Money, Monk.

AFRICA

## Ancient MONEY. See COINS and MEDALS. Paper Money. See the article BANK.

MONK anciently denoted, "a person who retired from the world to give himself up wholly to God, and to live in solitude and abstinence." The word is derived from the Latin monachus, and that from the Greek provagos, " solitary ;" of provos, solus, " alone."

The origin of monks seems to have been this : The persecutions which attended the first ages of the Gospel forced some Christians to retire from the world, and live in deserts and places most private and unfrequented, in hopes of finding that peace and comfort among beasts which were denied them among men. And this being the case of some very extraordinary persons, their example gave so much reputation to retirement, that the practice was continued when the reason of its commencement ceased. After the empire became Christian, instances of this kind were numerous; and those whose security had obliged them to live separately and apart, became afterwards united into societies. We may also add, that the mystic theology, which gained ground towards the close of the third century, contributed to produce the same effect, and to drive men into solitude for the purposes of enthusiastic devotion.

The monks, at least the ancient ones, were distinguished into solitaries, comobites, and sarabaites.

The solitary are those who live alone, in places remote from all towns and habitations of men, as do still

some of the hermits. The conobites are those who live Monk in community with several others in the same house, and under the same superiors. The sarabaites were strolling monks, having no fixed rule or residence.

The houses of monks again were of two kinds, viz. monasteries and lauræ. See MONASTERY and LAURA.

Those we call monks now a-days are comobites, who live together in a convent or monastery, who make vows of living according to a certain rule established by the founder, and wear a habit which distinguishes their order.

Those that are endowed, or have a fixed revenue, are most properly called monks, monachi; as the Chartreux, Benedictines, Bernardines, &c. The Mendicants, or those that beg, as the Capuchins and Franciscans, are more properly called religious and friars; though the names are frequently confounded.

The first monks were those of St Anthony; who, towards the close of the fourth century, formed them into a regular body, engaged them to live in society with each other, and prescribed to them fixed rules for the direction of their conduct. These regulations, which Anthony had made in Egypt, were soon introduced into Palestine and Syria by his disciple Hilarion. Almost about the same time, Aones or Eugenius, with their companions Gaddanas and Azyzas, instituted the monastic order in Mesopotamia and the adjacent countries; and their example was followed with such rapid success, that

onk.

335 that in a short time the whole east was filled with a lazy set of mortals, who, abandoning all human connexions, advantages, pleasures, and concerns, wore out a languishing and miserable life amidst the hardships of want, and various kinds of suffering, in order to arrive at a more close and rapturous communication with God and angels.

From the east this gloomy institution passed into the west, and first into Italy and its neighbouring islands ; though it is uncertain who transplanted it thither. St Martin, the celebrated bishop of Tours, creeted the first monasteries in Gaul, and recommended this religious solitude with such power and efficacy, both by his instructions and his example, that his funeral is said to have been attended by no less than 2000 monks. From hence the monastic discipline extended gradually its progress through the other provinces and countries of Europe. There were besides the monks of St Basil (called in the East Calogeri, from xalos yegws, " good old man") and those of St Jerome, the hermits of St Augustine, and afterwards those of St Benedict and St Bernard; at length eame those of St Francis and St Dominic, with a legion of others; all which see under their proper heads, BENEDICTINES, &c.

Towards the close of the fifth century, the monks, who had formerly lived only for themselves in solitary retreats, and had never thought of assuming any rank among the sacerdotal order, were now gradually distinguished from the populace, and endowed with such opulence and honourable privileges that they found themselves in a condition to claim an eminent station among the supports and pillars of the Christian community. The fame of their piety and sanctity was so great, that bishops and presbyters were often chosen out of their order; and the passion of erecting edifices and convents, in which the monks and holy virgins might serve God in the most commodious manner, was at this time carried beyond all bounds. However their licentiousness, even in this century, was become a proverb; and they are said to have excited the most dreadful tumults and seditions in various places. The monastic orders were at first under the immediate jurisdiction of the bishops, from which they were exempted by the Roman pontiff about the end of the 7th century; and the monks, in return, devoted themselves wholly to advance the interests and to maintain the dignity of the bishop of Rome. This immunity which they obtained, was a fruitful source of licentiousness and disorder, and oceasioned the greatest part of the vices with which they were afterwards so justly charged. In the 8th century the monastic discipline was extremely relaxed both in the castern and western provinces, and all efforts to restore it were ineffectual. Nevertheless, this kind of institution was in the highest esteem, and nothing could equal the veneration that was paid about the close of the 9th century to such as devoted themselves to the sacred gloom and indolence of a convent. This veneration induced several kings and emperors to call them to their courts, and to employ them in civil affairs of the greatest moment. Their reformation was attempted by Louis the Meek, but the effect was of short duration. In the 11th century they were exempted by the popes from the authority of their sovereigns, and new orders of monks were continually established; insomuch that in the council of Lateran that was held

in the year 1215, a decree was passed, by the advice Monk. of Innocent III. to prevent any new monastic institutions; and several were entirely suppressed. In the 15th and 16th centuries, it appears, from the testimonies of the best writers, that the monks were generally lazy, illiterate, profligate, and licentions epicurcs, whose views in life were confined to opulence, idleness, and plcasurc. However, the Reformation had a manifest influence in restraining their excesses, and rendering them more circumspect and cautious in their external conduct.

Monks are distinguished by the colour of their habits into bluck, white, gray, &c. Among the monks, some are called monks of the choir, others professed monks, and others lay monks ; which last are destined for the service of the convent, and have neither clericate nor literature.

Cloistered MONKS, are those who actually reside in the house : in opposition to extra-monks, who have benefices depending on the monastery.

Monks are also distinguished into reformed, whom the civil and eeclesiastical anthority have made masters of ancient convents, and put in their power to retrieve the ancient discipline, which had been relaxed; and ancient, who remain in the convent, to live in it according to its establishment at the time when they made their vows, without obliging themselves to any new reform.

Anciently the monks were all laymen, and were only distinguished from the rest of the people by a particular habit and an extraordinary devotion. Not only the monks were prohibited the priesthood, but even priests were expressly prohibited from becoming monks, as appears from the letters of St Gregory. Pope Syricins was the first who called them to the clericate, on oecasion of some great scarcity of pricsts, that the ehurch was then supposed to labour under : and since that time, the priesthood has been usually united to the monastical profession.

MONK, George, a personage memorable for having been the principal agent in restoring Charles II. to his crown, was descended from a very ancient family, and born in Devonshire in 1608. Being an unprovided younger son, he dedicated himself to arms from his youth, and obtained a pair of colours in the expedition to the Isle of Rhée : he scrved afterwards in the Low Countries with reputation, in both King Charles's northern expeditions; and did such service in quelling the Irish rebellion, that he was appointed governor of Dublin, but was superseded by parliamentary authority. Being made major-general of the Irish brigade employed in the siege of Nantwich in Cheshire, he was taken prisoner by Sir Thomas Fairfax, and remained confined in the Tower of London until the year 1646; when, as the means of obtaining liberty, he took the covenant, and accepted a command in the Irish service under the parliament. He obtained the command in chief of all the parliamentary forces in the north of Ireland, where he did signal services, until he was called to account for a treaty made with the Irish rebels; a circumstance which was only obliterated by his future good fortune. He served in Scotland under Oliver Cromwell with such success, that he was left there as commander in chief; and he was one of the commissioners for uniting that kingdom with the new erected commonwealth. He

caster, who bestowed many privileges upon the town. Monmo He served at sea also against the Dutch; and was treat-Here Henry V. surnamed of Monmouth, was born. The famous historian Geoffrey was also bern at this Monod place. Formerly it gave the title of earl to the family of Carey, and of duke to King Charles the Second's eldest natural son; but now of carl to the Mordaunts, who are also earls of Peterborough. It contained 3503 inhabitants in 1811, is well built, carries on a considerable trade with Bristol by means of

the Wye, and has a weekly market, and three fairs. MONMOUTHSHIRE, a county of England; an-ciently reckoned a part of Walcs, but in Charles II.'s time taken into the Oxford circuit, and made an English county. It is bounded on the north by Herefordshire, on the east by Gloucestershire, on the south by the river Severn, and on the west by the Welsh counties of Brecknock and Glamorgan. Its extent from north to south is about 30 miles, from east to west 26, and in cirenmference 110. It is subdivided into six hundreds, and 127 parishes. In 1811, this county contained 12,127 houses, and 62,127 inhabitants. It sends only three members to parliament, that is, one for Monmouth, and two for the county. The air is temperate and healthy; and the soil fruitful, though mountainous and woody on the western side. The hills feed sheep, goats, and horned cattle ; and the valleys produce plenty of grass and eorn. This county is extremely well watered by several fine rivers ; for, besides the Wye, which parts it from Gloucestershire, the Mynow, which runs between it and Herefordshire, and the Rumney, which divides it from Glamorganshire, it has, peculiar to itself, the Usk, which enters this county a little above Abergavenny, runs mostly southward, and falls into the Severn by the mouth of the Ebwith ; which last river runs from north to south, in the western side of the county. All these rivers, especially the Wye and Usk, abound with fish, particularly salmon and trout.

MONOCEROS, UNICORN, in Astronomy, a southern constellation formed by Hevelius, containing in his catalogue 19 stars, and in the Britannic Catalogue 31.

MONOCEROS. See MONODON, CETOLOGY Index.

MONOCHORD ; an instrument by which the several proportions of musical sounds and intervals, as well in the natural as in tempered scales are tried. Originally it had, as its name implies, only one string; but it is better constructed with two; for, by means of this additional string, we have an opportunity of judging of the harmony of two tempered notes in every possible variety of temperament.

The reader who may wish for further information respeeting the construction and use of monochords, may consult the appendix to Mr Atwood's Treatise on Rectilinear Motion, and Mr Jones's observations on the scale of music, monochord, &c. in his Physiological Disquisitions.

MONOCHORD is also used for any musical instrument that consists of only one string or chord ; in this sense the trumpet marine may properly be called a monochord.

MONOCULUS, a genus of insects of the order of aptera. See ENTOMOLOGY Index.

MONODON, a genus of fishes belonging to the order of cete. See CETOLOGY Index.

MONODY, in ancient poetry, a mournful kind of song,

Monk

ed so kindly on his return, that Oliver is said to have Monmouth grown jealous of him. He was, however, again sent to Scotland as commander in chief, and continued there five years; when he dissembled so well, and improved circumstances so dexterously, that he aided the desires of a wearied pcople, and restored the king without any disturbance : for which he was immediately rewarded both with honours and profit : (See Britain, Nº 194, &c.). He was created duke of Albemarle, with a grant of 7000l. per annum estate, beside other emoluments; and enjoyed the confidence of his master without forfeiting that of the people. After his death in 1670, there was published a treatise composed by him while he remained prisoner in the Tower, entitled, " Observations on Military and Political Affairs," a small folio.

MONK-Fish. See SQUALUS, ICHTHYOLOGY Index. Monk's Head, or Wolf's bane. See ACONITUM, BO-TANY Index.

MONKEY. See SIMIA, MAMMALIA Index.

MONMOUTH, JAMES, DUKE OF, son to Charles II. by Mrs Lucy Walters, was born at Rotterdam in 1649. Upon the Restoration, he was called over to England, where the king received him with all imaginable joy, created him earl of Orkney (which was changed into that of Monmouth), and he took his seat in the house of peers in the ensuing session of parliament. He married Anne, the heiress of Francis earl of Buccleugh; and hence it eame to pass that he had also the title of *Buccleugh*, and took the surname of *Scot*, according to the eustom of Scotland. In 1668 his father made him captain of his life-guard of horse; and in 1672 he attended the French king in the Netherlands, and gave proofs of bravery and conduct. In 1673 the king of France made him lieutenant-general of his army, with which he came before Maestricht, and behaved himself with incredible gallantry, being the first who entered it himself. He returned to England, was received with all possible respect, and was received chancellor of the university of Cambridge. After this he went to assist the prince of Orange to raise the siege of Mons, and did not a little contribute towards it. He returned to England; and was sent in quality of his father's general, to quell an insurrection in Scotland, which he effected ; but soon after he fell into disgrace; for, being a Protestant, he was deluded into ambitious schemes, upon the hopes of the exclusion of the duke of York : he conspired against his father and the duke; and when the latter came to the throne by the title of James II. he openly appeared in arms, encouraged by the Protestant army; but coming to a decisive battle before he had sufficient forces to oppose the royal army, he was defeated, taken soon after concealed in a ditch, tried for high treason, condemned, and beheaded in 1685, aged 36. See BRITAIN, Nº 242, 249 --- 265.

MONMOUTH, the capital of the county of Monmouthshire in England, 129 miles from London, and 33 miles from Bristol. It has its name from its situation at the conflux of the Monow or Mynwy, and the Wye, over each of which it has a bridge, and a third over the Frothy. Here was a eastle in William the Conqueror's time which Henry III. took from John baron of Monmouth. It afterwards came to the house of Lan-

fonody song, sung by a person all alone, to give vent to his grief. The word is derived from poros, " alone," and onophyada, " I sing."

MON

sites.

MONOECIA, from poros, alone, and ownos, a house ; the name of the 21st class in Linnæus's sexual method. See BOTANY.

MONOGAMY, compounded of mores, solus, and grames, "marriage," the state or condition of those who have only married once, or are restrained to a single wife. See POLYGAMY.

MONOGLOSSUM, in Ancient Geogruphy, a mart town of the Hither India, situated on the Sinus Canthi, into which the Indus empties itself. Said to be Mangalor on the coast of Malabar. E. Long. 74°, N. Lat. 13°.

MONOGRAM, a character or eypher, composed of one, two, or more letters interwoven; being a kind of abbreviation of a name, anciently used as a seal, badge, arms, &e.

MONOGYNIA, from povos, alone, and youn, a woman; the name of the first order or subdivision in the first 13 classes of Linnæus's sexual method; consisting of plants which, besides their agreement in their elassic character, generally derived from the number of their stamina, have only one style.

MONOMOTAPA, a country of Southern Africa, lying north-eastward of the Cape of Good Hope. The air of this country is very temperate ; the land fertile in pastures and all the necessaries of life, being watered by several rivers. The inhabitants arc rich in black eattle, which they value more than gold. They have a vast number of elephants, as appears from the great quantity of ivory that is exported. There is also a considerable trade in gold dust. This country is divided into seven provinces or petty kingdoms, vassals to the king ; viz. Monomotapa Proper, Quiteve, Manica, Inhambana, Inhemior, Sahia, and Sofala.

MONONGAHELA, a river of North America, which rises in the Laurel mountains in Virginia, and after a course of about 200 miles, joins the Alleghany at Pittsburg. The two rivers united then form the Ohio. The Monongahela is navigable for boats about 100 miles.

MONOPETALOUS, in Botany, a term applied to flowers that have only one petal or flower-leaf.

MONOPHYSITES, (from provos, solus, and quois, natura), a general name given to all those sectaries in the Levant who only own one nature in Jesus Christ ; and who maintain, that the divine and human natures of Christ were so united as to form only one nature, yet, without any change, confusion, or mixture of the two natures.

The Monophysites, however, properly so called, are the followers of Severus, a learned monk of Palestine, who was created patriarch of Antioch in 513, and Petrus Fullensis.

The Monophysites were encouraged by the emperor Anastasius, but depressed by Justin and succeeding emperors. However, this sect was restored by Jacob Baradæus an obscure monk, insomuch that when he died bishop of Edessa, A. D. 588, hc left it in a most flourishing state in Syria, Mesopotamia, Armenia, Egypt, Nubia, Abyssinia, and other countries. The laborious efforts of Jacob were sceonded in Egypt and the adjacent countries, by Theodosius bishop of Alexandria;

Vol. XIV. Part I.

the east considered him as their second parent and founder, and are to this day called Jacobites, in honour of Monopoly their new chief. The Monophysites are divided into two sects or parties, the one African, the other Asiatic; at the head of the latter is the patriarch of Antioch, who resides for the most part in the monastery of St Ananias, near the city of Merdin : the former are under the jurisdiction of the patriarch of Alexandria, who generally resides at Grand Cairo, and are subdivided into Cophts and Abyssinians. From the 15th century downwards, all the patriarchs of the Monophysites have taken the name of Ignatius, in order to show that they are the lineal successors of Ignatins, who was bishop of Antioch in the first century, and consequently the lawful patriarch of Antioch. In the 17th century, a small body of the Monophysites in Asia ahandoned for some time the doctrine and institution of their ancestors, and embraced the communion of Rome : but the African Monophysites, notwithstanding that poverty and ignorance which exposed them to the seductions of sophistry and gain, stood firm in their principles, and made an obstinate resistance to the promises, presents, and attempts employed by the papal missionaries to bring them under the Roman yoke : and in the 18th century, those of Asia and Africa have persisted in their refusal to enter into the communion of the Romish church, notwitstanding the earnest entreaties and alluring offers that have been made from time to time by the pope's legates, to conquer their inflexible constancy. The Monophysites propagate their doetrine in Asia with zeal and assiduity, and have not long ago gained over

bit the maritime coast of India. MONOPOLY, one or more persons making themselves the sole masters of the whole of a commodity, manufacture, and the like, in order to make private advantage of it, by selling it again at a very advanced price. Or it is a license or privilege allowed by the king for the sole buying and selling, making, working, or using any thing whatsoever .- Monopolies had been carried to an enormous height during the reign of Queen Elizabeth; and were heavily complained of by Sir Edward Coke, in the beginning of the reign of King James I.: but were in great measure remedied by statute 21 Jac. I. c. 3. which declares such monopolies to be contrary to law, and void ; (except as to patents, not exceeding the grant of 14 years, to the au-thors of new inventions; and except also patents concerning printing, saltpetre, gunpowder, great ordnance, and shot); and monopolists are punished with the forfeiture of treble damages and double costs, to those whom they attempt to disturb ; and if they procure any action, brought against them for these damages, to be stayed by any extrajudicial order, other than of the court wherein it is brought, they incur the penalties of præmunire. Combinations also among victuallers or artificers, to raise the price of provisions, or any commodities, or the rate of labour, are in many cases severely punished by particular statutes ; and, in general, by statute 2 and 3 Edward VI. c. 15. with the forfeiture of 101. or 20 days imprisonment, with an allowance of on-ly bread and water, for the first offenee; 201. or the pillory for the second; and 40l. for the third, or else the pillory, loss of one ear, and perpetual infamy. U u By

to their communion a part of the Nestorians, who inha-

and he became so famous that all the Monophysites of Monophy

1

Monopoly By a constitution of the emperor Zeno, all monopolies and combinations to keep up the price of merchandise, provisions, or workmanship, were prohibited, upon pain of forfeiture of goods and perpetual banishment. See COMMERCE and CORN LAWS, SUPPLEMENT.

MONOSYLLABLE, in Grammar, a word that consists only of one syllable, and is composed either of one or more letters pronounced at the same time. The too frequent use of monosyllables has a very bad effect in English poetry, as Mr Pope both intimates and exemplifies in the same verse, viz.

" And ten slow words oft creep in one dull line."

MONOTHELITES, (compounded of µ0105, " sin-gle,', and Atanua, " will," of Atau, volo, " I will,") an ancient sect, which sprung out of the Eutychians; thus called, as only allowing of one will in Jesus Christ.

The opinion of the Monothelites had its rise in 630, and had the emperor Heraelius for an adherent : it was the same with that of the Acephalous Severians. They allowed of two wills in Christ, considered with regard to the two natures; but reduced them to one, hy reason of the union of the two natures ; thinking it ahsurd there should be two free wills in one and the same person. They were condemned by the sixth general conncil in 680, as being supposed to destroy the perfection of the humanity of Jesus Christ, depriving it of will and operation. Their sentiments were afterwards embraced by the Maronites.

MONOTONY, an uniformity of sound, or a fault in pronunciation, when a long series of words is delivered in one unvaried tone. Sec READING.

MONOTROPA, BIRD'S-NEST; a genus of plants belonging to the monandria class; and in the natural method ranking with those of which the order is doubtful. See BOTANY Index.

MONREAL. See MONTREAL.

MONRO, DR ALEXANDER, senior, a celebrated physician and anatomist, was the son of Mr John Monro, who was for some years a surgeon in the army under King William in Flanders, and who afterwards settled as a surgeon in Edinburgh. The subject of this biographical sketch was born in London in 1697.

He showed an early inclination to the study of physic; and the father, after giving him the best education that Edinburgh then afforded, sent him successively to London, Paris, and Leyden, to improve himself further in his profession. At London, he attended the lectures of Messrs Hawksbee and Whiston on experimental philosophy, and the anatomical demonstrations of Mr Cheselden. At Paris he attended the hospitals, and the lectures on the different branches of physic and surgery; and towards the end of autumn 1718, he went to Leyden, and studied under the great Boerhaave.

On his return to Edinburgh in autumn 1719, Messrs Drummond and Maegill, who were then conjunct nominal professors and demonstrators of anatomy to the Surgeons Company, having resigned in his fayour, his father prevailed on him to read some public lectures on anatomy, and to illustrate them by showing the curious anatomical preparations which he had made and sent home when abroad. He at the same time persuaded Dr Alston, then a young man, to give some

public lectures on botany. Accordingly, in the begin- Monro ning of the winter 1720, these two young professors began to give regular courses of lectures, the one on the materia medica and botany, the other on anatomy and surgery ; which were the first regular courses of lectures on any of the branches of medicine that had ever been read at Edinburgh, and may be looked upon as the opening of that medical school which has since acquired such great reputation all over Europe.

In summer 1721 and 1722, Dr Monro, by the persuasion of his father, read some lectures on chirurgical subjects, particularly on wounds and tumours, which he never would publish, having written them in a hurry and before he had much experience; but inserted from time to time the improvements he thought might be made in surgery, in the volumes of Medical Essays and Observations to be hereafter mentioned.

About the year 1720, his father communicated to the physicians and surgeons at Edinburgh, a plan which he had long formed in his own mind, of having the different branches of physic and surgery regularly taught at Edinburgh ; which was highly approved of by them, and by their interest regular professorships of anatomy and medicine were instituted in the university. His son, Dr Monro, was first made university professor of anatomy; and two or three years afterwards, Drs Sinclair, Rutherford, Innes, and Plummer, were made professors of medicine; the professorship of materia medica and botany, which Dr Alston then held, having been added to the university many years before. Immediately after these gentlemen were elected professors, they began to deliver regular courses of lectures on the different branches of medicine, and they and their successors have uniformly continued so to do every winter.

The plan for a medical education at Edinburgh was still incomplete without an hospital, where students could see the practice of physic and surgery, as well as hear the lectures of the professors. A scheme was therefore proposed by Dr Monro's father, and others, particularly the members of the Royal College of Physicians and Board of Surgeons, for raising by subscription a fund for building and supporting an hospital for the reception of diseased poor; and our author published a pamphlet setting forth the advantages that would attend such an institution. In a short time a considerable sum of money was raised, a small house was fitted up, and patients were admitted into it, and regularly attended by many of the physicians and surgeons in town. The fund for this charity increasing very considerably, in a great measure from the activity and influence of that very worthy citizen and magistrate George Drummond, Esq. the foundation was laid of the present large, commodious, and useful hospital, the Royal Infirmary; in the planning of which Dr Monro suggested many useful hints, and in particular the elegant room for chirurgical operations was designed and executed under his direction. Provost Drummond and he were nominated the building committee; and the fabric was entirely completed in a short space of time. It has since been so largely endowed, as to be capable of receiving a great number of discased poor, whose cases the students of physic and surgery have an opportunity of seeing daily treated with the greatest attention and care by physicians and surgeons eminent in their profession ; and a register of the particulars of all the cases which have been received

Monro.

received into the house since its first opening has been Monro kept, in books appropriated for that purpose, for the use of the students.

In order to make the hospital of still farther use to the students, Dr Monro frequently, while he continued professor of anatomy, gave lectures on the chirurgical cases; and Dr Rutherford, then professor of the practice of physic, began, in the year 1748, to deliver clinical lectures, to be continued every winter, on the most remarkable cases in the hospital.

Dr Monro, though he was clected professor of anatomy in the year 1721, was not received into the university till-the year 1725, when he was inducted along with that great mathematician the late Mr Colin Maclaurin, with whom he ever lived in the strictest friendship. From this time he regularly every winter gave a course of lectures on anatomy and surgery, from October to May, upon a most judicious and comprehensive plan : A task in which he persevered with the greatest assiduity, and without the least interruption, for near 40 years; and so great was the reputation he had acquired. that students flocked to him from the most distant corners of his majesty's dominions.

In 1759, our professor entirely relinquished the business of the anatomical theatre to his son Dr Alexander, who had returned from abroad, and had assisted him in the course of lectures the preceding year. But after this resignation, he still endeavoured to render his labours useful to makind, by reading clinical lectures at the hospital for the improvement of the students; of which Dr Duncan, who was one of his pupils, has given the following account. " There I had myself the happiness of heing a pupil, who profited by the judicious conduct of his practice, and was improved by the wisdom and acuteness of his remarks. I have indeed to regret that I attended only the last course of lectures in which he had ever a share, and at a time when he was subjected to a disease which proved at length fatal. Still, however, from what I saw and from what I heard, I can venture to assert, that it is hardly possible to conceive a physician more attentive to practice, or a preceptor more anxious to communicate instructions. His humanity, in the former of these characters, led him to bestow the most anxious care on his patients while they were alive; and his zeal in the latter induced him to make them the subject of useful lessons when they happened to die .- In the different stations of physician, of lecturer, and of manager in the hospital, he took every measure for inquiring into the eauses of diseases by dissection .- He personally attended the opening of every body; and he not only dietated to the students an accurate report of the dissection, but with nice discrimination contrasted the diseased and sound state of every organ. Thus, in his own person he afforded to the students a conspicuous example of the advantages of early anatomical pursuits, as the happiest foundation for a medical superstructure. His being at once engaged in two departments, the anatomical theatre and clinical chair, furnished him with opportunities both on the dead and living body, and placed him in the most favourable situation for the improvement of medicine; and from these opportunities he derived every possible advantage which they could afford."

His father, old Mr Monro, lived to an advanced age;

and enjoyed the unspeakable pleasure of beholding a Monro. son, esteemed and regarded by mankind, the principal actor in the execution of his favourite plan, the great object of his life, the founding a seminary of medical education in his native country : The son, who survived him near 30 years, had the satisfaction to behold this seminary of medical education frequented yearly by 300 or 400 students, many of whom came from the most distant corners of his majesty's dominions, and to see it arrive to a degree of reputation far beyond his most sanguine hopes, being equalled by few, and inferior to none, in Europe.

Dr Monro was not only very active in the line of his own profession, but as a citizen and general member of the community; for, after he had resigned the anatomical chair to his son, he executed with the strictest punctuality the duties of several engagements both of a civil and political nature : He was a director of the Bank of Scotland, a justice of the peace, a commissioner of high roads, &c. At length, after a life spent in the most active industry, he became afflicted with a tedious and painful disease, which he bore with equal courage and resignation till his death, which happened on July 10. 1767, in the 70th year of his age.

Of his works, the first in order is his Osteology, which was written for the use of students, but is capable also of affording instruction to the oldest and most experienced practitioner; as, besides a minute description of the parts copied from nature, it everywhere abounds with new and important observations immediately applicable to practice. It has been translated into many different languages ; has passed through numerons editions; and has been reprinted in foreign countries in the most superb manner, accompanied with ele-gant and masterly engravings. His description of the Lacteal Sac and Thoracic Duct contains the most accurate account of that important part of the body which has been yet published ; and his Anatomy of the Nerves will transmit to posterity an excellent example of accurate dissection, faithful description, and ingenious reasoning. The six volumes of Medical Essays and Observations, published by a society in Edinburgh, are universally known and esteemed. To that society he was appointed secretary; but, after the publication of the first volume, to which he had largely contributed, the members growing remiss in their attendance, he became the sole collector and publisher of the work : To him we are therefore in a great measure indehted for those numerous and important discoveries with which this publication has enriched every department of medical knowledge. In the two first volumes of the Physical and Literary Essays, published by the physical society of Edinburgh, in which he had the rank of one of the presidents, we find several papers written by him, which are not the least ornaments of that collection. His account of the Suecess of Inoculation in Scotland may be considered as his last publication : It demonstrates his extensive correspondence and indefatigable industry, and has had great influence in promoting that salutary practice. Besides these, he was also the author of several other elegant and masterly productions, which were either never published, or were published without his knowledge and from incorrect copies. A collection of all his works, properly arranged, corrected, and illustrated with copperplates, has been published by Dr Uu 2 Alexander

Monro Monselcmines.

Alexander Monro, his son and successor in the anatomical chair, in a splendid quarto volume, printed for Elliot, Edinburgh, 1781; to which is prefixed a life of the author, by another of his sons, Dr Donald, physician in London. The observation of an excellent judge, the illustrious Haller, concerning our author's Medical Essays and Observations, which now form a part of this collection, may with no less justice be applied to the whole : " It is a book which ought to be in the possession of every medical practitioner."

MONS, an ancient, large, handsome, rich, and very strong city of the Netherlands. It is situated on an uneven and marshy soil on the river Trouille. In the neighbourhood are extensive coal mines which are worked. It has several manufactures, and a good trade. It was taken by the allies in 1709, and by the French in July 1746; but rendered back by the treaty of Aix-la-Chapelle, after the fortifications were demolished. It was taken by the French in 1794, and while in their possession was chief town of the department of Jemappe. It was separated from France at the peace of Paris in 1814, and annexed to the kingdom of the Netherlands. The population in 1800 was 18,291. E. Long. 3. 51. N. Lat. 50. 25.

Mons Sacer, in Ancient Geography, a mountain of the Sabines beyond the Anio, to the east of Rome; whither the common people retired once and again to avoid the tyranny of the Patricians. From this secession, and the altar of Jupiter Terribilis erected there, the mountain took its name.

MONSEIGNEUR, in the plural Messeigneurs, a title of honour and respect used by the French in writing to persons of superior rank or quality.

Dukes, peers, arehbishops, bishops, and presidents à la mortier, were complimented with the title of Monseignour. In the pctitions presented to the sovereign courts, they used the term Messeigneurs.

MONSEIGNEUR, absolutely used, was a title restrained to the dauphin of France. This custom was unknown till the time of Louis XIV. before which the dauphin was styled Monsicur le Dauphin.

MONSELEMINES, a people inhabiting that part of Biledulgerid, which borders on the territories of the emperor of Moroceo. They are a mixed race, descended from the ancient Arabs and fugitive Moors. Their country extends from about 90 miles beyond Cape Non, to the distance of 60 miles from St Croix. It is mostly fertile; and, with little cultivation, produces the necessaries of life. A number of streams water the plains, which abound with fig, date, palm, and almond trees. The gardens produce excellent grapes, which the Jews convert into brandy after they have been dried by the Arabs.

The Monselemine territory is very populous, and would be much more so, were it not for the almost continual wars in which the people are engaged against the emperor of Morocco; for, as this country is the retreat of the rich Moors, who wish to fly from the tyranuy of the emperor, they are too well acquainted with the Moorish customs to be surprised by that prince. As soon as a Moorish army takes the field, the inhabitants mount their horses, and occupy the passes of the mountains; while the women and slaves retire to the interior parts of the country, or to the desert, if they are hard pressed. Their horses, which they break in

an admirable manner, are said to be the best in the Mousele world; obedient to the voice of their master, and almines lowing no stranger to mount them.

The people derive their name and origin from one Monsoo Moseilama, who was contemporary with Mahomet. They respect the prophet, as do other Mahometans; but neither believe that he was infallible, nor that his descendants are all inspired by God, nor that their will should be a law, nor that such faith is necessary in order to be a good Maliometan. The influence of their high priest is nearly despotic; for though he has no troops, he may command the nation, and peace and war depend upon his will. He has no property, yet every thing is at his disposal; he requires nothing from any, yet all are disposed to give him.

The Monselemines, on Friday, meet in their mosques for prayer, and the same is likewise the day of their principal market, when their goods are exposed to sale in the public squares. They never attempt to make proselytes; and they treat their Christian slaves with humanity, which may perhaps be owing to the avarice of their masters. The Jews are allowed among them the free exercise of their religion. Polygamy is permitted among them; but the situation of the women is more respectable, and they are not so much seeluded as among the Moors, mingling more in society, walking at large, and visiting their friends. The Monselemine children are brought up with great eare, and are not obliged to exhibit proofs of their courage till they can be considered as men.

MONSIEUR, in the plural Messieurs, a term or title of civility, used by the French in speaking to their equals, or those a little below them, answering to Mr or Sir among the English.

MONSIEUR, absolutely used, was a title appropriated to the second son of France, or the king's brother. The king was also ealled Monsieur, but that only by the children of France.

MONSONIA, a genus of plants belonging to the polyadelphia class. See BOTANY Index.

MONSOON, a regular or periodical wind, in the East Indies, blowing constantly the same way, during six months of the year, and the contrary way the remaining six.

In the Indian ocean, the winds are partly general, and blow all the year round the same way, as in the Ethiopic occan; and partly periodical, i. e. half the year blow one way, and the other half year on the opposite points: and those points and times of shifting differ in different parts of this ocean. These latter are what we call monsoons.

The shifting of these monsoons is not all at once; and in some places the time of the change is attended with calms, in others with variable winds, and particularly those of China, at ceasing to be westerly, are very subject to be tempestuous; and such is their violence, that they seem to be of the nature of the West India hurricanes, and render the navigation of those seas very unsafe at that time of the year. These tempests the seamen call the breaking up of the monsoons.

Monsoons, then, are a species of what we otherwise call trade winds. They take the denomination monsoon from an ancient pilot, who first crossed the Indian sea by means hereof. Though others derive the name from

nsoon, from a Portuguese word signifying motion or change inster. of wind and sea.

Lucretius and Apollonius make mention of annual winds which arise every year, etcsia flabria, which seem to be the same with what in the East Indies we now call monsoons. For the physical cause of these winds, see METEOROLOGY.

MONSTER; a birth or production of a living being, degenerating from the proper and usual disposition of parts in the species to which it belongs: As, when there are too many members, or too few; or some of them are extravagantly out of proportion, either on the side of defect or excess. The word comes from the Latin monstrum, of monstrando, " showing." Whence also the box wherein relicks were anciently kept to be shown, was called monstrum. Dugdalc mentions an inventory of the church of York with this article, Item unum monstrum cum ossibus sancti Petri in beryl, et crucifixo in summitate.

Aristotle defines a monster to be a defect of nature. when, acting towards some end, it cannot attain to it. from some of its principles being corrupted.

Monsters do not propagate their kind; for which reason some rank mules among the number of monsters, as also hermaphrodites.

Females which bring forth twins, are found most liable to produce monsters. The reason, probably, is owing to this; that though the twins are covered with one common chorion, yet they have each their separate amnios, which by their contiguity may chance to grow together, and so occasion a confusion or blending of the parts. Hence so many double creatures.

Various theories have been proposed by philosophers and physiologists to account for the production of monsters. But after all, it must be confessed, that we are very little acquainted with those deviations from the ordinary course of nature. For each organized being there appears to exist a primitive germ or model of the different species drawn by the Creator, determined by forms and sexes, and realized in the individuals of both sexes, which must unite in order to their reproduction. From this model nature never departs, unless when compelled by circumstances which derange the primitive organization common to the species, and produce what are called monsters.

With respect to structure, monsters are of various kinds. Some have an excess or defect in certain parts; such as those which are called acephalous, or who want the head ; those which have two heads, two arms, two legs, and one body, or which have two bodies and one head, or which have three legs; and those which want the arms or the legs. Others err through an extraordinary and deformed conformation, through an unnatural union of certain parts or viscera, through a great derangement in one or more of their members, and through the extraordinary place which these often oceupy in consequence of this derangement or transposition. The monster described by Dr Eller of the academy of Berlin was of this kind. It was a feetus of nine months, 28 inches long, with an enormous head and frightful countenance; and in the middle of a broad and vast forehead it had a reddish eye, without either eyebrows or eyelids, and sunk deep into a square hole. Immediately below this eyc was an excrescence which strongly resembled a penis with a glans, a prepuce, and

an urethra : the part covered with hair was likewise be- Monster. low the nape of the neck. In other monsters we meet with the unnatural union of some parts, which from their destination and functions, ought always to be separate; and the separation of other parts, which, for the same reasons, ought constantly to be united. The reader may see the different ways in which the formation of monsters takes place, in four memoirs by M. Lemery, inserted in L'Histoire de l'Academie des Sciences, 1738 and 1739. M. du Verney has likewise published a memoir on the same subject.

In the volume published by the Academy of Sciences in 1724, mention is made by M. Gcoffroy of a monster born in Barrois 1722. This monstrous production consisted of two children without the inferior extremities, joined together by a common navel: each of them had a nurse, sucked, and eat pap; and the one sucked while the other slept. The reader may likewise consult the second part of Winslow's Memoirs on Monsters, inserted in the volume published by the Academy of Sciences in 1734, where he will find the history of two very extraordinary twin monsters, who evidenced during their life a great difference in their moral and physical qualities. We are obliged simply to refer to these Memoirs, as they are too long for abridgement.

It is observed by Haller, that in some monsters the natural structure is changed by some shock or passion : in others the structure, independent of any accident, is originally monstrous; such as when all the members are reversed from left to right, when the person has six fingers, and in many other instances. M. dc Maupertuis mentions, that there is at Berlin a family who have had six fingers on each hand for several generations. M. de Riville saw an instance of this at Malta, of which he has given a description. M. Renou, surgeon at Pommeraye in Anjou, has published an account of some families with six fingers, which are to be found in several parishes of the Lower Anjou, and which have existed there from time immemorial. This deformity is perpetuated in these families even when they intermarry with persons who arc free from it. Whether the propagation of these supernumerary organs, which are not only useless but inconvenient and even disagreeable, be owing to the father or mother, their children of both sexes are subject to it indiscriminately. A father and mother with six fingers frequently have a part, and sometimes the whole of their children, free from this deformity; but it again makes its appearance, and in a very great degree, in the third generation. From this it appears, that this fault in the conformation is hereditary. M. Reaumur has likewise published the history of a family in the island of Malta, the children of which are born with six fingers and six toes. But it deserves to be inquired, Whether these supernumerary fingers are real fingers? The reader may here consult the Journal de Physique for November 1774, p. 372. This variety of sexdigitary hands and feet is not comprehended in the Researches sur quelques conformations monstrueuses des doigts dans l'homme, which is inserted in the Memoirs of the Academy of Sciences for 1771. In the Journal de Physique for August 1776, we find a description of a double uterus and vagina observed in a woman who died in childbed, by Dr Purcell of Dublin : and in that for June 1788.

Monster. 1788, we have an account of a man with seven fingers

- on each hand, by Baron Dietrich. Several monstrous productions are to be seen in the cabinet at Chantilly. 1. Two ealves joined together in the body, with each a separate head and neck, and four legs in whole. 2. Two calves united only by the pelvis, with only one anus and one tail: the whole is supported by six legs, four before and two behind. 3. A lamb with six legs, four of which are behind. 4. The skeleton of a ram, which has likewise six legs. 5. A hermaphrodite deer. 6. The head of a foal, which has only one eye in the middle of the forehead. 7. Some leverets with six and eight legs. 8. A puppy, the lips of which are divided four-fold. 9. Some foetuses of a hog which have a kind of tube upon their forehead one or two inches long; and another, the hinder part of which is double in every thing. 10. Two double human fectuses joined by the belly, with four arms and three legs. II. A young chicken with two bodies and one head. 12. A pigeon and a duck, each with two bills. 13. A duck with two heads. 14. A. pigeon with four feet. 15. A capon with three feet ; the third being fixed to the anus. 16. Two heads of a calf joined together, each of them with two ears: these two heads were both fixed to one neck. 17. In the Menagerie at Chantilly there was formerly to be seen a cow with five fect, the fifth of which was connected with the dug. 18. A rabbit without ears. 19. Two cats, each having two heads. 20. Two leverets newly bronght forth, well shaped in the body and legs, but connected together by means of only one head. 21. Several eggs, in the figure of which there occur some monstrous appearances and extraordinary deformities, sufficient to show that they are contrary to the established form of nature.

Mr Home, surgeon, some time ago presented to Mr John Hunter, the double skull of a child, born at Calcutta in May 1783 of poor parents aged 30 and 35, and which lived to be nearly two years old. The body of this child was naturally formed : but the head had the phenomenon of appearing double ; another head of the same size, and almost equally perfect, being attached to its upper part. In this extraneous and preternatural head no pulsation could be felt in the arteries of the temples; but the superficial veius were very evident. One of the eyes had been hurt by the fire, upon which the midwife, in her first alarm, threw the child: the other moved readily; but the iris was not affected by the approach of any thing to it. The external ears of this head were very imperfect; the tongue adhered to the lower jaw, except for about half an inch at the lip, which was loose; the jaw was capable of motion, but there were no teeth. The child was shown about the streets of Calcutta for a curiosity; but was rendered unhealthy by confinement, and died at last of a bite of the cobra de capello. It was dug up by the East India Company's agent for salt at Tumlock, and the skull is now in the museum of Mr Hunter.

Among the monstrous productions of the animal kingdom, we may rank those individuals which ought only to possess one sex, but in which we observe the union or the appearance of two. See the articles AN-DROGYNES and HERMAPHRODITE.

M. Fabri arranges mutilations of the members, dis-

## MON

tortions, gibbosites, tumors, divisions of the lips or Monsy of the palate, compressions of the cranium, and many other deformities of this kind, in the class of morbific monstruosities. In that which he calls connatural (connaturelle) monstruositics, are placed the plurality, transposition, and insertion of the parts. To explain these facts, a great many writers have had recourse to the effect of the imagination of pregnant women .----The causes of the first class of monstruosities are discussed by M. Fabri, who observes, that some of them are internal with regard to the mother, and others external. By an internal cause he here means all those depravations or morbific principles which can affect the fluids, and which vitiate the form and structure of the solids; in particular the uterus, in which such depravations have often been found to occur. To these he adds violent affections of the mind, spasmodic contractions, hysteric convulsions, and the many inconveniences of this kind to which women are extremely subject. External causes comprehend every thing which can act externally upon the foetus contained in the uterus, such as the pressure of the clothes; and in short every thing which prevents the free dilatation of the belly in women that are pregnant, violent motions, falls, blows, and all accidents of this kind. These external causes, and especially the first, compress the fœtus in the womb, and oblige it to remain in a very confined situation. This according to the observation of Hippocrates, produces those embryos which are born with some entire part wounded. M. Fabri maintains, that all deformities of the fætus proceed from some mechanical and accidental causes.

The name of monsters is likewise given to animals enormous for bulk; such as the elephant among terrestrial quadrupeds, and the shark and the whale among sea animals; to other animals remarkable for fierceness and eruelty; and to animals of an extraordinary species, which, we are told, arises from the copulation of one animal with another of a different genus. According to the report of travellers, Africa abounds with monsters of this kind; and accounts of the East are full of descriptions of sea monsters, which, however, are seldom to be seen, such as sea men, mermaids, &c.

Monsters arc more common and more extraordinary in the vegetable than in the animal kingdom, because the different juices are more easily deranged and confounded together. Leaves are often seen, from the internal parts of which other leaves spring forth, and it is not uncommon to see flowers of the ranunculus from the middle of which issues a stalk bearing another flower. M. Bonnet informs us, that in certain warm and rainy years he has frequently met with monsters of this kind in rose trees. This observer saw a rose, from the centre of which issued a square stalk of a whitish colour, tender, and without prickles, which at its top bore two flower buds opposite to each other, and totally destitute of a calyx; a little above the buds issued a petal of a very irregular shape. Upon the prickly stalk which supported the rose, a leaf was observed which had the shape of a trefoil, together with a broad flat pedicle. In the memoirs of the Academy of Sciences for 1707, p. 448, mention is made of a rose from the centre of the leaves of which issued a rose branch two or three inches long, and furnished

with

unster with leaves. See the same Memoirs for 1749, p. 44. and for 1724, p. 20. In the Memoirs for 1775, a mague very singular instance is mentioned of a monstruosity observed by M. Duhamel, in an apple-tree ingrafted with clay. At the place of the insertion, there appeared a hud which produced a stalk and some leaves; the stalk and the pedicle of the leaves were of a pulpy substance, and had the most perfect resemblance both in taste and smell to the pulp of a green apple. An extraordinary chamæmelum is mentioned in the Acta Helvetica. M. Bonnet, in his Recherches sur l'usage des feuilles, mentions likewise some monstrous produetions which have been found in fruits with kernels, analogous in their nature to those which occur in the flowers of the ranunculus and of the rose tree. He has scen a pear, from the cye of which issued a tuft of 13 or 14 leaves, very well shaped, and many of them of the natural size. He has seen another pear which gave rise to a ligneous and knotty stalk, on which grew another pear somewhat larger than the first.---The stalk had probably flourished, and the fruit had formed. The lilium album polyanthos, observed some years ago at Breslaw, which hore on its top a bundle of flowers, consisting of 102 lilies all of the common shape, is well known. M. Reynier has mentioned some individuals monstrous with respect to the flower, in the Journal de Physique et d'Histoire Naturelle, for Novemher 1785. He has likewise mentioned a monstrous tulip which is seen in the gardens of some amateurs; juniper berries with horns; a balsamine with three spurs, &e.

These vegetable productions which are so extraordinary, and so contrary to the common course of things, do nevertheless present deviations subject to particular laws, and reducible to certain principles, by distinguishing such as are perpetuated either by seed or by transplanting, from those which seem to be only accidental. Monstruosities which are perpetuated exist in the original organization of the seed of the plant, such as marked or eurled leaves, &e. The word monster is more properly applied to those irregularities in plants, which arise from frequent transplantation, and from a particular culture, such as double flowers, &c. : but those monstruosities which are not perpetuated, and which arise from aecidental and transient causes deranging the primitive organization of the plant when it comes to be unfolded, as is the effect of diseases, of heat or cold, of a superfluity or searcity of juices, of a depravation of the vessels contributing to nutrition, of the sting of inseets, of contusions and natural graffs, retain also the name of monsters. Of this kind are knobs or swellings, stunting, gall nuts, eertain streaks, and other similar defects.

MONT-BLANC. See Mont-Blanc. MONTAGUE, LADY MARY WORTLEY, accompanied her husband who was sent on an embassy to Constantinople in the beginning of the 18th century. On her return she introduced the practice of inoculation into England, and thenee acquired great celebrity. She cultivated the belles lettres; and at one period of her life she was the friend of Pope, and at another his enemy. While they were at enmity with each other, Lady Mary Montague embraced every opportunity of defaming the poet, who well knew how to take revenge. Both of them carried their animosity to so

great a height, that they became the subject of public Montague. conversation. After a long life, full of singular and romantie adventures, she died about the year 1760. From her we have Letters, written during her travels from the year 1716 to the year 1718. They have been translated into French, and published at Rotterdam 1764, and at Paris 1783, one vol. 12mo. They are composed in a lively, interesting, and agreeable style, and contain many eurious facts relating to the manners and government of the Turks, which are nowhere else to be found. The Baron de Tott, who lived many years at Constantinople, attacked them with great severity; but they have been defended with equal zeal by M. Guis of Marseilles, who has published a valuable work on Turkey. It need not appear extraordinary, that persons who have visited the same country should not see things in the same light. How few travellers agree in their accounts of the same objects, which they nevertheless pretend to have seen and to have examined with attention.

MONTAGUE, Edward Wortley, son of the former, passed through such variegated scenes, that a bare recital of them would savour of the marvellous. From Westminster school, where he was placed for education, he ran away three several times. He exchanged elothes with a chimney-sweeper, and he followed forsome time that sooty occupation. He next joined himself to a fisherman, and cried flounders in Rotherhithe. He then sailed as a cabin boy to Spain ; where he had no sooner arrived, than he ran away from the vessel, and hired himself to a driver of mules. After thus vagabondizing it for some time, he was discovered by the eonsul, who returned him to his friends in England. They received him with a joy equal to that of the father of the prodigal son in the gospel. A private tutor was employed to recover those rudiments of learning which a life of dissipation, of blackguardism, and of vulgarity, might have obliterated. Wortley was sent to the West Indies, where he remained some time; then returned to England, acted according to the dignity of his birth, was chosen a member, and served in two successive parliaments. His expences exceeding his income, he became involved in debt, quitted his native country, and commenced that wandering traveller he continued to the time of his death. Having visited most of the eastern countries, he contracted a partiality for their manners. He drank little wine, a grea deal of eoffec; wore a long beard; smoked much: and, even whilst at Venice, he was habited in the eastern style. He sat cross-legged in the Turkish fashion through choice. With the Hebrew, the Arabie, the Chaldaic, and the Persian languages, he was as well acquainted as with his native tongue. He published several pieces. One on the "Rise and Fall of the Roman Empire." Another an exploration of "The Causes of Earthquakes." As this gentleman was remarkable for the uncommon incidents which attended his life, the close of that life was no less marked with singularity. He had been early married to a woman who aspired to no higher a character than that of an industrious washerwoman. As the marriage was solemnized in a frolic, Wortley never deemed her sufficiently the wife of his bosom to cohabit with her. She was allowed a maintenance. She lived contented, and was too submissive to be troublesome

Montanists,

Montague troublesome on account of the conjugal rites. Mr Montague, on the other hand, was a perfect patriarch in his manners. He had wives of almost every nation. When he was with Ali Bey in Egypt, he had his household of Egyptian females, each striving who should be the happy she who could gain the greatest ascendency over this Anglo-Eastern bashaw. At Constantinople, the Grecian women had charms to captivate this unsettled wanderer. In Spain a Spanish brunette, in Italy the olive-complexioned female, were solicited to partake the honours of the bridal bed. It may be asked what became of this group of wives ? Mr Montague was continually shifting the place, and conse-quently varying the scene. Did he travel with his wives as the patriarch did with their flocks and herds? No such thing. Wortley, considering his wives as bad travelling companions, generally left them behind him. It happened, however, that news reached his cars of the death of the original Mrs Montague the washerwoman. Wortley had no issue by her; and without issue male, a very large estate would revert to the second son of Lord Bute. Wortley owing the family no obligations, was determined, if possible, to defeat their expectations. He resolved to return to England and marry. He acquainted a friend with his intentions; and he commissioned that friend to advertise for any young decent woman who might be in a pregnant state. Several ladies answered it. One ont of the number was selected, as being the most eligible object. She waited with eagerness for the arrival of her expected bridegroom; but, behold, whilst he was on his journey, death very impertinently arrested him in his career.

MONTAGUE Island, one of the Hebrides, in the South sea near Sandwich island. E. Long. 168. 37. S. Lat. 17. 26.

MONTAIGNE, MICHEL DE, a French gentleman, was born in Perigord in 1533. His father educated him with great care, and made him learn Latin as other children learn their mother tongue. His tutors were Nicholas Gronchi, who wrote De Comitiis Romanorum; William Guerenti, who wrote on Aristotle; George Buchanan; and M. Anthony Muret. He was also taught Greek by way of recreation; and because some think that starting children out of their sleep spoils their understanding, he was awakened every morning with the sound of music. He was counsellor for a while in the parliament of Bourdeaux ; afterwards made mayor of Bourdeaux. He published his Essays, so much known in the world, in 1580. Montaigne had a great deal of wit and subtlety, but no small share of conceit and vanity. The lcarned and ingenious are much divided in their opinion about his works. He died in 1592.

MONTALCINO, a small populous town of Italy in Tuscany, and in the territory of Sienna, with a bishop's sec. . It is seated on a mountain, 17 miles southeast of Sienna, and 44 south-east of Florence. E. Long. 11. 30. N. Lat. 43. 7.

MONTALTO, an episcopal town of Italy, in the Marca of Ancona; seated on the river Monacio, 10 miles north of Ascoli, and 45 south of Ancona. E. Long. 13. 30. N. Lat. 42. 54.

MONTANISTS, Christian heretics, who sprang up about the year 171, in the reign of the emperor

Marcus Aurelius. They were so called from their Montani leader, the heresiarch Montanus, a Phrygian by birth; whence they are sometimes styled Phrygians and Catachio phrygians.

Montanus, it is said, embraced Christianity in hopes of rising to the dignities of the church. He pretended to inspiration; and gave out, that the Holy Ghost had instructed him in several points, which had not been revealed to the apostles. Priscilla and Maximilla, two enthusiastic women of Phrygia, presently became his disciples; and in a short time he had a great number of followers. The bishops of Asia being assembled together, condemned his prophecies, and excommunicated those who dispersed them.

The Montanists, finding themselves exposed to the censure of the whole church, formed a schism, and set up a distinct society under the direction of those who called themselves prophets. Montanus, in conjunction with Priscilla and Maximilla, was at the head of the sect.

These sectaries made no alteration in the creed. They only held that the Holy Spirit made Montanus his organ for delivering a more perfect form of discipline than what was delivered by the apostles. They refused communion for ever to those who were guilty of notorious crimes, and believed that the bishops had no authority to reconcile them. They held it unlaw-ful to fly in time of persecution. They condemned second marriages, allowed the dissolution of marriage, and observed three lents.

The Montanists became separated into two branches, one of which were the disciples of Proclus and the other of Æschines. The latter are charged with following the heterodoxy of Praxes and Sabellius concerning the Trinity.

MONTARGIS, a considerable town of France, in the department of Loiret, situated on the river Long, at the junction of the two canals which connect the Seine and the Loire. It is 62 miles south of Paris, has some manufactories of paper and woollen, and is a place of considerable trade. E. Long. 2. 36. N. Lat. 48. I.

MONTAUBAN, a considerable town of France, in the department of Lot, seated on the river Tarne, 20 miles north of Toulouse. E. Long. 1. 27. N. Lat. 43. 56.

MONTBAZON, a town of France, in the department of Indre and Loire, 135 miles south-west of Paris. E. Long. 0. 45. N. Lat. 47. 17.

MONTBELLIARD, a strong town of France, in the department of Hant Rhine, seated near the river Doubs, 45 miles north-east of Bezançon. Its population in 1800 was 4000. E. Long. 6. 50. N. Lat. 47: 31.

MONTBLANC, a town of Spain in the province of Catalonia, 15 miles north of Tarragon. E. Long. 1. 5. N. Lat. 41. 20.

MONTBRISON, a considerable town of France, in the department of Loire, seated on the river Veziza, 250 miles south by cast of Paris. It contained 4703 inhabitants in 1800. E. Long. 4. 27. N. Lat. 45. 32.

MONTECCHIO, a considerable town of Italy, in the duchy of Reggio, 10 miles south-east of Parma, and eight north-west of Reggio. E. Long. 15. 54. N. Lat. 38. 8.

MONTE-FALCO,

Monte-

Falco

quieu.

MONTE-FALCO, a town of Italy, in the territory of the Church and duchy of Spoletto; seated on a mountain near the river Clitunno, 12 miles west of VIontes-Spoletto. E. Long. 12. 40. N. Lat. 42. 58.

MONTE-Falcone, a town of Italy, in Friuli, with a castle, near the river Ponzano, 12 miles northwest of Trieste. It is in the Lombardo-Venetian territories of Austria. E. Long. 13. 20. N. Lat. 45. 50.

MONTE-Fiascone, a small but populous town of Italy, in the territory of the Church, with a bishop's see; seated on a mountain, near the lake Bolsena, in a country abounding with excellent wine, 12 miles south-west of Orvieto, and 45 north-west of Rome. E. Long. 12. 4. N. Lat. 42. 26.

MONTE-Marano, a populous town of Italy, in the kingdom of Naples, and in the Farther Principato; seated on the river Calore, 18 miles south of Bene-vento. E. Long. 15. 0. N. Lat. 40. 48.

MONTE-Mor-o-novo, or Monte-major-el-novo, a considerable town of Portugal, on the road from Lisbon to Badajoz. W. Long. 9. 35. N. Lat. 38. 42.

MONTE-Mor-o-velho, or Monte-major el-velho, a town of Portugal in the province of Beira, with a very large castle, seated in a fertile country, 10 miles south-west of Coimbra, and 83 north of Lisbon. W. Long. 8. 9. N. Lat. 40. 5.

MONTE-Peloso, an episcopal town of Italy, in the kingdom of Naples, and in the Basilieata ; seated on a mountain near the river Basiento, 14 miles east of Cirenza. E. Long. 16. 28. N. Lat. 40. 46.

MONTE-Pulsiano, a town of Italy, in Tuscany, with a hishop's see; seated on a high mountain, near the river Chiana, in a country noted for excellent wine, 25 miles south-east of Sienna, and 50 south by east of Florence. E. Long. 11. 49. N. Lat. 43. 10.

MONTE-Sancto, formerly called Mount Athos, a monntain of Turkey in Europe, on the gulf of Contessa. It is called Monte-Sancto, or the Holy Mount, because there are 22 monasteries thereon, in which are 4000 monks, who never suffer a woman to come near them. It is 17 miles south of Salonichi. E. Long. 24.9. N. Lat. 40. 10.

MONTE-Verde, a town of Italy, in the kingdom of Naples, and in the Farther Principato, with a bishop's see : 60 miles east of Naples. E. Long. 15. 42. N. Lat. 40. 51.

MONTEGO BAY, a flourishing town on the north side of Jamaiea. It has a very considerable commerce; 150 vessels elear out annually. The harbour is capacious; but exposed to north winds, which at certain times in the year blow with great violence. In June 1795, a fire consumed an immense quantity of stores, and great part of the town. W. Long. 77. 50. N. Lat. 18. 29. MONTESA, a very strong town of Spain, in the kingdom of Valencia. It is the seat of an order of knighthood of the same name; and is five miles from Xativa. W. Long. 0. 30. N. Lat. 39. 0.

MONTESQUIEU, CHARLES DE SECONDAT, BA-RON, a most illustrious Frenchman, descended from an ancient and noble family of Guienne, was born at the castle of La Brede, near Bourdeaux, in 1689. The greatest care was taken of his education; and at the age of 20 he had actually prepared materials for his Spirit of Laws, by well digested extracts from those

VOL. XIV. Part I.

immense volumes of civil law which he had studied, Montesnot barely as a civilian, but as a philosopher. He became a counsellor of the parliament of Bourdeaux in 1714, and was received president à mortier two years after. In 1721 he published his Persian Letters; in which, under the screen of Oriental manners, he satinized those of France, and treated of several important subjects by delicate transient glances : he did not avow this publication; but was no sooner pointed out as the author, than zeal without knowledge, and envy under the mask of it, united at once against the Persian Letters. He was received into the French academy in 1728; and having previously quitted his eivil employments, he entirely devoted himself to his genius, and was no longer a magistrate, but a man of letters. Having thus set himself at liberty, he travelled through Germany, Italy, Switzerland, Holland, and England, in which last country he resided three years, and contracted intimacies with the greatest men then alive; for Locke and Newton were dead. The result of his observations was, " that Germany was fit to travel in, Italy to sojourn in, England to think in, and France to live in." On his return he retired for two years to his estate at La Brede, where he finished his work On the Causes of the Grandeur and Deelension of the Romans; which appeared in 1734. The reputation acquired by this last work only cleared the way for his greater undertaking, the Spirit of Laws, which was printed at Geneva in 2 vols. 4to, 1750. This was, immediately attacked by the adversaries of his Persian Letters, in a multitude of anonymous pamphlets; containing all the reproaches to which a liberal mind is exposed from eraft and ignorance, M. Montesquieu drew up a defence of this work; which for truth, moderation, and delicacy of ridieule, may be regarded as a model in its way. This great man was peaceably enjoying that fulness of esteem which his great merits had procured him, when he fell sick at Paris, and died on the 10th of February 1755 .- The following eharacter of this great man is drawn by Lord Chesterfield. " His virtues did honour to human nature, his writings justice. A friend to mankind, he asserted their undoubted and unalienable rights with freedom, even in his own country; whose prejudices in matters of religion and government he had long lumented, and endeavoured, not without some success, to remove. He well knew, and justly admired, the happy constitution of this country, where fixed and known laws equally restrain monarchy from tyranny, and liberty from licentiousness. His works will illustrate his name, and survive him, as long as right reason, moral obligation, and the true spirit of laws, shall be understood, respeeted, and maintained." As to his personal qualities, we are told by his eulogist, M. d'Alembert, that "he was of a sweet, gay, and even temper. His conversation was spirited, agreeable, and instructive. Nobody told a story in a more lively manner, or with more grace and less affectation. He had frequent absence of mind; but always awaked from it by some unexpected stroke that re-animated the languishing conversation. Though he lived with the great, he retired whenever he could to his estate in the country, and there met his books, his philosophy, and his repose. Surrounded at his leisure hours with peasants, after having studied man in the commerce of the world, he studied them in those Xx simple

quieu.

Montesquieu ma.

simple people solely instructed by nature. With them he cheerfully conversed ; he endeavoured, like Socrates, to find out their genius, and appeared as happy with Montezu- them as in the most brilliant assemblies; especially when he reconciled their differences, and by his beneficence relieved them from their distresses."

Besides the works already mentioned, M. Montesquieu wrote several small pieces, as the Temple of Gnidns, Lysimachus, and an Essay upon Taste, which is left unfinished. His works have been collected since his death, and printed at Paris in a splendid edition, in quarto. They have likewise all of them been translated into English.

MONTEZUMA, or MOCTEÇUMA, was emperor or king of Mexico when Cortez invaded that country in 1518, invited thither, as he pretended, by the inhabitants, whose children Montezuma, in the blindness of his superstition, had sacrificed to his idols. The warlike animals on which the Spanish officers were mounted, the artificial thunder with which they were armed, the wooden castles on which they had crossed the ocean, the armour with which they were covered, the victories which they gained wherever they went; all these circumstances, added to that foolish disposition to wonder which always characterizes a simple people, so operated upon the minds of the Mexicans, that when Cortez arrived at the city of Mexico, he was received by Montezuma as his master, and by the inhabitants as a god. At first they fell down in the streets when a Spanish valet passed by ; but by degrees the court of Montezuma grew familiar with the strangers, and ventured to treat them as men. Montezuma, unable to expel them by force, endeavoured to inspire them with confidence at Mexico by expressions of friendship, while he employed secret means to weaken their power in other quarters. With this view, one of his generals, who had private orders to that purpose, attacked a party of the Spaniards who were stationed at Vera Cruz; and, although his troops were unsuccessful, yet three or four of the Spaniards were killed. The head of one of them was carried to Montezuma. In consequence of this, Cortez did what has been reckoned one of the boldest political strokes that ever was performed. He ran to the palace, followed by fifty of his troops; and, by persuasion and threats, carried the emperor prisoner into the Spanish quarters. He afterwards obliged him to deliver up those who had attacked his troops at Vera Cruz: and, like a general who punishes a common soldier, he loaded Montezuma with chains. He next obliged him to acknowledge himself in public the vassal of Charles V.; and, in name of tribute for his homage, Cortez received 600,000 merks of pure gold. Montezuma soon afterwards feil a sacrifice to his submission to the Spaniards. He and Alvaro, the lieutenant of Cortez, were besieged in the palace by 200,000 Mexicans. The emperor proposed to show himself to his subjects, that he might persuade them to desist from the attack : but the Mexicans no longer considered him in any other light but as the slave of foreign conquerors. In the midst of his speech, he received a blow with a stone which wounded him mortally; and he expired soon after, A. D. 1520 .- See CORTEZ. This unfortunate prince left two sons and three daughters, who embraced the Christian faith. The eldest received baptism, and obtained from Charles

V. lands, revenues, and the title of count de Moniezu- Montez ma. He died in 1608; and his family is one of the ma most powerful in Spain.

MONTFERRAT, a province of Italy, with the title Montger of a duchy; bounded on the east by the duchy of Milan, and part of the territory of Genoa; on the north, by the Vercellese and Canavese; on the west, by Piedmont properly so called ; and on the south by the territory of Genoa, from whence it is separated by the Apennine mountains. It contains 200 towns and castles ; and is very fertile and well cultivated, abounding in corn, wine, oil, and silk. It belongs to the king of Sardinia, and Casal is the capital town.

MONTFORT, a town of France, in the department of Ille and Vilaine, seated on the river Mene, 12 miles

from Rennes. W. Long. 1. 58. N. Lat. 48. 8. MONTFORT, a handsome and strong town of the Netherlands, in the United Provinces, with an ancient. castle; seated on the river Yssel, seven miles from Utrecht. E. Long. 5. o. N. Lat. 52. 4.

MONTFORT, a town of Germany, in the circle of Suabia, on the confines of Tirol, 16 miles south of Lindow, and the lake of Constance. It is capital of a country of the same name, which has been almost all purchased by the house of Austria. E. Long. 9. 51. N. Lat. 47. 22.

MONTFORT-DE-LEMOS, an ancient town of Spain, in the kingdom of Galicia, with a magnificent castle, where the Comarca of Lemos resides. It is seated in a fertile country, 25 miles north-east of Orensa, and 55 south-cast of Compostella. W. Long. 7. 9. N. Lat. 42. 28.

MONTFORT-L'AMULY, a town of France, in the department of Seine and Oise, 25 miles from Paris. E. Long. 2. 50. N. Lat. 48. 45.

MONTGATZ, a town of Lower Hungary, in the county of Pereczas, with a strong fortress. It is encompassed with a great morass, and art and nature have rendered it almost impregnable. It was defended by the princess Ragotsky, wife of Count Tckcli, when besieged by an army of the imperialists, who were obliged to raise the siege in 1688. E. Long. 21. 55. N. Lat. 46. 26. MONTGERON, Louis-Basile Carre De, was

born at Paris in 1686: his father was master of requests. He was scarcely 25 years of age when he purchased the place of counsellor in parliament, where by his wit and external qualifications he gained considerable reputation. Deeply engaged in all the vices which flow from irreligion, he was converted by an extraordinary circumstance. He went on the 7th of September 1731 to the tomb of Deacon Paris, with an intention to examine, with the rigour of the severest critic, the miracles which were reported to be performed there. But, according to his own account, he felt himself suddenly beat to the earth by innumerable flashes of light with which he was surrounded. His incredulity was converted into flaming zeal, and he became the apostle of the saint whom he formerly ridiculed. From that moment he devoted hinself to the fanaticism of convulsions, with the same impetuosity of character with which he had run into the most shameful excesses. He had not long been the disciple of Jansenism when he suffered persecution. When the chamber of inquests was banished in 1732, he was sent into the mountains of Auvergue; which, instead

ryshire.

L

Iontgeron stead of cooling, tended rather to inflame his zeal. During his exile, he formed the plan of collecting the lontgome proofs of the miracles wrought at the tomb of the abbé Paris, and of composing what he called a Demonstration of them. On his return to Paris, hc prepared to execute this plan; and on the 29th of July 1737, he actually presented to the king at Versailles a volume in quarto superbly bound. This work he accompanied with a speech, which is a mixture of zeal and argument in a tolerable style. In consequence of this work, which some consider as a masterpiece of eloquence, and others as a mass of absurditics, he was committed to the Bastile. After a few months confinement, he was sent to an abbey of Benedictine monks in the diocese of Avignon ; whence he was in a short time carried to Viviers. He was afterwards confined in the citadel of Valence, where he died, A. D. 1574, aged 68. The work which he presented to the king was entitled La verité des Miracles operées par l'intereession de M. Paris, &c. &c .--The critics, even to this day, seem to be guided in their opinion concerning this book either by hatred or by enthusiasm. " It would be extremely rash (says the abbé de St Pierre, in the second volume of his Annales, p. 593.) to maintain with the Molinists, that no miraculous cure was ever performed at the tomb of the abbé Paris; and to say with the Jansenists, that these cures were performed by a supernatural power, would be the height of fanaticism. The truth is, (adds the same author), that no miracle appears ever to have been performed at this tomb except in the cure of the human body; in all other cases, there would have been the want of that imagination on which the whole mi-racle depended." Thus, although Montgeron ventured to compare these prodigies with the miracles of Jesus Christ and his apostles, yet we find no person raised from the dead, no multiplication of loaves, no command obeyed by the elements, and no blind or deaf restored to their sight or hearing. It belongs to the Author of nature alone, or to those who have derived power from him, to work such miracles as are recorded by the evangelists, or in the history of the apostles. Montgeron added a second and third volunic on the same subject : he left also in manuscript a work which he composed in prison contre les Incredules. Religion, it must be confessed, has had much more powerful advocates. Fortunately Pascal and Bossuet are among the number; and it could well have wanted both Paris and Montgeron, whatever virtues they might possess in other respects.

MONTGOMERY, the capital of a county of the same name in North Wales, 158 miles from London, took its name from Roger de Montgomery earl of Shrewsbury, who built the castle. It is called by the Welsh Tre Valdin, that is, Baldwin's town; having been built by Baldwin, lieutenant of the marches of Wales, in the reign of William I. The Welsh, after having put the garrison to the sword, demolished it in 1095; but Henry III. rebuilt it, and granted it the privileges of a free borough, with other liberties. It is a tolerably well built town, in a healthful situation and fertile soil, with 932 inhabitants in 1811.

MONTGOMERYSHIRE, a county of North Wales, 40 miles in length and 37 in breadth; bounded on the north by Merionethshire and Denbighshire, on the north-east and east by Shropshire, on the south by

Radnorshire and Cardiganshire, and on the west by Montgome. the last-mentioned county and part of Merionethshire. ryshire, It is divided into six hundreds; has five market Month. towns and 47 parishes, and in 1811 contained 51,931 inhabitants. It lies in the three several dioceses of St Asaph, Bangor, and Hereford; but sends only two members to parliament, one for the county, and one for the town of Montgomery. The air is pleasant and salubrious ; but this county, being extremely mountainous, is not very fertile, except in the valleys, which afford some corn and plenty of pasture, but the south, south-east, and north-east parts, being more level, are extremely fruitful, especially a pleasant vale, watered by the Severn.

MONTH, the twelfth part of a year. See CHRO-NOLOGY, Nº 17.

MONTH, in its proper acceptation, is that space of time which the moon takes up in passing from any certain point to the same again, which is called a periodical month; or it is the space of time between two conjunctions of the moon with the sun, which is called a synodical month. That space of time which the sun takes up in passing through one sign or 12th part of the zodiac, is also called (but improperly) a month. So that there are two sorts of months; lunar, which are measured by the moon ; , and solar, which arc measured by the sun. The lunar periodical month consists of 27 days 7 hours 43 minutes 5 seconds : The lunar synodical month is 29 days 12 hours 44 minutes 3 seconds and 11 thirds. A solar month contains, upon a mean calculation, 30 days 10 hours 29 minutes 5 seconds.

The Jews, Greeks, and Romans, made use of lunar synodical months; but, to avoid fractions, they consisted alternately of 29 and 30 days. The former, the Romans called cavi, and the Greeks zoidoi; the latter were termed pleni and mangers.

1. The Hebrew months were ranged differently in their sacred and in their civil year.

Order of the Sacred Year

MON

Month.

These months being lunar cannot exactly answer to our solar months; but every Jewish month must be conceived to answer to two of ours, and partake of both. As these 12 lunar months consisted only of 354 days, the Jews, in order to bring it nearer to the true year, took care every three years to intercalate a 13th month into the number, which they called *Vc-adar*, or the second Adar. The new moon was always the beginning of the month; and it is said the Jews had people posted on elevated places, to give notice to the Sanhedrim as soon as she made her appearance: After this, proclamation was made by sound of trumpet, and " the feast of the new moon, the feast of the new moon," resounded amongst the people.

The ancient Hebrew months were of 30 days each, excepting the last, which consisted of 35; so that the year contained 365 days, with an intercalary month at the end of 120 years, which, by absorbing the odd hours which remained at the conclusion of each year, brought it back nearly to its proper place. This regulation of the year was borrowed from the Egyptians.

2. The months of the Athenian year, as we have before observed, consisted alternately of 29 and 30 days. The first month, according to Meton's reformation of the kalendar, began with the first new moon after the the summer solstice, and was called *hecatombæon*, answering to the latter half of June, and the former half of July. The order of the months, with the number of days in each, arc as follow:

| I   | Hecatombaon,  | 30 | 7 Posidion,       | 30 |
|-----|---------------|----|-------------------|----|
| 2   | Metageitnion, | 29 | 8 Gamelion,       | 29 |
| 3   | Boedromion,   | 30 | 9 Elaphebolion,   | 30 |
| 1   | Mamacterion.  | 20 | 10 Munichion,     | 29 |
| T C | Panension.    | 20 | II Thargelion,    | 30 |
| 6   | Anthesterion. | 29 | 12 Scirrophorion, | 29 |

Each month was divided into three decades of days called  $\delta_{i\chi\eta\mu\epsilon_{\xi}\alpha}$ . The first was called Manos  $\alpha_{\xi\chi}\rho_{\mu\epsilon_{\xi}\alpha}$  or is queues, or the decade of the beginning of the month; the second was Manos  $\mu\epsilon_{\xi}\alpha_{\xi}\alpha_{\xi}$  or the decade of the middle; and the third was Manos  $\varphi$ Sanolos, manopuese or  $\lambda_{\eta}\gamma_{0}\sigma_{0}\sigma_{0}$ , the decade of the expiring month.

The first day of the first decade was termed reopenvice, because the first month began with the new moon; the second day was devlee isamers ; the third reily isamers, &c. The first day of the second decade was πewly μεosvilos, the second deviege mersvilos, &c .- the days of this decade were also called zeuln en dena, deulegu en dena, &c. The first day of the third decade was newly in in and; the second was devleea en' eixadi, &c. i. e. the first, second, &c. after 20, because the last decade began on the 20th day. This decade was also counted by inversion thus; OSworlos dexain the 21st, OSworlos ervain the 22d, oBurorles ordon the 23d, and so of the rest to the last day of the month, which was called svn nas vea, the old and the new, because one part of that day belonged to the old and the other to the new moon; but after the time of Demetrius, the last day of the month was called from him Anunleias; it sometimes was named Teiaxas.

The Grecian months, thus consisting of 29 and 30

X

days alternately, fell short of the solar year II days Ment 6 hours. To remedy this defect, the cycle of four years, called *rilgallagis*, was invented.—In this cycle, after the first two years, they added an intercalated month called *eucorius*, consisting of 22 days; and again, after the expiration of two years more, they inserted another month of 23 days, the fourth part of a day having in the space of four years amounted to a whole day. Sec YEAR.

3. The Roman year under Romulus consisted of 10 months only, and began with March, which contained 31 days; then followed April which had 30, May 31, June 30, Quintilis 31, Sextilis 30, September 30, October 31, November 30, December 30. These 10 months containing no more than 304 days, this account was in a short time found to be deficient. Numa Pompilius, therefore, took away one day from each of these six months, April, June, Sextilis, September, November, December ; and to the six days thus obtained he added 51, which was the number that Romulus's year, in his opinion, wanted to make it perfect. Numa had now 57 days to dispose of; he therefore divided them, and constituted two other months, January and February; the former consisting of 29 and the latter of 28 days. The month of January, which he placed at the winter solstice, he made instead of March to begin the year. Thus Numa's year consisted of 355 days: but this being found 10 days 6 hours short of the solar year, he made use of the intercalation of 90 days at the expiration of eight years perpetually; which number, being made up of the 11 days and a quarter, kept the year pretty well to its place. The beginning of the year in Julius Cæsar's time had anticipated its true place 67 whole days: these he intercalated betwixt November and December : so that the year consisted, for this one time, of 15 months or 445 days. This reformation was called the Julian correction, and this year the year of confusion. At the end of 12 years, by the ignorance of priests, who did not understand intercalation, 12 days had been intercalated for nine. This was observed by Augustus Cæsar, and rectified, by ordering 12 years to pass without any intercalary days. The order and succession of months was the same as that of Numa : But January, March, May, Quintilis, Sextilis, October, and December, had each 31 days; April, June, September 30, and February, in common years, 28; but every fourth year or bissextile 29. This, with a very little difference, is the ac-count observed at present. Quintilis, in compliment to Julius Cæsar was called July, because in this month he was born; and Sextilis, in honour of Augustus, was called August ; both which names are still continued .---See YEAR.

Each month by the Romans was divided into kalends, nones, and ides, all of which were reckoned backwards. The kalends were the first day of the month. The nones fell on the seventh, and the ides on the 15th, of March, May, July, October—but in all other months the nones were on the fifth, and the ides on the 13th. For the more easy comprehension of the Roman manner of dating, according to this division of the months, here follows a table.

MONTIA, a genus of plants belonging to the triandria class, and in the natural method ranking with those of which the order is doubtful. See BOTANY Index.

MONTINIA, a genus of plants belonging to the diceeia class. See BOTANY Index.

MONTMEDI, a small but strong town of France, in the department of the Meuse, seated on the river Chire, which divides it into the upper and lower towns. It is 22 miles south-east of Sedan, 27 south-west of Luxemburg, and 135 north-east of Paris. E. Long. 5. 23. N. Lat. 49. 32

MONTMORENCI, FRANÇOIS HENRY DE. See LUXEMBURG.

MONTMORENCY, a town of France, in the department of Seine and Oise, remarkable for the tombs of the dukes of this name. It is seated on a hill, near a large valley, fertile in fruits, especially excellent eherries. E. Long. 2. 24. N. Lat. 48. 59.

MONTPELIER, one of the finest towns of France, and the most considerable in the department of Herault, excepting Thoulouse, is situated in E. Long. 3. 58. N. Lat. 43. 37. This town has been long famous for its salubrious air, and on this account has been the frequent

MON

resort of invalids. But the climate, according to some Montpelier, travellers, is considerably changed, having at times con- Montreal. stant rains for three months together, and often very thick fags. Its situation, though on an eminence, never could be healthy; for between it and the Mediterranean (which is about two leagues distant) it is one continued marsh, covered with noxious vapours, which when the sea breeze sets in, blows directly on the town and the country adjacent ; of the sad effects of which, its unhealthy inhabitants, with their meagre looks, are the most convincing proofs.

This city stands upon a rising ground fronting the Mediterranean; on the other side is an agreeable plain, extending about the same distance towards the mountains of the Cevennes. It is reekoned well built, yet the streets are in general narrow and the houses dark. The city contained 33,913 inhabitants in 1800, many of whom are Protestants, and are sociable, gay, and good tempered. The trade of Montpelier is very extensive in wine, cordials, oil, verdigris, and saltpetre;and the manufactures in silk and woollen goods are eonsiderable. The markets are well supplied with fish, poultry, butcher's meat, and game, at reasonable rates. The wine of the country is strong and harsh: Burgundy is dear, and so is sweet wine of Frontignan, though made in the neighbourhood of Cette. Liquors of various sorts are compounded and distilled at Montpelier. The environs are extremely pleasant, having on one side La Place de Peyrou, which forms a fine terrace. From thence on a clear day, may be seen to the eastward the Alps, which form the frontiers of Italy; to the south-west, the Pyrenean mountains, which form those of Spain, both at about 50 leagues distant ; and to the southward a most extensive view of the Mediterranean. Not far from thence is a noble aqueduct, with a double tier of arches; by this, water is brought from a mountain at three leagues distance, into two basons in a small elegant temple at the west end of the town. Here also is a royal garden, where on certain days public lectures were formerly held on botany. On the other side of the town is the esplanade, a beautiful walk, bordered on each side by olive trees, from whenee there is a pleasing prospect of the sea and the country adjacent to the town. Previous to the revolution, Montpelier had an university, an academy of sciences, and it was the see of a bishop.

MONTREAL, an island of North America, in the river St Lawrence, ten leagues in length, and four leagues broad, and about 60 miles above Quebec. It was taken from the French by generals Amherst and Murray on the 8th of September 1760. The soil of the island is exceedingly rich and good, producing all kinds of European fruits and vegetables in great abundance, with variety of garden fruits. The south side is the most inhabited, and of course best cultivated; and besides the settlements, which are numerous, the island is adorned with villas, for the retirement of the more wealthy merehants during the summer season.

The town of MONTREAL, situated on this island, and formerly called Ville Marie, is the second place in Canada for extent, buildings, and strength; and besides posessing the advantage of a less rigorous climate, for delightfulness of situation is infinitely preferable to Quebee. It stands on the side of a hill, sloping to the south, with many agreeable villas upon it, which with the

350 

10

Montreal the island of St Helen, and the river (which is here rat.

about two nules broad), form a most charming land-Montser- scape. It was formerly enclosed with walls, to protect , it from the Indians, but these were levelled some years ago. Though the city is not very broad from north ta south, it covers a great length of ground from east to west, and is fully as large and populous as Quebec. The streets are regular, forming an oblong square ; the houses well built, and in particular the public edifices, which far exceed those of the capital in beauty and commodiousness ; the residence of the knights hospitallers being extremely magnificent .- There are several gardens, in which, however, the proprietors have consulted use more than elegance, particularly those of the Sisters of the Congregation, the Nunnery Hospital, the Recollets, Jesuit Seminary, and Governor. The number of inhabitants in 1807 was about 10,000. The gardens produce peaches, apricots, plums, currants, &c. By the situation of the place, the inhabitants are well supplied with all kinds of river fish, some of which are unknown to Europeans. They have likewise plenty of black cattle, horses, hogs, and poultry. The neighbouring shores supply them with a great variety of game in the different seasons; and the island abounds with springs of good water and numerous rivulets. The trade in furs is considerable, and vessels of 200 tons can come up to the town. Sce CANADA, SUPPLE-MENT.

MONTREAL, a town of Spain, in the kingdom of Arragon, with a castle, seated on the river Xiloca, 25 miles north-west of Terville, and 40 south-east of Ca-lataud. W. Long. 1. 2. N. Lat. 41. 9.

MONTREAL, a town of Sicily, and in the valley of Mazara, with an archbishop's see ; seated on a rivulet, five miles west of Palermo, and 50 north-east of Mazara. E. Long. 13. 31. N. Lat. 38. 14.

MONTREAL, or MOUNT ROYAL, a fortress of Germany, in the circle of the Lower Rhine, in the Prussian territories, seated on the river Moselle, 22 miles north-east of Triers. E. Long. 7. 6. N. Lat. 49. 59.

MONTROSE, a handsome town of North Britain, in the shire of Angus, situated at the mouth of the river Esk, on the German ocean, 46 miles north-east of Edinburgh. The houses are neat, and many of them in the modern taste. The most remarkable public buildings are, the town-house, the church, and an elegant episcopal chapel .- Montrose is a royal burgh, and a dukedom in the family of Graham. It stands between two rivers, the south and north Esks, over the latter of which there is a handsome stone bridge, and over the former there is one of wood. The salmon fisheries on these rivers are very extensive, and form a considerable branch of commerce. The harbour is a fine semicircular bason defended by a handsome stone pier. A great number of trading vessels belong to this port. The population of Montrose in 1811 amounted to 8955. W. Long. 2. 32. N. Lat. 36. 40.

MONTROSE, Marquis of. See GRAHAM; and BRI-TAIN, Nº 137, 138, 143, 265.

MONTSERRAT, a mountain of Spain, in Catalonia, one of the most singular in the world for situation, shape, and composition. It stands single, towering over a hilly country like a pile of grotto work or Gothic spires; and its height so great, that to a beholder on the top the neighbouring mountains appear to be sunk to a

level with the plain. It is composed of steep rocks, Monts which at a distance seem indented; whence it is said to have received the name Montserrat from the Latin word serra, a " saw." It is impossible to describe the beauty, richness, and variety, of the landscapes discovered from the most elevated point : but the extensiveness of the prospect may be conceived by the reader, upon being told that the islands of Minorea and Majorca, which are at the distance of 60 leagues, are discovered from this elevation.

Montserrat is particularly famous for the adoration that is paid to an image of the Virgin, which according to tradition was found in a cave in this mountain by some shepherds in the year 880. Over this image, Guthred earl of Barcelona caused a monastery and chapel to be erected ; but after remaining in this receptacle upwards of 700 years, Philip II. and Philip III. built a magnificent church for its reception. Innumerable and astonishing miracles are ascribed to this holy image. The convent or monastery is situated in a nook of the mountain ; it seems as if vast torrents of water, or some violent convulsion of nature, had split the eastcrn face of Montserrat, and formed in the cleft a sufficient platform to build the monastery upon. The river Llobregat roars at the hottom, and perpendicular walls of rock of prodigious height, rise from the water edge near half way up the mountain. Upon these masses of white stone rests the small piece of level ground which the monks inhabit. Close behind the abbey, and in some parts impending over it, huge cliffs shoot up in a semicircle to a stupendous elevation : their summits are split into sharp cones, pillars, pipes, and other odd shapes, blanched and bare; but the interstices are filled up with forests of evergreen and deciduous trees and plants. Fifteen hermitages are placed among the woods; nay, some of them on the very pinnacles of the rock, and in cavities hown out of the loftiest of these pyramids.

The monastery is one of the 45 religious houses of the Spanish congregation of the order of St Benedict; their general chapter is held every fourth year at Valladolid, where the deputies choose abbots and other dignituries for the ensuing quadrennium. In this monastery, they elect for abbot a Catalan and a Castilian alternately. Their possessions are great, consisting of nine villages lying to the south of the mountain ; but the king has lately curtailed their income about 6000 livres a-year, by appropriating to his own use the best house in each village, some of which, with their tythes, are worth 200 dollars per annum. Their original foundation, in 866, gave them nothing but the mountain; and to donations and economy they owe the great increase of their landed property. They are bound to feed and harbour for three days all poor pilgrims that come up and pay their homage to the Virgin; and the allowance is a luncheon of bread in the morning, as much more, with broth at noon, and bread again at night. Sometimes, on particular festivals, 7000 persons arrive in one day; but people of condition pay a reasonable price for what they eat .--The number of professed monks, according to Mr Swinburne, is 76 (according to M. Bourgoanne 60); of lay brothers, 28; and of singing boys 25; besides physician, surgeon, and servants. The church is a gloomy edifice; and the gilding is much sullied with the 351

intser- the smoke of 85 lamps of silver, of various forms and rat. sizes, that hang round the cornice of the sauctuary. Funds have been bequeathed by different devotees for furnishing them with oil. The choir above stairs is decorated with the life of Christ, in good wooden carving. A gallery runs on each side of the chancel, for the convenience of the monks. A large iron grate divides the church from the chapel of the Virgin, where the image stands in a niche over the altar, before which burn four tapers in large silver candlesticks, the present of the duke of Medina Celi. In the sacristy, and passages leading to it, are presses and cupboards full of relicks and ornaments of gold, silver, and precious stones; they point out, as the most remarkable, two crowns for the virgin and her son, of inestimable value; some large diamond rings; an excellent cameo of Medusa's head ; the Roman emperors in alabaster ; and the sword of St Ignatius. But as no offerings to this miraculous statue can be rejected or otherwise disposed of, the shelves are crowded with most whimsical ex votos, viz. silver legs, fingers, breasts, car-rings, watches, two-wheeled chaises, boats, carts, and such like trumpery.

On different parts of the mountain, as already noticed, are a number of hermitages. Each of these solitary retreats, which at a distance seem destitute of every thing, has a chapel, a cell, a well in the rock, and a little garden. The inhabitant of one of them, which is dedicated to St Beneto, has the privilege of making an annual entertainment on a certain day; on which day all the other hermits are invited, when they receive the sacrament from the hands of the mountain vicar, and after divine service dine together. They meet also at this hermitage, on the days of the saints to which their several hermitages are dedicated, to say mass and commune with cach other. But at other times they live in a very solitary and recluse manner, perform various penances, and adhere to very rigid rules of abstituence; nor do they ever cat flesh; nor are they allowed to keep within their walls either dog, cat, bird, or any living thing, lest their attention should be withdrawn from heavenly to earthly affections. Most of these hermits are said to be persons of fortune and family, disgusted with the world, who have retired thither to devote themselves to meditation, selfdenial, and contrition.

MONTSERRAT, one of the Caribbee isles, belonging to Great Britain. It is a very small, but very pleasant island, so called by Columbus from its resemblance to the famous mountain near Barcelona in Catalonia. It lies in W. Long. 61. o. N. Lat. 16. 50. having Antigua to the north-east, St Christopher's and Nevis to the north-west, and Guadaloupe lying south-southcast at the distance of about nine leagues. It is about nine miles in diameter, and is supposed to contain about 40,000 or 50,000 acres. The climate is warm, but less so than Autigua, and is esteemed very healthy. The surface is mountainous, but with pleasant, rich, and fertile valleys; the hills arc covered with eedars and other fine trees. Here arc all the animals as well as vegetables and fruits that are to be found in the other islands. The inhahitants raised formerly a considerable quantity of indigo. The produce now is chiefly cotton, rum, and sugar. There is no good harbour, but three tolerable roads, at Plymouth, Old Harbour, and Ker's Bay.

MONUMENT, in Architecture, a building destined Monument to preserve the memory, &c. of the person who raised it, or the person for whom it was raised; such are a, mausoleum, a triumphal arch, a pyramid, &c.

MOOD, or MODE. See MODE.

Moons of Syllogism. See LOGIC, Nº 85. MOOD, or Mode, in Grammar, the different manner of conjugating verbs. See GRAMMAR.

MOON, (Luna )), in Astronomy, one of the heavenly bodies, usually ranked among the plancts; but with more propriety accounted a satellite, or secondary planet.

Among the ancients, the moon was an object of prime regard .- By the Hebrews she was more regarded than the sun, and they were more inclined to worship her as a deity. The new moons, or first days of every month, were kept as festivals among them, which were celebrated with sound of trumpets, entertainments, and sacrifice. (See Numb. xviii. 11. x. 16. 1 Sam. xx. 5-18.). People were not obliged on these days to rest. The feasts of new moons were a miniature representation of the feast of trumpets, which was held on the first of the month Tisri, which was the beginning of the civil year. The Jews not being acquainted with the physical eauses of celipses, looked upon them, whether of sun or moon, as signs of the divine displeasure. The Grecians looked upon the moon as favourable to marriage; and the full moons, or the times of conjunction of sun and moon, were held the most lucky seasons for celebrating marriages; because they imagined the moon to have great influence over generation. The full moon was held favourable for any undertakings by the Spartans : And no motive could induce them to enter upon an expedition, march an army, or attack an enemy, till the full of the moon. The moon was supposed both by Greeks and Romans to preside over child-birth. The patricians at Rome wore a crescent on their shoes, to distinguish them from the other orders of men. This crescent was called Lunula. Some say it was of ivory, others that it was worked upon the shoe, and others that it was only a particular kind of fibula or buckle.

For the astronomical phenomena connected with the moon, see ASTRONOMY Index.

Harvest-Moon .- It is remarkable, that the moon, during the week in which she is full in harvest, rises sooner after sunsetting than she does in any other full moon week in the year. By doing so, she affords an immediate supply of light after sunset, which is very beneficial to the farmers for reaping and gathering in the fruits of the carth : and therefore they distinguish this full moon from all the others in the year, by calling it the harvest-moon.

Influence of the Moon on the Human Body.-The famous Dr Mead was a believer in the influence of the sun and moon on the human body, and published a book to this purpose, entitled De Imperio Solis ac Lunce in Corpore humano: but this opinion has been exploded by most philosophers, as equally unreasonable in itself, and contrary to fact. As the most accurate and sensible barometer is not affected by the various positions of the moon, it is not thought likely that the human body should be affected by them. Several learned and ingenious men, however, still consider Dr Mead's doctrine as far from being unfounded.

MOON, Influence of, on the Earth's Atmosphere.-It has Moon.

changes of the moon and those of the weather.

hours, 43 minutes.

#### 0 MO

3. Periodical, in regard to Ascending equinoxes. the moon's passing the equa-Northern lunistices. tor; continues 27 days, 7 Descending equinoxes. Southern Innistices.

Sig. Toaldo has calculated a series of probabilities that a change of weather will take place on the approach of any one of these ten situations, and these he has expressed in a tabular form as follows,

|              | New moon            | ) (    | 6:1  |
|--------------|---------------------|--------|------|
|              | First quarter       |        | 5:2  |
|              | Full moon           |        | 5:2  |
| 1 ( )        | Last quarter        |        | 5:4  |
| nat a change | Perigeum            | s is d | 7:I  |
| will take    | Apogeum             |        | 4:1  |
| place at     | Ascending equinox   |        | 13:4 |
|              | Northern lunistice  |        | 11:4 |
|              | Descending equinox  | 1      | 11:4 |
|              | [Southern lunistice |        | 3:1  |

In general, each of the ten situations changes the weather that prevailed under the preceding situation, and it seldom happens that a change of weather takes place without a corresponding change in the lunar situations. From the inequality of their revolutions, these situations are often combined, and by this union their effect in producing changes of the atmosphere is greatly increased, especially when a union takes place between the syzigies and apsides. Thus,

|               | New moon with perigee 7 | <b>[</b> 33:1 |
|---------------|-------------------------|---------------|
| That a change | Ditto with apogee       | is 2 7:1      |
| will follow   | Full moon with perigec  | 10:1          |
|               | Ditto with apogee       | L 8:1         |

These combined situations are generally accompanied or followed by storms and tempests, cspecially when they take place near the moon's passage over the equator. This is more particularly the case in the months of March and September, and we find that at the new and full moon in these months, the weather takes a certain character, by which it is distinguished for the succeeding three or six months. The same takes place at the solstices, especially at the winter solstice. The new moon does not always, however, produce a change of weather; and this want of effect is most likely to happen at those new moons which are most distant from the apsides.

Though Toaldo considers it as perfectly ascertained that cach succeeding situation of the moon alters that state of the atmosphere which had been produced by the preceding situation; it must, however, be observed that some situations of the moon favour good and others bad weather. Thus the perigce, the new and full moon, the passage over the equator, and the northern lunistice are favourable to bad weather, while the apogee

Moon. has been the opinion of the vulgar in almost all ages and countries, that the changes which take place in the state of our atmosphere, or the changes of the weather, depend in a great measure on certain situations of the moon. This particular opinion is alluded to by Virgil (A), and is applied in the shepherd of Banbury's rules for judging of the weather (B). We have, under METEOROLOGY, Nº 90 to 92, given the result of some observations on the connection between the

> It can scarcely be doubted that an opinion so generally received must be founded on something more than fancy or prejudice; and indeed the observations of several eminent mcteorologists within the last thirty years have contributed materially to favour this opinion. Independent of actual observation, it appears reasonable to infer, that a body so large, and so near the carth, as the moon, whose gravitating influence on the earth's surface in producing the flux and reflux of the sea, cannot be altogether inactive with respect to the air, a fluid much more susceptible of changes than the sea.

> We have already noticed (METEOROLOGY, Nº 14.) the theory of Mr Luke Howard, on the moon's influence on the mercury of the barometer, and we are now to give a short account of what has been advanced on her general influence by the philosophers of the continent. Among these, Signior Toaldo may be said to have led the way.

From observations made at Padua, during fifty years, on the state of the weather that corresponded to certain changes of the moon, he found that these changes were always accompanied by good or bad weather; and he at length became enabled to foretel with some degree of certainty what would be the state of the atmosphere that should follow any situation of the moon. There are ten situations of the moon, which, according to Toaldo, are capable of producing a sensible effect on the earth's atmosphere. These are the syzigies \* or new and full moon ; the quadratures ; the apsides, or apogee and perigee; the lunistices, or these points when the moon is nearest to our zenith and at the greatest distance from it; and the moon's equinoxes. There are three different relations of the moon's motion producing a corresponding number of revolutions, each having a certain duration, and each corresponding to some of the above ten situations, as it will be seen by the following table.

## Revolutions.

1. Synodical, in regard to the sun; continues 29 days 12 hours 44 minutes.

2. Anomalistic, in regard to the moon's course; continues 27 days 13 hours 43 minutes.

<sup>3.</sup> On the fourth day of the new moon, if bright, with sharp horns-No winds nor rain till the month be finished.
Joon.

gee, quadratures and southern lunistice, are more favourable to good weather.

The changes produced by the influence of the lunar situations, seldom take place on the exact days on which these situations happen, but either precede or follow them; and Toaldo has found that, in the six winter months, the changes of weather commonly precede the lunar situations, whereas in the six summer months they more commonly follow them.

There are certain days before and after new and full moon, which deserve particular attention in forming our judgments of the weather, especially the octants or the fourth day before new and full moon, as at these times the weather is inclined to change, and it may be pretty certainly predicted, that a change will follow at the next lunar situation. Virgil has particularly noticed this fourth day as a sure mark of the succeeding weather (c.) If the weather continues unchanged on the fourth, fifth, and sixth day of the moon, it proves that the lunar influence is at that time very weak, and we are to expect no change till the full moon, or perhaps till the next new moon.

Sig. Toaldo compared a diary which he had kept for many years of the state of the barometer with the ten situations of the moon, and from the comparison deduced the following conclusions, viz.

1. That at the time of the moon's apogce, the mercury rises higher hy the sixth part of a line than at the perigee.

2. That at the time of the quadratures it is higher by the tenth of a line than at the time of the syzigies.

3. That it is higher by a fourth of a line at the sonthern than at the northern lunistice. This correspondence of the lunar situations with the ascent of the mercury in the barometer does not hold at the time of the moon's passage through her equinoctial points. The mercury is then higher, especially when she is passing in Libra; and as such situations of the moon generally indicate bad weather, this circumstance is not conformable to meteorological observations.

In this case Toaldo thinks that we must be guided in our judgment of the weather, rather by the moon than by the barometer.

The case is similar during the coincidence of the equinoctial points with the perigee, at which time the mercury is unusually high; but this coincidence is a sign of great regularity.

According to Toaldo, the rising and setting of the moon, as well as its superior and inferior passage of the meridian, all which situations he calls the moon's angles, may serve for foretelling rain. The seasons most exposed to rain, are the rising and setting of the moon ; while its passage over the meridian is most favourable to good weather. It has ever been observed that during rainy days, the sky always clears a little while the moon is passing the meridian. An exception to this rule must, however, be made when the moon's angle does not coincide with that of the sun. t

VOL. XIV. Part I.

M 0 0

Bad years take place when the apsides of the moon Moon. fall in the four cardinal points of the zodiac. Their intervals, therefore, are as four to five, eight to nine, &c. or as the intervals of the passage of the apsides through the four cardinal points of the zodiac. Thus the year 1777 was, in general, a bad year; and in that year the apsides of the moon were in the equinoctial signs; and it is probable that the years in which the apsides fall in the signs Taurus, Leo, Virgo and Aquarius, will be good and moderate years, as the year 1776 really was; and in that year the apsides of the moon were in Taurus and Virgo.

Every 18th year must be similar. We, however, cannot depend upon a return altogether the same, on account of the three different revolutions of the moon; and therefore it may happen, that the epoch of this extraordinary year may be retarded a year or perhaps two. Though approximations only are here given, this does not prevent their being useful to farmers, if they only pay attention to circumstances. Besides, various exceptions must be made for different parts of the earth; and it is difficult to determine these before-hand, as what regards this system is applicable to the whole globe; but when the result of the system has been improved by local observations, the conjectures for each country will be attended with more certainty.

The 54th year must have a greater similarity to the first than to all the rest; because, at this period, the situations of the moon, in regard to the sun and the earth, arc again found in the same points.

The quantity of the rain which falls in nine successive years, is almost equal to that which falls in the next following nine. But this is not the case when we compare in like manner the quantity of rain which falls in six, eight, or ten years \*.

The observations of M. Lamarck, though they con-Mag. vol. firm the opinion of the moon's general influence on the iii. atmosphere, do not agree with those of Toaldo, as to the situations of that luminary which correspond to the changes of the weather. He could not find that agreement between the syzigies and quadratures of the moon and a change of weather, which has been so much dwelt on by Toaldo; but he is of opinion, that we are to consider the declination of the moon as the principal cause of her influence on the atmosphere.

Lalande had conceived the idea that when the moon entered the northern hemisphere, or had north declination, the weather was most likely to be cold and dry, and that when she passed to the south of the equator, it was likely to be rainy. The observations of Lamarck, however, tend to establish the contrary opinion.

Lamarck considers the two following principles as established by his observations; viz.

1. That it is in the elevation of the moon above, and her depression below the equator, that we use to search for those regularly varied effects which she produces on our atmosphere.

2. That the determinable circumstances, which con-Y y spire

(c) Luna revertentes cum primum colligit ignes, Si nigrum obscuro comprenderit aëra cornu; Maximus agricolis pelagoque parabitur imber. At, si virgineum suffuderit ore ruborem, Wentus crit; vento semper rubet aurea Phoebe.

M

Considering that every lunar month, or every revolution of the moon in the zodiac, may be divided into two distinct portions, each containing about fourteen days, and each giving occasion to a particular atmospheric constitution, we may assume these as two circumstances of importance in meteorology, and we may call one the boreal or northern constitution, viz. that in which the moon passes through the six northern signs of the zodiac, and the other, the austral or southern constitution, viz. that in which she traverses the six southern signs.

Lamarck is convinced by observation, that in these climates, during a boreal constitution, there chiefly prevail southerly, south-westerly, and westerly winds, though sometimes, in the summer, the winds pass to the southeast. In general, during this constitution, the barometer exhibits only moderate elevations of the mercury ; most commonly the season is rainy or moist, and the air loaded with clouds. And, lastly, it is particularly during this constitution that we observe the effects of storms and tempests, when the causes which occasion them hecome activc.

On the contrary, during an austral constitution, the winds which chicfly predominate blow from the north and north-west, and in the summer north-east, and even casterly winds. In general during this constitution, the barometer exhibits considerable elevations in the column of mercury, at least if the wind is not very strong ; the weather is then most usually clear, cold and dry, and in the summer it is soldom (we might almost say never) during this constitution that storms are formed.

These atmospheric constitutions are not, however, so permanently characterised as to render it easy to distinguish them at all times by the state of the atmosphere. The atmospheric air is a movcable fluid, and so easily displaced, that it is not surprising that in the temperate zones, where the influence of the heavenly bodies acts less strongly than between the tropics, from various causes, that counteract very often the regular influence of the moon, and tend to mask and even change its effects.

The perturbations which these variable causes produce on the regular effects of the influence of the moon on the atmosphere, occasion in fact many variations in the two atmospheric constitutions which we have been describing; and this is doubtless the reason why they have been hitherto disregarded. M. Lamarck positively asserts, that these perturbations, though frequent, and sometimes vcry considerable, do not prevent the character of each of these constitutions from being remarked in the greatest number of cases.

The probability that he finds, according to his observations, is estimated at five out of eight; that is to say, out of 48 atmospheric constitutions comprchended in the lunar year, he estimates there will be found at least 30 agreeing with the principles pointed out in his memoir ; and he adds, that among the disturbing causes which modify the before-mentioned effects, several may be foreseen, and perhaps even appreciated as to their quantity of effect.

He considers what is here pointed out as a fact ; as an

2

order of things which any one may prove by observa- Moon tion \*.

Lamarck has also endeavoured to ascertain what truth \* See Jo there may be in the periodical return of the variations de Plage of the atmosphere at the end of nineteen years ; and he Nichol. has found, by comparing meteorological observations, Jour. 4t that this return is far from being so correct as is gene-vol. iv. rally believed.

Astronomers also know well, that the cycle of nineteen years is not exact within an hour and a half; an error which amounts to a whole day in the course of Phil 308 years t.

M. Cotte has also bestowed much attention on this Mag. va subject of the moon's influence ; but appears to think v. that our observations are not sufficiently numerous or accurate, to deduce any thing like a correct theory, and he is not disposed to go so far as M. Lamarck.

M. Cottc agrees in general with Mr Luke Howard's observations on the moon's influence. (See METEORO-LOGY). He noted, during the space of 34 years and five months, from the 1st of January 1768, to the 22d of May 1802), the ascending and descending direction of the barometer in each of the syzigies and quarters of the moon which have occurred through that period of time. He states the total sum of the elevations and depressions of the mercury at each of the phases as follows.

For 34 TY Years. New moon. 1st Quar. Full moon. 2d Quar.

| Sum of elevation | ons 218 | 290<br>220 | 199<br>279 | 106 | times. |
|------------------|---------|------------|------------|-----|--------|
| Differences      | 62      |            |            | 84  |        |
| Dinerchees       | 03      | 01         |            | •   |        |

These results, of nearly 35 years observations, confirm, as will be seen, the conclusions drawn by Mr Howard, both from his observations of one year at Plaistow, and those made for 10 years in the Royal Society's apartments.

It is to be remarked, 1st, That the four numbers which express the differences between the elevations and depressions are nearly in an exact proportion, since  $63:67:80:85\frac{5}{63}$ 

2dly, That the two latter phases, viz. the full moon and last quarter, have more effect than the two first.

3dly, He examined what phases of the moon corresponded to the greatest and least height of the mercury for each month during ten years, and obtained the following results.

For 10 Years. New Moon. 1st Quar. Full Moon. 2d Quar. Greatest elevation 28 times. 26 26 occurred at Greatest depres-130 34 29 27 sion occurred at I 3 Differences 4

The science may be therefore said to have advanced one step farther on this occasion; and it is to be hoped that, by multiplying observations, and combining them in various ways to obtain their results, its progress may be still accelerated. The useful purposes which may be thereby answered in philosophy, agriculture, and medicine, may be properly urged to observers as the means 20

g. vol.

of supporting their ardour, and indemnifying them for those sarcasms and reflections which even some learned men have been pleased to bestow upon observations of this sort, together with their authors \*. See METEOR-OLOGY, SUPPLEMENT.

Moon-Eyes, among horses, when the weakness of the eye increases or decreases according to the course of the moon ; so that in the wane of the moon his eyes are muddy and troubled, and at new moon they clear up. This observation is probably inaccurate.

Moon-stone, or Adularia. See ADULARIA, MINE-RALOGY Index.

MOON-Wort. See LUNARIA, BOTANY Index.

MOOR, in country affairs, denotes a tract of land, usually overrun with heath.

Moor-Cock, or Gor Cock. See TETRAO, ORNITHO-LOGY Index.

Moon Land, or Moory Soil, in Agriculture, is a black, light, and soft earth, very loose, and without any admixture of stones; and with very little clay or sand.

MOORE, or MORE, EDWARD, an ingenious writer, was bred a linen-draper, but quitted business to join the retinue of the Muses; and he certainly had a very happy and pleasing talent for poetry. In his Trial of Selim the Persian, he complimented Lord Lyttelton in an clegant kind of panegyric, couched under the appearance of accusation : and his Fables for the Female Sex, for casy versification, poignant satire, and striking morals, approach nearer to the manner of Gay than any other of the numerous imitations of that author. He wrote also three dramatic pieces; the Gamester, a tragedy; The Foundling, and Gil Blas, comedies. The success of these was not such as they merited, the first of them having met with a cold reception, for no other apparent reason but because it too nearly touched a favourite and fashionable vice ; and the second having been condemned for its supposed resemblance to Sir Richard Steele's Conscious Lovers, but to which good judges have been inclined to give it greatly the preference. Mr Moore married a lady of the name of Hamilton, daughter to Mr Hamilton table-dccker to the princesses, who had herself a very poetical turn, and has been said to have assisted him in the writing of his tragedy. One specimen of her poetry, however, was handed about before their marriage, and has since appeared in print in different collections of songs. It was addressed to a daughter of the famous Stephen Duck ; and begins with the following stanza:

Would you think it, my Duck ? (for the fault I must own),

Your Jenny at last is quite covetous grown :

Though millions if Fortune should lavishly pour,

I still would be wretched if I had not MORE.

And after half a dozen stanzas more, in which, with great ingenuity and delicacy, and yet in a manner that expresses a great affection, she has quibbled on our author's name, she concludes with the following lines :

You may wonder, my girl, who this dear one can be, Whose merit can boast such a conquest as me :

But you shan't know his name, tho' I told you before,

It begins with an M, but I dare not say MORE.

In the year 1753, Mr Moore commenced a weekly Moore miscellaneous paper, entitled, The World, by Adam Fitz-Adam, in which undertaking he was assisted by Moorlands. Lord Chesterfield with some Essays. This paper was collected into two volumes, and Mr Moore died soon after.

MOORE, DR JOHN. See SUPPLEMENT.

MOORING, the act of confining and securing a ship in a particular station, by chains or cables, which are either fastened to the adjacent shore, or to anchors in the bottom.

A ship may be either moored by the head, or by the head and stern; that is to say, she may be secured by anchors before her, without any behind ; or she may have anchors out, both before and behind her; or her cables may be attached to posts, rings, or moorings, which answer the same purpose.

When a ship is moored by the head with her own anchors, they are disposed according to the circumstances of the place where she lies and the time she is to continue therein. Thus, wherever the tide ebbs and flows, it is usual to carry one anchor out towards the flood, and another towards the ebb, particularly where there is little room to range about; and the anchors are laid in the same manuer, if the vessel is moored head and stern in the same place. The situation of the anchors, in a road or bay, is usually opposed to the reigning winds, or those which are most dangerous ; so that the ship rides therein with the effort of both her cables. Thus if she rides in a bay, or road, which is exposed to a northerly wind and heavy sea from the same quarter, the anchors passing from the opposite bows ought to lie east and west from each other: hence both the cables will retain the ship in her station with equal effort against the action of the wind and sea.

MOORINGS, in sea language, are usually an assemblage of anchors, chains, and bridles, laid athwart the bottom of a river or haven, to ride the shipping contained therein. The anchors employed on this occasion have rarely more than one fluke, which is sunk in the water near low-water mark. Two anchors being fixed in this manner on the opposite side of the river, are furnished with a chain extending across from one to the other. In the middle of the chain is a large square link, whose lower end terminates in a swivel, which turns round in the chain as about an axis, whenever the ship veers about with the change of the tide. To this swivel link are attached the bridles, which are short pieces of cable, well served, whose upper ends are drawn into the ship at the mooring ports, and afterwards fastened to the masts or cable bolts. A great number of moorings of this sort are fixed in the harbours adjacent to the king's dock-yards, as Deptford, Chatham, Portsmouth, Plymouth, &c.

MOORLANDS, a tract so called, in the north part of Staffordshire, where the land rises gradually into small hills, which run through the midst of England in one continued ridge, rising higher and higher to Scotland, and sending forth many rivers. The soil here is so foul and cold, that the snows lie almost all the year on the tops of the hills ; and it is withal very rugged and barren: it, however, yields plenty of coal, lead, copper, rance-marble, and millstones; and some of the limestone hills bear such a sweet though short grass, as is very grateful to the oxen, of which here is Yy2

3

Moorlands a very good breed. It is observed here, that the west wind always brings rain, and the east and south fair Mopsus. weather ; that though this tract is full of bogs, it is as healthy as any other part of the county; and that it produces the same plants as the Peak of Derby.

MOORS. See Morocco.

MOORS, in the Isle of Man, those who summon the courts for the several sheadings ; such as the lords bailiffs. Every moor has the like office with our bailiff of the hundred.

See CERVUS, MAMMALIA MOOSE, or Elk. Index.

MOOT, a difficult case argued by the young barristers and students at the inns of court, by way of exercise, the better to qualify them for practice, and to defend the causes of their clients. This, which is called mooting, is the chief exercise of the inns of court. Particular times are appointed for the arguing moot cases : the place where this exercise is performed was anciently called moot-hall; and there is a bailiff, or surveyor of the moots, annually chosen by the bench to appoint the moot men for the inns of chancery, and to keep an account of the performance of exercises. The word is formed either from the Saxon metan, gemetan, " meeting"; or from the French mot, 4 a word."

MOPSUS, in fabulous history, a celebrated prophet, son of Manto and Apollo, during the Trojan war. He was consulted by Amphimachus, King of Colophon, who wished to know what success would attend his arms in a war which he was going to undertake. He predicted the greatest calamities; but Calchas, who had been a soothsayer of the Greeks during the Trojan war, promised the greatest successes. Amphimachus followed the opinion of Calchas; but the prediction of Mopsus was fully verified. This had such an effect upon Calchas, that he died soon after. His death is attributed by some to another mortification of the same nature. The two soothsayers, jealous of each other's fame, came to a trial of their skill in divination. Calchas first asked his antagonist, how many figs a neighbouring tree bore? 10,000 except one, replied Mopsus, and one single vessel can contain them all. The figs were gathered, and his conjectures were true. Mopsus now to try his adversary, asked him how many young ones a certain pregnant sow would bring forth? Calchas confessed his ignorance ; and Mopsus immediately said that the sow would bring forth on the morrow ten young ones, of which only one should be a male, all black, and that the females should all be known by their white streaks. The morrow proved the veracity

of his prediction; and Calchas died by the excess of Mons grief which his defeat produced. Mopsus after death was ranked among the gods, and had an oracle at Malia, celebrated for the true and decisive answers which it gave. Another Mopsus, son of Ampyx and Chloris, born at Titaressa in Thessaly. He was the prophet and soothsayer of the Argonauts, and died at his rcturn from Colchis by the bite of a scrpent in Libya. Jason erected him a monument on the sea shore, where afterwards the Africans built him a temple, where he gave oracles. He has often been confounded with the son of Manto, as their professions and their names were alike.

MORÆA, a genus of plants belonging to the triandria class; and in the natural method ranking under the 6th order, Ensatæ. See BOTANY Index.

MORAI, is the name given at Otaheite in the South sea to the burying grounds, which are also places of worship. This is a pile of stone raised pyramidically upon an oblong base or square 267 fect long and 87 wide. On each side is a flight of steps ; those at the sides being broader than those at the ends; so that it terminated not in a square of the same figure with the base, but in a ridge like the roof of a house. There were 11 of these steps to one of these morais, each of which was 4 fect high, so that the height of the pile was 44 feet, each step was formed of one course of white eoral stone, which was neatly squared and polished ; the rest of the mass (for there was no hollow within) consisted of round pebbles, which, from the regularity of their figure, secmed to have been wrought. The foundation was of rock stones, which were also squared. In the middle of the top stood an image of a bird earved in wood, and near it lay the broken one of a fish carved in stone. The whole of this pyramid made part of one side of a spacious area or square 360 feet by 354, which was walled in with stone, and paved with flat stones in its whole extent. About 100 yards to the west of this building was another paved area or court, in which were several small stages raised on wooden pillars about seven feet high, which are called by the Indians ewattas, and seem to be a kind of altars, as upon these are placed provisions of all kinds, as offerings to their gods. On some of them were seen whole hogs, and on others the skulls of above 50, besides the skulls of many dogs. The principal object of ambition among the natives is to have a magnificent morai. The male deities (for they have them of both sexes) are worshipped by the men, and the female by the women; and each have morais, to which the other sex is not admitted, though they have also morais common to both.

## MORAL PHILOSOPHY, or MORALS.

MORAL PHILOSOPHY is, " The science of MANNERS. OF DUTY ; which it traces from man's nature and condition, and shows to terminate in his happiness." In other words, it is, "The knowledge of our DUTY and FELICITY ;" or, " The art of being VIR FUOUS and HAPPY."

It is denominated an art, as it contains a system of rules for becoming virtueus and happy. Whoever practises these rules, attains an habitual power or facility of becoming virtuous and happy. It is likewise called a science, as it deduces those rules from the principles and connexions of our nature, and proves that the observance of them is productive of our happi-

It is an art, and a science of the highest dignity, importance, and use. Its object is man's duty, or his conduct.

duct in the several moral capacities and connexions which he sustains. Its office is to direct that conduct ; to show whence our obligations arise, and where they terminate. Its use, or end, is the attainment of happiness; and the means it employs are rules for the right conduct of our moral powers.

Moral Philosophy has this in common with Natural Philosophy, that it appeals to nature or fact ; depends on observation ; and builds its reasonings on plain uncontroverted experiments, or upon the fullest induction of particulars of which the subject will admit. We must observe, in both these sciences, how nature is affeeted, and what her conduct is in such and such circumstances: Or, in other words, we must collect the appearances of nature in any given instance ; trace these to some general principles or laws of operation; and then apply these principles or laws to the explaining of other phenomena.

Therefore Moral Philosophy inquires, not how man might have been, but how he is, constituted : not into what principles or dispositions his actions may be artfaily resolved, but from what principles and dispositions they actually flow: not what he may, by education, habit, or foreign influence, come to be or do, but what, by his nature, or original constituent principles, he is formed to be and do. We discover the office, use, or destination of any work, whether natural or artificial, by observing its structure, the parts of which it consists, their connexion or joint action. It is thus we understand the office and use of a watch, a plant, an eye, or hand. It is the same with a living creature of the rational or brute kind. Therefore, to determine the office, duty, or destination of man; or, in other words, what his business is, or what conduct he is obliged to pursue; we must inspect his constitution, take every part to pieces, examine their mutual relations one to the other, and the common effort or tendency of the whole.

It has not been thus, however, that the science has always been taught. The earliest moralists did not erect systems upon a just analysis of the powers of the human mind; nor have all those who thought such a foundation necessary to be laid, deduced their theories from the very same principles. As moral truths are not capable of rigid demonstration, it appears to us, that we cannot more properly introduce the system which we have adopted, than by giving our readers a short view of the most celebrated systems that have been maintained by others. They will thus have an opportunity of judging for themselves of the respective merits of the different theories, and of adopting that which shall appear to them to place practical virtue on the firmest basis.

#### HISTORY of the Science of MORALS.

WHILST there has been a remarkable agreement the teri actions which are virtuous and those which are vicious; and whilst they have uniformly taught, that it is our duty and our interest to perform the one and to avoid the other; they have yet differed exceedingly concerning the test or criterion of virtue, as well as concerning the principle or motive by which men are induced to pursue it. One cause of this difference in

5

on lvir-

tue le.

opinion respecting matters of such universal importance, may perhaps be traced to the mistakes into which philosophers are apt to fall concerning the original state of man.

It is very generally taken for granted, that the first Probable men were savages of the lowest rank, and that the race cause of gradually gigilized ignet during the gamma of many this vagradually civilized itself during the course of many riety. succeeding ages. Without mutual intercourse, the progress of civilization could never have commenced; and as the practice of justice is absolutely necessary to every species of friendly intercourse, those original savages, it is supposed, must have been just in their dealings, and just upon some principle which has its foundation in human nature. But to develope the principle by which savages are influenced in their conduct, no tedious or intricate process of reasoning can be necessary. It must have a place in every mind, and be instantaneous in all its decisions. Hence it has been supposed, that the principle to which modern philosophers have given the name of the moral sense, is instinctive; that it is the sole judge of virtue and vice; and that its admonitions have such authority, as to enforce obedience without regard to the consequences of any action.

Other philosophers, who deny that the moral sense is instinctive, and who yet suppose that the original' state of man was savage, are forced to pile hypothesis upon hypothesis, each unnatural in itself, and all contradictory to one another, in order to account for the commencement of civilization and the formation of society. It has been supposed, that the desire of selfpreservation and the love of power are the governing principles in human nature; that in the savage state every man had a right to every thing which he could seize by fraud or force; that all had an innate propensity to invade each other's property; and that hence war, rapine, and bloodshed, prevailed universally, till the savages discovered the expediency of uniting undersome form of government for their mutual protection.

But before the original state of man had been made the basis of such opposite theories as these, it would surely have been proper to inquire upon what grounds. that state has been supposed to be savage. To us these grounds appear to be nothing better than mere imaginations; the dreams of pocts, and of such philoso-. pliers as bend facts to their own systems. In the authentic history of our species, there is no evidence, indeed there can be no evidence, that the first men were savages; and every thing which we know of human nature leads us to believe, that had they been so, the race could never have been civilized but by the miraculous interposition of some superior being. The only record of the earliest ages of the world to which the smallest credit is due, represents all'the nations of the earth as having sprung from one pair, and that pair as having been instructed in their duty by their beneficent Creator. If this be the fact, and no consistent theist can controvert it, the precepts of morality would be originally conveyed from one generation to another; not in a systematical or scientific form, but as the laws Modes of of the Universal Sovereign, whose authority demand-'communied implicit obedience. Accordingly we find, that cating inthe first teachers of morals were men of superior rank struction as well as of eminent talents, who formed collections liest mora--of maxims derived from their ancestors, " with the lists.

view.

358

+ Bruce's Elements, and Enfield's Hi-

\* Bruce's view of perfecting subordination \*, polishing manners, Elements of and educating youth. Such were the proverbs of the Science Solomon, the Words of Agur, and the Wisdom of of Ethics. the son of Siraeh." These instructors did not analyze the human mind into its various faculties, and build a system of morals either upon a particular instinct pointing to the supreme good, or upon the fitness of things discovered by reason. Short isolated sentences were the mode in which they conveyed their precepts; which they prefaced by observing, that " the fear of the Lord is the beginning of knowledge ;" and enforced by the assurance, that " length of days, and long life, and peace, should they add to those who obeyed them." The sayings of the celebrated wise men of Greece were collections of apoplithegms, made in the same manner, and delivered with similar views. Thales and Pythagoras +, who founded the one the Ionic and the other the Italic school, made collections of precepts for the conduct as well of a state as of private life. " Neither the crimes nor the thoughts of bad men (said Thales) Philosophy. are concealed from the gods. The only method of being just, is to avoid doing that which we blame in others." Of Pythagoras it is related by Porphyry and Laertius, that from Samos he repaired to Delos, and after presenting an offering of cakes to Apollo, there received, or pretended to receive, moral dogmas from the pricstess; which he afterwards delivered to his disciples under the character of divine precepts. Amongst these were the following : That, " next to gods and demons, the highest reverence is due to parents and legislators; and that the laws and customs of

our country are to be religiously observed." To these maxims or apophthegnis, which, for the sake of delighting the ear and aiding the memory, were sometimes delivered in verse, succeeded, as has been supposed, the mode of instruction by fable or allegory. But the truth scems to be, that this method of communicating moral and political wisdom was as ancient as the other : for we have a beautiful specimen of it in the ninth chapter of the book which relates the transactions of the Judges of Israel. The fables of Esop, too, which were written at a very early period, remain lasting modes of this species of art among the Greeks.

When the instructors of mankind had proceeded thus far as to give an artificial form to their precepts, they soon advanced a step fatther, and reduced their observations into classes or predicaments. Pythagoras, who visited Egypt, has been supposed to have learned from its priests the method of arranging the virtues into distinct classes. But it is the opinion of an excellent Mr Bruce. writer ‡, founded on the previous aspects of ethics, and

on the comprehensive talents of the Samian philosopher, that the honour of the invention ought to be ascribed to himself. Be this as it may, it was observed by the inventor, that " all the maxims of morality might be referred to the duties which men owe to themselves, and the duties which they owe to each other." Hence the four cardinal virtues of the ancients, PRU-DENCE, TEMPERANCE, FORTITUDE, and JUSTICE; of which the first three refer to the individual, and the fourth to society.

Hitherto lessons in morality had not taken a syste-The Moral principles of matic form; but they were gradually approaching to Socrates. it. Socrates was perhaps the first Pagan philosopher who established all his precepts on one sure and steady

basis. In his lectures and discourses, he seems to have had one great object in view ‡, to connect the moral # Bruce's maxims which were fitted to regulate the conduct Elements of mankind, with sublime conceptions respecting the and  $E_n$  character and government of a supreme Being. The field's He first principles of virtuous conduct which are common story, &c, to all mankind, are according to this excellent moralist, laws of God : and the conclusive argument by which he supports this opinion is, that no man departs from these principles with impunity. " It is frequently possible (says he) for men to screen themselves from the penalty of human laws, but no man can be unjust or ungrateful without suffering for his crime; hence I conclude, that these laws must have proceeded from a more excellent legislator than man." From this it would appear, that in the opinion of Socrates, conscience, or the moral sense, approving of any action, is the criterion by which it is known to be virtuous, and the will of God that which obliges men to perform it.

Socrates himself left no writings behind him, nor, as Origin of far as we know, offered any regular and complete theory the Greek of ethics. His disciples, however, who were numerous sects. and distinguished, became the founders of the celebrated Greek sects. Among them the first great question was, " what are the foundations of virtue ?" and the second, " what are the distinctions betwixt good and evil, happiness and misery?" The answers given to these important questions divided the philosophers and their disciples into distinct orders.

In answer to the former question, Plato taught \* Theories that " virtue is to be pursued for its own sake; and of Plate, that being a divine attainment, it cannot be taught, \* Enfield but is the gift of God." This scens to differ in nothing, but the name, from the doctrine of those moderns who place the sole foundation of virtue in the approbation of the moral sense. The founder of the academy indeed has no such phrase as mord, sense in any of his writings with which we are acquainted; but if virtue cannot be taught, and if it is to be pursued for its own sake, it must in itself be good, and the object of some feeling, whether called sense, instinct, or passion. His solution of the second question agitated among the sects is not indeed very consistent with this necessary inference from his answer to the first; but for his inconsistencies we are not accountable. " Our highest good (he says) consists in the contemplation and knowledge of the first good, which is mind or God; and all those things which are called good by men, are in reality such only so far as they are derived from the first and highest good. The only power in human nature which can acquire a resenblance to the supreme good, is reason; and this resemblance consists in prudence, justice, sanctity, and temperance."

Aristotle, the founder of the Peripatetic school, was Aristothe pupil of Plato ; but of the two great moral ques-tle, tions he gives solutions somewhat different from those of his master. " Virtue (according to him ‡) is ei-t Enfield ther theoretical or practical. Theoretical virtue consists in the due exercise of the understanding ; practical, in the pursuit of what is *right* and *good*. Practical virtue is acquired by habit and excreise." This theory seems to differ little from that adopted by Cudworth, Clarke, and Price, which shall be considered afterwards.

ra 1.

With respect to happiness or good, the doetrine of Aristotle is very rational. " Pleasures (he says) are essentially different in kind. Disgraceful pleasures are wholly unworthy of the name. The purest and noblest pleasure is that which a good man derives from virtuous actions. Happiness, which consists in a conduct conformable to virtue, is either contemplative or active. Contemplative happiness, which consists in the pursuits of knowledge and wisdom, is superior to active happiness, because the understanding is the higher part of human nature, and the objects on which it is cmployed are of the noblest kind. The happiness which arises from external possessions is inferior to that which arises from virtuous actions; hut both are necessary to produce perfect felicity."

The Stoics, another eelebrated sect of Greek philosophers, maintained \*, that " nature impels every man to pursue whatever appears to him to be good." According to them, " self-preservation and defence is the first law of animated nature. All animals necessarily derive pleasure from those things which are suited to them; but the first object of pursuit is, not pleasure, but conformity to nature. Every one, therefore, who has a right discernment of what is good, will be chiefly concerned to conform to nature in all his actions and pursuits. This is the origin of moral obligation." With respect to happiness or good, the Stoical doctrine was altogether extravagant: They taught, that " all external things are indifferent, and eannot affect the happiness of man; that pain which does not belong to the mind, is no evil; and that a wise man will be happy in the midst of torture, because virtue itself is happiness (A)."

As the Stoics held that there is but one substance, partly active and partly passive, in the universe (see METAPHYSICS, N° 261, 262), and as they called the active principle God, their doctrine, which makes virtue consist in a conformity to nature, bears no small resemblance to that of those moderns who rest moral obligation on the Divine will. It was therefore on better grounds than has been sometimes supposed, that Warburton, when characterizing the founders of the "v. Leg. three principal sects in Greece, represented + Plato, of loses. as the patron of the moral sense ; Aristotle of the essential differences; and Zeno of arbitrary will. These principles, when separated from each other, and treatcd in the manner of the ancients, may not cach be able to bear the superstructure which was raised upon it; but the principles of most of the other seets were much less pure, and infinitely more dangerous.

Cudworth ‡, whose testimony when relating the doetrines of antiquity is entitled to the fullest eredit, affirms, that Aristippus the founder of the Cyrenaic of istip- school, Democritus, and Protogoras, with their followers among the atomists, taught, that " the distinction between virtue and vice is merely arbitrary; that nothing is just or unjust, sacred or profane, but as it is agreeable or contrary to established laws and customs ;

that what is just to-day, human authority may make unjust to-morrow; and that present pleasure is the sovereign good of man."

With these impieties, the moral doetrines of Epi-and of Epieurus have very unjustly been eonfounded. The phy-curus. sical and metaphysical systems of that philosopher are indeed strange compositions of ingenuity and absurdity, truth and falsehood; and the moral precepts of many of his followers were in the highest degree licentious and impure. Eut his own life was exemplary; and his cthical system, if candidly interpreted, is much more rational than that of the Stoics; though it must be confessed, that no scet produced men of more determined virtue than the school of Zeno. According to Epicurus \*, " the end of living, or the ultimate good \* Enfield's which is to be sought for its own sake, is happiness. History. The happiness which belongs to man, is that state in which he enjoys as many of the good things, and suffers as few of the evils ineident to human nature as possible; passing his days in a smooth eourse of tranquillity. Pleasure is in its own nature good, as pain is in its nature evil. The one is therefore to be pursued, and the other to be avoided, for its own sake. Plcasure and pain are not only good and evil in themselves, but they are the measures of what is good or evil in every object of desire and aversion; for the ultimate reason why we pursue one thing and avoid another is, because we expect pleasure from the former, and apprehend pain from the latter .- That pleasure, however, which prevents the enjoyment of a greater pleasure, or produces a greater pain, is to be shunned; and that pain which either removes a greater pain, or procures a greater pleasure, is to be endured."

Upon these self-evident maxims, Epieurus builds his system of ethies; and proves, with great force of argument, " that a steady course of virtue produces the greatest quantity of happiness of which human nature is eapable." Without a prudent eare of the body, and a steady government of the mind, to guard the one from diseases and the other from the clouds of prejudice, happiness is unattainable. By temperance we enjoy pleasure, without suffering any consequent inconvenience. Sobriety enables us to content ourselves with simple and frugal fare. Gentleness, as opposed to an irascible temper, greatly contributes to the tranquillity and happiness of life, by preserving the mind from perturbation, and arming it against the assaults of ealumny and malice. Fortitude enables us to bear those pains which prudence eannot shun, and banishes fear from the mind; and the practice of justice is absolutely necessary to the existence of society, and by consequence to the happiness of every individual." These reasonings come home to every man's bosom : and had not this philosopher, by denying the providence, if not the being, of God, most unhappily excluded from his system the very possibility of a future state of retribution, his moral philosophy would have been the most rational, and of course the most useful, of any that

(A) Since this short history was written, a very pleasing view of Stoicism has been given to the public in Ferguson's Principles of Moral and Political Science; a work which the student of ethics will do well to eousult. Perhaps the amiable author may unintentionally have softened the austere dogmas of the Poreh, by transfusing into them something of the mild spirit of the gospel ; but, if so, he has much improved the system of Zeno.

that was taught in the schools of Greece. This enormous defect, however, laid it open to the grossest corruptions ; and by his followers it was in fact corrupted so as to countenance the most impure and criminal pleasures of sense.

These several systems of cthics continued to be cultic philoso- tivated with more or less purity through all the revolutions of the Grecian states, and they were adopted by the Romans after Greece itself became a province of the empire. They had been introduced into Egypt during the reigns of the Ptolemies, and were taught with much celebrity in the schools of Alexandria .---The philosophy which was most cultivated in those schools was that of Plato; but from a desire of uniformity which took possession of the Alexandrian Platonists, many of the dogmas of Aristotle and Zeno, as well as the extravagant fictions of the east, were incorporated with the principles of the old academy .---The patrons of this heterogeneous mass have been called cclectic philosophers, because they professed to select from each system those doctrines which were rational and important, and to reject every thing which was false or futile; but they added nothing to the purity of Plato's ethics, and they increased the obscurity and mysticism of his physics and metaphysics.

After the subversion of the Roman empire, every and revival species of philosophy, if syllogistic wrangling deserve not that name, was banished for ages from the schools science in of Europe; and ethics, properly so called, gave place to ecclesiastical casuistry, and to the study of the civil and canon law. When the Greeks, whom the fury and fanaticism of Mahomet II. had driven from Constantinople, introduced into Italy the knowledge of their own language, the eabincts of ancient philosophy were again unlocked; the systems of the different sects were adopted with the utmost avidity; and, without accurate investigation of their respective merits, men became Platonists, Peripatetics, or Stoics, as fancy or caprice prompted them to choose their leaders. The euros epn of Aristotle, in particular, had not less authority over his modern admirers than it had of old in the Lyceum at Athens. At length the spirit of Luther and the genius of Bacon broke these fetters, and taught men to think for themselves as well in science as in religion. In physics, the effects produced by the writings of Bacon were great and rapid ; for in physics the ancient theories were totally and radically wrong .--With respect to morals, however, the case was different. Each of the celebrated schools of antiquity was in possession of much moral truth, blended indeed with error: and long after the Stagyrite and his rivals had lost all influence in physical science, philosophers of eminence followed them implicitly in the science of ethics.

13 Theories

At this day, indeed, there is hardly a theory of moof Hobbes, rals at all distinguished, to which something very similar may not be found in the writings of the ancients. -Hobbes adopted the principles of Democritus and Protagoras, and taught expressly that "there is no

criterion of justice or injustice, good or evil, besides the laws of each state; and that it is absurd to inquire at any person except the established interpreters of the law, whether an action be right or wrong, good or cvil (B)." These impious absurdities have been often confuted. Cudworth, who composed his True Intellectual System of the Universe, in order to trace the metaphysical atheism of Hobbes to its source, and to expose it to the public in all its weakness, undertook likewise to overthrow his ethical system, in a treatise, entitled Of Eternal and Immutable Morality. That work was left unfinished; but the theory of its great author was adopted, illustrated, and very ably supported, by the doctors Clarke and Price.

According to these three admirable scholars, " we of Cudfeel ourselves irresistibly determined to approve some worth, actions, and to disapprove others. Some actions we and Pricannot but conceive of as right, and others as wrong; and of all actions we are led to form some idea, as cither fit to be performed, or unfit, or as neither fit nor unfit to be performed, i. e. as indifferent. The power within us which thus perceives and determines, they declare to be the understanding ; and they add, that it perceives or determines immediately or by intuition, because right and wrong denote simple ideas. As there are some propositions, which when attended to necessarily determine all minds to believe them, so are there some actions whose natures are such, that when observed, all rational beings immediately and necessarily approve them. He that can impartially attend, it is said, to the nature of his own perceptions, and determine that when he conceives gratitude or beneficence to be right, he perceives nothing true of them, or understands nothing, but only suffers from a sense, has a turn of mind which appears unaccountable: for the more we examine, the more indisputable it will appear to us, that we express necessary truth, when we say of some actions that they are right, and of others that they are wrong." It is added, that " we cannot perceive an action to be right without approving it, or approve it without being conscious of some degree of satisfaction and complacency; that we cannot perceive an action to be wrong without disapproving it, or disapprove it without being displeased with it; and that the first must be liked, the last disliked ; the first loved, the last hated." By the patrons of this system, obligation to action, and rightness of action, are held to be coincident or identical. " Virtue, they affirm, has a real, full, obligatory power, antecedently to all laws, and independently of all will; for obligation is involved in the very nature of it. To affirm that the performance of that which to omit would be wrong is not obligatory, unless conducive to private good, or enjoined by a superior power, is a manifest contradiction \*." \* Price

Few men have descrved better of letters and philo-Review, sophy than Cudworth, Clarke, and Price; and yet and Clar their theory of morals appears to us to be contradic-on the tory and unintelligible. It is certainly romantic, and tributes. founded upon principles which, if they be denied, no man

man by argument can be compelled to grant. There is, say they, an absolute right and wrong, fitness and unfitness, in actions; but if so, the actions which are right and fit must be right and fit for something, because fitness, which respects no end, is wholly inconceivable. To say that any particular action is fit, and vet fit for no particular purpose, is just as absurd as to say that the angles at the base of an isosceles triangle are equal but neither to one another, nor to any other angles ; and we may with no less propriety talk of the relation of equality attaching to a particular angle, and to nothing else with which the angle is equal, than of the absolute fitness or rightness of any action or course of actions. If it be said that such actions are fit and right, because they tend to promote the harmony of the world and the happiness of men, this may be granted; but it overturns the intellectual theory from its very foundation. Actions which are fit and right only for their consequences, are approved and liked for the sake of those consequences; and the happiness of men, among whom the virtuous person himself is certainly to be included, is the motive or ultimate obligation to their performance.

Similar to this theory, and liable to the same objections, is that which resolves moral approbation into a sense of propriety : for if actions be approved because they are proper, it must be because they are proper for some end or purpose, propriety in the abstract being a word without meaning.

Many philosophers, feeling the force of these and of similar objections to the intellectual theory of Cndworth, Clarke, and Price, as well as to a sense of propriety in the abstract, have had recourse to another hypothesis, apparently better founded. Observing that all mankind decide on the morality of characters and actions instantaneously, without weighing their consequences in the balance of reason, they suppose that such decisions are made by an instinct of our common nature, implanted in the human breast by the hand that formed it. To this instinct some of them give the name of conscience, and others that of moral sense, in contradiction to external sense the other great and universal inlet of human knowledge. By this moral sense we intuitively discover an essential difference in the quality of all thoughts and actions, and a general distinction of them into good and evil, just as by the tongue and palate we discover an essential difference in the taste of all objects, and a general distinction of them into pleasant and unpleasant. The ablest advocates for this instinctive system agree, that the moral sense is the immediate and involuntary criterion of only a few general truths, which in their joint operation upon the mind, lay the basis of moral obligation. Others have carried it to what we think a very dangerous extreme; as by affirming that we cannot prove, in regard to our moral feelings, that they are conformable to any extrinsic and eternal relations of things, they seem to wish that reason were banished from the science of ethics. Were this true, it would in many cases be impossible to distinguish the prejudices of early education from the pure dictates of original instinct, and the most permicions conduct might be sanctified with the approbation of what would be deemed the ultimate test of virtue and vice.

VOL. XIV. Part I.

stinctive theories of morality, Mr Hume blended them together; and, upon the broader basis of reason and internal sense co-operating with each other, he rearcd a system which, though different from those of all his predecessors, he rendered plausible, and supported with his usual ingenuity.

According to him, sentiment and reason concur in al+ Of Mr most all moral determinations; and he proves, that Hume. for this purpose, " there is implanted in the human breast a disinterested principle of benevolence or sympathy which makes men take pleasure in each other's happiness. The merit or demerit of actions consists wholly in their utility or natural tendency to add to the sum of human happiness; and the same he holds to be true of qualities whether bodily or mental. This utility or natural tendency it is the office of reason to discover; for that faculty alone can trace relations and consequences. Such qualities or actions as reason discovers to be useful either to the individual or society, the instinctive principle of benevolence makes us instantly approve, and this approbation constitutes their morality. Thus temperance, fortitude, courage, industry, &c. reason discovers to be useful to him who possesses them ; and upon this discovery they are approved of by the sentiment of sympathy. They are, therefore moral qualities and the sources of the private virtues. In like manner, generosity, cheerfulness of temper, mercy, and justice, are discovered to be useful to society, and are accompanied with the approbation of that sentiment of sympathy which makes every man feel a satisfaction in the felicity of all other men. They therefore constitute the social virtues. Of every quality and every action, the merit or demerit, and of consequence the degree of approbation or disapprobation which is bestowed upon it, is in exact proportion to its utility and the circumstances of the case in which it occurs. The social virtues are therefore greater than those which are private, and one social virtue is greater than another; but every quality and every action which is useful, either to society or to the individual, is more or less virtuous, provided the good of the individual be considered as subordinate to the good of the public."

This theory is ingenious : and in placing the merit of actions in their ntility, it furnishes a criterion of virtue which can be employed by reason ; but it seems not to be wholly free from error, and it is obviously defective. By pretending that the same sentiment of approbation is given to useful actions voluntarily performed and to useful qualities which are merely constitutional, Mr Hume confounds the merit of virtuous habits with the value of natural talents. Yet every man's consciousness will surely tell him, that the feeling or sentiment which attaches to deeds of justice, clemency, and beneficence, is very different from that which attaches to beauty of form, strength of body, vigour of mind, and mere extent of capacity. All these actions and qualities are useful ; but when we approve of the former, besides attending to their utility, we consider them as in the man's power, and attribute the merit of them immediately to himself. When we approve, or rather admire, the latter on account of their utility, we know them to be not in the man's power, and we attribute the merit of them immediately to the Author of nature.

To remedy the defects of the intellectual and in- . But the defects of this theory are in practice more 62 pernicious

Lord

pernicious than its errors. The author well observes that the end of all moral speculations is to teach us our duty, and by proper representations of the deformity of vice and heauty of virtue, to beget correspondent habits, and engage us to avoid the one and embrace the other; but the theory under review holds out no motive sufficient in all cases for this purpose.

It is indeed true, as Mr Hume affirms, that the virtues which are immediately useful or agreeable to the person possessed of them, are desirable in a view to self-interest, and that a regard to self-interest ought to engage us in the pursuit. It is likewise true, that the virtues which are useful and agreeable to others, are generally more desirable than the contrary qualities; for as by the constitution of our nature no enjoyment is sincere without some reference to company and society; so no society can be agreeable, or even tolerable, where a man feels his presence unwelcome, and discovers all around him symptoms of disgust and aversion. These considerations he deems sufficient to enforce the duties of humanity, clemency, and beneficence; but he states a case himself in which they would certainly fail to make a man abstain from his neighbour's property. The greater part of property he considers, and rightly considers, as having its foundation in human laws, which are so calculated as to preserve the peace and promote the general good of the society, at the unavoidable expence sometimes of the individual. Now, in particular incidents, a sensible knave, by secretly purloining from the hoards of a worthless miser, might make himself comfortable and independent for life, without causing any breach in the social union, and even without hurting a single individual. What then should hinder him from acting thus? His self-interest would be promoted ; and if he possessed a generous spirit, he might gratify his sentiment of benevolence or sympathy by doing good with his money to the poor, which the miser never did. For enforcing the uniform practice of justice in such cases as this, Mr Hume's theory of morals contains no adequate motive; but a very sufficient one is held out by the system which we are now to consider.

17 A system of ethics built upon religion.

That system, which seems to have been unknown to the ancients, is built upon religion, of which indeed it constitutes a very essential part; and those by whom it has been taught, maintain that no other foundation is sufficient to bear a regular superstructure of practical ethics. The philosophers of this school (D) define virtue to be " the doing good to mankind, in obedience to the will of God, and for the sake of everlasting happiness :" So that with them " the good of mankind" is the subject, " the will of God" the criterion or rule, and "everlasting happiness" the motive, of human virtue. The moral sense, supposing it real, they consider as a very inadequate rule of conduct, as being in many cases difficult to be distinguished from prejudice; and many of them confidently deny its existence. The other rules, such as the fitness of things, abstract right, the truth of things, the law of reason, &c. they consider either as unintelligible, or as relative to some end by

which the rules must themselves be tried. The two great questions, which in the system of these religious philosophers demand solution, are : 1st, By what means shall a man in every case discover precisely what is the will of God? and, 2dly, What evidence have we that there will be a future state of retribution and of everlasting happiness ?

Of these two questions, the latter belongs wholly to religion; and to solve it they call in the aid of revelation, as well as of that which is called the religion of nature. The former question is in the province of morality; and to find answers to it which will apply to every case, is the whole business of their system.

The will of God respecting human conduct may be discovered by reasoning à priori from his existence and attributes, or à posteriori from the tendency of his works. Being himself independent and all perfect, it is inconceivable that his view in creating the world could be any thing else than to communicate some portion of his own felicity. (See METAPHYSICS, Nº 312). This conclusion is agreeable to what we perceive of his works, in which there are a thousand contrivances, all tending to give happiness to man, and to all animated nature ; and of not one of which the natural tendency is to inflict pain, or prove ultimately injurious. Mankind are linked together by various ties, and made to depend in a great measure upon each other's conduct. That conduct, therefore, which is naturally productive of the greatest sum of human happiness, must be agreeable to the will of God; or, in other words, virtuous conduct. That, of which the natural tendency is the reverse, must be vicious; and that conduct, if there be any such, which tends to produce neither happiness nor misery, must be indifferent, i. e. neither morally good nor morally evil. It is to be observed, however, that as, previous to their own obedience or disolicdience, all men stand in the same relation to their Creator, it must be his will that an equal portion of the happiness of which human nature is capable be communicated to all by whom that nature is shared. Whence it follows, that only such conduct as, if universally pursued by all men in the same station and circumstances, would be productive of the greatest sum of human happiness on the whole, can be agreeable to the will of the Creator ; and that, in judging of the morality of actions, we are not to regard their immediate consequences in a particular case, but their natural and ultimate tendency if performed in all cases.

This is a criterion of virtue which differs widely from the local or occasional utility set up by Mr Hume: for the particular consequences of an action and its general tendency may often be at variance, so that what might in certain circumstances be immediately useful, would yet be highly criminal and ultimately pernicious. The general tendency of actions, too, may be always known, and known with the utmost certainty: the whole of their particular consequences can never be discovered. One thing, however, is evident, that if all men in their respective stations would regulate their conduct by the natural tendency

(D) GASTREL, CUMBERLAND, PUFFENDORFF, NORRIS, BERKELEY, GAY, LAW, RUTHERFORTH, SOAME JENYNS, Dr JOHNSON, Mr PALEY, and Mr GISBORNE, &c.

Na's in-

a state.

dency of every action, the particular and general consequences of their conduct would be the same, and the greatest happiness would result from it of which human nature is in this world capable. And therefore, since it is only through the perverseness of some person or persons concerned, that the particular consequences of any action, of which the natural tendency is to produce misery, can ever bring happiness to a single individual; it can no more be the will of God that we make these occasional and distorted consequences the rnle of our conduct, than it can be his will that the vices of other men should be the basis of our virtues. According to this scheme of morals, which rests all obligation on private happiness, the whole difference between an act of prudence and an act of duty, is this : That in the former case we consider only what we shall gain or lose in this world; in the latter, what we shall gain or lose in the world to come.

Although the patrons of this theory question the reality of the moral sense as an instinct, they allow that a sentiment of approbation or disapprohation of actions, according as they are virtuous or vicious, is generated by the associating principle (see INSTINCT, and METAPHYSICS, Nº 97.); and that this sentiment, though factitious, operates instantaneously as if it were instinctive. They insist that our earliest actions are the result of imitation ; that when we first begin to trace consequences, education and the desire of immediate enjoyment are our only guides; that as our mind expands and our knowledge increases, the hopes and fears of futurity become the motives, and the will of God the rule of our conduct; and that long practice in virtue, upon these principles, produces habits by which we go on with satisfaction in the same course, without looking forward on every particular occasion, to the ultimate consequences and first motives of our actions. Thus do habits of justice, benevolence, elemency, and moral approbation, spring through a proper course of discipline, out of the selfish principle; and when these

habits are completely formed and deeply rooted, man has attained the utmost perfection of which he is capable in this state of probation, and is fitted for another of retribution and happiness.

That these philosophers have not a just view of hu-Defectsand man nature, when they deny that there are any innate excellency principles of benevolence in man, we shall endeavour of the sy-te show when we have the formation of the therm. to show when we lay the foundation of that theory which we think descrives to be preferred to all others; but we fully agree with a candid and able writer\*, who \* Stuart's seems to consider them as under the same mistake, "that Elements their theory of morals has no tendency to weaken the of the Phi-foundations of virtue; and that he the account which losophy of foundations of virtue; and that by the account which the Human it gives of the rise of the social affections, it obviates wind. many of the arguments which had formerly been urged against the selfish system." Nay, we seruple not to confess, that the mode of investigation which it employs in all cases to discover the will of God, may in some cases be necessary in any system which does not banish the use of reason from the science of ethics. On this account, as well as out of respect to the first moralist + Johnston. of the age, who affirms, that " it must be embraced by all who are willing to know why they act, or why they forbear, to give any reason of their conduct to them-selves or to others," we shall apply it to one of those cases of social duty which Mr Hume's principle of utility could not resolve. Such an example will enable the meanest of our readers to decide between the merits of it and of the theory which we shall adopt; or, as we rather hope, it will show them that the two theories lead to the same practical conclusions.

Having thus given our readers a short view of the most celebrated systems of ethics which have prevailed from the earliest ages of the world to the present day, we now proceed, agreeably to our definition of the science, to trace man's duty from his nature and connexions, and to show that the steady practice of virtue must terminate in his ultimate happiness.

PART I.

#### CHAP. I. Of MAN and his CONNEXIONS.

MAN is boru a weak, helpless, delicate creature, unprovided with food, clothing, and whatever else is necessary for subsistence or defence. And yet, exposed as the infant is to numberless wants and dangers, he is utterly incapable of supplying the former, or securing himself against the latter. But, though thus feeble and exposed, he finds immediate and sure resources in the affection and care of his parents, who refuse no labours, and forego no dangers, to nurse and rear up the tender babe. By these powerful instincts, as by some mighty chain, does nature link the parent to the child, and form the strongest moral connexion on his part, before the child has the least apprehension of it. Hunger and thirst, with all the sensations that accompany or are connected with them, explain them. selves by a language strongly expressive, and irresistibly moving. As the several senses bring in notices and informations of surrounding objects, we may per-

ceive in the young spectator early signs of a growing wonder and admiration. Bright objects and striking sounds are beheld and heard with a sort of commotion and surprise. But, without resting on any, he eagerly passes on from object to object, still pleased with whatever is newest. Thus the love of novelty is formed, and the passion of wonder kept awake. By degrees he becomes acquainted with the most familiar objects, his parents, his brethren, and those of the family who are most conversant with him. He contracts a fondness for them, is uncasy when they are gone, and charmed to see them again. These feelings become the foundation of a moral attachment on his side; and by this reciprocal sympathy he forms the domestic alliance with his parents, brethren, and other members of the family. Hence he becomes interested in their concerns; and feels joy or grief, hope, or fear, on their account, as well as his own. As his affections now point beyond himself to others, he is denominated a good or ill creature, as he stands well or ill affected to them. These, then, are the first links of the 222 moral

moral chain ; the early rudiments, or outlines, of his Of Man character; his first rude essays towards agency, freeand his Connexdom, manhood.

When he begins to make excursions from the nursery, and extends his acquaintance abroad, he forms His child- a little circle of companions, engages with them in play, or in quest of adventures; and leads, or is led by them, as his genius is more or less aspiring. Though this is properly the season in which appetite and passion have the ascendant, yet his imagination and intellectual powers open apace; and as the various images of things pass before the mental cye, he forms variety of tastes; relishes some things, and dislikes others, as his parents, companions, and a thousand other circumstances, lead him to combine agreeable or disagreeable sets of ideas, or represent to him objects in alluring or odious lights.

As his views are enlarged, his active and social powers expand themselves in proportion ; the love of action, of imitation, and of praise, emulation, curiosity, docility, a passion for command, and fondness of change. His passions are quick, variable, and pliant to every impression ; his attachments and disgusts quickly succeed each other. He compares things, distinguishes actions, judges of characters, and loves or hates them, as they appear well or ill affected to himself, or to those he holds dear. Mcanwhile he soon grows sensible of the consequences of his own actions, as they attract applause, or bring contempt : he triumphs in the former ; and is ashamed of the latter, wants to hide them, and blushes when they are discovered. By means of these powers he becomes a fit subject of culture, the moral tie is drawn closer, he feels that he is accountable for his conduct to others as well as to himself, and thus is gradually ripening for society and action.

22 His youth.

As man advances from childhood to youth, his passions as well as perceptions take a more extensive range. New senses of pleasure invite him to new pursuits; he grows sensible to the attractions of beauty, feels a peculiar sympathy with the sex, and forms a more tender kind of attachment than he has yet experienced. This becomes the cement of a new moral relation, and gives a softer turn to his passions and behaviour. In this turbulent period he enters more deeply into a relish of friendship, company, exercises, and diversions; the love of truth, of imitation, and of design, grows upon him; and as his connexions spread among his neighbours, fellow citizens, and countrymen, his thirst of praise, emulation, and social affections grow more intense and active. Meanwhile, it is impossible for him to have lived thus long without having become sensible of those more august signatures of order, wisdom, and goodness, which are stamped on the visible creation; and of those strong suggestions within himself of a parent mind, the source of all intelligence and beanty; an object as well as source of that activity, and those aspirations which sometimes rouse his inmost frame, and carry him out of himself to an almighty and all-governing power : Hence arise those sentiments of reverence, and those affections of gratitude, resignation, and love, which link the soul with the Author of Nature, and form that most sublime and godlike of all connexions.

23 His manbood.

Man having now reached his prime, cither new passions succeed, or the old set are wound up to a

higher pitch. For, growing more sensible of his con- Of Mar nexions with the public, and that particular commuand his nity to which he more immediately belongs; and taking withal a larger prospect of human life, and its various wants and enjoyments; he forms more intimate friendship, grasps at power, courts bonour, lays down cooler plans of interest, and becomes more attentive to the concerns of society : he enters into family connexions, and indulges those charities which arise from thence. The reigning passions of this period powerfully prompt him to provide for the decays of life : and in it compassion and gratitude exert their influence in urging the man, now in full vigour, to requite the affection and care of his parents, by supplying their wants and alleviating their infirmities.

At length human life verges downwards; and old Old age. age creeps on apace, with its anxiety, love of ease, interestedness, fearfulness, foresight, and love of offspring. -The experience of the aged is formed to direct, and their coolness to temper, the heat of youth: the former teaches them to look back on past follics; and the latter to look forward into the consequences of things, and provide against the worst. Thus every age has its peculiar genius and set of passions corresponding to that period, and most conducive to the prosperity of the rest. And thus are the wants of one period supplied by the capacities of another, and the weaknesses of one age tally to the passions of another.

Besides these, there are other passions and affections Passions of a less ambulatory nature, not peculiar to one period, every age but belonging to every age, and acting more or less in every breast throughout life. Such are self-love, benevolence, love of life, honour, shame, hope, fear, desire, aversion, joy, sorrow, anger, and the like. The two first are affections of a cooler strain; one pointing to the good of the individual, the other to that of the species : joy and sorrow, hope and fear, seem to be only modifications, or different exertions, of the same original affections of love and hatved, desire and aversion, arising from the different circumstances or position of the object desired or abhorred, as it is present or absent. From these likewise arise other secondary or occasional passions, which depend, as to their existence and several degrees, upon the original affections being gratified or disappointed ; as anger, complacence, confidence, jealousy, love, hatred, dejection, exultation, contentment, disgust, which do not form leading passions, but rather hold of them.

By these simple but powerful springs, whether pe-Their je riodical or fixed, the life of man, weak and indigent effects. as he is, is preserved and secured, and the creature is prompted to a constant round of action, even to supply his own numerous and ever-returning wants, and to guard against the various dangers and evils to which he is obnoxions. By these links men are connected with each other, formed into families, drawn into particular communities, and all united as by a common league into one system or body, whose members feel and sympathise one with another. By this admirable adjustment of the constitution of man to his state, and the gradual evolution of his powers, order is maintained, society upheld, and human life filled with that variety of passion and action which at once enliven d diversify it. This is a short sketch of the principal movements of ing pow and diversify it.

of Man the human mind. Yet these movements are not the whole of man; they impel to action, but do not direct it: they need a regulator to guide their motions, to measure and apply their forces; and accordingly they have one that naturally superintends and directs their action. We are conscious of a principle within us, which examines, compares, and weighs things; notes the differences, observes the forces, and foresees the consequences, of affections and actions. By this power we look back on past times, and forward into futurity, gather experiences, estimate the real and comparative value of objects, lay out schemes, contrive means to execute them, and settle the whole order and economy of life. This power we commonly distinguish by the name of reason or reflection, the business of which is not to suggest any original notices or sensations, but to canvass, range, and make deductions from them.

We are intimately conscious of another principle within us, which approves of certain sentiments, passions, and actions, and disapproves of their contraries. In consequence of the decisions of this inward judge, we denominate some actions and principles of conduct right, honest, good; and others wrong, dishonest, ill. The former excite our esteem, moral complacence, and affection, immediately and originally of themselves, without regard to their consequences, and whether they affect our interest or not. The latter do as naturally and necessarily call forth our contempt, scorn, and aversion. That power by which we perceive this difference in affections and actions, and feel a consequent relish or dislike, is commonly called conscience or the moral sense.

That there is such a power as this in the mind of every man of sound understanding, is a fact which cannot be controverted; 'but whether it be an instinctive power, or the result of early and deep-rooted associations, has been long and ably debated. The question is of importance in the science of human nature, as well as in ascertaining the standard of practical virtue; but to us it appears that the contending parties have carried their respective opinions to dangerous extremes.

When it is affirmed, as it sometimes has been, that reason has nothing to do in ethical science, but that in every possible situation our duty is pointed out and the performance of it enforced by mere sentiment, the consequence seems to be, that virtue and vice are nothing permanent in themselves, but change their nature according to local circumstances. Certain it is, that sentiment has in similar situations approved of very different practices in different ages and different na-A ttemptions. At present this sentiment in Europe approves of the universal practice of justice, and of parents protecting their children, whether well or ill formed, whether strong or weak: but in Sparta we know that theft, if dexterously practised, was approved, and not unfrequently rewarded; and that the exposition of lame and deformed children was not only permitted, but absolutely enjoined. There is nothing which our conscience or moral sense condemns with greater severity, or views as a crime of a deeper dye, than children's unkind treatment of their aged parents; yet there arc savages, among whom instincts of all kinds ought to prevail in greater purity than in civilized nations, whose moral

sense permits them to put their aged and decrepid pa- Of Man rents to death. If this sense be instinctive, and the sole judge of right and wrong, bow comes it to decide so differently on the same line of conduct in different ages and distant countries? The instinct of brutes, in similar circumstances, prompt uniformly to similar ac-tions in every age and in every region where the species is found; and the external senses of man afford in all nations the same unvaried evidence concerning their respective objects. To these observations we may add, that instincts must be calculated for the state of nature, whatever that state may be, and therefore cannot be supposed capable of directing our steps through all the labyrinths of polished society, in which duties are to be performed that in a state of nature would never have been thought of.

But though for these reasons it is apparent that mere sentiment, whether called conscience or the moral sense, would alone be a very unsafe guide to virtue in every individual case that may occur, we think that those who resolve all such sentiment into habit and the effect of education, without giving any part of it to nature, advance an opinion which is equally illfounded and not less dangerous. There are, indeed, men who affirm that all henevolence is hypocrisy, friendship a cheat, public spirit a farce, fidelity a snarc to procure trust and confidence; and that while all of us at bottom pursue only our private interest, we wear those fair disguises, in order to put those off their guard with whom we have to deal, and to expose them the more to our wiles and machinations. Others again, too virtuous to accuse themselves and all mankind of direct knavery, yet insist, that whatever affection one may feel, or imagine he feels, for others, no passion is or can be disinterested ; that the most generous friendship, however sincere, is only a modification of self-love; and that even unknown to ourselves we seek only our own gratification, while we appear the most deeply engaged in schemes for the liberty and happiness of mankind.

Surely the mildest of these representations is an exaggerated picture of the selfishness of man. Selflove is indeed a very powerful as well as an essential principle in human nature; but that we have likewise an instinctive principle of benevolence, which, without any particular regard to our own interest, makes us feel pleasure in the happiness of other men, is a fact which we think admits of very complete proof. For, as Mr Hume well argues, "when a man grieves for a friend who could be of no service to him, but on the contrary stood in need of his constant patronage and protection, how is it possible to suppose that such passionate tenderness arises from self-interest, which has no 30 foundation in nature ? What interest (asks the same Examined, deep thinker) can a fond mother have in view, who and shown loses her health by her assiduous attendance on her sick child, and afterwards languishes and dies of grief when freed by its death from the slavery of attendance ?---Have we no satisfaction (continues he) in one man's company above another's, and no desire of the welfare of our friend, even though absence or death should prevent us from all participation in it? Or what is it commonly that gives us any participation in it, even. while alive and present, but our affection and regard to him?" Nor is it to contemporaries and individuals alone.

and his Connexions,

Of Man and his Connexions.

MORAL PHILOSOPHY.

alone, that, independent of all interest, we feel a benevolent attachment. We constantly bestow praise on actions ealculated to promote the good of mankind, though performed in ages very distant and in countries most remote ; and he who was the author of such actions is the object of our esteem and affection. There is not perhaps a man alive, however selfish in his disposition, who does not applaud the sentiment of that emperor, who recollecting at supper that he had done nothing in that day for any one, exclaimed with regret, that the day had been lost ! yet the utmost subtility of imagination can discover no appearance of interest that we can have in the generosity of Titus, or find any connexion of our present happiness with a character removed so far from us both in time and in place. But, as Mr Hume justly observes, if we even feign a character consisting of all the most generous and beneficent qualities, and give instances in which these display themselves, after an eminent and most extraordinary manner, for the good of mankind, we shall instantly engage the esteem and approbation of all our audience, who will never so much as inquire in what age or country the accomplished person lived.

These are facts which cannot be controverted; and they are wholly unaccountable, if there be not in human nature an instinctive sentiment of benevolence or sympathy which feels a disinterested pleasure in the happiness of mankind. But an end in which we feel pleasure we are naturally prompted to pursue; and therefore the same sentiment impels every man, with greater or less force, to promote the happiness of other men, which by means of it becomes in reality his own good, and is afterwards pursued from the combined motives of benevolence and self-enjoyment. For in obeying this sentiment we all feel an inward complacency, self-approbation, or consciousness of worth, or merit; and in disobeying it, which cannot be done but with reluctance, we feel remorse, or a consciousness of unworthiness or demerit. It appears, however, from history, that the sentiment, as it is instinctive, points only to the good of mankind, without informing us how that good is to be promoted. The means proper for this purpose must be discovered by reason; and when they are brought into view, this sentiment, conscience, or moral sense, instantly shows us that it is our duty to pursue them.

to origiobjector's mistaking the extent of those powers ;

Hence we see how different lines of conduct may in nate in the similar circumstances be approved of as virtuous in different nations. When the Spartan exposed his sickly and deformed child, and when the savage put his aged parents to death, neither of them erred from want of sentiment, or from having sentiments originally different from ours. Their errors resulted from a defect in reasoning. They both imagined that they were obeying the law of benevolence by preventing misery: for a weak and deformed person was very ill qualified to exist with any degree of comfort under the military constitution of Sparta, where all were soldiers, and under the necessity of enduring the greatest hardships; and in a state where the people have no fixed habitations, and where the chase supplies even the necessaries of life, an aged and infirm person is in danger of perishing through hunger, by one of the cruellest

and most lingering of deaths. The theft allowed in Of M Sparta, if theft it may be ealled, was a still less devia- and h tion from the instinctive law of benevolence. Boys Conne were taught to slip as eunningly as they could into the, gardens and public halls, in order to steal away herbs or meat; and if they were canght in the fact, they were punished for their want of dexterity. This kind of theft, since it was authorized by the law and the consent of the citizens, was no robbery ; and the intention of the legislator in allowing it, was to inspire the Spartan youth, who were all designed for war, with the greater boldness, subtlety, and address; to inure them betimes to the life of a soldier; and to teach them to shift for themselves, and to live upon little. That the Spartan legislator did wrong in giving his countrymen a constitution, of which successful war was the ultimate object; and that savages, rather than kill their aged parents, or suffer them to die of hunger, ought to cultivate the ground, and abandon the chase; is readily granted : but the faults of the one as well as of the other arose not from any improper decision of the moral sense, but from a defect in their reasoning powers, which were not able to estimate the advantages and disadvantages of different modes of life. In moral decisions, therefore, conscience and reason are aiding to each other. The former principle, when separated from the latter, is defective, enjoining only the good of mankind, but unable to point out the means by which it can be most effectually promoted; and the latter principle, when scparated from the former, only directs a man to do what is most prudent, but cannot give him a conception of duty.

Part

These two powers of reason and conscience are evi-which dently principles different in nature and kind from the different passions and affections. For the passions are mere force hind fr or power, blind impulses, acting violently and without the pas choice, and ultimately tending each to their respective sions objects, without regard to the interest of the others, affectiv or of the whole system. Whereas the directing and judging powers distinguish and ascertain the different forces, mutual proportions and relations, which the passions bear to each other, and to the whole ; recognize their several degrees of merit, and judge of the whole temper and conduct, as they respect either the individual or the species; and are capable of directing or restraining the blind impulses of passion in a due consistency one with the other, and a regular subordination to the whole system.

This is some account of the constituent principles of Division our nature, which, according to their different mix-the p tures, degrees, and proportions, mould our character sions. and sway our conduct in life. In reviewing that large train of affections which fill up the different stages of human life, we perceive this obvious distinction among them; that some of them respect the good of the individual, and others carry ns beyond ourselves to the good of the species or kind. The former have therefore been called private, and the latter public affections. Of the first sort are love of life, of pleasure, of power, and the like. Of the last are compassion, gratitude, friendship, natural affection, and the like. Of the private passions (D), some respect merely the security and defence, of the creature, such as resentment and fear; whereas others

(D) Here we use passions and affections without distinction. Their difference will be marked afterwards.

of Moral others aim at some positive advantage or good, as wealth, ease, fame. The former sort, therefore, because of this bligation. difference of objects, may be termed defensive passions. These answer to our dangers, and prompt us to avoid fensive them if we can, or boldly to encounter them when we cannot.

The other class of private passions, which pursue ivate or private positive good, may be called appetitive. Howpetitive ever, we shall still retain the name of private in contradistinction to the defensive passions. Man has a great variety of wants to supply, and is capable of many enjoyments, according to the several periods of his life, and the different situations in which he is placed. To these therefore a suitable train of private passions correspond, which engage him in the pursuit of whatever is necessary for his subsistence or welfare.

Our public or social affections are adapted to the several social convexions and relations which we bear to others, by making us sensible of their dangers, and interesting us in their wants, and so prompting us to seeure them against one and supply the other.

This is the first step then to discover the duty and destination of man, the having analyzed the principles of which he is composed. It is necessary, in the next place, to consider in what order, proportion, and measure, of those inward principles, virtue, or a sound moral temper and right conduct, consists; that we may discover whence moral obligation arises.

#### CHAP. II. Of DUTY, or MORAL OBLIGATION.

It is by the end or design of any power or movement that we must direct its motions, and estimate the degree of force necessary to its just action. If it want the force requisite for the obtaining its end, we reekon it defeetive; if it has too much, so as to be carried beyond it, we say it is overcharged ; and in either case it is imperfect and ill contrived. If it has just enough to reach the scope, we esteem it right and as it should be. Let us apply this reasoning to the passions.

The defence and security of the individual being the sure of defen- aim of the defensive passions, that security and defence must be the measure of their strength or indulgence. If they are so weak as to prove insufficient for that end, or if they carry as beyond it, i. e. raise unnecessary commotions, or continue longer than is needful, they are unfit to answer their original design, and therefore are in an unsound and unnatural state. The exercise of fear or of resentment has nothing desirable in it, nor ean we give way to either without painful sensations. Without a certain degree of them, we are naked and exposed. With too high a proportion of them, we are miserable, and often injurious to others. Thus cowardice or timidity, which is the excess of fear, instead of saving us in danger, gives it too formidable an appearance, makes us incapable of attending to the best means of preservation, and disarms us of eourage, our natural armour. Fool hardiness, which is the want of a due measure of fear, leads us heedlessly into danger, and lulls us into a pernicious security. Revenge, i. e. excessive resentment, by the violence of its commotion, robs us of that presence of mind which is often the best guard against injury, and inclines us to pursue the aggressor with more severity than self-defence requires. Pasillanimity, or the want of a just indignation against

wrong, leaves us quite unguarded, and tends to sink Of Moral the mind into a passive enervated tameness. There-Obligation. fore, " to keep the defensive passions duly proportioned to our dangers, is their natural pitch and tenor."

The private passions lead us to pursue some positive Measure of species of private good : that good therefore which is the private the object and end of each must be the measure of their passions. respective force, and direct their operation. If they are too weak or sluggish to engage us in the pursuit of their several objects, they are evidently deficient; but if they defeat their end by their impetuosity, then are they strained beyond the just tone of nature. Thus vanity, or an excessive passion for applause, betrays into such meannesses and little arts of popularity, as make us forfeit the honour we so anxiously court. On the other hand, a total indifference about the esteem of mankind, removes a strong guard and spur to virtue, and lays the mind open to the most abandoned prosecutions. Therefore, " to keep our private passions and desires proportioned to our wants, is the just measure and pitch of this elass of affections."

The defensive and private passions do all agree in Comparageneral, in their tendency or conduciveness to the in-tive force. terest or good of the individual. Therefore, when there is a collision of interest, as may sometimes happen, that aggregate of good or happiness, which is composed of the particular goods to which they respectively tend, must be the common standard by which their comparative degrees of strength are to be measured : that is to say, if any of them, in the degree in which they prevail, are incompatible with the greatest aggregate of good or most extensive interest of the individual, then are they unequal and disproportionate. For in judging of a particular system or constitution of powers, we call that the supreme or principal end, in which the aims of the several parts or powers coincide, and to. which they are subordinate; and reekon them in due proportion to each other, and right with regard to the whole, when they maintain that subordination of subserviency. Therefore, "to proportion our defensive and private passions in such measure to our dangers and wants as best to seeure the individual, and obtain the greatest aggregate of private good or happiness, is their just balance or comparative standard in case of. competition."

In like manner as the public or social affections point Measure of at the good of others, that good must he the measure the public of their force. When a particular social affection, as affections, gratitude, or friendship, which belongs to a particular social connexion, viz. that of a benefactor, or of a friend, is too feeble to make us act the grateful or friendly part, that affection, being insufficient to answer its end, is defective and unsound. If on the other hand, a particular passion of this class counteract or defeat the interest it is designed to promote, by its violence or disproportion, then is that passion excessive and irregular. Thus natural affection, if it degenerates into a passionate fondness, not only hinders the parents from judging coolly of the interest of their offspring, but often leads them into a most partial and pernicious indulgence.

As every kind affection points at the good of its Collision of particular object, it is possible there may sometimes be social affeca collision of interests or goods. Thus the regard due tions.

368

Of Moral to a friend may interfere with that which we owe to Obligation a community. In such a competition of interests, it is evident that the greatest is to be chosen; and that is the greatest interest which contains the greatest sum or aggregate of public good, greatest in quantity as well as duration. This then is the common standard by which the respective forces and subordinations of the social affections must be adjusted. Therefore we conclude that "this class of affections are sound and regular when they prompt us to pursue the interest of individuals in an entire consistency with the public good ;" or in other words, " when they are duly proportioned to the dangers and wants of others, and to the various relations in which we stand to individuals or to society."

Thus we have found, by an induction of particulars the natural pitch or tenor of the different orders of affection, considered apart by themselves. Now, as the virtue or perfection of every creature lies in following its nature, or acting suitably to the just proportion and harmony of its several powers; therefore, " the vir-TUE of a creature endowed with such affections as man must consist in observing or acting agreeably to their natural pitch and tenor."

43 Balance of affection.

But as there are no independent affections in the fabric of the mind, no passion that stands by itself without some relation to the rest, we cannot pronounce of any one, considered APART, that it is either too strong or too weak. Its strength and just proportion must be measured not only by its subserviency to its own iminediate end, but by the respect it bears to the whole system of affections. Therefore we say a passion is too strong, not only when it defeats its own end, but when it impairs the force of other passions, which are equally necessary to form a temper of mind suited to a certain economy or state; and too weak, not merely on account of its insufficiency to answer its end, but because it cannot sustain its part or office in the balance of the whole system. Thus the love of life may be too strong when it takes from the regard due to one's country, and will not allow one bravely to encounter dangers, or even death, on its account. Again, The love of fame may be too weak when it throws down the fences which render virtue more secure, or weakens the incentives which make it more active and public spirited.

44 Limits of private af fections.

If it be asked, " How far may the affections towards private good or happiness be indulged ?" One limit was before fixed for the particular indulgence of each, viz. their subordination to the common aggregate of good to the private system. In these therefore a due regard is always supposed to be had to health, reputation, fortune, the freedom of action, the unimpaired exercise of reason, the calm enjoyment of one's self, which are all private goods. Another limit now results from the balance of affection just named, viz. " The security and happiness of others ;" or, to express it more generally, "a private affection may be safely indulged, when, by that indulgence, we do not violate the obligations which result from our higher relations or public connexions." A just respect therefore being had to these boundaries which nature has fixed in the breast of every man, what should limit our pursuits of private happiness? Is nature sullen and penurious? or, does

the God of nature envy the happiness of his off- Of Mor Obligati spring?

Whether there is ever a real collision of interests between the *public* and *private* system of affections, or Collision the ends which each class has in view, will be after-interests. wards considered; but where there is no collision, there is little or no danger of carrying either, but especially the public affections, to excess, provided both kinds are kept subordinate to a discreet and cool selflove, and to a calm and universal benevolence, which principles stand as guards at the head of cach system.

Part

This then is the conduct of the passions, considered Result. as particular and separate forces, carrying ns out to their respective ends; and this is their balance or economy, considered as compound powers, or powers mutually related, acting in conjunction towards a common end, and consequently as forming a system or whole.

Now, whatever adjusts or maintains this balance, Subord whatever in the human constitution is formed for di- tion of recting the passions so as to keep them from defeating powers their own end or interfering with cach other, must be a principle of a superior nature to them, and ought to direct their measures and govern their proportions. But it was found that reason or reflection is such a principle, which points out the tendency of our passions, weighs their influence upon private and public happiness, and shows the best means of attaining either. It having been likewise found that there is another directing or controlling principle, which we call cox-SCIENCE or the MORAL SENSE, which, by a native kind of authority, judges of affections and actions, pronouncing some just and good, and others unjust and ill; it follows, that the passions, which are merc impulse or blind forces, are principles inferior and subordinate to this judging faculty. Therefore, if we would follow the order of nature, i. e. observe the mutual respects and the subordination which the different parts of the human constitution bear one to another, the passions ought to be subjected to the direction and authority of the leading or controlling principles.

We conclude, therefore, from this induction, that In what the constitution or just economy of human nature con- consists sists in a regular subordination of the passions and affections to the authority of conscience and the direction of reason.

That subordination is regular, when the proportion Econo formerly mentioned is maintained; that is to say, nature " when the defensive passions are kept proportioned ner to our dangers; when the private passions are proportioned to our wants ; and when the public affections are adapted to our public connexions, and proportioned to the wants and dangers of others."

But the natural state, or the sound and vigorous con-Huma stitution of any creature, or the just cconomy of its virtue powers, we call its health and perfection; and the acting perfect agreeably to these, its virtue or goodness. Therefore, "the heatlh and perfection of man must lie in the aforesaid supremary of conscience and reason, and in the subordination of the passions to their authority and direction. And his virtue or goodness must consist in acting agreeably to that order or economy."

That such an ornament of the mind, and such above conduct of its powers and passions, will stand the test former of reason, cannot admit of any dispute. For, upon a to rea

Moral fair examination into the consequences of things, or igation, the relations and aptitudes of means to ends, reason evidently demonstrates, and experience confirms it, that,

" to have our defensive passions duly proportioned to our dangers, is the surest way to avoid or get clear of them, and obtain the security we seek after .- To proportion our private passions to our wants, is the best means to supply them ;--- and, to adapt our public affections to our social relations, and the good of others, is the most effectual method of fulfilling the one, and procuring the other." In this sense, therefore, virtue may be said to be a "conduct conformable to reason," as reason discovers an apparent aptitude, in such an order and economy of powers and passions, to answer the end for which they are naturally formed.

If the idea of moral obligation is to be deduced mereween af. ly from this aptitude or connexion between certain passions, or a certain order and balance of passions and certain ends obtained or to be obtained by them, then the idea is reason or reflection, which perceives that aptitude or gation, connexion, the proper judge of moral obligation; and on this supposition it may be defined, as hath been done by some, the connexion between the affection and the end, or, which is the same thing, between the action and the motive; for the end is the motive or the final cause, and the affection is the action, or its immediate natural cause. A man, from mere self-love, may be induced to fulfil that obligation which is founded on the connexion between the defensive passions and their ends, or the private passions and their ends; because in that case his own interest will prompt him to indulge them in the due proportion required. But if he has no affections which point beyond himself, no principle but self-love, or some subtle modification of it, what shall interest him in the happiness of others, where there is no connexion between it and his own? or what sense can he have of moral obligation to promote it ? Upon this scheme, therefore, without public or social affection, there could be no motive, and consequently no moral obligation, to a beneficent disinterested conduct.

But if the mere connexion between certain passions or a certain order of passions, and certain ends, is what constitutes or gives us the idea of moral obligation, then why may not the appositeness of any temper or conduct, nay, of any piece of machinery, to obtain its end, form an equally strict moral obligation? for the connexion and aptitude are as strong and invariable in the latter instances as in the former. But as this is confounding the most obvious differences of things, we must trace the idea of moral obligation to another and a more natural source.

Let us appeal, therefore, to our inmost sense and muspe- experience, " how we stand affected to those different sets of passions, in the just measure and balance of which we found a right temper to consist." For this is entirely a matter of experience, in which we must examine, as in any other natural inquiry, " what are the genuine feelings and operations of nature, and what affections or symptoms of them appear in the given instance."

The defensive passions, as anger and fear, give us rather pain than pleasure, yct we cannot help feeling them when provoked by injury, or exposed to harm. We account the creature imperfect that wants them, . VOL. XIV. Part I.

because they are necessary to his defence. Nay, we Of Moral should in some measure condemn ourselves, did we Obligation want the necessary degree of resentment and caution. But if our resentment exceeds the wrong received, or our caution the evil dreaded, we then blame ourselves for having overacted our part. Therefore, while we are in danger, to be totally destitute of them, we reckon a blameable defect, and to feel them in a just, i. e. necessary measure, we approve, as suited to the nature and condition of such a creature as man. But our security obtained, to continue to indulge them, we not only disapprove as hurtful, but condemn as unmanly, unbecoming and mean-spirited : Nor will such a conduct afford any self-approving joy when we coolly reflect upon it.

With regard to the private passions, such as love of why the life, pleasure, case, and the like, as these aim at pri-private. vate good, and are necessary to the perfection and happiness of the individual, we should reckon any creature defective, and even blameable, that was destitute of them. Thus, we condemn the man who imprudently ruins his fortune, impairs his health, or exposes his life; we not only pity him as an unfortunate creature, but feel a kind of moral indignation and contempt of him, for having made himself such. On the other hand, though a discreet self-regard does not attract our esteem and veneration, yet we approve of it in some degree, in a higher and different degree from what we would regard a well-contrived machine, as necessary to constitute a finished creature, nay, to complete the virtuous character, as exactly suited to our present indigent state. There are some passions respecting private good, towards which we feel higher degrees of approbation, as the love of knowledge, of action, of honour, and the like. We esteem them as marks of an ingenious mind; and cannot help thinking the character in which they are wanting remarkably stupid, and in some degree immoral.

With regard to the social affections, as compassion, Why the natural affection, friendship, benevolence, and the like, public. we approve, admire, and love them in ourselves, and, in all in whom we discover them, with an esteem and approbation, if not different in kind, yet surely far superior in degree, to what we feel towards the other passions. These we reckon necessary, just, and excellently fitted to our structure and state; and the creature which wants them we call defective, ill-constituted, a kind of abortion. But the public affections we esteem as self-worthy, originally and eternally amiable.

But among the social affections we make an obvious Distinction and constant distinction, viz. between those particular between passions which urge us with a sudden violence, and nn-vehement easy kind of sensation, to pursue the good of their re- and calm spective objects, as pity, natural affection, and the like ; affections. and those calm dispassionate affections and desires which prompt us more steadily and uniformly to promote the happiness of others. The former we generally call passions, to distinguish them from the other sort, which go more commonly by the name of affections, or calm desires. The first kind we approve indeed, and delight in; but we feel still higher degrees of approbation and moral complacence towards the last, and towards all limitation of the particular instincts, by the principle of universal benevolence. The more objects the calm affections take in, and the worthier these are, their dig-3 A nity

art I.

Of Moral nity rises in proportion, and with this our approbation Obligation keeps an exact pace. A character, on the other hand, which is quite divested of these public affectious, which

feels no love for the species, but instead of it entertains malice, rancour, and ill will, we reckon totally immoral and unnatural.

Such then are the sentiments and dispositions we feel when these several orders of affections pass before the mental eye.

Therefore, " that state in which we feel ourselves moved, in the manner above described, towards those affections and passions, as they come under the mind's review, and in which we are, instantaneously and independently of our choice or volition, prompted to a correspondent conduct, we call a state of moral obligation." Let us suppose, for instance, a parent, a friend, a benefactor, reduced to a condition of the utmost indigence and distress, and that it is in our power to give them immediate relief. To what conduct are we obliged? what duty does nature dictate and require in such a case? Attend to nature, and nature will tell, with a voice irresistibly audible and commanding to the human heart, with an authority which no man can silence without being self-condemned, and which no man can elude but at his peril, "that immediate relief ought to be given." Again, Let a friend, a neighbour, or even a stranger, have lodged a deposite in our hands, and after some time reclaim it; no sooner do these ideas of the confidence reposed in us, and of property not transferred, but deposited, occur, than we immediately and unavoidably feel and recognize the obligation to restore it. In both these cases we should condemn and even loathe ourselves if we acted otherwise, as having done, or omitted doing, what we ought not, as having acted beneath the dignity of our nature ;-- contrary to our most intimate sense of right and wrong :- we should accuse ourselves as guilty of ingratitude, injustice, and inhumanity,-and be conscious of deserving the censure, and therefore dread the resentment, of all rational beings .----But in complying with the obligation, we feel joy and self-approbation,-are conscious of an inviolable harmony between our nature and duty, and think ourselves entitled to the applause of every impartial spectator of our conduct.

58 Moral obligation,

Moral

agent.

To describe, therefore, what we cannot perhaps define, a state of moral obligation is " that state in which a creature, endued with such senses, powers, and affections as man, would condemn himself, and think he descrved the condemnation of all others, should he refuse to fufil it; but would approve himself, and expect the approbation of all others, upon complying with it."

And we call him a MORAL AGENT, who is in such a state, or is subject to moral obligation. Therefore, as man's structure and connexions often subject him to such a state of moral obligation, we conclude that he is a moral agent. But as man may sometimes act without knowing what he does, as in cases of frenzy or disease, or in many natural functions; or, knowing what hedocs, he may act without choice or affection, as in cases of necessity or compulsion ; therefore, to denominate an action moral, i. e. approveable, or blameable, it must be done knowingly and willingly, or from affection and choice. " A morally good action, then, is to fulfil a moral obligation knowingly and willingly." And a

morally bad action, or an immoral action, is, " to vio- Of Moral late a moral obligation knowingly and willingly." Obligation.

As not an action, but a series of actions, constitute a character; as not an affection, but a series of affections, Moral chaconstitute a temper ; and as we denominate things by racter and the gross, à fortiori, or by the qualities which chiefly temper prevail in them; therefore we call that a " morally good good and character, in which a series of morally good actions pre-bad. vail ;" and that a " morally good temper, in which a series of morally good affections have the ascendant." A bad character and bad temper are the reverse. But where the above mentioned order or proportion of passions is maintained, there a series of morally good affeetions and actions will prevail. Therefore, " to maintain that order and proportion, is to have a morally good temper and character." But a " morally good temper and character is moral rectitude, integrity, virtue, or the completion of duty."

If it be asked, after all, " how we come by the idea How we " of moral obligation or duty ?" we may answer, That come by we come by it in the same way as by our other original the idea and primary perceptions. We receive them all from moral obli-nature, or the great Author of nature. For this idea of moral obligation is not a creature of the mind, or dependent on any previous act of volition ; but arises on certain occasions, or when certain other ideas are presented to the mind, as necessarily, instantaneously, and unavoidably, as pain does upon too near an approach to the fire, or pleasure from the fruition of any good. It does not, for instance, depend on our choice, whether we shall feel the obligation to succour a distressed parent, or to restore a deposite intrusted to us when it is recalled. We cannot call this a compound idea made up of one or more simple ideas. We may indeed, nay we must, have some ideas antecedent to it, e. g. that of a parent in distress-of a child-able to relieve-of the relation of one to the other-of a trust-of right, &c. But none of these ideas constitute the perception of obligation. This is an idea quite distinct from, and something superadded to, the ideas of the correlatives, or the relation subsisting between them. These indeed, by a law of our nature, are the occasion of suggesting it; but they are as totally different from it as colours are from sounds. By sense of reflection we perceive the correlatives; our memory recals the favours or deposite we received; the various circumstances of the case are matters of fact or experience; but some delicate inward organ or power, or call it what we please, does, by a certain instantaneous sympathy, antecedent to the cool deductions of reason, and independent of previous instruction, or volition, perceive the moral harmony, the living, irresistible charms of moral obligation, which immediately interests the correspondent passions, and prompts us to fulfil its lawful dictates.

We need not apprehend any danger from the quick-The use ness of its decisions, nor be frightened because it looks reason i like instinct, and has been called so. Would we ap-moralca prove one for deliberating long, or reasoning the matter much at leisure, whether he should relieve a distressed parent, feed a starving neighbour, or restore the trust committed to him? should we not suspect the reasoner of knavery, or of very weak affections to virtue? We employ reason, and worthily employ it, in examining the condition, relations, and other circumstances of the agent or patient, or of those with whom

60 Moral action good and bad.

#### Part I.

Of Percep- whom either of them are connected, or, in other words, tion and the state of the case : and in complicated cases, where Affection. the circumstances are many, it may require no small attention to find the true state of the case; but when the relations of the agent or patient, and the circumstances of the action are obvious, or come out such after a fair trial, we should scarcely approve him who demurs on the obligation to that conduct which the case suggests.

Pleasure not the idea of obligation.

64

From what has been said, it is evident, that it is not the pleasure or agreeable sensations, which accompany the exercise of the several affections, nor those consequent to the actions, that constitute moral obligation, or excite in us the idea of it. That pleasure is posterior to the idea of obligation; and frequently we arc obliged, and acknowledge ourselves under an obligation, to such affections and actions as are attended with pain; as in the trials of virtue, where we are obliged to sacrifice private to public good, or a present pleasure to a future interest. We have pleasure in serving an aged parent, but it is neither the perception nor prospect of that pleasure which gives us the idea of obligation to that conduct.

#### CHAP. III. The FINAL Causes of our moral Faculties of PERCEPTION and AFFECTION.

65 The survey proposed.

WE have now taken a general prospect of MAN and of his moral powers and connexions, and on these erectcd a scheme of duty or moral obligation, which seems to be confirmed by experience, consonant to reason, and approved by his most inward and most sacred senses. It may be proper, in the next place, to take a more particular view of the final causes of those delicate springs hy which he is *impelled* to action, and of those clogs by which he is restrained from it. By this detail we shall be able to judge of their aptitude to answer their end. in a creature endued with his capacities, subject to his wants, exposed to his dangers, and susceptible of his enjoyments; and from thence we shall be in a condition to pronounce concerning the end of his whole structure, its harmony with its state, and consequently its subserviency to answer the great and benevolent intentions of its Author.

Inward of the

66

The supreme Being has seen fit to blend in the whole anatomy of of things a prodigions variety of discordant and contrathe system ry principles, *light* and *darkness*, *plcasure* and *pain*, of the mind good and evil. There are multifarious natures, *higher* and lower, and many intermediate ones between the wide-distant extremes. These are differently situated, variously adjusted, and subjected to each other, and all of them subordinate to the order and perfection of the whole. We may suppose man placed as in a centre amidst those innumerable orders of beings, by his outward frame drawing to the material system, and by his inward connected with the INTELLECTUAL or moral, and of course affected by the laws which govern both, or affected by that good and that ill which result from those laws. In this infinite variety of relations with which he is surrounded, and of contingencies to which he is liable, he feels strong attractions to the good, and violent repulsions or aversions to the ill. But as good and ill are often blended, and wonderfully complicated one with the other; as they sometimes immediately produce and run up into each other,

and at other times lie at great distances, yet by means Of Percepof intervening links introduce one another; and as these effects are often brought about in consequence of Affection. hidden relations and general laws, of the energy of which he is an incompetent judge; it is easy for him to mistake good for evil, and evil for good, and consequently he may be frequently attracted by such things as are destructive or repel such as are salutary. Thus, by the tender and complicated frame of his body, he is subjected to a great variety of ills, to sickness, cold, heat, fatigue, and innumerable wants. Yet his knowledge is so narrow withal, and his reason so weak, that in many cases he cannot judge, in the way of investigation or reasoning, of the connexions of those effects with their respective causes, or of the various latent energies of natural things. He is therefore informed of this connexion by the experience of certain senses or organs of perception, which by a mechanical instantaneous motion, feel the good and the ill, receiving pleasure from one, and pain from the other. By these, without any reasoning, he is taught to attract or choose what tends to his welfare, and to repel and avoid what tends to his ruin. Thus, hy his senses of taste and smell, or by the pleasure he receives from certain kinds of food, he is admonished which agree with his constitution; and by an opposite sense of pain he is informed which sort disagree, or are destructive of it; but is not by means of this instructed in the inward natures and constitutions of things.

Some of those senses are armed with strong degrees Use of apof uncasiness or pain, in order to urge him to seek after petites and such objects as are suited to them. And these re- passions. spect his more immediate and pressing wants; as the sense of hunger, thirst, cold, and the like; which, by their painful importunities, compel him to provide food, drink, raiment, shelter. Those instincts by which we are thus prompted with some kind of commotion or violence to attract and pursue good, or to repel and avoid ill, we call appetites and passions. By our senses then we are informed of what is good or ill to the private system, or the individual; and by our private appetites and passions we are impelled to one, and restrained from the other.

In consequence of this machinery, and the great Man's outtrain of wants to which our nature subjects us, we are ward state. engaged in a continued series of occupations, which often require much application of thought, or great bodily labour, or both. The necessaries of life, food, clothes, shelter, and the like, must be provided; conveniencies must be acquired to render life still more casy and comfortable. In order to obtain these, arts, industry, manufactures, and trade are necessary And to secure to us the pcaceable enjoyment of their fruits, civil government, policy, and laws, must be contrived. and the various business of public life carried on : thus, while man is concerned and busied in making provision. or obtaining security for himself, he is by degrees engaged in connexions with a family, friends, neighbours, a community, or a commonwealth. Hence arise new wants, new interests, new cares, and new employments. The passions of one man interfere with those of another. Intcrests are opposed. Competitions arise, contrary courses are taken. Disappointments happen, distinctions are made, and parties formed. This opens a vast 3 A 2 scene

tion and

Of Percep-scene of distraction and embarrassment, and introduces tion and a mighty train of good and ill, both public and private. Yet amidst all this confusion and hurry, plans of action Affection.

must be laid, consequences foreseen or guarded against, inconveniences provided for; and frequently particular resolutions must be taken, and schemes executed, without reasoning or delay.

60 Provisions for it.

By public

passions.

71

72

Congratu-

73 Resent-

ment.

lation.

Pity.

Now what provision has the Author of our nature made for this necessitous condition ? how has he fitted the actor, man, for playing his part in this perplexed and busy secne ?

Our supreme Parent, watchful for the whole, has not senses and left himself without a witness here neither, and hath made nothing imperfect, but all things are double one against the other. He has not left man to be informed, only by the cool notices of reason, of the good or ill, the happiness or misery of his fellow creatures .- He has made him sensible of their good and happiness, but especially of their ill and misery, by an immediate sympathy, or quick feeling of pleasure and of pain.

The latter we eall PITY or COMPASSION. For the former, though every one, who is not quite divested of humanity, feels it in some degree, we have not got a name, unless we call it CONGRATULATION or joyful SYMPATHY, or that good humour which arises on sceing others pleased or happy. Both these feelings have been called in general the PUBLIC or COMMON SENSE, zown purpusoroun, by which we feel for others, and are interestcd in their concerns as really, though perhaps less sensibly, than in our own.

When we see our fellow creatures unhappy through the fault or injury of others, we feel resentment or indignation against the unjust causers of that misery .- If we are conscious that it has happened through our fault or injurious conduct, we feel shame ; and both these classes of senses and passions, regarding misery and wrong, arc armed with such sharp sensations of pain, as not only prove a powerful guard and security to the species, or public system, against those ills it may, but serve also to lessen or remove those ills it does, suffer. Compassion draws us out of ourselves to bear a part of the misfortunes of others, powerfully solicits us in their favour, melts us at the sight of their distress, and makes us in some degree unhappy till they are relieved from it. It is peculiarly well adapted to the condition of human life, because it is much more and oftener in our power to do mischief than good, and to prevent or lessen misery than to communicate positive happiness; and therefore it is an admirable restraint upon the more selfish passions, or those violent impulses that carry us to the hurt of others.

Public affections.

There are other particular instincts or passions which interest us in the concerns of others, even while we are most busy about our own, and which are strongly attractive of good, and repulsive of ill to them. Such are natural affection, friendship, love, gratitude, desire of fame, love of society, of one's country, and others that might be named. Now as the private appetites and passions were found to be armed with strong sensations of desire and uneasiness, to prompt man the more effectually to sustain labours, and to encounter dangers in pursuit of those goods that are necessary to the preservation and welfare of the individual, and to avoid those ills which tend to his destruction; in like manner it was necessary, that this other class of desires 4

and affections should be prompted with as quick sen- Of Perce sations of pain, not only to counteract the strength of tion and theit antagonists, but to engage us in a virtuous aeti- Affection vity for our relations, families, friends, neighbours, country. Indeed our sense of right and wrong will admonish us that it is our *duty*, and *reason* and *experience* farther assure us that it is both our *interest* and best security, to promote the happiness of others; but that sense, that reason, and that experience, would frequently prove but weak and incffeetual prompters to such a conduct, especially in cases of danger and hardship, and amidst all the importunities of nature, and that constant hurry in which the private passions involve us, without the aid of those particular kind affections which mark out to us particular spheres of duty, and with an agreeable violence engage and fix us down to them.

It is evident, therefore, that those two classes of Contrast affection, the private and public, are set one against the balance other, and designed to controul and limit cach other's passions influence, and thereby to produce a just balance in the whole \*. In general, the violent sensations of \* Vid. Ha pain and uneasiness which accompany hunger, thirst, cheson's and the other private appetites, or too great fatigne Conduct of mind as well as of body, prevent the individual sions. Tree from running to great excesses in the exercise of the I. § 2. higher functions of the mind, as too intense thought in the search of truth, violent application to business of any kind, and different degrees of romantic heroism. On the other hand, the finer senses of perception, and those generous desires and affections which are connected with them, the love of action, of imitation, of truth, honour, public virtue, and the like, are wisely placed in the opposite scale, in order to prevent us from sinking into the dregs of the animal life, and debasing the dignity of man below the condition of brutes. So that, by the mutual reaction of those opposite powers, the bad effects are prevented that would naturally result from their acting singly and apart, and the good effects are produced which cach arc severally formcd to produce.

The same wholesome opposition appears likewise in Contrast the particular counter-workings of the private and balance public affections one against the other. Thus compas-private sion is adapted to connterpoise the love of ease, of plea- passions sure, and of life, and to disarm on to set how he plea- passions sure, and of life, and to disarm or to set bounds to resentment; and resentment of injury done to ourselves, or to our friends who are dearer than ourselves, prevents an effeminate compassion or consternation, and gives us a noble contempt of labour, pain, and death. Natural affection, friendship, love of one's country, way zeal for any particular virtue, are frequently more than a match for the whole train of selfish passions. -On the other hand, without that intimate overruling passion of self-love, and those private desires which are connected with it, the social and tender instincts of the human heart would degenerate into the wildest dotage, the most torturing anxiety, and downright frenzy.

But not only are the different orders or elasses of Contra affection checks one upon another, but passions of the among same classes are mutual elogs. Thus, how many are the sai withheld from the violent outrages of resentment by classes fear ! and how easily is fear controlled in its turn, while mighty wrongs awaken a mighty resentment! The

Part

art I.

flection.

an.

Percep. The private passions often interfere, and therefore moion and derate the violence of each other; and a calm self. love is placed at their head, to direct, influence, and controul their particular attractions and repulsions. The public affections likewise restrain one another; and all of them are put under the controll of a calm dispassionate benevolence, which ought in like manner to direct and limit their particular motions. Thus most part, if not all the passions, have a twofold aspect, and serve a twofold end. In one view they may be considered as powers, impelling mankind to a certain course, with a force proportioned to the apprehended moment of the good they aim at. In another view they appear as weights, balancing the action of the powers, and controlling the violence of their impulses. By means of these powers and weights a natural poise is settled in the human breast by its all-wise Author, by which the creature is kept tolerably steady and regular in his course, amidst that variety of stages through which he must pass.

But this is not all the provision which God has made articular reptions for the hurry and perplexity of the scene in which instincts man is destined to act. Amidst those infinite attracapproba-tions and repulsions towards private and public good and ill, mankind either cannot often foresce the consequenees or tendencies of all their actions towards one or other of these, especially where those tendencies are intricate and point different ways, or those conscquences remote and complicated; or though, by careful and cool inquiry, and a due improvement of their rational powers, they might find them out, yet, distracted as they are with business, amused with trifles, dissipated by pleasure, and disturbed by passion, they either have or can find no leisure to attend to those consequences, or to examine how far this or that conduct is productive of private or public good on the whole. Therefore, were it left entirely to the slow and sober deductions of reason to trace those tendencies, and make out those consequences, it is evident, that in many particular instances the business of life must stand still, and many important occasions of action be lost, or perhaps the grossest blunders be committed. On this account, the Deity, besides that general approbation which we bestow on every degree of kind affection, has moreover implanted in man many particular perceptions or determinations to approve of certain qualities or actions, which, in effect, tend to the advantage of society, and are connected with private good, though he does not always see that tendency, nor mind that connexion. And these perceptions or determinations do, without reasoning, point out, and, anteccdent to views of interest, prompt to a conduct beneficial to the public, and useful to the private system. Such is that sense of candour and veracity, that abhorrence of fraud and falsehood, that sense of fidelity, justice, gratitude, greatness of mind, fortitude, clemency, decorum, and that disapprobation of knavery, injustice, ingratitude, meanness of spirit, cowardice, cruelty, and indecorum, which are natural to the human mind. The former of those dispositions, and the actions flowing from them, are approved, and those of the latter kind disapproved by us, even abstracted from the view of their tendency or conduciveness, to the happiness or miscry of others, or of ourselves. In one we discern a beauty, a superior excellency, a congruity to the

dignity of man; in the other a deformity, a littleness, a Of Percepdebasement, of human nature. tion and

There are other principles also connected with the Affection. good of society, or the happiness and perfection of the individual, though that connexion is not immediately Others of apparent, which we behold with real complacency and an inferior approbation, though perhaps inferior in degree, if not order. in kind, such as gravity, modesty, simplicity of deportment, temperance, prudent economy; and we feel some degree of contempt and dislike where they are wanting, or where the opposite qualities prevail. These and the like perceptions or feelings are either different modifications of the moral sense, or subordinate to it, and plainly serve the same important purpose, being expeditious monitors, in the several emergencies of a various and distracted life, of what is right, what is wrong, what is to be pursued, and what avoided; and, by the pleasant or painful consequences which attend them, exerting their influence as powerful prompters to a suitable conduct.

From a slight inspection of the above-named prin- Their geneciples, it is evident they all carry a friendly aspect to ral tendensociety and the individual, and have a more immediate cies. or a more remote tendency to promote the perfection or good of both. This tendency cannot be always foreseen, and would be often mistaken, or seldom attended to by a weak, busy, short-sighted creature like man, both rash and variable in his opinions, a dupe to his own passions, or to the designs of others, liable to sickness, to want, and to error. Principles, therefore, which are so nearly linked with private security and public good, hy directing him, without operose reasoning, where to find the one, and how to promote the other; and, hy prompting him to a conduct conducive to both, are admirably adapted to the exigencies of his present state, and wisely calculated to obtain the ends of universal benevolence.

It were casy, by considering the subject in another Passions fitlight, to show, in a curious detail of particulars, how ted to a wonderfully the inside of man, or that astonishing train trial. of moral powers and affections with which he is cnducd, is fitted to the several stages of that progressive and probationary state through which he is destined to pass. As our faculties are narrow and limited, and rise from very small and imperfect beginnings, they must be improved by exercise, by attention, and repeated trials. And this holds true not only of our intellectual hut of our moral and active powers. The former are liable to errors in speculation, the latter to blunders in practice, and both often terminate in misfortunes and pains. And those errors and blunders are generally owing to our passions, or to our too forward and warm admiration of those partial goods they naturally pursue, or to our fear of those partial ills they naturally repel. Those misfortunes, therefore, lead us back to consider where our misconduct lay, and whence our errors flowed; and consequently are salutary pieces of trial, which tend to enlarge our views, to correct and refine our passions, and consequently improve both our intellectual and moral powers. Our passions then are the rude materials of our virtue, which Heaven has given us to work up, to refine and polish into a harmo-. nious and divine pieccof workmanship. They furnish out the whole machinery, the calms and storms, the lights and shades of human life. They show mankind in every attitude

81

Of Duty or attitude and variety of character, and give virtue both its struggles and its triumphs. To conduct them well Virtue. in every state, is merit; to abuse or misapply them, is

82 To a progressive state.

83

Harmony

structure

and state.

of our

demerit. The different sets of senses, powers, and passions, which unfold themselves in those successive stages, are both necessary and adapted to that rising and progressive state. Enlarging views and growing connexions re-

quire new passions and new habits ; and thus the mind, by these continually expanding and finding a progressive exercise, rises to higher improvements, and pushes forward to maturity and perfection.

In this beautiful economy and harmony of our structure, both outward and inward, with that state, we may at once discern the great lines of our duty traced out in the fairest and brightest characters, and contemplate with admiration a more august and marvellous scene of divinc wisdom and goodness laid in the human breast, than we shall perhaps find in the whole compass of nature.

From this detail it appears, that man, by his original

frame, is made for a temperate, compassionate, benevo- Of Duty lent, active, and progressive state. He is strongly at- Virtue tractive of the good, and repulsive of the ills which befal others as well as himself. He feels the highest ap-In what probation and moral complacence in those affections, and econom in those actions, which immediately and directly respect virtue the good of others, and the highest disapprobation, and sists. abhorrence of the contrary. Besides these, he has many particular perceptions or instincts of approbation, which, though perhaps not of the same kind with the others, yet are accompanied with correspondent degrees of affection, proportioned to their respective tendencies to the public good. Therefore, by acting agreeably to these principles, man acts agreeably to his structure, and ful-fils the benevolent intentions of its Author. But we call a thing good when it answers its end, and a creature good, when he acts in a conformity to his constitution. Consequently, man must be denominated good or virtuous when he acts suitably to the principles and destination of his nature.

#### PART II.

# CHAP. I. The principal Distinctions of DUTY or VIRTUE.

WE have now considered the constitution and connexions of man, and on those erected a general system of duty or moral obligation, cousonant to reason, approved by his most sacred and intimate sense, suitable to his mixed condition, and confirmed by the cxperience of mankind. We have also traced the final causes of his moral faculties and affections to those noble purposes they answer, with regard both to the private and the

85 General division of duty.

Duty to

public system. From this induction it is evident, that there is one order or class of duties which man owes to himself: another to society : and a third to God.

The duties he owes to himself are founded chiefly on one's self. the defensive and private passions, which prompt him to pursue whatever tends to private good or happiness, and to avoid or ward off whatever tends to private ill or miscry. Among the various goods which allure and solicit him, and the various ills which attack or threaten him, " to be intelligent and accurate in selecting one, and rejecting the other, or in preferring the most excellent goods, and avoiding the most terrible ills, when there is a competition among either, and to be discreet in using the best means to attain the goods and avoid the ills, is what we call prudence. This, in our inward frame, corresponds to sagacity, or quickness of sense, in our ontward .- " To proportion our defensive passions to our dangers, we call fortitude; which always implies " a just mixture of calm resentment or animosity, and well governed caution." And this firmness of mind auswers to the strength and muscling of the body. And " duly to adjust our private passions to our wants, or to the respective moment of the good we affect or pursue, we call temperance ; which does therefore always imply, in this large sense of the word, "a just balance or command of the passions."

The second class of duties arises from the public or Duties social affections, "the just harmony or proportion of society. which to the dangers and wants of others, and to the several relations we bear, commonly goes by the name of justice." This includes the whole of our duty to society, to our parents, and the general polity of nature; particularly gratitude, friendship, sincerity, natural affection, benevolence, and the other social virtues : This, being the noblest temper, and fairest complexion of the soul, corresponds to the beauty and fine proportion of the per-The virtues comprehended under the former son. class, especially prudence and fortitude, may likewise be transferred to this; and according to the various circumstances in which they are placed, and the more confined or more extensive sphere in which they operate, may be denominated private, economical, or civil prudence, fortitude, &c. These direct our conduct with regard to the wants and dangers of those lesser or greater circles with which they are connected.

The third class of duties respects the DEITY, and Duties arises from the public affections, and the several glorious God. relations, which he sustains to us as our Creator, Benefactor, Lawgiver, Judge, &c.

We choose to consider this set of duties in the last Metho place; because, though prior in dignity and excellency, they seem to be last in order of time, as thinking it the most simple and easy method to follow the gradual progress of nature, as it takes its rise from individuals, and spreads through the social system, and still ascends upwards, till at length it stretches to its almighty Parent and Head, and so terminates in those duties which are highest and best.

The duties resulting from these relations, are reve-Piety rence, gratitude, love, resignation, dependence, obedience, worship, praise : which, according to the model of our fine capacities, must maintain some sort of proportion to the grandeur and perfection of the object whom we venerate, love, and obey. "This proportion or harmony is expressed by the general name of piety or devotion,"

Man's devotion," which is always stronger or weaker according to the greater or less apprehended excellency of its obutv to fimself. ject. This sublime principle of virtue is the enlivening soul which animates the moral system, and that cement which binds and sustains the other duties which man owes to himself or to society. 01

science. This then is the general temper and constitution of virtue, and these are the principal lines or divisions of To those good dispositions which respect the duty. several objects of our duty, and to all actions which flow from such dispositions, the mind gives its sanction or testimony. And this sanction or judgment concerning the moral quality, or the goodness of actions or dispositions, moralists call conscience. When it judges of an action that is to be performed, it is called an antecedent conscience; and when it passes sentence on an action which is performed, it is called a subsequent conscience. The tendency of an action to produce happiness, or its external conformity to a law, is termed its material goodness. But the good dispositions from which an action proceeds, or its conformity to law in every respect, constitutes its formal goodness.

When the mind is ignorant or uncertain about the moment of an action or its tendency to private or public good; or when there are several circumstances in the case, some of which, being doubtful, render the mind dubious concerning the morality of the action ; that is called a *doubtful* or *scrupulous* conscience; if it mistakes concerning these, it is called an erroneous conscience. If the error or ignorance is involuntary or invincible, the action proceeding from that error, or from that ignorance, is reckoned innocent, or not imputable. If the error or ignorance is supine or affected, i. e. the effect of negligence, or of affectation and wilful inadvertence, the conduct flowing from such error, or such ignorance, is criminal and imputable .--Not to follow one's conseience, though erroneous and ill-informed, is criminal, as it is the guide of life; and to countcract it, shows a depraved and incorrigible spirit. Yet to follow an erroncous conscience is likewise criminal, if that error which misled the conscience was hutchs. the effect of inattention, or any criminal passion \*.

ral Inst.

92 divi-

93 w connce is be reed.

If it be asked, "How an erroneous conscience shall ii c. 3. be rectified, since it is supposed to be the only guide of life, and judge of morals? we answer, In the very same way that we would rectify reason if at any time it should judge wrong, as it often does, viz. by giving it proper and sufficient materials for judging right, i. e. by inquiring into the whole state of the case, the relations, connexions, and several obligations of the actor, the consequences and other circumstances of the action, or the surplusage of private or public good which results, or is likely to result, from the action or from the omission of it. If those circumstances are fairly and fully stated, the conscience will be just and impartial in its decision; for, by a necessary law of our nature, it approves and is well affected to the moral form; and if it seems to approve of vice or immorality, it is always under the notion or mask of some virtue. So that, strictly speaking, it is not conscience which errs; for its sentence is always conformable to the view of the case which lies before it; and is just, upon the supposition that the case is truly such as it is represented to it. All the fault is to be imputed to the

agent, who neglects to be better informed, or who, Of Man's through weakness or wickedness, hastens to pass sen- duty to tence from an imperfect evidence. Hiniself. ~

#### CHAF. II. Of Man's Duty to HIMSELF. Of the Nature of GOOD, and the Chief GOOD.

EVERY creature, by the constitution of his nature is Divisions of determined to love himself; to pursue whatever tends good. to his preservation and happiness, and to avoid whatever tends to his hurt and misery. Being endued with sense and perception, he must necessarily receive plcasure from some objects, and pain from others. Those objects which give pleasure are called good; and those which give pain, evil. To the former he feels that attraction or motion we call desire or love; to the latter, that impulse we call aversion or hatred .- To objects which suggest neither pleasure nor pain, and areapprehended of no use to procure one or ward off the other, we feel neither desire nor aversion ; and such objects are called indifferent. Those objects which do not. of themselves produce pleasure or pain, but are the means of procuring either, we call useful or no.rious. Towards them we are affected in a subordinate manner, or with an indirect and reflective rather than a direct and immediate affection. All the original and particular affections of our nature lead us out to and ultimately rest in the first kind of objects, viz. those which give immediate pleasure, and which we therefore call good directly so. The calm affection of self-love alone is conversanta bout such objects as are only consequentially good, or merely useful to ourselves.

But, besides those sorts of objects which we call Moral good, merely and solely as they give pleasure, or are good. means of procuring it, there is a higher and nobler species of good, towards which we feel that peculiar movement we call approbation or moral complacency; and which we therefore denominate moral good. Such are our affections, and the consequent actions to them. The perception of this is, as has been already observed, quite distinct in kind from the perception of other. species; and though it may be connected with pleasure or advantage by the benevolent constitution of nature, yet it constitutes a good independent of that pleasure and that advantage, and far superior not in degree only but in dignity to both. The other, viz. the *natural good*, consists in obtaining those pleasures which are adapted to the peculiar senses and passions, susceptible of them, and is as various as are those senses and passions. This, viz. the moral good, lies in the right conduct of the several senses and passions, or their just proportion and accommodation to their respective objects and relations, and this is of a more simple and invariable kind.

By our several senses we arc capable of a great va-Human riety of pleasing sensations. These constitute distinct happiness. ends or objects ultimately pursuable for their own sake. To these ends, or ultimate objects, correspond peculiar appetites or affections, which prompt the mind to pursue them. When these ends are attained, there it rests, and looks no farther. Whatever therefore is pursuable, not on its own account, but as subservicnt or necessary to the attainment of something else that is intrinsically valuable for its own sake, be that value ever so great or ever so small, we call a mean,

375

irt II.

376 Of Man's mean, and not an end. So that ends and means conduty to Himself. Consequently happiness, *i. e. human* happiness, cannot be one simple uniform thing in creatures constituted as we are, with such various senses of pleasure, or such different capacities of enjoyment. Now the same principle, or law of our nature, which determines us to pursue any one end or species of good, prompts us to pursue every other end or species of good of which we are susceptible, or to which our Maker has adapted an original propension. But

Maker has adapted an original properiod. Like amidst the great multiplicity of ends or goods which form the various ingredients of our happiness, we perceive an evident gradation or subordination suited to that gradation of senses, powers, and passions, which prevails in our mixed and varions constitution, and to that ascending series of connexions which open upon us in the different stages of our progressive

Gradation of goods.

state. Thus the goods of the body, or of the external senses, seem to hold the lowest rank in this gradation or scale of goods. These we have in common with the brutes ; and though many men are brutish enough to pursue the goods of the body with a more than brutal fury, yct, when at any time they come in competition with goods of an higher order, the unanimous verdict of mankind, by giving the last the preference, condemns the first to the meanest place. Goods consisting in exterior social connexions, as fame, fortune, power, civil authority, seem to succeed next, and are chiefly valuable as the means of procuring natural or moral good, but principally the latter. Goods of the intellect are still superior, as taste, knowledge, memory, judgment, &c. The highest arc moral goods of the mind, directly and ultimately regarding ourselves, as command of the appetites and passions, prudence, forti-tude, benevolence, &c. These are the great objects of our pursuit, and the principal ingredients of our happiness. Let us consider cach of them as they rise one above the other in this natural series or scale, and touch briefly on our obligations to pursue them.

Goods of the body. 99 Good health;

98

Those of the bodly are health, strength, agility, hardiness, and patience of change, neatness, and decency.

Good health, and a regular easy flow of spirits, are in themselves sweet natural enjoyments, a great fund of pleasure, and indeed the proper seasoning which gives a flavour and poignancy to every other pleasure. The want of health unfits us for most duties of life, and is especially an enemy to the social and humane affections, as it generally renders the unhappy suffercr peevish and sullen, disgusted at the allotments of Providence, and consequently apt to entertain suspicious and gloomy sentiments of its Author. It obstructs the free exercise and full improvement of our reason, makes us a burden to our friends, and useless to society. Whereas the uninterrupted enjoyment of good health is a constant source of good humour, and good humour is a great friend to openness and benignity of heart, enables us to encounter the various ills and disappointments of life with more courage, or to sustain them with more patience; and, in short, conduces much, if we are otherwise duly qualified, to our acting our part in every exigency of life with more firmness, consistency, and dignity. Therefore it imports us much to preserve and improve a habit or enjoyment,

without which every other external entertainment is Of Many tasteless, and most other advantages of little avail.— duty to And this is best done by a strict temperance in diet Himsen. and regimen, by regular exercise, and by keeping the mind serene and unruffled by violent passions, and How preunsubdued by intense and constant labours, which served. greatly impair and gradually destroy the strongest constitutions.

Strength, sgility, hardiness, and patience of change, Strength, suppose health, and are unattainable without it; but agility, & they imply something more, and are necessary to gnard it, to give us the perfect use of life and limbs, and to secure us against many otherwise unavoidable ills.— The exercise of the necessary manual, and of most of the elegant arts of life, depends on strength and agility of body; personal dangers, private and public dangers, the demands of our friends, our families, and country, require them; they are necessary in war, and ornamental in peace; fit for the employment of a country and a town life, and they exalt the entertainments and diver- How atsions of both. They are chiefly obtained hy moderate tained. and regular exercise.

Few arc so much raised above want and dependence, Patience or so exempted from business and care, as not to be change; often exposed to inequalities and changes of diet, exercise, air, climate, and other irregularities. Now, what can be so effectual to secure one against the mischiefs arising from such unavoidable alterations, as hardiness, and a certain versatility of constitution which can bear extraordinary labours, and submit to great changes, without any sensible uneasiness or bad consequences. This is best attained, not by an over great delicacy How at and minute attention to forms, or by an invariable re-tained. gularity in diet, hours, and way of living, but rather by a bold and discreet latitude of regimen. Besides, deviations from established rules and forms of living, if kept within the bounds of sobriety and reason, are friendly to thought and original sentiments, animate the dull scene of ordinary life and business, and agreeably stir the passions, which stagnate or breed ill humour in the calms of life.

Neatness, cleanliness, and decency, to which we may Neatness add dignity of countenance and demeanour, seem to have decency something refined and moral in them : at least we ge-&c. nerally esteem them indications of an orderly, genteel, and well governed mind, conscious of an inward worth, or the respect due to one's nature. Whereas nastiness, slovenliness, awkwardness, and indecency, are shrewd symptoms of something mean, careless, and deficient, and betray a mind untaught, illiberal, unconscious of what is due to one's self or to others. How much cleanliness conduces to health, needs hardly to be mentioned; and how necessary it is to maintain one's character and rank in life, and to render us agreeable to others as well as to ourselves, is as evident .- There are certain motions, airs and gestures, which become the human countenance and form, in which we perceive a comeliness, openness, simplicity, gracefulness; and there are others, which to our sense of decorum appear uncomely, affected, disingenuous, and awkward, quite unsuitable to the native dignity of our face and form. The first are in themselves the most easy, natural and commodious, give one boldness and presence of mind, a modest assurance, an address both awful and alluring; they bespeak candour and greatness

MORAL PHILOSOPHY.

Man's ness of mind, raise the most agreeable prejudices in one's favour, render society engaging, command reluty of Timself. spect, and often love, and give weight and authority both in conversation and business; in fine, they are the colouring of virtue, which show it to the greatest advantage in whomsoever it is; and not only imitate, but in some measure supply it where it is wanting. Whereas the last, viz. rudeness, affectation, indecorum, and the like, have all the contrary effects; they are burdensome to one's self, a dishonour to our nature, and a nuisance in society. The former qualities or goods are best attained hy a liberal education, by preserving a just sense of the dignity of our nature, by keeping the best and politest company, hut, above all, by acquiring those virtuous and ennobling hahits of mind which are decency in perfection, which will give an air of unaffected grandeur, and spread a lustre truly engaging over the whole form and deportment. bods of

We are next to consider those goods which consist terior so-in exterior social connexions, as fame, fortune, civil authority, power.

The first has a twofold aspect, as a good pleasant in itself, or gratifying to an original passion, and then as expedient or useful towards a farther end. Honour from the wise and good, on the account of a virtuous conduct, is regaling to a good man; for then his heart re-echoes to the grateful sound. There arc few quite indifferent even to the commendation of the vulgar. Though we cannot approve that conduct which proceeds entirely from this principle, and not from good affection or love of the conduct itself, yet, as it is often a guard and additional motive to virtue in creatures imperfect as we are, and often distracted by interfering passions, it might be dangerous to suppress it altogether, however wise it may he to restrain it within due bounds, and however laudable to use it only as a scaffolding to our virtue, which may be taken down when that glorious structure is finished, but hardly till then. To pursue fame for itself, is innocent ; to regard it only as an auxiliary to virtue, is noble; to seek it chiefly as an engine of public usefulness is still more noble, and highly praise-worthy. For though the opinion and breath of men are transient and fading things, often obtained without merit, and lost without cause; yet as our business is with men, and as our capacity of serving them is generally increased in proportion to their esteem of us, therefore sound and well established moral applause may and will be modestly, not ostentatiously, sought after by the good; not indeed as a solitary refined sort of luxury, but as a public and proper instrument to serve and bless mankind. At the same time they will learn to despise that reputation which is founded on rank, fortune, and any other circumstances or accomplishments that are foreign to real merit, or to nseful services done to others, and think that praise of little avail which is purchased without descrt, and bestowed without judgment.

Fortune, power, and civil authority, or whatever is Pr, &c. called influence and weight among mankind, are goods of the second division, that is, valuable and pursuable only as they are useful, or as means to a farther cnd, viz. procuring or preserving the immediate objects of enjoyment or happiness to ourselves or others. Therefore to love such goods on their own account, and to pursue them as ends, not the means of enjoyment,

VOL. XIV. Part I.

must be highly preposterous and absurd. There can Of Man's be no measure, no limit, to such pursuit; all must be duty to whim, caprice, extravagance. Accordingly, such ap- Himself. petites, unlike all the natural ones, are increased by possession, and whetted by enjoyment. They are always precarious, and never without fears, because the objects lic without one's self; they are soldom without sorrow and vexation, because no accession of wealth or power can satisfy them. But if those goods are consi- How far dcred only as the materials or means of private or pub-pursuable. lic happiness, then the same obligations which bind us to pursue the latter, bind us likewise to pursue the former. We may, and no doubt we onght, to seek such a measure of wealth as is necessary to supply all our real wants, to raise us above servile dependence, and provide us with such conveniences as are suited to our rank and condition in life. To be regardless of this measure of wealth, is to expose ourselves to all the temptations of poverty and corruption : to forfeit our natural independency and freedom; to degrade, and consequently to render the rank we hold, and the character we sustain in society, useless, if not contemptible. When these important ends are secured, we ought not to murmur or repine that we possess no more; yet we are not secluded by any obligation, moral or divine, from seeking more, in order to give us that happiest and most godlike of all powers, the power of doing good. A supine indolence in this respect is both absurd and criminal; absurd, as it robs us of an inexhausted fund of the most refined and durable enjoyments; and criminal, as it renders us so far useless to the society to which we belong. " That Avarice. pursnit of wealth which goes beyond the former end, viz. the obtaining the necessaries, or such convenieneies of life, as, in the estimation of reason, not of vanity or passion, are suited to our rank and condition, and yet is not directed to the latter, viz. the doing good, is what we call avarice." And " that pursuit of power, which after securing one's self, i. e. having attained the proper independence and liberty of a rational social creature, is not directed to the good of 112 others, is what we call ambition, or the lust of power." Ambitior. To what extent the strict measures of virtue will allow us to pursue either wealth or power, and civil authority, is not perhaps possible precisely to determine. That must be left to prudence, and the peculiar character, condition, and other circumstances of each man. Only thus far a limit may be set, that the pursuit of cither must encroach upon no other duty or obligation which we owe to ourselves, to society, or to its parent and head. The same reasoning is to be applied to power as to wealth. It is only valuable as an instrument of our own security, and of the free enjoyment of those original goods it may, and often does, administer to us, and as an engine of more extensive happiness to our friends, our country, and mankind.

Now the best, and indeed the only way to obtain a How fame solid and lasting fame, is an uniform inflexible course and power of virtue, the employing one's ability and wealth in are attainsupplying the wants, and using one's power in promoting or securing the happiness, the rights and liberties of mankind, joined to an universal affability and politeness of manners. And surely one will not mistake the matter much, who thinks the same course condueive to the acquiring greater accessions both of wealth + 3 B and

and power; especially if he adds to those qualifications a vigorous industry, a constant attention to the characters and wants of men, to the conjunctures of times, and continually varying genius of affairs; and a steady intrepid honesty, that will neither yield to the allurements, nor be overawed with the terrors, of that corrupt and corrupting scene in which we live. We have sometimes heard indeed of other ways and means, as fraud, dissimulation, servility, and prostitution, and the like ignoble arts, by which the men of the world (as they are called, shrewd politicians, and men of address!) amass wealth, and procure power; but as we want rather to form a man of virtue, an honest, contented, happy man, we leave to the men of the world their own ways, and permit them, unenvied and unimitated

114 Goods of the intellect.

378

Of Man's

duty to

Himself.

115 Their moment.

\* Philos. Sinic. Confuc lib. i. § 3, 4, & C. 116 The pleasures they give. 11 Knowledge and taste:

by us, to reap the fruit of their doings. The next species of objects in the scale of good, are the goods of the intellect, as knowledge, memory, judgement, taste, sagacity, docility, and whatever else we call

intellectual virtues. Let us consider them a little, and the means as well obligations to improve them. As man is a rational creature, capable of knowing

the differences of things and actions ;--as he not only sees and feels what is present, but remembers what is past, and often foresees what is future ;---as he advances from small beginnings by slow degrees, and with much labour and difficulty, to knowledge and experience ;--as his opinions sway his passions,-as his passions influence his conduct,-and as his conduct draws consequences after it, which extend not only to the present but to the future time, and therefore is the principal source of his happiness or misery; it is evident, that he is formed for intellectual improvements, and that it must be of the utmost consequence for him to improve and cultivate his intellectual powers, on which these opinions, those passions, and that conduct depend\*.

But besides the fnture consequences and moment of improving our intellectual powers, their immediate excrcise on their proper objects yields the most rational and refined pleasures. Knowledge, and a right tastc in the arts of imitation and design, as poetry, painting, sculpture, music, architecture, afford not only an innocent, but a most sensible and sublime entertainment. By these the understanding is instructed in ancient and modern life, the history of men and things, the energies and effects of the passions, the consequences of virtue and vice; by these the imagination is at once entertained and nourished with the beauties of nature and art, lighted up and sprcad out with the novelty, grandcur, and harmony of the universe; and, in fine, the passions are agreeably roused, and suitably engaged, by the greatest and most interesting objects that can fill the human mind. He who has a taste formed to those ingenious delights, and plenty of materials to gratify it, can never want the most agreeable exercise and entertainment, nor once have reason to make that fashionable complaint of the tediousness of time. Nor can he want a proper subject for the discipline and improvement of his heart. For, being daily conversant with beauty, order, and design, in inferior subjects, he bids fair for growing in due time an admirer of what is fair and well-proportioned in the conduct of life and the order of society, which is only order and design exerted in their highest subject. He will learn to

transfer the numbers of poetry to the harmony of the Of Man's mind and of well-governed passions; and, from admi- Himself ring the virtues of others in moral paintings, come to approve and imitate them himself. Therefore, to cultivate a true and correct taste must be both our interest and our duty, when the circumstances of our station give leisure and opportunity for it, and when the doing it is not inconsistent with our higher obligations or engagements to society and mankind,

It is best attained by reading the best books, where How at good sense has more the ascendant than learning, and tained. which pertain more to practice than to speculation; by studying the best models, i. e. those which profess to imitate nature most, and approach the nearcst to it, and by conversing with men of the most refined taste, and the greatest experience in life.

As to the other intellectual goods, what a fund of Other in entertainment must it be to investigate the truth and tellecture various relations of things, to trace the operations of goods, nature to general laws, to explain by these its manifold phenomena, to understand that order by which the universe is upheld, and that economy by which it is governed! to be acquainted with the human mind, the connexions, subordinations, and uses of its powers, and to mark their energy in life ! how agreeable to. the ingenious inquirer, to observe the manifold relations and combinations of individual minds in society, to discern the causes why they flourish or decay, and from thence to ascend, through the vast scale of beings, to that general Mind which presides over all; and operates unseen in every system and in every age, through the whole compass and progression of nature! Devoted to such entertainments as these, the contemplative have abandoned every other pleasure, retired from the body, so to speak, and sequestered themselves from social intercourse : for these, the busy have often preferred to the hurry and din of life the calm retreats of contemplation; for these, when once they came to taste them, even the gay and voluptuous have thrown up the lawless pursuits of sense and appetite, and acknowledged these mental enjoyments to be the most refined, and indeed the only luxury. Besides, by a just and large knowledge of nature, we recognize the perfections of its Author; and thus piety, and all those pious affections which depend on just sentiments of his character, are awakened and confirmed; and a thousand superstitious fears, that arise from partial views of his nature and works, will of course be excluded. An extensive prospect of human life, and of the periods and revolutions of human things, will conduce much to the giving a certain greatness of mind, and a noble contempt to those little competitions about power, honour, and wealth, which disturb and divide the bulk of mankind; and promote a calm endurance of those inconveniencies and ills that are the common appendages of humanity. Add to all, that a just knowlede of human nature, and of those hinges upon which the business and fortunes of men turn, will prevent our thinking either too highly or too meanly of our fellow creatures, give no small scope to the exercise of friendship, confidence, and good will, and at the same time brace the mind with a proper caution and distrust (those nerves of prudence), and give a greater mastery in the conduct of private as well as public life. Therefore, by cultivating our intellectual abilities, we shall

"Man's best promote and secure our interest, and be qualified for acting our part in society with more honour to ourluty to Timself. selves, as well as advantage to mankind. Consequently, to improve them to the utmost of our power is our duty; they are talents committed to us by the Almighty Head of society, and we are accountable to him for the use of them. 120

The intellectual virtues are best improved by accurate and impartial observation, extensive reading, and unconfined converse with men of all characters, especially with those who to private study, have joined the widest acquaintance with the world, and greatest practice in affairs; but, above all, by being much in the world, and having large dealings with mankind. Such opportunities contribute much to divest one of prejudices and a scrvile attachment to crude systems, to open one's views, and to give that experience on which the most useful because the most practical knowledge is built, and from which the surest maxims for the conduct of life are deduced.

The highest goods which enter into the composition of human happiness are moral goods of the mind, directly and ultimately regarding ourselves ; as command of the appetites and passions, prudence and caution, magnanimity, fortitude, humility, love of virtue, love of God, resignation, and the like. These sublime goods are goods by way of cminence, goods recommended and enforced by the most intimate and awful sense and consciousness of our nature; goods that constitute the quintessence, the very temper of happiness, and form that complexion of soul which renders us approveable and lovely in the sight of God; goods, in fine, which are the elements of all our future perfection and felicity. Most of the other goods we have considered depend partly on ourselves, and partly on accidents which we can neither foresee nor prevent, and result from causes which we cannot influence or alter. They are such goods as we may possess to-day and lose to-morrow, and which require a felicity of constitution and talents to attain them in full vigour and perfection, and a felicity of conjunctures to secure the possession of them. Therefore, did our happiness depend altogether or chiefly on such transitory and precarious possessions, it were itself most precarious, and the highest folly to be anxious about it. But though creatures, constituted as we are, cannot be indifferent about such goods, and must suffer in some degree, and consequently have our happiness incomplete without them, yet they weigh but little in the scale when compared with moral goods. By the benevolent constitution of our nature, these are placed within the sphere of our activity, so that no man can be destitute of them unless he is first wanting to himself. Some of the wisest and best of mankind have wanted most of the former goods, and all the external kind, and felt most of the opposite ills, such at least as arise from without; yet by possessing the latter, viz. the moral goods, have declared they were happy; and to the conviction of the most impartial observers have appeared happy. The worst of men have been surrounded with every outward good

and advantage of fortune, and have possessed great Of Man's parts ; yet for want of moral rectitude, have been, and duty to have confessed themselves, notoriously and exquisitely Himself. miscrable. The exercise of virtue has supported its votaries, and made them exult in the midst of tortures almost intolerable; nay, how often has some false form or shadow of it sustained even the greatest (E) villains and bigots under the same pressures ! But no external goods, no goods of fortune, have been able to alleviate the agonies or expel the fcars of a guilty mind, conscious of the deserved hatred and reproach of mankind, and the just displeasure of Almighty God.

As the present condition of human life is wonder- The mixed fully chequered with good and ill, and as no height of condition station, no affluence of fortune, can absolutely ensure of human the good, or secure against the ill, it is evident that a particular great part of the comfort and serenity of life must lie virtues. in having our minds duly affected with regard to both, i. e. rightly attempered to the loss of one and the sufferance of the other. For it is certain that outward calamities derive their chief malignity and pressure from the inward dispositions with which we receive them. By managing these right, we may greatly abate that malignity and pressure, and consequently diminish the number, and weaken the force, of the ills of life, if we should not have it in our power to obtain a large share of its goods. There are particularly three virtues which go to the forming this right temper towards ill, and which are of singular efficacy, if not totally to remove, yet wonderfully to alleviate, the calamities of life. These are fortitude or patience, humility, and resignation.

Fortitude is that calm and steady habit of mind Fortitude. which either moderates our fears, and enables us bravely to encounter the prospect of ill, or renders the mind screne and invincible under its immediate pressure. It lies equally distant from rashness and cowardice : and though it does not hinder us from feeling, yet prevents our complaining or shrinking under the stroke. It always includes a generous contempt of, or at least a noble superiority to, those precarious goods of which we can ensure neither the possession nor continuance. The man therefore who possesses this virtue in this ample sense of it, stands upon an eminence, and sees human things below him; the tempest indeed may reach him, but he stands secure and collected against it upon the basis of conscious virtuc, which the severest storms can seldom shake, and never overthrow.

Humility is another virtue of high rank and dignity, Humility. though often mistaken by proud mortals for meanness and pusillanimity. It is opposed to pride, which commonly includes in it a false or overrated estimation of our own merit, an ascription of it to ourselves as its only and original cause, an unduc comparison of ourselves with others, and in consequence of that supposed superiority, an arrogant preference of ourselves, and a supercilious contempt of them. Humility, on the other hand, seems to denote that modest and ingenuous temper of mind, which arises from a just and equal 3 B 2 estimate

(E) As Ravaillac, who assassinated Henry IV. of France; and Balthasar Geraerd, who murdered William I. prince of Orange.

107

124

380

dHLV to Himself.

Of Man's estimate of our own advantages compared with those of others, and from a sense of our deriving all originally from the Author of our heing. Its ordinary attendants are mildness, a gentle forbearance, and an easy unassuming humanity with regard to the imperfections and faults of others; virtues rare indeed, but of the fairest complexion, the proper offspring of so lovely a parent, the best ornaments of such imperfect creatures as we are, precious in the sight of God, and which sweetly allure the hearts of men.

126 Resignation.

Resignation is that mild and heroic temper of mind which arises from a sense of an infinitely wise and good providence, and enables one to acquiesce with a cordial affection in its just appointments. This virtue has something very particular in its nature, and sublime in its efficacy. For it teaches us to bear ill, not only with patience, and as being unavoidable, but it transforms, as it were, ill into good, by leading us to consider it, and every event that has the least appearance of ill, as a divine dispensation, a wise and benevolent temperament of things, subservient to universal good, and of course including that of every individual, especially of such as calmly steep to it. In this light, the administration itself, nay every act of it, becomes an object of affection, the evil disappears, or is converted into a balm which both heals and nourisheth the mind. For though the first unexpected access of ill may surprise the soul into grief, yet that grief, when the mind calmly reviews its object, changes into contentment, and is by degrees exalted into veneration and a divine composure. Our private will is lost in that of the Almighty, and our security against every real ill rosts on the same bottom as the throne of him who lives and reigns for ever.

127 Chief good, objective and formal.

Before we finish this section, it may be fit to observe, that as the Deity is the supreme and inexhausted source of good, on whom the happiness of the whole creation depends; as he is the highest object in nature, and the only object who is fully proportioned to the intellectual and moral powers of the mind, in whom they ultimately rest, and find their most perfect exercise and completion ; he is therefore termed the Chief good of man, objectively considered. And virtue, or the proportioned and vigorous exercise of the several powers and affections on their respective objects, as above described, is, in the schools, termed the chief good, formally considered, or its formal idea, being the inward temper and native constitution of human happiness.

From the detail we have gone through, the following corollaries may be deduced.

T2S Corollaries.

1. It is evident, that the happiness of such a progressive creature as man can never be at a stand, or continue a fixed invariable thing. His finite nature, let it rise ever so high, admits still higher degrees of improvement and perfection. And his progression in improvement or virtue always makes way for a progression in happiness. So that no possible point can be assigned in any period of his existence in which he is perfectly happy, that is, so happy as to exclude higher degrees of happiness. All his perfection is only comparative. 2. It appears that many things must conspire to complete the happiness of so various a creature as man, subject to so many wants, and susceptible of such different pleasures. 3. As his capaci-ties of pleasure cannot be all gratified at the same

time, and must often interfere with each other in such Duties a precarious and fleeting state as human life, or be Society frequently disappointed, perfect happiness, i. e. the' undisturbed enjoyment of the several pleasures of which we are capable, is unattainable in our present state. 4. That state is most to be sought after, in which the fewest competitions and disappointments can happen, which least of all impairs any sense of pleasure, and opens an inexhausted source of the most refined and lasting enjoyments. 5. That state which is attended with all those advantages, is a state or course of virtue. 6. Therefore, a state of virtue, in which the moral goods of the mind are attained, is the happiest state.

#### CHAP. III. Duties of Society.

#### SECT. I. Filial and Fraternal Duty.

As we have followed the order of nature in tracing the history of man, and those duties which he owes to himself, it seems reasonable to take the same method with those he owes to society, which constitute the sccond class of his obligations.

His parents are among the earliest objects of his at-Connexic tention; he becomes soonest acquainted with them, of parent reposes a peculiar confidence in them, and seems to regard them with a fond affection, the early prognostics of his future piety and gratitude. Thus does nature dictate the first lines of filial duty, even before a just sense of the connexion is formed. But when the child is grown up, and has attained to such a degree of understanding, as to comprehend the moral tie, and be sensible of the obligations he is under to his parents; when he looks back on their tender and disinterested affection, their incessant cares and labours in nursing, educating, and providing for him, during that state in which he had neither prudence nor strength to care and provide for himself, he must be conscious that he owes to them these peculiar duties.

1. To reverence and honour them, as the instruments Duties of nature in introducing him to life, and to that state parents of comfort and happiness which he enjoys; and therefore to esteem and imitate their good qualities, to alleviate and bear with, and spread, as much as possible, a decent veil over their faults and weaknesses.

2. To be highly grateful to them, for those favours which it can hardly ever be in his power fully to repay; to show this gratitude by a strict attention to their wants, and a solicitous care to supply them; by a submissive deference to their authority and advice, especially by paying great regard to it in the choice of a wife, and of an occupation; by yielding to, rather than peevishly contending with, their humours, as remembering how offsthey have been persecuted by his; and, in fine, by soothing their cares, lightening their sorrows, supporting the infirmities of age, and making the remainder of their life as comfortable and joyful as possible.

As his brothren and sisters are the next with whom Duties the creature forms a social and moral connexion, to brethr them he owes a fraternal regard , and with them and sits them he owes a fraternal regard ; and with them ought he to enter into a strict league of friendship, mutual sympathy, advice, assistance, and a generous intercourse of kind offices, remembering their relation

th the

this

unties of to common parents, and that brotherhood of nature ociety. which unites them into a closer community of interest and affection.

#### SECT. II. Concerning Marriage.

When man arrives to a certain agc, he becomes nnexion sensible of a poculiar sympathy and tenderness towards the other sex; the charms of beauty engage his attenher sex. tion, and call forth new and softer dispositions than he has yet felt. The many amiable qualities exhibitcd by a fair outside, or by the mild alurement of fcmale manners, or which the prejudiced spectator without much reasoning supposes those to include, with several other circumstances both natural and accidental, point his view and affection to a particular object, and of course contract that general rambling rcgard, which was lost and useless among the undistinguished crowd, into a peculiar and permanent attachment to one woman, which ordinarily terminates in the most important, venerable, and delightful connexion in

The state of the brute creation is very different from that of human creatures. The former are clothed and generally armed by their structure, easily find what is necessary to their subsistence, and soon attain their vigour and maturity; so that they need the care and aid of their parents but for a short while; and therefore we see that nature has assigned to them vagrant and trausient amours. The connexion being purely natural, and merely for propagating and rearing their offspring, no sooner is that end answered, than the connexion dissolves of course. But the human race are of a more tender and defenceless constitution; their infancy and non-age continue longer; they advance slowly to strength of body and maturity of reason; they need constant attention, and a long series of cares and labours, to train them up to decency, virtue, and the various arts of life. Nature has, therefore, provided them with the most affectionate and anxious tutors, to aid their weakness, to supply their wants, and to accomplish them in those necessary arts, even their own parents, on whom she has devolved this mighty charge, rendered agreeable by the most alluring and powerful of all ties, parental affection. But unless both concur in this grateful task, and continue their joint labours, till they have reared up and planted out their young colony, it must become a prey to every rude invader, and the purpose of nature in the original union of the human pair be defcated. Therefore our structure as well as condition is an evident indication, that the human sexes are destined for a more intimate, for a moral and lasting union. It appears likewise, that the principal end of marriage is not to propagate and nurse up an offspring, but to educate and form minds for the great duties and extensive destinations of life. Society must be supplied from this original nursery. with useful members, and its fairest ornaments and supports.

al ends The mind is apt to be dissipated in its views and acts of friendship and humanity; unless the former be directed to a particular object, and the latter employed in a particular province. When men once indulge in this dissipation, there is no stopping their career; they grow insensible to moral attractions; and, by ob-

structing or impairing the decent and regular exer- Duties of cise of the tender and generous feelings of the human Society. heart, they in time become unqualified for, or averse to, the forming a moral union of souls, which is the cement of society, and the source of the purest domestic joys. Whereas a rational, undepraved love, and its fair companion, marriage, collect a man's views, guide his heart to its proper object, and, by confining his affection to that object, do really enlarge its influence and use. Besides, it is but too evident from the conduct of mankind, that the common ties of humanity are too feeble to engage and interest the passions of the generality in the affairs of society. The connexions of neighbourhood, acquaintance, and general intercourse, are too wide a field of action for many, and those of a public or community are so for more; and in which they either care not or know not how to exert themselves. Therefore nature, ever wise and benevolent, by implanting that strong sympathy which reigns between the individuals of each sex, and by urging them to form a particular moral connexion, the spring of many domestic endearments, has measured out to each pair a particular sphere of action, proportioned to their views, and adapted to their respective capacities. Besides, by interesting them deeply in the concerns of their own little circle, she has connected them more closely with society, which is composed of particular families, and bound them down to their good beliaviour in that particular community to which they belong. This moral connexion is marriage, and this sphere of action is a family.

Of the conjugal alliance the following are the natu-Duties of ral laws. First, Mutual fidelity to the marriage hed. marriage. Disloyalty defeats the very end of marriage ; dissolves the natural coment of the relation ; weakens the moral tie, the chief strength of which lies in the reciprocation of affection; and by making the offspring uncertain. diminishes the care and attachment necessary to their education.

2. A conspiration of connsels and endeavours to promote the common interest of the family, and to educate their common offspring. In order to observe these laws, it is necessary to cultivate, both before and during the married state, the strictest decency and chastity of manners, and a just sense of what becomes their respective characters.

3. The union must be inviolable, and for life. The nature of friendship, and particularly of this species of it, the education of their offspring, and the order of society and of successions, which would otherwise be extremely perplexed, do all seem to require it. To preserve this union, and render the matrimonial state more harmonious and comfortable, a mutual esteem and tenderness, a mutual deference and forbearance, a communication of advice, and assistance and anthority, are absolutely necessary. If either party keep within their proper departments, there need he no disputes about power or superiority, and there will be none. They have no opposite no separate interests, and therefore there can be no just ground for opposition of conduct.

From this dctail, and the present state of things, in Polygamy, which there is pretty near a parity of numbers of both sexes, it is evident that polygamy is an unnatural state ; and though it should be granted to be more fruitful of

136

382

Society.

Dutics of of children, which however it is not found to be, yet it is by no means so fit for rearing minds, which seems to be as much, if not more, the intention of nature than the propagation of bodies.

#### SECT. III. Of Parental Duty.

137 Connexion of parents and children.

The connexion of parents with their children is a natural consequence of the matrimonial connexion; and the duties which they owe them result as natural-ly from that connexion. The feeble state of children, subject to so many wants and dangers, requircs their incessant care and attention; their ignorant and uncultivated minds demand their continual instruction and culture. Had human creatures come into the world with the full strength of men, and the weakness of reason and vehemence of passions which prevail in children, they would have been too strong or too stubborn to have submitted to the government and instruction of their parents. But as they were designed for a progression in knowledge and virtue, it was proper that the growth of their bodies should keep pace with that of their minds, lest the purposes of that progression should have been defeated. Among other admirable purposes which this gradual expansion of their outward as well as inward structure serves, this is one, that it affords ample scope to the exercise of many tender and generous affections, which fill up the domestic life with a beautiful variety of duties and enjoyments; and are of course a noble discipline for the heart, and a hardy kind of education for the more honourable and important duties of public life.

138 The authority found-

The above-mentioned weak and ignorant state of children seems plainly to invest their parents with such connexion. authority and power as is necessary to their support, protection, and education; but that authority and power can be construcd to extend no farther than is necessary to answer those ends, and to last no longer than that weakness and ignorance continue; wherefore, the foundation or reason of the authority and power ceasing, they cease of course. Whatever power or authority then it may be necessary or lawful for parents to exercise during the non-age of their children, to assume or usurp the same when they have attained the maturity or full excreise of their strength and reason would he tyrannical and unjust. From hence it is evident, that parents have no right to punish the persons of their children more severely than the nature of their wardship requires, much less to invade their lives, to encroach upon their liberty, or transfer them as their property to any master whatsoever.

139 Duties of parents.

The first class of duties which parents owe their children respect their natural life; and these comprehend protection, nurture, provision, introducing them into the world in a manner suitable to their rank and fortune, and the like.

140 Education.

The second order of duties regards the intellectual and moral life of their children, or their education in such arts and accomplishments as are necessary to qualify them for performing the duties they owe to themsclves and to others. As this was found to be the principal design of the matrimonial alliance, so the fulfilling that design is the most important and dignified of all the parental duties. In order therefore to fit the child for acting his part wisely and worthily as a

man, as a citizen, and a creature of God, both parents Duties ought to combine their joint wisdom, authority, and Society, power, and each apart to employ those talents which are the peculiar excellency and ornament of their respective sex. The father ought to lay out and superintend their education, the mother to execute and manage the detail of which she is eapable. The former should direct the manly exertion of the intellectual and moral powers of his child. His imagination, and the manner of those exertions, are the peculiar province of the latter. The former should advise, protect, command, and, by his experience, masculine vigour, and that superior authority which is commonly ascribed to his sex, brace and strengthen his pupil for active life, for gravity, integrity, and firmness in suffering. The business of the latter is to bend and soften her male pupil, by the charms of her conversation, and the softness and decency of her manners, for social life, for politeness of taste, and the elegant decorums and enjoyments of humanity; and to improve and refine the tenderness and modesty of her female pupil, and form her to all those mild domestic virtues which are the peculiar characteristies and ornaments of her sex : To conduct the opening minds of their sweet charge through the several periods of their progress, to assist them in each period, in throwing out the latent seeds of reason and ingenuity, and in gaining fresh accessions of light and virtue; and at length, with all these advantages, to produce the young adventurers upon the great theatre of human life, to play their several parts in the sight of their friends, of society, and mankind.

#### SECT. IV. Herile and Servile Duty.

In the natural course of human affairs, it must neces- The grot sarily happen that some of mankind will live in plenty of this of and opulence, and others be reduced to a state of indigence and poverty. The former need the labours of the latter, and the latter provision and support of the former. This mutual necessity is the foundation of that connexion, whether we call it moral or civil, which subsists between masters and servants. He who feeds another has a right to some equivalent, the labour of him whom he maintains, and the fruits of it. And The con he who labours for another has a right to expect that tions of he should support him. But as the labours of a man of vice. ordinary strength are certainly of greater value than mere food and clothing; because they would actually produce more, even the maintenance of a family, were the labourcr to employ them in his own behalf; therefore he has an undoubted right to rate and dispose of his service for certain wages above mere maintenance; and if he has incautiously disposed of it for the latter only, yet the contract being of the onerous kind, he may equitably claim a supply of that deficiency. If the service be specified, the servant is bound to that only; if not, then he is to be construed as bound only to such services as are consistent with the laws of justice and humanity. By the voluntary servitude to which he subjects himself, he forfeits no rights but such as are necessarily included in that servitude, and is obnoxious to no punishment but such as a voluntary failure in the service may be supposed reasonably to require. The offspring of such servants have a right to that

Duties of that liberty which neither they nor their parents have Society. forfeited.

#### As to those who, because of some heinous offence. the case of or for some notorious damage, for which they cannot otherwise compensate, are condemned to perpetual serreat offen vice, they do not, on that account, forfeit all the rights ers. of men; but those, the loss of which is necessary to securc society against the like offences for the future, or to repair the damage they have done. 144

With regard to captives taken in war, it is barba-"he case of aptives. rous and inhuman to make perpetual slaves of them, unless some peculiar and aggravated circumstances of guilt have attended their hostility. The bulk of the subjects of any government engaged in war may be fairly estcemed innocent enemies; and therefore they have a right to that clemency which is consistent with the common safety of mankind, and the particular security of that society against which they are engaged. Though ordinary captives have a grant of their lives, yet to pay their liberty as an equivalent is much too high a price. There are other ways of acknowledging or returning the favour, than by surrendering what is Hutches. far dearer than life itself \*. To those who, under pretext for. Inst. of the necessities of commerce, drive the unnatural trade hill lib iii. of bargaining for human flesh, and consigning their innocent but unfortunate fellow creatures to eternal servitude and misery, we may address the words of a fine writer ; " Let avarice defend it as it will, there is an fonest reluctance in humanity against buying and selling, and regarding those of our own species as our wealth and possessions."

### SECT. V. Social Duties of the private Kind.

Hitherto we have considered only the domestic economical duties, because these are first in the progress of nature. But as man passes beyond the little circle of a family, he forms connexions with relations, friends, neighbours, and others; from whence results a new train of duties of the more private social kind, as " friendship, chastity, courtesy, good neighbourhood, charity, forgiveness, hospitality."

145 an's apti-Man is admirably formed for particular social atde for so-tachments and duties. There is a peculiar and strong propensity in his nature to be affected with the sentiments and dispositions of others Men, like certain musical instruments, are set to each other, so that the vibrations or notes excited in one raise correspondent notes and vibrations in the others. The impulses of pleasure or pain, joy or sorrow, made on one mind, are by an instantaneous sympathy of nature communicated in some degree to all; especially when hearts are (as a humane writer expresses it) in unison of kindness; the joy that vibrates in one communicates to the other also. We may add, that though joy thus imparted swells the harmony, yct grief vibrated to the heart of a friend, and rebounding from thence in sympathetic notes, melts as it were, and almost dies away. All the passions, but cspecially those of the social kind, are contagious; and when the passions of one man mingle with those of another, they increase and multiply prodigiously. There is a most moving eloquence in the human countenance, air, voice and gesture, wonderfully expressive of the most latent feelings and passions of the soul, which darts them like a subtle

flame into the hearts of others, and raises correspon- Duties of dent feelings there : friendship, love, good humour, Society. joy, spread through every feature, and particularly shoot from the eyes their softer and ficrcer fires with an irresistible energy. And in like manner the opposite passions of hatred, enmity, ill humour, melancholy, diffuse a sullen and saddening air over the face, and flashing from eye to eye, kindle a train of similar passions. By these, and other admirable pieces of machinery, men are formed for society and the delightful interchange of friendly sentiments and duties, to increase the happiness of others by participation, and their own by rebound; and to diminish, by dividing, the common stock of their misery.

The first emanations of the social principle beyond Duties arite bounds of a first bound buties arite the bounds of a family lead us to form a nearer con-sing from innetion of friendship or good will with these who are private rejunction of friendship or good will with those who are lation. anywise connected with us by blood or domestic alliance. To them our affection does commonly exert itself in a greater or less degree, according to the nearness or distance of the relation. And this proportion is admirably suited to the extent of our powers and the indigence of our state; for it is only within those lesser circles of consanguinity or alliance that the generality of mankind are able to display their abilities or benevolence, and consequently to uphold their connexion with society, and subservicecy to a public interest. Therefore it is our duty to regard these closer connexions as the next department to that of a family, in which nature has marked out for us a sphere of activity and usefulness; and to cultivate the kind affections which are the coment of these endearing alliances.

Frequently the view of distinguishing moral quali-Ingredients ties in some of our acquaintance may give birth to ship. that more noble connexion we call FRIENDSHIP, which is far superior to the alliances of consanguinity. For these are of a superficial, and often of a transitory nature, of which as they hold more of instinct than of reason, we cannot give such a rational account. But friendship derives all its strength and beanty, and the only existence which is durable, from the qualities of the heart, or from virtuous and lovely dispositions. Or, should these be wanting, they or some shadow of them must be supposed present .- Therefore friendship may be described to be, " The union of two souls by means of virtue, the common object and coment of their mutual affection." Without virtue, or the supposition of it, friendship is only a mercenary league, an alliance of interest, which must dissolve of course when that interest decays or subsists no longer. It is not so much any particular passion, as a composition of some of the noblest feelings and passions of the mind. Good sense, a just taste and love of virtue, a thorough candour and benignity of heart, or what we usually call a good temper, and a generous sympathy of sentiments and affections, are the necessary ingredients of this virtuous connexion. When it is grafted on csteem, strengthened by habit, and mellowed by time, it yields infinite pleasure, ever new and ever growing; is a noble support amidst the various trials and vicissitudes of life, and a high seasoning to most of our other enjoyments .---To form and cultivate virtuous friendship, must be very improving to the temper, as its principal object is virtue, set off with all the allurement of countenance, air.

ety.

383

Part II

384

Duties of air, and manners, shining forth in the native graces Society. of manly honest sentiments and affections, and rendered visible as it were to the friendly spectator in a conduct unaffectedly great and good; and as its principal exercises are the very energies of virtue, or its effect and emanations. So that wherever this amiable attachment prevails, it will exalt our admiration and attachment to virtue, and unless impeded in its course by unnatural prejudices, run out into a friendship to the human race. For as no one can merit, and none ought to usurp, the sacred name of friend, who hates mankind : so whoever truly loves them, possesses the most essential quality of a true friend.

148 Its duties.

The duties of friendship are a mutual esteem of each other, unbribed by interest, and independent of it; a generous confidence, as far distant from suspicion as from reserve; an inviolable harmony of sentiments and dispositions, of designs and interests; a fidelity unshaken by the changes of fortune ; a constancy unalterable by distance of time or place ; a resignation of one's personal interest to those of one's friend, and a reciprocal, unenvious, unreserved exchange of kind offices .---But, amidst all the excrtions of this moral connexion, humane and generous as it is, we must remember that it operates within a narrow sphere, and its immediate operations respect only the individual; and therefore its particular impulses must still be subordinate to a more public interest, or be always directed and controlled by the more extensive connexions of our nature.

When our friendship terminates on any of the other sex, in whom beauty or agreeableness of person and external gracefulness of manners conspire to express and heighten the moral charm of a tender honest heart, and sweet, ingenuous, modest temper, lighted up by good sense; it generally grows into a more soft and endearing attachment. When this attachment is improved by a growing acquaintance with the worth of its object, is conducted by discretion, and issues at length, as it ought to do, in the moral connexion for-\* See Sect merly mentioned \*, it becomes the source of many amiable dutics, of a communication of passions and interests, of the most refined decencies, and of a thousand nameless deep-felt joys of reciprocal tenderness and love, flowing from every look, word, and action. Here friendship acts with double energy, and the natural conspires with the moral charms to strengthen and secure the love of virtue. As the delieate nature of female honour and decorum, and the inexpressible grace of a chaste and modest behaviour are the surest and indeed the only means of kindling at first, and ever after of keeping alive, this tender and elegant flame, and of accomplishing the excellent ends designed by it; to attempt by fraud to violate one, or, under pretence of passion, to sully and corrupt the other, and, by so doing, to expose the too often credulous and unguarded object, with a wanton cruelty, to the hatred of her own sex and the scorn of ours, and to the lowest infamy of both, is a conduct not only base and criminal, but inconsistent with that truly rational and refined enjoyment, the spirit and quintessence of which are derived from the bashful and sacred charms of virtue kept untainted, and therefore ever alluring to the lover's heart.

4

Courtesy, good neighbourhood, affability, and the like Duties duties, which are founded on our private social con- Society nexions, are no less necessary and obligatory to creatures united to society, and supporting and support- Courtesy ed by each other in a chain of mutual want and de-good pendence. They do not consist in a smooth address, neighborn an artificial or obsequious air, fawning adulations or hood, & a polite servility of manners; but in a just and modest sense of our own dignity and that of others, and of the reverence due to mankind, especially to those who hold the higher links of the social chain; in a discreet and manly accommodation of ourselves to the foibles and humours of others; in a strict observance of the rules of decorum and civility; but, above all, in a frank obliging carriage, and generous interchange of good deeds rather than words. Such a conduct is of great use and advantage, as it is an excellent security against injury, and the best claim and recommendation to the esteem, civility, and universal respect of mankind. This inferior order of virtues unites the particular members of society more closely, and forms the lesser pillars of the civil fabric ; which, in many instances, supply the unavoidable defects of laws, and maintain the harmony and decorum of social intercourse, where the more important and essential lines of virtue are wanting.

Charity and forgiveness arc truly amiable and use- Charity ful duties of the social kind. There is a twofold di-forgivene stinction of rights commonly taken notice of by moral writers, viz. perfect and imperfect. To fullil the former, is necessary to the being and support of society; to fulfil the latter, is a duty equally sacred and obligatory, and tends to the improvement and prosperity of society; but as the violation of them is not equally prejudicial to the public good, the fulfilling them is not subjected to the cognizance of law, but left to the candour, humanity, and gratitude of individuals. And by this means ample scope is given to exercise all the generosity, and display the genuine merit and lustre of virtue. Thus the wants and misfortunes of others call for our charitable assistance and seasonable supplies. And the good man, unconstrained by law, and uncontrolled by human authority, will cheerfully acknowledge and generously satisfy this mournful and moving claim; a claim supported by the sanction of heaven, of whose bounties he is honoured to be the grateful trustee. If his own perfect rights are invaded by the injustice of others, he will not therefore reject their imperfect right to pity and forgiveness, unless his grant of these should be inconsistent with the more extensive rights of society, or the public good. In that case he will have recourse to public justice and the laws, and even then he will prosecute the injury with no unnecessary severity, but rather with mildness and humanity. When the injury is merely personal, and of such a nature as to admit of alleviations, and the forgiveness of which would be attended with no worse consequences, especially of a public kind, the good man will generously forgive his offending brother. And it is his duty to do so, and not to take private revenge, or retaliate evil for evil. For though resentment of injury is a natural passion, and implanted, as was observed + above, for wise and good ends; yet, + SeePel considering the manifold partialities which most men chap, if have for themselves, was every one to act as judge

149 Love and chastity.

ii. of this chapter.

Duties of in his own cause, and to execute the sentence dictated by his own resentment, it is but too evident that mankind would pass all bounds in their fury, and the last sufferer be provoked in his turn to make full reprisals. So that evil, thus encountering with evil, would produce one continued series of violence and misery, and render society intolerable, if not impracticable. Therefore, where the security of the individual, or the good of the public, does not require a proportionable retaliation, it is agreeable to the general law of benevolence, and to the particular end of the passion (which is to prevent injury and the misery occasioned by it), to forgive personal injuries, or not to return evil for evil. This duty is one of the noble refinements which Christianity has made upon the general maxims and practice of mankind, and enforced, with a peculiar strength and beauty, by sanctions no less alluring than awful. And indeed the practice of it is generally its own reward; by expelling from the mind the most dreadful intruders upon its repose, those rancorous passions which are begot and nursed by resentment, and by disarming and even subduing every enemy one has, except such as have nothing left of men but the outward form.

nitali.

nmer-

The most enlarged and humane connexion of the private kind scems to be the hospitable alliance, from which flow the amiable and disinterested duties we owe to strangers. If the exercise of passions of the most private and instinctive kind is beheld with moral approbation and delight, how lovely and venerable must those appear which result from a calm philanthropy, are founded in the common rights and connexions of society, and embrace men, not of a particular sect, party, or nation, but all in general without distinction, and without any of the little partialitics of self-love.

#### SECT. VI. Social Duties of the COMMERCIAL Kind.

The next order of connexions are those which arise duties from the wants and weakness of mankind, and from the various circumstances in which their different situations place them. These we may call commercial connexions, and the duties which result from them commercial duties, as justice, fair-dealing, sincerity, fidelity to com-154 pacts, and the like.

Though nature is perfect in all her works, yet she has observed a manifest and eminent distinction among them. To all such as lie beyond the reach of human skill and power, and are properly of her own department, she has given the finishing hand. These man may design after and imitate, but he can never rival them, nor add to their beauty or perfection. Such are the forms and structure of vegetables, animals, and many of their productions, as the honcy comb, the spider's web, and the like. There are others of her works which she has of design left unfinished, as it were, in order to exercise the ingenuity and power of man. She has presented to him a rich profusion of materials of every kind for his conveniency and use; but they are rude and unpolished, or not to be come at without art and labour. These therefore he must apply, in order to adapt them to his use, and to enjoy them in perfection. Thus nature hath given him an infinite variety of herbs, grains, fossils, minerals, woods, Vol. XIV. Part I.

water, earth, air, and a thousand other crude mate- Duties of rials, to supply his numerous wants. But he must sow, Society. plant, dig, refine, polish, build, and, in short, manufacture the various produce of nature, in order to obtain even the necessaries, and much more the conveniencics and elegancies of life. These then are the price of his labour and industry, and, without that, nature will sell him nothing. But as the wants of mankind are many, and the single strength of individuals small, they could hardly find the necessaries, and much less the conveniencies of life, without uniting their ingenuity and strength in acquiring these, and without a mutual intercourse of good offices. Some men are better formed for some kinds of ingenuity and labour, and others for other kinds; and different soils and climates are enriched with different productions; so that men, by exchanging the produce of their respective labours, and supplying the wants of one country with the superfluities of another, do in effect diminish the labours of each, and increase the abundance of all. This is the foundation of all commerce, or exchange of commodities and goods, one with another; in order to facilitate which, men have contrived different species of coin, or moncy, as a common standard by which to estimate the comparative values of their respective goods. But to render commerce sure and effectual, justice, fair-dealing, sincerity, and fidelity to compacts, are absolutely necessary.

Justice or fair-dealing, er, in other words, a dis-Justice; position to treat others as we would be treated by them, is a virtue of the first importance, and inseparable from the virtuous character. It is the cement of society, or that pervading spirit which connects its members, inspires its various relations, and maintains the order and subordination of each part of the whole. Without it, society would become a den of thieves and banditti, hating and hated, devouring and devoured, by one another.

And here it may be proper to take a view of Mr Humc's supposed case of the sensible knave and the worthless miser (Nº 16), and consider what would be the duty of the former according to the theory of those moralists who hold the will of God to be the criterion or rule, and everlasting happiness the motive of human virtue.

It has been already observed, and the truth of the universally observation cannot be controverted, that, by sccretly a duty on observation cannot be controverted, that, by secretly a day on purloining from the coffers of a miser, part of that the princi-gold which there lies useless, a man might in parti-who held cular circumstances promote the good of society, the will of without doing any injury to a single individual : and God to be it was hence inferred, that, in such circumstances, in the criteri-would be no duty to abstain from that work is on of virwould be no duty to abstain from theft, were local uti- tue. lity arising from particular consequences the real criterion or standard of justice. Very different, however, is the conclusion which must be drawn by those who consider the natural tendency of actions, if universally performed, as the critcrion of their merit or demerit, in the sight of God. Such philosophers attend, not to the particular consequences of a single action in any given case, but to the general consequences of the principle from which it flows, if that principle were universally adopted. You cannot (say they) permit one action and forbid another, without showing a dif-30 ference

Part II

Duties of ference between them. The same sort of actions, Society. therefore, must be generally permitted or generally forbidden. But were every man allowed to ascertain for himself the circumstances in which the good of society would be promoted, by secretly abstracting the superfluous wealth of a worthless miser, it is plain that no property could be secure ; that all incitements to industry would be at once removed ; and that, whatever might be the immediate consequences of any particular theft, the general and necessary consequences of the principle by which it was authorized must soon prove fatal. Were one man to purloin part of the riches of a real miser, and to consider his conduct as vindicated by his intention to employ those riches in acts of generosity, another might by the same sort of casuistry think himself authorized to appropriate to himself part of his wealth; and thus theft would spread through all orders of men, till society were dissolved into separate, hostile, and savage families, mutually dreading and shunning each other. The general consequences, therefore, of encroaching upon private property tend evidently and violently to universal misery

On the other hand, indeed, the particular and immediate consequences of that principle which considers every man's property as sacred, may in some cases, such as that supposed, be in a small degree injurious to a few families in the neighbourhood of the miser and the knave. But that injury can never be of long duration ; and it is infinitely more than counterbalanced by the general good consequences of the principle from which it accidentally results; for these consequences extend to all nations and to all ages. Without a sacred regard to property, there could neither be arts nor industry nor confidence among men, and happiness would be for ever banished from this world. But the communication of happiness being the end which God had in view when he created the world, and all men standing in the same relation to him, it is impossible to suppose that he does not approve, and will not ultimately reward, those voluntary actions of which the natural tendency is to increase the sum of human happiness; or that he does not disapprove, and will not ultimately punish, those which naturally tend to aggravate human misery. The conclusion is, that a strict adherence to the principle of justice is universally, and in all possible circumstances, a duty from which we cannot deviate without offending our Creator, and ultimately bringing misery upon oursclves.

157 Sincerity.

Sincerity, or veracity, in our words and actions, is another virtue or duty of great importance to society, being one of the great bands of mutual intercourse, and the foundation of mutual trust. Without it, society would be the dominion of mistrust, jealousy, and fraud, and conversation a traffic of lies and dissimulation. It includes in it a conformity of our wordswith our sentiments, a correspondence between our actions and dispositions, a strict regard to truth, and an irreconcilable abhorrence of falsehood. It does not indeed require, that we expose our sentiments indiscrectly, or tell all the truth in every case; but certainly it does not and cannot admit the least violation of truth or contradiction to our sentiments. For if these bounds are once passed, no possible limit can be assigned where the violation shall stop, and no pretence of pri-

vate or public good can possibly counterbalance the ill Duties of consequences of such a violation. Society.

Fidelity to promises, compacts, and engagements, is 158 likewise a duty of such importance to the security of Fidelity to commerce and interchange of benevolence among man-promises. kind, that society would soon grow intolerable with-compacts. out the strict observance of it. Hobbes, and others &c. who follow the same track, have taken a wonderful deal of pains to puzzle this subject, and to make all the virtues of this sort mercly artificial, and not at all obligatory, antecedent to human conventions. No doubt compacts suppose people who make them; and promises persons to whom they are made ; and therefore both suppose some society, more or less, between those who enter into those mutual engagements. But is not a compact or promise binding, till men have agreed that they shall be binding? or are they only binding, because it is our interest to be bound by them, or to fulfil them? Do not we highly approve the man who fulfils them, even though they should prove to be against his interest? and do not we condemn him as a knave who violates them on that account ? A promise is a voluntary declaration by words, or by an action equally significant, of our resolution to do something in behalf of another, or for his service. When it is made, the person who makes it is by all supposed under an obligation to perform it. And he to whom it is made may demand the performance as his right. That perception of obligation is a simple idea, and is on the same footing as our other moral perceptions, which may be described by instances, but cannot be defined. Whether we have a perception of such obligation quite distinct from the interest, either public or private, that may accompany the fulfilment of it, must be referred to the conscience of every individual. And whether the mere sense of that obligation, apart from its concomitants, is not a sufficient inducement or motive to keep one's promise, without having recourse to any selfish principle of our nature, must be likewise appealed to the conscience of every honest man.

It may, however, be not improper to remark, that Shown in this, as in all other instances, our chief good is be duites combined with our duty. " Men act from expecta-independ tion. Expectation is in most cases determined by the authorit assurances and engagements which we receive from of the m others. If no dependence could be placed upon these ral sense assurances, it would be impossible to know what judgement to form of many future events, or how to regulate our conduct with respect to them. Confidence, therefore, in promises, is essential to the intercourse of human life, because without it, the greatest part of our conduct would proceed upon chance. But there could be no confidence in promises, if men were not obliged to perform them. Those, therefore, who allow not to the perceptions of the moral sense all that authority which we attribute to them, must still admit the obligation to perform promises; because such performance may be shown to be agreeable to the will of God, in the very same manner in which, upon their principles, we have shown the uniform practice of justice to be so.

Fair dealing and fidelity to compacts require that we What I take no advantage of the ignorance, passion, or inca-duties pacity of others, from whatever cause that incapacity quire,

ociety.

1 15.

ties of arises ;- that we be explicit and candid in making bargains, just and faithful in fulfilling our part of them. And if the other party violates his engagements, redress is to be sought from the laws, or from those who are intrusted with the execution of them. In fine, the commercial virtues and duties require that we not only do not invade, but maintain the rights of others ;-that we be fair and impartial in transferring, bartering, or exchanging property, whether in goods or service; and be inviolably faithful to our word and our engagements, where the matter of them is not criminal, and where they are not extorted by force. See PROMISE.

#### SECT. VII. Social Duties of the POLITICAL Kind.

We arc now arrived at the last and highest order of duties respecting society, which result from the exercise of the most generous and heroic affections, and are founded on our most enlarged connexions.

The social principle in man is of such an expansive nature, that it cannot be confined within the circuit of a family, of friends, or a neighbourhood; it spreads into wider systems, and draws men into larger confederacies, communities, and commonwealths. It is in those only that the higher powers of our nature attain the highest improvement and perfection of which they are capable. These principles hardly find objects in the solitary state of nature. There the principle of action rises no higher at farthest than natural affection towards one's offspring. There personal or family wants entirely engross the creature's attention and labour, and allow no leisure, or if they did, no exercise for views and affections of a more enlarged kind. In solitude all are employed in the same way, in providing for the animal life. And even after their utmost labour and care, single and unaided by the industry of others, they find but a sorry supply of their wants, and a feeble precarious security against dangers from wild beasts; from inclement skies and seasons; from the mistakes or petulant passions of their fellow creatures; from their preference of themselves to their neighbours; and from all the little exorbitancies of self-love. But in society, the mutual aids which men give and receive shorten the labours of each, and the combined strength and reason of individuals give security and protection to the whole body. There is both a variety and subordination of genius among mankind. Some are formed to lead and direct others, to contrive plans of happiness for individuals and of government for communities, to take in a public interest, invent laws and arts, and superintend their execution, and, in short, to refine and civilize human life. Others, who have no such good heads, may have as honest hearts, a truly public spirit, love of liberty, hatred of eorruption and tyranny, a generous submission to laws, order, and public institutions, and an extensive philanthropy. And others, who have none of those capacities either of heart or head, may be well formed for manual exercise and bodily labour. The former of these principles have no scope in solitude, where a man's thoughts and concerns do all either centre in himself or extend no farther than a family; into which little circle all the duty and virtue of the solitary mortal is crowded. But society

finds proper objects and exercises for every genius, Daties of and the noblest objects and exercises for the noblest Society. geninses, and for the highest principles in the human constitution; particularly for that warmest and most divine passion which God hath kindled in our 1. soms. the inclination of doing good, and reverencing our nature; which may find here both employment and the most exquisite satisfaction. In society, a man has not only more leisure, but better opportunities, of applying his talents with much greater perfection and success, especially as he is furnished with the joint advice and assistance of his fellow creatures, who are now more closely united one with the other, and sustain a common relation to the same moral system or community. This then is an object proportioned to his most enlarged social affections; and in serving it he finds scope for the exercise and refinement of his highest intellectual and moral powers. Therefore society, or a state of civil government, rests on these two principal pillars, " That in it we find security against those evils which are unavoidable in solitude,-and obtain those goods, some of which cannot be obtained at all, and others not so well, in that state where men depend solely on their individual sagacity and industry."

From this short detail it appears, that man is a social creature, and formed for a social state; and that society, being adapted to the higher principles and destinations of his nature, must of necessity be his natural state.

162 The duties suited to that state, and resulting from Politicat those principles and destinations, or, in other words, duties. from our social passions and social connexions, or relation to a public system, are, love of our country, resignation and obedience to the laws, public spirit, love of liberty, sacrifice of life and all to the public, and the like.

Love of our country, is one of the noblest passions Love of that can warm and animate the human breast. It in- one's councludes all the limited and particular affections to our try. parents, friends, neighbours, fellow citizens, countrymen. It ought to direct and limit our more confined and partial actions within their proper and natural bounds, and never let them encroach on those sacred and first regards we owe to the great public to which we belong. Were we solitary creatures, detached from the rest of mankind, and without any capacity of comprehending a public interest, or without affections leading us to desire and pursue it, it would not be our duty to mind it, nor criminal to neglect it. But as we are PARTS of the public system, and are not only capable of taking in large views of its intcrests, but by the strongest affections connected with it, and prompted to take a share of its concerns, we are under the most sacred ties to prosecute its security and welfare with the utmost ardour, especially in times of public trial. This love of our country does not import an attachment to any particular soil, climate, or spot of earth, where perhaps we first drew our breath, though those natural ideas are often associated with the moral ones, and, like external signs or symbols, help to ascertain and bind them; but it imports an affection to that moral system, or community, which is governed by the same laws and magistrates, and whose several parts are variously connected one with the other, and

211

Duties of all united upon the bottom of a common interest. Perhaps indeed every member of the community cannot comprehend so large an object, especially if it extends through large provinces, and over vast tracts of land : and still less can he form such an idea, if there is no public, i. e. if all are subject to the caprice and unlimited will of one man; but the preference the generality show to their native country, the concern and longing after it which they express when they have been long absent from it; the labours they undertake and sufferings they endure to save or serve it, and the peculiar attachment they have to their countrymen, evidently demonstrate that the passion is natural, and never fails to exert itself when it is fairly disengaged from foreign clogs, and is directed to its proper object. Wherever it prevails in its genuine vigour and extent, it swallows up all sordid and selfish regards ; it conquers the love of ease, power, pleasure, and

wealth; nay, when the amiable partialities of friend-

ship, gratitude, private affection, or regards to a fami-

ly, come in competition with it, it will teach us bravely

to sacrifice all, in order to maintain the rights, and

164 Resignation and obedience Sic.

promote or defend the honour and happiness, of our country. Resignation and obedience to the laws and orders of the society to which we belong, are political duties necessary to its very being and security, without which to the laws, it must soon degenerate into a state of licentiousness and anarchy. The welfare, nay, the nature of civil society, requires, that there should be a subordination of orders, or diversity of ranks and conditions in it ;-that certain men, or orders of men, be appointed to superintend and manage such affairs as concern the public safety and happiness ;-that all have their particular provinces assigned them; that such a subordination be settled among them as none of them may interfere with another; and finally, that certain rules or common measures of action be agreed on, by which each is to discharge his respective duty to govern or be governed, and all may concur in securing the order, and promoting the felicity, of the whole political body. Those rules of action are the laws of the community; and those different orders are the several officers or magistrates appointed by the public to explain them, and superintend or assist in their execution. In consequence of this settlement of things, it is the duty of each individual to obey the laws enacted ; to submit to the executors of them with all due deference and homage, according to their respective ranks and dignity, as to the keepers of the public peace, and the guardians of public liberty; to maintain his own rank, and perform the functions of his own station, with diligence, fidelity, and incorruption. The superiority of the higher orders, or the authority with which the state has invested them, entitle them, especially if they employ their authority well, to the obedience and submission of the lower, and to a proportionable honour and respect from all. The subordination of the lower ranks claims protection, defence, and security from the higher. And the laws, being superior to all, require the obedience and submission of all, being the last resort, beyond which there is no decision or appeal.

Public spirit, heroic zeal, love of liberty, and the other political duties, do, above all others, recommend

those who practise them to the admiration and ho- Duties of mage of mankind; because, as they are the offspring Society. of the noblest minds, so are they the parents of the greatest blessing to society. Yet, exalted as they are, Foundation it is only in equal and free governments where they of public can be exercised and have their due effect ; for there spirit, low only does a true public spirit prevail, and there only of liberty is the public good made the standard of the civil con-&c. stitution. As the end of society is the common interest and welfare of the people associated, this end must of necessity be the supreme law, or common standard, by which the particular rules of action of the several members of the society towards each other are to be regulated. But a common interest can be no other than that which is the result of the common reason or common feelings of all. Private men, or a particular order of men, have interests and feelings peculiar to themselves, and of which they may be good judges; but these may be separate from, and often contrary to, the interests and feelings of the rest of the society; and therefore they can have no right to make, and much less to impose, laws on their fellow citizens, inconsistent with, and opposite to, those interests and those feelings. Therefore, a society, a government, or real public, truly worthy the name, and not a confederacy of banditti, a clan of lawless savages, or a band of slaves under the whip of a master, must be such a one as consists of freemen, choosing or consenting to laws themselves; or, since it often happens that they cannot assemble and act in a collective body, delegating a sufficient number of representatives, i. e. such a number as shall most fully comprehend, and most equally represent, their common feelings and common interests, to digest and vote laws for the conduct and controul of the whole body, the most agreeable to those common feelings and common interests.

A society thus constituted by common reason, and Politica formed on the plan of a common interest, becomes im-duties of mediately an object of public attention, public venera- every cit-tion, public obedience, a public and inviolable attachment, which ought neither to be seduced by bribes, nor awed by terrors; an object, in fine, of all those extensive and important duties which arise from so glorious a confederacy. To watch over such a system; to contribute all he can to promote its good by his reason, his ingenuity, his strength, and every other ability, whether natural or acquired; to resist, and, to the utmost of his power, defeat every encroachment upon it, whether carried on by a secret corruption or open violence ; and to sacrifice his ease, his wealth, his power, nay life itself, and, what is dearer, still, his family and friends, to defend or save it, is the duty, the honour, the interest, and the happiness of every citizen; it will make him venerable and beloved while he lives, be lamented and honoured if he falls in so glorious a cause, and transmit his name with immortal renown to the latest posterity.

As the PEOPLE are the fountain of power and au- Of the thority, the original seat of majesty, the authors of people. laws, and the creators of officers to execute them; if they shall find the power they have conferred abused by their trustees, their majesty violated by tyranny or by usurpation, their authority prostituted to support violence or screen corruption, the laws grown pernicious through accidents unforescen or unavoidable, or rendered

atv to rendered ineffectual through the infidelity and corruption of the executors of them; then it is their right, and what is their right is their duty, to resume that delegated power, and call their trustees to an account ; to resist the usurpation, and extirpate the tyranny; to restore their sullied majesty and prostituted authority; to suspend, alter, or abrogate those laws, and punish their unfaithful and corrupt officers. Nor is it the duty only of the united body; but every member of it ought, according to his respective rank, power, and weight in the community, to concur in advancing and supporting these glorious designs.

Resistance, therefore, being undoubtedly lawful in extraordinary emergencies, the question, among good reasoncrs, can only be with regard to the degree of necessity which can justify resistance, and render it expedient or commendable. And here we must acknowledge, that, with Mr Hume \*, " we shall always incline to their side that draw the bond of allegiance very close, and who consider an infringement of it as the last refuge in desperate cases, when the public is in the lighest danger from violence and tyranny. For besides the mischiefs of a civil war, which commonly attends insurrection, it is certain, that where a disposition to rebellion appcars among any people, it is one chief cause of tyranny in the rulers, and forces them into many violent measures, which, had every one been inclined to submission and obedience, they would never have embraced. Thus the tyrannicide, or assassination approved of by ancient maxims, instead of keeping tyrants and usurpers in awe, made them ten times more fierce and unrelenting; and is now justly abolished on that account by the laws of nations, and universally condemned, as a base and treacherous method of bringing to justice those disturbers of society."

#### CHAP. IV. Duty to GOD.

OF all the relations which the human mind sustains, that which subsists between the Creator and his creatures, the supreme Lawgiver and his subjects, is the highest and the best. This relation arises from the nature of a creature in general, and the constitution of the human mind in particular; the noblest powers and affections of which point to an universal Mind, and would be imperfect and abortive without such a direction. How lame then must that system of morals be, which leaves a Deity out of the question ! How disconsolate, and how destitute of its firmest support !

It does not appear, from any true history or experience of the mind's progress, that any man, by any formal deduction of his discursive power, ever reasoned himself into the belief of a God. Whether such a belief is only some natural anticipation of soul, or is derived from father to son, and from one man to another, in the way of tradition, or is suggested to us in consequence of an immutable law of our nature, on beholding the august aspect and beautiful order of the universe, we will not pretend to determine. What seems most agreeable to experience is, that a sense of its beauty and grandeur, and the admirable fitness of one thing to another in its vast apparatus, leads the mind necessarily and unavoidably to a perception of a design, or of a designing cause, the origin of all, by a progress as simple and natural as that by which a beautiful pic-

ture or a fine building suggests to us the idea of an ex- Duty to cellent artist. For it seems to hold universally true, that wherever we discern a tendency or co-operation of things towards a certain end, or producing a common effect. there, by a necessary law of association, we apprehend design, a designing energy or cause. No matter whether the objects are natural or artificial, still that suggestion is unavoidable, and the connexion between the effect and its adequate cause obtrudes itself on the mind, and it requires no nice search or elaborate deduction of reason to trace or prove that connexion. We are particularly satisfied of its truth in the subject before us by a kind of direct intuition; and we do not seem to attend to the maxim we learn in schools, " That there cannot be an *infinite series* of *causes* and *effects*, producing and produced by one another." That maxim is familiar only to metaphysicians; but all men of sound understanding are led to believe the existence of a God. We are conscious of our existence, of thought, sentiment, and passion, and sensible withal that these came not of ourselves; therefore we immediately recognize a parent mind, an original intelligence, from whom we borrowed those little portions of thought and activity. And while we not only feel kind affections in ourselves, and discover them in others, but likewise behold round us such a number and variety of creatures, endued with natures nicely adjusted to their several stations and economies, supporting and supported by cach other, and all sustained by a common order of things, and sharing different degrees of happiness according to their respective capacitics, we are naturally and necessarily led up to the Father of such a numerous offspring, the fountain of such wide-suread happiness. As we conceive this Being before all, above all, and greater than all, we naturally, and without reasoning, ascribe to him every kind of perfection, wisdom, power, and goodness without bounds, existing through all time, 170 and pervading all space. We apply to him those glo-His relarious epithets of our Creator, Preserver, Benefactor, the tion to the supreme Lord and Lawgiver of the whole society of ra-mind. tional and intelligent creatures. Not only the imperfections and wants of our being and condition, but some of the noblest instincts and affections of our minds, connect us with this great and universal nature. The mind, in its progress from object to object, from one character and prospect of beauty to another, finds some blemish or deficiency in each, and soon exhausts or grows weary and dissatisfied with its subject; it sees no character of excellency among men equal to that pitch of esteem which it is capable of exerting; no object within the compass of human things adequate to the strength of its affection : nor can it stay anywhere in this self-expansive progress, or find repose after its highest flights, till it arrives at a Being of unbounded greatness and worth, on whom it may cmploy its sublimest powers without exhausting the subject, and give scope to the utmost force and fulness of its love without satiety or disgust. So that the nature of this Being corresponds to the nature of man; nor can his intelligent and moral powers obtain their entire end, but on the supposition of such a Being, and without a real sympathy and communication with him. The native propensity of the mind to reverence whatever is great and wonderful in nature, finds a proper object of homage in him who spread out the heavens

and

God.

Part I

390

God

Duty to and the earth, and who sustains and governs the whole of things. The admiration of beauty, the love of order, and the complacency we feel in goodness, must rise to the highest pitch, and attain the full vigour and jey of their operations, when they unite in him who is the sum and source of all perfection.

171 Immorality

It is evident from the slightest survey of morals, of impiety. that how punctual soever one may be in performing the duties which result from our relations to mankind, yet to be quite deficient in performing those which arise from our relation to the Almighty, must argue a strange perversion of reason or depravity of heart. If imperfect degrees of worth attract our veneration, and if the want of it would imply an insensibility, or, which is worse, an aversion to merit, what lameness of affection or immorality of character must it be to be unaffected with, and much more to be ill-affected to, a Being of superlative worth ! To love society, or particular members of it, and yet to have no sense of our connexion with its Head, no affection to our common Parent and Benefactor; to be concerned about the approbation or censure of our fellow creatures, and yet to feel nothing of this kind towards him who sees and weighs our actions with unerring wisdom and justice, and can fully reward or punish them, betrays equal madness and partiality of mind. It is plain, therefore, beyond all doubt, that some regards are due to the great Father of all, in whom every lovely and adorable quality combines to inspire veneration and homage.

As it has been observed already, that our affections depend on our opinions of their objects, and generally keep pace with them, it must be of the highest importance, and secms to be among the first duties we owe to the Author of our being, " to form the least imperfect, since we cannot form perfect, conceptions of his character and administration." For such conceptions, thoroughly imbibed, will render our religion rational, and our dispositions refined. If our opinions are diminutive and distorted, our religion will be superstitious, and our temper abject. Thus, if we aseribe to the Deity that false majesty which consists in the unbenevolent and sullen exercise of mere will or power, or suppose him to delight in the prostrations of servile fear, or as servile praise, he will be worshipped with mean adulation and a profusion of compliments. Farther, If he be looked upon as a stern and implacable Being, delighting in vengeance, he will be adored with pompous offerings, sacrifiees, or whatever else may be thought proper to soothe and mollify him. But if we believe perfect goodness to be the character of the supreme Being, and that he loves those most who resemble him most, the worship paid him will be rational and sublime, and his worshippers will seek to please him by imitating that goodness which they adore. The foundation then of all true religion is a rational faith. And of a rational faith these seem to be the chief articles, to believe, " that an infinite all-perfect Mind exists, who has no opposite nor any separate interest from that of his creatures : that he superintends and governs all creatures, and things ;---that his goodness extends to all his creatures, in different degrees indeed, according to their respective natures, but without any partiality or envy :-- that he does every thing for the best, or in a subserviency to the perfection and

happiness of the whole; particularly that he directs Duty and governs the affairs of men, inspects their actions, distinguishes the good from the bad, loves and befriends the former, is displeased with and pities the latter in this world, and will according to their respective deserts reward one and punish the other in the next ;--that, in fine, he is always earrying on a scheme of virtue and happiness through an unlimited duration; and is ever guiding the universe, through its successive stages and periods, to higher degrees of perfection and felicity." This is true Theism, the glorious scheme of divine faith; a scheme exhibited in all the works of God, and executed through his whole administration.

This faith, well founded and deeply felt, is nearly Moralit connected with a true moral taste, and hath a powerful theisn. efficacy on the temper and manners of the theist. He who admires goodness in others, and delights in the practice of it, must be conscious of a reigning order within, a rectitude and candour of heart, which disposes him to entertain favourable apprehensions of men, and, from an impartial survey of things, to presume that good order and good meaning prevail in the universe; and if good meaning and good order, then an ordering, an intending mind, who is no enemy, no tyrant to his creatures, but a friend, a benefactor, an indulgent sovereign. On the other hand, a bad man, having nothing goodly or generous to contemplate within, no right Immor intentions, nor honesty of heart, suspects every person of athei and every thing; and, beholding nature through the gloom of a selfish and guilty mind, is either averse to the belief of a reigning order, or, if he cannot suppress the unconquerable anticipations of a governing mind, he is prone to tarnish the beauty of nature, and to impute malevolcnee, or blindness and impotence at least. to the Sovereign Ruler. He turns the universe into a forlorn and horrid waste, and transfers his own character to the Deity, by ascribing to him that uncommunicative grandeur, that arbitrary or revengeful spirit, which he affects or admires in himself. As such a temper of mind naturally leads to atheism, or to a superstition fully as bad; therefore, as far as that temper depends on the unhappy creature on whom it prevails, the propensity to atheism or superstition consequent thereto must be immoral. Further, If it be true that the belief or sense of a Deity is natural to the mind, and the evidence of his existence reflected from his works so full as to strike even the most superficial observer with convietion, then the supplanting or corrupting that sense, or the want of due attention to that evidence, and, in consequence of both, a supine ignorance or affected unbelicf of a Deity, must argue a bad temper or an immoral turn of mind. In the ease of invincible ignorance, or a very bad education, though nothing can be concluded directly against the character; yet whenever ill passions and habits pervert the judgment, and by perverting the judgment terminate in atheism, then the case becomes plainly eriminal.

But let easuists determine this as they will, a true The co faith in the divine character and administration is genexion nerally the consequence of a virtuous state of mind, theism The man who is truly and habitually good, feels the virtue. love of order, of beauty, and goodness, in the strongest degree ; and therefore eannot be insensible to those emanations of them which appear in all the works of God, nor

Duty to nor help loving their supreme source and model. He cannot but think, that he who has poured such beauty and goodness over all his works, must himself delight in beauty and goodness, and what he delights in must be both aniiable and happy. Some indeed there are, and it is pity there should be any such, who, through the unhappy influence of a wrong education, have entertained dark and unfriendly thoughts of the Deity and his administration, though otherwise of a virtuous temper themselves. However, it must be acknowledged, that such sentiments have, for the most part, a bad effect on the temper; and when they have not, it is because the undepraved affections of an honest heart are more powerful in their operation than the speenlative opinions of an ill-informed head.

177 re, &cc.

178

But wherever right conceptions of the Deity and his providence prevail, when hc is considered as the inexhausted source of light, and love, and joy, as acting in the joint character of a Father and Governor, imparting an cudless variety of capacities to his creatures, and supplying them with every thing necessary to their full completion and happiness; what veneration and gratitude must such conceptions, thoroughly believed, excite in the mind? How natural and delightful must it be to one whose heart is open to the perception of truth, and of every thing fair, great, and wonderful in nature, to contemplate and adore him who is the first fair, the first great, and first wonderful : in whom wisdom, power, and goodness, dwell vitally, essentially, originally, and act in perfect concert ? What grandeur is here to fill the most enlarged capacity, what beauty to engage the most ardent love, what a mass of wonders in such exuberance of perfection to astonish and delight the human mind through an unfailing duration !

heraffec-If the Deity is considered as our supreme Gnardian and Benefactor, as the Father of Mercies, who loves his creatures with infinite tenderness, and in a particular manner all good men, nay all who delight in goodness, even in its most imperfect degrees ; what resignation, what dependence, what generous confidence, what hope in God and his all-wise providence, must arise in the soul that is possessed of such amiable views of him ! All those exercises of piety, and above all a superlative esteem and love, are directed to God as to their natural, their ultimate, and indeed their only adequate object; and though the immense obligations we have received from him may excite in us more lively feelings of divine goodness than a general and abstracted contemplation of it, yet the affections of gratitude and love are of themselves of the generous disinterested kind, not the result of self-interest, or views of reward. A perfect character, in which we always suppose infinite goodness, guided by unerring wisdom, and supported by almighty power, is the proper object of perfect love; which, as such, we are forcibly drawn to pursue and to aspire after. In the contemplation of the divine nature and attributes, we find at last what the ancient philosophers sought in vain, the SUPREME AND SOVEREIGN GOOD; from which all other goods arise, and in which they are all contained. The Deity therefore challenges our supreme and sovereign love, a sentiment which, whosoever indulges, must be confirmed in the love of virtuc, in a desire to imitate its all-perfect pattern, and in a chcerful security that all his great

concerns, those of his friends and of the universe, shall Duty to be absolutely safe under the conduct of unerring wis-God. dom and unbounded goodness. It is in his care and providence alone that the good man, who is anxious for the happiness of all, finds perfect screnity; a screnity neither ruffled by partial ill nor soured by private disappointment.

When we consider the unstained purity and absolute Repentperfection of the divine nature, and reflect withal on ance, &c. the imperfection and various blemishes of our own, we must sink, or be convinced we ought to sink, into the deepest humility and prostration of soul before him who is so wonderfully great and holy. When, further, we call to mind what low and languid feelings we have of the divine presence and majesty, what insensibility of his fatherly and universal goodness, nay, what ungrateful returns we have made to it, how far we come short of the perfection of his law and the dignity of our own nature, how much we have indulged the selfish passions, and how little we have cherished the benevelent ones; we must be conscious that it is our duty to repent of a temper and conduct so unworthy our nature and unbecoming our obligations to its Author, and to resolve and endeavour to act a wiser and better part for the future. 180

Nevertheless, from the character which his works Hopes of exhibit of him, from those delays or alleviations of pu-pardon. nishment which offenders often experience, and from the merciful tenor of his administration in many other instances, the sincere penitent may entertain good hopes that his Parent and Judge will not be strict to mark iniquity, but will be propitious and favourable to him, if he honestly endeavonrs to avoid his former practices, and subdue his former habits, and to live in a greater conformity to the divine will for the future. If any doubts or fears should still remain, how far it may be consistent with the rectitude and equity of the divine government to let his iniquities pass unpunished, yet he cannot think it unsuitable to his paternal elemency and wisdom to contrive a method of retrieving the penitent offender, that shall unite and reconcile the majesty and mercy of his government. If reason cannot of itself suggest such a scheme, it gives at least some ground to expect it. But though natural religion cannot let in moral light and assurance on so interesting a subject, yct it will teach the humble theist to wait with great submission for any farther intimations it may please the supreme Governor to give of his will; to examine with candour and impartiality whatever evidence shall be proposed to him of a divine revelation, whether that evidence is natural or supernatural; to embrace it with veneration and cheerfulness, if the evidence is clear and convincing; and, finally, if it bring to light any new relations or connexious, natural religion will persuade its sincere votary faithfully to comply with the obligations, and perform the duties which result from those relations and connexions. This is theism, piety, the completion of morality!

We must farther observe, that all those affections Worship, which we supposed to regard the Deity as their imme-praise, diate and primary object, are vital energies of the soul, thanksand consequently exert themselves into act, and, like giving. all other energies, gain strength or greater activity by that exertion. It is therefore our duty as well as highest interest, often at stated times, and by decent and solemn

# MORAL PHILOSOPHY.

Part II

392

God.

Duty to lemn acts, to contemplate and adore the great Original of our existence, the Parent of all beauty and of all good ; to express our veneration and love by an awful and devout recognition of his perfections; and to evidence our gratitude by celebrating his goodness, and thankfully acknowledging all his benefits. It is likewise our duty, by proper exercises of sorrow and humiliation, to eonfess our ingratitude and folly ; to signify our dependence on God, and our confidence in his goodness, by imploring his blessing and gracious eoucurrence in assisting the weakness and euring the corruptions of our nature; and, finally, to testify our sense of his authority, and our faith in his government, by devoting ourselves to do his will, and resigning ourselves to his disposal. These duties are not therefore obligatory, because the Deity needs or can be profited by them; but as they are apparently decent and moral, suitable to the relations he sustains of our Creator, Benefactor, Lawgiver, and Judge ; expressive of our state and obligations; and improving to our tempers, by making us more rational, social, god-like, and consequently more happy.

182 External worship.

We have now considered INTERNAL piety, or the worship of the mind, that which is in spirit and in trnth; we shall conclude the section with a short account of that which is EXTERNAL. External worship is founded on the same principles as internal, and of as strict moral obligation. It is either private or public. Devotion that is inward or purely intellectual, is too spiritual and abstracted an operation for the bulk of mankind. The operations of their minds, such especially as are employed on the most sublime, immatcrial objects, must be assisted by their outward organs, or by

some help from the imagination ; otherwise they will Duty to soon be dissipated by sensible impressions, or grow tire-God some if too long continued. Ideas are such fleeting things, that they must be fixed; and so subtle, that they must be expressed and delineated, as it were, by sensible marks and images; otherwise we cannot attend to them, nor be much affected by them. Therefore, verbal adoration, prayer, praise, thanksgiving, and confession, are admirable aids to inward devotion, fix our attention, compose and enliven our thoughts, impress us more deeply with a sense of the awful presence in which we are, and, by a natural and mechanical sort of influence, tend to heighten those devout feelings and affections which we ought to entertain, and after this manner reduce into formal and explicit act.

This holds true in a higher degree in the case of public public worship, where the presence of our fellow-erea-worship, tures, and the powerful contagion of the social affections, conspire to kindle and spread the devout flame with greater warmth and energy. To conclude : As God is the parent and head of the social system, as he has formed us for a social state, as by one we find the best security against the ills of life, and in the other enjoy its greatest comforts, and as, by means of both, our nature attains its highest improvement and perfeetion ; and moreover, as there are public blessings and crimes in which we all share in some degree, and public wants and dangers to which all are exposed-it is therefore evident, that the various and solemn offices of public religion are duties of indispensable moral obligation, among the best cements of society, the firmest prop of government, and the fairest ornament of both

# PART III.

## CHAP. I. Of PRACTICAL ETHICS, or the CULTURE of the MIND.

184 Dignity

WE have now gone through a particular detail of and import- the several duties we owe to OURSELVES, to SOCIETY, ance of the and to GOD. In eonsidering the first order of duties, subject. we just touched on the methods of acquiring the different kinds of goods which we are led by nature to pursue; only we left the consideration of the method of acquiring the moral goods of the mind to a chapter by itself, because of its singular importance. This chapter then will contain a brief enumeration of the arts of acquiring virtuous habits, and of eradieating vicions ones, as far as is consistent with the brevity of such a work : a subject of the utmost difficulty as well as importance in morals; to which, nevertheless, the least attention has been generally given by moral writers. This will properly follow a detail of duty, as it will direct us to such means or helps as are most necessary and conducive to the practice of it.

185 Sensible ideas and sensible taste.

In the first part of this inquiry we traced the order in which the passions shoot up in the different periods of human life. That order is not accidental or dependent on the eaprice of men, or the influence of eustom and education, but arises from the original constitution and laws of our nature; of which this is one, viz.

" That sensible objects make the first and strongest impressions on the mind." These, by means of our outward organs, being conveyed to the mind, become objects of its attention, on which it reflects when the outward objects are no longer present, or, in other words, when the impressions upon the outward organs ccase. These objects of the mind's reflection are called ideas or notions. Towards these, by another law of our nature, we are not altogether indifferent; but correspondent movements of desire or aversion, love or hatred, arise, according as the objects which they denote made an agreeable or disagreeable impression on our organs. Those ideas and affections which we experience in the first period of life, we refer to the body, or to sense; and the taste, which is formed towards them, we call a sensible, or a merely natural taste ; and the objects corresponding to them we in general call good or pleasant.

But as the mind moves forward in its course, it ex- Ideas of tends its views, and receives a new and more complex heauty at set of ideas, in which it observes uniformily, variety, a fine tas similitude, symmetry of parts, reference to an end, novelty, grandear. These compose a vast train and diversity of imagery, which the mind compounds, divides, and moulds into a thousand forms, in the absence of those objects which first introduced it. And this more complicated imagery suggests a new train of desires and affections,

## art III.

plane of affections, full as sprightly and engaging as any which

e Mind have yet appeared. This whole class of perceptions or *impressions* is referred to the *imagination*, and forms a higher taste than the sensible, and which has an immediate and mighty influence on the finer passions of our nature, and is commonly termed a fine taste.

The objects which correspond to this taste we use to call beautiful, great, harmonious, or wonderful, or in general by the name of beauty.

187 oralideas The mind, still pushing onwards and increasing its A a mostock of ideas, ascends from those to a higher species of ! taste. objects, viz. the order and mutual relations of minds to each other, their reciprocal affections, characters, actions, and various aspects. In these it discovers a beauty, a grandeur, a decorum, more interesting and alluring than in any of the former kinds. These objects, or the notions of them, passing in review before the mind, do, by a necessary law of our nature, call forth another and nobler set of affections, as admiration, esteem, love, hononr, gratitude, benevolence, and others of the like tribe. This class of perfections, and their correspondent affections, we refer, because of their objects (manners), to a moral scuse, and call the taste or temper they excite, moral. And the objects which are agreeable to this taste or temper we denominate by the general name of moral beauty, in order to distinguish it from the other, which is termed natural.

188 arces of

These different sets of ideas or notions arc the mapeiation. terials about which the mind employs itself, which it blends, ranges, and diversifies ten thousand different ways. It feels a strong propension to connect and associate those ideas among which it observes any similitude or any aptitude, whether original and natural, or customary and artificial, to suggest each other. See METAPHYSICS.

189 ws of

I ding

tale and

is of the in ina-

But whatever the reasons arc, whether similitnde, cociation. existence, causality, or any other aptitude or relation, why any two or more ideas are connected by the mind at first, it is an established law of our nature, " that when two or more ideas have often started in company, they form so strong an union, that it is very difficult ever af-ter to separate them." Thus the *lover* cannot separate the idea of merit from his mistress ; the courtier that of dignity from his title or ribbon; the miser that of happiness from his bags. It is these associations of worth or happiness with any of the different sets of objects or images before specified that form our taste or complex idea of good. By another law of our nature, " our affections follow and are governed by this taste. And to these affections our character and conduct are similar and proportioned on the general tenor of which our happiness principally depends."

As all our *leading* passions then depend on the diionsfol. rection which our taste takes, and as it is always of taste. the same strain with our leading associations, it is worth while to inquire a little more particularly how these are formed, in order to detect the secret sources from whence our passions derive their principal strength, their various rises and falls. For this will give us the true key to their management, and let us into the right method of correcting the bad and improving the good. impor-

No kind of objects make so powerful an impression on us as those which are immediately impressed on our senses, or strongly painted on our imaginations. What-+

VOL. XIV. Part I.

over is purely intellectual, as abstracted or scientific Culture of truths, the subtle relations and differences of things, the Mind. has a fainter sort of existence in the mind ; and though it may exercise and whet the memory, the judgment, or the reasoning power, gives hardly any impulse at all to the active powers, the passions, which are the main springs of motion. On the other hand, were the mind entirely under the direction of sense, and impressible only by such objects as are present, and strike some of the outward organs, we should then be precisely in the state of the brute creation, and be governed solely by instinct or appetite, and have no power to controul whatever impressions are made upon us : Nature has therefore endued us with a middle faculty, wonderfully adapted to our mixed state, which holds partly of sense and partly of reason, being strongly allied to the former, and the common receptacle in which all the notices that come from that quarter are treasured up; and yet greatly subservient and ministerial to the latter, by giving a body, a coherence, and beauty to its conceptions. This middle faculty is called the imagination, one of the most busy and fruitful powers of the mind. Into this common storehouse are likewise carried all those moral forms which are derived from our moral faculties of perception; and there they often undergo new changes and appearances, by being mixed and wrought up with the ideas and forms of sensible or natural things. By this coalition of imagery, natural beauty is dignified and heightened by moral qualities and perfections, and moral qualities are at once exhibited and set off by natural beauty. The sensible beauty, or good, is refined from its dross by partaking of the moral; and the moral receives a stamp, a visible character and currency, from the sensible.

As we are first of all accustomed to sensible impres-Its energy sions and sensible enjoyments, we contract early a sensual in various relish or love of pleasure, in the lower sense of the word, heighten-In order, however, to justify this relish, the mind, as ing sensible it becomes open to higher perceptions of beauty and pleasures; good, borrows from thence a noble set of images, as fine taste, generosity, social affections, friendship, good fellowship, and the like; and, by dressing out the old pursuits with these new ornaments, gives them an additional dignity and lustre. By these ways the desire of a table, love of finery, intrigue, and pleasure, are vastly increased beyond their natural pitch, having an impulse combined of the force of the natural appetites, and of the superadded strength of those passions which tend to 193 in heightthe moral species. When the mind becomes more sen- ching the sible to those objects or appearances in which it per-pleasures ceives beauty, uniformity, grandeur, and harmony, as of beauty, fine clothes, elegant furniture, plate, pictures, gardens, harmony, houses, equipage, the beauty of animals, and particu-&c. larly the attractions of the sex ; to these objects the mind is led by nature or taught by custom, the opinion and example of others, to annex certain ideas of moral character, dignity, decorum, honour, liberality, tenderness, and active or social enjoyment. The consequence of this association is, that the objects to which these are annexed must rise in their value, and be pursued with proportionable ardour. The enjoyment of them is often attended with pleasure; and the mere possession of them, where that is wanting, frequently draws respect from one's fellow-creatures : This respect is, by many, thought equivalent to the pleasure of enjoyment. Hence 3 D

# MORAL PHILOSOPHY.

394

104 in raising the value of external symbols, 8. c.

> 195 in heightening the value of

Culture of it happens that the idea of happiness is connected with the Mud. the mere possession, which is therefore eagerly sought after without any regard to the generous use or honourable enjoyment. Thus the passion, resting on the means not the end, i. e. losing sight of its natural object, becomes wild and extravagant.

In fine, any object, or external denomination, a staff, a garter, a cup, a crown, a title, may become a moral badge or emblem of merit, magnificence, or honour, according as these have been found or thought, by the possessors or admirers of them, to accompany them; yct, by the deception formerly mentioned, the marit or the conduct which entitled, or should entitle to those marks of distinction, shall be forgot or neglected, and the badges themselves be passionately affected or pursued, as including every excellency. If these are attained by any means, all the concomitants which nature, eustom, or accidents have joined to them, will be supposed to follow of course. Thus, moral ends with which the unhappy admirer is apt to colour over his passion and views will, in his opinion, justify the most immoral means, as prostitution, adulation, fraud, treachery, and every species of knavery, whether more open or more disguised.

When men are once engaged in active life, and find that wealth and power, generally called INTEREST, are the great avenues to every kind of enjoyment, they are power, &c. apt to throw in many engaging moral forms to the object of their pursuit, in order to justify their passion, and varnish over the measures they take to gratify it, as independency on the vices or passions of others, provision and security to themselves and friends, prudent economy or well-placed charity, social communication, superiority to their enemics, who are all villains, honourable service, and many other ingredients of merit. To attain such capacities of nsefulness or enjoyment, what arts, nay what meannesses, can be thought blamcable by those cool pursuers of interest ?-- Nor have they whom the gay world is pleased to indulge with the title of men of pleasure, their imaginations less pregnant with moral images, with which they never fail to ennoble, or, if they cannot do that, to palliate their gross pursuits. Thus admiration of wit, of sentiments and merit, friendship, love, generous sympathy, mutual confidence, giving and receiving pleasure, are the ordinary ingredients with which they season their gallantry and pleasurable entertainments; and by which they impose on themselves, and endeavour to impose on others, that their amours are the joint issue of good sense and virtue.

These associations, variously combined and propor-196 ence on all tioned by the imagination, form the chief private pasthepassions, sions, which govern the lives of the generality, as the love of action, of pleasure, power, wealth, and fame; they influence the defensive, and affect the public passions, and raise joy or sorrow as they are gratified or disappointed. So that in effect these associations of good and evil, beauty and deformity, and the passions they raise, are the main hinges of life and manners, and the great sources of our happiness or misery. It is evident, therefore, that the whole of moral culture must depend on giving a right direction to the leading passions, and duly proportioning them to the value of the objects or goods pursued, under what name soever they may appear.

Now, in order to give them this right direction and

due proportion, it appears from the foregoing detail, Culture of that those associations of ideas, upon which the passions the Mind depend, must be duly regulated; that is to say, as an exorbitant passion for wealth, pleasure, or power, flows Moral culfrom an association or opinion, that more beauty and ture, by good, whether natural or moral, enters into the enjoy-correcting ment or possession of them, than really belongs to ei-our taste ther; therefore, in restoring those passions to their just tions; proportion, we must begin with correcting the opinion, or breaking the false association, or, in other words, we must decompound the complex phantom of happiness or good, which we fondly admire; disunite those ideas that have no natural alliance; and separate the original idea of wealth, power, or pleasure, from the foreign mixtures, incorporated with it, which enhance its value, or give it its chief power to enchant and seduce the mind. For instance, lct it be considered how poor and inconsiderable a thing wealth is, if it be disjoined from real use, or from ideas of capacity in the possessor to do good, from independence, generosity, provision for a family or friends, and social communication with others. By this standard let its true value be fixed; let its misapplication, or unbenevolent enjoyment, be accounted sordid and infamous; and nothing worthy or estimable be ascribed to the mere possession of it, which is not borrowed from its generous use.

If that complex form of good which is called pleasure by self-de If that complex form of good which is caned pleusart had, and engage us, let it be analyzed into its constituent prin- nial, and counterciples, or those allurements it draws from the heart process; and imagination, in order to heighten the low part of the indulgence; let the separate and comparative moment of each be distinctly ascertained and deduced from that gross part, and this remainder of the accumulated enjoyment will dwindle down into a poor, insipid, transitory thing. In proportion as the opinion of the good pursued abates, the admiration must decay, and the passions lose strength of course. One effectual way to lower the opinion, and consequently to weaken the habit founded upon it, is to practise lesser pieces of selfdenial, or to abstain, to a certain pitch, from the pursuit or enjoyment of the favourite object; and, that this may be the more easily accomplished, one must avoid those occasions, that company, those places, and the other circumstances, that inflamed one and endeared the other. And, as a counter-process, let higher or even different enjoyments be brought in view, other passions played upon the former, different places frequented, other exercises tried, company kept with persons of a different or more correct way of thinking both in natural and moral subjects.

As much depends on our setting out well in life, let by a sou the youthful fancy, which is apt to be very florid and and natu luxuriant, he early accustomed by instruction, example, and significant moral exercises, nay, by looks, gestures, and every other testimony of just approbation or blame, to annex ideas of merit, honour, and happiness, not to birth, dress, rank, beauty, fortune, power, popularity, and the like outward things, but to moral and truly virtuous qualities, and to those enjoyments which spring from a well-informed judgment and a regular conduct of the affections, especially those of the social and disinterested kind. Such dignified forms of beauty and good, often suggested, and, by moving pictures and examples warmly recommended to the imagination, enforced by the authority of conscience, and demonstrated by reason to be tho

aracter,

alture of the surest means of enjoyment, and the only indepenne wind dent, undeprivable, and durable goods, will be the best eounterbalance to meaner passions, and the firmest foundation and security of virtue. 200

It is of great importance to the forming a just taste, or pure and large conceptions of happiness, to study and understand human nature well, to remember what a complicated system it is, particularly to have deeply imprinted on our mind that GRADATION of senses, faculties, and powers of enjoyment formerly mentioned, and the subordination of goods resulting from thence, which nature points out, and the experience of mankind confirms. Who, when they think seriously, and are not under the immediate influence of some violent prejudice or passion, prefer not the pleasures of action, contemplation, society, and most exercises and joys of the moral kind, as friendship, natural affection, and the like, to all sensual gratifications whatsoever ? Where the different species of pleasure are blended into one complex form, let them be accurately distinguished, and be referred each to its proper faculty and sense, and examined apart what they have peculiar, what common with others, and what foreign and adventitious. Let wealth, grandeur, luxury, love, fame, and the like, be tried by this test, and their true alloy will be found out. Let it be further considered, whether the mind may not be easy and enjoy itself greatly, though it want many of those elegancies and superfluities of life which some possess, or that load of wealth and power which others eagerly pursue, and under which they groan. Let the difficulty of attaining, the precariousness of possessing, and the many abatements in enjoying overgrown wealth and envied greatness, of which the weary possessors so frequently complain, as the hurry of business, the burden of company, of paying attendance to the few, and giving it to many, the cares of keeping, the fears of losing, and the desires of increasing what they have, and the other troubles which accompany this pitiful drudgery and pompous servitude ; let these and the like circumstances be often considered, that are conducive to the removing or lessening the opinion of such goods, and the attendant passion or set of passions will decay of course.

Let the peenliar bent of our nature and character be your own observed, whether we are most inclined to form associations and relish objects of the sensible, intellectual, or moral kind. Let that which has the ascendant be particularly watched; let it be directed to right objects, be improved by proportioned exercises, and guarded by proper ehecks from an opposite quarter. Thus the sensible turn may be exalted by the intellectual, and a taste for the beauty of the fine arts, and both may be made subservient to convey and rivet sentiments highly moral and public-spirited. This inward survey must extend to the strength and weaknesses of one's nature, one's conditions, connexions, habitudes, fortunes, studies, acquaintance, and the other circumstanees of one's life, from which every man will form the justest estimate of his own dispositions and character, and the best rules for correcting and improving them. And in order to do this with more advantage, let those times or critical seasons be watched when the mind is best disposed towards a change; and let them be improved by rigorous resolutions, promises, or whatever else will engage the mind

to persevere in virture. Let the conduct, in fine, be of- Culture of ten reviewed, and the causes of its corruption or im- the Mind. provement be earefully observed.

It will greatly conduce to refine the moral tastc and by frequent strengthen the virtuous temper, to accustom the mind to moral exerthe frequent exercise of moral sentiments and determi-cises; nations, by reading history, poetry, particularly of the picturesque and dramatic kind, the study of the fine arts; by conversing with the most eminent for good sense and virtue; but above all, by frequent and repeated acts of humanity, compassion, friendship, politeness, and hospitality. It is exercise that gives health and strength. He that reasons most frequently becomes the wisest, and most enjoys the pleasures of wisdom. He who is most often affected by objects of compassion in poetry, history, or real life, will have his sonl most open to pity, and its delightful pains and duties. So he also who practices most diligently the offices of kindness and charity, will by it cultivate that disposition from whence all his pretensions to personal merit must arise, his present and his future happiness.

An useful and honourable employment in life will by an hoadminister a thousand opportunities of this kind, and nest cmgreatly strengthen a sense of virtue and good affections, ployment; which must be nourished by light training, as well as our understandings. For such an employment, by enlarging one's experience, giving a habit of attention and caution, or obliging one, from necessity or interest, to keep a guard over the passions, and study the outward deceneies and appearances of virtue, will by degrees produce good habit, and at length insinuate the love of virtue and honesty for its own sake.

It is a great inducement to the exercise of benevo-by viewing lence to view human nature in a favourable light, to men and observe the characters and circumstances of mankind a fair light; on the fairest sides, to put the best constructions on their actions they will bear, and to consider them as the result of partial and mistaken rather than ill affeetions, or, at worst, as the excesses of a pardonable selflove, seldom or never the effect of pure maliee.

Above all, the nature and consequences of virtue and by considevice, their eonsequences being the law of our nature ration and and will of heaven; the light in which they appear to pious exerour supreme Parent and Lawgiver, and the reception they will meet with from him, must be often attended to. The exercises of piety, as adoration and praise of the divine excellency, invocation of and dependence on his aid, confession, thanksgiving, and resignation, are habitually to be indulged, and frequently performed, not only as *medicinal*, but highly *improving* to the temper.

To conclude : It will be of admirable efficacy to-by just wards eradicating bad habits, and implanting good views of ones, frequently to contemplate human life as the great human life, and its connursery of our future and immortal existence, as that state nexion of probation in which we are to be educated for a divine with a fulife ; to remember, that our virtues or vices will be im-ture. mortal as ourselves, and influence our future as well as our present happiness-and therefore, that every disposition and action is to be regarded as pointing beyond the present to an immortal duration .- An habitual attention to this wide and important connexion will give a vast compass and dignity to our sentiments and actions, a no-3 D 2 ble

### CHAP. II. Alotives to VIRTUE from Personal HAPPINESS.

Motives from perpiness.

\* Fide Part I. chap. i. ii.

200 Happiness of virtue from within.

WE have already considered our obligations to the practice of virtue, arising from the constitution of our nature, by which we are led to approve a certain order and cconomy of effections, and a certain course of action correspondent to it\*. But, besides this, there are several motives which strengthen and secure virtue, though not themselves of a moral kind. These are, its tendency to personal happiness and the controry tendency of vice. " Personal happiness arises either from the state of a man's own mind, or from the state and disposition of external causes towards him."

We shall first examine the "tendency of virtue to happiness with respect to the state of a man's own mind." This is a point of the utmost consequence in morals, because, unless we can convince ourselves, or show to others, that, by doing our duty, or fulfilling our moral obligations, we consult the greatest satisfaction of our own mind, or our highest interest on the whole, it will raise strong and often unsurmountable prejudices against the practice of virtue, especially whenever there arise any appearances of opposition between our duty and our satisfaction or interest. To ereatures so desirous of happiness, and averse to misery, as we are, and often so oddly situated amidst contending passions and interests, it is necessary that virtue appear not only an honourable but a pleasing and beneficent form. And in order to justify our choice to ourselves as well as before others, we must ourselves feel and be able to avow in the face of the whole world, that her ways are ways of pleasantness, and her paths the paths of peace. This will show, beyond all contradiction, that we not only approve, but can give a sufficient reason for what we do.

210 Influence of temper of the mind.

Let any man in a cool hour, when he is disengaged vice on the from business, and undisturbed by passion (as such cool hours will sometimes happen), sit down, and seriously reflect with himself what state or temper of mind he would choose to feel and indulge, in order to be easy and to enjoy himself. Would he choose, for that purpose, to be in a constant dissipation and hurry of thought; to be disturbed in the exercise of his reason; to have various and often interfering phantoms of good playing before his imagination, soliciting and distracting him by turns, now soothing him with amusing hopes, then torturing him with anxious fears; and to approve this minute what he shall condemn the next? Would he choose to have a strong and painful sense of every petty injury; quick apprehensions of every impending evil; incessant and insatiable desires of power, wealth, honour, pleasure; an irreconcilable antipathy against all competitors and rivals; insolent and tyrannical dispositions to all below him ; fawning, and at the same time envious, dispositions to all above him; with dark suspicions and jealousies of every mortal? Would he choose neither to love nor be beloved of any; to have no friend in whom to confide, or with whom to interchange his sentiments or designs; no favourite, on whom to bestow his kindness, or vent

his passions; in fine, to be conscious of no merit with From Han mankind, no esteem from any creature, no good affec- piness. tion to his Maker, no concern for, nor hopes of, his approbation; but in-tead of all these, to hate, and know that he is hated, to condemn, and know that he is condemned by all; by the good, because he is so unlike; and by the bad because he is so like themselves; to hate or to dread the very Being that made him; and, in short, to have his breast the seat of pride and passion, petulance and revenge, deep melancholy, cool malignity, and all the other furies that ever possessed and tortured mankind ?- Would our cahn inquirer after happiness pitch on such a state, and such a temper of mind, as the most likely means to put him in possession of his desired ease and self-enjoyment ?

Or would be rather choose a serene and easy flow of Influence thought; a reason clear and composed; a judgment virtue or unbiassed by prejudice, and undistracted by passion; a the temp sober and well-governed faney, which presents the images of things true, and unmixed with delusive and unnatural charms, and therefore administers no improper or dangerous fuel to the passions, but leaves the mind free to choose or reject, as becomes a reasonable creature; a sweet and sedate temper, not easily ruffled by hopes or fears, prone neither to suspicion nor revenge, apt to view men and things in the fairest lights, and to bend gently to the humours of others rather than obstinately to contend with them? Would he choose such moderation and continence of mind, as neither to be ambitious of power, fond of honours, eovetous of wealth, nor a slave to pleasure ; a mind of course neither elated with success, nor dejected with disappointment; such a modest and noble spirit as supports power without insolence, wears honour without pride, uses wealth without profusion or parsimony; and rejoices more in giving than in receiving pleasure; such fortitude and equanimity as rises above misfortunes, or turns them into blessings; such integrity and greatness of mind, as neither flatters the vices, nor triumphs over the follies of men; as equally spurns servitude and tyranny, and will neither engage in low designs; nor abet them in others? Would he choose, in fine, such mildness and benignity of heart as takes part in all the joys, and refuses none of the sorrows, of others; stands well affected to all mankind; is conscions of meriting the esteem of all, and of being beloved by the best; a mind which delights in doing good without any show, and yet arrogates nothing on that account; rejoices in loving and being beloved by its Maker, aets ever under his eye, resigns itself to his providence, and triumphs in his approbation ? Which of these dispositions would be his choice in order to be contented, serene, and happy? The former tem-per is VICE, the latter VIRTUE. Where one prevails, there MISERY prevails, and by the generality is acknowledged to prevail. Where the other reigns, there HAPPINESS reigns, and by the confession of mankind is acknowledged to reign. The perfection of either temper is misery or happiness in perfection .- THERE-FORE, every approach to either extreme is an approach to misery or to happiness ; i. e. every degree of vice or virtue is accompanied with a proportionable degree of misery or happiness.

The principal alleviations of a virtuous man's cala-The all mities are these :- That though some of them may ations o's have

tok II.

His enjoyments are more numerous, or, if less numerous, yet more intense than those of the bad man: for he shares in the joys of others by rebound; and every increase of general or particular happiness is a real addition to his own. It is true, his friendly sympathy with others subjects him to some pains which the hardhearted wretch does not feel; yet to give a loose to it, is a kind of agreeable discharge. It is such a sorrow as he loves to indulge : a sort of pleasing anguish that sweetly melts the mind, and terminates in a self-approving joy. Though the good man may want means to execute, or be disappointed in the success of, his benevolent purposes; yet, as was formerly + observed, he is still conscious of good affection, and that consciousness is an enjoyment of a more delightful savour than the greatest triumphs of successful vice. If the ambitious, covetous, or voluptuous, are disappointcd, their passions recoil upon them with a fury proportioned to their opinion of the value of what they pursue, and their hope of success; while they have nothing within to balance the disappointment, unless it is an useless fund of pride, which, however, frequently turns mere accidents into mortifying affronts, and exalts grief into rage and frenzy. Whereas the meek, humble, and benevolent temper, is its own reward, is satisfied from within; and, as it magnifies greatly the pleasure of success, so it wonderfully alleviates, and in a manner annihilates, all pain for the want of it.

As the good man is conscious of loving and wishing well to all mankind, he must be sensible of his deserving the esteem and good-will of all; and this subposed reciprocation of social feelings is, by the very frame of our nature, made a source of very intense and enlivening joys. By this sympathy of affections and intcrests, he feels himself intimately united with the human race; and, being sensibly alive over the whole system, his heart receives and becomes responsive to every touch given to any part. So that, as an eminent philosopher \* finely expresses it, he gathers contentment and delight from the pleased and happy states of those around him, from accounts and relations of such happiness, from the very countenances, gestures, voices, and sounds, even of creatures foreign to our kind, whose signs of joy and contentment he can any way discern.

not inwe with tural source of joy whatever, or deaden his sense of any innocent gratification. They rather keep the several senses and powers of enjoyment open and disengaged, intense and uncorrupted by riot or abuse; as is evident to any one who considers the dissipated, unfeeling state of men of *pleasure*, *ambition*, or *interest*, From Hapand compares it with the serene and gentle state of a piness. mind at peace with itself, and friendly to all mankind, 216unruffled by any violent emotion, and sensible to every The misery good-natured and alluring joy.

It were easy, by going through the different sets of the private affections mentioned formerly +, to show, that it is only passions. by maintaining the proportion settled there, that the *See* Part I. mind arrives at true repose and satisfaction. If *fear* exceeds that proportion, it sinks into melancholy and dejection. If unger passes just bounds, it ferments into rage and revenge, or subsides into a sullen corroding gloom, which embitters every good, and renders one exquisitely sensible to every ill. The private passions, the love of honour especially, whose impulses are more generons, as its effects are more diffusive, are instruments of private pleasure; but if they are dispropertioned to our wants, or to the value of their several objects, or to the balance of other passions equally necessary and more anniable, they become instruments of intensc pain and misery. For, being now destitute of that counterpoise which held them at a due pitch, they grow turbulent, peevish, and revengeful, the cause of constant restlessness and torment, sometimes flying out into a wild delirious joy, at other times settling in a deep splenetic grief. The concert between reason and passion is then broke: all is dissonance and distraction within. The mind is out of frame, and feels an agony proportioned to the violence of the reigning passion.

The case is much the same, or rather worse, when In the puany of the particular kind affections arc out of their blic affec. natural order and proportion; as happens in the case tion. of effeminate pity, exorbitant love, parental dotage, or any party passion, where the just regards to society are supplanted. The more social and disinterested the passion is, it breaks out into the wilder excesses, and makes the more dreadful havock both within and abroad; as is but too apparent in those cases where a false species of religion, honour, zeal, or party-rage, has seized on the natural enthusiasm of the mind, and worked it up to madness. It breaks through all ties natural and eivil, disregards the most sacred and solemn obligations, silences every other affection whether *publie* or *private*, and transforms the most gentle natures into the most savage and inhuman.

Whereas, the man who keeps the *balance* of *affection* Happiness, even, is easy and serene in his motions; mild, and yet of well proaffectionate; uniform and consistent with himself: is portioned not liable to disagreeable collisions of interests and passions; gives always place to the most friendly and humane affections, and never to dispositions or acts of resentment, but on high occasions, when the *security* of the *private*, or *welfare* of the *public* system, or the *great interests* of mankind, necessarily require a noble indignation; and even then he observes a just measure in wrath; and last of all, he proportions every passion to the value of the object he affects, or to the importance of the end he pursues.

To sum up this part of the argument, the honest Sum of the and good man has eminently the advantage of the knav- argument. ish and selfish wretch in every respect. The pleasures which the last enjoys flow chiefly from external advantages and gratifications; are superficial and transitory; dashed with long intervals of satiety, and frequent

# MORAL PHILOSOPHY.

Motives to quent returns of remorse and fear ; dependent on favourable accidents and conjunctures ; and subjected to the humours of men. But the good man is satisfied from himself; his principal possessions lie within, and therefore beyond the reach of the caprice of men or fortune ; his enjoyments are exquisite and permanent ; accompanied with no inward checks to damp them, and always with ideas of dignity and self-approbation; may be tasted at any time, and in any place. The gratifications of vice arc turbulent and unnatural, generally arising from the relief of passions in themselves intolerable, and issuing in tormenting reflection; often irritated by disappointment, always inflamed by enjoyment, and yet ever cloyed with repctition. The pleasures of virtue are calm and natural; flowing from the excreise of kind affections, or delightful reflections in consequence of them; not only agreeable in the prospect, but in the present feeling ; they never satiate nor lose their relish; nay, rather the admiration of virtue grows stronger every day; and not only is the desirc but the enjoyment heightened by every new gratification; and, unlike to most others, it is increased, not diminished, by sympathy and communication .- In fine, the satisfactions of virtue may be purchased without a bribe, and possessed in the humblest as well as the most triumphant fortune; they can bear the strictest review, do not change with circumstances, nor grow old with time. Force cannot rob, nor fraud cheat us of them; and, to crown all, instead of abating, they enhance every other pleasure.

External effects of virtue. 221 On the

body.

220

398

Virtue.

222 On one's fortune, interest, &c.

But the happy consequences of virtue are seen not only in the internal enjoyments it affords a man, but " in the favourable disposition of external causes towards him, to which it contributes."

As virtue gives the sober possession of one's self, and the command of one's passions, the consequence must be heart's ease, and a fine natural flow of spirits, which conduce more than any thing else to health and long life. Violent passions, and the excesses they occasion, gradually impair and wear down the machine. But the calm placid state of a temperate mind, and the healthful excreises in which virtue engages her faithful votaries, preserve the natural functions in full vigour and harmony, and exhilarate the spirits, which are the chief instruments of action.

It may by some be thought odd to assert, that virtue is no enemy to a man's fortune in the present state of things .- But if by fortune be meant a moderate or competent share of wealth, power, or credit, not overgrown degrees of them; what should hinder the virtuous man from obtaining that ? He cannot cringe or fawn, it is truc, but he can be civil and obliging as well as the knave; and surely his civility is more alluring, because it has more manliness and grace in it than the mean adulation of the other : hc cannot cheat or undermine; but he may be cautious, provident, watchtul of occasions, and equally prompt with the rogue in improving them : he scorns to prostitute himself as a pander to the passions, or as a tool to the vices of mankind; but he may have as sound an understanding and as good capacities for promoting their real interests as the veriest court slave : and then he is more faithful and true to those who employ him. In the common course of business, he has the same chances with the knave of acquiring a fortunc, and rising in the world.

He may have equal abilities, equal industry, equal at-From Hav tention to business; and in other respects he has greatly the advantage of him. People love better to deal with him; they can trust him more; they know he will not impose on them, nor take advantage of them, and can depend more on his word than on the oath or strongest securities of others. Whereas what is commonly called cunning, which is the offspring of ignorance, and constant companion of knavery, is not only a mean-spirited. but a very short-sighted talent, and a fundamental obstacle in the road of business. It may indeed procure immediate and petty gains; but it is attended with dreadful abatements, which do more than overbalance them, both as it sinks a man's credit when discovered, and cramps that largeness of mind which extends to the remotest as well as the nearest interest, and takes in the most durable equally with the most transient gains. It is therefore easy to see how much a man's credit and reputation, and consequently his success, depend on his honesty and virtue.

With regard to security and peace with his neigh- On one bours, it may be thought, perhaps, that the man of a peace and quiet forgiving temper, and a flowing benevolence and security courtesy, is much exposed to injury and affronts from every proud or peevish mortal, who has the power or will to do mischief. If we suppose, indeed, this quietness and gentleness of nature accompanied with cowardice and pusillanimity, this may often be the case; but in reality the good man is bold as a lion, and so much the bolder for being the calmer. Such a person will hardly be a butt to mankind. The ill natured will be afraid to provoke him, and the good natured will not incline to do it. Besides, true virtue, which is conducted by reason, and exerted gracefully and without parade, is a most insinuating and commanding thing ; if it cannot disarm malice and resentment at once, it will wear them out by degrees, and subdue them at length. How many have, by favours and prudently yielding, triumphed over an enemy, who would have been inflamed into tenfold rage by the fiercest opposition ! In fine, goodness is the most universally popular thing that can be.

To conclude; the good man may have some enc- On one mies, but he will have more friends; and, having given family. so many marks of private friendship or public virtue, he can hardly be destitute of a patron to protect, or a sanctuary to entertain him, or to protect or entertain his children when he is gone. Though he should have little else to leave them, he bequeaths them the fairest, and generally the most unenvied, inheritance of a good name, which, like good seed sown in the field of futurity, will often raise up unsolicited friends, and yield a benevolent harvest of unexpected charities. But should the fragrance of the parent's virtue prove offensive to a perverse or envious age, or even draw persecution on the friendless orphans, there is one in heaven who will be more than a father to them, and recompense their parent's virtues by showering down blessings on them.

## CHAP. III. Motives to VIRTUE from the BEING and PROVIDENCE of GOD.

BESIDES the interesting motive mentioned in the Twoex last Chapter, there are two great motives of virtue, nal mot strictly to virtue

piness.

ives to strictly connected with human life, and resulting from the very constitution of the human mind. The first is irtue. " the BEING and PROVIDENCE of GOD; the second is the IMMORTALITY of the SOUL, with future rewards and punishments.

It appears from Chap. IV. of Part II. that man, by the constitution of his nature, is designed to be a RELI-GIOUS CREATURE. He is intimately connected with the Deity, and necessarily dependent on him. From that connexion and necessary dependence result various obligations and duties, without fulfilling which, some of his sublimest powers and affections would be incomplete and abortive. If he be likewise an IMMORTAL creature, and if his present conduct shall affect his future happiness in another state as well as in the present, it is evident that we take only a partial view of the creature, if we leave out this important property of his nature; and make a partial estimate of human life, if we strike out of the account, or overlook, that part of his duration which runs out into eternity.

It is evident from the above-mentioned Chapter, that " to have a respect to the Deity in our temper and conduct, to venerate and love his character, to adore his goodness, to depend upon and resign ourselves to his providence, to seek his approbation, and act under a sense of his authority, is a fundamental part of moral virtue, and the completion of the highest destination of our nature."

a port to But as *piety* is an essential part of virtue, so likewise it is a great support and enforcement to the practice of it. To contemplate and admire a Being of such transcendent dignity and perfection as GOD, must naturally and necessarily open and enlarge the mind, give a freedom and ampleness to its powers, and a grandeur and elevation to its aims. For, as an excellent divine observes, " the greatness of an object, and the excellency of the act of any AGENT about a transcendent object, doth mightily tend to the enlargement and improvement of his faculties." Little objects, mean company, mean cares, and mean business, cramp the mind, contract its views, and give it a creeping air and deportment. But when it soars above mortal cares and mortal pursuits into the regions of divinity, and converses with the greatest and best of Beings, it spreads itself into a wider compass, takes higher flights in reason and goodness, becomes godlike in its air and manners. Virtue is, if one may say so, both the effect and cause of largeness of mind. It requires that one think freely, and act nohly. Now what can conduce more to freedom of thought and dignity of action, than to conceive worthily of GOD, to reverence and adore his unrivalled excellency, to imitate and transcribe that excellency into our own nature, to remember our relation to him, and that we are the images and representatives of his glory to the rest of the creation ? Such feelings and exercises must and will make us scorn all actions that are base, unhandsome, or unworthy our state; and the relation we stand in to GOD will irradiate the mind with the light of wisdom, and ennoble it with the liberty and dominion of virtue.

The influence and efficacy of religion may be considered in another light. We all know that the presence of a friend, a neighbour, or any number of spectators, but especially an august assembly of them, uses

to he a considerable check upon the conduct of one From the who is not lost to all sense of honour and shame, and Immortalicontributes to restrain many irregular sallies of passion. ty of the Soul. In the same manner we may imagine, that the awe of some superior mind, who is supposed privy to our secret conduct, and armed with full power to reward or punish it, will impose a restraint on us in such actions as fall not under the controul or animadversion of others. If we go still higher, and suppose our inmost thoughts and darkest designs, as well as our most secret actions, to lie open to the notice of the supreme and universal Mind, who is both the spectator and judge of human actions, it is evident that the belief of so august a presence, and such awful inspection, must carry a restraint and weight with it proportioned to the strength of that belief, and be an additional notive to the practice of many duties which would not have been performed without it.
