This operation consists in subtracting the divisor from the dividend, and again from the remainder, as often as it can be done, and reckoning the number of subtractions; as,

21	19
7 first subtraction	8 first subtraction
14	11
7 second subtraction	8 second subtraction
7	3 remainder.
7 third subtraction.	
0	

As this operation, performed at large, would be very tedious, when the quotient is a high number, it is proper to shorten it by every convenient method; and, for this purpose, we may multiply the divisor by any number whose product is not greater than the dividend, and so subtract it twice or thrice, or oftener at the same time. The best way is to multiply it by the greatest number, that does not raise the product too high, and that number is also the quotient. For example, to divide 45 by 7, we inquire what is the greatest multiplier for 7, that does not

Division. not give a product above 45; and we shall find that it is 6; and 6 times 7 is 42, which, substracted from 45, leaves a remainder of 3. Therefore 7 may be substracted 6 times from 45; or, which is the same thing, 45 divided by 7, gives a quotient of 6, and a remainder of three.

If the divisor do not exceed 12, we readily find the highest multiplier that can be used from the multiplication table. If it exceed 12, we may try any multiplier that we think will answer. If the product be greater than the dividend, the multiplier is too great; and if the remainder, after the product is substracted from the dividend, be greater than the divisor, the multiplier is too small. In either of these cases, we must try another. But the attentive learner, after some practice, will generally hit on the right multiplier at first.

If the divisor be contained oftener than ten times in the dividend, the operation requires as many steps as there are figures in the quotient. For instance, if the quotient be greater than 100, but less than 1000, it requires 3 steps. We first inquire how many hundred times the divisor is contained in the dividend, and subtract the amount of these hundreds. Then we inquire how often it is contained ten times in the remainder, and subtract the amount of these tens. Lastly, We inquire how many single times it is contained in the remainder. The method of proceeding will appear from the following example:

To divide 5936 by 8.

From	5936	
Take	5600	= 700 times 8.
Rem.	336	
From which take	320	= 40 times 8.
Rem.	16	
From which take	16	= 2 times 8.
	0	742 times 8 in all.

It is obvious, that as often as 8 is contained in 59, so many hundred times it will be contained in 5900, or in 5936; and, as often as it is contained in 33, so many ten times it will be contained in 330, or in 356; and thus the higher places of the quotient will be obtained with equal ease as the lower. The operation might be performed by substracting 8 continually from the dividend, which will lead to the same conclusion by a very tedious process. After 700 substractions, the remainder would be 336; after 40 more, it would be 16; and after 2 more, the dividend would be entirely exhausted. In practice, we omit the cyphers, and proceed by the following

Rules. 1st, "Assume as many figures on the left "hand of the multiplier as contain the divisor once "or oftener: find how many times they contain it, "and place the answer as the highest figure of the "quotient.

2d, "Multiply the divisor by the figure you have "found, and place the product under the part of the "dividend from which it is obtained.

3d, "Substract the product from the figures above it.

4th, "Bring down the next figure of the dividend "to the remainder, and divide the number it makes up, "as before."

Remainder	17

The numbers which we divide, as 59, 33, and 16, in the first example, are called *dividuals*.

It is usual to mark a point under the figures of the dividend, as they are brought down, to prevent mistakes.

If there be a remainder, the division is completed by a vulgar fraction, whose numerator is the remainder, and its denominator the divisor. Thus, in Ex. 3. the quotient is 2671, and the remainder 17; and the quotient completed is $2671\frac{17}{365}$.

A number which divides another without a remainder is said to measure it; and the several numbers which measure another, are called its *aliquot parts*. Thus, 2, 4, 6, 8, and 12, are aliquot parts of 24. As it is often useful to discover numbers which measure others, we may observe,

1st, Every number ending with an even figure, that is, with 2, 4, 6, 8, or 0, is measured by 2.

2d, Every number ending with 5 or 0, is measured by 5.

3d, Every number, whose figures, when added, amount to an even number of 3's or 9's, is measured by 3 or 9, respectively.

Contractions and Varieties in Division.

First, When the divisor does not exceed 12, the whole computation may be performed without setting down any figures except the quotient.

Ex. 7)35868 (5124 or 7)35868
5124

Secondly, when the divisor is a composite number, and one of the component parts also measures the dividend, we may divide successively by the component parts.

Ex. 1st.] 30114 by 63 2d.] 975 by 105 = 5 × 7 × 3

	9)30114		5)975
	7) 3346		3)195
Quotient	478		7) 65
		Quotient	$9\frac{2}{7}$

This method might be also used, although the component parts of the divisor do not measure the dividend; but the learner will not understand how to manage

Division. manage the remainder till he be acquinted with the doctrine of vulgar fractions.

Thirdly, When there are cyphers annexed to the divisor, cut them off, and cut off an equal number of figures from the dividend; annex those figures to the remainder. *Ex.* To divide 378643 by 5200.

52|00)3786|43(72$\frac{4243}{5200}$.
364 .

146
104

4243

The reason will appear by performing the operation at large, and comparing the steps.

To divide by 10, 100, 1000, or the like. Cut off as many figures on the right hand of the dividend as there are cyphers in the divisor. The figures which remain on the left hand compose the quotient, and the figures cut off compose the remainder.

Fourthly, When the divisor consists of several figures, we may try them separately, by inquiring how often the first figure of the divisor is contained in the first figure of the dividend, and then considering whether the second and following figures of the divisor be contained as often in the corresponding ones of the dividend with the remainder (if any) prefixed. If not, we must begin again, and make trial of a lower number. When the remainder is nine, or upwards, we may be sure the division will hold through the lower places; and it is unnecessary to continue the trial farther.

Fifthly, We may make a table of the products of the divisor, multiplied by the nine digits, in order to discover more readily how often it is contained in each dividual. This is convenient when the dividend is very long, or when it is required to divide frequently by the same divisor.

73 by 2 = 146	73)53872694(737982
3 = 216	511.....
4 = 292	
5 = 365	277
6 = 438	219
7 = 511	
8 = 584	582
9 = 657	511
	716
	657
	599
	584
	155
	146
	Rem. 8

Sixthly, To divide by 9, 99, 999, or any number of 9's, transcribe under the dividend part of the same, shifting the highest figure as many places to the right hand as there are 9's in the divisor. Transcribe it again, with the like change of place, as often as the length of the dividend admits; add these together, and cut off as many figures from the right hand of the sum as there are 9's in the divisor. The figures which remain on the left hand compose the quotient, and those cut off the remainder. Division.

If there be any carriage to the unit place of the quotient, add the number carried likewise to the remainder, as in Ex. 2.; and if the figures cut off be all 9's, add 1 to the quotient, and there is no remainder.

Examples. 1st] 99)324123 2d.]99)547825

	3241	5478
	32	54

		Quotient 5533.58 rem.

3d.] 999)476523
476

476|999
1

Quotient 477

To explain the reason of this, we must recollect, that whatever number of hundreds any dividend contains, it contains an equal number of 99's, together with an equal number of units. In Ex. 1. the dividend contains 3241 hundreds, and a remainder of 23. It therefore contains 3241 times 99, and also 3241, besides the remainder already mentioned.—Again, 3241 contains 32 hundreds, and a remainder of 41: it therefore contains 32 99's, and also 32, besides the remainder of 41. Consequently the dividend contains 99, altogether, 3241 times, and 32 times, that is, 3273 times, and the remainder consists of 23, 41, and 32, added, which makes 96.

As multiplication supplies the place of frequent additions, and division of frequent substractions, they are only repetitions and contractions of the simple rules, and when compared together, their tendency is exactly opposite. As numbers, increased by addition, are diminished and brought back to their original quantity by subtraction; in like manner, numbers compounded by multiplication are reduced by division to the parts from which they were compounded. The multiplier shows how many additions are necessary to produce the number; and the quotient shows how many subtractions are necessary to exhaust it. It follows, that the product, divided by the multiplicand, will quote the multiplier; and because either factor may be assumed for the multiplicand, therefore, the product divided by either factor, quotes the other. It follows, also, that the dividend is equal to the product of the divisor and quotient multiplied together; and hence these operations mutually prove each other.

To prove multiplication. Divide the product by either factor. If the operation be right, the quotient is the other factor, and there is no remainder.

To prove division. Multiply the divisor and quotient together; to the product add the remainder, if any; and, if the operation be right, it makes up the dividend. Otherwise divide the dividend (after subtracting the remainder, if any) by the quotient. If the operation be right, it will quote the divisor. The reason of all those rules may be collected from the last paragraph.

Compound Division.

12 Rule I. "When the dividend only consists of different denominations, divide the higher denomination, and reduce the remainder to the next lower, taking in (p. 629. Rule V.) the given number of that denomination, and continue the division."

Examples.

Divide L. 465 : 12 : 8 by 72.

28			770		
4|00			)108|00(27 quote.		

It is best not to reduce the terms lower than is necessary to render them equal. For instance, if each of them consists of an even number of sixpences, fourpences, or the like, we reduce them to sixpences, or fourpences, but not to pence.

The use of division is to find either of the factors by whose multiplication a given number is produced, when the other factor is given; and therefore is of two kinds, since either the multiplier or the multiplicand may be given. If the former be given, it discovers what that number is which is contained so many times in another. If the latter be given, it discovers how many times one number is contained in another. Thus, it answers the questions of an opposite kind to those mentioned under Rule IV. p. 629. as, To find the quantity of a single parcel or share; to find the value, weight, or measure, of a single article; to find how much work is done, provisions consumed, interest incurred, or the like, in a single day, &c.

The last use of division is a kind of reduction exactly opposite to that described under Rule V. p. 629. The manner of conducting and arranging it, when there are several denominations in the question, will appear from the following examples.

1. To reduce 15783 pence, to pounds, sh. and pence.

	20	
12)15783(1315(65		
12 · · ·	120 ·

48	120		
206	86		
192	80		
145	6		
144			
1			

Ans. 38lb. 4 oz. 6dwt. 1 gr.

In the first example, we reduce 15783 pence to shillings, by dividing by 12, and obtain 1315 shillings, and a remainder of 3 pence. Then we reduce 1315 shillings to pounds, by dividing by 20, and obtain 65 pounds and a remainder of 15 shillings. The divisions might have been contracted.

In the practice of arithmetic, questions often occur which require both multiplication and division to resolve. This happens in reduction, when the higher denomination does not contain an exact number of the lower.

Rule *for mixed reduction.* "Reduce the given denomination by multiplication to some lower one, which is an aliquot part of both; then reduce that by division to the denomination required."

Ex. Reduce 31742l. to guineas.

31742	Here we multiply by 20, which reduces the pounds to shillings; and divide the product by 21, which reduces the shillings to guineas.
20	
21)634840(30230	
63 · · · ·	
048	
42	
64	
63	
10	Answer, 30230 guineas and 10 shillings.

As

As Portuguese money frequently passes here in payments, we shall give a table of the pieces, and their value.

A moidore	= L. 1	7	–
A half moidore	= –	13	6
A quarter moidore	= –	6	9
A double Joannes	= 3	12	–
A Joannes -	= 1	16	–
A half ditto -	= –	18	–
A quarter ditto	= –	9	–
An eighth ditto	= –	4	6

Note 1. Guineas may be reduced to pounds, by adding one-twentieth part of the number.

2. Pounds may be reduced to merks by adding one half.

3. Merks may be reduced to pounds by subtracting one-third.

4. Four moidores are equal to three Joannes: wherefore moidores may be reduced to Joannes, by subtracting one-fourth; and Joannes to moidores, by adding one-third.

5. Five Joannes are equal to 9l. Hence it is easy to reduce Portuguese money to sterling.

Another case, which requires both multiplication and division, is, when the value, weight, measure, or duration of any quantity is given, and the value, &c. of a different quantity required, we first find the value, &c. of a single article by division, and then the value, &c. of the quantity required, by multiplication.

Ex. If 3 yards cost 15s. 9d. what will 7 yards cost, at the same rate?

s.	d.	
3) 15	9	Price of 3 yards.
5	3	Price of 1 yard, by Rule IV. p. 629.
	7	
L. 1	16 9	Price of 7 yards (by par. *ult.* p. 632. col. 1.).

Many other instances might be adduced, where the operation, and the reason of it, are equally obvious. These are generally, though unnecessarily, referred to the rule of Proportion.

We shall now offer a general observation on all the operations in arithmetic. When a computation requires several steps, we obtain a just answer, whatever order we follow. Some arrangements may be preferable to others in point of ease, but all of them lead to the same conclusion. In addition, or subtraction, we may take the articles in any order, as is evident from the idea of number; or, we may collect them into several sums, and add or subtract these, either separately or together. When both the simple operations are required to be repeated, we may either complete one of them first, or may introduce them promiscuously, and the compound operations admit of the same variety. When several numbers are to be multiplied together, we may take the factors in any order, or we may arrange them into several classes, find the product of each class, and then multiply the products together. When a number is to be divided by several others, we may take the divisors in any order, or we may multiply them into each other, and divide by the product; or we may multiply them into several parcels, and divide by the products successively. Lastly, When multiplication and division are both required, we may begin with either; and when both are repeatedly necessary, we may collect the multipliers into one product, and the divisors into another; or, we may collect them into parcels, or use them singly, and that in any order. Still we shall obtain the proper answer, if none of the terms be neglected.

When both multiplication and division are necessary to obtain the answer of a question, it is generally best to begin with the multiplication, as this order keeps the account as clear as possible from fractions. The example last given may be wrought accordingly as follows:

s.	d.
15	9
	7
3)5 10	3
1 16	9

Some accountants prove the operations of arithmetic by a method which they call casting out the 9's, depending on the following principles:

First, If several numbers be divided by any divisor: (the remainders being always added to the next number), the sum of the quotients, and the last remainder, will be the same as those obtained when the sum of the number is divided by the same divisor. Thus, 19, 15, and 23, contain, together, as many 5's, as many 7's, &c. as their sum 57 does, and the remainders are the same; and, in this way, addition may be proven by division. It is from the correspondence of the remainders, that the proof by casting out the 9's is deduced.

Secondly, If any figure with cyphers annexed, be divided by 9, the quotient consists entirely of that figure; and the remainder is also the same. Thus, 40, divided by 9, quotes 4, remainder 4; and 400 divided by 9, quotes 44, remainder 4. The same holds with all the digits; and the reason will be easily understood: every digit, with a cypher annexed, contains exactly so many tens; it must therefore contain an equal number of 9's, besides a remainder of an equal number of units.

Thirdly, If any number be divided by 9, the remainder is equal to the sum of the figures of the number, or to the remainder obtained, when that sum is divided by 9. For instance, 3765, divided by 9, leaves a remainder of 3; and the sum of 3, 7, 6, and 5, is 21, which divided by 9, leaves a remainder of 3. The reason of this will appear from the following illustration:

3000	divided by quotes	333;	remainder 3
700	quotes	77;	remainder 7
60	quotes	6;	remainder 6
5	quotes	0;	remainder 5
3765		416	Sum of rem. 21

Again: 21 divided by 9 quotes 2; remainder 3

wherefore, 3765 divided by 9 quotes 418; remainder 3; for the reason given. Hence we may collect the following rules for practice,

To cast the 9's out of any number, or to find what remainder will be left when any number is divided by 9: Add the figures; and when the sum exceeds 9, add the figures which would express it. Pass by the 9's; and when the sum comes exactly to 9, neglect it, and begin anew. For example, if it be required to cast the 9's out of 3573294, we reckon thus; 3 and

Division. 5 is 8, and 7 is 15; 1 and 5 is 6, and 3 is 9, which we neglect; 2 and (passing by 9) 4 is 6; which is the remainder or RESULT. If the article out of which the 9's are to be cast contains more denominations than one, we cast the 9's out of the higher, and multiply the result by the value of the lower, and carry on the product (casting out the 9's, if necessary), to the lower.

To prove addition, cast the 9's out of the several articles, carrying the results to the following articles; cast them also out of the sum. If the operation be right, the results will agree.

To prove subtraction, cast the 9's out of the minuend; cast them also out of the subtrahend and remainder together; and if you obtain the same result, the operation is presumed right.

To prove multiplication, cast the 9's out of the multiplicand, and also out of the multiplier, if above 9. Multiply the results together, and cast the 9's, if necessary, out of their product. Then cast the 9's out of the product, and observe if this result correspond with the former.

Ex. 1st.] 9276 res. $6\times8=48$ res. 3.
8

74208 res. 3.

2d.] 7898 res. $5\times3=15$ res. 6.
48 res. 3

63184
31592

379104 res. 6.

The reason of this will be evident, if we consider multiplication under the view of repeated addition. In the first example it is obviously the same. In the second, we may suppose the multiplicand repeated 48 times. If this be done, and the 9's cast out, the result, at the end of the 9th line, will be 0; for any number, repeated 9 times, and divided by 9, leaves no remainder. The same must happen at the end of the 18th, 27th, 36th, and 45th lines; and the last result will be the same as if the multiplicand had only been repeated 3 times. This is the reason for casting out the 9's from the multiplier as well as the multiplicand.

To prove division, cast the 9's out of the divisor, and also out of the quotient; multiply the results, and cast the 9's out of the product. If there be any remainder, add to it the result, casting out the 9's, if necessary. If the account be right, the last result will agree with that obtained from the dividend.

Ex.] 42) 2490 (59 res. $5\times6=30$ res. 3.
res. 6 210

390
378

Rem. 12 - - res. 3.

And the result of the dividend is 6

This depends on the same reason as the last; for the dividend is equal to the product of the divisor and quotient added to the remainder.

We cannot recommend this method, as it lies under the following disadvantages. Divisio

First, If an error of 9, or any of its multiples, be committed, the results will nevertheless agree; and so the error will remain undiscovered. And this will always be the case, when a figure is placed or reckoned in a wrong column; which is one of the most frequent causes of error.

Secondly, When it appears by the disagreement of the results, that an error has been committed, the particular figure or figures in which the error lies are not pointed out; and, consequently, it is not easily corrected.

CHAP. VI. RULE OF PROPORTION.

SECT. I. SIMPLE PROPORTION.

QUANTITIES are reckoned proportional to each other, when they are connected in such a manner, that if one of them be increased or diminished, the other increases or diminishes at the same time; and the degree of the alteration on each is a like part of its original measure; thus four numbers are in the same proportion, the first to the second as the third to the fourth, when the first contains the second, or any part of it, as often as the third contains the fourth, or the like part of it. In either of these cases, the quotient of the first, divided by the second, is equal to that of the third divided by the fourth: and this quotient may be called the *measure of the proportion.* 13

Proportionals are marked down in the following manner:

6 : 3 :: 8 : 4
12 : 36 :: 9 : 27
9 : 6 :: 24 : 18
16 : 24 :: 10 : 15

The rule of Proportion directs us, when three numbers are given, how to find a fourth, to which the third may have the same proportion that the first has to the second. It is sometimes called the *Rule of Three*, from the three numbers given; and sometimes the *Golden Rule*, from its various and extensive utility.

RULE. "Multiply the second and third terms together, and divide the product by the first."

Ex. To find a fourth proportional to 18, 27, and 34.

18 : 27 :: 34 : 51
34

108
81

18)918(51
90

18
18

0

To explain the reason of this, we must observe that if two or more numbers be multiplied or divided alike, the products or quotients will have the same proportion.

18 : 27
Multiplied by 34, 612 : 918
Divided by 18, 34 : 51

Proportion. The products 612, 918, and the quotients 34, 51, have therefore the same proportion to each other that 18 has to 27. In the course of this operation, the products of the first and third term are divided by the first; therefore the quotient is equal to the third.

The first and second terms must always be of the same kind; that is, either both moneys, weights, measures, both abstract numbers, or the like. The fourth, or number sought, is of the same kind as the third.

When any of the terms is in more denominations than one, we may reduce them all to the lowest. But this is not always necessary. The first and second should not be reduced lower than directed p. 632. col. 1. par. *penult.*; and, when either the second or third is a simple number, the other, though in different denominations, may be multiplied without reduction.

			L.	*s.*	*d.*			
Ex. 5	:	7 ::	25	11	3			
					7			
						L.	*s.*	*d.*
			5) 178	18	9	(35	19	9

The accountant must consider the nature of every question, and observe the circumstance which the proportion depends on; and common sense will direct him to this if the terms of the question be understood. It is evident that the value, weight, and measure of any commodity is proportioned to its quantity; that the amount of work or consumption is proportioned to the time; that gain, loss, or interest, when the rate and time are fixed, is proportioned to the capital sum from which it arises; and that the effect produced by any cause is proportioned to the extent of the cause. In these, and many other cases, the proportion is direct, and the number sought increases or diminishes along with the term from which it is derived.

In some questions, the number sought becomes less, when the circumstances from which it is derived become greater. Thus, when the price of goods increases, the quantity which may be bought for a given sum is smaller. When the number of men employed at work is increased, the time in which they may complete it becomes shorter; and, when the activity of any cause is increased, the quantity necessary to produce a given effect is diminished. In these, and the like, the proportion is said to be inverse.

General Rule *for stating all questions, whether direct or inverse.* "Place that number for the third "term which signifies the same kind of thing with "what is sought, and consider whether the number "sought will be greater or less. If greater, place the "least of the other terms for the first; but, if less, "place the greatest for the first."

Ex. 1st.] If 30 horses plough 12 acres, how many will 42 plough in the same time?

H. H. A.
30 :: 42 :: 12

Here, because the thing sought is a number of acres, we place 12, the given number of acres, for the third term; and, because 42 horses will plough more than 12, we make the lesser number 30, the first term, and the greater number, 42, the second term.

Ex. 2d.] If 40 horses be maintained for a certain sum on hay, at 5d. per stone, how many will be maintained on the same sum when the price of hay rises to 8d. Proportion.

d. d. H.
8 : 5 :: 40

Here, because a number of horses is sought, we make the given number of horses, 40, the third term; and, because fewer will be maintained for the same money, when the price of hay is dearer, we make the greater price, 8d. the first term; and the lesser price 5d. the second term.

The first of these examples is direct, the second inverse. Every question consists of a supposition and demand. In the first, the supposition is, that 30 *horses plough* 12 *acres*, and the demand *how many* 42 *will plough?* and the first term of the proportion, 30, is found in the supposition, in this and every other direct question. In the second, the supposition is, *that* 40 *horses are maintained on hay at* 5d. and the demand, *how many will be maintained on hay at* 8d.? and the first term of the proportion, 8, is found in the demand, in this and every other inverse question.

When an account is stated, if the first and second term, or first and third, be measured by the same number, we may divide them by that measure, and use the quotients in their stead.

Ex. If 36 yards cost 42 shillings, what will 27 cost?

Y. Y. sh.
36 : 27 :: 42
4 : 3 :: 42
—— s. d.
4)126(31 6

Here 36 and 27 are both measured by 9, and we work with the quotients 4 and 3.

Sect. II. Compound Proportion. 14

Sometimes the proportion depends upon several circumstances. Thus, it may be asked, if 18 men consume 6 bolls corn in 28 days, how much will 24 men consume in 56 days? Here the quantity required depends partly on the number of men, partly on the time; and the question may be resolved into the two following ones:

1st, If 18 men consume 6 bolls, in a certain time, how many will 24 men consume in the same time?

M. M. B. B.
18 : 24 : 6 : 8
6

Answer, 24 men will consume 8 bolls in the same time.

18)144(8

2d, If a certain number of men consume 8 bolls in 28 days, how many will they consume in 56 days?

D. D. B. B.
28 : 56 :: 8 : 16
8

Ans. The same number of men will consume 16 bolls in 56 days.

28)448(16

In the course of this operation, the original number of bolls, 6, is first multiplied into 24, then divided by 18, then multiplied into 8, then divided by 28. It would answer the same purpose to collect the multipliers into one product, and the divisors into another; and then to multiply the given number of bolls by the former, and divide the product by the latter, p. 633. col. 1. par. *ult.*

The above question may therefore be stated and wrought as follows:

Proportion. Men 18 : 24 :: 6 bolls
Days 28 : 56

144 144
36 120

504 1344
6

504)8064(16

Here we multiply 18 into 28 for a divisor, and 6 into the product of 24 by 56, for a dividend.

"In general, state the several particulars on which "the question depends, as so many simple proportions, "attending to the sense of the question to discover "whether the proportions should be stated directly or "inversely; then multiply all the terms in the first "rank together, and all those in the second rank to-"gether; and work with the product as directed in "the simple rule (Sect. i. p. 634.")

Example. If 100 men make 3 miles of road in 27 days, in how many days will 150 men make 5 miles?

Men 150 : 100 :: 27 days.
3 5

450 500
27

450)13500(30 days, ans.

Here the first stating is inverse, because more men will do it in fewer days; but the second is direct, because more miles will require more days.

The following contraction is often useful. After stating the proportion, if the same number occurs in both ranks, dash it out from both; or, if any term in the first rank, and another in the second rank are measured by the same numbers, dash out the original terms, and use the quotients in their stead.

Ex. If 18 men consume 30l. value of corn in 9 months, when the price is 16s. per boll, how many will consume 54l. value in 6 months, when the price is 12s. per boll? In this question, the proportion depends upon three particulars, the value of corn, the time and the price. The first of which is direct, because the more the value of provisions is, the more time is required to consume them: but the second and third are inverse, for the greater the time and price is, fewer men will consume an equal value.

Value 30 : 54 :: 18 men.
Months 6 : 9
Price 12 : 16
10 9
3 3
4

36
18

288
36

10)648(64 8/10

Here we observe 6 in the first rank measures 54 in the second: so we dash them out, and place the quotient 9 in the second rank. Next, because 30 and 9 are both measured by 3, we dash them out, and place down the quotients 10 and 3; then, because 12 and 16 are both measured by 4, we dash them out, and place down the quotients 3 and 4. Lastly, Because there is now 3 in both columns, we dash them out, and work with the remaining terms, according to the rule.

The moneys, weights, and measures of different countries, may be reduced from the proportion which they bear to each other.

Ex. If 112 lb. avoirdupois make 104 lb. of Holland, and 100 lb. of Holland make 89 of Geneva, and 110 of Geneva make 117 of Seville, how many lbs. of Seville will make 100lb. avoirdupois? Proportion.

112 : 104 :: 100
100 : 89
110 : 117

If it be required, how many lb. avoirdupois will make 100 of Seville, the terms would have been placed in the different columns thus:

104 : 112 :: 100
89 : 100
117 : 110

Sect. III. Distributive Proportion.

If it be required to divide a number into parts, which have the same proportion to each other, that several other given numbers have, we add these numbers together, and state the following proposition: As the sum is to the particular numbers, so is the number required to be divided to the several parts sought.

Ex. 1st.] Four partners engage to trade in company; A's stock is 150l. B's 320l. C's 350l. D's 500l.; and they gain 730l.: Required how much belongs to each, if the gain be divided among them in proportion to their stocks?

					Rem.
A's stock	L. 150	1320 : 150 :: 730 :	L. 82	19	1 — 120
B's	320	1320 : 320 :: 730 :	176	19	4 — 960
C's	350	1320 : 350 :: 730 :	193	11	2 — 720
D's	500	1320 : 500 :: 730 :	276	10	3 — 840
Whole stock	1320	Proof L. 730			

This account is proved by adding the gains of the partners; the sum of which will be equal to the whole gain, if the operation be right; but, if there be remainders, they must be added, their sum divided by the common divisor, and the quotient carried to the lowest place.

Ex. 2d.] A bankrupt owes A 146l. B 170l. C 45l. D 480l. and E 72l.; his whole effects are only 342l. 7s. 6d. How much should each have?

A's debt	L.146	913 : 146 :: L.342 7 6 :	L. 54 15	A's share.
B's	170	913 : 170 :: 342 7 6	63 15	B's
C's	45	913 : 45 :: 342 7 6	16 17 6	C's
D's	480	913 : 480 :: 342 7 6	180	D's
E's	72	913 : 72 :: 342 7 6	27	E's
	L.913		L.342 7 6	

This might also be calculated, by finding what composition the bankrupt was able to pay per pound; which is obtained by dividing the amount of his effects by the amount of his debts, and comes to 7s. 6d. and then finding by the rules of practice, how much each debt came to at that rate.

Chap. VII. RULES FOR PRACTICE.

The operations explained in the foregoing chapters comprehend the whole system of arithmetic, and are sufficient for every computation. In many cases, however, the work may be contracted, by adverting to the particular circumstances of the question. We shall explain, in this chapter, the most useful methods which practice has suggested for rendering mercantile computations easy; in which the four elementary rules of arithmetic are sometimes jointly, sometimes separately employed.

Sect. I. Computation of Prices.

The value of any number of articles, at a pound, a shilling,

Practice.

shilling, or a penny, is an equal number of pounds, shillings, or pence; and these two last are easily reduced to pounds. The value, at any other rate, may be calculated by easy methods, depending on some contraction already explained, or on one or more of the following principles.

1st, If the rate be an aliquot part of a pound, a shilling, or a penny, then an exact number of articles may be bought for a pound, a shilling, or a penny; and the value is found by dividing the given number accordingly. Thus, to find the price of so many yards at 2s. 6d. which is the eighth part of a pound, we divide the quantity by eight, because every eight yards cost L.1.

2d, If the rate be equal to the sum of two other rates which are easily calculated, the value may be found by computing these separately, and adding the sums obtained. Thus, the price of so many yards, at 9d. is found, by adding their prices, at 6d. and 3d. together.

3d, If the rate be equal to the difference of two easy rates, they may be calculated separately, and the lesser subtracted from the greater. Thus, the value of so many articles at 11d. is found, by subtracting their value at a penny from their value at a shilling. We may suppose that a shilling was paid for each article, and then a penny returned on each.

4th, If the rate be a composite number, the value may be found by calculating what it comes to at one of the component parts, and multiplying the same by the other.

Case I. "When the rate is an aliquot part of a "pound, divide the quantity by the number which "may be bought for a pound."

Table of the aliquot parts of L.1.

10 shillings	$= \frac{1}{2}$ of L.1.	1s. 4d.	$= \frac{1}{13}$ of L.1.
6s. 8d.	$= \frac{1}{3}$	1s. 3d.	$= \frac{1}{16}$
5s.	$= \frac{1}{4}$	1s.	$= \frac{1}{20}$
4s.	$= \frac{1}{5}$	8d.	$= \frac{1}{30}$
3s. 4d.	$= \frac{1}{6}$	6d.	$= \frac{1}{40}$
2s. 6d.	$= \frac{1}{8}$	4d.	$= \frac{1}{60}$
2s.	$= \frac{1}{10}$	3d.	$= \frac{1}{80}$
1s. 8d.	$= \frac{1}{12}$	2d.	$= \frac{1}{120}$

Ex. 1st.] What is the value of 7463 yards, at 4s.?

5)7463

L. 1492 12s.

2d.] What is the value of 1773 yards, at 3d.?

80)1773

L. 22 3 3

In the first example we divide by 5 because 4s. is $\frac{1}{5}$ of a pound; the quotient 1492 shows how many pounds they amount to; besides which there remain three yards at 4s. and these come to 12s. In the second example, we divide by 80, as directed, and the quotient gives L.22, and the remainder 13 yards, which at 3d. come to 3s. 3d.

This method can only be used in calculating for the particular prices specified in the table. The following 6 cases comprehend all possible rates, and will therefore exhibit different methods of solving the foregoing questions.

Case II. "When the rate consists of shillings only, "multiply the quantity by the number of shillings, and "divide the product by 20: Or, if the number of "shillings be even, multiply by half the number, and "divide the product by 10."

Ex. 1st.] 4573 at 13s.

13

13719
4573

20)59449

L. 2972 9s.

2d.] 7543 at 14s. Practice.

7

10)52801

L. 5280 2s.

The learner will easily perceive, that the method in which the second example is wrought, must give the same answer as if the quantity had been multiplied by 14, and divided by 20; and as the division by 10 doubles the last figure for shillings, and continues all the rest unchanged for pounds, we may obtain the answer at once, by doubling the right-hand figure of the product before we set it down.

If the rate be the sum of two or more aliquot parts of a pound, we may calculate these as directed in Case I. and add them. If it be any odd number of shillings, we may calculate for the even number next lower, and add thereto the value of a shilling. If it be 19s. we may subtract the value at a shilling, from the value at a pound.

Case III. "When the rate consists of pence only."

Method 1. If the rate be an aliquot part of a shilling, divide the quantity accordingly, which gives the answer in shillings; if not, it may be divided into two or more aliquot parts: calculate these separately, and add the values; reduce the answer to pounds.

1 penny is $\frac{1}{12}$ of a shilling
2d. $\frac{1}{6}$ of ditto.
3d. $\frac{1}{4}$ of ditto.
4d. $\frac{1}{3}$ of ditto.
6d. $\frac{1}{2}$ of ditto.
5d. is the sum of 4d. and 1d. or of 2d. and 3d.
7d. is the sum of 4d. and 3d. or of 6d. and 1d.
8d. is the sum of 6d. and 2d. or the double of 4d.
9d. is the sum of 6d. and 3d.
10d. is the sum of 6d. and 4d.
11d. is the sum of 6d. 3d. and 2d.

Ex. 1st.] 7423 at 4d.

3)7423

20)2474 4

L. 123 14 4

Here, because 4d. is one third of a shilling, we divide by 3, which gives the price in shillings, and reduce these by division to pounds.

2d.] 9786 at 9d.

At 6d. $= \frac{1}{2}$ of 1s. 4893
At 3d. $= \frac{1}{2}$ of 6d. 2446 6
At 9d. 7339 6

L. 366 19 6

Here we suppose, that first 6d. and then 3d. is paid for each article; half the quantity is the number of shillings which they would cost at 6d. each. Half of that is the cost at 3d. and these added and reduced give the answer.

3d.] 4856 at 11d.

At 6d. $= \frac{1}{2}$ of 1s. 2428
At 3d. $= \frac{1}{2}$ of 6d. 1214
At 2d. $= \frac{1}{3}$ of 6d. 809 $\frac{4}{4}$
11d. 4451 4

L. 222 11 4

Here we calculate what the articles would cost at 6d. at 3d. and at 2d. and add the values.

It is sometimes easier to calculate at two rates, whose difference is the rate required, and subtract the lesser value from the greater. Thus, the last example may be wrought by subtracting the value at a penny from the value at a shilling. The remainder must be the value

Practice.

value at 11d.

At 1s.	4856s.	10d. may be wrought as the difference of 1s. and 2d.; and several other rates in like manner.
At 1d.=$\frac{1}{12}$	404 8	
At 11d.	4451 4	
	L.222 11 4	

Meth. 2. *Multiply the quantity by the number of pence, the product is the answer in pence. Reduce it to pounds.*

Meth. 3. *Find the value at a penny by division, and multiply the same by the number of pence.*

Case IV. "When the rate consists of farthings only, find the value in pence, and reduce it by division "to pounds."

Ex. 1st.] 37843 at 1 farthing.

4)37843 farth.
12) 9460$\frac{3}{4}$ pence
788 4$\frac{3}{4}$
L. 39 8 4$\frac{3}{4}$

3d. 72564 at $\frac{1}{4}$d.

3
4)217692 farth.
1) 54423 pence
4535 3
L. 226 15 3

2d.] 23754 at $\frac{1}{2}$d.

2)23754 halfpence
12)11877 pence
989 9
L. 49 9 9

Or, 72564

At $\frac{1}{2}$d. 3682 d.
At $\frac{1}{4}$d. 18141 d.
12)54423 d.
4535 3
L. 226 15 3

We may also find the amount in twopences, threepences, fourpences, or sixpences, by one division, and reduce these as directed in Case I.

Case V. "When the rate consists of pence and farthings, find the value of the pence, as directed in "Case III. and that of the farthings from the proportion which they bear to the pounds. Add these together, and reduce."

Ex. 1st.] 3287 at 5$\frac{1}{4}$d.

At 4d.=$\frac{1}{3}$ of 1s.	1095	8
At 1d.=$\frac{1}{4}$ of 4d.	273	11
At 1f.=$\frac{1}{4}$ of 1d.	68	5$\frac{3}{4}$
At 5$\frac{1}{4}$	1438	$\frac{1}{4}$
	L. 71	18 $\frac{3}{4}$

2d.] 4573 at 2$\frac{3}{4}$

At 2d.=$\frac{1}{6}$ of 1s.	762	2
At $\frac{1}{2}$d.=$\frac{1}{4}$ of 2d.	190	6$\frac{1}{2}$
At $\frac{1}{4}$d.=$\frac{1}{2}$ of $\frac{1}{2}$d.	85	3$\frac{1}{4}$
At 2$\frac{1}{4}$	1037	11$\frac{3}{4}$
	L. 51	17 11$\frac{3}{4}$

3d.] 2842 at 3$\frac{1}{4}$d.

At 3d.=$\frac{1}{4}$ of 1s.	710	6
At 3f.=$\frac{1}{4}$ of 3d.	176	7$\frac{1}{2}$
At 3$\frac{1}{4}$	887	1$\frac{1}{2}$
	L. 44	8 1$\frac{1}{2}$

4th.] 3572 at 7$\frac{1}{2}$d.

At 6d.=$\frac{1}{2}$ of 1s.	1386	
At 1$\frac{1}{2}$d.=$\frac{1}{4}$ of 6d.	346	6
At 7$\frac{1}{2}$	1732	6
	L. 87	12 6

It is sometimes best to join some of the pence with the farthings in the calculation. Thus, in Ex. 4. we reckon the value at 6d. and at 3 halfpence, which makes 7$\frac{1}{2}$d.

Practice.

If the rate be 1$\frac{1}{2}$, which is an eighth part of a shilling, the value is found in shillings, by dividing the quantity by 8.

Case VI. "When the rate consists of shillings and "lower denominations."

Method 1. *Multiply the quantity by the shillings, and find the value of the pence and farthings, if any, from the proportion which they bear to the shillings. Add and reduce.*

Ex. 1st.] 4258 at 17s. 3d.

17
29806
4258

	L.8271 7 1

The learner should at first try every calculation more ways than one; which will not only serve the purpose of proving the operation, but will render him expert at discovering the best method for solving each question, and will lead him to invent other methods; for we have not exhausted the subject.

Thus, if the number of articles be 20, each shilling of the rate makes a pound of the amount. If it be 12, each penny of the rate makes a shilling of the amount. If 240, each penny of the rate makes a pound of the amount. If 480, each halfpenny makes a pound. If 960, each farthing makes a pound. If the number of articles be a multiple, or an aliquot part of any of these, the amount is easily calculated. And if it be near to any such number, we may calculate for that number, and add or subtract for the difference.

We have hitherto explained the various methods of computation, when the quantity is a whole number, and in one denomination. It remains to give the proper directions when the quantity contains a fraction, or is expressed in several denominations.

When the quantity contains a fraction, work for the integers by the preceding rules, and for the fraction take proportional parts.

When the quantity is expressed by several denominations, and the rate given for the higher; calculate the higher, consider the lower one as fractions, and work by the last rule.

When the rate is given for the lower denomination, reduce the higher denomination to the lower, and calculate accordingly.

Practice. Note 1st, 7 lb. 14 lb. and 21 lb. are aliquot parts of 1 qr.: and 16 lb. is $\frac{1}{7}$ of 1 cwt.; and are therefore easily calculated.

2d, If the price of a dozen be so many shillings, that of an article is as many pence; and if the price of a gross be so many shillings, that of a dozen is as many pence.

3d, If the price of a ton or score be so many pounds, that of 1 cwt. or a single article, is as many shillings.

4th, Though a fraction less than a farthing is of no consequence, and may be rejected, the learner must be careful lest he lose more than a farthing, by rejecting several remainders in the same calculation.

SECT. II. DEDUCTIONS on WEIGHTS, &c. 18

The full weight of any merchandise, together with that of the cask, box, or other package, in which it is contained, is called the *gross weight*. From this we must make proper deductions, in order to discover the quantity for which price or duty should be charged, which is called the *nett weight*.

Tare is the allowance for the weight of the package; and this should be ascertained by weighing it before the goods are packed. Sometimes, however, particularly in payment of duty, it is customary to allow so much per C. or so much per 100 lb. in place of tare.

Tret is an allowance of 4lb. on 104 granted on currants, and other goods on which there is waste, in order that the weight may answer when the goods are retailed.

Cloff, or Draught, is a further allowance granted on some goods in London, of 2 lb. on every 3 C. to turn the scale in favour of the purchaser. The method of calculating these and the like will appear from the following examples.

Ex. 1st. What is the nett weight of 17 C. 2 q. 14lb. tare 18 lb. per cwt.

	C. q. lb.	*C. q. lb.*
	17 2 14 gross. or	17 2 14
		6
16lb. $=\frac{1}{7}$ C.	2 2 2	
2lb. $=\frac{1}{8}$ of 16lb.	1 7	105 3 –
		3
18 lb.	2 3 $9\frac{1}{4}$ tare	
		317 1 –
	14 3 $4\frac{1}{4}$ nett.	28) 317$\frac{1}{4}$lb. *C. q. lb.*
		4) 11 $9\frac{1}{4}$ (2 3 $9\frac{1}{4}$ tare.

In the first method, we add the tare at 16lb. which is $\frac{1}{7}$ of the gross weight, to the tare, at 2 lb. which is $\frac{1}{8}$ of the former. In the second, we multiply the gross weight by 18; the tare is 1 lb. for each cwt. of the product, and is reduced by division to higher denominations.

2d.] What is tret of 158 C. 2 q. 24 lb.

C. q. lb. *C. q. lb.*

22) 158 2 26 (6 – 11 Tret.

156

2

4

10

28

286

286

0

Because tret is always 4 lb. in 104, or 1 lb. in 26, it is obtained by dividing by 26.

Practice.

3d.] What is the cloff on 28 C. 2 q.?

C.	q.
28	2
	2
3) 57	(19 lb.

This allowance being 2 lb. on every 3 C. might be found by taking $\frac{2}{3}$ of the number of C's and multiplying it by 2. It is better to begin with multiplication, for the reason given, p. 633. col. 2. par. 1.

Sect. III. Commission, &c.

19 It is frequently required to calculate allowances on sums of money, at the rate of so many per 100l. Of this kind is Commission, or the allowance due to a factor for buying or selling goods, or transacting any other business; Premium of Insurance, or allowance given for engaging to repay one's losses at sea, or otherwise; Exchange, or the allowance necessary to be added or subtracted for reducing the money of one place to that of another; Premiums on Stock, or the allowance given for any share of a public stock above the original value. All these and others of a like kind are calculated by the following

Rule. "Multiply the sum by the rate, and divide "the product by 100. If the rate contain a fraction, "take proportional parts."

Ex. What is the commission on 728l. at $2\frac{1}{4}$ per cent.?

	728
	2
2 per cent.	1456
$\frac{1}{2}$	364
$\frac{1}{4}$	182
	1|00)20|02
	20
	40
	12
	4|80
	4 Answ. L.20 — $4\frac{1}{4}$
	3|20

When the rate is given in guineas, which is common in cases of insurance, you may add a twentieth part to the sum before you calculate. Or you may calculate at an equal number of pounds, and add a twentieth part to the answer.

When the given sum is an exact number of 10 pounds, the calculation may be done without setting down any figures. Every 10l. at $\frac{1}{2}$ per cent. is a shilling; and at other rates in proportion. Thus, 170l. at $2\frac{1}{2}$ per cent. is 17s.; and, at $\frac{1}{4}$ per cent. 8s. 6d.

Sect. IV. Interest.

20 Interest is the allowance given for the use of money by the borrower to the lender. This is computed at so many pounds for each hundred lent for a year, and a like proportion for a greater or a less time. The highest rate is limited by our laws to 5 per cent. which is called the *legal interest;* and is due on all debts constituted by bond or bill, which are not paid at the proper term, and is always understood when no other rate is mentioned.

Practic

The interest of any sum for a year, at any rate, is found by the method explained in the last section.

The interest of any number of pounds for a year, at 5 per cent. is one-twentieth part, or an equal number of shillings. Thus, the interest of 34675l. for a year, is 34675 shillings.

The interest for a day is obtained by dividing the interest for a year, by the number of days in a year. Thus, the interest of 34675l. for a day is found by dividing 34675 shillings by 365, and comes to 95 shillings.

The interest for any number of days is obtained by multiplying the daily interest by the number of days. Thus the interest of 34675l. for 17 days, is 17 times 95 shillings or 1615 shillings; and this divided by 20, in order to reduce it, comes to 80l. 15s.

It would have served the same purpose, and been easier, to multiply at first by 17, the number of days; and instead of dividing separately by 365, and by 20, to divide at once by 7300, the product of 365 multiplied by 20; and this division may be facilitated by the table inserted p. 631. col. 1.

The following practical rules may be inferred from the foregoing observations.

I. *To calculate interest at 5 per cent.* "Multiply the "principal by the number of days, and divide the pro- "duct by 7300."

II. *To calculate interest at any other rate.* "Find "what it comes to at 5 per cent. and take a proper pro- "portion of the same for the rate required."

Ex. 1st. Interest on 34675l. for 17 days, at 5 per cent.?

	34675

Interest.

Int. at 5 per cent. L. — 6 8
Deduce $\frac{1}{5}$ — 1 4

Int. at 4 per cent. L. — 5 4

When partial payments are made, we proceed in the following manner: Let us suppose a bill of 170l. was due 12th August, that 54l. was paid on the 18th September, 56l. on the 17th October, and the balance on the 14th November; and let it be required to find how much interest is due.

		Days.		
Aug. 12.	L. 170	37	1190	
Sept. 18. pd.	54		510	
				6290
	116	29	1044	
Oct. 17. pd.	56		232	
				3364
	60	28		1680
Nov. 14. pd.	60			
	—		7300)11334(L. 1 : 11 : $\frac{1}{2}$.	
	0			

Here we subtract the several payments from the original sum in their order, placing the dates in the margin; and from this it appears that there is interest due on 170l. from 12th August to 18th September, on 116l. from 18th September to 17th October, and on 60l. from 17th October to 14th November. We next compute the number of days in each of these periods, and mark it against the respective sum. Then we multiply each sum by the number of days; reserving a column, when necessary, for the products of the several figures in the multiplier. Lastly, We add these products, and divide their sum by 7300.

Interest on current accounts is calculated nearly in the same manner. For example, let the interest due on the following account be required to 31st July, at 4 per cent.

Dr. Mr A. Baird, his account current with W. Neil, Cr.

Deduce $\frac{1}{5}$ part 14 1$\frac{1}{2}$

Interest at 4 per cent. L.2 16 7

Here the sums on either side of the account are introduced according to the order of their dates. Those on the Dr. side are added to the former balance, and those on the Cr. side subtracted. Before we calculate the days, we try if the last sum 91l. be equal to the balance of the account, which proves the additions and subtractions; and, before multiplying, we try if the sum of the column of days be equal to the number of days, from 15th January to 31st of July.

In the 5th and 6th multiplications, we begin at the pence column, and take in the carriage, In the 7th, instead of multiplying the 6s. 8d. by 21, we add the third part 21 to the product, because 6s. 8d. is the third of a pound. This is done by marking down the second line 1287, instead of 1280. As the computation on the odd shillings and pence is troublesome, and makes a very small increase of the interest, some neglect them altogether; others add one to the pound, when the shillings exceed 10, and neglect them when below it.

2d.] Required interest on the following account to 31st December, allowing 5 per cent. when the balance is due to J. T. and 4 per cent. when due to N. W.

Dr. Mr J. T. his account current with N. W. Cr.

Interest due to N. W. at 5 per cent.	L.6	8	9
Deduce $\frac{1}{5}$ - -	1	5	9
Due to N. W. at 4 per cent.	L.5	3	0
Due to J. T. at 5 per cent.	3	7	11$\frac{1}{2}$
Balance due to N. W.	L.1	15	0$\frac{1}{2}$

Interest.

In this account, the balance is sometimes due to the one party, sometimes to the other. At the beginning, there is a balance due to N. W.; and on the 9th of April there is 200l. due him. On the 12th of May, J. T. pays him 300l. which discharges what he owed, and leaves a balance of 100l. due him. The balance continues in J. T's favour till the 24th of September, when N. W. pays 242l. These changes are distinguished by the marks Dr. and Cr. The products are extended in different columns, and divided separately.

When payments are made on constituted debts, at considerable distances of time, it is usual to calculate the interest to the date of each payment, and add it to the principal, and then subtract the payment from the amount.

Ex. A bond for 540l. was due the 18th Aug. 1772; and there was paid 19th March 1773, 50l.; and 19th December 1773, 25l.; and 23d September 1774, 25l.; and 18th August 1775, 110l. Required the interest and balance due on the 11th November 1775?

CHAP. VIII. VULGAR FRACTIONS.

IN order to understand the nature of vulgar fractions, we must suppose unity (or the number 1) divided into several equal parts. One or more of these parts is called a *fraction*, and is represented by placing one number in a small character above a line, and another under it: For example, two fifth parts is written thus, $\frac{2}{5}$. The number under the line (5) shows how many parts unity is divided into, and is called the *denominator*. The number above the line (2) shows how many of these parts are represented, and is called the *numerator*.

It follows from the manner of representing fractions, that, when the numerator is increased, the value of the fraction becomes greater; but, when the denominator is increased, the value becomes less. Hence we may infer, that, if the numerator and denominator be both increased, or both diminished, in the same proportion, the value is not altered; and therefore, if we multiply both by any number whatever, or divide them by any number which measures both, we shall obtain other fractions of equal value. Thus, every fraction may be expressed in a variety of forms, which have all the same signification.

Vulg. Fracti.

A fraction annexed to an integer, or whole number, makes a mixed number. For example, five and two third-parts, or $5\frac{2}{3}$. A fraction whose numerator is greater than its denominator is called an *improper fraction*. For example, seventeen third-parts, or $\frac{17}{3}$. Fractions of this kind are greater than unity. Mixed numbers may be represented in the form of improper fractions, and improper fractions may be reduced to mixed numbers, and sometimes to integers. As fractions whether proper or improper may be represented in different forms, we must explain the method of reducing them from one form to another, before we consider the other operations.

PROBLEM I. "To reduce mixed numbers to improper "fractions: Multiply the integer by the denominator "of the fraction, and to the product add the numerator. "The sum is the numerator of the improper fraction "sought, and is placed above the given denominator."

Ex. $5\frac{2}{3}=\frac{17}{3}$

5 integer.
3 denominator.

15 product.
2 numerator given.

17 numerator sought.

Because one is equal to two halves, or 3 third-parts, or 4 quarters, and every integer is equal to twice as many halves, or four times as many quarters, and so on; therefore, every integer may be expressed in the form of an improper fraction, having an assigned denominator: The numerator is obtained by multiplying the integer into the denominator. Hence the reason of the foregoing rule is evident: 5, reduced to an improper fraction, whose denominator is 3, makes $\frac{15}{3}$. and this added to $\frac{2}{3}$ amounts to $\frac{17}{3}$.

PROBLEM II. "To reduce improper fractions to "whole or mixed numbers: Divide the numerator by "the denominator."

Ex. $\frac{112}{17}=6\frac{10}{17}$

17)112(6$\frac{10}{17}$
102
10

1. $\frac{3148}{10}$
2. $\frac{342}{12}$
3. $\frac{75316}{27}$
4. $\frac{157764}{128}$
5. $\frac{3655}{15}$
6. $\frac{73904}{14}$
7. $\frac{86422}{21}$
8. $\frac{43652}{218}$

This problem is the converse of the former, and the reason may be illustrated in the same manner.

PROBLEM III. "To reduce fractions to lower terms: "Divide both numerator and denominator by any num- "ber which measures both, and place the quotients in "the form of a fraction."

Example. $\frac{135}{360} = \frac{27}{72} = \frac{3}{8}$

Here we observe that 135 and 360 are both measured by 5, and the quotients form $\frac{27}{72}$ which is a fraction of the same value as $\frac{135}{360}$ in lower terms. Again, 27 and 72 are both measured by 9, and the quotients form $\frac{3}{8}$, which is still of equal value, and in lower terms.

It is generally sufficient, in practice, to divide by such measures as are found to answer on inspection, or by the rules given p. 629. col 2. But, if it be required to reduce a fraction to the lowest possible terms, we must divide

Vulgar Fractions.

vide the numerator and denominator by the greatest number which measures both. What number this is may not be obvious, but will always be found by the following rule.

To find the greatest common measure of two numbers, divide the greater by the lesser, and the divisor by the remainder continually, till nothing remain; the last divisor is the greatest common measure.

Example. Required the greatest number which measures 475 and 589?

475)589(1
475
114)475(4
456
19)114(6
114
0

Here we divide 589 by 475, and the remainder is 114; then we divide 475 by 114, and the remainder is 19; then we divide 114 by 19, and there is no remainder: from which we infer, that 19, the last divisor, is the greatest common measure.

To explain the reason of this, we must observe, that any number which measures two others, will also measure their sum and their difference, and will measure any multiple of either. In the foregoing example, any number which measures 589, and 475, will measure their difference 114, and will measure 456, which is a multiple of 114; and any number which measures 475, and 456, will also measure their difference 19. Consequently, no number greater than 19 can measure 589 and 475. Again, 19 will measure them both, for it measures 114, and therefore measures 456, which is a multiple of 114, and 475, which is just 19 more than 456; and, because it measures 475 and 114, it will measure their sum 589. To reduce $\frac{475}{589}$ to the lowest possible terms, we divide both numbers by 19, and it comes to $\frac{25}{31}$.

If there be no common measure greater than 1, the fraction is already in the lowest terms.

If the greatest common measure of 3 numbers be required, we find the greatest measure of the two first, and then the greatest measure of that number, and the third. If there be more numbers, we proceed in the same manner.

PROBLEM IV. "To reduce fractions to others of "equal value that have the same denominator: 1st, "Multiply the numerator of each fraction by all the "denominators except its own. The products are numerators to the respective fractions sought." 2d, "Multiply all the denominators into each other; the "product is the common denominator."

Ex. $\frac{4}{5}$ and $\frac{7}{9}$ and $\frac{3}{8}=\frac{288}{360}$ and $\frac{280}{360}$ and $\frac{135}{360}$.

$4\times9\times8=288$ first numerator.
$7\times5\times8=280$ second numerator.
$3\times5\times9=135$ third numerator.
$5\times9\times8=360$ common denominator.

Here we multiply 4, the numerator of the first fraction, by 9 and 3 the denominators of the two others; and the product 288 is the numerator of the fraction sought, equivalent to the first. The other numerators are found in like manner, and the common denominator 360, is obtained by multiplying the given denominators 5, 9, 8, into each other. In the course of the whole operation, the numerators and denominators of each fraction are multiplied by the same number, and therefore their value is not altered.

The fractions thus obtained may be reduced to lower terms, if the several numerators and denominators have a common measure greater than unity. Or, after arranging the number for multiplication, as is done above, if the same number occur in each rank, we may dash them out and neglect them; and if numbers which have a common measure occur in each, we may dash them out and use the quotients in their stead; or any number which is a multiple of all the given denominators, may be used as a common denominator. Sometimes a number of this kind will occur on inspection, and the new numerators are found by multiplying the given ones by the common denominator, and dividing the products by the respective given denominators.

If the articles given for any operation be mixed numbers, they are reduced to improper fractions by Problem I. If the answer obtained be an improper fraction, it is reduced to a mixed number by Problem II. And, it is convenient to reduce fractions to lower terms, when it can be done, by Problem III. which makes their value better apprehended, and facilitates any following operation. The reduction of fractions to the same denominator by Problem IV. is necessary to prepare them for addition or subtraction, but not for multiplication or division.

1. ADDITION of VULGAR FRACTIONS. 22

RULE. "Reduce them, if necessary, to a common "denominator; add the numerators, and place the sum "above the denominator."

Ex. 1st.] $\frac{3}{5}+\frac{2}{9}=\frac{27}{45}+\frac{10}{45}$ by Problem IV.$=\frac{37}{45}$

2d.] $\frac{5}{7}+\frac{8}{9}+\frac{9}{10}=\frac{450}{630}+\frac{560}{630}+\frac{567}{630}=\frac{1577}{630}\ \frac{450}{560}$

By Problem II.$=3\frac{317}{630}=\frac{567}{1577}$

The numerators of fractions that have the same denominator signify like parts; and the reason for adding them is equally obvious, as that for adding shillings or any other inferior denomination.

Mixed numbers may be added, by annexing the sum of the fractions to the sum of the integers. If the former be a mixed number, its integer is added to the other integers.

2. SUBTRACTION of VULGAR FRACTIONS. 23

RULE. "Reduce the fractions to a common denominator; subtract the numerator of the subtrahend "from the numerator of the minuend, and place the remainder above the denominator."

Ex. Subtract $\frac{2}{7}$ from $\frac{5}{12}$ — remainder $\frac{11}{84}$.

$\frac{5}{12}=\frac{35}{84}$, $\frac{2}{7}=\frac{24}{84}$ by Prob. IV.

from 35
take 24
rem. 11

To subtract a fraction from an integer: subtract the numerator from the denominator, and place the remainder above the denominator; prefix to this the integer diminished by unity.

Ex. Subtract $\frac{3}{7}$ from 12. — remainder $11\frac{4}{7}$.

To subtract mixed numbers, proceed with the fractions by the foregoing rule, and with the integers in the common method. If the numerator of the fraction in the subtrahend exceed that in the minuend, borrow the value of the denominator, and repay it by adding 1 to the unit place of the subtrahend.

Vulgar Fractions.

Ex. Subtract $145\frac{7}{9}$ from $238\frac{3}{5}$.

$\frac{3}{5}=\frac{27}{45}$, $\frac{7}{9}=\frac{35}{45}$ by Prob. IV.

$248\frac{27}{45}$ — $145\frac{35}{45}$ — $102\frac{37}{45}$

$\frac{27}{45}$ — $\frac{35}{72}$ — $\frac{35}{37}$

Here, because 27, the numerator of the fraction in the minuend, is less than 35, the numerator of the subtrahend, we borrow 45 the denominator; 27 and 45 make 72, from which we subtract 35, and obtain 37 for the numerator of the fraction in the remainder, and we repay what was borrowed, by adding 1 to 5 in the unit place of the subtrahend.

The reason of the operations in adding or subtracting fractions will be fully understood, if we place the numerators of the fractions in a column like a lower denomination, and add or subtract them as integers, carrying or borrowing according to the value of the higher denomination.

24

3. Multiplication of Vulgar Fractions.

Rule. "Multiply the numerators of the factors "together for the numerator of the product, and the "denominators together for the denominator of the "product."

Ex. 1st.] $\frac{2}{3}\times\frac{5}{7}=\frac{10}{21}$

$2\times5=10$ num.

$3\times7=21$ den.

2d] $8\frac{2}{3}\times7\frac{3}{4}=\frac{1302}{12}\times65\frac{2}{20}$

$8\frac{2}{3}=\frac{26}{3}$ by Prob. I.

$7\frac{3}{4}=\frac{31}{4}$ by ditto.

$42\times31=1302$

$5\times4=20$

To multiply $\frac{5}{7}$ by $\frac{2}{3}$, is the same as to find what two third parts of $\frac{5}{7}$ comes to; if one-third part only had been required, it would have been obtained by multiplying the denominator 7 by 3, because the value of fractions is lessened when their denominators are increased: and this comes to $\frac{5}{21}$; and, because two-thirds were required, we must double that fraction, which is done by multiplying the numerator by 2, and comes to $\frac{10}{21}$. Hence we infer, that fractions of fractions, or compound fractions, such as $\frac{2}{7}$ of $\frac{3}{5}$ are reduced to simple ones by multiplication. The same method is followed when the compound fraction is expressed in three parts or more.

If a number be multiplied by any integer, its value is increased: If it be multiplied by 1, or taken one time, it undergoes no alteration. If it be multiplied by a proper fraction, or taken for one half, two-thirds, or the like, its value is diminished, and the product is less than the number multiplied.

The foregoing rule extends to every case, when there are fractions in either factor. For mixed numbers may be reduced to improper fractions, as is done in Ex. 2d.; and integers may be written, or understood to be written, in the form of fractions whose numerator is 1. It will be convenient, however, to give some further directions for proceeding, when one of the factors is an integer, or when one or both are mixed numbers.

1st, To multiply an integer by a fraction, multiply it by the numerator, and divide the product by the denominator. *Ex.* $3756\times\frac{3}{5}=2253\frac{3}{5}$

3

5)11268($2253\frac{3}{5}$

2d, To multiply an integer by a mixed number, we multiply it first by the integer, and then by the fraction, and add the products.

Ex. $138\times5\frac{3}{4}=793\frac{1}{2}$

$138\times5=690$

$138\times\frac{3}{4}$

3

4)414($103\frac{1}{2}$

$793\frac{1}{2}$

3d, To multiply a mixed number by a fraction, we may multiply the integer by the fraction, and the two fractions together, and add the products.

Ex. $15\frac{3}{8}\times\frac{2}{9}=3\frac{5}{12}$

$15\times\frac{2}{9}=3\frac{3}{9}=3\frac{4}{12}$

$\frac{3}{8}\times\frac{2}{9}=\frac{6}{72}=\frac{1}{12}$

$3\frac{5}{12}$

4th, When both factors are mixed numbers, we may multiply each part of the multiplicand first by the integer of the multiplier, and then by the fraction, and add the four products.

Ex. $8\frac{2}{5}$ by $7\frac{3}{4}$

$8\times7=56$

$8\times\frac{3}{4}=\frac{24}{4}=6$ by Prob. II.

$\frac{2}{5}\times7=\frac{14}{5}=2\frac{4}{5}$ — $2\frac{16}{20}$

$\frac{2}{5}\times\frac{3}{4}=$ — $\frac{6}{20}$

product $65\frac{2}{20}$ as before.

4. Division of Vulgar Fractions.

25

Rule I. "Multiply the numerator of the dividend "by the denominator of the divisor. The product is "the numerator of the quotient."

II. "Multiply the denominator of the dividend by "the numerator of the divisor. The product is the de-"nominator of the quotient."

Ex. Divide $\frac{2}{3}$ by $\frac{7}{9}$. Quotient $\frac{18}{35}$

$2\times9=18$

$5\times7=35$.

To explain the reason of this operation, let us suppose it required to divide $\frac{5}{7}$ by 7, or to take one-seventh part of that fraction. This is obtained by multiplying the denominator by 7; for the value of fractions is diminished by increasing their denominators, and comes to $\frac{5}{49}$. Again, Because $\frac{7}{9}$ is nine times less than seven, the quotient of any number divided by $\frac{7}{9}$ will be nine times greater than the quotient of the same number divided by 7. Therefore we multiply $\frac{2}{35}$ by 9, and obtain $\frac{18}{35}$.

If the divisor and dividend have the same denominator, it is sufficient to divide the numerators.

Ex. $\frac{12}{17}$ divided by $\frac{3}{17}$ quotes 4.

The quotient of any number divided by a proper fraction is greater than the dividend. It is obvious, that any integer contains more halves, more third parts and the like, than it contains units; and, if an integer and fraction be divided alike, the quotients will have the same proportion to the numbers divided; but the value of an integer is increased when the divisor is a proper fraction; therefore, the value of a fraction in the like case is increased also.

The foregoing rule may be extended to every case, by reducing integers and mixed numbers to the form of improper fractions. We shall add some directions for shortening the operation when integers and mixed numbers are concerned.

1st, When the dividend is an integer, multiply it by

Vulgar Fractions.

by the denominator of the divisor, and divide the product by the numerator.

Ex. Divide 368 by $\frac{5}{7}$

7

5)2576(515$\frac{5}{5}$ quotient.

2d, When the divisor is an integer, and the dividend a fraction, multiply the denominator by the divisor, and place the product under the numerator.

Ex. Divide $\frac{3}{8}$ by 5 quotient $\frac{3}{40}$.

$8 \times 5 = 40$

3d, When the divisor is an integer, and the dividend a mixed number, divide the integer, and annex the fraction to the remainder; then reduce the mixed number, thus formed, to an improper fraction, and multiply its denominator by the divisor.

Ex. To divide $576\frac{4}{11}$ by 7 quotient $82\frac{2}{77}$

7) 576 (82

56

16

14

$2\frac{4}{11} = \frac{26}{11}$

$11 \times 7 = 76$

Here we divide 576 by 7, the quotient is 82, and the remainder 2, to which we annex the fraction $\frac{4}{11}$; and reduce $2\frac{4}{11}$ to an improper fraction $\frac{26}{11}$, and multiply its denominator by 7, which gives $\frac{26}{77}$.

Hitherto we have considered the fractions as abstract numbers, and laid down the necessary rules accordingly. We now proceed to apply these to practice. Shillings, and pence may be considered as fractions of pounds, and lower denominations of any kind as fractions of higher; and any operation, where different denominations occur, may be wrought by expressing the lower ones in one form of vulgar fractions, and proceeding by the following rules. For this purpose the two following problems are necessary.

PROBLEM V. "To reduce lower denominations to "fractions of higher, place the given number for the "numerator, and the value of the higher for the denominator."

Examples.

1. Reduce 7d. to the fraction of a shilling. Ans. $\frac{7}{12}$.
2. Reduce 7d. to a fraction of a pound. Ans. $\frac{7}{240}$.
3. Reduce 15s. 7. to a fraction of a pound. Ans. $\frac{187}{240}$.

PROBLEM VI. "To value fractions of higher denominations, multiply the numerator by the value of "the given denomination; and divide the product by "the denominator; if there be a remainder, multiply "it by the value of the next denomination, and continue the division."

Ex. 1st.] Required the value of $\frac{17}{60}$ of 1l.

9

50

45

5

Decimal Fractions.

In the first example, we multiply the numerator 17 by 20, the number of shillings in a pound, and divide the product 340 by 60, the denominator of the fraction, and obtain a quotient of 5 shillings; then we multiply the remainder 40 by 12, the number of pence in a shilling, which produces 480, which divided by 60 quotes 8d. without a remainder. In the second example we proceed in the same manner; but as there is a remainder, the quotient is completed by a fraction.

Sometimes the value of the fraction does not amount to an unit of the lowest denomination; but it may be reduced to a fraction of that or any other denomination, by multiplying the numerator according to the value of the places. Thus $\frac{1}{1289}$ of a pound is equal to $\frac{12}{1289}$ of a shilling, or $\frac{240}{1289}$ of a penny, $\frac{960}{1289}$ of a farthing.

CHAP. IX. DECIMAL FRACTIONS.

26

SECT. I. NOTATION *and* REDUCTION.

THE arithmetic of vulgar fractions is tedious, and even intricate to beginners. The difficulty arises chiefly from the variety of denominators; for when numbers are divided into different kinds of parts, they cannot be easily compared. This consideration gave rise to the invention of decimal fractions, where the units are divided into like parts; and the divisions and subdivisions are regulated by the same scale which is used in the arithmetic of integers. The first figure of a decimal fraction signifies tenth parts, the next hundredth parts, the next thousandth parts, and so on: and the columns may be titled accordingly. Decimals are distinguished by a point, which separates them from integers, if any be prefixed.

The use of cyphers in decimals, as well as in integers, is to bring the significant figures to their proper places, on which their value depends. As cyphers, when placed on the left hand of an integer, have no signification, but, when placed on the right hand, increase the value ten times each; so cyphers, when placed on the right hand of a decimal, have no signification; but, when placed on the left hand, diminish the value ten times each.

The notation and numeration of decimals will be obvious from the following examples.

4.7	signifies Four and seven tenth parts.
.47	Four tenth parts, and seven hundredth parts, or 47 hundredth parts.
.047	Four hundredth parts, and seven thousandth parts, or 47 thousandth parts.
.407	Four tenth parts, and seven thousandth parts, or 407 thousandth parts.
4.07	Four, and seven hundredth parts.
4.007	Four, and seven thousandth parts.

The column next the decimal point is sometimes called *decimal primes*, the next *decimal seconds*; and so on.

To reduce vulgar fractions to decimal ones: "Annex a cypher to the numerator, and divide it by the "denominator, annexing a cypher continually to the "remainder."

Ex.

Decimal Fractions.

Ex. 1st.] $\frac{12}{75}$=.16

22)70(31818
66
*40
22
180
176
*40
22
180

The reason of this operation will be evident, if we consider that the numerator of a vulgar fraction is understood to be divided by the denominator; and this division is actually performed when it is reduced to a decimal.

In like manner, when there is a remainder left in division, we may extend the quotient to a decimal, instead of completing it by a vulgar fraction, as in the following example:

25)646(25$\frac{21}{25}$ or 25.84.
50
146
125
Rem. 21.0
200
100
100
0

From the foregoing examples, we may distinguish the several kinds of decimals. Some vulgar fractions may be reduced exactly to decimals, as Ex. 1st and 2d, and are called *terminate* or *finite decimals*. Others cannot be exactly reduced, because the division always leaves a remainder; but, by continuing the division, we will perceive how the decimal may be extended to any length whatever. These are called *infinite decimals*. If the same figure continually returns, as in Ex. 3d and 4th, they are called *repeaters*. If two or more figures return in their order, they are called *circulates*. If this regular succession go on from the beginning, they are called *pure repeaters*, or *circulates*, as Ex. 3d and 5th. If otherwise, as Ex. 4th and 6th, they are mixed repeaters or circulates, and the figures prefixed to those in regular succession are called the *finite part*. Repeating figures are generally distinguished by a dash, and circulates by a comma, or other mark, at the beginning and end of the circle; and the beginning of a repeater or circulate is pointed out in the division by an asterisk.

Decim Fractio

Lower denominations may be considered as fractions of higher ones, and reduced to decimals accordingly. We may proceed by the following rule, which is the same, in effect, as the former.

To reduce lower denominations to decimals of higher. "Annex a cypher to the lower denomination, and divide it by the value of the higher. When there are several denominations, begin at the lowest, and reduce them in their order."

Ex. To reduce 5 cwt. 2. qr. 21 lb. to a decimal of a ton?

28)210(.75
196
140
140
0

4)2.75(.6875
24
35
32
30
28
20
20
0

20)5.6874(.284375
40
168
160
87
80
75
60
150.
140
100
100
0

Here, in order to reduce 21 lb. to a decimal of 1 qr. we annex a cypher, and divide by 28, the value of 1 qr. This gives .75. Then we reduce 2.75 qrs. to a decimal of 1 cwt. by dividing by 4, the value of 1 cwt. and it comes to .6875. Lastly, 5.6875 cwt. is reduced to a decimal of a ton by dividing by 20, and comes to .284375.

To value a decimal fraction. "Multiply it by the value of the denomination, and cut off as many decimal places from the product as there are in the multiplicand. The rest are integers of the lower denomination."

Example. What is the value of .425 of L. 1?

.425
20
sh. 8.500
6
d. 3.000

Sect. II. Arithmetic *of* Terminate Decimals.

The value of decimal places decreases like that of integers, ten of the lower place in either being equal to one of the next higher: and the same holds in passing from decimals to integers. Therefore, all the operations are performed in the same way with decimals, whether 27

Decimal Fractions.

whether placed by themselves or annexed to integers, as with pure integers. The only peculiarity lies in the arrangement and pointing of the decimals.

In addition and subtraction, "Arrange units under "units, tenth parts under tenth parts, and proceed as "in integers."

32.035	from 13.348	and 12.248
116.374	take 9.2993	10.6752
160.63		
12.3645	4.0487	1.5728
331.4035		

In multiplication, "Allow as many decimal places "in the product as there are in both factors. If the "product has not so many places, supply them by pre-"fixing cyphers on the left hand."

Ex. 1st.]	1.37	2d.]	43.75	3d.]	.1572
	1.8		.48		.12
	1096		35000		.01864
	137		17500		
	2.466		21.0000		

The reason of this rule may be explained, by observing, that the value of the product depends on the value of the factors; and since each decimal place in either factor diminishes its value ten times, it must equally diminish the value of the product.

To multiply decimals by 10, move the decimal point one place to the right; to multiply by 100, 1000, or the like, move it as many places to the right as there are cyphers in the multiplier.

In division, "Point the quotient so that there may "be an equal number of decimal places in the dividend "as in the divisor and quotient together."

Therefore, if there be the same of decimal places in the divisor and dividend, there will be as many in the quotient.

If there be more in the dividend, the quotient will have as many as the dividend has more than the divisor.

If there be more in the divisor, we must annex (or suppose annexed) as many cyphers to the dividend as may complete the number in the divisor, and all the figures of the quotient are integers.

If the division leave a remainder, the quotient may be extended to more decimal places; but these are not regarded in fixing the decimal point.

The reason for fixing the decimal point, as directed, may be inferred from the rule followed in multiplication. The quotient multiplied by the divisor produces the dividend; and therefore the number of decimal places in the dividend is equal to those in the divisor and quotient together.

The first figure of the quotient is always at the same distance from the decimal point, and on the same side as the figure of the dividend, which stands above the unit place of the first product. This also takes place in integers: and the reason is the same in both.

It was formerly observed, that numbers were diminished when multiplied by proper fractions, and increased when divided by the same. Thus, multiplication by fractions corresponds with division by integers; and division by fractions with multiplication by integers; when we multiply by $\frac{1}{2}$ or .5, we obtain the same answer as when we divide by 2, and every integer has a correspondent decimal, which may be called its *reciprocal*. Multiplication by that decimal supplies the place of division by the integer, and division supplies the place of multiplication.

Decimal Fractions.

To find the reciprocal of any number, divide 1 with cyphers annexed by that number.

Ex. Required the reciprocal of 625.

625)1.000(.0016
625
3750
3750
0

The product of any number multiplied by .0016 is the same as the quotient divided by 625. *Example.*

625)9375(15	9375
625	.0016
3125	56250
3125	9375
0	15.0000

Because .0016 is $\frac{1}{625}$ of unity, any number multiplied by that fraction will be diminished 625 times. For a like reason, the quotient of any number divided by .0016, will be equal to the product of the same multiplied by 625. *Example.*

.0016)516.0000(322500	516
48·····	625
36	2580
32	1032
40	3096
32	322500
80	
80	
0	

Sect. III. Approximate Decimals.

It has been shown that some decimals, though extended to any length, are never complete; and others, which terminate at last, sometimes consist of so many places, that it would be difficult in practice to extend them fully. In these cases, we may extend the decimal to three, four, or more places, according to the nature of the articles, and the degree of accuracy required, and reject the rest of it as inconsiderable. In this manner we may perform any operation with ease by the common rules, and the answers we obtain are sufficiently exact for any purpose in business. Decimals thus restricted are called *approximates*.

Shillings, pence, and farthings, may be easily reduced to decimals of three places, by the following rule. Take half the shillings for the first decimal place, and the number of farthings increased by one, if it amount to 24 or upwards; by two, if it amount to 48 or upwards; and by three, if it amount to 72 or upwards, for the two next places.

The reason of this is, that 20 shillings make a pound, two shillings is the tenth part of a pound; and therefore

fore half the number of shillings makes the first decimal place. If there were 50 farthings in a shilling, or 1000 in a pound, the units of the farthings in the remainder would be thousandth parts, and the tens would be hundredth parts, and so would give the two next decimal places; but because there are only 48 farthings in a shilling, or 960 in a pound, every farthing is a little more than the thousandth part of a pound; and since 24 farthings make 25 thousandth parts, allowance is made for that excess by adding 1 for every 24 farthings, as directed.

If the number of farthings be 24, 48, or 72, and consequently the second and third decimal places 25, 50, and 75, they are exactly right; otherwise they are not quite complete, since there should be an allowance of $\frac{1}{24}$, not only for 24, 48, and 72 farthings, but for every other single farthing. They may be completed by the following rule: Multiply the second and third decimal places, or their excess above 25, 50, 75, by 4. If the product amount to 24 or upwards, add 1; if 48, add 2; if 72, add 3. By this operation we obtain two decimal places more; and by continuing the same operation, we may extend the decimal till it terminate in 25, 50, 75, or in a repeater.

Decimals of sterling money of three places may easily be reduced to shillings, pence, and farthings, by the following rule: Double the first decimal place, and if the second be 5 or upwards, add 1 thereto for shillings. Then divide the second and third decimal places, or their excess above 50, by 4, first deducing 1, if it amount to 25, or upwards; the quotient is pence, and the remainder farthings.

As this rule is the converse of the former one, the reason of the one may be inferred from that of the other. The value obtained by it, unless the decimal terminate in 25, 50 or 75, is a little more than the true value; for there should be a deduction, not only of 1 for 25, but a little deduction of $\frac{1}{25}$ on the remaining figures of these places.

We proceed to give some examples of the arithmetic of approximates, and subjoin any necessary observations.

Addition.

Cwt.	*qrs.*	*lb.*	
3	2	14	= 3.625
2	3	22	= 2.94642
3	3	19	= 3.61964
4	1	25	= 4.47321
14	3	24	14.96427

Subtraction.

Cwt.	*qrs.*	*lb.*	
3	2	2	= 3.51785
1	1	19	= 1.41964
3	–	11	2.09821

If we value the sum of the approximates, it will fall a little short of the sum of the articles, because the decimals are not complete.

Some add 1 to the last decimal place of the approximate, when the following figure would have been 5, or upwards. Thus the full decimal of 3qrs. 22lb. is .946,428571, and therefore .94643 is nearer to it than .946,42. Approximates, thus regulated, will in general give exacter answers, and sometimes above the true one, sometimes below it.

The mark + signifies that the approximate is less than the exact decimal, or requires something to be added. The mark — signifies that it is greater, or requires something to be subtracted.

Multiplication.

```
Meth. 1st]8278+   Meth. 2d]8278   Meth. 3d].8278
           2153+           2153             3512
     ----------      ----------          -------
       24834            16556|            16556
      41390               827|8             827
      8278                413|90            413
     16556                 24|834            24
     ----------      ----------          -------
     1782|2534        1782|2534            1782
```

Here the last four places are quite uncertain. The right-hand figure of each particular product is obtained by multiplying 8 into the figures of the multiplier; but if the multiplicand had been extended, the carriage from the right-hand place would have been taken in; consequently the right-hand place of each particular product, and the four places of the total product, which depend on these, are quite uncertain. Since part of the operation therefore is useless, we may omit it; and for this purpose, it will be convenient to begin (as in p. 629. col. 1. *fifth* variety) at the highest place of the multiplier. We may perceive that all the figures on the right hand of the line on Meth. 2. serve no purpose, and may be left out, if we only multiply the figures on the multiplicand, whose products are placed on the right hand of the line. This is readily done by inverting the multiplier in Meth. 3. and beginning each product with the multiplication of that figure which stands above the figure of the multiplier that produces it, and including the carriage from the right-hand place.

If both factors be approximates, there are as many uncertain places, at least in the product, as in the longest factor. If only one be an approximate, there are as many uncertain places as there are figures in that factor, and sometimes a place or two more, which might be affected by the carriage. Hence we may infer, how far it is necessary to extend the approximates, in order to obtain the requisite number of certain places in the product.

Division.

Here all the figures on the right hand of the line are uncertain; for the right-hand figure of the first product 7448 might be altered by the carriage, if the divisor were extended; and all the remainders and dividuals that follow are thereby rendered uncertain. We may omit these useless figures; for which purpose, we dash a figure on the right hand of the divisor at each step, and neglect it when we multiply by the figure of the quotient next obtained; but we include the carriage. The operation, and the reason of it, will appear clear, by comparing the operation at large, and contracted, in the above example.

Chap.

Interminate Decimals.

Chap. X. INTERMINATE DECIMALS.

Sect. I. Reduction of Interminate Decimals.

As the arithmetic of interminate decimals, otherwise called the *arithmetic of infinites*, is facilitated by comparing them with vulgar fractions, it will be proper to inquire what vulgar fractions produce the several kinds of decimals, terminate or interminate, repeaters or circulates, pure or mixed. And first, we may observe, that vulgar fractions, which have the same denominator, produce decimals of the same kind. If the decimals corresponding to the numerator 1 be known, all others are obtained by multiplying these into any given numerator, and always retain the same form, providing the vulgar fraction be in its lowest terms.

Thus, the decimal equal to $\frac{1}{7}$ is .142857
which multiplied by 3

produces the decimal equal to $\frac{3}{7}$. .428571

Secondly, If there be cyphers annexed to the significant figures of the denominator, there will be an equal number of additional cyphers prefixed to the decimal. The reason of this will be evident, if we reduce these vulgar fractions to decimals, or if we consider that each cypher annexed to the denominator diminishes the value of the vulgar fraction ten times, and each cypher prefixed has a like effect on the value of the decimal.

Thus, $\frac{1}{7}$=.142857, $\frac{2}{25}$=.28 $\frac{45}{100}$=.0,45
$\frac{1}{70}$=.0,142857, $\frac{7}{2500}$=.0028 $\frac{1}{2000}$=.000,45

We may therefore confine our attention to vulgar fractions whose numerator is 1, and which have no cyphers annexed to the significant figures of the denominator.

Thirdly, Vulgar fractions, whose denominators are 2 or 5, or any of their powers, produce terminate decimals; for if any power of 2 be multiplied by the same power of 5, the product is an equal power of 10, as appears from the following table:

2	× 5	=	10	
2^2 or 4	× 5^2 or	25=	100 or 10^2	
2^3 or 8	× 5^3 or	125=	1000 or 10^3	
2^4 or 16	× 5^4 or	625=	10000 or 10^4	
2^5 or 32	× 5^5 or	3125=	100000 or 10^5	

And the reason is easily pointed out: for $2^3 \times 5^3 = 2 \times 2 \times 2 \times 5 \times 5 \times 5$; or, because the factors may be taken in any order, $= 2 \times 5 \cdot \times 2 \times 5 \times 2 \times 5$; and this, if we multiply the factors by pairs, becomes $10 \times 10 \times 10$, or 10^3. The like may be shown of any other power. And we may infer, that if any power of 10 be divided by a like power of 2 or 5, the quotient will be an equal power of 5 or 2 respectively, and will come out exact, without a remainder; and, since the vulgar fractions above mentioned are reduced to decimals by some such division, it follows that the equivalent decimals are terminate.

The number of places in the decimal is pointed out by the exponent of the power; for the dividend must be a like power of 10, or must have an equal number of cyphers annexed to 1, and each cypher of the dividend gives a place of the quotient.

Ex. $\frac{1}{32}$=.03125, a decimal of 5 places, and 32=$\frac{5}{2}$.

Again, No denominators except 2, 5, or their powers, produce terminate decimals. It is obvious from p. 631. col. 2. par. 4. that, if any denominator which produces a terminate decimal be multiplied thereby, the product will consist of 1, with cyphers annexed; and consequently the lowest places of the factors, multiplied into each other, must amount to 10, 20, or the like, in order to supply a cypher for the lowest place of the product; but none of the digits give a product of this kind, except 5 multiplied by the even numbers; therefore one of the factors must terminate in 5, and the other in an even number. The former is measured by 5, and the latter by 2, as was observed p. 630. col. 2. par. 7. Let them be divided accordingly, and let the quotients be multiplied. This last product will be exactly one-tenth part of the former; and therefore will consist of 1, with cyphers annexed, and the factors which produce it are measured by 5 and 2, as was shewn before. This operation may be repeated; and one of the factors may be divided by 5, and the other by 2, till they be exhausted; consequently they are powers of 5 and 2.

Fourthly, Vulgar fractions, whose denominators are 3 or 9, produce repeating decimals.

Thus, $\frac{1}{9}$=.11$\dot{1}$ $\frac{5}{9}$=55$\dot{5}$
$\frac{2}{9}$=.22$\dot{2}$ $\frac{2}{3}$ or $\frac{6}{9}$=66$\dot{6}$
$\frac{1}{3}$ or $\frac{3}{9}$=.33$\dot{3}$ $\frac{7}{9}$=77$\dot{7}$
$\frac{4}{9}$=.44$\dot{4}$ $\frac{8}{9}$=88$\dot{8}$

The repeating figure is always the same as the numerator. Hence we infer, that repeating figures signify ninth parts; a repeating 3 signifies $\frac{1}{3}$; a repeating 6 signifies $\frac{2}{3}$; and a repeating 9 signifies $\frac{9}{9}$, or 1.

The value of repeating decimals may also be illustrated by collecting the values of the different places: for example, let the value of 11$\dot{1}$ be required: the first decimal place signifies $\frac{1}{10}$, the next, $\frac{1}{100}$, the next $\frac{1}{1000}$. The sum of the two first places is $\frac{11}{100}$, of the three places $\frac{111}{1000}$; and so on. If we subtract these values successively from $\frac{1}{9}$, the first remainder is $\frac{1}{90}$, the second $\frac{1}{900}$, the third $\frac{1}{9000}$. Thus, when the value of the successive figures is reckoned, the amount of them approaches nearer and nearer to $\frac{1}{9}$, and the difference becomes 10 times less for each figure assumed; and, since the decimal may be extended to any length, the difference will at last become so small, that it need not be regarded. This may give a notion of a decreasing series, whose sum may be exactly ascertained, though the number of terms be unlimited.

Fifthly, Vulgar fractions, whose denominators are a product of 3 or 9 multiplied by 2, 5, or any of their powers, produce mixed repeaters. The reason of this will be evident, if, in forming the decimal, we divide the numerator successively by the component parts of the denominator, as directed p. 630. col. 1. par. ult. &c.

Intermi-nate Decimals.

&c. The first divisor is 2, 5, or some of their powers, and consequently gives a finite quotient by p. 649, col. 1. par. 3, &c. The second divisor is 3 or 9; and therefore, when the figures of the dividend are exhausted, and figures annexed to the remainder, the quotient will repeat, by p. 649. col. 2. par. 2.

Ex. $\frac{1}{144}$ 144=16×9.

	640		0

In order to illustrate this subject farther, we shall explain the operation of casting ont the threes, which resembles that for casting out the nines, formerly laid down, p. 633. col. 2. par. 4.—p. 634. col. 2. par. 3. and depends on the same principles, being a method of finding the remainder of a number divided by 3. If the same number be divided by 3 and by 9, the remainders will either agree, or the second remainder will exceed the first by 3 or by 6. The reason of this will be obvious, if we suppose a collection of articles assorted into parcels of 3, and afterwards into parcels of 9, by joining three of the former together. If the lesser parcels be all taken up in composing the greater ones, the remainder will be the same at the end of the second assortment as before; but if one of these lesser parcels be left over, the remainder will be more, and if two of them be left over, the remainder will be 6 more. Therefore, when the nines are cast out from any number, and the result divided by 3, the remainder is the same as when the number is divided by 3: Thus, the results on casting out the 3's may be derived from those obtained by casting out the 9's; and the same correspondence which was pointed out with respect to the latter, for proving the operations of arithmetic, applies also to the former.

To cast out the 3's from any number, add the figures, neglecting 3, 6, or 9; and, when the sum amounts to 3, 6, or 9, reject them; and carry on the computation with the excess only. For example, take 286754: in casting out the 3's we compute thus; 2 and 8 is 10, which is three times 3, and 1 over; 1 and (passing by 6) 7 is 8, which is twice 3 and 2 over; 2 and 5 is 7, which is twice 3 and 1 over; lastly, 1 and 4 is 5, which contains 3 once, and 2 over, so the result is 2.

If the 3's be cast out from 2^2 or 4, the result is 1; from 2^3 or 8, the result is 2; from 2^4 or 16, the result is 1; and universally the odd powers of 2 give a result of 2, and the even powers give a result of 1. As every higher power is produced by multiplying the next lower by 2, the result of the product may be found by multiplying the result of the lower power by 2, and casting out the 3's if necessary. Therefore if the result of any power be one, that of the next higher is 2, and that of the next higher (4 with the 3's cast out, or) 1. Thus the results of the powers of 2 are 1 and 2 by turns; also, because the result of 5, when the 3's are cast out, is 2, its powers will have the same results as the corresponding powers of 2.

If the denominator be a product of an even power of 2 or 5, multiplied by 3, the repeating figure of the corresponding decimal is 3; but, if it be the product of an odd power, the repeating figure is 6. For, in forming the decimal, we may divide by the component parts of the denominator, and the first divisor is a power of 2 or 5; therefore the first quotient is a like power of 4 or 2 (p. 649. col. 1. par. 3. &c.) and this power is again divided by 4. If it be an even power, the remainder or result is 1, as was demonstrated above; and if cyphers be annexed to the remainder, and the division continued, it quotes a repeating 3; but it be an odd power, the remainder is 2, and the quotient continued by annexing cyphers is a repeating 6.

If the denominator be 9, multiplied by 2, or any of its powers, the repeating figure may be found by casting out the 9's from the corresponding power, by 5; and if it be multiplied by 5, or any of its powers, by casting out the 9's from the corresponding power of 2. For if the decimal be formed by two divisions, the first quotes the corresponding power; and the second, because the divisor is 9, repeats the resulting figure after the dividend is exhausted.

If any mixed repeater be multiplied by 9, the product is a terminate decimal, and may be reduced (p. 649. col. 1. par. 3. &c.) to a vulgar fraction, whose denominator is 2, 5, or some of their powers; therefore all mixed repeaters are derived from vulgar fractions, whose denominators are products of 2, 5, or their powers, multiplied by 3 or 9.

Sixthly, All denominators, except 2, 5, 3, 9, the powers of 2 and 5, and the products of these powers, multiplied by 3 or 9, produce circulating decimals. We have already shown, that all terminate decimals are derived from 2, 5, or their powers; all pure repeaters, from 3 or 9; and all mixed repeaters, from the products of the former multiplied by the latter. The number of places in the circle is never greater than the denominator diminished by unity: Thus $\frac{1}{7}$ produces .142857, a decimal of 6 places; and $\frac{1}{17}$ produces .0588235294117647, a decimal of 16 places. The reason of this limit may be inferred from the division; for whenever a remainder which has recurred before, returns again, the decimal must circulate, and the greatest number of possible remainder is one less than the divisor: But frequently the circle is much shorter. Thus $\frac{1}{11}$=.09, a circle of 2 places.

When a vulgar fraction, whose numerator is 1, produces a pure circulate, the product of the circle multiplied by the denominator, will consist of as many 9's as there are places in the circle. Thus $\frac{1}{7}$=.142857, which multiplied by 7 produces 999999. The like holds in every decimal of the same kind; for they are formed by dividing 10, or 100, or 1000, or some like number, by the denominator, and the remainder is 1, when the decimal begins to circulate; for the division must be then exactly in the same state as at the beginning: Therefore, if the dividend had been less by 1, or had consisted entirely of 9's, the division would have come out without a remainder; and since the quotient multiplied by the divisor, produces the dividend, as was shown p. 631. col. 2. par. 3. it follows, that the circulating figures, multiplied by the denominator, produce an equal number of 9's.

Every vulgar fraction, which produces a pure circulate,

Interminate Decimals.

late, is equal to one whose numerator is the circulating figures, and its denominator a like number of 9's. If the numerator be 1, the vulgar fraction is reduced to that form by multiplying both terms into the circle of the decimal; and if the numerator be more than 1, the equivalent decimal is found by multiplying that which corresponds to the numerator 1 into any other numerator.

Thus $\frac{1}{7}$=.142857,=$\frac{142857}{999999}$ and $\frac{1}{10}$=.027.=$\frac{27}{999}$
$\frac{2}{7}$=.285714,=$\frac{285714}{999999}$ $\frac{2}{37}$=.054.=$\frac{54}{999}$
$\frac{3}{7}$=.428571,=$\frac{428571}{999999}$ $\frac{3}{37}$=.216.=$\frac{216}{999}$

Hence we may infer, that pure circulates are equal in value to vulgar fractions whose numerators consist of the circulating figures, and denominators of as many 9's as there are places in the circle. To place this in another point of view, we shall reduce a vulgar fraction, whose numerator consists entirely of 9's, to a decimal.

$\frac{375}{999}$ 990)375000(.375,
2997··

7530
6993

5370
4995

*375

The remainder is now the same as the dividend, and therefore the quotient must circulate; and, in general, since any number with 3 cyphers annexed, may be divided by 1000, without a remainder, and quotes the significant figures; therefore, when divided by 999, it must quote the same figures, and leave an equal remainder. This also applies to every divisor which consists entirely of 9's. Circles of two places, therefore, signify ninety-ninth parts; circles of 3 places, signify nine hundred and ninety-ninth parts; and so on.

The value of circulating decimals may also be illustrated by adding the values of the places. Thus, if two figures circulate, the first circle signifieth hundredth parts, and every following circle signifies one hundred times less than the preceding; and their values added, as in p. 649. col. 2. par. 3. will approach nearer to ninety-ninth parts than any assigned difference, but will never exactly complete it.

All denominators which are powers of 3, except 9, produce pure circulates; and the number of places in the circle is equal to the quotient of the denominator divided by 9.

Thus, $\frac{1}{27}$=.037, a circle of 3 places, and 27 divided by 9=3
$\frac{1}{81}$=.012345679, a circle of 9 places, and 81 divided by 9=9.

These decimals may be formed, by dividing the numerator by the component parts of the denominator. In the first example, the component parts of the numerator are 9 and 3. The division by 9 quotes a pure circulate, and the circulating figure is not 3, 6, or 9, if the vulgar fraction be in its lowest terms. And any other repeating figure divided by 3, quotes a pure circulate of 3 places; for the first dividual must leave a remainder of 1 or 2. If the first remainder be 1, the second remainder is 2, (because, if 1 be prefixed to the repeating figure, and the 3's be cast out, the result is 2), and, for a like reason, the third dividual clears off without a remainder. If the first remainder be 2, the second is (twice 2 or 4, with the 3's cast out, or) 1, and the third 0; so the circle is always complete at 3 places, and the division begins anew. The sum of such a circle cannot be a multiple of 3; for since the repeating figure is not 3, nor any of its multiples, the sum of 3 places is not a multiple of 9, and therefore cannot be divided by 9, nor twice by 3, without a remainder.

Interminate Decimals.

Again, If the decimal equal to $\frac{1}{27}$ be divided by 3, we shall obtain the decimal equal to $\frac{1}{81}$. The dividend, as we have shown already, is a pure circulate of 3 places, whose sum is not a multiple of 3. Therefore, when divided by 3, the first circle leaves a remainder of 1 or 2, which being prefixed to the second, and the division continued, the remainder at the end of the second circle, is 2 or 1, and at the end of the third circle, there is no remainder; all which may be illustrated by casting out the 3's. The division being completed at 9 places, finishes the circle; and it may be shown, as before, that the sum of these places is not a multiple of 3. The learner will apprehend all this if he reduce these, or the like vulgar fractions, to decimals, by successive divisions.

27= 9×3, and 9)1.0(.1111, and 3) 1111(.037,
81=27×3, and 3)037,037,037(.012345679.

For the same reason, if any circulating decimal, not a multiple of 3, be divided by 3, the quotient will circulate thrice as many places as the dividend; and if any circulate obtained by such division be multiplied by 3, the circle of the product will be restricted to one-third of the places in the multiplicand.

All vulgar fractions, whose denominators are multiples of 2, 5, or their powers, except those already considered, produce mixed circulates; for they may be reduced by dividing by the component parts of the denominator. The first divisor is 2, 5, or some of their powers, and therefore gives a fine quotient. The second divisor is none of the numbers enumerated p. 650. col. 2. par. 2. and therefore gives a circulating quotient when the significant figures of the dividend are exhausted, and cyphers annexed to the remainder.

All mixed circulates are derived from vulgar fractions

Interminate Decimals.

tions of this kind, whose denominators are multiples of 2, 5, or their powers; and therefore all other denominators, except 8 and 9, produce pure circulates. The reader will easily perceive, that when a decimal is formed from a vulgar fraction, whose numerator is 1, when the remainder 1 occurs in the division the decimal is a pure circulate; but if any other remainder occurs twice, the decimal is a mixed circulate. We are to show that this last will never happen, unless the divisor be a multiple of 2, 5, or their powers. If two numbers be prime to each other, their product will be prime to both; and if two numbers be proposed, whereof the first does not measure the second, it will not measure any product of the second, if the multiplier be prime to the first. Thus, because 7 does not measure 12, it will not measure any product of 12 by a multiplier prime to 7. For instance, it will not measure 12×3, or 36. Otherwise, the quotient of 12 divided by 7, or $1\frac{5}{7}$ multiplied by 3, would be a whole number, and 5×3 would be measured by 7, which it cannot be, since 5 and 3 are both prime to 7.

Now, if we inspect the foregoing operation, we shall perceive that the product of 136, the remainder where the decimal begins to circulate, multiplied by 999, is measured by the denominator 216. But 999 is not measured by the denominator, otherwise the decimal would have been a pure circulate; therefore 126 and 136 are not prime to each other, but have a common measure, and that measure must apply to 864, a multiple of 126, and to 1000, the sum of 136 and 864; see p. 642, col. 2. par. *ult.* &c. But it was proven, p. 649, col. 1. par. 1. that no numbers, except the powers of 5 and 2, measure a number consisting of 1 with cyphers annexed; consequently the denominator must be measured by a power of 2 or 5. The reader will perceive, that the exponent of the power must be the same as the number of cyphers annexed to 1, or as the number of figures in the finite part of the decimal.

We shall now recapitulate the substance of what has been said with respect to the formation of decimals: 2, 5, and their powers, produce finite decimals, by p. 649, col. 1. par. 3, &c. and the number of places is measured by the exponent of the power; 3 and 9 produce pure repeaters (p. 649. col. 2. par. 2.) The products of 2, 5, and their powers, by 3 or 9, produce mixed repeaters by p. 649. col. 2. par. *ult.*; their products by other multipliers, produce mixed circulates by p. 649. col. 2. par. *ult.*; and all numbers of which 2 and 5 are not aliquot parts, except 3 and 9, produce pure circulates. To find the form of a decimal corresponding to any denominator, divide by 2, 5, and 10, as often as can be done without a remainder; the number of divisions shows how many finite places there are in the decimal, by p. 651. col. 2. par. 3. If the dividend be not exhausted by these divisions, divide a competent number of 9's by the last quotient, till the division be completed without a remainder: the number of 9's required show how many places there are in the circle; and the reason may be inferred from p. 650. col. 2. par. 5.

We shall conclude this subject by marking down the decimal produced by vulgar fractions, whose numerator is 1, and denominator 30; and under that the reader may observe their connexion with the denominators.

Interminate Decim.

RULES *for reducing interminate decimals to vulgar fractions.*

I. "If the decimal be a pure repeater, place the repeating figure for the numerator, and 9 for the denominator."

II. "If the decimal be a pure circulate, place the circulating figures for the numerator, and as many 9's as there are places in the circle for the denominator."

III. "If there be cyphers prefixed to the repeating or circulating figures, annex a like number to the 9's in the denominator."

IV. "If the decimal be mixed, subtract the finite part from the whole decimal. The remainder is the numerator; and the denominator consists of as many 9's as there are places in the circle, together with as many cyphers as there are finite places before the circle."

Thus, $235,62,=\frac{23327}{99000}$

From the whole decimal	23562
We subtract the finite part	235
and the remainder	23327 is the numerator.

The reason may be illustrated by dividing the decimal into two parts, whereof one is finite, and the other a pure repeater or circulate, with cyphers prefixed. The sum of the vulgar fractions corresponding to these will be the value of the decimal sought.

$.235,62$, may be divided into $.235\frac{235}{1000}$ by Rule I. and $.000,62=\frac{62}{99000}$ by Rules II. III.

In order to add these vulgar fractions, we reduce them to a common denominator; and, for that purpose, we multiply both terms of the former by 99, which gives $\frac{23265}{99000}$; then we add the numerators.

235 or by method explained p. 628. col. 1. par 3.
99

		Sum of numerators.		
2115	23500	23265	or	23562
2115	235	62		235
23265	23265	23327		23327

The value of circulating decimals is not altered, though one or more places be separated from the circle, and considered as a finite part, providing the circle be completed. For example, .27 may be written .2,72, $\frac{270}{900}$, or $\frac{27}{99}$, which is also the value of .27. And if two or more circles be joined, the value of the decimal is still the same. Thus, $2727,=\frac{2727}{9999}$, which is reduced by dividing the terms by 101 to $\frac{27}{99}$.

Interminate Decimals.

All circulating decimals may be reduced to a similar form, having a like number both of finite and circulating places. For this purpose, we extend the finite part of each as far as the longest, and then extend all the circles to so many places as may be a multiple of the number of places in each.

Ex. ·34,725, extended, ·34,725725725725,
1,4562, 14,562456245624,

Here the finite part of both is extended to two places, and the circle to 12 places, which is the least multiple for circles of 3 and 4 places.

30 SECT. II. ADDITION *and* SUBTRACTION *of* INTERMINATE DECIMALS.

To add repeating Decimals. "Extend the repeating "figures one place beyond the longest finite ones, and "when you add the right-hand column, carry to the "next by 9."

Ex. ·3752$\dot{4}$ or 37524 ·23 ·29$\dot{6}$ $\frac{7}{36}$
·8 88888 ·328 ·42 $\frac{11}{45}$
·643 643 ·469$\dot{1}$ ·7548 $\frac{11}{74}$
·73 73333 ·3$\dot{6}$ ·31 $\frac{2}{73}$
264046

To subtract repeating Decimals. "Extend them as "directed for addition, and borrow at the right-hand "place, if necessary, by 9."

·93560 ·646 ·7358 ·7382 ·469
·84738 ·53421 ·62563 ·68 ·38
·08721 ·11173

The reason of these rules will be obvious, if we recollect that repeating figures signify nine parts. If the right-hand figure of the sum or remainder be 0, the decimal obtained is finite; otherwise it is a repeater.

To add circulating Decimals. "Extend them till "they become similar (p. 652. col. 1. par. *ult.* &c.); "and when you add the right-hand column, include "the figure which would have been carried if the circle had been extended further."

Ex. 1st.]	*Extended.*	*Ex.* 2d.]	*Extended.*
·574,	·574,574,	·874,	·874,874,874,
·2,698,	·269,869,	·1463	·146,333333,
·428	·428	·1,58,	·158,585858,
·37,983	·379,839,	·32,	·323,232323,
	1.652,284,		1.503,026390,

Note 1. Repeaters mixed with circulates are extended and added as circulates.

Note 2. Sometimes it is necessary to inspect two or more columns for ascertaining the carriage; because the carriage from a lower column will sometimes raise the sum of the higher, so as to alter the carriage from it to a new circle. This occurs in Ex. 2.

Note 3. The sum of the circles must be considered as a similar circle. If it consist entirely of cyphers, the amount is terminate. If all the figures be the same, the amount is a repeater. If they can be divided into parts exactly alike, the amount is a circle of fewer places; but, for the most part, the circle of the sum is similar to the extended circles.

·3,868,	·0842,	$\frac{2}{7}$	·368	·003094·	$\frac{5}{81}$,
·4,375,	·08,42	$\frac{3}{5}$	·57,	·765,	$\frac{7}{48}$
·853492,	·0,842	$\frac{8}{11}$	·895	·76,	$\frac{2}{11}$
·62,	·0842	$\frac{16}{17}$	·742	·765	$\frac{3}{22}$.

Interminate Decimals.

To subtract circulating Decimals. "Extend them "till they become similar; and when you subtract the "right-hand figure, consider whether 1 would have "been borrowed if the circles had been extended further, and make allowance accordingly.

			or, 3,60

31 SECT. III. MULTIPLICATION *of* INTERMINATE DECIMALS.

CASE I. "When the multiplier is finite and the "multiplicand repeats, carry by 9 when you multiply "the repeating figure: The right-hand figure of each "line of the product is a repeater; and they must be "extended and added accordingly."

Ex. ·1349$\dot{4}$
·376
94461
80966
4048332
·0495246$\dot{1}$

If the sum of the right-hand column be an even number of 9's, the product is finite; otherwise, it is a repeater.

CASE II. "When the multiplier is finite, and the "multiplicand circulates, add to each product of the "right-hand figure the carriage which would have "been brought to it if the circle had been extended. "Each line of the product is a circle similar to the "multiplicand, and therefore they must be extended "and added accordingly."

The product is commonly a circulate similar to the multiplicand; sometimes it circulates fewer places, repeats, or becomes finite; it never circulates more places.

Ex. ·37,46, ×·235

35714285

38,571428	571428	571428,
385714	285714	285714,
3857	142857	142857,
38	571428	571428,
	385714	385714,
	3857	142857,
	38	571428,
		385714,
		3857,
		38,
38,961038,	961038,	961038,

It is evident, that if a repeating multiplier be extended to any length, the product arising from each figure will be the same as the first, and each will stand one place to the right hand of the former. In like manner, if a circulating multiplier be extended, the product arising from each circle will be alike, and will stand as many places to the right hand of the former as there are figures in the circle. In the foregoing examples, there are as many of these products repeated as is necessary for finding the total product. If we place down more, or extend them further, it will only give a continuation of the repeaters or circulates.

This is obvious in Ex. 1st and 2d. As the learner may not comprehend it so readily in Ex. 3d. when the multiplicand is a circulate, and consequently each line of the product is also a circulate, we have divided it into columns, whose sums exhibit the successive circles. The sum of the first column is 38,961037, and there is a carriage of 1 from the right-hand column, which completes 38,961038. This one is supplied from the three first lines of the second column, the sum of which is 999999, and being increased by 1 in consequence of the carriage from the third column, amounts to 1,000000, and therefore carries 1 to the first column, and does not affect the sum of the remaining lines, which are the same as those of the first column. The third column contains two sets of these lines, which amount to 999999, beside the lines which compose the circle. Each of these sets would be completed into 1,000000 by the carriage from the 4th column, if extended, and each would carry 1 to the second column. One of these would complete the sum of the three first lines, and the other would complete the sum of the circle. In like manner, if the circles be extended ever so far, the increasing carriages will exactly answer for the increasing deficiencies, and the sum will be always a continuation of the circle; but the product could not circulate, unless the sum of the lines marked off in the second column had consisted entirely of 9's; or had been some multiple of a number of 9's; and the circles must be extended till this take place, in order to find the complete product.

The multiplication of interminate decimals may be often facilitated, by reducing the multiplier to a vulgar fraction, and proceeding as directed p. 643. col. 1. par. 6.
Thus,

4th.] $.3824 \times \dot{7}. = \frac{7}{9}$
7
9)2.6768
$.974\dot{2}$

5th.] $.384 \times .2\dot{3} = \frac{23}{90}$
23   2
1152   23
768
90)8.832
$.0981\dot{3}$.

Therefore, in order to multiply by $\dot{3}$, we take one-third part of the multiplier; and, to multiply by $\dot{6}$, we take two-thirds of the same. Thus,

6th.] $.784 = .\dot{3} \times \frac{1}{3}$
3).784
$.261\dot{3}$

7th.] $.8761 \times .\dot{6} = \frac{2}{3}$
2
3)1.7522
$.5840\dot{6}$

As the denominator of the vulgar fractions always consists of 8's, or of 9's with cyphers annexed, we may use the contraction explained p. 631. col 1. par. *ult.* &c.; and this will lead us exactly to the same operation which was explained p. 653. col. 2. par. *ult.* &c. on the principles of decimal arithmetic.

8th.] $.735 \times .3,26 = \frac{323}{990}$
323   3

1668
834
999)101470,
101,
101,571,

When the multiplier is a mixed repeater or circulate, we may proceed as in Ex. 5th and 8th; or we may divide the multiplier into two parts, of which the first is finite, and the second a pure repeater or circulate, with cyphers prefixed, and multiply separately by these, and add the products.

Thus, $.384 \times .2\dot{3}$ or by .2 = .0768
and by $.05 = .0213\dot{3}$
.09813

or thus, .384
$.2\dot{3}$

In Ex. 13th, we have omitted the products of the divisor, and only marked down the remainders. These are found, by adding the left-hand figure of the dividual to the remaining figures of the same. Thus, 363 is the first dividual; and 3, the left-hand figure, added to 63, the remaining figures, gives 66 for the first remainder; and the second dividual, 666, is completed by annexing the circulating figure 6. The reason of which may be explained as follows. The highest place of each dividual shows, in this example, how many hundreds it contains; and as it must contain an equal number of ninety-nines, and also an equal number of units, it follows, that these units, added to the lower places, must show how far the dividual exceeds that number of ninety-nines. The figure of the quotient is generally the same as the first place of the dividual, sometimes one more. This happens in the last step of the foregoing example, and is discovered when the remainder found, as here directed, would amount to 99, or upwards; and the excess above 99 only, must in that case be taken to complete the next dividual.

14th.].01, × .01, = $\frac{1}{990}$

1

(81828384858687888990919293949596979899

The number of places in the circle of the product is sometimes very great, though there be few places in the factors: but it never exceeds the product of the denominator of the multiplier, multiplied by the number of places in the circle of the multiplicand. Therefore, if the multiplier be 3 or 6, the product may circulate three times as many places as the multiplicand; if the multiplier be any other repeater, nine times as many; if the multiplier be a circulate of two places, ninety-nine times as many; thus, in the last example, .01, a circulate of two places, multiplied by .10, a circulate of two places, produces a circulate of twice 99, or 198 places. And the reason of this limit may be inferred from the nature of the operation; for the greatest possible number of remainders, including 0, is equal to the divisor 99; and each remainder may afford two dividuals, if both the circulating figures, 3 and 6, occur to be annexed to it. If the multiplier circulate three places, the circle of the product, for a like reason, may extend nine hundred and ninety-nine times as far as that of the multiplicand. But the number of places is often much less.

The multiplication of interminate decimals may be proven, by altering the order of the factors, (p. 628. col. 2. par. 2.) or by reducing them both to vulgar fractions in their lowest terms, multiplying these as directed p. 643. col. 2. par. 3. and reducing the product to a decimal.

Sect. IV. Division *of* Interminate Decimals.

32

Case I. "When the dividend only is interminate, "proceed as in common arithmetic; but, when the figures of the dividend are exhausted, annex the repeating figure, or the circulating figures in their order, instead of cyphers, to the remainder."

Ex.

2d.] Divide .6532$\dot{8}$ by 8.

8).6532$\dot{8}$(.08166$\dot{1}$.

In these accounts the quotient is never finite. It may repeat if the dividend repeats; or, if the dividend circulate, it may circulate an equal number of places, often more, and never fewer. The greatest possible extent of the circle is found by multiplying the divisor into the number of places in the circle of the dividend. Thus, a circulate of 3 places, divided by 3, quotes a circulate of 3 times 3 or 9 places.

Case II. "When the divisor is interminate, the "multiplications and subtractions must be performed "according to the directions given for repeating and "circulating decimals."

1090,90
0

The foregoing method is the only one which properly depends on the principles of decimal arithmetic; but it is generally shorter to proceed by the following rule.

Extract. of Roots.

"Reduce the divisor to a vulgar fraction, multiply "the dividend by the denominator, and divide the product by the numerator."

Ex. 1st.] Divide .37845 by $\dot{5}=\frac{5}{9}$.
9
5)3,40605(.68121.

2d.] Divide .3784$\dot{5}$ by $\dot{6}=\frac{2}{3}$
3
2)1.353$\dot{6}$(.56768$\dot{3}$.

Note 1. Division by $\dot{3}$ triples the dividend, and division by $\dot{6}$ increases the dividend one half.

Note 2. When the divisor circulates, the denominator of the vulgar fraction consists of 9's, and the multiplication is sooner performed by the contraction explained p. 628. col. 1. par. 1. It may be wrought in the same way, when the divisor repeats, and the denominator, of consequence, is 9.

Note 3. If a repeating dividend be divided by a repeating or circulating divisor; or, if a circulating dividend be divided by a similar circulating dividend; or, if the number of places in the circle of the divisor be a multiple of the number in the dividend; then the product of the dividend multiplied by the denominator of the divisor will be terminate, since like figures are subtracted from like in the contracted multiplication, and consequently no remainder left. The form of the quotient depends on the divisors as explained at large, p. 649. col. 1. par. 1.—p. 651. col. 2. par. 3.

Note 4. In other cases, the original and multiplied dividend are similar, and the form of the quotient is the same as in the case of a finite divisor. See p. 655. col. 2. par. *ult.* &c.

Note 5. If the terms be similar, or extended till they become so, the quotient is the same as if they were finite, and the operation may be conducted accordingly; for the quotient of vulgar fractions that have the same denominator is equal to the quotient of their numerators.

Chap. XI. OF THE EXTRACTION OF ROOTS.

The origin of powers by involution has already been explained under the article Algebra, N° 66. There 33
now remains therefore only to give the most expeditious methods of extracting the square and cube roots; the reasons of which will readily appear from what is said under that article. As for all powers above the cube, unless such as are multiples of either the square and cube, the extraction of their roots admits of no deviation from the algebraic canon which must be always constructed on purpose for them.

If the root of any power not exceeding the seventh power be a single digit, it may be obtained by inspection, from the following table of powers.

Extraction of Roots.

1st power or root.	2d power or square.	3d power or cube.	4th power or biquadrate.	5th power or sursolid.	6th power or cube squared.	7th power.
1	1	1	1	1	1	1
2	4	8	16	32	64	128
3	9	27	81	243	729	2187
4	16	64	256	1024	4096	16384
5	25	125	625	3125	15625	78125
6	36	216	1296	7776	46656	279936

8	64	512	4096	32768	262144	2097152
9	81	729	6561	59049	531441	4782969

Sect. I. Extraction *of the* Square Root.

34 Rule I. "Divide the given number into periods of "two figures, beginning at the right hand in integers, "and pointing toward the left. But in decimals, begin "at the place of hundreds, and point toward the right. "Every period will give one figure in the root."

II. "Find by the table of powers, or by trial, the "nearest lesser root of the left-hand period; place the "figure so found in the quot; subtract its square from "the said period, and to the remainder bring down the "next period for a dividual or resolvend."

III. "Double the quot for the first part of the di-"visor; inquire how often this first part is contained "in the whole resolvend, excluding the units place; "and place the figure denoting the answer both in the "quot and on the right of the first part; and you have "the divisor complete."

IV. "Multiply the divisor thus completed by the "figure put in the quot, subtract the product from the "resolvend, and to the remainder bring down the fol-"lowing period for a new resolvend, and then proceed "as before."

Note 1st. If the first part of the divisor, with unity supposed to be annexed to it, happen to be greater than the resolvend, in this case place 0 in the quot, and also on the right of the partial divisor; to the resolvend bring down another period; and proceed to divide as before.

Note 2. If the product of the quotient figure into the divisor happen to be greater than the resolvend, you must go back and give a lesser figure to the quot.

Note 3. If, after every period of the given number is brought down, there happen at last to be a remainder, you may continue the operation, by annexing periods or pairs of cyphers, till there be no remainder, or till the decimal part of the quot repeat or circulate, or till you think proper to limit it.

If the square root of a vulgar fraction be required, find the root of the given numerator for a new numerator, and find the root of the given denominator for a new denominator. Thus the square root of $\frac{4}{9}$ is $\frac{2}{3}$, and the root of $\frac{16}{25}$ is $\frac{4}{5}$; and thus the root of $\frac{25}{4}$ ($=6\frac{1}{4}$) is $\frac{5}{2}=2\frac{1}{2}$.

But if the root of either the numerator or denominator cannot be extracted without a remainder, reduce the vulgar fraction to a decimal, and then extract the root, as in Ex. 3d. above.

Sect. II. Extraction *of the* Cube Root.

Rule I. "Divide the given number into periods of "three figures, beginning at the right hand in integers, "and pointing toward the left. But in decimals, begin "at the place of thousands, and point toward the right. "The number of periods shows the number of figures "in the root."

II. "Find by the table of powers, or by trial, the "nearest lesser root of the left-hand period; place the "figure so found in the quot; subtract its cube from "the said period; and to the remainder bring down "the next period for a dividual or resolvend."

The divisor consists of three parts, which may be found as follows:

Extraction of Roots.

III. "The first part of the divisor is found thus: "Multiply the square of the quot by 3, and to the pro- "duct annex two cyphers; then inquire how often this "first part of the divisor is contained in the resolvend, "and place the figure denoting the answer in the quot."

IV. "Multiply the former quot by 3, and the pro- "duct by the figure now put in the quot; to this last "product annex a cypher; and you have the second "part of the divisor. Again, Square the figure now "put in the quot for the third part of the divisor; "place these three parts under one another, as in addi- "tion; and their sum will be the divisor complete."

V. "Multiply the divisor, thus completed, by the "figure last put in the quot, subtract the product from "the resolvend, and to the remainder bring down the "following period for a new resolvend, and then pro- "ceed as before."

Note 1. If the first part of the divisor happen to be equal to or greater than the resolvend; in this case, place 0 in the quot, annex two cyphers to the said first part of the divisor, to the resolvend bring down another period, and proceed to divide as before.

Note 2. If the product of the quotient figure into the divisor happen to be greater than the resolvend, you must go back, and give a lesser figure to the quot.

Note 3. If, after every period of the given number is brought down, there happen at last to be a remainder, you may continue the operation by annexing periods of three cyphers till there be no remainder, or till you have as many decimal places in the root as you judge necessary.

Ex. 1st. Required the cube root of 12812904.

If the cube root of a vulgar fraction be required, find the cube root of the given numerator for a new numerator, and the cube root of the given denominator for a new denominator. But if the root of either cannot be extracted without a remainder, reduce the vulgar fraction to a decimal, and then extract the root.

Under the article ARITHMETIC in the SUPPLEMENT, will be found a full exposition of the fundamental principles of the science.

A R I

Arius.

ARIUS, a divine of the fourth century, the head and founder of the ARIANS, a sect which denied the eternal divinity and substantiality of the Word. He was born in Libya, near Egypt. Eusebius, bishop of Nicomedia, a great favourite of Constantia, sister of the emperor Constantine, and wife of Licinius, became a zealous promoter of Arianism. He took Arius under his protection, and introduced him to Constantia; so that the sect increased, and several bishops embraced it openly. There arose, however, such disputes in the cities, that the emperor, in order to remedy these disorders, was obliged to assemble the council of Nice, where, in the year 325, the doctrine of Arius was condemned. Arius was banished by the emperor, all his books were ordered to be burnt, and capital punishment was denounced against whoever dared to keep them. After five years banishment, he was recalled to

A R I

Arius.

Constantinople, where he presented the emperor with a confession of his faith, drawn up so artfully, that it fully satisfied him. Notwithstanding which, Athanasius, now advanced to the see of Alexandria, refused to admit him and his followers to communion. This so enraged them, that by their interest at court, they procured that prelate to be deposed and banished. But the church of Alexandria still refusing to admit Arius into their communion, the emperor sent for him to Constantinople; where, upon delivering in a fresh confession of his faith in terms less offensive, the emperor commanded Alexander, the bishop of that church, to receive him the next day into his communion: but that very evening Arius died. The manner of his death was very extraordinary: as his friends were conducting him in triumph to the great church of Constantinople, Arius, pressed by a natural necessity, stepped aside to ease himself;

Arius, Ark.

himself; but expired on the spot, his bowels gushing out.

But the heresy did not die with the heresiarch: his party continued still in great credit at court. Athanasius, indeed, was soon recalled from banishment, and as soon removed again; the Arians being countenanced by the government, and making and deposing bishops as it best served their purposes. In short, this sect continued with great lustre above 300 years: it was the reigning religion of Spain for above two centuries: it was on the throne both in the east and west; it prevailed in Italy, France, Pannonia, and Africa; and was not extirpated till about the end of the 8th century.

This heresy was again set on foot in the west by Servetus, who, in 1531, wrote a little treatise against the mystery of the Trinity. After his death Arianism got footing in Geneva; from whence it removed into Poland; but at length degenerated, in a great measure, into Socinianism. Erasmus seems to have aimed at reviving Arianism, in his Commentaries on the New Testament; and the learned Grotius seems to lean a little that way.

With regard to the state of Arianism in England, it may be sufficient to observe, that from the numerous publications of that cast which are daily making their appearance, it seems to be rather a growing, than exploded, doctrine there.

Plate LVII. fig. 1.

ARK, or *Noah's* ARK, a floating vessel built by Noah, for the preservation of his family, and the several species of animals, during the deluge.

The ark has afforded several points of curious inquiry among the critics and naturalists, relating to its form, capacity, materials, &c.

The wood whereof the ark was built is called in the Hebrew *Gopher wood*, and in the Septuagint *square timbers*. Some translate the original *cedar*, others *pine*, others *box*, &c. Pelletier prefers cedar on account of its incorruptibility, and the great plenty of it in Asia; whence Herodotus and Theophrastus relate, that the kings of Egypt and Syria built whole fleets thereof, instead of deal.

The learned Mr Fuller, in his Miscellanies, has observed, that the wood whereof the ark was built was nothing but that which the Grecks call κυπαρισσος, or the *cypress tree*; for, taking away the termination, *kupar* and *gopher* differ very little in sound. This observation the great Bochart has confirmed, and shown very plainly that no country abounds so much with this wood as that part of Assyria which lies about Babylon.

In what place Noah built and finished his ark is no less made a matter of disputation. But the most probable opinion is, that it was built in Chaldea, in the territories of Babylon, where there was so great a quantity of cypress in the groves and gardens in Alexander's time, that that prince built a whole fleet out of it for want of timber. And this conjecture is confirmed by the Chaldean tradition, which makes Xisuthrus (another name for Noah) set sail from that country.

The dimensions of the ark, as given by Moses, are 300 cubits in length, 50 in breadth, and 30 in height; which some have thought too scanty, considering the number of things it was to contain; and hence an argument has been drawn against the authority of the relation. To solve this difficulty, many of the ancient fathers and the modern critics have been put to very miserable shifts: But Buteo and Kircher have proved geometrically, that taking the common cubit of a foot and a half, the ark was abundantly sufficient for all the animals supposed to be lodged in it. Snellius computes the ark to have been above half an acre in area. Father Lamy shows, that it was 110 feet longer than the church of St Mary at Paris, and 64 feet narrower: and if so, it must have been longer than St Paul's church in London, from west to east, and broader than that church is high in the inside, and 54 feet of our measure in height; and Dr Arbuthnot computes it to have been 81,062 tons.

Ark.

The things contained in it were, besides eight persons of Noah's family, one pair of every species of unclean animals, and seven pair of every species of clean animals, with provisions for them all during the whole year. The former appears, at first view, almost infinite; but if we come to a calculation, the number of species of animals will be found much less than is generally imagined; out of which, in this case, are excepted such animals as can live in the water; and Bishop Wilkins shows that only 72 of the quadruped kind needed a place in the ark.

By the description Moses gives of the ark, it appears to have been divided into three stories, each ten cubits or 15 feet high; and it is agreed on, as most probable, that the lowest story was for the beasts, the middle for the food, and the upper for the birds, with Noah and his family; each story being subdivided into different apartments, stalls, &c. though Josephus, Philo, and other commentators, add a kind of fourth story under all the rest; being, as it were, the hold of the vessel, to contain the ballast and receive the filth and fæces of so many animals: but F. Calmet thinks, that what is here reckoned a story, was no more than what is called the *keel* of ships, and served only for a conservatory of fresh water. Drexelius makes 300 apartments; F. Fournier, 333; the anonymous author of the questions on Genesis, 400; Buteo, Temporarius, Arias Montanus, Hostus, Wilkins, Lamy, and others, suppose as many partitions as there were different sorts of animals. Pelletier makes only 72, viz. 36 for the birds, and as many for the beasts. His reason is, that if we suppose a greater number, as 333 or 400, each of the eight persons in the ark must have had 37, 41, or 60 stalls to attend and cleanse daily, which he thinks impossible to have been done. But it is observed, that there is not much in this: to diminish the number of stalls without the diminution of animals is in vain; it perhaps being more difficult to take care of 300 animals in 72 stalls than in 300. As to the number of animals contained in the ark, Buteo computes that it could not be equal to 500 horses; he even reduces the whole to the dimensions of 56 pair of oxen. F. Lamy enlarges it to 64 pair of oxen, or 128 oxen; so that, supposing one ox equal to two horses, if the ark had room for 256 horses, there must have been room for all the animals. But the same author demonstrates, that one floor of it would suffice for 500 horses, allowing nine feet square to a horse.

As to the food in the second story, it is observed by Buteo from Columella, that 30 or 40 pounds of hay ordinarily suffices for an ox a day; and that a solid cubit of hay, as usually pressed down in our hay ricks,

Ark. weighs about 40 pounds; so that a square cubit of hay is more than enough for one ox in one day. Now it appears, that the second story contained 150,000 solid cubits; which divided between 206 oxen, will afford each more hay, by two-thirds, than he can eat in a year. Bishop Wilkins computes all the carnivorous animals equivalent, as to the bulk of their bodies, and their foods, to 17 wolves, and all the rest to 280 beeves. For the former he allows 1825 sheep; and for the latter, 109,500 cubits of hay: all which will be easily contained in the two first stories, and a deal of room to spare. As to the third story, nobody doubts of its being sufficient for the fowls, with Noah, his sons, and daughters. Upon the whole, the learned bishop remarks, that of the two, it appears much more difficult to assign a number and bulk of necessary things to answer the capacity of the ark, than to find sufficient room for the several species of animals already known to have been there. This he attributes to the imperfection of our list of animals, especially those of the unknown parts of the earth; adding, that the most expert mathematician at this day could not assign the proportion of a vessel better accommodated to the purpose than is here done: and hence he finally concludes, that the capacity of the ark, which had been made an objection against Scripture, ought to be esteemed a confirmation of its divine authority; since, in those ruder ages, men, being less versed in arts and philosophy, were more obnoxious to vulgar prejudices than now; so that, had it been a human invention, it would have been contrived, according to those wild apprehensions, which arise from a confused and general view of things, as much too big as it had been represented too little.

But it must be observed, that, besides the places requisite for the beasts and birds, and their provisions, there was room required for Noah to lock up household utensils, the instruments of husbandry, grains, and seeds to sow the earth with after the deluge; for which purpose it is thought that he might spare room in the third story for 36 cabins, besides a kitchen, a hall, four chambers, and a space about 48 cubits in length to walk in.

Plate LVII. fig. 2. *Ark of the Covenant*, a small chest or coffer, three feet nine inches in length, two feet three inches in breadth, and two feet three inches in height, in which were contained the golden pot that held manna, and Aaron's rod, and the tables of the covenant. This coffer was made of shittim wood, and covered with a lid, which was made of solid gold. The ark was reposited in the holiest place of the tabernacle. It was taken by the Philistines, and detained 20, some say 40 years, at Kirjath-jearim; but the people being afflicted with emerods on account of it, returned it with divers presents. It was afterwards placed in the temple.

The lid or covering of the ark was called the *propitiatory* or *mercy-seat;* over which were two figures placed called *Cherubims*, with expanded wings of a peculiar form. Here the Schechinah rested both in the tabernacle and temple in a visible cloud: hence were issued the Divine oracles by an audible voice; and the high-priest appeared before this mercy-seat once every year on the great day of expiation; and the Jews, wherever they worshipped, turned their faces towards the place where the ark stood.

In the second-temple there was also an ark, made of the same shape and dimensions with the first, and put in the same place, but without any of its contents and peculiar honours. It was used as a representative of the former on the day of expiation, and a repository of the original copy of the holy Scriptures, collected by Ezra and the men of the great synagogue, after the captivity. And in imitation of this, the Jews to this day have a kind of ark in their synagogues, wherein their sacred books are reposited. This they call *aron*. Leo of Modena gives a description thereof in his Account of the Customs and Ceremonies of those of his Nation. "The Jews (says he), in the eastern side of their synagogues, have an ark, or armory, called *aron*, in memory of the ark of the covenant. In this are preserved the five books of Moses, written on vellum, with ink made on purpose," &c. Some have supposed that the figure of this ark is still remaining on the triumphal arch of Titus at Rome; though Villalpandus and others, with greater reason, are of opinion, that it is the table of shew bread. *Prideaux's Con.* vol. i. p. 209. Tertullian calls this ark *Armarium Judaicum;* whence the phrase, *to be in the armory of the synagogue*, q. d. in the number of canonical writings.

A chest or coffer, very nearly resembling the Jewish ark, and called the *house of the God*, was found in Huaheine, one of the islands in the southern sea. Mr Banks could obtain no other information concerning it than what the name imports. *Hawkesworth's Account*, &c. vol. ii. p. 252.

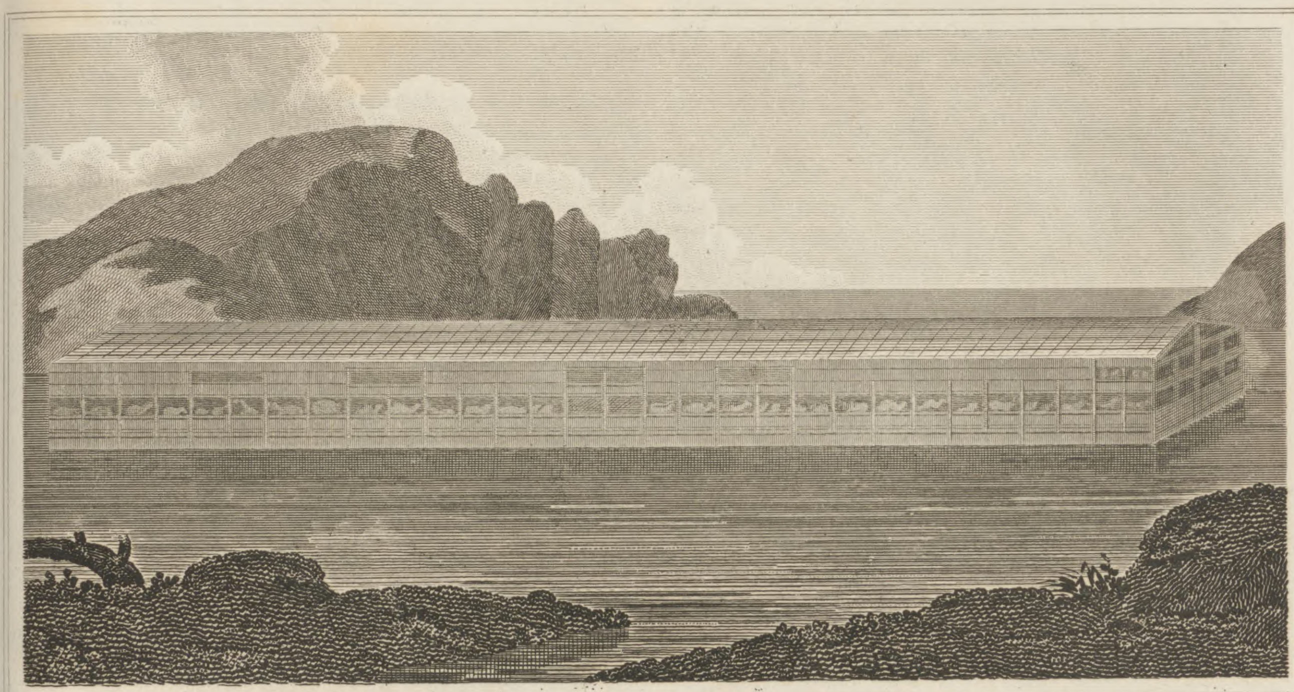
ARKLOW, a sea-port town of Ireland, in the county of Wicklow, and province of Leinster. W. Long. 6. 15. N. Lat. 52. 55.

ARKWRIGHT, Sir Richard, celebrated for his invention of machinery in spinning and carding cotton, was originally a country barber in poor circumstances, but acquired by his inventions a very great fortune. About the year 1767, when he had quitted the profession of a barber, and went up and down the country buying hair, he came to Warrington. At that time, it is said, he had some mechanical project in view, of the nature of a perpetual motion. One John Kay, a clockmaker of that place, becoming acquainted with him, endeavoured to dissuade him from this scheme, but said that much money might be made by spinning cotton, which he promised to describe to him. Arkwright urged as an objection, that that scheme had been the ruin of many; but he came to Kay's bedside next morning, and asked him if he could make a small engine at a moderate expence, as this Kay had been employed to make a cotton-spinning engine for a Mr Hayes, who likewise employed himself in making cylindrical carding engines, and who was brought as a witness on the trial in which Arkwright's patent was set aside in 1785. Mr Hayes proved, that he had invented an engine of a similar construction to Arkwright's, but had not brought it to perfection. Arkwright and Kay made application to Peter Atherton, Esq. now of Liverpool, to make such an engine; but he refused to undertake it, from the external poverty of the former, although on the evening of the same day he undertook to give Kay the use of a smith, and watch-tool maker, to make the heavier parts of the engine; and Kay agreed to instruct the workmen, and to make the clockmakers share of it. In this manner Arkwright's

NOAHS ARK.

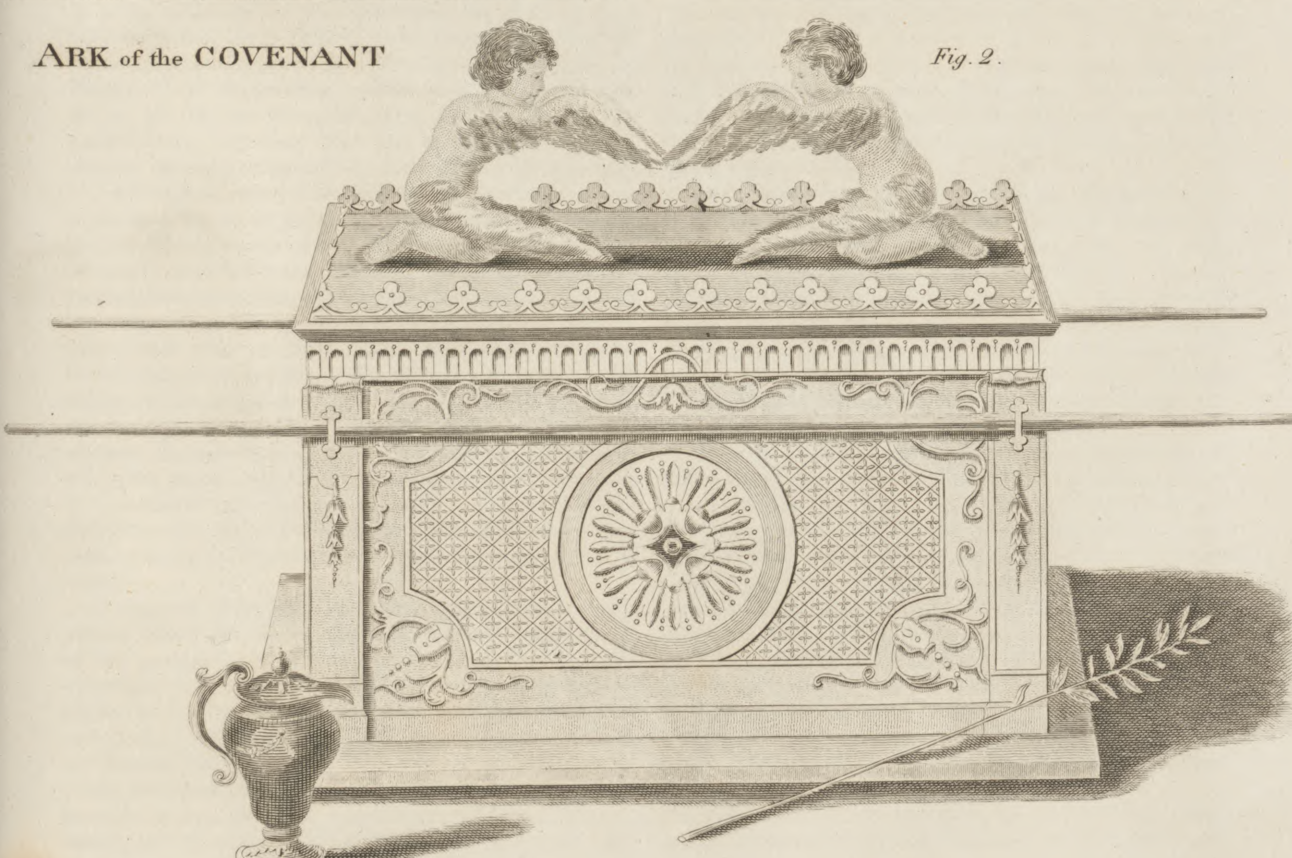
floating on the waters of the deluge

Fig. 1.



ARK of the COVENANT

Fig. 2.



E. Mitchell sculp.t

Arkwright. wright's first engine was made, for which he afterwards took out a patent. Mr Arkwright went into partnership soon after with a Mr Smally of Preston in Lancashire; but being at a loss for money, they went to Nottingham, and there, by the assistance of some rich individuals, erected a considerable cotton mill, which was turned by horses.

The report generally circulated through the manufacturing towns is, that he borrowed these inventions, and that he enriched himself at other men's expence and ingenuity. From all accounts, however, it appears, that the cotton-spinning was no new attempt at the time Mr Arkwright engaged in it, but an object which had been the subject of much attention; but as it had not succeeded, it would accordingly happen, that more difficulties were to be overcome, and subjects of subordinate inventions to be digested, and brought to maturity and effect. Although the carding and spinning of cotton before Mr Arkwright engaged in it was hardly any thing, yet it became a great national manufacture through his means. He states in his case, as drawn by himself, that one Paul and others of London, about 40 or 50 years previous to his time, having invented an engine for spinning cotton, obtained a patent for it, after which they repaired to Nottingham; and there, after having been assisted by several persons, and much money had been expended on the undertaking, many families had been ruined by the failure of their scheme;—that various engines had been constructed by different persons, for spinning cotton, flax, wool, &c. into several threads at once, about 20 or 30 years back, but that no real advantage had been derived from them; and that an engine was construeted in 1767, by one Hargrave of Blackwell in Lancashire, which would at once spin 20 or 30 threads of cotton into yarn for the fustian manufacture, but that after his engine had been destroyed by popular tumults in Lancashire, he removed to Nottingham, where for a while he practised under a patent; but an association being formed against him, his patent was rendered null, and at length he died in obscurity and distress; that he, Arkwright, had invented certain engines for spinning and carding, which had taken about five years in bringing them to perfection; and after 12,000l. had been expended upon them, they had neither produced advantage or profit either to him or his partners. As it must be allowed, that he did not think to make his scheme to bear all at once, he must certainly be considered as the person who after many others had been unsuccessful, engaged in a national undertaking, did display so much skill, perseverance, and activity, as to make it not only productive of value to himself, but likewise to the nation at large.

It appears, from these various accounts, that the object in which Sir Richard Arkwright was engaged, is of the greatest national value; that from his various exertions, he is deserving both of the respect and admiration of the world; and, that although his family is enriched, the benefits which the nation have received are inestimably greater.

On the 22d of December, 1786, upon presenting an address from the high sheriff and hundred of Wirksworth, he was knighted by his present majesty, and died August 3. 1793, at his works at Crumford, in Derbyshire. (*Gen. Biog.*). Arkwright || Arm.

ARLES, a city of France, in the department of the Mouths of the Rhone, formerly Provence, seated on the east side of the Rhone, on a hill, whose declivity is towards the north. It is an archbishop's see; and is celebrated for its antiquities both within and without the city. Those of which any remains are now to be seen are the amphitheatre, the obelisk, the elysian fields, the sepulchres, columns with their capitals, busts, pedestals, aqueduets, with some remains of the capitol, and the temples of their gods. The other ancient monuments are entirely destroyed. Under the amphitheatre, in 1651, they found the statue of Venus, which was worshipped by this city; and has been since carried to the castle of Versailles. It is a master-piece which will always be admired by connoisseurs.

The amphitheatre is one of the most remarkable pieces of antiquity. It was built by the Romans, but the time is unknown, though some say by Julius Cæsar. It is of an oval form, and about 400 yards in circumferenee, and the front is 34 yards in height. The middle, called the *arena*, is 142 yards wide and 104 broad. The porticoes or piazzas are three stories, built with stones of a prodigious size. Each of them consists of 60 arches, which still remain; and the walls are of surprising thickness, but gone to decay.

The obelisk is the only one of this kind to be seen in France. It seems to be one of the forty brought from Egypt to Rome, because it is of the same oriental granite with them. They are generally full of hieroglyphic characters; but this is quite smooth. In 1675, it was found in a private garden near the walls of the city, not far from the Rhone. It consists of one piece; and is 52 feet high, and 7 in diameter at the base. It is now supported with four lions made of bronze; and on the top a blue ball is placed, with the arms of France, and over that a sun.

The Pagans burying place called the *Elysian Fields*, is without the city, upon an agreeable hill, divided into two parts. The first, called *Moulaires*, has very few tombs, they having been broken to build the walls of gardens, which are made in that place. The second, called *Eliscamp*, contains a great number. Those of the Pagans have the letters D. M. which signify *Diis Manibus*. Those of the Christians have a cross. Pieces of coin of gold, silver, and bronze, are found here; as also urns, lamps, and cups, without number.

Here is a royal academy of sciences, consisting of thirty members, who must be natives, gentlemen, and inhabitants of the city. It enjoys the same privileges as that at Paris. Arles is surrounded with marshy land, which renders the air full of vapours, and makes it not very wholesome. E. Long. 4. 48. N. Lat. 43. 0.

ARLEUX, an ancient town in France, in the department of the North, with a castle. It was taken by the French in 1645, and retaken by the allies in 1711: but the French got possession again the same month. E. Long. 3. 6. N. Lat. 50. 20.

ARLON, an ancient town of the Netherlands, formerly a strong place, but now dismantled. E. Long. 5. 28. N. Lat. 49. 4.

ARM, a part of the human body, terminating at one end in the shoulder, and at the other in the hand.

Arm || Armada.

ARM, among sportsmen, is applied to a horse, when by pressing down his head, he endeavours to defend himself against the bit, to prevent his being checked by it. The remedy is, to have a wooden ball covered with velvet, or other matter, put on his chaul, which will so press him between the jaw bones as to prevent his bringing his head so near his breast.

ARM, in *Geography*, is used for the branch of a sea or river. Italy and Sicily are only parted by an arm of the sea. St George's arm in the Mediterranean is the Thracian Bosphorus.

ARM is also used figuratively for power. The secular arm is the lay or temporal authority of a secular judge; to which recourse is had for the execution of the sentences passed by ecclesiastical judges.

The church sheds no blood: even the judges of the inquisition, after they have found the person guilty, surrender him to the secular arm. The council of Antioch, held in 341, decrees, that recourse be had to the secular arm to repress those who refuse obedience to the church: for secular arm, they here use exterior power.

ARM, in respect of the magnet. A loadstone is said to be armed, when it is capped, cased, or set in iron or steel, in order to make it take up the greater weight, and also to distinguish readily its poles. See MAGNETISM.

ARMACALES, a river of Babylon (Abydenus); called *Fossa Regia*, the *Royal Trench* or *Cut* (Polybius); the *Royal River* (Ptolemy); *Almarchur* (Pliny); *Naarmalcha*, (Ammian); a factitious channel or cut, made by Nabuchodonosor, and a horn or branch of the Euphrates, (Abydenus). The Euphrates naturally divides into two channels, one passing through Babylon, the other through Seleucia, and then falls into the Tigris; the factitious channel between these two is the Royal River; which mixes with the Tigris, a great deal lower down than Seleucia, at Apamea, (Ptolemy).

ARMADA, a Spanish term, signifying a fleet of men of war. The armada which attempted to invade England in the time of Queen Elizabeth, is famous in history.

This armada, to which the Spaniards, in confidence of success, gave the name of *Invincible*, consisted of 150 ships, most of which were greatly superior in strength and size to any that had been seen before. It had on board near 20,000 soldiers, and 8000 sailors, besides 2000 volunteers of the most distinguished families in Spain. It carried 2650 great guns, was victualled for half a year, and contained such a quantity of military stores, as only the Spanish monarch, enriched by the treasures of the Indies and America, could supply. The troops on board were to be joined by 34,000 more which the duke of Parma had assembled in the neighbourhood of Nieuport and Dunkirk. For transporting these, he had, with incredible labour, provided a great number of flat-bottomed vessels, and had brought sailors to navigate them from the towns in the Baltic. Most of these vessels had been built at Antwerp; and as he durst not venture to bring them from thence by sea to Nieuport, lest they should have been intercepted by the Dutch, he was obliged to send them along the Scheldt to Ghent, from Ghent to Bruges by the canal which joins these towns, and from Bruges to Nieuport by a new canal which he dug on the present occasion. This laborious undertaking, in which several thousand workmen had been employed, was already finished, and the duke now waited for the arrival of the Spanish fleet; hoping, that as soon as it should approach, the Dutch and English ships which cruised upon the coast would retire into their harbours. Armada.

When the news reached England that this mighty fleet was preparing to sail, terror and consternation universally seized the inhabitants. A fleet of not above 30 ships of war, and those very small in comparison, was all that was to oppose it by sea. All the commercial towns of England, however, were required to furnish ships for reinforcing this small navy. The citizens of London, instead of fifteen vessels, which they were commanded to equip, voluntarily fitted out double the number; and the gentry and nobility equipped 43 ships at their own charge. Lord Howard of Effingham was admiral: and under him served Drake, Hawkins, and Forbisher, all of them renowned as seamen of courage and capacity. The principal fleet was stationed at Plymouth. A smaller squadron, consisting of 40 vessels, English and Flemish, was commanded by Lord Seymour, second son of Protector Somerset, and lay off Dunkirk in order to intercept the duke of Parma.

The land forces of England were more numerous than those of the enemy, but inferior in discipline and experience. An army of 20,000 men was disposed in different bodies along the south coast, with orders to retire backwards and waste the country, if they could not prevent the Spaniards from landing; 22,000 foot and 1000 horse, under the command of the earl of Leicester, were stationed at Tilbury, in order to defend the capital; and the principal army, consisting of 34,000 foot and 2000 horse, commanded by Lord Hunsdon, was reserved for guarding the queen's person, and appointed to march whithersoever the enemy should appear. These armies, though all the Spanish forces had been able to land, would possibly have been sufficient to protect the liberties of their country. But as the fate of England, in that event, must depend on the issue of a single battle, all men of serious reflection entertained the most awful apprehensions of the shock of at least 50,000 veterans, commanded by experienced officers, under so consummate a general as the duke of Parma. The queen alone was undaunted. She issued all her orders with tranquillity, animated her people to a steady resistance, and employed every resource which either her domestic situation or her foreign alliances could afford her. She even appeared on horseback in the camp at Tilbury; and riding through the lines, discovered a cheerful and animated countenance, exhorted the soldiers to remember their duty to their country and their religion, and professed her intention, though a woman, to lead them herself into the field against the enemy, and rather perish in battle than survive the ruin and slavery of her people. "I know (said she, intrepidly) I have but the weak and feeble arm of a woman; but I have the heart of a king, and of a king of England too!" The heroic spirit of Elizabeth communicated itself to the army, and every man resolved to die rather than desert his station.

The Spanish armada was ready in the beginning of May; but its sailing was retarded by the death of the marquis

Armada. marquis of Santa Croce the admiral, and that also of the vice-admiral the duke of Paliano. The command of the expedition was therefore given to the duke of Medina Sidonia, a man entirely unexperienced in sea affairs. This promotion, in some measure, served to frustrate the design, which was also rendered less successful by some other accidents. Upon leaving the port of Lisbon, the armada next day met with a violent tempest, which sunk some of the smallest of their shipping, and obliged the fleet to put back into the harbour. After some time spent in refitting, they put again to sea. Being descried by Fleming, a Scotch pirate, who was roving in those seas, he immediately sailed towards the English fleet, and informed the admiral of their approach. Effingham had just time to get out of port when he saw the Spanish armada coming full sail towards him, disposed in the form of a crescent, and stretching the distance of seven miles from the extremity of one division to that of the other. The English admiral considering that the Spaniards would probably be much superior to him in close fight, by reason of the size of their ships and the number of their troops, wisely resolved to content himself with harassing them in their voyage, and with watching attentively all the advantages which might be derived from storms, cross winds, and such like fortuitous accidents. It was not long before he discerned a favourable opportunity of attacking the vice-admiral Recaldo. This he did in person; and on that occasion displayed so much dexterity in working his ship, and in loading and firing his guns, as greatly alarmed the Spaniards for the fate of the vice-admiral. From that time they kept much closer to one another; notwithstanding which, the English on the same day attacked one of the largest galeasses. Other Spanish ships came up in time to her relief; but in their hurry one of the principal galleons, which had a great part of the treasure on board, ran foul of another ship, and had one of her masts broken. In consequence of this misfortune she fell behind, and was taken by Sir Francis Drake; who on the same day took another capital ship, which had been accidentally set on fire.

Several other rencounters happened, and in all of them the English proved victorious, through the great advantage which they derived from the lightness of their ships, and the dexterity of the sailors. The Spaniards in that age did not sufficiently understand nautical mechanics, to be able to avail themselves of the unusual magnitude of their ships. The English sailed round them, approached or retired, with a velocity that filled them with amazement, and did infinitely greater execution with their cannon; for while every shot of theirs proved effectual, their ships suffered very little damage from the enemy, whose guns were planted too high, and generally spent their force in air.

The Spaniards, however, still continued to advance till they came opposite to Calais; there the duke de Medina having ordered them to cast anchor, he sent information to the duke of Parma of his arrival, and entreated him to hasten the embarkation of his forces. Farnese accordingly began to put his troops on board. But at the same time he informed Medina, that, agreeably to the king's instructions, the vessels which he had prepared were proper only for transporting the troops, but were utterly unfit for fighting; and for this reason, till the armada were brought still nearer, and the coast cleared of the Dutch ships which had blocked up the harbours of Nieuport and Dunkirk, he could not stir from his present station, without exposing his army to certain ruin, the consequence of which would probably be the entire loss of the Netherlands. Armada.

In compliance with this request, the armada was ordered to advance; and it had arrived within sight of Dunkirk, between the English fleet on the one hand, and the Dutch on the other, when a sudden calm put a stop to all its motions. In this situation the three fleets remained for one whole day. About the middle of the night a breeze sprung up; and Lord Howard had recourse to an expedient which had been happily devised on the day before. Having filled eight ships with pitch, sulphur, and other combustible materials, he set fire to them, and sent them before the wind against the different divisions of the Spanish fleet.

When the Spaniards beheld these ships in flames approaching towards them, it brought to their remembrance the havock which had been made by the fire ships employed against the duke of Parma's bridge at the siege of Antwerp. The darkness of the night increased the terror with which their imaginations were overwhelmed, and the panic flew from one end of the fleet to the other. Each crew, anxious only for their own preservation, thought of nothing but how to escape from the present danger. Some of them took time to weigh their anchors, but others cut their cables, and suffered their ships to drive with blind precipitation, without considering whether they did not thereby expose themselves to a greater danger than that which they were so solicitous to avoid. In this confusion the ships ran foul of one another: the shock was dreadful, and several of them received so much damage as to be rendered unfit for future use.

When daylight returned, Lord Howard had the satisfaction to perceive that his stratagem had fully produced the desired effect. The enemy were still in extreme disorder, and their ships widely separated and dispersed. His fleet had lately received a great augmentation by the ships fitted out by the nobility and gentry, and by those under Lord Seymour, who had left Justin de Nassau as alone sufficient to guard the coast of Flanders. Being bravely seconded by Sir Francis Drake and all the other officers, he made haste to improve the advantage which was now presented to him, and attacked the enemy in different quarters at the same time with the utmost impetuosity and ardour. The engagement began at four in the morning and lasted till six at night. The Spaniards displayed in every rencounter the most intrepid bravery; but, from the causes already mentioned, they did very little execution against the English; while many of their own ships were greatly damaged, and twelve of the largest were either run aground, or sunk, or compelled to surrender.

It was now evident that the purpose of the armada was utterly frustrated. The Spanish admiral, after many unsuccessful rencounters, prepared therefore to make his way home; but as the winds were contrary to his return through the Channel, he resolved to take the

Armada || Armagh.

the circuit of the island. The English fleet followed him for some time; and had not their ammunition fallen short, through the negligence of the public offices in supplying them, they had obliged the armada to surrender at discretion. Such a conclusion of that vain-glorious enterprise would have been truly illustrious to the English, but the event was scarcely less fatal to the Spaniards. The armada was attacked by a violent storm in passing the Orkneys; and the ships, having already lost their anchors, were obliged to keep at sea, while the mariners, unaccustomed to hardships, and unable to manage such unwieldy vessels, allowed them to drive on the Western isles of Scotland, or on the coast of Ireland, where they were miserably wrecked. Not one half of the fleet returned to Spain, and a still smaller proportion of the soldiers and seamen; yet Philip, whose command of temper was equal to his ambition, received with an air of tranquillity the news of so humbling a disaster. "I sent my fleet (said he) to combat the English, not the elements. God be praised that the calamity is not greater!" This calamity, however, was sensibly felt all over Spain, and there was scarcely a single family of rank in the kingdom that did not go into mourning for the death of some near relation; insomuch that Philip, dreading the effect which this universal face of sorrow might produce upon the minds of the people, imitated the conduct of the Roman senate after the battle of Cannæ, and published an edict to abridge the time of public mourning.

ARMADILLA, in Spanish America, denotes a squadron of men of war, to the number of six or eight, from twenty-four to fifty pieces of cannon, which the king maintains, to prevent foreigners from trading with the Spaniards and the Indians, both in time of war and peace.

The vessels of this armadilla are those that have been so much talked of, under the name of *guarda costas*. They have even power to take all Spanish merchant ships they meet with on the coast that have not licenses from the king.

The South sea has its armadilla as well as the North sea. The ordinary abode of the former is at Calao, the port of Lima; that of the latter at Carthagena.

ARMADILLO, in *Zoology*, a synonyme of the dasypus. See DASYPUS, MAMMALIA *Index*.

ARMAGEDDON, a place spoken of in the Revelation (xvi. 16.), which literally signifies the mountain of Mageddon or Megiddo, a city situated in the great plain at the foot of Mount Carmel, where King Josiah received his mortal wound in the battle against Necho king of Egypt. At Armageddon, the three unclean spirits, coming out of the dragon's mouth, shall gather together the kings of the earth to the battle of the great day of God Almighty (Rev. xvi. 13. 14.). The word armageddon, according to Mr Poole, does not signify any particular place, but is here an allusion, as some think, to that of Megiddo, mentioned Judges v. 19. where Barak overcame Sisera with his great army, and where Josiah was slain (2 Kings xxiii. 30.). Others translate this word, *the mountain of the gospel*, and others, *the mountain of apples or fruits*.

ARMAGH, a county of Ireland, bounded by Louth on the south; Lough-Neagh, on the north; Tyrone and Monaghan, on the west; and Down in part on the east, from which it is separated by the river Newry. It is in length 32 miles, in breadth 20; and is divided into five baronies, containing about 290,786 acres, or 454 English square miles. Both the air and soil are good, especially the latter, which is said to be the richest in Ireland; only there is a certain tract in it called the *Fewes*, that is, *hilly* and *barren*. The county of Armagh sends two members, and the city one, to the imperial parliament.

Armagh || Armamaxi.

Armagh, standing near the river Kalin, gives name to the county, and is the see of the primate of all Ireland. It is said to have been founded by St Patrick in the fifth century: and in 1142, it was constituted an archbishopric, together with Dublin, Cashel, and Tuam, by Cardinal Papyreo, with the consent of the kings, dukes, bishops, abbots, and states of Ireland. This Papyreo was sent into Ireland by Pope Eugenius, to reform the abuses that had crept into the church discipline of that country. Here was anciently a famous monastery built by St Columbo, or Columbanus, about the year 610. The cathedral was often burnt, but as often rebuilt and enlarged, and particularly by Patrick Scanlain, about 1262. His successor Nicholas, son of Molissa, besides books, rich ecclesiastical vestments, and other things, bestowed on it an annual pension of twenty marks. He appropriated also to his see the manor of Dromyskin. He died the 10th of May, 1303. This town was first subjected to the English by John de Courcy; but afterwards entirely destroyed by Tir Oen, or O'Neal, in Queen Elizabeth's time. However, it was afterwards recovered, rebuilt, and garrisoned by the English.

The see of Armagh is valued in the king's books, by an extent taken anno 30th Henry VIII. at 183l. 17s. 5½d. Irish money per annum, which amounts to 187l. 18s. 0¾d. the difference between Irish and Sterling money being at that time one-fourth. But by an extent returned in the 15th of James I. it is valued at 400l. sterling per annum, and pays so much first fruits to this day. It is reputed to be worth annually 8000l. The chapter of Armagh is composed of five dignitaries and four prebendaries, who have voices in every capitular act. The dignitaries are thus ranked, viz. a dean, chanter, chancellor, treasurer, and archdeacon. There are also eight vicars choral, and an organist, attendant on the service of the cathedral. The vicars choral were anciently fewer; and of the number only one priest. Primate Marsh added another priest, but without increasing the number of vicars. In the year 1720, Primate Lindsay obtained a new charter for enlarging the number of the said vicars to eight, and laid out upwards of 4000l. on a purchase, in augmentation of the estate of the choir. See ARMAGH, SUPPLEMENT.

ARMAGNAC, formerly a province of Guienne in France, which with Gascony now forms the department of Gers, is 55 miles in length, and 40 in breadth; bounded on the west by the river Garonne, on the south by Bigorre and Bearn, on the west by Gascony, and on the north by Condomois and Agenois: Auch is the capital town. It is fertile in corn and wine, and carries on a considerable trade in brandy, wool, and bonchretin pears, which are excellent.

ARMAMAXI, in antiquity, a kind of Scythian chariots or carriages, composed of two wheels, variously

Armament || Armenia.

ously adorned with crowns, shields, breastplates, and other spoils, carried in procession after the images of the gods and great men.

ARMAMENT, a large body of forces, raised and provided with the furniture of war, either for land or sea service.

ARMATURA, in a general sense, is the same with what we otherwise call armour.

ARMATURA is more particularly used in the ancient military art, for a kind of exercise, performed with missive weapons, as darts, spears, arrows, and the like. In this sense, armatura stands contradistinguished from palaria; the latter being the exercise of the heavy-armed, the former of the light-armed.

The armatura was practised with great diligence among the Romans; they had their *campidoctores*, on purpose to instruct the *tyrones* or young soldiers in it. Under it were included the throwing of the spear or javelin, shooting with bows and arrows, &c.

ARMATURA is also an appellation given to the soldiers who were light-armed.

ARMATURA is also a denomination given to the soldiers in the emperor's retinue. Of these we find two schools, mentioned in the *Notitia Imperii*, called the *armaturæ seniores* and *armaturæ juniores*. Their commander was entitled *tribunus armaturarum*.

ARMED, in the sea language. A cross bar shot is said to be armed, when some rope yarn or the like is rolled about the end of the iron bar, which runs through the shot.

ARMED, in *Heraldry*, is used when the horns, feet, beak, or talons, of any beast or bird of prey, are of a different colour from the rest of their body.

ARMED *Ship*, a vessel occasionally taken into the service of the government in time of war, and employed to guard some particular coast, or attend on a fleet. She is therefore armed and equipped in all respects like a ship of war, and commanded by an officer of the navy, who has the rank of master and commander. All ships of this sort are upon the establishment of the king's sloops, having a lieutenant, master, purser, surgeon, &c.

ARMENE, or ARMINA, anciently a hamlet of Paphlagonia, (Ptolemy). The inhabitants encompassed it with a wall, because of the coldness of the place, imagining by that means to render it warmer. But this proving ineffectual, gave rise to the proverb *Armenen muro cingere*, used to express some egregious folly.

ARMENIA, a country of Asia, anciently divided into Armenia Major and Minor. Armenia Major, according to Strabo, was bounded on the south by Mount Taurus, which separated it from Mesopotamia; on the east, by the two Medias; on the north by Iberia and Albania, or rather that part of Mount Caucasus which surrounds them both; and on the west, by Armenia Minor, or the mountains Paryadres, some Pontic nations, and the Euphrates. The most considerable cities were Artaxata, Tigranocerta, and Theodosiopolis. —Armenia Minor was bounded on the east by the Euphrates; on the south by Mount Taurus, which separated it from Cilicia; on the west and north by a long chain of mountains, called in different places *Mons Scordiscus*, *Amanus*, and *Antitaurus*, by which it was separated from Cappadocia.

Whence this tract received the name of *Armenia* is not determined. The Greeks suppose it to be so called from one *Armenus* who attended Jason in the Argonautic expedition, and afterwards settled in this country. Others, transforming Armenia into Aramia, derive its name from Aram the son of Shem, or from one of the kings of Armenia bearing that name. Bochart imagines it to be a contraction or compound of *Aar*, a Hebrew word signifying a "mountain," and *Mini* signifying "metal," and which was the name of a province of Armenia mentioned by the prophet Jeremiah. Armenia.

Herodotus derives the ancient Armenians from the Phrygians, by reason that several Phrygian words were crept into the ancient Armenian language. But Strabo reckons them to have been originally Syrians, which Bochart looks upon to be the most probable opinion.

Armenia is said to have been very early advanced to the honour of a kingdom. Berosus makes one Sytha the first founder of this monarchy, whose successor Bardanes, he says, was driven out by Ninus king of Assyria. Plutarch mentions one Araxes king of Armenia, who in a war with the Persians, being assured of success by an oracle, provided he sacrificed his two daughters, caused the two daughters of one Miesalcus, a nobleman of his court, to be sacrificed in their stead, flattering himself that he thereby complied with the oracle. But Miesalcus did not fail to revenge the death of his own daughters by putting the king's two daughters to death, and pursued himself so closely, that he was drowned in attempting to swim across the Araxes, which was then called *Helmus*.

The Armenians were in process of time subdued by the Medes, to whom Astyages made them tributaries, but allowed them to be governed by their own kings; but on the dissolution of the Median empire by Cyrus, the kingdom was reduced to the form of a province, and they were governed by Persian prefects or lieutenants. On the destruction of the Persian empire by Alexander the Great, Armenia fell into the hands of the Macedonians; to whom it continued subject till the beginning of the reign of Antiochus the Great. This prince having appointed two prefects, called *Zadriades* and *Artaxias*, to govern Armenia, they excited the people to a revolt, and caused themselves to be proclaimed kings of the provinces over which they presided. Antiochus being then very young, they were attended with success beyond their expectation; which encouraged them to attempt the enlargement of their territories. Accordingly, invading the neighbouring countries, they took from the Medes the provinces of Caspiana, Phaunitis, and Basoropida; from the Iberians Chorzena and Gogorena on the other side of the Cyrus; from the Chalybes and Mossynæci, the provinces of Pareneta and Herexena, which bordered on Armenia Minor.

On this occasion, the above-mentioned division of the kingdom into Armenia Major and Minor first took place. Artaxias became king of Armenia Major and Zadriades of Armenia Minor; and this distinction subsists even at this day.

By whom Artaxias was succeeded is not known; neither have we any account of the transactions of his reign, farther than that Antiochus led a powerful army against him and Zadriades, but without being able to recover a single province. Upon this he concluded a peace, designing to fall upon them at a proper opportunity;

Armenia. portunity; but they having entered into alliance with the Romans, by that means secured themselves in the possession of their kingdom. After this, Artaxias was defeated and taken prisoner by Antiochus Epiphanes; but, somehow or other, seems to have been restored to his kingdom.

From this time we meet with a chasm in the Armenian history for 70 years; during which all we know is, that Tigranes, the king's son, was delivered up as an hostage to the Parthians; from whence it is plain, that the Armenians had been carrying on an unsuccessful war with that nation. On the news of his father's death, however, the Parthians set the young king at liberty, having first obliged him to give up a considerable part of his kingdom by way of ransom.

Tigranes being thus restored to his father's kingdom, was prevailed upon in the beginning of his reign to enter into an alliance with Mithridates Eupator against the Romans, whose power began to give jealousy to all the princes of Asia. One of the articles of this treaty was, that Mithridates should have the cities and conquered countries, and Tigranes the captives and plunder. In consequence of this, Tigranes was to invade Cappadocia, which he had lately been obliged, by a decree of the senate of Rome, to give up to Ariobarzanes. But before either of the princes took the field, a marriage was solemnized with all possible magnificence between Tigranes and Cleopatra the daughter of Mithridates.

Immediately after the nuptials, Tigranes set out on his intended expedition; and Ariobarzanes, on the first news of his march, abandoned his kingdom and fled to Rome. Thus Tigranes, without fighting a stroke, enriched himself with the booty, and then proclaimed Ariarathes, Mithridates's son, king of Cappadocia, to the universal satisfaction of the people.

In the mean time, the Syrians being harassed with a long and intestine war of the Seleucidæ, invited Tigranes to come and take possession of their country; which he accordingly did, and kept it for 18 years, till he was driven out by Pompey, and Syria reduced to the form of a Roman province. Encouraged by this success, he next invaded Armenia Minor; defeated and killed King Artanes, who opposed him with a considerable army; and in one campaign made himself master of the whole kingdom. From Armenia Minor he marched against the Asiatic Greeks, the Adiabenians, the Assyrians, and the Gordians; carrying all before him, and obliging the people wherever he came to acknowledge him sovereign. From this second expedition he returned home loaded with booty, which he soon after increased by the spoils of Cappadocia, invading that kingdom a second time at the instance of Mithridates, who had been obliged by the Romans to withdraw his forces from thence. From Cappadocia Tigranes, besides other booty, brought back into Armenia no fewer than 300,000 captives, having surrounded the country with his numerous forces in such a manner that none could escape. These, together with the prisoners he had taken in his two first expeditions, he employed in building the city of Tigranocerta, which they afterwards peopled.

In the mean time Mithridates, who had concluded a peace with the Romans for no other end than to gain time, sent a solemn embassy to Tigranes, inviting him to enter into a second alliance against the common enemy. This he at first declined; but in the end was prevailed upon by his wife Cleopatra to send him considerable supplies, though he never came heartily into the war, not caring to provoke the Romans, who on their part kept fair with him, taking no notice for the present of the supplies he had sent Mithridates. That unfortunate prince being soon after defeated by Lucullus, was forced to fly for shelter into Armenia, where he met with a very cold reception from his son-in-law, who would neither see him, treat with him, nor own him as his relation; however, he promised to protect his person, and allowed him in one of his castles a princely retinue, and a table suitable to his former condition. Armenia.

Though this total overthrow of Mithridates might have opened the eyes of Tigranes, and made him oppose with all his might the growing power of the Romans, he foolishly left them to finish their conquest of Pontus, while he marched at the head of a very numerous army against the Parthians, with a design to recover from them the dominions they had formerly extorted from him before they set him at liberty. These he easily retook; and not satisfied with what formerly belonged to him, he added to them all Mesopotamia, the countries that lay about Ninus and Arbela, and the fruitful province of Mygdonia; the Parthians, though at that time a mighty people, flying everywhere before him. From Mesopotamia Tigranes marched into Syria to quell a rebellion which had been raised by Cleopatra, surnamed *Selene;* who after the death of her husband Antiochus Pius, reigned jointly with her sons in that part of Syria which Tigranes had not seized on. The malcontents were quickly reduced; and the queen herself was taken prisoner, and confined to the castle of Seleucia, where she was soon after put to death by the king's orders. From Syria Tigranes passed into Phœnicia, which he subdued either entirely or in great part, spreading far and wide the terror of his arms, insomuch that all the princes of Asia except those who were in alliance with the Romans, either in person or by their deputies, submitted and paid homage to the conqueror.

The king, having now subdued all Syria to the borders of Egypt, and being elated with a long course of victories and prosperous events, began to look upon himself as far above the level of other crowned heads. He assumed the title of *King of kings*, and had many kings waiting upon him as menial servants. He never appeared on horseback without the attendance of four kings dressed in livery, who ran by his horse; and when he gave answers to the nations that applied to him, the ambassadors stood on either side the throne with their hands clasped together, that attitude being of all others then accounted among the orientals the greatest acknowledgment of vassalage and servitude. In the midst of all this haughtiness, however, he was unexpectedly visited by an ambassador from Lucullus the Roman general, who, without any ceremony, told him, that he came to demand Mithridates king of Pontus, who had taken refuge in his dominions, and, in case of his refusal, to declare war against him. Notwithstanding his high opinion of himself, Tigranes returned a mild answer to this message: in which, however, he refused to deliver up his father-in-law; and being

Armenia. being highly provoked at Lucullus for not giving him the title of *King of kings* in his letter, he did not so much as bestow upon him the title of *general* in his answer. In the mean time, being informed that Zarbienus king of the Gordians had entered into a private alliance with the Romans, he put him, his wife, and children to death; and then, returning into Armenia, received with the greatest pomp imaginable his father-in-law Mithridates, whom till that time he had not admitted into his presence, though he had resided a year and eight months in his dominions. They had several private conferences; and at last Mithridates was sent back to Pontus with 10,000 horse, to raise there what disturbances he could.

Lucullus, on the other hand, hearing the king's resolution to protect Mithridates, immediately began his march for Armenia, at the head of only two legions of foot and 3000 horse, having left 6000 men in Pontus to keep that country quiet. Having passed the Euphrates without opposition, he detached two parties; one to besiege a city where he heard that Tigranes's treasure and concubines were kept; and the other, under Sextilius, to block up Tigranocerta, in order to draw the king to a battle. But Tigranes, after having put to death the scout that brought him the first intelligence of the approach of the Romans, made towards Mount Taurus, which he had appointed for the place of the general rendezvous. The Roman general then despatched Muræna in pursuit of the king; who, having overtaken him in a narrow pass, defeated him, and, besides all the baggage, carried off a great many prisoners, the king himself have fled in the beginning of the skirmish. After this, he sent out several parties to scour the country, in order to prevent the innumerable forces of Tigranes from joining into one body. This, however, he was not able to effect; Tigranes was joined by such numbers of Gordians, Medes, Adiabenians, Albanians, Iberians, &c. that before he left Mount Taurus, his army consisted, according to Plutarch, of 150,000 foot armed cap-a-pee, 35,000 pioneers, 20,000 archers and slingers, and 55,000 horse.

Lucullus was so far from being dismayed at this formidable army, that the only fear he had was lest the king should follow the advice of Mithridates, which was, not to engage the Romans, but, by ravaging the country, distress them for want of provisions. In order to draw him to a battle, therefore, he formed the siege of Tigranocerta, imagining that Tigranes would never suffer that fine city to be taken without making an attempt to relieve it. The event fully answered his expectations: Tigranes having called a council of war, it was unanimously resolved to attack the Romans; and Taxilis, whom Mithridates sent to dissuade the king from venturing a battle, was in danger of losing his head on account of the advice he gave. The Roman general finding Tigranes disposed to come to an engagement, left Muræna with 6000 men to carry on the siege, while he himself marched against the king's vast army with only 10,000 men according to some, and the highest computations make them no more than 18,000. The Romans were at first greatly disheartened; but being encouraged by Lucullus, they immediately broke the Armenian army, who betook themselves to flight almost at the first onset. The Romans pursued them till night, making a most terrible slaughter. Plutarch informs us, that of the Armenians, Armenia. 100,000 foot were killed, and that very few of the cavalry escaped; whereas of the Romans only five men were killed and 100 wounded. Antiochus the philosopher mentioning this battle, says that the sun never beheld the like: and Livy, that the Romans never fought to such a disadvantage; the conquerors not amounting to a twentieth part of the conquered. Tigranes in his flight having met with his son in as forlorn a condition as himself, resigned to him his royal robes and diadem, desiring him to shift for himself and save those royal ensigns. The young prince delivered them to a trusty friend, who, being taken by the Romans, consigned them to Lucullus.

While the king was making his escape after this terrible overthrow, he was met by Mithridates, who was marching to his assistance at the head of a considerable army. The king of Pontus cheered up his son-in-law as well as he could, and encouraged him to continue the war: advising him, instead of fruitlessly bewailing the present disaster, to rally his troops, raise new supplies, and renew the war, not questioning but that in another campaign he might repair all the losses he had sustained: but while the two kings were consulting upon these matters, Lucullus made himself master of Tigranocerta. From this city he marched into the small kingdom of Gordyene, where he celebrated, with the utmost pomp, the obsequies of King Zarbienus, whom Tigranes had put to death, lighting the funeral pile with his own hand. In this kingdom, besides immense sums of gold and silver, he met with such store of provisons as enabled him to carry on the war without putting the republic to any charge.

The two kings, having levied new forces, appointed their troops to rendezvous in the spacious plains on the other side of Mount Taurus; whereupon Lucullus leaving Gordyene, and passing by Mount Taurus, encamped close by the enemy. Several skirmishes happened for some time between the two armies without any considerable advantage; but Lucullus could by no means draw them to a general engagement. Upon this he decamped, as if he designed to march to Artaxata and lay siege to that place, where Tigranes had left his wife and children, with great part of his treasures. He had scarce formed his camp when the enemy appeared, and sat down close by him. Lucullus did not allow them to fortify their camp, but immediately attacked them, and having put them to flight after a faint resistance, pursued them all night with great slaughter, took most of the chief officers prisoners, and returned the next day loaded with booty.

The Roman soldiers now, finding the cold very severe, though it was no later in the year than the autumnal equinox, requested their general to allow them to retire into winter quarters. This request he rejected with indignation; upon which they mutinied. Lucullus did all he could to persuade them to continue in their duty; and prevailed so far that they consented to lay siege to Nisibis in hopes of booty. This place they took: and Lucullus, to the great satisfaction of his troops, took up his winter quarters there. The next year, however, his forces again mutinied, accusing him of amassing immense wealth for himself; and throwing their empty purses at his feet, told him, that

Armenia. as he enriched himself alone, he might carry on the war by himself. He endeavoured to appease them as much as possible; but the sedition being fomented by a party who favoured Pompey the Great, at that time aspiring to the command of Lucullus's army, the latter found himself obliged to sit still and see Mithridates and Tigranes overrun Cappadocia, and recover all Armenia and great part of Pontus. They would have gained much greater advantages, had not a son of Tigranes taken arms against his father, and obliged him to divide his troops. The father and son coming to a pitched battle, the latter was defeated, and forced to save himself in Parthia, where he persuaded Phraates, king of that country, to assist him with a numerous army against his father. Phraates having laid siege to Artaxata, Tigranes the elder was obliged to hide himself in the mountainous parts of his kingdom; upon which the king of Parthia returned home. Of this Tigranes the father being apprised, he immediately abandoned the fastnesses of the mountains; and falling upon his son at Artaxata, dispersed the rebels with great slaughter; and entered his metropolis in triumph. Tigranes the son first fled to Mithridates; but finding him reduced to great straits, having been overcome a few days before, with the loss of 40,000 men, by Pompey, he went over to the Romans, and led them into Armenia against his father as an ally of Mithridates.

Tigranes, being now quite dispirited, and unable to make head against the Romans, resolved at once to submit. Accordingly he waited on Pompey in his camp, and having delivered his sword to two lictors, prostrated himself before him, and laid his diadem at his feet. Pompey, however, gave him a gracious reception, restored him the kingdom of Armenia, but fined him of 6000 talents for making war on the Roman people without cause. As the king had appealed to the Roman general for justice against his son, Pompey heard both parties the next day, and made the son governor of Gordyene and Sophene; but the treasures that were kept in the latter he adjudged to his father, because without them he could not pay the fine. The son, being thus disappointed, endeavoured first to make his escape, and afterwards, by private messengers, solicited the inhabitants not to deliver up the treasures to his father. This being taken very much amiss by Pompey, he caused him to be kept in irons; and even then he found means to stir up Phraates king of Parthia, whose daughter he had married, against the Romans, and to form a conspiracy against his father's life; whereupon Pompey sent him in chains to Rome, where he was kept prisoner in the house of L. Flavius a senator, till the tribuneship of P. Clodius, who, being bribed with a large sum of money, set him at liberty in spite of Pompey and the senate.

Tigranes being now thoroughly humbled, willingly yielded to the Romans, Cappadocia, Syria, Cilicia, and that part of Phœnicia which he possessed, contenting himself with his paternal kingdom; and not only paid the fine laid upon him, but made large presents to Pompey, and all the officers of his army, which procured him the title of *the friend and ally of the Roman people*. He afterwards entered into a war with Phraates king of Parthia, by whom he was overcome, and would have been driven out of his kingdom, had not a peace been brought about by the mediation of Pompey. He ever after cultivated a strict friendship with the Romans; insomuch that he not only refused to receive Mithridates, who fled to him after he had been routed by Pompey near Mount Stella, but even offered a reward of 100 talents to any one that would put him to death. His second son also, by name Sariaster, took up arms against him; but by the assistance of the Romans, that rebellion was soon quelled. He died in the 85th year of his age; and was succeeded by his son Artuasdes, called by Josephus *Artabazes*, by Orosius *Artabanes*, and by others *Artoadistes*. Armenia.

From this time to the time of Trajan, Armenia was governed by its own kings; but as they were plainly vassals to the Romans, though they did not take that title till the reign of the emperor Nero, their history falls to be considered under that of the Romans.

By Trajan the kingdom of Armenia Major was reduced to the form of a Roman province; but it soon recovered its liberty, and was again governed by its own kings in the reigns of Constantine the Great, and his successor, to whom the kings of Armenia were feudatories. In the reign of Justin II. the Saracens subdued and held it till the irruption of the Turks, who possessed themselves of this kingdom, and gave it the name of *Turcomania*. The Turks, after the reduction of Armenia, invaded Persia, and other countries subject to the emperors of the east; which gave the Armenians an opportunity of shaking off the Turkish yoke, and setting up kings of their own, by whom they were governed till the country was again subdued by Occadan, or, as some style him *Heccata*, the son of Cingis, and first cham of the Tartars. Neither was the conquest of Armenia by the Tartars so absolute as to extirpate the race of their kings: seeing we read of Haithon, surnamed the *Armenian*, reigning some time after, and going in person to treat with Mungo, the great cham of Tartary, of the concerns of his kingdom; and in our chronicles we find mention made of Leo king of Armenia, who, in the reign of Richard II. came into England to sue for aid against the Turks, by whom he had been driven from his kingdom. In the year 1472 of the Christian era Ussan Cassanes king of Armenia succeeding to the crown of Persia, made Armenia a province of that empire; in which state it continued till the year 1522, when it was subdued by Selim II. and made a province of the Turkish empire. Some say that Selim I. reduced it on his return from Persia, where he had gained a complete victory over the great Sophi Ismael. But Sansovin assures us, that in the reign of Selim I. who died in 1520, both the Lesser and Greater Armenia had their own kings; and adds, that Selim caused the head of the king of the Lesser Armenia to be cut off and sent to Venice as a mark of his victory. We read nowhere else of any kings of Armenia after it became a province of Persia. Be that as it will, the Turkish annals cited by Calvisius inform us, that Selim II. conquered Armenia in 1552, since which time it has ever continued subject to the Turks, except the eastern part, which the Persians are masters of to this day.

Concerning Armenia Minor, we find very little recorded, except what has been already mentioned, and what falls under the Roman history. It was made a Roman province by Vespasian, continued so till the division

Armenia. division of the empire, when it was subjected to the emperors of the east; and, on the decline of their power, was subdued first by the Persians, and afterwards by the Turks, who gave it the name of *Genech*, and have kept it ever since.

This country is still divided into the Great and Small. Great Armenia comprehends what is now called *Turcomania*. It has Georgia on the north, from which it is separated by high mountains; the river Euphrates on the west; Diarbeker, Curdistan, and Aderbijan, on the south; and Shirvan on the east. The chief towns in that part of Armenia belonging to Turkey are Arzum the capital, near the springs of the Euphrates, a large city and a great thoroughfare for the caravans betwixt Turkey and Persia; Kara, a strong city, head of the government of the same name; Bayazid, a republic of Curds, near Mount Ararat: Baha, another republic of the same; and Van or Wan, on the lake Van, the head of a government of the same name; with other towns of less note. That part of Armenia subject to Persia is chiefly contained in the province of Aran, in which are several fine towns; as, Erivan or Rivan, the capital of the whole; Ganjals, one of the finest cities in Persia, in the north of the province, near the Kur; Kapan, on the south side, near the Aras; besides Naksivan, Astabad Julsa, Ordabad, Baylakan or Pilkan on the Aras; Berdah and Shilkah on the Kur.

The country in general is full of mountains and valleys, lakes and rivers; particularly the country about the Three Churches, near Erivan, is admirably fine, being full of rivulets, which render it extremely fruitful. Besides great quantities of all sorts of grain, here are fields of a prodigious extent covered with tobacco: but it is not a native of the place, though supposed by some to be the terrestrial paradise: for it all came originally from America. The rest of the country produces rice, cotton, flax, melons, and grapes: in short, there is nothing wanting but olives; which is by some thought to prove that the ark could not rest on Mount Ararat, because the dove brought an olive branch in her mouth, and this tree never leaves a place where it once grew. It seems, however, to have been otherwise anciently; for Strabo tells us, that the olive grew in Gogarene, a province of Armenia. They get oil to burn from the ricinus, and use linseed oil in the kitchen. The water melons are as cool as ice in the hottest day, and melt in the mouth; the best are produced in the salt lands, near the Three Churches and the river Aras. After rain, the sea salt lies in crystals upon the fields, and even crackles under the feet. About ten miles from the Three Churches, in the road to Teflis, there are pits or quarries of fossil salt, which yield enough to supply all Persia, without being exhausted: they cut it into large pieces like stone, and each buffalo carries two of them; the mountain from whence it is dug is nothing but a mass of salt, which appears like a rock of silver when the sun shines on the places not covered with earth.

This country has been remarkable for its extreme cold from the remotest antiquity; Sir John Chardin tells us, that he found ice in the rivulets in the mornings even of the month of July. In many places, also, if they had not the convenience of watering their grounds, they would be almost entirely barren.

The Armenians are an honest, civil, polite people, Armenia. scarce troubling themselves about any thing else but trade, which they carry on in most parts of the world, by which means they have spread themselves over the east, and also a great part of Europe; and wherever they come, commerce is carried on with spirit and advantage.

The religion of the Armenians is the Christian, of the Eutychian sect; that is, they own but one nature in Jesus Christ; and when they speak of the hypostatical union, that he is perfect God and perfect man without mixture. They have a high esteem for a book they call the *Little Gospel*, which treats of the infancy of Jesus, and says that the Virgin Mary being pregnant, her sister Salome accused her of having prostituted herself; to which the Virgin answered, that she needed only to lay her hand on her belly, and she would know how she came to be with child: this Salome accordingly did, and fire came out of her belly, which consumed the half of her arm; upon which she acknowledged her fault, and drew it back; after which it was healed by putting it to the same place.

The Armenian clergy consist of patriarchs, archbishops, doctors, secular priests, and monks. The secular priests are not allowed to marry a second time; and therefore they take care to choose young healthy wives; they maintain themselves and families by following some occupation, insomuch that they have hardly time to perform their ecclesiastical functions: they lie in the churches on the vigils of those days they are obliged to officiate.

The Armenian monks are of the order of St Basil; and every Wednesday and Friday they eat neither fish, nor eggs, nor oil, nor any thing made of milk, and during Lent they live upon nothing but roots; they are allowed wine only on the Saturday in the Holy Week, and meat on the Easter Sunday. Besides the great Lent they have four others of eight days each, which are instituted to prepare for the four great festivals, of the Nativity, the Ascension, the Annunciation, and of St George; in which times they must not so much as speak of eggs, fish, oil, or butter.

The Armenians have seven sacraments; baptism, confirmation, penance, the eucharist, extreme unction, orders, and matrimony. In baptism, the child is plunged three times into the water, and the same form of words that is used with us is repeated every time; the priest then puts a small cord made with silk and cotton on the neck of the infant, and anoints his forehead, chin, stomach, armpits, hands, and feet, making the sign of the cross on each part. When the child is baptized, he is carried home by the godfather with the sound of drums and trumpets. The women do not go to church till 40 days after their delivery; and they observe many Jewish customs.

At the communion, to which infants of two or three months old are admitted, the priests give a piece of the consecrated host soaked in the consecrated wine. The elements are covered with a great veil, and placed in a cupboard near the altar, on the side of the gospels. When the priest takes the chalice and patin, he is followed by his deacons and subdeacons, with flambeaux and plates of copper furnished with bells: in this manner, with a censer before him, he goes in procession round the sanctuary: he then sets them on the altar,

pronounces

Armenia || Armillary.

pronounces the words of consecration, and turns himself to the people, who fall down, kiss the earth, and beat their breasts; then, after taking it himself, he distributes the host soaked in wine to the people.

The Armenians seem to place the chief part of their religion in fastings and abstinences: and among the clergy, the higher the degree the lower they must live; insomuch that it is said the archbishops live on nothing but pulse. They consecrate holy water but once a-year; at which time every one fills a pot and carries it home, which brings in a considerable revenue to the church.

ARMENIACA. See PRUNUS.

ARMENIAN, something belonging to or produced in Armenia: thus we say, *Armenian bole*, *Armenian stone*, &c. See BOLE, and *ARMENUS Lapis*.

ARMENTIERS, a small handsome town in the department of the North in France, containing 7600 inhabitants. It was taken by Lewis XIV. in 1667, who dismantled it; and it now belongs to the French. It is seated on the river Lis. E. Long. 3. 3. N. Lat. 50. 40.

ARMENUS LAPIS, *Armenian stone*, in *Natural History*, a mineral substance, which is but improperly called a *stone;* being no other than an ochreous earth; and properly called *blue ochre*. It is a very valuable substance in painting, being a bright and lively blue. It was in so high esteem as a paint among the ancients, that counterfeits were continually attempted to serve in its place. Theophrastus had recorded it as a thing judged worthy a place in the Egyptian annals, which of their kings had the honour of inventing the factitious kind; and he tells us the genuine native substance was a thing of that value, that presents were made of it to great persons, and that the Phœnicians paid their tribute in it.—It is a very beautiful earth, of an even and regular texture; and of a fine blue, sometimes deeper, sometimes paler, and frequently mixed with green. It is soft, tender, and light; of an even, but somewhat dusty surface; it adheres firmly to the tongue, and is dry, but not harsh to the touch. It easily breaks between the fingers, and does not stain the hands. It is of a brackish disagreeable taste, and does not ferment with acids. It is a very scarce fossil; but is found very pure, though but in small quantities, in the mines at Gosselaer in Saxony. It is frequently found spotted with green, and sometimes with black; and very often is mixed among the green ochre, called *berggruen* by the Germans, which has thence been erroneously called by its name. See further the article BICE.

ARMIERS, a town in France in the department of the North, seated on the river Sambre. E. Long. 3. 45. N. Lat. 50. 15.

ARMIGER, a title of dignity, belonging to such gentlemen as bear arms; and these are either by courtesy, as sons of noblemen, eldest sons of knights, &c.; or by creation, such as the king's servants, &c. See ESQUIRE.

ARMILLARY, in a general sense, something consisting of rings or circles.

ARMILLARY Sphere, an artificial sphere composed of a number of circles of the mundane sphere, put together in their natural order, to ease and assist the imagination in conceiving the constitution of the heavens and the motions of the celestial bodies. The armillary sphere revolves upon its axis within a silvered horizon, which is divided into degrees, and moveable every way upon a brass supporter. The other parts are the equinoctial, zodiac, meridian, the two tropics, and the two polar circles. See GEOGRAPHY.

Armillary || Arminians

ARMILUSTRIUM, in Roman antiquity, a feast held among the Romans, in which they sacrificed, armed, to the sound of trumpets.

ARMINIANS, a religious sect, or party, which arose in Holland, by a separation from the Calvinists. They followed the doctrine of Arminius (see the next article); who, thinking the doctrine of Calvin, with regard to free-will, predestination, and grace, too severe, began to express his doubts concerning them in the year 1591; and upon further inquiry adopted sentiments more nearly resembling those of the Lutherans than of the Calvinists. After his appointment to the theological chair at Leyden, he thought it his duty to avow and vindicate the principles which he had embraced; and the freedom with which he published and defended them exposed him to the resentment of those that adhered to the theological system of Geneva, which then prevailed in Holland; but his principal opponent was Gomar, his colleague. The controversy which was thus begun, became more general after the death of Arminius, in the year 1609, and threatened to involve the United Provinces in civil discord. The Arminian tenets gained ground under the mild and favourable treatment of the magistrates of Holland, and were adopted by several persons of merit and distinction. The Calvinists, or Gomarists, as they were now called, appealed to a national synod: accordingly the synod of Dort was convened by order of the States General, in 1618, and was composed of ecclesiastical deputies from the United Provinces, as well as from the reformed churches of England, Hessia, Bremen, Switzerland, and the Palatinate. The principal advocate in favour of the Arminians was Episcopius, who, at that time, was professor of divinity at Leyden. It was first proposed to discuss the principal subjects in dispute, and that the Arminians should be allowed to state and vindicate the grounds on which their opinions were founded: but some difference arising as to the proper mode of conducting the debate, the Arminians were excluded from the assembly; their case was tried in their absence; and they were pronounced guilty of pestilential errors, and condemned as corrupters of the true religion. In consequence of this decision, they were treated with great severity: they were deprived of all their posts and employments; their ministers were silenced, and their congregations were suppressed. However, after the death of Prince Maurice, who had been a violent partizan in favour of the Gomarists, in the year 1625, the Arminian exiles were restored to their former reputation and tranquillity; and under the toleration of the state, they erected churches and founded a college at Amsterdam, appointing Episcopius to be the first theological professor. The Arminian system has very much prevailed in England since the time of Archbishop Laud, and its votaries in other countries are very numerous.

The distinguishing tenets of the Arminians may be comprised

Arminians. comprising in the followed five articles; relating to predestination, universal redemption, the corruption of man, conversion, and perseverance.

1. "With respect to the first, they maintained, "That God, from all eternity, determined to bestow salvation on those who he foresaw would persevere unto the end in their faith in Christ Jesus; and to inflict everlasting punishment on those who should continue in their unbelief, and resist unto the end his divine succours: so that election was conditional, and reprobation in like manner the result of foreseen infidelity and persevering wickedness."

2. On the second point the Arminians taught, "That Jesus Christ, by his sufferings and death, made an atonement for the sins of all mankind in general, and of every individual in particular; that, however, none but those who believe in him can be partakers of their divine benefit."

3. On the third article, they held, "That true faith cannot proceed from the exercise of our natural faculties and powers, nor from the force and operation of free will; since man, in consequence of his natural corruption, is incapable either of thinking or doing any good thing; and that, therefore, it is necessary, in order to his conversion and salvation, that he be regenerated, and renewed by the operation of the Holy Ghost, which is the gift of God through Jesus Christ."

4. "That this divine grace, or energy of the Holy Ghost, begins and perfects every thing that can be called good in man, and consequently all good works are to be attributed to God alone; that, nevertheless, this grace is offered to all, and does not force men to act against their inclination, but may be resisted and rendered ineffectual by the perverse will of the impenitent sinner." Some modern Arminians interpret this and the last article with a greater latitude.

5. "That God gives to the truly faithful, who are regenerated by his grace, the means of preserving themselves in this state;" and though the first Arminians made some doubt with respect to the closing part of this article, their followers uniformly maintained, "that the regenerate may lose true justifying faith, forfeit their state of grace, and die in their sins."

The modern system of Arminianism likewise, founded on a comprehensive plan projected by Arminius himself, as appears from a passage in his last will, extends the limits of the Christian church, and relaxes the bonds of fraternal communion in such a manner, that Christians of all sects and denominations, whatever their sentiments and opinions may be, Papists excepted, may be formed into one religious body, and live together in brotherly love and concord. But, in order to avoid the reproach of being altogether unconnected by any common principles, Episcopius drew up a confession of faith, expressed for the most part in words and phrases of Holy Scripture, which the Arminians have generally adopted, though not enjoined upon them by any authoritative obligation. The Arminians are also called *Remonstrants*, from an humble petition, entitled their *Remonstrance*, which, in the year 1610, they addressed to the States of Holland. Their principal writers are Arminius, Episcopius, Vorstius, Grotius, Curcellæus, Limborch, Le Clerc, and Wetstein; not to mention many others of more modern date.

ARMINIUS, JAMES, whose real name in Low Dutch was James Harmanni, a famous Protestant divine, from whom the modern sect of Arminians (see the preceding article) take their name, was born at Oude water, in Holland, in 1560. He was ordained minister at Amsterdam on the 11th of August 1588; where he soon distinguished himself by his sermons, which were remarkable for their solidity and learning, and gained him universal applause; but Martin Lydias, professor of divinity at Franeker, judging him a fit person to refute a writing in which Beza's doctrine of predestination had been attacked by some ministers of Delft, Arminius at his entreaties undertook the task; but upon thoroughly examining the reasons on both sides, he came into the opinions he proposed to destroy, and afterwards went still farther than the ministers of Delft had done. In 1600, he opposed those who maintained that ministers should subscribe the confession and catechism every year. In 1602, a pestilential disease raged at Amsterdam, during which he acted with the greatest resolution and courage, in assisting the poor, and comforting the sick; and Lucas Trelcatius and Francis Junius dying of that disease at Leyden, the curators of that university chose Arminius professor of divinity there, and he was afterwards made doctor of divinity. Disputes upon grace were soon after kindled in that university; and he was at length engaged in a new contest, occasioned by a disputation of his concerning the divinity of the Son. These contests, his continual labour, and the concern of seeing his reputation blasted by a multitude of slanders in relation to his opinions, impaired his health, and threw him into a fit of sickness, of which he died on the 19th of October 1609. Arminius was esteemed an excellent preacher; his voice was low, but very agreeable; and his pronunciation admirable; he was easy and affable to persons of all ranks, and facetious in his conversation amongst his friends. His great desire was, that Christians would bear with one another in all controversies which did not affect the fundamentals of their religion; and when they persecuted each other for points of indifference, it gave him the utmost dissatisfaction. The curators of the university of Leyden had so great a regard for him, that they settled a pension upon his wife and children. He left several works, viz. 1. Disputationes de diversis Christianæ religionis capitibus. 2. Orationes, itemque tractatus insigniores aliquot. 3. Examen modesti libelli Gulielmi Perkinsi de prædestinationis modo et ordine, itemque de amplitudine gratiæ divinæ. 4. Analysis capitis noni ad Romanos. 5. Dissertatio de vero et genuino sensu capitis septimi epistolæ ad Romanos. 6. Amica collatio cum D. Francisco Junio de prædestinatione, per literas habita. 7. Epistola ad Hippolytum à collibus." Arminius || Armoisin.

ARMIRO, a town of Thessaly, in European Turkey; seated on the gulf of Velo. E. Long. 23. 5. N. Lat. 39. 10.

ARMISTICE, in military affairs, a temporary truce or cessation of arms for a very short space of time. The word is Latin, *armistitium;* and compounded of *arma*, "arms," and *sto*, "to stand, or stop."

ARMOISIN, a silk stuff, or kind of taffety, manufactured in the East Indies, at Lyons in France, and at Lucca in Italy. That of the Indies is slighter than those made in Europe.

ARMONIAC,

Armoniac || Armourer.

ARMONIAC. See AMMONIAC, CHEMISTRY *Index.*

ARMONICA. See HARMONICA.

ARMORIAL, something relating to arms or coats of arms. See ARMS and HERALDRY.

ARMORIC, or AREMORIC, something that belongs to the province of Bretagne, or Britanny, in France. The name *Armorica* was anciently given to all the northern and western coast of Gaul, from the Pyrenees to the Rhine; under which name it was known even in Cæsar's time. The word is of Bas Breton origin, and denotes as much as *maritime;* compounded, according to M. Menage, of, *ar*, "upon," and *more*, "sea."

ARMORIST, a person skilled in the knowledge of armour.

ARMORUM CONCUSSIO; the clashing of arms practised by the Roman armies previous to an engagement, and intended to strike a panic into their enemies; it always followed the classicum and the barritus. See CLASSICUM and BARRITUS.

ARMOUR, a defensive habit, wherewith to cover and secure the body from the attacks of an enemy. In ancient statutes this is frequently called *harness.*—Parts of armour are, the buckler, cuirass, helmet, coat of mail, gauntlet, &c.

A complete armour anciently consisted of a casque or helm, a gorget, cuirass, gauntlets, tasses, brassets, cuishes, and covers for the legs, to which the spurs were fastened. This they called *armour cap-a-pie;* and was the wear of the cavaliers and men at arms.—The infantry had only part of it; viz. a pot or headpiece, a cuirass, and tasses; but all light. Lastly, The horses themselves had their armour, wherewith to cover the head and neck. Of all this furniture of war, scarce any thing is now retained except the cuirass; the gorget, or neck piece worn by officers, being at present only a badge of honour, and of no defence.

The gallantry of going to the battle naked, without any defensive armour, prevailed so far, that the French, during the reign of Louis XIV. were obliged to be continually issuing ordonnances to restrain it; in consequence of which the general officers, and those of the cavalry, were obliged to resume the cuirass, which yet has been but ill observed.

ARMOUR, *Coat*, is the escutcheon of any person, or family, with its several charges, and other furniture; as mantling, crest, supporters, motto, &c. Thus we say, a gentleman of coat armour; meaning one who bears arms.

ARMOURER, a maker of arms or armour.—The Roman armourers were disposed in certain places in the empire, it being forbid either to sell, or buy, or make arms elsewhere. They were exempt from all offices and taxes, and received a salary from the public.

When once they had taken the employment on themselves, neither they nor their children were allowed to quit it. To prevent this, they had a kind of note, or stigma, impressed on the arm, whereby they might be known. If any of them fled, or secreted their ware, the rest were obliged to answer for him; on account of which, the effects of such as died without a legal heir went to the college. There were 15 armamentaries, or repositories of arms, in the Eastern empire, placed near the frontiers, and 19 in the Western.

ARMOURER *of a ship*, a person whose office is to take care that the arms be in a condition fit for service.

Armoure || Arms.

ARMOURY, a storehouse of arms, or a place wherein military habiliments are kept, to be ready for use. There are armouries in the Tower, and in all arsenals, citadels, castles, &c.

ARMOURY is also used for a branch of heraldry; being the knowledge of coat armours, as to their blazons and various intendments.

ARMOZA, or HARMOZIA, a town in Caramania, at the mouth of the Anamis, which falls into the Persian gulf (Arrian); *Armuza*, (Ptolemy); and from this the neighbouring island, and a small kingdom, take the modern name of *Ormus*. E. Long. 56. 17. N. Lat. 27. 0.

ARMS, ARMA, in a general sense, includes all kinds of weapons, whether for defence or offence. Nicod derives the word from the Latin phrase *quod operiant armos*, because they cover the shoulders or sides; but Varro derives *arma, ab arcendo, eo quod arceant hostes*, It is supposed that the first artificial arms were of wood, and were only employed against beasts; and that Belus, the son of Nimrod, was the first that waged war: whence, according to some, came the appellation *bellum*. Diodorus Siculus takes Belus to be the same with Mars, who first trained soldiers up to battle.—Arms of stone, and even of brass, appear to have been used before they came to iron and steel. Josephus assures us, that the patriarch Joseph first taught the use of iron arms in Egypt, arming the troops of Pharaoh with a casque and buckler.

What contributed most to render the Romans masters of the world, was, that having successively warred against all nations, they constantly renounced their own methods, arms, &c. wherever they met with better. Thus Romulus during his war with the Sabines, a bold and warlike nation, adopted their broad buckler, in lieu of the small Argian buckler, which he had used till that time.

The principal arms of the ancient Britons were hatchets, scythes, lances, swords, and bucklers: the Saxons, &c. brought in the halbert, bow, arrows, arbalists, &c. By the ancient laws of England, every man was obliged to bear arms, except the judges and clergy. Under Henry VIII. it was expressly enjoined on all persons to be regularly instructed, even from their tender years, in the exercise of the arms then in use; viz. the long bow and arrows: and to be provided with a certain number of them. 33 Hen. VIII.

ARMS, *Arma*, in *Law*, are extended to any thing which a man takes in his hand in his wrath, to cast at, or strike another.

By the common law, it is an offence for persons to go or ride armed with dangerous weapons: but gentlemen may wear common armour, according to their quality, &c. 3d Inst. The king may prohibit force of arms, and punish offenders according to law; and herein every subject is bound to be aiding. Stat. 7. Edw. I. None shall come with force and arms before the king's justices, nor ride armed in affray of the peace, on pain to forfeit their armour, and to suffer imprisonment, &c. 2 Edw. III. c. 3.

The importation of arms and ammunition are prohibited by 1 Jac. II. c. 8. and by 1 W. and M. stat. 2 c. 2. Protestant subjects may have arms for their defence.

Arms. fence. So likewise arms, &c. shipped after prohibition, are forfeited by 29 Geo. I. c. 16. sec. 2.

Arms of offence in use among us at present are, the sword, pistol, musket, bayonet, pike, &c.

The arms of the Highlanders are, the broadsword, target, poniard, and whinyar or durk, &c. There are several acts of parliament for disarming the Highlanders; see 1 Geo. I. c. 54.; 11 Geo. I. c. 26.; 19 Geo. II. c. 39.; 21 Geo. II. c. 34.; 26 Geo. II. c. 22. and 29.

Fire-Arms are those charged with powder and ball; such are cannon, mortars, and other ordnance; muskets, carabines, pistols, and even bombs, grenadoes, carcasses, &c. In the History of the Royal Academy for the year 1707, we have an account of some experiments made with fire arms, differently loaded, by M. Cassini. Among other things he observes, that by loading the piece with a ball which is somewhat less than the calibre, and only laying a little gunpowder below the ball and a good deal above it, it will yield a vehement noise, but have no sensible effect or impulse on the ball. This he takes to have been all the secret of those people who pretended to sell the art of rendering one's self invulnerable, or shot proof.

Arms, Pass of, was a kind of combat in use among the ancient cavaliers.

Arms, Stand of. A stand of arms signifies a musket, a bayonet, a sword, belt, and cartridge box.

Arms of parade or *courtesy*, were those used in the ancient justs and tournaments; which were commonly unshod lances, swords without edge or point, wooden swords, and even canes.

Arms denote the natural weapons, or parts of defence, of beasts; as claws, teeth, tusks of elephants, beaks of birds, &c.

Arms, are also used figuratively for the profession of a soldier. Thus we say, He was bred to arms.

Arms, or *Armories*, are also used in heraldry for marks of dignity and honour, regularly composed of certain figures and colours, given or authorized by sovereigns, and borne on banners, shields, coats, &c. for the distinction of persons, families, and states; and passing by descent to posterity. They are called *arms*, in regard they are borne principally on the buckler, cuirass, banners, and other apparatus of war. They are also called *coats of arms*, *coat armour*, &c. because anciently embroidered on surcoats, &c. See Heraldry. Some will have the name to have been first occasioned by the ancient knights, who in their justs and tournaments bore certain marks (which were frequently their mistress's favours) in their armour, i. e. their helmets or shields, to distinguish them from each other.

Arms at present follow the nature of titles, which being made hereditary, these are also become so, being the several marks for distinguishing of families and kindreds, as names are of persons and individuals.

Arms are variously distinguished by the *Heralds*.

Arms of Alliance, are those which families or private persons join to their own, to denote the alliances which they have contracted by marriage.

Arms Assumptive, are such as a man has a right to assume of himself in virtue of some gallant action. As, if a man who is no gentleman of blood, nor has coat armour, takes a gentleman, lord, or prince, prisoner in any lawful war; he becomes entitled to bear the shield of such prisoner, and enjoy it to him and his heirs. The foundation hereof is that principle in military law, that the dominion of things taken in lawful war passes to the conqueror. Arms.

Arms, canting, are those wherein the figures bear an allusion to the name of the family. Such are those of the family of La Tour in Auvergne, who bear a tower; that of the family of Prado in Spain, whose field is a meadow. Most authors hold these the most noble and regular, as is shown by an infinity of instances produced by Father Varrenne and Menetrier.—They are much debased when they come to partake of the *Rebus*.

Arms, charged, are such as retain their ancient integrity and value, with the addition of some new honourable charge or bearing, in consideration of some noble action.

Arms of community, are those of bishoprics, cities, universities, and other bodies corporate.

Arms of concession, or augmentation of honour, are either entire arms, or else one or more figures given by princes, as a reward for some extraordinary service.

Arms of dominion, are those which emperors, kings, and sovereign states bear; being annexed to the territories which they possess. Thus the three lions are the arms of England; the fleurs de lys those of France, &c.

Arms of family, or *paternal arms*, are such as belong to a particular family, and which no other person has a right to assume.

Arms, full, or *entire*, are such as retain their primitive purity, integrity, or value; without any alterations, diminutions, abatements, or the like. It is a rule, that the simpler and less diversified the arms, the more noble and ancient they are. For this reason Garcias Ximenes, first king of Navarre, and his successors for several ages, bore only gules, without any figure at all.

The arms of princes of the blood, of all younger sons, and junior families, are not pure and full; but distinguished and diminished by proper differences, &c.

Arms of patronage, are those which governors of provinces, lords of manors, &c. add to their family arms, in token of their peculiar superiority and jurisdiction.

Arms of pretension, are those of such kingdoms or territories to which a prince or lord has some claim, and which he adds to his own, though the kingdoms or territories be possessed by a foreign prince or other lord. Thus the kings of England have quartered the arms of France with their own, ever since the claim of Edward III. to that kingdom, in 1330.

Arms of succession, are assumed by those who inherit estates, manors, &c. by will, entail, or donation, and which they either impale or quarter with their own arms.

Arms are also said to be *parted*, *couped*, *quartered*, &c.

Arms are said to be *false* and *irregular*, when there is something in them contrary to the established rules of heraldry. As, when metal is put on metal, or colour on colour, &c.

The laws, and other affairs of arms, with the cognizance of offences committed therein, belong, among us, to the earl marshal and college of arms.

Arms, in *Falconry*, denote the legs of a hawk, from the thigh to the foot. See Falconry.

Armstrong.

ARMSTRONG, Dr John, an eminent physician, poet, and miscellaneous writer, was born in Castleton parish, Roxburghshire, where his father and brother were ministers; completed his education in the university of Edinburgh, where he took his degree in physic, Feb. 4. 1732, with much reputation; and published his thesis, as the forms of that university require; the subject was *De tabe purulenta*. In 1735 he published a little humorous fugitive pamphlet in 8vo, entitled, "An Essay for abridging the Study of Physic; to which is added a Dialogue betwixt Hygeia, Mercury, and Pluto, relating to the practice of Physic, as it is managed by a certain illustrious Society. As also an Epistle from Usbeck the Persian to Joshua Ward, Esq." This piece contains much fun and drollery; in the dialogue, he has caught the very spirit of Lucian. In 1737 he published a Synopsis of the History and Cure of the Venereal Disease, 8vo. This was soon followed by the *Economy of Love*; a poem which has much merit, but, it must be confessed, is too strongly tinctured with the licentiousness of Ovid. It is said, however, that his maturer judgment expunged many of the luxuriances of youthful fancy, in an edition "revised and corrected by the author" in 1768. It appears by one of the cases on literary property, that Mr Millar paid 50 guineas for the copy-right of this poem, which was intended as a burlesque on some didactic writers. It has been observed of Dr Armstrong, that his works have great inequalities, some of them being possessed of every requisite to be sought after in the most perfect composition, while others can hardly be considered as superior to the productions of mediocrity. *The Art of preserving Health*, his best performance, which was published in 1744, will transmit his name to posterity as one of the first English writers, and has been honoured with the following testimony of a respectable critic. On this work we shall also transcribe a beautiful eulogium from an eminent physician*: "Of all the poetical performances on this subject that have come to my hands, Dr Armstrong's Art of preserving Health is by far the best. To quote every charming description and beautiful passage of this poem, one must transcribe the whole. We cannot, however, expect new rules, where the principal design was to raise and warm the heart into a compliance with the solid precepts of the ancients, which he has enforced with great strength and elegance. And, upon the whole, he has convinced us, by his own example, that we ought not to blame antiquity for acknowledging

One power of physic, melody, and song."

* *Dr Mackenzie's History of Health.*

In 1746 Dr Armstrong was appointed one of the physicians to the Hospital for Lame and Sick Soldiers behind Buckingham house. In 1751 he published his poem on Benevolence, in folio; and in 1753, "Taste, an Epistle to a young Critic." In 1758 appeared, "Sketches or Essays on various subjects, by Launcelot Temple, Esq. in two parts." In this production, which possesses much humour and knowledge of the world, and which had a remarkably rapid sale, he is supposed to have been assisted by Mr Wilkes. In 1760 he had the honour of being appointed physician to the army in Germany, where in 1761 he wrote a poem called "Day, an Epistle to John Wilkes of Aylesbury, Esq." In this poem, which is not collected in his works, he wantonly hazarded a reflection on Churchill, which drew on him the serpent-toothed vengeance of that severest of satirists, whose embalming or corrosive pen could deify or lampoon any man, according as he acquiesced with, or dissented from his political principles. In 1770 Dr Armstrong published a collection of Miscellanies, in 2 vols.; containing, 1. The Art of preserving Health. 2. Of Benevolence, an Epistle to Eumenes. 3. Taste, an Epistle to a young Critic, 1753. 4. Imitations of Shakespeare and Spenser. 5. The Universal Almanack, by Noureddin Ali. 6. The Forced Marriage, a tragedy. 7. Sketches." In 1771 he published "A short Ramble through some parts of France and Italy, by Launcelot Temple;" and in 1773, in his own name, a quarto pamphlet, under the title of "Medical Essays;" towards the conclusion of which, he accounts for his not having such extensive practice as some of his brethren, from his not being qualified to employ the usual means, from a ticklish state of spirits, and a distempered excess of sensibility. He complains much of the behaviour of some of his brethren, of the herd of critics, and particularly of the reviewers. He died in Sept. 1779; and to the no small surprise of his friends, left behind him more than 300l. saved out of a very moderate income, arising principally from his half-pay.

Armstrong || Army.

ARMUYDEN, a sea-port town of the United Provinces, in the island of Walcheren, formerly very flourishing; but now inconsiderable, the sea having stopped up the harbour. The salt works are its chief resource. E. Long. 3. 40. N. Lat. 51. 30.

ARMY, a large number of soldiers, consisting of horse and foot, completely armed, and provided with artillery, ammunition, provisions, &c. under the command of one general, having lieutenant-generals, major-generals, brigadiers, and other officers under him. An army is composed of squadrons and battalions; and is usually divided into three corps, and formed in three lines: the first line is called the *van-guard*, the second the *main body*, and the third the *rear-guard*, or *body of reserve*. The middle of each line is possessed by the foot; the cavalry form the right and left wing of each line; and sometimes they place squadrons of horse in the intervals between the battalions. When the army is drawn up in order of battle, the horse are placed at five feet distance from each other, and the foot at three. In each line the battalions are distant from each other 180 feet, which is nearly equal to the extent of their front; and the same holds of the squadrons, which are about 300 feet distant, the extent of their own front. These intervals are left for the squadrons and battalions of the second line to range themselves against the intervals of the first, that both may more readily march through these spaces to the enemy: the first line is usually 300 feet distant from the second, and the second from the third, that there may be sufficient room to rally when the squadrons and battalions are broken. See the article War.

This is to be understood of a land army only. A naval or sea army is a number of ships of war, equipped and manned with sailors and marines, under the command of an admiral, with other inferior officers under him. See War, Part II.

It has been observed, that in Europe a prince with a million of subjects cannot keep an army of above 10,000 men, without ruining himself. It was other-

wise

Army. wise in the ancient republics: the proportion of soldiers to the rest of the people, which is now as about one to 100, might then be as about one to eight. The reason seems owing to that equal partition of lands which the ancient founders of commonwealths made among their subjects; so that every man had a considerable property to defend, and means to defend it with: whereas, among us, the lands and riches of a nation being shared among a few, the rest have no way of subsisting but by trades, arts, and the like; and have neither any free property to defend, nor means to enable them to go to war in defence of it, without starving their families. A large part of our people are either artisans or servants, and so only minister to the luxury and effeminacy of the great. While the equality of lands subsisted, Rome, though only a little state, being refused the succours which the Latins were obliged to furnish after the taking of the city in the consulate of Camillus, presently raised ten legions within its own walls; which was more, Livy assures us, than they were able to do in his time, though masters of the greatest part of the world. A full proof, adds the historian, that we are not grown stronger; and that what swells our city is only luxury, and the means and effects of it.

Our armies anciently were a sort of militia, composed chiefly of the vassals and tenants of the lords. When each company had served the number of days or months enjoined by their tenure, or the customs of the fees they held, they returned home. The armies of the empire consist of divers bodies of troops, furnished by the several circles. The gross of the French armies under the Merovingian race, consisted of infantry. Under Pepin and Charlemagne, the armies consisted almost equally of cavalry and foot: but since the declension of the Carlovingian line, the fees being become hereditary, the national armies, says Le Gendre, are chiefly cavalry.

A well regulated standing army is greatly superior to a militia; although a militia, it is to be observed, after serving two or three campaigns, may become equal to a standing army, and in every respect a match for veteran troops. See MILITIA.

One of the first standing armies of which we have a distinct account, in any well authenticated history, is that of Philip of Macedon. His frequent wars with the Thracians, Illyrians, Thessalians, and some of the Greek cities in the neighbourhood of Macedon, gradually formed his troops, which in the beginning were probably militia, to the exact discipline of a standing army. When he was at peace, which was very seldom, and never for any long time together, he was careful not to disband that army. It vanquished and subdued, after a long and violent struggle, indeed, the gallant and well exercised militias of the principal republics of ancient Greece; and afterwards, with very little struggle, the effeminate and ill exercised militia of the great Persian empire. The fall of the Greek republics and of the Persian empire, was the effect of the irresistible superiority which a standing army has over every sort of militia. It is the first great revolution in the affairs of mankind of which history has preserved any distinct or circumstantial account.

The fall of Carthage, and the consequent elevation of Rome, is the second. All the varieties in the fortune of those two famous republics may very well be accounted for from the same cause. Army.

From the end of the first to the beginning of the second Carthaginian war, the armies of Carthage were continually in the field, and employed under three great generals, who succeeded one another in the command; Hamilcar, his son-in-law Asdrubal, and his son Hannibal; first in chastising their own rebellious slaves, afterwards in subduing the revolted nations of Africa, and, lastly, in conquering the great kingdom of Spain. The army which Hannibal led from Spain into Italy must necessarily, in those different wars, have been gradually formed to the exact discipline of a standing army. The Romans, in the mean time, though they had not been altogether at peace, yet they had not during this period, been engaged in any war of very great consequence; and their military discipline, it is generally said, was a good deal relaxed. The Roman armies which Hannibal encountered at Trebia, Thrasymenus, and Cannæ, were militia opposed to a standing army. This circumstance, it is probable, contributed more than any other to determine the fate of those battles.

The standing army which Hannibal left behind him in Spain, had the like superiority over the militia which the Romans sent to oppose it, and in a few years, under the command of his brother the younger Asdrubal, expelled them almost entirely from that country.

Hannibal was ill supplied from home. The Roman militia, being continually in the field, became in the progress of the war a well disciplined and well exercised standing army; and the superiority of Hannibal grew every day less and less. Asdrubal judged it necessary to lead the whole, or almost the whole, of the standing army which he commanded in Spain, to the assistance of his brother in Italy. In this march he is said to have been misled by his guides; and in a country which he did not know, was surprised and attacked by another standing army, in every respect equal or superior to his own, and was entirely defeated.

When Asdrubal had left Spain, the great Scipio found nothing to oppose him but a militia inferior to his own. He conquered and subdued that militia; and in the course of the war, his own militia necessarily became a well disciplined and well exercised standing army. That standing army was afterwards carried to Africa, where it found nothing but a militia to oppose it. In order to defend Carthage, it became necessary to recal the standing army of Hannibal. The disheartened and frequently defeated African militia joined it, and at the battle of Zama composed the greater part of the troops of Hannibal. The event of that day determined the fate of the two rival republics.

From the end of the second Carthaginian war till the fall of the Roman republic, the armies of Rome were in every respect standing armies. The standing army of Macedon made some resistance to their arms. In the height of their grandeur, it cost them two great wars and three great battles, to subdue that little kingdom; of which the conquest would probably have been still more difficult, had it not been for the cowardice of its last king. The militias of all the civilized nations of the ancient world, of Greece, of Syria, and

Army. of Egypt, made but a feeble resistance to the standing armies of Rome. The militias of some barbarous nations defended themselves much better. The Scythian or Tartar militia, which Mithridates drew from the countries north of the Euxine and Caspian seas, were the most formidable enemies whom the Romans had to encounter after the second Carthaginian war. The Parthian and German militias too were always respectable, and upon several occasions gained very considerable advantages over the Roman armies. In general, however, and when the Roman armies were well commanded, they appear to have been very much superior.

Many different causes contributed to relax the discipline of the Roman armies. Its extreme severity was, perhaps, one of those causes. In the days of their grandeur, when no enemy appeared capable of opposing them, their heavy armour was laid aside as unnecessarily burdensome, their laborious exercises were neglected as unnecessarily toilsome. Under the Roman emperors, besides, the standing armies of Rome, those particularly which guarded the German and Pannonian frontiers, became dangerous to their masters, against whom they used frequently to set up their own generals. In order to render them less formidable, according to some authors Dioclesian, according to others Constantine, first withdrew them from the frontiers, where they had always before been encamped in great bodies, generally of two or three legions each, and dispersed them in small bodies through the different provincial towns, from whence they were scarce ever removed, but when it became necessary to repel an invasion. Small bodies of soldiers quartered in trading and manufacturing towns, and seldom removed from these quarters, became themselves tradesmen, artificers, and manufacturers. The civil came to predominate over the military character; and the standing armies of Rome gradually degenerated into a corrupt, neglected, and undisciplined militia, incapable of resisting the attack of the German and Scythian militias, which soon afterwards invaded the western empire. It was only by hiring the militia of some of those nations to oppose to that of others, that the emperors were for some time able to defend themselves. The fall of the western empire is the third great revolution in the affairs of mankind, of which ancient history has preserved any distinct or circumstantial account. It was brought about by the irresistible superiority which the militia of a barbarous has over that of a civilized nation; which the militia of a nation of shepherds has over that of a nation of husbandmen, artificers, and manufacturers. The victories which have been gained by militias have generally been not over standing armies, but over other militias in exercise and discipline inferior to themselves. Such were the victories which the Greek militia gained over that of the Persian empire; and such too were those which in later times the Swiss militia gained over that of the Austrians and Burgundians.

The military force of the German and Scythian nations, who established themselves upon the ruins of the western empire, continued for some time to be of the same kind in their new settlements as it had been in their original country. It was a militia of shepherds and husbandmen, which in time of war took the field under the command of the same chieftains whom it was accustomed to obey in peace. It was therefore tolerably well exercised and tolerably well disciplined. As arts and industry advanced, however, the authority of the chieftains gradually decayed, and the great body of the people had less time to spare for military exercises. Both the discipline and the exercise of the feudal militia, therefore, went gradually to ruin, and standing armies were gradually introduced to supply the place of it. When the expedient of a standing army, besides, had once been adopted by one civilized nation, it became necessary that all its neighbours should follow the example. They soon found that their safety depended upon their doing so, and that their own militia was altogether incapable of resisting the attack of such an army. Army.

The soldiers of a standing army, though they may never have seen an enemy, yet have frequently appeared to possess all the courage of veteran troops, and the very moment that they took the field, to have been fit to face the hardiest and most experienced veterans. In a long peace the generals perhaps may sometimes forget their skill; but where a well regulated standing army has been kept up, the soldiers seem never to forget their valour.

When a civilized nation depends for its defence upon a militia, it is at all times exposed to be conquered by any barbarous nation which happens to be in its neighbourhood. The frequent conquests of all the civilized countries in Asia by the Tartars, sufficiently demonstrates the natural superiority which the militia of a barbarous has over that of a civilized nation. A well regulated standing army is superior to every militia. Such an army, as it can best be maintained by an opulent and civilized nation, so it can alone defend such a nation against the invasion of a poor and barbarous neighbour. It is only by means of a standing army, therefore, that the civilization of any country can be perpetuated, or even preserved for any considerable time.

As it is only by means of a well regulated standing army that a civilized country can be defended, so it is only by means of it that a barbarbous country can be suddenly and tolerably civilized. A standing army establishes, with an irresistible force, the law of the sovereign through the remotest provinces of the empire, and maintains some degree of regular government in countries which could not otherwise admit of any. Whoever examines with attention the improvements which Peter the Great introduced into the Russian empire, will find that they almost all resolve themselves into the establishment of a well regulated standing army. It is the instrument which executes and maintains all his other regulations. That degree of order and internal peace which that empire has ever since enjoyed, is altogether owing to the influence of that army.

Men of republican principles have been jealous of a standing army as dangerous to liberty. It certainly is so, wherever the interest of the general and that of the principal officers are not necessarily connected with the support of the constitution of the state. The standing army of Cæsar destroyed the Roman republic; the standing army of Cromwell turned the long parliament out of doors. But where the sovereign is himself the general,

Army & Arnaud.

general, and the principal nobility and gentry of the country the chief officers of the army; where the military force is placed under the command of those who have the greatest interest in the support of the civil authority, because they have themselves the greatest share of that authority; a standing army can never be dangerous to liberty: on the contrary it may, in some cases, be favourable to liberty. The security which it gives to the sovereign renders unnecessary that troublesome jealousy which in some modern republics seems to watch over the minutest actions, and to be at all times ready to disturb the peace of every citizen. Where the security of the magistrate, though supported by the principal people of the country, is endangered by every popular discontent; where a small tumult is capable of bringing about in a few hours a great revolution; the whole authority of government must be employed to suppress and punish every murmur and complaint against it. To the sovereign, on the contrary, who feels himself supported not only by the natural aristocracy of the country, but by a well regulated standing army, the rudest, the most groundless, and the most licentious remonstrances, can give little disturbance. He can safely pardon or neglect them, and his consciousness of his own superiority naturally disposes him to do so. That degree of liberty which approaches to licentiousness can be tolerated only in countries where the sovereign is secured by a well regulated standing army. It is in such countries only that the public safety does not require that the sovereign should be trusted with any discretionary power for suppressing even the impertinent wantonness of this licentious liberty.

ARNALL, WILLIAM, a noted political writer in defence of Sir Robert Walpole, was originally an attorney's clerk; but being recommended to Walpole, he employed him for a course of years in writing the *Free Briton* and other papers in defence of his administration. By the report of the secret committee, he appears to have received, in the space of four years, no less than 10,997l. 6s. 8d. out of the treasury for his writings! but spending his money as fast as it came, and his supplies stopping on Sir Robert's resignation, he died broken-hearted and in debt, in the 26th year of his age. His invention was so quick, that his honourable employer used to say, no man in England could write a pamphlet in so little time as Arnall.

ARNAUD DE MEYRVEILH, or MEREUIL, a poet of Provence, who lived at the beginning of the 13th century. He wrote a book entitled *Las recastenas de sa contesse*, and a collection of poems and sonnets. He died in the year 1220. Petrarch mentions him in his Triumph of Love.

ARNAUD DE VILLA NOVA, a famous physician, who lived about the end of the 13th and beginning of the 14th century. He studied at Paris and Montpelier, and travelled through Italy and Spain. He was well acquainted with languages, and particularly with the Greek, Hebrew, and Arabic. He was at great pains to gratify his ardent desire after knowledge; but this passion carried him rather too far in his researches: he endeavoured to discover future events by astrology, imagining this science to be infallible; and upon this foundation he published a prediction, that the world would come to an end in the middle of the 14th century. He practised physic at Paris for some time; but having advanced some new doctrines, he drew upon himself the resentment of the university; and his friends, fearing he might be arrested, persuaded him to retire from that city. Upon his leaving France, he retired to Sicily, where he was received by King Frederick of Arragon with the greatest marks of kindness and esteem. Some time afterwards, this prince sent him to France, to attend Pope Clement in an illness; and he was shipwrecked on the coast of Genoa, about the year 1313. The works of Arnaud, with his life prefixed, were printed in one volume in folio, at Lyons, in 1520; and at Basil in 1585, with the notes of Nicholas Tolerus.

Arnaud, Arnay-le-duc.

ARNAUD D'ANDILLY, *Robert*, the son of a celebrated advocate of the parliament of Paris, was born in 1588; and being introduced young at court, was employed in many considerable offices, all which he discharged with great integrity and reputation. In 1644 he quitted business, and retired into the convent of Port Royal des Champs, where he passed the remainder of his days in a continued application to works of piety and devotion; and enriched the French language with many excellent translations of different writers, as well as with religious compositions of his own. He died in 1674, and his works are printed in 8 vols. folio.

ARNAUD, *Antony*, brother of the preceding, and a doctor of the Sorbonne, was born in 1612. He published, in 1643, *A Treatise on frequent Communion*, which highly displeased the Jesuits; and the disputes upon grace, which broke out about this time in the university of Paris, and in which he took a zealous part with the Jansenists, helped to increase the animosity between him and the Jesuits. But nothing raised so great a clamour against him as the two letters he wrote on *Absolution*; in the second of which the faculty of divinity found two propositions which they condemned, and M. Arnaud was expelled the society. Upon this he retired; and during a retreat which lasted near 25 years, he composed that great variety of works which are extant of his, on grammar, geometry, logic, metaphysics, and theology. In 1679, he withdrew from France, lived in obscurity in the Netherlands, and died in 1694. His heart, at his own request, was sent to be deposited in the Port Royal. Arnaud had a remarkable strength of genius, memory, and command of his pen; nor did these decay even to the last year of his life. Mr Bayle says, he had been told by persons who had been admitted into his familiar conversation, that he was a man very simple in his manners; and that unless any one proposed some question to him, or desired some information, he said nothing that was beyond common conversation, or that might make one take him for a man of great abilities; but when he set himself to give an answer to such as proposed a point of learning, he seemed as it were transformed into another man: he would then deliver a multitude of fine things with great perspicuity and learning.

ARNAUD DE RONSIL, *George*, an eminent French surgeon. See SUPPLEMENT.

ARNAY-LE-DUC, a town of France, in the department of Cote d'Or, which carries on a pretty good trade. It is seated on the Auxois, in a valley near the river Aroux. E. Long. 4. 26. N. Lat. 47. 7.

ARNDT,

Arndt ‖ Arnisæus.

ARNDT, John, a famous Protestant divine of Germany, born at Ballenstad, in the duchy of Anhalt, in the year 1555. At first he applied himself to the study of physic: but falling into a dangerous sickness, he made a vow to change his profession for that of divinity, if he should be restored to health; which he accordingly did upon his recovery. He was a minister first at Quedlinburg and then at Brunswick. He met with great opposition in this last city: his success as a preacher raising the enmity of his brethren, who became his bitter enemies. In order to ruin his character, they ascribed a variety of errors to him; and persecuted him to such a degree, that he was obliged to leave Brunswick, and retire to Isleb, where he was minister for three years. In 1611, George duke of Lunenburg, who had a high opinion of his integrity and sanctity, gave him the church of Zell, and appointed him superintendant of all the churches in the duchy of Lunenburg; which office he discharged for 11 years, and died in 1621. It is reported that he foretold his death, having said to his wife, upon his return home after his last sermon, that now he had preached his funeral sermon. He wrote in High Dutch *A Treatise on True Christianity*, which has been translated into several languages.

ARNE, Dr Thomas Augustine, distinguished by his skill in music, was the son of Mr Arne an upholsterer in Covent-Garden, whom Addison is supposed to have characterized in N° 155 and N° 160 of The Tatler; and brother of Mrs Cibber the player. He was early devoted to music, and soon became eminent in his profession. July 6. 1759, he had the degree of doctor of music conferred on him at Oxford. His compositions are universally applauded, and he was also particularly skilful in instructing vocal performers. He died March 5. 1778, having written the following pieces: *Artaxerxes*, 1762; *The Guardian outwitted*, 1764; *The Rose*, 1778; all of them operas.

ARNHEIM, a town of the Low Countries, in the province of Guelderland, capital of Veluive. It is adorned with several fine churches, particularly that of St Walburg and of St Eusebius; which last has a very high tower. The town has five gates, and several fine ramparts, part of which are washed by the Rhine, and the other parts have wide and deep ditches before them. There is a canal made between this place and Nimeguen, at the expence of both towns, on which boats pass backwards and forwards to carry on a trade between them. The air is very healthful; on which account it is inhabited by persons of distinction. E. Long. 5. 55. N. Lat. 52. 0.

ARNICA, Leopard's bane. See Botany *Index*.

ARNISÆUS, Henningus, a philosopher and physician of great reputation, about the beginning of the 17th century. He was born at Halberstadt in Germany, and was professor of physic in the university of Helmstadt. His political works are much esteemed. The most remarkable of them is his book *De authoritate principum in populum semper inviolabili*, printed at Francfort in 1612. In this he maintains that the authority of princes ought not to be violated. He wrote also upon the same doctrine his three books, *De jure Majestatis*, printed at the same place in 1610; and his *Reflectiones Politicæ*, printed at Francfort in 1615. Having received an invitation to go to Denmark, he went thither, and was made counsellor and physician to the king. He travelled into France and England, and died in November 1635. Besides the pieces already mentioned, he wrote several philosophical, medicinal, and poetical treatises.

Arnisæus ‖ Arnold.

ARNOBIUS, professor of rhetoric at Sicca, in Numidia, towards the end of the third century. It was owing to certain dreams which he had that he became desirous of embracing Christianity. For this purpose he applied to the bishops to be admitted into the church. But they, remembering the violence with which he had always opposed the true faith, had some distrust of him; and before they would admit him, insisted on some proofs of his sincerity. In compliance with this demand, he wrote against the Gentiles: wherein he has refuted the absurdities of their religion, and ridiculed their false gods. In this treatise he has employed all the flowers of rhetoric, and displayed great learning: but from an impatience to be admitted into the body of the faithful, he is thought to have been in too great a hurry in composing his work, and thence it is that there does not appear in this piece such an exact order and disposition as could be wished; and not having a perfect and exact knowledge of the Christian faith, he published some very dangerous errors. Mr Bayle remarks, that his notions about the origin of the soul, and the cause of natural evil, and several other important points, are highly pernicious. St Jerome, in his epistle to Paulinus, is of opinion that his style is unequal and too diffuse, and that his book is written without any method; but Dr Cave thinks this judgement too severe, and that Arnobius wants neither elegance nor order in his composition. Vossius styles him *the Varro of the ecclesiastical writers*. Du Pin observes that his work is written in a manner worthy of a professor of rhetoric: the turn of his sentiments is very oratorical; but his style is a little African, his expressions being harsh and inelegant. We have several editions of this work of Arnobius against the Gentiles, one published at Rome in 1542, at Basil in 1546 and 1560, at Paris in 1570, at Antwerp in 1582, and one at Hamburgh in 1610, with notes by Gebhard Elmenhostius, besides many others. He wrote also a piece entitled *De Rhetoricæ Institutione*; but this is not extant.

ARNOLD, of Brescia, in Italy, distinguished himself by being the founder of a sect which opposed the wealth and power of the Roman clergy. He went into France, where he studied under the celebrated Peter Abelard. Upon his return to Italy, he put on the habit of a monk, and opened his invectives in the streets of Brescia. The people crowded round him. He told them he was sent to reform abuses, to pull down the proud and to exalt the humble. He then pointed his declamation against the bishops, against the clergy, against the monks, and finally against the Roman pontiff himself: to the laity only he was indulgent. Churchmen, said he, who hold benefices, bishops who have domains, and monks that have possessions, will all be damned. His hearers shouted approbation. These things, continued he, belong to the prince; he may give them to whom he pleases, but he must give them to the laity. It is on their tithes, and the voluntary contributions

Arnold. contributions of the people, that those sons of God must live: they must be frugal, continent, and mortified.

The church of Brescia was soon thrown into the greatest confusion, and the people, already prejudiced against their ministers, threatened to overturn their altars. The sacred writings he urged in support of his assertion, and from them he denounced the vengeance of heaven against the violators of the law. Indeed, nothing could be more glaringly offensive than the ostentatious parade of the bishops and great abbots, and the soft and licentious lives of the monks and clergy.

In 1139 was celebrated a grand council at Rome. Arnold was cited to appear before it. His accusers were the bishop of Brescia, and many others, whom he had ridiculed and insulted. Nor from his judges could he look for much indulgence. He was found guilty, and sentenced to perpetual silence. Upon this he left Italy, crossed the Alps, and found a refuge in Zurich.

Though Arnold had quitted Italy, yet had his opinions taken deep root, and Rome itself was infected by them. Irritated by the conduct of their master Innocent II. the Roman people assembled in the capitol. It was proposed that the power of the pontiff, which they called exorbitant, should be restrained: this was carried: then suddenly, inspired as it were by the genius of the place, they moved that the senate, which for years had been abolished, should be restored. The proposition was received with the loudest acclamations. Innocent in vain opposed the bold design; there was a magic in it which spread irresistibly, and for a moment seemed to rouse the fallen spirit of the nation. The pope viewed with horror the reverse of fortune which threatened the tiara; to be shorn of his mighty power, and to become the mere shepherd of the Christian people, was a thought too afflicting: he fell sick and died.

Under his two immediate successors Celestin and Lucius, whose reigns were but of a few months, the Romans pursued their darling object. They waited on the latter, and, in an imperious tone, demanded the restitution of all the honours and civil rights which had been usurped from the people. The prince of the senate, said they, whom we have chosen, will best administer the important trust; the tithes and offerings of the faithful will sufficiently answer all the exigencies of your holiness: It was thus that our ancient bishops lived. Lucius survived this event but a few days. His successor was Eugenius III. the friend and disciple of the renowned Bernard. The night before his consecration the senators assembled, and it was agreed, that either he should solemnly confirm all their proceedings, or they would annul his election. This resolution was notified to him. He called together his friends; and it was their advice, that he should neither accede to the extravagant demands, nor expose himself, by a refusal, to the fury of the populace. He therefore silently withdrew from Rome, and retired to a neighbouring fortress. Here the ceremony of his consecration was performed.

Arnold, who in banishment had contemplated the effects of his admonitions on the minds of the Romans, and the success which seemed to follow their exertions, was now informed that the pope had retired, and the gates of the capital were open to receive him: it was likewise suggested to him, that his presence was more than ever necessary, to give energy to their resolves, form to their plans, and stability to their undertakings. Arnold took fire at the news; an unusual swell of enthusiasm filled his breast; and he fancied that, like Junius Brutus, he was called at once to give liberty to Rome. At his appearance a new stream of vigour animated the citizens; they called him their friend and deliverer. The Brescian walked amongst them; his deportment was humble, his countenance emaciated, his address affable, and he spoke to them of moderation, submission, of obedience. With the nobles and new senators he held another language; though to them also he was mild and diffident, speaking much of virtue and of respect for religion and the laws. But no sooner was he sensible of his own real influence, and saw the length to which the revolters had already carried their designs, than he threw aside the mask, and appeared in his own character, daring, impetuous, self-sufficient, vain. He harangued the people: he talked of their forefathers the ancient Romans, who, by the wisdom of their senate and the valour of their armies, had conquered nations and subdued the earth. He dwelt on the names and the achievements of the Bruti, the Gracchi, and the Scipios; and of these men, said he, are you not the children? He advised, that the capitol be instantly repaired; that the equestrian order be restored; that the people have their tribunes; that dignity attend the senate; that the laws, which had been silent and neglected, be revived in all their vigour. He spoke of the pope as of a deposed and banished tyrant: "But should you again be disposed (continued he) to admit him within these walls; first fix your own rights and determine his. He is but your bishop: let him therefore have his spiritual jurisdiction. The government of Rome, its civil establishments, and its territories, belong to you. These you will keep if you have the spirit of men and the hearts of Romans." Fired by this harangue, the people, headed by the most disaffected of the nobles, publicly attacked the few cardinals and churchmen who remained in the city; they set fire to the palaces; and they compelled the citizens to swear obedience to the new government. Moderate men, who saw the folly of the attempt, were shocked at these excesses of popular phrenzy; but it was in vain to oppose the torrent: they submitted, looking forward with some curiosity to the termination of an event which had begun in extravagance, and must end in disappointment. Arnold.

Eugenius till now had viewed, with some concern, the wild derangement of his people: but when it seemed that their eyes opened to their own excesses, he could be inactive no longer. He excommunicated the ringleaders of the faction; and at the head of his troops, who were chiefly composed of Tiburtini, a people always hostile to the Romans, he marched against the enemy. His friends within the walls, who were numerous, co-operated with his designs, and in a few days overtures for peace were made to the pontiff. He acceded to them, but on condition that they should annul the arrangements they had made, and if they would have senators, that they should acknowledge

all

Arnold || Arnoldus.

all their power was from him. The people were satisfied, and they threw open the gates, through which Eugenius entered, amid the acclamations of a fawning and inconstant multitude. Before this event Arnold had retired; but he left behind him many friends strongly attached to his person and principles. Of himself we hear little more till the reign of Adrian our countryman; when, on account of fresh tumults, he and his adherents were excommunicated, and Rome was threatened with an interdict unless they expelled the whole party from their walls. This they did. The Arnoldists retired with their champion into Tuscany, where he was received as a prophet and honoured as a saint. His enemies, however, prevailed; he was made prisoner, and conducted under a strong escort to Rome. In vain was great interest made to save his life; he was condemned and executed, and his ashes thrown into the Tiber, lest the people should collect his remains and venerate them as the relicks of a sainted martyr.

"Such was Arnold of Brescia; a man (says Mr Berington *), whose character, whose principles, and whose views, we perhaps should be disposed to admire, had his life been recorded by unprejudiced historians, and not brought down to us drawn in the blackest colours which party, bigotted zeal, and enthusiasm, could lay on. He was rash, misjudging, and intemperate, or never would he have engaged in so unequal a contest. The view of such a phenomenon in the 12th century excites a pleasing admiration. To attack the Roman pontiff and his clergy in the very centre of their power, required a more than common share of fortitude: to adopt a settled scheme of restoring to its pristine glory the republic of Rome, demanded a stretch of thought comprehensive and enterprising; and to forego the ease and indulgence of a dissipated age, for the reformation of manners and the suppression of what he thought usurped dominion, argued a character of mind disinterested, generous, and benevolent. But, Arnold, like other reformers, went too far; and passion soon vitiated undertakings which were begun perhaps with motives the most laudable.—The readiness with which the Roman people embraced this plan of lowering the jurisdiction of the pontiff, and restraining it within those bounds which the true spirit of Christianity had fixed, at once shows that they could reason justly, and that they considered the unbounded sway of the triple crown, to which reluctantly they submitted, as an assumed prerogative, to which violence or misconstruction, and not Christian right, had given efficacy."

* *Hist. of the lives of Abelard and Heloisa.*

ARNOLDISTS, in church history, a sect so called from their leader Arnold of Brescia. See the preceding article.

ARNOLDUS, GOTHOFREDUS, pastor and inspector of the churches of Perleberg, and historiographer to the king of Prussia, was born at Annaburg in the mountains of Misnia in 1666. He was a zealous defender of the Pietists, a sect among the German Protestants, and composed a great number of religious works; particularly an *Ecclesiastical History*, which exposed him to the resentment of the divines; and another giving an account of the doctrines and manners from the first ages, in which he frequently animadverts upon Cave's Primitive Christianity. He died in 1714. Various are the opinions concerning Arnoldus in Germany; some of his own countrymen and profession extolling him to the skies as a saint of the last century, and setting an inestimable value upon his works; while others pronounce damnation upon him as an arch-heretic, and condemn his writings as heterodox.

Arnoldus || Arnway.

ARNON, in *Ancient Geography*, a brook running between the borders of the Moabites and Ammonites on the other side Jordan (Moses, Joshua): Josephus calls it a river rising on the borders of Arabia, and at length falling into the Dead sea. It is also called the river of Gad, as appears 2 Sam. xxv. 5. compared with 2 Kings x. 33.

ARNOT. See BUNIUM, BOTANY *Index*.

ARNOTTO, the same with Anotta. See ANOTTA and BIXA, BOTANY *Index*.

ARNSTADE, a town of Germany, in Thuringia, on the river Gera. E. Long. 11. 3. N. Lat. 50. 54.

ARNULPH, or ERNULPH, bishop of Rochester in the reign of Henry I. He was born in France, where he was some time a monk of St Lucian de Beauvais. The monks led most irregular lives in this monastery; for which reason he resolved to quit it, but first took the advice of Lanfranc archbishop of Canterbury, under whom he had studied in the abbey of Bec, when Lanfranc was prior of that monastery. This prelate invited him over to England, and placed him in the monastery of Canterbury, where he lived a private monk till Lanfranc's death. When Anselm came to the archiepiscopal see, Arnulph was made prior of the monastery of Canterbury, and afterwards abbot of Peterborough. In 1115, he was consecrated bishop of Rochester, which see he held nine years, and died in March 1124, aged 84.

Arnulph wrote, 1. A piece in Latin concerning the foundation, endowment, charters, laws, and other things relating to the church of Rochester: it is generally known by the title of *Textus Roffensis*, and is preserved in the archives of the cathedral church of Rochester. 2. An Epistle in Answer to some Questions of Lambert abbot of Munster; and 3. An Epistle on Incestuous Marriage.

ARNUS, now *Arno*, a very rapid river of Tuscany, which it divides, and in its course washes Florence and Pisa; rising in the Apennines, to the east of Florence, near a village called *S. Maria della Gratie*, on the borders of Romagna, 15 miles to the west of the sources of the Tiber; and then turning southwards towards Arretium, it is there increased by the lakes of the Clanis; after which it runs eastward, dividing Florence into two parts, and at length washing Pisa, falls eight miles below it into the Tuscan sea.

ARNWAY, JOHN, a clergyman distinguished by his benevolence and loyalty to King Charles I. was descended from a very good family in the county of Salop, from which he inherited a considerable estate. He was educated at Oxford; and, having received holy orders, obtained the rectories of Hodnet and Ightfield, where he distinguished himself by his piety and exemplary charity: for it was his custom to clothe annually 12 poor people, and every Sunday to entertain as many at his table, not only plentifully, but with intimacy and respect. The civil war breaking out, he preached against rebellion, and raised and clothed eight troopers for the service of King Charles I. upon which his house

was

Arnway ‖ Arpagius.

was plundered by the parliament's army. He then went to Oxford to serve the king in person, which subjected him to a new train of misfortunes: for his estate was soon after sequestrated, and himself imprisoned till the king's death; after which he went to the Hague, where he published, 1. The Tablet, or the Moderation of Charles I. the Martyr; and, 2. An Alarm to the Subjects of England. He at last went to Virginia, where he died in 1653.

AROBE. See ARROBAS.

AROLEO, an American weight, equal to 25 of our pounds.

AROMA PHILOSOPHORUM, denotes either saffron, or the aroph of Paracelsus; as *aroma germanicum* denotes elecampane. See AROPH.

AROMATA, in *Ancient Geography*, a town of Lydia, famous for its generous wines; and hence the appellation, (Strabo). Also the name of a trading town and promontory of Ethiopia, at the termination of the Sinus Avalites of the Red sea, (Arrian).

AROMATIC, an appellation given to such plants as yield a brisk fragrant smell, and a warm taste; as all kinds of spices, &c. See MATERIA MEDICA.

ARONA, a town of Italy, in the duchy of Milan, with a strong castle. It stands on the lake Maggiore. E. Long. 8. 25. N. Lat. 45. 41.

ARONCHES, a town of Portugal, in Alentejo, on the confines of Spain, seated on the river Caro. It is well fortified, and has about 500 inhabitants. W. Long. 5. 16. N. Lat. 14. 39.

AROOL, a town of the empire of Russia, in the Ukraine, seated on the river Occa. E. Long. 38. 15. N. Lat. 51. 48.

AROPH, a contraction of *aroma philosophorum;* a name given to saffron.

AROPH Paracelsi, a name given to a kind of chemical flowers, probably of the same nature with the Ens Veneris, elegantly prepared by sublimation from equal quantities of lapis hæmatites and sal ammoniac.

AROPH is also a term frequently used by Paracelsus in a sense synonymous with *lithontriptic*.

AROSBAY, a town of the East Indies, on the coast of the island of Madura, near Java. E. Long. 14. 30. N. Lat. 9. 30.

AROURA, a Grecian measure of 50 feet. It was more frequently used for a square measure of half the plethron. The Egyptian aroura was the square of 100 feet.

ARPAD, in *Ancient Geography*, is thought to have been a city of Syria. It was always placed with Hamath, (2 Kings xviii. 34. xix. 13. Isaiah x. 9. xxxvi. 19. xxxvii. 13. Jerem. xlix. 25.) Sennacherib boasts of having reduced Arpad and Hamath, or of having destroyed the gods of these two places. Hamath is known to be the same with Emesa; and it is thought that Arpad is the same with Arad or Arvad, as it is sometimes called in Hebrew. See ARAD.

ARPAGIUS, or HARPAGIUS, among the ancients, a person who died in the cradle, at least in early youth. The word is formed from the Greek ἁρπαζω, *I snatch*. The Romans made no funerals for their *arpagii*. They neither burnt their bodies, nor made tombs, monuments, or epitaphs for them; which occasioned Juvenal to say,

——Terra clauditur infans
Et minor igne rogi.

Arpagius ‖ Arragon.

In after times it became the custom to burn such as had lived to the age of 40 days, and had cut any teeth; and these they called Αρπακτοι or Αρπαγμενοι, q. d. *rapti, ravished*. The usage seems to have been borrowed from the Greeks; among whom, Eustathius assures us, it was the custom never to bury their children either by night or full day, but at the first appearance of the morning; and that they did not call their departure by the name of *death*, but by a softer appellation, Ημεραις αρπαγη, importing that they were ravished by Aurora, or taken away to her embraces.

ARPENT, signifies an acre or furlong of ground; and according to the old French account in Doomsday-book, 100 perches make an arpent. The most ordinary acre, called *l'arpent de France*, is 100 perches square: but some account it but half an acre.

ARPHAXAD, the son of Shem and father of Salah. Arphaxad was born in the year of the world 1658, a year after the deluge, and died in the year of the world 2096, at the age of 438 years, (Gen. xi. 12. &c.).

ARPI. See *ARGOS Hippium*.

ARPINAS, or ARPINO, JOSEPH CÆSAR, a famous painter, born in the year 1560, at the castle of Arpinas, in the kingdom of Naples. He lived in great intimacy with Pope Clement VIII. who conferred upon him the honour of knighthood, and bestowed on him many other marks of his friendship. In the year 1600, he went to Paris with Cardinal Aldobrandin, who was sent legate to the French court on the marriage of Henry IV. with Mary of Medicis. His Christian majesty gave Arpinas many considerable presents, and created him a knight of St Michael. The colouring of this painter is thought to be cold and inanimate; yet there is spirit in his designs, and his compositions have somewhat of fire and elevation. The touches of his pencil being free and bold, give therefore pleasure to connoisseurs in painting: but they are generally incorrect. What he painted of the Roman history is the most esteemed of all his works. The following pieces of this master were in the late royal collection of France, viz. the Nativity of our Saviour, Diana and Acteon, the Rape of Europa, and a Susanna. He died at Rome in 1640.

ARPINUM, a town of the Volsci, a little to the east of the confluence of the rivers Liris and Fibrenus, in the Terra di Lavora; now decayed, and called *Arpino*. It was the native place of Cicero, and of Caius Marius, (Sallust).

ARQUA, a town of Italy, in the Paduan, and territory of Venice, remarkable for the tomb of Petrarch. E. Long. 11. 43. N. Lat. 45. 43.

ARQUEBUS. See HARQUEBUS.

ARQUES, a town of Normandy, now the department of the Lower Seine, in France, seated on a small river of the same name. E. Long. 1. 30. N. Lat. 49. 54.

ARRACHEE, in *Heraldry*, a term applied to the representations of plants torn up by the roots.

ARRACK. See ARACK.

ARRAGON, a province of Spain, bounded on the north by the Pyrenean mountains, which separate it

Aragon, Arraignment.

from France; on the west by Navarre and the two Castiles; on the south, by Valencia; and on the east, by Catalonia. It is in length about 180 miles, and in breadth 149; but the land is mountainous, dry, sandy or stony, badly cultivated, and worse peopled. However it does not want rivers; for besides the Ebro, which crosses it in the middle, there are the Xalo, the Cinea, the Galego, and the Arragon. The air is pure and wholesome; and there are mines of iron, and some say of gold. The most fertile parts are about the rivers: for there the land produces corn, wine, oil, flax, hemp, various fruits, and a small quantity of saffron, besides large flocks of sheep, and plenty of game in the woods.

The Arragonese have the character of being bold, courageous, and well bred; but positive in their opinions, and bigotted in their religion. These were the first of the Spaniards that threw off the Moorish yoke. Saragossa is the capital of this province; and the other chief towns are Balbastro, Jaca, Sarazona, Haesca, Calatajud, Albarrazin, Trevel, Daroca, and Boria.

ARRAIGNMENT, in *Law*, the arraigning or setting a thing in order, as a person is said to arraign a writ of novel disseisin, who prepares and fits it for trial.

ARRAIGNMENT is most properly used to call a person to answer in form of law upon an indictment, &c.

When brought to the bar, the criminal is called upon by name to hold up his hand; which though it may seem a trifling circumstance, yet is of this importance, that by the holding up of his hand *constat de persona*, and he owns himself to be of that name by which he is called. However it is not an indispensable ceremony; for being calculated merely for the purpose of identifying the person, any other acknowledgement will answer the purpose as well: therefore, if the prisoner obstinately and contemptuously refuses to hold up his hand, but confesses he is the person named, it is fully sufficient.

Then the indictment is to be read to him distinctly in the English tongue (which was law, even while all other proceedings were in Latin), that he may fully understand his charge. After which it is to be demanded of him, whether he be guilty of the crime whereof he stands indicted, or not guilty?

When a criminal is arraigned he either stands mute, or confesses the fact, or else he pleads to the indictment.

1. If he says nothing, the court ought *ex officio* to impannel a jury to inquire whether he stands obstinately mute, or whether he be dumb *ex visitatione Dei*. If the latter appears to be the case, the judges of the court (who are to be of counsel for the prisoner, and to see that he hath law and justice) shall proceed to the trial, and examine all points as if he had pleaded not guilty. But whether judgment of death can be given against such a prisoner, who hath never pleaded, and can say nothing in arrest of judgment, is a point yet undetermined.

If he be found to be obstinately mute (which a prisoner hath been held to be that hath cut his own tongue), then, if it be on an indictment of high treason, it hath long been clearly settled, that standing mute is equivalent to a conviction, and he shall receive the same judgment and execution.

The English judgment of penance for standing mute was as follows: That the prisoner be remanded to the prison from whence he came, and put into a low dark chamber; and there be laid on his back, on the bare floor, naked, unless where decency forbids; that there be placed upon his body as great a weight of iron as he could bear, and more; that he have no sustenance, save only, on the first day, three morsels of the worst bread; and, on the second day, three draughts of standing water that should be nearest to the prison door; and in this situation this should be alternately his daily diet, *till he died*, or, as anciently the judgment ran, *till he answered*.

Arraignment

It hath been doubted whether this punishment subsisted at the common law, or was introduced in consequence of the statute Westm. I. 3 Edw. I. c. 12. which seems to be the better opinion. For not a word of it is mentioned in Glanvil or Bracton, or in any ancient author, case, or record (that hath yet been produced), previous to the reign of Edward I.: but there are instances on record in the reign of Henry III. where persons accused of felony, and standing mute, were tried in a particular manner, by two successive juries and convicted: and it is asserted by the judges in 8 Henry IV. that, by the common law before the statute, standing mute on an appeal amounted to a conviction of the felony. This statute of Edward I. directs such persons, "as will not put themselves upon inquests of felonies before the judges at the suit of the king, to be put into hard and strong prison (*soient mys en la prisone fort et dure*) as those which refuse to be at the common law of the land." And, immediately after this statute, the form of the judgment appears in Fleta and Britton to have been only a very strait confinement in prison, with hardly any degree of sustenance; but no weight is directed to be laid upon the body, so as to hasten the death of the miserable sufferer: and indeed any surcharge of punishment on persons adjudged to penance, so as to shorten their lives, is reckoned by Horne in the Mirror as a species of criminal homicide. It also clearly appears by a record of 31 Edw. III. that the prisoner might then possibly subsist for 40 days under this lingering punishment. It is therefore imagined that the practice of loading him with weights, or, as it is usually called, *pressing him to death*, was gradually introduced between 31 Edward III. and 8 Henry IV. at which last period it first appears upon the books; being intended as a species of mercy to the delinquent, by delivering him the sooner from his torment: and hence it is also probable, that the duration of the penance was then first altered; and instead of continuing *till he answered*, it was directly to continue *till he died*, which must very soon happen under an enormous pressure.

The uncertainty of its original, the doubts that were conceived of its legality, and the repugnance of its theory (for it rarely was carried into practice) to the humanity of the laws of England, all concurred to require a legislative abolition of this cruel process, and a restitution of the ancient common law; whereby the standing mute in felony, as well as in treason and in trespass, amounted to a confession of the charge.

2. If the prisoner make a simple and plain confession, the court hath nothing to do but to award judgment: but it is usually very backward in receiving and recording

Arraignment, Arran.

cording such confession, out of tenderness to the life of the subject; and will generally advise the prisoner to retract it, and,

3. Plead to the indictment; as to which, see the article *Plea of Indictment*.

ARRAN, an island of Scotland, in the frith of Clyde, between Kintyre and Cunningham. Of this island the best description we have is that given by Mr Pennant in his Tour through Scotland, vol. ii. 172—184.

"Arran, or properly *Arr-inn*, or, 'the island of mountains,' seems not to have been noticed by the ancients, notwithstanding it must have been known to the Romans, whose navy, from the time of Agricola, had its station in the *Glottæ Estuarium*, or the frith of Clyde. Camden, indeed, makes this island the Glotta of Antonine, but no such name occurs in his Itinerary: it was therefore bestowed on Arran by some of his commentators. By the immense cairns, the vast monumental stones, and many relicks of Druidism, this island must have been considerable in very ancient times. Here are still traditions of the hero Fingal, or Fin Mac Coul, who is supposed here to have enjoyed the pleasures of the chase; and many places retain his name: but I can discover nothing but oral history that relates to the island till the time of Magnus the Barefooted, the Norwegian victor, who probably included Arran in his conquests of Kintyre. If he did not conquer that island, it was certainly included among those that Donald Bane was to cede; for it appears that Acho, one of the successors of Magnus, in 1263, laid claim to Arran, Bute, and the Cumbrays, in consequence of that promise: the two first he subdued, but the defeat he met with at Largs soon obliged him to give up his conquests. Arran was the property of the crown. Robert Bruce retired thither during his distresses, and met with protection from his faithful vassals. Numbers of them followed his fortunes; and after the battle of Bannockburn, he rewarded several, such as the Maccooks, Mackinnons, Macbrides, and Maclouis, or Fullertons, with different charters of lands in their native country. All these are now absorbed by this great family, except the Fullertons, and a Stewart, descended from a son of Robert III. who gave him a settlement here. In the time of the Dean of the isles, his descendant possessed Castle Douan; and *he and his bluid*, says the Dean, *are the best men in that countrey*. About the year 1334, this island appears to have formed part of the estate of Robert Stewart, great steward of Scotland, afterwards Robert II. At that time they took arms to support the cause of their master; who afterwards, in reward, not only granted at their request an immunity from their annual tribute of corn, but added several new privileges, and a donative to all the inhabitants that were present. In 1456, the whole island was ravaged by Donald earl of Ross and lord of the Isles. At that period, it was still the property of James II.; but in the reign of his successor James III. when that monarch matched his sister to Thomas lord Boyd, he created him earl of Arran, and gave him the island as a portion. Soon after, on the disgrace of that family, he caused the countess to be divorced from her unfortunate husband; and bestowed both the lady and island on Sir James Hamilton, in whose family it continues to this time, a very few farms excepted.

Arran.

"Arran is of great extent, being 23 miles from Sgreadan Point north to Beinnean south; and the number of inhabitants is about 7000, who chiefly inhabit the coasts; the far greater part of the country being uninhabited by reason of the vast and barren mountains. Here are only two parishes, Kilbride and Kilmorie; with a sort of chapel of ease to each, founded in the last century, in the golden age of this island, when it was blessed with Anne duchess of Hamilton, whose amiable disposition and humane attention to the welfare of Arran render at this distant time her memory dear to every inhabitant. The principal mountains of Arran are, Goatfield, or Gaoilbheinn, or "the mountain of the winds," of a height equal to most of the Scottish Alps, composed of immense piles of moorstone, in form of wool packs, clothed only with lichens and mosses, inhabited by eagles and ptarmigans; Beinbharrain, or "the sharp-pointed;" Ceum-na-caillich, "the step of the carline or old hag;" and Grianan-Athol, that yields to none in ruggedness. The lakes are, Loch-jorsa, where salmon come to spawn; Lochtana; Loch-nah-jura, on the top of a high hill; Loch-mhachrai; and Loch-knoc-a-charbeil, full of large eels. The chief rivers are, Abhan-mhor, Moina mhor, Slondrai-machrei, and Jorsa; the two last remarkable for the abundance of salmon.

"The quadrupeds are very few; only otters, wild cats, shrew mice, rabbits, and bats: the stags, which used to abound, are now reduced to about a dozen. The birds are, eagles, hooded crows, wild pigeons, stares, black game, grous, ptarmigans, daws, green plovers, and curlews. It may be remarked, that the partridge at present inhabits this island, a proof of the advancement of agriculture.

"The climate is very severe: for besides the violence of wind, the cold is very rigorous; and snow lay here in the valleys for 13 weeks of the last winter. In summer the air is remarkably salubrious; and many invalids resort here on that account, and to drink the whey of goats milk.

"The principal disease here is the pleurisy: smallpox, measles, and chincough, visit the island once in seven or eight years. The practice of bleeding twice every year seems to have been intended as a preventive against the pleurisy; but it is now performed with the utmost regularity at spring and fall. The duke of Hamilton keeps a surgeon in pay; who at those seasons makes a tour of the island. On notice of his approach, the inhabitants of each farm assemble in the open air; extend their arms; and are bled into a hole made in the ground, the common receptacle of the vital fluid. In burning fevers, a tea of *wood sorrel* is used with success, to allay the heat. An infusion of *ramsons*, or *allium ursinum*, in brandy, is esteemed here a good remedy for the gravel.

"The men are strong, tall, and well made; all speak the Erse language, but the ancient habit is entirely laid aside. Their diet is chiefly potatoes and meal; and during winter, some dried mutton or goat is added to their hard fare. A deep dejection appears in general though the countenances of all; no time can be spared for amusement of any kind; the whole being given for procuring the means of paying their rent, of laying in their fuel, or getting a scanty pittance of meat and clothing.

Arran. "The leases of farms are 19 years. The succeeding tenants generally find the ground little better than a *caput mortuum;* and for this reason: Should they at the expiration of the lease leave the lands in a good state, some avaricious neighbours would have the preference in the next setting, by offering a price more than the person who had expended part of his substance in enriching the farm could possibly do. This induces them to leave it in the original state. The method of setting a farm is very singular: each is commonly possessed by a number of small tenants; thus a farm of 40l. a-year is occupied by 18 different people, who by their leases are bound, conjunctly and severally, for the payment of the rent to the proprietor. These live in the farm in houses clustered together, so that each farm appears like a little village. The tenants annually divide the arable land by lot; each has his ridge of land, to which he puts his mark, such as he would do to any writing; and this species of farm is called *run-rig*, (i. e.) ridge. They join in ploughing; every one keeps a horse or more; and the number of those animals consumes so much corn, as often to occasion a scarcity; the corn and pease raised being (much of it) designed for their subsistence, and that of the cattle, during the long winter. The pasture and moor land annexed to the farm is common to all the possessors. All the farms are open. Enclosures of any form, except in two or three places, are quite unknown: so that there must be a great loss of time in preserving their corn, &c. from trespass. The usual manure is sea-plants, coral and shells. The run-rig farms are now discouraged: but since the tenements are set by roup or auction, and advanced by an unnatural force to above double the old rent, without any allowance for enclosing, any example set in agriculture, any security of tenure by lengthening the leases, affairs will turn retrograde, and the farms relapse into their old state of rudeness; migration will increase (for it has begun), and the rents be reduced even below their former value: the late rents were scarce 1200l. a-year; the expected rents 3000l.

"The produce of the island is oats; of which about 5000 bolls, each equal to nine Winchester bushels, are sown, 500 of beans, a few pease; and above 1000 bolls of potatoes are annually set: notwithstanding this, 500 bolls of oat meal are annually imported, to subsist the natives.

"The live stock of the island is 3183 milch cows; 2000 cattle, from one to three years old; 1058 horses; 1500 sheep; and 500 goats: many of the two last are killed at Michaelmas, and dried for winter provision, or sold at Greenock. The cattle are sold from 40s. to 50s. per head, which brings into the island about 1200l. per annum: I think that the sale of horses also brings in about 300l. Hogs were introduced here only two years ago. The herring fishery round the island brings in 300l. the sale of herring nets 100l. and that of thread about 300l. for a good deal of flax is sown here. These are the exports of the island; but the money that goes out for mere necessaries is a melancholy drawback.

"The women manufacture the wool for the clothing of their families; they set the potatoes and dress and spin the flax. They make butter for exportation, and cheese for their own use.

"The inhabitants in general are sober, religious, and industrious; great part of the summer is employed in getting peat for fuel, the only kind in use here; or in building or repairing their houses, for the badness of the materials requires annual repairs: before and after harvest, they are busied in the herring fishery; and during winter the men make their herring nets; while the women are employed in spinning their linen and woollen yarn. The light they often use is that of lamps. From the beginning of February to the end of May, if the weather permits, they are engaged in labouring their ground: in autumn they burn a great quantity of fern to make kelp. So that, excepting at new-year's day, at marriages, or at the two or three fairs in that island, they have no leisure for any amusements: no wonder then at their depression of spirits.

Arran Arras.

"Arran forms part of the county of Bute, and is subject to the same sort of government: but, besides, justice is administered at the baron's bailie-court, who has power to fine as high as 20s.; can decide in matters of property not exceeding 40s.; can imprison for a month; and put delinquents into the stocks for three hours, but that only during day-time. In this island there are many of those rude antiquities or monuments called *cairns*, *druidical circles*, &c. See CAIRNS. See also BUTESHIRE, SUPPLEMENT.

ARRANGEMENT, or RANGEMENT, the disposition of the parts of a whole in a certain order.

The modern philosophy shows us, that the diversity of the colours of bodies depends entirely on the situation and arrangement of the parts, which reflect the light differently; the diversity of tastes and smells on the different arrangements of the pores, which render them differently sensible; and the general diversity of bodies on the different arrangement of their parts. The happy arrangement of words makes one of the greatest beauties of discourse.

ARRAS, a large town in France, capital of the department of Pas de Calais. It is seated on a mountain; and the parts about it are full of quarries, where they get stone for building. It is divided into two parts, the town and the city. The abbot of St Vedast is lord of the town, and the bishop of Arras of the city, which is the least part. They are divided by a strong wall, a large fosse, and the little river Chrinchron, which 100 paces below falls into the Scarp. They are both well fortified, enclosed by high ramparts, and by double deep fosses, which in several places are cut out of the rock. It has four gates, and a strong citadel with five bastions, and contained 18,872 inhabitants in 1815. The most remarkable places are, the great square where the principal market is kept; this is full of fine buildings, with piazzas all round it like those of Covent-garden. Not far from this is the lesser market, which contains the town-house, a very noble structure, with a high tower covered with a crown, on the top of which is a brazen lion, which serves for a vane. In the midst of this market is the chapel of the Holy Candle, which the Papists pretend was brought by the Virgin Mary herself above 600 years ago, when the city was afflicted with divers diseases, and every one that touched the candle was cured: it is kept in a silver shrine. This chapel has a spire steeple, adorned with several statues. The cathedral church of Notre-Dame stands in the city: it is a very large Gothic building, extremely

Arras || Arrest.

extremely well adorned; the tower is very high, and has a fine clock embellished with little figures in bronze, which represent the passion of Jesus Christ; they pass before the bell to strike the hours and half hours. In this church there is a silver shrine, enriched with pearls and diamonds, which contains a sort of wool, which they call *manna*, that they say fell from heaven in the time of a great drought, almost 1400 years ago: they carry it very solemnly in procession when they want rain. The abbey-church of St Vedast is the greatest ornament of Arras, it being adorned with a fine steeple, and seats for the monks of admirable workmanship; the pulpit is of brass, fashioned like a tree, supported by two bears of the same metal, sitting on their hind legs; there are little bears in different postures coming to climb up the tree. The chimes are remarkable for the different tunes which they play. It is from this city that the tapestry called *arras hangings* takes its denomination. E. Long. 2. 56. N. Lat. 50. 17.

ARRAS, or *Araxes*, is also the name of a river of Georgia, which discharges itself into the Caspian sea.

ARRAY, in *Law*, the ranking or setting forth of a jury, or inquest of men impannelled on a cause.

Battle-Array, the order or disposition of an army, drawn up with a view to engage the enemy. See ARMY.

ARRAYERS, or ARRAGERS, ARRAITORES, is used in some ancient statutes, for such officers as had care of the soldiers armour, and saw them duly accoutred in their kinds. In some reigns, commissioners have been appointed for this purpose. Such were the commissioners of array appointed by King Charles I. in the year 1642.

ARREARS, the remainder of a sum due, or money remaining in the hands of an accountant. It likewise signifies the money due for rent, wages, &c. or what remains unpaid of pensions, taxes, &c.

ARRENTATION, in the forest laws, implies the licensing the owner of lands in a forest to enclose them with a low hedge and a small ditch, in consideration of a yearly rent.

ARREOYS, a secret society of a very singular kind, in Otaheite. See SUPPLEMENT.

ARREST, in *English Law*, (from the French word *arrester*, to *stop* or *stay*), is the restraint of a man's person, obliging him to be obedient to the law; and is defined to be the execution of the command of some court of record or office of justice. An arrest is the beginning of imprisonment; where a man is first taken, and restrained of his liberty, by power or colour of a lawful warrant.

Arrests are either in *civil* or *criminal* cases.

1. An arrest in a *civil cause* is defined to be the apprehending or restraining one's person by process in execution of the command of some court.

An arrest must be by corporal seizing or touching the defender's body; after which the bailiff may justify breaking open the house in which he is, to take him: otherwise he has no such power; but must watch his opportunity to arrest him. For every man's house is looked upon by the law to be his castle of defence and asylum, wherein he should suffer no violence. Which principle is carried so far in the civil law, that, for the most part, not so much as a common citation or summons, much less an arrest, can be executed upon a man within his own walls. Peers of the realm, members of parliament, and corporations, are privileged from arrests; and of course from outlawries. And against them the process to enforce an appearance must be by summons and distress *infinite*, instead of a *capias*. Also clerks, attorneys, and all other persons attending the courts of justice (for attorneys being officers of the court, are always supposed to be there attending) are not liable to be arrested by the ordinary process of the court, but must be sued by bill (called usually a *bill of privilege*), as being personally present in court. Clergymen performing divine service, and not merely staying in the church with a fraudulent design, are for the time privileged from arrests, by statute 50 Edw. III. c. 5. and 1 Rich. II. c. 16.; as likewise members of convocation actually attending thereon, by statute 8 Hen. VI. c. 1. Suitors, witnesses, and other persons, necessarily attending any courts of record upon business, are not to be arrested during their actual attendance, which includes the necessary coming and returning. Seamen in the king's service are privileged from arrests for debts under 20l. (1 Geo. II. c. 14. and 14 Geo. II. c. 38.); and soldiers or marines are not liable to arrests for a debt of less than 10l. (30 Geo. II. c. 6. 11.). And no arrest can be made in the king's presence, nor within the verge of his royal palace, nor in any place where the king's justices are actually sitting. The king hath moreover a special prerogative (which indeed is very seldom exerted), that he may by his *writ of protection* privilege a defendant from all personal and many real suits, for one year at a time, and no longer; in respect of his being engaged in his service out of the realm. And the king also by the common law might take his creditor into his protection, so that no one might sue or arrest him till the king's debt was paid: but by the statute 25 Edw. III. c. 19. notwithstanding such protection, another creditor may proceed to judgment against him, with a stay of execution, till the king's debt be paid; unless such creditor will undertake for the king's debt, and then he shall have execution for both. And, lastly, By statute 29 Car. II. c. 7. no arrest can be made, nor process served, upon a Sunday, except for treason, felony, or breach of the peace.

Arrest

2. An arrest in a *criminal cause* is the apprehending or restraining one's person, in order to be forthcoming to answer an alleged crime. To this arrest all persons whatsoever are, without distinction, equally liable; and doors may be broken open to arrest the offender: but no man is to be arrested, unless charged with such a crime as will at least justify holding him to bail when taken. There is this difference also between arrests in civil and criminal cases, that none shall be arrested for debt, trespass, or other cause of action, but by virtue of a precept or commandment out of some court; but for treason, felony, or breach of the peace, any man may arrest with or without warrant or precept. But the king cannot command any one by word of mouth to be arrested; for he must do it by writ, or order of his courts, according to law: nor may the king arrest any man for suspicion of treason, or felony, as his subjects may; because if he doth wrong, the party cannot have an action against him.

Arrests by private persons are in some cases commanded. Persons present at the committing of a felony

Arrest ‖ Arrhephoria.

lony must use their endeavours to apprehend the offender, under penalty of fine and imprisonment; and they are also, with the utmost diligence to pursue and endeavour to take all those who shall be guilty thereof out of their view, upon a hue and cry levied against them. By the vagrant act, 17 Geo. II. c. 5. every person may apprehend beggars and vagrants; and every private person is bound to assist an officer requiring him to apprehend a felon.

In some cases likewise arrests by private persons are rewarded by law. By the 4 and 5 William and Mary, c. 8. persons apprehending highwaymen, and prosecuting them to a conviction, are entitled to a reward of 40l.; and if they are killed in the attempt, their executors, &c. are entitled to the like reward. By the 6 and 7 William III. c. 17. persons apprehending counterfeiters and clippers of the coin, and prosecuting them to conviction, are entitled to 40l.

By 5 Ann. c. 31. persons who shall take any one guilty of burglary, or the felonious breaking and entering any house in the daytime, and prosecute them to conviction, shall receive the sum of 40l. within one month after such conviction.

With regard to arrests by public officers, as watchmen, constables, &c. they are either made by their own authority, which differs but very little from the power of a private person; or they are made by a warrant from a justice of peace. See WARRANT.

ARREST of Judgment, in *Law*, the assigning just reason why judgment should not pass: as, Want of notice of the trial; a material defect in the pleading; when the record differs from the deed impleaded; when persons are misnamed; where more is given by the verdict than is laid in the declaration, &c. This may be done either in criminal or civil cases.

ARRESTMENT, in *Scots Law*, signifies the securing of a criminal till trial, or till he find caution to stand trial, in what are called *bailable crimes*. In civil cases, it signifies either the detaining of strangers, or natives *in meditatione fugæ*, till they find caution *judicio sisti*, or the attaching the effects of a stranger in order to found jurisdiction. But, in the most general acceptation of the word, it denotes that diligence by which a creditor detains the goods or effects of his debtor in the hands of third parties till the debt due to him be either paid or secured. See LAW.

ARRESTO FACTO SUPER BONIS, &c. a writ brought by a denizen against the goods of aliens found within this kingdom, as a recompense for goods taken from him in a foreign country.

ARRESTS, in *Farriery*, mangy tumours upon a horse's hinder legs, between the ham and the pastern.

ARRETIUM, (Cicero, Cæsar); *Arrhetium*, (Ptolemy); *Urbs Arrhetinorum*, (Polybius); one of the twelve ancient towns of Tuscany, near the Arnis and Clanis, situated in a pleasant valley. Now *Arezzo*, 42 miles east of Florence. E. Long. 13. 18. N. Lat. 43. 15.

ARRHABONARII, a sect of Christians, who held that the eucharist is neither the real flesh or blood of Christ, nor yet the sign of them; but only the pledge or earnest thereof.

ARRHEPHORIA, a feast among the Athenians, instituted in honour of Minerva, and Herse daughter of Cecrops. The word is composed of ἀρρήτων, *mystery*, and φέρω, *I carry*; on account of certain mysterious things which were carried in procession at this solemnity.—Boys, or, as some say, girls, between seven and twelve years of age, were the ministers that assisted at this feast, and were denominated ἀρρηφόροι. This feast was also called *Hersiphoria*, from the daughter of Cecrops, already mentioned.

Arrhephoria ‖ Arrow.

ARRIAN, a famous philosopher and historian under the emperor Hadrian and the two Antonines, was born at Nicomedia in Bithynia. His great learning and eloquence procured him the title of *The second Xenophon*, and raised him to the most considerable dignities at Rome, even the consulship itself. We have four books of his Dissertations upon Epictetus, whose scholar he had been; and his History of Alexander the Great, in seven books, is greatly admired by the best judges.

ARRIEGE, a department in the south of France, at the foot of the Pyrenees, and named from a river which flows through it. The southern part is covered with mountains, which afford pasture to great quantities of cattle; in the northern parts corn of all kinds, and vines, are cultivated. There are mines of iron, copper, silver, lead, and coal. There are a few manufactures of cottons and woollens. The superficial extent of the department is 529,540 hectares, and its population in 1815 was 222,936. Foix is the chief town.

ARRIERE, the hinder or posterior part of any thing.

ARRIERE Ban, in the French customs, was a general proclamation, whereby the king summoned to war all that held of him, both his vassals, i. e. the noblesse, and the vassals of his vassals.

ARRIERE Fee, or *Fief*, is a fee dependent on a superior one. These fees commenced, when the dukes and counts, rendering their governments hereditary in their families, distributed to their officers parts of the royal domains which they found in their respective provinces, and even permitted those officers to gratify the soldiers under them in the same manner.

ARROBAS, or AROBAS, a weight used in Spain, Portugal, and the foreign dominions of both. The arrobas of Portugal, is also called *arata*, and contains thirty-two Lisbon pounds; that of Spain contains twenty-five Spanish pounds. In Peru it is called *arruse*.

ARROE, a small island of Denmark, in the Baltic sea, a little south of the island of Funen. It is eight miles in length, and about two in breadth; and produces corn, aniseed, black cattle, and horses. It has three parishes, the most considerable of which is Kopin. It stands at the south side of the island, in the bottom of a bay, and has a port with some trade. E. Long. 9. 40. N. Lat. 55. 20.

ARROJO DE ST SERVAN, a town of Spain, in Estremadura. W. Long. 5. 20. N. Lat. 38. 40.

ARRONDEE, in *Heraldry*, a cross, the arms of which are composed of sections of a circle, not opposite to each other so as to make the arms bulge out thicker in one part than another; but the sections of each arm lying the same way, so that the arm is everywhere of an equal thickness, and all of them terminating at the edge of the escutcheon like the plain cross.

ARROW, a missive weapon of offence, slender, pointed,

Arrow || Arsinoe.

pointed, and barbed, to be cast or shot with a bow. See ARCHERY.

ARROW-Makers, are called *fletchers;* and were formerly, as well as bowyers, persons of great consequence in the commonwealth.

Arrow-heads and quarrels were to be well boched or brased, and hardened at the points with steel; the doing of which seems to have been the business of the arrow-smith.

ARROW-Head. See SAGITTARIA, BOTANY *Index.*

ARROW-Root. See MARANTA, BOTANY *Index.*

ARSACES, otherwise MITHRIDATES, a king of the Parthians, spoken of in the first book of Maccabees, xiv. 2. He considerably enlarged the kingdom of Parthia by his good conduct and valour. See PARTHIA.

ARSCHIN, in commerce, a long measure used in China to measure stuffs. Four arschins make three yards of London.

ARSENAL, a royal or public magazine, or place appointed for the making and keeping of arms, necessary either for defence or assault. Some derive this word from *arx*, a *fortress;* others from *ars*, denoting a *machine;* others again from *arx* and *senatus*, because this was the defence of the senate: but the more probable opinion derives it from the Arabic *darsenaa*, which signifies *arsenal.*

The arsenal of Venice is the place where the galleys are built and laid up. The arsenal of Paris is that where the cannon or great guns are cast.

ARSENIC. See MINERALOGY and CHEMISTRY *Index.*

ARSENIUS, a deacon of the Roman church, of great learning and piety. He was pitched upon by the pope to go to the emperor Theodosius, as tutor to his son Arcadius. Arsenius arrived at Constantinople in the year 383. The emperor happening one day to go into the room where Arsenius was instructing Arcadius, his son was seated, and the preceptor standing; at this he was exceedingly displeased, took from his son the imperial ornaments, made Arsenius sit in his place, and ordered Arcadius for the future to receive his lessons standing uncovered. Arcadius, however, profited but little by his tutor's instructions, for some time after he formed a design of despatching him. The officer to whom Arcadius had applied for this purpose, divulged the affair to Arsenius, who retired to the deserts of Scete, where he passed many years in the exercises of the most strict and fervent devotion. He died there, at 95 years of age.

ARSHOT, a town of the Austrian Netherlands, situated about 14 miles east of the city of Mechlin, in E. Long. 4. 45. N. Lat. 51. 5.

ARSINOE, in *Ancient Geography*, a town of Egypt, on the west side of the Arabian gulf, near its extremity, to the south of Hieropolis, (Strabo, Ptolemy); called *Cleopatris* by some. Another Arsinoe, a town of Cilicia, (Ptolemy); and the fifth of that name in Cilicia, (Stephanus); with a road or station for ships, (Strabo). A third Arsinoe, in the south of Cyprus, with a port between Citium and Salamis, (Strabo). A fourth, an inland town of Cyprus, called *Marium* formerly, (Stephanus). A fifth in the north of Cyprus, between Acamas and Soli, (Strabo); so called from Arsinoe, a queen of Egypt, Cyprus being in the hands of the Ptolemies. A sixth Arsinoe, a maritime town of Cyrene, formerly called *Teuchira.* A seventh Arsinoe, in the Nomos Arsinoites, to the west of the Heracleotes, on the western bank of the Nile, formerly called *Crocodilorum Urbs*, (Strabo); the name *Arsinoe* continued under Adrian, (Coin). Ptolemy calls this Arsinoe an inland metropolis, and therefore at some distance from the Nile, with a port called *Ptolemais.* An eighth Arsinoe, a maritime town of Lycia; so called by Ptolemy Philadelphus, after the name of his consort, which did not hold long, it afterwards recovering its ancient name *Patara*, (Strabo). A ninth, a town of the Troglodytæ, near the mouth of the Arabian gulf, which towards Ethiopia is terminated by a promontory called *Dire*, (Ptolemy). This Arsinoe is called *Berenice*, and the third of that name in this quarter, with the distinction *Epideres;* because situated on a neck of land running out a great way into the sea.

Arsinoe || Art.

ARSIS and THESIS, in *Music*, is a term applied to compositions in which one part rises and the other falls.

ARSMART. See PERSICARIA, BOTANY *Index.*

ARSON, in *English Law*, is the malicious and wilful burning of the house or outhouse of another man; which is felony at common law.

This is an offence of very great malignity, and much more pernicious to the public than simple theft: because, first, it is an offence against that right of habitation which is acquired by the law of nature as well as by the laws of society; next, because of the terror and confusion that necessarily attends it; and, lastly, because in simple theft the thing stolen only changes its master, but still remains *in esse* for the benefit of the public; whereas, by burning, the very substance is absolutely destroyed. It is also frequently more destructive than murder itself, of which too it is often the cause: since murder, atrocious as it is, seldom extends beyond the felonious act designed, whereas fire too frequently involves in the common calamity persons unknown to the incendiary, and not intended to be hurt by him, and friends as well as enemies.

ARSURA, in ancient customs, a term used for the melting of gold or silver, either to refine them, or to examine their value.—The method of doing this is explained at large in the Black Book of the Exchequer, ascribed to Gervaise, in the chapter *De officio Militis Argentarii*, being in those days of great use, on account of the various places and different manners in which the king's money was paid.

ARSURA is also used for the loss or diminution of the metal in the trial. In this sense, a pound was said *tot ardere denarios*, to lose so many pennyweights.

ARSURA is also used for the dust and sweepings of silversmiths, and others, who work in silver, melted down.

ART is defined by Lord Bacon, a proper disposal of the things of nature by human thought and experience, so as to answer the several purposes of mankind; in which sense *art* stands opposed to *nature.*

Art is principally used for a system of rules serving to facilitate the performance of certain actions; in which sense it stands opposed to *science*, or a system of speculative principles.

Arts are commonly divided into *useful* or *mechanic*, *liberal* or *polite.* The former are those wherein the *hand*

Arts. *hand* and *body* are more concerned than the mind; of which kind are most of those which furnish us with the *necessaries* of life, and are popularly known by the name of *trades;* as baking, brewing, carpentry, smithery, weaving, &c.—The latter are such as depend more on the labour of the mind than that of the hand; they are the produce of the *imagination*, their essence consists in *expression*, and their end is *pleasure*. Of this kind are poetry, painting, music, &c.

1 Origin and progress of useful arts. *Kames's Sketches*, Sk. V.

Progress of the ARTS. Some useful arts must be nearly coeval with the human race; for food, clothing, and habitation, even in their original simplicity, require some art. Many other arts are of such antiquity as to place the inventors beyond the reach of tradition. Several have gradually crept into the world without an inventor. The busy mind, however, accustomed to a beginning in things, cannot rest till it finds or imagines a beginning to every art. The most probable conjectures of this nature the reader may see in the historical introductions to the different articles.

In all countries where the people are barbarous and illiterate, the progress of arts is extremely slow. It is vouched by an old French poem, that the virtues of the loadstone were known in France before the year 1180. The mariner's compass was exhibited at Venice anno 1260, by Paulus Venetus, as his own invention. John Goya of Amalfi was the first who, many years afterward, used it in navigation; and also passed for being the inventor. Though it was used in China for navigation long before it was known in Europe, yet to this day it is not so perfect as in Europe. Instead of suspending it in order to make it act freely, it is placed upon a bed of sand, by which every motion of the ship disturbs its operation. Hand-mills, termed *querns*, were early used for grinding corn: and when corn came to be raised in greater quantity, horse-mills succeeded. Water-mills for grinding corn are described by Vitruvius. Wind-mills were known in Greece, and in Arabia as early as the seventh century; and yet no mention is made of them in Italy till the fourteenth. That they were not known in England till the reign of Henry VIII. appears from a household book of an earl of Northumberland, cotemporary with that king, stating an allowance for three mill-horses, "two to draw in the mill, and one to carry stuff to and from the mill." Water-mills for corn must in England have been of a later date. The ancients had mirror-glasses, and employed glass to imitate crystal vases and goblets; yet they never thought of using it in windows. In the 13th century, the Venetians were the only people who had the art of making crystal glass for mirrors. A clock that strikes the hours was unknown in Europe till the end of the 12th century. And hence the custom of employing men to proclaim the hours during night; which to this day continues in Germany, Flanders, and England. Galileo was the first who conceived an idea that a pendulum might be used for measuring time; and Huygens was the first who put the idea in execution, by making a pendulum clock. Hook, in the year 1660, invented a spiral spring for a watch, though a watch was far from being a new invention. Paper was made no earlier than the 14th century; and the invention of printing was a century later. Silk manufactures were long established in Greece before silk-worms were introduced there. The manufacturers were provided with raw silk from Persia: but that commerce being frequently interrupted by war, two monks, in the reign of Justinian, brought eggs of the silk-worm from Hindostan, and taught their countrymen the method of managing them.—The art of reading made a very slow progress. To encourage that art in England, the capital punishment for murder was remitted, if the criminal could but read, which in law language is termed *benefit of clergy*. One would imagine that the arts must have made a very rapid progress when so greatly favoured: but there is a signal proof of the contrary: for so small an edition of the Bible as 600 copies, translated into English in the reign of Henry VIII. was not wholly sold off in three years. The people of England must have been profoundly ignorant in Queen Elizabeth's time, when a forged clause added to the 20th article of the English creed passed unnoticed till about 50 years ago. Arts.

The discoveries of the Portuguese on the west coast of Africa, is a remarkable instance of the slow progress of arts. In the beginning of the 15th century, they were totally ignorant of that coast beyond Cape Non, 28 degrees north latitude. In 1410, the celebrated Prince Henry of Portugal fitted out a fleet for discoveries, which proceeded along the coast to Cape Bajadore in 28 deg. but had not courage to double it. In 1418, Tristan Vaz discovered the island Porto Santo; and the year after, the island Madeira was discovered. In 1439, a Portuguese captain doubled Cape Bajadore; and the next year the Portuguese reached Cape Blanco, lat. 20 degrees. In 1446, Nuna Tristan doubled Cape de Verd, lat. 14. 40. In 1448, Don Gonzallo Vallo took possession of the Azores. In 1449, the islands of Cape de Verd were discovered for Don Henry. In 1471, Pedro d'Escovar discovered the island St Thomas and Prince's island. In 1484, Diego Cam discovered the kingdom of Congo. In 1486, Bartholomew Diaz, employed by John II. of Portugal, doubled the Cape of Good Hope, which he called *Cabo Tormentoso*, from the tempestuous weather he found in the passage.

2 Causes which advanced the progress of arts.

The exertion of national spirit upon any particular art, promotes activity to prosecute other arts. The Romans, by constant study, came to excel in the art of war, which led them naturally to improve upon other arts. Having, in the progress of society, acquired some degree of taste and polish, a talent for writing broke forth. Nevius composed in verse seven books of the Punic war; besides comedies, replete with bitter raillery against the nobility. Ennius wrote annals, and an epic poem. Lucius Andronicus was the father of dramatic poetry in Rome. Pacuvius wrote tragedies. Plautus and Terence wrote comedies. Lucilius composed satires, which Cicero esteems to be slight and void of erudition. Fabius Pictor, Cincius Alimentus, Piso Frugi, Valerius Antias, and Cato, were rather annalists than historians, confining themselves to naked facts, ranged in order of time. The genius of the Romans for the fine arts was much inflamed by Greek learning, when free intercourse between the two nations was opened. Many of those who made the greatest figure in the Roman state commenced

Arts. menced authors; Cæsar, Cicero, &c. Sylla composed memoirs of his own transactions, a work much esteemed even in the days of Plutarch.

The progress of art seldom fails to be rapid, when a people happen to be roused out of a torpid state by some fortunate change of circumstances. Prosperity, contrasted with former abasement, gives to the mind a spring, which is vigorously exerted in every new pursuit. The Athenians made but a mean figure under the tyranny of Pisistratus; but upon regaining freedom and independence, they were converted into heroes. Miletus, a Greek city of Ionia, being destroyed by the king of Persia, and the inhabitants made slaves, the Athenians, deeply affected with the misery of their brethren, boldly attacked the king in his own dominions, and burnt the city of Sardis. In less than 10 years after, they gained a signal victory at Marathon; and, under Themistocles, made head against that prodigious army with which Xerxes threatened utter ruin to Greece. Such prosperity produced its usual effects: arts flourished with arms, and Athens became the chief theatre for sciences, as well as for fine arts. The reign of Augustus Cæsar, which put an end to the rancour of civil war, and restored peace to Rome, with the comforts of society, proved an auspicious era for literature; and produced a cloud of Latin historians, poets, and philosophers, to whom the moderns are indebted for their taste and talents. One who makes a figure rouses emulation in all: one catches fire from another, and the national spirit is everywhere triumphant: classical works are composed, and useful discoveries made in every art and science. With regard to Rome, it is true, that the Roman government under Augustus was in effect despotic: but despotism, in that single instance, made no obstruction to literature, it having been the policy of that reign to hide power as much as possible. A similar revolution happened in Tuscany about three centuries ago. That country having been divided into a number of small republics, the people, excited by mutual hatred between small nations in close neighbourhood, became ferocious and bloody, flaming with revenge for the slightest offence. These republics being united under the great duke of Tuscany, enjoyed the sweets of peace in a mild government. That comfortable revolution which made the deeper impression by a retrospect to recent calamities, roused the national spirit, and produced ardent application to arts and literature. The restoration of the royal family in England, which put an end to a cruel and envenomed civil war, promoted improvements of every kind; arts and industry made a rapid progress among the people, though left to themselves by a weak and fluctuating administration. Had the nation, upon that favourable turn of fortune, been blessed with a succession of able and virtuous princes, to what a height might not arts and sciences have been carried! In Scotland, a favourable period for improvement was the reign of the first Robert, after shaking off the English yoke; but the domineering spirit of the feudal system rendered every attempt abortive. The restoration of the royal family mentioned above, animated the legislature of Scotland to promote manufactures of various kinds: but in vain; for the union of the two crowns had introduced despotism into Scotland, which sunk the genius of the people, and rendered them heartless and indolent. Liberty, indeed, and many other advantages, were procured to them by the union of the two kingdoms; but the salutary effects were long suspended by mutual enmity, such as commonly subsists between neighbouring nations. Enmity gradually wore out, and the eyes of the Scots were opened to the advantages of their present condition; the national spirit was roused to emulate and to excel; talents were exerted, hitherto latent; and Scotland at present makes a figure in arts and sciences above what it ever made while an independent kingdom. Arts.

Another cause of activity and animation, is the being engaged in some important action of doubtful event; a struggle for liberty, the resisting a potent invader, or the like. Greece, divided into small states frequently at war with each other, advanced literature and the fine arts to unrivalled perfection. The Corsicans, while engaged in a perilous war for defence of their liberties, exerted a vigorous national spirit; they founded a university for arts and sciences, a public library, and a public bank. After a long stupor during the dark ages of Christianity, arts and literature revived among the turbulent states of Italy. The Royal Society in London, and the Academy of Sciences in Paris, were both of them instituted after civil wars that had animated the people and roused their activity.

As the progress of arts and sciences toward perfection is greatly promoted by emulation, nothing is more fatal to an art or science than to remove that spur, as where some extraordinary genius appears who soars above rivalship. Mathematics seem to be declining in Britain; the great Newton, having surpassed all the ancients, has not left to the moderns even the faintest hope of equalling him; and what man will enter the lists who despairs of victory!

In a country thinly peopled, where even necessary arts want hands, it is common to see one person exercising more arts than one: in several parts of Scotland, one man serves as a physician, surgeon, and apothecary. In every populous country, even simple arts are split into parts, and each part has an artist appropriated to it. In the large towns of ancient Egypt, a physician was confined to a single disease. In mechanic arts that method is excellent. As a hand confined to a single operation becomes both expert and expeditious, a mechanic art is perfected by having its different operations distributed among the greatest number of hands: many hands are employed in making a watch, and a still greater number in manufacturing a web of woollen cloth. Various arts or operations carried on by the same man, invigorate his mind; because they exercise different faculties; and as he cannot be equally expert in every art or operation, he is frequently reduced to supply want of skill by thought and invention. Constant application, on the contrary, to a single operation, confines the mind to a single object, and excludes all thought and invention: in such a train of life, the operator becomes dull and stupid, like a beast of burden. The difference is visible in the manners of the people: in a country where, from want of hands, several occupations must be carried on by the same person, the people are knowing and conversable: in a populous country, where manufactures flourish, they are ignorant and unsociable. The same effect is equally visible in countries where an

Arts.

art or manufacture is confined to a certain class of men. It is visible in Indostan, where the people are divided into casts, which never mix even by marriage, and where every man follows his father's trade. The Dutch lint-boors are a similar instance: the same family carries on the trade from generation to generation; and are accordingly ignorant and brutish even beyond other Dutch peasants. The inhabitants of Buckhaven, a sea-port in the county of Fife, were originally a colony of foreigners, invited hither to teach our people the art of fishing. They continue fishers to this day, marry among themselves, have little intercourse with their neighbours, and are dull and stupid to a proverb.

3 Progress of the *fine arts.*

Useful arts pave the way to fine arts. Men upon whom the former had bestowed every convenience, turned their thoughts to the latter. Beauty was studied in objects of sight; and men of taste attached themselves to the fine arts, which multiplied their enjoyments, and improved their benevolence. Sculpture and painting made an early figure in Greece; which afforded plenty of beautiful originals to be copied in these imitative arts. Statuary, a more simple imitation than painting, was sooner brought to perfection: the statue of Jupiter by Phidias, and of Juno by Polycletes, though the admiration of all the world, were executed long before the art of light and shade was known. Apollodorus, and Zeuxis his disciple, who flourished in the 95th Olympiad, were the first who figured in that art. Another cause concurred to advance statuary before painting in Greece, viz. a great demand for statues of their gods. Architecture, as a fine art, made a slower progress. Proportions, upon which its elegance chiefly depends, cannot be accurately ascertained, but by an infinity of trials in great buildings: a model cannot be relied on; for a large and a small building, even of the same form, require different proportions.

4 Literary composition.

From the fine arts mentioned, we proceed to literature. It is agreed, among all antiquaries, that the first writings were in verse, and that writing in prose was of a much later date. The first Greek who wrote in prose was Pherecides Syrus: the first Roman was Appius Cæcus, who composed a declamation against Pyrrhus. The four books of the Chatah Bhade, which is the sacred book of Hindostan, are composed in verse stanzas; and the Arabian compositions in prose followed long after those in verse. To account for that singular fact, many learned pens have been employed; but without success. By some it has been urged, that as memory is the only record of events where writing is unknown, history originally was composed in verse for the sake of memory. This is not satisfactory. To undertake the painful task of composing in verse, merely for the sake of memory, would require more foresight than ever was exerted by a barbarian: not to mention that other means were used for preserving the memory of remarkable events; a heap of stones, a pillar, or other object that catches the eye. The account given by Longinus is more ingenious. In a fragment of his treatise on verse, the only part that remains, he observes, "that measure or verse belongs to poetry, because poetry represents the various passions with their language; for which reason the ancients, in their ordinary discourse, delivered their thoughts in verse rather than in prose." Longinus thought, that anciently men were more exposed to accidents and dangers, than when they were protected by good government and by fortified cities. But he seems not to have adverted, that fear and grief inspired by dangers and misfortunes, are better suited to humble prose than to elevated verse. It may be added, that however natural poetical diction may be when one is animated with any vivid passion, it is not supposable that the ancients never wrote nor spoke but when excited by passion. Their history, their laws, their covenants, were certainly not composed in that tone of mind.

Arts.

An important article in the progress of the fine arts, which writers have not sufficiently attended to, will perhaps explain this mystery. The article is the profession of a bard, which sprung up in early times before writing was known *, and died away gradually as writing became more and more common †.

* See the article *Writing.*

† See *Bard.*

The songs of the bards, being universal favourites, were certainly the first compositions that writing was employed upon: they would be carefully collected by the most skilful writers, in order to preserve them in perpetual remembrance. The following part of the progress is obvious. People acquainted with no written compositions, but what were in verse, composed in verse their laws, their religious ceremonies, and every memorable transaction that was intended to be preserved in memory by writing. But when subjects of writing multiplied, and became more and more involved; when people began to reason, to teach, and to harangue; they were obliged to descend to humble prose: for to confine a writer or speaker to verse in handling subjects of that nature would be a burden unsupportable.

5 History.

The prose compositions of early historians are all of them dramatic. A writer destitute of art is naturally prompted to relate facts as he saw them performed: he introduces his personages as speaking and conferring; and he himself relates what was acted, and not spoke. The historical books of the Old Testament are composed in that mode; and so addicted to the dramatic are the authors of those books, that they frequently introduce God himself into the dialogue. At the same time, the simplicity of that mode is happily suited to the poverty of every language in its early periods. The dramatic mode has a delicious effect in expressing sentiment, and every thing that is simple and tender. Read, as an instance of a low incident becoming, by that means, not a little interesting, Ruth i. 8. to iv. 16.

The dramatic mode is far from pleasing so much in relating bare historical facts. Read, as an example, the story of Adonijah in 1 Kings i. 11—49.

In that passage there are frequent repetitions; not however by the same person, but by different persons, who have occasion in the course of the story to say the same things; which is natural in the dramatic mode, where things are represented precisely as they were transacted. In that view, Homer's repetitions are a beauty, not a blemish; for they are confined to the dramatic part, and never occur in the narrative.

But the dramatic mode of composition, however pleasing, is tedious and intolerable in a long history. In the progress of society new appetites and new passions arise; men come to be involved with each other

Arts. in various connexions; incidents and events multiply, and history becomes intricate by an endless variety of circumstances. Dialogue accordingly is more sparingly used, and in history plain narration is mixed with it. Narration is as it were the ground work; and dialogue is raised upon it, like flowers in embroidery. Homer is admitted by all to be the great master in that mode of composition.

The narrative mode came in time so to prevail, that in a long chain of history, the writer commonly leaves off dialogue altogether. Early writers of that kind appear to have very little judgment in distinguishing capital facts from minute circumstances, such as can be supplied by the reader without being mentioned. The history of the Trojan war by Dares Phrygius is a curious instance of that cold and creeping manner of composition. The Roman histories before the time of Cicero are chronicles merely. Cato, Fabius Pictor, and Piso, confined themselves to naked facts. In the Augustæ Historiæ Scriptores we find nothing but a jejune narrative of facts, commonly of very little moment, concerning a degenerate people, without a single incident that can rouse the imagination or exercise the judgment. The monkish histories are all of them composed in the same manner.

The dry narrative manner being very little interesting or agreeable, a taste for embellishment prompted some writers to be copious and verbose. Saxo-Grammaticus, who in the 12th century composed in Latin a history of Denmark surprisingly pure at that early period, is extremely verbose and full of tautologies. Such a style, at any rate unpleasant, is intolerable in a modern tongue, before it is enriched with a stock of phrases for expressing aptly the great variety of incidents that enter into history.

The perfection of historical composition which writers at last attain to after wandering through various imperfect modes, is a relation of interesting facts, connected with their motives and consequences. A history of that kind is truly a chain of causes and effects.

The history of Thucydides, and still more that of Tacitus, are shining instances of that mode.

6 Eloquence. Eloquence was of a later date than the art of literary composition; for till the latter was improved there were no models for studying the former. Cicero's oration for Roscius is composed in a style diffuse and highly ornamented; which, says Plutarch, was universally approved, because at that time the style of Asia, introduced into Rome with its luxury, was in high vogue. But Cicero, in a journey to Greece, where he leisurely studied Greek authors, was taught to prune off superfluities, and to purify his style, which he did to a high degree of refinement. He introduced into his native tongue a sweetness, a grace, a majesty, that surprised the world, and even the Romans themselves. Cicero observes with great regret, that if ambition for power had not drawn Julius Cæsar from the bar to command legions, he would have become the most complete orator in the world. So partial are men to the profession in which they excel. Eloquence triumphs in a popular assembly; makes some figure in a court of law composed of many judges, very little where there is but a single judge, and none at all in a despotic government. Eloquence flourished in the republics of Athens and of Rome; and makes some figure at present in a British house of commons. Arts.

7 Tragedy. The Greek stage has been justly admired among all polite nations. The tragedies of Sophocles and Euripides, in particular, are by all critics held to be perfect in their kind, excellent models for imitation, but far above rivalship. If the Greek stage was so early brought to maturity, it is a phenomenon not a little singular in the progress of arts. The Greek tragedy made a rapid progress from Thespis to Sophocles and Euripides, whose compositions are wonderful productions of genius, considering that the Greeks at that period were but beginning to emerge from roughness and barbarity into a taste for literature. The compositions of Eschylus, Sophocles, and Euripides, must have been highly relished among a people who had no idea of any thing more perfect. We judge by comparison, and every work is held to be perfect that has no rival. It ought at the same time to be kept in view, that it was not the dialogue which chiefly enchanted the Athenians, nor variety in the passions represented, nor perfection in the actors; but machinery and pompous decoration, joined with exquisite music. That these particulars were carried to the greatest height, we may with certainty conclude from the extravagant sums bestowed on them: the exhibiting a single tragedy was more expensive to the Athenians than their fleet or their armies in any single campaign.

One would imagine, however, that these compositions were too simple to enchant for ever: as variety in action, sentiment, and passion, is requisite, without which the stage will not continue long a favourite entertainment: and yet we find not a single improvement attempted after the days of Sophocles and Euripides. The manner of performance, indeed, prevented absolutely any improvement. A fluctuation of passion and refined sentiments would have made no figure on the Grecian stage. Imagine the discording scene between Brutus and Cassius in Julius Cæsar to be there exhibited, or the handkerchief in the Moor of Venice: how slight would be their effect, when pronounced in a mask, and through a pipe? The workings of nature upon the countenance, and the flexions of voice expressive of various feelings, so deeply affecting in modern representation, would have been entirely lost. If a great genius had arisen with talents for composing a pathetic tragedy in perfection, he would have made no figure in Greece. An edifice must have been erected of a moderate size: new actors must have been trained to act with a bare face, and to pronounce in their own voice. And after all, there remained a greater miracle still to be performed, viz. a total reformation of taste in the people of Athens. In one word, the simplicity of the Greek tragedy was suited to the manner of acting; and that manner excluded all improvements.

8 Comedy. With respect to comedy, it does not appear that the Greek comedy surpassed the tragedy in its progress toward perfection. Horace mentions three stages of Greek comedy. The first well suited to the rough and coarse manners of the Greeks, when Eupolis, Cratinus, and Aristophanes wrote. These authors were not ashamed to represent on the stage real persons, not even disguising their names; of which we have a striking instance in a comedy of Aristophanes, called *The Clouds*, where Socrates is introduced, and most contemptuously,

Arts. temptuously treated. This sort of comedy, sparing neither gods nor men, was restrained by the magistrates of Athens, so far as to prohibit persons to be named on the stage, This led writers to do what is done at present: the characters and manners of known persons were painted so much to the life, that there could be no mistake; and the satire was indeed heightened by this regulation, as it was an additional pleasure to find out the names that were meant in the representation. This was termed the *middle comedy*. But as there still remained too great scope for obloquy and licentiousness, a law was made, prohibiting real events or incidents to be introduced upon the stage. This law happily banished satire against individuals, and confined it to manners and customs in general. Obedient to this law are the comedies of Menander, Philemon, and Diphilus, who flourished about 300 years before the Christian era. And this is termed the *third* stage of Greek comedy. The comedies of Aristophanes which still remain, err not less against taste than against decency. But the Greek comedy is supposed to have been considerably refined by Menander and his contemporaries. Their works, however, were far from perfection, if we can draw any conjecture from their imitator Plautus, who wrote about a century later. Plautus was a writer of genius; and it may be reasonably supposed that his copies did not fall much short of the originals, at least in matters that can be faithfully copied; and he shows very little art, either in his compositions or in the conduct of his pieces. With respect to the former, his plots are wondrous simple, very little varied, and very little interesting. The subject of almost every piece is a young man in love with a music girl, desiring to purchase her from the procurer, and employing a favourite slave to cheat his father out of the price; and the different ways of accomplishing the cheat is all the variety we find. In some few of his comedies the story rises to a higher tone, the music girl being discovered to be the daughter of a freeman, which removes every obstruction of a marriage between her and her lover. In the conduct of his pieces there is a miserable defect of art. Instead of unfolding the subject in the progress of the action, as is done by Terence, and by every modern writer, Plautus introduces a person for no other end but to explain the story to the audience. In one of his comedies, a household god is so obliging as not only to unfold the subject, but to relate before-hand every particular that is to be represented, not excepting the catastrophe.

The Roman theatre, from the time of Plautus to that of Terence, made a rapid progress. Aristotle defines comedy to be "an imitation of light and trivial subjects, provoking laughter." The comedies of Plautus correspond accurately to that definition: those of Terence rise to a higher tone.

Nothing is more evident than the superiority of Terence above Plautus in the art of writing; and, considering that Terence is a later writer, nothing would appear more natural, if they did not copy the same originals. It may be owing to genius that Terence excelled in purity of language and propriety of dialogue; but how account for his superiority over Plautus in the construction and conduct of a play? It will not certainly be thought, that Plautus would imitate the worst constructed plays, leaving the best to those who should come after him. This difficulty does not seem to have occurred to any of the commentators. Had the works of Menander and of his cotemporaries been preserved, they probably would have explained the mystery; which for want of that light will probably remain a mystery for ever. Arts.

9 Epopee. Homer has for more that 2000 years been held the prince of poets. Such perfection in an author who flourished when arts were far short of maturity, is truly wonderful. The nations engaged in the Trojan war are described by him as in a progress from the shepherd state to that of agriculture. Frequent mention is made in the Iliad of the most eminent men being shepherds. Andromache, in particular, mentions seven of her brethren who were slain by Achilles as they tended their father's flocks and herds. In that state, garments of woollen cloth were used; but the skins of beasts, the original clothing, were still worn as an upper garment; every chief in the Iliad appeared in that dress. Such indeed was the simplicity of this early period, that a black ewe was promised by each chief to the man who would undertake to be a spy. In times of such simplicity, literature could not be far advanced; and it is a great doubt, whether there was at that time a single poem of the epic kind for Homer to imitate or improve upon. Homer is undoubtedly a wonderful genius, perhaps the greatest that ever existed: his fire, and the boldness of his conceptions, are inimitable. But in that early age, it would fall little short of a real miracle, to find such ripeness of judgment, and correctness of execution, as in modern writers are the fruits of long experience and progressive improvements during the course of many centuries. Accordingly, that Homer is far from being so ripe, or so correct, cannot escape the observation of any reader of taste and discernment. One striking particular is, his digressions without end, which draw our attention from the principal subject. Diomedes, for instance, meeting with Glaucus in the field of battle, and doubting from his majestic air, whether he might not be an immortal, inquires who he was, declaring that he would not fight with a god. Glaucus lays hold of this very slight opportunity, in the very heat of action, to give a long history of his family. In the mean time the reader's patience is put to a trial, and his ardour cools. Again, Agamemnon desiring advice how to resist the Trojans, Diomedes springs forward; but before he offers advice, gives the history of all his progenitors, and of their characters, in a long train. And, after all, what was the sage advice that required such a preface? It was, that Agamemnon should exhort the Greeks to fight bravely. At any rate, was Diomedes so little known, as to make it proper to suspend the action at so critical a juncture, for a genealogical history? There is a third particular which justly merits censure; and that is, an endless number of minute circumstances, especially in the description of battles, where they are most improper. The capital beauty of an epic poem is, the selection of such incidents and circumstances as make a deep impression, keeping out of view every thing low or familiar. An account of a single battle employs the whole fifth book of the Iliad and a great part of the sixth: yet in the whole there is no general action; but unknown warriors, whom we never heard of before, killed at a distance with an arrow or a javelin;

Arts. lin; and every wound described with anatomical accuracy. The whole seventeenth book is employed in the contest about the dead body of Patroclus, stuffed with minute circumstances, below the dignity of an epic poem. In such scenes the reader is fatigued with endless particulars; and has nothing to support him but the melody of Homer's versification. Arts.

10 Causes of the decline of the fine arts.

Having traced the progress of the fine arts toward maturity, in a summary way, the decline of these arts comes next in order. An art, in its progress toward maturity, is greatly promoted by emulation; and, after arriving at maturity, its downfal is not less promoted by it. It is difficult to judge of perfection but by comparison; and an artist, ambitious to outstrip his predecessors, cannot submit to be an imitator, but must strike out something new, which, in an art advanced to ripeness, seldom fails to be a degeneracy. This cause of the decline of the fine arts may be illustrated by various instances. The perfection of vocal music is to accompany passion, and to enforce sentiment. In ancient Greece, the province of music was well understood; which being confined within its proper sphere, had an enchanting influence. Harmony at that time was very little cultivated, because it was of very little use: melody reaches the heart, and it is by it chiefly that a sentiment is enforced, or a passion soothed; harmony, on the contrary, reaches the ear only; and it is a matter of undoubted experience, that the most melodious airs admit but of very simple harmony. Artists, in later times, ignorant why harmony was so little regarded by the ancients, applied themselves seriously to its cultivation; and they have been wonderfully successful. But they have been successful at the expence of melody; which in modern compositions, generally speaking, is lost amid the blaze of harmony. These compositions tickle the ear by the luxury of complicated sounds, but seldom make any impression on the heart. The Italian opera, in its form, resembles the Greek tragedy, from which it is evidently copied; but very little in substance. In the latter, music being made subservient to sentiment, the dialogue is nervous and sublime: in the former, the whole weight is laid on music; and the dialogue, devoid of sentiment, is weak and spiritless. Restless man knows no golden mean, but will be attempting innovations without end. By the same ambition, architecture has visibly declined from its perfection. The Ionic was the favourite order when architecture was in its height of glory. The Corinthian order came next; which, in attempting greater perfection, has deviated from the true simplicity of nature; and the deviation is still greater in the Composite order. With respect to literary productions, the first essays of the Romans were very imperfect. We may judge of this from Plautus, whose compositions are abundantly rude, though much admired by his cotemporaries, being the best that existed at that time. The exalted spirit of the Romans hurried them on to the grand and beautiful; and literary productions of all kinds were in perfection when Augustus reigned. In attempting still greater perfection, the Roman compositions became a strange jumble of inconsistent parts: they were tumid and pompous; and, at the same time, full of antitheses, conceit, and tinsel wit. Every thing new in the fine arts pleases, though less perfect than what we are accustomed to; and, for that reason, such compositions were generally relished. We see not by what gradual steps writers, after the time of Augustus, deviated from the patterns that were before them; for no book of any moment after that time is preserved till we come down to Seneca, in whose works nature and simplicity give place to artificial thought and bastard wit. He was a great corrupter of the Roman taste; and after him nothing was relished but brilliant strokes of fancy, with very little regard to sentiment: even Virgil and Cicero made no figure in comparison. Lucan has a forced elevation of thought and style very difficult to be supported; and, accordingly, he sinks often into puerile reflections; witness his encomium on the river Po; which, says he, would equal the Danube, had it the same number of tributary streams. Quintilian, a writer of true and classical taste, who was protected and encouraged by Vespasian, attempted to stem the tide of false writing. His rhetoric is composed in an elegant style; and his observations contain every delicacy of the critical art. At the same time flourished Tacitus, possessing a more extensive knowledge of the nature of man than any other author, ancient or modern, if Shakespeare be not excepted. His style is original, concise, compact, and comprehensive; and, in what is properly called his *history*, perfectly correct and beautiful. He has been imitated by several, but never equalled by any. Brutus is said to be the last of the Romans for love of liberty: Quintilian and Tacitus may be said to be the last of the Romans for literary genius. Pliny the younger is no exception; his style is affected, turgid, and full of childish brilliancy. Seneca and Pliny are proper examples of writers who study show more than substance, and who make sense yield to sound. The difference between these authors and those of the Augustan age, resembles the difference between Greek and Italian music. Music, among the Greeks, limited itself to the employment to which it is destined by nature, viz. to be the handmaid of sense, to enforce, enliven, or sweeten a sentiment. In the Italian opera, the mistress is degraded to be handmaid; and harmony triumphs with very little regard to sentiment.

Another great cause that precipitates the downfal of every fine art is despotism. The reason is obvious; and there is a dismal example of it in Rome, particularly with regard to eloquence. We learn from a dialogue accounting for the corruption of the Roman eloquence, that in the decline of the art it became fashionable to stuff harangues with impertinent poetical quotations, without any view but ornament merely; and this also was long fashionable in France. It happened unluckily for the Romans, and for the world, that the fine arts were at their height in Rome, and not much upon the decline in Greece, when despotism put an end to the republic. Augustus, it is true, retarded their fall, particularly that of literature; it being the policy of his reign to hide despotism, and to give his government an air of freedom. His court was a school of urbanity, where people of genius acquired that delicacy of taste, that elevation of sentiment, and that purity of expression, which characterise the writers of his time. He honoured men of learning, admitted them to his table, and was bountiful to them. It would be painful to follow the decline of the fine arts in Rome to their

Arts. their total extirpation. The tyranny of Tiberius, and of subsequent emperors, broke at last the elevated and independent spirit of the brave Romans, reduced them to abject slavery, and left not a spark of genius. The science of law is the only exception, as it flourished even in the worst of times: the Roman lawyers were a respectable body, and less the object of jealousy than men of power and extensive landed property. Among the Greeks also, a conquered people, the fine arts decayed; but not so rapidly as at Rome: the Greeks, farther removed from the seat of government, being less within the reach of a Roman tyrant. During their depression, they were guilty of the most puerile conceits: witness verses composed in the form of an axe, an egg, wings, and such like. The style of Greek authors, in the reign of the emperor Adrian, is unequal, obscure, stiff, and affected. Lucian is the only exception that may be made.

We scarcely need any other cause but despotism, to account for the decline of statuary and painting in Greece. These arts had arrived at their utmost perfection about the time of Alexander the Great; and from that time they declined gradually with the vigour of a free people; for Greece was now enslaved by the Macedonian power. It may in general be observed, that when a nation becomes stationary in that degree of power which it acquires from its constitution and situation, the national spirit subsides, and men of talents become rare. It is still worse with a nation that is sunk below its former power and pre-eminence; and worst of all when it is reduced to slavery. Other causes concurred to accelerate the downfal of the arts mentioned. Greece, in the days of Alexander, was filled with statues of excellent workmanship; and there being little demand for more, the later statuaries were reduced to heads and busts. At last the Romans put a total end both to statuary and painting in Greece, by plundering it of its finest pieces; and the Greeks, exposed to the avarice of the conquerors, bestowed no longer any money on the fine arts.

* Petronius Arbiter. The decline of the fine arts in Rome is by a * writer of taste and elegance ascribed to a cause different from any above mentioned, a cause that overwhelms manhood as well as the fine arts wherever it prevails; and that is opulence, joined with its faithful attendants avarice and luxury. "In ancient times (says he), when naked virtue had her admirers, the liberal arts were in their highest vigour; and there was a generous contest among men, that nothing of real and permanent advantage should long remain undiscovered. Democritus extracted the juice of every herb and plant; and, lest the virtue of a single stone or twig should escape him, he consumed a lifetime in experiments. Eudoxus, immersed in the study of astronomy, spent his age upon the top of a mountain. Chrysippus, to stimulate his inventive faculty, thrice purified his genius with hellebore. To turn to the imitative arts; Lysippus, while labouring on the form of a single statue, perished from want. Myron, whose powerful hand gave to the brass almost the soul of man and animals,—at his death found not an heir! Of us of modern times what shall we say? Immersed in drunkenness and debauchery, we want the spirit to cultivate those arts which we possess. We inveigh against the manners of antiquity; we study vice alone; and vice is all we teach. Where now is the art of reasoning? Where astronomy? Where is the right path of wisdom? What man now-a-days is heard in our temples to make a vow for the attainment of eloquence, or for the discovery of the fountain of true philosophy? Nor do we even pray for health of body, or a sound understanding. One, while he has scarce entered the porch of the temple, devotes a gift in the event of the death of a rich relation; another prays for the discovery of a treasure; a third for a ministerial fortune. The senate itself, the exemplary preceptor of what is good and laudable, has promised a thousand pounds of gold to the capitol; and, to remove all reproach from the crime of avarice, has offered a bribe to Jupiter himself. How should we wonder that the art of painting has declined, when, in the eyes both of the gods and men, there is more beauty in a mass of gold than in all the works of Phidias and Apelles."—In England, the fine arts are far from such perfection as to suffer by opulence. They are in a progress, it is true, toward maturity; but they proceed in a very slow pace. Arts.

There is still another cause that never fails to undermine a fine art in a country where it is brought to perfection, abstracting from every one of the causes above mentioned. It is remarked a little above, that nothing is more fatal to an art or to a science than a performance so much superior to all of the kind as to extinguish emulation. This remark is exemplified in the great Newton, who having surpassed all the ancients, has not left to his countrymen even the faintest hope of rivalling him; and to that cause is attributed the visible decline of mathematics in Great Britain. The same cause would have been fatal to the arts of statuary and painting among the Greeks, even though they had continued a free people. The decay of painting in modern Italy is, probably, owing to the same cause: Michael Angelo, Raphael, Titian, &c. are lofty oaks that bear down young plants in their neighbourhood, and intercept from them the sunshine of emulation. Had the art of painting made a slower progress in Italy, it might have there continued in vigour to this day. Velleius Paterculus says judiciously, "Ut primo ad consequendos quos priores ducimus accendimur; ita, ubi aut præteriri aut æquari eos posse desperavimus, studium cum spe senescit; et quod adsequi non potest, sequi desinit: præteritoque eo in quo eminere non possimus, aliquid in quo nitamur conquirimus."

The decline of an art or science proceeding from the foregoing cause, is the most rapid where a strict comparison can be instituted between the works of different masters. The superiority of Newton above every other mathematician can be ascertained with precision; and hence the sudden decline of that science in Great Britain. In Italy a talent for painting continued many years in vigour, because no painter appeared with such superiority of genius as to carry perfection in every branch of the art. As one surpassed in designing, one in colouring, one in graceful attitudes, there was still scope for emulation. But when at last there was not a single perfection but what one or other master had excelled in, from that period the art began to languish. Architecture continued longer in vigour than painting, because the principles of comparison in the former are less precise than in the latter. The artist who

Arts.

who could not rival his predecessors in an established mode, sought out a new mode for himself, which, though perhaps less elegant or perfect, was for a time supported by novelty.

11 Useful arts less subject to decline.

Useful arts will never be neglected in a country where there is any police; for every man finds his account in them. Fine arts are more precarious. They are not relished but by persons of taste, who are rare; and such as can spare great sums for supporting them are still more rare. For that reason, they will never flourish in any country, unless patronized by the sovereign, or by men of power and opulence. They merit such patronage, as one of the springs of government: and a capital spring they make, by multiplying amusements, and humanizing manners; upon which account they have always been encouraged by good princes.

12 Theory of the polite arts.

General Theory of the Polite Arts. The essence of the polite arts, as before observed, consists in *expression*. The end of these arts is *pleasure;* whereas the end of the sciences is *instruction* and *utility*. Some of the polite arts, indeed, as eloquence, poetry, and architecture, are frequently applied to objects that are useful, or exercised in matters that are instructive, as we shall show more particularly in their proper place; but in these cases, though the ground-work belongs to those sciences which employ the understanding, yet the expression arises from the inventive faculty. It is a picture that is designed by Minerva, to which the Muses add the colouring, and the Graces the frame. This union forms therefore the perfection of the art, according to that sententious and well known precept of Horace:

Omne tulit punctum, qui miscuit utile dulci.

13 What arts so denominated.

Under the denomination therefore, of Polite Arts, we comprehend, 1. Eloquence; 2. Poetry; 3. Music; 4. Painting; 5. Sculpture; 6. Graving; 7. Architecture; 8. Declamation; 9. Dancing. Particular descriptions of these arts are given under their respective names. This branch of the present article is intended as a general introduction to them; and, as such, will be occasionally referred to.

There is one very essential reflection, which it appears to us proper to make in the first place, on the polite arts in general. All the rules in the world are not sufficient to make a great poet, an able orator, or an excellent artist; because the quality necessary to form these, depends on the natural disposition, the fire of genius, which no human art can confer, but which is the pure gift of heaven. The rules, however, will prevent a man from being a bad artist, a dull orator, or a wretched poet; seeing they are the reflections of the greatest masters in those arts, and that they point out the rocks which the artist should shun in the exercise of his talents. They are of use, moreover, in facilitating his labours, and in directing him to arrive by the shortest and surest road at perfection. They refine, strengthen, and confirm his taste. Nature, abandoned to herself, has something constantly wild and savage. Art, founded on just and sagacious rules, gives her elegance, dignity, and politeness; and it is impossible to sacrifice properly to the Graces, without knowing the incense that is pleasing to them.

14 Use of precepts.

Beauty is the object of all the polite arts. It is not, however, so easy, as it may seem, to give a clear and determinate idea of what we precisely mean by that term *. Many able writers, who have treated expressly on the subject, have shown that they were totally ignorant of what it was. It is one of these expressions that we comprehend immediately, that present us with a clear and precise idea, that leave a distinct impression on our minds, when it is simply written or pronounced; but which philosophers envelope in darkness, when they attempt to elucidate it by definitions and descriptions; and the more, as mankind have different ideas of beauty, their opinions and tastes being as various as their understandings and physiognomies. We may say, however, in general, that beauty results from the various perfections of which any object is susceptible, and which it actually possesses; and that the perfections which produce beauty consist principally in the agreeable and delightful proportions which are found, 1. Between the several parts of the same object; 2. Between each part and the whole together; 3. Between the parts and the end or design of the object to which they belong. *Genius*, or invention, is that faculty of the mind by which beauty is produced. *Taste* †, disposition, or rather the natural sensation of the mind refined by art, serves to guide the genius in discerning, embracing, and producing, that which is beautiful of every kind. From whence it follows, that the general theory of the polite arts is nothing more than the knowledge of what they contain that is truly beautiful and agreeable; and it is this knowledge, this theory, which modern philosophers call by the Latin name of *æsthetica*.

Arts.

15 *Beauty, genius, taste,* what.

* See the article *Beauty*.

† See *Taste*.

It should be constantly remembered, that the essence of the polite arts consists in expression. This expression lies sometimes in the words, and sometimes in the pen; sometimes in sounds and their harmony, and at others in corporeal attitudes; sometimes in the pencil or in the chisel, and at others in the graver; sometimes in a proper disposition or judicious employment of the mechanic arts, and at others merely in their manner of acting. From whence arise those arts that we have mentioned, and which are described in their order.

16 First general rule.

The general theory of the polite arts, or *esthetics*, necessarily supposes, therefore, certain rules; but these general rules are of no great number. The first is, That whoever would devote himself to the polite arts, should above all things *consult his genius;* divest himself of self-love; and examine if he be a true son of Apollo, and cherished by the Muses: for

> In vain, rash author, dost thou strive to climb,
> By lofty verse, Parnassus' height sublime,
> If heaven does not by secret powers inspire,
> Or if thy natal star darts not poetic fire.

This precept with regard to poetry in particular, is applicable to all the polite arts in general: for their most happy success is founded on *imagination*. By this term, we understand, in general, a faculty of the mind, a particular genius, a lively invention, a certain subtle spirit, which gives a facility in discovering something new. But it is necessary also to describe just bounds to this term *new*, which must not be here taken in an absolute sense. Solomon wisely remarks, that, even in his time, *there was nothing new under the*

17 *Imagination* what.

18 *Novelty* and *Invention.*

Arts. *the sun.* In fact, all that exists, and all that is capable of being discovered in the known world, has already been discovered. The fine arts in their imitations of nature, in their expressions, can borrow images, figures, comparisons, from those things only that exist and are known. As there have been from the beginning of the world to our days, millions of authors in each of the polite arts, almost all the possible combinations of the various subjects have been produced by their lively imaginations; and when we hear the ignorant part of mankind talk of a work of wit or of art *that is entirely new*, that offers ideas which were before utterly unknown, that had never entered into the brain of any other man, we should refer such assertions to the class of popular errors: and reflect on those stories we every day hear of certain empirics, who pretend to be alone possessed of marvellous methods of cure by means of simples; as if there were any plant, any stalk of grass that grows in our world, that can have escaped the researches of botanists. But the novelty, of which we here speak, consists in the ingenious use of combinations of all the various objects of nature, that are new, happy, and agreeable, that have not yet been exhausted, and which appear even to be inexhaustible; and of the use which the artist makes of all new discoveries, which he turns to his advantage by a judicious application. Invention therefore supposes a considerable fund of preliminary knowledge, such as is capable of furnishing ideas and images, to form new combinations. But there is no art by which invention itself can be produced; for that, as we have already said, is the gift of heaven; and it is an endowment which we cannot even make use of whenever we please. We would rather say, therefore, that invention consists in producing, in works of genius, *that which is unexpected;* an object, a harmony, a perfection, a thought, an expression of which we had no idea, that we could not foresee, nor hope to find, where the artist has so happily placed it, and where we perceive it with delight. This idea appears applicable to such of the polite arts as affect the mind by the hearing as well as by the sight; and it is a matter that is highly essential.

19 2d Rule, Improvement of taste. The second rule is, That every artist ought incessantly to labour in the improvement of his *taste;* in acquiring that sensible, refined, and clear discernment, by which he will be enabled to distinguish the real beauties in each object, the ornaments that are agreeable to it, and the proportions and relations that subsist among the several parts: and by this faculty, he will be regulated in the employment of his natural talents. This labour consists not only in the profound reflections he will make on the properties of objects, as they relate to the fine arts, but also in a constant, assiduous study of the grand models of beauty.

20 3d, Imitation of nature. The third rule to be observed in the practice of the polite arts, is *the imitation of nature.* Every object in the universe has its peculiar nature, of which the artist should never lose sight in his manner of treating it. In vain will he otherwise ornament his work with the most refined and most brilliant strokes; for, if nature be not justly imitated, it will for ever remain imperfect. The sublime Homer has sometimes sinned against this rule: for, as the gods have a nature peculiar to themselves, it cannot be a just imitation when we attribute to them passions that are scarcely pardonable in mortals, and make them frequently converse in a language that is at once vulgar and ridiculous. It was not to imitate nature, to put in the mouth of a hero, at the moment of a decisive battle, a harangue that must become tedious by its excessive length, and which certainly could not have been heard by the thousandth part of a numerous army: but we have already touched upon some of the faults that are strewed over the poems of that great man; to multiply or dwell upon them would be ungrateful. We must, however, observe that this imitation of nature, which appears at first view so simple and so easy, is of all things the most difficult in practice; and that it requires a discernment so sagacious, and an expression so happy, as is rarely bestowed by heaven on mortal man. Arts.

21 4th, Perspicuity. *Perspicuity* forms the fourth rule of expression. In all the fine arts, in general, an obscure, perplexed, ambiguous, and elaborate expression, is always bad. The true striking beauty must be manifest and perceptible to the most ignorant of mankind as well as the most learned. Those are even false or inferior beauties that have occasion for a covering, a kind of veil that may make them appear greater than they really are: true beauty wants no veil, but shines by its native lustre. From the union of the true imitation of nature with perspicuity of expression arises that *truth* which is so essential in the productions of the fine arts.

22 5th, Elevation of sentiment. In all the polite arts, and in all the subjects they embrace, there must necessarily reign an elevation of sentiment, that expresses each object in the greatest perfection of which it is susceptible; that imitates nature in her most exalted beauty. This makes the fifth general rule. The design of the fine arts being to excite pleasure by the expression of that which is beautiful, every artist should raise himself above his subject; and, choosing the most favourable light wherein to place it, should there embellish it with the greatest, most noble, and beautiful ornaments, that his own genius can suggest; still, however, observing a strict imitation of nature.

23 6th, The sublime to be endeavoured after. From the observation of these two last rules results the *sublime*, which is the union of the greatest perspicuity with the strictest truth and most exalted elevation possible. It is necessary to remark here, that the most simple and common subjects are susceptible of a sublime that is agreeable to their nature. An idyl or landscape may be as sublime in their kinds as an epic poem or a history piece. When Moses begins the book of Genesis, with these words, *In the beginning God created the heaven and the earth;* or when he tells us, that God said, *Let there be light, and there was light;* these expressions are sublime in the highest degree, because they are perfectly clear, true, and elevated. Every author should therefore endeavour after the sublime * in every subject that he undertakes; and this makes the sixth and last general rule in the practice of the polite arts. But if he cannot attain to this, it is, however, indispensably necessary that he constantly make use of expressions that are *noble and refined.* Every thing that is *low*, *indecent*, or *disagreeable*, is naturally repugnant to the sublime. See the articles Arts, *Fine*, and Drama, in the Supplement.

* See the article Grandeur and Sublimity.

Art

Art ‖ Artaxerxes.

ART is also an appellation given to several superstitious practices, as, *St Anselm's art*, *St Paul's art*, &c. *Art and Part*, in *Scots Law*. See ACCESSORY.

ARTA, by some called *Larta*, a town of Lower Albania, in Turkey in Europe, with a Greek archbishop's see. It is a pretty large town, and contains, according to Mr Hobhouse, about 5000 inhabitants, of which less than a fourth are Mahometans. It had formerly a castle, but this has been suffered to fall to decay. Arta is situated at the distance of seven or eight miles from the gulf to which it gives name. The neighbouring grounds produce grapes, tobacco, oats, and maize; and there is some little trade in wool, cotton, cloths, &c. E. Long. 21. 15. N. Lat. 39. 20.

ARTABA, an ancient measure of capacity used by the Persians, Medes, and Egyptians.

The Persian artaba is represented by Herodotus as bigger than the Attic medimnus by three Atic chœnixes: from which it appears that it was equal to $6\frac{3}{4}$ Roman modii; consequently that it contained $166\frac{2}{3}$ pounds of wine or water, or $126\frac{2}{3}$ pounds of wheat. The Egyptian artaba contained five Roman modii, and fell short of the Attic medimnus by one modius; consequently held $133\frac{1}{3}$ pounds of water or wine, 100 pounds of wheat, or 60 of flour.

ARTABANUS, the name of several kings of Parthia. See PARTHIA.

ARTABAZUS, the son of Pharnaces, commanded the Parthians and Chorasmians in the famous expedition of Xerxes. After the battle of Salamis, he escorted the king his master to the Hellespont with 60,000 chosen men; and after the battle of Platæa, in which Mardonius engaged contrary to his advice, he made a noble retreat, and returned to Asia with 40,000 men under his command.

ARTAXATA, the royal residence and metropolis of Armenia Major (Strabo, Pliny, Juvenal), and built according to a plan of Hannibal, for King Artaxias, after whom it was called. It was situated on an elbow of the river Araxes, which formed a kind of peninsula, and surrounded the town like a wall, except on the side of the isthmus, but this side was secured by a rampart and ditch. This town was deemed so strong, that Lucullus, after having defeated Tigranes, durst not lay siege to it; but Pompey compelled him to deliver it up without striking a blow. It was then levelled with the ground; but the Armenians have a tradition, that the ruins of it are still to be seen at a place called *Ardachat*. Sir John Chardin says, that it has the name of *Ardachat* from Artaxias, whom in the East they call *Ardechier*. Here are the remains of a stately palace which the Armenians take to be that of Tiridates who reigned in the time of Constantine the Great. One front of this building is but half ruined, and there are many other fine antiquities which the inhabitants call *Tact Tradat*, that is, the throne of Tiridates. Tavernier also mentions the ruins of Artaxata between Erivan and Mount Ararat, but does not specify them. The ancient geographers mention another city of the same name, likewise situated on the Araxes, but in the northern part of Media, known among the ancients by the name of *Acropatia*.

ARTAXERXES, the name of several kings of Persia. See PERSIA.

Artedi ‖ Artemidorus.

ARTEDI, PETER, an eminent naturalist, was born in Sweden in the year 1705, in the province of Angermania. Although his parents were poor, yet it appears they found means to give him a liberal education, and with this view they sent him to the college of Hurnesand. Intending to embrace the ecclesiastical profession, he went in 1724 to Upsal; but being fond of the study of natural history, he yielded to the bent of inclination, and directed his attention towards medicine. In natural history he made rapid progress, and soon arose to considerable eminence, particularly in the knowledge of *Ichthyology*. His reputation for natural knowledge was high when Linnæus arrived at Upsal in the year 1728. A lasting friendship was formed between these two great men. Confining his botanical studies to the umbeliferous plants, he suggested a new mode of classification; but Artedi was much better acquainted with chemistry than botany. His attention was chiefly directed to ichthyology, the classification of which he greatly reformed, and new-modelled upon philosophical principles. This arrangement added greatly to his reputation as a naturalist. When the two friends were about to leave Upsal, Linnæus to go to Lapland, and Artedi to England, they reciprocally bequeathed to each other their manuscripts and books upon the event of death. In the year 1735, they, however, met again at Leyden, where Artedi was introduced to Seba, and employed in preparing for the press the third volume of that eminent naturalist's *Thesaurus*, which chiefly related to fishes. Artedi formed the resolution, as soon as that work was finished, to return to his native country, to publish the fruits of his own labours; but unfortunately as he was returning home from Seba's house on the evening of September 27. 1735, the night being dark, he fell into the canal and was drowned. According to agreement, his manuscripts came into the hands of Linnæus, and he published his *Bibliotheca Ichthyologica*, and *Philosophia Ichthyologica*, together with a life of the author, at Leyden in the year 1738. (*Gen. Biog.*).

ARTEDIA. See BOTANY *Index*.

ARTEMIDORUS, famous for his Treatise on Dreams. He was born at Ephesus, but took upon him the surname of *Daldianus* in his book, by way of respect to his mother country Daltis. He styled himself *the Ephesian* in his other performances. He not only bought up all that had been written concerning the explication of dreams, which amounted to many volumes; but he likewise spent many years in travelling, in order to contract an acquaintance with fortune-tellers; he also carried on an extensive correspondence with all the people of this sort in the cities and assemblies of Greece, Italy, and the most populous islands; collecting at the same time all the old dreams, and the events which are said to have followed them. The work which he wrote on dreams consisted of five books: the first three were dedicated to one Cassius Maximus; and the last two to his son, whom he took a good deal of pains to instruct in the nature and interpretation of dreams. This work, though filled with frivolous observations, contains some things that are interesting. It was first printed in Greek at Venice in 1518; and Rigaltius published an edition at Paris, in Greek and Latin, in 1603, and added some notes. Artemidorus wrote also a treatise upon Auguries, and an-

Artemidorus || Artemisium.

other upon Chiromancy; but they are not extant. He lived under the emperor Antoninus Pius.

ARTEMISIA, wife of Mausolus, king of Caria, has immortalized herself by the honours which she paid to the memory of her husband. She built for him in Halicarnassus, a very magnificent tomb, called the *Mausoleum*, which was one of the seven wonders of the world, and from which the title of *Mausoleum* was afterwards given to all tombs remarkable for their grandeur; but she died of regret and sorrow before the Mausoleum was finished. She appointed panegyries to be made in honour of him, and proposed a prize of great value for the person who should compose the best. He died about the end of the 106th Olympiad, 351 years before the Christian era.

ARTEMISIA, queen of Caria, and the daughter of Ligdamis, marched in person in the expedition of Xerxes against the Greeks, and performed wonders in the sea-fight near Salamis, 480 years before the Christian era. Being pursued by an Athenian vessel, she attacked one of the Persian ships, commanded by Demasithymus, king of Calyndus, her enemy, and sunk it; on which the Athenians, thinking that her ship was on the side of the Greeks, ceased their pursuit; but Xerxes was the principal person imposed upon in this affair; for believing she had sunk an Athenian vessel, he declared, that "the men had behaved like women, and the women like men." Xerxes intrusted her with the care of the young princes of Persia, his sons, when, agreeably to her advice, he abandoned Greece, in order to return to Asia. These great qualities did not secure her from the weakness of love: she was passionately fond of a man of Abydos, whose name was Dardanus, and was so enraged at his neglect of her, that she put out his eyes while he was asleep. The gods in order to punish her for this, inspired her with a still stronger passion for him; so that the oracle having advised her to go to Leucas, which was the usage of desperate lovers, she took the leap from thence, and was interred at that place.—Many writers confound this Artemisia with the former, the wife of Mausolus.

ARTEMISIA, *Mugwort*, *Southernwood*, and *Wormwood*. See BOTANY *Index*.

ARTEMISIUM, in *Ancient Geography*, a promontory on the north-east of Eubœa, (called *Leon* and *Cale Acte* by Ptolemy), memorable for the first sea engagements between the Greeks and Xerxes.

The Grecian fleet was stationed in the harbour; while that of the Persians, too numerous for any harbour to contain, had anchored in the road that extends between the city of Castanæa and the promontory of Sepias, on the coast of Thessaly.

The first line of their fleet was sheltered by the coast of Thessaly; but the other lines, to the number of seven, rode at anchor, at small intervals, with the prows of the vessels turned to the sea. When they adopted this arrangement, the waters were smooth, the sky clear, the weather calm and serene: but on the morning of the second day after their arrival on the coast, the sky began to lower; the appearance of the heavens grew threatening and terrible; a dreadful storm succeeded, and for three days raged with unabating fury. Four hundred galleys were destroyed by its violence, besides a vast number of storeships and transports. Eight hundred ships of war, however, besides innumerable vessels of burden, sailed into the Pegasean bay, and anchored in the road of Apheté, which at the distance of a few miles, lies directly opposite to the harbour of Artemisium. Artemisium.

The Grecians had posted centinels on the heights of Eubœa to observe the consequence of the storm, and to watch the motions of the enemy. When informed of the disaster which had befallen them, they poured out a joyous libation, and sacrificed with pious gratitude, to "Neptune the Deliverer." From *Gillies's History of Greece.*

The Persians, however, being recovered from the terrors of the storm, prepared for battle; and as they entertained not the smallest doubt of conquering, they detached 200 of their best sailing vessels round the isle of Eubœa, to intercept the expected flight of the enemy through the narrow Euripus.

About sunset the Grecian fleet approached in a line; and the Persians met them with the confidence of victory, as their ships were still sufficiently numerous to surround those of their opponents. At the first signal the Greeks formed into a circle, at the second they began the fight. Though crowded into a narrow compass, and having the enemy on every side, they soon took 30 of their ships, and sunk many more. Night came on, accompanied with an impetuous storm of rain and thunder; the Greeks retired into the harbour of Artemisium; the enemy were driven to the coast of Thessaly.

By good fortune, however, rather than by design, the greatest part of the Persian fleet escaped immediate destruction, and gained the Pegasean bay; but the ships ordered to sail round Eubœa met with a more dreadful disaster. They were overtaken by the storm, after they had adventured further from the shore than was usual with the wary mariners of antiquity. Clouds soon intercepted the stars, by which alone they directed their course; and after continuing during the greatest part of the night the sport of the elements, they all perished miserably amidst the shoals and rocks of an unknown coast.

The morning arose with different prospects and hopes to the Persians and the Greeks. To the former it discovered the extent of their misfortunes; to the latter it brought a reinforcement of 53 Athenian ships. Encouraged by this favourable circumstance, they determined again to attack the enemy, at the same hour as on the preceding day, because their knowledge of the coast and their skill in fighting their ships rendered the dusk peculiarly propitious to their designs. At the appointed time, they sailed towards the road of Apheté; and having cut off the Cilician squadron from the rest, totally destroyed it, and returned at night to Artemisium.—The Persian commanders being deeply affected with their repeated disasters, but still more alarmed at the much-dreaded resentment of their king, they determined to make one vigorous effort for restoring the glory of their arms. By art and stratagem, and under favour of the night, the Greeks had hitherto gained many important advantages. It now belonged to the Persians to choose the time for action. On the third day at noon, they sailed forth in the form of a crescent, which was still sufficiently

Artemisium || Arthur.

ficiently extensive to enfold the Grecian line. The Greeks, animated by former success, were averse to decline any offer of battle; yet it is probable that their admirals, and particularly Themistocles, would much rather have delayed it to a more favourable opportunity. Rage, resentment, and indignation, supplied the defect of the barbarians in skill and courage. The battle was longer, and more doubtful, than on any former occasion; many Grecian vessels were destroyed, five were taken by the Egyptians, who particularly signalized themselves on the side of the barbarians, as the Athenians did on that of the Greeks. The persevering valour of the latter at length prevailed, the enemy retiring, and acknowledging their superiority, by leaving them in possession of the dead and the wreck. But the victory cost them dear; since their vessels, particularly those of the Athenians, were reduced to a very shattered condition; and their great inferiority in the number and size of their ships, made them feel more sensibly every diminution of strength.

ARTEMISIUM, a town of Oenotria, (Stephanus): now *S. Agatha*, in the Hither Calabria, on the river Pisaurus, or la Foglia, distant eight miles from the Tuscan sea.—Another of the Contestani, in Spain, (Strabo); otherwise called *Dianium*: now *Denia*, on the sea coast of Valencia.

ARTERIOTOMY, the opening an artery, with design to procure an evacuation of blood. See SURGERY.

ARTERY, in *Anatomy*, a conical tube or canal which conveys the blood from the heart to all parts of the body. See ANATOMY.

ARTHRITIS, in *Medicine*, the GOUT. See the *Index* subjoined to MEDICINE.

ARTHRODIA, in *Natural History*, a genus of imperfect crystals, found always in complex masses, and forming long single pyramids, with very short and slender columns.

ARTHRODIA, in *Anatomy*, a species of articulation, wherein the flat head of one bone is received into a shallow socket in the other. The humerus and scapula are joined by this species of articulation.

ARTHUR, the celebrated hero of the Britons, is said to have been the son of Uthor Pendragon king of Britain, and to have been born in 501. His life is a continued scene of wonders. It is said that he killed four hundred and seventy Saxons with his own hand in one day; and, after having subdued many mighty nations, and instituted the order of the Knights of the Round Table, died A. D. 542, of wounds which he received in battle. The most particular detail of his story and his exploits is that given by Geoffroy of Monmouth: but the probable there is so blended with the marvellous and the extravagant, that not only the truth of the whole, but even the reality of Arthur's existence, has been called in question.

In this controversy, Mr Whittaker has taken much pains to vindicate the existence, and discriminate between the real and the fabulous transactions, of the British worthy. "Many of the actions (he observes) attributed to Arthur by the Welsh chronicles of Britain, are as absurd in themselves as they are spurious in their authority. Written, as those narratives were, many centuries after the facts, and being merely the authentic accounts of Arthur, embellished with the fictions and distorted by the perversions of folly; they are inconsistent equally with the state of the times, and the history of the continent and the island. And the ignorance of the forgers, and the credulity of their abettors, can be equalled only by the injudiciousness and incredulity of the opponents to both. If some accounts of Arthur and Cunobeline in these histories be certainly spurious, others are as certainly genuine. And the relations of Suetonius, Dio, and Nennius, are not to be rejected, because of the falsehoods which imposture has grafted upon them, and absurdity admitted with them.

Arthur. *History of Manchester*, vol. ii. 4th edit. p. 31. *et seq.*

"The existence of Arthur is evinced by that of the fables, which have at once annihilated his actions and his name with the misjudging critic. And the reasoner's own arguments really turn against himself, and demonstrate the point which they were intended to disprove. The annals of Wales have long laboured in Arthur's commendation. The Highlanders have long had a poetical history of his exploits in their own language. The whole island is in traditionary possession of his character; and 600 or 700 places within it are still distinguished by his name.

"The genuine actions of the chief are mentioned by his own historians, with a modesty and conciseness that is no bad argument of the truth, and with a particularity of time and place that is a good evidence of the facts. They are noticed by men, whom the death of the hero had exempted from all temptation to flattery: they are recited by persons, whom a proximity to the time had precluded from all possibility of mistake: and they are attested by the best historical authority, writers who lived cotemporary with him, authors who conversed with his warriors, and historians that wrote within a few years after him. He is spoken of as the honourable father of the British heroes by the aged Llomarch, a writer actually cotemporary with him, and some time resident at his court. One of his greater actions is incidentally recorded by Taliessin, an historical bard living under Maelwn Gwined, who was a sovereign among the Britons in the days of Arthur, Gildas, and Llomarch. Another of his considerable exploits is casually intimated by Myrdhin Wyhlt or Merlinus Caledonius, who complains of the severe treatment which he himself received from Rydderch Hael, a king cotemporary with Urien Reged, and engaged with him in a war against the Saxons on the death of Ida in 590. And all his actions are particularly recited by Nennius.

"In the *Historia Britonum* of this last author, Arthur's victories over the Saxons are thus recorded. The first battle was fought at the mouth of the river which is denominated *Glem*. The second, third, fourth, and fifth, were upon another river, that is called *Duglas*, and lies in the region Linuis. The sixth was on a stream, which bears the appellation of *Bassas*. The seventh was in the wood of Celidon, that is, in Cat Coit Celidon. The eighth was at Castle Gunnion; and the ninth was at the city of the Legion. The tenth was on the bank of the river Ribroit; the eleventh at the hill Agned Cathregonion; and the twelfth at Mount Badon. These twelve battles of Arthur are described to us in the same manner as Vortimer's three. Only the general facts are mentioned, and only the common names of places are recited, in both. And

Arthur. from the whole air and aspect of the history, the remarkable conciseness with which the notices are given, and the great ease with which the places are pointed out, the detail appears to have been drawn up at the distance only of a few years from the transactions, and when these little references were sufficiently understood."

Mr Whittaker proceeds to ascertain the scenes of Arthur's battles; after which he gives a relation of them with a surprising particularity. A severe critic might be apt to say, as Dr Kippis observes, that it requires all our faith in the author's judgment, as well as in his ingenuity and learning, not to suspect that he sometimes allows too much scope to fancy and conjecture. However, the whole of what he hath advanced is singularly curious, and deserves peculiar attention and consideration. And no one can help admiring the penetration with which he hath formed such a regular detail of facts, from the combined aid of history, romance, and tradition. According to Mr Whittaker, Arthur's principal exploits were against the northern Saxons, whilst he was only prince of the Silures, and Ambrosius was the dictator or pendragon of the Britons. "In a series probably of five campaigns, and in a succession certainly of eleven victories, this great commander had repelled the Saxons from the north of Flavia, dislodged them from all Maxima, and dispossessed them of all Valentia. And these were successes so unchequered with misfortunes, so great in themselves, and so beneficial to the public, that the name of Arthur claims the first rank in the list of military, and the better one of patriot, heroes." The twelfth battle of Arthur was fought in the south of England, after he was elected to the pendragonship, against Cerdic the Saxon. "This (says Mr Whittaker) was a most extraordinary victory, and completes the circle of Arthur's military glories." In the author's account of this prince's conduct in peace, he asserts, that "Arthur saw that an appointment was wanted, which should at once be a more regular and more honourable signature of merit; by the certainty of the honour and the greatness of the dignity, call out all the worth of all the worthy in the nation, and collect it round the throne of the pendragon. Accordingly he established a military order. It was the first that had ever been instituted in the island; and it has since been imitated by all the nations on the continent. By means of this association, Arthur raised among the provincials a general glow of ingenuous heroism, the first spirit of chivalry that ever appeared in Europe; that manly and honourable gallantry of soul, which has made him and his worthies the subject of romantic histories over all the west of it. By this, and this alone, could he have been what history represents him, the Revered Father of the British Heroes in general, even to the conclusion of the sixth century, and nearly the middle of the seventh. The order naturally survived its founder. And the members of it were denominated the Warriors of Arthur, though the persons were born half a century after his death." Mr Whittaker goes on to inform us, that under the prudent management of Arthur for 20 years together, a fair prospect dawned upon the Britons, and long scenes of future glories opened to their imaginations. "But the gay vision was destroyed at once by the commencement of a civil war. Many towns still remained in ruins, the memorial of the former wars, and the disgrace of the present. The diffused spirit of chivalry was turned upon the nation, and heroism became the tool of dissension. And the dreadful combination of civil evils was begun and consummated, at once, by the death of the renowned Arthur in battle. Thus died the incomparable hero in 542."

Ibid. p. 34.—64.

Arthur's Seat.

To these observations it may not be improper to add the following account of the discovery of Arthur's tomb, which appears to be tolerably well authenticated. Henry II. who was the first of the Plantagenet line, being, in the last year of his reign, at Pembroke, and hearing there a Welsh bard singing to his harp the story of Arthur, concluding with an account of his death, and burial in the churchyard of Glastonbury between two pyramids; the king instantly gave orders that the matter should be inquired into, and the body dug up. This was done as the king directed; and at the depth of seven feet was found a vast stone, whereon was fastened a leaden cross, with this inscription on the inside: *Hic Jacet Sepultus Inclytus Rex Arturius in Insula Avalonia*; i. e. "Here lies the famous King Arthur, buried in the isle of Avalon." Digging still lower, they found the king's body in the trunk of a tree, his beautiful queen lying by him, with long flowing hair, in colour bright as gold, which, however, sunk into dust when touched. The king's bones were very large sized; and in his skull there were ten wounds or more, all cicatrized, except that of which he died. This discovery was made in the year 1189, as Giraldus Cambrensis tells us, who saw these bones, and examined the whole matter carefully. There was also a table containing this story, set up in the monastery of Glastonbury, and the leaden cross with the inscription remained there till the dissolution of the monastery, where it was seen by the great antiquary Leland; but what is become of it since does not appear.

Of the different places above alluded to as being distinguished by our hero's name, and serving to evince his existence, the following may be mentioned as one of the principal.

Arthur's Seat, a high hill in the neighbourhood of Edinburgh, said to have been so denominated from a tradition that King Arthur surveyed the country from its summit, and had also defeated the Saxons in its neighbourhood. This hill rises by a steep and rugged ascent, till it terminates in a rocky point near 700 feet high from the base, being more than double the height of the cross on the top of St Paul's, London, which is 340 feet. On the south it is in many parts a perpendicular rock, composed of basaltic pillars regularly pentagonal or hexagonal, about three feet in diameter, and from 40 to 50 feet in height. Contiguous upon the west, and partly connected with it at the base, are Salisbury Crags, of inferior height, but exhibiting an appearance equally singular and grand. They present to the city an awful front of broken rocks and precipices, forming a sort of natural amphitheatre of solid rock; and backward from the craggy verge above, the hill forms an extensive irregular slope, the surface affording pasture to numerous flocks of sheep. The crags, besides ores, spars, rock plants, and here and there, it is said, some precious stones, afford an inexhaustible supply of stone for paving the streets

Arthur's Seat || Article.

streets and other purposes. In quarrying, a part of the crags has been worn down into a spacious shelf, having the appearance of a lofty terrace, and stretching a considerable length. From hence is a near and distinct prospect of the city, with its environs and the adjacent country. But from the pinnacle called Arthur's Seat the view is more noble and extensive. The traveller may here sit and survey at his ease the centre of the kingdom, besides having a complete view of Edinburgh and its castle, on which he looks down as if seated among the clouds. In a word, the German ocean, the whole course of the Forth, the distant Grampians, and a large portion of the most populous and best cultivated part of Scotland, form a landscape sublime, various, and beautiful.

The denomination of this hill, derived as above, has been adduced as an argument against those who dispute the existence of the British Arthur. That derivation, however, though probable, is not without uncertainty. For *Arthur's Seat* is said to be derived, or rather corrupted, from *A'rd Seir*, a "place or field of arrows," where people shot at a mark: And this not improperly; for among these cliffs is a dell or recluse valley, where the wind can scarcely reach, now called the *Hunter's Bog*, the bottom of it being a morass. The adjacent crags are supposed to have taken their name from the earl of *Salisbury*, who in the reign of Edward III. accompanied that prince in an expedition against the Scots.

ARTICHOKE. See CINARA, BOTANY *Index*.

ARTICLE, a clause or condition of a contract, treaty, &c. It is also a small part or division of a discourse, book, or writing.

ARTICLE of Death, the last pangs or agony of one just expiring.

ARTICLE of Faith, is by some defined a point of Christian doctrine, which we are obliged to believe, as having been revealed by God himself, and allowed and established as such by the church.

The thirty-nine articles were founded, for the most part, upon a body of articles compiled and published in the reign of Edward VI. They were first passed in the convocation, and confirmed by royal authority in the year 1562. They were afterwards ratified anew in the year 1571, and again by Charles I. The law requires a subscription to these articles of all persons ordained to be deacons or priests, 13 Eliz. cap. 12.; of all clergymen inducted to any ecclesiastical living, by the same statute; and of licensed lecturers and curates, 13 Eliz. cap. 12. and 13 and 14 Ch. II. cap. 4. of the heads of colleges, of chancellors, officials, and commissaries, and of schoolmasters. By 1 Will. III. cap. 12. dissenting teachers are to subscribe all, except the 34th, 35th, and 36th, and part of the 20th (and in the case of Anabaptists, except also part of the 27th); otherwise they are exempted from the benefits of the act of toleration.

ARTICLE, in *Grammar*, denotes a particle used in most languages for the declining of nouns, and denoting the several cases and genders thereof.

The use of articles arises chiefly hence, that in languages which have no different terminations, to express the different states and circumstances of nouns, there is something required to supply that office.

The Latins have no articles; but the Greeks, and most of the modern languages, have had recourse to them, for fixing and ascertaining the vague signification of common and appellative names. Article || Artificer.

The Greeks have their ὁ, the eastern tongues their *he emphaticum*; the Italians their *il*, *lo*, and *la*; the French their *le*, *la*, and *les*; the Germans their *der*, *das*, *dat*.

The English also have two articles, *a* and *the*; which being prefixed to substantives, apply their general signification to some particular things.

Some grammarians make the article a distinct part of speech; others will have it a pronoun, and others a noun adjective. See GRAMMAR.

Articles are of great service in a language, as they contribute to the more neat and precise expressing of several properties and relations, which must otherwise be lost. And hence one great advantage of such languages over the Latin, in that the article being either expressed or left out, makes an alteration in the sense, which the Latins cannot distinguish. Thus when the devil said to our Saviour, *Si tu es Filius dei*, it may either be understood, "if thou art *a* son of God," or, "if thou art *the* son of God." The Italians even prefix articles to proper names, which do not naturally need any, because they themselves signify things individually. Thus, they say, *il Ariosto*, *il Tasso*, *il Petrarcha*. Even the French join the article to the proper names of kingdoms, provinces, &c. as *la Suede*, *la Normandie*. And we likewise annex it to the names of certain mountains and rivers; as, the *Rhine*, the *Danube*, the *Alps*, &c.

ARTICULATE SOUNDS, are such sounds as express the letters, syllables, or words of any alphabet or language; such are formed by the human voice, and by some few birds, as parrots, &c.

ARTICULATION, or JOINTING, is the joining of bones together. See ANATOMY.

ARTICULATION, in *Botany*, is the connexion of parts that consist of joints or knees, such as the pods of French honeysuckles, which when ripe divide into so many parts as there are knees or joints; also those parts of plants which swell into nodes or joints, and which usually send forth branches.

ARTIFICER, a person whose employment it is to manufacture any kind of commodity, as in iron, brass, wool, &c. such are smiths, brasiers, carpenters, &c. The Roman artificers had their peculiar temples, where they assembled and chose their own patron, to defend their causes; they were exempted from all personal services. Taruntenus Paternus reckons 32 species of artificers, and Constantine 35, who enjoyed this privilege. The artificers were incorporated into divers colleges or companies, each of which had their tutelar gods, to whom they offered their worship. Several of these, when they quitted their profession, hung up their tools, a votive offering to their gods. Artificers were held a degree below merchants, and *argentarii* or money-changers, and their employment more sordid. Some deny, that in the earliest ages of the Roman state artificers were ranked in the number of citizens: others, who assert their citizenship, allow that they were held in contempt, as being unfit for war, and so poor that they could scarcely pay any taxes. For which reason they were not entered among the citizens in the censor's books; the design of the census being only to

see

Artificer || Artillery.

see what number of persons were yearly fit to bear arms, and to pay taxes towards the support of the state. It may be added, that much of the artificers business was done by slaves and foreigners, who left little for the Romans to mind but their husbandry and war. By means of the arts, the minds of men are engaged in inventions beneficial to the whole community; and thus prove the grand preservative against the barbarism and brutality, which ever attend on an indolent and inactive stupidity.

By the English laws, artificers in wool, iron, steel, brass, or other metal, going out of the kingdom into any foreign country without license, are to be imprisoned three months, and fined in a sum not exceeding one hundred pounds. And such as going abroad, and not returning on warning given by our ambassadors, &c. shall be disabled from holding lands by descent or devise, from receiving any legacy, &c. and be deemed aliens. Stat. 5. Geo. I. cap. 27. By 23 Geo. II. cap. 13. § 1. penalty is also inflicted on seducing artificers to go abroad. Ramazini has a treatise on the diseases of artificers.

ARTIFICIAL, in a general sense, denotes something made, fashioned, or produced by art, in contradistinction from the production of nature.

ARTIFICIAL is also frequently used for factitious. Thus we have artificial sal ammoniac, artificial borax, &c.

ARTIFICIAL *Fire-works* are compositions of inflammable materials, chiefly used on solemn occasions, by way of rejoicing. See PYROTECHNY.

ARTIFICIAL *Lightning*. See ELECTRICITY and LIGHTNING.

ARTIFICIAL *Lines*, on a sector or scale, are certain lines so contrived, as to represent the logarithmic sines and tangents; which, by the help of the line of numbers, will solve all questions in trigonometry, navigation, &c. pretty exactly.

ARTIFICIAL *Magnets*. See MAGNETS.

ARTIGI, indeclinable, (Pliny); *Artigis*, (Ptolemy); a town of the Turduli, in Bætica. Now *Alhama*.

ARTILLERY, in its general sense, denotes the offensive apparatus of war, particularly of the missile kind. Among the French the term was anciently appropriated to ARCHERY. In its modern acceptation it signifies fire-arms, mounted on their carriages and ready for action, with their balls, their bombs, their grenades, &c.

If we take the term in a more extensive meaning, it includes the powder, the matches, instruments for fire-works, the utensils of ordnance, the machines which facilitate their motion and transport them, the vehicles over which they traverse rivers, every thing necessary to them, and all that enters into the form of a train of artillery.

The same word, still farther extended in its meaning, likewise comprehends the men destined for the service of the *artillery;* the people who provide the artillery with materials and implements when engaged, the cannoniers, the bombardiers, the officers of every rank, and engineers of every kind.

By *artillery* is likewise understood the science which the officers of artillery ought to possess. This science teaches to know the nature of all the materials and ingredients which enter into the composition and the structure of every thing relative to the artillery, such as nitre, sulphur, charcoal; the properties of air and fire; the composition and preparation of gunpowder; the materials for fire-works; the construction, proportions, &c. of the different warlike machines; the arrangement, movement, and whole management, of cannon, &c. in the field or in sieges, in such manner, that each of them, according to the length of its tube and the diameter of its bore, may be situated in the best place and at the properest distance for execution, and that the whole train taken together may reciprocally assist and support each other with the greatest advantage. Artillery.

Artillery has undergone many changes from its origin to the present time. The artillery of the ancients were the catapulta, the balistæ, the different kinds of slings, &c. In latter ages, the Franks used the hatchet as a missile weapon, throwing it in the same manner as the Americans do theirs called the *tomahawk*. The Gascons and Genoese were excellent cross-bow men. The Swiss owed their victories to their strength and skill in the use of the pike, halberd, and espadon or two-handed sword; and the victories of Cressy, Poictiers, and Agincourt, will occasion the valour and skill of the English archers to be transmitted down to latest posterity. See ARCHERY.

The chevalier Folard was extremely attached to the ancient machines first mentioned, and seemed even to prefer them to our fire-arms; an opinion which must appear not a little extraordinary from such a person. Father Daniel might well be mistaken in the comparison which he made between the effects of ancient and modern artillery, and in his conclusion that the latter was of little use: the situation of this good father removed him from the scenes of war and the opportunities of military experience. But it is astonishing, that one so learned in the military art as the commentator of Polybius, who had ocular demonstration of the success of modern artillery, should have declared so violently against it. Whatever be the case with these authors and their maxims, it may be asserted that cannon is one of the most singular discoveries which have been made amongst men; and by little and little it has changed the whole art of war, and of consequence influenced the whole system of policy in Europe. The era of artillery is dated from the battle of Cressy in 1346, because it is only from that day that cannon were mentioned in battle. Edward III. of England successfully employed some pieces of artillery placed in the front of his army. The invention of artillery was then known in France as well as in England; but probably Philip VI. marched with so much hurry and precipitation to attack his enemy, that he left his cannon as useless encumbrances behind him. The ignorance of that age in mechanical arts considerably retarded the progress of artillery; and that of which they were then possessed was so unwieldy and imperfect, that they could not possibly discern its importance and efficacy in practice.

After the invention of gunpowder, the Spaniards were the first who armed part of their foot with muskets and harquebusses, and mixed them with the pikes. In this they were soon imitated by most other nations; though the English had not entirely laid aside their favourite weapon the long bow, and generally taken to the

Artillery. the use of fire-arms, during the reign of Queen Elizabeth.

The first muskets were very heavy, and could not be fired without a rest: they had matchlocks, and barrels of a wide bore, that carried a large ball and charge of powder, and did execution at a great distance. The musketeers on a march carried only their rests and ammunition; and had boys to bear their muskets after them, for which they were allowed great additional pay. They were very slow in loading, not only by reason of the unwieldiness of the pieces, and because they carried the powder and balls separate, but from the time it took to prepare and adjust the match; so that their fire was not near so brisk as ours is now. Afterwards a lighter kind of matchlock musket came into use; and they carried their ammunition in bandeliers, which were broad belts that came over the shoulder, to which were hung several little cases of wood covered with leather, each containing a charge of powder: the balls they carried loose in a pouch, and they had also a priming horn hanging by their side. Matchlocks were, about the beginning of this century, universally disused in Europe, and the troops were armed with firelocks; to which, much about the same time, the bayonet being added, pikes also were laid aside; which latter change, whether it was for the better or not, is a point that still admits of dispute among the best military writers, who are divided in their opinions about it, though most of them disapprove of it.

The old English writers call those large muskets *calivers;* the harquebus was a lighter piece that could be fired without a rest. The matchlock was fired by a match, fixed by a kind of tongs in the serpentine or cock, which by pulling the trigger was brought down with great quickness upon the priming in the pan, over which there was a sliding cover, which was drawn back by hand, just at the time of firing. There was a great deal of nicety and care required to fit the match properly to the cock, so as to come down exactly true on the priming, to blow the ashes from the coal, and to guard the pan from the sparks that fell from it: a great deal of time was also lost in taking it out of the cock, and returning it between the fingers of the left hand, every time that the piece was fired; and wet weather often rendered the matches useless. However, most writers allow that they were very sure, and less apt to miss fire than the firelock.

The firelock is so called, from producing fire of itself, by the action of the flint and steel. The most ancient invention of this sort is the wheel lock, which we find mentioned in Luigi Collado's Treatise of Artillery, printed at Venice, 1586, as then lately invented in Germany. This sort of lock was used till within these hundred years, especially for pistols and carabines. It was composed of a solid steel wheel, with an axis, to which was fastened a chain, which, by being wound round it, drew up a very strong spring: on pulling the trigger, the spring acting, whirled the wheel about with great velocity, and the friction of the edge of it (which was a little notched) against the stone produced the fire; the cock was made so as to bring the stone upon the edge of the wheel, part of which was in the pan, and touched the priming; they used any common hard pebble for that purpose, which served as well as flint.

These locks were inconvenient, took time to wind up (or span, as they termed it), and sometimes would not go off; an instance of which may be seen in Ludlow's Memoirs. Artillery.

When the firelock, such as we now use, was invented, we cannot ascertain; it is called by writers of about the middle of the last century, a *snaphane* or *snaphance*, which being the Dutch word for a *firelock*, seems to indicate that it is a Dutch invention, and that we took it from them. But Ward, in his Animadversions of War, printed in 1639, p. 502, after describing the exercise of the firelock, pistol, and carabine (by which he means the wheel-lock), says, that as most of our pieces go with English locks, which differ from firelocks, he shall add the method of handling them; and then gives the exercise of the snaphine carabine; by which it appears, that there was little or no difference between that and the pieces now in use. The more modern writers call it a *fusee* from the French word *fusil;* whence the name of fusileers is still continued to several of our regiments, which were the first that were armed with them on the disuse of matchlocks.

They used the musket and rest in England so late as the beginning of the civil wars, as may be seen in Col. Bariffe's Young Artillery Man, printed at London, 1643.

Figuera, in his embassy in 1518, relates, that the Persians would neither make use of infantry nor of artillery, because by them the impetuosity of attack and the facility of retreat were equally encumbered and retarded: in these expedients alone their address and their glory consisted. This method of advancing and recalling is widely different from the present conduct of war, as the artillery in armies is now prodigiously multiplied, and must be transported to every place where any body of troops whatever is destined to operate.

The length and diameter of cannon has been much diminished, which must likewise proportionably diminish their weight. It is by long practice and experience that they have discovered how much might be deduced from their magnitude in both these respects with propriety, without hurting the grand effects which, on some occasions, it is necessary they should produce, by rendering them more easy to be wielded, which was the advantage pursued by lessening their size. See further the articles CANNON, GUNNERY, and PROJECTILES.

Improvements, however, are still making, and will probably long continue to be made, in these ignivomous machines that mock the thunder, which, though they seem to be invented for the destruction of the human race and the subversion of empires, have yet by their effects rendered war less savage and less sanguinary; political alliances have been more successfully conciliated among all nations, conquests are become less frequent and less rapid, and successes in war have been more easily reduced to calculation.

The change introduced in the military art by the modern artillery, Dr Smith observes, has enhanced greatly both the expence of exercising and disciplining any particular number of soldiers in time of peace, and that of employing them in time of war. Both their arms and their ammunition are become more expensive. A musket is a more expensive machine than a javelin *Wealth of Nations*, vol. iii. p. 70.

or

Artillery. or a bow and arrows; a cannon or a mortar, than a balista or a catapulta. The powder which is spent in a modern review is lost irrecoverably, and occasions a very considerable expence. The javelins and arrows which were thrown or shot in an ancient one, could easily be lifted up again, and were besides of very little value. The cannon and the mortar are not only much dearer, but much heavier machines than the balista or catapulta, and require a greater expence, not only to prepare them for the field but to carry them to it. As the superiority of the modern artillery too over that of the ancients is very great, it has become much more difficult, and consequently much more expensive, to fortify a town so as to resist even for a few weeks the attack of that superior artillery.

In modern war the great expence of fire arms gives an evident advantage to the nation which can best afford that expence; and consequently, to an opulent and civilized, over a poor and barbarous nation. In ancient times, the opulent and civilized found it difficult to defend themselves against the poor and barbarous nations. In modern times the poor and barbarous find it difficult to defend themselves against the opulent and civilized. The invention of fire arms, an invention which at first sight appears to be so pernicious, is certainly favourable both to the permanency and to the extension of civilization.

It has to many appeared matter of surprise, that the battles of the ancients should be described with an order, perspicuity, and circumstantial minuteness, which are not to be found in the military writers of modern times. Scholars have endeavoured to explain this difference by observing the immense disproportion, in point of dignity and abilities, between the military historians of modern Europe and those of Greece and Rome. But the difficulty will be better solved, Dr Gillies thinks, by reflecting on the changes introduced into the art of war by the change of artillery; which, in military operations, form the pivot on which the whole turns. 1. From the nature of fire arms, modern battles are involved in smoke and confusion. 2. From the same cause, modern armies occupy a much greater extent of ground, and begin to act at much greater distances: which renders it more difficult to observe and ascertain their manœuvres. 3. The immense train of artillery, ammunition, &c. required in the practice of modern war, gives a certain immobility to our armies, which renders it impossible to perform, without great danger, those rapid evolutions in sight of an enemy, which so often decided the battles of the ancients. With us, almost every thing depends on the judicious choice of ground, a matter requiring great military genius, but not admitting the embellishments of historical description.

In the battles of the Greeks and Romans, the extraordinary disproportion between the numbers slain on the side of the victors and the vanquished has been observed as another remarkable circumstance. But this necessarily resulted from the nature of their arms. Their principal weapons being not missile, but manual, armies could not begin to act till they had approached so near to each other, that the conquered found themselves cut off from all possibility of retreat. In modern times, such consequences seldom take place. The use of fire arms (which often render the action itself more bloody), furnishes the defeated party with various means of retreating with considerable safety. The sphere of military action is so widely extended in modern times, that before the victors can run over the space which separates them from the vanquished, the latter may fall back, and proceed with little loss beyond their reach; and should any village, hedge, ravine, &c. be found in their way, may often check the ardour of their pursuers. Upon these considerations, the invention of gunpowder and modern artillery may be said to have saved the effusion of human blood. Equestrian engagements (since the principles on which cavalry act remain nearly the same in every age) are still distinguished by similar circumstances to those which appear so extraordinary in the battles of antiquity. Artillery, Artist.

Artillery Park, the place in the rear of both lines of an army, for encamping the artillery, which is drawn up in lines, of which one is formed by the guns; the ammunition waggons make two or three lines, 60 paces behind the guns, and 30 distant from one another; the pontoons and tumbrils make the last line. The whole is surrounded with a rope which forms the park: the gunners and matrosses encamp on the flanks; and the bombardiers, pontoon men, and artificers, in the rear.

Artillery Train, a certain number of pieces of ordnance, mounted on carriages, with all their furniture fit for marching.

Artillery Company, a band of infantry, consisting of 600 men, making part of the militia or city guard of London.

ARTIST, in a general sense, a person skilled in some art. Mr Harris defines an artist to be, "A person possessing an habitual power of becoming the cause of some effect, according to a system of various and well-approved precepts." See Art.

We are told * of a privilege granted at Vicenza to artists, like that of *clergy* in England; in virtue thereof criminals adjudged to death save their lives if they can prove themselves the most excellent and consummate workmen in any useful art. This benefit is allowed them *in favorem artis*, for the first offence, except in some particular crimes, of which coining is one; for here the greater the artist, the more dangerous the person.

* *Evel. Discourse of Medals*, p. 237, &c.

Artist (*Artista*), in an academical sense, denotes a philosopher or proficient in the faculty of arts.

In the early ages of universities, the seven liberal arts completed the whole course of study, or philosophy, as it is called: whence the masters of this faculty were denominated *artists*. What they understood by the liberal arts used to be summed up in the following Latin verse.

Lingua, Tropus, Ratio, Numerus, Tonus, Angulus, Astra.

Artist is more peculiarly used, by Paracelsus and other adepts, for a chemist or alchemist. We find frequent mention, in authors of this class, of Elias Artista, or Elias the artist, who is to come some time before the dissolution of the world, and restore and make perfect all arts and sciences, but especially the gold-making art; and usher in a truly golden age, or millennium. The lower and meaner things in this sublime art, Paracelsus observes, God has permitted to be already discovered; but for the greater and more important

Artist || Aruba.

portant matters, as the transmutation of other metals into gold, they are reserved to the coming of Elias the artist.

ARTOBRIGA, a town of Vindelicia (Ptolemy): Now *Altzburg*, in Bavaria, on the Danube, below Ingoldstadt (Aventinus): but Cluverius supposes it to be *Lebanau*, on the Saltzbach, below Lauffen, in the archbishopric of Saltzburg.

ARTOCARPUS, the BREAD-FRUIT TREE. See BOTANY *Index*.

ARTOIS, a late province of France, and one of the finest and most fertile in the whole kingdom. Formerly it was one of the 17 provinces of the Netherlands, but now belongs entirely to France, and is included in the department of the Straits of Calais. The names of *Artois*, and *Arras* its capital, are derived from the Atrebates, a people of Gallia Belgica, mentioned by Julius Cæsar. Its greatest length from north to south is about 24 leagues, and its breadth about 12, being bounded to the south and west by Picardy, to the east by Hainault, and to the north by Flanders. A considerable trade is carried on in the province in grain, flax, hops, wool, and linen cloth. The most considerable places in Artois are, Arras the capital, Bapanme, Bethune, St Venant, and St Omer.

ARTOLICA, in *Ancient Geography*, a town of the Salassii in Gallia Cispadana, at the foot of the Alps: now called *la Tuile* by the inhabitants, a hamlet of Savoy, in the duchy of Aoust, at the foot of Mount St Bernard the Less.

ARTOTYRITES, a Christian sect, in the primitive church, who celebrated the eucharist with bread and cheese, saying, that the first oblations of men were not only of the fruits of the earth, but of their flocks. The word is derived from αρτος, *bread*, and τυρος, *cheese*.

The Artotyrites admitted women to the priesthood and episcopacy; and Epiphanius tells us, it was a common thing to see seven girls at once enter into their church, robbed in white, and holding a torch in their hand; where they wept and bewailed the wretchedness of human nature, and the miseries of this life.

ARAU, in *Ancient Geography*, a town of Bætica, in the jurisdiction of the Conventus Hispalensis: now *Alclea*, a citadel of Andalusia, on the Bætis or Guadalquiver, seven leagues above Seville.

ARVALES FRATRES, in Roman antiquity, a college of 12 priests, instituted by Romulus, and chosen out of the most noble families, himself being one of that body: they assisted in the sacrifices of the ambervalia annually offered to Ceres and Bacchus, for the prosperity of the fruits of the earth; when they wore on their heads crowns made of ears of corn. The original of this institution was as follows: Acca Laurentia, Romulus's nurse, was accustomed once a-year to make a solemn sacrifice for a blessing on the fields, her 12 sons always assisting her in the solemnity; but at last losing one of her sons, Romulus offered himself to supply his place, and gave this small society the name of *Arvales fratres*. This order was in great repute at Rome: they held the dignity for life, and never lost it upon account of imprisonment, banishment, or any other accident.

ARUBA, a small uninhabited island on the coast of Terra Firma, and situated in W. Long. 70. 20. N. Lat. 12. 30.

Aruba || Arundel.

ARUCI, in *Ancient Geography*, a town of the Celtici, in the north of Lusitania, (Antonine, Inscription), called also *Aruci Novum*, to distinguish it from the following: Now supposed to be *Moura*, a small city of Portugal, near the confluence of the Ardila and Guadalquiver.

Aruci Vetus, in *Ancient Geography*, a small city of the Turdetani, in Bætica, (Ptolemy); now *Aroche*, a hamlet of Andalusia, on the confines of Portugal and Estremadura, on the river Gama, seven leagues to the east of Aruci Novum or Moura. From it a mountain, in its neighbourhood, takes the name *Arucitanus*. Now *la Sierra de Aroche*.

ARUCIA, in *Ancient Geography*, a town of Illyria, in the inland parts of Liburnia, (Ptolemy). Now *Bregna*, according to some; but *Ottoschatz*, according to others, a citadel of Morlachia.

ARVERNI, an appellation early used for the capital of the Arverni, according to the custom of the latter ages of naming towns from the people; it was formerly called *Nemossus*, (Strabo). The *Arverni*, a brave and ancient people, and one of the most powerful nations of Gaul, claimed affinity with the Romans, as descendants from Antenor, (Lucan): and after their conquest by the Romans, their ancient liberty was preserved to them on account of their bravery, (Pliny). Above 1000 years ago the town was called *Clarus Mons*, from its situation, (Valesius). Now *Clermont*, in Auvergne. E. Long. 3. 20. N. Lat. 45. 42.

ARVIL SUPPER, a feast or entertainment made at funerals, in the north part of England. Arvil bread is the bread delivered to the poor at funeral solemnities; and *arvil*, *arval*, *arfal*, are used for the burial or funeral rites; as,

> Come, bring my jerkin, Tibb, I'll to the *arvil;*
> Yon man's dea scuy seoun, it makes me marvil.
> *Yorksh. Dial.* p. 58.

ARVIRAGUS, an ancient British king who flourished in the time of the emperor Domitian. He gained a complete victory over Claudius: but being soon after besieged in the city of Winchester, he made a treaty with the Romans, and married the emperor's daughter Genuissa. This monarch lived to a good old age: he confirmed the ancient laws, enacted new ones, and liberally rewarded persons of merit.

ARUM, WAKEROBIN, or CUCKOW-PINT. See BOTANY *Index*.

ARUNDA, a town of Hispania Bætica, on the Anas or Guadiana, (Ptolemy, Pliny): Now said to be *Ronda*, in the province of Granada, on the confines of Andalusia. W. Long. 5. 40. N. Lat. 36. 26.

ARUNDEL, THOMAS, archbishop of Canterbury in the reigns of Richard II. Henry IV. and Henry V. was the second son of Robert earl of Arundel and Warren, and brother of Richard earl of Arundel, who was beheaded. At 22 years of age, from being archdeacon of Taunton he was raised to the bishopric of Ely, the 6th of April 1375, in the reign of Edward III. He was a great benefactor to the church and palace of this see; among other donations he gave a curious table of massy gold, adorned with precious

Arundel. stones, which had been given to Prince Edward by the king of Spain, and sold by the latter to Bishop Arundel. In 1386, he was appointed lord chancellor of England; two years after, he was translated to the see of York; and, in 1396, was advanced to the archiepiscopal see of Canterbury, when he resigned the chancellorship. This was the first instance of the translation of an archbishop of York to the see of Canterbury. Scarcely was he fixed in this see, when he had a contest with the university of Oxford about the right of visitation. The affair was referred to King Richard, who determined it in favour of the archbishop. At his visitation in London, he revived an old constitution, by which the inhabitants of the respective parishes were obliged to pay to their rector one halfpenny in the pound out of the rent of their houses. In the second year of his translation, a parliament being held at London, the commons with the king's leave impeached the archbishop, together with his brother the earl of Arundel, and the duke of Gloucester, of high treason. The archbishop was sentenced to be banished, and within forty days to depart the kingdom on pain of death. He retired first to France; and then to the court of Rome, where Pope Boniface IX. gave him a kind reception. About this time the duke of Lancaster (afterwards Henry IV.) was in France, having been banished by King Richard. The nobility and others, tired with the oppressions of Richard, solicited the duke to take the crown. This their request they drew up in a letter, and sent it over by faithful messengers to Archbishop Arundel, desiring him to be their advocate on this occasion with the duke. The archbishop being a fellow sufferer, gladly accepted the office; and went with the messengers to the duke at Paris, where they delivered the letters from the nobles and commons of England, and the archbishop seconded them with the best arguments he could invent. The inviting offer, after some objections which were easily obviated, the duke accepted; and upon his accession to the throne, Arundel, who had returned with him to England, was restored to his see. In the first year of this prince's reign, Arundel summoned a synod which sat at St Paul's. The next year the commons moved that the revenues of the church might be applied to the service of the public; but Arundel opposed the motion with such vigour, that it was thrown aside. In the year 1408, Arundel began to exert himself against the Lollards, or Wickliffites; and his zeal for suppressing that sect carried him to several unjustifiable severities against the heads of it, particularly against Sir John Oldcastle and Lord Cobham. He also procured a synodical constitution, which forbade the translation of the Scriptures into the vulgar tongue. This prelate died at Canterbury, Feb. 20. 1413, of an inflammation in his throat, with which he was seized (as is pretended) whilst he was pronouncing sentence upon Lord Cobham. The Lollards asserted this to be a judgment from God; and indeed Bishop Goodwin speaks in the same manner, saying, "He who had withheld from the people the word of God, the food of the soul, by the just judgement of God had his throat so closed, that he could not speak a single word, nor swallow meat or drink, and was so starved to death." He was buried in the cathedral church of Canterbury, near the west end, under a monument erected by himself in his lifetime. To this church he was a considerable benefactor; for he built the lantern-tower and great part of the nave: gave a ring of five bells, called from him *Arundel's ring*, several rich vestments, a mitre enchased with jewels, a silver gilt crosier, and two golden chalices. Arundel, Arundelian.

ARUNDEL, a borough and market town in Sussex, seated on the north-west side of the river Arun, over which there is a bridge. It has a harbour, capable of receiving ships of 200 tons, and the navigation is continued to the Thames by a canal. The river abounds in mullet of a very fine quality. The castle, which gives the title of earl to its possessors, is seated on the east of the Tame, and is reputed to be a mile in compass. It sends two members to parliament; and is 55 miles south-west-by-south of London, and ten miles east of Chichester. Arundel is the premier earldom in England, belonging to the illustrious family of Norfolk; and is the only title in England that goes along with the lands. W. Long. 0. 25. N. Lat. 50. 45. Population 2700 in 1811.

ARUNDEL Oil, in the *Materia Medica*. At Bombay, Gombroon, and Surat, in the East Indies, there grows a tree which bears a nut enclosed in a rough husk, which resembles much the horse chesnut; and the kernel of the nut yields an oil by expression, which is of a purgative nature. A tea-spoonful of it is reckoned a dose. The tree goes by the name of the *arundel tree* at Bombay, and its oil by that of the *arundel oil*. Mr Sinclair, one of the surgeons belonging to the royal regiment of artillery, who was formerly surgeon to an East India ship, gave Dr Monro of London a small bottle full of this oil, which he said was much used for the cure of the dysentery in India, and that he had given it in four recent cases of dysentery with succes. Dr Monro thinks it probable that this is the oil of the purging nuts mentioned in Dale's Pharmacologia, which are got from the tree called *lignum moluccense, pavana dictum, fructu avellanæ*, J. B. 1. 342; and *pinus Indica, nucleo purgante*, C. B. 492; and the *palma Christi Indica*, Tournefort Mat. Med.

ARUNDELIAN MARBLES, OXFORD MARBLES, or PARIAN CHRONICLE, are ancient stones (as has been supposed), whereon is inscribed a chronicle of the city of Athens, engraven in capital letters in the island of Paros, one of the Cyclades, 264 years before Jesus Christ. They take their first name from Thomas earl of Arundel, who procured them out of the East, or from Henry his grandson, who presented them to the university of Oxford.

The Arundelian marbles, in their perfect state, contained a chronological detail of the principal events of Greece during a period of 1318 years, beginning with Cecrops, before Christ 1582 years, and ending with the archonship of Diognetus, before Christ 264. But the chronicle of the last 90 years is lost; so that the part now remaining ends at the archonship of Diotimus, 354 years before the birth of Christ; and in this fragment the inscription is at present so much corroded and effaced, that the sense can only be discovered by very learned and industrious antiquaries; or, more properly speaking, supplied by their conjectures.

This chronicle, and many other relicks of antiquity, real or pretended, were purchased in Asia Minor, in Greece, or in the islands of the Archipelago, by Mr William Petty, who in the year 1624 was sent by Thomas

Arundelian.

Thomas earl of Arundel for the purpose of making such collections for him in the east. They were brought into England about the beginning of the year 1629, and placed in the gardens belonging to Arundel house in London.

Soon after their arrival they excited a general curiosity, and were viewed by many inquisitive and learned men; among others by Sir Robert Cotton, who prevailed upon Selden to employ his abilities in explaining the Greek inscriptions. Selden and two of his friends, Patrick Young, or, as he styled himself in Latin, *Patricius Junius*, and Richard James, immediately commenced their operations, by cleaning and examining the marble containing the Smyrnean and Magnesian league, and afterwards proceeded to the Parian chronicle. The following year Selden published a small volume in quarto, including about 39 inscriptions copied from the marbles.

In the turbulent reign of Charles I. and the subsequent usurpation, Arundel house was often deserted by the illustrious owners; and, in their absence, some of the marbles were defaced and broken, and others either stolen or used for the ordinary purposes of architecture. The chronological marble, in particular, was unfortunately broken and defaced. The upper part, containing 31 epochas, is said to have been worked up in repairing a chimney in Arundel house.

In the year 1667, the Hon. Henry Howard, afterwards duke of Norfolk, the grandson of the first collector, presented these supposed remains of antiquity to the university of Oxford.

Selden's work becoming very scarce, Bishop Fell engaged Mr Prideaux to publish a new edition of the inscriptions, which was printed at Oxford in 1676. In 1732 Mr Maittaire obliged the public with a more comprehensive view of the marbles than either of his predecessors. Lastly, Dr Chandler published a new and improved copy of the marbles in 1763, in which he corrected the mistakes of the former editors; and in some of the inscriptions, particularly that of the Parian chronicle, supplied the *lacunæ* by many ingenious conjectures.

The Arundelian marbles have generally been regarded as a curious monument of antiquity. They were, however, discovered in some instances to be inconsistent with the most authentic historical accounts; Sir Isaac Newton and several other modern philosophers paid little or no regard to them; and of late their absolute authenticity has been severely questioned in an express dissertation upon the subject, entitled *The Parian Chronicle*. In this dissertation much ingenuity as well as judgment, and a great extent of ancient learning, are displayed. His doubts, the author observes, arise from the following considerations.

I. "The characters have no certain or unequivocal marks of antiquity." The Π and Σ, which frequently occur in the form supposed to be the most ancient (viz. the perpendicular line of the Π on the right hand only half as long as that on the left, and the Σ in the form of a prostrate Ξ), are so well known, that any modern fabricator of a Greek inscription, which he intends to impose upon the world as a relick of antiquity, would most probably use them in preference to the more common and ordinary forms. But the letters in the Parian chronicle have no appearance of antiquity except this very equivocal one. They do not in the least resemble the Sigean, the Nemean, or the Delian inscriptions, which are supposed to be of a more ancient date. They differ in many respects from the letters on the Marmor Sandvicense, which, according to the learned editor of that inscription, was engraved in the year before Christ 374. They bear no sort of resemblance to the characters on the Farnesian pillars, to those of the Alexandrian manuscript, or others of a later date. They seem, continues our author, to resemble perhaps more than any other the letters of the alphabet taken by Montfaucon from the Marmor Cyzicenum at Venice. They are plain and simple in their form, and such as an ordinary stonecutter of the present age would probably make, if he were employed to engrave a Greek inscription according to the alphabet now in use. The small letters intermixed among the larger have, in the opinion of our author, an air of affectation and artifice, rather than genuine antiquity; and he is persuaded, that the antiquity of an inscription can never be proved by the mere form of the letters, because the most ancient characters may be as easily counterfeited as those which compose our present alphabets.

That the learned reader may form a competent idea of the characters in the Parian chronicle, the author has compared them with those of other inscriptions, and given what is usually termed a *fac simile*.

In regard to several *archaisms*, as they are called, in this chronicle, and which our author specifies, he contends, that no conclusion can be drawn from them in favour of its antiquity. What reason could there be, he asks, for introducing these into the Parian chronicle? We do not usually find them in Greek writers of the same age, or even in those of the most early date. The reign of Ptolemy Philadelphus, with the 21st year of which the date of the chronicle coincides, was not an age of rude antiquity with respect to the Greek language; being only 130 years after the time of Xenophon and Plato, when the Greek was spoken and written in its utmost purity and elegance: and we can scarcely suppose, that even a stonecutter, in that refined age, would have been permitted to disgrace a superb and learned monument with such barbarisms as occur in the chronicle. The archaisms, however, he remarks, are not uniformly observed in this inscription. He adduces six instances of deviation; and adds, he is almost tempted to suspect, that εμ Παρω, εμ Μαραθωνι, and other pretended archaisms, are owing to a mere affectation of antiquity, or to a corrupted dialect and pronunciation in later ages. Those archaisms, our author acknowledges, appear on other marbles: but he thinks, that, for that very reason, they would naturally be adopted by the fabricator of a supposititious inscription; and the authenticity of those inscriptions in which they appear must be established before they can be urged in opposition to the present argument.

II. "It is not probable that the chronicle was engraved for *private use*."—Our author thinks it an impossible supposition that such an expensive and cumbersome work could have been executed by a private citizen, either for his own amusement, or for the benefit of his fellow citizens. In the first place, a long inscription could not be engraved in marble without such an expence as few learned Greeks were able to afford. Or,

Arundelian.

Or, if its author, by an uncommon felicity, was able to erect such a literary monument, the scheme would have been useless and imprudent; as all the contents of the inscription might have been published more commodiously and effectually by the common mode of writing in use at that time.

A variety of arguments is adduced, illustrating the superiority of a manuscrpt to such an inscription as the chronicle, in a number of respects; and enforcing the improbability of its having ever been executed, either for public or private use. Much evidence from ancient history is likewise produced in support of the assertion, that the common mode of writing, in the reign of Ptolemy Philadelphus, was not on stones. It is not, however, necessary to prove, by the testimony of ancient authors, that books were written on parchment, or paper made of the Egyptian papyrus, or any such materials, before the date of the Parian chronicle. This is sufficiently evinced by the very existence of the writings of Moses, David, Solomon, and the Jewish prophets; the works of Homer, Hesiod, Anacreon, Pindar, Æschylus, Sophocles, Euripides, Herodotus, Hippocrates, Aristophanes, Thucydides, Xenophon, Plato, Demosthenes, Aristotle, &c.: And it is still more incontestably proved by the libraries which were collected in preceding ages, or about that time; such as those of Polycrates in Samos, Pisistratus and Euclides at Athens, Nicocrates in Cyprus, Euripides the poet, Aristotle the philosopher, Clearchus at Heraclea Pontica, and the most extensive and magnificent library of Ptolemy Philadelphus in Egypt, founded in or before the year 284, which in his time is said to have contained 100,000 volumes, and to have been enlarged by his successors to the amount of almost 600,000. Not long afterwards a library was founded at Pergamus by Attalus and Eumenes, which, according to Plutarch, contained 200,000. These are clear and decisive proofs that the common mode of writing in the time of Ptolemy Philadelphus was not on stones.

III. "The chronicle does not appear to have been engraved by *public authority*."

1. The first argument in support of this opinion is, that inscriptions of that kind usually begin with a particular form, as, Η ΒΟΥΛΗ ΚΑΙ Ο ΔΗΜΟΣ. 'The senate and the people;' or thus, ΕΔΟΞΕΝ ΤΗΙ ΒΟΥΛΗΙ ΚΑΙ ΤΟΙ ΔΗΜΩΙ, 'It pleased the senate and the people, &c.' But the Parian chronicle begins in the manner of a private man, speaking of his own performance in the first person singular. This argument, our author remarks, cannot be much affected by observing, that the beginning of the inscription is obliterated; for it is necessarily implied by the words now remaining.

2. The facts and dates which are mentioned in this chronicle, do not appear to have been extracted from any public records, or calculated to answer the purpose of authentic documents; as many eminent princes and magistrates are passed over without notice; in several instances, the transactions of whole centuries are omitted; and the facts, chiefly specified, are not matters of general or national importance.

3. The Parian inscription is such a one as we can hardly suppose the magistrates or the people of Paros would have ordered to be engraved. Stately sepulchres, pillars, triumphal arches, and the like, were erected to perpetuate the glory of eminent men. The remembrance of events in which nations were interested, the succession of princes, &c. were preserved in the same manner. Leagues, decrees, and laws, were likewise engraved on marble or brass, and fixed to a pillar, the walls of a temple, or other public buildings; because such inscriptions were designed for the inspection of the people, as they essentially concerned their conduct, their property, their liberty, or their lives. But, our author asks, for whom could the chronicle of Paros be intended? It contains no encomiums of any of the patriots, the heroes, or the demigods of the country, no decrees of the magistrates, no public records, no laws of state. On the contrary, it is a work of mere speculation and learning, in which the inhabitants of that island, especially the common people, had not the least interest or concern.

Arundelian.

These words at the beginning, αρχοντος εμ Παρῳ, would naturally lead us to suppose, that the inscription related to Paros. And, if so, it would have been natural for the author to have mentioned some of the most important occurrences in the history of that island. But, says this acute and learned critic, what scheme does our chronologer pursue on this occasion? Does he record the events and revolutions of his own country? Does he mention any of the battles, sieges, and treaties of the Parians? any of their public institutions? any of their poets, patriots, or warriors? Does he mention Archilochus, who was honoured by his countrymen, and distinguished as a poet in a general assembly of the Greeks? Not a syllable on any of these subjects! On the contrary, he rambles from place to place, and records the transactions of Athens, Corinth, Macedon, Lydia, Crete, Cyprus, Sicily, Persia, and other foreign countries with which Paros had no connexion.

In this view the inscription seems to have been as impertinent in the island of Paros, as a marble monument would be in this country, recording the antiquities of France or Spain; or one in Jamaica recording the revolutions of England. But upon supposition that the inscription is a forgery, it is easy to account for this extraordinary circumstance. A few chronological occurrences in the ancient history of Paros would not have been so interesting to the generality of readers, or so valuable in the estimation of every lover of antiquities, or, in short, so profitable to the compiler, as a general system of Grecian chronology.

IV. "The Greek and Roman writers, for a long time after the date of this work, complain that they had no chronological account of the affairs of ancient Greece." This position is confirmed by the testimony of Julius Africanus, Justin Martyr, Plutarch, Josephus, Varro, Diodorus Siculus, and others; and the following series of interrogatories is subjoined: "Thucydides, I know, lived 140 years before the chronicle is said to have been written; but if Thucydides, as well as other writers, complained that there was nothing but uncertainty in the earlier period of Grecian history, from whence can we suppose the author of this inscription collected such a clear, determinate, and comprehensive system of chronology? If he had any sources of information, which were unknown to succeeding writers, how happens it, that they should all of them overlook this most considerable, most exact, most creditable author?

Arundelian.

thor? Why did they omit this ancient account of their early ages? Why did they not copy his most memorable epochas? Why did they not produce his authority? or, at least, why did they not mention his opinion? Surely nothing, to all appearance, could be more elaborate, more important, or of higher authority, than a chronological table, which was thought worthy of being engraved on marble.

V. "The chronicle is not once mentioned by any writers of antiquity." This, indeed, appears a strong argument against its authenticity. Apollodorus, an Athenian, the disciple of Aristarchus the grammarian, and Panætius the philosopher, wrote a genealogical and historical work on the early ages of Greece; but, though composed 120 years after the date of the Parian chronicle, it does not contain the smallest traces of a systematical chronology. It is remarkable, too, that the chronicle of Apollodorus is quoted by Diodorus Siculus, Strabo, Plutarch, A. Gellius, Lucian, and many other writers of antiquity; while the Parian chronicle, which comprehends a more extensive period, is entirely unnoticed. It contains, however, such wonderful discoveries in ancient history, that if it had existed 264 years before the Christian era, it must have excited a general attention, and been referred to as an authority by writers of succeeding times. But we do not find, in any author of antiquity, either poet or historian, geographer or chronologer, mythologist or scholiast, the most distant allusion to the Parian chronicle; though it was such a common practice among the ancients to mention the works of their predecessors, that in many books we find references and allusions to three, four, five, six, or seven hundred different authors of every denomination.

VI. "Some of the facts mentioned in the chronicle seem to have been taken from writers of a later date." Our inquirer collates several passages in the Parian chronicle with parallel passages in Greek authors, to evince that there is, in the former, an appearance of imitation, or a stronger resemblance than such as may be supposed to arise from accident; that there are likewise some improbabilities attending the account of Deucalion, as related in the Parian chronicle; and that the names of six, and, if the lacunæ are properly supplied, the names of 12 cities appear to have been engraved on the marble, exactly as we find them in Ælian's Various History. But there is not, our author observes, any imaginable reason for this particular arrangement. It does not correspond with the time of their foundation, with their situation in Ionia, with their relative importance, or with the order in which they are placed by other eminent historians. The argument by which our author endeavours to prove that the Parian chronicle has, in this instance, copied Ælian's Various History, seems decisive of the fact. He observes, that six names may be transposed 720 different ways; and that 12 names admit of 479,001,600 different transpositions. Supposing, then, that there is no particular reason for one arrangement rather than another, it will follow, that the chance of two authors, placing them in the same order, is, in the former case, as 1 to 720; and in the latter, as 1 to 479,001,600. It is therefore, says he, utterly improbable, that these names should have been placed in this order on the marble, if the author of the inscription had not transcribed them from the historian. Arundelian.

It may indeed be urged, with regard to this similarity of arrangement in the Parian chronicle and Ælian's Various History, that the inference might be the very inverse of that which is specified by our author. But that Ælian should have seen the Parian chronicle, without once mentioning it; or that he should have exactly copied a list of towns, arranged neither according to chronological or topographical order, is indeed a supposition equally improbable with the other.

VII. "Parachronisms appear in some of the epochas, which we can scarcely suppose a Greek chronologer in the 129th Olympiad would be liable to commit." After specifying these, our inquirer asks, Would a writer of reputation and learning, in one of the most polished and enlightened eras of ancient Greece, commit such mistakes, in opposition to the positive attestations of the most accurate historians, in events of public notoriety? Would a private citizen, or a magistrate of Paros, order a crude and inaccurate series of epochas to be engraved at a great expence, and transmitted to posterity on a marble monument? It is hardly probable.

VIII. "The history of the discovery of the Parian chronicle is obscure and unsatisfactory." Our author observes, that it is attended with some suspicious circumstances, and without any of those clear and unequivocal evidences which always discriminate truth from falsehood. There are no data in the inscription by which to discover the place where the marble was erected. The place likewise where it was found is not ascertained; though the generality of writers who have had occasion to mention it have supposed that it was found in the island of Paros. If it was erected at Smyrna, as some imagine, our author asks for what purpose does the writer mention Astyanax the archon of Paros, and not one circumstance relative to Smyrna? If, adds he, it was erected at Paros, why does he not mention more archons of that city than one? or how shall we account for his profound silence with respect to all the events and revolutions which must have happened in that island, and have been infinitely more interesting to the natives than the transactions of any foreign country!

The train of circumstances by which the Parian chronicle came into the possession of Mr Petty, whom Lord Arundel had sent into the east for the purpose of collecting antiquities, as well as the subsequent conduct of Peiresc its former owner, affords our author a strong presumption, that "the inscription was actually fabricated, with the view of obtaining for it a high price, upon the pretence that it was a relick of great antiquity. It is certain, that there is something mysterious in the conduct of the first ostensible proprietors. These marbles had been totally unknown, or unnoticed, for almost 1900 years, and at last are dug out of the ground—nobody can tell us when or where!"

IX. "The literary world has been frequently imposed upon by spurious books and inscriptions, and therefore we should be extremely cautious with regard to what we receive under the venerable name of antiquity." This proposition is illustrated by a great variety

Arundelian ‖ Arusini.

riety of examples, and very properly exposes the forgeries which have disgraced the republic of letters in different ages; and although one of the more recent ones cited, namely, Ossian's poems, be a point very far indeed from being established, yet that deceptions of this kind have been practised is an unquestionable fact.

In endeavouring, towards the end of his dissertation, to investigate the time of the supposed forgery, he observes that the 16th century, and the prior part of the 17th, produced a multitude of grammarians, critics, and commentators, deeply versed in Grecian literature, and amply qualified for the compilation of such a chronological system as that of the Arundelian marbles. Above all, the science of chronology was particularly studied and investigated about that time; "Nunc fervet chronologia," says Scaliger in the year 1605, "omnes hoc ferrum excalfaciunt." Casaubon treats those persons with contempt who were unacquainted with the improvements which had been made in that department of learning after the revival of letters. Innumerable systems of chronology had been published before the year 1625: from which it was easy to extract a series of memorable events, and give the compilation a Grecian dress. "The avidity," says our author, "with which all relicks of antiquity were then collected, and the high price at which they were purchased, were sufficient inducements to any one, whose avarice or whose necessity was stronger than his integrity, to engrave his labours on marble, and transmit them to Smyrna, as a commodious emporium for such rarities."

The precise period of the fabrication, however, must still be reckoned apocryphal and uncertain. The sum of fifty guineas, which Peiresc gave to the supposed fabricator, was inadequate to such a laborious and expensive work. Upon the whole, perhaps, it would be too hasty to pronounce decisively that this famous chronicle, so long respected, is an imposition upon the public. It may, however, be safely affirmed, that the suspicions against it are extremely strong, and the objections already cited of a nature very difficult to be removed. No attempts have yet been made with this view: But under some future article, as CHRONOLOGY, MARBLES, or PARIAN *Chronicle*, we may possibly have an opportunity of resuming the subject with additional information.

ARUNDO, the REED. See BOTANY *Index*.

ARUSINI CAMPI (erroneously written *Taurasini* by Cluverius), plains in Lucania, famous for the last battle fought between the Romans and Pyrrhus. That prince being at Tarentum, and hearing that the two new consuls Curius Dentatus and Cornelius Lentulus had divided their forces, the one including Lucania and the other Samnium; he likewise divided a chosen detachment of his army into two bodies, marching with his Epirots against Dentatus, in hopes of surprising him in his camp near Beneventum. But the consul having notice of his approach, marched out of his intrenchments with a strong detachment of legionaries to meet him, repulsed his vanguard, put many of the Epirots to the sword, and took some of their elephants. Curius, encouraged by this success, marched into the Arusian fields, and drew up his army in a plain, which was wide enough for his troops, but too narrow for the Epirot phalanx to act with its full effect. But the king's eagerness to try his strength and skill with so renowned a commander, stimulated him to engage at that great disadvantage. Upon the first signal the action began; and one of the king's wings giving way, victory seemed to incline to the Romans. But that wing where the king fought in person repulsed the enemy, and drove them to their intrenchments. This advantage was in great part owing to the elephants; a circumstance which Curius perceiving, commanded a body of reserve, which he had posted near the camp, to advance and attack those animals with burning torches; which frightened and annoyed them to such a degree, that they wheeled about, broke into the phalanx, and put that body into the utmost disorder. The Romans taking advantage of this confusion, charged with such fury that the enemy were entirely broken and defeated. Pyrrhus retired to Tarentum, attended only by a small body of horse, leaving the Romans in full possession of his camp; which they so much admired, that they made it a model which they followed ever after.

Arusini ‖ Arx.

ARUSPICES, or HARUSPICES, in Roman antiquity, an order of priests who pretended to foretel future events by inspecting the entrails of victims killed in sacrifice; they were also consulted on occasion of portents and prodigies. The haruspices were always chosen from the best families; and as their employment was of the same nature as that of the augurs, they were as much honoured. Their college, as well as those of the other religious orders, had its particular registers and records.

ARX, in the ancient military art, a town, fort, or castle, for defence of a place.

The arx in ancient Rome was a distinct edifice from the capitol, though some have confounded the two. According to Ryckius, the arx, properly speaking, was a place on the highest part of the Capitoline mount, stronger and better fortified than the rest, with towers and pinnated walls: in which was also the temple of Jupiter Capitolinus.

ARX also denotes a consecrated place on the Palatine mount, where the augurs publicly performed their office. Some will have the arx to have been the augural temple; but Varro expressly distinguishes between the two.

ARX was particularly used for a public place in Rome, set apart for the operations of the augurs. In which sense arx amounts to the same with what is otherwise called *auguraculum* and *auguratorium*, and in the camp *augurale*. Out of this arx it was that the *feciales*, or heralds, gathered the grass used in the ceremony of making leagues and treaties.

ARX Britannica, a citadel of Batavia, whose foundation is seen at low water, near the old mouth of the middle Rhine: some imagine it the pharos or high tower of Caligula, as Suetonius calls it; a monument of Caligula's sham conquest of Britain. Others that it was built by Drusus, with an altar afterwards by Claudius, on his expedition into Britain. But the usual passage was from Gessoriacum; and Suetonius expressly says, Claudius passed over thence. The ancient name of this citadel, now covered by the sea, is nowhere expressed: Now commonly called *t'Huis Britten*, or *Brittenburg*; that is, *Arx Britannica*; but from what authority does not appear.

ARYTENOIDES,

Aryte-noides ‖ Asa.

ARYTENOIDES, in *Anatomy*, the name of two cartilages, which, together with others, constitute the head of the larynx. It is also applied to some muscles of the larynx.

ARYTHMUS, in *Medicine*, the want of a just modulation in the pulse. It is opposed to *eurythmus*, a pulse modulated agreeably to nature.

ARZILLA, a very ancient maritime town of Africa, in the kingdom of Fez, about five leagues from Tangiers. It is built at the mouth of a river, and inhabited by Moors and Jews, who carry on no trade. It was formerly a Roman colony; afterwards fell under the government of the Goths; and was next taken by the Mahometans. Alphonso of Portugal, surnamed the African, took it by assault in 1471, and brought away the presumptive heir of the crown. After that prince came to the throne, he besieged it, in 1508, with 100,000 men; but was obliged to abandon the undertaking. However, at length the Portuguese forsook it of their own accord. W. Long. 5. 30. N. Lat. 35. 30.

AS, in antiquity, a particular weight, consisting of 12 ounces; being the same with *libra*, or the Roman pound. The word is derived from the Greek ἑις, which in the Doric dialect is used for ἑις, *one*, q. d. an entire thing; though others will have it named *as* quasi *æs*, because made of brass.

As was also the name of a Roman coin, which was of different weights and different matter in different ages of the commonwealth. Under Numa Pompilius, according to Eusebius, the Roman money was either of wood, leather, or shells. In the time of Tullus Hostilius, it was of brass; and called *as libra*, *libella*, or *pondo*, because actually weighing a pound or 12 ounces. Four hundred and twenty years after, the first Punic war having exhausted the treasury, they reduced the *as* to two ounces. In the second Punic war, Hannibal pressing very hard upon them, they reduced the *as* to half its weight, viz. to one ounce. And, lastly, by the Papirian law, they took away half an ounce more, and consequently reduced the *as* to the diminutive weight of half an ounce: and it is generally thought that it continued the same during the commonwealth, and even to the reign of Vespasian. The *as*, therefore, was of four different weights in the commonwealth. Its original stamp was that of a sheep, ox, or sow: but from the time of the emperors, it had on one side a Janus with two faces, and on the reverse the rostrum or prow of a ship.

As was also used to denote any integer or whole. Whence the English word *ace*. Thus *as* signified the whole inheritance; whence *hæres ex asse*, the heir to the whole estate.

ASA, king of Judah, succeeded his father Abijam. He pulled down the altars erected to idols, restored the worship of the true God, and, with the assistance of Benhadad king of Syria, took several towns from the king of Israel. He died 917 years before the Christian era, and was succeeded by Jehoshaphat.

Asa, among naturalists. The writers of the later ages have formed this word *asa* from the *lasar* of the ancients, and attributed it to a gum very different from that anciently known by the name they have thus corrupted.

The asa of the ancients was an odoriferous and fragrant gum; and the asa of the after ages had so little title to this epithet, that they distinguished it by one, expressing its being of an offensive or stinking smell. The Arabian writers, according to this distinction, describe two kinds of asa, the one stinking, the other aromatic; and the modern Greeks preserved the name *asa*, or *lasar*, to the stinking gum the Latins called by that name, but added a distinctive epithet to express its smell, and called it *scardolasarum*.

Asa ‖ Asar-addon.

Asa or Assa, in the *Materia Medica*, a name given to two very different substances, called *asa-dulcis* and *asa-fœtida*.

Asa-Dulcis is the same with Benzoin.

Asa-Fœtida is the concrete juice of an umbelliferous plant growing in several parts of Asia. See Ferula, Botany and Materia Medica *Index*.

ASAPH, St, a city in Flintshire, with a bishop's see; on which account principally it deserves notice, being in itself but a poor place. As a bishopric, it is of great antiquity, and was founded about the year 560, by Kentigern, a Scotsman, bishop of Glasgow. He began the church on the banks of the river Elwy, whence it is called by the Welsh *Land Elwy*, and in Latin *Elwensis*. Kentigern returning into Scotland, left a holy man his successor, St Asaph. Who was his successor is uncertain, as there are no records that mention it; and it seems rather probable that the religious settled here had been necessitated to remove to some more peaceable abode, as the country was frequently the seat of war between the English and the Welsh. This see was formerly a very wealthy one; but its revenues were greatly lessened by the profusion of Bishop Parfew, who alienated much of the lands belonging to this bishopric.

This diocese doth not contain any one whole county; but consists of part of Denbigh, Flint (where its church is), Montgomery, and Merioneth shires, and a small part of Shropshire; wherein are 121 parishes, and 131 churches and chapels, most of which are in the immediate patronage of the bishop. This see hath but one archdeaconry, viz. that of St Asaph, which is united to the bishopric, for the better maintenance thereof. This see is valued in the king's books at 187l. 11s. 6d. but computed to be worth annually 1500l. The tenth of the clergy comes to 186l. 19s. 6¼d. To this cathedral belong a bishop, a dean, archdeacon, chancellor, &c.

ASAPPES, or Azapes, an order of soldiers in the Turkish army, whom they always expose to the first shock of any enemy: to the end that the enemy being thus fatigued, and their swords blunted, the spahis and janizaries may fall on and find an easy conquest. The word is derived from the Turkish *saph*, which signifies *rank*, from whence they have formed *asphaph*, "to range in battle." The asappes are said to be held of so little value, that they frequently serve as bridges for the cavalry to pass over in bad roads, and as fascines to fill up the ditches of places besieged. They travel on foot, and have no pay but the plunder they can get from the enemy.

ASAR-addon, or Esar-Haddon, the son of Sennacherib, succeeded his father about 712 years before the Christian era, and united the kingdoms of Nineveh and Babylon. He rendered himself master of Syria; sent a colony to Samaria; and his generals took

King-

Asarina ‖ Asbestos.

King Manasses, and carried him loaded with chains to Babylon. Asar-Addon died after a reign of 12 years.

ASARINA. See CHELONE.

ASAROTA, ασαρωτα, from α and σαιρω, *I sweep*, a kind of painted pavements in use before the invention of mosaic work. The most celebrated was that at Pergamus, painted by Sesus, and exhibiting the appearance of crumbs, as if the floor had not been swept after dinner, whence, according to Pliny, the denomination. Perrault supposes them to have been a black kind of pavements of a spongy matter.

ASARUM, ASARABACCA. See BOTANY *Index*.

ASBAMEA, a fountain of Cappadocia, near Tyana, sacred to Jupiter, and to an oath. Though this fountain bubbled up, as in a state of boiling, yet its water was cold, and never ran over, but fell back again: (Philostratus, Ammian).

ASBESTOS, a native fossil stone, which may be split into threads and filaments, from one inch to ten inches in length, very fine, brittle, yet somewhat flexible, silky, and of a grayish colour, not unlike talc of Venice. It is almost insipid to the taste, insoluble in water, and possesses the wonderful property of remaining unconsumed in the fire, which only whitens it.

The industry of mankind has found a method of working this mineral, and employing it in divers manufactures, chiefly cloth and paper. The manufacture is undoubtedly difficult enough. Pliny calls the asbestos *inventu rarum, textu difficillimum*. Wormius assures us, that the method of making cloth of asbestos is now entirely unknown. And indeed one would scarcely imagine the thing practicable, without the mixture of some other pliant matter, as wool, hemp, or flax, along with the asbestos, the filaments of this latter appearing too coarse and brittle to make any tolerable fine work. However this be, Bart. Porta assures us, that in his time the spinning of asbestos was a thing known to every body at Venice. Sig. Castagnatta, superintendant of some mines in Italy, is said to have carried the manufacture to such perfection, that his asbestos was soft and tractable, much resembling lamb skin dressed white: he could thicken and thin it at pleasure, and thus either make it into a very white skin or a very white paper.

This kind of linen cloth was chiefly esteemed by the ancients; though then better known and more common than among us, being held equally precious with the richest pearls: nor is it now of mean value, even in the country where it is most generally made, a China cover (i. e. a piece of 23 inches and three-quarters long) being worth 80 tale, i. e. 36l. 13s. 4d. Pliny says, he himself had seen napkins thereof, which, being taken foul from the table after a feast, were thrown into the fire, and by that means were better scoured than if they had been washed in water, &c. But its principal use, according to Pliny, was for the making of shrouds, for royal funerals, to wrap up the corpse, so that the ashes might be kept distinct from those of the wood, &c. whereof the funeral pile was composed: and the princes of Tartary, according to the accounts in the Philosophical Transactions, still use it at this day in burning their dead. Some of the ancients are said to have made themselves clothes of it, particularly the Brachmans among the Indians. The wicks for their perpetual lamps, according to Dr Lister, were also made of it: some to this day use it for the wicks of such lamps as they would not have any trouble with; because the asbestos never wasting, there is no occasion for shifting the wick. Septalla, canon of Milan, had thread, ropes, nets, and paper made of the asbestos. A handkerchief or pattern of the linen was long since presented to the Royal Society, a foot long and half a foot broad. This gave two proofs of its resisting fire; though, in both experiments, it lost above three drachms of its weight. When taken out red hot, it did not burn a piece of white paper on which it was laid, Mr Villette pretends that his large burning concave usually vitrifies the asbestos.

Asbestos ‖ Ascendant.

The method of preparing the incombustible paper and cloth is thus described by Ciampini: The stone is laid to soak in warm water; then opened and divided by the hands, that the earthy matter may be washed out. The ablution being several times repeated, the flaxlike filaments are collected and dried; and they are most conveniently spun with an addition of flax. Two or three filaments of the asbestos are easily twisted along with the flaxen thread, if the operator's fingers are kept oiled. The cloth also, when woven, is best preserved by oil from breaking or wasting. On exposure to the fire, the flax and the oil burn out, and the cloth remains pure and white. Probably from the dissipation of some extraneous matter of this kind proceeded the diminution of weight in the handkerchief just recited; for pure asbestos leaves nothing. The shorter filaments which separate in washing the stone may be made into paper in the common manner.

The asbestos is found in Crete and Cyprus; in Tartary; at Namur in the Low Countries; in Thuringia among the mines; in the old Noricum; in Egypt; in the mountains of Arcadia; at Puteoli; in the island of Corsica; in the island of Anglesey in Wales; in Aberdeenshire in Scotland; at Montauban in France; and in Siberia.

ASCALON, an ancient city, and one of the five satrapies or principalities of the Philistines; situated on the Mediterranean, 43 miles to the south-west of Jerusalem (Antonine), between Azotus to the north and Gaza to the south. The birthplace of Herod the Great, hence surnamed *Ascalonita* (Stephanus). Famous for its scallions, which take name from this town (Strabo, Pliny). Now *Scalona*. E. Long. 34. 30. N. Lat. 31. 30.

ASCANIUS, the son of Æneas and Creusa, succeeded his father in the kingdom of the Latins, and defeated Mezentius king of the Tuscans, who had refused to conclude a peace with him. At length he founded Alba Longa; and died about 1139 years before the Christian era, after a reign of 38 years.

ASCARIS. See HELMINTHOLOGY *Index*.

ASCENDANT, in *Astrology*, denotes the horoscope, or the degree of the ecliptic which rises upon the horizon at the time of the birth of any one. This is supposed to have an influence on the person's life and fortune, by giving him a bent and propensity to one thing more than another.

In the celestial theme, this is also called the *first house*, the *angle of the East* or *Oriental angle*, and the *significator of life*. Such a planet ruled in his *ascendant*: Jupiter was in his *ascendant*, &c. Hence the word is also used in a moral sense, for a certain superiority which

Ascendant || Ascension Island.

which one man has over another, from some unknown cause.

ASCENDANTS, in *Law*, are opposed to descendants in succession; i. e. when a father succeeds his son, or an uncle his nephew, &c. heritage is said to ascend, or go to ascendants.

ASCENDING, in *Astronomy*, is said of such stars as are rising above the horizon in any parallel of the equator.

Ascending Latitude, is the latitude of a planet when going towards the north pole.

Ascending Node, is that point of a planet's orbit, wherein it passes the ecliptic, to proceed northward. This is otherwise called the *northern node*, and represented by this character ☊.

Ascending Vessels, in *Anatomy*, those which carry the blood upwards; as the aorta ascendens. See Anatomy.

ASCENSION, in *Astronomy*, is either right or oblique. Right ascension of the sun, or a star, is that degree of the equinoctial, counted from the beginning of Aries, which rises with the sun or star in a right sphere. Oblique ascension is an arch of the equator intercepted between the first point of Aries and that point of the equator which rises together with a star in an oblique sphere.

Ascension Day, a festival of the Christian church, held ten days before Whitsuntide, in memory of our Saviour's ascension into heaven after his resurrection.

Ascension Island, a barren island on the coast of Africa, lying in W. Long. 14° 22′ 31″. S. Lat. 7° 56′. The following account is given of it by Mr Forster. "This island was first discovered in 1501, by Joaõ de Nova Galego, a Portuguese navigator, who named it *Ilha de Nossa Senhora de Conceiçao*. The same admiral on his return to Portugal in 1502, discovered the island of St Helena, which obtained that name from the day of the discovery. Ascension was seen a second time by Alfonso d'Albuquerque on his voyage to India in 1503, and then received the name it now bears; but was already at that time in the same desolate condition as at present. We sent several parties on shore, who passed the night on the watch for turtles, which came to lay their eggs on the sandy shores. The dreariness of this island surpassed all the horrors of Easter island and Terra del Fuego, even without the assistance of snow. It was a ruinous heap of rocks, many of which, as far as we could discern from the ship, seemed to be totally changed by the fire of a volcano. Nearly in the centre of the island rises a broad white mountain of great height, on which we discerned some verdure by the help of our glasses, from whence it has obtained the name of *Green Mountain*.

"We landed early in the morning among some rocks, the surf being always immensely high on the great beach; which consists of minute shell-sand, chiefly of a snowy white, very deep, dry, and intolerable to the eyes when the sun shines. We ascended among heaps of black cavernous stone, which perfectly resembles the most common lavas of Vesuvius and Iceland, and of which the broken pieces looked as if they had been accumulated by art. The lava currents cooling very suddenly, may easily be imagined to produce such an effect. Having ascended about 12 or 15 yards perpendicular, we found ourselves on a great level plain of six or eight miles in circuit; in the different corners of which we observed a large hill of an exact conical shape, and of a reddish colour, standing perfectly insulated. Part of the plain between these conic hills was covered with great numbers of smaller hillocks, consisting of the same wild and ragged lava as that near the sea, and ringing like glass when two pieces are knocked together. The ground between the heaps of lava was covered with a black earth, on which we walked very firmly; but when these heaps did not appear, the whole was a red earth, which was so loose, and in such dry minute particles, that the wind raised clouds of dust upon it. The conic hills consisted of a very different sort of lava, which was red, soft, and crumbling into earth. One of these hills stands directly in front of the bay, and has a wooden cross on its summit, from whence the bay is said to take its name. Its sides are very steep, but a path near three quarters of a mile long winds round it to the summit. After examining this remarkable country a little longer, we concluded, with a great degree of probability on our side, That the plain on which we stood was once the crater or seat of a volcano, by the accumulation of whose cinders and pumice stones the conic hills had been gradually formed: that the currents of lava which we now saw divided into many heaps, had perhaps been gradually buried in fresh cinders and ashes; and the waters coming down from the interior mountain in the rainy season, had smoothened every thing in their way, and filled up by degrees the cavity of the crater. The rocky black lava was the residence of numberless men-of-war birds and boobies, which sat on their eggs, and suffered us to come close to them.

Ascension Island.

"About eight in the evening, it being then quite dark, a small vessel came into the bay, and anchored directly within us. Captain Cook having hailed her repeatedly, received in answer that she was the Lucretia, a New York sloop, which had been at Sierra Leon, and was now come to catch turtles, in order to sell them at the windward islands of the West Indies. A lieutenant was sent on board, who learned from the master, that he had taken our ship to be a French Indiaman, and was very desirous of trading with English India ships, in which he was disappointed by the company's regulations. He dined with our officers the next day, but on the 31st at day-break left the island. On the 30th in the morning, we landed a second time; and, crossing the plain, arrived at a prodigious lava current, intersected by many channels from six to eight yards deep, which bore strong marks of being worn by vast torrents of water, but were at present perfectly dry, the sun being in the northern hemisphere. In these gullies we found a small quantity of soil consisting of a black volcanic earth, mixed with some whitish particles gritty to the touch. Here we saw some small bunches of purslane, and a species of grass (*panicum sanguineum*) which found sufficient nutriment in the dry soil. Having at last, with great fatigue, climbed over this extensive and tremendous current of lava, which was much more solid than the heaps nearer to the sea, we came to the foot of the Green Mountain, which even from the ship's place in the bay we had plainly distinguished to be of a different nature from all the rest of the country. Those parts of the lava which surrounded it were covered with a prodigious quantity

Ascension Island || Ascent.

of purslane, and a new kind of fern, *lonchites Adscensionis*, where several flocks of wild goats were feeding. The great mountain is divided in its extremities, by various clefts, into several bodies; but in the centre they all run together, and form one broad mass of great height. The whole appears to consist of a gritty tophaceous limestone, which has never been attacked by the volcano, but probably existed prior to its eruption; its sides are covered with a kind of grass, peculiar to the island, which Linnæus has named *aristida Adscensionis*. We likewise observed several flocks of goats feeding on it; but they were all excessively shy, and ran with surprising velocity along tremendous precipices, where it was impossible to follow them. The master of the New York sloop acquainted us, that there is a spring of water on one part of this mountain, which falls down a great precipice, and is afterwards absorbed in the sand. I am almost persuaded, that, with a little trouble, Ascension might shortly be made fit for the residence of man. The introduction of furze (*ulex Europæus*), and of a few other plants which thrive best in a parched soil, and are not likely to be attacked by rats or goats, would soon have the same effect as at St Helena. The moisture attracted from the atmosphere by the high mountains in the centre of the island, would then no longer be evaporated by the violent action of the sun, but collect into rivulets, and gradually supply the whole island. A sod of grasses would everywhere cover the surface of the ground, and annually increase the stratum of mould, till it could be planted with more useful vegetables.

"We returned gradually to Cross Bay, in the heat of noon, over the plain; having a space of more than five miles to traverse, where the sun burnt and blistered our faces and necks, and heated the soil to such a degree, that our feet were likewise extremely sore. About three o'clock we arrived at the water's side; and after bathing in a small cove among a few rocks, we made a signal for a boat, and were taken on board. The next forenoon we made another small excursion, in company with Captain Cook, towards the Green Mountain; but we were all of us so much fatigued, that we could not reach it. We made no new observations in the course of this day, the nature of the island being dreary beyond description in its outskirts."

ASCENSIONAL DIFFERENCE, the difference between the right and oblique ascension of the same point to the surface of the sphere.

ASCENT, in a general sense, implies the motion of a body upwards, or the continual recess of a body from the earth. The Peripatetics attribute the spontaneous *ascent* of bodies to a principle of levity inherent in them. The moderns deny any such thing as spontaneous levity; and show, that whatever *ascends*, does it in virtue of some external impulse or extrusion. Thus it is that smoke and other rare bodies *ascend* in the atmosphere; and oil, light woods, &c. in water; not by any internal principle of levity, but by the superior gravity or tendency downwards of the parts of the medium wherein they are. The *ascent* of light bodies in heavy mediums is produced after the same manner as the *ascent* of the lighter scale of a balance. It is not that such scale has an internal principle whereby it immediately tends upwards; but it is impelled upwards by the preponderancy of the other scale; the excess of the weight of the one having the same effect, by augmenting its impetus downwards, as so much real levity in the other; by reason the tendencies mutually oppose each other, and that action and reaction are always equal.

Ascent || Ascham

Ascent of Bodies on Inclined Planes, the reader will find explained under MECHANICS; *Ascent of Fluids*, under HYDROSTATICS; and *Ascent of Vapours* under the article EVAPORATION.

ASCESIS, properly denotes exercise of the body. It is formed from the verb ασκειν, used by the ancients in speaking of the sports and combats of the athletæ.

ASCESIS is also used by philosophers, to denote an exercise conducive to virtue, or to the acquiring a greater degree of virtue. This is particularly denominated the *philosophical ascesis*, because practised chiefly by philosophers, who make a more peculiar profession of improving themselves in virtue; on the model whereof the ancient Christians introduced a religious ascesis.

ASCETERIUM, in ecclesiastical writers, is frequently used for a monastery, or place set apart for the exercise of virtue and religion. The word is formed from *ascesis*, "exercise;" or *ascetra*, "one who performs exercise." Originally it signified a place where the athletæ or gladiators performed their exercises.

ASCETIC, an ancient appellation given to such persons as, in the primitive times, devoted themselves more immediately to the exercises of piety and virtue, in a retired life; and particularly to prayer, abstinence, and mortification. The word is derived from ασκεω, *exerceo*, "I exercise." Afterwards, when the monks came in fashion, this title was bestowed upon them; especially upon such of them as lived in solitude.

ASCETIC is also a title of several books of spiritual exercise.—As, the *Ascetics*, or devout exercises of St Basil, archbishop of Cæsarea in Cappadocia.

We also say the *ascetic* life, meaning the exercise of prayer, meditation, and mortification.

ASCHAFFENBURG, a town of Germany, seated on the river Maine, in the circle of the Lower Rhine, formerly belonging to the elector of Mentz, but now to the king of Bavaria. It is memorable for being the place where the king of Great Britain took up his quarters the night before the battle of Dettingen. E. Long. 9. 5. N. Lat. 49. 54.

ASCHAM, ROGER, an Englishman of considerable learning in the 16th century, was born at Kirby Wiske, a village in Yorkshire, near Northallerton. John Ascham, his father, was house-steward in the family of Scroop, and by his wife, Margaret, was connected with several respectable families. A short time before his death, Sir Anthony Winfield, having conceived a predilection for his third son Roger, took him into his family, and extended his bounty so far as to give him the advantage of a private education along with his own sons. Under a domestic tutor, he made a rapid progress in classical learning, and early discovered a great partiality for reading. The superiority of genius and docility of temper which he constantly displayed,

Ascham. displayed, induced his patron to send him to St John's college, Cambridge, in the year 1530.

The revival of Grecian and Roman literature at the period Ascham entered upon his studies, was peculiarly favourable to the natural bent of his inclination. A desire of excelling uniformly influenced his conduct, and adopting the maxim, *Qui docet, discit*, he began to teach boys the rudiments of the Greek language, as soon as he was acquainted with the elementary parts himself. His plan was approved by Pember; and under the direction of this valuable friend, he soon became acquainted with the best Greek and Latin authors. But he took particular delight in reading Cicero and Cæsar; and upon them he formed the elegance of his Latin style, which proved so honourable and so advantageous in the after part of his life.

Ascham took his first degree of bachelor of arts in the 18th year of his life, and was chosen fellow of the college about a month afterwards. The favourable disposition, however, which he manifested towards the reformed religion, was no small obstacle in the way of his preferment. He was elected master of arts in the year 1537, the 21st of his age; and about this period he began to act in the capacity of a tutor.

His reputation for Greek learning soon brought him many pupils; and these were so well instructed, that several of them afterwards arose to considerable eminence. Of these, William Grindall was one of the most distinguished, who obtained the station of master of languages to the lady Elizabeth, upon the recommendation of Sir John Cheke. It appears uncertain why Ascham himself was not appointed to that honourable station, but his partiality for the university seems, from a hint in one of his letters, to have been the cause. At that period there was no particular chair appropriated to the Greek language; but Ascham was appointed by the university to read lectures upon that language in the schools. A dispute arose in the university at that time about the pronunciation of the Greek language, in which Ascham first opposed the method observed by Sir John Cheke and Sir Thomas Smith; but, upon more mature deliberation, he adopted that method, which has ever since been practised in the English schools. Both on account of the beauty of his hand-writing, and the purity and elegance of his Latin, he was employed to write the public letters of the university.

By the advice of his friend Pember, he turned his attention to the study of instrumental music, and thereby enlivened his leisure hours, and prepared his mind for renewed exertion. In his study he also amused himself with embellishing the pages of his manuscripts with beautiful draughts; and in the field he joined in the diversion of the bow and arrow. The learned Ascham did not deem his labour improperly bestowed in writing a book entitled *Toxophilus*, in that age when the practice of fire-arms was in its infancy, and the proper use of the bow was of more importance than for mere amusement. This work was useful at that time for introducing into the English language, a more natural, easy, and truly English diction, than was formerly in use; and it also abounds with many beautiful allusions and curious fragments of English history. Ascham candidly acknowledges, that being anxious to make the tour of Italy, which was then the great republic of letters, and particularly of Grecian literature, he wished, by dedicating his book to the king, to obain a pension, to enable him to make that tour. It reflects some lustre on the benevolence of Henry VIII. that in the year 1544, he settled upon him an annual pension of 10l. which Dr Johnson, considering the circumstance of the times, estimates at the value of 100l. Upon the death of Henry, this pension was for some time discontinued, but was again renewed by Edward VI. and doubled by Queen Mary. In the same year also, Ascham obtained the appointment of orator to the university, an office which he retained with great reputation, during the period he was connected with the university. Ascham.

For some years he received an annual gratuity from Lee, archbishop of York, but to what amount is not recorded; and, in 1548, upon the death of his pupil Grindall, preceptor to the lady Elizabeth, his pupils and writings had acquired him such celebrity, that he was appointed to direct the studies of that princess. He successfully acquitted himself in that honourable charge; but two years after, from some unknown cause of dissatisfaction, he returned to the university, having taken an abrupt leave of the princess. This part of his conduct did not lessen him in the esteem of Elizabeth; for in the same year, she recalled him to court, and appointed him secretary to Sir Richard Morisine, ambassador to the emperor Charles V. In his way to London, he paid a visit to Lady Jane Gray, whom he found in her chamber, reading Plato's Phædo, in Greek, "and that," says he, "with as much delight as some gentlemen would read a merry tale in Boccace;" while the duke and duchess, and the rest of the household, were hunting in the park.

In the character of secretary to Sir Richard, besides aiding him in the management of his public affairs, he also conducted his private studies. During the mornings of four days in the week, he read with him a portion of Herodotus or Demosthenes; and, in the evenings, some pages of Sophocles or Euripides; and, on the other mornings, he wrote the letters of public business; and, on the evenings, he either wrote his own private letters, or continued his diary and remarks. While Ascham was on his travels, he made a short excursion to Italy; but was much disgusted with the manners of the people, especially of the Venetians. After his return from that tour, he favoured the world with a curious tract, entitled "A Report and Discourse of the Affairs and State of Germany," &c.

Upon the death of Edward VI. Morisine was recalled, and Ascham returned to the university. But through the interest of Bishop Gardiner, the fortune of Ascham soon took a favourable turn, who although he knew him to be a Protestant, obtained him the office of Latin secretary to the queen, with liberty to retain his university emoluments, and the additional salary of 10l. a-year. The prudence of Ascham enabled him to act a respectable part, both under the intolerant reign of Mary, and also in the most perilous situations during the reign of Elizabeth; and the readiness and elegance of his Latin style, rendered him a useful member at court. He is reported to have written, during the course of three days, 47 letters to persons in the highest ranks of life.

When the crown passed to a Protestant prince, it

Ascham ‖ Ascites.

made little alteration in the condition of Ascham, who still retained his station. He spent several hours every day in reading the learned languages with the queen; and her proficiency was equal to his labours, and it might have been expected, that his rewards would have been more ample than 20l. per annum, together with the prebend of Westwang. Some have alleged, that the queen kept him poor, because, it is said, he was addicted to cock-fighting, and in other respects extravagant; but the defects in his character should not have deprived him of the rewards due to actual services.

In consequence of a conversation which took place in the apartment of Secretary Cecil, upon the subject of education, Sir Richard Sackville, who was present, requested him to write a book on the general subject of education. This work is entitled "The Schoolmaster;" and while it displays the humanity of the author, contains many excellent instructions to the teachers of youth. This treatise was published by his widow after his death. By too close application to composing a poem, which he intended to present to the queen on the new year's day of 1569, he was seized with an illness, which proved fatal, and he died in the 53d year of his age, on the 23d of December, 1568. His death was universally lamented, and the queen expressed her regret, by saying, that, "she would rather have lost 10,000l. than her tutor Ascham." His epistles, which are valuable, both on account of their style and historical information, were published after his death, and dedicated to the queen; and his other works have since been collected into one volume by Bennet.

Roger Ascham appears to have been possessed of an amiable disposition, kind to his friends, and grateful to his benefactors. Although he was firm in his adherence to his religious opinions, yet his zeal did not carry him to excess in opposing those of other men. His talents both as a man and as a scholar were very considerable, and he deserved more ample returns for his services than were conferred upon him by those who enjoyed the benefit of his labours in the advancement of solid learning and correct taste. (*Gen. Biog.*).

ASCIBURGIUM, in *Ancient Geography*, mentioned by Tacitus, supposed to be one of the 50 citadels built on the Rhine; who adds, some imagined it was built by Ulysses. Here was a Roman camp and a garrison. To its situation on the banks of the Rhine answers a small hamlet, now called *Asburg* not far from Meurs, in the duchy of Cleves.

ASCIDIA. See HELMINTHOLOGY *Index.*

ASCII, among *Geographers*, an appellation given to those inhabitants of the earth, who at certain seasons of the year have no shadow: Such are all the inhabitants of the torrid zone, when the sun is vertical to them.

ASCITÆ, (from ασκος, a *bag* or *bottle*), in antiquity, a sect or branch of Montanists, who appeared in the second century. They were so called, because they introduced a kind of Bacchanals into their assemblies, who danced round a bag or skin blowed up: saying, they were those new bottles filled with new wine whereof our Saviour makes mention, Matth. ix. 17.—They are sometimes also called *Ascodrogitæ*.

ASCITES, in *Medicine*, the dropsy of the abdomen. See MEDICINE *Index*.

ASCLEPIA, a festival of Æsculapius the god of physic, observed particularly at Epidaurus, where it was attended with a contest between the poets and musicians, whence it was likewise called Ἱερος Αγων, *the sacred contention.*

Asclepia ‖ Asculum Apulum.

ASCLEPIAD, in *Ancient Poetry*, a verse composed of four feet, the first of which is a spondee, the second a choriambus, and the two last dactyls; or of four feet and a cæsura, the first a spondee, the second a dactyl, after which comes the cæsura, then the two dactyls; as, *Mœcenas atavis edite regibus.*

ASCLEPIADES, one of the most celebrated physicians among the ancients, was a native of Prusa in Bithynia; and practised physic at Rome, under Pompey, 96 years before the Christian era. He was the head of a new sect; and, by making use of wine and cold water in the cure of the sick, acquired a very great reputation. He wrote several books, which are frequently mentioned by Galen, Celsus, and Pliny; but they are now lost.

ASCLEPIADES, a famous physician under Hadrian, of the same city with the former. He wrote several books concerning the composition of medicines; both internal and external.

ASCLEPIAS, SWALLOW-WORT. See BOTANY *Index.*

ASCODUTÆ, in antiquity, a sect of heretics in the second century, who rejected all use of symbols and sacraments, on this principle, That incorporeal things cannot be communicated by things corporeal, nor divine mysteries by any thing visible.

ASCOLI, formerly *Asculum Apulum*, a pretty large and populous town of Italy, in the marquisate of Ancona, and territory of the church. It is a bishop's see, and seated on a mountain, at the bottom of which runs the river Fronto. E. Long. 15. 20. N. Lat. 42. 27.

ASCOLI *de Satriano*, formerly *Asculum Picenum*, an episcopal city of Italy, in the kingdom of Naples; seated on a mountain. E. Long. 15. 5. N. Lat. 42. 8.

ASCOLIA, in Grecian antiquity, a festival celebrated by the Athenian husbandmen in honour of Bacchus, to whom they sacrificed a he-goat, because it destroys the vines (*Ovid. Fast.* i. 457.); and, to show the greater indignity to an animal hated by Bacchus, the peasants, after having killed him, made a foot-ball of his skin. Virgil has beautifully described the occasion of the sacrifice and manner of celebrating the festival, *Georg.* ii. 380.

ASCRIPTITII, or ADSCRIPTITII, were a kind of villains, who, coming from abroad, settle in the lands of some new lords, whose subjects or servants they commence; being so annexed to the lands, that they may be transferred and sold with the same. Adscriptitii is sometimes also used in speaking of aliens or foreigners newly admitted to the freedom of a city or country.

ASCRIPTITII was also used in the military laws for the recruits appointed to supply the losses of the legions, called also *Accensi.*

ASCRIVIUM, in *Ancient Geography*, a town of Dalmatia, on the Sinus Rhizicus (Pliny, Ptolemy): Now *Cattaro* (Harduin); the capital of the territory of Cattaro, in Venetian Dalmatia. E. Long. 19. 20. Lat. 45. 25.

ASCULUM APULUM, in *Ancient Geography*, a town of Apulia, much mentioned in the war with Pyrrhus

Asculum Apulum || Ashby de la Zouch.

Pyrrhus (Florus, Plutarch): Now called *Ascoli;* a city of the Capitanata, in the kingdom of Naples. E. Long. 16. 30. N. Lat. 41. 15.

Asculum Picenum, in *Ancient Geography*, a town of the Piceni (Cæsar); and the capital (Florus): Now *Ascoli*, in the marquisate of Ancona, on the river Fronto. E. Long. 15. 5. N. Lat. 42. 50.

ASCYRUM, Peter's-wort. See Botany *Index.*

ASDRUBAL, the name of several Carthaginian generals. See Carthage.

ASEKI, or Asekai, the name which the Turks give to the favourite sultanas who have brought forth sons. These are greatly distinguished above others in their apartments, attendants, pensions, and honours.

ASELLUS, in *Zoology*, the trivial name of a species of oniscus. See Oniscus, Entomology *Index.*

ASGILL, John, a late humorous writer, was bred to the law, and practised in Ireland with great success. He was there elected a member of the house of commons, but was expelled for writing a treatise on the possibility of avoiding death; and being afterwards chosen a member for the borough of Bromber in Sussex, he was also on the same account expelled the parliament of England. After this, he continued 30 years a prisoner in the Mint, Fleet, and King's-bench; during which time he published a multitude of small political pamphlets, several of which were in defence of the Hanoverian succession, and against the pretender. He died in the rules of the King's-bench, in the year 1738, when he was upwards of fourscore.

ASH. See Fraxinus, Botany *Index.*

ASHANTEE, an extensive territory of western Africa, situated immediately behind the states which occupy the Gold coast. This kingdom, which was but lately known to Europeans, seems to be the most powerful, civilized, and commercial of any on the western coast of Africa. Since 1806 they have had various wars with the tribes on the coast, and from their superior courage and skill, are likely to conquer this whole region.

Ash-Hole, among chemists, is the lowest part of a furnace; and is intended to receive the ashes falling from the fire, and to give a passage to the air which is to be introduced into the furnace, to keep up the combustion.

Ash-Wednesday, the first day of Lent; supposed to have been so called from a custom in the church, of sprinkling ashes that day on the heads of penitents then admitted to penance. See Lent.

ASHBORN, a town in Derbyshire, seated between the rivers Dove and Compton, over which there is a stone bridge, in a rich soil. It is a pretty large town, and contained 2112 inhabitants in 1811. W. Long. 1. 35. N. Lat. 53. 0.

ASHBURTON, a town in Devonshire. It sends two members to parliament, and is one of the four stannery towns. It is seated among the hills, which are remarkable for tin and copper; and has a very handsome church. It contained 3053 inhabitants in 1811. It gives title of Baron to the family of Dunning. W. Long. 3. 10. N. Lat. 50. 30.

ASHBY de la Zouch, a market-town of Leicestershire, situated in W. Long. 1. 20. N. Lat. 52. 40. It had a castle which was long in the possession of the family of de la Zouch. It afterwards fell into the hands of Edward IV. who granted it to Sir Edward Hastings, created Baron Hastings, with license to make a castle of the manor-house, to which he adjoined a very high tower. It was demolished in 1648; but a great part of the tower is still standing. The town contained 3141 inhabitants in 1811.

Ashby de la Zouch || Ashmole.

ASHDOD, or Azotus. See Azotus.

ASHES, the earthly particles of combustible substances after they have been burnt.

If the ashes are produced from vegetable bodies they contain a considerable quantity of fixed salt, blended with earthy particles: and from these ashes the fixed alkaline salts called *pot-ash*, *pearl-ash*, &c. are extracted. See Chemistry *Index.*

The ashes of all vegetables are vitrifiable, and found to contain iron.—They are also an excellent manure for cold and wet grounds.

Several religious ceremonies depend upon the use of ashes. St Jerome relates, that the Jews in his time rolled themselves in ashes, as a sign of mourning. To repent in sackcloth and ashes, is a frequent expression in Scripture for mourning, and being afflicted for our sins. There was a sort of ley and lustral water made with the ashes of a heifer sacrificed upon the great day of expiation; the ashes whereof were distributed to the people, and this water was used in purifications, as often as any touched a dead body, or was present at funerals, (Numb. xix. 17.). Tamar after the injury received from her brother Amnon, covered her head with ashes, (2 Sam. xiii. 9.). The Psalmist in great sorrow says, that he had eaten ashes as if it were bread, (Ps. cii. 9.); which, however, is to be considered as an hyperbole. He sat on ashes, he threw ashes on his head; his food, his bread, was spoiled with the ashes wherewith he was covered.

The ancient Persians had a sort of punishment for some great criminals, which consisted in executing them in ashes. The criminal was thrown headlong from a tower 50 cubits high, which was filled with ashes to a particular height, (2 Mac. xiii. 5. 6.). The motion which the criminal used to disengage himself from this place, plunged him still deeper into it, and this agitation was further increased by a wheel which stirred the ashes continually about till at last he was stifled.

ASHFORD, a market town of Kent, situated about 12 miles south-west of Canterbury, in E. Long. 45. and N. Lat. 51. 15.

ASHLAR, a term used among builders; by which they mean common or free stones, as they come out of the quarry, of different lengths and thicknesses.

ASHLERING, among builders, signifies quartering, to lath to, in garrets, about two and a half or three feet high, perpendicular to the floor, up to the under side of the rafters.

ASHMOLE, Elias, an industrious English antiquarian, and an eminent philosopher of the 17th century, was born at Litchfield in 1617. Having enjoyed the advantages of a country education, he went to London at the age of 16, and resided in the family of James Paget, Esq. one of the barons of the exchequer, and then turned his attention to the law and other branches of literature. In the year 1638, he married, and commenced the business of attorney in London. When

Ashmole.

When the civil war began, he then being a widower, entered into the king's service in the ordnance department. When residing in the city of Oxford in that capacity, he entered Brazen Nose college, and began the study of natural philosophy, mathematics, and astronomy. Naturally inclined to grave and scientific trifles, he wandered too far into the wilds of astrological imposture, not a little encouraged by several eminent men of that age. From the same cause, he entered keenly into the secrets of masonry, and made considerable additions to the history of that sect.

When Worcester was surrendered to the parliament in 1646, Ashmole retired to London, where he became acquainted with the famous astrologers, Moore, Lilly, and Booker.

Having retired to Berkshire in the year following, he added the knowledge of botany to his other acquirements. There he became acquainted with Lady Mainwaring, a well-jointured widow, whom he married in 1649; and although her estate was sequestered on account of his loyalty, yet through the interest of Lilly and others, he again recovered his property, and afterwards settled in London, where his house became the resort of all the curious literati of the place. A taste for chemistry, or rather alchemy, was produced, by his conversation with William Blackhouse; and Ashmole, under a feigned name, published a work upon that subject. The next effort of his industry, was a collection of the manuscripts of English alchemy, which he published under the title of *Theatrum Chymicum Britannicum*, in 4to. This work was the effect of great labour and much expence; and although it procured him much fame among the learned, yet it was only a collection of *Alchemy;* and he appears to have been ignorant of real chemical knowledge. About this period, he began to number among his acquaintances, Selden, Oughtred, and Dr Wharton.

The wealth he acquired by his marriage engaged him in several disputes, and the lady herself at last made an attack upon him in chancery, but he was honourably acquitted, and the lady restored to her affectionate husband. His active industry never wearied out, and he next attended to the study of antiquity and the investigation of records. Along with Sir W. Dugdale, he about this period traced a Roman road to Litchfield. Abandoning all other pursuits, he began to make preparations for his "History of the order of the Garter;" a production which procured him lasting fame. Upon a visit to Oxford, he gave a full description of the coins bequeathed to that university by Laud; and about this time, John Tradescant, the famous gardener of Lambeth, presented him with the collection of curiosities, which both he and his father had procured.

Upon the restoration, Ashmole was greatly respected by the king, who made him Windsor herald, and employed him to give a description of the royal medals. The offices of commissioner and comptroller of excise were conferred upon him; and being called to the bar in the Middle Temple, he was afterwards admitted a fellow of the Royal Society. The university of Oxford conferred upon him the degree of doctor of physic; and several other employments and emoluments were given him, until he rose to the highest eminence in the literary world. About this time his second wife died, and he married the daughter of his friend Sir W. Dugdale. In May 1762, he addressed his great work on the order of the Garter to the king, entitled "The institution, laws, and ceremonies of the most noble order of the Garter; collected and digested into one body, by Elias Ashmole of the Middle Temple, Esq. Windsor herald at arms," folio, London, 1672. In favour of his brother-in-law, Mr Dugdale, he resigned his office of herald of Windsor; and when offered the office of garter king-at-arms, he declined it in favour of Sir W. Dugdale. About this time a fire broke out in one of the chambers of the temple adjacent to his, and consumed a library which he had been collecting during the course of thirty-three years, together with 9000 coins, and many valuable antiquities; but his manuscripts and gold medals fortunately were saved. In 1683, he sent his manuscripts and curiosities to the university of Oxford, which laid the foundation of the *Musæum Ashmoleanum*, still in Oxford. On the death of Sir W. Dugdale, he refused a second time the office which he held. At the advanced age of 76, he died, and was interred in the church of Great Lambeth. Industry, perseverance, curiosity, and accuracy, appear to have been the leading features in his character. (*Gen. Biog.*).

Ashmole, Asia.

ASIA, according to the ancients, was one of the three great divisions of the earth, and is considered by the moderns as one of the four quarters of the habitable globe. Its extent is immense; and its importance, both in a historical and in a philosophical point of view, is very great. It contains every variety of soil and climate, and is inhabited by nations which possess undoubted claims to the highest antiquity. When Europe was yet covered by deep forests, thinly inhabited by a few wild animals, or by a barbarous race of men, destitute of science, and even of the meanest of those accommodations which the progress of art now enables all classes of people to enjoy, Asia abounded with flourishing cities and populous nations, in which commerce and agriculture had reached a considerable measure of improvement.

1
The countries of Asia to be considered as connected with each other.

The revolutions which have occurred in different regions of the great Asiatic continent, occupy a great space in the general history of the human race. These revolutions have possessed this peculiar character, that when they commenced in one quarter of Asia, we most frequently find that they extended themselves, in a few years, to the remotest regions, and even sometimes into the centre of Europe. As the human mind usually derives its character from the situation in which it is placed, we shall be enabled, by attention to the soil and climate, and geographical position of the principal parts of Asia, to form some general principles from which to deduce the causes that have influenced the destiny of the nations by which it is inhabited. Without enlightened notions of general geography, history degenerates into a mere detail of romantic adventures, and no valuable progress can be made in political or in commercial science. We shall here therefore give a general description of this vast continent, considering it, as far as possible, as one great whole, the various parts of which have at times possessed an influence over each other; leaving its particular districts and countries, to be separately discussed as they occur in the arrangement of our work, unless in such in-

stances

Asia.

stances as may seem to claim special notice from the singularity of their nature, or the recentness of the period at which time they have come to the knowledge of the European nations.

2 Boundaries of Asia.

Beginning with its north-west corner adjoining to Europe, the boundary of Asia commences at Waigats straits, opposite to the island of Nova Zembla, in what is called the *Northern ocean* or *Icy sea*. From thence the boundary extends southward along the Uralian chain of mountains, which are thus accounted half European and half Asiatic. After leaving these mountains, Asia is understood by geographers, to proceed in a south-westerly direction, through the provinces of the Russian empire, till it meets the river Don, where it approaches nearest to the Wolga. Proceeding along the river Don, it enters into the Black sea, which it crosses diagonally, proceeding to the south-west through the straits of the Bosphorus, at Constantinople, and through the Propontis and Hellespont; from whence turning south it proceeds through the Archipelago, and the eastern part of the Mediterranean sea called the *Levant*, to the isthmus of Suez, a narrow neck of land of 60 miles over, which divides Asia from Africa. The remaining part of the western boundary of Asia, is formed by the Red sea or Arabian gulf, which is connected with the Arabian sea, by the strait of Babelmandel.

The southern boundary of Asia, is formed by the great Indian ocean, under a variety of names derived from the different parts of the Asiatic coast, which are washed by its waters. Along the whole of this southern boundary, the ocean and the land alternately encroach upon each other, thereby forming immense bays and gulfs of the ocean, and peninsulated tracts of land. Thus to the eastward of the straits of Babelmandel, the Indian ocean advances northward under the appellation of the Arabian sea, having the peninsula of Arabia on the west, and the western peninsula of India on the east. Penetrating still farther north, it receives the name of the gulf of Ormus, and afterwards of the Persian gulf, which advances very far in a north-westerly direction, having Arabia on the south-west, and Persia on the north-east. The same Arabian sea in its north-eastern extremity, making a slighter inroad upon the land, receives the river Indus on the east of Persia, and is called the gulf of Scindi. To the eastward of the nearest peninsula of India, the same Indian ocean forms a most extensive gulf, called the *bay of Bengal*, bounded on the east and west by the two Indian peninsulas. The farther peninsula stretches to a great distance southward under the name of *Malacca*, beyond which the boundaries of the continent assume in general an easterly direction, more especially after passing the gulf of Siam, immediately beyond Malacca and the gulf of Tonkin, on the boundaries of China and of the farther India. The Chinese empire encroaches eastward upon the great Pacific ocean, which is here the boundary of Asia. Its coasts are sufficiently regular. Its bays and gulfs are trifling when compared with those of the Indian ocean, although towards its northern extremity, the Pacific ocean, under the name of the *Yellow sea*, advances into the continent, forming to the eastward the peninsula of Corea, of moderate extent. After which this eastern ocean passing the isles of Japan, at a great distance to the north, again encroaches on the land, forming the sea or great bay of Ochotsk, which has the peninsula of Kamtschatka on its eastern side, and the country of Siberia or the mainland of Asia on the west. Beyond Kamtschatka one more gulf is formed in that direction, called the *sea of Anadyr*, terminating in the gulf of Notchen, to which succeeds the peninsula of Tschutski, stretching to the eastward, till it approaches the coast of America at the bay of St Laurence. After which, turning to the westward, the Asiatic continent is entirely bounded on its northern side by the Icy sea, forming obscure gulfs and promontories, of which little knowledge has yet been obtained, and which can never be of much importance to the human race.

Asia.

3 Extent of the Asiatic continent.

The great continent whose general outline we have thus slightly traced, must necessarily vary considerably in breadth and length, according to the points from which an estimate of its mensuration is formed. Some idea, however, may be obtained of the territory included in it, from observing that the continent of Asia, from the Hellespont at 26° of E. Long. extends to nearly 190° E. Long. at East Cape, or to the 170° of W. Long. being a line of 164° or 9500 geographic miles, allowing 60 miles to a degree. The extreme breadth of this continent, from the south cape of Malacca, in 2° of N. Lat. to Cape Severo Vostochnoi, in 77° N. Lat. amounts to about 4500 geographic miles. Hence the length of the continent of Asia is not less than 7583 British miles, and its breadth from south to north is about 5250.

4 Relative position of the nations of Asia.

That the relative situation of the nations inhabiting this continent may be rightly understood, it is necessary to remark that the centre of Asia consists of an immense and irregular plain, which is elevated to a vast height above the surrounding countries, and extends some thousand miles in every direction. This elevated region or high level of land, stands aloft like a table, and is supported by a crest or front of lofty and precipitous rocks, which overlook in every direction the surrounding regions. The high level, or elevated territory, which these rocks surround and seem to uphold on all sides, constitutes the proper country of Tartary. The climate, even in latitude 27°, which elsewhere is extremely hot, is here very cold, and the soil is barren. In some directions, to the extent of 1000 miles, nothing is to be found but frightful deserts, covered with moving sands, which at times are carried aloft, as in Arabia and Africa, by the winds. They are rendered passable by ridges of mountains which divide them; and the summits of these mountains are covered with perpetual snow. Even where the soil seems more favourable, only the hardiest plants and trees can flourish in this barren region, whose inhabitants have in all ages remained in the pastoral state, subsisting by the produce of their flocks and herds, without engaging in the labours of agriculture.

5 High region in the centre of Asia.

6 Distribution of the countries of Asia.

This vast upland tract, which is probably the highest region of the old hemisphere, and which forms the largest extent of continued elevated land upon the globe, contains in general the tract or countries of the Kalmucs, of the Mongols, Thibet, and Eastern Turkestan, or the original country of the Turks. From the borders of this tract in the centre of Asia, the great rivers of that continent descend towards the ocean in every direction; such as the *Oxus* and *Jaxartes*

on,

Asia.

on the west, the *Amur* on the east, the *Ganges* and *Burrampooter* on the south, and the *Oby* and *Jenisea* on the north. The countries that surround this tract are, therefore, justly considered by Major Rennel and others, as a kind of inclined planes or hanging levels, or descents along the skirts of it, seeing the waters flow so regularly and uninterruptedly from it, as from a common centre, to all the surrounding seas. On the south of this elevated region, are the vast countries of India, descending gradually to the great southern or Indian ocean. They receive from their exposure the fiercest rays of a tropical sun, and are sheltered by the rocky front of the high country behind them from every northern blast. On the west of the elevated tract, are the countries which formed the ancient Persian empire, and which, in like manner, descend gradually, though more irregularly, towards the setting sun, and the territory of Europe. On the east of the high table, or elevated central region, is the immense empire of China, descending with its rivers towards the great Pacific or Eastern ocean. On the north of the same region is Siberia, descending gradually to the Icy sea. The high country to the south intercepts from Siberia the heated air which might otherwise advance towards it from a more fervid climate, while its gradual descent towards the north exposes it unprotected to every blast that may ascend from the icy regions of the pole, and thus the climate is rendered as much too cold in proportion to its latitude, as India is too hot. The soil, however, of Siberia, is in many places equal in fertility to that of almost any other country of the globe, and it has only been prevented from rising into importance, by the intolerable severity of a long winter, which has always operated as a tax upon the industry of its inhabitants, to prevent any great increase of population. Its rivers are bound up during half the year, under a covering of almost impenetrable ice; and the ocean into which they flow, can at no season be navigated with safety, a circumstance which banishes those resources which an extensive commerce might afford, to compensate the evils of the climate.

Geog. of Herodot.

7 Alluvions of the Asiatic rivers.

It may here be remarked, that the rivers which descend towards the south, from the high centre of Asia, through countries subject to periodical rainy seasons, have by their *alluvions*, or by carrying down immense quantities of mud and earth, formed vast fertile plains near the sea coasts, similar in their nature to the Delta, or rich valley of Lower Egypt. Accordingly, in the south of Asia, from Persia to China; near the mouths of the Indus, the Ganges, and other rivers, immense tracts of level country are found, which are periodically overflowed, and which, aided by the warmth of the climate, exhibit a degree of fertility in all the productions of the vegetable world, of which in our temperate and colder regions we have little conception.

8 Boundaries of the high level.

The high level of which we have now spoken, which is of so much importance both to the geography and to the history of Asia, is bounded, as already mentioned, on all sides by a crest or ridge of mountains, adjoining to which are lesser chains of hills, which gradually subside in the neighbouring low countries. The great ridge called *Imaus* by the ancients, or the *Indian Caucasus*, is properly the crest or front of the western declivity towards Persia. The part of this crest or the front of the high level towards the south was anciently called *Emodus*, and sometimes also *Imaus*, of which it is a continuation. The modern name is *Hindoo-Kho*.—The northern front of the high territory which overlooks the Baikal lake, and the whole length of Siberia, is of immense extent, and is usually called by historians the *Altaic* ridge or chain. The appellation of the front of the same high country towards China is little known to European geographers, but it forms in itself nothing more than a continuation of the ridges of Imaus and Altai surrounding the high country of Tartary.

Asia.

9 Chain of mountains proceeding from the high level.

This high country or elevated level, which may with propriety be called *Grand Tartary*, sends forth in different directions various ramifications of itself, or chains of mountains, to the utmost extremities of Asia. Thus it sends forth eastward a chain of mountains to the gulf of Corea to the northward of Pekin. This chain appears like a continuation of the Altaic mountains, which may thus be considered as proceeding from the 70° to the 140° of east longitude, or about 5000 miles. Another mountainous chain proceeds north-eastward to the gulf or sea of Ochotsk opposite Kamtschatka. A similar ridge, called the *Uralian chain*, proceeds to the north-west, and terminating in the vicinity of Nova Zembla, within the polar circle, has already been mentioned as one of the boundaries which divide Asia from Europe. Another chain, better known to both ancient and modern writers, proceeds from Imaus, or the front of the great high level, westward, under the celebrated name of *Mount Taurus*, and terminates in the Mediterranean sea at the peninsula of Lesser Asia. This important ridge has on the one side, or to the south, a great part of the ancient Persian empire, and on the north the great salt lake called the *Caspian sea*, and also the Black sea, with the high country of Georgia between them, which anciently received the appellation of the *Grecian Caucasus*.

10 Western Tartary.

A great tract of low country which lies to the east and to the north of the Caspian, and proceeds westward along the shores of the Black sea, also receives from modern geographers the appellation of *Tartary*, and was anciently denominated *Scythia*. Hence what is called *Tartary* must be regarded as consisting of two very distinct tracts of country situated upon very different levels. Eastern Tartary, lying beyond the mountains of Imans and southward of the mountains of Altai, constitutes the high level or elevated central region of Asia; whereas the country called *Tartary* situated upon the Caspian and the Black seas, now sometimes called *Russian Tartary*, is not only situated upon a lower level, but instead of consisting of a horizontal plane, it lies upon a south exposure, and its rivers, such as the Wolga and the Don, descend southward into the Caspian and the Black seas, which are placed along the northern basis of the ridge of mountains anciently denominated *Taurus*. Beyond the sources of the Don and the Wolga, however, the country begins to descend towards the polar circle and the Icy sea, like the rest of Siberia, of which it partakes the name.

11 Asia divided into civilized and barbarous.

In all ages Asia might be divided into two regions; the civilized, containing men who cultivated the soil and lived in cities; and the barbarous, whose inhabitants subsisted by hunting or by the pastoral life. To the

Asia.

the former belonged the three countries which descend from the elevated region of Asia on the east, the south, and the west, forming the empires of China, of India, and the ancient Persian empire, extending to the Hellespont. To the barbarous or uncivilized nations have always belonged the far more extensive tracts of Siberia, of High Tartary, and of the Western or Lower Tartary, which lies to the north of the Caspian sea, of Mount Caucasus, and of the Black sea. On the south-west of Asia also a different race of barbarians, engaged in a great measure in a similar life of pasturage, under the denomination of *Arabs*, have occupied an immense portion of territory; and both of these classes of barbarians, the Tartars of the east and north, and the Arabs of the south-west, have at times acted a most important part in the affairs of Asia, and even of Europe; and by their movements have decided the destiny of nations.

12 Knowledge of Herodotus concerning Asia.

The knowledge of the ancients concerning Asia appears to have been extremely limited. Herodotus, like all the ancient writers, admitted the existence of a northern ocean, upon the shores of which the Hyperboreans were supposed to exist, a peaceful race of men, upon whom nobody made war, and who never disturbed the tranquillity of other nations. He was also acquainted with the existence of various Scythian, or, as we now call them, *Tartar* tribes, inhabiting the country to the north of the Black sea and the Caspian, and upon the river Jaxartes, which he understood to flow into the lake Aral to the eastward of the Caspian. But Herodotus did not believe in the existence of an eastern ocean, or that Asia was in that quarter bounded by the sea. He also extended Europe indefinitely to the east, including all in that division of the globe that lies to the northward of Mount Caucasus and the Caspian sea. To the eastward of what he called Asia, that is, the Persian empire, he considered India as the last inhabited country, asserting, that "the Indians are the people of Asia that are nearest the east and the place of the rising sun." Beyond India he confessed that he knew nothing. "As far as India (says he) Asia is well inhabited; but from India eastward the whole country is one vast desert, unknown and unexplored." In these times, therefore, it is certain that the Greeks knew nothing of the vast empire of China and its dependencies, or of the peninsula beyond the Ganges, which forms the eastern division of India. Indeed it would appear that the elevated region of Tartary formed in these early times an impenetrable barrier which divided the western nations of Asia from those on the east. Neither does it appear that Herodotus was well acquainted with the southern frontiers even of Persia and Arabia. The whole Arabian sea, including the Arabic gulf, was called the *Erythrean* or *Red sea*; but he does not seem to have known that the sea bordering upon the ancient kingdom of Persia or Persia Proper, is itself nothing more than a gulf like that which divides Arabia from Egypt and Ethiopia, to which the name of *Red sea* is now exclusively confined.

13 The Macedonian expedition falsified the geography of Asia.

It is a circumstance not a little singular, that the visit of Alexander the Great to India through Persia did by no means extend the limits which preceding geographers had assigned to Asia. A correct knowledge of the coast of the conquered empire of Persia was indeed acquired, but neither to the east nor to the north was any knowledge gained. The high ridge of Imaus, forming the front of the elevated region of Tartary, was denominated by the geographers of Alexander the *Indian Caucasus*, probably from some obscure notion, that this ridge was a continuance of the mountains of that name between the Euxine and Caspian seas. Beyond India also he admitted of no tract of land whatever, thus making India the most eastern country of Asia, and consequently of the whole earth, although Herodotus had placed a vast desert beyond it. But it is probable that this diminution of territory to the eastward might be a sacrifice to the vanity of Alexander, who wished to imagine, and to make others believe, that he had approached the world's boundary. In another point also the geography of Asia was falsified by the followers of this conqueror. Herodotus had rightly described the Caspian sea as a great lake, but the followers of Alexander imagined they had discovered it to be a gulf of the northern ocean. With this ocean, therefore, they were under the necessity of supposing it to communicate by a narrow channel; a circumstance which led them to limit the continent to a very trifling extension northward. The knowledge which Herodotus possessed concerning the unconnected state of the Caspian in respect of other seas being thus lost, its geographical position as a lake remained unknown in the times of Eratosthenes, Strabo, and Pliny. It was, however, regained in the age of Ptolemy, who restored its form of a lake, but under such dimensions and proportions as demonstrate that the smaller lake, called *Aral*, which is 200 miles to the eastward, was mistaken for a part of it.

Asia.

14 Mount Taurus of the ancients.

The most remarkable feature in the ancient Greek and Roman descriptions of Asia, that is, of the country to the westward of Imaus, and to the south of the Caspian sea, is the high ridge of mountains which they in general denominated *Taurus*. This ridge was to them as it were a line of separation between two worlds, the civilized and the barbarous; or two climates, the warm and fertile, and the cold and barren. As Taurus, however, is at times broken into distinct chains of mountains which occasionally alter their general direction, various names were ascribed to particular parts of it, such as Niphates, Caspius, Paropamisus, Caucasus, Emodus, &c. The general chain, however, or the Taurus of the ancient geographers, originated in the south-west extremity of what they called *Asia Minor*, that is, the small part of Asia embraced between the Euxine or Black sea on the north, the straits of the Hellespont and the Dardanelles on the west, and the Levant or eastern part of the Mediterranean sea on the south. The ridge of Taurus was understood to pass eastward through lesser Asia at no great distance from the shores of the Levant. From thence, in its course eastward, it separated Armenia from Mesopotamia, the two countries called *Media* from each other, and the greater Media from the narrow tract along the southern border of the Caspian sea. Opposite to the south end of the Caspian its inferior ridges were divided by a vast chasm called the *Caspian straits*, which was with the ancients an important geographical point, being supposed to be in the same parallel with Issus and Rhodes. This remarkable chasm or strait formed the best road or passage from Media, Mesopotamia, and the western

15 The Caspian strait.

Asia.

western countries in general, to Parthia, Hyrcania, Aria, and others on the east, because by it considerable deserts to the south might be avoided. Alexander the Great passed through it in his way from Rages towards Aria and Baetria. It is at present called the *strait of Khoward*, from a town or district in the neighbourhood, and is almost due north from Ispahan: it is eight miles through, and is in general not more than 40 yards in breadth. Pliny says, that it is only wide enough for a carriage, and modern writers have said that where it is narrowest and most winding, a litter can scarcely pass. The mountains are very lofty on each side. The bottom is upon the whole flat, and at certain seasons a considerable stream of salt water flows along it towards the desert on the south.

After having passed the south-east corner of the Caspian, Taurus proceeding farther eastward, was understood by the ancients, and represented, as separating the countries of Parthia, Margiana, and Bactria, on the north, from those of Aria, Drangiana, and the north-western provinces of India, watered by the heads of the Indus. Here Taurus was known to meet the lofty ridge of Imaus, which we have already mentioned as the western front of the elevated region that forms the centre of Asia. But as this general account of the opinions of the ancients concerning the course of these mountains can give little idea of the general level of the countries through which they pass, we shall here notice more particularly the elevation of these countries, and the way in which they are divided from each other. In doing so we shall chiefly follow the authority of the learned and accurate Major Rennel; and we prefer the use of ancient appellations to the names assigned to these provinces by the barbarians who now inhabit or rather wander over them.

16 Elevation or level of countries westward from Imaus.

We have said, that from Imaus, or from the high region of central Asia, or Great Tartary, the country descends gradually towards the west, forming what was called *Asia* by the ancients, but what was in truth little more than the Persian empire. In departing from Imaus, however, the country is very elevated, and various ridges occur, which gradually, after assuming a variety of forms, unite in the ridge which terminates far to the west at the extremities of the Lesser Asia, and was called *Mount Taurus*, as already stated. In their progress the valleys or ordinary country near these mountains gradually becomes lower as it proceeds towards the west, and the mountains themselves decline in height. Even in the west, however, the mountains appear not a little elevated.

17 Most westerly territory lowest.

Returning from the west, or beginning with the peninsula of Asia or Asia Minor, which is enclosed on three sides by the Mediterranean, Ægean, and Euxine seas, it is to be remarked that even this tract acquires speedily a considerable elevation; but the southern part of Lesser Asia towards the Mediterranean is by far the highest, being the proper Taurus itself, rising abruptly from the neighbourhood of the sea-coast, and turning the courses of the principal waters towards the Euxine sea on the north.

18 Second portion higher.

The next portion of territory is still more elevated, extending from the Euxine to the Caspian sea. To the north it sends forth a tract of very mountainous country called *Caucasus*, or the modern Georgia, which overlooks the Sarmatian plains, or, in other words, the desert of Astracan, and the country of the Tartars called *Don Cossacs*, being the low lands on the north both of the Euxine and Caspian seas. Southwards this high region, which is a part of the Taurus of the ancients, overlooks the vast low countries, in which are contained the kingdoms or states of Syria, Mesopotamia, Assyria, and Babylonia, and even the great Arabian desert. The ancient divisions of this high region were called Cappadocia, Armenia, Pontus, Colchis, Iberia, Albania, the country of the Carduchians, and a part of Media. It seems to be the highest continued tract of territory in Western Asia, giving rise to the rivers Euphrates, Tigris, Cyrus, Araxes, Hypanis or Kuban, and Phasis, which flow from it in different directions towards the Euxine or Caspian seas, or the Persian gulf. It is worthy of remark, that in the higher parts of this region two great salt lakes are to be found.

Asia.

19 Eastern tract highest.

Advancing eastward is a third portion of still more elevated territory, extending from the Caspian sea to the lofty Imaus, or western crest of the great Asiatic highlands. This third region is still higher than the two former parts of the tract of Mount Taurus. Its breadth is very various. Its western quarter is limited by the approach towards each other of the Caspian and Persian seas; but the high country expands to a much greater breadth beyond the Caspian, till it is again narrowed on its approach to Imaus by two valleys, along the one of which flows the river Indus to the south, and along the other the Oxus to the north-west, anciently terminating in the Caspian sea, but now in the sea or lake of Aral. Of this third portion of the high country of Western Asia the northern part between the Caspian sea and Mount Imaus contains the ancient Parthia, Margiana, and Sogdiana, which overlook towards the north the low countries of Western Tartary, in that quarter called *Chorasmia*, and the seats of the Massagetæ (the ancient Magog) at the Jaxartes. The middle part of the high country contains Aria and Baetriana, adjoining on the east to Mount Imaus. The southern part of the same elevated region contains Persia Proper, Carmania, Arachosia, &c. which towards the Persian gulf are bordered by the low tract of maritime Persia. The highest continuous ridge of this territory is that which passes by the south-east of the Caspian sea and Hyrcania, between Drangiana on the south and Aria on the north, and from thence between Baetriana and the provinces of India; where, as it approaches Imaus, which, as already stated, is the front of a yet more elevated region, it swells to an immense magnitude and height, and is covered with snow annually till the month of August.

20 Lateral ridges of Taurus.

From this tract of elevated country, which we have thus described as gradually increasing in height from the Mediterranean to Mount Imaus, various lateral ridges project towards the south, forming between them different hollow basons or low countries. But these southern projections are not equal in altitude to the great chain that proceeds from west to east. The most westerly of these cross ridges is that which begins from the body of Taurus, near the place where it is crossed by the Euphrates, at the northern extremity of Syria. The ridge proceeds to the south, inclining to the west, and forms a kind of mound or dam, skirting the eastern shore of the Mediterranean, under the names

Asia. names of Amanus, Lebanon, &c. Having passed the Mediterranean and the southern border of Palestine, it advances to the eastern coast of the Red sea, where it spreads out, and forms the centre of Arabia, finally terminating in what is called *Arabia Felix*, or the southern part of the Arabian peninsula. Asia.

Farther to the east another ridge proceeds towards the south, which was called by the Greeks *Zagros*, and advances to the neighbourhood of the Persian gulf. Between this last ridge on the east, and the former, or Syrian ridge, on the west, and Taurus on the north, is a great valley or tract of low country that formed the ancient empire of Assyria, which was guarded in this manner by a wall of mountains on three sides, and by the Persian gulf and the Arabian desert on the south. It is watered by the fertilizing streams of the Tigris and Euphrates, upon which Nineveh and Babylon formerly stood. To the eastward the country becomes more dry and elevated. Passing through Media, a great salt desert occupies the centre of the country, having Persia Proper on the south, and Parthia on the north; and continuing still to ascend, the mountains become more numerous and less regular, in proportion as they approach Imaus. These regions, however, are of great importance in ancient history as the seats of civilization and of empire, though they are now sunk into obscurity, and a prey in a great measure to tribes of barbarians, who wander over them with their flocks and herds, and reside in tents. The eastern part of the countries known to the ancients as Asia, or rather as the Persian empire, still retains that name; but to the westward of the Euphrates Asia belongs to Turkey, excepting the great country or peninsula of Arabia, of which we shall here take some general notice.

21 Arabia. This country is worthy of the utmost attention in a historical point of view, on account of the influence which its inhabitants have had upon a great part of the nations of Asia, and consequently upon a large portion of the human race. They have contrived to extend themselves farther over the world than almost any other people, and have preserved in all situations more strongly than other nations, their language, religion, manners, and peculiar customs. From the river Senegal, on the west coast of Africa, to the Indus, colonies of Arabs are to be met with, and also from the heads of the Euphrates on the north to the island of Madagascar. Even the Tartar hordes have scarcely occupied a wider extent on the globe.

22 Boundaries of Arabia. Arabia, properly so called, is that great peninsula formed by the Red sea, or Arabic gulf, on the west, the Indian ocean, or Arabian sea, on the south, and the Persian gulf on the north-east. Accordingly, the ancients appear to have comprehended under the name of Arabia, the whole tract lying between those seas and a line drawn from the point of the Persian gulf to that of the Arabic gulf. This line, however, was never the real boundary of the country, which appears to have at all times extended northwards to a great distance, and to have been limited on one side by the river Euphrates, and on the west by Syria, Palestine, and the isthmus of Suez. Thus Arabia may be regarded as a vast but irregular triangle. From the northern point at Beles, where Xenophon and the Greeks first passed the Euphrates, to the straits of Babelmandel, is a line of 1500 miles, forming the western side of the triangle, while its southern basis presents a front of 1000 miles to the Indian ocean. The medium breadth of the peninsula from Bassora on the Persian gulf to Suez on the Red sea is upwards of 700 miles. The entire surface of the country, therefore, exceeds France or Germany in a fourfold proportion. Being situated from 13° to 30° of N. Lat. and of consequence partly between the tropics, its climate must necessarily be regarded as hot. In some provinces, indeed, the heat is excessive; but in this country, as in others, the degrees of elevation of the soil produce effects upon the temperature which set aside all calculations that might be founded upon the general principle of the vicinity or remoteness of the torrid zone. To understand the varieties of climate that exist in Arabia, it is necessary to attend to the form and aspect of its surface. The whole centre of the Arabian peninsula, or interior country, consists of a succession of mountains. Around the foot of these mountains, adjacent to the sea-coast, is a belt of flat ground. This belt surrounds the whole of the Arabian peninsula. It proceeds along the shores of the Red sea, of the Indian ocean, and of the Persian gulf. Even the desert of Syria on the north may be considered as a part of this belt. It extends everywhere to the distance of about two days journey from the sea, and is denominated *Tehama* by the Arabs. This belt of flat land is dry and sandy, and presents one unvaried picture of desolation. It bears every mark of having been anciently a part of the bed of the sea. Its bottom soil is a grayish clay, with a large proportion of sand, and having remains of marine animals interspersed to a great distance from the shore. It contains large strata of salt, which in some places even rise up into hills. Its regular inclination towards the sea indicates that it has emerged gradually; and the sea seems still continuing to recede. The banks of coral are still increasing, and coming nearer to the shore, so as to render the navigation round Arabia every day more and more dangerous. The sand accumulated by the billows gradually fills up the intermediate space, and joins these beds of coral to the continent. This recession of the sea, however, or conquest over the watery element, has produced little advantage to man. The Tehama is everywhere a frightful desert of sand, diversified only by naked rocks, with nothing to soften the force of the sun's rays, and in which all vegetation is burnt up. The drought is so extreme in these flat plains, that whole years pass without rain; and the torrents which descend from the hills, which occupy the interior of the country, are lost among the sands long before they can reach the sea.

In the interior country, the soil and climate are very different. The great ranges of lofty mountains attract vapours, which, descending in abundant rains, cool the air, and quicken vegetation. The cold occasioned by the height of the country produces falls of snow, but this never lies long upon the ground. While the inhabitants of the plains suffer by heat, those of the hills are obliged to wrap themselves in pelices; but as the hills or mountains are by no means of the primary order in point of elevation, ice and steady frost seem to be unknown. The soil, however, is as much diversified as in other countries; but the figure of the hills is unfavourable to their fertility. They are in general

Asia.

so craggy and precipitous as to afford little space or soil for vegetable productions, the best part of the soil being continually washed away by the waters. Hence the culture of the land is difficult and expensive. Terraces must be formed, and the soil carefully preserved and accumulated upon them; so that, upon the whole, no part of Arabia can with any propriety be denominated rich or fertile. In the southern division of it, called by the ancients, by way of eminence, *the Happy*, or *Arabia Felix*, the inhabitants are at once industrious and poor. The desert between Syria and the Euphrates, or that part of Arabia which extends to the northward of the peninsula, is altogether incapable of improvement by culture. A wide level of sand is only intersected by sharp mountains destitute of verdure, which render more powerful by reflection the intense rays of an almost tropical sun. The rare and hardy plants, the tamarind, or the acacia, that strike their roots into the clefts of the rocks, are nourished by the dews of night. A grove of date trees, or a green pasture, attracts a small colony of Arabs; and a well of water is a place of importance and of resort.

Yet this desert is not destitute of a tolerable number of inhabitants. They rear the camel, a strong and patient beast of burden, which subsists on the most stunted and withered roots, or upon herbs of the gourd species, which abound in the driest countries. Neither are they destitute of horned cattle, and goats and sheep; and naturalists consider this as the native country of the horse, which is the peculiar favourite of the Arabians.

23
Two classes of Arabs.

Properly speaking, there are two kinds or classes of Arabs; the one sedentary, that is, living in cities, or attached to husbandry, and the other, wandering in the pastoral state, called *Bedouins*. The Arabs settled in cities, and especially in sea-port towns, of which there are several on the coasts of the peninsula, have lost somewhat of their distinctive national manners by their intercourse with strangers; but the Bedouins, who live in tents, and are divided into tribes or clans, retain the customs and manners of their earliest ancestors. They are the genuine Arabs, and possess in the aggregate all those characteristics of which the other branches of the nation exhibit different shades and degrees. It is the difference in their ways of living that constitutes the great distinction between the different tribes. The genuine and nobler Arabs disdain husbandry, as an employment by which they would be degraded. They maintain no domestic animals but sheep, camels, and horses. Hence it is known, that Mahomet, the founder of their religion, belonged to a noble tribe or race, because he was a dealer in camels. Some tribes are even mentioned contemptuously by their countrymen, because they keep cows or dromedaries; and the peasants who cultivate the soil are accounted the lowest class. Even among the tribes which apply to agriculture, the chiefs live always in tents, and leave the culture of their grounds to their subjects, whose dwellings are miserable huts.

In the interior of Arabia, towards the Indian ocean, which is chiefly the quarter capable of being cultivated, some governments exist of a considerable extent; such as Yemen and Hadramant, and Oman. In these the people are of a mild and civilized character. A stranger travels unprotected and alone with as much safety as in any country in Europe. The only danger of imposition or of ill usage occurs in the sea-port towns, from the officers of government. Here also the religion of Mahomet exhibits a less intolerant aspect than in Turkey, Africa, or almost any other country. Indeed it is not a little singular, that while this religion extended itself to the pillars of Hercules, to the mouths of the Ganges, and to the extreme regions of Tartary, several tribes of native Arabs, secure in the fastnesses of their rugged mountains, regarded it with indifference or contempt. Some tribes in the interior could never be subdued by the power of the caliphs, and retain the worship of the heavenly bodies, as in the times of their ancestors. Even a tribe of Jews has existed for ages amidst these inaccessible mountains, though the most odious of mankind in the eyes of the surrounding Mahometans.

Asia.

The Bedouins, or wandering Arabs, who constitute the body of the nation, are divided into an endless variety of tribes. Their chiefs, whether high or low, are denominated *schiecks*. These schiecks or nobles are very numerous, and the plebeians are invariably actuated and guided by them: They are both shepherds and soldiers. The dignity of schieck is hereditary, but is not confined to the order of primogeniture. The petty schiecks, who form the hereditary nobility, choose the grand schieck of any district out of the reigning family, without regarding the degree of his propinquity to his last predecessor. They pay him little or no revenue, and the other schiecks are rather his equals than his subjects. If dissatisfied with his government, they depose him, or go away with their cattle, and join another tribe. These emigrations, which happen not unfrequently, produce great revolutions among the tribes. Even the peasants possess a similar privilege. Though understood to be slaves, they may quit the service of a master with whom they are dissatisfied, and choose another. It was remarked, in the time of the Romans, that the Arabs were at once addicted to robbery and to commerce; a fact which holds true to this day. They become the faithful servants of the merchant, who hires them to conduct him through the desert; while at the same time they are extremely apt to consider the property of unprotected travellers as an object which they may lawfully seize. But it may also be remarked, that we are sometimes apt to consider as robbery what the Arabs view in another light. Every grand schieck, or schieck of schiecks, as he is called, considers himself as the absolute lord of his whole territory, and exacts duties upon all goods carried through his dominions. The Europeans are wrong when they suppose the sums paid by travellers to the grand schiecks to be a ransom to redeem them from pillage. On the contrary, it is regarded by the Arab nobles in no other light than as the duties levied in other countries by princes for the support of the government. The southern part of Arabia, called by the ancients *Arabia Felix*, has at times been subdued by strangers; but the Bedouins, who live in tents in the desert, do not appear to have ever been effectually conquered. In a contest with them, much is hazarded, and little can be won. Their horses and camels, which in eight or ten days can perform a march of 400 or 500 miles, disappear before a victorious army. The secret waters of the desert elude

the

Asia.

the search of the invader, and his troops are consumed by hunger, thirst, and fatigue, in the pursuit of an invisible foe, who mocks his efforts, and at all times finds safety in the midst of a burning solitude.

24 How far connected with foreign states.

Notwithstanding the memory of their ancient independence, even the wandering Arabs are frequently tempted to settle near towns, or in fertile provinces; which has in different ages brought them into subjection to the sovereigns of these provinces. Their neighbours, also, such as the Persians, the princes of the Greek empire, and the modern Turks, have contrived to acquire an influence over some of the tribes, by sowing dissensions among the great families, and espousing the cause of pretenders to the dignity of grand schieck. Accordingly the Turks allege that they are the sovereigns of Arabia; but this is no more than a vain-glorious assertion, which is so far from being true, that they find it necessary to pay the usual tribute to the schiecks when their caravans pass through the desert to Mecca. The tribes who live near the road keep the wells open, permit the passage of merchandise, and escort the caravans. Quarrels, indeed, often occur, in which the rapacity of the Bedouins is seldom more remarkable than the insolence of the Turks, who regard all the Arabs as rebels. The famous Ali Bey, when he conducted the Egyptian caravan, would not pay all the duties on his way to Mecca, but promised to pay the rest on his return, but forgot his promise. On the year following the Arabs assembled in greater numbers, and obliged the captain of the caravan to pay both for himself and Ali Bey. The Turks exclaimed against this as an act of robbery; yet the Arabs had only done themselves justice. The conduct of Abdalla, pacha of Damascus, who commanded the Syrian caravan in 1756, was still more odious. When the schiecks of the tribe of Harb came to meet him to receive the stipulated toll, he gave them a friendly invitation to visit him; but instead of paying the toll, he cut off their heads, and sent them to Constantinople, as a proof of his victory over the rebel Arabs. The stroke which they had thus suffered, by the death of their chiefs, hindered them from attempting any thing in revenge, on either that or the following year: The caravans travelled in triumph to Mecca, and the Turks boasted of the valour and prudence of Abdallah Pacha. But in the third year the Arabs avenged the slaughtered schiecks, and, with an army of 80,000 men, raised out of all the tribes, routed the Turks, and pillaged the caravan.—Thus the Arabs, notwithstanding their internal divisions, consider themselves on extraordinary occasions as one nation. A certain subordination even subsists among the tribes: The petty tribes being unable to defend themselves, place themselves under the protection of the greater, and are governed by their laws; and thus are powerful tribes formed by the union of several small tribes.

25 Character and food of the people.

The climate and barren soil of their country has a considerable influence on the general character of the Arabians. They are an extremely sober and frugal nation, which produces in them an appearance of leanness and stinted growth. The usual articles upon which the better sort subsist are, rice, pulse, milk, and butter: mutton is their most common species of butcher's meat, but they seldom eat of it, as all kinds of animal food are accounted unwholesome in these hot countries. The common people have little other food than a kind of bread made of *durra*, a sort of coarser millet, by kneading it with camels milk, oil, butter, or grease: They also use barley bread. Like the other natives of the warm regions of Asia, they have less restlessness or natural desire for exercise than the natives of the colder countries of Europe; and this inactivity is, no doubt, increased by their general habits of abstinence and extreme frugality with regard to food. They are astonished when they observe the quantity of all kinds of meat that Europeans devour at a meal, and account them guilty of the most odious gluttony; for they themselves, at least the wandering Arabs, are not only taught from their youth to live upon little, but even to accommodate themselves to any kind of food. Hence locusts are in common use among them, and have a considerable influence upon their condition. Immense clouds of these animals sometimes descend upon a district, and produce the greatest mischief, by destroying the whole verdure. They darken the air, and appear at a distance like clouds of smoke. The noise of their flight is stunning, like that of a waterfall. Every thing that is green is wasted by them; but corn, either ripe or nearly so, is too hard for their use. The Arabs of the desert convert this scourge to their advantage. They roast the locusts alive, and devour them eagerly; or they kill and dry them, and store them up for use: This food is said to be by no means unwholesome. The Jews of Arabia assert, that the fowls, of which the Israelites ate so largely in the wilderness or desert, were only clouds of locusts; and they ridicule our translators, for supposing that they found quails where quails never were.

Asia.

26 Their conduct towards women.

In Arabia polygamy was always tolerated, and is permitted by the law of Mahomet; but the Arabians are, in general, too poor to avail themselves of the privilege of possessing a plurality of wives. The law, however, has this effect, that it often induces the rich to give their daughters to poor men in preference to those who are wealthy. The marriage articles are made out before the cadi or judge. The wife's property is secured to her even during the marriage, so that she becomes absolute mistress of her husband's house; and he, having no separate property, can have no means of bringing another wife into the family. All women, however, in Arabia, live in a most retired manner. They receive no visits from strangers of the other sex. In the houses of the rich the front apartments belong to the men, and those behind to the women. In the houses of persons of inferior rank, destitute of a variety of apartments, when the husband carries a stranger to his house, he enters before him, and calls aloud, *tarik*, retire; upon which the women instantly disappear, and even his most intimate friends never see one of them. Their notions of the delicacy necessary to be observed, with regard to women, is extreme. It is accounted unpolite to salute a woman, or even to look her steadfastly in the face. In the neighbourhood of the city of Barra, an adventure occurred which displays in strong colours the jealousy of the Arabians in whatever concerns the other sex. A man of eminence, belonging to the tribe of Montesidsi, had given his daughter in marriage to an Arab of the tribe of Korne. Shortly after the marriage a schieck of an inferior tribe asked him in a coffeehouse, whether

27 Jealousy.

Asia.

whether he was father of the handsome young wife of such a one, whom he named? The father supposing his daughter's honour ruined, immediately left the company to stab her. At his return from the execution of this inhuman deed, he who had so indiscreetly put the question, was gone. Breathing nothing now but vengeance, he sought him everywhere; and not finding him, killed in the mean time several of his relations, without sparing even his cattle or servants. The offender offered the governor of Korne a great sum, if he would rid him of so furious an adversary. The governor sent for him who had been offended, and endeavoured by threats and a show of the apparatus of punishment to force him to a reconciliation; but the vengeful Arab would rather meet death than forego his revenge. Then the governor, to preserve a man of such high honour, soothed him to an agreement, by which the first aggressor gave his daughter, with a handsome portion, in marriage to him whom he had offended. But the father-in-law durst never after appear before his son-in-law.

28 Their vindictive spirit.

Revenge is indeed among the Arabs a most ungovernable sentiment. In some of the states of the southern part of the peninsula the government is strong enough to restrain private revenge, and to assume to itself the punishment of crimes, as in other civilized countries; but over a great part of Arabia, the relations of a person slain are allowed to accept a composition in money, to require the murderer to surrender himself to justice, or to avenge themselves on him or his family. The passion of avarice is often found to afford, among barbarians, the best means of subduing animosity; but in many places among the Arabians it is accounted disgraceful to take money for the shedding of blood, which, by their laws of honour, can be expiated only by blood. Their refined malice even refuses to be satisfied by the destruction of the assassin either by their own hands or by the hand of public justice; for this would be to deliver from an unworthy member a family which deserves no such favour from them: hence they revenge themselves, as custom allows, by substituting an innocent to the guilty person, and seek an opportunity of slaying the chief or the most considerable person of the race of him by whom they have been injured. When a murder has been committed, therefore, the two families are in continual fears till some one or other of the murderer's family be slain. Till this occur no reconciliation can take place, and the quarrel is occasionally renewed. If in the contest a man of the murdered person's family happen to fall, there can be no peace till two others of the murderer's have been slain, and there are instances of such family feuds lasting forty years.

Nor is the point of honour confined to such cases as those we have now mentioned. The noble Bedouins carry their pride higher than even our barbarous ancestors seem to have done. If one schieck says to another, with a serious air, "thy bonnet is dirty," or "the wrong side of thy turban is out," nothing but blood can wash away the reproach; and not merely the blood of the offenders, but that also of all the Arabs of his family. An insult offered to the beard of an Arab is regarded with equal indignation, and produces equal resentment.

When these capital points, however, are avoided, the Arabs are understood to be by no means quarrelsome. They take a pride in preserving their coolness of temper against reproachful language. When a dispute happens suddenly to arise among them, they make much noise, and are apt to forget themselves, and to proceed to extremities; but should an indifferent person calmly say to them, "think of God and his prophet," they instantly make an effort to resume their tranquillity, and a reconciliation is effected. If this contest cannot be settled at once, they choose arbitrators, to whose decision they submit. Asia.

29 Manners.

The manners of the Arabs are grave and serious. As soon as boys attain to five or six years of age, they pass whole days together in their father's company, and are indeed allowed to be as seldom out of it as possible. Being thus always under the eyes of persons advanced in life, they acquire a pensiveness and gravity of manners, and an air of recollection, at a very early age. Their imaginations being accustomed to barren deserts and bare rocks, are apt to acquire a gloomy cast; but in Yemen or Arabia Felix, where the soil is more fertile and the population more considerable, they posses sufficient vivacity of character, and are extremely fond of society. In the towns of Syria in which they settle, they are far more cheerful and fond of amusement than the Turks. Both there and in Arabia Felix they are fond of frequenting coffee-houses and public markets.

30 Literature.

In the earliest ages the Arabians were always accounted admirers of poetry, and were accustomed to celebrate in verse the military exploits of their chiefs. The genius and merit of a rising poet was rewarded by the applause of his own and of the kindred tribes; and they regarded him as a herald risen up to immortalize their renown. Before the days of Mahomet there existed an institution which the fanaticism of his first followers abolished. An annual fair was held, to which the most distant or hostile tribes resorted, and which lasted thirty days. For some time before and after this fair, amounting in all to two, or as some say, to four months, a general truce took place; during which every public and private quarrel was suspended throughout the whole extent of Arabia. This truce was sanctioned by the laws of honour; and, as a breach of it was attended with perpetual infamy, every sword was religiously sheathed while it lasted. At this great market not only corn and wine, but also eloquence and poetry were exchanged. The prize was disputed by the emulation of the bards, and the victorious performance was deposited in the archives of the prince; and, on some extraordinary occasions, inscribed in letters of gold, and suspended in the temple of Mecca, which even in these early times was a place of national pilgrimage. Generosity and valour formed the favourite theme of the songs of the Arabian poets; and their keenest satire or bitterest reproach against a despicable race, consisted of the affirmation, that the men knew not how to give, nor the women to deny. Such a festival, resembling, in some measure, the Olympic games of the Greeks, must have possessed considerable influence in humanizing the manners of the people. As the northern part of Arabia was situated in the very centre of the most civilized nations of antiquity, whose caravans must have been continually passing through it; its inhabitants, therefore, could not fail

at

Asia.

at a very early period, to acquire some portion of that information which an acquaintance with intelligent strangers brings along with it. As a commerce with India appears at a very early period to have been carried on by sea from the southern parts of the peninsula, it is probable that such a portion of literature as might be requisite for conducting its transactions would be cultivated by the Arabians in a very distant antiquity. Literature however was never diffused to any great extent in this peninsula. In the northern parts, indeed, or in the Syrian desert, where the Roman and Persian empires flourished on each side, the Arabian city of Palmyra appears to have received and cultivated the learning and the arts of Greece; and at a future period, when the successors of Mahomet carried their dominion into other countries, in which they settled and pursued the arts of peace, the Arabian conquerors cultivated various branches of literature. At all times, however, the desert itself, or the native country of the Arabians, has exhibited an illiterate race of men. At present their youth are not indeed entirely neglected. The chiefs of the desert can frequently read and write, and in the cities many of the lowest of the people possess these qualifications. They have schools in their mosques for the education of the poor; and in great towns there are schools to which persons in better circumstances send their sons; but no girls attend the public schools, being privately taught at home by women. The Arabians can scarcely be said to possess any science. Astronomy is somewhat valued by them, but only in subserviency to astrology, a science highly esteemed and very lucrative in the East, though prohibited by the Mahometan law. From their ignorance they are indeed extremely fond of what are called the *occult sciences*, which are supposed to enable their possessors to become familiar with genii, and to oblige them to obey their pleasure, to teach how to command the winds and seasons, to cure the bites of serpents and many diseases or infirmities. A great part, however, of these occult sciences have appeared to strangers to be nothing more than tricks, which the credulity of the people induces individuals to practise upon them. The Arabians are also extremely superstitious. It frequently happens that a town has been reared on the spot which it occupies, merely in consequence of its having been the dwelling place of some Mahometan hermit or saint. In this way the city of Loheia was founded. Its founder and patron was a saint called *Schieck Sælei*, who spent his days in a hut on the shore of the Red sea. A house of prayer was afterwards raised over his tomb, and some devout persons imagining it would be a great happiness to live near the remains of so holy a person, built huts around it. Nearly at the same time the sea having retreated from a neighbouring harbour, an accident which is always happening on the Arabian coast, the inhabitants deserted it, and settled at Loheia, which is now a well-frequented port. In the same way the city of Beit el Fakeh originated around the tomb of a saint called *Achmed ibn Musa*. Some devout persons built themselves cottages round his tomb, and the harbour of Galeska being about the same time choaked up, the inhabitants of that city removed thither. This saint was a great worker of miracles. A Turkish pacha, who had been for 20 years a captive in Spain, where he was bound with ponderous chains to two large stones, long and vainly invoked the aid of different saints. Last of all he bethought himself of the great Achmed, and invoked him also in his turn. The saint stretched out his hand from his tomb; and at that very instant, in the presence of many witnesses, the pacha arrived from Spain, bearing with him his chains and the stones to which they were fixed. This miracle took place not many years ago, on the eve of the festival of the saint; and the Arabs regard it as authenticated by unexceptionable evidence, notwithstanding all prayers or invocations to saints are strictly prohibited by the Koran. Another miracle performed by Ismael Mulk, the patron saint of the city of Tacæs, is easily accounted for. Two beggars had asked charity from the dola or governor of Tacæs, but only one of them had tasted of his bounty. The other went upon this to the tomb of Ismael Mulk to implore his aid. Ismael, who, when alive, had been very charitable, stretched his hand out of the tomb, and gave the beggar a letter containing an order on the dola to pay the beggar an hundred crowns. Upon examining this order with the greatest care, it was found that Ismael Mulk had written it with his own hand, and sealed it with his seal. The governor could not refuse payment, but to avoid all subsequent trouble from such bills of exchange, he had a wall built inclosing the tomb.

31 Superstitions.

In the southern parts of Arabia the posterity of the saints are treated with as much respect as is shewn to the descendants of Mahomet at Mecca, which is very great. Every person who can number a reputed saint among his ancestors, is dignified with the title of Schieck, and accounted an ecclesiastic by birth. Families thus find it their interest to establish, by every possible means, the sanctity of the person from whom they are descended, and to maintain the authenticity of the miracles ascribed to him. In this manner, in spite of the Koran, which is strictly unitarian, the superstitious worship of saints is daily extending its influence among the Arabs, and feigned miracles are consequently multiplying, so that they may be said in some measure to be relapsing into the polytheism of their ancestors. At the same time it is to be observed, that within these forty years a sort of reformation of religion has been attempted, and even accomplished, in a part of the central or mountainous country of Arabia, by one Abdul Wahheb, in whose family a sovereignty of considerable extent has been established. He taught that God, as the creator and governor of the world, is the only proper object of worship. He forbade the invocation of saints, and the very mention of the name of Mahomet, or of any other prophet, in prayer, as practices savouring of idolatry. He forbade the making of vows to obtain deliverance from danger, as a crime against providence. He represented Moses, Mahomet, Jesus Christ, who were respected by his countrymen as prophets, as merely great men, whose history might be read with improvement; denying that any book was ever written by divine inspiration, or brought down from heaven by the angel Gabriel.

32 Hospitality and charity.

In thinly peopled countries men can afford to be hospitable to strangers, because they see them seldom. In Arabia, however, this virtue is still more valued than elsewhere. Poverty is a misfortune very general among

Asia.

among the people of this country; and when travelling through their deserts they are apt to suffer great hardships both from hunger and thirst. Hence among them kindness to strangers, and charity to the poor, are the most popular of all virtues, and a breach of the sacred laws of hospitality is productive of the most indelible dishonour. The rapacity of even an Arabian robber is checked by the influence of this law, and an enemy is safe with those who have consented to taste along with him a morsel of bread. On the whole it appears that the inhabitants of this great territory, though in general barbarians, are yet of a mixed character. A part of them have in every age participated the civilization of the countries in their neighbourhood; and though the tribes of the desert have been always in some measure independent, and governed only by their own fancy or prejudices, yet they have always acknowledged a connexion with the rest of the nation that reside in towns, or that cultivate the soil. Though labouring under a degree of that tendency to indolence which is common to rude nations, yet their poverty and the hardships to which they are inured, prepare them for the toils of war, and render them capable of enterprise.

33 Persia.

Of the present Persian empire, in a general view of Asia, it is unnecessary to take much notice. Both sides of the Persian gulf are to some distance possessed by the Arabs, and the interior provinces have sunk into decay under a long succession of military usurpations. Cultivation is in a great measure confined to the near neighbourhood of a few towns; and a considerable part of the open country is used for the pasturage of the cattle of wandering hordes of barbarians that have descended from Tartary, and that now occupy these seats of ancient civilization and riches.

We have already remarked, that between the Persian gulf on the south, and the Caspian sea on the north, but nearest to the Caspian, a chain of mountains, the celebrated Taurus of the ancients, proceeds from the straits of the Dardanelles eastward to the front of the high central region of Asia called *Imaus*. After passing the Caspian sea and the Persian gulf, these mountains widen to a great extent, and the middle ridge, as it reaches Imaus, becomes very elevated. This middle ridge appears to be crossed by no rivers, and accordingly the streams which descend from itself, or from Imaus on the northern side of it, proceed in a north-westerly direction to the Caspian or the lake Aral. These are chiefly the Oxus and the Jaxartes. To the south of the middle ridge of Taurus, the rivers descend southward to the Arabian sea or Indian ocean. The principal river that descends southward from the western or

34 River Sind or Indus.

south-western front of Imaus is the river Sind or Indus, the upper branches of which approach very near to those of the Oxus; and it may be proper here to remark that the present commerce between the Russian empire and India proceeds in this channel. The merchants, after leaving the Caspian sea, travel in caravans or bodies up the river Oxus and down the river Indus. In the mountainous country near the western and south-western front of Imaus, are several beautiful valleys, which in all ages have been the admiration of travellers. Among these we may mention between Imaus and the Caspian, the valley or country of Sogdia with its capital Samarcand. This country was in ancient times accounted by the orientals a terrestrial paradise, possessing all the fertility of a torrid climate with the salubrity of the coldest regions. Not less remarkable, upon the south-western front of Imaus, on one of the heads of the river Indus, is the valley of Cashmere, which in every age has been the happy valley of the Indian poets, or the paradise of Hindoostan. It is of an oval form, about 80 miles in length and 40 in breadth, and is supposed to have been once filled with water, which having burst its mound, left this valley fertilized to the most distant ages by the mud which had been deposited in it. The emperors of Hindoostan frequently visited it to forget the cares of government, and to collect new health and vigour from the salubrity of the air and the beauties of the place. In 1664 Aurengzebe went thither for this purpose from Agra his Indian capital. M. Bernier attended in quality of physician to one of his omrahs. The train of the emperor was extremely splendid. The heats on the march were dreadful, as the lofty mountains that skirt the front of the high region of Tartary prevent the cool air of the north from descending to refresh the parched plains of India. A vast mountain called *Bember* divides Cashmere from India. The southern side of this mountain is steep and arid. The procession encamped in the channel of a large torrent dried up, full of sand and stones, which were burning hot. "After passing the Bember (says M. Bernier) we pass from a torrid to a temperate zone: for we had no sooner mounted this dreadful wall of the world, I mean this high, steep, black, and bald mountain of Bember, than in descending on the other side, we found an air that was pretty tolerable, fresh, gentle and temperate. But that which surprised me more in these mountains was to find myself in a trice transported out of the Indies into Europe. For seeing the earth covered with all our plants and shrubs, except hyssop, thyme, marjoram, and rosemary, I imagined I was in some of our mountains of Auvergne in the midst of a forest of all kinds of trees, pines, oaks, elms, plane-trees. And I was the more astonished, because in all those burning fields of Indostan, whence I came, I had seen almost nothing of all that.

Asia.

35 Cashmere.

"Among other things relating to plants this surprised me, that one and a half days journey from Bember I found a mountain that was covered with them on both sides, but with this difference, that on the side of the mountain that was southerly towards the Indies there was a mixture of Indian and European plants, and on that which was exposed to the north I observed none but European ones, as if the former had participated of the air and temper of Europe and the Indies, and the other had been merely European." The same traveller proceeds in this description of this valley or kingdom of Cashmere. "Thousands of cascades descend from the surrounding mountains of this enchanting plain, and forming rivulets meandring through all parts, render it so fair and fruitful, that one would take this whole kingdom for some great evergreen garden, intermixed with villages and boroughs discovering themselves between trees, and diversified by meadows, fields of rice, corn, and divers other legumes, of hemp and saffron, all interlaced with ditches full of water, with channels, with small lakes and rivulets here and there. Up and down everywhere are also

Asia.

also seen some of our European plants, flowers, and all sorts of our trees, as apples, pears, prunes, apricots, cherries, nuts, vines. The particular gardens are full of melons, skirrets, beets, radishes, all sorts of our pot-herbs, and of some we have not."

This delightful spot is surrounded by the mountains adjoining to Imaus, which are of vast height and rude aspect, perpetually covered with snow. At the foot of the exterior chain of mountains is an inner circle of hills, which abound in trees, grass, and various sorts of vegetation, and which are full of all kinds of cattle, as cows, sheep, goats, gazelles, and musks. The exterior mountains are so lofty and cold, that the pioneers of Aurengzebe were obliged to cut through a glaciere, or a great mass, as Bernier calls it, of icy snow. The capital is sometimes called *Cashmere*, sometimes *Sirinagur*, and sometimes *Nagas*. It is in N. Lat. 34. 12. on the banks of a celebrated river, the *fabulosus Hydaspes* of the ancients. Its current is smooth, and it is navigable in Cashmere by small boats. The town was in Bernier's time three quarters of a French league long on both sides of the river, and extending from it along a navigable canal to a small but beautiful lake. The houses are built of wood, four stories or more in height. The lower story is for the cattle, the next for the family, and the third and fourth serve as warehouses. The roofs are planted with tulips, which have a most beautiful effect in the spring. Every part of the country exhibits the remains of palaces, pavilions, and gardens, formed there by the emperors of Hindoostan. The periodical rains which almost deluge the rest of India, are excluded from Cashmere by the height of the mountains; and it experiences only light showers, which, however, are sufficient to feed the thousands of cascades which descend into the valley from every part of the stupendous and romantic bulwark of mountains by which it is encircled. The horses of this country are small, hardy, and sure-footed. The cows are black and ugly, but yield abundance of milk and excellent butter. They have also a kind of sheep which is used to carry burdens. The elk is mentioned as one of the wild animals that inhabit the woods at the base of the snowy mountains in the neighbourhood.

Cashmere is famous for its manufacture of shawls made of the wool of the broad-tailed sheep of Thibet, whose fleeces, in fineness, beauty, and length, are said to exceed all others in the world. The Cashmerians engross this article, and have factors in all parts of Thibet for buying up the wool, which is sent into Cashmere and worked into shawls of the highest value. The Indian emperor Akbar, who conquered this country in 1585, greatly encouraged this manufacture, and introduce it into Lahore. The natural colour of the wool is said to he gray tinged with red, but sometimes it is quite white.

The Cashmerians are accounted an ingenious people, fond of poetry, and having a language of their own. They are industrious mechanics, and the various articles of their workmanship are sent to all parts of India. They are celebrated for the fineness of their features and their admirable complexions. They look like Europeans, and neither resemble their neighbours of Tartary nor of India, having nothing of the flat noses and small eyes of the Tartars, nor of the black colour of the Indians. In the time of Bernier the Indian courtiers were extremely solicitous to obtain Cashmerian women, to have children by them whiter than the natives of Hindoostan, that they might pass for the true Mogul breed of the same race with their monarch.

Asia.

As already mentioned, India consists of two peninsulas, one to the westward and the other to the eastward of the Ganges. The western peninsula is overlooked from the north, by that part of the chain of Imaus or Emodus which constitutes the southern front of the region of Tartary. In the south-western side of this high region the rivers Ganges and Indus have their source. After advancing westward to no great distance from the Indus, the river Ganges turns towards the south, and afterwards traverses almost the whole breadth of the peninsula in an easterly direction, till at last it proceeds south into the bay or gulf of Bengal. The Indus, rising in the south-western part of Tartary, called *Cashgar*, descends in a south but somewhat westerly course, till it enters the Arabian sea by various channels to the northward of the bay of Cutch. At its mouth it has a broad delta or tract of fertile land, like the Nile in Egypt, formed by its own alluvions, or the deposition of mud brought down from the high country by the periodical floods to which it is subject. To a great distance from the sea it flows, like the Nile, along a fertile valley enriched by its inundations. Parallel to the channel of the river, after it has received all its tributary streams, run two chains of mountains, by which its course is directed, and its valley is separated from other countries. Beyond the mountains, on the east, extends a sandy desert of 200 miles in breadth, by which the valley of the Indus is shut out from the rest of India. The whole course of this river amounts to nearly 1000 miles. It has an uninterrupted navigation from the sea, for flat-bottomed vessels of nearly 200 tons, as high as the city of Lahore, at the distance of about 650 miles. The current of the Indus must be rapid, as vessels frequently fall down the river from Lahore in 12 days; but the ascending passage requires six or seven weeks.

36 Sources of the Ganges and Indus.

As the Indus and the Ganges nearly peninsulate or enclose western India on the north, in a manner similar to that in which it is enclosed by the ocean on the south, we shall take some farther notice of the course of the Indus. This river is the most westerly of India. Before it enters the narrow tract already mentioned between the mountains, which run parallel to its course, it is formed by the contribution of a variety of streams, which have their sources in the rugged country adjacent to high Tartary. These rivers, whose union forms the Indus, water a large and fertile territory, a part of which appears to have belonged to the ancient Persian empire of Darius Hystaspes. Various great and populous cities have in different ages stood upon these streams, in what is called the Panjab, or country of the five rivers, which consists of spacious and fertile plains. Alexander the Great reached these plains, and they formed the scene of his exploits against Porus and other Indian kings. Here also ended the progress of the Macedonian conqueror. He built a fleet of vessels, and descended the river with his army; an attempt which he is said to have been induced to make, from a notion that he had found out the head of the Nile. As in his time it was not known to the Greeks

37 Indus described.

Asia.

that any other river in the world, excepting that of Egypt, contained crocodiles, the discovery of crocodiles in the river Indus, suggested the notion in these times, when geography was so little understood, that there might be some communication between this river and the great river of Africa. Arrian says, that Alexander had even written to his mother an account of his discovery of the head of the Nile. But the voyage down the river pointed out the mistake, as it brought him to the ocean.

38 Delta of the Indus.

The lower parts of the Indus, or the fertile but swampy land near its mouth, was in the time of the ancients unhealthy and hot in the extreme. This rich delta or triangle of land is of great extent, each side of the triangle being 115 miles in length. The mouth of the river was well known at a very early period. Not only did Nearchus, the admiral of Alexander the Great, sail from it to the Persian gulf; but at a much earlier period, Darius Hystaspes, from curiosity to ascertain the place at which the Indus met the ocean, built, according to Herodotus, a fleet on the borders of Scythia, that is, of Tartary, high up the river, and gave the command of it to Scylax, a Grecian of Caryandra, an able sailor. He was directed to be attentive to discoveries on both sides; and when he reached the mouth, to sail westward, and that way to return home. He executed his commission; passed the straits of Babelmandel; and in thirty months from the time he sailed from Caspatyrus, landed safely in Egypt, at the place from whence it is said, that Necho sent his Phœnicians to circumnavigate Africa, by its now well-known promontory the Cape of Good Hope. This expedition took place in the 12th year of Darius, and in the year 509 before the Christian era.

The delta or low country is still extremely unhealthy. The heats are so violent, in consequence of the vicinity of the sandy deserts, that it is found necessary to ventilate the houses occasionally, by means of apertures in the tops like chimneys. When the hottest winds prevail, the windows that are closely shut exclude the warmer current of the air, while the more elevated part of the atmosphere being cooler, descends through the chimneys. The soil depends for its fertility entirely upon the overflowings of the river; and it sometimes happens that a single shower does not fall during three years. There are no trees upon the delta; but in the drier parts the soil is covered with brushwood. The city of Tatta stands in the delta, upon the western branch of the river, about 65 miles from the sea, which is the distance to which the tide ascends. The British had at one period a factory here, for the purpose of transmitting the English broad cloths to the high countries around the sources of the Indus. Beyond Tatta, various towns are formed along the fertile banks of this river, during its whole progress between the parallel ranges of mountains, which are distant from its banks from 30 to 40 miles. In latitude 29° 8′, on the eastern side, the Indus is joined

39 River Setlege.

by the river Setlege or Hysudrus; and it is to be remarked, that in consequence of the sandy deserts by which the lower parts of the Indus are surrounded, this is the first river that falls into it, in a tract of 520 miles from the sea. The river Setlege is the southern boundary of the Panjab already mentioned, which having from time immemorial been a most fertile and populous region, and at the same time the frontier of India towards the north-west, has been the scene in different ages of the most dreadful massacres, by the celebrated destroyers of mankind, Alexander the Great, Timur or Tamerlane, and Kouli Khan. The river Setlege rises at the foot of Mount Imaus, and is joined by another stream, called the *Beyah* or *Hyphasis*. Both of them pass through a fertile tract of country.

Asia.

40 Chunaub.

About 50 miles above the discharge of the Setlege, another river, called the *Chunaub* or *Acesines*, falls into the Indus. On the southern banks of the Chunaub, in latitude 30° 34′ stands the city of Moultan, the capital of a province, in a country very fertile in cotton, and also in sugar, opium, brimstone, galls, and abounding in camels, which animals also are reared in great numbers on the lower parts of the Indus. This city is remarkable for being the principal residence of the Banians, an hereditary cast or tribe, who employ themselves solely in commerce, and are the merchants or brokers of India. Their chief resides here, but they form settlements in every commercial town of India; and they send colonies to the trading towns of Arabia and Persia, and even as far as Astracan. As these die away or incline to return home, a supply is sent from India of unmarried young men. As no females attend them, they live at Astracan and some other places, with Tartarian women: but the contract lasts only during their residence. They are highly esteemed for the integrity of their dealings, and are trusted to a great extent by Europeans and other strangers, as well as by the natives. They are the bankers of India; and the confidence reposed in them is one of the means by which the civilization of that country has been preserved amidst its revolutions and the sanguinary wars of its princes. No prince has ever offered violence to the Banians, with the view of extorting from them their treasures, without speedily finding himself undone. His officers have instantly conspired against him, because by robbing the Banians, or bankers in whose hands their money was deposited, he ultimately plundered the very persons who supported his power, and had the readiest access to his person. About 160 miles above Moultan, is Lahore, the capital of the Seiks, a set of religionists who venerate the ox like the Hindoos, but who are pure Monotheists and Predestinarians, worshipping God without the use of images. They form a sort of aristocratical republic. They can raise 100,000 cavalry, and they have of late become very formidable. They are a kind of Indian reformers, hostile both to the government and the religion of the country. They admit of proselytes, and have no casts or division into distinct hereditary professions. In their territory a vast mountain of rock salt is found, which is cut into dishes, plates, and stands for lamps.

41 Capital of the Banians.

42 Behut.

Between Lahore and Moultan, the Chunaub is joined by the Behut, or the *fabulosus Hydaspes*, which flows, as already mentioned, from the romantic Cashmere. A little above the mouth of the Chunaub, the Indus receives an obscure river, the Lucca, from the territory on the north-west, called *the kingdom of Candahar*. The city of Candahar, situated in N. Lat. 33. E. Long. 67. 15. was anciently a place of much importance, being the gate of India, with respect to Persia, and the great magazine of Indian and Persian goods.

Asia.

goods. Somewhat higher, that is, more northerly, two tributary streams enter the Indus, called the *Cow* or *Cophenes*, and the *Kameh* or *Gurdus*. On the former stands the city of Ghizni, and on the latter is Cabul. This last city is in N. Lat. 34. 36. and E. Long. 68. 58. near the foot of the Indian Caucasus, or Imaus. It stands in so happy a climate, that it produces the fruits both of the temperate and torrid zones, though it is in the near neighbourhood of mountains, whose summits are covered with perpetual snow. The Indian historians speak of it with raptures. Cabul is the residence of the kings of Candahar. It has at all times been of much importance, as the frontier of India towards the river Oxus, which flows into the Caspian sea, and towards Tartary. In ancient times, it always was a great commercial magazine, as well as an important fortress. To this day, it is on the direct road by which the commerce of the southern parts of the Russian empire is carried on with India. It is at present noted for its vast fairs of horses and cattle, the first of which are brought hither by the Usbec Tartars; and merchants resort to these markets from Persia, China, and Tartary. Near the mouth of the river Kameh, the city of Attock stands upon the Indus. Attock signifies *forbidden;* this being the original boundary of Hindoostan, towards the north-west, which the Hindoos were prohibited to pass. Here the river is three quarters of a mile broad, and the water is cold, and the stream rapid and turbulent, having much black sand suspended in it. To this place the Indus descends from the lofty mountains of Imaus, and the high region of Tartary. The remainder of its course, therefore, lies through a country little known, and so rude in its soil and climate, as scarcely to admit even of the most slender population.

Returning to the ocean, it is to be observed, that the most eastern of the branches into which the Indus is divided towards its mouth, flows into the bay or gulf of Cutch, which advances far into the country, receiving the river Puddar. This river, and the bay into which it flows, form one side of the fertile peninsula of Guzerat, the other side of the same peninsula being contiguous to the gulf of Cambay. The western parts of the peninsula of Guzerat are mountainous and woody. The rest is extremely rich, and once famed for a very considerable commerce of its productions. Here stood, in former times, on the promontory of Guzerat in the neighbourhood of Diu, one of the last remaining possessions of the Portuguese in India, the great temple or pagoda of Sumnat. It was destroyed in the eleventh century by Mahmud, the greatest of the princes of that race of Tartars called *Turks*. He was the sovereign of Ghizni, which we have already noticed as a town in the kingdom of Candahar, upon one of the streams that fall into the Indus from the north-west. Being a most fanatical Mahometan, he undertook 12 holy wars, as they were called, against the unbelieving nations of India. Lahore, Moultan, and Delhi, were compelled to open their gates to him, and he at last reached and conquered the rich peninsula or kingdom of Guzerat. On the payment of a tribute, the rajahs preserved their dominions, and the people their lives and fortunes; but to the religion of the country Mahmud was inexorable. Many hundred temples or pagodas were levelled with the ground.

43 Bay of Cutch.

44 Pagoda of Sumnat.

Asia.

Many thousand idols were demolished; and the servants of the Arabian prophet were stimulated, and rewarded, by the precious materials of which they were composed. The pagoda of Sumnat was at this time conspicuous beyond all the retreats of Indian superstition. Its magnificence and its destruction deserve well to be noticed, as indicating the character of two Asiatic nations: the riches and devout superstition of the one, and the furious fanaticism which the other had been able to diffuse over a great part of the world. This pagoda, or temple, was endowed with the revenue of 2000 villages; 2000 Brahmins were consecrated to the service of the deity, whom they washed each morning and evening with water from the distant Ganges. The subordinate ministers consisted of 300 musicians, 300 barbers, and 500 dancing girls, conspicuous for their birth or beauty. Three sides of the temple were protected by the ocean: the narrow isthmus was fortified by a natural or artificial precipice, and the city and adjacent country were peopled by a nation of fanatics. They confessed the sins and the punishment of Kinnoge and Delhi; but they boasted, that if the impious stranger should presume to approach their holy precincts, he would surely be overwhelmed by a blast of the divine vengeance. By this challenge the faith of Mahmud was animated to a personal trial of the strength of this Indian deity. Fifty thousand of his worshippers were pierced by the spears of the Moslems; the walls were scaled; the sanctuary was profaned; and the conqueror aimed a blow of his iron mace at the head of the idol. The trembling Brahmins are said to have offered ten millions sterling for his ransom; and it was urged by the wisest counsellors, that the destruction of a stone image would not change the hearts of the Gentoos, and that such a sum might be dedicated to the relief of the true believers: "Your reasons," replied the sultan, "are specious and strong; but never in the eyes of posterity shall Mahmud appear as a merchant of idols." He repeated his blows, and a treasure of pearls and rubies, concealed in the belly of the statue, explained in some degree the devout prodigality of the Brahmins. The fragments of the idol were distributed to Gazna, Mecca, and Medina. Bagdad listened, says the historian, to the edifying tale; and Mahmud was saluted by the caliph, with the title of *Guardian of the fortune and faith of Mahomet*. *Gibbon*, vol. v.

45 City of Cambay.

Adjoining to the peninsula of Guzerat, and at the bottom of the gulf of Cambay, stands the city of that name, which once was the capital of a considerable kingdom. It is situated in a great manufacturing country, which furnishes large quantities of coarse unbleached cotton cloth, for Persia, Arabia, Egypt, and Abyssinia; also blue cloths for the same countries, and for the English and Dutch trade on the western coast of Africa; likewise blue and white checks to be used as mantles in Arabia and Turkey, some coarse, and others enriched with gold; muslins for turbans, gauzes, mixed stuffs of silk and cotton, and shawls made of the Cashmerian wool. This country also sends annually to Surat, Bengal, China, Persia, and Arabia, immense quantities of raw cotton, as well as rich embroideries of various kinds.

46 Form of the peninsula of Hindoostan.

From the bottom of the gulf of Cambay, the peninsula of western India may be said to begin in the strict-

Asia.

est sense; as a line of coast here commences, which proceeds without interruption, or any considerable bending, to Cape Comorin, the southern part of the peninsula, after which the coast suddenly turns to the north-east; and the bay of Bengal bounds the peninsula on the east. From Cambay to Cape Comorin, the western coast of the peninsula may be divided into three unequal parts. The first extends from the most advanced part of the gulf southward, a little beyond the city of Surat. The second tract of coast, which is more extensive than this, in a fourfold proportion, is called *the coast of Concan*, or *the pirate coast*. To the southward of this, the coast of the peninsula, all the way to Cape Comorin, receives the appellation of the *Malabar coast*. The first of these divisions, lying upon the eastern shore of the gulf of Cambay, consists of a low country, into which the rivers descend from the upper part of the peninsula of Hindostan. After passing Surat, however, the physical structure of the peninsula assumes a peculiar character well worthy of attention. The Concan and Malabar coasts which form almost the whole of the western shores of the peninsula are extremely low, and a narrow stripe of level land, of from 40 to 50 miles in breadth, runs along the coast of Surat to Cape Comorin. At the back of this stripe of low land, a chain of mountains runs

47 Ghauts.

parallel to the sea shore. They are called *the Ghauts*, and rise to a surprising height, opposing to the west a lofty wall of rugged and precipitous rocks. The whole chain seems one continued crest or wall, inaccessible to the summit, unless by paths which have been worked by the hand of man, and which cannot be ascended, even by a single traveller, without the fatiguing labour of many hours. From the root of these rocks, the plain towards the sea is variegated with small hills, which gradually descend into a level and fertile country, blest with a cool and healthy air. The small hills near the foot of the Ghauts are clothed with forests of the most valuable timber; and from the sides of the mountains magnificent cataracts descend, forming torrents which facilitate the conveyance of the timber to the sea coast.

The word *Ghauts* signifies *passes;* but this name has been given to the whole front of rocks which overlooks the western coast. At the summit of the Ghauts the country is level, and consists of an elevated tract of fertile and populous plains, which are supported to the west by the Ghauts, as by the walls of a terrace formed on an immense scale. The country, however, begins gradually to descend towards the east; and accordingly from Surat to Cape Comorin, the great rivers of the peninsula uniformly flow from the Ghauts eastward, and form considerable tracts of low rich land upon that coast, which receives the appellation of the *Coromandel coast*. Thus the western peninsula of India must be considered as resembling a plane, gradually inclining towards the east, and supported on the west by a long chain of lofty rocks.

In the north-western quarter of the peninsula, the

48 Nerbudda river.

two most considerable rivers that flow into the gulf of Cambay, are the Nerbudda, in N. Lat. 23. 10. E. Long. 82. 10. which runs a course of 700 miles, from the centre of the northern part of the peninsula; and

49 Tapti.

the river Tapti, upon which stands the celebrated city of Surat, in N. Lat. 21. 11. This city has long been well known as a place of great commerce. It is the port from which the Mahometan pilgrims sail on their way to Mecca. The oldest British factory in India is in this city, and it is still a place of the first commercial importance. Wheat grows in great abundance in the surrounding country, of equal quality with that of Europe, though it scarcely flourishes farther to the south.

Asia.

On the coast of Concan, or the Pirate coast, is the island of Bombay, containing a celebrated British settlement which need not here be noticed. The Pirate coast contains a great variety of harbours, and is thus described by Mr Rennel: "Perhaps there are few coasts so much broken into small bays and harbours, and that at the same time have so straight a general outline. This multitude of small ports, uninterrupted view along shore, and elevated coasts favourable to distant vision, have fitted this coast for the seat of piracy; and the alternate land and sea breezes that prevail during a great part of the year, oblige vessels to navigate very near the shore. No wonder then that Pliny should notice them in his time, as committing depredations on the Roman East India trade; and although a temporary check has been given them in the destruction of Angria's fleets, &c.; yet we may expect they will continue the practice while commerce lasts. They are protected by the shallowness of their ports and the strength of the country within. As pirates, they have greater natural advantages than those of Barbary, who being compelled to roam far from their coast, have expensive outsets: here the prizes come to their own doors, and the cruizers may be secure in port until the prey is discovered."

50 Coast of Concan, or Pirate coast.

In ancient times the Romans were obliged to put on board their merchant ships a number of archers to defend them against the attacks of these pirates. In modern times the pirates have made a considerable figure, particularly under a chief called *Angria*, who was subdued by the English, and his port Gheriah taken. They sometimes use vessels of 300 tons with three masts; but, in general, they are of 150 tons and only two masts. Their cannon are six and nine pounders. They make prize of all that do not condescend to purchase their passports. As the British trade in these seas is carried on in large vessels, it does not suffer from the pirates; but the ships of the Indians are much exposed to their enterprises. It is said, that the celebrated Hyder Ally established a sea port upon this coast, at the town of Mangalore, with a view of accomplishing a most grand but visionary plan. He had formed the project not only of becoming sovereign of the Indian seas, but even retaliating on the British the invasions they had made into India. To become a naval power, he invited shipwrights from all countries, and under them trained his own subjects. He had heard something of the effects of frost in cold climates, and had formed some strange ideas of the solidity and strength, or hardness, of the waters of the European seas. Under the notion, therefore, of combating against oceans of ice, he strengthened his ships with planks of great thickness. But his port was twice taken by British detachments. In 1786 a fleet from Bombay brought away from it nine great ships and several

51 Mangalore. Hyder Ally's project of invading England.

Asia.

veral lesser ones. In 1781, he had nearly finished six ships of the line, and several frigates and sloops of war, when the port of Mangalore was again captured.

52 Water snakes show the vicinity of the Pirate coast.

It is to be observed, that the approach to this coast was formerly thought very dangerous. Ships were hurried forward by so rapid a current, that they could neither keep their reekoning, nor distinguish the coast during the rainy season. Many vessels were consequently lost. These misfortunes have eeased, since an observation was made of a fact noticed by Arrian in ancient times, that in the Indian ocean, at a certain distance from land, many water serpents, from 12 to 13 inches in length, are to be seen rising above the surfaee of the water. When these serpents are seen, they indicate that the coast is precisely two degrees distant. This coast of Concan was aneiently denominated the *Lymirica regio*. It was greatly frequented by Roman merchants, and is thus spoken of by Arrian: "Originally they performed only coasting voyages from harbour to harbour, sailing from Cana, on the coast of Arabia Felix, till Hippalus, an adventurous seaman, having considered the situation of the harbours and the form of the sea, found out a navigation through the ocean, at the season in which the winds blow with us from the sea, and the west-south-west wind prevails in the Indian oeean, which wind is called *Hippalus*, from the first discoverer of that navigation. From that time till now, some sail in a direct course from Cana, others from the harhour of the Aromati: they who sail for Lymirica make a longer stay; others who steer for Barygasa or Scythia, stay not above three days; they spend the rest of the time in completing their usual voyage."

53 Malabar coast.

Southward of Mangalore, all the way to Cape Comorin, this shore receives the appellation of the *Malabar coast*. It contains several towns, the first of whieh is Tellieherry: from the shore to the Ghauts, the country here and elsewhere is extremely beautiful. Pepper is the chief article of commerce; but coffee is also enltivated. There are varions other towns of note, partieularly Mahi, originally a French settlement, Calicut, Canganore, Cochin, and Ajenga. The interior of the level eountry, to the foot of the Ghauts, is covered with fine forests, both here and in Conean, which contain that most valuable of all treasures for the navigation of the Indian sea, the teek wood, whieh deserves partieular attention. It is an evergreen, and esteemed a saered tree. The Gentoos repair or build their pagodas with this timber only, when timber is at all used. Its property of resisting the worm, which in these climates is so destruetive to all ships, renders it of the utmost importanee. Mr Rennel speaks in the following terms of it: "I cannot close this account, without remarking the unpardonable negligence we are guilty of in delaying to build teek ships of war for the use of the Indian seas. They might be freighted home without the eeremony of regular equipment, as to masts, sails, and furniture, which might be calculated just to answer the purpose of the home passage at the best season, and erews could be provided in India. The letter annexed, which was written with the best intentions nine or ten years ago, will explain the circumstance of the same case. Teek ships of forty years old and upwards, are no uncommon objects in the Indian seas, while an European built ship is ruined there in five years. The ships built at Bombay are the best, both in point of workmanship and materials, of any that are constructed in India; and although fourth rates are mentioned only in the letter, there is no doubt that third rates may be construeted, as there is a choiee of timber. The Spaniards build capital ships in their foreign settlements. The East India Company have a teek ship on her fourth voyage at present, which ship has wintered in England; therefore, any objection founded on the effects of frost on the teek timber is done away.

54 Teek wood.

Asia.

"Frequent have been the opportunities I have had of observing how very rapid the decay of ships built of European timber is in the East Indies; and, on the contrary, how durable the ships are that are built of the wood of that country, namely, the teek, which may not be improperly styled *Indian oak*. The number of ships of war that were ruined in those seas during the late war (1757 to 1762,) may be admitted as a proof of the former remark; and the great age of the ships built in India may serve to prove the latter. What I mean to infer from this for your lordships use is, that ships of war under third rates may be construeted in India, and, with moderate repairs, last for ages; whereas a ship of European construetion can remain there but a very few years; to whieh disadvantage may be added, that of losing, in the mean time, the services of the ships that are sent to relieve the worn-out ones.

55 Laccadive isles.

To the westward of the Malabar coast, at the distance of several leagues, are the Laccadive isles. They extend from latitude 10° to 12° 50′ north. They are supposed to be the isles mentioned by Ptolemy, under the title of *Insulæ numero* 19; though in fact they are 32 in number. They are small, and covered with trees. They have some trade. They export the produet of the eocoa trees, that is to say, the oil extracted from the nut, and eordage formed of the rind. They also export dried fish to the continent of India, and receive rice in return. Ambergrease is frequently found floating near these islands. At a eonsiderable distanee from the Laccadives are the Maldive islands. They extend from N. Lat. 1. to 7. 25. From their number, Ptolemy calls them *Insulæ* 1378. The natives make the number of their isles amount to 12,000. They are divided into 13 provinees under one king, whose subjects are miserably poor. He assumes, however, the magnificent title of *sultan of the Maldives, king of* 13 *provinces and* 12,000 *isles*: But these isles, whatever their number may be, are extremely trifling. A fishery, however, is earried on in their vicinity; and they produce cocoa nuts, which, with the cordage produeed from that useful tree, are sold upon the western coast of India. These isles are chiefly worthy of notice, on account of one artiele obtained from them; this is the eowry, a small species of shell, the *cypræa moneta* of Linnæus. These shells, whieh appear to be produced in the Maldives alone, have been used as current coin for ages past in different parts of the world. The shells are collected twice in the month, at the full and new moon, by the women, who wade into the sea for that purpose up to their middle. They are packed up in parcels of 12,000 each, and are used as current money among the poor in Bengal. As provisions are exceedingly cheap in that country, it is found absolutely

56 Maldives.

57 Cowry shells.

Asia.

solutely necessary to employ, for the use of the common people, something less valuable than any coin formed of metal. These shells or cowries serve this purpose. One cowry is rated in Bengal at the hundredth and sixtieth part of a penny. Eighty cowries make a pun; and from 50 to 60 puns are equal to a rupee, or four shillings and sixpence British money. In Africa, in the country of the negroes, upon the rivers Niger, Senegal, and Gambia, these cowries also pass as current money; but at about ten times the value that they bear in Bengal. Hence, the English, French, and Dutch, are induced to purchase them in India, and to bring them to Europe, from whence they are afterwards exported for the purposes of trade; and thus, an useless shell, brought from the miserable islands of which we are now speaking, comes to be ultimately employed to purchase the persons of men.

58 Cape Comorin.

Cape Comorin is the most southern part of this peninsula, and consequently of Hindostan. It is in N. Lat. 8°. A little to the north of this cape, the Ghauts terminate. The sea adjacent to it is considered by the natives as sacred, and persons resort thither to perform ablutions and lustrations. From this point the land turns towards the north-east, along the gulf of Manara, which is between the main-land and the island of Ceylon. This island was known to the ancients, by the name of *Taprobana*. Pliny treats very particularly concerning it, and the Arabian geographers of a later age give it the name of *Serendib*. It is rich in almost all mineral productions excepting the diamond, and possesses a fertile soil. On account of the cinnamon which it produces, the Portuguese made themselves masters of the whole of its ports. In 1656, they were expelled by the Dutch; who had been invited thither by the monarch of the island, to rescue him from the state of dependance in which he was held by the Portuguese. The emperor repaid the Dutch in cinnamon, all the expence of their efforts in his favour; and in return speedily found himself in the same dependant state as before his victories over the Portuguese. The cunning Dutchmen obtained from him a grant of coast, round the island, 12 miles in breadth, reckoning from the sea; and under pretence of defending him from foreign invasions, they fortified every one of his ports. Having thus hemmed in his majesty, these good allies had it at all times in their power, by refusing to sell him salt, to compel him and his subjects to submit to any terms they were pleased to dictate.

59 Ceylon.

It is to be observed, that the natives of this island differ totally in their language, and in a considerable degree in their religion, from the inhabitants of the neighbouring continent. They are worshippers of Budho or Gaudma, who they believe came upon earth for the salvation of mankind. They have many pagodas or temples, which are richly carved. Between the island of Ceylon and the continent, at the narrowest part of the strait, is a chain of rocks which runs entirely across the channel. The length of the chain is about 30 miles, but the whole is frequently interrupted by narrow passages, which however are extremely shallow. It is very probable that this succession of rocks, at some period, formed part of an isthmus, which united Ceylon to the continent. Pliny takes notice of the greenish cast of this shallow part of the channel, of its being filled with shrubs, that is, with corals. On each side of the chain of rocks, the water does not exceed for some distance the depth of 13 or 14 feet. The chain of rocks which we have now mentioned, is called by the Mahometans *Adam's Bridge*. Their tradition is, that our common father, after his transgression, was cast down from paradise, which they understand to have been celestial, and not terrestrial as we do; that he fell upon Ceylon; but that afterwards this bridge was made by angels, to enable him to pass over to the continent. The highest mountain of the island, which is of a conical form, is called *Adam's Peak*. On the summit is a flat stone, with an impression resembling a human foot, which is two feet long. The Mahometans say that it is the mark of Adam's foot; that he fell from paradise on this summit, and that Eve fell near Judda in Arabia. They were separated 200 years, after which he found his wife, and conducted her to his old retreat in Ceylon, where he died and was buried, and where two large tombs remain, which are visited by Mahometan pilgrims. But the Pagan inhabitants of the island ascribe the mark of the foot to their great deity Buddo, Budho, or Gaudma, when he ascended into heaven. To this summit therefore they also make pilgrimages, and here they offer sacrifices, which, by an ancient custom, descriptive of a very tolerant spirit, they give to the Mahometan pilgrims.

Asia.

60 Adam's bridge.

61 Adam's Peak.

62 Ceylon relinquished to Britain.

This fine island, with the valuable spices and other riches which abound in it, is now relinquished by the Dutch in favour of the British: and it remains to be seen, whether the natives will find their independence increased by this new alteration of the protectors of their coast, and the purchasers of their cinnamon; or whether the monarch and his people will not as usual be kept under controul, by the aid of the monopoly of salt, an article of immense importance in hot climates where vegetable food is chiefly used.

From Cape Comorin north-eastward to Cape Calmere, in N. Lat. 10° 20′, is above 220 miles. The country is watered by frequent streams from the north-west, that is, descending from the eastern side or summit of the Ghauts. At Cape Calmere what is properly called the *Coromandel coast* begins. In the southern part of it is the pearl fishery, which has been well known and practised during several ages.

63 Coromandel coast.

64 River Cavery.

Around Cape Calmere, is the delta of the river Cavery, which proceeding from the south of the Ghauts, near the western shore of the peninsula, there forms an extensive tract of low and fertile land, well suited to the cultivation of rice, the grain best suited to hot climates. This delta formed what was called the *kingdom of Tanjore*, now a province belonging to the British East India Company. The river is at one place divided by an island called *Seringham*, upon which are two pagodas or Indian temples, one of which is perhaps the most famed in Hindostan for its sanctity, magnitude, and the vast resort of pilgrims, who go to it from all quarters. Mr Orme gives the following description of this sacred retreat. "It is composed of seven square enclosures one within the other, the walls of which are 20 feet high, and four feet thick. These enclosures are 350 feet distant from one another, and each has four large gates with a high tower, which are placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outward wall is near four miles in circumference, and its gateway to the

65 Pagoda of Seringham.

Asia.

the south is ornamented with pillars, several of which are single stones 35 feet long, and nearly five in diameter; and those which form the roof are still larger. In the inmost enclosures are the chapels. About half a mile to the east of Seringham, and nearer to the Cavery than the Coleroon, is another large pagoda called *Jumbakistna*, but this has only one enclosure. The extreme veneration in which Seringham is held, arises from a belief that it contains the identical image of the god Wistchnu, which used to be worshipped by the god Brachma. Pilgrims from all parts of the peninsula come here to obtain absolution, and none come without an offering of money; and a large part of the revenue of the island is allotted for the maintenance of the Brahmins who inhabit the pagoda; and these with their families formerly composed a multitude not less than 40,000 souls, maintained without labour by the liberality of superstition. Here, as in all the other great pagodas of India, the Brahmins live in a subordination which knows no resistance, and slumber in a voluptuousness which knows no wants; and sensible of the happiness of their condition, they quit not the silence of their retreats to mingle in the tumults of the state, nor point the brand, flaming from the altar, against the authority of the sovereign, or the tranquillity of the government."

66 Tranquebar and Pondicherry.

Upon the same coast is situated the small Danish settlement of Tranquebar; to the northward of which is Pondicherry, a settlement formerly belonging to the French, but now permanently annexed to the British possessions. Near Pondicherry, the bird called the *vulture* is frequently found. This animal is well known to feed upon dead or putrid carcases. A singular circumstance concerning it has been observed in every age in the eastern countries, that though very rare in a particular quarter, yet when two hostile armies approach to give battle to each other, the air is suddenly seen filled with multitudes of them, flying with their usual sluggish wing, from every quarter, to partake of the carnage. Hence in former times they were supposed to possess a prophetic instinct, or presage of battle, which led them to seek the spot of future slaughter three days before the event. To this opinion Milton alludes, when he compares the great enemy of mankind to one of these birds.

67 Vultures.

——"As when a flock
Of ravenous fowl, though many a league remote,
Against the day of battle, to a field
Where armies lie encamp'd, come flying, lur'd
With scent of living carcases design'd
For death, the following day, in bloody fight;
So scented the grim feature, and upturn'd
His nostril wide into the murky air,
Sagacious of his quarry from afar."

Paradise Lost, book x. l. 273.

Between Pondicherry and Madras, the river Paliar enters the sea. Upon this river, about 66 miles above its mouth, stands the city of Arcot, the *Arcati regia Sorœ* of Ptolemy, and *Soro-mandalam*, corrupted into the modern *Coromandel*, giving name to the whole coast.

68 Krishna.

At a considerable distance to the north is the great river Kistnah or Krishna, in Lat. 15. 43. It rises near the western Ghauts, and like all the other rivers of this extensive coast annually overflows a vast tract of country. Into the north side of this river, in Lat. 16. 20. flows a great stream called the *river Beema*, which also rises at the head of the Ghauts, within 50 miles of the other side of the peninsula. It runs a course of 350 miles. To the north of the river Krishna is the celebrated and once powerful kingdom of Golconda, abounding in corn, rice, cattle, sheep, and every necessary of life; also in fish, which are found in the numerous rivers, which in some places are in a great measure formed by art. Dams are made across the hollows between hills sometimes half a league in length. These are filled during the rainy season; and the inhabitants introduce the water as it is wanted into the lower country, which, assisted by the heat of this climate, produces prodigious fertility.

Asia.

69 Godavery.

The river Godavery is the next great stream upon this eastern coast of the peninsula. Like the others, it rises near the western coast, and flows towards the east. It is joined by another great river called the *Bain-gonga*. The delta of this river is of vast fertility, enriched by the soil brought down by the periodical inundations. To this river succeeds a flat coast, which, unlike the more southerly parts of this eastern side of the peninsula, has behind it, at some distance inland, a barren lofty chain of rude and almost inaccessible mountains. The part of the coast betwixt the sea and these mountains is called the *Circars*. To the northward the country descends regularly towards the east, as throughout the rest of the peninsula. In general, however, it is soft and morassy, though fertile. This country was known in the time of Pliny. It is now called *Orissa* or *Orixa*, and was in his time said to be the seat of the *Gangaridæ Calingæ*, whose monarch was very powerful, being able to bring into the field 70,000 foot, 1000 horse, and 500 elephants. Beyond this part of the Indian territory, at some distance, the mouths of the Ganges begin, forming the extremity of the bay of Bengal, and of the eastern side of this peninsula.

70 Ganges.

The Ganges is the most celebrated of all the eastern rivers, being in every part of its course held sacred by the original inhabitants of the country. It periodically overflows an immense extent of fertile territory, formed by the deposition of mud, which in the course of ages it has brought down from the higher country. Compared to this mighty stream, the Egyptian Nile sinks into insignificance, and the fertility which it produces is trifling. So completely is the whole of this country formed by the alluvions of its river, that there is not a stone quarry on the banks of the Ganges for the space of 500 miles. The depth of the river to that distance is 30 feet. Immediately at the mouth, however, it is obstructed by the mud brought down by its own floods, so that its eastern or true channel cannot be entered by large vessels. The channel called the *Hoogley river*, upon which the city of Calcutta stands, is the most useful of its mouths, being that which is entered by large vessels, though even at the mouth of this branch great danger is experienced from numbers of longitudinal banks at its entrance, formed by the mud or sand brought down and deposited there by the waters of the river. There are some other branches also which may be entered during the rainy season, or at its close. At the great

71 Hoogley.

tract

Asia.

tract which faces the bay is a collection of flat islands, divided by a labyrinth of canals covered with trees, and forming altogether a forest as large as the principality of Wales. The head of the delta is 220 miles from the sea in a straight line. The numerous channels which pass through it in every direction, form a complete inland navigation along the lower parts. Ships sail amidst a forest divided into numberless isles by a continual labyrinth of channels, so various in breadth that a vessel has at one time her masts almost entangled in trees, while at another she passes uninterruptedly along a capacious river beautifully sheltered with woods. The woods, however, are dreadfully infested by tigers, to which the pious Hindoos, when coming on a pilgrimage, to wash themselves in the sacred stream, are apt to fall a prey.

72 Source of the Ganges.

It has been already mentioned, that this great river rises in the southern part of the high central region of Asia. Its source is a small stream which issues from under a mass of snow accumulated on the south side of the Himmalaya mountains, between 31° and 32° of north latitude, and 78° and 79° of east longitude. From thence the Ganges proceeds to a considerable distance westward, among mountains, after which it precipitates itself into a deep chasm, from which, at a great distance, it escapes, and enters at once, as from a second source, into the vast and fertile plains of Hindoostan. Through these it runs navigable with an easy and smooth current 1320 miles, till it reaches the sea. The place at which it emerges through a gap or division of the lofty Imans, or southern front of Tartary, is called *Hurdwar*. In this neighbourhood the mountains are covered with lofty spires of ice, overlooking the torrid plains of India. Into the Ganges flow multitudes of great rivers from each side, which give a matchless inland navigation. It receives in its course through the plains eleven rivers, some of which are equal in size to the Rhine, and none less than the Thames. It maintains 30,000 boatmen by the carriage of salt and food for ten millions of people in the province of Bengal, and all this independent of its fisheries, and of its different exports and imports. Where it passes through valleys which require not the aid of its inundations to assist the fertility of the soil, the country is defended by vast dikes, which are kept up at an enormous expence. One branch of the Ganges is thus confined for the extent of 70 miles, so that when the river is full, passengers in ships and boats look down on each side as from a lofty eminence into the adjacent country. Its waters are periodically increased by the tropical rains, and by the melting of the snows in the mountains of Tartary adjacent to its source; it then assumes the appearance of a sea of almost boundless extent. When the rains subside the water quickly passes away, and in its stead there suddenly ascends to view a fertile country, which, by the rapidity of tropical vegetation, is almost instantly covered with corn fields and other plantations, some of the islands of the Ganges producing three or four crops yearly.

73 Jumna.

The most important of the rivers which join the Ganges is the Jumna from the south. It proceeds through a very fertile country; and Delhi and Agra, the ancient Mogul capitals, are situated upon it. Though the waters of the Ganges are in every part held sacred, yet they are doubly so at their junction with the Jumna, which is also accounted sacred. The city, which stands at the junction or forks of the two rivers, is therefore called *Allahabad* or *the City of God*. At some distance below this is the city and district of Benares, the great seat of the Hindoo sciences, in which the Brahmins instruct immense numbers of pupils in their religion, contained in books written in, what is now a dead language, the Sanscrit. Many other great cities stand upon this river, of which it is unnecessary here to take notice. The whole country naturally enjoys extreme fertility, and being possessed by an industrious people it abounds with inhabitants.

Asia.

74 Bootan.

To the north-east of Bengal, which is the province at the mouth of the Ganges, the high country of Bootan is situated, near the foot of the mountains that overlook the plains of Hindoostan. Here the great chain of Emodus, caped with eternal snow, shows itself to the inhabitants of Hindoostan, over the lesser hills which guard its approach. On the eastward of the Ganges the river Burrampooter also falls into the bay of Bengal. This river is superior to the Ganges in size and in extent of course. It rises, like it, in the southern part of the high regions of Tartary, but flows eastward; and as its channel lies among rugged rocks and mountains, inhabited only by scattered and barbarous tribes, it is of little renown, and till lately was unnoticed by strangers, though its mouth is close to the mouth of the Ganges. It has only been discovered to be a first-rate river so late as the year 1765. Beyond the lower part of the Burrampooter, Hindoostan speedily terminates to the east, at a narrow chain of mountains running from north to south, the last province receiving the appellation of *Chittagong*. This province proceeds only to a short distance southward along the eastern shore of the bay of Bengal.

75 Burrampooter.

The great country of Hindoostan, from the Panjab and the course of the Indus on the west, to the lower part of the Burrampooter and Chittagong on the east, and from the front of Tartary on the north to Cape Comorin on the south, has undoubtedly from the most distant ages been one of the most fertile and populous regions on the globe. Its civilization runs back to the remotest periods, and the monuments of ancient magnificence which it exhibits are innumerable. When Alexander the Great invaded the western part of it, he found it, as it now is, filled with an industrious, wealthy, and civilized people, possessing the same religion and manners as at present. In its original state it does not appear that India, like China, was ever united under one government, unless when subjected to a foreign yoke. It would seem to have been divided into a great number of independent principalities, and it has always had a tendency to fall back into that state, a circumstance which has rendered its different parts an easy prey to foreigners. The Hindoos are a mild and humane people; but they are at the same time an extremely inactive, timid, and feeble race of men, patient of insults and injustice, so that all invaders have been able to subdue them. A Tartar conquest introduced the Mahometan religion and a feudal government into their country, and changed their language for that of Persia, though to this day the Mahometans are only as one to ten of the population. The British also coming from an island of the Western ocean, have, with a handful of men, been able to become their masters. A remnant, indeed, of Hindoo independence exist

76 Character of the Hindoos.

Asia. exists in what are called the *Mahratta states*, upon the summit of the Ghauts in the western part of the peninsula; but this independence they will not probably be long able to preserve. Even in the ordinary exertions of life, the Hindoos act like men destitute of energy. As carpenters, for example, they perform their work with much neatness and dexterity, but they employ small and light tools, which to men of a more vigorous character and habit, appear contemptible; and when an ordinary beam is to be turned over, an assistant labourer must give his aid, of which an European workman would not perceive the necessity; but the Hindoos living in a country in which labour is extremely cheap, are accustomed to supply by numbers their own deficiency of energy of mind, or of strength of body.

A general imbecility of character seems indeed to mark this nation, or an incapacity to make any vigorous effort of self-command. In matters of intellect they are slaves of imagination and of education. On the banks of the Ganges, in a fertile climate, in which human life is easily sustained, and the constitution naturally prone to indolence, a superstition has been invented which seems to have proved a source of the greatest misfortunes to the nation. Not only is the imagination filled, and the exercise of the understanding injured, by endless legends or tales about the transfiguration of their divinities, but a set of ceremonies and regulations is introduced which places every part of life under controul. The whole people are divided into tribes or hereditary casts. A member of one of these casts cannot marry into a different cast without contracting impurity, and being for ever dishonoured or driven out of his tribe. A Hindoo is not permitted by his religion to eat with a stranger, or even to drink water that has been drawn by impure hands, that is to say, by persons belonging to a different cast. One cast only, the Rajaputes, are permitted to eat animal food, but the rest are compelled by their religion to live upon vegetables alone. Endless minute observances in their eatings are also imposed upon them, founded on the notion of the possibility of contracting pollution in this way. Thus are the Hindoos, though a mild and humane race, rendered in the most ordinary actions of life, the most unsocial as well as the most irrational of mankind. Being occupied at every moment by some religious ceremony or other, and filled with the dread of pollution, they appear contemptible to those strangers whom they avoid as profane or impure. From the impossibility, in this manner imposed upon them, of uniting in any respect with the Tartars who conquered their country, they have sunk into a degraded and despised race; whereas, could they have united or mingled with the invaders, they must speedily have become as one people, and the evils resulting from conquest would gradually have been forgotten. They have persevered for ages in the same intellectual errors, because they have got possession of their imaginations, and because they want energy to cast off any habit or train of thought to which they have once submitted.

The Hindoos appear to be no less destitute of self-command in their active than in their intellectual powers. Hence arises the unbounded superiority in all military enterprises which the Europeans possess over them. The attack of their armies is thus described by an ingenious writer: "It may perhaps afford some measure of gratification to European curiosity, to be informed, that the undisciplined troops of Asia, generally inflamed with *bang* and other intoxicating drugs, pour forth, as they advance, a torrent of menacing and abusive language on their adversaries. Every expression of contempt and aversion, every threat, fitted to make any impression of terror, or to excite ideas of horror, that custom readily presents or inventive fancy can suggest, accompanies the utmost ferocity of looks, voice, and gesture. A murmuring sound, with clouds of dust, announces their approach, while they are yet at the distance of several miles. As they advance, their accents are more and more distinctly heard, until at last, with their eyes fixed and weapons pointed at some individual, they devote him, with many execrations, to destruction, giving his flesh, like the heroes in Homer and the Philistine warriors, to the dogs, and the birds of the air, and the beasts of the field. The numbers of the Asiatic armies, the ferocity of their manner, and the novelty of their appearance, would unnerve and overcome the hearts of the small European bodies that are opposed to them in the field of battle, if experience had not sufficiently proved how much the silence of discipline excels barbarian noise, and uniformity of design and action, the desultory efforts of brutal force, acting by starts, and liable to the contagion of accidental impression." Asia.

Indeed the superiority of Europeans over Hindoos is so great, that it is never balanced by almost any difference in point of numbers. If a body of European troops is only sufficiently numerous to cover a tolerable extent of ground, so that one part of them may rest while the other is on guard, and that advantage may be taken of the victory when gained, the event of the war is uniformly unfavourable to the feeble natives of this region. There seems to exist a defect in their moral nature, to which military discipline cannot afford a remedy. An European gentleman, though a stranger to the use of arms, if called upon by what he accounts his honour or his duty, is able, with an unchanging countenance, to meet the hazard of instant death, and can take the chance of giving or receiving destruction with little passion, and without exhibiting the external symptoms either of anger or of fear. The case is different with the mild and timid inhabitants of Hindoostan; they cannot meet danger with coolness and recollection, but are under the necessity of working themselves into a rage, which enables them to rush upon perils which they are unable calmly to encounter. Thus their fury is irregular and fruitless, like that of men under the influence of intoxication; while at the same time, if their passion decline for an instant, they are seized with sudden terror, and under its influence sometimes rush into greater perils than they wished to avoid. They possess throughout their country fortresses situated upon elevated and precipitous mountains, or surrounded by works of art of inconceivable solidity and strength. Many of these fortresses, under defence, would prove absolutely impregnable, and in this ardent climate, the armies of their northern invaders might perish miserably before them, but these fortresses the Hindoos have been utterly unable to defend. They cannot long remain coolly and without passion on the defensive; in some moment or other of weakness they become

Asia.

become panic-struck, and all is lost. They cast themselves headlong from the summit of the walls, and sometimes, having murdered their wives and children, they cast themselves upon the weapons of their antagonists; finding death in this manner, though the agitation that accompanies their blind fury prevents them from finding revenge for their calamities.

77 What advantages arise from an intercourse with Hindoostan.

In every age, the inhabitants of Hindoostan, who want nothing from the rest of mankind, have received the gold and silver of other nations in return for the precious productions of their favoured soil: the sugar, the spices, the gems, and the valuable manufactures of the country, have at all times been sought, either by commerce or by conquest. But excepting these productions of nature, or of art, it does not appear that any valuable advantages can be derived from an intercourse with the people. Notwithstanding the high antiquity of their civilization, they are inferior in every branch of science to ourselves. Their moral and political speculations are extremely trifling, so far at least as has hitherto been discovered. Their poetry may have its beauties, but it undoubtedly equals not the productions of the north-western regions, that is, of Europe. It is probable, that the only branch of valuable knowledge which could be improved by an intercourse with the people of these countries is, that which concerns the construction of different machines, or the performance of processes connected with the various parts of manufacturing, agricultural, or domestic economy. They are understood to possess several machines of wonderful simplicity, and to perform many processes in an easier and less expensive mode than we are accustomed to do in Europe. They used, from time immemorial, the drill-plough, which with us is a late invention. Their hand-mills for grinding grain are at once simple and effectual; as also their process of distillation. It ought to be recollected by the European nations, that they are but of yesterday when compared with the Hindoos; though we have outrun them in the career of intellect, or of general science, yet the improvement of the processes and instruments connected with the economy of ordinary life requires various successive experiments, which can only be performed during a great length of time, especially if these processes are not usually performed by persons conversant in the highest walks of literature. All newly invented machines and processes are apt to be complex, expensive, and imperfect. It is only after repeated trials and alterations that they are reduced to that simplicity which constitutes their excellence. Ample leisure has been allowed for these trials and improvements in the civilized nations of the East; and the simplicity of their machines, which deducts from their apparent importance, ought to be regarded as their perfection. They were probably invented by more ingenious men than those who now use them, and they probably had the same imperfections by which ours are at present affected: but succeeding generations gradually improved them, and they have at last come down into the possession of a degenerate race, incapable of discerning the value of tools in whose construction there is no seeming intricacy, though their gradual progress to the present state may have required much exertion from successive minds possessed of great energy and ingenuity. We may take the liberty to suggest, therefore, to such of our countrymen as have occasion to reside for any length of time among this ancient people, that one of the most valuable services which they can perform to society in Europe might consist of executing and transmitting accurate descriptions of the different tools and machinery made use of by the Hindoos, and of the processes used by them in the different branches of their domestic economy and management. The discovery of the ancient code of Roman law at Amalfi in Italy, together with the introduction of Grecian literature after the taking of Constantinople by the Turks, gave to the European nations immense assistance in their progress to civilization, by exhibiting to them the practices and the sentiments of a former enlightened age, and thereby abridging their labour in the pursuit of intellectual improvement. A similar aid, or abridgement of the labours of invention, would in all probability be derived from a minute acquaintance with the practices and machinery employed with success during so many ages in the economy of Hindostan.

Asia.

78 Eastern peninsula of India.

Leaving this mild, but timid and feeble race of men, we pass to the eastern peninsula of India, a narrow part of which stretches under the name of Malacca to within two degrees of the equator. Before advancing to the main land, however, we may notice towards the south-eastern part of the bay of Bengal a group of isles called the *Andamans*, chiefly remarkable on account of the singular people by whom they are inhabited. They are the northern division of a number of small islands, stretching from 10° 32′ to 13° 40′ N. Lat. and from 90° 6′ to 92° 9′ E. Long.: the southern division of these isles is called the *Nicobars*, inhabited by a mild and inoffensive people. What is called the *Great Andaman*, the chief of the northern division of islands, is 140 miles in length, and 20 in breadth. A settlement was established upon it by the British in 1793, and convicts are transported thither from Bengal. All that voyagers have related of uncivilized life is said to fall short of the barbarism of the people of Andaman. The ferocious natives of New Zealand, or the shivering half-animated savages of Terra del Fuego, are in a state of refinement, compared to these islanders. The population of the Great Andaman, and its dependencies amounts to little more than 2000 souls, whose sole occupation it is to rove along the margin of the sea in quest of a precarious meal of fish, which during the tempestuous season they often seek in vain. In stature, the Andamaners seldom exceed five feet. Their limbs are disproportionably slender, their bellies protuberant, with high shoulders and large heads; and, strange to find in this part of the world, they are a degenerate race of negroes, with woolly hair, flat noses, and thick lips. Their eyes are small and red; their skin of a deep sooty black; whilst their countenances exhibit the extreme of wretchedness, a mixture of famine and ferocity. They go quite naked, and are insensible of any shame from exposure. Two young women, allured by the temptation of fish, were secured, and brought on board a ship at anchor in the harbour. The captain treated them with great humanity: They soon got rid of all fear of violence, except what might be offered to their chastity, which they guarded with unremitting vigilance. Although they had a small apartment allotted to themselves, and had no real cause for apprehension,

79 Andaman isles.

Symes's Embassy to Ava.

Asia. hension, one always watched while the other slept. They suffered clothes to be put on, but took them off again as soon as opportunity offered, and threw them away as useless incumbrances. When their fears were over, they became cheerful, chattered with freedom, and were inexpressibly diverted at the sight of their own persons in a mirror. They were fond of singing, sometimes in melancholy recitative, at others in a lively key; and often danced about the deck with great agility, slapping their posteriors with the back of their heel. Wine and spirituous liquors were disagreeable to them: no food seemed so palatable as fish, rice, and sugar. In a few weeks, having recovered strength, and become fat, from the more than half famished state in which they were brought on board, they began to think confinement irksome, and longed to regain their native freedom. In the middle of the night, when all but the watchmen were asleep, they passed in silence through the captain's cabin, jumped out of the stern windows into the sea, and swam to an island half a mile distant, where it was in vain to pursue them, had there been any such intention; but the object was, to retain them by kindness, not by compulsion; an attempt that has failed on every trial. Hunger may (and these instances are rare) induce them to put themselves in the power of strangers; but the moment that want is satisfied, nothing short of coercion can prevent them from returning to a way of life more congenial to their savage nature. The few implements they use are of the rudest texture; a bow from four to five feet long; the string made of the fibre of a tree, or a slip of bamboo, with arrows of reed, headed with fish bone, or wood hardened in the fire, is their principal weapon. Besides this they carry a spear of heavy wood sharply pointed, and a shield made of bark, to defend themselves from the assaults of their enemies; for even these poor wretches have rights to assert and dignities to maintain. Necessity has taught them an expert management of their arms, on which they rely for subsistence. Happily for them, their numerous bays and creeks abound with fish, which they shoot and spear with surprising dexterity. They are said also to use a small hand-net made of the filaments of bark; the fish, when caught, are put into a wicker basket, which they carry on their backs. Having kindled a fire, they throw the food on the coals, and devour it half-broiled. A few diminutive swine are to be found in the skirts of the forests, and among the mangrove thickets in the low grounds; but these are very scarce, and are probably the progeny of a stock left by former navigators. When a native has the good fortune to slay one, he carefully preserves the skull and teeth, to ornament his hut. They cross the bays, and go to fish, either in canoes formed of a hollow tree, or on rafts of bamboo, which they direct by paddles. Their habitations display little more ingenuity than the dens of wild beasts; for sticks stuck in the ground are bound together at the top, and fastened transversely by others, to which branches of trees are suspended; an opening is left on one side, just large enough to admit of entrance;—leaves compose their bed. Being much incommoded by insects, their first occupation in a morning is to plaster their bodies all over with mud, which, hardening in the sun, forms an impenetrable armour. They paint their woolly heads with red ochre and water. When thus completely dressed, a more hideous appearance is not to be found in human form. Asia.

Although their principal food consists of fish, yet they eagerly seize on whatever else presents itself: lizards, guanas, rats, and snakes, supply a change of repast. The vegetable diet of the Andamaners consists of the natural produce of the woods, in which the researches of Europeans find little that is palatable or nutritious. The fruit of the mangrove is principally used, having often been found in their deserted habitations, steeping in an embanked puddle of water. As they have no pot or vessel that can bear the action of fire, they cannot derive much advantage from such esculent herbs as the forests may contain; indeed, their extenuated and diseased figures too plainly indicate the want of wholesome nourishment. Unhappily for them, the cocoa-nut, which thrives in the utmost luxuriance in the neighbouring isles, is not to be found here; but they are extremely fond of it; and whenever a nut was left in their way by the settlers, it was immediately carried off with much apparent satisfaction.

There are several sorts of trees on the island; among which are, the *ficus religiosa* or banyan tree, the almond tree, and the oil tree; which latter grows to a great height, and from it a very useful oil is thus produced:—A horizontal incision being made in the trunk, six or eight inches deep, a chip fourteen or fifteen inches long is cut at right angles, and the surface of the incision being hollowed and filled with live coals, the turpentine, or wood oil, exudes copiously from the top of the wound. The peniagre tree is also found, and is well adapted for the knees of ships; and the iron tree, of stupendous size, whose timber almost bids defiance to the axe of the wood-cutter; the red wood, which makes beautiful furniture, little inferior to fine mahogany. Besides these, there are numberless creepers and rattans which surround the stems of the larger trees, and, interwoven with each other, form so thick a hedge, that it is impossible to penetrate far into the forests, but by the slow and laborious process of cutting a road.

It is a sort of historical mystery how a race of negroes should be found here, a people so widely differing, not only from all the inhabitants of that vast continent in which the island of Andaman is embayed, but also from the natives of the Nicobar islands, which are immediately contiguous to it. Some have supposed, that a Portuguese vessel, early in the sixteenth century, laden with slaves from Africa, may have been cast on these shores, and that the present Andamaners are the descendants of such as escaped drowning. This conjecture, however, is proved to be erroneous, from an account of the Andamaners given by two Mahometan travellers, long before the navigation of these seas by Europeans. But an accident similar to that now suggested may possibly, at some period or other, have occurred to an Arabian vessel, as that people are known to have sailed upon the Indian ocean as early as the seventh century; and they not only explored the continent of India as far as the Chinese sea, but likewise gained a knowledge of most of the Eastern islands.

Returning from these islands to the province called *Chittagong*, which forms the extremity on the east of the British East India Company's possessions, as well as the boundary in that quarter of the territory of Hindoostan, we enter upon the farther or eastern peninsula

Asia.

of India. From Chittagong, proceeding southward along the eastern shores, the coast is fertile and rich for a considerable distance within land, forming the ancient kingdom of Aracan. Parallel to the coast runs a chain of lofty and precipitous mountains, forming the boundary of Aracan to the eastward. Beyond these mountains eastward is a level and fertile country, containing rivers which, descending from the regions of High Tartary already mentioned, descend southward along the peninsula, fertilizing the soil by their periodical floods, and forming at their mouths a great extent of low and fertile territory, or delta land. The country to the south-east of Aracan is called *Pegu*; that to the east has long been called *Ava* by Europeans, from the name of the former capital, but is called by the people of the country *Birmah*, and the people themselves *Birmans*. This last people, the Birmans, have recently subdued both of the kingdoms called *Pegu* and *Aracan*, and form at the present period a rising empire of great importance in the east, and well deserving our attention. Though their territories are only divided from those of the British East India Company by a narrow chain of mountains, and at one place by a trifling river called the *Naaf*, yet it was only very lately that they were at all known to the Europeans in that quarter as a neighbouring power of any consideration, our connexion with them having formerly been merely in the way of commerce carried on from their southern ports, near the mouth of the bay of Bengal. The following circumstance gave rise to farther inquiries concerning them:—The trade of Aracan had suffered by the attacks of some robbers, or pirates, who infested the rivers near the coast. They conveyed their plunder across the river Naaf into the Chittagong province, where, being secured from pursuit under the protection of the British flag, they disposed of their spoils to advantage, and lived at ease till returning want impelled them to resume their predatory excursions. On its being ascertained that three of the most distinguished of the robbers had sought refuge in the British districts, the king or emperor of the Birmans sent one of his officers into the East India Company's territories at the head of 5000 men, with injunctions to the commander to bring with him the delinquents, dead or alive, and not to return without them. To support this detachment, an army of 20,000 men was held in readiness at Aracan.

80 Aracan.

81 Birmah.

82 Birman army enters the British territory in India.

Senee Nunda Kiozo, the Birman chief, having crossed the river Naaf, and encamped within the Company's territory on the western bank, sent a letter to the British magistrate of Chittagong, acquainting him of the reasons for the inroad; that the seizure of the delinquents was his sole object, without harbouring any design of hostility against the English. At the same time he declared, that, till the delinquents were given up, he would not depart from the Company's territory. In confirmation of this threat, he fortified his camp with a stockade. These matters being reported to the British government at Calcutta, the refugees were ordered to be apprehended and kept in custody; and, in the mean time, detachments of Europeans, and of Indian troops in their service, called *Sepoys*, with proper artillery, were sent to the spot under Major General Erskine. On the approach of General Erskine, the Birman general sent a flag of truce to propose terms of accommodation, stipulating for the surrender of the fugitive pirates as the basis of the agreement. It was replied, that no proposal could be listened to while the Birmans continued on the British territory; that, unless they departed from it in a limited time, force would be used; but that, if they would withdraw peaceably, the subject of their complaints would be discussed. On receiving this answer, the Birman chief, with a manly confidence in the character of his antagonists, which commanded respect, personally waited on General Erskine, and stated the nature of his instruction, the enormity of the offenders, and the outrages they had committed. General Erskine assured him that the British government had no desire to afford an asylum to robbers; that it had no objection to do jostice; but insisted, that in the first instance, the Birmans ought to retire peaceably from the British territory. The Birman general, in consequence of these assurances, professed his reliance on General Erskine, and agreed to withdraw his troops. The retreat was conducted in the most orderly manner; and so strict was the discipline of the Birman army, that not one irregular act was committed while they remained within the Company's territory. The charges against the refugees were afterwards investigated, and their guilt being clearly established, they were delivered over to their own laws, by whose sentence two out of the three underwent capital punishment.

Asia.

This event called the attention of the British government in India towards the Birmans, a people evidently of a superior character to the Hindoos, whose territory was in their vicinity, and with whom, by their southern ports, a very extensive commerce had within a few years sprung up; which, in the single article of teek-wood, already required an annual return of Indian commodities to the amount of 200,000l. sterling. It therefore appeared a matter of importance to enter into something in the nature of a commercial treaty with this power, at least to the effect of obtaining regular protection for our merchants when visiting their ports. With this view, and to obtain farther intelligence concerning the nature of the government, the character of the people, and the advantages to be derived from intercourse with them, the governor-general of Bengal, Sir John Shore, sent by sea to the principal Birman port a regular embassy; at the head of which was Michael Symes, Esq. then a captain in the British army. From the information obtained and published in consequence of this embassy, the following account of the Birmans and their empire is extracted.

83 British embassy to the Birmans. Vide *Symes's Embassy.*

As already noticed, the Birman empire extends along the western coast of the eastern peninsula of India, or forms the eastern side of the bay of Bengal. It approaches the frontier of China on the north-east, and is limited on the north by the rugged and mountainous country which forms the south-eastern front of the high region of Tartary, being a continuation to this quarter of the great chain of Imaus. From the foot of that elevated region, this, like the western peninsula of India, descends gradually to the south, and the rivers proceed in that direction till the largest of them terminate near Cape Negrais in the south-eastern quarter of the bay of Bengal, where the coast turns suddenly eastward to a considerable distance; after which it proceeds as formerly to the south. The principal

Asia.

cipal towns of the Birman empire stand upon the rivers; and the British embassy sailed up the chief river, the Irrawaddy or Erabatty, to a great distance, till they reached Ummerapoora, the present capital of the Birman dominions.

84 History of the Birmans.

The Birmans and the people of Pegu have long been rival states. The Birmans, though formerly subject to the king of Pegu, revolted about the middle of the sixteenth century, and appear to have acquired a superiority over the Peguers which continued down to about the year 1740. At that period a war took place, which was prosecuted on both sides with savage ferocity; but as the Peguers, living to the southward near the mouth of the navigable rivers already mentioned, had a considerable intercourse with European traders, from whom they could purchase better arms than are manufactured in the east, they gradually obtained a superiority, and gained several victories over the Birmans in the years 1750 and 1751. These advantages were so vigorously prosecuted, that in the year 1752 the Birman capital Ava was invested. The Birmans, dispirited by repeated defeats, and probably ill commanded, after a short siege Diveepdee, the last of a long line of kings, was made prisoner with all his family, except two sons who escaped to Siam. Beinga Della, king of Pegu, left his brother Apporaza as governor of Ava, and carried to Pegu the captive Birman king. Thus a complete conquest appeared to be effected. The landholders and principal inhabitants of the country round Ava submitted, and took an oath of allegiance to the king of Pegu, who in an insolent proclamation, announced the annexation of the Birman country to the Pegu monarchy. In the mean time,

85 Alompra first of the present dynasty.

a Birman of low extraction, Alompra, aspired to become the deliverer of his country. He had submitted like the rest, and was continued by the conqueror in the command of an inconsiderable village, Monchaboo. Here he had no more than 100 devoted followers, upon whose intrepidity and fidelity he could rely. This village, like most of the Birman towns, was surrounded by a stockade. This he strengthened and repaired, without awakening any suspicion in the Pegu conquerors, who never suspected that so inconsiderable a person would attempt a rebellion. In Alompra's village of Monchaboo there were no more than 50 Pegu soldiers, who treated the Birmans with great arrogance: Taking advantage of the indignation excited by some particular act of indignity, Alompra encouraged his followers to attack the Pegu soldiers, and he put every one of them to the sword. Even after this act of rebellion, Alompra disguised his intention with a view

86 Alompra's rebellion.

to gain time. He wrote to the brother of the Pegu king Apporaza, who had been left governor of Ava, expressing much humility and regret for what had happened, professing his fidelity to the Pegu government, and representing the massacre as the result of an accidental quarrel between the Pegu soldiers and the people of his village. These assurances prevented vigorous measures from being taken with sufficient speed against him. Apporaza, having pressing bussiness at Pegu, left Ava under the government of his nephew Dotachew, with instructions to keep Alompra as a prisoner. Accordingly about a thousand men were sent to occupy Alompra's turbulent village, and to send himself to Ava. They expected no opposition, and came ill prepared for it. They were not a little disconcerted to find the gates of the stockade around the village shut against them on their arrival, which was late in the evening; and at daybreak next morning they were suddenly attacked and routed by the Birmans. Alompra, having thus involved a small party of his countrymen in rebellion against their conquerors, represented to them that there no longer existed for them any safety but in victory; that they would never be forgiven, and must resolve to conquer or perish. He invited the Birmans of the neighbouring towns to join his standard, and he found a small number who were willing to embrace his apparently desperate fortunes: with these he adopted the sudden resolution of marching towards Ava the Birman capital, before the numerous detachments of Peguers that were scattered over the provinces could be recalled for its defence. As he advanced, fame magnified his numbers. The governor of Ava, who had no more than 3000 men, was disconcerted; and, despairing of success, deserted that city with his troops, and a few of his countrymen who remained behind him were put to death by the populace. Instead of advancing in person, Alompra

87 Alompra's success.

now sent his second son Shembuan to take possession of Ava. These events occurred in autumn 1753. In consequence of his first success Alompra's reputation became unbounded. His countrymen everywhere revolted, and attached themselves to him as their deliverer. The Pegu king was alarmed for the northern districts of his own territory, in which the Birman population exceeded that of the Peguers. A large force was collected under Apporaza the Pegu king's brother. It consisted of an army, and of a numerous fleet of war boats, which sailed up the Irrawaddy to reduce the insurgents. He laid siege to Ava, where Shembuan held out 40 days, till his father Alompra advanced to his aid. Apporaza raised the siege, and went to encounter Alompra. The contest was chiefly confined to the fleet; the armies only skirmishing on shore. Shembuan having advanced from the fort of Ava to attack the rear of the Peguers, they gave way and fled with precipitation, suffering great slaughter in their retreat. The Peguers, enraged by these misfortunes, put to death the dethroned monarch of the Birmans, together with all the principal men of his nation, to the amount of several hundreds, that were in their power, under pretence that they had been detected in a plot against their conquerors. This only rendered the mutual hatred of the nations more violent; and in several towns the Birmans rose upon the Pegu garrisons, and massacred the whole of them.

88 Alompra aspires to royalty.

In the mean time Alompra continued to improve his fortune, and avowedly endeavoured to establish in his own person the sovereignty of his country. When the son of the late king attempted to return, he drove him back to his asylum among the Siamese. Towards the end of the year 1754 the Pegu king Beinga Della, with a considerable army, laid siege to Prome, a frontier town defended by a solid wall, a deep ditch, and a strong stockade. The Birmans successfully resisted a general assault, and the Peguers had recourse to a blockade. Alompra sent 36 war boats to the assistance of the town, which stands upon a river; the commander of these threw himself with a considerable supply of men and provisions into the town, and sent back his boats, only a few of which were taken. After

Asia.

a farther delay of six weeks, Alompra arrived in person and attacked the Peguers both by land and water. Instead of keeping up a fire of musquetry as usual, the boats closed, and after a desperate engagement, the Peguers abandoned the siege. The tide of success was now so completely turned, that the war was become defensive on the part of the king of Pegu. He retired to his capital, which being near the sea-coast, the contest became a kind of maritime warfare in the mouths and creeks of the rivers; which last are extremely numerous in the low delta land near their mouth. At this time both the French and English were in possession of factories in the Pegu country, and both the Peguers and Birmans solicited the assistance of the strangers, being abundantly sensible that a few ships of burden furnished with guns would give a vast advantage to either party, in a contest against the war boats used in their country. In the course of the year 1755 both the French and English appear to have entered secretly into separate negociations with each of the parties, and to have promised aid to each of them. Both of them ultimately broke faith with Alompra, and joined the people of Pegu. Notwithstanding this assistance, the Birman leader continued to enjoy a career of success. He was victorious on land, and the aid of the foreigners by water only produced a slight degree of embarassment. At one time three English ships and one French ship assisted the Pegu force, consisting of 200 armed boats, while 10,000 men marched along with them as a land force; but the Birmans disconcerted the attack by a stratagem. With considerable ingenuity they constructed fire-rafts, consisting of a number of boats fastened together, and filled with combustibles. These rafts were floated with a strong spring tide to where the European ships lay at anchor, and directed with such skill and effect as to oblige them to slip their cables and remove, the French ship narrowly escaping destruction. Alompra at last succeeded in cutting off the communication between Pegu and the sea. A French ship coming to the assistance of the Peguers was taken by surprise; and as her papers proved the object of her voyage, her officers were put to death by the order of Alompra: other foreigners, however, particularly the English, taken in the important Pegu town of Syriam, were suffered to depart unmolested, though he had sufficient reason to complain of their countrymen. Alompra was at last, in consequence of his success in every quarter, enabled to lay siege to Pegu itself, the capital of his enemies. It was situated on an extensive plain, surrounded with a high solid wall, flanked by small towers, and strengthened on each face by demibastions equidistant. A broad ditch contained about three feet depth of water, and the pagoda of Shoemadoo, which will be afterwards described, served as a citadel. Circumvallation is a favourite mode of warfare with the Birmans, as they are almost destitute of cannon, and therefore trust rather to famine than to force. Having invested Pegu, and erected numerous stockades both to hem in the town, and to secure his own army against external attack, Alompra, in the month of January 1757, resolved to wait patiently till the want of supplies should bring the city into his power. After a siege of two months the numerous population of Pegu became mutinous in consequence of want. The king summoned a council of his family and chiefs, and proposed to sue for peace, on condition of being allowed to govern his country, consenting to do homage for it to the Birman monarch. The proposal was accepted by Alompra; but, as a preliminary, the Pegu king was under the necessity of surrendering to the conqueror his only unmarried daughter. For some days the peace seemed restored, and the besiegers and the besieged mingled with each other in amity; but Alompra, probably with a treacherous intention, having introduced some soldiers in disguise into the town, they were seized and put to death by order of the king of Pegu's nephew Choupavea. Hostilities recommenced, and at last the king of Pegu, who appears to have been a timid man, privately admitted the Birmans into the city, on condition that his own life should be spared; the town itself was delivered up to plunder.

Asia.

89 Pegu taken.

Alompra, thus successful, extended his power over several surrounding provinces, and rendered Monchaboo, his original residence, the seat of imperial government. While upon an expedition to Cassay, a northern province of his empire, the Peguers revolted, but were defeated on his return. On this occasion he was led to suspect, that the persons belonging to a British settlement at the island of Negrais, had given assistance to the revolters: They were suddenly attacked, therefore, by his orders, in October 1759, and most of them destroyed. A few escaped in two vessels, the Shaftesbury and the Victoria. Alompra next made war upon his neighbours on the east, the Siamese, accusing them of assisting his enemies of Pegu, and of raising conspiracies against his authority. He undertook an expedition against the capital of Siam; the enemy harassed his march, but did not hazard a decisive engagement. In a month he reached the vicinity of the metropolis, which prepared to sustain a siege; but here the career of Alompra terminated. He was taken ill of a mortal disease, said to be a species of scrophula. He foresaw his end, and gave orders for an immediate attack; but he died on the 15th of May 1760, before he reached his capital. He was deeply regretted by his people, who admired his talents and his success, and regarded him as their deliverer from a foreign yoke. He is represented as having performed no less service to his country by the laws which he enacted, than by the battles which he fought. In particular, he reformed the administration of justice, prohibited magistrates to sit in judgment, unless in a public place, and required every decree to be registered. He also issued edicts against gaming, and the use of spirituous liquors, in his dominions.

90 Massacre of the British.

91 War with Siam.

92 Death of Alompra.

The Birman law vests the right of succession in the eldest heir male; but, upon the death of Alompra, his second son, Shembuan, made an attempt to seduce the army and to seize the throne. Receiving little support, he submitted to his eldest brother, Namdogee Praw, who, at the request of their common mother, received him into favour. One of Alompra's generals, called *Nuttoon*, was a more dangerous rival. A division of the army under his command seized upon the city of Ava. He expected succours from Siam, but was disappointed; and being besieged in Ava, he was reduced to great distress. He tried to make his escape; but was taken and put to death with most of his adherents. The destruction of Nuttoon did not put an end to

93 Alompra succeeded by his eldest son Namdogee Praw.

Asia.

to the disturbances that agitated the Birman empire. A younger brother of Alompra, who held a considerable government, aspired to independence; but he also was taken in his fortress, after a siege of three months. His life was spared, but he was kept a close prisoner. Namdogee Praw died at his capital in March 1764, of the same disease that brought his father to the grave, leaving one son, Momien, an infant. Shembuan, the second son of Alompra, now seized the government as king; and the child of his elder brother was educated in religious obscurity, as a rhahan or priest. Shembuan's first undertaking was a war against the Siamese, whose country, in the year 1766, he entered at different points with three armies; which, after some resistance, effected a junction. Having approached the capital, a general battle was fought, in which the Birmans were successful, and invested the capital of Siam. Each party had some artillery, which was of little service; and the Birmans had recourse to blockade, which, as already noticed, is their favourite system of warfare. After a two months siege, the king of Siam secretly made his escape. The city capitulated, and a Siamese governor was appointed, who swore allegiance, and engaged to pay tribute to the Birman monarch.

94 Shembuan obtains the throne.

95 Invades Siam.

96 The Chinese invade Birmah.

In the beginning of the year 1767, a Chinese army invaded the Birman empire. Shembuan prepared to meet this danger; and it appears that, in consequence of the numerous wars in which they had recently been engaged, the Birmans were enabled to act upon this occasion with a considerable degree of military skill and energy. They formed two separate armies, one consisting of 10,000 infantry and 2000 cavalry, was sent to meet the invaders. They accordingly advanced, and encamped within eight miles of the Chinese army. On the following day, an action took place, in which the Birmans were worsted and retired. The Chinese, elated by their success, pressed eagerly forward, and were in this manner drawn to a considerable distance into the country. In the mean time, a second Birman army, amounting to 30,000 men, had taken a circuitous road, and got into the rear of the Chinese. The army in front now made a stand, and the invaders found themselves hemmed in on all sides. The Tartar cavalry, on whose activity the Chinese army depended for provisions, would no longer venture out either to procure supplies or to protect convoys. The Birmans now attacked their enemy with impetuosity, who resisted with a resolution founded on despair. The conflict lasted three days, and the Chinese at last attempted to cut their way through the weakest part of the Birman line. This attempt proved fatal. The Birmans, sure of being reinforced, maintained their ground till the troops of both their armies arrived to their assistance. The Chinese now sunk under the pressure of an attack from numbers which were increasing every hour. The carnage was dreadful, as the Birmans are extremely ferocious and unrelenting in war. Of the Chinese army not a man returned to his native country. About 2500 were preserved from the sword and conducted to the Birman capital, where they were employed in such occupations as they understood, without any other reward for their labour than a bare subsistence.

Meanwhile, Shembuan's successes against the Siamese were attended with no permanent advantage. His armies were no sooner recalled than his authority was openly disregarded. He sent one of his generals once more into their country; but he met with such opposition as compelled him to retreat and to demand reinforcements. This last request was complied with, in a manner that produced a serious danger. One of the viceroys of the southern parts of the empire was commanded to raise the necessary supplies; but as his jurisdiction was inhabited chiefly by families of Peguers, he had no sooner assembled his recruits and placed arms in their hands, than they became conscious of their own strength, and were seized with a desire to regain their empire. They rose upon their Birman officers and companions, and commenced an indiscriminate slaughter. It was not till after an army of 20,000 men was assembled, with 24 pieces of cannon, besides a great number of war boats, that they could be subdued. While this struggle was going on in the lower part of the empire against the people of Pegu, now considered as rebels, Shembuan followed out a plan of conquest to the north-west, in the country called *Cassay*. His troops even penetrated within what are called the *Himmaleh hills*, which form a continuation of the lofty Imaus, and which descending towards the extremity of the bay of Bengal, seem to be a barrier raised by nature to protect the unwarlike inhabitants of Hindoostan from the more hardy natives of the east. Shembuan lost a great number of troops in attacking the chiefs or rajahs of these hilly countries, but at last succeeded in subduing a great number of them, though the conquest could be of little utility, as possession of these rude territories could scarcely be retained.

Asia.

On his return from this north-western expedition, Shembuan went southward to visit his Pegu territories, which had so recently been involved in civil war. On this occasion he pretended to discover that the old king of Pegu, who had been taken by Alompra, and had remained all this while in prison, had engaged in some kind of conspiracy. In consequence of an accusation to this effect, the dethroned monarch underwent the form of a trial, was condemned and put to death. Many persons of rank, of the race of the Peguers, were also put to death on this occasion, under pretence that they had given countenance or aid to the late rebellion.

97 Old king of Pegu put to death.

These were among the last transactions of Shembuan's life. He died in the city of Ava, about the middle of spring, in the year 1776. He was succeeded by his son Chenguza, who appears in every respect to have been incapable of exercising dominion with any tolerable degree of propriety. He degraded his father's most respectable officers, and plunged into the most shameful debauchery, which he avowed openly by repealing the edict against the use of spirituous liquors. He put to death a younger brother, from jealousy of his ambition, employed himself wholly in hunting, and left public affairs to be managed by favourites. He also put to death one of his uncles, kept another of them close prisoner, and watched vigilantly a third of them, who affected to live in the most inoffensive obscurity. In a fit of jealousy he also put to death his wife in a public and open manner, and having at last rendered himself both odious and terrible, a conspiracy was

98 Death of Shembuan.

99 Chenguza succeeds to the throne.

Asia.

was formed against him, at the head of which was his uncle Minderagee Praw, the result of which was, that the latter obtained possession of the throne, and Chenguza, deserted by all the world, was killed by the father of the wife whom he had put to death, though the slayer was afterwards also put to death, under pretence of having shed royal blood contrary to the express letter of the law of the Birmans.

100 Minderagee succeeds to the throne.

Shembuan Mia Shean Minderagee Praw, the fourth son of the deceased Alompra, thus succeeded to the possession of the empire. In the first days of the conspiracy, a pretence had been made that the object of it was to raise to the throne Momien, the only child of Namdogee Praw the eldest son of Alompra; but this pretence was speedily laid aside, and in eleven days after his accession to the throne, he was put to death. Minderagee Praw, notwithstanding the manner in which he obtained the sovereignty, is understood to have governed well, and he was upon the throne when the British envoy, Captain Symes visited that country. While he led a private life, however, this monarch is represented as having imbibed much of the superstition that so strongly characterizes every form of religion in the east. During his days of leisure he had directed much of his attention to astronomy, and became a thorough believer in judicial astrology. Some few Brahmins had for ages been accustomed to emigrate from Cassay and Aracan, to Ava, where, on account of their superior knowledge, they were employed as professors of science. A college was established and lands appropriated for its support. These Brahmin doctors composed almanacks, calculating eclipses; and from their intercourse with the planets, pronounced the propitious hour and season to attempt any momentous undertaking. Long before his elevation, these Brahmins had foretold to Minderagee Praw the fortune that awaited him. The accomplishment of their prophecy confirmed their influence over him. He appointed a certain number to be his chaplains, who, on court days, arrayed in white robes and standing round the throne, chaunt a solemn benediction in melodious recitative. This ceremony is performed as soon as the king ascends the imperial seat, and before the commencement of public business. Prompted by the persuasions of his counsellors, Minderagee resolved to withdraw the seat of government from Ava, and to found a new city.

101 New capital Ummerapoora.

The site fixed on for the projected settlement was judicious: about four miles north-east of Ava, there is a deep and extensive lake called *Toungemann*, formed by the influx of the river during the monsoon, through a narrow channel, which afterwards expands and displays a body of water a mile and a half broad, and seven or eight miles long. This lake first takes a northerly direction, nearly parallel with the river; it afterwards curves to the south-east, in a lessening sheet, and diminishes to a morass favourable to the culture of rice. When filled by the periodical rains, the lake with the river on one side, encloses a dry and healthy peninsula, on which *Ummerapoora*, the name given to the new city, now stands. Buildings in the Birman country are composed for the most part of wood; and water carriage being here convenient, the old town was speedily demolished, and the present capital rose from its materials; whilst such was the assiduity used in removal, that Ummerapoora became, in a short time, one of the most flourishing and well built cities of the east. The fort likewise, which is spacious and regular, is completely fortified after the Asiatic manner. A lofty rampart, protected by a parapet, and strengthened by bastions composed of excellent masonry, is further secured by a deep and broad ditch, faced with brick and filled with water: the gateways are guarded by cannon, and retrenchments defend the passes of the ditch. The new monarch soon resolved to extend his dominions westward, by the conquest of Aracan. This country, as already mentioned, is situated to the westward of Ava, along the shore of the bay of Bengal, but the direct road is embarrassed by a chain of mountains 56 miles in breadth. The road is so difficult that an enterprising people might easily have defended the passes against any superiority of number; but the Birman king knew too well the indolent character of the king of Aracan, and the unwarlike disposition of his subjects, to dread any vigorous opposition. This country, however, had never been completely conquered: the Moguls on the west, the Peguers on the east, and the Portuguese from Europe, had at different times carried their arms into the heart of the country, but after these passing inroads Aracan had always recovered its independence. The difficulty of conquest, on the present occasion, consisted chiefly of finding a way into a country so well defended by nature. The range of lofty mountains, already mentioned, nearly encircles it on the east. From the southern quarter at Negrais, Aracan could only be invaded by water, through the many rivers that intersect the country adjacent to the sea. From the side of Chittagong, entry into Aracan must be effected by a march along the sea beach, which is interrupted by several channels, that owe their waters chiefly to the action of the tide. The coast, however, is extremely well adapted to commerce, by the various large and well cultivated islands which it possesses, and the variety of channels by which vessels can pass into the country, which to the mountains is everywhere low and well watered. The trade of Aracan has not indeed been very considerable. It is confined to salt, bees wax, elephants teeth, and rice. This latter article is produced in such abundance, that it might be improved into a lucrative branch of commerce. Possession of Aracan and its islands is not only coveted by the Birmans, on account of the fertility of the soil, but also from the protection it might afford to their boats, which navigating along the coast make an annual voyage to Chittagong and Calcutta, where they dispose of the produce of their country, and in return bring back cloth and the commodities of India.

Asia.

102 Invasion and conquest of Aracan.

In the year 1783, the Birmans accomplished their intended invasion, by attacking Aracan in different detachments, a part of which crossed the mountains, while others went round by water. After a naval engagement, which terminated in favour of the invaders, the king of Aracan took flight with his family; but being closely pursued, he was taken prisoner, and conducted to the Birman capital, where he was treated with humanity, but died in the course of a year. The town and port of Aracan fell after a faint resistance. The booty found in it was considerable, but on nothing was a higher value placed, than on an image of burnished brass of the god of the Birmans, called *Gaudma*, or *Boodh*,

Asia.

Boodh, or *Budhoo*. The figure is about 10 feet high in the customary sitting posture, with the legs crossed, the left hand resting on the lap and the right pendent. This image is believed to be an original resemblance, taken from life, and is so highly venerated, that pilgrims have for centuries come from the remotest countries, even Ceylon, China, and Japan, where the supremacy of Gaudma is acknowledged, to pay their devotions at the feet of his brazen representative. There were also found five images of Rakuss, the dæmon of the Hindoos, of the same metal and stature. These were valued as guardians of the sanctity of the idol. A singular piece of ordnance was also found of enormous dimensions, composed of huge bars of iron beaten into form. This ponderous cannon measured 30 feet in length, two feet and a half in diameter at the mouth, and 10 inches in the calibre; it was transported to Ummerapoora by water, and deposited in the yard of the royal palace, where it is now preserved as a military trophy; it is mounted on a low carriage supported by six wheels, and is covered from the weather by a wooden pent-house. Gaudma and his infernal guards were, in like manner, conveyed by water to the capital, with much pomp and superstitions parade.

103 Aracan now a Birman province.

Since this period Aracan, with its dependencies, has constituted a province of the Birman empire, and is governed by a maywoon or viceroy. Birman troops are distributed in the different towns, and lands were granted to many Birmans, on condition that they should come with their families and settle in the country. The valuable acquisition of Aracan did not satisfy the ambition of Minderagee Praw, and he speedily turned his arms against the Siamese, his neighbours on the south-east. From the year 1785 to 1793, he carried on against them a very sanguinary war, in which he suffered a considerable number of defeats, though the Siamese could make no progress against him upon his own territory. At length the Siamese proposed a negociation, which terminated in a treaty of peace, very favourable to the Birman interests, as the Siamese consented to relinquish to them a considerable extent of territory to the southward, on the western side of the peninsula.

104 Extent of the Birman empire.

The result of all these acquisitions is, that the Birman empire upon the whole, at present, appears to include the space between 9° and 26° N. Lat. and between 92° and 107° E. Long. from Greenwich, or about 1050 geographical miles in length, and 600 in breadth. These are stated as the ascertainable limits taken from the Birman accounts, though it is thought that their territories stretch still farther to the north; but it must be remarked, that in the southern parts the breadth often varies, and is in many places very inconsiderable. On the whole, however, they possess a territory superior in extent to the German empire. But their perpetual wars, especially their sanguinary contests with Pegu and Siam, have greatly depopulated their country: and here, as in every other part of the world, it has been found, that war, while it ruins the vanquished, is seldom the source of internal prosperity to the victorious nation. From what can be discovered, there is no reason to believe that their present population, including Aracan, exceeds 17,000,000. Yet the soil of the southern provinces of the Birman empire is remarkably fertile, and produces as luxuriant crops of rice as are to be found in the finest parts of Bengal; but extensive plains, on which the vestiges of former culture and population are abundant, remain without a single house or inhabitant, having been desolated by the ravages of war, during the contests of the Birmans and Peguers, so that the finest territories in the world have in many places of this empire become, for a time at least, the undisputed domain of the wild beasts of the forest. In the northern parts of the empire, the country becomes irregular and mountainous; but the plains and valleys, particularly near the rivers, are exceedingly fruitful. They yield good wheat, and the various kinds of small grain which grow in warm climates, with the different sorts of esculent vegetables: sugar canes, tobacco of superior quality, indigo, cotton, and the different tropical fruits in perfection, are all natural products of this favoured land.

Asia.

105 Climate.

The climate of every part of the Birman empire is said to testify its own salubrity by the best of all criterions, the appearance and figure of the natives, who appear equal in strength and activity to any other race of men in the world. The seasons are regular, and the extremes of heat and cold are seldom experienced; at least the duration of that intense heat, which immediately precedes the commencement of the rainy season, is so short, that it incommodes but for a very little time. During the residence of the British embassy in the country, only one man was lost by disease. Another met an accidental death: in wandering through the woods he became the prey of a tiger.

106 Teek wood.

One of the most valuable productions of this empire is the teek tree, which grows in vast abundance in the southern parts of the empire, near the great rivers. This article alone renders a free commerce with the Birmans of vast importance to the British settlements in India. Teek wood, so absolutely necessary for the navigation of the eastern seas, cannot be conveyed from the Malabar to the Coromandel coast of the western peninsula of India, or to Calcutta, but at an expence so great as to preclude the attempt. This wood grows indeed on the banks of the river Godaverry, but the impediments to procuring it from that quarter have hitherto been found insurmountable. Hence a great part of British India depends for ship-timber upon the Birman empire. Most other descriptions of timber are also found in this empire; on the banks of the river Irravady a large log of fir was seen by Doctor Buchanan, one of the gentlemen belonging to the embassy. He was informed by the natives that it had been washed down by the torrents from a mountainous part of the country northward of the capital, where it grows in abundance and of considerable magnitude. It is called *tænys*. The turpentine is extracted from it, and turned to use, but the wood is considered as of little value on account of its softness. It will probably hereafter be brought to market in India, as top-gallant-masts and yards made of teek are thought too heavy, and European and American spars are often bought for these purposes at a very exorbitant price.

107 Animals.

On account of the depopulation of various parts of the country by war, the wild animals have multiplied to a great extent. The most troublesome of these are tigers, which infest all the forests, and what are called *jungles* or woody thickets near the banks of torrents, so as to render it dangerous to enter them: wild elephants

Asia.

also abound, and occupy the forests in great numbers. These powerful animals, allured by the early crops of rice and sugar cane, make predatory excursions in large troops, and do much mischief, destroying more than they devour. The peasantry have often to lament the destruction of their most exposed plantations in consequence of these inroads. Herds of deer are frequently seen, and horses and cattle are reared in abundance by the people. They have also large herds of buffaloes, which have a powerful antipathy to a red or scarlet colour, and are so extremely fierce, that the tigers dare not attack them.

The two peninsulas of India are the native countries of the peacock, and also of our barn-door fowl; the latter abound in the jungles or thickets, and are well known to sportsmen in India. They differ little from the barn-door fowl in Europe, except that the wild sort are all similar in colour; a dark red, with black breast and legs: their flesh is very delicate.

108 Minerals.

The Birman empire abounds in minerals. Near the frontiers of China they have mines of gold and silver; there are also mines of gold, silver, rubies, and sapphires, at present open on a mountain near the river Keenduem; but the most valuable, and those which produce the finest jewels, are in the vicinity of the capital. Precious stones are found in several other parts of the empire. The inferior minerals, such as contain iron, tin, lead, antimony, arsenic, sulphur, &c. are met with in great abundance; amber, of a consistence unusually pure and pellucid, is dug up in large quantities near the principal river. Gold likewise is discovered in the sandy beds of streams which descend from the mountains; diamonds and emeralds are not found in any part of the Birman empire, but it affords amethysts, garnets, very beautiful chrysolites, jasper, loadstone, and marble. This last is equal in quality to the finest marble of Italy, and admits of a polish that renders it almost transparent; but it is not allowed to be sold in its rude state or in blocks, being held sacred, and used only for the purpose of manufacturing images of Gaudma.

109 Petroleum wells.

They have also wells of petroleum, which were visited by the British envoy, who describes his journey to them in the following terms: "Doctor Buchanan partook of an early dinner with me, and when the sun had descended so low as to be no longer inconvenient, we mounted our horses to visit the celebrated wells that produce the oil, an article of universal use throughout the Birman empire. The face of the country was cheerless and sterile; the road, which wound among rocky eminences, was barely wide enough to admit the passage of a single cart; and in many places the track in which the wheels must run, was a foot and a half lower on one side than the other: there were several of these lanes, some more circuitous than others, according to the situation of the small hills among which they led: vehicles going and returning were thus enabled to pursue different routes, except at particular places, where the nature of the ground would only admit of one road; when a cart came to the entrance of such a defile, the driver hallooed out to stop any that might interfere with him from the opposite side, no part being sufficiently wide for two carts to pass. The hills, or rather hillocks, were covered with gravel, and yielded no other vegetation than a few stunted bushes. The wheels had worn ruts deep into the rock, which seemed to be rather a mass of concreted gravel than hard stone, and many pieces of petrified wood lay strewed about. It is remarkable, that wherever these petrifactions were found, the soil was unproductive, and the ground destitute of verdure. The evening being far advanced, we met but few carts; those which we did observe were drawn each by a pair of oxen, and of a length disproportionate to the breadth, to allow space for the earthen pots that contained the oil. It was a matter of surprise to us how they could convey such brittle ware, with any degree of safety, over so rugged a road; each pot was packed in a separate basket, and laid on straw; notwithstanding which precaution, the ground all the way was strewed with the fragments of the vessels and wet with oil; for no care can prevent the fracture of some in every journey. As we approached the pits, which were more distant than we had imagined, the country became less uneven, and the soil produced herbage; it was nearly dark when we reached them, and the labourers had retired from work. There seemed to be a great many pits within a small compass; walking to the nearest, we found the aperture about four feet square, and the sides, as far as we could see down, were lined with timber; the oil is drawn up in an iron pot, fastened to a rope, passed over a wooden cylinder which revolves on an axis supported by two upright posts; when the pot is filled, two men take the rope by the end, and run down a declivity which is cut in the ground to a distance equivalent to the depth of the well; thus, when they reach the end of their track, the pot is raised to its proper elevation; the contents, water and oil together, are then discharged into a cistern, and the water is afterwards drawn off through a hole at the bottom. Our guide, an active intelligent fellow, went to the neighbouring house and procured a well-rope, by means of which we were enabled to measure the depth, and ascertained it to be 37 fathoms, but of the quantity of oil at the bottom we could not judge; the owner of the rope, who followed our guide, affirmed that when a pit yielded as much as came up to the waist of a man, it was deemed tolerably productive; if it reached to his neck it was abundant; but that which rose no higher than the knee was accounted indifferent: when a well is exhausted, they restore the spring by cutting deeper into the rock, which is extremely hard in these places where the oil is produced. Government farm out the ground that supplies this useful commodity; and it is again let to adventurers, who dig wells at their own hazard, by which they sometimes gain, and often lose, as the labour and expence of digging are considerable. The oil is sold on the spot for a mere trifle; I think two or three hundred pots for a tachal or half-a-crown. The principal charge is incurred by the transportation and purchase of vessels. We had but half gratified our curiosity when it grew dark, and our guide urged us not to remain any longer, as the road was said to be infested with tigers that prowled at night among the rocky uninhabited ways through which we had to pass; we followed his advice, and returned, with greater risk, as I thought, of breaking our necks from the badness of the road than of being devoured by wild beasts. At ten o'clock we reached our boats without any misadventure."

110 Character of the Birmans.

The Birmans are very far from being in a state of intellectual darkness. Though they have not explored

Asia.

the depths of science, nor reached to excellence in the finer arts, yet they have an undeniable claim to the character of a civilized and well instructed people. Their police is better regulated than in most European countries. In their natural dispositions they are high-spirited, active, impatient and irascible; but at the same time they are friendly and hospitable to strangers, and their manners are rather expressive of manly candour than of courteous dissimulation: a knowledge of letters is so widely diffused, that there are no mechanics, few of the peasantry, or even the common watermen, usually the most illiterate class, who cannot read and write in the vulgar tongue; few, however, are versed in their books of science, which containing many Shanscrit terms, and being often written in the Pali text, are (like the Hindoo Shasters) above the comprehension of the multitude. The Birmans are not shackled by any prejudices of casts like the Hindoos, restricted to hereditary occupations, or forbidden to participate with strangers in every kind of social connexion. Hence it is probable, that if a respite is allowed them from foreign wars, their progress in improvement will be rapid. They are a very sober people, and though the activity of their character renders them fond of amusements, yet multitudes of them are seen assembled together upon their public festivals, without one act of intemperance being committed, or a single instance of intoxication being perceived.

111 Women.

The laws or customs of the Birmans with regard to women contain a strange mixture of reason and of absurdity; on the one hand the women are allowed entire freedom, and are considered as of much importance, while in other respects they are treated with great contempt. The Birmans encourage all strangers to marry Birman wives; even slaves taken in war who comply with this invitation, acquire considerable privileges. This custom, in which these people agree with the wisest and best governed nations of antiquity, is singular among the civilized countries of the east, and peculiarly remarkable in a people surrounded by kingdoms where women are kept inviolably sacred from the sight and converse of strangers, and where the exclusive system of casts or tribes admits neither of civil nor religious proselytism. Even the public prostitutes in China are prohibited from having intercourse with strangers. The Hindoo women of rank are no less inaccessible, and admission into a respectable cast is not to be obtained by money. The Birmans, on the contrary, sensible that the strength of an empire consists in its population, admit to their society men of all religions and complexions, Pagans or Jews, Mahometans or Christians, the disciples of Confucius or the worshippers of fire; the children of whom, born of a Birman woman, are understood to be natural-born subjects of the state, and are entitled to the same protection and privileges as if they had sprung from a line of Birman ancestry. Accordingly the jealousy which prompts the eastern nations to immure their women within the walls of a haram, and to surround them with guards, seems scarcely to have any influence over the minds of this extraordinary people. Birman wives and daughters are not concealed from the sight of men, and are suffered to have as free intercourse with the world as the rules of European society admit. A man can only marry one wife; but it appears that their men of rank take a second in the character of a concubine, who is by law, however, obliged to attend and obey the lawful wife as a servant. Women are accounted of such political importance, that great care is taken to prevent their being conveyed out of the country. The law in this point is very rigorous; every ship, before she receives her clearance, is diligently searched by the officers of the customhouse; even if their vigilance were to be eluded, the woman would be quickly missed, and it would soon be discovered in what vessel she had gone, nor could that ship ever return to a Birman port but under penalty of confiscation of the property, and the infliction of a heavy fine and imprisonment on the master: female children also, born of a Birman mother, are not suffered to be taken away. Men are permitted to emigrate; but they think that the expatriation of women would impoverish the state, by diminishing the sources of its population.

Asia.

On the other hand, women are treated in many respects as not belonging to the same scale of creation as men; the evidence of a woman is not received as of equal weight with that of a man, and a woman is not suffered to ascend the steps of a court of justice, but is obliged to deliver her testimony on the outside of the roof. The lower class of Birmans make no scruple of selling their daughters, or even their wives, to strangers who come to reside among them for a short time, and none of the parties are understood to be dishonoured by the connexion. When the master of a family incurs debts which he cannot pay, his wife and daughters may be sold as slaves for payment of his creditors. Near the great towns is a place, called *tackally*, in the suburbs, assigned to common prostitutes, who are under the controul of a public superintendant. He frequently purchases the unfortunate women who are sold for the payment of the debts of their relations, and makes gain by the prostitution of them.

Still, however, domestic society is on a very different footing among the Birmans from that in which it is placed among the other eastern nations, and the women take a much more active share in the superintendance of all affairs, as appears from the following anecdote, which fell under the observation of the British embassy, in the neighbourhood of whose residence a large ship was building for the governor of Maindu. "If this ship was not composed of prime materials, the building at least was well attended to; every morning the governor's wife crossed the river in her husband's barge, attended by two or three female servants: after landing, she commonly took her seat on one of the timbers in the yard, and overlooked the workmen for some hours; after which she returned home, and seldom missed coming back in the evening to see that the day's task had been completed. The slip on which the ship was built happened to be contiguous to our first habitation, a circumstance that caused us to remark her constant visits; curiosity, however, did not prompt her, or any of her attendants, to come within our precincts, whilst decorum deterred us from making advances towards an acquaintance. Her husband never accompanied her, and she did not seem to require his aid. Women in the Birman country are not only good housewives, but likewise manage the more important mercantile concerns of their husbands, and attend to their interests in all out-door transactions: they are industri-

Asia.

ous to the greatest degree, and are said to be good mothers, and seldom from inclination unfaithful wives."

112 Marriages.

Marriages among the Birmans are not contracted till the parties attain the age of puberty. The contract is purely civil, and the priests have no interference in it. When a young man is desirous to marry a girl, his mother, or nearest female relation, first makes the proposal in private. If the suit be successful, a party of his friends proceed to the house of the parents of the maiden, and adjust the dowry. On the morning of the bridal-day the bridegroom sends to the bride three loongees, lower garments; three tubbecks, or sashes; and three pieces of white muslin; also such jewels, ear-rings, and bracelets, as his circumstances admit of. A feast is prepared by the bride's parents, and formal writings are executed. The new-married couple eat out of the same dish. The bridegroom presents the bride with some pickled tea, which she accepts, and returns the compliment, which terminates the ceremony.

113 Politeness.

The Birmans are extremely polite, but at the same time unceremonious in their manners. Their form of demonstrating respect consists of assuming a sitting or low posture. Accordingly, when persons of rank visited the East India Company's ambassador, they no sooner came into the apartment than they instantly took to themselves chairs and sat down, while their attendants assumed a low posture, by resting upon their hams in the eastern manner. Though the embassy was at first received with considerable distrust by the government, yet the members of which it was composed were treated with the utmost politeness and personal respect, both by persons in office and by all ranks of people. The curiosity with which they were visited when at Pegu is thus described:—"Our hall in the morning was generally crowded, as every person of distinction in Pegu paid us the compliment of a visit, except the maywoon, who, within the precincts of his own government, where he represents the king, never returns a visit. Numbers both of men and women, prompted by harmless curiosity, surrounded the paling of the enclosure from morning till night: Those of a better class usually came in, some previously asking permission; but many entered without it. Perfectly free from restraint among themselves, the Birmans scruple not to go into your house without ceremony, although you are an utter stranger. To do them justice, however, they are not at all displeased at your taking the same freedom with them. This intrusion is confined wholly to your public room: they do not attempt to open a door; and where a curtain dropped denotes privacy, they never offer to violate the barrier. On entering the room, they immediately descend into the posture of respect. Of all our customs, none seemed to surprise them more than the preparations for dining: the variety of utensils, and our manner of sitting at a table, excited their wonder. They never took any greater liberty than merely to come into the room, and sit down on the floor: they meddled with nothing, and asked for nothing; and when desired to go away, always obeyed with cheerfulness. Had untold gold been placed before them, I am confident not a piece would have been purloined." The behaviour of these people at another of their towns is thus mentioned: "The news of the mission had reached the place before we arrived, and excited a general curiosity to see the boomien of the colars, or the general of the strangers, as they were pleased to denominate me. Not only the better class of the inhabitants of Mecaday came to visit us, but likewise people of condition from all the towns and villages twenty miles round: I have sometimes received eight or ten different companies in a morning. When a party wished to be introduced, a message was sent to ask permission; which being obtained, they entered the room in a crouching position, and sat down on their heels, men and women alike. They always brought a gift of something, whatever they supposed might be acceptable; tobacco, onions, fine rice, &c. No company presented themselves empty handed: it would not have been respectful. Of course, their offerings drew from me a suitable return; such as, fillets of Indian muslin to the women, and a Cossembuzar silk handkerchief to the men. Several parties of women came unaccompanied by their husbands, or any of their male friends; and, according to the notions entertained by them, there was nothing indecorous in it: They were unconscious of any thing but an innocent desire to gratify curiosity and manifest respect. Women of a better class were always accompanied by a train of female attendants; and, like the sex everywhere, were more lively, good humoured, and inquisitive than the men."

Asia.

114 Amusements.

Among the public amusements of this people are mentioned boxing-matches, fireworks, processions, exhibitions of dancing; as also plays and puppet-shows.

115 Chess.

Persons of rank among them are fond of chess. This game is held in high estimation among the superior ranks: the board they use is exactly similar to ours, containing 64 squares, and their number of troops the same, 16 on each side; but the names, the power, and disposal of them, differ essentially. The king and his minister (a queen is never introduced by the orientals) are mounted on elephants: these are defended by two castles or *yettay;* two knights on horseback, *mene;* two officers on foot, one called *meem*, the other *chekey;* and eight *maundelay* or foot soldiers. The forces of each party are arranged on three lines, by which eight squares remain unoccupied: none of the pieces possess equal force with our queen; and this restricted operation renders the Birman mode of playing more complex and difficult than ours. The Birmans affirm that it is a game of high antiquity, and that it is acknowledged and authorized by their sacred writings, although every play of chance is prohibited. This testimony confirms the opinion of the late Sir William Jones, that chess was invented in India, and is not, as generally imagined, of Persian origin. The Birmans call it *chedreen*, a word that bears some resemblance to the name which is given to the game in most other parts of the world.

116 Throwing water on the last day of the year.

One of their amusements deserves attention, chiefly on account of its singularity and the good temper which it indicates. It is thus described by Mr Symes, who held the place of ambassador:—"On the 12th of April, the last day of the Birman year, we were invited by the maywoon to bear a part ourselves in a sport that is universally practised throughout the Birman dominions on the concluding day of their annual cycle. To wash away the impurities of the past, and commence the new year free from stain, women on this day are accustomed to throw water on every man they meet,

Asia.

meet, which the men have the privilege of retorting. This license gives rise to a great deal of harmless merriment, particularly among the young women, who, armed with great syringes and flaggons, endeavour to wet every man that goes along the street, and in their turn receive a wetting with perfect good humour. Nor is the smallest indecency ever manifested in this or in any other of their sports. Dirty water is never cast. A man is not allowed to lay hold of a woman, but may fling as much water over her as he pleases, provided she has been the aggressor; but if a woman warns a man that she does not mean to join in the diversion, it is considered as an avowal of pregnancy, and she passes without molestation.

"About an hour before sunset we went to the maywoon's, and found that his lady had provided plentifully to give us a wet reception. In the hall were placed three large china jars, full of water, with bowls and ladles to fling it. Each of us, on entering, had a bottle of rose water presented to him, a little of which we in turn poured into the palm of the maywoon's hand, who sprinkled it over his own vest of fine flowered muslin. The lady then made her appearance at the door, and gave us to understand that she did not mean to join in the sport herself, but made her eldest daughter, a pretty child in the nurse's arms, pour from a golden cup some rose-water mixed with sandel wood, first over her father, and then over each of the English gentlemen: this was a signal for the sport to begin. We were prepared, being dressed in linen waistcoats. From ten to twenty women, young and middle aged, rushed into the hall from the inner apartments, who surrounded and deluged without mercy four men, ill able to maintain so unequal a contest. The maywoon was soon driven from the field; but Mr Wood having got possession of one of the jars, we were enabled to preserve our ground till the water was exhausted: It seemed to afford them great diversion, especially if we appeared at all distressed by the quantity of water flung in our faces. All parties being tired, and completely drenched, we went home to change our clothes, and in the way met many damsels who would willingly have renewed the sport; they, however, were afraid to begin without receiving encouragement from us, not knowing how it might be taken by strangers; but they assailed Baba-sheem and his Birman attendants with little ceremony. No inconvenient consequences were to be apprehended from the wetting; the weather was favourable, and we ran no risk of taking cold. Having put on dry clothes, we returned to the maywoon's, and were entertained with a dance and puppet show that lasted till even."

117 Dress.

The court dress of the Birman nobles is represented as very becoming. It consists of a long robe of flowered satin or of velvet, reaching to the ankles, with an open collar and loose sleeves. Over this there is a scarf, or flowing mantle, that hangs from the shoulders, and on their heads they wear high caps of velvet, either plain, or of silk, embroidered with flowers of gold, according to the rank of the owner. Ear-rings are worn by the men; and some persons of condition use tubes of gold about three inches long, and as thick as a large quill, which expands at one end like the mouth of a speaking trumpet. Others wear a heavy mass of gold, beaten into a plate, and rolled up. This lump of metal forms a large orifice in the lobe of the ear, and drags it down by the weight to the extent of sometimes of two inches. Men of rank wear in common dress a tight coat, with long sleeves made of muslin, or of extremely fine nankeen, which is manufactured in the country; also a silk wrapper that encircles the waist. The working class are usually naked to the middle, but in the cold season, a mantle or vest of European broad cloth is highly prized. The women tie their hair in a bunch on the top of the head. They bind it round with a fillet, the ornaments of which express the rank of the wearer. A short shift, reaching to the pit of the stomach, and drawn tight by strings, supports the breasts. Over that is a loose jacket, with close sleeves. Round their waist they roll a long piece of silk or cloth, which reaching to their feet, and sometimes trailing on the ground, encircles them twice, and is then tucked in. When women of condition go abroad, they wear a silk sash resembling a long shawl, which crosses their bosom, and is cast over the shoulders, so as to flow gracefully on each side. The lowest class of females often wear only a single garment in the form of a sheet, which, wrapped round the body, and tucked under the arm, crosses their breasts, which it scarcely conceals, and descends to their ankles. Thus when they walk, the lower part of the cloth, where it overlaps, is opened by the protrusion of the leg, and displays to a side view as high as the middle of the thigh. Indeed, every woman when walking must shew a great part of her leg, as the lower part of their dress is never closed by a seam. Women in full dress stain the palms of their hands and their nails of a red colour, by means of a vegetable juice, and strew on their bosoms powder of sandel wood, or of a bark called by them *sunneka*, with which some rub their faces. Both men and women tinge the edges of their eyelids and their teeth with black.

118 Persons of the people.

The Birmans in their features have a nearer resemblance to the Chinese than to the natives of Hindoostan. The women, especially in the northern parts of the empire, are fairer than the Hindoo females, but not so delicately formed. They are inclined to corpulence, and their hair is black, long, and coarse. The men are athletic and active, but not tall. They have a very youthful appearance, from the custom of plucking out the hair of their beards instead of shaving. Girls are taught at an early age to turn their arms in such a manner as to make them appear distorted. When the arm is extended, the elbow is inverted, the inside of the joint being protruded, and the external part bending inwards.

119 Religion.

With regard to religion, the Birmans are a sort of Hindoos; not votaries of Brahma, but sectaries of Boodh; which latter is admitted by Hindoos of all descriptions to be the ninth avatar or descent of the deity in his capacity of preserver. He reformed the doctrines contained in the vedas, and severely censured the sacrifice of cattle, or depriving any being of life. He is called the author of happiness: his place of residence was discovered at Gaya in Bengal, by the illustrious Amara, renowned amongst men, "who caused an image of the supreme Boodh to be made, and he worshipped it: Reverence be unto thee in the form of Boodh; reverence be unto thee, lord of the earth; reverence be unto thee an incarnation of the deity, and

Asia.

and eternal one; reverence be unto thee, O God, in the form of mercy!"

Gotma, or Gantum, according to the Hindoos of India, or Gaudma, among the inhabitants of the more eastern parts, is said to have been a philosopher, and is by the Birmans believed to have flourished above 2300 years ago. He taught in the Indian schools the heterodox religion and philosophy of Boodh. The image that represents Boodh is called *Gaudma* or *Gantum*, which is now a commonly received appellation of Boodh himself: This image is the primary object of worship in all the countries situated between Bengal and China. The sectaries of Boodh contend with those of Brahma for the honour of antiquity, and are certainly far more numerous. The Cingalese, that is, the original inhabitants of Ceylon, are Boodhists of the purest source; and the Birmans acknowledge to have originally received their religion from that island. It was brought, say the rhahaans, first from Zehoo (Ceylon) to Aracan, and thence was introduced into Ava, and probably into China; for the Birmans assert with confidence that the Chinese are Boodhists.

This is a curious subject of investigation; and the concurrent testimony of circumstances, added to the opinions of the most intelligent writers, seem to leave little doubt of the fact. It cannot, however, be demonstrated beyond the possibility of dispute, till we shall have acquired a more perfect knowledge of Chinese letters, and a readier access to their repositories of learning. Little can at present be added to the lights cast on the subject by the late Sir William Jones, in his discourse delivered to the Asiatic society on the Chinese. That great man has expressed his conviction in positive terms, that "Boodh was unquestionably the Fo of China," and that he was also the god of Japan, and the Woden of the Goths; an opinion which corresponds with, and is perhaps grafted on, the information of the learned and laborious Kæmpfer, corroborated afterwards by his own researches. On whatever grounds the latter inference rests, it will not tend to weaken the belief of his first position, when I observe that the Chinese deputies, on the occasion of our introduction to the seredan, or high priest of the Birman empire, prostrated themselves before him, and afterwards adored an image of Gaudma with more religious fervour than mere politeness or acquiescence in the customs of another nation would have excited. The bonzes also of China, like the rhahaans of Ava, wear yellow, as the sacerdotal colour; and in many of their customs and ceremonies there may be traced a striking similitude.

120 Laws.

The laws of the Birmans are connected with their religion, being contained in what they call the *Derma Sath*, or *Sastra*, which is one of many commentaries on the writings of Menu, to whom, according to the Hindoos, the sacred principles of their law were revealed by divine authority.

The Sastra provides specifically for almost every case of crime that can be committed, and adds a copious chapter of precedents and decisions to guide the inexperienced. The Birmans agree with the Hindoos in one benevolent doctrine, the sinfulness of depriving any creature of life to satisfy a carnivorous appetite; but the Birmans do not carry this branch of their religion to any scrupulous length, like the timid and superstitious natives of the western peninsula. Merely to eat flesh is not deemed a crime by the Birmans; but he who eats it is not exempt from sin, unless the creature died a natural death, or was slain by accident, or by other hands. But in every thing that concerns religion the Birmans are abundantly liberal. The prohibition to kill animals as objects of food is nowhere very scrupulously observed, except by the rhahaans or priests. In times of danger, or in consequence of superstition, the king and his viceroys sometimes issue proclamations, enjoining obedience to the sacred law; but these produce little other effect than to cause the animals for a short time to be killed with more secrecy than usual; and wherever foreigners are in question, both the government and the people are abundantly tolerant. The maywoon of Pegu, who sent to the embassy large supplies of fruit, rice, oil, tamarinds, and spices, did not indeed offer any butchers meat for the use of the table; but they were allowed to purchase and kill whatever they wanted, such as, fowls, kid, and venison. When they had advanced farther into the country, a private intimation was given to the ambassador, that there would be no crime if a servant of his should kill a fat bullock when he met one; that it would be ascribed to accident, and reparation might be made to the owner, who would think himself amply recompensed for his loss by two tachals, about six shillings; and the beast being dead, there could be no sin in eating it, but that a public sanction could not previously be given to slaughter one. The Birmans never quarrel with a stranger on account of his religion. Their principal sea-port, Rangoon, has long been the asylum of insolvent debtors from the different settlements of India. It is crowded with foreigners of desperate fortunes, who find from the Birmans a friendly reception, and carry on a petty trade, which affords a decent subsistence to those who act with prudence. Here are to be found fugitives from all countries of the east, and of all complexions: Malabars, Moguls, Persians, Parsees, Armenians, Portuguese, French, and English all mingle here, and are engaged in various branches of commerce. The members of this discordant multitude are not only permitted to reside under the protection of government, but likewise enjoy the most liberal toleration in matters of religion: They celebrate their several rites and festivals, totally disregarded by the Birmans, who have no inclination to make proselytes. In the same street may be heard the solemn voice of the muezzin, calling pious Islamites to early prayers, and the bell of the Portuguese chapel tinkling a summons to Romish Christians. Processions meet and pass each other without giving or receiving cause of offence. The Birmans never trouble themselves about the religious opinions of any sect, nor disturb their ritual ceremonies, provided they do not break the peace, or meddle with their own divinity, Gaudma; but if any person commit an outrage, which the mussulmans in their zeal for the true faith will sometimes do, the offender is sure to be put into the stocks; and if that does not calm his turbulent enthusiasm, they bastinado him into tranquillity.

121 Religious toleration.

122 Rhahaans or priests.

The rhahaans, or priests, are a kind of monks who live in cloisters, profess celibacy, and abstain from every sensual indulgence. The prescribed punishment for a rhahaan detected in an act of incontinence, is expulsion

Asia.

expulsion and public disgrace. The delinquent is seated on an ass, and his face daubed with black paint, interspersed with spots of white. He is thus led through the streets, with a drum beating before him, and afterwards turned out of the city. The juniors only go abroad by the permission of the superior or prior of the convent. They are dressed in a long loose cloak, and yellow is the only colour worn by them. The rhahaans never dress their own victuals, holding it an abuse of time to perform any of the common functions of life, which, so long as they occupy, must divert them from the abstract contemplation of the divine essence. They receive the contributions of the laity ready cooked, and prefer cold food to hot. At the dawn of the morning they begin to perambulate the town, to collect supplies for the day: Each convent sends forth a certain number of its members, who walk at a quick pace through the streets, supporting with the right arm a blue lackered box, in which the donations are deposited; these usually consist of boiled rice mixed with oil, dried and pickled fish, sweetmeats, fruit, &c. During their walk they never cast their eyes to the right nor to the left, but keep them fixed on the ground; they do not stop to solicit, and seldom even look at the donors, who appear more desirous to bestow than the others to receive. The rhahaans eat but once a-day, at the hour of noon. A much larger quantity of provisions being commonly procured than suffices for the members of the convent, the surplus is disposed of as charitably as it was given, to the needy stranger, or the poor scholars who daily attend them to be instructed in letters, and taught their moral and religious duties.

123 Kioums, or monasteries.

In their choice of a residence, the rhahaans commonly select the most retired spots they can find, where shady trees, particularly the tamarind and banyan, protect them from the noonday sun. Their monasteries are different from common houses; they are made entirely of wood; the roof is composed of different stages supported by strong pillars; the inside comprehends one large hall; the whole house is open at the sides, and no private apartments are allowed: Publicity is the prevailing system of Birman conduct, and they admit of no secrets either in church or state. All kioums or monasteries, whether in town or country, are seminaries for the education of youth, in which boys of a certain age are taught their letters, and instructed in moral and religious duties. To these schools the neighbouring villagers send their children, where they are educated *gratis*, no distinction being made between the son of the peasant, and of him who wears the tsaloe or string of nobility. A piece of ground contiguous to the grove is enclosed for a garden, where they sow vegetables and plant fruit trees; the Indian sweet potato and the plantain, being the most nutritious, are principally cultivated. The charity of the country people supplies them abundantly with rice, and the few necessaries which their narrow wants require. Abstracted from all worldly considerations, they do not occupy themselves in the common concerns of life: they never buy, sell, or accept of money. Formerly there were nunneries of virgin priestesses, who, like the rhahaans, wore yellow garments, cut off their hair, and devoted themselves to chastity and religion; but the Birman government has long since abolished these societies, and refuses to allow women, under pretence of religion, to be withdrawn from the performance of the important duty of contributing to support and increase the population of the state.

Asia.

124 Temples.

The Birmans are extremely magnificent in the structure of their temples; that of Shoemadoo, at the ancient city of Pegu, is most remarkable. We shall therefore give the description of it at full length: "The object in Pegu that most attracts and most merits notice, is the noble edifice of Shoemadoo or the golden supreme. This extraordinary pile of buildings is erected on a double terrace, one raised upon another. The lower and greater terrace is about 10 feet above the natural level of the ground, forming an exact parallelogram: the upper and lesser terrace is similar in shape, and rises about 20 feet above the lower terrace, or 30 above the level of the country. I judged a side of the lower terrace to be 1391 feet; of the upper 684. The walls that sustained the sides of the terrace, both upper and lower, are in a ruinous state; they were formerly covered with plaster wrought into various figures. The area of the lower is strewed with the fragments of small decayed buildings; but the upper is kept free from filth, and is in tolerable good order. There is reason to conclude, that this building and the fortress are coeval, as the earth of which the terraces are composed, appears to have been taken from the ditch; there being no other excavation in the city, or in its neighbourhood, that could have afforded a tenth part of the quantity.

125 Temple of Shoemadoo.

"The terraces are ascended by flights of stone steps, which are now broken and neglected. On each side are dwellings of the rhahaans raised on timbers four or five feet from the ground. These houses consist only of a large wall; the wooden pillars that support them are turned with neatness; the roofs are covered with tiles, and the sides are made of boards; and there are a number of bare benches in every house, on which the rhahaans sleep; but we saw no other furniture.

"Shoemadoo is a pyramidical building composed of brick and mortar, without excavation or aperture of any sort, octagonal at the base, and spiral at top; each side of the base measures 162 feet; this immense breadth diminishes abruptly, and a similar building has not unaptly been compared in shape to a large speaking trumpet.

"Six feet from the ground there is a wide projection that surrounds the base, on the plane of which are 57 small spires of equal size, and equidistant; one of them measured 27 feet in height, and 40 in circumference at the bottom. On a higher ledge there is another row, consisting of 54 spires of similar shape and measurement.

"A great variety of mouldings encircle the building, and ornaments somewhat resembling the fleur-de-lys surround the lower part of the spire; circular mouldings likewise girt it to a considerable height, above which there are ornaments in stucco not unlike the leaves of a Corinthian capital: And the whole is crowned by a tee or umbrella, of open iron-work, from which rises a rod with a gilded pennant.

"The tee or umbrella is to be seen on every sacred building that is of a spiral form; the raising and consecration of this last and indispensable appendage is an act

Asia.

act of high religious solemnity, and a season of festivity and relaxation. The present king bestowed the tee that covers Shoemadoo. It was made at the capital; and many of the principal nobility came down from Ummerapoora to be present at the ceremony of its elevation.

"The circumference of the tee is 56 feet; it rests on an iron axis fixed on the building, and is farther secured by large chains strongly rivetted to the spire. Round the lower rim of the tee are appended a number of bells, which, agitated by the wind, make a continual jingling.

"The tee is gilt, and it is said to be the intention of the king to gild the whole of the spire. All the lesser pagodas are ornamented with proportionable umbrellas of similar workmanship, which are likewise encircled by small bells.

"The extreme height of the edifice, from the level of the country, is 361 feet, and above the interior terrace 331 feet.

"On the south-east angle of the upper terrace there are two handsome saloons or kioums lately erected, the roofs composed of different stages, supported by pillars; we judged the length of each to be about 60 feet, and the breadth 30; the ceiling of one is already embellished with gold leaf, and the pillars are lackered; the decoration of the other is not yet completed. They are made entirely of wood; the carving on the outside is laborious and minute; we saw several unfinished figures of animals and men in grotesque attitudes, which were designed as ornaments for different parts of the building. Some images of Gaudma, the supreme object of Birman adoration, lay scattered around.

"At each angle of the interior and higher terrace there is a temple 67 feet high, resembling in miniature the great temple; in front of that, in the southern corner, are four gigantic representations in masonry of Palloo or the evil genius, half beast half human, seated on their hams, each with a large club on the right shoulder. The Pundoo who accompanied me, said that they resembled the Rahuss of the Hindoos. These are guardians of the temple.

Nearly in the centre of the east face of the area are two human figures in stucco beneath a gilded umbrella; one standing represents a man with a book before him, and a pen in his hand; he is called *Thasiamee*, the recorder of mortal merits and mortal misdeeds; the other, a female figure kneeling, is Maha Sumdera, the protectress of the universe, so long as the universe is doomed to last; but when the time of general dissolution arrives, by her hand the world is to be overwhelmed and everlastingly destroyed.

"A small brick building, near the north-east angle, contains an upright marble slab, four feet high, and three feet wide: there is a long legible inscription on it. I was told it was an account of the donations of pilgrims of only a recent date.

"Along the whole extent of the north face of the upper terrace there is a wooden shed, for the convenience of devotees who come from a distant part of the country. On the north side of the temple are three large bells of good workmanship, suspended nigh the ground between pillars; several deers horns lie strewed around; those who come to pay their devotions first, take up one of the horns and strike the bell three times, giving an alternate stroke to the ground: this act I was told is to announce to the spirit of Gaudma, the approach of a suppliant. There are several low benches near the foot of the temple on which the person who comes to pray places his offering, commonly consisting of boiled rice, a plate of sweetmeats, or cocoa nut fried in oil: when it is given, the devotee cares not what becomes of it; the crows and wild dogs often devour it in presence of the donor, who never attempts to disturb the animals. I saw several plates of victuals disposed of in this manner, and understood it to be the case with all that was brought.

Asia.

"There are many small temples on the areas of both terraces, which are neglected and suffered to fall into decay. Numberless images of Gaudma lie indiscriminately scattered. A pious Birman who purchases an idol, first procures the ceremony of consecration to be performed by the rhahaans; he then takes his purchase to whatever sacred building is most convenient, and there places it within the shelter of a kioum, or in the open ground before the temple; nor does he ever again seem to have any anxiety about its preservation, but leaves the divinity to shift for itself. Some of those idols are made of marble that is found in the neighbourhood of the capital of the Birman dominions, many are formed of wood and gilded, and a few are of silver. The latter, however, are not usually exposed and neglected like the others. Silver and gold are rarely used, except in the composition of household gods.

"On both the terraces are a number of white cylindrical flags raised on bamboo poles; these flags are peculiar to the rhahaans, and are considered as emblematic of purity and of their sacred functions. On the top of the staff there is a henza or goose, the symbol both of the Birman and Pegu nations.

"From the upper projection that surrounds the base of Shoemadoo, the prospect of the circumjacent country is extensive and picturesque; but it is a prospect of nature in her rudest state: there are few inhabitants, and scarcely any cultivation. The hills of Martaban rise to the eastward, and the Sitang river, winding along the plains, gives an interrupted view of its waters. To the northward about 40 miles are the Galadzet hills, whence the Pegu river takes its rise; hills remarkable only for the noisome effects of their atmosphere. In every other direction the eye looks over a boundless plain, chequered by a wild intermixture of wood and water."

The temple of Shoemadoo appears to be the largest in the Birman dominions. At the same time, they have many others formed upon a similar plan and of great extent. Of one of these we shall take notice, on account of the coincidence between its name, and the name of a Pagan temple mentioned in the sacred Scriptures. It is to be observed, that in the Birman tongue the word *shoe*, signifies *golden;* and the name of the temple to which we allude, is called *Shoedagon*, or *the temple of the golden Dagon*. It is thus described: "The temple of Shoedagon or Dagonng, about two miles and a half north of Rangoon, is a very grand building, although not so high by 25 or 30 feet as that of Shoemadoo at Pegu. It is much more ornamented; the terrace on which it stands is raised on a rocky eminence, considerably higher than the circumjacent

Asia.

jacent country. It is ascended by above 100 stone steps that have been suffered to fall into decay. The situation renders Shoedagon a conspicuous object at the distance of many miles. The tee and the whole of the spire are richly gilded, which, when the sun shines, exhibit a singularly splendid appearance.

"The small auxiliary buildings are yet more numerous than those that surround the base of the Pegu temple. Perceiving that several of these were in a ruinous state, whilst the foundations of others were just laid, and some half finished, I asked, why they did not repair the damages of the old before they erected new ones, and was told, that to mend a decayed praw or temple, though an act of piety, was not so meritorious as to erect a new one; that sometimes the old ones were repaired by those who were unwilling or unable to be at the expence of a complete building; but this entirely depended on the means or inclination of the donor.

"The borders of the terrace on which the temple is raised are planted with shady trees in regular rows: From this eminence there is a beautiful and extensive prospect; the Pegu and Rangoon rivers are seen winding through a level woody country, and the temple of Syriam, little inferior to those that have been described, stands near the junction of the streams. The rainy monsoon had now set in, and inundations were formed in several places. It would have been a more pleasing, though perhaps less picturesque scene, had the plains been cleared and the fields laid out for cultivation: we could observe few marks of improvement; woods, lakes, and rivers, presented themselves on every side."

126 Private buildings.

But although the Birmans display sufficient magnificence in their temples and public buildings, their private houses are constructed of very simple and cheap materials. Their king has even prohibited brick or stone to be used in the construction of any private house, from an apprehension, it is said, that if people were allowed to erect brick houses, they might erect brick fortifications to the danger of the state. It is not improbable, however, that the prohibition is owing to another cause. In the hot climates, where the soil is fertile, if the population happen to be defective, it is extremely difficult to prevent the whole country from being overrun with forests, which is at present in a great degree the case in the Birman dominions. One of the easiest modes of subduing these forests, consists of adopting the measure now mentioned, of prohibiting the use of brick or stone for private buildings. In other respects, however, the houses are built with sufficient attention to conveniency, and are all raised from the ground, either on wooden posts or bamboos, according to the size of the building; so that the lower floor is above the ground. The monasteries of the rhahaans, and the habitations of the higher ranks, are usually elevated six or eight feet, and those of the lower classes from two to four. The walls of the houses are made of boards or mats, supported on bamboos or posts. One inconvenience, however, attends them all, that from their being composed of such combustible materials, the inhabitants are under continual dread of fire, against which they take every precaution. The roofs are lightly covered; and at every door stands a long bamboo with an iron hook at the end to pull down the thatch. There is also another pole with an iron grating at the extremity to suppress flame by pressure. Almost every house has earthen pots filled with water, standing ready on the roof; and a number of firemen patrole the streets during the night to put out all fires and lights after a certain hour.

Asia.

127 Temporary houses.

It is customary when the king, or when persons of high rank travel, to erect temporary habitations for them, and this was done in honour of the British embassy. These temporary houses are thus described; "The materials of which these houses are made, are always easy to be procured; and the structure is so simple, that a spacious and by no means an uncomfortable dwelling, suited to the climate, may be erected in one day. Our habitation, consisting of a small room to each, and a hall, open to the north, in little more than four hours was in readiness for our reception. Fifty or sixty labourers completed it in that time; and, on emergency, could perform the work in much less. Bamboos, grass for thatching, and the ground rattan, are all the materials requisite; not a nail is used in the whole edifice; a row of strong bamboos from eight to ten feet high are fixed firm in the ground, which describe the outline, and are the supports of the building; smaller bamboos are then tied horizontally, by strips of the ground rattan, to these upright posts; the walls, composed of bamboo mats, are fastened to the sides with similar ligaments; bamboo rafters are quickly raised, and a roof formed, over which thatch is spread in regular layers, and bound to the roof by filaments of rattan; a floor of bamboo grating is next laid in the inside, elevated two or three feet above the ground; this grating is supported on bamboos, and covered with mats and carpets: this ends the process, which is not more simple than effectual. When the workmen take pains, a house of this sort is proof against very inclement weather. We experienced during our stay at Meeaday, a severe storm of wind and rain, but no water penetrated nor thatch escaped; and, if the tempest should blow down the house, the inhabitants would run no risk of having their brains knocked out or their bones broken; the fall of the whole fabric would not crush a lady's lap dog."

128 Administration of justice.

In the administration of justice the Birmans are extremely regular and formal; the place where the judges of any district sit is called the *rhoom*, where they hear the pleadings of parties or their counsel, and examine witnesses, whose depositions are taken down in writing. These depositions are sent to the maywoon or viceroy, who represents the king, and the judges transmit their opinions along with the evidence, which the maywoon either confirms or rejects as he thinks proper; and, in cases of capital conviction, orders execution or pardons the culprit. From his judgment there lies no appeal, unless the offender hold a royal commission; in which case the evidence must be transmitted to the council of state, and the king himself applies the law and pronounces judgment.

129 The rhoom.

The building denominated the *rhoom* is also the official hall where the members of provincial governments and all municipal officers are accustomed to assemble to transact public business. Every man of high rank in the Birman empire is a magistrate, and has a place of this description and name contiguous to his dwelling; but

Asia.

but always on the outside of the enclosure of his court-yard, and not surrounded by any fence or railing, in order to manifest publicity, and show that it is the seat of majesty and justice, to which all mankind may have free access. An imperial mandate to a governor, or an order from a governor to a petty miongee or chief of a small town or district, is invariably opened and read aloud in this sanctified hall. The Birman government, in the administration of public affairs, professes no such thing as privacy or concealment. The rhoom is likewise an appendage of dignity, as it denotes him to whose habitation it is annexed to be a person of rank and consequence; a building of this sort was erected within a few yards of the front gate of the British ambassador's enclosure. It is to be remarked, that when the ambassador had obtained from the government the establishment of certain regulations respecting commerce, and had returned to the sea port of Rangoon, the viceroy of that district informed him that the orders for carrying into effect the late regulations would be publicly read and registered at the rhoom on the following day. The viceroy also invited him to send a confidential person to be present at the ceremony; adding, that the records were also open to the public inspection; and that whoever chose might, at any time, procure a copy, by paying a trifling fee to the officers of the court. The result of this publicity is, that foreigners, acquainted with the character of the people, do not hesitate to trust themselves in the very centre of the country. At the distance of 150 miles from the coast, including the windings of the river, our embassy found a Mussulman merchant from Surat, out of economy, building a vessel of four hundred tons burden, instead of building it at the sea port of Rangoon. He meant, as soon as the hull should be finished, to float it down the stream. The inland navigation is considered as dangerous; but this merchant chose to encounter the risk for the sake of obtaining the teek timber at a cheap rate near the spot where it grows, and probably also for the sake of obtaining labour at a more moderate price. This adventurer furnishes a proof of the confidence that may be placed in the Birman government, and the security that a stranger has for his property.

130 Military force.

The Birman government is of a feudal nature in the strictest sense of the word. The people are a nation of soldiers; every man in the kingdom being liable to be called upon military service, and war is deemed the most honourable occupation. The regular military establishment of the nation, however, as among our ancestors in feudal times, is very inconsiderable, consisting only of the royal guards, and as many troops as are necessary to preserve the police of the capital. These are supposed to amount, in all, to about 2000 infantry, and 300 cavalry, though it is said that the cavalry scattered in small detachments through the districts adjoining to the capital, amount to about 2000. The infantry are armed with muskets and sabres, and are not uniformly clothed; the cavalry in the king's service, are natives of the northern province of Cassay, who are accounted much better horsemen than the Birmans; they seldom use any other weapon than a spear about seven or eight feet long. They ride like all orientals with short stirrups, and a loose rein; their dress is not unbecoming; it consists of a tight coat, with skirts reaching down to the middle of the thigh, and on their head they wear a turban of cloth rolled hard and plaited, which forms a high cone, that bends backwards in a graceful manner; their horses are small, but hardy and active, and are frequently exported to the western peninsula. When an army is to be raised, a mandate issues to all the viceroys of provinces and governors of districts, requiring a certain number of men to be at a general rendezvous on an appointed day; the levy is proportioned to the population of the province or district, estimated from the number of registered houses that it contains; the provincial court determines the burden which each house is to bear; a certain number of houses furnish a recruit among them, or pay 300 tackal in money, about 40l. or 45l.: The recruit is supplied with arms, ammunition, and, it is believed, with a daily allowance of grain, from the government; but he receives no pay. The families of these conscripts are carefully retained in their districts as hostages for the good conduct of their relation. In case of desertion or treachery, the innocent wife, children, and parents of the guilty person, are dragged to execution without pity; even cowardice subjects the family of the delinquent to capital punishment, and this barbarous law is rigorously inforced.

Asia.

131 War-boats.

By far the most respectable part of the Birman military force is the establishment of war-boats; every town of note in the vicinity of the principal rivers is obliged to furnish a certain number of men, and one or more boats, in proportion to the magnitude of the place: thus the king can command at a very short notice 500 of these vessels: They are constructed out of the solid trunk of the teek-tree, which is excavated partly by fire and partly by cutting; the largest are from 80 to 100 feet long, but the breadth seldom exceeds eight feet, and even this space is produced by artificially extending the sides after the trunk has been hollowed: they carry from 50 to 60 rowers, who use short oars, that work on a spindle. The prow is solid, and is a flat surface, on which, when they go to war, a piece of ordnance is mounted; a six, a nine, or even a twelve pounder. The gun-carriage is secured by lashings to strong bolts on each side, and swivels are frequently fixed on the curvature of the stern. Each rower is provided with a sword and a lance, which are placed by his side while he plies the oars. Besides the boatmen, there are usually 30 soldiers on board, who are armed with muskets: thus prepared, they go in fleets to meet the foe, and when in sight, draw up in a line, presenting their prows to the enemy. Their attack is extremely impetuous; they advance with great rapidity, and sing a war song, at once to encourage their people, daunt their adversaries, and regulate the strokes of their oars; they generally endeavour to grapple, and when that is effected, the action becomes very severe, as these people are endowed with great courage, strength, and activity. In times of peace they are fond of exercising in their boats, and they display much dexterity in the management of them. The vessels being low in the water, their greatest danger is that of being run down by a larger boat striking on their broadside, a misfortune which the steersman is taught to dread and to avoid above all other. It is surprising, says the author, to see the facility

Asia.

cility with which they steer and elude each other in their mock combats. The rowers are also practised to row backwards, and impel the vessel with the stern foremost; this is the mode of retreating, by means of which the artillery still bears upon their opponent. The largest of the war boats do not draw more than three feet water.

132 Revenue.

The revenue of the Birman king is, according to the laws of their religion, as stated in their sacred books, a tenth of all produce, and it is certain that one-tenth is the amount of the king's duty on all foreign goods imported into his dominions. The revenues arising from the customs on imports, and from internal produce, is mostly taken in kind; a small part of which is converted into cash: the rest is distributed as received in lieu of salaries to the various dependants of the court. Princes of the blood, high officers of state, and provincial governors, receive grants of provinces, cities, villages, and farms, to support their dignity, and as a remuneration of their services; the rents of these assignments they collect for their own benefit. Money, except on pressing emergency, is never disbursed from the royal coffers: to one man the fees of an office are allotted; to another a station where certain imposts are collected; a third has land; each in proportion to the importance of his respective employment. By these donations they are not only bound in their own personal servitude, but likewise in that of all their dependants; they are called slaves of the king, and, in turn, their slaves are denominated slaves to them; the conditions of these grants include also services of war as well as the duties of office. Thus the Birman government exhibits almost a faithful picture of Europe in the darker ages, when, on the decline of the Roman empire, the principles of feudal dependance were established by barbarians from the north.

133 The government feudal.

This system of feudal dependance may be considered as existing in the Birman government in its purest state. There are no hereditary dignities or employments; all honours and offices on the demise of the possessor revert to the crown, a circumstance which when taken along with the obligation to military service, which is incumbent upon all down to the lowest of the people, gives to this government that appearance of a military encampment and subordination which the feudal tenures have been understood to exhibit, but from which they degenerated in Europe, when dignities and authority became hereditary. In consequence of the feudal principles which here prevail, the subordination of rank is maintained and marked by the Birmans with the most tenacious strictness. In the manner of constructing houses, whether temporary or lasting, strict attention is paid to the form which indicates the rank of the inhabitants; nor dare any subject assume a mode of structure to which he is not legally entitled: the distinction consists chiefly of the number of stages of which the roof is composed; even domestic implements, such as the betel-box, water-flagon, drinking-cup, and horse-furniture, all express by their shape and quality the precise station of the owner; nor can one person intrude upon the rights of another under penalty of incurring a most severe punishment, which is never remitted. The tsaloe, or chain, is the badge of the order of nobility, of which there are different degrees, distinguished by the number of strings or small chains

134 Ranks in society.

that compose the ornament. These strings are fastened by bosses where they unite: three of open chain-work is the lowest rank; three of neatly twisted wire is the next; then of six, of nine, and of twelve; no subject is ever honoured with a higher degree than twelve; the king alone wears 24.

Asia.

As gold is understood to be the noblest of metals, the king of the Birmans, who is the foundation of rank, is designated or described by the appellation of *shoe* or *golden*; thus, a particular village inhabited by watermen in the service of the king, is called *Shoe-lee-rua*, or *golden boat village*, nor is the person of the sovereign ever spoken of but in conjunction with this precious metal. When a subject means to affirm that the king has heard any thing, he says, "It has reached the golden ears;" he who has obtained admission to the royal presence, has been at the golden feet; the perfume of ottar of roses, a nobleman observed one day, "was an odour grateful to the golden nose." Gold among the Birmans being a type of excellence, is not merely ascribed to their king, but on solemn occasions it is placed on his dress in such quantities as to prove not a little cumbersome. The form in which the ambassadors were introduced to his majesty, and the appearance which he made, are thus described: "On entering the gate, we perceived the royal saloon of ceremony in front of us, and the court assembled in all the parade of pomp and decoration. It was an open hall, supported by colonnades of pillars, 20 in length and only four in depth; we were conducted into it by a flight of steps, and advancing, took our places next the space opposite to the throne, which is always left vacant, as being in full view of his majesty. On our entrance, the basement of the throne was alone visible, which we judged to be about five feet high; folding doors screened the seat from our view: the throne, called *yazapalay*, was richly gilded and carved; on each side a small gallery, enclosed by a gilt balustrade, extended a few feet to the right and left, containing four umbrellas of state; and on two tables at the foot of the throne were placed several large vessels of gold, of various forms, and for different purposes; immediately over the throne a splendid piasath or pyramid rose in seven stages above the roof of the building, crowned by a tee or umbrella, from which a spiral rod was elevated above the whole.

135 Introduction of ambassadors to the Birman king.

"We had been seated little more than a quarter of an hour, when the folding-doors that concealed the seat opened with a loud noise, and discovered his majesty ascending a flight of steps that led up to the throne from the inner apartment; he advanced but slowly, and seemed not to possess a free use of his limbs, being obliged to support himself with his hands on the balustrade. I was informed, however, that this appearance of weakness did not proceed from any bodily infirmity, but from the weight of the regal habiliments in which he was clad; and if what we were told was true, that he carried on his dress 15 vis, upwards of 50 pounds avoirdupois of gold, his difficulty of ascent was not surprising. On reaching the top, he stood for a minute, as though to take breath, and then sat down on an embroidered cushion, with his legs inverted. His crown was a high conical cap, richly studded with precious stones: his fingers were covered with rings, and in his dress he bore the appearance of

Asia.

a man cased in golden armour, whilst a gilded or probably a golden wing on each shoulder did not add much lightness to his figure. His looks denoted him to be between 50 and 60 years old, of a strong make, in stature rather beneath the middle height, with hard features, and of a dark complexion; yet the expression of his countenance was not unpleasing, and seemed, I thought, to indicate an intelligent and inquiring mind.

"On the first appearance of his majesty, all the courtiers bent their bodies, and held their hands joined in an attitude of supplication. Nothing farther was required of us than to lean a little forward, and to turn in our legs as much as we could; not any act being so unpolite or contrary to etiquette as to present the soles of the feet towards the face of a dignified person. Four Bramins, dressed in white caps and gowns, chanted the usual prayer at the foot of the throne: a nakhaan then advanced into the vacant space before the king, and recited in a musical cadence the name of each person who was to be introduced on that day, and of whose present, in the character of a suppliant, he entreated his majesty's acceptance. My offering consisted of two pieces of Benares gold brocade; Doctor Buchanan and Mr Wood, each presented one. When our names were mentioned, we were separately desired to take a few grains of rice in our hands, and, joining them, to bow to the king as low as we conveniently could; with which we immediately complied. When this ceremony was finished, the king uttered a few indistinct words, to convey, as I was informed, an order for investing some persons present with the insignia of a certain degree of nobility; the imperial mandate was instantly proclaimed aloud by heralds in the court. His majesty remained only a few minutes longer, and during that time looked at us attentively, but did not honour us with any verbal notice, or speak at all, except to give the order before mentioned. When he rose to depart, he manifested the same signs of infirmity as on his entrance; after he had withdrawn, the folding doors were closed, and the court broke up."

It may here be added that among the Birmans the royal family is held of so much importance, that to succeed to the throne, every prince must be descended from royal parentage by both father and mother; for this reason incestuous marriages are permitted to their princes, but to nobody else; the king may indeed marry a second wife of inferior rank while his first is alive, but she is accounted merely a concubine, and her children are illegitimate, and cannot inherit the throne.

136 Literature.

The books of the Birmans are generally formed of the palmetto leaf, on which the letters are engraved with a stylus. Books are sometimes composed, however, of thin strips of bamboo delicately plaited, and varnished over in such a manner as to form a smooth hard surface upon a leaf of any dimension. This surface is afterwards gilded, and the letters traced upon it in black and shining japan. The margin is illumined by wreaths and figures of gold. The Birmans write from left to right, and though they leave no distinguishing space between their words, they mark the pauses of a sentence and the full stops. Their letters are distinct, and their manuscripts are in general very beautiful. Their language contains 33 simple sounds, and their alphabet consists of an equal number of distinct characters, exclusive of various marks and contractions, which are explained in their spelling-book. Their common characters consist of circles, and segments of circles, variously disposed and combined. The Birmans are extremely fond both of poetry and music: their poetry, when repeated by a well-educated person, is extremely melodious; it is sometimes in successive and sometimes in alternate rhymes: they have epic as well as religious poems of high celebrity, and they are fond of reciting in heroic numbers, the exploits of their kings and generals. It is said, that the prowess of the great Alompra, the deliverer of his country, is recorded in verses not unworthy of his courage and his fortune. The members of the British embassy were invited by the maywoon or viceroy of Pegu to one of their dramatic representations, which they applaud not a little. "The theatre was the open court, splendidly illuminated by lamps and torches; the maywoon and his lady sat in a projecting balcony of his house; we occupied seats below him, raised about two feet from the ground, and covered with carpets; a crowd of spectators were seated in a circle round the stage. The performance began immediately on our arrival, and far excelled any Indian drama that I had ever seen. The dialogue was spirited without rant, and the action animated without being extravagant; the dresses of the principal performers were showy and becoming. I was told that the best actors were natives of Siam, a nation, which though unable to contend with the Birmans and Peguers in war, have cultivated with more success the refined arts of peace. By way of interlude between the acts, a clownish buffoon entertained the audience with a recital of different passages; and by grimace and frequent alterations of tone and countenance, extorted loud peals of laughter from the spectators. The Birmans seem to delight in mimickry, and are very expert in the practice, possessing uncommon versatility of countenance. An eminent practitioner of this art, amused us with a specimen of his skill, at our own house, and, to our no small astonishment, exhibited a masterly display of the passions in pantomimic looks and gesture; the transitions he made from pain to pleasure, from joy to despair, from rage to mildness, from laughter to tears; his expression of terror, and, above all, his look of idiotism, were performances of first-rate merit in their line; and we agreed in opinion, that had his fates decreed him to have been a native of Great Britain, his genius would have rivalled that of any modern comedian of the English stage.

Asia.

137 Poetry.

"The plot of the drama performed this evening, I understood, was taken from the sacred text of the Ramayen of Balmiec (called by Sir William Jones, *Valmiec*) a work of high authority among the Hindoos. It represented the battles of the holy Ram, and the impious Rahwaan, chief of the Rakuss or demons, to revenge the rape of Secta, the wife of Ram, who was forcibly carried away by Rahwaan, and bound under the spells of enchantment. Vicissitudes of fortune took place during the performance that seemed highly interesting to the audience. Ram was at length wounded by a poisoned arrow; the sages skilled in medicine consulted on his cure; they discovered, that on the mountain Indragurry grew a certain tree that produced a

Asia.

gum, which was a sovereign antidote against the deleterious effects of poison; but the distance was so great that none could be found to undertake the journey. At length Honymaan, leader of the army of apes, offered to go in quest of it. When he arrived at the place, being uncertain which was the tree, he took up half the mountain and transported it with ease: thus was the cure of Ram happily effected, the enchantment was broken, and the piece ended with a dance and songs of triumph."

When at the capital, Ummerapoora, our author describes his visit to the royal library in the following terms: "Having finished our introductory visits to the different members of the royal family, we had now leisure to gratify our curiosity by viewing whatever the capital contained that was most deserving the notice of strangers. The day not being far advanced, we walked from the palace of Pagahm to see the pedigaut tiek, or royal library: it is situated at the north-west angle of the fort, in the centre of a court paved with broad flags, and close to a very handsome kioum or monastery. Before we entered the library we ascended the kioum, and found the inside correspond with the external appearance; the building was spacious and richly gilded; the pillars, the ceiling, and the pannels, were entirely covered with gold leaf; and the image of Gaudma shone with a brilliant lustre; a balustrade of wood, minutely and beautifully carved, protected the image from intruders. On the pannels of the walls were represented figures of inferior agents of the divinity, and of prostrate rhahaans in the act of devotion; these were all shaped in fret-work in the wood, and were of no contemptible workmanship: a well wrought foliage of the same bordered the pannels. The image of Gaudma in this kioum, was large, and made of marble; it was seated on a broad pedestal entirely gilded; in front of which, within the balustrade, stood a handsome girandole of cut glass of European manufacture: near the image was a gilded couch, which we were informed was the customary bed of the principal rhahaan, or head of all the Birman priesthood, when he chose to pass the night in the fort, which rarely happened. It was splendidly gilt; the bottom, however, was only a bare board; pillars were not wanting, for there were two, but they were made of wood. A mat spread on the floor is the highest luxury of repose in which the rhahaans indulge.

"From the kioum we proceeded to visit the adjacent library; it is a large brick building raised on a terrace, and covered by a roof of a very compound structure. It consists of one square room, with an enclosed veranda, or gallery, surrounding it: this room was locked, and as we had not brought a special order for seeing it, the person who had the care of the library said, that he was not at liberty to open the doors; but assured us, that there was nothing in the inside different from what we might see in the veranda, where a number of large chests, curiously ornamented with gilding and japan, were ranged in regular order against the wall; I counted 50, but there were many more, probably not less than 100. The books were regularly classed, and the contents of each chest were written in gold letters on the lid. The librarian opened two, and shewed me some very beautiful writing on thin leaves of ivory, the margins of which were ornamented with flowers of gold neatly executed. I saw also some books written in the ancient Pali, the religious text. Every thing seemed to be arranged with perfect regularity, and I was informed, that there were books upon divers subjects; more on divinity than any other; but history, music, medicine, painting, and romance, had their separate treatises. The volumes were disposed under distinct heads, regularly numbered; and if all the other chests were as well filled as those that were submitted to our inspection, it is not improbable that his Birman majesty may possess a more numerous library than any potentate from the banks of the Danube to the borders of China."

Asia.

Books were afterwards brought for sale to the gentlemen of the embassy, but always clandestinely; and an exorbitant price was demanded, under pretence that if any person were discovered to have sold books to a foreigner without permission, he would be liable to a severe penalty. A man was actually imprisoned for an offence of this nature, upon which Captain Symes sent a message to the chief woongee or prime minister, apprising him of the circumstance, and desiring to know whether it was illegal to sell books to himself or his suit; adding, that if their law prohibited it, he would reject such as in future might be brought, and direct every person under his authority to do the same. The woongee returned a civil message, and the man was set at liberty. His majesty being made acquainted with the affair, summoned on the following day, the principal rhahaans to attend his council, and submitted to them, whether or not it was consistent with Birman tenets, to grant books that treated of their history and laws to foreigners? The conclave, after solemn deliberation, determined in the affirmative, and added, that it was not only admissible, but laudable, for the dissemination of knowledge. His majesty was thereupon pleased to order a handsome copy of the Razawayn, or history of their kings, and of the Dhermasath, or code of laws, to be delivered to Captain Symes from the royal library; each was contained in one large volume, written in a beautiful manner, and handsomely adorned with painting and gilding.

138
Music.

Music is a science that is held in no small degree of estimation throughout the Birman empire, and is very generally cultivated; there is scarcely even a boatman who does not possess an instrument of some sort; they who can procure no better have at least what is called a *Jew's harp*, with which they delight to beguile half an hour of a cool evening, after a day spent in severe labour under a burning sun. Some of the professional musicians display considerable skill and execution; and the softer airs are pleasing even to an ear unaccustomed to the melodies of the country. The principal instruments are a soum or harp, made of light wood hollowed and varnished, in shape somewhat resembling a canoe with a deck; at the extremity, a piece of hard wood is neatly fastened, which tapers to the end, and rising curves over the body of the harp; from this curvature the strings, usually made of wire, are extended to a bridge on the belly of the instrument; there are two sounding holes, one on each side of the bridge. The size of the soum varies from two to five feet in length. The turr resembles our violin. It has only three strings, and is played on with a bow. The pullaway is a common flagelet. The kyezoup is a collection of about

Asia.

about 18 cymbals, suspended in a bamboo frame: these cymbals, varying in size, produce modulated gradations of sounds. The patola, or guitar of the Birmans, is said to be a curious instrument: it is the exact form, in miniature, of a crocodile; the body of which is hollow, with sounding holes in the back; three strings of wire extend from the shoulder to the tail, to which they are fastened. It is played on by the fingers, and is generally used to accompany the voice. The bondaw is a collection of drums, oblong in form, and varying in size, which are suspended perpendicularly in a wooden frame by leather thongs. The whole machine is about five feet in diameter, and four feet high. The performer stands in the centre, and beats on the drums with a small stick. This instrument is always introduced when there is a full band, and is much used in processions, of which the Birmans are very fond, being carried by two men, while the performer shuffles along in the inside, playing as he goes. The heem is the pipe of Pan, formed of reeds neatly joined together, and sounded by a common mouth-piece. It produces a very plaintive melody.

139 Time.

The Birmans divide their year into 12 months, which, strictly speaking, cannot be called *synodical*, although they comprehend the same number of days. A revolution of the moon, in passing from one conjunction with the sun to another, is performed in 29 days 12 hours and 44 minutes: but the Birman lunations consist of 29 and 30 days alternately, which causes a difference between the Newtonian and Birman lunar account of 8 hours and 48 minutes. The Birman months are as follows:

	Days.
Tagoo contains	29
Kayoung	30
Nay Young	29
Wazoo	30
Wagoung	29
Toozelien	30
Tandaing Guite.	29
Tazoung Moang	30
Gnadoh	29
Peeazoo	30
Taboodiray	29
Taboung	30
	354

In order to complete a solar revolution, they intercalate in every third year a month of 30 days, which is called *Toodea Wazoo;* in this third year the months of Tagoo and Nay Young have each 30 days instead of 29; they likewise suppress or pass over a day, which, if reckoned, would either be the 31st Taboung, or the 1st of Tagoo; by these means the number of days in three solar years is thus computed:

	Days.
Three lunar years of 354 days each,	1062
Intercalary month in the third year,	30
Two intercalary days in Tagoo and Nay Young,	2
Suppressed or passed over at the end of the year,	1
	1095

This computation corresponds in the number of days with three years; every fourth year, however, will occasion the difference of a day, on account of our bissextile or leap year: of this the Birmans are fully sensible, as well as of many other defects in their manner of reckoning; to remedy the confusion likely to ensue from such erroneous calculations, their style or mode has frequently been altered by arbitrary authority.

Asia.

The manner in which the Birman month is subdivided is somewhat peculiar; instead of reckoning the days progressively from the commencement to the close of the month, they divide it into two parts, and number the days of the increasing and of the waning moon separately. Each moon or month is also divided into weeks of seven days each, and Sunday, as with us, is the first day of the Birman week. The eighth day of the increasing moon, the fifteenth or full moon, and the eighth of the decreasing moon, are observed as sacred festivals. On these holidays no business is transacted in the rhoom; mercantile dealings are suspended; handicraft occupations are forbidden, and the strictly pious take no sustenance between the rising and the setting sun. This last instance of self denial, however, is uncommon, except in the metropolis, where it is submitted to by ambitious persons with a view to obtain favour with the king, who is understood to be a great favourer of the austerities of the Birman religion. Minute portions of time are divided as follows: "The space in which the finger can be raised and depressed is called *charazi;* ten charazi make one piaan; six piaan one bezana, about a minute. The day, of 24 hours commencing at noon, is divided into eight portions or yettee, of three hours each. These divisions of time are ascertained by a machine resembling the hour-glass, and sometimes by a perforated pan placed in a tub of water; they are announced by a stroke on an oblong drum, which is always kept near the dwelling of the chief magistrate of the city, town, or village; it is commonly raised on a high bamboo stage, with a roof of mats to protect it from the weather.

The edifice at the royal palace for the reception of this instrument is of masonry, and very lofty, whence the sound is said to be distinctly conveyed to the remotest quarters of the city.

140 Money.

The Birmans, like the Chinese, have no coin. Silver in bullion, and lead, are the current moneys of the country; weight and purity are of course the standard of value, and in the ascertainment of both the natives are exceedingly scrupulous and expert. What foreigners call a *tackal*, properly *kiat*, is the most general piece of silver in circulation; it weighs 10dwts 10¼gr.; its subdivisions are, the tubbee, two of which make one moo; two moo, one math; four math, one tackal; and one hundred tackal compose one viss. Money scales and weights are all fabricated at the capital, where they are stamped, and afterwards circulated throughout the empire; the use of any other is prohibited. The bankers, called by foreigners *pynions*, are likewise workers in silver and assayers of metal. This is a class of people very numerous, and indispensably necessary, as no stranger can undertake either to pay or receive money without having it first examined. Every merchant has a banker of this description, with whom he lodges all his cash, and who, for receiving and paying, gets an established commission of one per cent.; in consideration of which he is responsible for the quality of

Asia.

of what goes through his hands; and in no instance has it been known that breach of trust was committed by one of these bankers. The quantity of alloy varies in the silver current in different parts of the empire; at Rangoon it is adulterated twenty-five per *cent;* at Ummerapoora, fine, or what is called *flowered silver*, is most common; in this latter all royal dues are paid. Any person may have his silver either purified or depreciated to whatever standard he chooses; the nearest silversmith will be glad to perform the work, free from charge for his labour, as the bringer, by the operation, must lose a trifle, which the artist gains; the small quantity of metal that adheres to the crucible is his profit.

141 Measures.

The Birman measures of length are a paul-gaut or inch, 18 of which compose the jaim or cubit; the saundgaling or royal cubit, equal to 22 inches; the dad or bamboo, which consists of 7 royal cubits; 1000 dha make one Birman league or dain, nearly equal to two British miles and two furlongs; the league is also subdivided into tenths. The Birmans keep their accounts in decimals, after the manner of the Chinese.

142 Arts. Agriculture.

The Birmans have hitherto carried few of the arts to very great perfection. The art of agriculture, which is the foundation of all others, seems in a very imperfect state; this, however, does not appear to arise so much from want of skill in the people as from their present situation, which renders great exertions to procure subsistence by no means necessary. The soil is extremely fertile, while the population is very scanty; the Birmans, therefore, are somewhat in the state of colonists upon a new territory; land is abundant and cheap, while labour is obtained with difficulty; hence they cultivate only the most fertile spots, and these in an indifferent manner, leaving the greater part of the work to nature, which has been very bountiful to them. They are not, however, altogether unacquainted with some useful practices; they everywhere burn the rank grass, once a year, to improve the pasture. In some quarters of the country neat farms are to be seen, with lands well fenced and divided into enclosures to receive the cattle, of which there are great abundance; the fields are divided by thorn hedges; the low grounds are prepared for rice, and the higher lands are planted with leguminous shrubs, or left for pasture.

143 Ship-building.

The Birmans are at present endeavouring with great spirit to improve their maritime architecture. Formerly they used only small vessels, no better than a kind of boats; but having obtained farther information from their communication with Europeans, they are now launching vessels of considerable magnitude. When the British embassy were at Rangoon, they saw several ships, upon the stocks from 600 to 1000 tons burden; one belonging to the maywoon of Pegu, about 900 tons, was considered, by professional men, as a specimen of excellent workmanship; it was entirely formed by Birman carpenters upon a French model, as are most of their large vessels, the Birmans having received their first rudiments of the art from that nation: three or four vessels of burden were likewise in a state of forwardness belonging to English adventurers. Birman shipwrights appear to finish their work well; they are athletic men, and possess, in an eminent degree, that vigour which distinguishes Europeans, and gives them pre-eminence over the enervated natives of Hindoostan. Asia.

144 Salt.

Upon the sea coast they manufacture great quantities of salt, from which the government derives a considerable revenue. 145 Cloths. Cloths of different kinds are manufactured by the women in all parts of the empire; and even in the royal palace they carry on domestic manufactures. On a visit to the mother of the queen, the ambassador saw, in one of the galleries of her palace, three or four looms at work. At Pegu the women weave for their own and their husbands use silk and cotton cloth; the thread is well spun; the texture of the web is close and strong, and is mostly chequered like Scotch tartan. At a town in the interior, called *Pakang-yag*, situated on the river Irrawaddy, large quantities of silken cloth, and of silk and cotton mixed, are manufactured. The silk of which these goods are made comes from Yunan, the south-west province of China, in a raw state; the colours are bright and beautiful; the texture is close, and the cloth is said to wear much longer than any Chinese or Indian manufacture. 146 Saltpetre and gunpowder. At a town called *Summei-kioum* is the greatest manufactory of saltpetre and gunpowder in the kingdom. From a prejudice not unusual in the infancy of commerce, neither saltpetre nor gunpowder is suffered to be exported upon any plea. At the suburbs of a town called *Pagahm*, the members of the embassy found the inhabitants employed in pressing oil from the sesamum seed; 147 Oil mills. the grain is put into a deep wooden trough, in which it is pressed by an upright timber fixed in a frame; the force is increased by a long lever, on the extremity of which a man sits and guides a bullock that moves in a circle, thus turning and pressing the seed at the same time; the machine was simple, and answered the purpose effectually. There were not less than 200 of these mills within a narrow compass. From the circumstances of the cattle being in good order, we concluded, that they were fed on the seed after the oil was extracted. The land about Pagahm scarcely yields sufficient vegetation to nourish goats.

148 Glass.

Our readers will readily believe, that *we* perused with much pleasure the following passage in Captain Symes's Account of his Embassy: "Among the articles of foreign trade which had found their way into the Birman country, nothing was held in higher estimation than the European glass-ware, imported into Rangoon from the British settlements in India. The art of vitrification has long been known and practised in most countries of the east; but nowhere can they make a pure transparent substance, like that which is brought from Europe. The Birman monarch, who is a great admirer of the manufacture, was particularly desirous to introduce it into his own dominions; and supposing that every Englishman must be versed in the knowledge of making whatever comes from his own country, he sent a message to request that I would furnish his artificers with such instructions as might enable them to fabricate glass of a quality equal to what was made in England. Unluckily none of us happened to be skilled in the mystery of a glass-house; all, therefore, that we could do, was to explain the principles of the art, which Dr Buchanan obligingly undertook; and, in order to facilitate them in the acquire-

ment,

Asia.

ment, and guide them in the practice, I lent them the *Encyclopædia Britannica*, and pointed out the article where the process is fully explained. Baba Sheen, the second in authority at the port of Rangoon, and the Armenian interpreter, translated it into the Birman tongue."

As the Birmans possess within their country the whole materials from which the best kinds of glass are prepared, there is little reason to doubt, that this active people would speedily be enabled to reduce to practice the lesson they obtained in the manner above mentioned; and thus the proprietors and conductors of the Encyclopædia Britannica have the satisfaction to know, that the former edition of their work has contributed to diffuse, in the most distant regions of the globe, a knowledge of those arts which add convenience and elegance to civilized life. The utility of their undertaking has exceeded the limits of their own foresight, as they have, in this instance at least, laboured for the instruction and improvement of a prince and of a people, whose very name and existence were unknown to them when their labours commenced. Happy had it been for the nations of the east, had they derived from their intercourse with Europeans no other fruits than the extension of science, and the enlargement of their powers, by an acquaintance with that command over the different objects of nature, which human ingenuity has attained in this quarter of the world.

One manufacture on which the Birmans bestow much attention, must not pass unnoticed. It is carried on at a village called *Kyeock Zeit*, and consists of the formation of idols of marble. Our author saw 30 or 40 large yards crowded with statuaries at work, on images of various sizes, but all of the same personage, Gaudma, sitting cross-legged on a pedestal. The quarries whence the materials are obtained, are only a few miles distant. The marble is brought to the village in blocks; and after being fashioned, the blocks are publicly sold to pious people. The largest little exceeded the human size, and the price was said to be 100 tackals, that is, 12l. or 13l.: but some diminutive Gaudmas were to be disposed of as low as two or three tackals. The workmen were civil and communicative. Their tools were a chisel and a mallet, and they smooth the image with freestone and water. Many of the idols were beautifully polished, which is said to be accomplished by rubbing the marble with three different sorts of stone; the first rough, the second finer, and the third, such as hones are made of. The workmen afterwards use the palms of their hands. This last operation gives it a transparent clearness, far surpassing the brightest polish that European marble ever exhibits. Such images as are designed for gilding, are not finished so highly; but none of the idols are allowed to be sold to any, except native Birmans.

149 Marble.

150 Idols.

151 Commerce.

An extensive trade is carried on between Ummerapoora the capital of the Birman dominions, and Yunan in China. The principal export from the Birman territory is cotton, of which it is said there are two kinds, one of a brown colour, of which nankeens are made, the other white, like the cotton of India. This commodity is transported up the Irrawaddy in large boats, as far as a place called *Bamoo*; where it is bartered at the common market with Chinese merchants, who convey it partly by land and partly by water, into the Chinese dominions. Amber, ivory, precious stones, betel nut, and the edible nests brought from the eastern Archipelago, are also articles of commerce. In return, the Birmans procure raw and wrought silks, gold leaf, preserves, paper, and some utensils of hardware. A great inland commerce is also carried on between the capital and the southern parts of the empire, which is greatly assisted by the noble river Irrawaddy, that waters the country. The chief objects of this commerce are the necessaries of life. Several thousand boats are employed in transporting rice and salt from the southern or lower provinces, to supply Ummerapoora and the northern districts. Up the same stream are conveyed China ware and glass; also European broad cloth, with some hardware and coarse muslins from Bengal. Silver, lace, and precious stones, are brought down by the merchants.

Asia.

We have treated somewhat minutely of the manners and situation of this people, because they form a striking exception to the general features of the Asiatic character, as it has always existed among the other nations that inhabit the more fertile districts of that great continent. It is to be observed, that the Birmans are also of importance, in consequence of their geographical position in relation to the great British empire in India. A durable vessel of burthen cannot be built in the Ganges without the aid of teek plank, which can only be procured from Pegu. Should the timber trade of the Birman empire therefore be interrupted, the marine of Calcutta, amounting to 40,000 tons of shipping, would be reduced nearly to annihilation. This marine has already been of importance to Britain. In 1794, 14,000 tons of shipping, almost entirely India built, were freighted to carry rice to England, and reduced the price of that article of food to three halfpence per pound. The maritime ports of the Birman empire are extremely commodious for Indian commerce. Britain possesses the western side of the bay of Bengal; the Birmans the eastern, which is far superior to the former for the purposes of navigation. From Cape Comorin to the Ganges, is an unbroken line of exposed shore, without a single harbour capable of affording shelter to a vessel of 500 tons burden: But the Birmans possess three excellent ports, Negrais, the securest harbour in the bay; Rangoon, and Mergui, each of which is as convenient, and not less accessible than the Ganges, which is the only British port in the whole bay. In such circumstances, the importance to the government of the western peninsula of retaining a good understanding with these people, cannot be disputed. They are a very different race from the timid and passive Hindoos, whom we have conquered. Though unequal to Europeans in manufactures or in arts, yet in a climate adapted to their natural constitution and unfriendly to ours, they might prove dangerous enemies, in a contest with whom much might be lost, and nothing can be gained.

152 Importance of the Birmans to the British.

After this account of the Birmans and their empire, it will be unnecessary to take much notice of the rest of the eastern peninsula, as the inhabitants of that territory appear upon the whole to possess the same general character, laws, and manners. To the south-east of the Birman territory, the great eastern peninsula becomes forked, or divides itself into two separate peninsulas, with the gulf of Siam between them. The most westerly of these two peninsulas, is a narrow tract of

153 The remainder of the eastern peninsula.

Asia.

of country called *Malacca*, which stretches southward to a great distance, till it approaches the equator. The peninsula to the eastward of the gulf of Siam is much broader than the other, but proceeds to a much less distance southward. The city of Siam stands at the bottom of the bay of that name, where the division of Farther India into two peninsulas commences. The peninsula, beyond the Siamese territory, contains the countries called *Ciampa*, *Cambodia*, and *Cochin-China*, on the east, and *Tonquin* on the north-east.

154 Malacca.

The isthmus, or neck of land, by which the peninsula of Malacca joins the continent, is only about 50 miles in breadth. To the westward of it, at the distance of 260 miles, is the island of Junkseilon, which yields considerable quantities of tin. In 1784, 590 tons of that metal were exported. Malacca itself yields few commodities for exportation, excepting ivory and tin. The city of Malacca, however, is a true emporium or magazine of the various rich articles of commerce brought from the surrounding countries. This coast was known to the ancients. It was celebrated for its gold, on account of which it received the appellation of *Aurea Chersonesus*. Some imagine this to have been the Ophir of Solomon, though others contend that Ophir was a port in Africa. One reason for suspecting this or some other port of India to have been Ophir, is this, that Solomon's fleet is said to have brought home peacocks. These birds are natives of India, and at that early period were unknown in the interior or southern coasts of Africa. It is farther to be remarked, that on the eastern side of this peninsula, much gold is found near Pahang. This town is situated in N. Lat. 3° 50′, in a most fruitful country, at the mouth of a river which has an estuary of about a mile broad. The river contains much gold. Lumps of five or six ounces weight are said to have been found. It is brought up by divers. Sometimes eight hundred weight has been exported. This place, therefore, might well be the Ophir of Solomon; and the Jewish historian, Josephus, actually fixes it here.

1 *Kings*, x. 23.

Trangano or Tringoran, a small town a little to the north of Pahang, is seated on a river near the sea. It consists of about 1000 houses, half of which are inhabited by Chinese, who traffic in their junks to Siam, Cambodia, and Tonquin. Trangano is most deliciously situated amidst low hills, covered with the eternal verdure of undeciduous trees. Lemons, oranges, mangosteens, and all the fruits of the Indies, grow here in perfection; and the valleys produce grain, pulse, sugar, and especially pepper, in great abundance; but only in consequence of the industry of the Chinese, for the Malays themselves are too indolent to make the earth yield its full increase. We know too little of the ancient history of this singular people in particular, and indeed of the whole peninsula beyond the Ganges in general, to be able to account in a satisfactory manner for their present state, or their connexion with a multitude of adjoining tribes and states. The ancients formed of the whole of this great eastern peninsula, along both sides of the bay of Siam, a mighty empire, to which they gave the appellation of *Thinæ*, or *Sinæ*, distinguishing them from the Chinese on the one hand, and from the Hindoos on the other. The similarity of character and customs that is to be found among the whole of these states of Birmah, Malacca, Siam, Cambodia, Cochin-China, and Tonquin, render the existence of such an ancient empire extremely probable. It may have been destroyed by Tartar conquest or internal revolutions, and the inhabitants may have lost a great part of the civilization, and a multitude of the arts, which they once possessed. That this last supposition is not only probable, but in some degree true, is sufficiently demonstrated by a fact mentioned by Captain Symes, in the account already noticed, of his embassy to Ummerapoora. He saw in many places beautiful vaults and arches formed of stone or brick, supporting lofty buildings; but he learned, that the art of constructing vaults or arches is at present entirely lost in the country, and that no Birman workman will at the present period engage to erect a building of that kind.

Asia.

155 Character of the Malays.

The character of the inhabitants of the peninsula beyond the Ganges, appears to be more strikingly marked in the Malays than any other people; and at some remote period, they have undoubtedly made a considerable figure in these regions, and must have possessed a great spirit of national enterprise. They differ from the other states of the peninsula only in this, that the Arabs have converted them to Mahometanism. The feudal system at present exists among them in full perfection or barbarity. They have the same pride of honour and delight in war that distinguish the Birmans, and that marked the character of the ancient inhabitants of the north of Europe. They are governed by petty chiefs, who are engaged in endless and sanguinary hostilities against each other. Like the Birmans, the people in their persons are robust, but not tall. They are active and restless, and their ferocity in war is unbounded: No enterprise is so dangerous as to deter them from engaging in it. Not only will a handful of them in a boat attempt to board an European vessel of any size, and to murder the crew with their poniards; but when employed by the Dutch as soldiers in their wars against the English or Portuguese, 14 or 20 of them have been known to sally from a fort, under cover of the smoke of the cannon; and having found their way in an instant into one of the batteries of the besiegers, they have stabbed almost the whole gunners while working the artillery, and retreated with little loss, and before effectual measures could be taken against them. The Dutch are so cautious with regard to them, that unless in case of extreme necessity, they never employ above two or three of them at once as mariners on board the same ship: Yet this people, barbarous as they now are, have at one period made such national exertions, that their race and language is found to extend over a very large portion of the globe. To the south and east of Malacca the great Asiatic Archipelago is situated, containing a multitude of isles of immense extent. Over a great part of these isles the Malays have spread themselves, and their language is spoken. The first island to the south and south-west of Malacca is Sumatra, the passage between which and the main land, is called the *straits of Malacca*. The island of Sumatra is crossed in the middle by the equator: its length is about 800 miles, and its breadth about 130. A range of mountains runs along the whole island, sometimes in a double or triple chain, with beautiful valleys between them; but unless where cleared, both valleys and mountains are clothed with shady forests. The

156 Asiatic Archipelago.

Asia.

island has long been celebrated for its gold, and a mountain under the line is called *Ophir*, which affords an additional reason for supposing that the ships of King Solomon came to this quarter of the world. It is 13,842 feet high, or two miles and 1094 yards. The Malays upon the island are said to be skilful artists in works of fillagree, in both gold and silver. Sugar, ivory, teek wood, and all the other tropical productions, are found upon it; but its climate is extremely destructive to Europeans. Though no snow is ever seen on the island, yet the inhabitants of the mountains, like those of other Alpine regions, are subject to monstrous wens in the neck, or goitres.

To the east of Sumatra, and divided from it by the straits of Sunda, is the island of Java, in which also the Malays abound, and in which the Dutch have their settlement of Batavia. Like Sumatra, a chain of mountains runs along the middle of it, and it is extremely unhealthy to Europeans. Eastward of Java is the great island of Borneo, immediately under the line. A great part of the coasts is in the hands of the Malays, though Moors and Javanese are also found here. It produces all the vegetable and mineral productions that are found in the other parts of the Indies. The interior is mountainous, but unhealthy; and this, like all the rest of these islands, is subject to frequent and very dangerous earthquakes. The original inhabitants of this and the other islands in its neighbourhood are extremely barbarous, and have been driven from the sea coast by the Malays and other strangers. To the north-east of Borneo are the Philippine islands; and to the south-east are Celebes and the Molucca isles, beyond which is New Guinea, with a multitude of adjoining islands, all inhabited by barbarous tribes of little importance in a general view of Asia. To the south of all these islands is the vast island, or rather continent, of New Holland, which is scarcely inhabited, though equal in size to Europe.

157 Siam.

Returning to the continent of Farther India, the kingdom of Siam is situated, as already mentioned, at the bottom of the bay of that name, to the south-east of the Birman territory. The city stands at the mouth of a large river called *Meinam*, which fertilizes the country, and affords an internal navigation to a considerable distance. The river is deep, rapid, and broader than the Elbe. The upper part is rocky and interrupted by cataracts. At its lower part, the stream divides into several channels, passing through a level country, which it fertilizes by periodical inundations. The country is woody. The houses, like those of the Birmans, are raised aloft on stilts or posts; but upon the river a kind of floating habitations are used, in which many people constantly reside, and occasionally move from place to place when the waters are high. The capital is in latitude 14° 13′, and is surrounded by a lofty brick wall, which has not always been able, as already noticed, to defend it against the arms of the Birmans. Rice is produced in amazing crops, and all the fruits of the Indies rise up with little or no cultivation. Logwood, like that cut in Campeachy, is said to be one of the productions of the country. The Siamese territory is very narrow from east to west, but extends northward along its own river to a considerable distance.

158 Cambodia.

To the eastward of Siam is the kingdom of Cambodia, extending along the banks of its river, which flows in a course nearly parallel to the river of Siam. The most southerly point of the country, being the eastern extremity of the gulf of Siam, is called *Cape Cambodia*, beyond which the coast turns to the eastward, and the river Cambodia discharges itself into the sea through several mouths, forming by its alluvions a very fertile tract of territory, like the rivers of Siam and of Birmah. The capital stands 90 miles up the river, and consists only of one street, built on an eminence, to preserve it during the inundations: The present city of Cambodia, is supposed to be near the site of *Thina Metropolis Sinarum*, of Ptolemy and Marcianus. Mr Caverhill quotes Argensol for the proof, and says, on his authority, that marble ruins of an extensive city have been discovered to the north-west of Cambodia: yet Ptolemy relates, that it was not surrounded with such walls, nor had any thing worth mentioning. Arrian, in his *Periplus Maris Erythræi*, calls it the greatest of the inland cities, and that it sent to Barygaza, the modern Barochia, on the western side of Hindoostan, wool, thread, and *othonium sericum*. These were carried the whole of the journey by men on foot: prodigious indeed must the journey have been, if it is true that they went through Bactra, a detour of amazing extent. The kingdom of Cambodia was known to the Arabs by the name of Rachmi. It was visited in the ninth century by two Arabian travellers, who report, that the finest muslins in the world were made there, and that the natives wore garments so fine, that they might be drawn through a middle-sized ring. The same writers tell wonderful things of the *karkandan* or unicorn; but from the whole description, it is evident, that they mean no other animal than the one-horned rhinoceros.

Asia.

159 Ancient city.

160 Island of Pulo Condore.

The noted island of Pulo Condore lies about 15 leagues to the south of the western channel of the Cambodia. It is situated in latitude 8° 40′. Its form is that of a crescent; the length not above eight miles, the greatest breadth about two: the whole is lofty and mountainous, and it is surrounded by lesser isles. The name is derived from *pulo*, an isle, and *condore*, a calabash, from its production of that fruit. It was visited by Dampier in 1686. Here Dampier's crew found the custom to prevail which we have noticed, among the inferior class of Birmans, which exists over the whole peninsula beyond the Ganges, of the people of ordinary rank allowing their women to live with strangers. Our poet, Prior, humorously exaggerates the practice, and by mistake ascribes it to the Chinese.

> "In China, Dampier's travels tell ye,
> (Look in his index for Pagelli),
> Soon as the British ships unmoor,
> And jolly long-boats row to shore;
> Down come the nobles of the land,
> Each brings his daughter in his hand;
> Beseeching th' imperious tar,
> To make her but one hour his care.
> The tender mother stands affrighted,
> Lest her dear daughter should be slighted;
> And poor Miss Yaya dreads the shame
> Of going back the maid she came."

161 Ciampa.

Eastward of the estuaries of the river of Cambodia, is the

Asia.

the small territory of Ciampa, extending about 150 miles along the shore: the breadth not exceeding 90. The people appear to be of the same race with those that inhabit the rest of the peninsula, but their chief is tributary to the Cochin-Chinese, whom, however, they excel in naval, though not in military affairs. Their ships, or junks, are extremely well built; they are chiefly employed in the fisheries, which are very considerable, and form their most important source of commerce. The Chinese send ships very frequently to the northern parts of the country laden with tea, an inferior sort of silk, porcelain, and some other commodities of that empire. They take in return gold and columbo wood, to be burnt on the tombs of their ancestors and relations, or before the altars of their divinities. It is to be observed, that a strange mixture of religions here exists, in consequence of the influence of the neighbouring nations upon this small maritime state. Many of the people are Mahometans. Others are followers of the Chinese philosopher, Confucius; a third sort are worshippers of Gaudma; and the greatest part of the people jumble all these systems together. They all agree, however, to tolerate each other.

162 Cochin-China.

To the eastward of its tributary, Ciampa, the kingdom of Cochin-China begins, forming a long stripe of territory along the eastern shore of the farther peninsula of India. To the westward it is limited by a chain of lofty mountains, which run parallel to the coast of the Chinese sea, or eastern Pacific ocean. The whole of Cochin China, beginning from the borders of Cambodia, is in form of a bow, bending into the ocean as far as Cape Varelle, in Lat. 13°, when it inclines to to its northern extremity, in Lat. 17° 30′. The whole length of this great curvature is about five hundred and sixty miles, the breadth not exceeding that which we have ascribed to Ciampa. The northern borders are defended by a wall, which runs from the sea to the great chain of mountains, and forbids all approach from that quarter, as the inaccessible chain itself does every attempt of invasion from their western neighbours. The lower parts of this kingdom are overflowed during the rainy season; and here, as elsewhere in India, rice is the greatest harvest: a kind as white as snow is cultivated on the mountains and dry soils: when dressed, it is of a slimy viscous nature, and is made into pastes. Sugar, cotton, pepper, and other Indian commodities, are also cultivated here in great abundance by the labour of free men, and are articles of commerce with China. Among other commodities which are exported, mention is made of silk, and of certain kinds of wood much esteemed in the east, such as, aloes wood, or agallocha, erroneously called *eaglewood*, columbo, and others, of value either in mechanics or for their sweet scent. The price of columbo wood on the very spot is five ducats a pound, at the ports sixteen, and in Japan, to which much is exported, two hundred. A pillow of this wood is the highest luxury of the orientalists, particularly of the Japanese, who will give three or four hundred ducats per pound for a piece big enough for that purpose. The agallocha bears a good price, great quantities being shipped for Hindoostan for the use of the Hindoos, to burn their dead, who seem to emulate the ancient Romans in the aromatic profusion of their funeral piles.

Asia.

The war-boats of the Cochin-Chinese are very numerous, and resemble those of the Birmans. Those allotted to the defence of the coast are finely painted and highly varnished, rowed with fifty oars, and carry a cannon at the head, and two small ones on each side. The navy of the country is quickly manned, every district being bound to furnish a certain number of sailors, who serve with alacrity, as they are well treated, and their wives and children supported during their absence. They are dressed in uniform, with a gilt helmet, and a cloak which leaves their right arm quite bare.

163 Military power of Cochin-China.

The Cochin-Chinese have considerable fisheries, and both consume and export fish in large quantities. They make use of elephants as beasts of burden. On the backs of these huge animals they place a machine like the body of a coach, which conveys of outside and inside passengers about thirteen or fourteen persons. When the elephants arrive at a river, they take the water very readily, and even convey their fare in perfect safety over an arm of the sea a mile wide. The people of this country resemble the Chinese in their persons, but they are less in body, and more brave and active. The complexion of those on the coast is olive: that of the inland inhabitants near the mountains is fairer, and approaches to that of Europeans.

164 Tonquin.

The bay of Tonquin begins near the wall of Cochin-China at the northern extremity of that kingdom. The entrance of the bay is bounded on the eastern side by the island of Hainan. The tides of this bay have long been remarked on account of the following peculiarity, that a single flux and reflux occupies a full period of 24 hours. The kingdom of Tonquin is very narrow towards the south, at the Cochin-Chinese wall. To the west it is there bounded by the Cochin-Chinese chain of mountains, which soon retires, and gradually leaves a larger and larger expanse to the great plain of which this kingdom consists. The country is very populous, being thick set with villages. It is watered by a river, which, coming from the north or north-west, is called by the name of the country, Tonquin. It enters the bay by two mouths, one of which having only 12 feet water, is frequented by the flat-bottomed vessels of the Siamese and Chinese; but the other being deeper, is frequented by European vessels. The river is subject, like all others in that territory, to periodical floods, which fertilize the soil, and enable it to give forth abundant crops of rice and other productions of warm climates. The natives are acquainted, like the Birmans, with the practice of rearing occasional dwellings for any temporary purpose. About six leagues from the mouth of the river is the village of Domea, usually consisting of a hundred houses; yet, on the arrival of the European ships, it soon increases to a large town. The natives resort, for the sake of trade, from all parts. Houses suddenly spring up; for being only constructed of frames of bamboo, and the roof of palm or other leaves, a temporary town is quickly formed, in which a fair is kept as long as the ships remain in the harbour. Here, as well as in Cochin-China, Chinese opinions and notions prevail in a considerable degree. The religion of the country appears to be that of Budho, or Gaudma. Here also, as among the Birmans and all the other nations of the peninsula beyond the Ganges, the strange practice pre-

Asia.

vails of rendering the teeth black by means of art. All persons, high or low, rich or poor, are under the necessity of undergoing a dyeing process, for the purpose of avoiding that disgrace to human nature, of having teeth white, like those of dogs or elephants. Prior mentions this custom, but transfers it to the Chinese:

"In China, none hold women sweet,
"Unless their snags are black as jet:
"King Chiku put nine queens to death,
"Convict on statute iv'ry teeth."

165 Review of the eastern peninsula.

From the brief description here given of these countries, it will not be difficult to understand the physical aspect of the great peninsula of Farther India, and the political divisions which have resulted from it. Aracan on the west, and Cochin-China on the east of the peninsula, bear a considerable resemblance to each other. They both consist of a narrow tract of fertile territory, extending along the shore, and having behind them towards the continent a large chain of lofty and rugged mountains, which form the natural as well as political boundary. The rest of the peninsula is chiefly formed in the following manner:—Several chains of mountains run from north to south. Between every two chains is a tract of fertile country, watered by a large river proceeding also from north toward the south. Each of these valleys forms a kingdom, which is long and narrow, and bounded to the east and the west by a chain of mountains: Thus are formed the countries of Birmah, Siam, Cambodia, and Tonquin. The narrow peninsula of Malacca, however, must be regarded as a sort of territory by itself, probably formed by a continuation to a great distance southward of the chain of mountains that divides the Birman from the Siamese territory. Were it possible to unite into one empire the various nations which we have mentioned as inhabiting this vast peninsula of India to the eastward of the Ganges, the vigorous character of the people would probably render them extremely formidable to their neighbours the Chinese on the north-east as well as the Hindoos of the western peninsula. Any union of these countries, however, into one state, though a possible event, could only be accomplished during a great length of time, and after many struggles, in consequence of the bravery of the people, and the readiness with which they engage in war. The Birmans have indeed conquered Pegu, but only in consequence of a long continuance of the most sanguinary conflicts, which exhausted the population of both states, and almost destroyed the inhabitants of the conquered country. Aracan was, no doubt, more easily united to the Birman empire; but this in all probability arose from its being accidentally ill governed, and perhaps also from its vicinity to Hindostan, which had led its inhabitants to acquire much of the feeble character of the Hindoos. In the contests between the Birmans and the Siamese, is appeared that neither of the nations could be subdued, and that before the one of them could enlarge its territory, it must nearly exterminate the population of the other.

166 China.

From the peninsula of Farther India, we proceed north-eastward to China, of which we shall not here find it necessary to say much. As already mentioned, it is the tract of country which forms the gradual descent from the high regions of Tartary towards the Pacific ocean on the east. The dominion of the Chinese emperor extends over a civilized people, from the straits of Hainan, in N. Lat. 20° 13′, to the extremity of the province of Pe-tche-li, in Lat. 41° 15′, comprehending a space of nearly fifteen hundred miles in length, and in breadth above a thousand. Or, more accurately, according to the information obtained by Lord Macartney's embassy, China Proper includes a space of 1,297,999 square miles, inhabited by a population of 333,000,000. The island of Hainan, already mentioned, is at the southern extremity of the empire; but it is only half subdued, the natives in the interior of it maintaining their independence amidst lofty mountains. It produces gold, and the *lapis lazuli*, which is in great request among the Chinese, for giving a blue glazing to their porcelain. It has considerable fisheries on its coasts. From the continent opposite to this island the coast proceeds towards the north-east to the bay of Canton, which is the port frequented by Europeans. At Canton begins the celebrated imperial canal, or passage by water, which reaches from hence within land to Pekin, and the extremities of the empire; an extent of about 1800 English miles. Part of this inland navigation is formed by rivers and lakes, and the rest of it consists of a canal 900 miles in length, and a fathom and a half in depth. On the course of this internal navigation, multitudes of populous cities are situated, amidst a country in which the cultivation of every part of the soil is carried on with the most minute attention and economy.

Asia.

167 Isle of Hainan.

168 Canton.

169 Coasts of China.

Of the coasts of China, and indeed of the country at large, not much is known, in consequence of the jealousy which they entertain of all foreigners, and of the great rigour with which they put in force their prohibition to trade in any of their ports except Canton.

The next province to the north-east, proceeding along the coast is called *Foo-tchien*. The country is hilly and irregular: but, by the industry of the inhabitants, the sides of the hills are formed into terraces, ascending in a series of twenty or thirty, one above another; and these terraces are often continued for several miles in length. Water is forced up to these terraces in pipes of bamboo, and grain and other vegetables are cultivated upon them. On an island called *A-muy*, on the coast of this province, is a vast rocking stone, of 40 tons weight, moveable by the slightest touch. Opposite to the coast, also, is the island of Formosa, 90 leagues in length and 30 in breadth.—The next province northward on the eastern coast is called *Tche-Tchiang*. Like the rest of China, it is amazingly commercial. It is remarkable for its rich embroidered silks, its timber, its forests of bamboo, its salt-works upon the coasts, its mushrooms, hams, and vegetable tallow. A great part of the province has been won from the sea, as Holland was by the Dutch. It is guarded by immense mounds from the fury of the waves; and these mounds remain as stupendous marks of the industry of this most populous nation. They far exceed the similar dykes of Holland, as they have a much more powerful ocean to resist than that which assails the coast of the European low countries.

170 Wild silk worms.

The next province northward is called *Kyang-Nan*, near the northern boundary of which is the great and rapid river Whang-ho-hoo. Among the curiosities of this province is said to be the worm that fabricates not

the

Asia.

the common silk, but that mentioned by Pliny, which he and the ancient writers believed to be the only species of that beautiful production. Pliny represents silk as a vegetable, combed from the leaves and branches of trees. His error is not surprising; for the wild worms of this province, which resemble caterpillars, spin their webs on shrubs and bushes, and furnish as great quantities as the domestic worms. This silk costs in a manner nothing, and is so strong that the goods made from it are uncommonly lasting.

171 Northern boundary of China.

From hence northward, the Chinese coast is exposed not to the open ocean, but to a gulf, the eastern side of which consists of the peninsula of Korea. In Lat. 38° 12′ begins the province of Pe-tche-li already mentioned, which in N. Lat. 30° takes a north-eastern direction, and on the side of the gulf finishes China Proper, in N. Lat. 40°. The capital, Pekin, is in this northern part of the empire, about 100 miles from the mouth of the river Pei-ho. The empire ends about 150 miles farther, in Lat. 40° 45′, where the celebrated wall begins, whose length in a straight line is 700 or 800 miles, and including its windings and ascents over craggy mountains, or descents into deep valleys, may be estimated at double that length. It was intended as a bulwark against the invasions of the Tartars on this most accessible side of the empire; but this purpose it has never successfully fulfilled.

172 Climate.

The climate of China is liable to severe vicissitudes of heat and cold. The heat is powerful during the summer, because a great part of the country is in a southern latitude, and because its great extent does not admit of its being cooled by breezes from the sea. At the same time its vicinity to Siberia on the north, and to the elevated country of Tartary on the west, the mountains of which are covered with perpetual snow, expose it to a degree of cold in winter greater than what is known in the southern parts of Europe. It is also to be remarked, that the Chinese rivers, especially towards the northern parts of the empire, have a far more rapid current than those of either peninsula of India: the reason is, the country of China is itself much more elevated than India. It rises far more suddenly from the Pacific ocean than India does from its own seas. Hence it is enabled to oppose a more powerful front to the waters which wash its coasts, and which, impelled by the trade winds, would otherwise very rapidly encroach upon the land in this quarter of the globe.

173 Polygamy of the Chinese.

In China, domestic life is undoubtedly upon a worse footing than in the Indian peninsulas. The Hindoos who have not become Mahometans are monogamists; and we have seen that the same law prevails among the Birmans and the other nations of the eastern peninsula. But in China polygamy has always been allowed. This necessarily produces an unsocial mode of living, and the jealous seclusion of one half of the human species which uniformly attends the existence of such a law. It is not improbable, however, that the permission of polygamy, accompanied as it is in China, by a law of succession, which admits of no right of primogeniture, but divides the whole property of the parents equally among the children, may contribute in no small degree to the production of the crowded population that is found to exist in this empire. The luxury and sensuality of rich men is thus directed into a particular channel. Instead of becoming ostentatious and magnificent in their dress, equipage, and houses, they are led to expend their wealth in supporting and rearing up very numerous families.

Asia.

174 Chinese government.

The structure of the Chinese government perhaps deserves even more attention from philosophers than it has hitherto obtained. They acknowledge in their emperor absolute power in the most unlimited degree. From the nature of human affairs, however, it is evident that this power can be directly exerted over only a few individuals of the immense society of which he is the head. The people at large must necessarily be governed by delegated authority; and the value of the constitution of the state, or of the mode of government, must depend upon the manner in which a selection is made of those magistrates to whom the imperial power is intrusted. The Chinese emperor, like other Asiatic princes, will naturally be led to pass much of his time in the luxury of his palace among eunuchs and women. Were the nomination of the magistrates of the empire altogether intrusted to such a man, it is evident that the administration of affairs would speedily go into confusion, and usurpation and anarchy prevail. This, however, rarely occurs; and it is the peculiar nature of the Chinese government to reconcile despotism with a regular and prudent administration of affairs, and the luxury and weakness of the prince, with fidelity and ability on the part of his ministers. Foreign conquest does not alter this order of things. The strangers speedily coalesce with the vanquished people, and the conqueror submits his arbitrary will to the customs that he finds established among a wealthy and a numerous people. Hence the civilization of China has existed from the remotest antiquity. It has had periods of interruption and of anarchy, during which the nation has submitted to strangers; but these strangers soon ceased to be known as such. The ancient laws of the empire, by the admiration which they excited, subdued the minds of the barbarians, whose arms had proved irresistible.

The ostensible maxim of the Chinese government or constitution is this: that paternal authority is in all situations to be respected and implicitly obeyed; that the emperor is the father of the people, and to be regarded with boundless reverence as such; that all inferior magistrates are to be regarded in the same point of view; and the severities they inflict are to be considered not as the punishment of criminals, but as the chastisement of children intended for their benefit. From the nature of the human character, however, it is evident that this fiction, applied to a Tartarian conqueror recently seated upon the throne, would only go a short way to preserve the tranquillity of the state, and that, even under a long established line of hereditary princes, it would have little effect in restraining the ambition of enterprising individuals, or in preserving the submission of a discontented people. It may operate at times perhaps as a salutary prejudice on the minds of the weak and ignorant, or it may afford a plausible justification of that implicit obedience in the people, and absolute power in the prince, which are established and maintained by more powerful means; but farther its influence can scarcely extend.

The radical principle of the political constitution of China must consist of a more powerful and efficient

principle,

Asia.

principle, which appears to be this:—The law, or ancient custom of China, so arranges affairs, that the best informed men in the country, and those whose characters are most unexceptionable, shall at all times possess the power of the state and the administration of public business. Literature there affords the means of advancement; and China affords the singular example of a country governed by its men of letters. In this empire no order of nobility or of magistracy is hereditary. The whole country, however, is ruled by a privileged class of individuals called *Mandarins*, and it is upon the mode in which this ruling class is nominated, or selected from the mass of the people, that the peculiarity of the Chinese constitution and its whole value depend. There are two sets of mandarins, the civil and the military, who are employed in these different departments of the public service. Of each department there are six or seven classes or orders of mandarins, ascending above each other in a regular gradation of rank. The son of the lowest person in the state is allowed at certain appointed periods to present himself for trial before the mandarins of his district, either civil or military. If his character is without reproach, and if after various examinations, his learning or skill in the appointed exercises appear complete, he is admitted to the rank of a mandarin of the lowest order, which makes him a candidate for certain public offices, as the emperor, unless in very singular cases, only confers public employments upon mandarins thus found duly qualified. After a certain time he may present himself for trial in his district before the next superior order of mandarins, and, if received into their number, his rank in society is proportionably augmented, and he becomes a candidate for still higher employments. He may thus ascend by force of talents, and of an unblemished reputation, through all the orders of mandarins, till he is enrolled in the highest class, out of which the ministers of state, governors of provinces, and commanders of armies are appointed. In the different examinations and trials, favour or hereditary interest can give little assistance to the candidate; for no mandarin ever holds an office in the province where he was born; so that the judges cannot be the kindred of the persons who appear before them for examination or trial.

175 Apparent perfection of the Chinese constitution.

One would almost suppose that such a constitution must be absolutely perfect. The establishment of a hereditary reigning family at its head represses inordinate ambition, and prevents military usurpations by soldiers of fortune. As the emperor possesses the power of appointing any one of the imperial family as his successor, the hazard is avoided of having at any time an idiot or an infant placed at the head of the state. The expence of his court can be of little importance in this mighty empire. The absolute power ascribed to him can do little harm, as he is at all times surrounded by the ablest and most virtuous men of the nation. The manners of the people cannot become corrupted, because vice is not kept in countenance by the bad example of powerful men; as distinction and power can only be attained by persons whose integrity of conduct is proved to the satisfaction of men of advanced age, who have themselves risen to eminence by the accomplishments of their minds and the purity of their lives. It must be difficult, or almost impossible, to disturb the internal tranquillity of such a nation, because the ablest men that it contains are at the head of all affairs; and the power which results from uniting intellectual superiority to the authority of office must evidently prove irresistible. The administration, also, of public business will in general be well conducted, because the inferior mandarins, unprotected by family connections, will have no means of securing indemnity for ill conduct, and because their ambition will naturally lead them constantly to endeavour to recommend themselves to those of a superior class, whose public approbation affords the only means of obtaining farther preferment. Accordingly, in no country in the world has any government found it practicable to execute and keep in repair such immense public works as are found in China. Their prodigious canals and regular roads, together with the immense public magazines of grain accumulated to guard against any partial or general scarcity, demonstrate this to the satisfaction of every traveller.

Asia.

176 Bad effects of the Chinese constitution.

Yet this apparently unexceptionable government, which produces a numerous, an industrious, a peaceful, and wealthy people, does undoubtedly contain in a moral or intellectual point of view, some great and radical defect. It is true, that under it men become no worse; but it is also true that they become no better. No improvements are ever made; arts and sciences have remained for ages in the same state; invention is unknown: Imitation, regularity, and routine, pervade every order of society, and lull the human faculties into everlasting slumber. Though the Chinese annals extend to many thousands of years of civilization, yet in a few centuries, the Europeans, emerging from barbarism, have been able to surpass them in every science, and almost in all the arts of life. The present Chinese are precisely what their forefathers were 4000 years ago, and should their political arrangement continue for ages to come, there is no reason to believe that they will rise above their present state. With all their literature and all the encouragement they give to it, they do not yet practise alphabetical writing; but having a mark for every separate word, it is necessary for them to spend many years in learning to write and read. Though they have been acquainted with gunpowder from a very remote antiquity, the military art among them is so contemptible, or such is understood to be the feebleness of their character, that it is believed an European army of 100,000 men would find little difficulty in dethroning their emperor, and seizing the government of the country.

177 The defect of the constitution of China.

The imbecility of character, or the stagnation of intellect which takes place in China, cannot be ascribed to religion as among the superstitious Hindoos, for they tolerate all religions: they even admit of no religious establishment, and the greater number of them are supposed, as already mentioned, to be of the same religion with the more vigorous and active Birmans. The weakness of the Chinese, therefore, and want of progress in improvement, is in all probability to be ascribed to the manner in which power and preferment are obtained under their political constitution. In all countries the higher classes of society are apt to be afraid of novelties, because their situation cannot be made better. The lower classes, on the contrary, perceiving

Asia.

ceiving themselves at the bottom of the wheel of fortune, readily set changes at defiance, and are fond of whatever promises to improve their condition. Hence they applaud and patronize, though frequently to their cost, the fearless, the ambitious, and the contrivers of whatever is bold or uncommon. The higher classes naturally oppose all this, and patronize among their inferiors the qualities of caution, docility, submission, and whatever is farthest from innovation or an impatience of controul. In every society, ambitious men regulate their conduct in the way best calculated to recommend them to those from whom promotion comes. Hence in England, in consequence of the existence in the political constitution of a portion of popular patronage, aspiring individuals have often attempted to recommend themselves to notice by turbulence, and by loud declaration that all was wrong and ought to be altered. But in a society arranged like China, every candidate for preferment must necessarily study to regulate his conduct and manners in the way most acceptable to his superiors, who in that country are a set of wealthy and prudent old men. He will, therefore, like a student on trial for a degree at one of our universities, avoid whatever looks like novelty, rashness, or disrespect for those above him: He will labour to speak as they speak, and to think as they think: thus ambition itself will make him tame and submissive, and the passion for distinction will render him careful to keep in the beaten track, and to subdue his mind to an unqualified acquiescence in whatever has been long established. A society, whose most vigorous members are thus constantly occupied in subduing their own minds, and reducing them to this passive temper and to a corresponding demeanour, will necessarily possess the character of prudence, languor, timidity, and perpetual old age: It will hate novelty and invention, which will render improvement impossible, because all improvements are new, and the result of a restless spirit. Could the Chinese constitution be reversed; were the first or lowest class of mandarins elected by the multitude, or by persons of moderate wealth; were the second class elected by the first, the third class by the second and so upwards; it is evident, that the intellectual character of the people would speedily alter, and they would become as restless and enterprising, as they are now passive and stationary. That the happiness of this multitude of people would not by such a change be increased, is undoubtedly very true; that they might even in consequence of it be exposed to many sanguinary convulsions, is also very probable: but their rank in the scale of intelligent beings would be altered, and their importance among nations would be immeasurably increased. Foreigners would cease to be objects of terror to a people ruled by men of an enterprising character: To preserve tranquillity at home, it would be found necessary to have recourse to objects of distant enterprise: the immense population of this empire would enable and compel it to cover all Asia with its colonies; to fill the Indian ocean with its fleets, and the isles with its commercial and political establishments.

178 Korea.

Adjacent to the north-eastern quarter of China, and opposite to a part of the Chinese coast, is the peninsula of Korea, extending from latitude 42° 50′ to latitude 34°; bounded on one side by the gulf of Pe-tche-li, and on the eastern side by the Japanese gulf. Japan extends the whole length of the coast of Korea, and even stretches beyond its southern part. Korea is of an oblong form; about 100 leagues in breath, and 180 in length. Its inhabitants are a mixed people, and have been conquered at different periods by the Japanese, the Tartars, and the Chinese. The yoke of China, however, is very light, as the Chinese fear, that severe treatment might at some period induce them to unite with the Russians, who have advanced through Siberia towards the Chinese frontiers. Korea is mountainous, and produces most of the European fruits and forest trees; it was protected by a wall to the north-west, which, however, did not prevent a Tartar conquest, and is now neglected. The government is regular, and the customs and laws resemble those of the Chinese. The natives carry on a great commerce openly with China, and clandestinely with Japan, the Philippine isles, and perhaps Java: They also trade with the Russians to a considerable extent, and procure from them large quantities of furs, which they convey to China, and represent there as the produce of their own country. To facilitate their illicit trade with the Japanese, the latter have ceded to them a small island called *Susima* near their coast. As they possess abundance of European goods, no part of which they purchase in China, they are understood to obtain them by their trade with the Dutch at Batavia.

Asia.

179 Liquejo Isles.

To the eastward of the Chinese coast, and south of the peninsula of Korea, are several islands called the *isles of Liquejo*. The most considerable is Kintschin, extending north and south between latitude 26° 28′ and 25° 45′. It is about 50 leagues long, and 15 broad; the east and south parts of it are skirted by numberless little isles and rocks. The inhabitants are chiefly Chinese, who fled from the Tartars at the time of the last revolution; they export considerable quantities of cowries of the same species that is found in the Maldive isles: From these shells is prepared a white varnish. They also export a sort of large flat shells, which, when polished, are almost transparent, and are used by the Japanese in their windows instead of glass.

180 Japan.

To the eastward of Korea are the isles of Japan; they extend from latitude 30° to 40° north: their longitude is from 143° to 161° east. The surrounding seas are stormy and filled with dangerous rocks; the climate is changeable and subject to frequent rains; thunder is frequent, and earthquakes so common, as not to be regarded, unless, which is often the case, they produce dangerous consequences; the summer heat rises in July and August to 100 degrees of Fahrenheit's thermometer, and the cold of winter is proportionably severe; the country is everywhere mountainous, and the people of a mixed race from the neighbouring countries, but possessing a very active character. See JAPAN.

181 Chinese Tartary.

To the north of the wall of Korea and of China, Chinese Tartary begins. It is in general inhabited by Tartars in a pastoral state, subject to the present imperial family of China, who are themselves Tartars. This country extends northward to the river Amoor or Saghalien. This river takes its rise from the Keutaikam mountains, about the latitude of 49°, and longitude 110° east from Greenwich; and is here called *Onon*. Its direction is nearly north-east; and at the discharge

182 The river Amoor. *Sauer's Expedition to Russia.*

Asia. of the Nirza, where the city of Nertshinsk is situated, about latitude 52°, it bears the name of the Shilha. This course it continues to latitude 52½°, its most northern extremity, where the Tungoose call it *Amoor*, and the Chinese *Seghaalien Ula* (black mountain river, from the oak forests on the mountains hereabouts, which the Chinese call *blackwood*). From hence it is navigable in vessels of moderate size, having received considerable supplies from the torrents rushing down the eastern and northern mountains, as also from a very considerable river flowing from the south-west, and called the *Argoon*, which discharges itself into the Amoor, about 180 miles east of Nertshinsk. In the vicinity of these parts the Russians have several forts. From latitude 52¼° to 47½° it flows nearly south-east, receiving in its course a number of rivers both east and west. The Tshukir has its source from this side of the same mountains as gave rise to the Olekma and Aldan, (both emptying themselves into the Lena), and flowing nearly south, joins with the Silempid, which flows from the vicinity of the Ud; keeping nearly a western course into the Amoor. All these rivers are navigable for boats nearly to their source. The country is very mountainous, but the plains and valleys are spacious and fertile: the low country, however, labours under the disadvantage of being subject to inundations and earthquakes, which are very frequent.

No rivers of any importance join the Amoor from the east, except the two above mentioned. The Nonni Ula, however, a very large river, which takes its rise about the latitude of 51°, and longitude 123°, makes a considerable inland circuit, and empties itself into the Amoor at its southern extremity, about the latitude of 47½°. Another considerable river, the Usuri, loses itself in the Amoor nearer its estuary, about latitude 48½°. It rises from the lake Hinka, and has a communication after a short day's journey by land with the sea of Japan. It now flows in its own channel north-west into the sea of Ochotsk, about the latitude of 52½°, opposite the island Saghalien. This river is well stocked with fish, and its borders are covered with forests of oak, walnut, birch, and different sorts of pines. The soil is very rich, the climate mild and healthy. The whole course of this great river and its tributary streams is subject to the Chinese, or inhabited by people under their protection. It was discovered by the Russians in 1639 by means of some Cosacks: the Russians were delighted with the discovery of a river which report made to cast up gold and silver, and its neighbourhood to abound with the most precious furs, cattle, and fruit: the Russian colonists of Siberia emigrated thither in crowds, and depopulated their former country. They founded a fort in latitude 53°, which they called *Albasin*. The Chinese burnt it in 1680, and carried the garrison prisoners to Pekin; but it was rebuilt and strongly garrisoned, till it gave such serious cause of jealousy, that the affair was at last terminated in 1689, by a treaty at Nertshinsk, upon the river Indoga, in the reign of John and Peter afterwards surnamed the *Great*, and of Kang-hi, emperor of China. Had the Russians obtained the possession of Amoor, and of the forests and fertile territory in its vicinity, they might soon have got the command of the sea of Japan and of the coasts of China, by descending the river with their fleets. Even by marching from this river as from a magazine of arms and provisions, they could without difficulty have assaulted the Chinese empire, with an army trained in the discipline and the military tactics of Europe. By the treaty of Nertshinsk, however, the Chinese empire was declared to extend as high as Lat. 56° 32′. Its western limit is near the lake Baikal, at the northern front of the high region of Tartary, the greatest part of which also it includes. Beyond this, to the north and west, the territory is claimed by the Russians, who have settlements in various situations, and are in a great measure masters of the Tartar inhabitants of different tribes. These tribes are apt to become discontented with the Russian government; hence great numbers of them have recently emigrated to the Chinese territory upon the river Amoor. In the year 1787, there emigrated from the Russians no less than 6000 of the tribe called *Yakuti*, with all their cattle and goods, who put themselves under the protection of the Chinese. Thus at present upon the river Amoor, a mixed race of Chinese, and of people from all the Tartar and Siberian tribes, is uniting in a fertile country under the government of China, and will probably form out of their several dialects a new language of their own. The Chinese justly consider them as a valuable advanced guard to their frontiers, and give them every encouragement, by assisting them in the cultivation of grain, and in carrying on trade with Korea and other places in their neighbourhood. Asia.

Passing to the north of the Amoor and of the streams that flow into it, we come to Siberia, the proper country of the rein-deer, and of men who pass the winter in holes dug in the earth, to protect them against the severity of the climate. The whole territory inclines, as already mentioned, down toward the polar circle: but the surface of the country is various, and the coasts exhibit some peculiarities. Opposite to the mouth of the Amoor is the island of Saghalien, inhabited by a peaceable people, little known either to the Russians or Chinese. The island is 160 miles long, and 80 broad. It is situated at the mouth of the sea or gulf of Ochotsk, which has the main land of Siberia on the west, and the peninsula of Kamtschatka on the east. The Russians are settled on both sides of the bay. This peninsula having been visited of late years by different European navigators, has been described at least as minutely as its importance on the map of Asia requires. It is in general very mountainous; but a part of it which is level contains a deep rich soil composed of black earth. Firs, common pine, and larch trees of a tolerable size, with birch, poplar, ash, and mountain ash, cover the hills in the middle of the peninsula. The underwoods are currants, dog-roses, hawthorn, alder, and bushes producing berries. The climate in the southern parts is chilled by the sea-breezes, and in the northern by the cold winds from Siberia; but in the centre of the peninsula a sheltered valley produces very fine cabbages, potatoes, turnips, carrots, &c. together with buck-wheat and rye. Hemp also grows remarkably well, but there is little necessity for cultivating it, as the nettle answers every purpose equally well. The Kamtschadels and Russians make sewing thread of this last plant, the nettle, and fabricate from it their fishing nets, which, if used with caution and properly dried, serve them four or five years; the process 183 Kamtschatka.

Asia. cess of preparing it is nearly the same as that for hemp. On a good soil the nettle grows to the height of six or seven feet; the fibres are much finer, and a thread of equal thickness is said to be stronger than that made of the best hemp. The country is very subject to earthquakes, and has several volcanoes and hot springs.

In this quarter of the globe the coasts of the two great continents of America and of Asia begin to approach each other. From the American coast, opposite to Kamtschatka, extends to a considerable distance into the ocean the peninsula of Alyaska. From the
184 point of this peninsula a succession of islands called the
Aleutan isles. *Aleutan isles*, in the form of a crescent, crosses over to Kamtschatka. These islands are most closely joined where they approach the American continent, and the intervals between them become more considerable near the Asiatic shore. The concavity of the crescent is towards the north. The islands are, in general, inhabited; but the natives have been subdued by the Russians, or rather by the bodies of men who have been sent thither by different trading companies for the purposes of hunting and fishing. One of the Aleutan islands called *Oonalashka* is worthy of attention; it is in north latitude 53° 45′, and east longitude 193° 47′. It is very mountainous, and the natives live chiefly by fishing; they are of a middle size, of a very dark brown and healthy complexion, with round features, small nose, black eyes and hair, the latter very strong and wiry; they wear seal skins, with the hair outward, fastened like a carter's frock; they go bare-footed, unless when walking on the rocky beach, when they wear a kind of awkward boots made of the throat of the sea lion, soled with thick seal skin, which they line with dry grass. The men sometimes wear a kind of clothing made of the skins of birds, with the feathers occasionally outward or inwards; the skin side is dyed red, and ornamented with slips of leather hanging down to a considerable length: the seams are covered with thin slips of skin, ornamented or embroidered with white deers hair, goats hair, and the sinews of sea animals dyed of different colours; they also wear light pantaloons of white leather; the men have their hair cut short; the women wear theirs short before, combed over the forehead, and tied in a club on the top of the back part of the head. In wet weather, or when at sea, they wear a dress formed of the intestines of sea animals, the bladder of the halibut, or the skin of the tongue of a whale; it has a hood to cover the head, and is tied close round the neck and wrists, so that no water can penetrate; it is nearly transparent, and looks well. The men wear a wooden bonnet ornamented
185 with the whiskers of the sea lion and with beads. Their
Their baidars or boats. baidars or boats, which are the admiration of travellers from the ease with which they are navigated, are built in the following manner: A keel eighteen feet long, four inches thick on the top, not three inches deep, and two inches, or somewhat less, at the bottom. Two upper frames, one on each side, about an inch and a half square, and sixteen feet long, join to a sharp flat board at the head, and are about sixteen inches shorter than the stern, joined by a thwart, which keeps them about twelve inches asunder. Two similar frames near the bottom of the boat, six inches below the upper ones, about one inch square. Round sticks, thin, and about six inches distant from each other, are tied to these frames, and form the sides. For the top thwarts, very strong sticks, and nearly as thick as the upper frames, curved so as to raise the middle of the boat about two inches higher than the sides. There are thirteen of these thwarts or beams: seven feet from the stern is one of them; twenty inches nearer the head is another; a hoop about two inches high is fastened between them for the rower to sit in; this is made strong, and grooved to fasten an open skin to, which they tie round their body, and it prevents any water getting into the boat, although it were sunk. This frame is covered with the skin of the sea lion, drawn and sewed over it like a case. The whole is so extremely light, even when sodden with water, that it may be carried with ease in one hand. The head of the boat is double, the lower part sharp, and the upper part flat, resembling the open mouth of a fish, but contrived thus to keep the head from sinking too deep into the water; and they tie a stick from one end to the other, to prevent its entangling with the sea weeds. They row with ease, in a sea moderately smooth, about ten miles in the hour, and they keep the sea in a fresh gale of wind. The paddles that they use are double, seven or eight feet long, and made equally neat with the other articles. Asia.

The women of these islands plait neat straw mats, which serve for curtains and beds; they also make baskets, and kindle fires readily by strewing the powder of native sulphur upon dry grass or moss, after which they strike two pieces of quartz one against the other over it; the fine particles of sulphur immediately blaze like a flash of lightning, and set the whole of the dry grass or moss in a flame. The whole natives
186 of the Aleutan islands are held in a state of most mi-
Oppression of the Russians. serable slavery by the Russian hunters, who reside in this remote quarter of the globe, and compel them to hunt and fish in their service. Foxes and marmots are almost the only animals that the Russian hunters themselves can kill; for they are not capable of chasing the sea animals, which require particular agility in governing the small leather canoes in which the natives pursue the sea lion, the ursine seal, sea otter, porpoises, and common seals. The sea lion, called by the Rus-
187 sians *sirootsha*, is the strongest and largest of the seal
Sea lion. kind; it is covered with dark-coloured coarse hair, which is very thick and long about the neck and shoulders; the hinder part is tapering, with smooth short hair. The largest of these animals is about eight feet long; they have a small white spot on the temples, which is the only place about them vulnerable by arrows, which hardly pierce the skin in other parts; but if poisoned, they penetrate deep enough to destroy the animal. The flesh of the sea lion is cut into thin shreds and dried, and is eaten by the Russian hunters.
188 The ursine seal has a soft downy under fur, resembling
Ursine seal. brown silk; the largest of the species are about six feet long; when very young the fur is of a beautiful short glossy black, which changes to silvery when they grow up, and, when they become old; it is almost white. The most valuable fur is that of the sea otter,
189 called in Russia *morskoi-bobre;* the largest are about
Sea otter. five feet long, with a rich fur nearly black, interspersed with longer hairs of glossy white. From their value the pursuit after them has been so eager, that their numbers are declining fast. Indeed the destruction of

Asia.

all kinds of animals that produce valuable kinds of fur has there, of late, been so great, that the trade will probably soon be at an end; and this is the only period at which the natives of these islands, and of the adjoining Asiatic and American coast, can expect a deliverance from the state of slavery under which they have been reduced by the Russians. From the Aleutan chain of islands the two continents irregularly but rapidly approach toward each other till they come within a distance of 40 miles at Bering straits. At this quarter, the part of Asia that approaches nearest to America is a peninsula, having the Icy sea on the north and the Pacific ocean on the south; it is inhabited by a tribe called the *Tshutski*, who appear to be the same class of people that inhabit the opposite coast of America. The Tshutski nation or tribe is divided into two distinct branches: the one consists of stationary or fixed inhabitants of the coast; the other are called *Reindeer* or *Wanderers*. Of the stationary part of the tribe the population amounts to about 3000 males; they are industrious and neat workmen, as appears from their boats, lances, arrows, bows, apparel, and utensils, with which they supply the wandering part of their tribe; they dig cellars, in which they keep their supplies of food and oil. Their provisions consist of the dried flesh of sea animals and deer, of roots and herries. They keep the oil of the sea animals in seal skins; they obtain immense quantities of it, which they use for food, fuel, and light: and also, as an article of commerce with the wandering tribes.

190 Approach of Asia and America to each other.

191 Tshutski.

This wandering tribe consider themselves as a very superior and independent race of beings. They call all the nations that surround them old women, only fit to be their servants. Rein-deer are their only riches. These, and the skins of animals that they kill in hunting, they barter with the Russians for kettles, knives, and trinkets; which articles they again exchange with the stationary tribe, for arms, dresses, &c.

192 Capital of Siberia, Irkutsk.

Of Siberia in general it may be observed, that the Russians have fixed their capital in the neighbourhood of the Baikal lake, near the northern front of the high region of Tartary. It is called *Irkutsk*, and is situated in 103° 46′ 45″ east of Greenwich, and in N. Lat. 52° 16′ 30″. It contains 1500 houses, chiefly of wood, twelve stone churches, a cathedral, and two monasteries: besides which, there are several public buildings; an hospital, a public school, a library, and a theatre. The number of inhabitants is about 20,000. The merchants are numerous and affluent, and a considerable trade is carried on with the Chinese. Here the assortments of furs are made which are brought from America and the northern parts of Siberia. There is a glass-house near the Baikal lake, and a distillery, in which 60,000 ankers of spirits are made in a year; there are also salt-works at three springs, which supply the neighbouring country. The people are extremely hospitable to strangers. All kinds of food are cheap, as are spirituous liquors, and home-brewed beer; silks, cottons, linen, furs, and even English cloths, are sold at a moderate price. Many articles of luxury are brought from China, and the country itself supports immense herds of cattle and horses, and produces all the kinds of European grain; the chief disadvantage under which it labours is the intense severity of a winter which lasts during six months of the year. The severity of the winter, and its duration, increase in proportion to the distance from this most southern part of Siberia.

Asia.

193 River Kovima.

The first of the great rivers of Siberia towards the east that runs into the Icy sea is the Kovima, which takes its rise in what are called the *Virchoyanski mountains*, to the westward of the most northerly part of Kamtschatka. It flows in a direction nearly north-east about 1800 Russian versts, each verst being about three quarters of an English mile. Different Russian villages are situated upon it, or upon the different streams that fall into it. Of these it may be observed, that the village called *Virchni* is in N. Lat. 65° 28′ 25″, and E. Long. 153° 24′ 30″. Seredni, another village upon the same river farther down to the north, is in N. Lat. 67° 10′ 14″. A third village, containing 70 houses and a church, called *Neizshni*, is in N. Lat. 68° 17′ 14″, and E. Long. 163° 17′ 30″.

194 Climate.

To give a correct idea of the climate of these latitudes, we shall state the temperature at Virchni, as observed during nine days of the month of November 1786, old stile, by Martin Sauer, secretary to a Russian expedition, sent to attempt to navigate the Icy sea; the observations appear to have been made with a spirit thermometer of Reaumur.

195 Effects of cold.

On the 22d, at six A. M. nine ounces of mercury froze in two hours; the earth, the ice of the river, the timber of the houses, &c. cracking with reports equal

Asia.

to those of a musket. On the same evening ten ounces of mercury in a stopped phial, froze in two hours and a half. On the 23d, about ten o'clock A. M. the mercury in a stopped phial thawed, but in the evening of the same day was again quite frozen. On the 26th, in the morning, there was a thick fog, and the earth and the river cracked violently. On the 27th, at nine A. M. a sealed bottle of Astracan brandy (there called *French brandy*) exposed to the frost, thickened very much, but was not frozen. On the 28th, at noon, the mercury thawed, but at half past ten at night it was observed frozen. At 37° it was almost impossible to fell timber (which was as hard as the hatchet) unless it was perfectly dry; and in the greatest severity of the cold, the hatchets, on striking the wood, broke like glass. On coming out of a warm room it was absolutely necessary to breathe through a handkerchief; the body was imediately surrounded by a mist arising from the breath, and this mist consisted of very small nodules of hoar ice. Breathing caused a noise like the tearing of coarse paper or the breaking of thin twigs, and the expired breath was immediately condensed into the fine substance already mentioned. The northern lights were constant and very brilliant; they assumed an amazing diversity of shapes, and might be heard to shoot along.

196 Vegetables growing near the Icy sea.

The vegetable productions of this climate were chiefly the following.

Larch.—This is the chief tree in use for building, firing, &c. and the most plentiful. It is pretty sizeable as far as Virchni, and the country is moderately wooded about 200 versts lower, but the trees very stunted; beyond that they are in clusters on elevated spots of ground to about 30 versts from the Icy sea, where they cease growing, in about the latitude 68° 30′.

Birch extends to a little below Seredni, but very stunted and small trees.

Poplar and asp grow to a moderate size on the islands sheltered by mountains about the source of the Kovima, but do not extend so low down as Virchni.

Mountain ash is plenty as far as Virchni, but very scarce lower down.

Alder and willow have a trunk about 18 inches in circumference, and grow to the height of two fathoms, about Virchni. They gradually diminish in size, and cease growing with the larch.

Creeping-cedar, brushwood, black and red currant, rose, and juniper, are met with as low as Neizshni. Brushwood and creeping-willows extend to the Icy sea, but never exceed from six to eight inches. The creeping cedar, or *pinus cembra*, produces a considerable quantity of seeds or nuts in cones, like the common pine: but they ripen only the second year. Immense numbers are collected by the inhabitants; sometimes considerable quantities are found in the squirrels nests in hollow trees: in fact they are the chief food of squirrels and mice. A very pellucid and sweet oil is extracted from these seeds.

Mountain ash berries are gathered, and used to give a pleasant flavour to their drink.

Black and red currants are collected in abundance, and preserved in casks among ice; some are boiled and preserved. The black only extend to about Seredni, but the red continue growing as far as Neizshni.

Asia.

Cranberry.—These are scarce, and extend no further north than Seredni; they are always preserved raw.

Brusniki, *vaccinium vitis idæa*, whortleberry.—These are very plenty as far as Neizshni, and are preserved raw.

Colubniki are very numerous: they seem to delight in such stony places as are overflowed in the spring. They are very pleasant tasted, of a dark blue colour, and grow on a low bush exactly resembling a myrtle. They are preserved by boiling.

Maroshka, *rubus chamæmorus*.—These are the favourite berry of the inhabitants, and grow in damp mossy places, particularly near lakes. They are reckoned a certain cure for the scurvy, and are always preserved raw.

Siccha, growing on dry stony places about the mountains, on a creeping species of heath, with short needle leaves; they are very small, black, and stony, are collected in great abundance, and preserved by boiling.

Knezshnitsi, *rubus arcticus*, are scarce, growing about the roots of the alder and currant bushes.

197 Animals.

The following animals are found in the neighbourhood of the river Kovima, and are hunted for food or on account of the value of their skins.

Names.	*Price of the Skins.*
Elk,	2 rubles.
Deer,	1 do.
Bear,	1 do.
White bear,	1 do.
Glutton,	2 to 10 do.
Wolf,	2 to 8 do.
Fox,	1 to 5 do.
Stone Fox,	50 copeeks.
Ermine,	5 do.
Lynx,	3 to 10 rubles, according to the length of the hair.
Otter,	8 to 10 rubles.
Sable,	10 do.
Sheep, argali,	1 do.
Hare,	3 to 5 copeeks.
Marmot,	5 to 10 do.
Squirrel,	3 to 5 do.

198 Birds.

Most of the kinds of birds known in the northern parts of Great Britain are also found in Siberia at some period of the year. At Neizshni the swallows were observed swarming together under the caves of the church, chirping very much, particularly on the 2d of August old style, which is still used in Russia; and on the third there was not one to be found, nor had any body seen them depart. They appear about the 21st of May, and depart between the 2d and 6th of August, never staying beyond the latter date. The red-breasted remains a day or two longer than the white. The snow bunting, the first bird that appears, is seen about the middle of March, feeding on the seeds of grass on the sandy shores of the river, and about the roots of bushes where the snow is earliest melted by the sun. Different flights follow after each other for about a month; eagles follow close upon them. Swans, geese, and ducks arrive towards the end of April, and continue about the neighbouring lakes and rivers till the beginning of September. The river Kovima is frozen over about the 20th of September, and opens about the 24th of May, when it deluges the low country. At Neizshni, on the 25th of November, the sun

Asia.

goes down, and does not rise again till the 1st of January, when it appears above the horizon, and this is the time of the greatest cold.

199 Coast of the Icy sea described.

The coast of the Icy sea is moderately high, formed by projecting promontories and shallow bays, exposed to every wind except the south. The mountains are covered in different places with snow, which melting, produces small torrents that rush into the sea. The mountains are composed of granite, quartz, and a hard black stone; they produce moss, a kind of vetch, the root of which is edible, creeping willow and birch, not exceeding ten inches in height. Near the mouths of the large rivers the shores are covered with drift-wood, and in every place remains of huts left by different hunters are seen. Upon the shore rein-deer are found pretty numerous; bears, but not white; wolves, foxes, stone fox, wild sheep, and the whistling marmot; the gulls, ravens, hawks, black-headed buntings, snow-larks, a few partridges, geese, ducks, and divers. The productions of the sea itself are very few; some seals, herrings, whales, and a small species of salmon; but no traces of shell-fish of any kind are to be met with. The atmosphere is always cold and chilly, though the thermometer in the middle of July rises 14° and 16° above the freezing point of Reaumur. The fogs upon this sea are very remarkable, continually hovering above the ice at no great height; sometimes having the same appearance with islands when seen in a haze, and resembling vast columns of smoke. Neither ebb nor flow of the tide is perceived, and the ice is always brackish to the taste.

200 Attempt to explore the Icy sea.

This ocean never has been, and, in all probability, never can be fully explored; various attempts, however, have been made by individuals, as hunters, in search of places in which abundance of game may be found, or in search of what are called the *mammoths tusks*: these are the tusks of a species of animal that is now unknown and extinct; but which must once have existed in immense multitudes in Siberia. These tusks are found in great numbers buried under the high sandy shores of rivers at a considerable depth; the spring floods bring them to view by washing away the sand that covers them, and they appear to have been originally buried by similar floods; they are equal to elephants teeth in whiteness, beauty, and value, but very different in their shape, being all bent spirally: the largest are found on the shores of the Icy sea; one is mentioned, which in direct length extended to four feet one inch French measure; when measured along the bending, it was eight feet seven inches and four lines in length; its circumference near the root was 14 inches and 3 lines; the thickest part, which was at 22 inches from the root, was 17 inches and 8 lines; the weight of the whole was 115lb. avoirdupois. The outside was very brown from its having been exposed to the weather, and it was crackled through the coat or upper stratum about an inch; the inside was firm and very white.

201 Mammoth tusks.

Sauer's Expedition.

In search of this valuable kind of ivory, which forms an important branch of Siberian commerce, individuals have attempted to penetrate into the Icy sea, in the hope of discovering untouched stores upon new islands, or some unexplored continent. With this view one Lachoff made an expedition from the river Yana, with some attendants, in the year 1770, and the following years.

Of this expedition Mr Sauer obtained the following account from Zatai Protodiokanoff, a burgher of a Siberian town called *Yakutsk*, in N. Lat. 62° 1′ 50″, E. Long. 129° 34′. The account is chiefly of importance on account of the savage nature of the unknown region to which it refers, and the extraordinary circumstance of the bones of animals, particularly the rhinoceros, being found in it, which in our times can only inhabit the warmest latitudes. Protodiokanoff accompanied Lachoff in 1770, from his winter buildings at the estuary of the Yana, in the month of March, to Swatoi Noss, the northern promontory of a bay which receives this river.

Asia.

202 Expedition by Russian hunters.

"They saw an immense herd of deer going to the south, and observed that their traces were from the north across the Icy sea. Lachoff resolved, if possible, to find out whence they came; and in the beginning of April, set out very early in the morning, with his sledge drawn by dogs. Towards evening he arrived at an island 70 versts from the promontory, in a due north direction, where he passed the night, and the next day proceeded farther, the traces of the deer serving as a guide. About noon he arrived at a second island 20 versts distant, and in the same direction. The traces coming still farther from the north, he continued his route. At a small distance from the second island he found the ice so rugged and mountainous as to prevent his proceeding with dogs. He observed no land; and therefore, after passing the night on the ice, he returned, and with great difficulty, for want of provisions for his dogs, regained Swatoi Noss. He represented his discovery to the chancery of Yakutsk, and the intelligence was forwarded to St Petersburg. The empress Catherine II. called the islands by the name of the discoverer, and gave him the exclusive right of collecting ivory, and hunting animals in this place, and in any other that he might thereafter discover.

In 1783, he went with five workmen in a boat to the islands, and continued across straits, where he found the sea very salt, and a current setting to the west. He soon saw land to the north, the weather being pretty clear, and arrived on what he called the *third island*. The shore was covered with drift wood. The land was very mountainous, and seemingly of great extent; but no wood was seen growing, nor did he observe the traces of any human being. He found some tusks of the mammoth, saw the tracks of animals, and returned (without making any other discovery) to the first island, where Lachoff built a hut of the drift wood, and passed the winter. One of his companions left a kettle and a palma on the third island.

"This was reckoned a discovery of some importance, and the land-surveyor Chvoinoff received orders from the chancery of Yakutsk, to accompany Lachoff to this farthest island, and take an exact survey of the same. In 1775, on the 9th February, he left Yakutsk, and arrived on the 26th March at Ust Yansk Lemovia, or winter huts at the estuary of the Yana. He immediately proceeded across the bay to Swatoi Noss, which is 400 versts from the discharge of the river in a direction north-north-east. On the 6th May he arrived at the first island, which is 150 versts long, and 80 versts broad in the widest parts, and 20 versts in the narrowest. In the middle is a lake of considerable extent, but very shallow, but the borders of which are steep.

The

Asia.

The whole island, except three or four inconsiderable rocky mountains, is composed of ice and sand; and, as the shores fall, from the heat of the sun's thawing them, the tusks and bones of the mammoth are found in great abundance. To use Chvoinoff's own expression, the island is formed of the bones of this extraordinary animal, mixed with the horns and heads of the buffalo, or something like it, and some horns of the rhinoceros; now and then, but very rarely, they find a thin bone, very straight, of considerable length, and formed like a screw.

"The second island is 20 versts distant from this, low, and without drift-wood; 50 versts in length, and from 20 to 30 versts broad. Here also the tusks and other bones are found; and great numbers of the arctic foxes are to be met with on both. The surface is a bed of moss of considerable thickness, producing a few low plants and flowers, such as grow about the borders of the Icy sea. This moss may be stripped off as you would take a carpet from a floor, and the earth underneath appears like clear ice and never thaws; these spots are called *kaltusae*.

"The straits to the third island are 100 versts across. He travelled along the shore, and on the 21st May discovered a considerable river, near which he found the kettle, palma, and some cut wood, in the same place and situation, as they had been left by Lachoff's companions three years before Chvoinoff's arrival. This river he called *Izarevaia Reka*, in consequence of having discovered it on the 21st of May. The shore was covered with drift-wood, all of it extremely shattered. Ascending to the top of a very lofty mountain, he saw a mountainous land as far as his eye could trace in clear weather, extending east, west, and north. Continuing his route along the coast 100 versts, he observed three rivers, each of which brought down a great quantity of wood, and abounded in fish; and here the nerk, a species of salmon frequenting Ochotsk and Kamtschatka, was in abundance, though not found in the Kovima or Indigirka. On this land he passed the summer, and returned in the autumn to Swatoi Noss.

"I asked, whether he observed any regular ebb or flow of the tide? He said, 'that he did not observe any remarkable alteration:' Whether he recollected how the current set? 'He believed to the west:' Whether the water was salt? 'Yes, and very bitter.' He further observed, that there were whales and belluga, white bears, wolves, and rein-deer. No growing wood was to be seen, and the mountains were bare stone. None of these travellers took any notice of the depth of the water, nor were they acquainted with the nature of tides."

203 Opinions of philosophers about the Icy sea.

We account it worth while to take notice of these facts; partly, because no circumstance that can tend to elucidate the general structure of this globe, or point out its different productions, ought to be regarded as unimportant; and partly, because some philosophers have attempted, from the remains of animals which appear to have once inhabited the dreary regions within the polar circle, to infer that these countries must once have possessed a better climate, more favourable to animal life, which must have been altered by some extraordinary change in the astronomical position, or in the general temperature of the earth.

Asia.

Besides the rivers we have already noticed, Siberia contains many others; the chief of which rise near the northern front of the high region of Tartary, and receive the rest as tributary streams in their passage to the Icy sea; the principal are the Lena, the Jenisea, and the Oby. The description of them all is similar. They flow through a country containing a very trifling population, but which is as varied in its surface and in its mineral productions as any other part of the world: We shall here take notice of the Lena only, as a description of it will afford a sufficient general idea of the rest.

204 Rivers of Siberia.

205 River Lena described.

About a hundred miles west-south-west of a small Russian village called *Katshuga Pristan*, the Lena takes its rise from an inconsiderable lake among the mountains of Altai, near the Baikal lake. It flows in a gentle and uninterrupted stream, though here and there impeded by shallows at a late season, to about the distance of 300 miles from its source; when it deepens considerably. The direction is very winding, but pretty uniformly east-north-east to Yakutsk, and nearly north from thence to its discharge into the Icy sea, about the latitude 71° 30′, and longitude 127° east of Greenwich, after a course of 3450 geographical miles. The appearance that it assumes is continually varying. In some places, mountains bound the channel on both sides, clothed to the summits with stately pines; in others they are barren, projecting into the river, and turning its course, taking fantastic shapes, resembling ruins of large buildings, towers, and churches; the chasms overgrown with hawthorn, currant bushes, dog roses, &c. In some places the mountains retreat inland for miles, forming a back ground to extensive plains, and exposing a miserably built town, surrounded with corn fields, gardens, and pasture grounds, with a few herds of cattle grazing: These openings are frequent, at unequal distances of five to forty versts from each other, and are always occupied by villages as far as Olekma, 1800 versts from Katshuga. All beyond is desolate, except a few huts inhabited by convicts who have the charge of horses for the posts, and the towns of Petrofstsky, Yakutsk, and Gigansk. The best of them is only a collection of huts inhabited by priests and their attendants, officers, and Cossacks, who teach obedience, and enforce the payment of tribute from the wandering tribes of Tartars that infest the neighbourhood.

206 Rivers flowing into the Lena.

The following are the rivers that flow into the Lena.—The Ilga, 170 versts from Katshuga. The Koot, 469 versts from the same place. Very near the estuary of this river is a salt lake, which is very shallow, and works, the property of the present ispravink of the district, at which one boiling produces 1080 pounds weight of salt. Marakofka, 601 versts from Katshuga. Makarova, 690. Kiringa, 778. Vitima, 1178. This last river flows from a lake east of the Baikal. It is nearly equal to the Lena in width, depth, and extent; and is famous for sables, lynx, fox, ermine, squirrel, and deer. The sables of this river, and of the Momo, which falls into it 300 versts from the discharge, are very valuable, and of a superior quality. Numbers of Tungoose travel about here on the chase. Three versts up this river are the mountains that produce talc. Specimens have been formerly found, 28 inches square, and transparent as glass: What is now found is very small, but perfectly pellucid.

Asia.

cid. All the windows of these parts are glazed with it. The river Pellidui, 1202 versts from Katshuga; also famous for the above mentioned animals, and the last place that produces corn. Sparrows and magpies are not seen farther north: they only came here about the year 1780, after the ground had begun to be cultivated. The Nuye, 1475 versts from Katshuga. The Yerba, 1505. The Patama, 1575. The Oonaghtali, 1595. The Olekma, 1822. The Aldan, 2600. Besides several rivers farther north of no material consequence.

207 Siberian tribes.

The most remarkable of the native tribes of Siberia are the Tungoose, the Yakuti, and the Burati; all of whom appear to have originally descended thither from the southern and more elevated regions of Tartary. To these may be added the Cossacks, whom the Russians have everywhere introduced.

208 Tribe of Tungoose.

The Tungoose wander over an amazing extent of ground, from the mouth of the Amour to the Baikal lake, the rivers Angara or Tungooska, Lena, Aldan, Yudoma, Mayo, Ud, the sea coast of Ochotsk, the Amicon, Kovima, Indigirka, Alasey, the coast of the Icy sea, and all the mountains of these parts, constantly on the look-out for animals of the chase. They seldom reside more than six days in one place, but remove their tents, though it be to the small distance of 20 fathoms; and this only in the fishing season, and during the time of collecting berries. They leave their supplies of fish and dried berries in large boxes, built on trees or poles, for the benefit of themselves and their tribes in travelling during the winter. Berries they dry by mixing them with the undigested food (*lichen*) out of the stomach of the rein-deer, making thin cakes, which they spread on the bark of trees, and dry upon their huts in the sun or wind. They seem callous to the effects of heat or cold: their tents are covered with shamoy, or the inner bark of the birch, which they render as pliable as leather, by rolling it up, and keeping it for some time in the steam of boiling water and smoke. Their winter dress is the skin of the deer, or of the wild sheep, dressed with the hair on; a breast-piece of the same, which ties round the neck, and reaches down to the waist, widening towards the bottom, and neatly ornamented with embroidery and beads; pantaloons of the same materials, which also furnish them with short stockings, and boots of the legs of rein-deer, with the hair outward; a fur cap and gloves. Their summer dress only differs in being simple leather without the hair.

209 Customs of the Tungoose.

They commonly hunt with the bow and arrow; but some have rifle-barreled guns. They do not like to bury their dead, but place the body, dressed in its best apparel, in a strong box, and suspend it between two trees. The implements of the chase belonging to the deceased are buried under the box. Except a sorcerer is very near, no ceremony is observed; but in his presence they kill a deer, offer a part to the demons, and eat the rest. They allow polygamy; but the first wife is the chief, and is attended by the rest. The ceremony of marriage is a simple purchase of a girl from her father; from 20 to 100 deer are given, or the bridegroom works a stated time for the benefit of the bride's father. The unmarried are not remarkable for chastity. A man will give his daughter for a time to any friend or traveller that he takes a liking to; if he has no daughter he will give his servant, but not his wives. They are rather below the middle size, and extremely active; have lively smiling countenances, with small eyes; and both sexes are great lovers of brandy. They declare that they know no greater curse than to live in one place, like a Russian or Yakut, where filth accumulates, and fills the habitation with stench and disease.

Asia.

210 Yakuti.

The Yakuti, or Socha, are a Tartar tribe that originally descended into the country of Siberia from the high regions on the south. A nation of Mongals inhabiting a part of the country near China also call themselves *Socha*, and speak the same language as the Yakuti. The Russians discovered them in 1620: they were divided into many tribes, and the dissensions that existed among them contributed to their being subdued. Their number is computed at 50,000 males; but the population is declining. They complain of the oppression of the Russian government; and of late, as already mentioned, many of them have emigrated to the river Amoor, to enjoy the advantage arising from the protection of the milder and more popular government of the Chinese.

211 Their persons.

There is perhaps no nation in the world that can exhibit a greater variety with regard to size than the Yakuti. The affluent, whose dwellings are situated about the meadows on the south side of the Virchoyanski chain, are from five feet ten inches to six feet four inches high, well proportioned, extremely strong, and very active; while the indigent inhabitants of the more northerly parts are in general below the middle size, indolent, and of an unhealthy complexion; evidently stunted by the badness of their food, the severity of the climate, and the want of proper clothing. Their wealth consists of horses and horned cattle. The private property of no individual at present exceeds 2000, all species included; formerly, numbers of them possessed 20,000.

212 Means of subsistence.

With regard to their capacity of supporting themselves, they are independent. Their only necessaries are, a knife, hatchet (or palma), flint and steel, and a kettle; and with these articles the all-providing hand of God sufficiently supplies them, and capacitates them to furnish the other tribes. From the iron ore of the Vilui, they make their own knives, hatchets, &c. and of such temperature as baffles the more enlightened art of the Russians. This ore may be called native iron, from the little trouble they have in preparing it. Every utensil and article of dress they make themselves.

213 Religion of the Yakuti.

Tanghra is with them the general name of god, or perhaps of the supreme God; but they have other deities, whose names are in their language descriptive of their attributes. One of these is styled *Aar-toyon*, (or the merciful chief). To him they ascribe the creation, and suppose that he has a wife, whom they call *Kubey Chatoon*, (shining in glory). They are both almighty. Another god, called *Wechsyt*, (the advocate), carries up their prayers, and executes the will of the godhead. He sometimes appears among them, assuming the form of a white stallion, or of any bird, from the eagle to the cuckoo. It is he that intercedes for them, and procures all desirable things. The wife of Wechsyt, is called *Aksyt*, (the giver). These are their benevolent gods, together with a being whom they adore in the sun. They regard the fire, as containing a peculiar being possessed both of good and evil qualities,

Asia.

ties, and to whom they constantly offer sacrifices. Their malevolent aerial spirits are very numerous; they have no less than 27 tribes or companies of them. Their chief they call *Ooloo Toyon:* he has a wife and many children. Sugai Toyon, the god of thunder, is his minister of immediate vengeance. (Sugai signifies a hatchet). The rest they distinguish by the names of different colours. Cattle and horses are sacred to the different spirits whose colours they bear. They reckon eight tribes of spirits inhabiting Mung Taar (everlasting misery). Their chief is called *Ashary Bioho* (the mighty). They have wives, and the cattle sacred to them are quite black: Their departed shamans, or magicians, are supposed to unite to these. They dread greatly an evil goddess, whom they call *Enachsys*, (cowherdess). She damages the cows, inflicts disorders on them, destroys calves, &c. She is frequently honoured with propitiatory sacrifices.

Their magicians, or shamans, are chiefly men, though a few of them are women. Young magicians are instructed by an old professor of the art, who conducts them to the most solitary places of the woods; shews them the favourite spots of the spirits of the air and of the pit, and teaches them to invoke their power and prevail with them to appear. The magicians have a peculiar dress, consisting of a leather jacket, and an apron reaching from the chin to the knees. The whole is ornamented all over with iron plates, and pieces of iron and brass, hanging, which make a dismal noise when they agitate their bodies, during the fantastic but childish ceremonies which they perform while driving, as they say, the demons out of sick people. They use a tambour in their ceremony, and are the priests and physicians in the tribe.

214 Food.

In their roving parties, on the chase or travelling, they only take with them a scanty supply of kousmiss, depending on chance for the rest; and should their pursuits prove unfortunate, they find their food in the inner bark of the pines and birch-trees, or the different edible roots. Squirrels are in their estimation very good eating, but their favourite food is the whistling marmot. Of all their provisions, however, koumiss is the most valued; it is formed of mare's milk, collected in large leather buckets, wide at bottom, and narrow at the top: each containing about an anker. Into this a small piece of the stomach of a calf or colt is thrown, and some water mixed with it: it is agitated till it ferments, and acquires an agreeable acidity; and when taken in great quantities it has an intoxicating quality (See KOUMISS). Of this drink every one collects as much as he can; and some of the chiefs obtain more than 500 ankers of it. A day is then fixed upon by each chief to consecrate his stock, which is performed as follows:—A summer hut is built of thin poles, of a conical form, covered with the inner bark of birch, on some extensive meadow. It is ornamented, inside and out, with branches of the birch-tree, and a hearth is made in the centre. Relations and acquaintances are invited to the banquet; but all guests are welcome, of every nation, indiscriminately. The magicians, or shamans, take the head seats; others are seated according to the estimation of their seniority. When the hut is full, the elder shaman rises, and commands one of the Socha that he knows to be qualified (namely, that has not seen a corpse within the month, and that never has been accused of theft, or bearing false witness against any body, which defiles them for ever, and renders them unqualified for this sacred and solemn task), to take a large goblet, called a *tshoron*, which is used to drink out of on solemn occasions, and fill it with koumiss out of the first symir; then to place himself before the hearth, with his face to the east, holding the tshoron to his breast about two minutes. He then pours koumiss three times on the hot embers, as an offering to Aar Toyon. Turning a very little to the right, he pours three times to Kubey Chatoon; then, to the south, he offers in the same manner to each of the benevolent gods. With his face to the west, he pours three times to the 27 tribes of aerial spirits, and three times to the north to the eight tribes of the pit, and to the manes of their departed sorcerers. After a short pause, he concludes his libation by an offering to Enachsys, the cowherdess. The sorcerer then turns the man with his face to the east, and commences a prayer aloud, thanking the godhead for all favours received, and soliciting a continuance of their bounty. On concluding his prayer, he takes off his cap, with which he fans himself three times, and cries out aloud, "Oorui" (grant), which is repeated by all present. The elder shaman, then, taking the tshoron, drinks a little, and hands it to his brethren of the same order, from whom it passes to the company as they sit, except such as are defiled. Women are not admitted into the hut; nor are they or the disqualified allowed any of the koumiss out of the first symir, which they call sanctified, as possessing the power of purifying and strengthening in a divine sense. They all now go out of the hut, and seat themselves on the strewed branches of birches, in half circles, fronting the east. All the symirs are carried, and placed between the branches of trees stuck in the earth, and they commence drinking; every crescent having their symirs, tshoron, and presiding shaman who fills the goblet, and pushes it about with the course of the sun. The quantity that they drink is incredible. Tournaments now begin; wrestling, running, leaping, &c.; and if any one carry off the prize in all the achievements, he is esteemed as particularly favoured by the deities, and receives more respect and credit in his testimony than falls to the lot of a common man. When the ceremony is finished, they mount their horses, forming half circles, drinking a parting draught, and wheeling round with the sun's course, ride home. Women attend, and form parties among themselves at some distance from the men, where they drink, dance, &c.

215 Consecration of koumiss.

216 Character.

The Yakuti or Socha, in their intercourse with each other, have few atrocious vices. Robberies are seldom committed; they sometimes, indeed, lose their cattle from their straying in these wide countries. If stolen, detection is almost certain, as they relate all their losses at every public meeting; in consequence of which, if the lost beast has been seen, information is given, and it is traced. A thief is not only compelled to make restoration, but to make good all the losses of other Yakuti during the year, whether he has stolen the property or not. If one is accused of having stolen cattle, and eaten or killed them, he must either pay for them, receive a flogging, which is very disgraceful, or take an oath of his innocence, which is administered with so many superstitious solemnities, that innocent persons will

Asia.

will often rather pay the damages than take the oath. They are very revengeful of insults, and entail upon their progeny the duty of revenge: their gratitude, however, is equal to their resentment; they never forget a benefit; and not only make a return, but recommend to their children to persevere in friendship and gratitude to the benefactors of their parents. They are very obedient to their chiefs and old men. They deliberate in council on all matters of public concern, as the course which each is to take in the chase, &c. The old men are surrounded by the rest, and their advice is implicitly obeyed. A young man gives his opinion respectfully and cautiously; and, even when asked, he submits his ideas to the judgment of the old. They are extremely hospitable and attentive to travellers, and are very inquisitive; they ask questions frequently, but, at the same time, they answer them without embarrassment, and with a considerable appearance of intelligence. They are a vigorous race, accustomed to travel in the severest frosts, and to endure hunger with patience. They are, however, subject to some diseases, particularly rheumatisms, weakness of the eyes, boils, and the itch. The smallpox and measles have also at times proved very destructive amongst them.

217 Superstitions.

They have a multitude of petty superstitions, independent of their religion. Ravens, crows, and cuckoos, are ominous birds: and, if these perch near their huts, they dread some misfortune, which can only be averted by shooting the birds. On the contrary, eagles and large birds of prey are the foreboders of good; and almost every tribe has its object of veneration, but not of worship, as the eagle, the swan, the stallion, &c. They always take care to make the doors of their huts towards the east; the fire-place is in the middle, with the back of the chimney towards the door; the sides of the hut are furnished with benches and small cabins, which serve for sleeping places, and for sitting on. The men keep upon the south side and the women upon the north. Except the hostess, no woman may present food to a male stranger in front of the fire-place, but must walk round the chimney to present it. They never wash the vessels that contain their food; but when a dish is emptied, they clean it as well as they can with their fingers, accounting it ominous, or that it forebodes a scarcity, to wash away any part of their food. Their earthen vessels are preserved extremely clean by repeated burnings, as the fire consumes what adhered to the sides. Before eating any thing, they cast a morsel into the fire. Every Yakut has two names, and is only called by the right name, in cases of necessity, to avoid the search of evil spirits. They never mention the dead, unless allegorically, and forsake the hut in which any one has expired.

218 Women and marriage.

Polygamy is allowed among them, and some have six wives, but the first is respected by all the rest, and they dwell in separate huts: their marriage ceremonies are extremely formal. The young man, who wishes to marry, sends his friend to ask the consent of the bride's father, and what kalym (purchase) he demands; that is, how many horses and cattle, as also the quantity of raw meat, horse flesh, and beef, that he requires for treats and feasts; this they call *kurim;* half of the quantity is always given in presents to the bridegroom by the bride's father, and is called *yrdy*. The daughter's inclinations are always consulted; and, if she does not object, the kalym and kurim are stipulated. The bridegroom kills two fat mares, dresses the heads whole, and the flesh in pieces, and goes with three or four friends to the father of the bride. On his arrival at the hut, one of his friends enters, and places one of the dressed horse's heads before the fire, and returns to his companions without speaking a word. They then all enter the hut; and a sorcerer being placed opposite the fire, the bridegroom kneels on one knee with his face towards it, into which butter is thrown; he then lifts up his cap a little, and nods his head three times without bowing his body. The sorcerer pronounces him the happy man, and prophesies a succession of happy years, &c. Then the bridegroom rises, bows to the father and mother, and takes his seat opposite the bride's place, but keeps silent. The meat is then brought in, and the father of the bride distributes it among his own friends, but kills a fat mare to treat his new guests. Supper being over, the bridegroom goes to bed; the bride, who has not been present, is conducted into the hut, and to his bed, by some old women, and they sleep together; sometimes, however, the bride does not appear at the first visit. In the morning the friends return home, but the bridegroom remains three or four days. A time is now fixed for payment of the kalym, either at the new or full moon. The kalym and kurim are then carried without any ceremony, and delivered in the presence of many friends, who are feasted, and the bridegroom remains again three or four days, and fixes a time to receive the bride at his own dwelling, which must be new built on purpose; and this also at the new or full moon. All her relations, male and female, with friends and neighbours, sometimes more than a hundred, accompany the bride with her father and mother, taking with them eight or ten symirs full of melted butter, and the dressed meat of three mares. They go to the new hut prepared for them; three men are sent to the bridegroom in his old hut, and the greatest drinkers are chosen for this purpose. On entering, the first says, "we are come to see your dwelling, and to fix posts before your door." They then kneel on one knee before the fire: an ayack is filled with koumiss, and handed by two men to the three kneeling; each of whom empties an ayack at three draughts. They then rise and go out, all the company saluting them with one cheer. Three others enter; the first with nine sables, the second with nine foxes, and the third with twenty-seven ermine skins; these they hang on a peg in the chief corner of the hut, and retire. Then a number of women conduct the bride, her face being covered with ermine skins, to the hut; the entrance has a wooden bar placed across it, but of no strength, which the bride breaks with her breast, and enters the hut. She is placed before the fire, holding her hands open before her, into which seven pieces of sticks are put; as also several pieces of butter, which she throws into the fire. The shaman pronounces a blessing; she then rises and is again conducted, with her face concealed all the while, to the new hut, where the cover is taken from her face. The bridegroom enters, and feasts his guests two days; then presents all his relations with cattle, over and above the kalym; which is, however, returned on paying their formal visits, perhaps a year or more afterwards.

Sauer's Expedition.

Asia.

afterwards. When a child is about to be born, the husband is called; and two skilful women, in his presence, assist the delivery. If a son be born, a fat mare is killed on the third day; all the neighbours are invited to supper; the child is rubbed all over with fat, and a name given to it, the more insignificant the better; for an elegant name would only entice the demons to be continually about it. No ceremony is observed if the child be a daughter.

219 Funerals. The Yakuti bury a dead person in his best apparel, with his knife, flint, steel, tinder, and some meat, that he may not hunger on the road to the dwelling of souls. Two holes are dug under a tree; a favourite horse of the deceased is killed and buried in one, while the corpse is laid in the other; a fat mare is killed, dressed, and eaten, by the guests; her skin is suspended on the tree, under which the body lies with the head to the west. A magician, playing upon his tambour, invokes the demons to let the spirit of the departed rest in peace; and the ceremony is finished by filling up the grave. If an elder brother die, his wives become the property of the younger; but the wives of a younger brother become free at his death.

220 Arts. Their dress is similar to that of the Tungoose, but more complete. Their principal arts consist of working iron ore, as already mentioned, by means of charcoal, rendering it malleable without any previous process of fusion, and of dressing leather, which they are said to perform with wonderful success, so as to render it completely water-proof, in the following manner: For symirs or buckets, they take a fresh skinned cow's or horse's hide, and steep it in water a few days, when the hair easily rubs off. It is then hung up till nearly dry, when they lay it in blood until soaked through, and then hang it in a smoky place for a considerable time; of this they make their buckets and soles of boots, &c. The latter are completely water-proof, and the buckets or symirs even retain oil. The legs of boots they make of colts or calves skins, scraped and rubbed till they be soft, then sewed, steeped in blood, and dried in smoke; afterwards blackened with wood coals and fat several times, and smoked again: they are then water-proof. The thread with which they sew their clothes is made of the sinews from the legs of the horse-deer or elk. They are expert archers, and have a plentiful supply of arrows in their quivers. They make considerable quantities of hay, and collect berries which they preserve by boiling. To save their hay, they kill at the beginning of winter the cattle they intend to use for food, and let it freeze, which preserves it fresh and good during the whole of that season.

221 Tribe of Burati. Another tribe of Siberians inhabiting the southern parts of the territory, is the Burati. They are divided into a great number of separate small tribes, and are also a race of Tartars. They possess immense herds of cattle and horses. They are not unacquainted with letters, and have lamas or priests, like the inhabitants of the southern parts of High Tartary. There are also various other tribes, such as the Yukagiri, the Tshuvantsi, Chatinsy, &c. who do not seem to differ in their manners and character from those already described.

222 Population of Siberia. On the whole, however, it appears that the population of Siberia is very trifling. It is greatest towards the southern boundary, in the latitudes of the Baikal lake and the river Amoor, where the climate is mildest. To give an idea of the population of the lower or northern part, we shall here state, from the work already quoted, an account of the number of inhabitants from the latitude of 64°, to the extremity of the north coast, and from the river Kovima westward to the Anabara. "The district of Lashiversk comprehends the rivers Kovima, Alascy, Indigirka, and Yana, and those that flow into them: The tributary nations are

"The Russians inhabiting both districts, including exiles, &c. do not exceed 750 males."

223 Russians in Siberia. The Russian inhabitants of the better parts of Siberia, especially towards the west, employ themselves in the cultivation of grain, or as graziers or carriers. They have an excellent breed of horned cattle, with which, as well as with butter, they supply both the northern and eastern districts of the empire. They are wealthy, hospitable, healthy, and clean, and live under no controul of individuals, only paying a trifling sum to the captain of the district for government. The Siberians throughout are more industrious and independent than any Russian peasants, and live far more comfortably. They are making considerable progress in civilization, and this is perhaps, so far as the bulk of the people are concerned, the happiest part of that great empire.

224 Grand Tartary. We now return to the territory from which we set out, Grand Tartary, or the elevated level tract which constitutes the central region of Asia. This high country possesses considerable variety of soil and appearance. Towards China is an immense desert forming the boundary of that empire. It consists of sands, that move with the winds like the current of a river. Nature has formed three passages across them by means of three chains of mountains, which, as in Arabia or in Africa, are mixed with pleasant valleys amidst these oceans of sand. Travellers who take any other course are apt to be overwhelmed with the torrents of sand, which are equally dangerous as in the Arabian desert.

225 Desert of Lop, and roads through it.

Asia

The first of these communications is in latitude 42° north, to the east-north east of Pekin; the second to the east of the province of Shen-si; and the third in latitude 32°, to the east of Hami, on the frontiers of Thibet. By these roads a safe access was given through the vast Tartarian regions, from the countries bordering on the Caspian sea, and more remotely from Europe itself, to caravans of merchants, who had no other way of carrying on commerce with China in the middle ages, before the invention of the mariner's compass, and the discovery of the passage round the Cape of Good Hope, had laid open an easier mode of communication. It is not wonderful, that when travelling in these dreary solitudes, the imaginations of men should have been haunted and terrified by illusions. Accordingly, Marco Polo, a traveller in the middle ages who passed through the great desert, which he names the *desert of Lop*, says, that during the night, the caravans are terrified with the demons which haunt these horrid sands and dreadful deserts; the travellers must be careful how they stray, for they will imagine themselves called by their names by voices familiar to them, till they are brought to the edge of a precipice, and sometimes they will be entertained with aerial music. These romances reached Europe; and our poet, Milton, makes the lady in Comus, when benighted and bewildered on her way, to speak in the style of them.

——"A thousand fantasies
Begin to throng into my memory
Of calling shapes, and beck'ning shadows dire,
And aery tongues, that syllable men's names
On sands and shores and desert wildernesses."

Even these deserts, however, are not entirely destitute of inhabitants, as a few Tartars are found upon them, with their horses, asses, and mules.

226 Soil of Tartary, and inhabitants.

The rest of this high region possesses a considerable variety of soil. In general, however, though it bears abundance of trees and grass, the climate is extremely severe. The summits of all the chains of mountains are covered with perpetual snow, which augments the cold of the adjoining plains. Even in the southern parts of it, in latitude 31° 39′, within eight degrees of the burning Calcutta, the cold is frequently found to reach 29° below the freezing point, and this even within a dwelling house. The high country, as already mentioned, looks down from its different sides upon Persia, India, China, and Siberia, towards all which it is surrounded by steep precipices of difficult descent, which exclude its inhabitants from holding an easy intercourse with these regions. Southward, however, on the side of India, the mountains appear to be most precipitous, and the approach most difficult. Towards Siberia, on the north, it seems less so, and accordingly it is chiefly in that direction, or by the north-east or south-west, that the Tartars have in different ages approached China or Persia, and through them the southern regions of the Indies. The inhabitants of this lofty territory have in every age possessed the same character, and engaged in the same occupations. They have subsisted in a pastoral state, by means of their flocks and herds, and upon the flesh of such wild animals as they could obtain by the chase. They have, at the same time, been rude, and in general illiterate barbarians, possessing similar manners to their Siberian kindred, whom we have already described, the Tungouse, the Yakuti, and Burati. It is a singular circumstance, however, that in the southern part of this territory, called *Thibet*, a superstition should have established itself, which gives to an established priesthood the whole dominion of the state. What proves in a singular manner the influence of education upon mankind, is this, that the subjects of the lama, or high pontiff of the Tartars of Thibet, are no less unwarlike and unfit to defend themselves against invaders, than the subjects of the high-priest, who, in the regions of the west has so long occupied the capital of the Cæsars. This corner, however, of Grand Tartary, must be regarded merely as an exception to the general character of the people, who have at all times displayed the greatest aptitude for military enterprises. From this high region the great conquerors of Asia have descended, and under the names of Moguls, Turks, or Tartars, have repeatedly overrun, and assumed complete dominion over the surrounding civilized nations.

Asia.

227 Idea of the history of Asia and its revolutions.

The general history of the great continent of Asia may be stated in a few words. When the civilized nations which occupy the coasts of it on the west, the south, and the east, are well governed; when society is in a proper state, and its powers can be directed with skill and energy for the public protection, Grand Tartary becomes a place of little importance, or is merely regarded as a grazing territory fit for the breeding of cattle, which periodically are brought down to the great markets of the richer countries in which they are intended to be fattened and consumed. The Tartars themselves, divided into an immense multitude of tribes, are easily kept by the intrigues of their more artful neighbours in a state of constant domestic hostility, or they readily submit to the dominion, and engage in the service of the rulers of a better soil and climate, to which they are at all times willing to emigrate.

On the contrary, when the arrangements of society become defective in the surrounding nations; when public institutions are allowed to fall into decay, and when anarchy and weakness of government prevail, the Tartars gradually resume their independence. Being no longer either divided by the arts or overawed by the power of their neighbours, they acquire a contempt for their weakness, and an avidity to possess their riches. On such occasion, if an aspiring chief of a Tartar tribe is able by persuasion or by force to unite under his standard a few neighbouring tribes, he speedily becomes dangerous to the nations in his vicinity, and almost to the human race. By the booty obtained in some successful inroads, he acquires new associates; the hope of plunder brings his whole countrymen to his standard, and the few who are not led by hope, are compelled to follow and obey him through fear. All Tartary is soon in motion, and China, Persia, and India, are desolated and subdued.

That this is a correct account or true theory of the history of Asia, is evident from its present and past state. At present, China, which has repeatedly been conquered by the Tartars, commands them with the greatest ease. The power of the Chinese emperor is uncontrouled in the country of Thibet, which he protects by his arms, and rules by mandarins, his deputies.

Asia.

ties. Almost the whole of the high region of Tartary westward to Imaus, which looks down upon the Caspian sea, and northward along the coast of the Amoor and the Baikal lake, acknowledges his authority. The same appears to have been the case during the third century of the Christian era, when a Chinese general, in the reign of Vou-ti-thi, first emperor of the seventh dynasty, marched as far as the Caspian. A single anecdote will sufficiently point out the authority which the Chinese possessed over Tartary at that period. Mamgo, a Tartar chief, whose horde frequented the skirts of China, having incurred the displeasure of the government of that country, retired with his followers to the banks of the Oxus, and implored the protection of Sapor, the reigning emperor of Persia. The emperor of China claimed the fugitive, and alleged the rights of sovereignty. The Persian monarch pleaded the laws of hospitality, and with some difficulty avoided a war, by the promise, that he would banish Mamgo to the uttermost parts of the west; a punishment, as he described it, not less dreadful than death itself. Armenia was chosen for the place of exile, and a large district was assigned to the Scythian horde, on which they might feed their flocks and herds, and remove their encampment from one place to another, according to the different seasons of the year.—Between that period and the present, however, China has been repeatedly desolated by Tartar invasions, though it has always risen from its ruins, and resumed its ancient power and prosperity.

228 Story of Mamgo. See *Gibbon's History.*

Thus Asia has been the scene of continual revolutions. At one period the Tartars have been divided and weak barbarians, destitute of arts and of power, and subject to the controul of their civilized neighbours. These neighbours have at the same time been prosperous, commercial, and great. After the lapse of some time, however, the reverse of all this has taken place; the civilized nations have sunk into anarchy; Tartary has become strong; its ferocious tribes have united, and the enterprises resulting from their union have covered the earth with desolation and carnage. Thus the history of Asia has always proceeded in a circle; and it becomes the duty of the philosophical geographer to investigate the causes of this peculiarity, which has attended the human race in so great a portion of the globe. We shall here, therefore, endeavour first to point out those qualities in the character and manners of the Tartars, which have enabled them to vanquish the civilized nations of the earth from China to Germany, for so far their conquests have reached, as the Hungarians and the Turks originally descended from Grand Tartary, as well as the race of princes who now rule the great empire of China. We shall afterwards endeavour to explain the circumstances in the state of society among the eastern nations, which periodically reduce them to degeneracy and political weakness, and prevent their persevering in that career of civilization and of improvement, in which the nations of Europe are now so rapidly advancing, and to which the friends of humanity and of science, as yet, rather wish than hope a perpetual duration. If we are successful in our investigation of the causes of the revolutions now alluded to, the philosophy of general history will become extremely simple, and mankind will be enabled, from the experience of past ages, to distinguish the institutions which contain within themselves the seeds of decay and dissolution, from those which have a tendency to increase the energies of the human character, and to preserve upon the earth the dominion of civilization and of science over barbarism and ignorance.

229 Arrangement of the following remarks.

Arrian.

Asia.

We formerly remarked, that the human character is formed by its situation, or by the education which it receives. The education, however, of barbarians, or the situation in which they are placed, is almost entirely the result of their physical wants, and of the climate and soil which they inhabit: Hence their character is formed by these circumstances, and is the same in every age. On the contrary, the most remarkable circumstances in the situation and education of civilized men, and those which have the most powerful effect upon their character, arise not so much from the cold or heat of the region in which they are born, or from its comparative fertility or barrenness, as from the civil, religious, and political institutions which have been established in it, and the degree in which the human mind is habituated to the pursuits of an enlightened science, or accustomed to make exertions for the improvement of the various arts of life. Hence we shall find, that although the Tartars always resemble each other, yet in countries of equal fertility and of similar temperature, the Turks or Persians, and the Chinese and Indians, differ widely in consequence of the diversity of their institutions.

230 Causes of diversity of character among nations.

Though Grand Tartary, situated in the centre of Asia, and in contact with its great monarchies, is the place from which the revolutions of that continent have usually commenced, this high region must not be considered as the sole country of that barbarous race of people, usually called *Tartars* by the Europeans. We have seen, that kindred tribes inhabit the countries to the northward of China upon the river Amoor; they also occupy the whole length of the habitable part of Siberia, and proceed westward to the Caspian sea, and along the northern shores of the Black sea, to the mouth of the Danube. Thus they range over 110 degrees of longitude. When a movement, however, is once begun in Grand Tartary, it is apt to extend itself in a lesser or greater degree over the whole of these savage regions. Vanquished tribes are driven westward before their conquerors, and precipitated upon others, who in their turn are pressed upon the northern nations of Europe. At other times, the whole barbarous world submitting to the same master, and gathering around his victorious standard, has been known to pour down upon the more wealthy and peaceful nations of the south. In this way were accomplished the great conquests of the Moguls and Tartars, the Turks, and the Huns. A Tartar chief has been known to number 1,500,000 followers in arms, and to make an expedition at the head of 500,000 horse. Zenghis Khan's army usually amounted to 800,000 barbarian cavalry, who trode down the nations in their progress. Considered as a nation of shepherds and of warriors, the following circumstances have in all ages contributed to prepare the Tartar, or as they were anciently called the *Scythian tribes*, for a career of victory.

231 Extent of Tartary.

232 Causes of the Tartar victories. See *Gibbon's Hist.* vol. ii.

The corn or the rice which constitutes the ordinary and wholesome food of a civilized people can be obtained only by the patient toil of the husbandman. Some

233 Their food.

Asia. of the savages who dwell between the tropics are plentifully supplied with vegetable food by the liberality of nature; but in the climates of the north, and in the sterile plains of Grand Tartary, a nation of shepherds is reduced to depend for subsistence upon their flocks and herds. When animal food is dressed in a certain way, the common association of carnivorous and cruel probably deserves to be considered in no other light than that of a humane prejudice; but if it be true that the sentiment of compassion is imperceptibly weakened by the sight and practice of domestic cruelty, we may observe, that the horrid objects which are disguised by the arts of European refinement, are exhibited in their naked and most disgusting simplicity in the tent of a Tartarian shepherd. The ox or the sheep are slaughtered by the same hand from which they were accustomed to receive their daily food; and the bleeding limbs are served, with very little preparation, on the table of their unfeeling murderer. In the military profession, and especially in the conduct of a numerous army, the exclusive use of animal food appears to be productive of the most solid advantages. Corn is a bulky and perishable commodity; and the large magazines which are indispensably necessary for the subsistence of our troops, must be slowly transported by the labour of men and horses. But the flocks and herds which accompany the march of the Tartars afford a sure and increasing supply of flesh, milk, &c. In the far greater part of the uncultivated waste the vegetation of the grass is quick and luxuriant; and there are few places so extremely barren that the hardy cattle of the north cannot find some tolerable pasture. The supply is multiplied and prolonged by the undistinguishing appetite and patient abstinence of the Tartars. They indifferently feed on the flesh of those animals that have been killed for the table or have died of disease. Horse flesh, which has in every age and country been proscribed by the civilized nations of Europe and Asia, they devour with peculiar greediness; and this singular taste facilitates the success of their military operations. The active cavalry of Scythia is always followed in their most distant and rapid incursions by an adequate number of spare horses, who may be occasionally used, either to redouble the speed or to satisfy the hunger of the barbarians. Many are the resources of courage and poverty. When the forage round a camp of Tartars is almost consumed, they slaughter the greatest part of their cattle, and preserve the flesh, either smoked, or dried in the sun. On the sudden emergency of a hasty march, they provide themselves with a sufficient quantity of little balls of cheese, or rather of hard curd, which they occasionally dissolve in water, and this unsubstantial diet will support, for many days, the life and even the spirits of the patient warrior. But this extraordinary abstinence, which the stoic would approve, and the hermit might envy, is commonly succeeded by the most voracious indulgence of appetite. The wines of a happier climate are the most grateful present, or the most valuable commodity, that can be offered to the Tartars; and one of the most remarkable examples of their industry consists of the art, already mentioned, of extracting from mares milk a fermented liquor which possesses some power of intoxication. Like the animals of prey, the savages, both of the old and new world, experience the alternate vicissitudes of famine and plenty, and their stomach is inured to sustain, without much inconvenience, the opposite extremes of hunger and of intemperance. Asia.

234 Habitations.

The nature of their habitations also prepares the Tartars for war. In a country in which agriculture is carried on, the husbandmen are scattered over the face of the soil, and some time must elapse before they can assemble in a body to defend their own confines, or to invade the territories of others. The progress of manufactures and commerce insensibly collects a large multitude within the walls of a city: but these citizens are no longer soldiers; the arts which adorn and improve the state of civil society, corrupt the habits of the military life. The pastoral manners of the Scythians seem to unite the different advantages of simplicity and refinement. The individuals of the same tribe are constantly assembled, but they are assembled in a camp; and the native spirit of these dauntless shepherds is animated by mutual support and emulation. The houses of the Tartars are no more than small tents, of an oval form, which afford a cold and dirty habitation for the promiscuous youth of both sexes. The palaces of the rich consist of wooden huts, of such a size that they may be conveniently fixed on large waggons, and drawn by a team perhaps of 20 or 30 oxen. The flocks and herds, after grazing all day in the adjacent pastures, retire on the approach of night within the protection of the camp. The necessity of preventing the most mischievous confusion in such a perpetual concourse of men and animals, must gradually introduce, in their distribution of the order and the guard of the encampment, the rudiments of the military art. As soon as the forage of a certain district is consumed, the tribe, or rather army of shepherds, makes a regular march to some fresh pastures; and thus acquires, in the ordinary occupations of the pastoral life, the practical knowledge of one of the most important and difficult operations of war. The choice of stations is regulated by the difference of seasons. In the summer the Tartars advance towards the north, and pitch their tents on the banks of a river, or at least in the neighbourhood of a running stream; but in the winter they return to the south, and shelter their camp, behind some convenient eminence, against the winds, which are chilled in their passage over the bleak and icy regions of Siberia. These manners are admirably adapted to diffuse, among the wandering tribes, the spirit of emigration and conquest. The connexion between the people and their territory is of so frail a texture, that it may be broken by the slightest accident. The camp, and not the soil, is the native country of the genuine Tartar. Within the precincts of that camp, his family, his companions, his property, are always included; and in the most distant marches, he is still surrounded by the objects which are dear or valuable, or familiar in his eyes. The thirst of rapine, the fear or the resentment of injury, the impatience of servitude, have, in every age, been sufficient causes to urge the tribes of Scythia boldly to advance into some unknown countries, where they might hope to find a more plentiful subsistence or a less formidable enemy. Even the severity of the climates which they inhabit facilitates their enterprises. In the winter season, the broad and rapid rivers that discharge their waters into the Euxine, the Caspian, or the Icy sea, are strongly frozen; the fields

are

Asia.

are covered with a bed of snow; and the fugitive or victorious tribes may securely traverse with their families, their waggons, and their cattle, the smooth and hard surface of an immense plain.

235 Exercises.

The ordinary exercises of these people prepare them for war. The pastoral life, compared with the labours of agriculture and manufactures, is undoubtedly a life of idleness; and as the most honourable shepherds of the Tartar race devolve on their captives the domestic management of their cattle, their own leisure is seldom disturbed by any servile and assiduous cares. But this leisure, instead of being devoted to the soft enjoyments of love and harmony, is usually spent in the violent and sanguinary exercise of the chase. The plains of Tartary are filled with a strong and serviceable breed of horses, which are usually trained for the purposes of war and hunting. The Scythians of every age have been celebrated as bold and skilful riders: and constant practice has seated them so firmly on horseback, that they were supposed by strangers to perform the ordinary duties of civil life, to eat, drink, and even to sleep without dismounting from their steeds. They excel in the dexterous management of the lance; the long Tartar bow is drawn with a nervous arm; and the weighty arrow is directed to its object with unerring aim, and irresistible force: these arrows are often pointed against the harmless animals of the desert, which increase and multiply in the absence of their most formidable enemy; the hare, the goat, the roebuck, the fallow-deer, the stag, the elk, and the antelope. The vigour and patience both of the men and horses are continually exercised by the fatigues of the chase; and the plentiful supply of game contributes to the subsistence and even luxury of a Tartar camp. But the exploits of the hunters of Scythia are not confined to the destruction of innoxious beasts; they boldly encounter the angry wild-boar when he turns against his pursuers, excite the sluggish courage of the bear, and provoke the fury of the tiger as he slumbers in the thicket. Where there is danger there may be glory; and the mode of hunting which opens the fairest field to the exertions of valour, may justly be considered as the image and as the school of war. The general hunting matches, the pride and delight of the Tartar princes, compose an instructive exercise for their numerous cavalry. A circle is drawn of many miles in circumference, to encompass the game of an extensive district; and the troops that form the circle regularly advance towards a common centre, where the captive animals, surrounded on every side, are abandoned to the darts of the hunters. In this march, which frequently continues many days, the cavalry are obliged to climb the hills, to swim the rivers, and to wind through the valleys, without interrupting the prescribed order of their gradual progress. They acquire the habit of directing their eye, and their steps, to a remote object; of preserving their intervals; of suspending or accelerating their pace, according to the motions of the troops on their right and left; and of watching and repeating the signals of their leaders. Their leaders study in this practical school the most important lesson of the military art; the prompt and accurate judgment of ground, of distance, and of time. To employ against a human enemy the same patience and valour, the same skill and discipline, is the only alteration which is required in real war; and the amusements of the chase serve as a prelude to the conquest of an empire.

Asia.

236 Government.

The nature of their domestic government has at all times greatly favoured every attempt of the Tartars towards conquest. The political society of the ancient Germans has the appearance of a voluntary alliance of independent warriors. The tribes of Scythia, distinguished by the modern appellation of *hordes*, assume, on the contrary, the form of a numerous and increasing family; which in the course of successive generations, has been propagated from the same original stock. The meanest and most ignorant of the Tartars preserve, with conscious pride, the inestimable treasure of their genealogy; and whatever distinctions of rank may have been introduced by the unequal distribution of pastoral wealth, they mutually respect themselves and each other, as the descendants of the first founder of the tribe. The custom, which still prevails, of adopting the bravest and most faithful of the captives, may countenance the very probable suspicion, that this extensive consanguinity is in a great measure legal and fictitious. But the useful prejudice, which has obtained the sanction of time and opinion, produces the effects of truth; the haughty barbarians yield a cheerful and voluntary obedience to the head of their blood; and their chief, or mursa, as the representative of their great father, exercises the authority of a judge in peace, and of a leader in war. In the original state of the pastoral world, each of the mursas (if we may continue to use a modern appellation) acted as the independent chief of a large and separate family; and the limits of their peculiar territories were gradually fixed by superior force, or mutual consent. When, by a coincidence of fortune and of talents, a successful chieftain contrived to unite under his command a great number of separate hordes, with a view to a common enterprise, he found, from their ordinary habits of obedience and subordination, an army ready formed and arranged for action: each tribe or horde followed its own chief, to whose authority it was accustomed to submit. If the chief was taught to obey, the obedience of his horde might, from the habits of the people, be safely relied on. Thus these barbarians have at all times been able to send forth detachments upon distant expeditions, which have acted with all the promptitude of a well disciplined military force, and enabled them at once to push their conquests towards the tropic and polar circle, the Chinese empire, and the banks of the Danube.

237 The Tartars acquainted with the Chinese military arts.

To these advantages the Tartar chiefs have sometimes added a portion of military skill, according to the state in which it existed in the civilized nations in their neighbourhood. It has been an usual practice among the Chinese to receive into their pay some of the Tartar chiefs, and to use as soldiers considerable bodies of this brave and hardy race of men. These are employed as the cavalry of the Chinese armies, and become a convenient engine in the hands of an artful government, at once to keep Tartary itself in subjection, and to repress every attempt at rebellion among the Chinese themselves, when they at any time happen to become discontented, either in consequence of a corrupted and tyrannical administration, or of accidental famine, to which that over-peopled country is exposed. But these Tartar auxiliaries, or tools of power, have sometimes ultimately become very dangerous. When the Chinese princes,

Asia.

princes, trusting to the passiveness of their people, and to the irresistible force of their mercenary troops, have suffered themselves to sink into indolence, and to neglect the administration of affairs, the Tartar chiefs in their pay have sometimes learned to despise their feeble masters, and have turned against them the portion of military knowledge which they had acquired in the Chinese service, adding to it the whole vigour and ferocity which they derived from the habits of their early life. The most celebrated of the Tartar chiefs was the renowned Temujin, or Zinghis, who, in the 13th century of the Christian era, erected a monarchy among his pastoral countrymen, and, in his own person, or by his descendants, subdued the whole civilized nations of Asia. In his youth he was a vassal of the Chinese empire: he was led to invade it by a knowledge of its weakness and of the means of success, at a time when it was distracted by domestic faction, and left exposed in consequence of the revolt of 100,000 Khitans, who guarded the frontier. The conquest of the five northern provinces of that empire rendered him more dangerous to other nations. He marched westward, and attacked the flourishing and civilized empire of Carizme, which then existed to the eastward of the Caspian sea. After a battle, in which the sultan of Carizme lost 160,000 of his troops, that prince withdrew into his towns, in the hope of wearying out the barbarians by the length and difficulty of a number of regular sieges. But the foresight of Zinghis had formed a body of Chinese engineers, skilled in the mechanic arts, informed perhaps of the secret of gunpowder, and capable, under his discipline, of attacking a foreign country with more vigour and success than they had defended their own. The Persian historians relate the sieges and reduction of Otrar, Cogende, Bochara, Samarcand, Carizme, Herat, Merou, Nisabour, Balch, and Candahar; and the conquest of the rich and populous countries of Transoxiana, Carizme, and Chorasan. From the Caspian to the Indus, the Tartars ruined a tract of many hundred miles, which was adorned with the habitations and labours of mankind; and five centuries have not been sufficient to repair the ravages of four years.

The right of hereditary succession to the sovereignty of a number of united hordes, together with the revenue, which, by their customs, the sovereign was entitled to levy, had a tendency to render them long formidable. Zinghis had originally been raised to power by the admiration of his equals, and the success of his enterprises, under the title of khan. The right of hereditary succession was long confined to the blood of the founder of the monarchy; and at this moment all the khans who reign from the Crimea to the wall of China, represent themselves as the lineal descendants of the renowned Zinghis. But as it is the indispensable duty of a Tartar sovereign to lead his warlike subjects into the field, the claims of an infant are often disregarded; and some royal kinsman, distinguished by his age and valour, is entrusted with the sword and sceptre of his predecessor. Two distinct and regular taxes are levied on the tribes, to support the dignity of their national monarch, and of their peculiar chief; and each of those contributions amounts to the tythe, both of their property and of their spoil. A Tartar sovereign enjoys a tenth part of the wealth of his people; and as his own domestic riches of flocks and herds increase in a much larger proportion, he is able plentifully to maintain the rustic splendour of his court, to reward the most deserving or the most favoured of his followers, and to obtain, from the gentle influence of corruption, the obedience which might be sometimes refused to the stern mandates of authority. The manners of his subjects, accustomed, like himself, to blood and rapine, might excuse, in their eyes, such partial arts of tyranny as would excite the horror of a civilized people; but the power of a despot has never been acknowledged in the deserts of Scythia. The immediate jurisdiction of the khan is confined within the limits of his own tribe, and the exercise of his royal prerogative has been moderated by the ancient institution of a national council. The coroultai, or diet, of the Tartars was long regularly held in the spring and autumn, in the midst of a plain, where the princes of the reigning family and the mursas of the respective tribes may conveniently assemble on horseback, with their martial and numerous trains; and the ambitious monarch, who reviewed the strength, must consult the inclination of an armed people. Thus the rudiments of a feudal government may be discovered in the constitution of the Scythian or Tartar nations; and in all their conquests they have uniformly been disposed in some degree to retain some resemblance of this form of government, by distributing their new territory among their chiefs, to be ruled and divided among their followers in subordination to the head of the state.

Asia.

238 Weakness of other nations necessary to the success of the Tartars.

One circumstance, however, has always been necessary to the success of Scythian or Tartar conquest, that the neighbouring nations should be in a state of weakness. The Chinese and the Russians are at present the tyrants or masters of the Tartars, who heretofore tyrannized over the world. The Chinese rule them partly by art and partly by force; and the Russians find that they are unable to resist the arts and the military skill of Europe. The population of China amounts to between 300,000,000 and 400,000,000. That of Hindoostan is equal to 100,000,000; and the ancient Persian empire was capable of pouring forth to the invasion of Europe, an army amounting, as it is said, to three millions of men. Such nations, possessed of superior arts and means of defence, could not upon their own territory have been vanquished by any number of barbarians that could unite against them, did not some defect exist in their character, or had they not been brought into a state of political weakness by some fault in their government. Such reasoning is natural to modern Europeans, who see the present state of the Tartars with just indifference, as by no means formidable to the peace of the world. It is confirmed by history and experience. We shall therefore proceed to consider the circumstances which have hitherto had a tendency to expose all the Asiatic states to conquest and to ruin.

239 Circumstances that have weakened the Asiatic states.

One circumstance, which in most of the Asiatic states has a powerful tendency to produce a permanent inferiority of character in the people, and a constant tendency to anarchy and revolution in the government, arises from the imperfect state of domestic society. In all the countries of Asia that have adopted the Mahometan religion, polygamy is authorised by law, that is to say, besides Arabia, in Turkey, Persia, and Hindoostan, which last contains 10,000,000 of Mahometans. The same practice is also allowed in China,

240 Polygamy.

Asia.

China, and it has always prevailed among the rude tribes of Tartars. It is probable, that this law upon the whole facilitates population. It divides between the rich and the poor more equally, that is, in a better proportion to their means, the expence of rearing the future generation, as rich men, who can afford to do so, will naturally be led to have a greater number of children. But at the same time, there can be no doubt that this law must have a powerful tendency to repress the intellectual improvement of the people. The rich in every country dictate the fashions of life; and by this institution a fashion is necessarily introduced of treating women with jealousy, and thus of secluding one half the species from the ordinary society of the other. Women thus shut up in retirement, must possess illiterate and unimproved characters; they must also be prevented in a great degree from carrying on any part of the common business of life. From these circumstances more evils will arise than are at first obvious. One half of society, instead of being useful, becomes a burden upon the industry of the other. A secluded and unsocial mode of life is introduced, and as the human powers are best improved by intercourse with society, a considerable difficulty is thrown in the way of the enlargement of our faculties. Besides this, it must happen, that the ignorance and imbecility of one half of the species will affect the other. An Asiatic retires from the management of his business, to the society of an unintelligent and weak being, who neither sees nor knows any thing of the world or its affairs. In such society he must relinquish his reason and his rational faculties, before he can enjoy much satisfaction. In such society, however, he was educated during his first years, and a great part of his time must necessarily be spent. He cannot fly from it to the house of a friend, for no friend can receive him; and he can receive nobody freely into his dwelling, lest his female prisoners should be seen. This at least is the case with all those who live not in spacious mansions with a variety of apartments. In such a state of society, it is impossible that many men can acquire, or long preserve, much zeal for scientific pursuits, or that the improvement of literature and of ingenious arts can be very earnestly cultivated.

241 Its effects on population,

242 on the character of the people,

243 on the form of houses and cities,

These effects of the law which regulates domestic society, appear even to the most careless observer of an Asiatic city. It occupies a large extent of territory, because every family secludes itself from the other. Every house is surrounded by a wall, and stands in an enclosed area: Each family thus fortifies itself as within a rampart against the intrusion of all neighbours. Hence it has happened, that no attempt has ever been made in the cities of Asia to establish a republican form of government, even when the people were driven to despair by the severest oppression. There exists not that rapid communication of sentiment, and that confidence in each other, which takes place where society is more intimately blended, and which leads men to repose such confidence in each other, as to believe that they can act under the mere authority of public pactions or laws, without the interposition of a master. The mode of erecting their dwellings also explains the wonderful stories, told us by the ancient writers, of the immense extent of Babylon and of Nineveh. It also accounts for the great tracts of territory, which in modern times are occupied by the Asiatic cities. This circumstance also has contributed more than any thing else to expose them to the enterprises of invaders. The extent of their walls in proportion to the population they contain, rendered the defence of them difficult or impossible.

Asia.

244 on government.

The law of polygamy has also had a very fatal effect upon the Asiatic governments, and has been one of the most ordinary means of introducing anarchy into them. The princes have very numerous families by different women. Each of the female favourites of the reigning monarch attempts to establish her own children in the most advantageous situations. Hence, the Asiatic courts are at all times occupied by an endless tissue of dangerous intrigues. Attempts are often successfully made to inspire an old man with jealousy of his eldest son, the apparent heir. The knowledge of the existence of such attempts, or even of the possibility of their existence, and of the fatal effects which they may produce in a despotic government, disposes all the sons of the prince to watch the conduct both of him and of each other with the utmost jealousy: this jealousy is apt to burst out into open rebellion, and frequently does so. At all events, upon the death of an Asiatic monarch, his numerous sons, whose rivalship, hatred and jealousy of each other, have hitherto been confined within decent bounds, openly break out into violence. A younger brother knows that he is hated by the elder, who is now become his master. In defence of his own existence, therefore, he is compelled to have recourse to arms, and to obtain a crown or submit to destruction. In this way, the successor of an Asiatic prince has often to begin his reign by struggling against a considerable number of desperate rebellions, and must wade to the throne through the blood of his nearest kindred. As success does not always attend the arms of the elder brother, the law of primogeniture, being frequently violated, loses its importance and estimation in the eyes of the multitude. The royal family itself, covered as its members must be with parricides and crimes, cannot be greatly respected by the people, in whose eyes success and victory become, therefore, the only undoubted titles to obedience. Powerful subjects also, therefore, or enterprising military leaders, are frequently tempted to disregard the claims of the reigning family, and to appeal to the fortune of arms as a title to dominion. When successful, they find a people distracted by civil wars, and by the pretensions of different candidates, ready to acquiesce in any government that can bestow upon them a temporary repose.

245 Produces dissensions in the reigning family.

246 Produces usurpations.

Even should a reigning family escape these obvious calamities which lay waste the territories of a nation, and overthrow its prosperity by sanguinary civil contests, there are evils by which the law of polygamy more gradually, though not more certainly, undermines the safety of the state. The founder of a new dynasty is usually an ambitious and artful military chief. His first successors, educated in an active reign, and anxious to secure their dubious authority, usually partake his talents and energy. Time, however, soon sanctifies their right to the throne, though originally founded in usurpation. The monarch now placed in security, indulges in that luxury to which he is tempted by his situation; and luxury, where the

247 Polygamy produces bad government.

law

Asia.

law of polygamy exists, has more powerful and dangerous attractions, and is attended with more pernicious effects, than elsewhere. This kind of luxury, above all others, leads to an indolent life, and to the production of an ignorant and unintelligent character. The prince is led to shut himself up among a crowd of eunuchs and women, from whose society he can derive no improvement, and to whose counsels and passions he is ultimately led to intrust the direction of the most important affairs of his government. The armies of the state are soon neglected, by a monarch, whose favourites employ every art to inspire him with a disgust of the toils of war, that he may the more easily be retained within the precincts of his palace, and under their management and influence. The provinces are subjected to the most ruinous exactions to gratify their avarice, and every place of public trust comes to be filled by men who undertake not to administer public affairs, but to extort large sums of money from the people, to be conveyed to the favourites that rule within the palace. Thus the state experiences a rapid decay of its population and resources; and if it is attacked from abroad, it has no head to call forth its remaining powers, and direct them with vigour and skill against an invader. The population that remains may still be sufficiently ample for the defence of its own territory, and abundance of personal courage may exist among the citizens; but they cannot be arranged,

248 Instance of Turkey.

or their force rendered effectual, from the want of an active government. This appears to be precisely the situation of the Turks at the present moment. Their first princes, inhabiting the frontier of Europe and of Asia, exhibited, during a much longer period than is usual in the families of Asiatic monarchs, a very considerable degree of spirit and of exertion. But the law which authorises them to live with a multitude of women, all of whose children are legitimate, gradually produced its natural effect. The latter princes have shut themselves up in their palace, and neglected the administration of affairs. The provinces have been wasted; and instead of the numerous people which they once contained, immense forests are rising over the whole territory, and becoming the habitation of wild beasts. The governors of the remoter provinces are aspiring to independence; anarchy prevails in different quarters; and a foreign conquest is only prevented by the jealousy of the neighbouring nations, who cannot agree to whose lot these fine countries shall fall. Yet at this day the Turks are a race of as stout and brave men as their Scythian forefathers. They are equally willing to fly to arms, and sufficient numbers still remain to set every enemy at defiance; but they are not led by those vigorous chiefs who conducted their ancestors from the foot of Imaus, resisted the power of Persia, seized the city of Constantine, and diffused terror over Europe. A man of talents only is wanting to render them still respectable, if not formidable; but their unusual respect for the descendants of so many illustrious princes, has hitherto prevented their government from being seized, and their nation preserved by a bold usurper; while, in the mean time, their sultan, lost in the indolence and voluptuousness of his seraglio, and blinded by his favourites, refuses to come forth and to undertake the direction of the remaining armies of the state, or to place himself at the head of a warlike people.

Asia.

249 Polygamy ruinous to China.

This law of polygamy appears to be the single circumstance that has brought about the revolutions which have occurred in China. From the nature of the singular form of government established there, the human mind is indeed preserved in a state of perpetual imbecility, and is prevented from rising in improvement beyond a certain degree; this degree, however, it never fails to attain. It is sufficient to render the nation decidedly superior to their rude neighbours of Tartary; and as Chinese improvement can never advance far, there appears no good reason why it should ever decline or pass away. But the law of polygamy from time to time deranges all their institutions, and the regular march of their government. As they ascribe absolute power to their monarch, and their laws secure tranquillity to the state and complete obedience to his will, he can have no occasion to quarrel with his people, or to disturb institutions which give him the command of as much wealth as his wishes can crave, and as much power as he personally can have any inclination to exert. Accordingly, for some time after a recent conquest, all goes well in China: the monarch is delighted with the submission and tranquillity of his people, the industry and prosperity of the country, and the immense revenue which is placed at his disposal, and which he can have no occasion to use otherwise than in works of public magnificence, generosity, or utility. Speedily, however, this peaceable state of things produces its natural effects. The monarch having nothing to fear, and little to do, resigns himself to pleasure; and that pleasure most probably consists in the kind of indulgence which the law allows and encourages, of collecting around him, and passing his time in the society of, a multitude of beautiful women. Such, however, is the skilful structure of the Chinese government, that it proceeds and prospers without the interference of the prince, who is rather a useful name to prevent military usurpation than an active organ of the constitution. Affairs being in the hands of the most prudent men in the state, who have risen by approved fidelity and talents to the highest rank and trust, are conducted with abundance of care; and the responsibility of all inferior magistrates is enforced. Thus the emperor may be allowed to slumber with secure dignity in his palace: If he interefere not to do harm, the constitution of the state will provide for the management of public business and the prosperity of the people. But matters cannot long rest thus. A weak and ignorant prince, who passes his days secluded from the world, amidst eunuchs and women, will not comprehend the value of that constitution at the head of which he is placed; his favourites prevail with him to encroach upon its fundamental maxims; he is induced to distrust those officers who have risen by a gradual progress under the direction of the law to distinction and power, and to confer authority upon individuals to whom the constitution gives no title to receive it. As implicit obedience to magistrates, and above all to the emperor, is a fundamental maxim of Chinese jurisprudence, and inculcated as superior to all other duties, the will of the emperor meets with no resistance: The constitution trusts that he will not attempt to violate it;

but

Asia.

but if he do so, it provides no other remedy than the prayers and entreaties of the highest order of mandarins, which they have been known to employ at the hazard of their lives, and even with the certainty of destruction. As the imperial will, therefore, can in no way be resisted or controuled, when an emperor relinquishes himself to the dominion of the inmates of his palace, the consequences speedily occur which we have already mentioned as resulting from the law of polygamy in other countries. The defence of the state is disregarded; worthless men are raised to the command of armies and provinces; corruption becomes the means of obtaining preferment: The Tartar subjects find out the important secret, that the reins of government are loosely held, that the barriers which protect the treasures of a wealthy nation have fallen into decay, and that these treasures have come to be at the mercy of poverty and courage. Some chief endeavours to unite the shepherds of the west and the north in a common enterprise: His first efforts procure him plunder, if not dominion, and the prospect of his riches procures him new adherents, till at last the hardy cavalry of Scythia are enabled to disperse the feeble and ill-conducted armies of the Chinese; and their leader and his family, seated on the throne of a mighty empire, is gradually led, by similar circumstances, to proceed in the same career, from strength and activity, to weakness, degeneracy, and ruin. The constitution of China, indeed, triumphs over these calamities. The Tartars admire the arts and manners of the vanquished people; and the conqueror is willing to revive and preserve a constitution which preserves the prosperity of the people, while it submits every thing to the will of their master. Had the laws of that empire provided, as in Europe, that the inheritance both of public and private individuals should only pass to their legitimate children by one woman, China might undoubtedly have avoided many of its revolutions. Its princes might have been men of talents or otherwise, according to the ordinary vicissitudes that in the course of nature occur in families; but the possession of talents by the prince is not necessary to the good government of China: it is enough that he interfere not to do positive mischief, and under such a law, every temptation to do mischief would be removed from him.

250 General form of government in Asia, 251 feudal.

Another cause of periodical weakness in Asiatic nations arises from the general form of government that has been there adopted. Excepting in China, the Tartars have in all their conquests been led to establish themselves under a sort of feudal arrangement. In their native country, they were divided and subdivided into tribes and families, under a chief who had led them forth to war and conquest. In their new territories, it was natural for the chief to reward his successful officers with grants of provinces, which they were again to subdivide among their followers, under condition of remaining in subjection to himself, and of being ready on all occasions to attend him in war. These grants, however, were only bestowed upon individuals personally who received them: They were given as the price or pay of military service: They might be recalled at will, like the commission of an officer; and they were never meant to go to the heirs of the favoured chief, though undoubtedly in equal circumstances his heirs would be preferred to others. A government like this is exposed to two kinds of disorders; the one, arising from exorbitant power acquired by the great vassals: and the other, arising from the too great despotism of the prince.

Asia.

Under a monarch of great activity and vigilance, the chief vassals of the state, who have received large grants of territory, may be retained in sufficient subjection. He may summon them and their followers frequently to attend his person; and by engaging them in wars under him, may preserve his personal ascendency over them, by having frequent occasion to change their situations, and to prefer others to the places they occupy. Should his immediate successors, however, not be men of equal talents with himself, or should a disputed succession occur, the greater chiefs will immediately aspire to independence: the empire will fall to pieces, and degenerate into a hereditary aristocracy, in which every chief is engaged in hostility with his neighbours, and in which the people at large, oppressed by a multitude of petty tyrants, can enjoy no repose or prosperity. Such has been the destiny of several of the nations of Asia; and it was also the destiny of Europe after its conquest by the northern barbarians. It is true that the European princes gradually recovered the power that had been wrested from them, and converted into local inheritances by their great nobles. To subdue these nobles, they associated themselves with the populace, with the few merchants, and the industrious part of the nation. They encouraged these people to unite themselves into communities, and to fortify themselves with walls. They established courts of justice, whose regular and equitable procedure gained the affection of the weak, whom they protected, and brought odium upon the violence and despotism of the petty local tyrants of the country. The commercial and industrious part of the community were induced to contribute to the support of the prince, who seemed thus to labour only for their welfare, and to protect them against oppression. By this wealth he was enabled to confirm his power, and to subdue his refractory vassals. By following out these prudent maxims for a few generations, the dominion of law and order, along with the power of the sovereign, were established in the nations of Europe. But nothing of all this can occur in Asia. Power may there be acquired by the violence of sudden conquest, but it cannot be gained by a train of artful policy steadily pursued from father to son during a course of several generations. In consequence, as already mentioned, of the law of polygamy, no sooner does a prince die than one of two things occurs; either a war for the succession ensues among his children by different wives, which consumes the wealth of the people, and augments the power of the nobles, upon whom the candidates for dominion must rely for aid; or, to prevent this calamity, the eldest son of the deceased monarch seizes his younger brothers, and puts out their eyes, or destroys their lives. Thus an example of cruelty and injustice is exhibited, which destroys in the minds of the people every growing sentiment favourable to the establishment of order, and of humane and equitable laws.

252 Feudal government apt to become aristocratic.

253 Government by viceroys.

On the other hand, it has frequently happened in Asia, that the power of the monarch has not been lost by its vassals converting different districts into hereditary possessions. A succession during a few generations

Asia.

of active and warlike princes has given leisure for the chiefs of the Tartar tribes to acquire the manners of the nations whom they vanquished, and to sink, like them into a state of permanent subjection to a sovereign, become too powerful to be resisted. In this case, however, an error exists in the general structure of Asiatic governments, which gradually brings them to decay. The monarch divides his territory into provinces, and over each province he places a governor, or viceroy, whom he appoints and recals at pleasure. The governor of a province possesses within it the whole power of the master whom he represents; he collects the taxes, and remits them to the capital; he administers justice by himself, or by deputies whom he appoints and removes at pleasure; and lastly, he commands within his district the armies of the state. On a little reflection it will readily be conceived, that a nation governed in this way cannot permanently prosper. An absolute monarch can scarcely fail to be patriotic, because the whole country is his own, and he must regard his people as his property, or as a kind of appendage to his family. He will therefore intend to govern them well, or as advantageously as possible. But the governors whom he places over the provinces must entertain very different sentiments: The state is not their inheritance; they are appointed only for a season; and like tenants at will, they will endeavour to make the most of their temporary possession, though they diminish the permanent value of the estate. Hence these men are always apt to govern ill; and, with a view to make the most of their time and opportunity, they oppress the people by their rapacity. The monarch has no intention to sanction their conduct, but there exists no other means of restraining it than to maintain a perpetual and vigilant inspection over them. If he is not constantly at short intervals travelling into every part of his dominions, and viewing objects with his own eyes, the governors of provinces will take advantage of their situation, to oppress the people, and will endeavour to secure their own safety by corrupting the ministers who are near the person of the prince.

In a government thus constituted, too much is made to depend upon the activity and vigilance of one man. If the monarch relax in his attention, the state at once begins to decay; and even his personal infirmities, his youth, or his old age, produce important effects upon the provinces. When a weak prince happens to succeed to the throne, the decline of the empire becomes visible in a few years; and the most active reign scarcely suffices to repair the injuries which a short period of weak government has occasioned. All these evils are aggravated in Asia by the tendency which the law of polygamy has to introduce into the palace of the monarch a system of seclusion from business, of indolence, and of favouritism.

254 Viceregal government adopted in the Roman empire.

In the ancient Roman empire this practice was adopted of ruling the provinces by temporary governors possessed of unlimited power, and was attended with all the bad consequences which we have here described. From its first establishment, that empire, like an Asiatic monarchy, underwent a gradual progress of decay; and instead of the people becoming gradually more powerful, wealthy, and enlightened, every science and every art, together with the population of the state, declined, till the whole was oppressed and sunk under the inroads of the northern barbarians. It is a curious circumstance, and well worthy of all our attention, that the progress of modern Europe is altogether the reverse of this. In Asia a monarchy is no sooner established than its decline commences, and it gradually becomes weaker and weaker, till, in the course of a few successions, its overthrow is easily accomplished: whereas in Europe, for some centuries past, every state or monarchy of any tolerable extent, has gradually been waxing stronger and stronger, and is capable of greater exertions in proportion to the time that it has stood. Such, at least, is the case, with regard to the middle and northern states of Europe. The mode in which the government is administered will explain this, when contrasted with that which is adopted in most of the Asiatic states, and which existed in the Roman empire. In Europe the sovereign does not intrust the whole government and administration of affairs in a province to an individual, who is at once to be tax-gatherer, judge, and commander of the military force. On the contrary, instead of portioning out the whole territory of the state in provinces, to be allotted to particular viceroys, a more artificial arrangement is adopted. The business to be done is divided into different branches, and these branches, though sometimes extending over the whole territory, are intrusted by the sovereign to distinct individuals or classes of individuals. Thus an office or officer is established near the person of the prince, into which the whole taxes of the nation are ultimately paid. Under this office, or its managing minister, a variety of tax-gatherers are sent throughout the whole country, to collect in the different towns and districts the taxes established by law, and to remit them to the government. These tax-gatherers have no interference in military affairs or in the administration of justice. In like manner, a particular class of persons, properly qualified for the duty to be performed, are appointed to administer justice in the provinces, and to interfere no farther in public affairs. No part of the revenue comes into their hands, and they have no command of the military force of the state. Lastly, the whole military or soldiers likewise form a separate and distinct body. Their officers are all appointed by the prince and his ministers, upon whom they immediately depend, and they have no concern in the collection of the taxes, or in the administration of justice. Under a government thus constituted, if a tax-gatherer make an unjust exaction from any of the people, they complain to the judges, who, having no share in the management of the public revenue, and deriving no profit from the oppressions that may be committed in it, are disposed to listen to all complaints, and to do justice against the collectors of the taxes. The judges themselves are kept under controul in a similar way. Not being commanders of the military force, or entrusted with the direction of its operations, they can only pronounce decrees, but have no power to execute them. This must be performed by the military, who are a distinct body. They, however, will have no inclination to see the power of judges and lawyers exorbitantly increased, and will revolt from the idea of putting in force decrees which are notoriously unjust, and of which the public disapprove. Thus the people will, in every respect, be assured of protection. The judges will protect them against the tax-

Asia.

255 Why European nations improve instead of decaying like Asiatic states.

gatherers

Asia.

gatherers and the military, who, in their turn, will regard with jealousy the power of the judges. In this way a just and equitable government is maintained. Access is easily had to the prince, who can have no wish to see affairs ill administered. A great nation is governed like a single family, by allowing different duties to its different members, who are prevented from abusing their power. Industry is encouraged by the security of property; and the human mind, unsubdued by oppression, and animated by hope, is led to exert its whole energies in improving its own character and condition. Whereas in Asia, and in all those countries in which governors of provinces are appointed with absolute power to conduct the whole business of administration, every province is converted into a separate empire, in which no redress can be obtained for any grievance. If a tax-gatherer make an undue demand, the citizen can only state his complaint to the employer of that tax-gatherer, the provincial-governor, who is to receive the money that is to be paid. If a soldier do wrong, he can only be complained of to the same governor who is the master and patron of the soldier. If a judge is unjust, it is still to the same individual that the complaint must be carried. Thus no check or controul exists; and if the governor of the province is rapacious and unjust, and has need of unprincipled dependents to support his power, the people must submit to an oppression for which there is no remedy; and the whole state, thus divided into departments and oppressed, must speedily sink into ruin. Commerce cannot flourish where the fruits of industry are not secure; and without commerce those arts cannot prosper, the practice and improvement of which afford some of the best means of enlarging the human faculties."

256 Religions of Asia hurtful.

In many parts of Asia, religion is also a great source of national weakness. This arises from two causes; either from its dividing a state into different parties, or from its doctrines being of such a nature as to restrain in too great a degree the activity and improvement of the human mind.

257 Religion in some places divides the state.

Before the Turks subdued the Greek empire, they had been long enough settled in the countries near the Caspian sea, to acquire the religion of a more civilized people. By the time they subdued the country round Constantinople, and at last the capital itself, they were become zealous Mahometans; whilst the nation over whom they established their dominion, consisted of no less zealous Christians. Hence a line of separation was drawn between the conquerors and the conquered, which time has not been able to obliterate. One half of the state consists of masters, and the other of an oppressed people. In other nations the evils of conquest have been temporary, because in a short time the victors and the vanquished, mingling in the ties of affinity and thence of consanguinity, have ceased to be distinguished from each other, and have coalesced into one common people. But in Turkey, to this day, the proud invader is known from the vanquished native. Their respective religions have fixed upon each of them a mark, which has proved as indelible as that by which, in our West India islands, nature distinguishes the negro slave from his European master. Hence the Turks continue to act the part of insolent oppressors to their subjects, the Greeks; while the latter, accustomed to insults and to a sense of inferiority, have acquired the characteristics of slaves, insincerity and cowardice. It is not wonderful, therefore, that the Turkish empire should decay. It not only labours under all the evils attending upon the law of polygamy, and of a government by viceroys called *pachas;* but to these have been added an internal division among the people, which degrades the character of one half of the nation, without conferring any improvement upon the other. The same evil has existed during many centuries in Hindoostan. Before the conquest of it by the Mogul or Tartar princes, they had also embraced the Mahometan faith. Their new subjects, however, the Hindoos, adhered to the religion of their ancestors, with still more obstinacy than the Greek Christians have done against the Turks, and the result has been similar. The Mahometan conquerors, with all the advantages on their side, of victory, of public employment, and royal favour, never amounted to above one-tenth of the population of the country. The great body of the people, therefore, necessarily sunk into a contemptible and degraded condition, which impaired the national strength, and retained society in a violent and unnatural state in which it could not flourish.

Asia.

258 Hurtful religious doctrines.

We can scarcely consider as religious systems the superstitions of the Siberians and Tartars, or other rude Asiatic tribes. Leaving them out of view, therefore, the religions of Asia are chiefly three: that of Budho, Gaudma, or Fo, which prevails in Ceylon, the farther peninsula of India, China, Japan, and Thibet; the Mahometan religion, which, besides Arabia, is in possession of Turkey, Persia, and partly of Hindoostan; and, lastly, the Gentoo faith, which is adhered to by ninety millions of people in India. Of these, the religion of Budho, Gaudma, or Fo, seems the least pernicious. It is loaded with few ceremonies, so that it cannot greatly occupy the human mind. It is perfectly tolerant, and thus does not positively prohibit intellectual improvement; and its priests are men who voluntarily choose their profession, and, excepting in the sterile country of Thibet, have no interference in the ordinary business of life, and no share in the administration of public affairs. All error is, however, injurious to the human intellect, by diminishing its power of discerning truth. Even independent of this general circumstance, the religion of Gaudma has been dangerous in another point of view. It has a book which is of sacred authority, and believed to be the work of inspiration. That book is said to regulate minutely the ordinary affairs of life; the taxes to be paid to the state, and what ought to be accounted just and unjust in the common transactions of men: But an infallible law for the regulation of ordinary affairs is always a great evil, as it renders error and ill government perpetual. Such a book, at the time when it was written, might perhaps be a useful work, and contain many valuable maxims and rules for adjusting all kinds of business, and for the decision of all disputes; but human affairs, to proceed well, must be in a state of improvement, that is, in a state of change to what is better: But such a book has a tendency to oblige the nation that adopts it to stand still, and consequently to fall behind other nations. Hence they have all the

259 Religion of Budho.

Asia.

chances of falling back into barbarism that affect other nations, while there exists no possibility of their advancing farther in improvement.

260 Mahometan religion.

The Mahometan law has this speculative advantage over that of Gaudma or Budho, that it suffers not the supreme Intelligence to be likened to a stock or a stone; but its practical character is much more injurious to the world. It not only has an infallible book, which in the countries where it is adopted is regarded as the law of the land for regulating the decision of controverted causes in all courts of justice, but enjoins to its followers the observance of a number of daily ceremonies, consisting of prayers and washings at stated intervals, which tend to fix down superstition upon the human mind. In addition to these, its extreme intolerance has a tendency to render the intellectual improvement of the people that have once adopted it extremely difficult, while the sanction that it gives to the law of polygamy, at once places private society on a defective footing, and ensures the bad government of the state.

261 Gentoo religion.

The most pernicious of all the religions of Asia, however, appears to be the Gentoo superstition, or the religion of the natives of Hindoostan. It does not indeed authorize polygamy, nor does it sanction the persecution of those who believe in other religions; but in every other respect, it is most evidently ruinous to the vigour of the human character. It fills the mind with all the idle tales and superstitions of an absurd polytheism. It enjoins an endless variety of rites and purifications; and under its influence a morsel of bread cannot be eaten, or a cup of water tasted, without the utmost caution, that it have not come into contact with impure hands or impure vessels. The division of the people into hereditary casts, of different degrees of dignity according to their respective employments, none of which casts can intermarry, or even eat or drink together, completely insulates every class of inhabitants; and by fixing them down to hereditary occupations, prevents every exertion of talents beyond the sphere in which individuals happen to be born. Religion, or superstitious fear of offending against the rules of his cast, constantly occupies and absorbs the whole mind and faculties of a Hindoo, so as utterly to deprive him of intellectual vigour or courage to investigate the foundations of the notions which place under controul every step of his life. A people thus divided can possess little united strength or energy as a nation, and the feebleness even of their bodily exertions may well suggest the question, Whether superstitious fear and intellectual imbecility fixed down upon a people during a course of ages, has not a tendency to diminish the corporeal powers, and to render the body as feeble as the mind? In justice to the religion of the Hindoos, however, it may be observed, that if it prevent the nation from acquiring great power, it also guards its civilization, or the arts that it possesses from being entirely lost in consequence of conquests by barbarians. Every Hindoo being bound by his religion to follow the occupation of his father, if a whole cast is not utterly exterminated, the arts which were understood by its members cannot be lost. They are immediately practised anew; they come to be in request, and the cast is employed by society, and multiplied as before.

Asia.

262 Influence of physical causes on civilized nations.

That we may not appear, however, from a love of system, altogether to deny the effect of physical causes upon the history of the civilized nations of Asia, we shall acknowledge, that the fertility of the soil in these countries in all probability assists the tendency to negligence of management which appears in their governments. In the more barren regions of Europe, it is absolutely necessary that a government act with a considerable degree of caution, and administer justice well, to enable a nation to attain to any tolerable share of power or prosperity. With us, man has many imperious wants, which must be supplied before an individual can contribute any thing to the public. He must at least have food, which can only be extorted from an ungrateful soil by patient and skilful industry. He must also have clothes and fuel. The fertility of the Asiatic soil enables man to obtain food with less labour than in Europe, while the mildness of the climate subjects him to little expence on account of fuel and clothing. Hence in these countries a much less degree of industry is necessary for the support of individuals, and to enable them to contribute something towards the public revenue. Governments, therefore, are not so soon brought under the necessity of repairing their own errors. Abuses are more readily allowed to multiply, and at last can be got quit of with greater difficulty. Add to this, that in a country whose inhabitants could not originally subsist without the exertion of much industry, a more vigorous character is apt to diffuse itself among the people, than in those nations upon whom, in their rude state, the slightest effort of labour conferred abundance, and who have only come to find good management and industry requisite, in consequence of the great multiplication of their numbers.

263 Arabian conquest.

Besides the revolutions occasioned by Tartar invasions, several of the nations of Asia experienced a great revolution from the arms of another barbarous race of men, the inhabitants of the peninsula of Arabia. Similar causes to those which have repeatedly given victory to the Tartars, enabled the Arabians to vanquish the neighbouring nations. They also exist in a pastoral state, and are divided into tribes or families. The Arabians, however, have not been accustomed to conquest like the Tartars. Arabia is of trifling extent, when compared to Tartary and its dependencies; its strength being less, it is less likely to be engaged in distant enterprises. Unlike to Tartary, it has always possessed some cities, and a part of the people have connected themselves with the arts and the commerce of the civilized nations around them. Hence something more was necessary to rouse the Arabian nation, and to unite its members in one common enterprise, than the mere love of dominion. The Arabs became conquerors, only because Mahomet was successful in rendering them fanatics; and they subdued the earth, not so much from a desire to possess its riches and its luxuries, as from a zeal to extend the glory of God, and to give the means of salvation to mankind. When their religion had prevailed in all directions, and other nations adopted the same spirit and cause, the Arabians relapsed into their original unimportance, and ceased to be dangerous to the peace of the world.

Of late some of the nations of Asia have undergone subjugation

From Arrowsmith.

Published by A. Constable & Co. Edinburgh.

Asia.

subjugation, and others have been threatened with it, not from the ordinary quarter of Tartary, or from any other race of barbarians, but from the enterprises of the civilized nations of Europe. This new peril has originated from several causes. The discovery of the mariners compass, and the improvements which have occurred in navigation, have brought the nations of Asia, as it were, nearer to those of this north-west corner of the globe, and exposed them in a greater degree to their attacks. The nations of Europe, also, from their better government, and from a religion which prohibits polygamy, and which, at least in the protestant states, interferes little in the affairs of this world, and confers no dominion upon its priests, have of late been enabled to make a more rapid progress in the improvement of every art, than was ever formerly done, and among the rest they have improved the terrible art of war. In the mean time, the civilized nations of Asia have been either standing still as usual, satisfied with their allotted measure of intelligence, or they have been going backward. Thus the relative strength of these two quarters of the world has been greatly altered, and should any remarkable additional improvement in the art of navigation be soon made, it is probable that all Asia will be enslaved by European nations. Should such an event take place, its first consequences will probably prove unfortunate. Europe will be corrupted, while Asia will not be reformed. Its imperfect governments, however, and its false religions, will be broken up. The superiority of the human character in European countries is so great, and the population of North America is increasing so rapidly, carrying the pursuits of science and the practice of the arts in its train, that there is little doubt the race of Europe must in a few centuries obtain the dominion of the earth. A new era, therefore, is commencing for Asia, the events of which cannot be foreseen. From the short review, however, which we have taken of that great continent, we perceive, and we perceive with satisfaction, that the most beautiful regions of this globe are by no means unfit, as was supposed, for the production of a vigorous and active race of men. The Hindoo is timid and feeble; but it is not his climate which renders him so. In the same climate with Hindoostan, and scarcely divided from it, a vigorous race of men has been found to exist, forming a rising people, eager to emulate the career of civilized and powerful nations. It is the religion of the Hindoo, therefore, that is the cause of his weakness, as the government of China is the cause of the stationary character of its people. Were these causes of feebleness removed, and above all were the art of printing diffused, the nations of the earth would probably by degrees approach nearer to a similarity of mind and talents, than they have hitherto been accounted capable of doing. Even Siberia itself, by the great tracts of fertile land which attention to its inland navigation is capable of laying open, may one day contribute to the general stock of human power and riches. It ought never to be forgotten that this globe is given as a valuable domain or possession to the human race, only in proportion to the degree in which they subdue its native wildness or sterility; and it becomes a fit and salubrious habitation for them, according to the degree in which it is improved by cultivation. The rein-deer once wandered in the forests of Germany. It cannot now live upon the shores of the Baltic, and is forced to seek a region sufficiently cold for its constitution, within the polar circle and in the neighbourhood of the Icy sea. The progress of civilization and of agriculture have accomplished this change in the climate of the north of Europe, and the descendants of Europeans may probably accomplish still greater alterations upon the north of Asia.

264 European conquests.

265 Prospect of the destiny of Asia.

Asia ‖ Asisia.

Asia Minor, or *Lesser Asia*; the same with Natolia. See Natolia.

ASIARCHÆ, (termed by St Paul, *Chief of Asia*, Acts xix. 31.) were the Pagan pontiffs of Asia, chosen to superintend and have the care of the public games, which they did at their own expence: for which reason they were always the richest and most considerable men of the community.

ASIDE, in the drama, something said by an actor, which some, or even all the other actors present are supposed not to hear; a circumstance justly condemned as being unnatural and improbable.

ASIITO, a town of Italy, in Perugia, and in the pope's territories. E. Long. 23. 40. N. Lat. 43. 0.

ASILUS, or Hornet-fly. See Entomology *Index*.

ASINARA, an island of Italy, on the western coast of Sardinia. E. Long. 8. 30. N. Lat. 41. 0.

ASINIUS Pollio, a Roman consul and orator, distinguished himself under Augustus by his exploits and his literary works. He is frequently mentioned with praises by Horace and Virgil, and is said to have collected the first library at Rome. He died at Frescati, at 80 years of age.

ASIONGABER, Esiongeber, or Eziongeber, a town of Arabia Petræa, on the bay of Elath, a part of the Arabian gulf: the dock or station for the ships of Solomon and Jehoshaphat; an ancient town, mentioned also by Moses. It was afterwards called *Berenice* (Josephus).

ASISIA, or Assisia, a town of Liburnia (Ptolemy, Antonine), now in ruins, but exhibiting many monuments of antiquity. It is the Assesia or Asseria of Pliny. This author, after having specified the Liburnian cities that were obliged to attend the congress or diet of Scardona, adds to the catalogue the free Asserians, *immunesque Asseriates;* and this people, who created their own magistrates, and were governed by their own municipal laws, were no doubt more rich and powerful than their neighbours.

The vestiges of the walls of Asseria that still remain, are a sufficient proof of this; for their circumference is clearly distinguishable above ground, and measures 3600 Roman feet. The space enclosed by them forms an oblong polygon, and they are built with common Dalmatian marble; but not taken from the hill on which they stand, for that furnishes only soft stone. The walls are invested, both inside and out, with this marble: some of the stones are ten feet long, and they are all of considerable dimensions. The thickness of these fortifications is commonly about eight feet: but at the narrowest extremity, which falls towards the foot of the hill, they are eleven feet thick; and, in some parts, their height still above ground reaches to near 30 feet. An antiquary, or even a simple lover of the fine arts, or of erudition, the abbé Fortis observes, cannot help wishing at Podgraje (the modern name of Asseria),

Asisia ‖ Asna.

Asserіa), that some powerful hand *quicquid sub terra est in apertum proferit:* and such a wish becomes stronger when he reflects, that since the destruction of that city no search has ever been made under ground, with a view to discover any thing curious; and yet these walls without doubt enclose a valuable deposite of antiquities, thrown down in heaps, who knows by what cause; perhaps naturally, by an earthquake, or perhaps by a sudden inundation of barbarians, which is still worse. The gate now demolished, the considerable height of the walls to be seen in several places from without, some pieces of thick walls that still appear levelled to the ground among the bushes, are circumstances which give ground to hope that many costly monuments might be recovered out of these ruins. The magnificence of the remaining wall, and the many pieces of well-cut stone and fine marbles scattered over the contiguous fields, afford sufficient proof that both good taste and grandeur once flourished in that country. In the midst of the rubbish which covers the remains of Asseria, the parish church of the little village stands insulated; it is built of broken pieces of ancient ruins, taken as they happened to be nearest, mixed with mutilated inscriptions and fragments of noble cornices.

ASISIO, or ASITO, a city of the pope's territories in Italy, situated about 16 miles east of Perugia. E. Long. 13. 35. N. Lat. 43.

ASKELON. See ASCALON.

ASKERON, a place five miles from Doncaster, noted for a medicinal spring. It is a strong sulphureous water, and is slightly impregnated with a purging salt. It is recommended internally and externally in strumous and other ulcers, scabs, leprosy, and similar complaints. It is good in chronic obstructions, and in cases of worms and foulness of the bowels.

ASKRIG, a town in the north riding of Yorkshire. W. Long. 0. 5. N. Lat. 53. 50.

ASLANI, in *Commerce*, a silver coin, worth from 115 to 120 aspers. See ASPER.

ASMONEUS, or ASSAMONEUS, the father of Simon, and chief of the Asmoneans, a family that reigned over the Jews 126 years.

ASNA, or ESNA, a town in Upper Egypt, seated upon the Nile, and occupying the site of the ancient Latopolis. It is near the cataracts of the Nile, and is the last place of any magnitude on the side of Nubia. It contains several monuments of antiquity; and among the rest an ancient Egyptian temple, pretty entire, all painted throughout, except in some places that are effaced by time. The columns are full of hieroglyphic figures. This structure is considered by Denon as one of the most perfect monuments of ancient architecture he had seen. A little way from thence are the ruins of an ancient nunnery, said to be built by St Helena, surrounded with tombs.—Asna is the principal town in these parts, and the inhabitants are rich in corn and cattle. They drive a considerable trade into Lower Egypt and Nubia, by means of the Nile, and also by the caravans that pass over the desert. The inhabitants are all Arabs, except about 200 Copts, the ancient inhabitants, and a sort of Christians. They are under the government of the Turks, who have a cadi, and the Arabs have two scheriffs of their own nation. E. Long. 32. 35. N. Lat. 23. 15.

Asola ‖ Asow.

ASOLA, a town of the Bressan in Italy, belonging to the republic of Venice. E. Long. 14. 18. N. Lat. 45. 15.

ASOSO, a town of Italy, in the Trevisan, seated on a mountain 17 miles north-west of Treviso, and 10 north-east of Bassano. E. Long. 12. 2. N. Lat. 45. 49.

ASOPH, a town of Cuban Tartary, in Asia, seated on the river Don, near its mouth, a little to the east of the Palus Mæotis, or sea of Asoph. It has been several times taken and retaken of late years; but in 1739, the contending powers agreed that the fortifications should be demolished; and the town remains under the dominion of Russia. E. Long. 39. 5. N. Lat. 47. 18.

ASOPUS, a river of Phrygia Major, which, together with the Lycus, washes Laodicea, (Pliny).—Another of Bœotia, which running from Mount Cithæron, and watering the territory of Thebes, separates it from the territory of Platæa, and falls with an east course into the Euripus, at Tanagra. On this river Adrastus king of Sicyon built a temple to Nemesis, thence called *Adrasteia.* From this river Thebes came to be surnamed *Asopides*, (Strabo). It is now called *Asopo.* A third Asopus, a river of Peloponnesus, which runs by Sicyon, (Strabo); and with a north-west course falls into the Sinus Corinthiacus, to the west of Corith.—A fourth, a small river of the Locri Epicnemidii, on the borders of Thessaly, (Pliny); rising in Mount Oeta, and falling into the Sinus Maliacus.

ASOPUS, a town of Laconia, (Pausanias); on the Sinus Laconicus, with a port in a peninsula, between Boæ to the east, and the mouth of the Eurotas to the west. The citadel only remains standing, now called by the sailors *Castel Rampano.*

ASOR, or HASOR, in *Ancient Geography*, a town of the tribe of Judah, to the south-west, on the borders of Ascalon, (Joshua); as also Hasor-Hadata, translated by the Seventy Ασωρ Καινη (id).—Another Asor, Asorus, or Hazor, a town of Galilee; called the capital of all the kingdoms to the north of Palestine. It was taken by Joshua; the inhabitants were put to the sword, and their houses burnt. It was afterwards rebuilt (Judges, 1 Sam.); but remained still in the hands of the Canaanites, though in the lot of the tribe of Naphtali, (Joshua). It lay to the north of the Lacus Samachonites, called in Scripture the *Waters of Merom* (Josephus).

ASOW, a celebrated and important fortress of Russia, once a place of considerable trade, but now demolished. It was situated in the district of Bachmut, near the place where the Greeks many centuries ago built the city of Tanais, which was very famous for its trade, and underwent many vicissitudes. The Genoese, who settled a trade with Russia soon after the discovery of Archangel by Captain Chancellor, became masters of this place, and gave it the name of *Tana* or *Catana:* but the Tartars, who were very powerful in these parts, seem to have been in possession of it long before: for, as Busching informs us, there are Asow coins yet extant, on which is the name of *Tacktamyss Kan.* From the Genoese it fell into the hands of the Turks, lost its

Asow || Aspasia.

its trade, and became an inconsiderable town. In 1637, it was taken by the Cossacks, who defended it against the Turks in 1641, and next year set fire to it, and blew it up. The Turks rebuilt it with strong fortifications. The Russians laid claim to it in 1672, and took it in 1696; but, by the treaty of Pruth in 1711, it was restored to the Turks. In 1736, the Russians became masters of Asow; but by the treaty of Belgrade they were obliged to relinquish it, and entirely destroy the place.

ASP, in *Natural History*, a small poisonous kind of serpent, whose bite gives a speedy but easy death. It is said to be thus denominated from the Greek ασπις, *shield*, in regard to the manner of its lying convolved in a circle, in the centre of which is the head, which it exerts, or raises, like the umbo or umbilicus of a buckler. This species of serpent is very frequently mentioned by authors; but so carelessly described, that it is not easy to determine which, if any of the species known at present, may properly be called by this name. It is said to be common in Africa, and about the banks of the Nile; and Bellonius mentions a small species of serpent which he had met with in Italy, and which had a sort of callous excrescence on the forehead, which he takes to have been the aspis of the ancients. It was with the asp that Cleopatra is said to have despatched herself, and prevented the designs of Augustus, who intended to have carried her captive to adorn his triumphal entry into Rome. But the fact is contested: Brown places it among his vulgar errors. The indications of that queen's having used the ministry of the asp, were only two almost insensible pricks found in her arm; and Plutarch says it is unknown what she died of. At the same time, it must be observed, that the slightness of the pricks found in her arm furnishes no presumption against the fact; for no more than the prick of a needle point dipt in the poison was necessary for the purpose.

Lord Bacon makes the asp the least painful of all the instruments of death. He supposes it to have an affinity to opium, but to be less disagreeable in its operation; and his opinion seems to correspond with the accounts of most writers, as well as with the effects described to have been produced upon Cleopatra.

The ancients had a plaster called δι Ασπιδων, made of this terrible animal, of great efficacy as a discutient of strumæ and other indurations, and used likewise against pains of the gout. The flesh, and skin or exuviæ, of the creature, had also their share in the ancient materia medica.

ASPA, a town of Parthia, (Ptolemy), now *Ispahan*, (Holstenius). In Ptolemy the latitude seems to agree, being 33°; but whether the longitude does, is a question. E. Long. 51. 0. N. Lat. 32. 30.

ASPALATHUS, African Broom. See Botany *Index*.

ASPARAGUS, Sparagus, or Sparrow-grass. See Botany *Index*.

ASPASIA of Miletus, a courtesan who settled at Athens under the administration of Pericles, and one of the most noted ladies of antiquity. She was of admirable beauty: yet her wit and eloquence, still more than her beauty, gained her extraordinary reputation among all ranks in the republic. In eloquence she surpassed all her contemporaries; and her conversation was so entertaining and instructive, that notwithstanding the dishonourable commerce she carried on in female virtue, persons of the first distinction, male and female, resorted to her house as to an academy: she even numbered Socrates among her hearers and admirers. She captivated Pericles, in such a manner, that he dismissed his own wife, in order to espouse her; and, by her universal knowledge, irresistible elocution, and intriguing genius, she in a great measure influenced the administration of Athens. She was accused of having excited, from motives of personal resentment, the war of Peloponnesus; yet, calamitous as that long and obstinate conflict proved to Greece, and particularly to Athens, it may be suspected that Aspasia occasioned still more incurable evils to both. Her example, and still more her instructions, formed a school at Athens by which her dangerous profession was reduced into system. The companions of Aspasia served as models for painting and statuary, and themes for poetry and panegyric. Nor were they merely the objects, but the authors of many literary works, in which they established rules for the behaviour of their lovers, particularly at table; and explained the art of gaining the heart and captivating the affections. The dress, behaviour, and artifices of this class of women, became continually more seductive and dangerous; and Athens thenceforth remained the chief school of vice and pleasure, as well as of literature and philosophy.

Aspasia || Asperifoliate.

ASPASTICUM, (from ασπαζομαι, "I salute,") in ecclesiastical writers, a place, or apartment, adjoining to the ancient churches, wherein the bishop and presbyters sat, to receive the salutations of the persons who came to visit them, desire their blessing, or consult them on business.—This is also called *aspasticum diaconicum*, *receptorium*, *metatorium*, or *mesatorium*, and *salutatorium:* in English, "greeting-house."

ASPECT, in *Astronomy*, denotes the situation of the planets and stars with respect to each other.

There are five different aspects. 1. Sextile aspect is when the planets or stars are 60°-distant, and marked thus *. 2. The quartile, or quadrate, when they are 90° distant, marked □. 3. Trine, when 120° distant, marked △. 4. Opposition, when 180° distant, marked ☍. And, 5. Conjunction, when both in the same degree, marked ☌.

Kepler, who added eight new ones, defines aspect to be the angle formed by the rays of two stars meeting on the earth, whereby their good or bad influence is measured: for it is to be observed, that these aspects being first introduced by astrologers, were distinguished into benign, malignant, and indifferent; the quartile and opposition being accounted malign; the trine and sextile, benign or friendly; and the conjunction, indifferent.

ASPEN tree. See Populus, Botany *Index*.

ASPER, in *Grammar*, an accent peculiar to the Greek language, marked thus (ʽ); and importing that the letters over which it is placed ought to be strongly aspirated, or pronounced as if an *h* were joined with them.

Asper, or *Aspre*, in *Commerce*, a Turkish coin, three of which make a Medine.

ASPERIA arteria, in *Anatomy*, the same with the windpipe or trachea. See Anatomy *Index*.

ASPERIFOLIATE, or Asperifolious, among botanists, such plants as are rough-leaved, having their leaves

Asperifoliate || Asphaltites.

leaves placed alternately on their stalks, and a monopetalous flower divided into five parts.—They constitute an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are these genera, viz. tournefortia, cerinthe, symphytum, pulmonaria, anchusa, lithospermum, myosotis, heliotropium, cynoglossum, asperugo, lycopsis, echium, borrago: *magis minusve oleraceæ, mucilaginosæ, et glutinosæ sunt.* Lin. In the present system, these are among the pentandria monogynia.

ASPERIFOLIÆ PLANTÆ, rough-leaved plants; the name of a class in Hermannus, Boerhaave, and Ray's methods, consisting of plants which have four naked seeds, and whose leaves are rough to the touch.

In Tournefort's System, these plants constitute the third section or order of the second class; and in Linnæus's Sexual Method, they make part of the pentandria monogynia.

ASPERITY, the inequality of the surface of any body, which hinders the hand from passing over it freely.—From the testimony of some blind persons, it has been supposed that every colour hath its particular degree of asperity: though this has been denied by others. See the article BLIND.

ASPEROSA, a town of Turkey in Europe; it is a bishop's see, situated on the coast of the Archipelago. E. Long. 25. 20. N. Lat. 40. 58.

ASPERUGO, SMALL WILD BUGLOSS. See BOTANY *Index*.

ASPERULA, WOODROOF. See BOTANY *Index*.

ASPHALTITES, so called from the great quantity of bitumen it produces; called also the *Dead sea;* and from its situation, the *East sea*, the *Salt sea*, the *sea of Sodom*, the *sea of the Desert*, and the *sea of the Plain*, in the sacred writings: A lake of Judea.

Many things have been said and written of this famed, or, if they were indeed true, rather infamous lake: such as that it arose from the submersion of the vale of Siddim, where once stood, as is commonly reported, the three cities which perished in the miraculous conflagration, with those of Sodom and Gomorrah, for their unnatural and detestable wickedness: on which account this lake has been looked upon as a lasting monument of the just judgment of God, to deter mankind from such abominations. Hence it is added, that the waters of the lake are so impregnated with salt, sulphur, and other bituminous stuff, that nothing will sink or live in it; and that it casts such stench and smoke, that the very birds die in attempting to fly over it. The description likewise of the apples that grew about it, fair, without, and only ashes and bitterness within, were looked upon as a farther monument of God's anger. So likewise the description which many travellers give not only of the lake, but of all the country round about, of the whole appearing dreadful to behold, all sulphureous, bituminous, stinking, and suffocating: and lastly, what hath been farther affirmed of the ruins of the five cities being still to be seen in clear weather, and having been actually seen in these latter times; all these surprising things, and ill-grounded notions, though commonly, and so long, received among Christians, have been of late so much exploded, not only by the testimony of very credible witnesses, but even by arguments drawn from Scripture, that we must give them up as inventions, unless we will suppose the face and nature of all these things to have been entirely changed. Those, in particular, of bodies not sinking in the water, and of birds being stifled by the exhalations of it, appear now false in fact, though it is true, that the quantity of saline matters, with which it is impregnated, renders it so much specifically heavier than fresh water, that bodies will not so easily sink. Its waters were found, by Dr Marcet in 1807, to have a specific gravity of 1,211; but Klaproth, a German chemist, found it to be 1,245, which is much higher than that of sea water. But objects of all kinds above this specific gravity are found to sink in it; birds fly over it without injury, and according to Chateaubriand fishes live in it. The substances it holds in solution are nearly the same as are found in sea water; muriates of lime, of soda, and of magnesia. To reconcile these things with the experiments which Pliny* tells us had been made by Vespasian, is impossible, without supposing that those ingredients have been since much exhausted, which is not very probable. With respect to its salt, we are told, the Arabs make quantities of it from that lake, in large pits about the shore, which they fill with that water, and leave to be crystallized by the sun. This salt is in some cases much commended by Galen, as very wholesome, and a strengthener of the stomach, &c. on account of its unpleasant bitterness.

Asphaltites.

*Nat. Hist. lib. v. cap. 15.

What likewise relates to the constant smoke ascending from the lake, its changing the colour of its water three times a-day, so confidently affirmed by Josephus† and other ancients, and confirmed by Prince Radziville and other moderns, who pretend to have been eye-witnessess of it, is all now in the same manner exploded by authors of more modern date, and of at least equal candour. The unhealthiness of the air about the lake was affirmed by Josephus and Pliny, especially on the west; the monks that live in the neighbourhood confirm the same, and would have dissuaded Dr Pococke from going to it on that account; and, as he ventured to go and bathe in it, and was two days after seized with a dizziness, and violent pain in the stomach, which lasted near three weeks, they made no doubt but it was occasioned by it; and he doth not seem to contradict them. As to the water, it is, though clear, so impregnated with salt, that those who dive into it come out covered with a kind of saline matter. There is one remarkable thing relating to this lake, generally agreed on by all travellers and geographers, viz. that it receives the waters of Jordan, a considerable river, the brooks of Jabbok, Kishon, Arnon, and other springs, which flow into it from the adjacent mountains, and yet never overflows, though there is no visible way to be found by which it discharges that great influx. Some naturalists have been greatly embarrassed to find a discharge for these waters; and have therefore been inclined to suspect the lake had a communication with the Mediterranean. But, besides that we know of no gulf to corroborate this supposition, it has been demonstrated, by accurate calculation, that evaporation is more than sufficient to carry off the waters brought by the river. It is, in fact, very considerable; and frequently becomes sensible to the eye, by the fogs with which the lake is covered at the rising of the sun, and which are afterwards dispersed by the heat. It is enclosed on the east and west with exceeding high mountains, many of them craggy and dreadful to behold.

† *Bell. Jud. lib. v. cap. 5.*

Asphaltites. hold. On the north it has the plain of Jericho; or, if we take in both sides of the Jordan, it has the Great Plain, properly so called, on the south; which is open, and extends beyond the reach of the eye. Josephus gives this lake 580 furlongs in length, from the mouth of the Jordan to the town of Segor, on the opposite end, that is about 22 leagues; and about 150 furlongs or 5 leagues, in its greatest breadth; but our modern accounts commonly give it 24 leagues in length, and 6 or 7 in breadth. On the west side of it is a kind of promontory, where they pretend to show the remains of Lot's metamorphosed wife. Josephus says, it was still standing in his time; but when Prince Radziville inquired after it, they told him there was no such salt pillar or statue to be found in all that part. However, they have found means, about a century after him, to recover, as they pretended to assure Mr Maundrell, a block or stump of it, which may in time grow up, with a little art, into its ancient bulk.

It is to be observed here, that the name of *Dead sea* is not to be found in the sacred writings; but hath been given to this lake because no creature will live in it, on account of its excessive saltness, or rather bituminous quality; for the Hebrews rank sulphur, nitre, and bitumen, under the general name of *salt*. However, some late travellers have found cause to suspect the common report of its breeding no living creature; one of them having observed, on the shore, two or three shells of fish like those of an oyster, and which he supposes to have been thrown up by the waves, at two miles distance from the mouth of the Jordan, which he there takes notice of, lest they should be suspected to have been brought into the lake by that way. And Dr Pococke, though he neither saw fish nor shells, tells us, on the authority of a monk, that some sort of fish had been caught in it; and this is confirmed by Chateaubriand, who visited the shores of the lake in 1807. Mr Volney, however, affirms that it contains neither animal nor vegetable life. We see no verdure on its banks, nor are fish to be found within its waters. But he adds, that it is not true that its exhalations are pestiferous, so as to destroy birds flying over it. "It is very common (says he) to see swallows skimming its surface, and dipping for the water necessary to build their nests. The real cause which deprives it of vegetables and animals is the extreme saltness of the water, which is infinitely stronger than that of the sea. The soil around it, equally impregnated with this salt, produces no plants; and the air itself, which becomes loaded with it from evaporation, and which receives also the sulphureous and bituminous vapours, cannot be favourable to vegetation: hence the deadly aspect which reigns around this lake. In other respects, the ground about it, however, is not marshy; and its waters are limpid and incorruptible, as must be the case with a dissolution of salt. The origin of this mineral is easy to be discovered; for on the south-west shore are mines of fossil salt, of which I have brought away several specimens. They are situated in the side of the mountains which extend along that border; and, from time immemorial, have supplied the neighbouring Arabs, and even the city of Jerusalem. We find also on this shore fragments of sulphur and bitumen, which the Arabs convert into a trifling article of commerce; as also hot fountains, and deep crevices, which are discovered at a distance by little pyramids built on the brink of them. We likewise find a sort of stone, which, on rubbing, emits a noxious smell, burns like bitumen, receives a polish like white alabaster, and is used for the paving of court-yards. At intervals, we also meet with unshapen blocks, which prejudiced eyes mistake for mutilated statues, and which pass with ignorant and superstitious pilgrims for monuments of the adventure of Lot's wife; though it is nowhere said she was metamorphosed into stone like Niobe, but into salt, which must have melted the ensuing winter."

Asphaltites, Asphaltum.

It is on account of this bitumen that it hath had the name of *Asphaltite lake*, it being reported to have thrown up great quantities of that drug, which was much in use among the Egyptians, and other nations, for embalming of dead bodies. Josephus assures us, that in his days it rose in lumps as big as an ox without its head, and some even larger. But whatever it may have formerly done, we are assured by Mr Maundrell and others, that it is now to be found but in small quantities along the shore, though in much greater near the mountains on both sides the lake. But the contrary is since affirmed by two or more late * travellers; one of whom tells us, that it is observed to float on the surface of the water, and to come on the shore after windy weather, where the Arabians gather it, and put it to all the uses that common pitch is used for, even in the composition of some medicines; and another † tells us, he was there informed, that it was raised at certain times from the bottom, in large hemispheres, which, as soon as they touch the surface, and are acted upon by the external air, burst at once, with great noise and smoke like the *pulvis fulminans* of the chemists, dispersing themselves about in a thousand pieces. From both these judicious authors we may conclude the reason of Mr Maundrell's mistake, both as to the lake's throwing it up only on certain seasons (that reverend gentleman might chance to be there at the wrong time); and likewise as to his not observing it about the shores, seeing the Arabs are there ready to gather it as soon as thrown up: all of them describe it as resembling our black pitch, so as not to be distinguished from it but by its sulphureous smoke and stench when set on fire; and it has been thought to be the same with that which our druggists sell under the name of *bitumen Judaicum*, or *Jewish pitch*, though we have reason to think that this last is factitious, and that there is now none of the right asphaltum brought from Judea.

* *Pococke's Travels*, p. 56.

† *Shaw's Travels*, p. 374.

It hath, moreover, been confounded with a sort of blackish combustible stone thrown on the shore, and called by some *Moses's stone*, which being held in the flame of a candle, will soon burn, and cast a smoke and intolerable stench; but with this extraordinary property, that though it loses much of its weight and colour, it becoming in a manner white, yet it diminishes nothing in its bulk. But these, Dr Pococke tells us, are found about two or three leagues from the shore. He concludes, however, from it, that a *stratum* of that stone under the lake is probably one part of the matter that feeds the subterraneous fire, and causes the bitumen to boil up out of it. See Asphaltites, Supplement.

ASPHALTUM, Bitumen Judaicum, or Jews Pitch, is a light solid bitumen, of a dusky colour on the outside, and a deep shining black within; of very

Asphaltum ‖ Aspicueta.

little taste; and having scarcely any smell, unless heated, when it emits a strong pitchy one. It is found in a soft or liquid state on the surface of the Dead sea, and by age grows dry and hard. The same kind of bitumen is met with likewise in the earth, in other places of the world, in China, America, and in some places of Europe, as the Carpathian hills, France, Neufchatel, &c. There are several kinds of Jews pitch in the shops: but none of them are the genuine sort, and have little other title to their name than their being artificially compounded by Jews; and as they are a medley of we know not what ingredients, their medicinal use begins to be deservedly laid aside, notwithstanding the discutient, resolvent, pectoral, and other virtues attributed to this bitumen by the ancients. The true asphaltum was formerly used in embalming the bodies of the dead. The thick and solid asphalta are at present employed in Egypt, Arabia, and Persia, as pitch for ships; as the fluid ones, for burning in lamps, and for varnishes. Some writers relate, that the wall of Babylon, and the temple of Jerusalem, were cemented with bitumen instead of mortar. This much is certain, that a true natural bitumen, that for instance which is found in the district of Neufchatel, proves an excellent cement for walls, pavements, and other purposes, uncommonly firm, very durable in the air, and not penetrable by water. The watch and clock makers use a composition of asphaltum, fine lamp black, and oil of spike or turpentine, for drawing the black figures on dial plates: this composition is prepared chiefly by certain persons at Augsburg and Nuremberg. See the preceding article.

ASPHODELUS, Asphodel, or King's Spear. See Botany *Index*.

ASPHURELATA, in *Natural History*, are semimetallic fossils, fusible by fire, and not malleable in their purest state, being in their native state intimately mixed with sulphur and other adventitious matter, and reduced to what are called *ores*.

Of this series of fossils there are only five bodies, each of which makes a distinct genus; viz. antimony, bismuth, cobalt, zinc, and quicksilver.

ASPICUETA, Martin de, commonly called the Doctor of Navarre, or *Doctor Navarrus*, was descended of a noble family, and born the 13th of December 1491, at Varasayn, a small city of Navarre, not far from Pampeluna. He entered very young into the monastery of regular canons at Roncevaux, where he took the habit, which he continued to wear after he left the convent. He studied classical learning, natural and moral philosophy, and divinity, at Alcala, in New Castile, adopting chiefly the system of Petrus Lombardus, commonly called the *Master of the Sentences*. He applied to the study of the law at Ferrara, and taught it with applause at Toulouse and Cahors. After being first professor of canon law at Salamanca for 14 years, he quitted that place to be professor of law at Coimbra, with a larger salary. The duties of this office he discharged for the space of 20 years, and then resigned it to retire into his own country, where he took care of his nieces, the daughters of his deceased brothers. Having made a journey to Rome to plead the cause of Bartholomeo de Caranza archbishop of Toledo, who had been accused of heresy before the tribunal of the inquisition in Spain, and whose cause was, by the Pope's order, to be tried in that city, Aspicueta's writings, which were well known, procured him a most honourable reception. Pope Pius V. made him assistant to Cardinal Francis Aciat, his vice penitentiary; and Gregory XIII. never passed by his door without calling for him, and stopped sometimes a whole hour to talk with him in the street. His name became so famous, that even in his lifetime the highest encomium on a learned man was to call him a *Navarrus*. He was consulted as an oracle. By temperance he prolonged his life to a great length. His economy enabled him to give substantial proofs of his charity. Being very old, he used to ride on a mule through the city, and relieved all the poor he met; to which his mule was so well accustomed, that it stopped of its own accord at the sight of every poor man, till his master had relieved him. He refused several honourable posts in church and state, that he might have leisure to correct and improve the works he had already written, and compose others. He died at the age of 94, on the 21st of June 1586. He wrote a vast number of treatises, all which are either on morality or common law.

Aspicueta ‖ Assassin.

ASPIRATE, in *Grammar*, denotes words marked with the spiritus asper. See Asper.

ASPIRATION, among grammarians, is used to denote the pronouncing a syllable with some vehemence.

ASPLENIUM, Ceterach. See Botany *Index*.

ASS, in *Zoology*, is ranged as a species of equus, or horse. See Mammalia *Index*.

Coronation of the Ass, in antiquity, was a part of the ceremony of the feast of Vesta, wherein the bakers put bread crowns on the heads of these quadrupeds; *Ecce coronatis panis dependet asellis**. Hence, in an ancient calendar, the ides of June are thus denoted; *Festum est Vestæ. Asinus coronatur!*—This honour, it seems, was done the beast, because, by its braying, it had saved Vesta from being ravished by the Lampsacan god. Hence the formula, *Vestæ delicium est asinus*.

* *Ovid. Fast.* vi. 311.

ASSAI, in *Music*, signifies quick; and, according to others, that the motion of the piece be kept in a middle degree of quickness or slowness. As, *assai allegro, assai presto*. See Allegro and Presto.

ASSAM, a kingdom of eastern Asia. See Supplement.

ASSANCALA, a strong town in Armenia, near the river Arras, in the road between Erzerum and Erivan, and noted for its hot baths. It stands on a high hill, and has walls round it, strengthened with towers. E. Long. 41. 30. N. Lat. 39. 46.

ASSANCHIF, a town of Asia, in Diarbekir, seated on the river Tigris. E. Long. 42. 30. N. Lat. 37. 20.

ASSANS. See Assens.

ASSARIUM, in antiquity, denotes a small copper coin, being a part or diminutive of the *as*. The word ασσαριον is used by Suidas indifferently with οβολος and νομισμα, to denote a small piece of money; in which he is followed by Cujacius, who defines ασσαριον by *Minimus æris nummus*. We find mention of the assarion in the gospel of St Matthew, chap. x. ver. 29.

ASSARON, or Omer, a measure of capacity, in use among the Hebrews, containing five pints. It was the measure of manna which God appointed for every Israelite.

ASSASIN, or Assassin, a person who kills another

Assassin. ther with the advantage either of an inequality in the weapons, or by means of the situation of the place, or by attacking him at unawares.

The word *assassin* is said by some to have been brought from the Levant, where it took its rise from a certain prince of the family of the *Arsacidæ*, popularly called *Assassins*, living in a castle between Antioch and Damascus, and bringing up a number of young men, ready to pay a blind obedience to his commands; whom he employed in murdering the princes with whom he was at enmity. But according to Mr Volney, the word *Hassassin* (from the root *hass*, "to kill, to assassinate, to listen, to surprise,") in the vulgar Arabic signifies "Robbers of the night," persons who *lie in ambush to kill;* and is very universally understood in this sense at Cairo and in Syria. Hence it was applied to the *Batenians*, who slew by surprise. See the next article.

There was a certain law of nations, an opinion, received in all the republics of Greece and Italy, whereby he that assassinated an usurper of the supreme power was declared a virtuous man. At Rome especially, after the expulsion of the kings, the law was formal and solemn, and instances of it admitted. The commonwealth armed the hand of any citizen, and created him a magistrate for that moment.

Assassins, a tribe or clan in Syria, called also *Ismaelians* and *Batanists* or *Batenians*. These people probably owed their origin to the Karmatians, a famous heretical sect among the Mahometans, who settled in Persia about the year 1090; whence, in process of time, they sent a colony into Syria, where they became possessed of a considerable tract of land among the mountains of Lebanon, extending itself from the neighbourhood of Antioch to Damascus.

The first chief and legislator of this remarkable tribe appears to have been Hassan Sabah, a subtile impostor, who by his artifices made fanatical and implicit slaves of his subjects. Their religion was compounded of that of the Magi, the Jews, the Christians, and the Mahometans; but the capital article of their creed was to believe that the Holy Ghost resided in their chief; that his orders proceeded from God himself, and were real declarations of his divine pleasure. To this monarch the orientals gave the name of *Scheik;* but he is better known in Europe by the name of the *Old Man of the Mountain*. His dignity, instead of being hereditary, was conferred by election, where merit, that is, a superior multiplicity and enormity of crimes, was the most effectual recommendation to a majority of suffrages.

This chief, from his exalted residence on the summit of Mount Lebanon, like a vindictive deity, with the thunderbolt in his hand, sent inevitable death to all quarters of the world; so that from one end of the earth to the other, caliphs, emperors, sultans, kings, princes, Christians, Mahometans, and Jews, every nation and people, execrated and dreaded his sanguinary power, from the strokes of which there was no security. At the least suggestion or whisper that he had threatened the death of any potentate, all immediately doubled their guards, and took every other precaution in their power. It is known that Philip Augustus king of France, on a premature advice that the scheik intended to have him assassinated, instituted a new body-guard of men distinguished for their activity and courage, called *sergens d'armes*, with brass clubs, bows and arrows: and he himself never appeared without a club, fortified either with iron or gold. Most sovereigns paid secretly a pension to the scheik, however scandalous and derogatory it might be to the lustre of majesty, for the safety of their persons. The Knights Templars alone dared to defy his secret machinations and open force. Indeed they were a permanent dispersed body, not to be cut off by massacres or assassinations. Assassin.

This barbarous prince was furnished with resources unknown to all other monarchs, even to the most absolute despotic tyrant. His subjects would prostrate themselves at the foot of his throne, requesting to die by his hand or order, as a favour by which they were sure of passing into paradise. On them if danger made any impression, it was an emulation to press forward; and if taken in any enterprise, they went to the place of execution with a magnanimity unknown to others. Henry count of Champagne, who married Isabella daughter of Amaury king of Jerusalem, passing over part of the territory of the Assassins in his way to Syria, and talking highly of his power, their chief came to meet him. "Are your subjects (said the old man of the mountain) as ready in their submission as mine?" and without staying for an answer, made a sign with his hand, when ten young men in white, who were standing on an adjacent tower, instantly threw themselves down. On another occasion, Sultan Malek-Shah summoning the scheik to submit himself to his government, and threatening him with the power of his arms, should he hesitate to comply; the latter very composedly turning himself towards his guards, said to one of them, "Draw your dagger, and plunge it into your breast;" and to another, "Throw yourself headlong from yonder rock." His orders were no sooner uttered than they were joyfully obeyed: and all the answer he deigned to give the sultan's envoy was, "Away to thy master, and let him know I have many thousand subjects of the same disposition." Men so ready to destroy themselves were equally alert and resolute in being the ministers of death to others. At the command of their sovereign, they made no difficulty of stabbing any prince, even on his throne; and being well versed in the different dialects, they conformed to the dress and even the external religion of the country, that they might with less difficulty strike the fatal blow required by their chief. With the Saracens they were Mahometans; with the Franks, Christians: in one place they joined with the Mamelukes; in another, with the ecclesiastics or religious; and under this disguise seized the first opportunity of executing their sanguinary commission. Of this we meet with an instance, in the history of Saladin, while he was besieging Manbedge, the celebrated Hieropolis of antiquity. Being one day, with a few attendants, and they at some distance, reconnoitring the place for the better disposition of the attack, a man rushed on him with a dagger in his hand, and wounded him on the head; but the sultan, as he was endeavouring to repeat his stroke, wrested the dagger from him, and, after receiving several wounds, laid him dead at his feet. Before the sultan had well recovered himself, a second encountered him to finish the treachery of the former;

Assassins ‖ Assay.

but he met with the same fate: he was succeeded with equal fury by a third, who also fell by the hand of that magnanimous prince whom he was sent to assassinate. And it was observed that these wretches dealt about their fruitless blows as they lay in the agonies of death. With such rapidity was this transacted, that it was over before Saladin's guards could come to his assistance. He retired to his tent, and in great perturbation throwing himself on his sofa, ordered his servants to take a strict view of his household, and to cashier all suspected persons; at the same time asking with great earnestness, "Of whom have I deserved such treacherous usage?" But it afterwards appeared, that these villains had been sent by the old man of the mountain; of whom the vizir Kamscheglin had purchased the murder of Saladin, to free himself from so great a warrior, whom he could not meet in the field. To animate them in their frantic obedience, the scheik, before their departure on such attempts, used to give them a small foretaste of some of the delights which he assured them would be their recompense in paradise. Delicious soporific drinks were given them; and while they lay asleep, they were carried into beautiful gardens, where every allurement invited their senses to the most exquisite gratifications. From these seats of voluptuousness, inflamed with liquor and enthusiastic views of perpetual enjoyments, they sallied forth to perform assassinations of the blackest dye.

This people once had, or at least they feigned to have, an intention of embracing the Christian religion. They reigned a long time in Persia and on Mount Lebanon. Hulaku, a khan of the Mogul Tartars, in the year 655 of the Hegira, or 1254 of the Christian era, entered their country and dispossessed them of several places; but it was not till the year 1272 that they were totally conquered. This achievement was owing to the conduct and intrepidity of the Egyptian forces sent against them by the sultan Bibaris. It has, however, been thought, that the Druses, who still reside among the eminences of Mount Lebanon, and whose religion and customs are so little known, are a remnant of those barbarians.

ASSAULT, in *Law*, is an attempt to offer to beat another, without touching him: as if one lifts up his cane or his fist in a threatening manner at another; or strikes at him, but misses him: this is an assault, *insultus*, which Finch describes to be "an unlawful setting upon one's person." This also is an inchoate violence, amounting considerably higher than bare threats; and therefore, though no actual suffering is proved, yet the party injured may have redress by action of *trespass vi et armis*, wherein he shall recover damages as a compensation for the injury.

ASSAULT, in the military art, a furious effort made to carry a fortified post, camp, or fortress, wherein the assailants do not screen themselves by any works: while the assault continues, the batteries cease, for fear of killing their own men. The *enfans perdus* march first to the assault. See *Enfans Perdus*.

ASSAY, Essay, or Say, in *Metallurgy*, the proof or trial of the goodness, purity, value, &c. of metals and metalline substances. See Essay.

In ancient statutes this is called *touch;* and those who had the care of it *keepers of the touch*.—Under Henry VI. divers cities were appointed to have touch for wrought silver-plate, 2 Hen. VI. c. 14.—By this, one might imagine they had no better method of assaying than the simple one by the touchstone; but the case is far otherwise. In the time of King Henry II. the bishop of Salisbury, then treasurer, considering that though the money paid into the king's exchequer for his crown rents did not answer *numero et pondere*, it might nevertheless be mixed with copper or brass: wherefore a constitution was made, called the *trial by combustion;* which differs little or nothing from the present method of assaying silver. See a description of it in the Black Book in the Exchequer, written by Gervase of Tilbury, c. xxi. This trial is also there called *essaium*, and the officer who made it is named *fusor*. The method still in use of assaying gold and silver was first established by an act of the English parliament 1354.

Assay ‖ Assay-master.

Assaying, *Ars Docimastica*, in its extent, comprehends particular manners of examining every ore, or mixed metal, according to its nature, with the best-adapted fluxes; so as to discover, not only what metals, and what proportions of metal, are contained in ores; but likewise how much sulphur, alum, &c. may be obtained from each respectively. See Mineralogy *Index*. See also Assaying, Supplement.

Assaying is more particularly used by moneyers and goldsmiths, for the making a proof or trial by the cuppel, or test, of the fineness or purity of the gold and silver to be used in the coining of money, and manufacture of plate, &c. or that have been already used therein.

There are two kinds of assaying; the one before metals are melted, in order to bring them to their proper fineness; the other after they are struck, to see that the species be standard. For the first assay, the assayers used to take 14 or 15 grains of gold, and half a drachm of silver, if it be for money; and 18 grains of the one, and a drachm of the other, if for other occasions. As to the second assay, it is made of one of the pieces of money already coined, which they cut in four parts. The quantity of gold for an assay among us is six grains; in France nearly the same; and in Germany, about three times as much.

The proper spelling of that word, however, is Essay; under which article, therefore, the reader will find the subject more particularly treated.

Assay-Balance, or *Essay-Balance*. The flat pieces of glass often placed under the scales of an assay-balance, seem, by their power of electricity, capable of attracting, and thereby making the lighter scale preponderate, where the whole matter weighed is so very small. See *Essay-Balance*.

The electricity of a flat surface of about three inches square has been known to hold down one scale, when there were about 200 grains weight in the other. See Balance.

Assay-Master, or *Essay-Master*, an officer under certain corporations, intrusted with the care of making true touch, or assay, of the gold and silver brought to him; and giving a just report of the goodness or badness thereof. Such is the assay-master of the mint in the Tower, called also *assayer of the king*.

The assay-master of the goldsmith's company is a sort of assistant-warden, called also a *touch-warden*, appointed to survey, assay, and mark all the silver-work, &c. committed

Assay-master || Assemblies.

committed to him. There are also assay-masters appointed by statute at York, Exeter, Bristol, Chester, Norwich, Newcastle, and Birmingham, for assaying wrought plate. The assay-master is to retain eight grains of every pound troy of silver brought to him; four whereof are to be put in the pix, or box of deal, to be re-assayed the next year, and the other four to be allowed him for his waste and spillings.

Note, The number of pennyweights set down in the assay-master's report, is to be accounted as per pound, or so much in every pound of 12 ounces troy. For every 20 pennyweight, or ounce troy, the silver is found by the assay to be worse than standard or sterling, sixpence is to be deducted; because every ounce will cost so much to reduce it to standard goodness, or to change it for sterling.

In gold, for every carat it is set down to be worse than standard, you must account that in the ounce troy it is worse by so many times 3s. 8d.; and for every grain it is set down worse, you must account it worse by so many times 11d. in the ounce troy; and for every half grain $5\frac{1}{2}$d.: for so much it will cost to make it of standard goodness, &c.

ASSELYN, JOHN, a famous Dutch painter, was born in Holland, and became the disciple of Isaiah Vandervelde the battle-painter. He distinguished himself in history-painting, battles, landscapes, animals, and particularly horses. He travelled into France and Italy; and was so pleased with the manner of Bamboehio, that he always followed it. He painted many pictures at Lyons, where he married the daughter of a merchant of Antwerp, and returned with her to Holland. Here he first discovered to his countrymen a fresh and clear manner of painting landscapes, like Claude Lorraine; upon which all the painters imitated his style, and reformed the dark brown they had hitherto followed. Asselyn's pictures were so much admired at Amsterdam, that they sold there at a high price. He died in that city in 1660. Twenty-four pieces of landscapes and ruins, which he painted in Italy, have been engraved by Perelle.

ASSEMBLAGE, the uniting or joining of things together; or the things themselves so united or joined. It is also used, in a more general sense, for a collection of various things so disposed and diversified, that the whole produces some agreeable effect.

ASSEMBLY, the meeting of several persons, in the same place, upon the same design.

ASSEMBLY, in the beau-monde, an appointed meeting of fashionable persons of both sexes, for the sake of play, dancing, gallantry, conversation, &c.

ASSEMBLY, in the military art, the second beating of a drum before a march; at which the soldiers strike their tents, roll them up, and stand to arms.

ASSEMBLIES of the clergy are called *convocations*, *synods*, *councils*. The annual meeting of the church of Scotland is called a *General Assembly*: In this assembly his Majesty is represented by his Commissioner, who dissolves one meeting, and calls another, in the name of the *King*, while the Moderator does the same in the name of the *Lord Jesus Christ*.

ASSEMBLIES of the Roman people were called *comitia*.

Under the Gothic governments, the supreme legislative power was lodged in an assembly of the states of the kingdom held annually for the like purposes as our parliament. Some remains of this usage subsisted in the annual assemblies of the states of some provinces of France previous to the late revolution; but these were no more than shadows of the ancient assemblies. It is only in Great Britain, and perhaps in Sweden, that such assemblies retain their ancient powers and privileges.

Assemblies || Assets.

ASSENS, a sea-port town of Denmark, situated upon the Little Belt, a strait of the Baltic, which separates the isle of Funen from the continent. It is the common passage from the duchy of Sleswick to Copenhagen. E. Long. 10. 30. N. Lat. 55. 15.

ASSENT, in a general sense, implies an agreement to something proposed or affirmed by another.

Royal Assent, the approbation given by the king to a bill in parliament, after which it becomes a law.

ASSER, JOHN, or ASSERIUS MENEVENSIS, that is, *Asser of St David's*, bishop of Shirburn in the reign of Alfred the Great. He was born in Pembrokeshire in South Wales; and educated in the monastery of St David's by the archbishop Asserius, who, according to Leland, was his kinsman. In this monastery he became a monk, and by his assiduous application soon acquired universal fame as a person of profound learning and great abilities. Alfred, the munificent patron of genius, about the year 880, sent for him to court. The king was then at Dean in Wiltshire. He was so charmed with Asser, that he made him his preceptor and companion. As a reward for his services, he appointed him abbot of two or three different monasteries: and at last promoted him to the episcopal see of Shirburn, where he died and was buried in the year 910. He was, says Pits, a man of happy genius, wonderful modesty, extensive learning, and great integrity of life. He is said to have been principally instrumental in persuading the king to restore the university of Oxford to its pristine dignity and lustre. He wrote, *De vita et rebus gestis Alfredi*, &c. Lond. 1574, published by Archbishop Parker, in the old Saxon character, at the end of *Walsinghami hist.*——Francf. 1602, fol. Oxf. 1722, 8vo. Many other works are ascribed to this author by Gale, Bale, and Pits; but all doubtful.

ASSERIA. See ASISIA.

ASSERTION, in the language of the schools, a proposition advanced by the assertor, who avows the truth of it, and is ready to defend it.

ASSESSOR, an inferior officer of justice appointed chiefly to assist the ordinary judge with his opinion and advice.

ASSESSOR is also one who assesses, or settles taxes and other public dues.

ASSETS, in *Law*, signifies goods enough to discharge that burden which is cast upon the executor or heir, in satisfying the debts and legacies of the testator or ancestor. Assets are real or personal. Where a man hath lands in fee simple, and dies seised thereof, the lands which come to his heirs are assets real; and where he dies possessed of any personal estate, the goods which come to the executors are assets personal. Assets are also divided into *assets by descent*, and *assets in hand*. Assets by descent is where a person is bound in an obligation, and dies seised of lands which descend to the heir, the land shall be assets, and the

heir

Assets || Assiento.

heir shall be charged as far as the lands to him descended will extend. *Assets in hand* is when a man indebted makes executors, and leaves them sufficient to pay his debts and legacies; or where some commodity or profit ariseth to them in right of the testator: this is called *assets in their hands.*

ASSEVERATION, a positive and vehement affirmation of something.

ASSHETON, William, doctor of divinity, and rector of Beckenham, in Kent, was born in the year 1641, and was educated at Brazen-nose college, Oxford. After entering into orders, he became chaplain to the duke of Ormond, and was admitted doctor of divinity in 1673. Soon after, he was nominated to a prebend in the church of York, presented to the living of St Antholin, London, and to the rectory of Beckenham in Kent. He was the first projector of the scheme for providing for clergymen's widows, and others, by a jointure payable out of the mercers company. He wrote several pieces against the Papists and Dissenters, and some devotional tracts. He died at Beckenham in September 1711, in the 70th year of his age.

ASSIDEANS, or Chasidæans, (from the Hebrew *chasidim*, "merciful, pious"); those Jews who resorted to Mattathias to fight for the law of God and the liberties of their country. They were men of great valour and zeal, having voluntarily devoted themselves to a more strict observation of the law than other men. For after the return of the Jews from the Babylonish captivity, there were two sorts of men in their church; those who contented themselves with that obedience only which was prescribed by the law of Moses, and who were called *Zadikim*, i. e. the *righteous;* and those who, over and above the law, superadded the constitutions and traditions of the elders, and other rigorous observances: these latter were called *Chasidim*, i. e. the *pious.* From the former sprung the Samaritans, Sadducees, and Caraites; from the latter, the Pharisees and the Essenes.

ASSIDENT signs, in *Medicine*, are symptoms which usually attend a disease, but not always; hence differing from *pathognomic* signs, which are inseparable from the disease: e. gr. in the pleurisy, a pungent pain in the side, in an acute fever, difficulty of breathing, &c. collectively taken, are pathognomic signs; but that the pain extends to the hypochondrium or clavicle, or that the patient lies with more ease on one side than on the other, are *assident* signs.

ASSIDUUS, or Adsiduus, among the Romans, denoted a rich or wealthy person. The word in this sense is derived from *as assis*, q. d. a moneyed man. Hence we meet with *assiduous* sureties, *assidui fidejussores*, answering to what the French now call city sureties or securities, *cautions bourgeois.*

When Servius Tullius divided the Roman people into five classes, according as they were assessed or taxed to the public, the richer sort who contributed asses were denominated *assidui;* and as these were the chief people of business who attended all the public concerns, those who were diligent in attendances came to be denominated *assidui.*

ASSIENTO, a Spanish word signifying a *farm*, in commerce, is used for a bargain between the king of Spain and other powers, for importing negroes into the Spanish dominions in America, and particularly to Buenos Ayres. The first assiento was made with the French Guinea company; and, by the treaty of Utrecht, transferred to the English, who were to furnish 4800 negroes annually.

Assign || Assise.

ASSIGN, in *Common Law*, a person to whom a thing is assigned or made over.

ASSIGNATION, an appointment to meet. The word is generally understood of love-meetings.

ASSIGNEE, in *Law*, a person appointed by another to do an act, transact some business, or enjoy a particular commodity.

ASSIGNING, in a general sense, implies the making over the right of one person to another. In a particular sense, it signifies the pointing out of something; as, an error, false judgment, &c.

ASSIGNMENT, the transferring the interest one has in a lease, or other thing, to another person.

ASSIMILATION, in *Physics*, is that motion by which bodies convert other bodies related to them, or at least such as are prepared to be converted, into their own substance and nature. Thus, flame multiplies itself upon oily bodies, and generates new flame; air upon water, and produces new air; and all the parts, as well similar as organical, in vegetables and animals, first attract with some election or choice, nearly the same common or not very different juices for aliment, and afterwards assimilate or convert them to their own nature.

ASSISE, in old English law-books, is defined to be an assembly of knights, and other substantial men, together with a justice, in a certain place, and at a certain time: but the word, in its present acceptation, implies a court, place, or time, when and where the writs and processes, whether civil or criminal, are decided by judge and jury.

All the counties of England are divided into six circuits; and two judges are assigned by the king's commission, who hold their assises twice a-year in every county (except London and Middlesex), where courts of *nisi prius* are holden in and after every term, before the chief or other judge of the several superior courts; and except the four northern counties, where the assises are taken only once a-year) to try by a jury of the respective counties the truth of such matters of fact as are then under dispute in the courts of Westminster hall. These judges of assise came into use in the room of the ancient justices in eyre, *justiciarii in itinere;* who were regularly established, if not first appointed, by the parliament of Northampton, A. D. 1176, 22 Hen. II. with a delegated power from the king's great court or *aula regia*, being looked upon as members thereof: and they afterwards made their circuit round the kingdom once in seven years for the purpose of trying causes. They were afterwards directed by *magna charta*, c. 12. to be sent into every county once a-year to take or try certain actions then called *recognitions* or *assises;* the most difficult of which they are directed to adjourn into the court of common pleas to be there determined. The itinerant justices were sometimes mere justices of assise, or of dower, or of gaol-delivery, and the like; and they had sometimes a more general commission, to determine all manner of causes, *justiciarii ad omnia placita:* but the present justices of assise and *nisi prius* are more immediately derived

Assise. derived from the statute Westm. 2. 13 Edw. I. c. 30. explained by several other acts, particularly the statute 14 Edw. III. c. 16. and must be two of the king's justices of the one bench or the other, or the chief baron of the exchequer, or the king's serjeants sworn. They usually make their circuits in the respective vacations after Hilary and Trinity terms; assises being allowed to be taken in the holy time of Lent by consent of the bishops at the king's request, as expressed in statute Westm. 1. 3 Edw. I. c. 51. And it was also usual, during the times of Popery, for the prelates to grant annual licenses to the justices of assise to administer oaths in holy times: for oaths being of a sacred nature, the logic of those deluded ages concluded that they must be of ecclesiastical cognizance. The prudent jealousy of our ancestors ordained, that no man of law should be judge of assise in his own county: and a similar prohibition is found in the civil law, which has carried this principle so far, that it is equivalent to the crime of sacrilege for a man to be governor of the province in which he was born, or has any civil connexion.

The judges upon their circuits now sit by virtue of five several authorities. 1. The commission of the *peace* in every county of the circuit: and all justices of the peace of the county are bound to be present at the assises; and sheriffs are also to give their attendance on the judges, or they shall be fined. 2. A commission of *oyer* and *terminer*, directed to them and many other gentlemen of the county, by which they are empowered to try treasons, felonies, &c. and this is the largest commission they have. 2. A commission of general *gaol-delivery*, directed to the judges and the clerk of assise associate, which gives them power to try every prisoner in the gaol committed for any offence whatsoever, but none but prisoners in the gaol; so that one way or other they rid the gaol of all the prisoners in it. 4. A commission of *assise*, directed to the judges and clerk of assise, to take assises; that is, to take the verdict of a peculiar species of jury called an *assise*, and summoned for the trial of *landed* disputes. The other authority is, 5. That of *nisi prius*, which is a consequence of the commission of *assise* being annexed to the office of those justices by the statute of Westm. 2. 13 Edw. I. c. 30. And it empowers them to try all questions of fact issuing out of the courts of Westminster, that are then ripe for trial by jury. The original of the name is this; all causes commenced in the courts of Westminster-hall are by the course of the courts appointed to be there tried, on a day fixed in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arises; but with this proviso, *nisi prius justiciarii ad assisas capiendas venerint*, *unless before* the day prefixed the judges of assise come into the county in question. This they are sure to do in the vacations preceding each Easter and Michaelmas term, and there dispose of the cause; which saves much expence and trouble, both to the parties, the jury, and the witnesses. Assise || Assithment.

The word *assise* (from the French *assis*, seated, settled, or established, and formed of the Latin verb *assideo*, "I sit by") is used in several different senses. It is sometimes taken for the sitting of a court; sometimes for its regulations or ordinances, especially those that fix the standard of weights and measures; and sometimes it signifies a jury, either because juries consisted of a fixed determinate number, or because they continued sitting till they pronounced their verdict. In Scots law, an assise or jury consists of 15 sworn men (*juratores*), picked out by the court from a great number, not exceeding 45, who have been summoned for that purpose by the sheriff, and given in a list to the defender, at serving him with a copy of his libel.

ASSISIO, an episcopal town of Italy, in the duchy of Spoleto, built on the side of a very high mountain. The cathedral of St Francis is very magnificent, and composed of three churches, one above another. E. Long. 13. 35. N. Lat. 43. 4.

ASSITHMENT, a wiregeld, or composition, by a pecuniary mulct; from the preposition *ad*, and the Sax. *sithe*, *vice*; *quod vice supplicii ad expiandum delictum solvitur*.
