax-gatherers and some gardeners of Pozzuolo who had brought some figs into the city, whether the buyer or seller should pay the duty; after the tumult had continued several hours, Massaniello, who was present with his company, excited the mob to pillage the office built in the market for receiving the duty, and to drive away the officers with stones. The elect of the people, who, by deciding against the gardeners, had increased the tumult, ran to the palace, and informed the viceroy, who most imprudently neglected all means of putting a stop to the commotion. Massaniello, in the mean time, being joined by great numbers of people, ordered his young troop to set fire to all the offices for the taxes through the city; which command being executed with despatch, he then conducted them directly to the palace, where the viceroy, instead of ordering his Spanish and German guards to disperse them, encouraged their insolence by timidly granting their demands. As they rushed into the palace in a furious manner, he escaped by a private door, and endeavoured to save himself in Castel del Ovo; but being overtaken by the rioters in the streets, he was trampled upon by them, and pulled by the hair and whiskers. However, by throwing some handfuls of gold among them, he again escaped, and took sanctuary in a convent of Minims, where, being joined by the archbishop of Naples, Cardinal Filomarini, and several nobles, by their advice he signed a billet, by which he abolished all taxes upon provisions. As a means to quell the tumult, he likewise desired the cardinal to offer Massaniello a pension of 2400 crowns, who generously rejected the bribe ; and declared, that if the viceroy would keep his word, he would find them obedient subjects.

It was now expected that the tumult would cease; but Massaniello, upon his return to the market-place, being joined by several malecontents, among whom were Genuino and one Pcronnc, who had formerly been a captain of the Sbirri, he was advised by them to order the houses of those concerned in raising the tax to be burned ; which were accordingly in a few days reduced to ashes, with all their rich furniture. Massaniello being now absolute master of the whole city, and being joined by great numbers of people of desperate fortunes, he required the viceroy, who had retired to the Castel Nuovo, to abolish all the taxes, and to deliver up the writ of exemption granted by Charles V. This new demand greatly embarrassed the viccroy; but to appease the people, he drew up a false deed in letters of gold, and sent it to them by their favourite the duke of Matalone, who had before been in confinement. The fraud, however, being discovered, the duke was pulled from his horse and maltreated by the mob, and at length committed as a prisoner to Peronne. This accident, to the great joy of the viceroy, enraged the people against the nobility, several of whom they killed, burnt the houses of others, and threatened to extirpate them all. Massaniello, in the mean time, tat-

tered and half naked commanded his followers, who Naples, were now well armed, and reckoned about 100,000 men, with a most absolute sway. He ate and slept little, gave his orders with great precision and judgement, appeared full of moderation, without ambition and interested views. But the duke of Matalone having procured his liberty by bribing Peronnc, the viceroy imitated his example, and secretly corrupted Genuino to betray his chief. A conspiracy was accordingly formed against Massaniello by Matalone and Peronne; the duke, who was equally exasperated against the viceroy, proposing, that after his death his brother D. Joseph should head the rebels.

Massaniello in the mean time, by means of the cardinal archbishop, was negotiating a general peace and accommodation; but while both parties were assembling in the convent of the Carmelites, the banditti hired by Matalonc made an unsuccessful attempt upon Massaniello's life. His followers immediately killed 1 50 of them. Peronne and D. Joseph being discovered to be concerned in the conspiracy, were likewise put to death, and the duke with great difficulty escaped. Massaniello by this conspiracy was rendered more suspicious and severe. He began to abuse his power by putting several persons to death upon slight pretences ; and, to force the viceroy to an accommodation, he cut off all communication with the castles, which were unprovided with provision and ammunition .--- The viceroy likewise being afraid lest the French should take advantage of the commotion, earnestly desired to agree to a treaty; which was accordingly concluded on the A treaty fifth day of the insurrection, by the mediation of the conclude archbishop. By the treaty it was stipulated, that all between dutics imposed since the time of Charles V. should be Massanie abolished; that the writ of exemption granted by that lo and the emperor should be delivered to the people ; that for the viceroy. future no new taxes should be imposed ; that the vote of the clect of the people should be equal to the votes of the nobility; than an act of oblivion should be grantcd for all that was past; and that the people should continue in arms under Massaniello till the ratification of the treaty by the king.

By this treaty, no less than 10,000 persons who fattened upon the blood of the public were ruined .---The people, when it was solemnly published, manifested an extreme joy, believing they had now recovered all their ancient rights and privileges. Massaniello, at the desire of the viceroy, went to the palace to visit him, accompanied by the archbishop, who was obliged to threaten him with excommunication, before he would consent to lay aside his rags and assume a magnificent dress. He was received by the dukc with the greatest demonstrations of respect and friendship, while the duchess entertained his wife, and presented her with a robe of cloth of silver, and some jewels .--The viceroy, to preserve some shadow of authority, Massani appointed him captain-general; and at his departure lo appoint made him a present of a golden chain of great value, ed capt which with great difficulty he was prevailed upon to general accept; but yielded at length to the entreaties of the cardinal. Next day, in consequence of the commission granted him by the viceroy, he began to exercise all the functions of sovereign authority; and having caused a scaffold to be erected in one of the streets, and several

veral gibbets, he judged all crimes, whether civil or military, in the last resort; and ordered the guilty to be immediately put to death, which was the punishment he assigned to all offences. Though he neglected all forms of law, and even frequently judged by physiognomy, yet he is said not to have overlooked any criminal, or punished any innocent person.

His grandeur and prosperity were of very short continuance; for his mind becoming distracted and delirious for two or three days, he committed a great many mad and extravagant actions ; and on the 18th of July he was assassinated with the consent of the viceroy.

The tumult did not end with the death of Massaniello: on the contrary, the people now expelled the Spaniards from most of the cities throughout the kingdom; and this general insurrection being the subject of discourse at Rome, the duke of Guise, who happened then to be at the pope's court, took the opportunity, at the instigation of his holiness, to offer his service to the Ncapolitans against the Spaniards. The duke was prompted by his ambition to engage in this enterprise, especially as he himself had some distant pretensions to the crown. The Spaniards in the mean time made a vigorous attack on the city; but were repulsed by the people, who now formally renounced their allegiance to them. In a short time, however, their city being surprised by the new vicerov, the count d'Oniate, and the duke of Guise himself taken people prisoner, the people returned to their allegiance; and thus all the attempts of the French on Naples were frustrated. From that time the Spaniards continued in peaceable possession of the kingdom till the year 1707, when it was taken from them by Prince Eugene. It was formally ceded to the emperor by the treaty of Rastadt in 1713; but was recovered by the Spaniards in 1734, and a branch of the family of Spain has reigned there since that time. For a particular account of these revolutions, see the articles SPAIN and SICILY.

Naples, like the other states of Europe, has experienced many revolutions within the last thirty years. She took part in the alliance against France in 1793, but was little affected by the war till 1796, when the progress of the French arms in Italy induced her to conclude a peace. The continual encroachments of the French, however, made her take up arms again in concert with Austria in 1798; but her forces commanded by General Mack sustained repeated defeats, and the French gained possession of the capital. The king retired to Palermo in Sicily in December 1798, till the successes of Suwarrow compelled the French to withdraw their troops, after which he re-entered his capital in 1799. After the treaty of Luneville, Naples obtained pcace from France on the condition of giving up the port of Otranto. In 1806 the king admitted some British and Russian troops into his dominions, and this was made a pretext by Bonaparte for de-throning him. The kingdom of Naples was given to Joseph Bonapartc, who retained it till he was promoted to the crown of Spain in 1808, when Naples was given to Joachim Murat. From this period Naples followed the fortunes of France, and furnished men and money for her wars. After the disasters of the Russian campaign, Murat who had received some insults from Bonaparte shook off his authority, and entering into terms with the allies obtained a recognition of his in-

dependence. In the beginning of 1814 he assisted the Naples. Austrians in overthrowing the French viceroy in -Italy; but repenting of this course, or distrusting the intentions of the allies, he declared for Bonaparte when the latter returned to France in 1815. Fortune however did not favour him; he was defeated, and fled to France in May 1815. In a fit of rash enthusiasm he set out with a small band of 400 adventurers, landed in Naples in October, but instead of meeting with support was immediately taken and executed. Since that time Ferdinand IV. has had peaceable possession of the kingdom.

The climate of Naples is extremely hot, especially Climate, in July, August, and September. In winter there is produce, seldom any ice or snow, except on the mountains. Naples. On account of its fertility, it is justly termed an earthly paradise ; for it abounds with all sorts of grain, the finest fruit and garden productions of every kind, with rice, flax, oil, and winc, in the greatest plenty and perfection. It affords also saffron, manna, alum, vitriol, sulphur, rock crystal, marble, and several sorts of minerals, together with fine wool, and silk. The horses of this country are famous, and the flocks and herds very numerous. Besides these products, of which a considerable part is exported, there are manufactures of snuff, soap, and glass ware. Waistcoats, caps, stockings, and gloves, are also made of the hair or filaments of a shell fish, which are warmer than those of wool, and of a beautiful glossy green. In this kingdom likewise is found that called the Phrygian stone, or pietra fungifera, which, being laid in a damp shady place, will yield mushrooms, sometimes of a very large size, especially if the stone is sprinkled with hot water. See AGARICUS.

As to the mountains of this country, the principal are the Apennincs, which traverse it from south to north ; and Mount Vesuvius, which, as is well known, is a noted volcano, five Italian miles from Naples. The side of this mountain next the sea yields wine, particularly the two famed wines called Vino Greco and Lachrymæ Christi. One of the greatest inconveniences to which this kingdom is exposed is earthquakes, which the eruptions of Mount Vesuvius contribute, in some measure, to prevent. Another inconveniency, which, however, is common to it with other hot countries, is the great number of reptiles and insects, of which some are very poisonous.

With respect to religion, it is on a very bad foot. Religion, ing here. The number of convents and monasterics is astonishing. It is said, the clergy and convents possess two thirds of the whole kingdom : nay, some maintain, that were the kingdom divided into five parts, four would be found in the hands of the church. Notwithstanding this power and influence of the clergy, they have not been able hitherto to get the inquisition established here. In the year 1731, measures were taken for lessening the number of convents; and lately the order of Jesuits hath been suppressed. The papal bulls cannot be made public without the king's permission; nor are Protestants compelled to kneel in the churches, or at meeting the host; and in Lent they can very easily procure flesh meat. In the year 1740, the Jews were allowed to settle in the kingdom during the term of 50 years, and several privileges were granted them during that period ; at the expiration of which, 4H2 the

Naples.

\* View of

in Italy.

the grant was supposed to be renewed, unless they were expressly ordered to quit the country.

The king of Naples, or of the two Sicilies, is an hereditary monarch. The high colleges are, the council of state, the privy council, the treasury, the Sicily council, the council of war, &c. This kingdom is a papal licf; and the king, in acknowledgment of the pope's feudal right, sends him every year a white pal-fry, and a purse of 6000 ducats. The title of the king's eldest son is prince of Calabria. The number both of the high and low nobility in the kingdom of Naples is very great. "I am assured (says Dr Moore\*) Society, &c that the king of Naples counts among his subjects 100 persons with the title of prince, and a still greater with that of duke. Six or seven of these have estates which produce from 10 to 12 or 13,000l. a-year; a considerable number have fortunes of about half that value; and the annual revenue of many is not above 1000l. or 2000l. The inferior orders of the nobility are much poorer. Many counts and marquisses have not above 3001. or 4001. a-year of paternal estate; many have still less; and not a few enjoy the title without any estate whatever. These nobles, however, are excessively fond of splendour and show, which appears in the brilliancy of their equipages, the number of their attendants, the richness of their dress, and the grandeur of their titles. The finest carriages are painted, gilt, varnished, and lined, in a richer and more beautiful manner than has yet become fashionable either in England or in France. They are often drawn by six and sometimes by eight horses. Before the carriage, it is the mode to have two running footmen, and behind three or four servants in the richest liveries. The ladies and gentlemen within the coaches glitter in all the brilliancy of lace, embroidery, and jewels .---This finery is not confined to the persons within and without the coaches; it is extended to the horses, whose heads, manes, and tails, are ornamented with the rarest plumage, and set off with ribbons and artificial flowers."

The population of Naples in 1769 was 3,953,098; in 1783 it was 4,675,376, including 45,525 secular priests, 24,694 religious of the male sex, and 20,973 of the female. (Mentelle ct Malte Brun.).

In the kingdom of Naples, the hereditary jurisdiction of the nobles over their vassals subsists in the full rigour of the feudal government. The peasants therefore are poor; and it depends entirely on the personal character of the master, whether their poverty be not the least of their grievances. As this power is too often abused, the importance of the nobility depends in a great measure on the favour of the king, who, under pretence of any offence, can confine them to their estates, or imprison them at pleasure. Unless this prince were so very impolitic as to disgust all the nobility at once, and so unite the whole body against him, he has little to fear from their resentment. Even in case of such an union, as the nobles have lost the affection of their vassals, what could they do in opposition to a standing army of 30,000 men, entirely devoted to the crown? The government of Naples, therefore, is in fact a despotic monarchy, though something like the form of a feudal constitution in its ancient purity is still kept up by the biennial summons of the general

. . .

assembly. This convention, which consists of the no- Naples. bility and commons, is called together every two years, to deliberate on the customary free gift to the crown.

The inhabitants of this country have at all times borne but an indifferent character among other nations. " From the few hints dropped by the classic authors, we collect that the ancient Neapolitans were a race of epicures, of a soft indolent turn, averse from martial exerciscs, passionately fond of theatrical amusements and music, expert in all the refined arts that administer to the caprices of luxury, extravagant in their expressions and gestures, and dupes to various sorts of superstition. If we make allowance for a quantity of northern blood which has joined the original Grecian stream, and imparted a roughness not yet worn off by the mildness of the climate, we shall find the modern Neapolitans very like the ancient .- Provisions being here plentiful and cheap, the lower class of people work but little. Their delight is to bask in the sun, and do nothing. Persons of a middle rank frequent places of public resort; and very few of any rank attend to their proper business with the zeal and activity we are wont to meet with in the professional men of colder countries. Gluttony is a predominant vice, while instances of ebricty are comparatively rare. In the female sex, the passion for finery is almost superior to every other; and, though chastity is not the characteristic virtue of the country, Mr Swinburne doubts \* whether a Neupolitan woman would \* Travels not nine times out of ten prefer a present to a lover. in the two That furious jealousy for which the nation was once so Sicilies. remarkable, is now greatly abated. The breach of the conjugal vow sometimes occasions quarrels and assassinations among people of an inferior station ; and in the metropolis, assassinations are often perpetrated from much less cogent motives. Of these vices, many are doubtless owing to that slavery and oppression under which they groan, and to a radical defect in the administration of justice, though the kingdom is divided into 12 provinces or jurisdictions.

NAPLES, anciently Parthenope, afterwards Ncapolis, the capital of the kingdom of that name in Italy, lies in the province called Terra de Lavora, which is the richest and best inhabited of the whole kingdom, and comprehends a part of the ancient Campania Felix or the Happy. This city is fabled to owe its foundation to a Syren, and to have received its ancient name from its supernatural foundress. Whatever be its origin, it is the first for neatness, and the second for extent, of all the cities in Italy. It was formerly a place of strength; but its walls at present being of no real defence, its safety depends of course upon the force of its armics. It is most advantageously situated, having a delicious country on one side, and a noble bay of the Mediterranean on the other, with an excellent harhour. The circumference, including the suburbs, is said not to he less than 18 Italian miles, and the number of the inhabitants therein little less than 300,000. The houses are of stone, flat roofed, and generally lofty and uniform; but many of them have balconies, with lattice windows. The streets are well paved; but they are not lighted at night, and in the day time are disfigured, in many places, by stalls, on which provisions are exposed to sale. Here are a great number of fine churches, convents, fountains, and palaces of the nobility, Naples.

1

lity, many of whom constantly reside here. It is usual to walk on the tops of the houses in the evenings, to breathe the sweet cool air, after a hot sultry day. The climate here is so mild and warm, even in the winter, that plenty of green pease, artichokes, asparagus, and other vegetables, may be had so early as the beginning of the new year, and even all the winter. This city swarms with monks and nuns of all sorts, to such a degree, that there are no less than 149 convents. There are also 34 poorhouses, 11 hospitals, 43 parish churches, and 70 other churches. The magnificence of many of the churches exceeds imagination. In a cloister of the Carthusian monastery is a crucifix, said to be done by Michael Angelo, of inimitable workmanship.

To repel hostile attempts by sea, which from its situation, maritime powers might be tempted to make, Naples has, to the west, the Castel del Ovo, a confused pile of ancient buildings, and some modern batteries. The rock upon which this fortress stands was originally called Megara, then Lucullanum; and was considered as a place of strength so early as the year 475. Along the line of the shore towards the east are some batterics on the points of land, the bastions of the arsenal, and above it the lofty wall of the Castel Nuovo. This last fortress has been the usual refuge of the sovereigns and viceroys in all civil wars and tumults; for which reason they have long fixed their residence near its walls. A blockhouse and batteries defend the mouth of the harbour, and at the eastern extremity of the town is the Torrione de Carmine, better known by the figure it made in Massaniello's rebellion than by its extent or military strength. The castle of St Elmo commands Naples in every direction, and is in reality calculated rather to annoy and awe the citizens than to defend them from foreign invaders. The city is indeed far from being secure against a bombardment; for the sea is so deep, that a large vessel may come up to the vcry mole in defiance of the blockhouse and batteries, &c. Pictures, statues, and antiquities, are not so common in Naples as might be expected in so great and ancient a city, many of the most valuable pieces having been sent to Spain by the viceroys. The bay is one of the finest in the world, being almost of a round figure, about 30 miles in diameter, and three parts of it sheltered with a nohle circuit of woods and mountains. The city stands in the bosom of this bay, in as pleasant a situation, perhaps, as is in the world. Mr Keysler says, they reckon about 18,000 donne libere, or courtezans, in the city; and Dr Moore computes the number of lazzaroni, or blackguards at above 30,000. The greater part of these wretches have no dwelling houses, but sleep every night under porticos, piazzas, or any kind of shelter they can find. Those of them who have wives and children, live in the suburbs of Naples near Peusilippo, in huts, or in caverns or chambers dug out of that mountain. They are generally represented as a lazy, licentious, and turbulent set of people, as indeed by far the greater part of the rabble arc, who prefer begging or robbing, or running errands, to any fixed and permanent employment. Yct there are in Naples some flourishing manufactures, particularly of silk stockings, soap, snuff-boxes of tortoise shells and the lava of Mount Vesuvius, tables, and ornamental furniture of

marble. The city is supplied with a vast quantity of Naples water, by means of a very costly aqueduct, from the foot of Mount Vesuvius. Mr Addison says, it is in- Narbonne credible how great a multitude of retainers to the law there are in Naples, who find continual employment from the fiery temper of the inhabitants. There are five piazzas or squares in the city, appropriated to the nobility, viz. those called Capuana, Nido, Montagna, Porto, and Porta Nova. Of all the palaces, that of the king is not only the most magnificent, but also in the best style of architecture. The cathedral, though Gothic, is a very grand splendid edifice. It is here that the head and blood of St Januarius, the tutelary saint of Naples, are kept, the latter in two glass or crystal vials. The pretended liquefaction of the dried blood, as soon as bronght near the head of the saint; is a thing well known; Mr Addison says, it is one of the most bungling tricks he ever saw. The harbour is spacious, and kept in good repair. It is fortified. with a mole, which runs about a quarter of a mile into the sea, and at the extremity has a high lanthorn to direct ships safely into the harbour. Luxury here is restrained by severe sumptuary laws, and the women are more closely confined than in any other city of Italy. Here is an university and two academics of wits, the one called Gli Ardenti, and the other Gli Otiosi. The nunnery for ladies of quality is said to be the largest in the whole world, containing no less than 350 nnns, besides servants. The Mount of Piety, or the office for advancing money to the poor, on pledges, at a low interest, or without any, has an income of upwards of 50,000 ducats. The arsenal is said to contain arms for 50,000 men. The walls of the city consist of hard black quarry stones, called piperno. Instead of ice, vast quantities of snow are used for cooling their liquors, not so much as water being drank without it ; so that, it is said, a scarcity of it would as soon occasion a mutiny as a dearth of corn or provisions. Certain persons, who farm the monopoly of it from the government, supply the city all the year round from a mountain about 18 miles off, at so much the pound. In the beginning of 1799, it was taken by a body of French troops under General Championet. The streets of this city were lighted for the first time on the 16th December, 1806. Naples stands 110 miles south-east from Rome, 164 north-cast from Palermo in Sicily, 217 south-east from Florence, and 300 from Venice. E. Long. 14. 20. N. Lat. 40. 55.

NARBO, in Ancient Geography, a town of the Volscæ Tectosages, called also Narbo Martius, from the Legio Martia, the colony led thither 59 years before the consulate of Cæsar, (Velleius); increased with a colony of the Decumani or tenth legion by Cæsar. An ancient trading town on the Atax, which discharges itself into the sea through the Lacus Rubresus, or Rubrensis. Capital of Gallia Narbonensis ; surnamed Colonia Julia Paterna, from Julius Cæsar, the father of Augustus by adoption. Now called Narbonne, a city of Languedoc.

NARBONNE, is a city of France, in the department of Aude, with an archbishop's see, and is particularly famous for its honey. It is seated on a canal cut from the river Aude, which being but three miles from the sca, vessels come up it laden with merchandise, which renders

Nardus.

614

Narea.

Narbonne renders it a place of some trade. But though it pretends to the most remote antiquity under the Celtic kings, in ages anterior even to the Roman conquests, which under these latter masters gave its name to all Gallia Narbonensis, and was a colony of the first consideration, it is now dwindled to a wretched solitary town containing 9000 inhabitants, of whom threefourths are priests and women. The streets and buildings are mean and ruinous; it has indeed a communication with the Mediterranean, from which Narbonne is only about three leagues distant, by means of a small river which intersects the place; but their commerce is very limited, and chiefly consists in grain which they export to Cette and Marseilles. No marks of Roman magnificence remain, except several inscriptions in different parts of the city. It is divided into the city and the town, which are joined together by a bridge, with houses on each side, in which the richest merchants live. There are several churches and convents; the metropolitan church has a handsome steeple. E. Long. 3. 6. N. Lat. 43. 11.

NARCISSUS, in fabulous history, the son of the river Cephissus and Liriope the daughter of Oceanus, was a youth of great beauty. Tiresias foretold that he should live till he saw himself. He despised all the nymphs of the country; and made Echo languish till she became a merc sound, by refusing to return her passion : but one day coming weary and fatigued from the chase, hc stopped on the bank of a fountain to quench his thirst : when, seeing his own form in the water, he became so in love with the shadowy image, that he languished till he died. On which the gods, being moved at his death, changed him into the flower which bears his name.

NARCISSUS, a genus of plants belonging to the hexandria class; and in the natural method ranking under the 9th order, Spathaceæ. See BOTANY Index.

NARCOTICS, in Medicine, soporiferous drugs, which bring on a stupefaction. Among narcotics the most eminent are those usually prepared for medicinal uses from the poppy, especially opium; as also all those prepared from mandragoras, hyoscyamus, stramonium and datura. See MATERIA MEDICA Index.

NARDO, a pretty populous town in the kingdom of Naples, and in the Terra d'Otranto, with the title of a duchy and a bishop's see. E. Long. 18. 27. N. Lat. 43. 28.

In this little city are 8000 inhabitants. The steeple of its cathedral is built in a very uncommon but showy style of Gothic architecture. Luco Giordano and Solimeni have adorned the church with some agreeable paintings. This place was a part of the Balzo estate. The Aquavivas were the next possessors: they are thought to have come from the Marca di Ancona. In 1401, in consideration of their relationship to Pope Boniface IX. Laudislaus erected their manor of Atri into a dukedom, an honour till then seldom granted to any but princes of the blood royal. Claudius Aquaviva, a famous general of the Jesuits, who died in 1615, was of this family.

NARDUS, a genus of plants belonging to the triandria class; and in the natural method ranking under the 4th order, Gramina. See BOTANY Index.

This plant was highly valued by the ancients, both as an article of luxury and medicine. The unguentum

nardinum, was used at baths and feasts as a favourite Nardus, perfume. Its value is evident from that passage of Scripture, where our Saviour's head was anointed with a box of it, with which Judas found fault. From a passage in Horace, it appears that this ointment was so valuable among the Romans, that as much as could be contained in a small box of precious stone was considered as a sort of equivalent for a large vessel of wine, and a proper quota for a guest to contribute at an entertainment, according to the ancient custom:

### ----- Nardo vina merebere. Nardi parvus onyx eliciet cadum.

NAREA, the most southerly province of the empire of Abyssinia; a kingdom still governed by its own princes, who have the title of Beneros. Its territory was formerly more extensive than at present, the Galla having almost quite surrounded it, especially on the south-east and north. The country to the west is the most unknown part of Africa; the kingdom itself stands like a fortified place in the middle of a plain, being a high and mountainous country. A great many rivers, rising in the fourth and fifth degrees of north latitude, spread themselves over the level part of the country, and fill it with marshes all the way from south by east to north or north-west.-These marshes are bounded by mountains, of which those nearest the marshes are overgrown with coffce trees, the largest, if not the only ones, which grow in this country. The kingdom of Narea Proper is interspersed with small, unwholesome, but very fertile valleys. The mountainous country of Caffa adjoins immediately to Narca, and is said to be governed by a separate prince; but the Galla having settled themselves in all the flat ground to the very edge of the marshes, have in a great measure cut off the communication with Abyssinia for a long time past. The Nareans who inhabit the mountainous country have the lightest complexion of any people in Abyssinia; but those who inhabit the borders of the marshes are perfectly black, and have the features and woolly heads of negroes; but the mountaineers of Narea, and much more those of Caffa, are fair complexioned, more so than even the Neapolitans or Sicilians. It is said that snow has been seen to lie on some of the mountains of Caffa; but Mr Bruce imagines this to be a mistake, and thinks that it must have been hail.

Narea abounds with cattle, grain, and all kinds of provisions, both in the high and low country. The medium of commerce is gold, which they sell by weight; but the principal articles of trade arc coarse cotton cloths, antimony, beads, and incense, which are carried from this country to the kingdom of Angola, and the parts of the African continent towards the Atlantic. The people are exceedingly brave; and though they have been driven out of the low country by multitudes of Galla, they now bid them defiance, and drive them from their frontiers whenever they come too near. The Narean prisoners taken in these skirmishes arc sold to the Mahometan merchants at Gondar; and at Constantinople, Cairo, or in India, the women are more esteemed than those of any other part of the world. Both sexes have a cheerful kind disposition, and attach themselves inviolably to their masters, if properly treated. The people of Narea and Caffa speak a language peculiar to themselves.

NARRATION,

1

recital or rehearsal of a fact as it happened, or as it is supposed to have happened. See ORATORY, N° 26. 123.

Concerning NARRATION and Description we have the following rules and observations in the Elements of Critieism.

1. The first rule is, That in history the reflections ought to be chaste and solid; for while the mind is intent upon truth, it is little disposed to the operation of the imagination. Strada's Belgic history is full of poetical images, which being discordant with the subject, are unpleasant; and they have a still worse effect by giving an air of fiction to a genuine history. Such flowers ought to be scattered with a sparing hand, even in epic poetry; and at no rate are they proper till the reader be warmed, and by an enlivened imagination be prepared to relish them : in that state of mind, they are agreeable; but while we are sedate and attentive to an historical chain of facts, we reject with disdain every fietion.

2. Vida, following Horace, recommends a modest commencement of an epic poem; giving for a reason that the writer ought to husband his fire. Besides bold thoughts and figures are never relished till the mind be heated and thoroughly engaged, which is not the reader's case at the commencement. Homer introduces not a single simile in the first book of the Iliad, nor in the first book of the Odyssey. On the other hand, Shakespeare begins one of his plays with a sentiment too bold for the most heated imagination:

Bedford. Hung be the heav'ns with black, yield day to night !

Comets, importing change of times and states, Brandish your crystal tresses in the sky, And with them scourge the bad revolting stars, That have eonsented unto Henry's death ! Henry the Fifth, too famous to live long ! England ne'er lost a king of so much worth.

## First part Henry VI.

The passage with which Strada begins his history, is too poetical for a subject of that kind; and at any rate too high for the beginning of a grave performance.

3. A third rule or observation is, That where the subject is intended for entertainment solely, not for instruction, a thing ought to be described as it appears, not as it is in reality. In running, for example, the impulse upon the ground is proportioned in some degree to the eelerity of motion; though in appearance it is otherwise, for a person in swift motion seems to skim the ground, and searcely to touch it. Virgil, with great taste, describes quick running according to appearance; and raises an image far more lively than by adhering scrupulously to truth:

Hos super advenit Volsea de gente Camilla, Agmen agens equitum, et florentes ære eatervas, Bellatrix : non illa eolo calathisve Minervæ Fæmineas assueta manus ; sed prælia virgo Dura pati cursuque pedum prævertere ventos. Illa vel intaetæ segetis per summa volaret Gramina, nee teneras eursu læsisset aristas : Vel mare per medium, fluetu suspensa tumenti, Ferret iter, celeres nec tingeret æquore plantas.

Æneid, vii. 803.

4. In narration as well as in description, objects Narration. ought to be painted so accurately as to form in the mind of the reader distinct and lively images. Every useless eircumstance ought indeed to be suppressed, because every such circumstance loads the narration ; but if a eireumstance be necessary, however slight, it can-not be described too minutely. The force of language consists in raising complete images, which have the effect to transport the reader as by magic into the very place of the important action, and to convert him as it were into a spectator, beholding every thing that passes. The narrative in an epie poem ought to rival a picture in the liveliness and accuracy of its representations : no eircumstance must be omitted that tends to make a complete image ; because an imperfect image as well as any other imperfect conception, is cold and uninteresting. We shall illustrate this rule by several examples, giving the first place to a beautiful passage from Virgil:

Qualis populca mœrens Philomela sub umbra Amissos queritur fœtus, quos durus arator Observans nido implumes detraxit.

Georg. lib. iv. 511.

The poplar, ploughman, and unfledged young, though not essential in the description, tend to make a complete image, and upon that account are an embellishnient.

Again :

Hic viridem Æneas frondenti ex ilice metam Constituit, signum nautis. Æneid, v. 129.

Horace addressing to Fortune :

Te pauper ambit sollieita prece Ruris colonus : te dominam æquoris, Quicumque Bithynâ lacessit Carpathium pelagus earinâ.

Carm. lib. i. ode 35.

—— Illum ex mœnibus hostieis Matrona bellantis tyranni Prospieiens, et adulta virgo, Suspiret : Eheu, ne rudis agminum Sponsus lacessat regius asperum Tactu leonem, quem eruenta Per medias rapit ira eædes.

Carm. lib. iii. ode 2.

Shakespeare says, "You may as well go about to turn the sun to ice by fanning in his face with a *pcacock's* feather." The peacoek's feather, not to mention the beauty of the object, completes the image: an aceurate image cannot be formed of that fanciful operation, without conceiving a particular feather; and one is at a loss when this is neglected in the description. Again, "The rognes slighted me into the river with as little remorse, as they would have drown'd a bitch's blind puppies, fifteen i' th' litter."

Old Lady. You would not be a queen?

Anne. No, not for all the riches under heaven.

Old Lady. 'Tis strange : a threepence bow'd would hire me, old as I am, to queen it.

Henry VIII. act ii. se. 5.

In the following passage, the action, with all its materi-

al

Γ

Narration. al circumstances, is represented so much to the life, that it would scarce appear more distinct to a real spectator; and it is the manner of description that contri-

butes greatly to the sublimity of the passage-

He spake ; and, to confirm his words, out flew Millions of flaming swords, drawn from the thighs Of mighty cherubim ; the sudden blaze Far round illumin'd hell : highly they rag'd Against the Highest, and fierce with grasped arms, Clash'd on their sounding shields the din of war, Hurling defiance toward the vault of heav'n. MILTON, book i.

The following passage from Shakespeare falls not much short of that now mentioned in particularity of description:

O you hard hearts ! ye eruel men of Rome ! Knew you not Pompey ? Many a time and oft Have you climb'd up to walls and battlements, To towers and windows, yea, to chimney tops, Your infants in your arms, and there have sat The live-long day with patient expectation To see great Pompey pass the streets of Rome; And when you saw his chariot but appear, Have you not made an universal shout, That Tyber trembled underneath his banks, To hear the replication of your sounds, Made in his concave shore ?

### Julius Cæsar, act i. sc. 1.

The following passage is scarcely inferior to either of those mentioned:

"Far before the rest, the son of Ossian comes: bright in the smiles of youth, fair as the first beams of the sun. His long hair waves on his back : his dark brow is half beneath his helmet. The sword hangs loose on the hero's side; and his spear glitters as he moves. I fled from his terrible eye, king of high Temora. Fingal.

The Henriade of Voltaire errs greatly against the foregoing rule: every incident is touched in a summary way, without ever descending to eircumstances. This manner is good in a general history, the purpose of which is to record important transactions: but in a fable it is cold and uninteresting; because it is impractieable to form distinct images of persons or things represented in a manner so superficial.

It is observed above, that every useless circumstance ought to be suppressed. The crowding such circumstances is, on the one hand, not less to be avoided than the conciseness for which Voltaire is blamed, on the other. In the Æneid, Barce, the nurse of Sichæus, whom we never hear of before nor after, is introduced for a purpose not more important than to call Anna to her sister Dido: and that it might not be thought unjust in Dido, even in this trivial circumstance, to prefer her husband's nurse before her own, the poet takes care to inform his reader, that Dido's nurse was dead. To this may be opposed a beautiful passage in the same book, where, after Dido's last speech, the poet, without detaining his readers by describing the manner of her death, hastens to the lamentation of her attendants :

Dixerat : atque illam media inter talia ferro Collapsam aspieiunt comites, ensemque cruore Spumantem, sparsasque manus. It clamor ad alta Atria ; concussam bacehatur fama per urbem ; Lamentis gemituque, et fœmineo ululatu Tecta fremunt, resonat magnis plangoribus æther.

Lib. iv. 663.

Narration.

As an appendix to the foregoing rule, may be added the following observation, That to make a sudden and strong impression, some single circumstance, happily selected, has more power than the most laboured description. Macbeth, mentioning to his lady some voices he heard while he was murdering the King, says,

There's one did laugh in's sleep, and one cry'd Murder!

They wak'd each other; and I stood and heard them:

But they did say their prayers, and address them Again to sleep.

Lady. There are two lodg'd together.

Macbeth. One ery'd, God bless us ! and, Amen ! the other ;

As they had seen me with these hangman's hands,

Listening their fear. I could not say Amen,

When they did say, God bless us.

Lady. Consider it not so deeply.

Macbeth. But wherefore could not I pronounce Amen!

I had most need of blessing, and Amen

Stuck in my throat.

Lady. These deeds must not be thought After these ways; so, it will make us mad.

Macbeth. Methought, I heard a voice cry, Sleep no more !

Macbeth doth murder sleep, &c. Act ii. se. 2.

Describing Prince Henry :

I saw young Harry, with his heaver on,

His cuisses on his thighs, gallantly arm'd,

Rise from the ground like feather'd Mercury ;

And vaulted with such ease into his seat,

As if an angel dropt down from the elouds,

To turn and wind a fiery Pegasus,

And witch the world with noble horsemanship. First Part Henry IV. act iii. sc. 3.

King Henry. Lord Cardinal, if thou think'st on Heaven's bliss,

Hold up thy hand, make signal of thy hope.

He dies, and makes no sign !

Second Part Henry VI. act. iii. sc. iii.

The same author, speaking ludicrously of an army debilitated with diseases, says,

"Half of them dare not shake the snow from off their cassocks, lest they shake themselves to pieces."

"I have seen the walls of Balclutha, but they were desolate. The flames had resounded in the halls: and the voice of the people is heard no more. The stream of Clutha was removed from its place by the fall of the walls. The thistle shook there its lonely head: the moss whistled to the wind. The fox looked out from the windows: and the rank grass of the wall waved round

4

regration. round his head. Desolate is the dwelling of Morna : silence is in the house of her fathers." Fingal.

> To draw a character is the master stroke of description. In this Tacitus excels; his portraits are natural and lively, not a feature wanting or misplaced. Shakespeare, however, exceeds Tacitus in liveliness; some characteristical circumstance being generally invented or laid hold of, which paints more to the life than many words. The following instances will explain our meaning, and at the same time prove our observation to be just.

Why should a man, whose blood is warm within, Sit like his grandsire cut in alabaster ? Sleep when he wakes, and creep into the jaundice, By being peevish ? I tell thee what, Anthonio, (I love thee, and it is my love that speaks), There are a sort of men, whose visages Do eream and mantle like a standing pond; And do a wilful stillness cutertain, With purpose to be dress'd in an opinion Of wisdom, gravity, profound conceit; As who should say, I am Sir Oracle, And when I ope my lips, let no dog bark ! O my Anthonio ! I do know of those, That therefore only are reputed wise, For saying nothing.

## Merchant of Venice, act i. sc. 1.

Again:

" Gratiano speaks an infinite deal of nothing, more than any man in all Venice : his reasons are two grains of wheat hid in two bushels of chaff; you shall seek all day ere you find them; and when you have them, they are not worth the search." Ibid.

In the following passage a character is completed by a single stroke :

Shallow. O the mad days that I have spent; and to see how many of mine old acquaintance are dead.

Silence. We shall all follow, cousin.

Shallow. Certain, 'tis certain, very sure, very sure ; Death (as the Psalmist saith) is certain to all : all shall die. How a good yoke of bullocks at Stamford fair ?

Slender. Truly cousin, I was not there.

Shallow. Death is certain. Is old Double of your town living yet?

Silence. Dead, Sir.

Shallow. Dead! see, see: he drew a good bow: and dead. He shot a fine shot. How a score of ewes now ?

Silence. Thereafter as they be. A score of good ewes may be worth ten pounds.

Shallow. And is old Double dead ?

Second part Henry IV. act iii. sc. 2.

Describing a jealous husband :

" Neither press, coffer, chest, trunk, well, vanlt, but he hath an abstract for the remembrance of such places, and goes to them by his note. There is no hiding you in the house." Merry Wives of Windsor, act iv. se. 3.

Congreve has an inimitable stroke of this kind in his comedy of Love for Love :

Ben Legend. Well, father, and how do all at home? how does brother Dick, and brother Val? 4

VOL. XIV. Part II.

#### N A R

Sir Sampson. Dick, hody o' me, Dick has been dead Narration. these two years. I writ you word when you were at -Leghorn.

Ben. Mess, that's true ; marry I had forgot. Dick's dead, as you say. Act in. sc. 6.

Falstaff speaking of Ancient Pistol :

"He's no swaggerer, hostess; a tame cheater i'faith: you may stroak him as gently as a puppy greyhound ; he will not swagger with a Barbary hen, if her feathers turn back in any show of resistance."

Second part Henry IV. act ii. sc. 4.

Ossian, among his other excellencics, is eminently successful in drawing characters; and he never fails to delight his reader with the beautiful attitudes of his heroes. Take the following instances :

" O Oscar ! bend the strong in arm; but spare the feeble hand. Be thou a stream of many tides against the foes of thy people; but like the gale that moves the grass to those who ask thine aid .- So Trenmor lived ; such Trathal was; and such has Fingal been. My arm was the support of the injured; and the weak rested behind the lightning of my steel."

"We heard the voice of joy on the coast, and we thought that the mighty Cathmor came. Cathmor the friend of strangers! the brother of red-haired Cairbar! But their souls were not the same; for the light of heaven was on the bosom of Cathmor. His towers rose on the banks of Atha : seven paths led to his halls : seven chiefs stood on these paths, and called the stranger to the feast. But Cathmor dwelt in the wood to avoid the voice of praise."

" Dermid and Oscar were one: they reaped the battle together. Their friendship was strong as their steel; and death walked between them to the field. They rush on the foe like two rocks falling from the brow of Ardven. Their swords are stained with the blood of the valiant : warriors faint at their name. Who is equal to Oscar but Dermid ? who to Dermid but Oscar?

" Son of Comhal, replied the chief, the strength of Morni's arm has failed : 1 attempted to draw the sword of my youth, but it remains in its place : I throw the spear, but it falls short of the mark : and I feel the weight of my shield. We decay like the grass of the mountain, and our strength returns no more. I have a son, O Fingal ! his soul has delighted in the actions of Morni's youth ; but his sword has not been fitted against the foe, neither has his fame begun. I come with him to battle, to direct his arm. His renown will be a sun to my soul, in the dark hour of my departure. O that the name of Morni were forgot among the people! that the heroes would only say, Behold the father of Gaul."

Some writers, through heat of imagination, fall into contradiction ; some are guilty of downright absurdities ; and some even rave like madmen. Against such capital errors one cannot be more effectually warned than by collecting instances; and the first shall be of a contradiction, the most venial of all. Virgil speaking of Neptune,

4 T

Interea

Narration. - Interea magno misceri murmure pontum, Emissamque hyemem sensit Neptunus, et imis Stagna refusa vadis; graviter commotus, et alto Prospiciens, summa placidum caput extulit unda. Æneid. i. 128.

Again:

When first young Maro, in his boundless mind, A work t'outlast immortal Rome design'd. Essay on Criticism, 30.

The following examples are of absurdities.

"Alii pulsis é tormento catenis discerpti sectique, dimidiato corpore pugnabant sibi superstites, ac per-STRADA, Dec. ii. 2. emptæ partis ultores."

Il pover huomo, che non sen' cra accorto, Berni. Andava combattendo, ed era morto.

He fled, but flying, left his life behind.

Iliad, xi. 443.

Full through his neck the weighty falchion sped : Along the pavement roll'd the mutt'ring head. Odyssey, xxii. 365.

The last article is of raving like one mad. Cleopatra speaking to the aspic,

-Welcome, thou kind deceiver, Thou best of thieves; who, with an easy key, Dost open life, and unperceiv'd by us Ev'n steal us from ourselves; discharging so Death's dreadful office, better than himself; Touching our limbs so gently into slumber, That Death stands by, deceiv'd by his own image, And thinks himself but sleep.

DRYDEN, All for Love, act v.

Having discussed what observations occurred upon the thoughts or things expressed, we proceed to what more peculiarly concerns the language or verbal dress. As words are intimately connected with the ideas they represent, the emotions raised by the sound and by the sense ought to be concordant. An elevated subject requires an elevated style ; what is familiar, ought to be familiarly expressed : a subject that is serious and important, ought to be clothed in plain nervous language : a description, on the other hand, addressed to the imagination, is susceptible of the highest ornaments that sounding words and figurative expression can bestow upon it.

We shall give a few examples of the foregoing rules. A poet of any genius is not apt to dress a high subject in low words; and yet blemishes of that kind are found even in classical works. Horace, observing that men are satisfied with themselves, but seldom with their condition, introduces Jupiter indulging to each his own choice:

Jam faciam quod vultis; eris tu, qui modo miles, Mercator; tu, consultus modo, rusticus: hinc vos, Vos hinc, mutatis discedite partibus. eia, Quid ? statis ? nolint. atqui licet esse beatis. Quid causæ est, merito quin illis Jupiter ambas Iratus buccas inflct, neque se fore posthac Tam facilem dicat, votis ut præbeat aurem ? Sat. i. 16.

Jupiter in wrath puffing up both cheeks, is a low and Narration. even ludicrous expression, far from suitable to the gravity and importance of the subject : every one must feel the discordance. The following couplet, sinking far below the subject, is no less ludicrous:

Not one looks backward, onward still he goes, Yet ne'er looks forward farther than his nose. Essay on Man, ep. iv. 223.

On the other hand, to raise the expression above the tone of the subject, is a fault than which none is more common. Take the following instances:

Orcan le plus fidéle à servir ses desseins, Ne sous le ciel brûlant des plus noirs Africains. Bajazet, act in. sc. 8.

Les ómbres par trois fois ont obscurci les cieux Depuis que le sommeil n'est entré dans vos yeux ; Et le jour a trois fois chassé la nuit obscure Depuis que votre corps languit sans nourriture. Phædra, act i. sc. 3.

Assueris. Ce mortel, qui montra tant de zéle pour moi, Vit-il encore?

Asaph. \_\_\_\_Il voit l'astre qui vous éclaire. Esther, act ii. sc. 3.

Oui, c'est Agamemnon, c'est ton roi qui t'cveille ; Viens, reconnois la voix qui frappe ton oreille. Iphigenia.

No jocund health that Denmark drinks to-day, But the great cannon to the clouds shall tell; And the king's rowse the heav'n shall bruit again, Respeaking earthly thunder.

Hamlet, act i. sc. 2.

-In the inner room

I spy a winking lamp, that weakly strikes The ambient air, scarce kindling into light. SOUTHERNE, Fate of Capua, act iii.

In the Funcral Orations of the bishop of Mcaux, the following passages are raised far above the tone of the subject;

"L'Ocean etonné de se voir traversé tant de fois, en des appareils si divers, et pour des causes si differentes, Pag. 6. Sc."

" Grande reine, je satisfais à vos plus tendres desirs, quand je célébre cc monarque ; et son cœur qui n'a jamais vêcu que pour lui, s'eveille, tout poudre qu'il est, et devient scnsible, même sous ce drap mortuaire, au Pag. 32. nom d'un cpoux si cher."

The following passage, intended, one would imagine, as a receipt to boil water, is altogether burlesque by the laboured elevation of the diction :

A massy cauldron of stupendous frame

They brought, and plac'd it o'er the rising flame : Then heap the lighted wood ; the flame divides Bencath the vase, and climbs around the sides : In its wide womb they pour the rushing stream : The boiling water bubbles to the brim.

Iliad, xviii. 405.

In a passage at the beginning of the 4th book of Telemachus, one feels a sudden bound upward without preparation, which accords not with the subject : " Calypso,

" Calvpso, qui avoit éte jusq' à ce moment immoarration. bile et transporteé de plaisir en écoutant les aventures de Télémaque, l'interrompit pour lui faire prendre quelque repôs. Il est tems, lui dit-elle, que vous alliez goûter la douceur du sommeil aprés tant de travaux. Vous n'avez rien à craindre ici; tout vous est favorable. Abandonnez vous donc à la joie. Goutez la paix, et tous les autres dons des dieux dont vous allez être comblé. Demain, quand l'Aurore avec ses doigts de rôses entr'ouvrira les portes dorées de l'Orient, et que les chevaux du soleil, sortant de l'onde amére, répandront les flames du jour, pour chasser devant eux toutes les ctoiles du ciel, nons reprendrons, mon cher Télémaque, l'histoire de vos malheurs."

> This obviously is copied from a similar passage in the Æneid, which ought not to have been copied, because it lies open to the same censure ; but the force of authority is great:

At regina gravi jamdudum saucia eura, Vulnus alit venis, et eœco earpitur igni. Multa viri virtus animo, multusque recursat Gentis honos : hærent infixi pectore vultus, Verbaque : nec plaeidam membris dat cura quietem. Postera Phœbea lustrabat lampade terras, Humentemque Aurora polo dimoverat umbram; Cum sie unanimem alloquitur malesana sororem. Lib. iv. I.

The language of Homer is suited to his subject, not less accurately than the actions and sentiments of his heroes are to their characters. Virgil, in that particular, falls short of perfection : his language is stately throughout; and though he descends at times to the simplest branches of cookery, roasting and boiling for example, yet he never relaxes a moment from the high tone .- In adjusting his language to his subject, no writer equals Swift. We can recollect but one exception, which at the same time is far from being gross : The Journal of a modern Lady is composed in a style blending sprightliness with familiarity, perfectly suited to the subject; in one passage, however, the poet, deviating from that style, takes a tone above his subject. The passage we have in view begins 1. 115. But let me now a while survey, &c. and ends at 1. 135.

It is proper to be observed upon this head, that writers of inferior rank are continually upon the stretch to enliven and enforce their subject by exaggeration and superlatives. This unluckily has an effect contrary to what is intended; the reader, disgusted with language that swells above the subject, is led by contrast to think more meanly of the subject than it may possibly deserve. A man of prudence, beside, will be no less careful to husband his strength in writing than in walking; a writer, too liberal of superlatives, exhausts his whole stock upon ordinary incidents, and reserves no share to express, with greater energy, matters of importance.

Many writers of that kind abound so in cpithets, as if poetry consisted entirely in high sounding words. Take the following instance :

When black brow'd night her dusky mantle spread, And wrapt in solemn gloom the sable sky;

When soothing sleep her opiate dews had shed, And seal'd in silken slumbers every eye : ....

My waking thought admits no balmy rest, Nor the sweet bliss of soft oblivion share ;

But watchful woe distracts my aching breast, My heart the subject of corroding care :

From haunts of men with wandering steps and slow I solitary steal, and soothe my pensive woe.

Here every substantive is faithfully attended by some tumid epithet.

We proceed to a second remark, not less important than the former. No person of reflection but must be sensible, that an incident makes a stronger impression on an eyc witness, than when heard at second hand. Writers of genius, sensible that the eye is the best avenue to the heart, represent every thing as passing in our sight; and, from readers or hearers, transform us as it were into spectators : a skilful writer conceals himself, and presents his personages : in a word, every thing becomes dramatie as much as possible. Plutarch, de gloria Atheniensium, observes, that Thueydides makes his reader a spectator, and inspires him with the same passions as if he were an eye witness.

In the fine arts, it is a rule to put the capital objects in the strongest point of view; and even to present them oftener than once, where it can be done. In history painting, the principal figure is placed in the front, and in the best light: an equestrian statue is placed in a centre of streets, that it may be seen from many places at once. In no composition is there greater opportunity for this rule than in writing :

- Sequitur pulcherrimus Astur, Astur equo fidens et versicoloribus armis.

Æneid, x. 180.

----- Full many a lady I've ey'd with best regard, and many a time Th' harmony of their tongues hath into bondage Brought my too diligent car : for several virtues Have I lik'd several women : never any With so full soul, but some defect in her Did quarrel with the noblest grace she ow'd, And put it to the foil. But you, O you, So perfect, and so peerless, are created Of every creature's best. Tempest, act iii. sc. I.

Orlando.-That, in the desert inaccessible, Under the shade of melancholy boughs, Lose and neglect the creeping hours of time; If ever you have look'd on better days; If ever been where bells have knoll'd to church; If ever sat at any good man's feast; If ever from your eyelids wip'd a tear, And known what 'tis to pity, and be pity'd; Lct gentleness my strong enforcement be, In the which hope I blush, and hide my sword.

Duke sen. True is it that we have seen better days, And have with holy bell been knoll'd to church; And sat at good men's feasts; and wip'd our eyes Of drops that sacred pity had engender'd; And therefore sit you down in gentleness, And take upon command what help we have, That to your wanting may be minist'red.

As you like it.

With thee conversing I forget all time; All seasons and their change, all please alike.

4 I 2

Sweet

Narration.

Sweet is the breath of morn, her rising sweet, With charm of earliest birds ; pleasant the sun When first on this delightful land he spreads His orient heams on herbs, tree, fruit, and flow'r Glist'ring with dew; fragrant the fertile earth After soft show'rs; and sweet the coming on Of grateful ev'ning mild, the silent night With this her solemn bird, and this fair moon, And these the gems of heav'n, her starry train : But neither breath of morn, when she ascends With charm of earliest birds, nor rising sun On this delightful land, nor herb, fruit, flow'r, Glist'ring with dew, nor fragrance after show'rs, Nor grateful ev'ning mild, nor silent night, With this her solemn bird, nor walk by moon Or glittering star light, without thee is sweet. Paradise Lost, book iv. 1. 634.

"What mean ye, that ye use this proverb, The fathers have eaten sour grapes, and the children's teeth are set on edge ? As I live, saith the Lord God, ye shall not have occasion to use this proverb in Israel. If a man keep my judgments to deal truly, he is just, he shall surely live. But if he be a robber, a shedder of blood : if he have eaten upon the mountains, and defiled his neighbour's wife : if he have oppressed the poor and needy, have spoiled by violence, have not restored the pledge, have lift up his eyes to idols, have given forth upon usury, and have taken increase : shall he live? he shall not live : he shall surely die ; and his blood shall be upon him. Now, lo, if he beget a son, that seeth all his father's sins, and considereth, and doth not such like; that hath not eaten upon the mountains, hath not lift up his eyes to idols, nor defiled his neighbour's wife, hath not oppressed any, nor withheld the pledge, neither hath spoiled by violence, but hath given his bread to the hungry, and covered the naked with a garment : that hath not received usury nor increase, that hath executed my judgments, and walked in my statutes : he shall not die for the iniquity of his father; he shall surely live. The soul that sinneth, it shall die; the son shall not bear the iniquity of the father, neither shall the father bear the iniquity of the son; the righteousness of the righteous shall be upon him, and the wickedness of the wicked shall be upon him. Have I any pleasure that the wicked should die, saith the Lord God; and not that he should return from his ways, and live !" Ezekiel xvii.

A concise comprehensive style is a great ornament in narration; and a superfluity of unnecessary words, not less than of circumstances, a great nuisance. A judicious selection of the striking circumstances, clothed in a nervous style, is delightful. In this style, Tacitus excels all writers, ancient and modern. Instances are numberless: take the following specimen:

"Crebra hine prælia, et sæpius in modum latrocinii: per saltus, per paludes; ut euique fors aut virtus: temere, proviso, ob iram, ob prædam, jussu, et aliquando ignaris dueibus." Annal. lib. xii. § 39.

After Tacitus, Ossian in that respect justly merits the place of distinction. One cannot go wrong for examples in any part of the book.

If a concise or nervous style be a beauty, tautology must be a blemish; and yet writers, fettered by verse, 5

are not sufficiently careful to avoid this slovenly practiee: they may be pitied, but they cannot he justified. Take for a specimen the following instances, from the best poet, for versification at least, that England has to boast of:

High on his helm celestial lightnings play, His beamy shield emits a living ray; Th' unweary'd blaze incessant streams supplies, Like the red star that fires the autumnal skies. Iliad. 5.

Strength and omnipotence invest thy throne. Ibid. 576.

So silent fountains, from a rock's tall head, In sahle streams soft trickling waters shed. *Ibid.* ix. 19.

His clanging armour rung. Ibid. xii. 94.

Fear on their check, and horror in their eye. Ibid. xv. 4.

The blaze of armour flash'd against the day. *Ibid.* xvii. 736.

As when the picrcing blasts of Boreas blow. Ibid. xix. 380.

And like the moon, the broad refulgent shield Blaz'd with long rays, and gleam'd athwart the field. *Ibid.* xix. 402.

The humid sweat from every pore descends. Ibid. xxiii. 829.

We close this article with a curious inquiry. An object, however ugly to the sight, is far from being so when represented by colours or by words. What is the eause of this difference ? With respect to painting, the cause is obvious : a good picture, whatever the subject be, is agreeable by the pleasure we take in imitation; and this pleasure overbalancing the dis. agrecableness of the subject, makes the picture upon the whole agreeable. With respect to the description of an ugly object, the cause follows. To connect individuals in the social state, no particular contributes more than language, by the power it possesses of an expeditious communication of thought, and a lively representation of transactions. But nature hath not been satisfied to recommend language by its utility merely: independent of utility, it is made susceptible of many beauties, which are directly felt, without any intervening reflection. And this unfolds the mystery; for the pleasure of language is so great, as in a lively description to overbalance the disagreeableness of the image raised by it. This, however, is no encouragement to choose a disagreeable subject; for the pleasure is incomparably greater where the subject and the description are both of them agreeable.

The following description is upon the whole agreeable, though the subject described is in itself dismal:

Nine times the space that measures day and night To mortal men, he with his horrid crew

Lay
peration.

7

Lay vanquished, rolling in the fiery gulf, Confounded though immortal! but his doom Reserv'd him to more wrath; for now the thought Both of lost happiness and lasting pain Torments him : round he throws his baleful eyes That witness'd huge affliction and dismay, Mix'd with obdurate pride and stedfast hate. At once as far as angels ken he views The dismal situation waste and wild : A dungeon horrible, on all sides round As one great furnace flamed ; yet from those flames No light, but rather darkness visible Serv'd only to discover sights of wo, Regions of sorrow, doleful shades, where peace And rest can never dwell, hope never comes That comes to all ; but torture without end Still urges, and a fiery deluge, fed With ever-burning sulphur unconsum'd ! Such place eternal justice had prepar'd For those rebellious. Paradise Lost, book i. 50.

An unmanly depression of spirits in time of danger is not an agreeable sight; and yet a fine description or representation of it will be relished:

K. Richard. What must the king do now ? must he submit ?

The king shall do it: must he be depos'd ? The king shall be contented : must he lose The name of king? o' God's name let it go: I'll give my jewels for a set of beads; My gorgeous palace, for a hermitage; My gay apparel, for an almsman's gown; My figur'd goblets, for a dish of wood ; My seeptre for a palmer's walking staff; My subjects, for a pair of earved saints ; And my large kingdom, for a little grave ; A little, little, grave, an obsenve grave. Or I'll be buried in the king's highway ; Some way of common tread, where subjects feet May hourly trample on their sovereign's head ; For on my heart they tread now, whilst I live ; And, bury'd once, why not upon my head ? Richard II. act iii. sc. 6.

Objects that strike terror in a spectator, have in poctry and painting a fine effect. The picture, by raising a slight emotion of terror, agitates the mind; and in that condition every beanty makes a deep impression. May not contrast heighten the pleasure, by opposing our present security to the danger of encountering the object represented.

The other shape, If shape it might be call'd that shape had none Distinguishable in member, joint, or limb; Or substance might be call'd that shadow seem'd, For cach seem'd either; black it stood as night, Fierce as ten furies, terrible as hell, And shook a dreadful dart. Par. Lost, book ii. 666.

And clamour such as heard in heaven till now Was never: arms on armour clashing bray'd Horrible discord, and the madding wheels Of brazen chariots rage; dire was the noiso-Of conflict; overhead the dismal hiss Of fiery darts in flaming volleys flew, And flying vaulted either host with fire. So under fiery cope together rush'd Both battles main, with ruinous assault And unextinguishable rage : all heaven Resounded, and had earth been then, all earth Had to her centre shook. *Ibid.* book vi. 207.

Ghost.—\_\_\_\_But that I am forbid To tell the secrets of my prison-house, I could a tale unfold, whose lightest word Would harrow up thy soul, freeze thy young blood, Make thy two eyes, like stars start from their spheres, Thy knotty and combined loeks to part, And each particular hair to stand on end, Like quills upon the fretful porcupine : But this eternal blazon must not be To ears of flesh and blood. Hamlet, act i. se. 8.

Gratiano. Poor Desdemona ! I'm glad thy father's dead :

Thy match was mortal to him; and pure grief Shore his old thread in twain. Did he live now, This sight would make him do a desp'rate turn: Yea, eurse his better angel from his side, And fall to reprobation. Othello, act v. sc. S.

Objects of horror must be excepted from the foregoing theory; for no description, however lively, is sufficient to overbalance the disgust raised even by the idea of such objects. Every thing horrible ought therefore to be avoided in a description.

NARSES, the cunuch who rivalled Belisarius in heroism under the reign of the emperor Justinian, emerged from obsentity A. D. 538. From the domestie service of the palace, and the administration of the private revenue, he was suddenly exalted to the head of an army. He is ranked among the few eunuchs who have rescued that unhappy name from the contempt and hatred of mankind. A feeble diminutive body concealed the soul of a statesman and a warrior. His youth had been employed in the management of the loom and distaff, in the eares of the household, and the service of female luxury ; but, while his hands were busy, he secretly exereised the faculties of a vigorous and discerning mind. A stranger to the schools and the camp, he studied in the palace to dissemble, to flatter, and to persuade ; and as soon as he approached the person of the emperor, Justinian listened with surprise and pleasure to the manly eounsels of his chamberlain and private treasurer. The talents of Narses were tried and improved in frequent embassies ; he led an army into Italy, acquired a practical knowledge of the war and the country, and presumed to strive with the genius of Belisarius. Twelve years after his return, the cunuch was chosen to achieve the conquest which had been left imperfect by the first of the Roman generals. Instead of being dazzled by vanity or emulation, he seriously deelared, that unless he were armed with an adequate force, he would never consent to risk his own glory and that of his sovereign. Justinian granted to the favourite what he might have denied to the hero : the Gothie war was rekindled from its aslies, and the preparations were not unworthy of the ancient majesty of the empire.

Narses defeated the Goths, the Franks, and the Alamanni :

Narration, Narses. F

Narsus Nassau.

Alamanni; the Italian cities opened their gates to the conqueror; he entered the capital in triumph; and having established the seat of his government at Ravenna, continued 15 years to govern Italy under the title of Exarch.

His virtues, we are told, were stained with avarice; and in this provincial reign he accumulated a treasure of gold and silver which surpassed the modesty of a private fortune. His government was oppressive or unpopular; and the general discontent was expressed with freedom by the deputies of Rome. Before the throne of Justinian they boldly declared, that their Gothic servitude had been more tolerable than the despotism of a Greek eunuch; and that unless their tyrant were instantly removed, they would consult their own happiness in the choice of a master. Thus was his disgrace the effect of the people's disaffection; and his death, though in the extreme period of old age, was unseasonable and premature, since his genius alone could have repaired the last and fatal error of his life. He died about the year 567, and, as some say, at the advanced age of 95; but this does not appear very probable. See Gibbon's Rom. Hist. vol. iv. 4to edit. p. 194, 298, &c.

NARVA, a strong town of the Russian empire, in Livonia, with a castle and a harbour. It was taken by the Muscovites from the Danes in 1558, by the Swedes in 1581, and they defeated the Muscovites near it in 1700; but it was retaken by the Russians in 1704 by storm, and the inhabitants sent to Astracan. It is seated on the river Narva, 95 miles south-west of Wiburg, and 172 north-east of Riga. E. Long. 29. 0. N. Lat.

59. 8. NARWAL, a genus of whales. See MONODON, CETOLOGY Index.

NASSAU-SIEGEN, a small principality of Germany in the Westerwalde, is in general a mountainous woody country, with some arable and pasture ground, and a good breed of eattle. Its manufactures are chiefly those of iron and steel, having an iron mine in the neighbourhood of Siegen. Count John the Younger, in 1626, embraced the Roman Catholie religion, and endeavoured to introduce it into the country; but the principality, upon the extinction of the line of Nassau-Siegen in 1743, falling to the line of Nassau-Diotz, and therein to the prince of Orange, hereditary stadtholder of the United Provinces, the Protestants were delivered from their apprehensions of Popish tyranny The prince, on account of these territoand bigotry. ries, has a seat and voice at the diets of the empire and circle in the college of princes. His assessment in the matricula for Nassau-Siegen is 77 florins monthly; and towards the maintenance of the chamber judicatory, 50 rixdollars, six kruitzers and a half, each term. The revenue of this principality is estimated at 100,000 rixdollars.

NASSAU Dillenbourg, a principality of Germany, situated near the former. It has not much arable land, but plenty of wood, good quarries of stone, some silver and vitriol, copper and lead, with store of iron, for the working and smelting of which there are many forges and founderies in the country; and by these, and the sale of their iron, the inhabitants chiefly subsist. Calvinism is the religion of the principality, which contains five towns and two boroughs, and be-

longs entirely to William V. prince of Orange, and Nassau hereditary stadtholder of the United Provinces, whose father succeeded to a part of it in 1739 on the death National of Prince Christian, and to the rest in 1743 on the death of Prince William Hyacynth of Siegen. The prince, on account of this principality also and Dietz, has a seat and voice in the college of princes, at the dicts of the empire and circle. His assessment in the matricula, for Nassau-Dillenbourg, is 102 florins monthly; and to the chamber judicatory, 59 rixdollars six and half kruitzers, cach term. His revenue from this principality is computed at above 130,000 florins.

NASSAU-Hadamar, a country of Germany, which, till the year 1711, had princes of its own; but now belongs wholly to William V. prince of Orange.

NASSAU, prince of Orange. Sec MAURICE.

NATES, in Anatomy, a term expressing those two fleshy exterior parts of the body, vulgarly called the buttocks. See ANATOMY.

NATES Cerebri, are two circular protuberances of the brain, situated on the back side of the medulla oblongata, near the ccrcbellum.

NATION, a collective term, used for a considerable number of people inhabiting a certain extent of land, confined within fixed limits, and under the same government.

NATIONAL DEBT : the money owing by government

Our limits permit us to give but a very general sketch of this subject: However, as it is of considerable importance to every inhabitant of these kingdoms, we shall endeavour to give as clear and comprehensive a view of it as the bounds necessarily prescribed us will admit. In order to this, it may not be improper to refer back to the times that have gone before us, that we may the better discover the nature of public revenues, the manner of their expenditure, and the causes of public debt.

In that rude state of society which precedes the extension of commerce and the improvements of manufactures, when those expensive luxuries which commerce and manufactures can alone introduce, are altogether unknown; the person who possesses a large revenue can spend or enjoy that revenue in no other way than by maintaining nearly as many people as it can maintain. Among our feudal ancestors, the long time Smith's during which estates used to continue in the same fami- Wealth of ly, sufficiently demonstrates the general disposition of Nations. people to live within their income. Though the rustic hospitality constantly exercised by the great landholders may not to us in the present times seem consistent with that order which we are apt to consider as inseparably connected with good cconomy, yet we must certainly allow them to have been at least so far frugal as not commonly to have spent their whole income. Some part of this money, perhaps, they spent in purchasing the few objects of vanity and luxury with which the circumstances of the times could furnish them : but some part of it they seem commonly to have hoarded. They could not well indeed do any thing else but hoard whatever money they saved. To trade was disgraceful to a gentleman ; and to lend money at interest, which at that time was considered as usury and prohibited by law, would have been still more so.

linnal

Roht.

T N A those garrisoned towns, must be furnished with arms, National ammunition, and provisions. An immediate and great Debt. expence must be incurred in that moment of immediate danger, which will not wait for the gradual and slow returns of the new taxes. In this exigency government can have no other resources but in borrowing The same commercial state of society which, by the

operation of moral causes, brings government in this manner into the necessity of borrowing, produces in the subjects both an ability and an inclination to lend. If it commonly brings along with it the necessity of borrowing, it likewise brings along with it the facility of doing so.

A country abounding with merchants and manufacturers, necessarily abounds with a set of people through whose hands not only their own capitals, but the capitals of all those who either lend them money or trust them with goods, pass as frequently or more frequently than the revenue of a private man, who without trade or business lives upon his income, passes through his hands. The revenue of such a man can regularly pass through his hands only once in a year. But the whole amount of the capital and credit of a mcrchant who deals in a trade of which the returns arc very quick may sometimes pass through his hands two, three, or four times in a year. A country abounding with merchants and manufactures, therefore, necessarily abounds with a set of people, who have it at all times in their power to advance, if they choose to do so, a very large sum of money to government. Hence the ability in the subjects of a commercial state to lend.

The progress of the enormous debts which at pre-Blackst. sent oppress, and will in the long-run probably ruin, Commen. all the great nations of Europe, has been pretty uniform. In England, after the Revolution, when new connexions with Europe introduced a new system of forcign polities, the expences of the nation not only in settling the new establishment, but in maintaining long wars, as principals, on the continent, for the security of the Dutch barrier, reducing the French monarchy, settling the Spanish succession, supporting the house of Austria, maintaining the liberties of the Germanie body, and other purposes, increased to an unusual degree : insomuch that it was not thought adviseable to raise all the expences of any one year by taxes to be levied within that year, lest the unaccustomed weight of them should create murmurs among the people. It was therefore the policy of the times to anticipate the revenues of their posterity, by borrowing immense sums for the current service of the state, and to lay no more taxes upon the subject than would suffice to pay the annual interest of the sums so borrowed ; by this means converting the principal debt into a new species of property, transferable from one man to another at any time and in any quantity. This system indeed seems to have had its original in the state of Florenee, A. D. 1344; which government then owed about 60,000l. sterling; and being unable to pay it, formed the principal into an aggregate sum, called metaphorically a mount or bank, the shares whereof were transferable like our stocks, with interest at 5 per cent. the prices varying according to the exigencies of the state.

The same disposition to save and to hoard prevailed in the sovereign as well as in the subjects. Among nations to whom commerce and manufactures are little known, the sovereign is in a situation which naturally disposes him to the parsimony requisite for accumulation. In that situation the expence even of a sovereign cannot be directed by that vanity which delights in the gaudy finery of a court. The ignorance of the times affords but few of the trinkets in which that finery consists. Standing armies are not then necessary; so that the expence even of a sovereign, like that of any other great lord, can be employed in scarce any thing but bounty to his tenants and hospitality to his retainers. But bounty and hospitality very seldom lead to extravagance: though vanity almost always does. All the ancient sovereigns of Europe accordingly had treasures. Every Tartar chief in the present times is said to have one.

Ŧ

In a commercial country abounding with every sort of expensive luxnry, the sovereign, in the same manner as almost all the great proprictors in his dominions, naturally spends a great part of his revenue in purchasing those luxuries. His own and the neighbouring countries supply him abundantly with all the costly trinkets which compose the splendid but insignificant pageantry of a court. His ordinary expense becomes equal to his ordinary revenue, and it is well if it does not frequently exceed it. The amassing of treasure can no longer be expected : and when extraordinary exigencies require extraordinary expences, he must ne-cessarily call upon his subjects for an extraordinary aid. The late king of Prussia and his father arc the only great princes of Europe who, since the death of Henry IV. of France in 1610, are supposed to have amas-sed any considerable treasure. The parsimony which leads to accumulation has become almost as rare in republican as in monarchical governments. The Italian republics, the United Provinces of the Netherlands, are all in debt. The canton of Berne is the single republic in Europe which has amassed any considerable treasure. The other Swiss republies have not. The taste for some sort of pageantry, for splendid buildings at least and other public ornaments, frequently prevails as much in the apparently sober senate house of a little republic as in the dissipated court of the greatest king.

The want of parsimony in time of peace imposes the necessity of contracting debt in time of war. When war comes, there is no money in the treasury but what is necessary for carrying on the ordinary expence of the peace establishment. In war an establishment of three or four times that expense becomes necessary for the defence of the state, and consequently a revenue three or four times greater than the peace revenue. Supposing that the sovereign should have what he scaree ever has, the immediate means of augmenting his revenue in proportion to the augmentation of his expence; yet still the produce of the taxes, from which this increase of revenue must be drawn, will not begin to come into the treasury till perhaps ten or twelve months after they are imposed. But the moment in which war begins, or rather the moment in which it appears likely to begin, the army must be augmented, the fleets must be fitted out, the garrisoned towns must be put into a posture of defence : that army, that fleet

I

Nations, like private nien, have generally begun to borrow upon what may be called personal credit, without assigning or mortgaging any particular fund for the payment of the debt; and when this resource has failed them, they have gone on to borrow upon assignments or mortgages of particular funds.

What is called the unfunded debt of Great Britain, is contracted in the former of those two ways. It consists partly in a debt which bears, or is supposed to bear, no interest; and which resembles the debts that a private man contracts upon account; and partly in a debt which bears interest, and which resembles what a private man contracts upon his bill or promissory note. The debts which are due either for extraordinary services, or for services cither not provided for or not paid at the time when they are performed; part of the extraordinaries of the army, navy, and ordnance, the arrears of subsidies to foreign princes, those of seamen's wages, &c. usually constitute a dcbt of the first kind. Navy and exchequer bills, which are issucd sometimes in payment of a part of such debts and sometimes for other purposes, constitute a debt of the second kind; exchequer bills bearing interest from the day on which they are issued, and navy bills six months after they are issued. The bank of England, either by voluntarily discounting those bills at their eurrent value, or by agreeing with government for certain considerations to circulate exchequer bills, that is, to receive them at par, paying the interest which happens to be due upon them, keeps up their value, and facilitates their circulation, and thereby frequently enables government to contract a very large debt of this kind. During the great recoinage in King William's time, when the bank of England thought proper to put a stop to its usual transactions, exchequer bills and tallies are said to have sold from 25 to 60 per cent. discount, owing partly, no doubt, to the supposed instability of the new government established by the Revolution, but partly too to the want of the support of the bank of England.

When this resource is exhausted, and it becomes necessary, in order to raise money, to assign or mortgage some particular branch of the public revenue for the payment of the debt, government has upon different occasions done this in two different ways. Sometimes it has made this assignment or mortgage for a short period of time only, a year or a few years, for example; and sometimes for perpetuity. In the one ease, the fund was supposed sufficient to pay within the limited time both principal and interest of the money borrowed : In the other, it was supposed sufficient to pay the interest only, or a perpetual annuity equivalent to the interest; government being at liberty to redeem at any time this annuity upon paying back the principal sum borrowed. When money was raised in the one way, it was said to be raised by anticipation; when in the other, by perpetual funding, or, more shortly, by funding.

In the reign of King William, when the debt began to be amassed, and during a great part of that of Queen Anne, before we had become so familiar as we are now with the practice of perpetual funding, the

Debt.

greater part of the new taxes were imposed but for a National Main short period of time (for four, five, six, or seven years only), and a great part of the grants of every year consisted in loans upon anticipation of the produce of those taxes. The produce being frequently insufficient for paying within the limited term the principal and interest of the money borrowed, deficiencies arose; to make good which it became necessary to prolong the term.

On the 31st of December 1697, the funded and unfunded debts amounted to 21,515,742l. 135. 82d.; at the same time, 1714, they were 53,681,076l. 5s.  $6_{\frac{1}{2}}$ d. In 1755, before the breaking out of the war, they amounted to 72,289,6731.; and on the 5th of January 1763, at the eonclusion of the peace, they had accumulated to 122,603,3361. 8s. 24d. of funded debt, and of unfunded 13,027,5891. 28. 2d. more. In 1775, they were very nearly 130 millions; and the last American war added upwards of 120 millions more to that enormous sum: to pay the interest of which, and the charges of management, amounting annually to nearly eight millions and a half, the extraordinary revenues elsewhere enumerated \* (excepting only the land-tax \* See Reand annual malt tax) are in the first place mortgaged verme. and made perpetual by parliament. Perpetual, we say; but still redeemable by the same authority that imposed them : which, if it at any time ean pay off the eapital, will abolish those taxes which are raised to discharge the interest.

By this means, then, the quantity of property in the kingdom is greatly increased in idea compared with former times ; yet, if we coolly consider it, not at all increased in reality. We may boast of large fortunes, and quantities of money in the funds. But where does this money exist? It exists only in name, in paper, in public faith, in parliamentary security : and that is undoubtedly sufficient for the creditors of the public to rely on. But then what is the pledge which the public faith has pawned for the security of these debts? The land, the trade, and the personal industry of the subject; from which the money must arise that supplies the several taxes. In these, therefore, and these only, the property of the public creditors does really and intrinsically exist; and of eourse the land, the trade, and the personal industry of individuals, are diminished in their true value just so much as they are pledged to answer. If A's income amounts to rool. per annum; and he is so far indebted to B, that he pays him 50l. per annum for his interest; one half of the value of A's property is transferred to B the credi-The creditor's property exists in the demand tor. which he has upon the debtor, and nowhere else; and the debtor is only a trustee to his creditor for one half of the value of his income. In short, the property of a creditor of the public consists in a certain portion of the national taxes; by how much therefore he is the richer, by so much the nation, which pays these taxes, is the poorer.

The only advantage that ean result to a nation from public debts, is the increase of circulation, by multiplying the cash of the kingdom, and creating a new species of currency, assignable at any time and in any quantity; always therefore ready to be employed in any beneficial undertaking, by means of this its transferable quality; and yet producing some profit even when

Deht

National when it lies idle and unemployed. A certain propor-Debt. tion of debt seems to he highly useful to a trading people; but what that proportion is, it is not for us to determine. This much is indisputably certain, that the present magnitude of our national encumbrances very far exceeds all calculations of commercial bencfit, and is productive of the greatest inconveniences. For, first, The enormous taxes that are raised upon the necessaries of life for the payment of the interest of this debt, are a hurt both to trade 'and manufactures, by raising the price as well of the artificer's subsistence as of the raw material, and of course, in a much greater proportion, the price of the commodity itself. Nay, the very increase of paper circulation itself, when extended beyond what is requisite for commerce or foreign exchange, has a natural tendency to increase the price of provisions as well as of all other merchandise. For as its effect is to multiply the cash of the kingdom, and this to such an extent that much must remain unemployed, that eash (which is the universal measure of the respective values of all other commodities) must necessarily sink in its own value, and every thing grow comparatively dearer. Secondly, If part of this debt be owing to foreigners, either they draw out of the kingdom annually a considerable quantity of specie for the interest; or else it is made an argument to grant them unreasonable privileges in order to induce them to reside here. Thirdly, If the whole be owing to subjects only, it is then charging the active and industrious subject, who pays his share of the taxes to maintain the indolent and idle creditor who receives them. Lastly, and principally, It weakens the internal strength of a state, by anticipating those resources which should be reserved to defend it in case of necessity. The interest we now pay for our debt would undoubtedly be sufficient to maintain the most vigorous war that any national motives could possibly require. If indeed our ancestors in King William's time had annually paid, so long as their exigencies lasted, a far less sum than we now annually raise upon their accounts, they would not in time of war have borne so great burdens as they have bequeathed to and settled upon their posterity in time of peace; and might have been eased the instant the exigence was over.

On the whole, then, the national debt is undoubt edly a subject of vast importance, and as such it has been always considered; for much has been said and written upon it, and many schemes have been proposed at various times and by various persons for gradually removing it, it being considered by the most judicious as a most pernicious encumbrance to a commercial country. Some, we are aware, think it of vast utility; but this opinion is too excentric, and in our estimation too feebly supported, to be convincing. The public debt is indisputably a great grievance; and every lover of his country must surely wish to see it removed : the period, however, when this blessing shall take place, if indeed it ever arrive, must at least be very distant.

We refer such as wish for farther information on this interesting topic, to those who have treated of it at full length, as Smith in his Wealth of Nations, and Sir John Sinclair in his History of the Revenue. The writings of Dr Price likewise deserve considerable attention, especially as one of his plans for the reduction Vol. XIV. Part II.

of the debt has in fact been adopted, and in conse- National quence established, by the legislature : His three plans may he found in a pamphlet by William Morgan, entitled, A Review of Dr Price's Writings on the Sub- Natural, ject of the Finances of this Kingdom.

NATIVITY, or NATAL Day, the day of a person's birth. The word nativity is chiefly used in speak ing of the saints ; as, the nativity of St John the Baptist, &c. But when we say the Nativity, it is understood of that of Jesus Christ, or the feast of Christmas.

NATIVITY, nativitas, in ancient law books, signifies bondage or servitude.

NATIVITY, in Astrology, the theme or figure of the heavens, and particularly of the twelve houses, at the moment when a person was born; called also the horoscope.

Casting the nativity, or by calculation seeking to know how long the queen should live, &c. was made felony, an. 23. Eliz. c. 2.

NATIVO HABENDO, in Law, a writ directed to the sheriff, for a lord who claimed inheritance in any villain, when a villain was run away from him, for the apprehending and restoring him to the lord.

NATIX, in Natural History, a name given by some old writers to the nerita.

NATOLIA, the modern name of the Lesser Asia, being the most westerly part of Turkey in Asia, and consisting of a large peninsula, which extends from the river Euphrates as far as the Archipelago, the sea of Marmora, the straits of Gallipoli and of Constantinople, which separate it from Europe on the west. It is bounded on the north by the Black sea, and on the south by the Mediterranean.

NATRIX, in Zoology, the name of the common or water-snake, called also torquata, from the ring about its neck. See OPHIOLOGY Index.

NATRUM, or NATRON, the nitre of the aucients, one of the fixed alkalies. See SODA, CHEMISTRY Index.

It is found in great abundance in many parts of Asia, where the natives sweep it up from the surface of the ground, and called soap earth. The earliest account we have of it is in the scriptures, where we find that the salt called nitre in those times would ferment with vinegar, and possessed a detersive quality, so that it was used in baths and in washing. Solomou compares the singing of songs with a heavy heart, to the contrariety of vinegar and nitre : and Jcremiali says, that if the sinner wash himself with nitre, his sin is not eleansed off. These are properties that perfectly agree with this salt, hut not at all with our saltpetre, which is the nitre of the moderns.

NATTER-JACK, a species of RANA, which see, ERPETOLOGY Index.

NATURAL, in general, something that relates to nature. See NATURE.

NATURAL Children, are those born out of lawful wedlock. See BASTARD.

NATURAL Functions, are those actions whereby the aliments are changed and assimilated so as to become a part of the body.

NATURAL, in Heraldry, is used where animals, fruits, flowers, &c. are blazoned with the colours they naturally have, though different from the common colours

4K

of

NATURAL Note, in Music, is used in opposition to flat and sharp notes, which are called artificial notes. See NOTE, SCALE, &c.

NATURAL is also used for something coming immediately out of the hands of nature : in which sense it stands opposed to factitious or artificial, which signifies something wrought by art. Sce ARTIFICIAL.

Bishop Wilkins observes, that there appears a world of difference between natural and artificial things, when viewed with microscopes. The first ever appear adorned with all imaginable elegance and beauty; the latter, though the most curious in their kind, infinitely rude and unhewn : the finest needle appears a rough bar of iron; and the most accurate engraving or embossment, as if done with a mattock or a trowel.

NATURAL Beauty, or the beauty of natural objects, is that quality or those qualities in the works of nature, or more properly of God, which are calculated to excite pleasing sensations in the minds of all such persons of true tastc as attentively observe them. It will not, we trust, be deemed improper or impertinent, therefore, to introduce a few observations on this subject, previous to our treating of natural history .- To many, it is hoped, it will appear to be a very proper introduc-tion to that important article. "That sensibility to beauty, which, when cultivated and improved, we term taste, is universally diffused through the human

scrtations.

Natural

Natural

Beauty.

+ Dr Perci-species+; and it is most uniform with respect to those val's Mo-, objects, which being out of our power, are not liable to ral and Literary Dis- variation from accident, caprice, or fashion. The verdant lawn, the shady grove, the variegated landscape, the boundless ocean, and the starry firmament, are contemplated with pleasure by every attentive beholder. But the emotions of different spectators, though similar in kind, differ widely in degree ; and to relish with full delight the enchanting seenes of nature, the mind must be uncorrupted by avarice, sensuality, or ambition; quiek in her sensibilities; elevated in her sentiments; and devout in her affections. He who possesses such exalted powers of perception and enjoyment, may almost say, with the poet,

> I care not, Fortunc ! what you me deny ; You cannot rob me of free Nature's grace ; You eannot shut the windows of the sky, Through which Aurora shows her bright'ning face ; You eannot bar my constant feet to trace The woods and lawns, hy living stream, at eve : Let health my nerves and finer fibres brace, And I their toys to the great children leave : Of faney, reason, virtue, nought can me bereave.

" Perhaps such ardent enthusiasm may not be compatible with the necessary toils and active offices which Providence has assigned to the generality of men. But there are none to whom some portion of it may not prove advantageous : and if it were cherished by each individual, in that degree which is consistent with the indispensable duties of his station, the felicity of human From this life would be considerably augmented. source the refined and vivid pleasures of the imagination are almost entirely derived : and the elegant arts owe their choicest beauties to a taste for the contemplaNAT

tion of nature. Painting and sculpture are express imi- Natural tations of visible objects; and where would be the Beauty. charms of poetry, if divested of the imagery and embellishments which she borrows from rural seenes? Painters, statuaries, and poets, therefore, are always ambitious to acknowledge themselves the pupils of nature; and as their skill increases, they grow more and more delighted with every view of the animal and vegetable world. But the pleasure resulting from admiration is transient; and to cultivate taste, without regard to its influence on the passions and affections, 'is to rear a tree for its blossoms, which is capable of yielding the richest and most valuable fruit.' Physical and moral beauty bear so intimate a relation to each other, that they may be considered as different gradations in the scale of excellence; and the knowledge and relish of the former should be deemed only a step to the nobler

and more permanent enjoyments of the latter. "Whoever has visited the Leasowes, in Warwickshire, must have felt the force and propriety of an inscription which meets the eye at the entrance into those delightful grounds.

Would you then taste the tranguil seene ? Be sure your bosoms be serene : Devoid of hate, devoid of strife, Devoid of all that poisons life : And much it 'vails you, in their place, To graft the love of human race.

" Now such seenes contribute powerfully to inspire that serenity which is necessary to enjoy and to heighten their beauties. By a secret contagion, the soul catches the harmony which she contemplates; and the frame within assimilates itself to that which is without. For,

Who can forbear to smile with Nature ? Can The stormy passions in the bosom roll, While every gale is peace, and every grove Is melody ?

" In this state of sweet composure, we become susceptible of virtuous impressions, from almost every surrounding object. The patient ox is viewed with generous complacency; the guileless sheep with pity; and the playful lamb raises emotions of tenderness and love. We rejoice with the horse, in his liberty and exemption from toil, while he ranges at large through enamelled pastures; and the frolies of the colt would afford unmixed delight, did we not recollect the bondage which he is soon to undergo. We are charmed with the song of birds, soothed with the buzz of inseets, and pleased with the sportive motions of fishes, because these are expressions of enjoyment; and we exult in the felicity of the whole animated creation. Thus an equal and extensive benevolence is called forth into exertion; and having felt a common interest in the gratifications of inferior beings, we shall be no longer indifferent to their sufferings, or become wantonly instrumental in producing them.

" It seems to be the intention of Providence, that the lower order of animals should be subservient to the comfort, convenience, and sustenance of man. But his right of dominion extends no farther; and if this right be exercised with mildness, humanity, and justice, the subjects of his power will be no less benefited

Beauty.

Natural ed than himself. For various species of living creatures are annually multiplied by human art, improved in their perceptive powers by human culture, and plentifully fed by human industry. The relation, therefore, is reciprocal between such animals and man; and he may supply his own wants by the use of their labour, the produce of their bodies, and even the sacrifice of their lives, whilst he co-operates with all-gracious Heaven in promoting happiness, the great end of existence.

" But though it be true, that partial evil, with respect to different orders of sensitive beings, may be universal good; and that it is a wise and benevolent institution of nature, to make destruction itself, within certain limitations, the cause of an increase of life and enjoyment; yet a generous person will extend his compassionate regards to every individual that suffers for his sake: and whilst he sighs

# Even for the kid or lamb that parts its life Beneath the bloody knife,

he will naturally be solicitous to mitigate pain, both in duration and degree, by the gentlest modes of inflicting it.

"We are inclined to believe, however, that this sense of humanity would soon be obliterated, and that the heart would grow callous to every soft impression, were it not for the benignant influence of the smiling face of mature. The count de Lauzun, when imprisoned by Louis XIV. in the castle of Pignerol, amused himself during a long period of time with catching flies, and delivering them to be devoured by a rapacious spider. Such an entertainment was equally singular and cruel: and inconsistent, we believe, with his former character, and his subsequent turn of mind. But his cell had no window, and received only a glimmering light from an aperture in the roof. In less unfavourable eircumstances, may we not presume, that instead of sporting with misery, he would have released the agonizing flies, and bid them enjoy that freedom of which he himself was bereaved ?

" But the taste for natural beauty is subservient to higher purposes than those which have been enumerated; and the cultivation of it not only refines and humanizes, but dignifies and exalts the affections. It elevates them to the admiration and love of that Being who is the anthor of all that is fair, sublime, and good in the creation. Secpticism and irreligion are hardly compatible with the sensibility of heart which arises from a just and lively relish of the wisdom, harmony, and order subsisting in the world around us: and emotions of piety must spring up spontaneously in the bosom that is in unison with all animated nature. Actuated hy this divine inspiration, man finds a fane in every grove; and glowing with devout fervour, he joins his song to the universal chorus, or muses the praise of the Almighty, in more expressive silence. Thus they

" Whom Nature's works can charm, with God himself Hold converse: grow familiar, day by day, With his conceptions; act upon his plan; And form to his the relish of their souls."

On the whole, then, it certainly appears, that the

advantages resulting from a taste for natural beauties Natural are great and important : it is equally certain, that as Beauty. it is useful, so it is a continual source of real enjoyment; for a more rational pleasure cannot possibly occupy the attention or captivate the affections of mankind, than that which arises from a due consideration of the works of nature. Pleasure, we know, is a necessary ingredient in human life, in order in some measure to counterbalance the pains, the evils, and listlessnesses, which are at times perhaps unavoidable, and in order to render life tolerable. It is the part then of the moralist, and it has been frequently his business, to point out and recommend such pleasures as are highly gratifying, and are yet perfectly innocent. The Spectator, whose works will be admired as long as the language in which they are written is understood, recommends strongly and elegantly the pleasure of a garden; and a later writer +, of no common degree of me-+ Dr Know, rit, and of very considerable fame, has an essay ou the same subject, from which we shall select a few ohservations, and so conclude the article. " Not he alone (says this elegant writer) is to be esteemed a benefactor to mankind, who makes an useful discovery; but he also who can point out and recommend an innocent pleasure. Of this kind are the pleasures arising from the observation of nature; and they are highly agreeable to every taste uncorrupted by vicious indulgence. Rural scenes of almost every kind are delightful to the mind of man. But the misfortune is, that the greater part are hurried on in the career of life with too great rapidity to be able to give attention to that which solicits no passion. The darkest habitation in the dirtiest street of the metropolis, where money can be earned, has greater charms with many than the groves of Hagley.

" The patron of refined pleasure, the elegant Epicurus, fixed the seat of his enjoyment in a garden. He was of opinion, that a tranquil spot, furnished with the united sweets of art and nature, was the best adapted to delicate repose. And even the severer philosophers of antiquity were wont to discourse in the shade of a spreading tree, in some cultivated plantation. It is obvious, on intuition, that nature often intended solely to please the eye in her vegetable productions. Sho decorates the floweret that springs beneath our feet in all the perfections of external beauty. She has clothed the garden with a constant succession of various hues. Even the leaves of the tree undergo a pleasing vicissitude. The fresh verdure which they exhibit in the spring, the various shades which they assume in summer, the yellow and russet tinge of autumn, and the nakedness of winter, afford a constant pleasure to a lively imagination. From the snowdrop to the moss rose the flower garden displays an infinite variety of shape and colour. The taste of the florist has been ridiculed as trifling ; yet surely without reason. Did nature bring forth the tulip and the lily, the rose and the honeysuckle, to be neglected by the haughty pretender to superior reason? To omit a single social duty for the cultivation of a polyanthus were ridiculous as well as criminal; but to pass by the beauties lavished before us, without observing them, is no less ingratitude than stupidity. A bad heart finds little amusement but in a communication with the active world, where scope is given for the indulgence of 4K 2 malignant

Natural malignant passions ; hut an amiable disposition is com-Beauty. monly known by a taste for the beauties of the animal - and the vegetable creation." In short, since the world was made for our use, since the beauties of nature are

alike displayed before all men, and since they are nu- Natural questionably an inexhaustible fund of innocent amuse- Beauty, ment; that subject must be of vast importance which enables us to relish them properly ...

# NATURAL HISTORY.

Definition. THE objects of nature may be considered under two points of view; 1st, With respect to their form, structure, habits, and individual properties when viewed in a state of inactivity; 2dly, With respect to the mutual changes which they produce when made to act on Hence the study of nature may be each other. divided into two parts, NATURAL HISTORY and NA-TURAL SCIENCE ; the former considering bodies in comparatively an inactive state, the latter in a state of mutual action.

NATURAL HISTORY, then, is that part of natural knowledge which teaches us to distinguish and describe the objects of nature, to examine their appearance, structure, properties and uses, and to collect, preserve, and arrange them (A).

I. When we take a general survey of the objects of nature's with which we are surrounded, we are bewildered amidst the number and variety that are every where presented to our view. The air, the woods, the fields, the waters, teem with myriads of animals ; a large proportion of the earth's surface is covered with a green mantle of luxuriant herbage, interspersed with plants and flowers of a thousand varied tints; and when we search below this, when we explore the cloud-eapt mountain, the gloomy mine, the sequestered cavern, or the rocky eliff, we discover a great variety of mineral substances, either piled into irregular masses, or lying in uniform beds or layers, disposed in veins or seams, or scattered at random through the other stony matters.

To the easual observer, the number and variety of these objects would appear almost infinite. He would consider it equally impossible to enumerate them, as to number the stars, or count the sands on the sea shore. This idea, however, arises from his seeing them in confusion and disorder. The naturalist, hy separating them into those groups or elasses, in which they often naturally present themselves, has succeeded not only in distinguishing the several kinds from each other, but even in guessing pretty accurately at the number of species that have hitherto been discovered.

There are two objects which should principally oc-

cupy the attention of the naturalist : 1st, To classify natural substances ; 2dly, To examine their structure.

The number of natural productions being confessed- Classificaly very great, it is necessary to find out some means tion. of distinguishing them from each other, and of recognizing them on seeing them anew. These means are the peculiarities, or the assemblages of peculiarities, that exclusively belong to each body. Now there is searcely any substance that has a simple character, that is, which can be distinguished from every other substance by any one of its properties singly. It is only by the combination of several of these properties that. we can distinguish an object from others which resemble it in possessing some one or more of those very properties ; and the more numerous the species we compare, the more necessary it becomes to bring their properties together, in order to assign to each a character that may distinguish it from the rest. Hence to distinguish a species, considered independently from all others that exist in nature, it is necessary to express in its charaeter almost the whole of its properties ; and the more of these we take into the character, the more complete will be our description of the object. But no man can acquire a sufficiently accurate knowledge of all natural objects to enable him to give a complete description of. them : human life is too short to admit of the completion of such a task. All that can be expected from our limited faculties is to acquire a general knowledge of natural objects, confining our principal attention to such as possess some striking qualities, or appear convertible to the useful purposes of life.

To gain this end, two modes of procedure have been Methods adopted by naturalists. According to the first mode, and syswe employ characters that proceed by degrees from tems. particulars to generals. We begin by comparing together a certain number of species that bear the nearest relation to each other. In drawing the eharacters of these species, it is requisite to express only those differences, which, on a supposition that they arc the most nearly related, form but a small part of their properties; a number of species thus brought together constitutes what is called a genus or tribe.

The

(A) Some writers divide natural history into general and particular, which are thus defined by Cuvier. General natural history considers under a single point of view, all natural bodies, and the common result of all their actions in the great whole of nature. It determines the laws of coexistence of their properties; it establishes the degrees of resemblance that exist between different bodies, and elasses them according to these degrees. The Particular natural history of any body, to be perfect, should comprehend, 1st, The description of all the sensible properties of that body, and of all its parts ; 2d, The mutual relations of these parts, the motions which they produce, and the changes which they undergo while they remain united; 3d, The active and passive relations of this body with every other body in the universe; and 4th, The explanation of all these phenomena. See Tableau Elementaire d'Histoire Naturelle.

2 Immensity works.

The remainder of these properties which are common to all the species of the genus combine to form the character, or rather the description, of the genus, distinguishing it from all those which might be formed by bringing together other species; but the number of these common properties being still very considerable, we repeat the same means in order to reduce the characters of the genera to smaller terms. We compare together only those genera which most nearly resemble each other, and the generic characters now employed must only express those differences which form but a small part of their common properties. Those properties, which are common to all the genera, compose a character that distinguishes this assemblage or group from all other groups of genera. Such an assemblage of genera is called an order.

ssilica-

tion.

kingerns

exar ed.

Repeating the same operation, and bringing together such orders as are most nearly allied, we form a more general assemblage, called a class; and again uniting a certain number of classes, we form a higher division, to which naturalists have given the name of kingdom : this chain of divisions in which the higher links comprchend the lower, forms what is called a method. The other mode of procedure is to rise gra-dually from generals to particulars, beginning with the slightest and most obvious differences, thus forming the first division or kingdom; dividing each kingdom into classes, each class into orders, each order into genera, each genus into species, and each species into varieties. This descending series constitutes what is called a system, and is that which has been generally adopted by naturalists.

To illustrate this systematical classification of natural objects, let us select a familiar example. Among the various creatures that pass under our observation, a great number arc possessed of life, of sensation, and voluntary motion; these we call animals, and of these we form the animal kingdom. On examining various groups of animals, we find that many have four extremities, and suckle their young by means of teats ; these we eall quadrupeds or mammalia. We have thus formed a class of animals. Again we find that of the mammalia some have hoofed feet and blunt forc-teeth, and feed almost entirely on vegetables. These will constitute an order of the class of mammalia, to which Linnæus has given the name of belluæ. Of this order a certain number of animals agree in having six foreteeth in both jaws, and form a genus or tribe distinguished by this particular from the other animals of the same order, and commonly called the horse tribe. Lastly, In this tribe we find one species that has solid hoofs, a tail bristly at the end, an upright mane, and a black cross on the shoulder of the male. This species is the common ass.

Div &n of In framing an artificial system of natural history, many into most writers have agreed on the division of natural bodies into kingdoms, proceeding on the supposition that those marks which are to distinguish the objects of ene kingdom from those of another are sufficiently fixed and certain.

Let us examine for a little how far this supposition agrees with nature's works as we find them.

The division of natural objects commonly adopted is into three kingdoms; the animal, vegetable, and minoral kingdoms. This division has been almost universally

received as perfectly consistent with nature ; and is by Classificamost persons thought to be so clear and distinct, that they suppose it impossible to mistake in referring any particular object to its proper kingdom. This arises from their having noticed only such objects as bear evident marks of the division to which they belong; but if we draw their attention to a variety of other individuals, they will acknowledge themselves to be incompetent to the decision, or will erroneously refer to one division, what has, after accurate examination, been determined to belong to another.

There is one whole class of productions, called 200 phytes by naturalists, which seem to form the connecting links between the different kingdoms. They are animals of the polypus kind, mostly covered with a calcareous crust, differing little in composition from the shells of lobsters, slmmps, and other shell-fish, and formed like them from an exudation or secretion on the surface of their bodies. These polypi are connected together by thousands, or even millions, and assume a great variety of appearances according to their arrangenient : the same species, however, always assuming the same, or very nearly the same appearance. Some are connected together in form of stem and branches, as the flustræ, sertulariæ, corallines and others ; many of which have their offspring in the egg state attached to them, and so situated as to bear exact resemblance to the seedvessels of plants. These are altogether so like to many of the sea plants, as to be generally confounded with them, under the title of sea-weeds; but the attentive naturalist may, by examining them in their natural state, perceive the tentacula or feelers of each polypus extended in its search for food, and hastily retracting within its shell upon the least alarm. Many of this description are found attached to oysters or other shellfish ; and often to stones and pebbles which are covered or occasionally wetted by the sea.

Other zoophytcs assume less regular figures, and are much more firm and solid, resembling the productions of the mineral kingdom. Madrepores and millepores, called often brainstones, are of this kind. At first sight they look very like stones and pebbles, or like pieces of chalk or marble, but on an accurate inspection, any one may perceive marks of an organic structure ; and. when they are in a recent state, may detect the inhabitants of their numerous cells.

The above examples will suffice to prove, how insufficient is either a hasty examination or the judging by similarity of appearance, for determining to what kingdom of nature any particular object belongs. But there are many other productions to which few persons could without hesitation assign their places : For instance, where would we arrange the green powdery substance so common on paling; the spotted and streak. ed appearance on stones; the mould on cheese, or the green jelly-like matter that floats on the surface of the stagnant waters? Naturalists in general have assigned these productions to the vegetable kingdom ; but Sennebier and a few others have maintained that some of them are animals.

According to some writers, the most philosophical notion which we can form on this subject is, that the division of natural objects into kingdoms is artificial, and that Nature, acknowledging no such bonds, passes imperceptibly from the animal to the vegetable, and from. the.

630

tion.

Classifica- the vegetable to the mineral world, without defining where one ceases or where the next begins.

As the appearances of natural productions are insufficient, so are their properties and powers, for determiniug which are animals or which vegetables, according to the received acceptation of the terms. If locomotion is allowed to be the characteristic of an animal, where shall we place the oyster, or the zoophytes of which we have just been speaking, or where some species of ulva and conferva, plants that swim about detached in water ? If feeling or sensation be the test, who shall decide, that the sensitive plant (mimosa pudica), possessess it not? and who determine that the leaves of the fly-trap, (Dionæa muscipula), when they contract, and catch the fly as soon as it alights, do not

\* Skrimshire's Es-

Division of natural bodies into organized and inorganic.

feel the despoiler that comes to rob it of its honey ? Though these and similar objections may certainly says on Na- be made to the artificial division of nature's works into tory, vol. i. kingdoms, yet it is convenient to have such a division ; and even the very difficulty of cstablishing to which kingdom any object belongs, is an additional spur to

the genius and industry of the naturalist. The most natural division of the works of nature is that which distinguishes them into organized and inorganic bodies; and on the whole, we have seen no attempt to establish the differences between these so successful as that adopted by M. Dumeril in his late scientific work, Traité Elementaire d'Histoire Naturelle. " Some objects, says he, as animals and plants, have formerly constituted a part of other individuals, similar to themselves, from which they have been separated at a certain period, under the form of eggs, of germs, or of little living creatures; and their existence is evidently owing to this generation; they are born. Others, on the contrary, as stones, salts, water, may be formed by certain circumstances, and even by ourselves at pleasure. They have not necessarily made a part of other similar bodies; their existence seems to depend on certain fortuitous circumstances, that have produced the approximation of their constituent principles, and their origin might be referred to attraction. These bodies are formed. Vegetables and animals, in increasing their size, only develope themselves. Whatever may be their minuteness, we shall, on a careful examination, find them already formed, with their parts requiring only to be evolved. Their increase proceeds from within outwards by intus-susception. Stones, and a great many other bodies, are augmented only by the same matter from which they are produced; their growth takes place always from without, by a sort of aggregation.

" As the increase of the bodies which compose these two great subdivisions is not alike in both, a duration very different ought to be the result of these dissimilarity. In fact, minerals are susceptible of indefinite increase, and their end is always indeterminate; it is vague, and depends on the circumstances under which they are placed. Plants and animals ought, from the same circumstances which favoured their developement, to stop when their extension has been carried to the highest degree, so that the end or death of these bodies is fixed and necessary.

"The masses in which stones and other similar bodies generally present themselves, are angular, insulated, and very variable in their size. The individuals which we call plants and animals, have always, and necessarily, a

form that is constant, for the most part rounded and Classific symmetrical, and their extension is limited within cer- tion. tain bounds.

" There is this great difference between these bodies ; that those which increase by aggregation may be divided into molecules, or parts infinitely small, bearing a very near resemblance to the mass from which they were taken ; while in those which develope themselves, no portion can be taken away and exist by itself, at least unless it develope new parts, which replace those that are wanting.

" The bodies which do not develope themselves, are in general formed of fluids or solids which remain constantly in the same points ; they are composed of very few clements, which may be separated and again reunit-The bodies which develope themselves, on the ed. contrary, are essentially composed of solids and fluids, which are always changing, and in a state of renovation; they have always, and from necessity, more or \* Dume less consistence, they are penetrated and augmented by Traite fluids, and after being decomposed they can never be i. p. s. formed again such as they were before. \*. "

For the more convenient study of natural history, the Division whole subject may be divided into five great branches, natural a viz. Meteorology, Hydrography, Mineralogy, Botany, toly. and Zoology.

1. Metcorology includes the description of all those phenomena which take place in the atmosphere that surrounds our globe. In the present work it is considered under the articles METEOROLOGY, METEOROLITE, 9 Atmospheric ELECTRICITY, CLOUD, MOON, Influence gy of, &c.

2. Hydrography comprehends the natural history of Hydrography the sea, of rivers, lakes, and other collections of water phy. that make up so large a part of the earth. Much of this subject will be found treated of under the article RIVER, and various parts of it have been discussed under CHEMISTRY and MINERALOGY.

3. Mineralogy is that part of the subject which treats Minerale of the solid inorganic bodies that are found on the sur-gy. face or in the bowels of the earth. It has been considered under the articles GEOLOGY and MINERALOGY.

4. Botany comprehends the natural history of vege-Botany. tables. Sec BOTANY.

5. Zoology includes the natural history of all ani-Zoology. mated beings, and is subdivided into many subordinate classes.

These classes are different in number and denomination, according to the different systems of naturalists. Linne, whom we have principally followed in this work, has arranged animals under six classes : viz. 1. Mammalia, or those animals which suckle their young at mammæ or paps ; see MAN, MAMMALIA and CETO-LOGY. 2. Aves, or birds ; see ORNITHOLOGY. 3. Amphibia, or those animals which can live either on land or in water; see ERPETOLOGY and OPHIOLOGY. 4. Pisces, or fishes; see ICHTHYOLOGY. 5. Insecta, or insects; see ENTOMOLOGY. And 6. Vermes, or worms; see HELMINTHOLOGY and CONCHOLOGY.

Later naturalists have divided animals into a greater Covier's number of classes, and have subdivided these differently. rangeme Of these arrangements, that of M. Cuvier seems the most deserving of notice. After considering man, whom he very properly distinguishes from the other mammalia by allotting to him a separate book, he divides the rest of

olifica. of the animal kingdom into nine classes, viz. MAMMIFE-ROUS animals, BIRDS, REPTILES, FISHES, MOLLUSCA, WORMS, CRUSTACEOUS animals, INSECTS and ZOO-PHYTES.

We have already given an outline of four of these classes, viz. of the MAMMIFEROUS animals, under MAMMALIA, and of MOLLUSCA, WORMS and ZOO-PHYTES, under HELMINTHOLOGY. To complete our view of Cuvier's arrangement, we shall here add an outline of the remaining five elasses.

Cuvier divides birds into five orders, viz. RAPA-CIOUS birds or ACCIPITRES, PASSERINE birds, CLIM-BERS OF SCANSORES, GALLINACEOUS birds, WADERS or GRALLÆ, and ANSERINE birds.

off ds.

1. The RAPACIOUS birds have short feet, toes furnished with strong claws, and a hooked bill. They are subdivided into three sections ; viz. Nudicolles, having the head and part of the neck without feathers ; containing the vulture tribe. Plumicolles, having the head covered with feathers and a cere at the base of the bill, containing the falcon tribe; including Griffons, Eagles, Spurrow-hawks, Buzzards, Kites and Falcons. Nycterides, having the head flattened backward from the front and the eyes directed forward ; containing the oul tribe.

2. The PASSERINE birds are distinguished by having four toes, three before and one behind, with the external toes wholly or partially united. They are subdivided into seven sections : viz. Crenirostres, having the bill grooved towards the end of the mandible; containing the Shrikes, Flycatchers, Thrushes, Chatterers and Tanagers. Dentirostres, having a bill with notched edges; containing the Plant-clippers, Motmots, and Hornbills. Plenirostres, having the bill straight, strong, compressed and without a groove ; containing the Grakles, Crows, Rollers, and Birds of Paradise. Conirostres. having the bill conical ; containing the Orioles, Stares, Grosbeaks, Sparrows, and Buntings. Sabulirostres, having the bill slender like an awl; containing the Titmice, Manakins, Larks, and Wagtails. Planirostres, having the bill short, flattened horizontally, and opening very wide; containing the Swallows and Goat-suckers. Tenuirostres, having the bill slender, elongated and solid ; containing the Nuthatches, Creepers, Humming birds, Hoopoes, Bee-eaters, King's-fishers and Todys.

3. The CLIMBERS have two toes before and two behind. They are subdivided into two sections; viz. Cuncirostres, having a slender bill; containing Jacamars, Wood-peckers, Wry-necks, and Cuckoos. Levirostres, having the bill thick and light; containing the Anis, Touracoes, Musophages, Curucuis, Barbets, Toucans, and Parrots.

4. The GALLINACEOUS birds have the front toes united at their base by a short membrane. They are subdivided into two sections, viz. Alectrides, having common wings fitted for flying; containing the Pigeons, Grouse, Peacocks, Pheasants, Pintados, Turkeys, Curassows, Guans, Bustards. Brevipennes, having wings too short for flight ; containing the Ostrich, Cassowary and Dodo tribes.

5. The WADERS have elevated and naked tarsi and the two outer toes united. They are subdivided into five sections, viz. Brevirostres, having the bill short and thick; containing the Trumpeters, Screamers, Secretaries, Boat-bills, and Flamingos. Cultrirostres, having the bill

long, strong, and like a knife ; containing the Herons, Classifica-Jabirus and Ibisses. Latirostres ; having the bill long, weak, and flattened horizontally; containing the Spoonbills. Longirostres, having the bill slender, long and weak ; containing the Avosets, Plovers, Lapwings, Phalaropes, and Woodcocks. Pressirostres, having the bill middle-sized and compressed, containing the Oyster-Catchers, Rails, Coots and Jacanas.

6. The ANSERINE birds have the toes united by broad membranes. They are subdivided into four sections, viz. Pennipedes, having all the four toes united ; containing the Pelicans, Tropic birds and Darters. Macropteres, having the thumb free, the bill not indented, and very long wings; containing the Terns, Gulls, Skimmers, Petrels and Albatrosses. Servirostres, having the thumb free, the bill broad and servated, and wings of a moderate size ; containing the Ducks and Mergansers. Brachypteres, having the thumb either free or wanting, the bill not serrated, and the wings very short, containing the Grebes, Auks and Manchots.

16 The AMPHIBIA or REPTILES are divided into two Of reptiles. orders, as follows.

1. Those that have a heart with two auricles. This order is subdivided into two sections, viz. Chelonia, having a back shell and the jaws invested with horn, containing the Tortoise tribe, including Turtles and Tortoises. Sauria, having a scaly body and teeth ; containing the Lizard tribe, including the Croeodiles, Guanas, Dragons, Lizards, Skinks, and some others.

2. Those that have a heart with one auriele. This order is also subdivided into two sections, viz. Ophidia, having a scaly body, no feet, and always without branchiæ; containing the tribes of Anguis, Amphisbæna, Cæcilia, Acrocordon, Angaha, Coluber or Snake, Boa, and Crotalus or Rattle-Snake. Batrachia, having a naked skin, feet and branchiæ in the young animals; containing the Frogs, Salamanders, and (according to Cuvier's original table) the Siren.

The fishes are divided into two orders, CARTILAGI- Of fishes. NOUS and BONY fishes.

1. Those which have a Cartilaginous skeleton are divided into two sections, viz. Chondropterygii, with fixed branchiæ; containing the Lampreys, Hags, Rays, Dog-fish and Sea-monsters. Branchiostegi, with free branchiæ; containing the tribes Batrachus or American Toad-fish, Polyodon, Accipenser or Sturgeons, Pegasus, Syngnathus or Pipe-fish, Centriscus or Bellowsfish, Balistes or Horned-fish, Ostracion or Trunkfish, Tetraodon or Sun-fish, Oveides, Mola or Moles. Diodon or Porenpine-fish, Lophius or Frog-fish, and Cyclopterus or Lump-fish.

2. The fishes with a bony skeleton are subdivided into four sections, viz. Apodes, having no ventral fins; containing the tribes of Muræna or Eels, Gymnothorax, Synbranchus, Sphagebranchus, Gymnotus or Electric-eels, Trichiurus, Gymneterus, Ophidium, Ammodytes, or Sand-eels ; Anarrhichas, or Sea-wolves ; and Xiphias or Sword-fish. Jugulares, having the ventral fins situated before the pectoral; containing the Haddocks, Blennys, Hunch-back, Dragonets, Sea-dragons, and Star-gazers. Thoracici, with the ventral fins situated below the pectoral; containing the Bull-heads, Scorpions, Gurnards, Gobys, Surmullets, Mackerel, Stickle-backs, Long-tails, Lonehiurus, Johnes, Sciænes, Dorees, Stromateus, Theuthis, Chætodon, Dorados, Bodians,

#### HISTORY. NATURAL

Classifica- Bodians, Holocentrus, Lutiens, Perches, Anthias, Epinelephus, Wrasses, Breams, Scarcs, Flounders, Sea-serpents, Lepidopus, and Remoras. Abdominales, with the ventral fins situated behind the pectoral; containing the Mormyrus, Carps, Mullets, Flying-fish, Polynemus, Herrings, Atherines, Argentines, Salmons, Pikes, Loches, Anablapes, Silurus, Platysomatus, Armed-fish, Cuirass-fish, Amia, Acanthonotus, and Fistularia, or Tobacco-pipe-fish.

18 Of crustacea.

632

tion.

The CRUSTACEA are divided into two orders, as follows:

1. Monoculi, containing the tribes of Limulus, Calygus, Apus, Cyclops, and Polyphemus.

2. Ecrevisses, or Crabs, containing the tribes of Cancer, Inachus, Pagurus, Astacus, Palinurus, Scyllarus, and Squilla.

19 Of insects.

The INSECTS are distributed by Cuvier under two general orders, viz. Those with jaws, and those without jaws.

1. Insects with jaws are arranged under five sections, VIZ. GNATHAPTERA, NEUROPTERA, HYMENOPTERA, COLEOPTERA, and ORTHOPTERA. The GNATHAPTERA, have no wings, and are subdivided into Polygnathes, having several pairs of jaws, containing the tribes of Physodes, Oniscus, and Cymothoa ; Millepedes, with two jaws and feet at each ring of the body, containing the tribes of Julus and Seolopendra; Araneides, having the head joined to the corselets, eight feet, and abdomen without feet ; Seticaudes, having the head distinct, six feet, and abdomen terminated by silken threads; Ricinus, with the head distinct, six feet, and the abdomen naked. The NEU-ROPTERA have four reticulated wings, and are subdivided into Odonates, having the mouth covered with the lip, and the wings extended during repose; Tectipennes, with the mouth salient, and wings hidden below the body during repose; Agnathes, with a very small mouth, and no mandibles. The HYMENOPTERA have four veined wings, and of these some have the abdomen joined to the thorax by a pedicle; as the Mellites, having the lip prolonged into a trunk ; the Duplipennes, having the upper wings folded lengthwise ; the Chrysides, having the antenna bent, and the abdomen hollow below; the Anthophiles, with the antennæ filiform, wings not folded, abdomen round, and lips short ; the Trouisseurs, with setaceous antennæ, of 12 or 13 joints, rolling up spirally; the Myrmeges, with setaeeous beut antennæ, and a rounded abdomen ; the Insectirodes, with hent antennæ of 30 joints, and a prominent sting ; Cynipcs, with filiform antennæ and a spiral sting. Others of this section have the abdomen sessile, as the Uroceri, with palpæ scareely apparent, and a very prominent sting, and the Tenthredos with very prominent palpæ and a serrated sting. The COLEOPTERA have four wings, the uppermost of which are hard, and the lower fold transversely : they have either six palpæ, as the Carnassiers, with filiform or setaceous antennæ; or four palpæ; and of these latter some have the tarsus fivejointed, as the Lamellicornes, with clavated antennæ, having the club lamellated; the Clavicornes, with the antennæ either perfoliated or solid; the Brachelyteres, with moniliform antennæ and short elytra ; the Woodpiereers, with filiform antennæ and hard elytra; and the Apalytres, with filiform antennæ and soft elytra. Others have the tarsi four or five-jointed; as the Lucifuges, with variable antennæ and hard elytra; and the Blistering-flies, with

variable antennæ and soft elytra. Others again have the Class a tarsi four-jointed; as the Rostricornes, with antennæ on the beak; the Wood-eaters, with setiform antennæ; the Teretiforms, with clavated antennæ, and a body often cylindrical, and the elub solid ; the Planiforms, with granulated antennæ and a flattened body; and the Herbivori, with filiform or moniliform antennæ and a swollen body. A few have the tarsi three-jointed, as the Coecinella. The ORTHOPTERA have four wings, the upper hard and the lower folded longitudinally. They include the Forficulæ, having the anus terminated by a forceps; the Blattæ, with a flattened body and the head retiring below the corselet; the Mantis and Spectres, with a very long corselet; and the Leapers, with cylindrical body and long hinder legs formed for jumping.

2. The INSECTS without jaws are subdivided into HE-MIPTERA, LEPIDOTERA, DIFTERA, and APTERA. The HEMIPTERA have four wings frequently crossed, and a jointed beak ; and include the Frontirostres, having the beak rising from the fore part of the head ; the Collirostres, with the beak appearing to grow from the neek; and the Planipennes, with the wings not crossed and spreading, The LEPIDOPTERA have four wings covered with scales and a spiral trunk ; they include the Butterflies, with the antennæ terminated by a solid mass ; the Hesperiæ, with the antennæ curved at their extremity; the Fusicornes, with the antennæ swelling towards the middle, and the Seticornes, with setaeeous antennæ. The DIPTERA have only two wings; and include the Hydromies, with filiform or plumose antennæ and a trunk; the Sarcostomes, with a fleshy retractile trunk, terminated by two lips; the Sclerostomes, with very short antennæ, a horned projecting sucker, but no trunk ; and the Gad flies, with short antennæ, and neither sucker nor trunk. The APTERA have no wings: they include the Parasitical insects, or Fleas, Lice, and Mites.

It is not surprising that naturalists of taste and genius, The from the gradation that seems to take place among the of a works of nature, should have been led to form the no- of he tion that there exists in nature a regular series or chain of beings, the links of which, if we could discover them all, would be found to resemble each other so nearly, as only to exhibit to the superficial observer a few shades of difference. Natura non per saltum movet, has become a sort of axiom in natural history.

The notion of a chain of being is alluring, and does not want arguments in its favour. The Esquimaux Indian, or the inhabitant of Terra del Fuego, seems scareely superior in form, and very little in intellect, to the Oran Otan ; the Platypus, the flying Lemur, flying Squirrels, and, still more, the Bats, appear to form the connecting links between quadrupeds and birds; while the Seals, the Walrusses, and the whole order of Cete, connect the former with the fishes. In this latter class, the Flying Fish, in its capability of supporting itself in the air, seems to approach the feathered tribes, while some of these, as the Penguins, in their habits and manner of life, bear some distant resemblance to fishes. Again, the Siren and the Eels so nearly resemble each other, that it has been disputed whether the former should be reckoned among the Amphibia or the Fishes; while one species of Lizard, (Lacerta lumbricoides), is so like an earth-worm, as apparently to connect the Amphibia and the Vermes. Farther, the diminutive Humming-bird (Trochilus exilis), and the Humble

Humble Bce, (Apis terrestris), are so nearly alike, lassificaboth in size and manner of life, as to form no very exceptionable links of union between the birds and insects.

If we compare the vegetable tribes with some of the inferior classes of animals, we shall perceive many points of resemblance, which may seem to indicate a continuance of the same chain. Besides the Mimosa pudica and Dionæa muscipula, already mentioned, the Hedysarum gyrans, or moving plant, is a remarkable instance of the mobility of vegetables ; the earrion flower (Stapelia hirsuta), and some species of morel, bear the odour of putrid animal substances ; while on the other hand, the Mantis siccifolia might be mistaken for a dried leaf; several species of Pennatula (sea pens) and Sertularia, for ferns; the Madrepora fungites (mushroom madrepore), for a petrified mushroom; and the Tubularia magnifica, and Actiniæ, when expanded, for the most beautiful full-blown flowers.

Lastly, on comparing the mineral kingdom with the classes of organized beings, we find several so nearly resembling stones, as scarcely to be distinguished from them.

Though the view which we have given above, of the circumstances that have led naturalists to form the idea of a regular chain of beings, is specious; it will not bear the scrutiny of a strict examination. The resemblances which we have pointed out, are more apparent than real; and anatomy and chemistry, added to a more accurate acquaintance with the works of nature, have proved, that those links which, to superficial observers. appear most allied, are yet separated by considerable chasms. In fact, if we were to admit these resemblances as ever so accurate, they would lead us to form, not one chain, but many.

21 aber of ies in

tion.

It must be considered as a very difficult, though a very curious problem, to ascertain the number of species at present known throughout the several subdivisions of nature. From the different modes in which different naturalists have distributed the objects of their research, and from the additions that are perpetually made to our knowledge, it may be impossible to fix the precise number of known species at any given time; but we may make a tolerably near approximation to the truth; and this we shall now attempt, going through the several kingdoms, classes, and orders, as they have been treated of in the former parts of this work.

#### Amals. I. IN THE ANIMAL KINGDOM. A. MAN. 5 species. \*S Mam-B. MAMMALIA. 1. Primates, 100\* 2. Bruta, 30\* 3. Feræ, 184\* 4. Glires, 124 5. Decora, 82\* Vol. XIV. Part. II. +

(B) The numbers here given differ in several instances from those which we have seen in some late works on this subject. Thus, M. La Cépède, in a note to the discourse delivered by him at the close of his course of Natural History, states the numbers of some classes as follows : Mammalia, 416 species ; Birds, 2534 ; Reptiles, 125; Serpents, 180; Fishes, 992; in all 4247.

D. METALLIC ORES

are divided into 24 genera, cach metal forming a genus, 106

Total, 267 species \*. \* See Mi

neralogy.

Hence, taking the whole number of known animals at 23,000, that of vegetables at 50,000 and that of minerals 267, the whole number of known species of

natural objects will be 73,267. II. Though the classification of natural bodies is of Hints for the highest importance towards making us acquainted studying with unknown species, and distinguishing them from those which we already know; this alone is not sufficient to form a naturalist. His principal object should be to learn the habits, manners, and uses of the objects which he is studying ; and he may perhaps be assisted in this object by the following observations.

1. In Zoology, or the natural history of the animal Zoology. kingdom, it is necessary to ascertain both the distinctive characters of each individual animal, and its peculiar habits, properties and uses.

The naturalist first learns that the sheep, for instance, is in the class mammalia, being one of those animals that suckle their young; in the order pecora, because it is hoofed, and has no cutting teeth in the upper jaw; and that it is distinguished from other animals of the same order, by its having several blunt wedge-like incisive fore-teeth in the lower jaw only, hollow reclined horns, and no tusks.

This information would satisfy many, who call themselves naturalists; but it is far from being all that is required ; the philosophical investigator of Nature inquires into its habits; as its food, its period of gestation, its scason of lambing, the weather and climate most suited to its health and vigour. He endeavours to learn what produces the difference in its fleece, whether climate, food, or some peculiarity in the breed; and is anxious to ascertain what variety is most disposed to fatten, and what food effects this speedily ; with many other very useful particulars.

The information of the first kind is of consequence, and even necessary in many cases ; but that of the latter is most useful.

If a traveller discovers an animal possessing any useful property, or producing any useful drug, if he have not the first kind of information, he gives so confused and inaccurate a description of it, that others, mistaking the animal, discredit the anthor's account, and the world loses the benefit of his discovery.

2. Botany, or the natural history of the vegetable Botany; kingdom, in the usual acceptation of the term, implies and 4 L 2 only

(c) This number, drawn from the article BOTANY, compared with the three first volumes of Wildenow's edition of the Species Plantarum, and with Persoon's edition of the Systema Vegetabilium, of Linné, is certainly very far below the truth. Many years ago, the number of known species was reckoned at above twenty thousand, and there is reason to believe that it exceeds fifty thousand.

635

Objects and

utility of

Natural History.

Objects only the knowledge of the distinctive characters of and utility plants; and he who knows the greatest number, and is of Natural most accurate in determining the different species, is History. accounted the best botanist.

This however constitutes but a small part of the science; there is another distinct department, which may properly be termed the philosophy of botany, which is both more interesting and more useful. This includes the knowledge of the structure, or the anatomy of plants; and the knowledge of the uses, or functions of their various parts, as of the leaves, the bark, the pith, the roots, the juices, &c.; which is called the physiology of plants. It includes also an acquaintance with the soil and climate adapted to different vegetables, their mode of propagation, and the various uses to which their several parts or productions may be applied.

Botany, in the first sense, which may be called practical botany, is subservient, and absolutely necessary to the study of the philosophy of botany; for no one that is unacquainted with the classification of plants can either convey to others his own information, or himself receive the benefit of that of others, respecting cither the structure and cconomy or the habits and the uses of such plants, as may have been investigated.

If medical virtues are discovered in any vegetable production ; without the accuracy of the practical botanist, to ascertain and describe the particular plant which affords it, the discovery is often lost ; or perhaps, what is worse, the virtues are attributed to a different plant, and it is only by repeated failures, and in some cases after much mischief, that the error is detected.

It is evident that the same may happen to the agriculturist, the dyer, or any other artizan, who has discovered in the vegetable kingdom the means of improving his art, but has not botanical knowledge sufficient to give an accurate character of the plant, to which he is indebted for his discovery.

28 Mineralogy.

20

3. In Mineralogy, or the natural history of the mineral kingdom, almost half the students are of that class, who content themselves with collecting, and being able to arrange systematically the minerals they meet with. But in this department of natural history, as well as the other two, which we have considered, something more than arrangement is required.

It is the man who can analyze, and separate the component parts of mineral productions; who knows the art of assaying, and who knows à priori the probable site of a quarry, or a mine, and can tell the direction of a stratum of coal, or of marble, that we may call a mincralogist.

The natural history of the mineral kingdom includes geology, or the data upon which are founded the different theories of the formation of the earth. It includes the knowledge of those facts, upon which the art of mining, and the art of separating and purifying metals, is founded; and its object is to teach likewise the properties of those metals, as well as of the earths, and other mineral productions, when separated and in their simple state.

With respect to the utility of the study of natural Utility of history, we have unavoidably given many instances of it, the study. in considering the object of the science. We need therefore add but few others.

The grazier knows the advantage of attending to the Object habits and distinctive marks of our domestic animals. and util It is natural history, though not often studied scientifi- of Natur cally, that teaches him what variety of sheep to prefer ; History by what means to obtain a variety of cows, remarkable for their quantity of milk ; how to choose the stock To the that is best adapted to his land, and what is the best grazier. food for them during winter.

Much benefit is likely to accrue from the attention lately paid to the cultivation of what are termed the artificial grasses. Instead of sowing his hay seeds indiscriminately, the grazier may select only such grasses as are, by observation, found to be most suited to his soil and cattle.

The farmer's knowledge of the proper succession of To the crops, the best times for sowing them, when to wced, farmer. and with what to manure, as well as how to destroy both weeds and insects, is the knowledge of a naturalist; and surely he who is scientifically acquainted with the growth of plants, knowing what part the soil acts in vegetation, and what is the aliment most required by them, will have great advantage over the mere empirical farmer, who has no better reason for what he docs, than that his father did the same before him.

By studying the natural history of insects, we learn the habits of such as are noxious and injurious, and thence derive the means of destroying them.

The mineralogist has often enriched individual pro-To the prietors of land, and benefited his country, by the dis-landed pr covery of mines; he is enabled to direct the planners prietor. of canals by warning them of obstacles; and his knowledge has aided the physician in ascertaining the virtues of minerals, and of mineral waters.

In the arts, a knowledge of natural history prevents In the ar that confusion, and those innumerable errors that must be committed, when the natural productions which are employed cannot be accurately discriminated from others.

It is to the naturalist that we are many times indebted for the introduction of foreign animals and foreign plants into our own country. Wheat, oats, barley, and other vegetables, which are now become necessary to our existence, were not originally of British growth. The potato, now so general and so useful, was first introduced into this country by Gerard, a noted botanist, and was for some time cultivated in his garden as a rarity: The sugar-cane, the bread-fruit tree, the farinaceous palms, the flax and hemp, have all been transported by naturalists of the present day, to regions where they never grew before.

Besides the above, and many similar instances of advantage to be derived from studying the different branches of natural history, these two incalculable benefits necessarily arise to the student himself, from attending to the whole, or any part of the science; namely, a power of abstracting the mind, and reasoning methodically; and a habit of contemplating the \* Skrim Creator in his works \*.

Our limits do not permit us to enter further into the shire's fertile topic of the utility and advantages of natural Essays history. Its utility, in a moral and religious point of view, has been ably illustrated by Mr Ray, in his "Wisdom of God;" by Mr Bingley, in the introduction

636

Mole of tion to his " Animal Biography ;" and, in particular, reserving by Dr Paley, in his " Natural Theology ;" and to ecimens. these works we must refer our readers. -

III. We have stated it to be one of the principal <sup>34</sup> rt of pre- objects of natural history, to teach the mode of prerving spe\_serving specimens. This art, called by the French Taxidermie, is exceedingly curious, and would well deserve a much fuller consideration than we can here allot to it. We shall confine our attention on this sub-

ject entircly to the animal kingdom, and even here we must be very brief. The art of preparing and mounting the skins of ani-

mals appears to be pretty old; but it made no great progress before the 17th century, when Reaumur made some attempts to preserve the specimens from the attacks of insects. In the Journal de Physique for 1773, there is a memoir addressed to the Royal Society of London, by M. Kuckhan, on the methods of preparing birds, which is very curious, but is liable to many objections. In the same volume is a memoir by Mauduit, principally respecting the means of preserving animal specimens from the attacks of insects. His preservatives are of a poisonous nature ; and, of course, their use is . dangerous, while they do not appear to have been attended with the expected success. The arsenical soap of Becœur, much celebrated about the same time, is liable to similar objections.

The latest, and probably the best work on this subject, is that published a few years ago by M. Nicolas ; and from this the following observations are derived.

The instruments employed in the preparation of specimens are much the same as those used by anatomists in their ordinary dissections, consisting of small knives or scalpels, forceps or pincers of various forms, probes, needles, and pins or wires.

The prescrvatives employed by M. Nicolas to protect the specimens from insects, are principally of two kinds: 1. Sulphur, which he applies to the skins by means of fumigation, thus impregnating them with sulphurous acid ; 2. A liquor for maccrating the skins, another liquor for rubbing over the hair, and a pomatum for anointing the inside of the skin. The first liquor is prepared by steeping a pound and a half of powdered oak bark, and four ounces of powdered alum, in twenty English pints of cold water, for two days, taking care to shake the mixture from time to time. The *pomatum* is prepared of a pound of white soap, half a pound of caustic potash, four ounces of powdered alum, two English pints of water, four ounces of oil of petroleum, and the same of camphire. The soap, cut into small pieces, is put into an carthen pipkin, over a moderate fire; the water poured over it; and when the whole is formed into a sort of soft paste, the alum and then the oil are added; the whole well stirred together, removed from the fire, and when it is nearly cold the camphire is added; being before hand rubbed down in a mortar with a little spirit of wine. The pomatum, thus prepared, must be kept in glass vessels, well stopt; and, when used, is to be lowered with water to the consistence of thin cream, and laid on the skins by means of a pencil brush.

The liquor employed for preserving the fur is prepared by infusing an ounce of white soap shred very small, two ounces of camphire broken into very small

pieces, the same of colocynth or bitter-apple grossly Mode of powdered, in two English pints of spirit of wine, for four preserving or five days, shaking the vessel from time to time, after specimens. which the liquor is to be filtered through blotting-paper.

M. Nicolas has given directions for preparing and preserving specimens of all the various classes of animals. We shall, as far as our limits permit, briefly follow him through each.

In skinning quadrupeds, he proposes to make an in-Directions cision along the middle of the back, from the haunches for stuffing to the shoulders, except in those animals whose skin is quadrupeds. very thick and hard, or is set with spines, in which the. opening must be made at the belly in the usual manner. In detaching the skin from the flesh, we must occasionally employ the knife, and as we proceed, mustinsert tow between the skin and flesh, to prevent soiling the fur. When the whole hody is detached, and the skin drawn down as far as the ankles, the nose, and the tip of the tail, the whole body is to be cut away except the head and extremities, which are left to give a better form and support to the specimen. All the fleshy and fatty parts, the brain, and the eyes, however, must be cut away, and nothing left but the bones, the spaces between which and the skin must be stuffed with tow. cut fine, and a little soft clay must be put within the orbits, in order to fix the artificial eyes.

Before stuffing, the skin is to be steeped for several days, from five to fiftcen, according to the size of the animal, in the liquor first described, and after steeping, the inside is to be well anointed with the pomatum.

When the legs and head are stuffed, the cavity of the skull filled with very dry moss, and the eyes fixed, wires are to be passed through the inside of the body, the extremitics, and the head and tail, in the following manner. Three iron wires of a moderate size, well annealed, at least twice as long as the animal, are to be twisted together for nearly half the length, and while one wire is left straight, the other two are to be bent at each end, so as to form a cross. When the skin is turned, ready for stuffing, these wires are to be placed within it in such a manner as that the straight wire shall pass through the head and tail, and the crossing wires through the extremities, coming out at the ball of each foot; and in this way after the cavity is filled up with tow, and the open part neatly stitched, the specimen may be fixed on a board in its natural position. Nothing remains now but to impregnate the fur with the bitter liquor last described, which is done by means of a sponge, with which the whole outside is to be well washed, then covered with folds of linen, and dried in the shade.

The art of preserving birds is perhaps the most curi-Directions ous part of the present subject, and is that to which the for stuffing most attention has been given. M. Nicolas has cx-birds. plained at some length the mode recommended by M. Kuckhan in the Journal de Physique ; that by Dr Lettsom, in the Naturalist's and Traveller's Companion ; that of Mauduit, inserted in the fifth number of the Encyclopédie Methodique ; and that of Dufresne, adopted by M. Daudin, and inserted in his Traité d'Ornithologie ; after which he details his own.

He describes three methods of preparing birds, according as we can procure fresh-killed specimens, whole dried skins brought from abroad, or detached parts of several Mode of several individuals of the same species. We shall here preserving confine ourselves to the first of these, as being best specimens, adapted to the generality of our readers.

When a fresh-killed bird is procured, it is to be placed upon a table, upon its back, with the tail turned towards the operator, who, after having separated with his fingers the feathers which cover the belly towards the right and left, is to make with a sealpel, a longitudinal incision through the skin, from the point of the breast-bone to about the middle of the belly. The edges of the skin are now to be raised with a pair of flat pincers, on each side, carefully separating the flesh as oceasion may require, by the knife, and inserting a little cotton from time to time, to prevent soiling the feathers. In this way the skin is to be detached from the shoulders and neck, and as much as possible of the body laid barc, after which a pretty strong thread is to be passed through the nostrils, and tied under the lower mandible, leaving the ends of the thread when tied together, at least twice as long as the neek. Now, holding the bird by the thread, with the back turned towards him, the operator is to hold together the feathers on the two edges of the incision as well as those that cover the breast, and pushing the head of the bird inwards with his thumb so as to form the neck into an arch, is to eut this off near the body, detach from it the gullet and wind-pipe, and all the fleshy parts, both of the neck and head, by drawing the skin as far back as possible towards the beak, and cutting off the neck-bones elose to the head ; he is to empty the skull with a hitle iron instrument in the form of an earpicker, and clean it properly with cotton. He is now to wrap eotton or tow about the head and neek, and to separate the rest of the skin, leaving the pinions and bones of the wings, and legs, and the tail, as directed for quadrupeds. After this has been done, the skin is to be turned out like a glove, with all its feathers turned inwards, all the natural openings of the bird, as well as any shot-holes, &e. made in killing the bird, are to be stitched up with a needle and fine thread ; then the whole skin as well as the bones, are to be washed with a strong infusion of tan with a little alum, by means of a peneil-brush, and the skin inclosed in a covered vessel that it may not dry too hastily.

In ten or twelve hours time we may wash the skin and bones again with the astringent liquor. Twice washing in this manner will be sufficient for very small birds, but those of a middling size will require maceration in the first liquor employed for quadrupeds during two days, and four or five days for those of larger size.

The skins being well imprognated with the astringent liquor, are to be smeared with the soapy pomatum, have artificial eyes fixed in the orbits by means of wax, and stuffed and mounted much in the same manner as quadrupeds, except that the wires employed for this purpose are rather differently bended.

Great nicety is required in fixing the different parts of a bird in its natural position, and in arranging the feathers smoothly and evenly. M. Nicolas directs thin plates of lead, to be placed so as to secure the wings in the proper position till the whole is completely arranged.

To preserve the feet and legs of birds, he anoints them with linseed oil mixed with camphire, and applied a little warm.

The last operation consists in enveloping the bird Mode of with bandages of muslin or fine linen, pinned round the preserving neck, breast, body, and rump, as well to seeure the specimens. feathers in their places during drying, as to allow of their being drenched with the bitter liquor to preserve them from the attacks of insects.

The different orders of insects require different modes Insects, of preparation. The following is a summary of our author's mode of preserving each kind.

For the coleoptera and hemiptera .- One of these insects, as soon as eaught, is to be earefully wrapt in very fine paper, with the ends of the paper curled round to prevent the animal from moving; and this roll of paper including the insect, is to be put into a little box of pasteboard till the inseet-hunter returns home. Each insect is then to be held between the thumb and forefinger of the left hand, the wings to be raised by means of a pin, and held open with the middle finger, while the abdomen of the animal is slit open from the back, and the entrails abstracted by means of an iron wire, and the cavity as well as the edges of the wound are to be washed with the bitter spirituous liquor described in Nº 36. by means of a very fine pencil. Then a small cotton plug impregnated with oil of petroleum is to be stuffed into the cavity, with the point of a wire, till the eavity is sufficiently full, when the wings are to be suffered to return to their natural situation, and the insect is ready for mounting. For mounting these insects, M. Nicolas employs little squares of card, through the middle and across which he passes a small iron wire well annealed, and about the size of a harpsicord string. A very fine needle is now to be passed through the animal, as near as possible to the corselet; and after having eovered the upright iron wire with a light coating of gum-water, he passes it through the hole made by the needle, and fixes the animal in such a manner that its feet may rest upon the eard.

For the lepidoptera.—He recommends them to be put, when eaught, into a triangular piece of paper, and afterwards into a pasteboard box of the same form, opening with a hinge. For mounting these insects it is sufficient to perforate their bodies with a fine needle, armed with a double thread impregnated with the bitter spirituous liquor, making the needle enter by the head and come out at the end of the belly, and then eutting the thread with seissars. The insect thus prepared is mounted by means of a eard, as directed for the coleoptera, and a piece of wood about an inch long, seven or eight lines broad, and a proper thickness, is placed below the wings on each side very near the body, and the wings are kept down by means of plates of lead.

In the preparation of specimens of fishes, M. Nicolas Fishes, prefers the method of Mauduit to that given by Dr Lettsom in the Naturalist's and Traveller's Companion; but as Mauduit's method requires much skill and address, he recommends the following, especially for the flat kinds of fish.

He makes a longitudinal incision with seissars along the belly of the fish from the anus to the lower mandible, and then gradually and carefully separates the skin from the flesh with the assistance of the blade and flat handle of a scalpel, till he has laid bare one side of the animal. He then passes to the other side, proceeding in the same manner to detach the skin from that part, after which he separates the head from the body with a pair

638

#### NATURAL HISTORY.

Mode of pair of scissars, and clears away the fleshy parts attached reserving to the head. He now detaches the skin from the back

pecimens, as far as the anus, and then laying the fish on the table, he passes the flat handle of the scalpel below the skin that covers the tail and neighbouring parts, in order to separate it completely. This done, he pushes the tail inwards, and with the assistance of the scalpel and drawing the skin very gently, he detaches this as near as possible to the end of the tail, which he then separates with scissars, thus leaving the skin with nothing attached to it but the head and extremity of the tail. It only remains now to clear away the cars and eyes, and properly clean the head.

The skin is now steeped for some days in the tanning liquor, then laid on a table, and when the head is properly arranged, a model of the body of the fish made of soft clay, mixed with fine sand, is placed within the skin, which is made to fit neatly over it, is then bound with little bandages of linen, and suffered to dry. When the clay is quite dry and hard, and the skin has acquired so much firmness as to retain its proper form, it is to be gently beaten all over to break the clay, so that it may be withdrawn through the opening. When this is done, the whole inside of the skin and head is to be smeared by means of a pencil brush with the soap pomatum. After which it is to be entirely filled with cut tow, and the opening stitched up as neatly as pos-sible. Then artificial eyes are to be placed in the orbits by means of soft wax, and the whole body is to be covered with a coat of white varnish prepared by digesting four ounces of clear turpentine, three ounces of sandarac, and one ounce of mastich in tears, with eight ounces of oil of turpentine, and four ounces of spirit of wine, in a bottle placed in a water bath.

41 ptiles.

42

43

Wrms.

Istacea.

In preparing specimens of reptiles,-after what has been said above, little direction will be required. The skin is to be stript backwards as far as the head, which is to be cut off and cleaned as in other specimens; after which the skin is to be macerated, anointed within with pomatum, stuffed and varnished as before.

The crustacea, including crabs, lobsters, star-fish, and sea-urchins, require but little preparation. In crabs the shell, and in lobsters the tail, is to he separated from the rest of the body; as much as possible of the meat is to be picked out from the body and large claws; the whole interior is to be smeared with the soap pomatum, and after having united the parts, the whole is to be suffered to dry.

The star-fish and urchins, if taken alive, should be killed by plunging them in spirit of wine, and afterwards drying them in the sun or in an oven moderately heated.

As to worms the only mode of preserving the mollusca, or those with naked bodies, is to keep them in spirits; and of the testacea or shell-fish, the only part thought worth preserving is the shell; for the preparation of which, see CONCHOLOGY.

The above is but an imperfect abstract of M. Nicolas's "Methode de preparer et conserver les Animaux de toutes les classes," which is illustrated by plates, and is well deserving the attention of collectors of specimens.

There is also an excellent essay on this subject by Dufresne, under Taxidermie, in the Nouveau Dictionaire d'Histoire Naturelle.

It will be expected that in this introductory article History. on natural history, we should say something of its rise and progress. Much of our observations on this subject History of have been anticipated in preceding articles on the par-natural ticular branches of natural history, so that little remains history, for us to do in this place than to give a general sketch of the early history of this branch of physics.

We have reason to believe that the works of nature Jewish have formed the favourite study among the ingenious and writers. inquisitive from the earliest ages of the world. From the continual allusions to the Creator's works, and the beautiful metaphors drawn from them, which abound in the inspired writings of the Jewish prophets and poets, especially those of Joh, Isaiah, Daniel and David, we know that these sages were well acquainted with natural history, as far at least as observation extended. Solomon, as we are told, was acquainted with all vegetables, " from the cedar of Lebanon to the hyssop that springeth out of the wall;" and probably so wise a man was well acquainted with the other kingdoms of nature. Some writers have gone so far as to assert that Aristotle and Theophrastus learned natural history from the writings of Solomon, though on what data they ground this assertion, we are at a loss to determine.

The principal writers on natural history among the ancients, whose writings have come down to us, are Aristotle, Theophrastus, and Pliny the elder. Of the Aristotle. first we may remark with Haller, that his writings on this subject exhibit a continued chain of physical and anatomical facts, which for the most part appear to have been the result of accurate observation. He relied less than any of the ancient naturalists on uncertain and fabulous report; he industriously collected and examined natural bodies, and appears to have himself dissected many animals, especially fishes, or at least to have been present at their dissection. There are even to be found in his writings, references by letters to figures which he employed to illustrate his observations.

Theophrastus wrote chiefly on the natural history of Theophraplants and fossils, on winds, and on fire. His works stus. have been edited by Heinsius, but, except in plants, they do not contain much that is worthy of our observation more than what is to be found in the writings of Aristotle. 48

The natural history of Pliny is a valuable repository Pliny. of ancient knowledge, which, notwithstanding all its errors and extravagances, we may venture to call after the panegyric of his nephew, a comprehensive and learned work, little less various than nature herself. The author, in the dedication of his work to Vespasian, sensible of the defects with which it abounds, apologises for them, from the consideration that the path which he took had been in a great measure untrodden, and held forth to the traveller few enticements; while some parts of his subject had been so often handled, that readers were become cloyed with them : that it was an arduous task to give what is old an appearance of novelty; to add weight and authority to what is new; to cast a lustre upon subjects that have been obscured by time; to render acceptable what is become trite and disgusting; to obtain credit to doubtful relations; and, in a word, to represent every thing according to nature, and with all its natural properties. His design must be acknowledged to be grand and noble, and when we consider that the work was composed in the midst of important engagements,

#### HISTORY. NATURAL

engagements, and chiefly at broken periods stolen from History. sleep, we shall not wonder that it was imperfectly executed.

The ancients had no idea of methodical or systedelicient in matic distinctions. As they were acquainted with but few bodies in comparison with the moderns, and attended only to those which were useful to man ; they distinguished them only by their usual properties, their native country, their habitations, and the useful purposes to which they might be applied. From the few productions which they described, they were not led to perceive the necessity of searching among them for distinctive marks or relations, which may prevent their being confounded with each other. They doubtless believed that their descriptions were sufficient, and that the names which they imposed would descend with their customs to posterity, without being affected by the disorders and alterations that have changed the face of countries and the seat of empires. But the revolutions that have desolated the fairest regions of the globe, by insulating or displacing their inhabitants, or by confounding them with one another, and altering their language, have frequently almost extinguished the lamp of science. After many ages of ignorance and barbarity, we find in the few works of the ancient naturalists, which have escaped the ravages of war and the devastations of civil discord, little more than uncertainty and obscurity, with respect to those species which they have described. Notwithstanding the labours of numerous commentators, we do not certainly know what species of plant is the cicuta employed by the Greeks for the execution of criminals, and which terminated the life of Socrates. We cannot be sure that the animals, which we find best characterized in the ancient writings, bore the names which we attribute to them; nor are we more certain with respect to the an-

50 Rise of methods.

cient nomenclature of minerals. As long as studious men cultivated the sciences only through the medium of the writings of the ancients, and attempted nothing beyond the interpretation of these, natural history, like everyother branch of physics, remained obscure and confused, and fiction or imagination took the place of facts; but when they perceived the advantage of studying nature herself, and interrogating her by observation, methods were erected, and distinctive characters for the species introduced. This fortunate revolution took place in the 16th century. Cæsalpinns first attempted to reduce vegetables to classes, and distinguish them into tribes according to their form .- Gesner, besides the fine hints that he first gave of the constant relation between the structure of the seed and that of the other parts of plants, was the first who attempted any systematic and methodical arrangement of animals. In the 17th century, Morison, Ray, and Rivinus, improved on the hints of Cæsalpinus respecting the classification of vegetables ; and Aldrovandus, Rhedi, and Swammerdam upon those of Gesner

respecting animals ; and in a short time this first impulse History. given to the art of arranging and distinguishing natural bodies by constant characters, was communicated to all those who were employed in the study of nature. Tournefort, profiting by all the attempts towards method and system in the classification of vegetables that had been made before him, advanced a considerable step in botany, by his beautiful method of distinguishing plants according to the form of their flowers and fruits, which he published towards the end of the 17th century.

The same year of the 18th century (1707) gave Linné and birth to two men who have advanced the science of Buffon. natural history far beyond any of their predecessors. We need scarcely mention the names of Linné and Buffon. The Swedish naturalist extended his enlarged views through every branch of natural history ; he arranged in his Systema Naturæ and Systema Vegetabilium all the productions of nature, and distinguished them by characters that were precise and simple; he created a new language for expressing with brevity all these characters, and thus presented to the view, as in a compendious picture, all the properties of bodies. Buffon, proceeding in a different road, treated more copiously the most important parts of natural history, and of the animals that are most nearly allied to man, in a work which the fire of his genius and the brilliancy of his style have rendered a universal favourite. The rival of Aristotle and Pliny, whose genius he seems to have combined in the greatness of his views and extent of his plan, and altogether one of the first writers of his age, he inspired a passion for the study of nature in numbers, who without his works would never have engaged in such a study, and communicated to his countrymen that taste which has ever since survived him.

After what has been given in the particular treatises on natural history in this Encyclopædia, both as to the progress of the science, and the principal works on each department of it, since the time of Linné and Buffon ; it is unnecessary for us to trace its progress beyond that period. The advances made within these few years are immense, our stock of information is prodigiously increased, and the modes of study greatly improved and facilitated. The labours of Cuvier, Geoffroy, Lacépède, Dumont, Dumeril, Lamarck, Duvernois, Sonnini, Bloch, Spallanzani, Esper, Jussieu, Wildenow, Werner, Patrin, St Fond, Brochant, Brongniart, Klaproth, Fourcroy, Vauquelin, Shaw, Latham, Bancroft, Catesby, Ellis, Smith, Withering, Woodville, Kirwan, Playfair, Thomson, Jameson, &c. with the assistance to be derived from the Annales de Museum National, the Naturalist's Miscellany, the Linnæan Transactions, and the splendid plates of Merian, Schreber, Curtis, Sowerby, Sotheby, &c. afford ample proofs of the industry and success with which this delightful field has been cultivated, and of the rich harvest that has been derived from the united efforts of so many men of genius and talents.

method.

losophy branch of knowledge which considers the powers and

atural

however, two more parts to the number, viz. Magnet- Natural ism and Electricity. It is remarkable, that in the En- Philosophy glish universities these two latter branches are never. taken notice of in lecturing on natural philosophy, the old division being still retained, without any mention of these two important articles. The reason may be, that they are only subject to experiment, and not yet reduced to mathematical reasoning; which is the method of teaching philosophy in one of those celebrated seminarics. Of these branches of this extensive science, it is not our intention to take even a general view in this place. We must therefore refer our readers to each particular article, where they will find them treated at considerable length.

N

NATURALISATION, in Law, the act of naturalizing an alien, or putting him into the condition of a natural-born subject, and entitling him to the rights and privileges thereof. But none can be naturalized unless they have received the saerament within one month before the bringing in of the bill, and taken the onths of allegiance and supremacy in the presence of the parliament. A person who is naturalized may have lands by descent, as heir at law, as well as obtain them by purchase; but he is disabled from being a member of the privy council or parliament; or from holding offices, 7 Jac. I. cap. 2. 12 Will. III. cap. 2. All children born out of the king's dominions, whose fathers were or are subjects of this kingdom at the time of their birth, are adjudged to be natural born subjects of this realm, except children of parents attainted of treason, or that are in the actual service of a foreign prince at enmity with us, 4 Geo. II. cap. 21. Every forcign scaman, who in time of war serves two years on board an English ship, is ipso facto naturalized, 13 Geo. II. eap. 3. And all foreign Protestants and Jews, upon their residing seven years in any of the British colonies, without being absent above two months at a time, or serving two years in a military capacity there, are upon taking the oaths naturalized to all intents and purposes, as if they had been born in this kingdom; and therefore are admissible to all such privileges, and no other, as Protestants or Jews born in this kingdom are entitled to. See ALIEN and DE-NIZEN.

In France before the Revolution, naturalization was the king's prerogative ; in England it is only done by act of parliament. In the former of those places, before their government was overturned, Swiss, Savoyards, and Scots, did not require naturalization, being reputed regnicoles, or natives.

NATURALS, among physicians, whatever naturally belongs to an animal, in opposition to non-naturals. See NON-NATURALS.

NATURE, according to Mr Boyle, has eight different significations ; it being used, 1. For the author of nature, whom the schoolmen call Natura Naturans, being the same with God. 2. By the nature of a thing we sometimes mean its essence ; that is, the attributes which make it what it is, whether the thing be corporeal or not; as when we attempt to define the nature of a fluid, of a triangle, &c. 3. Sometimes we confound that which a man has by nature with what accrues to him by birth; as when we say, that such a man is noble by nature. 4. Sometimes we take nature for an internal principle of motion; as when we say, that 4 M

properties of natural bodies, and their mutual actions on one another. The province of moral philosophy is the mind of man; its inquiries and researches are into the intellectual world. Natural philosophy, on the other hand, is only concerned with the material part of the creation. The Moralist's business is to inquire into the nature of virtue, the causes and effects of vice; to propose remedies for it, and to point out the mode of attaining happiness, which only can be the result of virtuous conduct. The Naturalist, on the contrary, has nothing to do with spirit; his business is solely about body or matter; and he ought to have a solid and accurate knowledge of all material substances, together with their affections and properties ; and if possible, he is to investigate the reasons of such and such appearances .--Indeed, the first and principal part of this science is, to collect all the manifest and sensible appearances of things, and reduce them into a body of natural history. Philosophy has often been said, and is even now very generally thought, to mean an inquiry into all the causes of things ; but experience informs us, that though we are acquainted with a good number of effects, we can trace but few of their causes ; so that philosophy itself will really be found to be in general but a collection of facts. Still, however, it differs from natural history in its appropriated sense ; the business of which is only to observe the appearances of natural bodies separately, and from these appearances to class them with other bodies : natural philosophy goes farther, and recites the action of two or more bodies of the same or different kinds upon one another ; and though it can neither investigate nor point out the causes of those effects, whatever they are, yet, from mathematical reasoning combined with experience, it can be demonstrated, that in such circumstances such effects must always take place. There are cvidently two ways of making observations on the material world : the first is, when we view things nearly as they happen to occur, without any design or intervention of our own; in which way, indeed, no great improvements can be expected in the art, because chance having the direction, only exhibits occasional or extemporary properties. The other method is, when, after a thorough acquaintance with bodies, we apply them to other bodies equally known, diligently attending to the result, and observing whether any thing new arises. Such seems to be in general the nature of our article; nor is it our intention to be much more particular at present. We must therefore refer our readers respectively to those parts of the subject, respecting which they wish for more satisfaction and minuter details. The ancient and modern definitions of the word philosophy, together with its origin, as well as the manner of philosophizing in former times as well as at present, with the gradual improvement of science, particularly natural, we shall introduce, we think, more properly, under the words PHILOSOPHY and PHYSICS. We need only add, under the present article, what however is well known, that natural philosophy was till lately divided only into four parts, commonly called the four branches, viz. 1. Mechanies ; 2. Hydrostatics ; 3. Opties ; and, 4. Astronomy ; and these are again subdivided into various parts. Modern discoveries have added, Vol. XIV. Part II.

A V N

Naval

himself: but this seems only to have been practised when the enemy was thought superior in strength, and raised great apprehensions of danger in them. When Navarre, their fortifications were thought strong enough to defend them from the assaults of enemies, it was frequent to drag their ships to shore, which the Greeks called evalues, the Romans subducere. Around the ships the soldiers disposed their tents, as appears everywhere in Homer : but this seems only to have been practised in winter, when their enemy's fleet was laid up and could not assault them; or in long sieges, and when they lay in no danger from their enemies by sea; as in the Trojan war, where the defenders of Troy never once attempted to encounter the Grecians in a seafight.

The adjacent places were usually filled with inns and stews, well stocked with females, that prostituted themselves to the mariners, merchants, and artificers of all sorts, who flocked thither in great numbers; this, however, appears to have happened only in times of peace.

NAVAL Crown, among the ancient Romans, a crown adorned with figures of prows of ships, conferred on nersons who in sea engagements first boarded the enemy's vessel. See CROWN.

NAVAL Engagement. See TACTICS, Naval.

NAVAL Stores, comprehend all those particulars made use of, not only in the royal navy, but in every other kind of navigation; as timber and iron for shipping, pitch, tar, hemp, eordage, sail cloth, gunpowder, ordnance, and fire arms of every sort, ship chandlery wares, &c.

NAVAL Tactics, the military operations of fleets. See TACTICS, Naval.

NAVAN, a borough town of Ireland, in the county of Meath and province of Leinster; situated about 23 miles north-west of Dublin, on the river Boyne. It consists of two chief streets, which intersect each other at right angles .- The tholsel, or town house, is a handsome stone building. This place was formerly in great repute, and walled in by Hugh de Lacy. An abbey for regular eanons, dedicated to the Virgin Mary, was erected here; but whether antecedent to the end of the 12th century is not certain : about that period, however, it was either founded or re-edified by Joceline de Angulo or Nangle. In the burial ground are the remains of many ancient tombs. A barrack for horse is now built on the site of the abbey.

NAVARRE, a province of Spain, part of the ancient kingdom of Navarre, erected soon after the invasion of the Moors; and is otherwise called Upper Navarre, to distinguish it from Lower Navarre belonging to the French. It is bounded on the south and east by Arragon, on the north by the Pyrenees, and on the west by Old Castile and Biscay; extending from south to north about 80 miles, and from east to west about 75. It abounds in sheep and cattle; game of all kinds, as boars, stags, and roebueks; and in wild fowl, horses, and honey; yielding also some grain, wine, oil, and a variety of minerals, medicinal waters, and hot baths. Some of the ancient chiefs of this country were called Sobrarbores, from the custom, as it is supposed, which prevailed among some of those free nations, of choosing and swearing their

a stone by nature falls to the earth. 5. Sometimes we Nature 11 Naval. ~

understand by nature, the established course of things. 6. Sometimes we take nature for an aggregate of powers belonging to a body, especially a living one; in which sense physicians say, that nature is strong, weak, or spent; or that, in such or such diseases, nature left to herself will perform the cure. 7. Sometimes we use the term nature for the universe, or whole system of the corporeal works of God; as when it is said of a phœnix, or chimera, that there is no such thing in nature. 8. Sometimes too, and that most commonly, we express by the word nature, a kind of semi-deity, or other strange kind of being.

If, says the same philosopher, I were to propose a notion of nature, less ambiguous than these already mentioned, and with regard to which many axioms relating to that word may be conveniently understood, I should first distinguish between the universal and the particular nature of things. Universal nature I would define to be the aggregate of the bodies that make up the world in its present state, considered as a principle, by virtue whereof they act and suffer, according to the laws of motion prescribed by the Author of all things. And this makes way for the other subordinate notion ; since the particular nature of an individual consists in the general nature applied to a distinct portion of the universe; or, which is the same thing, it is a particular assemblage of the mechanical properties of matter, as figure, motion, &c. Kingdoms of NATURE. See KINGDOMS.

Conduct or Operations of NATURE. See NATURAL History.

NAVA, in Ancient Geography, (Taeitus); a river of Belgiea, which runs north-east into the left or west side of the Rhine. Now the Nahe, rising at the village Naheweiler, on the borders of the bishoprie of Triers, running through the Lower Palatinate, the duchy of Simmeren, by the small town of Bing, into the Rhine.

NAVAL, something relating to a ship ; whence,

NAVAL Architecture. See SHIP-Building.

NAVAL Camp, in antiquity, a fortification, consisting of a ditch and parapet on the land side, or a wall built in the form of a semicircle, and extended from one point of the sea to another. This was sometimes defended with towers, and beautified with gates, through which they issued forth to attack their enemies. Homer hath left us a remarkable description of the Grecian fortifications of this sort, in the Trojan war, beginning at ver. 436. Iliad n.

Then, to secure the naval camp and powers, They rais'd embattled walls with lofty towers : From space to space were ample gates around, For passing chariots; and a trench profound, Of large extent; and deep in earth below Strong piles infix'd stood adverse to the foe.

### POPE's Transt.

Towards the sea, or within it, they fixed great pales of wood, like those in their artificial harbours: before these the vessels of burden were placed in such order as that they might be instead of a wall, and give protection to those within ; in which manner Nicias is reported by Thucydides to have encamped Mavarre, their princes under some particular tree. The name of the province is supposed to be a contraction of Nava Errea, signifying, in the language of the Vascones, its ancients inhabitants, " a land of valleys." -For the particulars of its history, see the article SPAIN.

NAVARRE, Peter, an officer of eminence in the 16th century, and particularly celebrated for his dexterity in the directing and springing of mines. He was a native of Biseay, and of low extraction. According to Paul Jove, who affirms that he had an account of the matter from his own mouth, he was first a sailor; but being disgusted with that employment, he sought his fortune in Italy, when poverty compelled him to become footman to the cardinal of Arragon. He afterwards inlisted himself a soldier in the Houstine army; and having served there for some time, went to sea again, and distinguished himself by his courage. The reputation of his valour having reached the ears of Gonsalvo de Cordova, this general employed him in the war against Naples, and raised him to the rank of a captain. Having contributed greatly to the taking of that eity by very opportunely springing a mine, the emperor rewarded him for this signal service with the carldom of Alveto, situated in that kingdom, and gave him the title of Count of Navarre. Having the command of a naval expedition against the Moors in Africa, he was at first very successful, and took possession of Oran, Tripoli, and some other places; but being afterwards shipwreeked on the island of Gerbes, the great heats and the Moorish cavalry destroyed a part of his army. Our hero was equally unfortunate in Italy : He was made prisoner at the famous battle of Ravenna in 1512, and languished in France for the space of two years. When finding that the king of Spain, who had been prejudieed against him by his courtiers, would do nothing towards his ransom, he went into the service of Francis I. who gave him the command of 20 companies of infantry, consisting of Gaacons, Biseayans, and the inhabitants of the Pyrenean mountains. He distinguished himself in several successful expeditions, until the year 1522, when having been sent to the relief of the Genoese, he was taken by the Imperialists. They conducted him to Naples, where he remained a prisoner for three years in the Castel del Ovo. From this confinement he was released by the treaty of Madrid, and afterwards fought at the siege of Naples under Laulric in 1528: but being again made prisoner at the unfortunate retreat from Aversa, he was conducted a second time to the Castel del Ovo. Here the prince of Orange, having by order of the emperor, caused several persons of the Angevine faction to be beheaded, our hero would undoubtedly have suffered the same fate, if the governor, sceing his distressed situation, and feeling for the misfortunes of so great a man, had not saved him the shame of this last punishment by allowing him to die a natural death. Others pretend that he was strangled in his bed, having arrived at a very advanced age. Paul Jove and Philip Thomasini have written his life. This last informs us, that he was of a tall size, had a swarthy countenance, black eyes, beard, and hair. A duke of Sessa, in the last century, being desirous to honour his memory and that of the marshal de Lautree, caused a monument to be erected to each of them in the church of

#### N A V

Saint-Marie-le Neuve at Naples, where they had been Nuvarre interred without any funeral honours.

NAVARRE, Martin, surnamed Azpilcucta, because Nave. he was born in the kingdom which bears that name, successively professor of jurisprudence at Toulouse, Salamanca, and Coimbra, was consulted from all quarters as the oracle of law. For a part of his knowledge he was indebted to the schools of Cahors and Toulouse, in which he had studied. His friend Barthelemi Carewza, a Dominican, and archbishop of Toledo, having been charged with heresy by the court of inquisition at Rome, Navarre set out at the age of 80 years to defend him. Pius V. appointed him assessor to Cardinal Francis Alciat, vice-penitentiary. Gregory XIII. never passed his gate without sending for him, and sometimes would converse with him for an hour together on the street : he even deigned to visit him, accompanied by several cardinals. These honours did not render him more haughty. His character became so eminent, that even in his own time the greatest encomium that could be paid to a man of learning was to say that he was a Navarre: this name thus included the idea of erudition, as that of Roseius formerly marked an accomplished comedian. Azpilcucta was the oracle of the eity of Rome, and of the whole Christian world. For the influence which he had acquired, he was indebted not only to his knowledge, but also to his probity and virtue. Faithful to the duties which the church prescribed, his temperance and frugality preserved to him a vigorous constitution; and at a very advanced age his genius was equal to the severest study. His savings chabled him to give libe-ral assistance to the poor. His charities, indeed, were so great, that his mule, it is said, would stop as soon as she perceived a beggar, He died at Rome in 1586, at the age of 92. His works were collected and printed in 6 vols. folio at Lyons in 1597, and at Venice in 1602. They displayed more learning than judgement, and are now very seldom consulted. Navarre was uncle by the mother's side to St Francis of Sales. See SALES.

NAUCRARI, among the Athenians, was the name given to the chief magistrates of the  $\Delta \eta \mu o_i$ , " boroughs or townships," called Nauzgagias; because each was obliged, besides two horsemen, to furnish out one ship for the public service.

NAUCRATES, a Greek poet, who was employed by Artemisia to write a panegyric upon Mausolus.-An orator who endeavoured to alienate the eities of Lyeia from the interests of Brutus.

NAUCRATIS, a city of Egypt on the left side of the Canopic mouth of the Nile. It was celebrated for its commerce, and no ship was permitted to land at any other place, but was obliged to sail directly to the city, there to deposite its cargo. It gave birth to Athenæus.

NAUCRATITES Nomos, in Ancient Geography, (Pliny); a division of the Delta, so called from that town Naucratis; though Ptolemy comprises it under the Nomos Saites.

NAUCYDES, a statuary who lived about four centuries before the Christian era.

NAVE, in Architecture, the body of a church, where the people are disposed, reaching from the balluster, or rail of the door, to the chief choir, Some 4 M 2 derived

Nave,

Navel.

derive the word from the Greek 12005, "a temple;" and others from 12005, "a ship," by reason the vault or roof of a church bears some resemblance to a ship.

NAVEL, in Anatomy, the centre of the lower part of the abdomen; being that part where the umbilical

vessels passed out of the placenta of the mother. See Navel, ANATOMY Index.

NAVEL-Wort. See COTYLEDON, BOTANY Index. NAVEW. Sec BRASSICA, BOTANY Index.

# NAVIGATION

IS the art of conducting or carrying a ship from one port to another.

### HISTORY.

THE poets refer the invention of the art of navigation to Neptune, some to Bacchus, others to Hercules, others to Jason, and others to Janus, who is said to have made the first ship. Historians ascribe it to the Æginetcs, the Phœnicians, Tyrians, and the ancient inhabitants of Britain. Some suppose, that the first hint was taken from the flight of the kite ; others, as Oppian (De Piscibus, lib. i.), from the fish called nautilus : others ascribe it to accident .- Scripture refers the origin of so useful an invention to God himself, who gave the first specimen thereof in the ark built by Noah under his direction. For the raillery which the good man underwent on account of his enterprise shows evidently enough that the world was then ignorant of any thing like navigation, and that they even thought it impossible.

However, profane history represents the Phænicians, especially those of their capital Tyre, as the first navigators ; being urged to seek a foreign commerce by the narrowness and poverty of a slip of ground they possessed along the coasts ; as well as by the conveniency of two or three good ports, and by their natural genius for traffic. Accordingly, Lebanon, and the other neighbouring mountains, furnishing them with excellent wood for ship-building, in a short time they were masters of a numerous fleet; and constantly hazarding new navigations, and settling new trades, they soon arrived at an incredible pitch of opulence and populousness : insomuch as to be in a condition to send out colonies, the principal of which was that of Carthage; which, keeping up their Phœnician spirit of commerce, in time not only equalled Tyre itself, but vastly surpassed it; sending its merchant fleets through Hercules's Pillars, now the straits of Gibraltar, along the western coasts of Africa and Europe; and even, if we believe some authors, to America itself.

Tyre, whose immense riches and power are represented in such lofty terms both by sacred and profane authors, being destroyed by Alexander the Great, its navigation and commerce were transferred by the conqueror to Alexandria, a new city admirably situated for those purposes; proposed for the capital of the empire of Asia, which Alexander then meditated. And thus arose the navigation of the Egyptians; which was afterwards so much cultivated by the Ptolemies, that Tyre and Carthage were quite forgotten.

Egypt being reduced into a Roman province after the battle of Actium, its trade and navigation fell into the hands of Augustus; in whose time Alexandria was only inferior to Rome; and the magazines of the ca-

pital of the world were wholly supplied with merchandiscs from the capital of Egypt.

At length, Alexandria itself underwent the fate of Tyre and Carthage; being surprised by the Saracens, who in spite of the emperor Heraclius, overspread the northern coasts of Africa, &c. whence the merchants being driven, Alexandria has ever since been in a languishing state, though it still has a considerable part of the commerce of the Christian merchants trading to the Levant.

The fall of Rome and its empire drew along with it not only that of learning and the polite arts, but that of navigation; the harbarians into whose hands it fell, contenting themselves with the spoils of the industry of their predecessors.

But no sooner were the more brave among those nations well settled in their new provinces, some in Gaul, as the Franks; others in Spain, as the Goths; and others in Italy, as the Lombards; but they began to learn the advantages of navigation and commerce, and the methods of managing them, from the people they subdued; and this with so much success, that in a little time some of them became able to give new lessons, and set on foot new institutions for its advantage. Thus it is to the Lombards we usually ascribe the invention and use of banks, book-keeping, exchanges, rechanges, &ce.

It does not appear which of the European people, after the settlement of their new masters, first betook themselves to navigation and commerce. Some think it began with the French; though the Italians seem to have the justest title to it; and are accordingly regarded as the restorers thereof, as well as of the polite arts, which had been banished together from the time the empire was torn asunder. It is the people of Italy then, and particularly those of Venice and Genoa, who have the glory of this restoration ; and it is to their advantageous situation for navigation they in great measure owe their glory. In the bottom of the Adriatic were a great number of marshy islands, only separated by narrow channels, but those well screened, and almost inaccessible, the residence of some fishermen, who here supported themselves by a little trade in fish and salt, which they found in some of these islands. Thither the Veneti, a people inhabiting that part of Italy along the coasts of the gulf, rctired, when Alaric king of the Goths, and afterwards Attila king of the Huns, ravaged Italy.

These new islanders, little imagining that this was to be their fixed residence, did not think of composing any body politic; but each of the 72 islands of this little archipelago continued a long time under its several masters, and each made a distinct commonwealth. When their commerce was become considerable enough to give jealousy to their neighbours, they began to think

-

think of uniting into a body. And it was this union, first begun in the sixth century, but not completed till the eighth, that laid the sure foundation of the future grandeur of the state of Venice. From the time of this union, their fleets of merchantmen were sent to all the ports of the Mediterranean; and at last to those of Egypt, particularly Cairo, a new eity built hy the Saracen princes on the eastern banks of the Nile, where they traded for the spices and other products of the Indies. Thus they flourished, increased their commerce, their navigation, and their conquests on the terra firma, till the league of Cambray in 1508, when a number of jealous princes conspired to their ruin ; which was the more easily effected by the diminution of their East India commerce, of which the Portuguese had got one part and the French another. Genoa, which had applied itself to navigation at the same time with Venice, and that with equal success, was a long time its dangerous rival, disputed with it the empire of the sea, and shared with it the trade of Egypt and other parts both of the east and west.

Jealousy soon began to break out; and the two republies coming to blows, there was almost continual war for three centuries before the superiority was ascertained; when, towards the end of the 14th century, the battle of Chioza ended the strife; the Genoese, who till then had usually the advantage, having now lost all; and the Venetians, almost become desperate, at one happy blow, beyond all expectation, secured to themselves the empire of the sea, and superiority in commerce.

About the same time that navigation was retrieved in the southern parts of Europe, a new society of merchants was formed in the north, which not only carried commerce to the greatest perfection it was capable of till the discovery of the East and West Indies, but also formed a new scheme of laws for the regulation therefore, which still obtain under the names of Uses and Customs of the Sea. This society is that famous league of the Hanse towns, commonly supposed to have begun about the year 1164. See HANSE Towns.

For the modern state of navigation in England, Holland, France, Spain, Portugal, &c. see COMMERCE, COMPANY, &c.

We shall only add, that in examining the eauses of commerce passing successively from the Venetians, Genoese, and Hanse towns, to the Portnguese and Spaniards, and from these again to the English and Dutch, it may be established as a maxim, that the relation between commerce and navigation, or if we may he allowed to say it, their union, is so intimate, that the fall of the one inevitably draws after it that of the other; and that they will always either flourish or dwindle together. Hence so many laws, ordinances, statutes, &c. for its regulation ; and hence particularly that celebrated act of navigation, which an eminent foreign author calls the palladium or tutelar deity of the commerce of England ; which is the standing rule, not only of the British among themselves, but also of other nations with whom they traffie.

The art of navigation has been exceedingly improved in modern times, both with regard to the form of the vessels themselves, and with regard to the methods of working them. The use of rowers is now entirely superseded by the improvements made in the

formation of the sails, rigging, &c. by which means ships can not only sail much faster than formerly, but can tack in any direction with the greatest facility. It is also very probable that the ancients were neither so well skilled in finding the latitudes, nor in steering their vessels in places of difficult navigation, as the moderns. But the greatest advantage which the moderns have over the ancients is from the mariner's compass, by which they are enabled to find their way with as great facility in the midst of an immeasurable ocean, as the ancients could have done by creeping along the coast, and never going out of sight of land. Some people indeed contend, that this is no new invention, but that the ancients were acquainted with it. They say, that it was impossible for Solomon to have sent ships to Ophir, Tarshish, and Parvain, which last they will have to be Peru, without this useful instrument. They insist, that it was impossible for the an-cients to be acquainted with the attractive virtue of the magnet, and to be ignorant of its polarity. Nay, they affirm, that this property of the magnet is plainly mentioned in the book of Job, where the loadstone is men-tioned by the name of topaz, or the stone that turns itself. But it is certain, that the Romans, who conquered Judea, were ignorant of this instrument; and it is very improbable, that such an useful invention, if once it had been commonly known to any nation, would have been forgot, or perfectly concealed from such a prudent. people as the Romans, who were so much interested in the discovery of it.

Among those who admit that the mariner's compass is a modern invention, it has been much disputed who was the inventor. Some give the honour of it to Flavio Gioia of Amalfi in Campania \*, who lived \* Sce Maabout the beginning of the 14th century; while others riner's say that it came from the east, and was earlier known Compass. in Europe. But, at whatever time it was invented, it is certain, that the mariner's compass was not commonly used in navigation before the year 1420. In that year the science was considerably improved under the auspices of Henry duke of Visco, brother to the king of Portugal. In the year 1485, Roderick and Joseph, physicians to John II. king of Portugal, together with one Martin de Bohemia, a Portuguese, native of the island of Fayal, and scholar to Regiomontanus, calculated tables of the sun's declination for the use of sailors, and recommended the astrolabe for taking observations at sea. Of the instructions of Martin, the celebrated Christopher Columbus is said to have availed himself, and to have improved the Spaniards in the knowledge of the art; for the farther progress of which a lecture was afterwards founded at Seville by the emperor Charles V.

The discovery of the variation is claimed by Columbus, and by Sebastian Cabot. The former certainly did observe this variation without having heard of it. from any other person, on the 14th of September 1492, and it is very probable that Cabot might do the same. At that time it was found that there was no variation at the Azores, where some geographers have thought proper to place the first meridian; though it hath since been observed that the variation alters in time.—The use of the cross staff now began to be introduced among sailors. This ancient instrument is described by John Werner of Nuremberg, in his his annotations on the first book of Ptolemy's Geography, printed in 1514. He recommends it for observing the distance between the moon and some star, in order thence to determine the longitude.

At this time the art of navigation was very imperfect, on account of the inaccuracies of the plane chart, which was the only one then known, and which, by its gross errors, must have greatly misled the mariner, especially in voyages far distant from the equator. Its precepts were probably at first only set down on the sea charts, as is the custom at this day : but at length there were two Spanish treatises published in 1545; one by Pedro de Medina; the other by Martin Cortes, which contained a complete system of the art, as far as it was then known. These seem to have been the oldest writers who fully handled the art; for Mediua, in his dedication to Philip prince of Spain, laments that multitudes of ships daily perished at sea, because there were neither teachers of the art, nor books by which it might be learned; and Cortes, in his dedication, boasts to the emperor that he was the first who had reduced navigation into a compendium, valuing himself much on what he had performed. Medina defended the planc chart; but he was opposed by Cortes, who showed its errors, and endeavoured to account for the variation of the compass, by supposing the needle to be influenced by 'a magnetic pole (which he called the point attractive), different from that of the world; which notion hath been farther prosecuted by others. Medina's book was soon translated into Italian, French, and Flemish, and served for a long time as a guide to foreign navigators. However, Cortes was the favourite author of the English nation, and was translated in 1561; while Medina's work was entirely neglected, though translated also within a short time of the other. At that time the system of navigation consisted of the following particulars, and others similar : An account of the Ptolemaic hypothesis, and the circles of the sphere; of the roundness of the earth, the longitudes, latitudes, climates, &c. and eclipses of the luminaries; a kalendar; the method of finding the prime, epact, moon's age, and tides; a description of the compass, an account of its variation,. for the discovering of which Cortes said an instrument might easily be contrived ; tables of the sun's declination for four years, in order to find the latitude from his meridian altitude; directions to find the same by certain stars; of the course of the sun and moon ; the length of the days ; of time and its divisions; the method of finding the hour of the day and night; and lastly, a description of the sea chart, on which to discover where the ship is, they made use of a small table, that showed, upon an alteration of one degree of the latitude, how many leagues were run in each rhumb, together with the departure from the meridian. Besides, some instruments were described, especially by Cortes; such as one to find the place and declination of the sun, with the days, and place of the moon; certain dials, the astrolabe, and cross staff; with a complex machine to discover the hour and latitude at once.

About the same time were made proposals for finding the longitude by observations of the moon.— In 1530, Gemma Frisius advised the kceping of the time by means of small clocks or watches, then, as he

says, newly invented. He also contrived a new sort of cross staff, and an instrument called the *nantical quadrant*; which last was much praised by William Cunningham, in his Astronomical Glass, printed in the year 1559.

In 1537 Pedro Nuncz, or Nonius, published a book in the Portuguese language, to explain a difficulty in navigation proposed to him by the commander Don Martin Alphonso de Susa. In this he exposes the errors of the planc chart, and likewise gives the solution of several curious astronomical problems; amongst which is that of determining the latitude from two observations of the sun's altitude and intermediate azimuth being given. He observed, that though the rhumbs are spiral lines, yet the direct course of a ship will always be in the arch of a great circle, whereby the angle with the meridians will continually change: all that the steersman can here do for the preserving of the original rhumb, is to correct these deviations as soon as they appear sensible. But thus the ship will in reality describe a course without the rhumb line intended ; and therefore his calculations for assigning the latitude, where any rhumb line crosses the several meridians, will be in some measure erroneous. He invented a method of dividing a quadrant by means of concentric circles, which, after being much improved by Dr Halley, is used at present, and is called a nonius.

In 1577, Mr William Bourne published a treatisc, in which, by considering the irregularities in the moon's motion, he shows the errors of the sailors in finding her age by the epact, and also in determining the hour from observing on what point of the compass the sun and moon appeared. He advises, in sailing towards the high latitudes, to keep the reckoning by the globe, as there the plane chart is most erroncous. He despairs of our ever-being able to find the longitude, unless the variation of the compass should be occasioned by some such attractive point as Cortes had imagined; of which, however, he doubts : but as he had shown how to find the variation at all times, he advises to keep an account of the observations, as useful for finding the place of the ship ; which advice was prosecuted at large by Simon Stevin, in a treatise published at Leyden in 1599; the substance of which was the same year printed at London in English by Mr Edward Wright, entitled the Haven-finding Art. In this ancient tract also is described the way by which our sailors estimate the rate of a ship in her course, by an instrument called the log. This was so named from the piece of wood or log that floats in the water while the time is reckoned during which the line that is fastened to it is veering out. The author of this contrivance is not known; neither was it taken notice of till 1607, in an East India voyage published by Purchas : but from this time it became famous, and was much taken notice of by almost all writers on navigation in every country; and it still continues to be used as at first, though many attempts have been made to improve it, and contrivances proposed to supply its place; many of which have succeeded in quiet water, but proved useless in a stormy sea.

In 1581 Michael Coignet, a native of Antwerp, published a treatise, in which he animadverted on Medina. In this he showed, that as the rhumbs are spirals,

rals, making endless revolutions about the poles, numerous errors must arise from their being represented by straight lines on the sca charts; but though he hoped to find a remedy for these errors, he was of opinion that the proposals of Nonius were scarcely practicable, and therefore in a great measure useless. In treating of the sun's declination, he took notice of the gradual decrease in the obliquity of the ecliptic; he also described the cross staff with three transverse piecees, as it is at present made, and which he owned to have been then in common use among the sailors. He likewise gave some instruments of his own invention; but all of them are now laid aside, excepting perhaps his nocturnal. He constructed a sea table to be used by such as sailed beyond the 60th degree of latitude; and at the end of the book is delivered a method of sailing on a parallel of latitude by means of a ring dial and a 24 hour glass. The same year the discovery of the dipping needle was made by Mr Robert Norman \*. In his publication on that art he maintains, in opposition to Cortes, that the variation of the compass was eaused by some point on the surface of the earth, and not in the heavens : he also made considerable improvements in the construction of eompasses themselves; showing especially the danger of not fixing, on account of the variation, the wire directly under the fleur de luce; as compasses made in different countries have it placed differently. To this performance of Norman's is always prefixed a discourse on the variation of the magnetical needle, by Mr William Burrough, in which he shows how to determine the variation in many different ways. He also points out many errors in the practice of navigation at that time, and speaks in very severe terms concerning those who had published upon it.

All this time the Spaniards continued to publish treatises on the art. In 1585 an excellent compendium was published hy Roderico Zamorano ; which contributed greatly towards the improvement of the art, particularly in the sea charts. Globes of an improved kind, and of a much larger size than those formerly used, were now constructed, and many improvements were made in other instruments; however, the plane ehart continued still to be followed, though its errors were. frequently complained of. Methods of removing these errors had indeed been sought after; and Gerard Mercator seems to have been the first who found the truemethod of doing this, so as to answer the purposes of seamen. His method was to represent the parallels both of latitude and longitude by parallel straight lines, but gradually to augment the former as they approached the pole. Thus the rhumbs, which otherwise ought to have been curves, were now also extended into straight lines; and thus a straight line drawn between any two places marked upon the chart would make an angle with the meridians, expressing the rhumb leading from the one to the other. But though, in 1 569, Mercator published an universal map constructed in this manner, it doth not appear that he was acquainted with the principles on which this proceeded; and it is now generally believed, that the true principles on which the construction of what is called Mercator's chart depends, were first discovered by an Englishman, Mr Edward Wright.

Mr Wright supposes, but, according to the general opinion, without sufficient grounds, that this enlarge-

tioned by Ptolemy, and that the same thing had also been spoken of hy Cortes. The expressions of Ptolemy alluded to, relate indeed to the proportion between the distances of the parallels and meridians; but instead of proposing any gradual enlargement of the parallels of latitude in a general chart, he speaks only of particular maps; and advises not to confine a system of such maps to one and the same scale, but to plan them out by a different measure, as oceasion might rcquire : only with this preeaution, that the degrees of longitude in each should bear some proportion to those of latitude ; and this proportion is to be deduced from that which the magnitude of the respective parallels bears to a great circle of the sphere. He adds, that in particular maps, if this proportion be observed with regard to the middle parallel, the inconvenience will not be great though the meridians should be straight lines parallel to each other. Here he is said only to mean, that the maps should in some measure represent the figures of the countries for which they are drawn. In this sense Mercator, who drew maps for Ptolemy's tables, understood him; thinking it, however, an improvement not to regulate the meridians by one parallel, but by two; one distant from the northern, the other from the southern extremity of the map by a fourth part of the whole depth; by which means, in his maps, though the meridians are straight lines, yet they are generally drawn inclining to each other towards the poles. With regard to Cortes, he speaks only of the number of degrees of latitude, and not of the extent of them; nay, he gives express directions that they should all be laid down by equal measurement. on a seale of leagues adapted to the map.

ment of the degrees of latitude was known and men-

For some time after the appearance of Mereator's map, it was not rightly understood, and it was even thought to be entirely useless, if not detrimental .---However, about the year 1592, its utility began to be perceived; and seven years after, Mr Wright printed his famous treatise entitled, The Correction of certain Errors in Navigation, where he fully explained the reason of extending the length of the parallels of latitude, and the uses of it to navigators. In 1610, a second edition of Mr Wright's book was published with improvements. An excellent method was proposed of determining the magnitude of the earth ; at the same time it was judiciously proposed to make our common measures in some proportion to a degree on its surface, that they might not depend on the uncertain length of a barley corn. Some of his other improvements were, " The table of latitudes for dividing the meridian computed to minutes;" whereas it had been only divided to every tenth minute. He also published a description of an instrument which he calls the sea rings; and by which the variation of the compass, altitude of the sun, and time of the day, may be determined readily at once in any place, provided the latitude is known. He showed also how to correct the errors arising from the eccentricity of the eye in observing by the crossstaff. He made a total amendment in the tables of the declinations and places of the sun and stars from his own observations made with a six foot quadrant in the years 1594, 95, 96, and 97. A sea quadrant to take altitudes by a forward or backward observation; and likewise with a contrivance for the ready finding the latitude :

latitude by the height of the pole star, when not upon the meridian. To this edition was subjoined a translation of Zamorano's Compendium above mentioned, in which he corrected some mistakes in the orginal; adding a large table of the variation of the compass observed in very different parts of the world, to show that it was not occasioned by any magnetical pole.

These improvements soon became known abroad.— In 1608, a treatise entitled, Hypomnemata Mathematica, was published by Simon Stevin, for the use of Prince Maurice. In that part relating to navigation, the author having treated of sailing on a great circle, and shown how to draw the rhumbs on a globe mechanically, sets down Wright's two tables of latitudes and of rhumbs, in order to describe these lines more accurately, pretending even to have discovered an error in Wright's table. But all Stevin's objections were fully answered by the author himself, who showed that they arose from the gross way of calculating made use of by the former.

In 1624, the learned Wellebrordus Snellius, professor of mathematics at Leyden, published a treatise of navigation on Wright's plan, but somewhat obscurely: and as he did not particularly mention all the discoveries of Wright, the latter was thought by some to have taken the hiut of all his discoveries from Snellius. But this supposition is long ago refuted : and Wright enjoys the honour of those discoveries which is justly his due.

Mr Wright having shown how to find the place of the ship on his chart, observed that the same might be performed more accurately by calculation : but considering, as he says, that the latitudes, and especially the courses at sea, could not be determined so precisely, he forbore setting down particular examples; as the mariner may be allowed to save himself this trouble, and only mark out upon his chart the ships's way, after the manner then usually practised. However, in 1614, Mr Raphe Handson, among his nautical questions subjoined to a translation of Pitiscus's trigonometry, solved very distinctly every case of navigation, by applying arithmetical calculations to Wright's table of latitudes, or of meridional parts, as it hath since Though the method discovered by been called. Wright for finding the change of longitude by a ship sailing on a rhumb is the proper way of performing it, Handson also proposes two ways of approximation to it without the assistance of Wright's division of the meridian line. The first was computed by the arithmetical mean between the cosines of both latitudes; the other by the same mean between the secants as an alternative, when Wright's book was not at hand; though this latter is wider from the truth than the first. By the same calculations also he showed how much each of these compendiums deviates from the truth, and also how widely the computations on the erroneous principles of the plane chart differ from them all. The method, however, commonly used by our sailors is commonly called the middle latitude; which, though it errs more than that by the arithmetical mean between the two cosines, is preferred on account of its being less operose : yet in high latitudes it is more eligible to use that of the arithmetical mean between the logarithmic cosines, equivalent to the geometrical mean between the cosines themselves; a method since pro-

4

posed by Mr John Bassat. The computation by the middle latitude will always fall short of the true change of longitude; that by the geometrical mean will always exceed; but that by the arithmetical mean falls short in latitudes above 45 degrees, and exceeds in lesser latitudes. However, none of these methods will differ much from the truth when the change of latitude is sufficiently small.

About this time logarithms were invented by John Napier, baron of Merchiston in Scotland, and proved of the utmost service to the art of navigation. From which Mr Edmund Gunter constructed a table of logarithmic sines and tangents to every minute of the quadrant, which he published in 1620. In this work he applied to navigation, and other branches of mathematics, his admirable ruler known by the name of Gunter's scale \* ; on which are described lines of loga- \* See Gun rithms, of logarithmic sines and tangents, of meridio-ter's Scan nal parts, &c. He greatly improved the sector for the sames purposes. He showed also how to take a back observation by the cross staff, whereby the error arising from the eccentricity of the eye is avoided. He described likewise another instrument, of his own invention called the cross bow, for taking altitudes of the sun or stars, with some contrivances for the more ready collecting the latitude from the observation. The discoveries concerning logarithms were carried to France in 1624 by Mr Edmund Wingate, who published two small tracts in that year at Paris. In one of these he taught the use of Gunter's scale ; and in the other, of the tables of artificial sines and tangents, as modelled according to Napier's last form, erroneously attributed by Wingate to Briggs.

Gunter's rule was projected into a circular arch by the Reverend Mr William Oughtred in 1633, and its uses fully shown in a pamphlet cutitled, *The Circles of Proportion*, where, in an appendix, are well treated several important points in navigation. It has also been made in the form of a sliding ruler.

The logarithmic tables were first applied to the different cases of sailing by Mr Thomas Addison, in his treatise entitled, Arithmetical Navigation, printed in 1625. He also gives two traverse tables, with their uses; the one to quarter points of the compass, the other to degrees. Mr Henry Gellibrand published his discovery of the changes of the variation of the compass, in a small quarto pamphlet, entitled, A discourse mathematical on the variation of the magnetical needle, printed in 1635. This extraordinary phenomenon he found out by comparing the observations made at different times near the same place by Mr Burrough, Mr Gunter, and himself, all persons of great skill and experience in these matters. This discovery was likewise soon known abroad; for Father Athanasius Kircher, in his treatise entitled, Magnes, first printed at Rome in 1641, informs us, that he had been told it by Mr John Greaves; and then gives a letter of the famous Marinus Mersennus, containing a very distinct account of the same.

As altitudes of the sun are taken on shipboard by observing his elevation above the visible horizon; to obtain from thence the sun's true altitude with correctness, Wright observes it to be necessary that the dip of the visible horizon below the horizontal plane passing through the observer's eye should be brought into the account,

648

account, which cannot be calculated without knowing the magnitude of the earth. Hence he was induced to propose different methods for finding this; but complains that the most effectual was out of his power to execute; and therefore contented himself with a rude attempt, in some measure sufficient for his purpose : and the dimensions of the earth deduced by him corresponded very well with the usual divisions of the log line; however, as he wrote not an express treatise on navigation, but only for the correcting such errors as prevailed in general practice, the log line did not fall under his notice. Mr Richard Norwood, however, put in execution the method recommended by Mr Wright as the most perfect for measuring the dimensions of the earth, with the true length of the degrees of a great circle upon it; and, in 1635, he actually measured the di-stance between London and York; from whence, and the summer solstitial altitudes of the sun observed on the meridian at both places, he found a degree on a great circle of the earth to contain 367,196 English feet, equal to 57,300 French fathoms or toises: which is very exact, as appears from many measures that have been made since that time. Of all this Mr Norwood gave a full account in his treatise called The Seaman's Practice, published in 1637. He there shows the reason why Snellius had failed in his attempt : he points out also various uses of his discovery, particularly for correcting the gross errors hitherto committed in the divisions of the log line. But necessary amendments have been little attended to by sailors, whose obstinacy in adhering to established errors has been complained of hy the best writers on navigation. This improvement has at length, however, made its way into practice, and few navigators of reputation now make use of the old measure of 42 fect to a knot. In that treatise also Mr Norwood describes his own excellent method of setting down and perfecting a sea reckoning, by using a traverse table; which method he had followed and taught for many years. He shows also how to rectify the course by the variation of the compass being considered; as also how to discover currents; and to make proper allowance on their account. This treatise, and another on trigonometry, were continually reprinted, as the principal looks for learning scientifically the art of navigation. What he had delivered, especially in the latter of them, concerning this subject, was contracted as a manual for sailors, in a very small piece called his Epitome ; which useful performance has gone through a great number of editions. No alterations were ever made in the Seaman's Practice till the 12th edition in 1676, when the following paragraph was inserted in a smaller character: " About the year 1672, Monsieur Picart has published an account in French, concerning the measure of the earth, a breviate whereof may be seen in the Philosophical Transactions, Nº 112, wherein he concludes one degree to contain 365,184 English feet, nearly agreeing with Mr Norwood's experiment ;" and this advertisement is continued through the subsequent editions as late as the year 1732.

About the year 1645, MrBond published in Norwood's Epitome a very great improvement in Wright's method, by a property in his meridian line, whereby its divisions are more scientifically assigned than the author himself was able to effect ; which was from this theorem, that these divisions are analogous to the excesses of the lo-

Vol. XIV. Part II.

garithmic tangents of half the respective latitudes augmented by 45 degrees above the logarithm of the radius. This he afterwards explained more fully in the third edition of Gunter's works, printed in 1653 ; where, after observing that the logarithmic tangents from 45° upwards increase in the same manner that the secants added together do, if every half degree be accounted as a whole degree of Mercator's meridional line. His rule for computing the meridional parts belonging to any two latitudes, supposed on the same side of the equator, is to the following effect : " Take the logarithmic tangent, rejecting the radius, of half each latitude, augmented by 45 degrees ; divide the difference of those numbers by the logarithmic tangent of 45° 30', the radius being likewise rejected ; and the quotient will be the meridional parts required, expressed in degrees." This rule is the immediate consequence from the general theorem, That the degrees of latitude bear to one degree (or 60 minutes, which in Wright's table stands for the meridional parts of one degree), the same proportion as the logarithmic tangent of half any latitude augmented by 45 degrees, and the radius neglected, to the like tangent of half a degree augmented by 45 degrees, with the radius likewise rejected. But here was farther wanting the demonstration of this general theorem, which was at length supplied by Mr James Gregory of Aberdeen in his Exercitationes Geometrica, printed at London in 1668; and afterwards more concisely demonstrated, together with a scientific determination of the divisor, by Dr Halley in the Philosophical Transactions for 1695, Nº 219. from the consideration of the spirals into which the rhumbs are transformed in the stereographic projection of the sphere upon the plane of the equinoctial; and which is rendered still more simple by Mr Roger Cotes, in his Logometria, first published in the Philosophical Transactions for 1714, Nº 388. It is moreover added in Gunter's book, that if Toth of this division, which does not sensibly differ from the logarithmic tangent of 45° 1' 30" (with the radius subtracted from it), be used, the quotient will exhibit the meridional parts expressed in leagues, and this is the divisor set down in Norwood's Epitome. After the same manner the meridional parts will be found in mi-

dex. In an edition of the Seaman's Kalender, Mr Bond declared, that he had discovered the longitude by having found out the true theory of the magnetic variation ; and to gain credit to his assertion, he foretold, that at London in 1657 there would be no variation of the compass, and from that time it would gradually increase the other way; which happened accordingly. Again, In the Philosophical Transactions for 1668, Nº 40. he published a table of the variation for 49 years to come. Thus he acquired such reputation, that his treatise, entitled, The Longitude Found, was in 1676 published by the special command of Charles II. and approved by many celebrated mathematicians. It was not long, however, before it met with opposition ; and in 1678 another treatise, entitled, The Longitude not Found, made its appearance ; and as Mr Bond's hy-4 Npothesis

nutes, if the like logarithmic tangent of 45° 1' 30",

diminished by the radius, be taken ; that is, the num-

ber used by others being 12633, when the logarithmic

tables consist of cight places of figures besides the in-

pothesis did not in any manner answer its author's sanguine expectations, the affair was undertaken by Dr Halley. The result of his speculation was, that the magnetic needle is influenced by four poles; but this wonderful phenomenon seems hitherto to have eluded all our researches. In 1700, however, Dr Halley published a general map, with curve lines expressing the paths where the magnetic needle had the same variation; which was received with universal applause. But as the positions of these curves vary from time to time, they should frequently be corrected by skilful persons ; as was done in 1644 and 1756, by Mr William Mountaine, and Mr James Dodson, F. R. S. In the Philosophical Transactions for 1690, Dr Halley also gave a dissertation on the monsoons ; containing many very useful observations for such as sail to places subject to these winds.

After the true principles of the art were settled by Wright, Bond, and Norwood, the authors on navigation became so numcrous, that it would be impossible to enumerate them. New improvements were daily made, and every thing relative to it was settled with an accuracy not only unknown to former ages, but which would have been reekoned utterly impossible. The earth being found to be a spheroid, and not a perfect sphere, with the shortest diameter passing through the poles, a tracet was published in 1741, by the Rev. Doctor Patrick Murdoch, wherein he accommodated

Wright's sailing to such a figure; and Mr Colin Maclaurin, the same year, in the Philosophical Transactions, N° 461. gave a rule for determining the meridional parts of a spheroid; which speculation is farther treated of in his book of Fluxions, printed at Edinburgh in 1742.

Among the later discoveries in navigation, that of finding the longitude both by lunar observations and by time-keepers is the principal. It is owing chiefly to the rewards offered by the British parliament that this has attained the present degree of perfection. We are indebted to Dr Maskelyne for putting the first of these methods in practice, and for other important improvements in navigation. The time-keepers, constructed by Harrison for this express purpose, were found to answer so well, that he obtained the parliamentary reward.

The only works that have appeared of late in navigation are those on the longitude and navigation by Dr Mackay, of which the following account is transcribed from the Anti-Jacobin Review for September 1804.

"This publication, (Dr Mackay's Treatise on Navigation) and that on the longitude by the same author, form the most correct and practical system of navigation and nautical science hitherto published in this country; they may be considered not only of individual utility, but of national importance."

# THEORY OF NAVIGATION.

THE motion of a ship in the water is well known to depend on the action of the wind upon its sails, regulated by the direction of the helm. As the water is a resisting medium and the bulk of the ship very considerable, it thenec follows that there is always a great resistance on her fore-part; and when this resistance becomes sufficient to balance the moving force of the wind upon the sails, the ship attains her utmost degree of velocity, and her motion is no longer accelerated. This velocity is different according to the different strength of the wind; but the stronger the wind, the greater resistance is made to the ship's passage through the water : and hence, though the wind should blow ever so strong, there is also a limit to the velocity of the ship: for the sails and ropes ean bear but a certain force of air; and when the resistance on the fore-part becomes more than equivalent to their strength, the velocity can be no longer increased, and the rigging gives way.

The direction of a ship's motion depends on the position of her sails with regard to the wind, combined with the action of the rudder. The most natural direction of the ship is, when she runs directly before the wind, the sails are then disposed, so as to be at right angles thereto. But this is not always the case, both on account of the variable nature of the winds, and the situation of the intended port, or of intermediate headlands or islands. When the wind therefore happens not to be favourable, the sails are placed so as to make an oblique angle both with the direction of the ship and with the wind; and the sails, together with the rudder, must be managed in such a manner, that the direction of the ship may make an acute angle with that of the

wind; and the ship, making boards on different tacks, will by this means arrive at the intended port.

The reason of the ship's motion in this case is, that the water resists the side more than the fore-part, and that in the same proportion as her length exceeds her breadth. This proportion is so considerable, that the ship continually flies off where the resistance is least, and that sometimes with great swiftness. In this way of sailing, however, there is a great limitation: for if the angle made by the keel with the direction of the wind be too acute, the ship cannot be kept in that position; neither is it possible for a large ship to make a more acute angle with the wind than about 6 points; though small sloops, it is said, may make an angle of about 5 points with it. In all these eases, however, the velocity of the ship is greatly retarded; and that not only on account of the obliquity of her motion, but by reason of what is called her lee-way. This is occasioned by the yielding of the water on the leeside of the ship, by which means the vessel acquires a compound motion, partly in the direction of the wind, and partly in that which is necessary for attaining the desired port.

It is perhaps impossible to lay down any mathematical principles on which the lee-way of a ship could be properly calculated; only we may see in general that it depends on the strength of the wind, the roughness of the sea, and the velocity of the ship. When the wind is not very strong, the resistance of the water on the lee-side bears a very great proportion to that of the current of air; and therefore it will yield but very little: however, supposing the ship to remain

remain in the same place, it is evident, that the water having once begun to yield, will continue to do so for some time, even though no additional force was applied to it; but as the wind continually applies the same force as at first, the lee-way of the ship must go on constantly increasing till the resistance of the water on the lee-side balances the force applied on the other, when it will become uniform, as doth the motion of a ship sailing before the wind. If the ship changes her place with any degree of velocity, then every time she moves her own length, a new quantity of water is to be put in motion, which hath not yet received any momentum, and which of consequence will make a greater resistance than it can do when the ship remains in the same place. In proportion to the swiftness of the ship, then, the lce-way will be the less : but if the wind is very strong, the velocity of the ship bears but a small proportion to that of the current of air; and the same effects must follow as though the ship moved slowly, and the wind was gentle; that is, the ship must make a great deal of lee-way .- The same thing happens when the sea rises high, whether the wind is strong or not; for then the whole water of the ocean, as far as the swell reaches, has acquired a motion in a certain direction, and that to a very considerable depth. The mountainous waves will not fail to carry the ship very much out of her course; and this deviation will certainly be according to their velocity and magnitude. In all cases of a rough sea, therefore, a great deal of lee-way is made .- Another circumstance also makes a variation in the quantity of the lee-way; namely, the lightness or heaviness of the ship; it being evident, that when the ship sinks deep in the water, a much greater quantity of that element is to be put in motion before she can make any lee-way, than when she swims on the surface. As therefore it is impossible to calculate all these things with mathematical exactness, it is plain that the real course of a ship is exceedingly difficult to be found, and frequent errors must be made, which can only be corrected by celestial observations.

In many places of the ocean there are currents, or places where the water, instead of remaining at rest. runs with a very considerable velocity for a great way in some particular direction, and which will certainly carry the ship greatly out of her course. This occasions an error of the same nature with the lee-way : and therefore, whenever a current is perceived, its direction and velocity ought to be determined, and the proper allowances made.

Another source of error in reckoning the course of a ship proceeds from the variation of the compass.

There are few parts of the world where the needle points exactly north; and in those where the variation is known, it is subject to very considerable alterations. By these means the course of the ship is mistaken; for as the sailors have no other standard to direct them than the compass, if the needle, instead of pointing due north, should point north-east, a prodigious error would be occasioned during the course of the voyage, and the ship would not come near the port to which she was bound. To avoid errors of this kind, the only method is, to observe the sun's amplitude and azimuth as frequently as possible, by which the variation of the compass will be perceived, and the proper allowances

can then be made for errors in the course which this may have occasioned.

Errors will arise in the reckoning of a ship, especially when she sails in high latitudes, from the spherical figure of the earth; for as the polar diameter of our globe is found to be considerably shorter than the equatorial one, it thence follows, that the farther we remove from the equator, the longer are the degrees of latitude. Of consequence, if a navigator assigns any certain number of miles for the length of a degree of latitude near the equator, he must vary that measure as he approaches towards the poles, otherwise he will imagine that he hath not sailed so far as he actually hath done. It would therefore be necessary to have a table containing the length of a degree of latitude in every different parallel from the equator to either pole; as without this a troublesome calculation must be made at every time the navigator makes a reckoning of his course. Such a table, however, hath not yet appeared; neither indeed does it seem to be an easy matter to make it, on account of the difficulty of measuring the length even of one or two degrees of latitude in different parts of the world. Sir Isaac Newton first discovered this spheroidal figure of the earth ; and showed, from experiments on pendulums, that the polar diameter was to the equatorial one as 229 to 230. This proportion, however, hath not been admitted by succeeding calculators. The French mathematicians, who measured a degree on the meridian in Lapland, made the proportion between the equatorial and polar diameters to be as 1 to 0.9891. Those who measured a degree at Quito in Peru, made the proportion 1 to 0.99624, or 266 to 265. M. Bouguer makes the proportion to be as 179 to 178; and M. Buffon, in one part of his theory of the earth, makes the equatorial diameter exceed the polar one by 163 of the whole. According to M. du Sejour, this proportion is as 321 to 320; and M. de la Place, in his Mcmoir upon the Figure of Spheroids, has deduced the same proportion. From these variations it appears that the point is not exactly determined, and consequently that any corrections which can be made with regard to the spheroidal figure of the earth must be very uncertain.

It is of consequence to navigators in a long voyage to take the nearest way to their port ; but this is scarcely possible to be done. The shortest distance between any two points on the surface of a sphere is measured by an arch of a great circle intercepted between them : and therefore it is adviseable to direct the ship along a great circle of the earth's surface. But this is a matter of considerable difficulty, because there are no fixed marks by which it can be readily known whether the ship sails in the direction of a great circle or not. For this reason the sailors commonly choose to direct their course by the rhumbs, or the bearing of the place by the compass. These bearings do not point out the shortest distance between places ; because, on a globe, the rhumbs are spirals, and not arches of great circles. However, when the places lie directly under the equator, or exactly under the same meridian, the rhumb then coincides with the arch of a great circle, and of conscquence shows the nearest way. The sailing on the arch of a great circle is called great circle sailing; and the cases of it depend all on the solution of problems in spherical trigonometry. 4 N 2

PRACTICE

# PRACTICE OF NAVIGATION.

### BOOK I.

# Containing the Various Methods of Sailing.

#### INTRODUCTION.

THE art of navigation depends upon astronomical and mathematical principles. The places of the sun and fixed stars are deduced from observation and calculation, and arranged in tables, the use of which is absolutely necessary in reducing observations taken at sea, for the purpose of ascertaining the latitude and longitude of the ship, and the variation of the compass. The problems in the various sailings are resolved either by trigonometrical calculation, or by tables or rules formed by the assistance of trigonometry. By mathematics, the necessary tables are constructed, and rules investigated for performing the more difficult parts of navigation. For these several branches of science, and for logarithmic tables, the reader is referred to the respective articles in this work. A few tables are given at the end of this article; but as the other tables necessary for the practice of navigation are to be found in almost every treatise on that subject, it therefore seems unnecessary to insert them in this place.

### CHAP. J. Preliminary Principles.

# SECT. I. Of the Latitude and Longitude of a Place.

THE situation of a place on the surface of the earth is estimated by its distance from two imaginary lines intersecting each other at right angles: The one of these is called the *equator*, and the other the *first meridian*. The situation of the equator is fixed, but that of the first meridian is arbitrary, and therefore different nations assume different first meridians. In Britain, we esteem that to be the first meridian which passes through the royal observatory at Greenwich.

The equator divides the earth into two equal parts, called the *northern* and *southern hemispheres*; and the latitude of a place is its distance from the equator, reckoned on a meridian in degrees and parts of a degree; and is either north or south, according as it is in the northern or southern hemisphere.

The first meridian being continued round the globe, divides it into two equal parts, called the *castern* and *western hemispheres*; and the longitude of a place is that portion of the equator contained between the first meridian and the meridian of the given place, and is either east or west; according as it is in the eastern or western hemisphere, respectively to the first meridian.

PROB. I. The latitudes of two places being given, to find the difference of latitude.

RULE. Subtract the less latitude from the greater, if the latitudes be of the same name, but add them if

of contrary; and the remainder or sum will be the difference of latitude.

| Example 1. Required the differ    | rence of latitude be- |
|-----------------------------------|-----------------------|
| tween the Lizard, in latitude 49° | 57' N. and Cape St    |
| Vincent, in latitude 37° 2' N?    |                       |
| Latitude of the Lizard            | 40° 57'N.             |
| Latitude of Cane St Vincent       | 37 2N.                |
| Americano or one or or other      | 57                    |

Difference of latitude 12 55=775 miles. Ex. 2. What is the difference of latitude between Funchal, in latitude 32° 38' N, and the Cape of Good

| Hope, in latitude 34° 29' S?                     | 1                     |
|--------------------------------------------------|-----------------------|

### Difference of longitude

PROB. IV. Given the longitude of a place, and the difference of longitude between it and another place, to find the longitude of that place.

RULE. If the given longitude and the difference of longitude be of a contrary name, subtract the less from the greater, and the remainder is the longitude required of the same name with the greater quantity; but if they are of the same name, add them, and the sum is the longitude sought, of the same name with that given. If this sum exceeds 180°, subtract it from 360°, the remainder is the required longitude of a contrary name to that given.

Ex. 1. A ship from longitude 9° 54' E. sailed westerly till the difference of longitude was 23° 18' .- Required the longitude come to?

| Longitude sailed from                                                                                                         | 9°                | 54'                       | E.       |

### SECT. II. Of the Tides.

THE theory of the tides has been explained under the article ASTRONOMY, and will again be farther illustrated under that of TIDES. In this place, therefore, it remains only to explain the method of calculating the time of high water at a given place.

As the tides depend upon the joint actions of the sun and moon, and therefore upon the distance of these objects from the earth and from each other; and as, in the method generally employed to find the time of high water, whether by the mean time of new moon, or by the epacts, or tables deduced therefrom, the moon is supposed to be the sole agent, and to have an uniform motion in the periphery of a circle, whose centre is that of the earth ; it is hence obvious that method cannot be accurate, and by observation the error is sometimes found to exceed two hours. That method is therefore rejected, and another given, in which the error will seldom exceed a few minutes, unless the tides are greatly influenced by the winds.

PROB. I. To reduce the times of the moon's phases as given in the Nautical Almanac to the meridian of a known place.

RULE. To the time of the proposed phase, as given in the Nautical Almanac, apply the longitude of the place in time, by addition or subtraction, according as it is east or west, and it will give the time of the phase at the given place.

Ex. 1. Required the time of new moon at Salonique in May 1793 ?

PROB. II. To find the time of high water at a known place.

RULE. In the Nautical Almanac seek in the given month, or in that immediately preceding or following it, for the time of that phase which happens nearest to the given day : reduce the time of this phase to the meridian of the given place by Prob. I. and take the difference between the reduced time and the noon of the given day.

Find the equation answering to this difference in Table VII. which applied to the time of high water on the day of new or full moon at the given place, according as the table directs, will give the approximate time of high water in the afternoon.

Now, take the interval between the reduced time of the phase and the approximate time of high water; find the corresponding equation, which applied as before to the syzigy time of high water, will give the time of the afternoon high water.

If the time of the morning high water is required, increase the last interval by 12 hours, if the given day falls before the phase, or diminish it by 12 hours when after that phase; and the equation to this time, applied to the syzigy time, gives the morning time of high water.

Ex. 1. Required the morning and afternoon times of high water at Leith, 11th December 1793? Nearest phase to I th Dec is

| Longitude of Leith in time -                                                                                  |              | 0            | 13<br>13                  |   |

SECT. III. Of measuring a Ship's Run in a given Time.

THE method commonly used at sea to find the distance sailed in a given time, is by means of a log-line and half-minute glass. A description of these is given under the articles LOG and LOG-LINE; which see.

It has been already observed, that the interval between each knot on the line onght to be 50 feet, in order to adapt it to a glass that runs 30 seconds. But although the line and glass be at any time perfectly adjusted to each other, yet as the line shrinks after being wet, and as the weather has a considerable effect upon the glass, it will therefore be necessary to examine them from time to time; and the distance given by them must be corrected accordingly. The distance sailed may, therefore, be affected by an error in the glass, or in the line, or in both. The true distance may, however, be found as follows.

PROB. I. The distance sailed by the log, and the se-

conds run by the glass, being given, to find the true di-Ship's Run stance, the line being supposed right.

RULE.—Multiply the distance given by the log by 30, and divide the product by the seconds run by the glass, the quotient will be the true distance.

E.x. 1. The hourly rate of sailing by the log is nine knots, and the glass is found to run out in 35 seconds. Required the true rate of sailing?

9 30

35)270(7.7=true rate of sailing. *Ex.* 2. The distance sailed by the log is 73 miles, and the glass runs out in 26 seconds. Sought the true

> 73 30

distance?

# 26)2190(84.2 the true distance.

**PROB.** II. Given the distance sailed by the log, and the measured interval between two adjacent knots on the line; to find the true distance, the glass running exactly 30 seconds.

RULE. Multiply twice the distance, sailed by the measured length of a knot, point off two figures to the right, and the remainder will be the true distance.

Ex. 1. The hourly rate of sailing by the log is five knots, and the interval between knot and knot measures 53 feet. Required the true rate of sailing?

| Measu | red interval | <br>53 |
|-------|--------------|--------|
| Twice | hourly rate  | <br>IO |

True rate of sailing = 5.30

Ex. 2. The distance sailed is 64 miles, by a log-line which measures 42 feet to a knot. Required the true distance ?

| Twice given distance,<br>Measured interval, | = 120 .    |
|---------------------------------------------|------------|
|                                             | 256<br>512 |
| True distance,                              | 53.76      |

PROB. III. Given the length of a knot, the number of seconds run by the glass in half a minute, and the distance sailed by the log: to find the true distance.

RULE. Multiply the distance sailed by the log by six times the measured length of a knot, and divide the product by the seconds run by the glass; the quotient, pointing off one figure to the right, will be the true distance.

Ex. The distance sailed by the log is 159 miles, the measured length of a knot is 42 feet, and the glass runs 33 seconds in half a minute. Required the true distance ?

Distance by the log, 159Six times length of a knot= $42 \times 6 = 252$ 

Seconds run by the glass = 33)40068(121.4= true distance.

CHAP.

Plane failing.

## CHAP. II. Plane Sailing.

PLANE sailing is the art of navigating a ship upon principles deduced from the notion of the earth's being an extended plane. On this supposition the meridians are esteemed as parallel right lines. The parallels of latitude are at right angles to the meridians ; the lengths of the degrees on the meridians, equator, and parallels of latitude, are everywhere equal; and the degrees of longitude are reckoned on the parallels of latitude as well as on the equator .- In this sailing four things are principally concerned, namely, the course, distance, difference of latitude, and departure.

The course is the angle contained between the meridian and the line described by the ship, and is usually expressed in points of the compass.

The distance is the number of miles a ship has sailed on a direct course in a given time.

The difference of latitude is the portion of a meridian contained between the parallels of latitude sailed from and come to; and is reckoned either north or south, according as the course is in the northern or southern hemisphere.

The departure is the distance of the ship from the meridian of the place she left, reckoned on a parallel of latitude. In this sailing, the departure and difference of longitude are esteemed equal.

In order to illustrate the above, let A (fig. 1.) re-CFLXIII. present the position of any given place, and AB the meridian passing through that place; also let AC represent the line described by a ship, and C the point arrived at. From C draw CB perpendicular to AB. Now in the triangle ABC, the angle BAC represents the course, the side AC the distance, AB the difference of latitude, and BC the departure.

In constructing a figure relating to a ship's course, let the upper part of what the figure is to be drawn on represent the north, then the lower part will be south, the right-hand side east, and the left-hand side west.

A north and south line is to be drawn to represent the meridian of the place from which the ship sailed; and the upper or lower part of this line, according as the course is southerly or northerly, is to be marked as the position of that place. From this point as a centre, with the chord of  $60^{\circ}$ , an arch is to be described from the meridian towards the right or left, according as the course is easterly or westerly; and the course, taken from the line of chords if given in de-grees, but from the line of rhumbs if expressed in points of the compass, is to be laid upon this arch, beginning at the meridian. A line drawn through this point and that sailed from, will represent the distance, which if given must be laid thereon, beginning at the point sailed from. A line is to be drawn from the extremity of the distance perpendicular to the meridian; and hence the difference of latitude and departure will be obtained.

If the difference of latitude is given, it is to be laid upon the meridian, beginning at the point representing the place the ship left; and a line drawn from the extremity of the difference of latitude perpendicular to Sailing. the meridian, till it meets the distance produced, will limit the figure.

If the departure is given, it is to be laid off on a parallel, and a line drawn through its extremity will limit the distance. When either the distance and differ-ence of latitude, distance and departure, or difference of latitude and departure, are given, the measure of each is to be taken from a scale of equal parts, and laid off on its respective line, and the extremities connected. Hence the figure will be formed.

PROB. I. Given the course and distance, to find the difference of latitude and departure.

Example. A ship from St Helena, in latitude 15° 55' S. sailed S. W. by S. 158 miles. Required the latitude come to, and departure.

# By Construction.

Draw the meridian AB (fig. 2.), and with the chord of  $60^{\circ}$  describe the arch m n, and make it equal to the rhumb of 3 points, and through n draw AC equal to 158 miles; from C, draw CB perpendicular to AB; then AB applied to the scale from which AC was taken, will be found to measure 131.4 and BC 87.8.

### By Calculation.

# To find the difference of latitude.

| As radius<br>is to the cosine of the cours<br>so is the distance | se 3 points<br>158 -  | 10.00000<br>9.91985<br>2.19866 |
|------------------------------------------------------------------|-----------------------|--------------------------------|
| to the difference of latitude<br>To find the                     | 131.4 -<br>departure. | 2.11851                        |
| As radius<br>is to the sine of the course<br>so is the distance  | 3 points<br>158 -     | 10.00000<br>9.74474<br>2.19866 |
| to the departure -                                               | 87.8 -                | 1.94340                        |

In the traverse table, the difference of latitude answering to the course 3 points, and distance 158 miles, in a distance column is 131.4, and departure 87.8.

### By Gunter's Scale.

The extent from 8 points to 5 points, the complement of the course on the line of sine rhumbs (marked SR.) will reach from the distance 158 to 131.4, the difference of latitude on the line of numbers; and the extent from 8 points to 3 points on sine rhumbs, will reach from 158 to 87.8, the departure on numbers (A).

| Latitude St Helena =     | 15°55' S. |
|--------------------------|-----------|
| Difference of latitude - | 2 11 S.   |
| Latitude come to -       | 18 6 S.   |

PROB. II. Given the course and difference of latitude, to find the distance and departure.

Example.

655

Plane

(A) For the method of resolving the various problems in navigation, by the sliding gunter, the reader is referred to Dr Mackay's Treatise on the Description and Use of that Instrument.

*Example.* A ship from St George's, in latitude  $38^{\circ}$ 45' north, sailed SE  $\frac{1}{4}$ S: and the latitude by observation was  $35^{\circ}$  7' N. Required the distance run, and departure?

| Latitude | St George's | ti sarih  | 38° 45' N |
|----------|-------------|-----------|-----------|
| Latitude | come to     | Parat, aw | 35 7 N    |

Difference of latitude

# 38=218 miles.

3

# By Construction.

Draw the portion of the meridian AB (fig. 3.) equal to 218 m.: from the centre A with the chord of  $60^{\circ}$  describe the arch m n, which make equal to the rhumb of  $3\frac{4}{2}$  points: through A n draw the line AC, and from B draw BC perpendicular to AB, and let it be produced till it meets AC in C. Then the distance AC being applied to the scale, will measure 282 m. and the departure BC 179 miles.

### By Calculation.

### To find the distance.

| As radius<br>is to the secant of the course<br>so is the difference of latitude | 3 points<br>218 m. | 10.00000<br>10.11181<br>2.33846 |
|---------------------------------------------------------------------------------|--------------------|---------------------------------|
| to the distance                                                                 | 282 -              | 2.45027                         |
| As radius                                                                       | the Salt Land R    | 10.00000                        |
| is to the tangent of the course                                                 | 3 points           | - 9.91417                       |
| so is the difference of latitude                                                | 218 -              | 2.33846                         |
| to the departure • •                                                            | 178.9 -            | 2.25253                         |

#### By Inspection.

Find the given difference of latitude 218 m. in a latitude column, under the course of  $3\frac{1}{2}$  points; opposite to which, in a distance column, is 282 miles; a departure column is 178.9 m. the distance and departure required.

# By Gunter's Scale.

Extend the compass from  $4\frac{\pi}{2}$  points, the complement of the course, to 8 points on sine rhumbs, that extent will reach from the difference of latitude 218 miles, to the distance 282 miles in numbers; and the extent from 4 points to the course  $3\frac{\pi}{2}$  points on the line of tangent rhumbs (marked T. R.) will reach from 218 miles to 178.9, the departure on numbers.

PROB. III. Given course and departure, to find the distance and difference of latitude ?

*Example.* A ship from Palma, in latitude 28° 37' N. sailed NW. by W. and made 192 miles of departure : Required the distance run, and latitude come to?

#### By Construction.

Make the departure BC (fig. 4.) equal to 192 miles, draw BA perpendicular to BC, and from the centre C, with the chord of  $60^{\circ}$ , describe the arch m n, which make equal to the rhumb of 3 points, the complement of the course; draw a line through C n, which produce till it meets BA in A: then the distance AC being measured, will be equal to 231 m. and the difference of latitude AB will be 128.3 miles.

# By Oalculation.

#### To find the distance.

| As the sine of the course<br>is to radius<br>so is the departure -                                               | 5 points<br>192                           | 9.91985<br>10.00000<br>2.28330               |

PROB. IV. Given the distance and difference of latitude, to find the course and departure.

*Example.* A ship from a place in latitude 43° 13' N. sails between the north and east 285 miles; and is then by observation found to be in latitude 46° 31' N : Required the course and departure?

| Latitude sailed from -  | 1.00   | 43° | 13' N |  |
|-------------------------|--------|-----|-------|--|
| Latitude by observation | paret. | 46  | 31 IN |  |

Difference of latitude -

# By Construction.

3 18=198 miles.

Draw the portion of the meridian AB (fig. 5.) equal to 198 miles; from B draw BC perpendicular to AB: then take the distance 285 miles from the scale, and with one foot of the compass in A describe an arch intersecting BC in C, and join AC. With the chord of  $60^{\circ}$  describe the arch *m*:*n*, the portion of which, contained between the distance and difference of latitudes applied to the line of chords, will measure  $46^{\circ}$ , the course; and the departure BC being measured on the line of equal parts, will be found equal to 205 miles.

### By Calculation.

#### To find the course.

| As the distance<br>is to the difference of latitude<br>so is the radius | 285 -<br>198 - | 2.45484<br>2.29660<br>10.00000 |

|-----------------------------------------------------------------|---------------|---|--------------------------------|
| to the departure -                                              | 205           |   | 2.31177                        |

### By Inspection.

Find the given distance in the table in its proper column ; and if the difference of latitude answering thereto is the same as that given, namely, 198, then the departure will be found in its proper column, and the course at the top or bottom of the page, according as the difference of latitude is found in a column marked lat. at top or bottom. If the difference of latitude thus found does not agree with that given, turn over till the nearest thereto is found to answer to the given distance. This is in the page marked 46 degrees at the bottom, which is the course, and the corresponding departure is 205 miles.

### By Gunter's Scale.

The extent from the distance 285 to the difference of latitude 198 on numbers, will reach from 90° to 44°, the complement of the eourse on sines; and the extent from 90° to the course 46° on the line of sines being laid from the distance 285, will reach to the departure 205 on the line of numbers.

PROB. V. Given the distance and departure, to find the course and difference of latitude.

Example. A ship from Fort-Royal in the island of Grenada, in latitude 12° 9' N, sailed 260 miles be-tween the south and west, and made 190 miles of departure: Required the course and latitude come to ?

### By Construction.

Draw BC (fig. 6.) perpendicular to AB, and equal to the given departure 190 miles; then from the centre C, with the distance 260 miles, sweep an arch intersecting AB in A, and join AC. Now describe an arch from the centre  $\Lambda$  with the chord of 60°, and the portion m n of this areh, contained between the distance and difference of latitude, measured on the line of chords, will be 47° the course; and the difference of latitude AB applied to the scale of equal parts, measures 177 miles.

### By Calculation.

### To find the eourse.

to the difference of latitude 2.24916 177.5 By Inspection.

Seek in the traverse table until the nearest to the given departnre is found in the same line with the given distance 260. This is found to be in the page marked 47° at the bottom, which is the course; and the corresponding difference of latitude is 177.3. +

VOL. XIV. Part II.

By Gunter's Scale.

657 Plane

The extent of the compass, from the distance 260 to Sailing. the departure 190 on the line of numbers, will reach from 90° to 47°, the course on the line of sines: and the extent from 90° to 43°, the complement of the course on sines, will reach from the distance 260 to the difference of latitude  $177\frac{1}{2}$  on the line of numbers. Latitude Fort Royal 120

| Difference of latitude |   | 177 | - | = 2 | 57 | S |
|------------------------|---|-----|---|-----|----|---|
| *                      |   |     |   | -   |    | - |
| Latitude in -          | - | -   |   | 0   | 12 | N |

PROB VI. Given difference of latitude and departure, sought course and distance.

Example. A ship from a port in latitude 7° 56' S, sailed between the south and east, till her departure is 132 miles; and is then by observation found to be in latitude 12° 3' S. Required the eourse and distance?

| Latitude | sailed | from   | -     | 70 | 56' | S. |
|----------|--------|--------|-------|----|-----|----|
| Latitude | in by  | observ | ation | 12 | 3   | S. |

Difference of latitude 7=247.

### By Construction.

Draw the portion of the meridian AB (fig. 7.) equal Fig. 7. to the difference of latitude 247 miles; from B draw BC perpendicular to AB, and equal to the given departure 132 miles, and join AC: then with the chord of 60° describe an arch from the centre A; and the portion m n of this areh being applied to the line of chords, will measure about 28°; and the distance AC, measured on the line of equal parts, will be 280 miles.

### By Calculation.

| To find the eourse.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |          |                           |

#### By Inspection.

Seek in the table till the given difference of latitude and departure, or the nearest thereto, are found together in their respective columns, which will be under 28°, the required eourse; and the distance answering thereto is 280 miles.

### By Gunter's Scale.

The extent from the given difference of latitude 247 to the departure 132 on the line of numbers, will reach from 45° to 28°, the course on the line of tangents; and the extent from 62°, the complement of the course, to 90° on sines, will reach from the difference of latitude 247, to the distance 280 on numbers.

### CHAP. III. Of Traverse Sailing.

IF a ship sail upon two or more courses in a given time, the irregular track she describes is ealled a traverse; and to resolve a traverse, is the method of reducing these several courses, and the distances run, in-

40

to

### Traverte to a single course and distance. The method chiefly used sailing. for this purpose at sea is by inspection, which shall therefore be principally adhered to; and is as follows. Make a table of a breadth and depth sufficient to

Make a table of a breath and deput sufficient to contain the several courses, &c. This table is to be divided into six columns : the courses are to be put in the first, and the corresponding distances in the second column ; the third and fourth columns are to contain the differences of latitude, and the two last the departures.

Now, the several courses and their corresponding distances being properly arranged in the table, find the difference of latitude and departure answering to each in the traverse table; remembering that the difference of latitude is to be put in a north or south column, according as the course is in the northern or southern hemisphere; and that the departure is to be put in an east column if the course is easterly, but in a west column if the course is westerly: Observing also, that the departure is less than the difference of latitude when the course is less than 4 points or  $45^{\circ}$ ; otherwise greater.

Add up the columns of northing, southing, easting, and westing, and set down the sum of each at its bottom; then the difference between the sums of the north and south columns will be the difference of latitude made good, of the same name with the greater; and the difference between the sums of the cast and west columns, is the departure made good, of the same name with the greater sum.

Now, seek in the traverse table, till a difference of fatitude and departure are found to agree as nearly as possible with those above; then the distance will be found on the same line, and the course at the top or hottom of the page, according as the difference of latitude is greater or less than the departure.

In order to resolve a traverse by construction, describe a circle with the chord of  $60^\circ$ , in which draw two diameters at right angles to each other, at whose extremities are to be marked the initials of the cardinal points, north being uppermost.

Lay off each course on the circumference, reckoned from its proper meridian; and from the centre to each point draw lines, which are to be marked with the proper number of the course.

On the first radius lay off the first distance from the centre; and through its extremity, and parallel to the second radius, draw the second distance of its proper length; through the extremity of the second distance, and parallel to the third radius, draw the third distance of its proper length; and thus proceed until all the distances are drawn.

A line drawn from the extremity of the last distance to the centre of the circle will represent the distance made good: and a line drawn from the same point perpendicular to the meridian, produced, if necessary, will represent the departure; and the portion of the meridian intercepted between the centre and departure, will be the difference of latitude made good.

### EXAMPLES.

I. A ship from Fyal, in lat. 38° 32' N, sailed as follows: ESE 163 miles, SW ½ W 110 miles, SE ½ S 180 miles, and N by E 68 miles. Required the latitude come to, the course, and distance made good 2

### By Construction.

With the chord of 60° describe the circle NE, SW (fig. 8.), the centre of which represents the place the Fig. S. ship sailed frem : draw two diameters NS, EW at right angles to each other; the one representing the meridian, and the other the parallel of latitude of the place sailed from. Take each course from the line of rhumbs, lay it off on the circumference from its proper meridian, and number it in order 1, 2, 3, 4. Upon the first rhumb CI, lay off the first distance 163 miles from C to A; through it draw the second distance AB parallel to C2, and equal to 110 miles; through B draw BD equal to 180 miles, and parallel to C3; and draw DE parallel to C4, and equal to 68 miles. Now CE being joined, will represent the distance made good; which applied to the scale will measure 281 miles. The arch S n, which represents the course, being measured on the line of chords, will be found equal to 412. From E draw EF perpendicular to CS produced; then CF will be the difference of latitude, and FE the departure made good; which applied to the scale will be found to measure 210 and 186 miles respectively.

As the method by construction is scarcely ever practised at sea, it, therefore, seems unnecessary to apply it to the solution of the following examples.

II. A ship from latitude 1° 38' S. sailed as under. Required her present latitude, course, and distance made good ?

| 1 | 1997 - I                                                                                    |                            | Diff. of J                | Latitude.       | Dep          | arture.              | t |  |

### CHAP. IV. Of Parallel Sailing.

THE figure of the earth is spherical, and the meridians gradually approach cach other, and meet at the poles. The difference of longitude between any two places is the angle at the pole contained between the meridians of those places; or it is the arch of the

equator intercepted between the meridians of the given Parallel places; and the meridian distance between two places Sailing in the same parallel, is the arch thereof contained between their meridians. It hence follows, that the meridian distance, answering to the same difference of longitude, will be variable with the latitude of the parallel upou which it is reckoned; and the same difference of longitude will not answer to a given meridian distance when reckoned upon different parällels.

Parallel sailing is, therefore, the method of finding the distance between two places lying in the same parallel whose longitudes are known; or, to find the difference of longitude answering to a given distance, run in an east or west direction. This sailing is particularly useful in making low or small islands.

In order to illustrate the principles of parallel sailing, let CABP (fig. 9.) represent a section of one Fig . fourth part of the earth, the arch ABP being part of a meridian; CA the equatorial, and CP the polar semi-axis. Also let B be the situation of any given place on the earth; and join BC, which will be equal to CA or CP (c). The arch AB, or angle ACB, is the measure of the latitude of the place B; and the arch BP, or angle BCP, is that of its complement. If BD be drawn from B perpendicular to CP, it will represent the cosine of latitude to the radius BC or CA.

Now since circles and similar portions of circles are in the direct ratio of their radii; therefore,

As radius

Is to the cosine of latitude;

So is any given portion of the equator

To a similar portion of the given parallel. But the difference of longitude is an arch of the equator; and the distance between any two places under the same parallel, is a similar portion of that parallel.

Hence R : cosine latitude :: Diff. longitude : Distance. And by inversion,

Cosine latitude : R :: Distance : Diff. of longitude.

### Also.

Diff. of longitude : Distance :: R : cos. latitude.

PROB. I. Given the latitude of a parallel, and the number of miles contained in a portion of the equator, to find the miles contained in a similar portion of that parallel.

Ex. 1. Required the number of miles contained in a degree of longitude in latitude 55° 58'?

By Construction.

Draw the indefinite right line AB (fig. 10.); make Fig. 10. the angle BAC equal to the given latitude 55° 58', and AC equal to the number of miles contained in a degree of longitude at the equator, namely 60: from C draw CB perpendicular to AB; and AB being measured on the line of equal parts, will be found equal to 33.5, the miles required. 402

(B) Greigsness is about 2<sup>+</sup>/<sub>2</sub> miles distant from Aberdeen, in nearly a SEbE<sup>+</sup>/<sub>2</sub>E direction.

(c) This is not strictly true, as the figure of the earth is that of an oblate spheroid; and therefore the radius of curvature is variable with the latitude. The difference between CA and CP, according to Sir Isaac Newton's hypothesis, is about 17 miles. 5

to the miles in a deg. in the given par. 33.58 1.52609

### By Inspection.

To 56°, the nearest degree to the given latitude, and distance 60 miles, the corresponding difference of latitude is 33.6, which is the miles required.

### By Gunter's Scale.

The extent from  $90^{\circ}$  to  $34^{\circ}$ , the complement of the given latitude on the line of sines, will reach from  $60^{\circ}$  to 22.6 on the line of numbers.

to 33.6 on the line of numbers. There are two lines on the other side of the scale, with respect to Gunter's line, adapted to this particular purpose; one of which is entitled *chords*, and contains the several degrees of latitude: The other, marked M. L. signifying *miles of longitude*, is the *line* of *longitudes*, and shows the number of miles in a degree of longitude in each parallel. The use of these lines is therefore obvious.

*E.v.* 2. Required the distance between Treguier in France, in longitude 3° 14' W, and Gaspey Bay, in longitude 64° 27' W, the common latitude being 48° 47' N ?

| Longitude Treguier - 3° 14' W<br>Longitude Gaspey Bay 64 27 W                                                                                      |                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Difference of longitude $61  13=3673'$<br>As radins<br>is to the cosine of latitude, $48^{\circ}  47'$<br>so is the difference of longitude $3673$ | 10.00000<br>9.81882<br>3.56502 |
| to the distance - 2120 -                                                                                                                           | 3.38384                        |

**PROB.** II. Given the number of miles contained in a portion of a known parallel, to find the number of miles in a similar portion of the equator.

*Example.* A ship from Cape Finisterre, in latitude  $42^{\circ} 52'$  N, and longitude  $9^{\circ} 17'$  W, sailed due west 342 miles. Required the longitude come to?

#### By Construction.

Draw the straight line AB (fig. 11.) equal to the given distance 342 miles, and make the angle BAC equal to 42° 52', the given latitude : from B draw BC perpendicular to AB, meeting AC in C; then AC applied to the scale will measure 466'<sub>2</sub>, the difference of longitude required.

Fig. 11.

#### By Calculation.

| As radius         | -          | -  |         | 10.00000 |
|-------------------|------------|----|---------|----------|
| is to the secant  | of latitud | e, | 42° 52' | 10.13493 |
| so is the distant | ce         | -  | 342     | 2.53403  |

to the difference of longitude 466.6 2.66896

#### By Inspection.

The nearest degree to the given latitude is 43°; under which, and opposite to 171, half the given distance in a latitude column, is 234, in a distance column, which doubled gives 468, the difference of longitude.

If the proportional part answering to the difference

between the given latitude and that used, be applied to Parallel the above, the same result with that found by calculation will be obtained.

### By Gunter's Scale.

The extent from  $47^{\circ}$  8', the complement of latitude to  $60^{\circ}$  on the line of sines, being laid the same way from the distance 342, will reach to the difference of longitude  $466\frac{1}{2}$  on the line of numbers.

| Longitude Cape Finisterre<br>Difference of longitude | - | 9°<br>7 | 17'<br>47 | W |
|------------------------------------------------------|---|---------|-----------|---|
| Longitude come to                                    |   | 17      | 4         | W |

**PROB.** 111. Given the number of miles contained in any portion of the equator, and the miles in a similar portion of a parallel; to find the latitude of that parallel.

*Example*. A ship sailed due east 358 miles, and was found by observation to have differed her longitude 8° 42'. Required the latitude of the parallel?

### By Construction.

Make the line  $\overline{AB}$  (fig. 12.) equal to the given di-Fig. 12. stance; to which let BC be drawn perpendicular, with an extent equal to 522', the difference of longitude; describe an arch from the centre A, cutting BC in C; then the angle BAC being measured by means of the line of chords, will be found equal to  $46^{\circ}\frac{2}{3}$ , the required latitude.

| By Calculation                     | 2.       |          |
|------------------------------------|----------|----------|
| As the distance -                  | 358      | 2.55388  |
| is to the difference of longitude, | 522      | 2.71707  |
| so is radius                       | 10-11-11 | 10.00000 |

to the secant of the latitude, 46°42' 10.16379

#### By Inspection.

As the difference of longitude and distance exceed the limits of the table, let therefore the half of each be taken; these are 261 and 179 respectively. Now, by entering the table with these quantities, the latitude will be found to be between 46 and 47 degrees. Therefore, to latitude 46°, and distance 261 miles, the corresponding difference of latitude is 181'.3, which exceeds the half of the given distance by 2'.3. Again, to latitude 47°, and distance 261, the difference of latitude is 170.0, being 1'.0 less than the balf of that given : therefore the change of distance answering to a change of 1° of latitude is 3'.3.

Now, as  $3'.3:2'.3:1^\circ:42'$ . Hence the latitude required is  $46^\circ 42'$ .

### By Gunter's Scale.

The extent from 522 to 358 on the line of numbers, will reach from 90° to about  $43^{\circ}\frac{1}{3}$ , the complement of which  $46\frac{2}{3}$  is the latitude required.

PROB. IV. Given the number of miles contained in the portion of a known parallel, to find the length of a similar portion of another known parallel.

*Example.* From two ports in latitude 33° 58' N, distance 348 miles, two ships sail directly north till they are in latitude 48° 23' N. Required their distance?

### By Construction.

Draw the line CB, CE (fig. 13.), making angles Fig 13.

F 14.

arallel arilied with CP equal to the complements of the given latitudes, namely, 56° 2' and 41° 37' respectively: make BD equal to the given distance 348 miles, and perpendicular to CP; now from the centre C, with the radius CB, describe an arch intersecting CE in E; then EF drawn from the point E, perpendicular to CP, will represent the distance required; which being applied to the seale, will measure 278<sup>±</sup>/<sub>2</sub> miles.

### By Calculation.

| is to the cosine of the lat. come to 48 | 23 9.82226 |
|-----------------------------------------|------------|
| so is the given distance - 348          | 2.54158    |

to the distance required - 278.6 2.44510

### By Inspection.

Under 34°, and opposite to 174, half the given distanee in a latitude column is 210 in a distance column; being half the difference of longitude answering thereto. Now, find the difference of latitude to distance 210 miles over 48° of latitude, which is 140'.5; from which 1'.1 (the proportional part answering to 23 minutes of latitude) being subtracted, gives 139'.4 which doubled is 278'.8, the distance required.

### By Gunter's Scale.

The extent from  $56^{\circ}$  2', the complement of the latitude left, to  $41^{\circ}$  37', the complement of that come to, on the line of sines, being laid the same way from 348, will reach to  $278\frac{1}{2}$ , the distance sought on the line of numbers.

PROB. V. Given a certain portion of a known parallel, together with a similar portion of an unknown parallel; to find the latitude of that parallel.

*Example.* Two ships, in latitude  $56^{\circ}$  ° N, distant 180 miles, sail due south; and having come to the same parallel, are now 232 miles distant. The latitude of that parallel is required?

### By Construction.

Make DB (fig. 14.) equal to the first distance 180 miles, DM equal to the second 232, and the angle DBC equal to the given latitude  $56^{\circ}$ ; from the centre  $\mathbb{C}$ , with the radius CB, describe the arch BE; and through M draw ME parallel to CD, intersecting the arch BE in E; join EC and draw EF perpendicular to CD: then the angle FEC will be the latitude required; which being measured, will be found equal to  $43^{\circ} 53'$ .

### By Calculation.

| A  | s tl | ie d | istance on the known parallel | 180    | 2.25527 |
|----|------|------|-------------------------------|--------|---------|
| 19 | to   | the  | distance on that required     | 232    | 2.36549 |

to the eosine of the latitude come to 43 53 9.85778 By Inspection.

To latitude  $56^{\circ}$ , and half the first distance 90 in a latitude column, the corresponding distance is 161, which is half the difference of longitude. Now 161, and 116, half the second distance, are found to agree between 43 and 44 degrees; therefore, to latitude 43° and distance 161, the corresponding difference of latitude is 117'.7; the excess of which above 116' is 1'.7: and to latitude 44°, and distance 161, the differ-

Middle Latitude

Sailing.

ence of latitude is 115'.8 : hence 117.7-115.8=1'.9, the change answering to a difference of 1° of latitude. Therefore, 1'.9 : 1'.7 :: 1° : 53'

Hence, the latitude is 43° 53'.

### By Gunter's Scale.

The extent from 180 to 232 on the line of numbers, being laid in the same direction on the line of sines, from 34°, the complement of the latitude sailed from, will reach to 46° 7', the complement of the latitude come to.

### CHAP. V. Of Middle Latitude Sailing.

THE earth is a sphere, and the meridians meet at the poles; and since a rhumb-line makes equal angles with every meridian, the line a ship describes is, therefore, that kind of a curve called a *spiral*.

Let AB (fig. 15.) be any given distance sailed upon Fig. 15. an oblique rhumb, PBN, PAM the extreme meridians, MN a portion of the equator, and PCK, PEL two meridians intersecting the distance AB in the points CE infinitely near each other. If the arches BS, CD, and AR, be described parallel to the equator, it is hence evident, that AS is the difference of latitude, and the arch MN of the equator, the difference of longitude, answering to the given distance AB and eourse PAB.

Now, since CE represents a very small portion of the distance AB, DE will be the correspondent portion of a meridian : hence the triangle EDC may be considered as reetilineal. If the distance be supposed to be divided into an infinite number of parts, each equal to CE, and upon these, triangles be constructed whose sides are portions of a meridian and parallel, it is evident these triangles will be equal and similar; for, besides the right angle, and hypothenuse which is the same in each, the eourse or angle CED is also the same. Hence, by the 12th of V. Eue. the sum of all the hypothenuses CE, or the distance AB, is to the sum of all the sides DE, or the difference of latitude AS, as one of the hypothenuses CE is to the corre-sponding side DE. Now, let the triangle GIH (fig. Fig. 16. 16.) be constructed similar to the triangle CDE, having the angle G equal to the course : then as GH : GI :: CE : DC :: AB : AS.

Hence, if GH be made equal to the given distance AB, then GI will be the corresponding difference of latitude.

In like manner, the sum of all the hypothenuses CE, or the distance AB, is to the sum of all the sides CD, as CE is to CD, or as GH to HI, because of the similar triangles.

The several parts of the same rectilineal triangle will, therefore, represent the course, distance, difference of latitude, and departure.

Although the parts HG, GI, and angle G of the rectilineal triangle GIH, are equal to the corresponding parts AB, AS, and angle A, of the triangle ASB upon the surface of the sphere; yet HI is not equal to BS, for HI is the sum of all the arcs CD; but CD is greater than OQ, and less than ZX: therefore HI is greater than BS, and less than AR. Hence the difference of longitude MN cannot be inferred from the departure reekoned either upon the parallel sailed from, or on that come to, but on some intermediate parallel TV, 661

TV, such that the arch TV is exactly equal to the de-Latitude parture : and in this case, the difference of longitude would be easily obtained. For TV is to MN as the sine PT to the sine PM ; that is, as the cosine of latitude is to the radius.

The latitude of the parallel TV is not, however, easily determined with accuracy ; various methods have, therefore, been taken in order to obtain it nearly, with as little trouble as possible: first, by taking the arithmetical mean of the two latitudes for that of the mean parallel: secondly, by using the arithmetical mean of the cosines of the latitudes : thirdly, by using the geometrical mean of the cosines of the latitudes: and lastly, by employing the parallel deduced from the mean of the meridional parts of the two latitudes. The first of these methods is that which is generally used.

In order to illustrate the computations in middle latitude sailing, let the triangle ABC (fig. 17.) represent a figure in plane sailing, wherein AB is the difference of latitude, AC the distance, BC the departure, and the angle BAC the course. Also, let the triangle DBC be a figure in parallel sailing in which DC is the difference of longitude, BC the mcridian distance, and the angle DCB the middle latitude. In these triangles there is, therefore, one side BC common to both; and that triangle is to be first resolved in which two parts are given, and then the unknown parts of the other triangle will be easily obtained.

PROB. I. Given the latitudes and longitudes of two places, to find the course and distance between them.

| Example. Required the          | course | e and   | distar      | nce fi | roni |

Difference of longitude 4=604' IÓ

### By Construction.

Draw the right line AD (fig. 18.) to represent the meridian of the May; with the chord of 60° describe the arch mn, upon which lay off the chord of 32° 59, the complement of the middle latitude from m to n: from D through n draw the line DC equal to 604', the difference of longitude, and from C draw CB perpendicular to AD : make BA equal to 98', the difference of latitude, and join AC; which applied to the scale will measure 343 miles, the distance sought : and the angle A being measured by means of the line of

chords, will be found equal to 73° 24', the required Middle Latitudo course. sailing

|                                     |                |                |

By Inspection.

To middle latitude 57°, and 151 one-fourth of the difference of longitude in a distance column, the corresponding difference of latitude is 82.2.

Now 24.5, one fourth of the difference of latitude, and 82.2, taken in a departure column, are found to agree nearest in table marked  $6\frac{T}{2}$  points at the bottom, which is the course; and the corresponding distance 853 multiplied by 4 gives 343 miles, the distance required.

### By Gunter's Scale.

The extent from 98 the difference of latitude, to 504 the difference of longitude on numbers, being laid the same way front 33°, the complement of the middle latitude on sines, will reach to a certain point beyond the termination of the line on the scale. Now the extent between this point and 90° on sines, will reach from 45° to 73° 24', the course on the line of tangents. And the extent from 73° 24' the course, to 33° the complement of the middle latitude on the line of sines, being laid the same way from 604 the difference of longitude, will reach to 343 the distance on the line of numbers.

The true course, therefore, from the island of May to the Naze of Norway is N 73° 24' E, ENE3E. nearly; but as the variation at the May is 21 points west, therefore, the course per compass from the May is Ebs.

PROB. II. Given one latitude, course, and distance sailed, to find the other latitude and difference of longitude.

Example. A ship from Brest, in latitude 48° 23' N, and longitude 4° 30' W, sailed SW1 W 238 miles. Required the latitude and longitude come to ?

### By Construction.

With the course and distance construct the triangle ABC (fig. 17.), and the difference of latitude AB Fig. 17. being measured, will be found equal to 142 miles: hence the latitude come to is 46° 1' N, and the middle latitude 47° 12'. Now make the angle DCB equal to

(D) For R. ? cosine mid. lat. :: Diff. of long. : Departure ; And diff. of lat. : Dep: 1: R. : Tangent course. Hence diff. of lat. : cosine mid. lat. :: diff. of long. : tang. course ; Or diff. of lat. : diff. of long. :: cosine mid. lat. : tang. course.

### By Inspection.

To the course  $4\frac{1}{4}$  points, and distance 238 miles, the difference of latitude is 141.8, and the departure 191.1. Hence the latitude come to is  $46^{\circ}$  1' N, and middle latitude  $47^{\circ}$  12'. Then to middle latitude  $47^{\circ}$  12', and departure 191.1 in a latitude column, the corresponding distance is 281', which is the difference of longitude.

### By Gunter's Scale.

The extent from 8 points to  $3\frac{1}{4}$  points, the complement of the course on sine rhumbs, being laid the same way from the distance 238, will reach to the difference of latitude 142 on the line of numbers; and the extent from 42° 48' the complement of the middle latitude, to 53° 26', the course on the line of sines, will reach from the distance 238 to the difference of longitude 281 on numbers.

PROB. III. Given both latitudes and course, required the distance and difference of longitude ?

Example. A ship from St Antonio, in latitude  $17^{\circ}$  o' N, and longitude  $24^{\circ}$  25' W, sailed NW  $\frac{3}{4}$  N, till by observation her latitude is found to be  $28^{\circ}$  34'N. Required the distance sailed, and longitude come to? Latitude St Antonio  $17^{\circ} \circ N$  -  $17^{\circ} \circ N$ Latitude by observation 2834 N - 2834 N Difference of lat. II 34=694m. 4534Middle lat. 2247

#### By Construction.

Fig. I

Construct the triangle ABC (fig. 19.), with the given course and difference of latitude, and make the angle BCD equal to the middle latitude. Now the distance AC and difference of longitude DC being measured, will be found equal to 864 and 558 respectively.

### By Inspection.

To course 3<sup>‡</sup> points, and difference of latitude 231.3 one third of that given, the departure is 171.6 and distance 288, which multiplied by 3 is 864 miles.

Again to the middle latitude 22° 47', or 23°, and departure 271.6 in a latitude column, the distance is 186, which multiplied by 3 is 558, the difference of longitude.

#### By Gunter's Scalc.

The extent from  $4\frac{3}{4}$  points, the complement of the course, to 8 points on the line of sine rhumbs, will reach from the difference of latitude 694 to the distance 864 on numbers; and the extent from the course  $36^{\circ} 34'$  to  $67^{\circ} 13'$ , the complement of middle latitude on sines, will reach from the distance 864 to the difference of longitude 558 on numbers.

PROB. IV. Given one latitude, course, and departure, to find the other latitude, distance, and difference of longitude.

*Example*: A ship from latitude  $26^{\circ} 30'$  N, and longitude  $45^{\circ} 30'$  W, sailed NE $\frac{1}{2}$ N till her departure is 216 miles. Required the distance run, and latitude and longitude come to ?

### By Construction.

With the course and departure construct the triangle ABC (fig. 20.), and the distance and difference of la-Fig. 2014 titude being measured, will be found equal to 340 and 263 respectively. Hence the latitude come to is 30° 53', and middle latitude 28° 42'. Now make the angle BCD equal to the middle latitude, and the difference of longitude DC applied to the scale will measure 246'.

### By Inspection.

Under the course 31 points, and opposite to 108, half the departure, the distance is 170, and difference of latitude 1311; which doubled, give 340 and 263 for the distance and difference of latitude respectively.

Again, to middle latitude 28° 42', and departure 108, the distance is 123; which doubled is 246 the difference of longitude.

### By Gunter's Scale.

The extent from the course  $3\frac{r}{2}$  points, on since rhumbs, to the departure 216 on numbers, will reach from 8 points on sine rhumbs to about 340, the distance on numbers; and the same extent will reach from  $4\frac{\pi}{2}$ points, the complement of the course, to 263, the diffcrence of latitude on numbers; and the extent from 61° 18' the complement of the middle latitude, to 90° on sines, will reach from the departure 216 to the difference of longitude 246 on numbers.

PROB. V. Given both latitudes and distance ; to find the course and difference of longitude.

Example. From Cape Sable, in latitude 43° 24' N, and longitude 65° 39' W, a ship sailed 246 miles on a direct course between the south and east, and is then by observation in latitude 40° 48'N. Required the mee and longitude in ?

| Latitude Cape Sable,     | 43° | 24'N     | 43 <sup>°</sup> | 24'N |
|--------------------------|-----|----------|-----------------|------|
| Latitude by observation, | 40  | 48 N     | 40              | 48 N |
| Difference of latitude,  | 2   | 36=156', | sum 24          | 12   |

#### 6 Middle latitude 42

#### By Construction.

Make AB (fig. 21.) equal to 156 miles; draw BC perpendicular to AB, and make AC equal to 246 miles. Draw CD, making with CB an angle of 42° 6' the middle latitude. Now DC will be found to measure 256, and the course or angle A will measure

Longitude come to

### By Inspection.

The distance 246, and difference of latitude 156, are found to correspond above 42 points, and the departure is 190.1. Now, to the middle latitude 42°, and departure 193.1 in a latitude column, the corresponding distance is 256, which is the difference of longitude required.

### By Gunter's Scale.

The extent from 246 miles, the distance, to 156, the difference of latitude on numbers, will reach from 90° to about 39°, the complement of the course on the line of sines : and the extent from 48°, the complement of the middle latitude, to  $50^{\circ2}$ , the course on sincs, will reach from the distance 246m. to the difference of longitude 256m. on numbers.

PROB. VI. Given both latitudes and departure; sought the course, distance, and difference of longitude.

Example. A ship from Cape St Vincent, in latitude 37° 2'N, longitude 9° 2'W, sails between the south and west; the latitude come to is 18º 16'N, and departure 838 miles. Required the course and distance run, and longitude come to?

| Latitude Cape St Vinc  | ent, 37° 2'N              | 37° 2′  |
|------------------------|---------------------------|---------|
| Latitude come to       | 18 16N                    | 18 16   |
| Difference of latitude | 18 46=2<br>Middle latitud | c 17 39 |

### By Construction.

Make AB (fig. 22.) equal to the difference of lati-Fig. 22 tude 1126 miles, and BC equal to the departure 838, and join AC; draw CD so as to make an angle with CB equal to the middle latitude  $27^{\circ}$  39'. Then the course being measured on chords is about  $36^{\circ}\frac{2}{3}$ , and the distance and difference of longitude, measured on the line of equal parts, will be found to be 1403 and 946 respectively.

### By Calculation.

### By Inspection.

One tenth of the difference of latitude 112.6 and of the departure 83.8, arc found to agree under  $3\frac{1}{2}$ points, and the corresponding distance is 140, which multiplied by 10 gives 1400 miles. And to middle latitude 27°<sup>2</sup>, and 209.5 one fourth of the departure in a latitude column, the distance is 236.5; which multiplied by 4 is 946, the difference of longitude.

### By Gunter's Scale.

The extent from the difference of latitude 1126 to the departure 838 on numbers, will reach from 45° to  $36^{\circ\frac{2}{3}}$  the course on tangents; and the extent from 53"3 the complement of the course to 90° on sines, will reach from 1126 to 1403 the distance on numbers. Lastly, the extent from  $62^{\delta_{\frac{1}{3}}}$  the complement of the middle latitude, to 90° on sines, will reach from the departure 838 to the difference of longitude 946 on numbers.

PROB. VII. Given one latitude, distance, and departure, to find the other latitude, course, and difference of longitude.

Example. A ship from Bourdeaux, in latitude 44° 50' N, and longitude 0° 35' W, sailed between the north and west 374 miles, and made 210 miles of westing. Required the course, and the latitude and longitude come to?

### By Construction.

With the given distance and departure make the triangle ABC (fig 23.). Now the course being measured on the line of chords is about 34°, and the difference of latitude on the line of numbers is 309 miles: hence the latitude come to, is 49° 59' N, and middle latitude 47° 25'. Then make the angle BCD equal to 47° 25', and DC being measured will be 310 miles, the difference of longitude.
